

Which of the following best describes your situation?

Farmer/producer

Are you responding on behalf of an organisation or industry body?

No

How would you like to respond?

a. Answer discussion paper questions via the online survey

What are the opportunities to reduce emissions and build carbon stores in agriculture and the land? What are the main barriers to action?

China and India, honestly Australia is doing an amazing job and carrying a burden that has been imposed by left wing radical groups

How can we progress emission reduction efforts whilst also building resilience and adapting to climate change?

Work on countries that cause the problem not on countries that do the right things.

Are there initiatives or innovative programs underway that could be applied or expanded on at a national scale?

Settle down, we are burdened by drought, and many other issues, let's deal with real issues not made up issues.

How can the Australian Government bring together existing effort and new initiatives into one coordinated plan?

Listen to diverse groups eg agricultural sector rather than the left wing radicals

What are the most important options to be further adopted or supported, looking in the short and the longer-term?

Listening and learning from the successful agricultural sector rather than the radical left ideology.

What are the practical solutions to increase uptake?

Listen and learn.

How do you see the agriculture and land sectors contributing over the medium and longer-term? What are the opportunities to deliver emission reductions in parallel with wider goals?

Tackling the challenges from the real problem areas rather than pretending that agriculture is the demon. Tackling the city emissions and clearing for suburban communities.

How can the Australian Government better support agriculture and land sectors to:

a) build innovation

b) build capacity

c) ensure the system enables emissions reductions

Listen and learn. We are actively engaged in moving forward and some of us are intelligent despite what Labor might not believe.

What new initiatives could the Australian Government design that would support emissions reduction and carbon storage in agriculture and land and help ensure a productive, profitable, resilient and sustainable future for the sectors?

Stop the belief that Agriculture is causing this, and tackle the real problem areas. Agriculture can innovate if allowed to do this and not hampered by the onerous legislations of government that is under false belief that they are the problem.

A consistent and trusted approach for assessing and reporting emissions is often raised as a barrier to reducing emissions. Is there a role for the Australian Government in addressing this concern, and how can producers and land managers be supported?

Stop thinking agriculture is the problem. They actually are the solution.

What skills, knowledge and capabilities do you think producers and land managers need to implement change? What information and data would help them make decisions about emissions reductions and sustainable land management in the short and longer-term?

We can make multiple decisions and use data as long as it is accurate and has veracity not trumped up information that makes agriculture the demons.

Do you have any additional views or feedback that you would like to include in your response?

Listen and learn.

Is your response confidential?

No

Do you agree to your response being published on our website?

Yes

Please de-identify my response

Yes

I have read and understood the privacy notice and consent to the collection, use and disclosure of my personal information as outlined in the privacy notice.

Yes

Confirm that you have read and understand this declaration.
