**ABSTRACT**

Stroke is the third most health challenge in the world. A hospital based prospective case control study was done at a tertiary care hospital over a period of six month to analyse the impact of patient counselling in improving medication adherence of the stroke patients. It was found to be improved after patient education about drugs. The pharmacist play an essential role in improving medication adherence and reducing the incidence of various complications and recurrent stroke.

**KEYWORDS:** Stroke, medication adherence, complications, prospective.**INTRODUCTION**

Stroke is the third major cause of mortality worldwide, after cardiovascular disease (CHD) and cancer of all types and commonly occurs in elderly. WHO has defined stroke as "rapidly developing clinical signs of focal or global disturbance of cerebral function, lasting for more than twenty four hours or leading to death, with no apparent cause other than vascular origin".<sup>[1]</sup> Medication adherence refers to whether patients take their medications as prescribed and whether they continue to take a prescribed medication. Medication non-adherence is a growing concern among the health care professionals because of increasing evidence that it is prevalent and associated with adverse outcomes and higher costs of care. Non-adherence is not solely a patient problem but is impacted by both care providers and the healthcare system. Now a days, measurement of patient medication adherence and use of interventions to improve adherence are rare in routine clinical practice. One of the intervention which help to improve medication adherence is the patient counselling.<sup>[2]</sup> Patients with a poor understanding of their disease and medication regimen and their personal consequences of non-adherence are more likely not to take their medications properly. Patients should be educated about the benefits of treatment and what may happen if medications are not taken as prescribed. Counselling should be tailored to address a patient's specific diseases (e.g., a stroke may occur if blood pressure medications are missed). To enhance adherence, key points of the medication regimen should be reinforced, such as how the medication works,

the proper dosage schedule and administration (e.g., show patients how to use an inhaler), what to do if doses are missed or delayed, proper storage and common and serious adverse events. Pharmacists can improve adherence by simplifying information for all patients and assuming that most patients have difficulty understanding medical terminology.<sup>[3]</sup>

*Sylvie perreault et al(2012)*<sup>[4]</sup> done a study on Adherence to antihypertensive agents after ischemic stroke and risk of cardiovascular outcomes. The aim of study was to assess relationship between antihypertensive (AH) drug adherence and cardiovascular (CV) outcomes among 14277 patients with a recent ischemic stroke. They concluded as adherence to AH agents is associated with adherence to other preventive therapies like statins and antiplatelets.

**MATERIALS AND METHODS**

Study was conducted in Department of Neurology, of 350 bedded cosmopolitan multispecialty hospital situated in Trivandrum. The study was carried out for a period of six months. The study was a prospective case control study. Patients from the department of Neurology in cosmopolitan hospital who were diagnosed with stroke during the study period, were included after obtaining the permission for collection of data and to accompany physician in Neurology ward from the Head of the Neurology department.

**Sample Size**

Sample size was calculated for equivalence study of a continuous response variable from the two groups. The sample size was calculated using the formula;

$$N=2s^2 (Za+ZB)/d^2$$

Where;

$\alpha$  = Type one error i.e 0.05,  $Z\alpha = 1.96$

$\beta$  = Type two error i.e 0.20,  $Z\beta = 0.84$

$s$  = S.D of the score

$d$  = Difference in mean score

Hence total 140 patients were included in the study i.e. 70 in each group.

**Inclusion criteria**

All the inpatients admitted in the department with stroke during the study period Male and female patients aged between 18- 80yrs were included.

**Exclusion criteria**

Age below 18 years and above 80, Patients those who were not cooperative, Psychiatric patients were excluded.

For the study the patient were categorized into two group with 70 patient in each based on those who were receiving patient counselling (case) and those who were not (control). Patients were randomly assigned in a 1:1 ratio to groups.

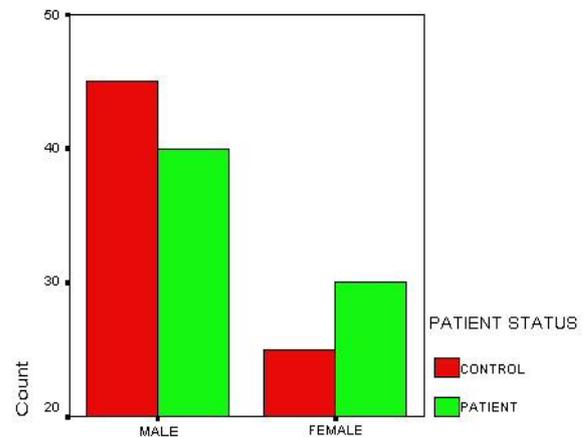

**Data collection**

The relevant data were collected while accompanying the clinician 6 days in a week and also from inpatient medical records. All the case records were reviewed and the details were collected during the particular hospital stay. A performa were designed for obtaining and evaluating drug use pattern, medication adherence, and severity of stroke. The Performa contains relevant details such as demographics, past medical history, past medication history, diagnosis, severity score, laboratory investigations, therapeutic plan.

