

## General Description

The MAX40658 evaluation kit (EV kit) is a fully assembled electrical demonstration kit that provides a proven design to evaluate the MAX40658 and MAX40659 transimpedance amplifier.

Note that the MAX40658 evaluation kit provides an electrical interface to the IC that is similar, but not identical to, a photodiode.

The MAX40658 EV kit PCB comes with a MAX40658AETA+ 18.3k $\Omega$  transimpedance device installed. To evaluate the MAX40659AETA+ (36.6k $\Omega$  transimpedance), contact the factory for free samples of the pin-compatible device.

## Features

- Easy +3.3V Electrical Evaluation of MAX40658
- EV Kit Designed for 50 $\Omega$  Interfaces
- -40°C to +85°C Temperature Range
- Evaluated 8-TDFN-EP MAX40658AETA+ Device
- Accommodates Easy-to-Use Components
- Proven PCB Layout
- Fully Assembled and Tested

[Ordering Information](#) appears at end of data sheet.

## Quick Start

### Required Equipment

- MAX40658 EV kit
- +3.6V, 100mA DC power supply
- Signal source up to 1GHz
- A minimum 500MHz to 2.5GHz oscilloscope

### Procedure

The MAX40658 EV kit is fully assembled and tested. Follow the below to verify board operation:

Caution: Do not turn on the power supply or the electronic load until all the connections are complete.

- 1) Connect a +3.3V supply and ground to V1\_Supply connector.
- 2) Connect a signal source to J2. Set the signal amplitude to 20mV<sub>P-P</sub> (7.07mV<sub>RMS</sub> or -30dBm). (Corresponding to 3.6 $\mu$ A<sub>P-P</sub>). Set the frequency to 100MHz.
- 3) Apply 1 $\mu$ A to the J11 DC input using a DC current source to emulate the DC component of the input signal. A voltage source connected from J11 to GND may be used if a DC current source is not available.
- 4) Connect OUT1+ (J10) and OUT- (J7) to the 50 $\Omega$  inputs of a high-speed oscilloscope.
- 5) Verify all the shunts are in default positions as shown in [Table 1](#).
- 6) The differential signal at the oscilloscope should be approximately 43mV<sub>P-P</sub> at 100MHz.

### Detailed Description of Hardware

The MAX40658 accepts a DC-coupled input from a high-speed photodiode. The MAX40658 evaluation board facilitates evaluation of MAX40658 TIA without a photodiode. The MAX40658 EV kit comes from the factory with a low input current and a high input current setup.

### Theory of Operation

The MAX40658 EV kit comes with an 8-TDFN EP with circuit providing photodiode emulation using a simplified electrical photodiode model. The model provides a 50Ω electrical input termination, resistors that convert the high-speed input voltage to high-speed current. A DC path is provided to model the average photodiode current.

### Test Interface

The MAX40658 outputs are back-terminated with 75Ω. To facilitate interface with 50Ω equipment, the MAX40658 EV kit places external 150Ω termination resistors in parallel with each output so that the EV kit will match a 50Ω environment.

Note that the output load has a direct effect on the overall gain and output signal swing. Because of the external 150Ω resistors and the 50Ω environments, the overall gain is reduced by 33%. If matching a 50Ω environment is not critical, higher gain can be achieved by increasing the load resistance.

### Current Pulse Measurements

To perform pulse measurements, the current pulses are created by providing a voltage pulse at J1 or J2 input. The input series resistance combination (R5 + R7) or

(R6 + R8), respectively, determines the amplitude of the current pulse.

For best performance, when providing the input voltage pulse at J1, remove the DC blocking capacitors C1 and C2 and replace them with a 0Ω short to DC couple the input to the MAX40658. Remove R3.

Use the following resistor combinations as shown in [Table 1](#) to create the respective current amplitude pulses.

### Current Pulse Measurements

To perform pulse measurements, the current pulses are created by providing a voltage pulse at J1 or J2 input. The input series resistance combination (R5+R7) or (R6+R8) respectively determines the amplitude of the current pulse.

For best performance, when providing the input voltage pulse at J1, remove the DC blocking capacitors C1 and C2 and replace them with a 0Ω short to DC couple the input to the MAX40658. Remove R3.

Use the following resistor combinations as shown in the table below to create the respective current amplitude pulses.

### Noise measurements

Remove the input resistors and shunt capacitor before attempting noise measurement. With the input resistors and shunt capacitor removed, the total capacitance at the IN-input 0.5pF.

**Table 1. Different Values of Rs (R5+R7) for Different Input Current Pulse Amplitudes.**

INPUT SERIES RESISTANCE R <sub>S</sub> (Ω)	GENERATOR INPUT AMPLITUDE STEP (V)	GENERATED INPUT CURRENT STEP (MA)
2200	0.55	0.1
100	0.35	1
9.4	4.6	92
