# Human-in-the-Loop Verification Loops that Actually Get Used

Grace Mbeki and Anders Holm

*Third Conference on Practical Automation (CPA 2026), Geneva*

Verification interfaces fail not because reviewers reject them in principle but because the cost per check is too high. We studied twenty deployed extraction pipelines and found that roll-up review — a single spreadsheet of all extracted rows with provenance links — was adopted in every case, while per-document review was abandoned in sixteen of twenty. The lesson is blunt: give humans one scannable artifact, link each value back to its source, and verification becomes a habit rather than a chore. We quantify the time savings and offer design guidance for teams building extraction products.
