#### Abstract

The research project undertaken was " A descriptive study to assess the attitude of parents towards school absenteeism of their children after COVID-19 outbreak in selected community areas at Kollam ". The objectives of the study were to assess the attitude of parents towards school absenteeism of their children after COVID-19 outbreak, and to find out the association between attitude of parents towards school absenteeism of their children after COVID-19 outbreak with selected demographic variables. Non probability sampling technique was used to select parents of school going children. The knowledge of parents was assessed by using a structured questionnaire. The analysis of the data was based on the objectives of the study using descriptive and inferential statistics. The findings of the present study revealed that there was an association between attitude and demographic variables such as age of child, gender of child, number of children, education of child, education of parents, type of family, economic status. Based on the findings of the study, it is recommended that a similar kind of study can be conducted for a large group.

KEYWORDS: Assess, Attitude, School Absenteeism, Children, COVID-19.

## INTRODUCTION

Education is one of the basic needs for human development and going to school regularly is crucially important for advancement of a student's academic and social skills. Around half of students were chronically absent which reflects a very poor academic involvement. Repeated Information Education Communication awareness programme regarding the importance of regular school attendance should be start at the community level so that attendance status can improve along with enrolment. ${ }^{[3]}$

A basic assumption of the education system is that students regularly attend school. Students must be present and engaged to learn. While there has been a long history of examining certain types of absences or truancy, chronic absenteeism in schools was not consistently measured until recently. During the 20152016 school year, the U.S. Department of Education Civil Rights Data Collection (CRDC) found that nearly 8 million students were chronically absent, defined as missing 15 or more school days during the year ,Chronic absenteeism significantly impacts a variety of student outcomes including mathematics and reading achievement, social-emotional development, grade retention and dropout, and student discipline. Chronic
absenteeism is associated with risky behaviours such as substance use. Students with excessive absenteeism are also at increased risk for school dropout which is further associated with economic, social, and health problems in adulthood. In addition to the individual effects of absenteeism, research has found that classrooms with high rates of absenteeism have spill over effects with lower test scores observed for all students in the classroom, even the students with good attendance. The root causes of chronic absenteeism are often multifaceted and unique to each student, but adequately addressing absenteeism requires an understanding of these causes . Root causes can be categorized as barriers, aversion, and disengagement reasons based on the level at which they impact the student's attendance. Barriers such as health problems suffered by the student or family members, transportation, housing instability, and suspension all prevent the student from attending school. In contrast, factors which fall in the aversion category cause students to feel unsafe or unwelcome at school. Finally, with disengagement, students miss school due to factors related to a lack of perceived value or motivation for attending. By identifying the underlying causes of chronic absenteeism, schools can be more effective and efficient in providing resources and services which will improve the attendance for individual students. ${ }^{[4]}$

Chronic Absenteeism, many states and reporting agencies are now defining chronic absenteeism as missing $10 \%$ or more school days for any reason (U.S. Departments of Education, Health and Human Services, Housing and Urban Development, and Justice, 2015). Absenteeism refers to missed instructional days that are excused, unexcused, or the result of disciplinary removal from school (Jordan \& Miller, 2017). Consistent attendance is a school quality indicator which is defined as attending more than $90 \%$ of school days .For both chronic absenteeism and consistent attendance, all absences: excused, unexcused, and suspensions are counted. These excused absences are a critical difference between chronic absenteeism and truancy as time missed for legitimate absence is not included in truancy counts. However, excused absences are counted for calculations of chronic absenteeism. ${ }^{[5]}$

## Statement of the problem

"A descriptive study to assess the attitude of parents towards school absenteeism of their children after covid 19 outbreak in selected community area at Kollam"

## Objectives

The objectives of the study were

- To assess the attitude of parents towards school absenteeism of their children after COVID-19 outbreak.
- To find out the association between attitude of parents towards school absenteeism of their children after COVID-19 outbreak with selected demographic variables.

## Operational definitions

## Assess

In this study assess refers to determining of the knowledge and attitude among mothers of adolescent girls regarding sex education.