**Data analysis**

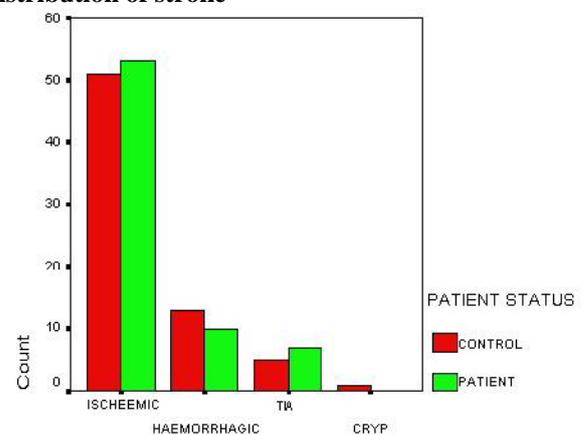

The collected data were recorded in Microsoft excel sheet.

The medication adherence data were collected with the use of Morisky medication adherence scale Medication adherence before and after patient education were noted and the improvement score is analysed. The medication adherence analysis were done using box whisker plot among case and control groups. The whole data were analysed using software IBM SPSS Statistics 21. The datas were statistically analysed using paired t-test, Wilcoxon sign rank test and Mann Whitney U test for comparing adherence.

**RESULTS AND DISCUSSION****Selection of case and control**

**Fig:1** The graph showing the distribution of gender among case and control groups.

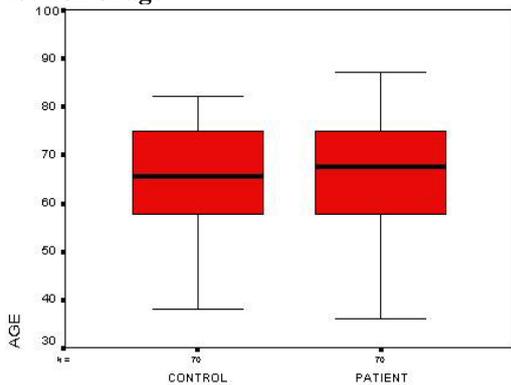

140 patients were randomly divided into two groups; case and control with equal number of patients in each. In control group 45 (64.3%) were males and 25 (35.7%) were females. The case group have 40 males (60.7%) and 30 females (42.9%). The difference in the distribution of gender in case and control was analysed using chi square test found to be significant. For analyzing medication adherence, randomly divided the patients to control and case. Mean age of control was  $65.26 \pm 10.96$  and that of case was  $66.24 \pm 11.77$ .

**Distribution of stroke**

**Fig:2** The graph showing the distribution of types of stroke among case and control group.

Distribution of type of stroke in control was found to be 51 patient with Ischemic stroke (72.9%), 13 with hemorrhagic (18.6%) 5 with transient ischemic attacks (7.1%) and one with cryptogenic stroke (1.4%). Case group have 53 patients with ischemic stroke (75.7%) 10 with hemorrhagic stroke (14.3%) and 7 patients with transient ischemic attacks (10%).The difference in the distribution of type of stroke in case and control was analysed using chi square test and found to be significant. 40 males (60.7%) and 30 females (42.9%) [Fig:1] A.

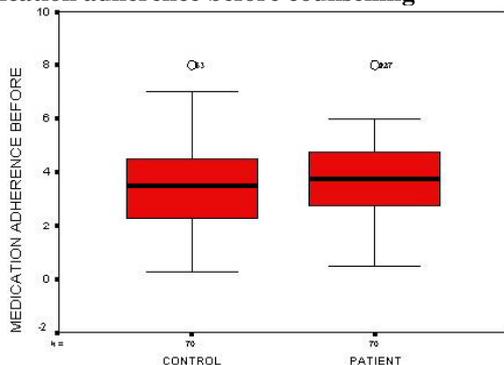

**Distribution of age**

**Fig: 3** The graph showing the distribution of age in case and control groups.

The mean age of control was 65.26yrs and standard deviation was 10.96 while mean age of case was 66.24yrs and standard deviation was 11.77. The equality of age were assessed using t-test. The standard error of mean was 1.31 in case of control and 1.41 in case of cases. 45 males (64.3%) and 25 females (35.7%).

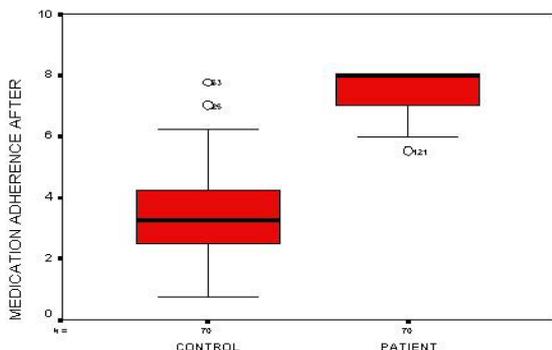

**Medication adherence before counselling**

**Fig: 4** The graph showing the distribution of medication adherence score in case and control before counselling.

The medication adherence before counselling was found to be comparable with score of 3.3036 in control and 3.7321 in case group.

