### ABSTRACT

Immunization is one of the primary prevention tools used against vaccine-preventable infectious diseases today. During the course of the immunization session, the health staff in charge, has the task of informing the user about the possible vaccinations indicated by the immunization schedule and offer possible vaccinations according to the needs of the patient and his health condition. The work experience of healthcare personnel in community and family health, whose mission is the prevention and control of the diffusion of infectious diseases through vaccination, has allowed to detect a criticality linked to the lack of a valid and updated tool that can be a guide on the coadministration of more vaccinations on the same day. The drafting of the "Guide to the coadministration of vaccines" was conducted from October 2018 to May 2019. The elaboration of the results of the qualitative systematic review took place through consultation of technical sheets, direct contact with pharmaceutical companies and review of the scientific reading. The tool used to conduct this study was mainly research in PubMed. The final work is represented in an Excel spreadsheet with specific commercial names of vaccines mostly used by the Health Authorities on the axis of the abscissas, and generic names on the ordinate axis. The format used makes it possible to rapidly comprehend the vaccines that can be coadministered in the same session and nevertheless ensure homogeneity of work among the healthcare personnel.

**KEYWORDS:** Vaccines, coadministration of vaccines, immunization.

### INTRODUCTION

In the historic period in which we live, subjected to constant changes, vaccinations play a fundamental role in society, so much so that they are often a topic of interest. Now vaccination calendar targets every age group, from 0 to 65 years and over. It is fundamental to underline how the phenomenon of globalization has changed human lifestyles. Think of the increase in international travel over the last few decades and the increased number of travelers, especially last minute. This shows how simple and easy it is to reach any part of the world in short time, with a high risk of spreading vaccine-preventable diseases. It is therefore essential, for those working in an immunization center, to have at their disposal a guide to coadminister 2 or more vaccines simultaneously in the same vaccination session. The need to build this instrument stems from the possibility of solving different problems that may occur during the vaccination session. The advantages derived from this guide are: creation of homogeneous methodologies for health professionals, reduction of patient waiting time, reduction of overbooking of patients, the possibility of speeding up the vaccination schedule) (eg. coadministering more vaccines in the same session, reduces uncalled for and excessive patient attendance). The vaccines available today are more effective and safe,

thanks to the progress of medical research and the complex series of quality controls to which they are constantly subjected.<sup>[1]</sup> Unlike decades ago, the vaccinations that are proposed by the vaccination calendar for life, published in the 2017-2019 Italian National Vaccination Prevention Plan, are many more, although in reality they contain less antigenic contents than the vaccines used in the past. Among the many questions that users ask if more vaccines given together weaken the immune system. The truth is that the simultaneous administration of multiple vaccines increases the chances of being protected against vaccine-preventable disease. Vaccines have the goal of stimulating our immune system for the formation of memory cells, appointed to ensure that the immune system will be capable to fight the infecting agent without getting sick. Diseases, weaken the organism, not vaccines.<sup>[2]</sup>

### MATERIALS AND METHODS

The guide to the coadministration of vaccines is an indispensable tool for the health professional who deals with vaccinations. It was designed and compiled by including the vaccines mostly used in pediatric and adult clinics, international vaccination center. The drafting of this Guide began in October 2018 and ended in

September 2019, making continuous updates based on latest published studies. The objective of this guide is to make health professionals independent in carrying out their professional tasks. Initially Vaccine package leaflet were consulted. Where adequate information was provided regarding the coadministration of several vaccines, in the same session, direct contact was made with the pharmaceutical companies, accompanied by the search for numerous studies by reviewing the scientific literature. Microsoft Excel was used to draw up the vaccination coadministration guide. The key words used

for the research reading and review were the following: "vaccination" and "coadministration of vaccines. The search tools mainly used for drafting up the table are:

- PubMed
- European Medicine Agency database
- Vaccine leaflets
- Red book, Pink book and other books
- Several other science database tools

The vaccine coadministration guide will be reviewed whenever there are updates.

**ABBREVIATIONS**

Same vaccine  
YES = can be coadministered  
NO = can not be coadministered  
NS = not specified. Evaluation by health personnel  
AL = age limit  
PENTAVALANT\*1: diphtheria, Tetanus, Pertussis, Haemophilus influenzae type b and Hepatitis B

**NOTES**

TEST1: can be coadministered, not guaranteed best protection under 2 years of age, consider booster dose.  
TEST2: at least 8 hour interval, after taking Dukoral before taking YFvax.  
MEN acwy NIMENRIX \* wait 28 days before giving any vaccine contain tetanus toxoids if it has not been performed on the same day as nimrix.  
PENTAVOX2: it can be given as a booster dose (like any adjuvanted hepatitis B) after a primary course with any hepatitis B vaccine.

GENERAL RULE: more vaccines can be co-administered in the same vaccination session, bearing in mind that if the injection site is the same, an interval of 2.5 cm must be respected between one vaccine and another.

