

Installation

1. Remove the two screws holding the diffuser to gain access to the interior.
2. Press the two tabs to release the LED tray to access the mains input terminal. This is hinged so the LED tray remains attached to the body.
3. Cable entry is available through rear, top and bottom or both ends. Ensure appropriate grommets or compression couplings are used to maintain the IP65 rating where required.
4. Connect the mains input supply as indicated on the left as per the required operation.
5. Connect the emergency battery leads to the circuit board where indicated.
6. Relocate the LED tray, ensuring it is secured using the tabs.
7. Refit the diffuser ensuring there is a good seal to maintain the IP65 rating.
8. Switch on mains supply and test for operation(allow 24hrs for batteries to charge).
9. Fit the legend on the front of the diffuser to suit the application from the four choices indicated on the right which are included.
10. Familiarise yourself with the enclosed emergency fittings test record sheet and ensure it is completed as required and left with the end user.