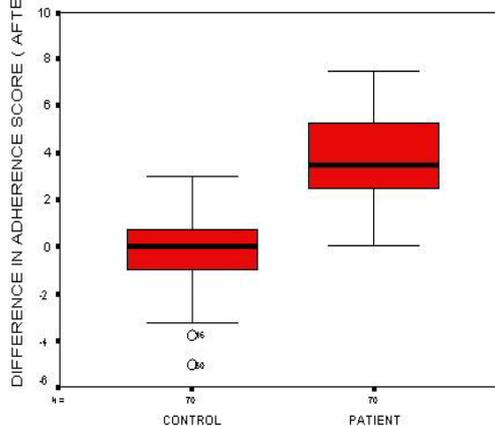

**Medication adherence after counselling**

**Fig: 5** The graph showing the distribution of medication adherence score in control and case after counselling.

Average medication adherence score after counselling was found as 3.26 in control group and 7.63 in case group.

**Medication adherence after - medication adherence before**

**Fig:6** The graph showing the difference in medication adherence score before and after in case and control groups.

The difference between the score of medication adherence before and after counselling was compared in case and control groups which is represented in the graph. The adherence to treatment among stroke patients is poor before counselling. The mean adherence of control is  $3.30 \pm 1.60$  [fig: 4] before counselling and  $3.26 \pm 1.49$  [fig: 5] after counselling. The mean adherence of case is  $3.73 \pm 1.61$  (fig: 4) before counselling and  $7.63 \pm 0.57$  [fig: 5] after counselling. The average was found to be approximately equal to zero for control while for case average was 3.90.

The adherence to treatment among stroke patients was poor before counselling which has improved significantly after counselling ( $p < 0.001$ ). Stroke is often occurring in patients with known hypertension, diabetes, hyperlipidemia etc. According to the study done by Marie. T. Brown *et al*<sup>[5]</sup> pharmacological antihypertensive therapy has a positive safety and tolerability profile and reduces the risk of stroke by approximately 30%. According to WHO the lack of adherence to medication is the common risk factor for achieving BP control. This failure in achieving BP control leads to stroke. Adherence to therapy will decrease the incidence of secondary stroke and improvement of stroke symptoms.<sup>[5]</sup>

**ACKNOWLEDGEMENT**

Behind every success there is a large no of effort and helping hand of a lot of kind heart people who gave their time and advice throughout the study to make everything possible. Here we give our sincere thanks to all those who helped us eachwhere in our study.

Prima facie, we would like to thank the supreme power the Almighty God who is obviously the one has always

guided us to work on the right path and blessed us with good health and wellbeing that were necessary for the project to become a reality. Next to him are our parents, whom we are greatly indebted for the continuous encouragement, support and attention to this stage.

We, Drisya viswam, Lydia B Peters, Nikhila k .v the students, were extremely grateful to our college, Sreekrishna College of Pharmacy & Research Centre. We are also thankful to Dr. Monikandan Nair our chairman who is the back born of our college. Dr. Shaji selvin, Principal of our college, for sharing expertise, sincere and valuable guidance and encouragement extending to all students. "Cosmopolitan Hospitals pvt limited, Trivandrum", its management and concerned staff for the confidence bestowed in us and entrusting our project entitled "A prospective case control study on impact of patient counselling by clinical pharmacist in improving medication adherence in patients with cerebrovascular accident at a tertiary care hospital".

At this juncture I feel deeply honored in expressing our sincere thanks to our institutional guide Mrs. Babitha M for making the resources available at right time and providing valuable insights, intuition and inspiration leading to the successful completion of our project.

We are highly indebted to our Hospital guides: Dr. Mlini Gopinath. MD DM (Cosmopolitan hospitals Pvt limited) for their guidance and constant supervision as well as for providing necessary information regarding the project & also for their support in completing the project.

We were highly grateful to Mr. B. Reghunath, Chairman of Institutional Ethical Committee and Review Board, and Dr. Ravindran MD. FCCP, Secretary and all other respectful members of the Institutional Ethical Committee and Review Board who gave approval and led us all the way of our study.

We wish to express our sincere thanks to Mr. N.K Subhash, Administrator of the hospital, for providing with all the necessary facilities and kind support throughout the days with whole-hearted co-operation.

We take this opportunity to express gratitude to all of the Department faculty members for their critical advice and guidance without which this project would not have been possible.

Last but not the least we place a deep sense of gratitude to Dr. Muraleedharan Nair, our statistician our family members, all our friends who assisted us in compiling the data for the project and other classmates who have been constant source of inspiration during the preparation of this project work.

We sincerely appreciate the instinctive support and guidance of all those people who have been instrumental in making this project a success. We have no valuable

words to express our thanks, but our heart is still full of the favors received from every person.