Dr. Ashong Duke  
Dr. Munafin Ludovici

Fig. 1: Guide to the Coadministration of vaccines.

The project is graphically represented so that it can be of practical and easy comprehension for health professionals. The commercial names of the vaccines are

noted on the x-axis, whilst the generic names are noted on the y-axis. The health personnel, who wants to verify the coadministration of different vaccines must position a

virtual line on the axis of the abscissa, on the vaccine of interest and follow the virtual line to the other vaccine of interest on the axis of the ordinates. If the answer is "YES", they can be coadministered. If the answer is "NO", the two vaccines are not compatible for coadministration and "AL" if the two vaccines cannot be coadministered because of age limits. In the lower area of the table, "NOTES" add additional information.

## RESULTS AND CONCLUSION

The qualitative systematic review of the scientific literature showed that any inactivated vaccine can be coadministered with other vaccines simultaneously, including those with attenuated components.<sup>[3]</sup> Before coadministering, however, it is necessary to check the health status of the patient through a pre-vaccination history that allows the health personnel to understand whether a patient is suitable for vaccination.

The results obtained from this research are many, including some news:

- cholera vaccine (Dukoral) can be administered at least 8 hours after oral typhoid vaccination;
- the 4 tablet anti-typhoid vaccination confers protection for 5 years;
- the yellow fever vaccine with other live attenuated vaccines (e.g MMR, MMRV, VARICELLA), can be coadministered in the same session
- meningococcal ACWY vaccine can be coadministered with anti-meningococcal B vaccine;
- the adjuvanted hepatitis B vaccine can be used as a booster dose in non-responding subjects<sup>[4]</sup>;
- possibility to dilute the ACT-HIB vaccination with TETRAVAC in a single vial.

- vaccine doses can administered 4 days before the minimum interval or age, are considered valid.<sup>[5]</sup> The 4 day grace period doesn't apply to the rabies vaccine<sup>[5]</sup>, the 4 day grace period should not be used when scheduling future vaccination visits, and should not be applied to the 28-day interval between live parenteral vaccines not administered at the same visit.<sup>[8]</sup>

Vaccination can be carried out in the same anatomic site provided that they are 2.5cm at a distance from each other.<sup>[6,7]</sup> The authors of this article advise that at least one of the two vaccine shots should be known to give less reactions so as to reduce patient discomfort and increase compliance to future vaccinations. E.g, if tetanus, meningitis and hepatitis A vaccines have to be given on the same day. The tetanus vaccine and hepatitis A vaccine can be given in the same anatomic site, whiles the meningitis vaccine can be given in another anatomic site.

The use of this instrument "Guide to the Coadministration of vaccines":

- ✓ reduces patient waiting time and overbooking.
- ✓ guides health personnel during daily work task
- ✓ guarantees homogeneity and professional autonomy and finally allows health personnel to quickly protect patients (no significant increase in reactogenicity, normal profiles of immunogenicity) who have to get vaccinations for special reasons.

The coadministration guide, is a continuously updated tool that allows healthcare personnel to carry out professional tasks in autonomy and of considerable utility for the management and organization of vaccination sessions.

**Abbreviation**

Antinflu	Antiflu
CHOLERA	CHOLERA
DT	Diphtheria-Tetanus
DTPa	Diphtheria -Tetanus-Pertussis acellulare
DTPped/ad	Diphtheria-Tetanus-Pertussis pediatric/adult
DTP-IPV	Diphtheria-Tetanus-Pertussis-Poliomyelitis(Inactivated)
DT-POLIO	Diphtheria-Tetanus-Poliomyelitis
JE	Japanese Encephalitis
Hexa	Hexavalent(Diphtheria-Tetanus-Pertussis-Poliomyelitis-Haemophilus influenzae b, Hepatitis B)
YF	Yellow Fever
HPV-9	Human Papilloma Virus 9 valent
HAV	Hepatitis A
HBV	Hepatitis B
HIB	Haemophilus influenzae b
HZ	Herpes Zoster
IPV	Inactivated Poliomyelitis Vaccine
MEN ACWY	Meningitis A,C,W,Y
MEN C	Meningitis C Coniugato
MMR	Measles-Mumps-Rosolia
MPRV	Measles-Mumps-Rosolia-Varicella
PENT	All combinations for pentavalent with Diphtheria-Tetanus-Pertussis-Poliomyelitis-Haemophilus influenzae b-Hepatitis B)
PCV13	Pneumococcal conjugato 13 valent
PPSV23	Pneumococcal polysaccharide vaccine 23 valent
RAB	Rabies
RTV	Rotavirus
T	Tetanus
TYPHD	Typhoid
TBE	Tick Borne Encephalitis
VAR	Varicella

**ACKNOWLEDGEMENTS**

Both authors contributed equally. Health professionals who would like to receive the pdf of the guide to the coadministration of vaccines and be continuously updated through an automatic mail list can send a mail “update coadministration of vaccines” to [vaccineinfoitaly@gmail.com](mailto:vaccineinfoitaly@gmail.com)
