## 2 Motivation

3 Necessary and sufficient conditions

4 The solution of  $AX + X^*B = 0$ 

< 🗇 🕨 < 🖃 >

## Sylvester equation for congruence

$$A \in \mathbb{F}^{m imes n}, B \in \mathbb{F}^{n imes m}, C \in \mathbb{F}^{m imes m}$$
 ( $\mathbb{F}$  an arbitrary field)

$$AX + X^*B = C$$

#### Sylvester equation for **\***-congruence

 $X \in \mathbb{F}^{n \times m}$ , unknown

 $(\star = T \text{ or } \ast)$ 

(Other name in the literature: "Sylvester-transpose matrix equation")

## Solution of Sylvester equation for congruence

 $AX + X^*B = C$  (\* = T or \*) Sylvester equation for congruence

#### **GOALS:**

- Find necessary and sufficient conditions for consistency.
- Find the dimension of the solution space.
- Find an expression for the solution.
- Find necessary and sufficient conditions for uniqueness of the solution.
- Find an (efficient) algorithm to compute the solution (when unique).

## Related equations and history

 $AX + X^*B = C$  (\* = T or \*) Sylvester equation for congruence

(a) Sylvester equation: AX + XB = C (A, B must be square!!)

- Solution know since (at least) the 1950's (Gantmacher).
- Characterization of consistency and uniqueness of solution already known (Roth, Gantmacher).
- Efficient algorithm for the unique solution already known (Bartels-Stewart).
- Mathscinet:
  - 83 references containing "Sylvester equation" in the title.
  - 44 references containing "Sylvester matrix equation" in the title.
  - 227 references containing "Sylvester equation" anywhere.
  - 91 references containing "Sylvester matrix equation" anywhere.

## 2 Motivation

#### 4 The solution of $AX + X^*B = 0$

▲ 同 ▶ → 三 ▶

## Consistency

## Theorem (Wimmer 1994, DT-Dopico 2011)

Let  $\mathbb{F}$  be a field with char  $\mathbb{F} \neq 2$ ,  $A \in \mathbb{F}^{m \times n}$ ,  $B \in \mathbb{F}^{n \times m}$ ,  $C \in \mathbb{F}^{m \times m}$ . Then

 $AX + X^*B = C$  is consistent

if and only if

$$\boldsymbol{P}^{\star} \left[ \begin{array}{cc} \boldsymbol{C} & \boldsymbol{A} \\ \boldsymbol{B} & \boldsymbol{0} \end{array} \right] \boldsymbol{P} = \left[ \begin{array}{cc} \boldsymbol{0} & \boldsymbol{A} \\ \boldsymbol{B} & \boldsymbol{0} \end{array} \right],$$

for some nonsingular P.

De Terán, Dopico, Guillery, Montealegre, Reye

🗇 🕨 🖉 🕨 🖉 🖻

## Consistency

## Theorem (Wimmer 1994, DT-Dopico 2011)

Let  $\mathbb{F}$  be a field with char  $\mathbb{F} \neq 2$ ,  $A \in \mathbb{F}^{m \times n}$ ,  $B \in \mathbb{F}^{n \times m}$ ,  $C \in \mathbb{F}^{m \times m}$ . Then

 $AX + X^*B = C$ is consistent

if and only if

$$\mathbf{P}^{\star} \left[ \begin{array}{cc} C & A \\ B & 0 \end{array} \right] \mathbf{P} = \left[ \begin{array}{cc} 0 & A \\ B & 0 \end{array} \right],$$

for some nonsingular P.

(Compare with Roth's criterion:

"AX - XB = C is consistent if and only if

$$\boldsymbol{P}^{-1}\left[\begin{array}{cc}\boldsymbol{A} & \boldsymbol{C}\\ \boldsymbol{0} & \boldsymbol{B}\end{array}\right]\boldsymbol{P} = \left[\begin{array}{cc}\boldsymbol{A} & \boldsymbol{0}\\ \boldsymbol{0} & \boldsymbol{B}\end{array}\right],$$

for some nonsingular  $P^{"}$ .)

# Consistency: proof

Wimmer's proof: Dimensionality arguments. DT-Dopico's proof: Based on:

Theorem (Wimmer 1994, Syrmos-Lewis 1994, Beitia-Gracia 1996)

 $A_1, A_2 \in \mathbb{F}^{m imes n}, B_1, B_2 \in \mathbb{F}^{p imes k}, C_1, C_2 \in \mathbb{F}^{m imes k}.$  Then

$$A_1X + YB_1 = C_1$$
  
 $A_2X + YB_2 = C_2$  is consistent

if and only if

$$P\begin{bmatrix} A_1 - \lambda A_2 & C_1 - \lambda C_2 \\ 0 & B_1 - \lambda B_2 \end{bmatrix} Q = \begin{bmatrix} A_1 - \lambda A_2 & 0 \\ 0 & B_1 - \lambda B_2 \end{bmatrix},$$

for some *P*, *Q* nonsingular.

# Uniqueness of solution

Theorem (Byers-Kressner 2006, Kressner-Schröder-Watkins 2009)

 $A, B \in \mathbb{C}^{n \times n}$ . Then

$$AX + X^*B = C$$
 has a unique solution

if and only if

(1)  $A + \lambda B^*$  is regular, and

(2) 
$$\star = T$$
: If  $\mu \in \text{Spec}(A + \lambda B^T) \setminus \{-1\}$ , then  
 $1/\mu \notin \text{Spec}(A + \lambda B^T) \setminus \{-1\}$  and, if  $-1 \in \text{Spec}(A + \lambda B^T)$ , then it  
has algebraic multiplicity one.

