Answers for the queries below:

Query	Response
1. Should the Resident Engineer always be on site daily during the construction works? Or should he/she be checking on the site periodically every day and during important events?	It is not necessary to be always present on site. However, daily visits to the site for supervision of ongoing works, checking reinforcements, inspections prior to concreting and to be present on concrete castings is necessary. Bidder to ensure to address/explain this in the quality control plan.
2. Currently the RFP states that the services of the Architect is needed for 3 months and the services of the Services Engineer is needed for 6 months (page 19 of the RFP)? Wouldn't the Architect and Services Engineer likely need to stay on for the duration of the project?	The duration for the Architect and Services Engineer is limited as their input would mostly be required during the Construction drawing reviews/approval stages.
