Observations:	Region:	ST	Water type:	S	CoGP MA:	M-40
Dead/weak/abnormally behaving fish present?	Y	If yes, see additional information/clinical score sheet.				
Clinical signs of disease observed?	N	If yes, see additional information/clinical score sheet.				
Post mortem signs observed?	N	If yes, see additional information/clinical score sheet.				
Diagnostic samples taken?	N					
UNI/REG only - if unable to carry out intended visit detail reason below:						

Additional Case Information:

The site has observed a degree of size variation within the stock, with undersized fish (runts) contributing to background mortality levels. Fin clips have been collected from culled fish for genetic testing, as the business suspects that poor broodstock genetics may be a contributing factor. Work is ongoing to identify affected broodstock lines in order to avoid their future use.

Pens 2 and 10 were noted to contain a higher proportion of smaller fish compared to the rest of the site. These fish are suspected to originate from a failed cohort associated with poor broodstock genetics. Despite their reduced size, the fish were observed swimming well and shoaling normally with the main population. Fin clips have been collected for genetic analysis to further investigate the underlying cause.

No feeding was taking place at the time of inspection due to reduced water quality associated with an increased algal presence. Feeding was scheduled to resume the following day, subject to environmental conditions improving. During the collection of fish for VMD sampling, the stock demonstrated a good feeding response.

The stock were observed shoaling normally and swimming well, with a good response to stimuli. 3 moribund fish with caudal fin damage were observed across the site; the lesions appeared to be healing well. A total of 12 mortalities were recorded across the site.

1 fish was sampled for VMD purposes. The fish was in good body condition and appeared to have been feeding well, with both the stomach and intestine containing feed. Internal examination revealed no significant abnormalities, and the fish was considered to be in good overall condition.

Fish Health Inspectorate visit report

Summary for information of site operator

Business no:	FB0119	Date of visit:	21/07/2026
Site no:	FS0356	Site name:	North Moine
Case no:	20260185	Inspector:	██████████

Inspection under the Animals and Animal Products (Examination for Residues and Maximum Residue Limits) (England and Scotland) Regulations 2015

The above site was visited in accordance with the Animals and Animal Products (Examination for Residues and Maximum Residue Limits) (England and Scotland) Regulations 2015.

Samples were taken to be analysed for veterinary residues.

The Inspector did not observe any clinical signs associated with the listed diseases as described in the Aquatic Animal Health (Scotland) Regulations 2009.

Records

The information required for the public record of aquaculture production businesses regarding this site was verified and where necessary updated.

Medicine records were inspected and found to be adequately maintained.

Aquaculture animal and aquaculture animal product movement records were inspected and appeared to be adequately maintained.

Mortality records were inspected and found to be adequately maintained.

Reports detailing the results of animal health surveillance carried out by or on behalf of the business and/or Marine Directorate were available for inspection.

R20

Please contact myself or the duty inspector should you require any further information or have any queries regarding this report.