 $\star$  = \*: If  $\mu$  ∈ Spec (A +  $\lambda B^*$ ), then 1/ $\overline{\mu} \notin$  Spec (A +  $\lambda B^*$ ).

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

# Uniqueness of solution: Algorithm

Using vec and Gaussian elimination:  $M \cdot \text{vec} X = \text{vec} C \rightsquigarrow O(n^6)$ !!!!

#### Algorithm 1 (Solution of $AX + X^*B = C$ )

 $A, B \in \mathbb{C}^{n imes n}, A + \lambda B^{\star}$  regular

**Step 1.** Compute the generalized Schur decomposition of  $A + \lambda B^*$  (with the QZ algorithm):

$$A = URV, \qquad B^* = USV.$$

**Step 2.** Compute  $E = U^* C(U^*)^*$ . **Step 3.** Solve  $RW + W^* S^* = E$ . **Step 4.** Compute  $X = V^* WU^*$ .

is equivalent to the set of equations

$$\begin{aligned} &E_i X_{ij} + X_{ij}^{\star} F_j = 0\\ &E_j X_{ji} + X_{ij}^{\star} F_i = 0, \end{aligned}$$

for i, j = 1, ..., d.

Note that we have:

$$i = j \rightarrow E_i X_{ii} + X_{ii}^* F_i = 0 \qquad (1 \text{ equation})$$

$$i \neq j \rightarrow \begin{cases} E_i X_{ij} + X_{ji}^* F_j = 0 \\ E_j X_{ji} + X_{ij}^* F_i = 0 \end{cases} \qquad (\text{system of 2 equations})$$

Sylvester equation for \*-congruence

# Using the KCF

By particularizing to  $F + \lambda F^*$  as the KCF of  $A + \lambda B^*$ , i.e.: direct sum of blocks:

**Type 1**: "finite blocks":  $J_k(\lambda_i) + \lambda I_k$ 

**Type 2**: "infinite blocks":  $\lambda J_m(0) + I_m$ 

**Type 3**: "right singular blocks":  $L_{\varepsilon}$ 

**Type 4**: "left singular blocks":  $L_n$ 

we have to solve:

(a)  $EX + X^*F = 0$ , with  $E + \lambda F^*$  of **type 1–4**  $\rightsquigarrow$  **4** equations (b)  $\begin{array}{c} E_i X + Y^*F_j = 0\\ E_j Y + X^*F_i = 0 \end{array}$ , with  $E_i + \lambda F_i^*$ ,  $E_j + \lambda F_j^*$  of **type 1–4**  $\rightsquigarrow$  **10** systems

## The KCF of $A + \lambda B^{\star}$

Let  $A \in \mathbb{C}^{m \times n}$ ,  $B \in \mathbb{C}^{n \times m}$ , set  $A + \lambda B^*$  with Kronecker canonical form

$$\begin{split} \mathcal{K}_{1} + \lambda \mathcal{K}_{2}^{\star} &= \mathcal{L}_{\varepsilon_{1}} \oplus \mathcal{L}_{\varepsilon_{2}} \oplus \cdots \oplus \mathcal{L}_{\varepsilon_{a}} \\ &\oplus \mathcal{L}_{\eta_{1}}^{T} \oplus \mathcal{L}_{\eta_{2}}^{T} \oplus \cdots \oplus \mathcal{L}_{\eta_{b}}^{T} \\ &\oplus (\lambda \mathcal{J}_{u_{1}}(0) + \mathcal{I}_{u_{1}}) \oplus (\lambda \mathcal{J}_{u_{2}}(0) + \mathcal{I}_{u_{2}}) \oplus \cdots \oplus (\lambda \mathcal{J}_{u_{c}}(0) + \mathcal{I}_{u_{c}}) \\ &\oplus (\mathcal{J}_{k_{1}}(\mu_{1}) + \lambda \mathcal{I}_{k_{1}}) \oplus (\mathcal{J}_{k_{2}}(\mu_{2}) + \lambda \mathcal{I}_{k_{2}}) \oplus \cdots \oplus (\mathcal{J}_{k_{d}}(\mu_{d}) + \lambda \mathcal{I}_{k_{d}}), \end{split}$$

where  $\varepsilon_1 \leq \varepsilon_2 \leq \cdots \leq \varepsilon_a$ ,  $\eta_1 \leq \eta_2 \leq \cdots \leq \eta_b$ , and  $u_1 \leq u_2 \leq \cdots \leq u_c$ . Then the dimension of the solution space of the matrix equation

$$AX + X^*B = 0$$

depends only on  $K_1 + \lambda K_2^{\star}$ .

## Codimension count

#### Theorem

The **dimension** of the solution space of  $AX + X^T B = 0$  is:

$$\dim \mathscr{S}(A,B) = \sum_{i=1}^{a} \varepsilon_i + \sum_{\mu_i=1} \lfloor k_i/2 \rfloor + \sum_{\substack{\mu_j=-1 \\ i < j}} \lceil k_j/2 \rceil + \sum_{\substack{i,j=1 \\ i < j}} (\varepsilon_i + \varepsilon_j) + \sum_{\substack{i < j \\ \mu_i \mu_j = 1}} \min\{k_i, k_j\} + \sum_{\substack{i,j \\ \mu_j = 0}} \lfloor \eta_j - \varepsilon_i + 1 \rfloor + \sum_{\substack{i,j \\ \mu_j = 0}} \min\{u_i, k_j\}$$