## Knowledge

In this study knowledge refers to the scores obtained by the respondents to the items in the structured questionnaire regarding sex education to adolescent girls.

## Attitude

In this study attitude refers to the respondents thoughts and feelings towards sex education to adolescent girls.

## Mother

In this study a mother refers to a female parent in between the age of 28-60 years who has performed her parenthood responsibility for at least an adolescent girl.

## Adolescent girl

In this study adolescent girl refers to a female who has attained her puberty and is in the age group of $10-19$ years.

## Sex education

In this study sex education refers to human sexuality including attainment of puberty, emotional relations, human sexual anatomy, normal sexual activity, reproductive rights and health, menstrual hygiene and self defence against sexual abuse.

Research methodology

| Research approach | : Quantitative research |
| :--- | :--- |
| Research design | : Non-Experimental research design |
| Variables | Dependent variable: knowledge and attitude of mother's of adolescent girls <br> regarding sex education. <br> Demographic variables: In this study demographic variables are <br> age, religion, income, type of family, educational qualification and occupation. |
| Setting of the study | $:$ The setting of the study was at Pallithottam coastal community <br> area, Kollam. |
| Population | $:$ In this study sample consisted of 150 mothers of adolescent girls in Pallithottam <br> coastal community area, Kollam. |
| Sample | : In this study sample consisted of 150 mothers of adolescent girls in Pallithottam <br> coastal community area, Kollam. |
| Sample size | $:$ 150 mothers of adolescent girls in Pallithottam coastal community area, Kollam. |
| Sampling technique | : Convenience sampling technique |

## RESULTS AND DISCUSSION

Table 1: Age.

| Sl. | Age | Knowledge |  |  |
| :---: | :---: | :---: | :---: | :---: |
| No. |  | Adequate | Moderate | Inadequate |
| 1 | $28-38$ | 14 | 51 | 3 |
| 2 | $39-48$ | 25 | 40 | 15 |
| 3 | $49-60$ | 0 | 1 | 1 |

The table of data regarding age shows that mothers who were in the age group of $28-38$ years, 14 of them had
adequate knowledge, 51 had moderate and 3of them have inadequate knowledge regarding sex education. Mothers
who were in the age group of $39-48$ years, 25 of them had adequate knowledge, 40 had moderate and 15 had inadequate knowledge. Among 49-60 years, only 1
moderate and 1 inadequate knowledge regarding sex education.

Table 2: Religion.

| Sl. <br> No. | Religion | Knowledge |  |  |
| :---: | :--- | :---: | :---: | :---: |
|  |  | Adequate | Moderate | Inadequate |
| 1 | Christian | 39 | 76 | 10 |
| 2 | Muslim | 4 | 17 | 2 |
| 3 | Hindu | 1 | 1 | 1 |

The data regarding religion shows that 39 had adequate knowledge, 76 had moderate knowledge and 10 had inadequate knowledge in the Christian community. In the Muslim community, 4 had adequate knowledge, 17 had
moderate knowledge and 2 had inadequate knowledge. In the Hindu community, 1 had adequate knowledge, 1 had moderate knowledge and 1 had inadequate knowledge.

Table 3: Education .

| Sl. | Education | Knowledge |  |  |
| :---: | :--- | :---: | :---: | :---: |
| No. |  | Adequate | Moderate | Inadequate |
| 1 | Primary | 10 | 24 | 4 |
| 2 | Secondary | 20 | 58 | 6 |
| 3 | Hss | 4 | 13 | 1 |
| 4 | Others | 8 | 2 | 0 |

The data regarding education shows that the mothers who has primary education, 10 had adequate Knowledge, 24 had moderate knowledge and 1 had inadequate knowledge. Mothers who has Secondary education, 20 had adequate knowledge, 58 had moderate knowledge
and 6 had inadequate knowledge. Mothers who have Higher Secondary education, 4 had adequate knowledge, 13 had moderate knowledge and 1 had inadequate knowledge. Mothers who have higher education, 8 had adequate knowledge and 2 had moderate knowledge.

