

Supplemental Table 1. Comprehensive communication plan of the ResiCOVID-19 project.

Communication strategies for the ResiCOVID-19 project	
a)	Communication actions will be deployed to cover the project's progress from its inception until the visualization of results upon implementing the proposals for improvement. A webpage/blog will be created, serving as a repository and information hub for project progress. Updated information will be published regularly on the project's process and results, including on social media.
b)	For scientific disclosure, publication of a minimum of six research articles is anticipated, both in national and international journals. Two digital scientific webinars will be organized. A media liaison will be developed to systematically inform the leading media on the sector, general media, and health and social sections.
c)	For the general public, informative videos on the project, the models, and the results will be prepared, as well as graphic material (including images and narratives obtained with the Photovoice technique made by residents and their family members).
