**Motivation**

Recent success of Large Language Models (LLMs) made many startups, corporations and individuals aware of AI's potential to automate many of their daunting tasks.

However customized AI assets today come at a high price.

We aim to democratize the use of AI by providing an end-to-end AI asset automatically.

We propose a system design that leverages the ever increasing availability of open-source AI models (Huggingface, Github ..) and the zero-shot reasoning capabilities of today's LLMs to solve tasks such as problem scoping, task planning, model selection, and to build automatic prototypes.

Additionally, we use tools like Docker to ease building and scaling these AI prototypes.

**System design**

AI for everyone

Democratizing AI assets with automatic prototyping

**Discussion**

- New models can easily be added to the model base.
- Human expertise can be programatically encoded and added to the model base.
- This builds a competitive advantage for companies over time by concretizing their know-how.
