#### **IMPORTANT NOTES**

#### Note:

- Please fill the number of workers in the appropriate category and classify in the correct cell as local or expatriate, male or female
- The number of staffs entered should be the number working in that particular 6 months.
- Part Time workers SHOULD NOT be included as they will be counted where they are employed full time.
- A person included in one category SHOULD NOT be included in another category
- In the total column, enter the figure as a total for local (Male and Female), total for expatriate (Male and Female) for that respective category
- If the appropriate category is not found, pls insert an additional row/column and provide a description of the category and the number of health personnel in that category (in the same format - local, expatriate, male, female)
- For further clarifications or information, pls contact via telephone: 332 8887 (142 / 158 / 183 /161 ) or email: ppd@health.gov.mv
- \*Please email the soft copy (in original format provided- Excel) to ppd@health.gov.mv (pls DO NOT change any part of the format)
- This data is an important data to assess the number employed in the health workforce and will be published in Health Statistics, Statistical
   Year Book of Maldives and other relevant publication

This report may be filled from Hospitals or Health Centers or Health Posts. Please fill in data relevant to the health facility.

**Bed Occupancy** means the number of beds that were occupied in a hospital / health centre during a day. This count of heads or CENSUS is taken at the same time every day e.g. 12 am [midnight].

**For example**, if there were 5 inpatients at midnight on 1 April, the occupancy is said to be 5. Likewise, note each day's occupancy.

Given below is the bed occupancy of a Health centre with 10 beds for the month of April.

	Date	Bed Occupancy	
		Occupancy	
	1-Apr	5	
	2-Apr	6	
	3-Apr	7	
	4-Apr	6	
	5-Apr	5	
	6-Apr	4	
	7-Apr	5	
	8-Apr	6	
	9-Apr	7	
	10-Apr	4	
	11-Apr	5	
	12-Apr	4	
	13-Apr	3	
	14-Apr	4	
	15-Apr	5	
	16-Apr	6	
	17-Apr	5	
	18-Apr	4	
	19-Apr	5	
	20-Apr	4	
	21-Apr	5	
	22-Apr	4	
1	23-Apr	5	
	24-Apr	4	
	25-Apr	5	
	26-Apr	6	
	27-Apr	5	
	28-Apr	6	
	29-Apr	5	
	30-Apr	5	
		150	
Total occupancy for April		150	
Total Number of days in April		30	
Number of beds		10	
Bed Occupancy Rate =			ccupancy x 100
			of days x No. of beds
		i.e.	<u>150x100</u>
			30x10
		i.e.	50

<u>Duration of stay</u> means the number of days each patient stayed in the hospital/health centre and is calculated only when a patient is discharged or dies i.e. only when both the dates [admission/discharge/death] are known.

Given below is the admission and discharge register of a Hospital.

Patient's Name		Date of Discharge/Death	Duration of Stay
Α	1-Apr	4-Apr	3
В	2-Apr	8-Apr	6
С	2-Apr	5-Apr	3
D	3-Apr	10-Apr	7
Е	4-Apr	5-Apr	1
Total dura	20		
No: of inpa	5		
Average duration of Stay			20/5= <b>4 days</b>

If the durations of stay of each patient are added up then this will give the total duration of stay of the inpatients that were discharged or died. The total duration of stay divided by the number of inpatients that were discharged or died would give the average duration of stay.

In calculating the average duration of stay, do not include the duration of stay of patients who have not been discharged.

## ير. يا في ساج برلامكوس يالوكرير مكوس

# مرسم 3: الله مرة على الموسم ورع والمسمر ورع ورسم

This guideline aims to guide doctors in filling out death certificates. Death certification is an important part of a doctor's duties as the information recorded in the death certificates helps decision makers in future planning and determines health priorities for prevention of preventable deaths due to similar causes in the future.

The diagnosis that doctors enter in the death certificate is used to establish the cause of death for that person. This information is used for various purposes, the main use been to inform policy-makers about the leading causes of death in the country in order to prioritize activities focusing on reducing burden of diseases and preventing deaths from these cause. The family gets the original death certificate which they use for funeral arrangements and other legal purposes. The information on the certificate is also important for family members so that they know what caused the death, and are aware of conditions that may occur or could be prevented in other family members.

The cause of death in the death certificate is coded by trained coders who have the expert knowledge in applying the *International Statistical Classification of Diseases and Related Health Problems*, of which Maldives uses its 10th revision (ICD-10). The ICD-10 is managed by the World Health Organization and classifies thousands of diseases as individual items and groups similar diseases together in a meaningful way.

The coded certificates are then analyzed and tabulated. This tabulation forms the basis for national mortality statistics. These are critical for establishing national health program priorities, for health planning and policy, and to inform debate about the allocation of health resources. Good-quality mortality statistics are fundamental for the prevention of premature deaths. By agreement, countries are obliged to report their mortality statistics to the World Health Organization. These statistics form the basis for international health statistics and for international program priorities. They also form the basis for national and global burden of disease estimates and for decisions about global priorities to improve health.

Since the cause of death data is important in health planning and establishing priority programs, it is imperative that good quality causes of death data are produced. For this purpose we need to improve death certification. Currently WHO classifies Maldives in the category, "low quality" cause of death data. This is because in the data we produce ill-defined codes appear on >20% of the deaths. In 2010 the percentage of ill-defined causes was 20.7% and in 2011 this percentage was 26.4%. Therefore, we need to put extra effort of death to improve death certification to improve quality the cause of data.

# Instructions for Completing the Cause-of-Death Section of the Death Certificate

The cause-of-death section consists of two parts.

