Google

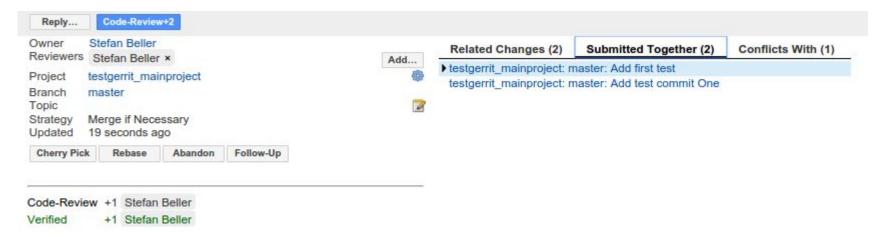

Coupling Changes in Gerrit

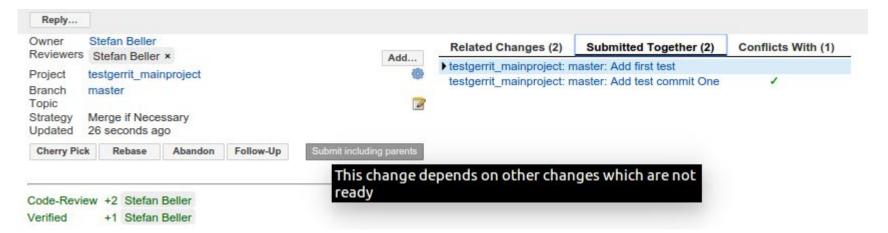

2015-11-07, Stefan Beller, <sbeller@google.com>

The Merge Queue is gone

- The SUBMITTED state is gone
 - No more "Submitted, Merge Pending"
 - Only states: New, Draft, Merged, Abandoned
- Immediate feedback!
 - Either you can be sure it merged,
 - or an error pops up in the change screen

- Typical workflow:
 - Submit in backwards order
 - Piling up pending changes
 - On submission of the first change, all are merged (hopefully)
- Replaced by submission of ancestors
 - "Submit this change and 5 ancestors"
 - pseudo atomic

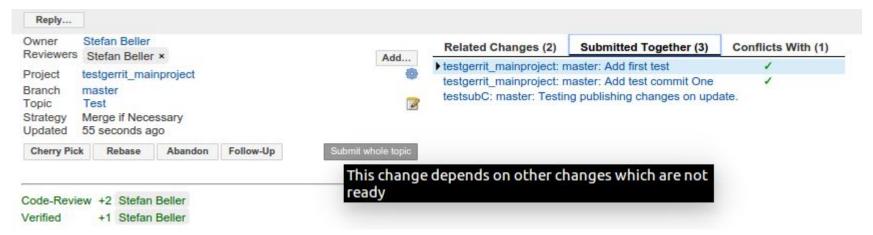

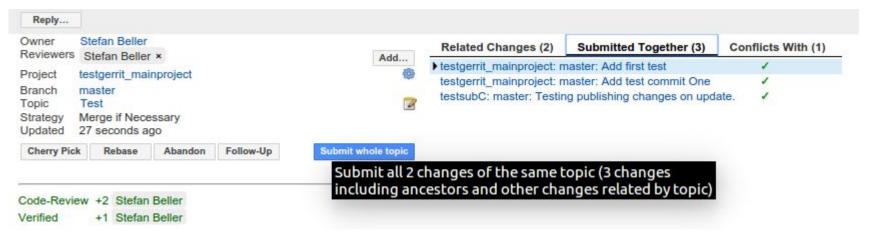

Submission of topics

- A new workflow
 - Submit whole topic
 - "Submit all 5 changes of the same topic (7 changes including ancestors and other changes related by topic)"
- Submission coupled by topics and ancestors thereof
 - works across repositories
 - pseudo atomic

Submission of topics

Submission of topics

Atomicity in Android

Superproject subscriptions

- Have Android in a superproject
 - All components in Submodules
 - Changes in submodules trigger automatic update in the superproject
 - Coupling by topic across components, generates one superproject commit
- Benefits:
 - Atomic fetch
 - Less fetches (only updated submodules)
- Gerrit is ready, Git not yet.

Git submodules

- Improve Git
 - Performance (-j 16 for submodule related operations)
 - o Better UI
- Gerrit ?
 - Better UI ? (show log instead of \$SHA1..\$SHA1)
 - Better configuration for superprojects

Thanks, Questions?
