

Go Passwordless

Last updated: March 2023

Say goodbye to passwords and prevent account takeovers.

Why Passwords are the Problem

We all have an ever-growing list of passwords to juggle on a daily basis which give us a headache. No matter how strong our passwords can be by making them to be long, a combination of different character types, unguessable, random, regularly changed, not reused, still stolen passwords are one of the most commonplace causes of data breaches. With all the effort and time spent on struggling with passwords and trying not to be locked out from a forgotten password, think about the cost of missed opportunities and work from wasting productive time!

According to Gartner, 20% to 50% of all IT help desk calls are for password resets, which cost organizations time and resources. So, password resets only replaces the problem with another problem.

Key Benefits

- Quick deployment,
- Simple to use,
- Seamless SSO integrations,
- Cost saving,
- Credential lifecycle management,
- Affordable and easy to scale,
- Automated user onboarding,
- Role-based administrative privileges.

FIDO is the Solution

FIDO2 (Fast IDentity Online) protocol is the strongest standards-based authentication available. With FIDO, in addition to security, users can have a convenient passwordless login experience.

This standard uses security keys for passwordless authentication and is widely supported by all browsers, operation systems, and leading companies' products and services, including Microsoft, Google, and Apple.

Passwordless with IDmelon

IDmelon empowers organizations to deploy FIDO as simply and quickly as possible and scale affordably and enables staff to use whatever devices they own as a FIDO security key. A great experience for both users and IT administrators.

Simple and Secure Steps for Fast FIDO Deployment

It's a race against time for organizations to protect themselves from the constant threat of hacking and phishing attacks. IDmelon Passwordless Orchestration Platform (IPOP) provides a solution that is not only effective and secure, but also fast and convenient.

Import Users

Admins can automatically import users from Azure AD or a CSV file into the IDmelon Credential Lifecycle Management Admin Panel.

Assign Keys to Users

Admins use Panel to assign FIDO2 form factors by only sending the IDmelon prefabricated onboarding email to the users. The new users receive the email and follow a simple process to onboard their new or already deployed smartphones, security keys, proximity or contactless access cards/ID badges, and key fobs as a FIDO2 USB security key.

Create Security Key Policies

Admins can create security policies according to their organization's needs and assign them to whichever users they want. These policies enhance the security of organizations by enabling them to have complete control over their data access. They can decide who can have access to what, when and from where!

Phishing-resistant

Passwordless Authentication.

Superior security for workforce authentication with existing devices as FIDO security keys.