Part I is for reporting a chain of events leading directly to death, with the **immediate cause** of death (the final disease, injury, or complication directly causing death) on Line (a) and the **underlying cause** of death (the disease or injury that initiated the chain of morbid events that led directly and inevitably to death) on the lowest used line.

Part 2 is for reporting all other significant diseases, conditions, or injuries that contributed to death but which did not result in the underlying cause of death given in Part I. The cause-of-death information should be YOUR best medical OPINION. Report each disease, abnormality, injury, or poisoning that you believe led to that death. A condition can be listed as "probable" even if it has not been definitively diagnosed.

## **Examples of properly completed medical certifications**

## Case history no. 1

Shortly after dinner on the day prior to admission to the hospital, this 48-year-old male developed a cramping, epigastric pain, which radiated to his back, followed by nausea and vomiting. The pain was not relieved by positional changes or antacids. The pain persisted, and 24 hours after its onset, the patient sought medical attention. He had a 10-year history of excessive alcohol consumption and a 2-year history of frequent episodes of similar epigastric pain. The patient denied diarrhea, constipation, hematemesis, or melena. The patient was admitted to the hospital with a diagnosis of an acute exacerbation of chronic pancreatitis. Radiological findings included a duodenal ileus and pancreatic calcification. Serum amylase was 4,032 units per liter. The day after admission, the patient seemed to improve. However, that evening he became disoriented, restless, and hypotensive. Despite intravenous fluids and vasopressors, the patient remained hypotensive and died. Autopsy findings revealed many areas of fibrosis in the pancreas with the remaining areas showing multiple foci of acute inflammation and necrosis.

## Case history no. 2

A 30-year-old, gravida-six, para-five, with a history of gestational hyper-tension, reported to the emergency room at 36 weeks gestation with complaints of abdominal cramping and light vaginal bleeding during the past 12 hours. At time of first assessment, fetal heart tones were detected. The uterus was tense, irritable, and tender. The mother was hypotensive with tachycardia. A presumptive diagnosis of abruptio placenta was made, and an emergency cesarean section was performed under general anesthesia. The baby was stillborn. The mother continued to bleed from her uterus and phlebotomy sites and went into profound shock secondary to disseminated intravascular coagulation. Despite administration of blood and clotting factors, intravascular pressure could not be maintained, and the mother died on the operating table. Maternal autopsy confirmed the clinical diagnosis.

# Case history no. 3

This 24 year old male was admitted to the hospital 6 hours following a coconut falling on to his head. On admission he was confused and had nasal bleeding. About one hour after the admission, he went in to deep coma. The CT brain revealed a large sub dural haematoma and cerebral contusion. He died two hours after the admission to the hospital.

#### **CAUSE OF DEATH**

Take care to make the entry legible. Use a computer printer or print legibly using permanent black ink in completing the cause-of-death section. **Do not abbreviate** conditions entered in section.

# PART 1 (Chain of events leading directly to death)

- Only one cause should be entered on each line. Line (a) MUST ALWAYS have an entry. DO
   NOT leave blank. Additional lines may be added if necessary.
- If the condition on Line (a) resulted from an underlying condition, put the underlying condition on Line (b), and so on, until the full sequence is reported. ALWAYS enter the underlying cause of death on the lowest used line in Part 1.
- For each cause indicate the best estimate of the interval between the presumed onset and the date of death. The terms "unknown" or "approximately" may be used. General terms, such as minutes, hours, or days, are acceptable, if necessary. DO NOT leave blank.
- The terminal event (e.g., cardiac arrest or respiratory arrest) should not be used. If a mechanism of death seems most appropriate to you for Line (a), then you must always list its cause(s) on the line(s) below it (e.g., cardiac arrest due to coronary artery atherosclerosis or cardiac arrest due to blunt impact to chest).
- If an organ system failure such as congestive heart failure, hepatic failure, renal failure, or respiratory failure is listed as a cause of death, always report its etiology on the line(s) beneath it (e.g., renal failure due to Type I diabetes mellitus).
- When indicating neoplasm as a cause of death, include the following: 1) primary site or that the primary site is unknown, 2) benign or malignant, 3) cell type or that the cell type is unknown, 4) grade of neoplasm, and 5) part or lobe of organ affected. Example: *a primary well-differentiated squamous cell carcinoma, lung, left upper lobe*.

#### **PART 2** (Other significant conditions)

- Enter all diseases or conditions contributing to death that were not reported in the chain of events in Part I and that did not result in the underlying cause of death. See examples.
- If two or more possible sequences resulted in death, or if two conditions seem to have added together, report in Part 1 the one that, in your opinion, most directly caused death. Report in Part 2 the other conditions or diseases.

## **CHANGES TO CAUSE OF DEATH**

If additional medical information or autopsy findings become available that would change the cause of death originally reported, the original death certificate should be amended by the certifying physician by immediately reporting the revised cause of death to Ministry of Health.

#### **COMMON PROBLEMS IN DEATH CERTIFICATION**

The elderly decedent should have a clear and distinct etiological sequence for cause of death, if possible. Terms such as *senescence*, *infirmity*, *old age*, and *advanced age* have little value for public health or medical research. Age is recorded elsewhere on the certificate. When a number of conditions resulted in death, the physician should choose the single sequence that, in his or her opinion, best describes the process leading to death, and place any other pertinent conditions in Part II.

#### **INFANT DECEDENT**

The infant decedent should have a clear and distinct etiological sequence for cause of death, if possible.

"Prematurity" should not be entered without explaining the etiology of prematurity. Maternal conditions may have initiated or affected the sequence that resulted in infant death, and such maternal causes should be reported in addition to the infant causes on the infant's death certificate (e.g., *Hyaline membrane disease due to prematurity, 28 weeks due to placental abruption due to blunt trauma to mother's abdomen*).
