

# Azure Infrastructure Modernisation

## Overview

There is a strong opportunity for partners that migrate their customer's on-premises environments to Microsoft Azure. If you do not have the skills or resource in-house, the Infinigate Cloud PRO team can handle the migration, whilst allowing you to charge for ongoing managed services, as well as earning margin from the Azure Consumption Revenue.

## Reasons for Migration

Rising on-premises IT infrastructure costs

An aging or out-of-support legacy IT infrastructure

Security threats

Storage capacity limitations

New compliance regulations

Complex availability and disaster recovery needs

Increased agility required to deliver business growth

## Assess

During the assessment phase, our team will:

- Gain a full understanding of your customer's business transformation goals
- Assess and review the existing IT infrastructure and applications to evaluate migration readiness
- Identify a desired future state IT roadmap
- Propose a new cloud solution design to enable your customer to achieve their business goals

## Migrate

Based on the output of the assess phase and the agreed target solution, our team will use one of the following methodologies to move your customer's infrastructure to the cloud:

- Rehost
- Refactor
- Replace

## Optimise

The optimise phase comprises of:

- Analysis and monitoring to manage cloud spend and use, to allocate and trim costs to build towards your customer's next cloud investment
- Use of security and management tools to govern, secure and monitor your customer's cloud investment

## Manage

Optional managed services include:

- Monitoring your customer's cloud infrastructure
- Reactive support
- Security and patch management
- Backup
