1 - Fit the drive

•

0

2 - Connect the following to the drive:

- The line supply, ensuring that it is: within the voltage range of the drive off
- · The motor, ensuring that its coupling corresponds to the supply voltage
- · The control via the logic inputs
- · The speed reference via the logic or analog inputs

3 - Switch on the drive, but do not give a run command

4 - Configure the following:

- The nominal frequency (bFr) of the motor, if it is other than 50 Hz for the E range or other than 60 Hz for the U range (only appears the first time the drive is switched on).
- The ACC (Acceleration) and dEC (Deceleration) parameters.
- The LSP (Low speed when the reference is zero) and HSP (High speed when the reference is maximum) • parameters. •
- The ItH parameter (Motor thermal protection).
- The preset speeds SP2-SP3-SP4. ٠ The speed reference if it is other than 0 - 5 V (0 -10V or 0 -20mA or 4 -20mA).

5 - Configure the following in the drC menu:

The motor parameters, only if the factory configuration of the drive is not suitable.

6 - Start the drive

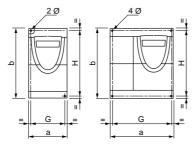

Factory configuration

The Altivar 11 is factory-configured for the most common operating conditions:

- Logic inputs:
 - LI1, LI2 (2 directions of operation): 2-wire control on transition, LI1 = forward, LI2 = reverse.
- LI3, LI4: 4 preset speeds (speed 1 = speed reference or LSP, speed 2 = 10 Hz, speed 3 = 25 Hz, speed 4 = 50 Hz).
 Analog input Al1: speed reference (0 + 5 V).
- Relay R1: the contact opens in the event of a fault (or drive off).
- DO output: analog output, image of the motor frequency.

If the factory configuration is not suitable, the FUn menu can be used to modify the functions and the I/O assignments.

14

Install the unit vertically, at \pm 10°. Do not place it close to heating elements. Leave sufficient free space to ensure that the air required for cooling purposes can circulate from the bottom to the top of the unit. Free space in front of unit: 10 mm minimum.

When IP20 protection is adequate, it is recommended that the protective cover stuck to the top of the drive is removed, as shown on the next page.

- From -10°C to 40° C:• d \geq 50 mm: no special precautions.
- d = 0 (drives attached together): remove the protective cover stuck to the top of the drive,
- From 40°C to 50°C: d ≥ 50 mm: remove the protective cover stuck to the top of the drive, as shown below (the degree of protection becomes IP20).
 From 40°C to 50°C: d ≥ 50 mm: remove the protective cover stuck to the top of the drive, as shown below (the degree of protection becomes IP20).
- From 50°C to 60°C: d ≥ 50 mm: remove the protective cover stuck to the top of the drive, as shown below (the degree of protection becomes IP20), and derate the drive nominal current by 2.2% for every °C above 50°C.

Mounting the drives on base plates

ATV 11Peeeeee drives can be mounted on (or in) a steel or aluminium machine frame, observing the following conditions:

Maximum ambient temperature: 40 °C

Vertical mounting at ± 10°

The drive must be fixed at the centre of a support (frame) which is a minimum of 10 mm thick and with a square cooling area (S) of 0.12 m² minimum for steel and 0.09 m² for aluminium, exposed to the open air. Support area for the drive (min 142 x 72) machined on the frame with a surface smoothness of 100 μ m max and a roughness of 3.2 µm max.

Mill the tapped holes lightly in order to remove any burrs.

Coat the whole support surface of the drive with thermal contact grease (or equivalent).

Attach the drive ESPAÑOI using 2 M5 screws 2 tapped (not supplied). 0000Q holes ØM5 шШ mm ≥142 r ITALIANO 131 <u>≥10 mm</u> s Minimum machined <u>oootoo</u> area 0 60 mm ≥72 mm

Verify the thermal state of the drive by checking parameter tHd (SUP menu), to confirm that the drive has been mounted correctly.

When SFt = HF, the selected frequency automatically changes to the selected frequency automatically changes	Ĵ.

	Code	Description	Factory setting
	FLr	Catch on the fly	nO
FRANÇAIS		Enables a smooth restart if the run command is maintained after the following events: - loss of line supply or switch off - fault reset or automatic restart - freewheel stop. The speed resumes from the estimated speed of the motor at the time of the restart them follows the ramp to the reference speed. This function requires 2-wire control (tCC = 2C) with tCt = LEL. n D: function intervenes at each run command, resulting in a slight delay (1 second max.). If continuous automatic injection braking has been configured (Ct) this	
Ë		function cannot be activated.	
I.	40 RCE	Analog/logic output DO Assignment - n D: not assigned - D C r : analog output = current in the motor. The full signal corresponds to 200% of the nominal drive current.	rFr
ENGLISH		 <i>r F r</i> : analog output = motor frequency. The full signal corresponds to 100% HSP. <i>F L R</i>: logic output = frequency threshold reached, closed (state 1) if the motor frequency exceeds the adjustable threshold Ftd. <i>5 r R</i>: logic output = reference reached, closed (state 1) if the motor frequency is equal to the reference. <i>C L R</i>: logic output = current threshold reached, closed (state 1) if the motor current exceeds the adjustable threshold Ctd. Ftd is only accessible if ACt = FtA, Ctd is only accessible if ACt = CtA. 	
CH		frequency threshold, adjustable from 0 to 200 Hz current threshold, adjustable from 0 to 1.5 Inv (Inv = nominal drive current)	= bFr
ESPAÑOL DEUTSCH	fit r	Automatic restart - n D: function inactive - y E 5: Automatic restart, after locking on a fault, if the fault has disappeared and the other operating conditions permit the restart. The restart is performed by a series of automatic attempts separated by increasingly long waiting periods: 1 s, 5 s, 10 s, then 1 min for the following periods. If the restart has not taken place after 6 min, the procedure is aborted and the drive remains locked until it is switched off then switched on. The following faults permit this function: OHF, OLF, ObF, OSF, PHF. The drive fault relay remains activated if this function is active. The speed	nO
ESF		 reference and the operating direction must be maintained. This function is only accessible in 2-wire control (tCC = 2C) with tCt = LEL. Check that any accidental start does not present any danger to personnel or equipment. Motor frequency 	50 (E range)
	bFr	(Same as bFr 1st level adjustment parameter)	or
ITALIANO	IPL	Set to 50 Hz or 60 Hz, taken from the motor rating plate. Phase loss fault configuration This parameter is only accessible on 3-phase drives. - n D: inhibition of the line phase loss fault - y E 5: activation of monitoring for the line phase loss fault	60 (U range) YES
	5 [5	Configuration backup - n D: function inactive - y E 5: saves the current configuration to the EEPROM memory. SCS automatically switches to nO as soon as the save has been performed. This function is used to keep another configuration in reserve, in addition to the current configuration. When drives leave the factory the current configuration and the backup configuration are both initialised to the factory configuration.	nO

