Many parents are wondering how to ensure their families have a great summer, while balancing safety concerns in the middle of the COVID-19 pandemic. Our experts at UHealth Jackson Children’s Care want to make sure you and your children have a safe summer by engaging in low-risk activities to avoid the spread of the virus.

Here are some recommendations if you are considering summer camp for your child this summer:

- Ask if the camp is following CDC guidelines
- Ask questions about the camp’s screening protocols
- Make sure campers and counselors wear a mask at all times
- Make sure social distancing and handwashing are being practiced
- Make sure the camp has strict sanitation protocols of all high-contact areas
- Consider the number of children enrolled at camp
- Smaller groups are safer for your child
- Outdoor activities are generally safer

Other outdoor activities that should be considered during the pandemic:

- Walking in the park is safe, but remember to keep your distance from others
- Avoid using playground equipment, which poses a high-risk to your child because of the frequently touched surfaces such as slides, swings, and monkey bars
- Going to beach is low-risk if it’s not crowded and you practice social distancing
- Avoid community pools due to high-touch surfaces such as lounge chairs
- Public entertainment venues, such as the zoo, are considered low-risk
Get your child excited about wearing a mask:

- Be a role model and practice wearing a mask with your child
- Put the mask on your child at home first for a few minutes to practice
- If your child is small, put the mask on their stuffed animal or doll
- Pretend to be a superhero while wearing the mask
- Children under two years old should not wear a mask

How to travel safely in the summer:

- Visit www.cdc.gov to see if the area you plan to visit is a hot spot for COVID-19
- Renting a car is considered low risk; but make sure the vehicle is sanitized before getting into it with your family
- Be aware of rest stops during road trips; if you stop at a service plaza, wear a mask, practice social distancing, and wash your hands immediately.
- Air travel is considered higher risk because you are in a confined space with other people and it’s harder to practice social distancing
- If you must travel by plane, wear a mask, disinfect the area where you will be seating, and use hand sanitizer

What you need to know about multisystem inflammatory syndrome in children (MIS-C):

- This condition causes different parts of the body to become inflamed, including the heart, kidneys, lungs, brain, skin, eyes, or gastrointestinal organs
- Children with MIS-C tested positive for COVID-19 or were exposed to the virus
- Florida has not had many cases.
- The two consistent symptoms that have been reported include fever and abdominal pain
- Other symptoms include vomiting, diarrhea, neck pain, rash, bloodshot eyes, and exhaustion

Be aware that not all children will have all the same symptoms