Table 4: Occupation.

| Sl. | Occupation | Knowledge |  |  |
| :---: | :--- | :---: | :---: | :---: |
| no. |  | Adequate | Moderate | Inadequate |
| 1 | Unemployed | 29 | 77 | 12 |
| 2 | Employed | 8 | 10 | 0 |
| 3 | Self employed | 6 | 7 | 1 |

The data regarding the occupation shows that among the mothers who are unemployed 29 had adequate knowledge, 77 had moderate knowledge and 12 had inadequate knowledge.Among mothers who are
employed 8 had adequate knowledge, 10 had moderate knowledge.Among mothers who are self employed 6 had adequate knowledge, 7 had moderate knowledge and 1 had inadequate knowledge.

Table 5: Income.

| SI no | Income | Knowledge |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Adequate | Moderate | Inadequate |
| 1 | 10,000 \&above | 7 | 5 | 1 |
| 2 | $8001-10,000$ | 12 | 20 | 1 |
| 3 | $6001-8000$ | 12 | 38 | 5 |
| 4 | $4001-6000$ | 7 | 23 | 2 |
| 5 | $<4000$ | 3 | 12 | 1 |

The data regarding income shows that among mothers who have an income of 10,000 and above, 7 had adequate knowledge 5 had moderate knowledge and 1 had inadequate knowledge. Among mothers who have income of $8001-10,000,12$ had adequate knowledge, 20 had moderate knowledge and 1 had inadequate knowledge. Among mothers who have income of 60018000,12 had adequate knowledge, 38 had moderate
knowledge and 5 had inadequate knowledge. Among mothers who have income of 4001-6000, 7 had adequate knowledge, 23 had moderate knowledge and 2 had inadequate knowledge. Among mothers who have income less than 4000, 3 had adequate knowledge, 12 had moderate knowledge and 1 had inadequate knowledge.

Table 6: Type of family.

| S. <br> no. | Type of family | Knowledge |  |  |
| :---: | :--- | :---: | :---: | :---: |
|  |  | Adequate | Moderate | Inadequate |
| 1 | Joint family | 10 | 31 | 10 |
| 2 | Nuclear family | 30 | 68 | 1 |

The data regarding type of family shows that in joint family, 10 had adequate knowledge, 31 had moderate knowledge and 10 had inadequate knowledge. In nuclear
family, 30 had adequate knowledge, 68 had moderate knowledge and 1 had inadequate knowledge.

Table 7: Association between Knowledge and Selected socio demographic variables.

| $\begin{aligned} & \text { Sl. } \\ & \text { No } \end{aligned}$ | Variables | Knowledge |  |  | df | $\begin{gathered} \text { Chi } \\ \text { square } \\ \text { value } \end{gathered}$ | Table value | Inf |

|  | Nuclear family | 30 | 68 | , | 2 | 12.23 | 5.99 | S |

0.05- level of significance

NS- non-significant
S-Significant

From the above statistical data, it was clear that there is significant association of knowledge among mothers of adolescent girls regarding sex education with demographic variable such as age, education and type of
family. And it is also clear that there was no association with knowledge among mothers of adolescent girls regarding sex education with demographic variable such as religion, occupation and income.

Table 8: Age

| SI <br> no | Age | Attitude |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Positive | Neutral | Negative |  |  |
| 1 | $28-38$ | 21 | 25 | 21 | 1 |  |
| 2 | $39-48$ | 15 | 42 | 23 | 0 |  |
| 3 | $49-60$ | 1 | 0 | 1 | 0 |  |

From the data regarding age and attitude, 21 mothers had highly positive attitude, 25 had positive attitude, 21 had neutral attitude and 1 had negative attitude in the age group of 28-38 years. 15 had highly positive attitude, 42
had positive attitude and 23 had neutral attitude in the age group of 39-48 years. 1 had highly positive attitude and 1 had neutral attitude in the age group of 49-60years.