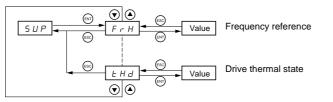

•

-•

ATV11.book Page 23 Tuesday, April 16, 2002 1:10 PM

Code	Description	Factory setting
F Ε 5	Reminder of the configuration - n B: function inactive - r E L: the current configuration becomes identical to the backup configuration previously saved by SCS. rEC is only visible if the backup has been carried out. FCS automatically switches to nO as soon as this action has been performed. - I n I: the current configuration becomes identical to the factory setting. FCS automatically switches to nO as soon as this action has been performed. For rEC and InI to be taken into account the ENT key must be held down for 2 s.	nO

Monitoring menu SUP

When the drive is running, the value displayed is that of one of the monitoring parameters. The default value which is displayed is the motor reference (parameter FrH).

While the value of the required new monitoring parameter is being displayed, the **"ENT"** key must be pressed a second time to confirm the change of monitoring parameter and to store it. From then on the value of this parameter will be displayed during operation (even after the drive has been switched off). If the new choice is not confirmed by pressing the **"ENT"** key for a second time, the drive will return to the previous parameter after it has been switched off.

The following parameters can be accessed, with the drive stopped or running.

Code	Parameter	Unit
FrH	Display of the frequency reference (factory configuration)	Hz
гFг	Display of the output frequency applied to the motor	Hz
LEr	Display of the motor current	A
ULn	Display of the line voltage	V
£ Hr	Display of the motor thermal state: 100% corresponds to the nominal thermal state. Above 118%, the drive trips on an OLF fault (motor overload) It can be reset below 100%.	%
ĿНd	Display of the drive thermal state: 100% corresponds to the nominal thermal state. Above 118%, the drive trips on an OHF fault (drive overheating). It can be reset below 80%.	%

Starter does not start, no fault displayed

- Check that the run command input(s) have been actuated in accordance with the chosen control mode.
 When the drive is switched on, at a manual fault reset, or after a stop command, the motor can only be powered once the "forward" and "reverse" commands have been reset. If they have not been reset, the drive will display "rdY" or "nSt" but will not start.

Faults displayed

•

ICAIS

0

The cause of the fault must be removed before resetting.

Faults SOF, OHF, OLF, OSF, ObF, and PHF can be reset via a logic input if this function has been configured. Faults OHF, OLF, OSF, ObF, and PHF can be reset via the automatic restart function, if this function has been configured. All faults can be reset by switching the drive off then on again.

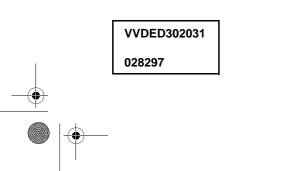

FRAN	Fault	Remedy
Ë	D E F overcurrent	 Ramp too short, check the settings. Inertia or load too high, check the size of the motor/drive/load. Mechanical locking, check the state of the mechanism.
ENGLISH	5 <i>E F</i> motor short-circuit, insulation fault	 Check the cables connecting the drive to the motor, and the insulation of the motor.
	In F internal fault	 Check the environment (electromagnetic compatibility). Send the drive to be checked/repaired.
	<i>E F F</i> configuration fault	 Return to factory settings or call up the backup configuration, if it is valid. See parameter FCS in the FUn menu.
	5 D F overspeed	 Instability, check the motor, gain and stability parameters. Driving load too high, add a braking module and resistor and check the size of the motor / drive / load.
н	D H F drive overload	 Check the motor load, the drive ventilation and the environment. Wait for the drive to cool before restarting.
DEUTSCH	DLF motor overload	 Check the setting of the motor thermal protection, check the motor load. Wait for the drive to cool before restarting.
DE	05 F overvoltage	Check the line voltage.
	D b F overvoltage during deceleration	 Braking too harsh or driving load. Increase the deceleration time, add a braking resistor if necessary and activate the brA function if it is compatible with the application.
ESPANOL	<i>P H F</i> line phase failure	 This protection only operates with the drive on load. Check the power connection and the fuses. Reset. Check the line supply / drive compatibility. If there is an unbalanced load, inhibit the fault via IPL = nO (FUn menu).
	U5 F undervoltage	Check the voltage and the voltage parameter.