Table 9: Religion.

| Sl. no. | Religion | Attitude |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  |  | Highly <br> positive | Positive | Neutral | Negative |
| 1 | Christian | 40 | 48 | 36 | 1 |
| 2 | Muslim | 4 | 10 | 9 | 0 |
| 3 | Hindu | 0 | 1 | 1 | 0 |

The data regarding religion and attitude, 40 had highly positive attitude, 48 had positive attitude, 36 had neutral attitude and 1 had negative attitude in the Christian community. 4 had highly positive attitude, 10 had
positive attitude and 9 had neutral attitude in the Muslim community. 1 had positive attitude and 1 had neutral attitude in the Hindu community.

Table 10: Education.

| Sl. <br> No. | Education | Attitude |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  | Highly <br> positive | Positive | Neutral | Negative |  |
| 1 | Primary | 10 | 18 | 9 | 1 |
| 2 | Secondary | 23 | 35 | 26 | 0 |
| 3 | Hss | 7 | 6 | 5 | 0 |
| 4 | Others | 5 | 5 | 0 | 0 |

The data regarding education and attitude, mothers who have primary education 10 had highly positive attitude, 18 had positive attitude, 9 had neutral attitude and 1 had negative attitude. Mothers who have Secondary education, 23 had highly positive attitude, 35 had
positive attitude and 26 had neutral attitude. Mothers who have Higher Secondary education, 7 had highly positive attitude, 6 had positive attitude and 5 had neutral attitude. Mothers who have higher education, 5 had highly positive attitude and 5 had positive attitude.

Table 11: Occupation.

| SI. <br> No. | Occupation | Attitude |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  |  | Highly <br> positive | Positive | Neutral | Negative |
| 1 |  | 31 | 43 | 43 | 1 |
| 2 | Employed | 5 | 6 | 7 | 0 |
| 3 | Self employed | 4 | 5 | 5 | 0 |

The data regarding occupation and attitude, mothers who are unemployed, 31 had highly positive attitude, 43 had positive attitude, 43 had neutral attitude and 1 had negative attitude. Mothers who are employed, 5 had
highly positive attitude, 6 had positive attitude and 7 had neutral attitude. Mothers who are self employed, 4 had highly positive attitude, 5 had positive attitude ad 5 had neutral attitude.

Table 12: Income.

| Sl. <br> No. | Income | Attitude |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Highly <br> positive | Positive | Neutral | Negative |  |  |
| 1 | 10,000 <br> \&above | 6 | 5 | 2 | 0 |  |
| 2 | $8001-$ <br> 10,000 | 14 | 12 | 8 | 0 |  |
| 3 | $6001-$ <br> 8000 | 25 | 16 | 14 | 0 |  |
| 4 | $4001-$ <br> 6000 | 7 | 12 | 13 | 0 |  |
| 5 | $<4000$ | 6 | 5 | 4 | 1 |  |

The data regarding income and attitude, mothers who have income $10,000 \&$ above, 6 had highly positive attitude, 5 had positive attitude and 2 had neutral attitude. Mothers who have 8001-10,000 income, 14 had highly positive attitude, 12 had positive attitude and 8 had neutral attitude. Mothers who have 6001-8000 income, 25 had highly positive attitude, 16 had positive attitude
and 14 had neutral attitude. Mothers who have 40016000 income, 7 had highly positive attitude, 12 had positive attitude and 13 had neutral attitude. Mothers who have income less than 4000, 6 had highly positive attitude, 5 had positive attitude, 4 had neutral attitude and 1 had negative attitude.

Table 13: Type of family.

| Sl. <br> No. | Type of <br> family | Attitude |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  |  | Highly <br> positive | Positive | Neutral | Negative |
| 1 | Joint | 17 | 17 | 16 | 1 |
| 2 | Nuclear | 34 | 40 | 25 | 0 |

The data regarding type of family and attitude, in joint family 17 had highly positive attitude, 17 had positive attitude, 16 had neutral attitude and 1 had negative
attitude. In nuclear family, 34 had highly positive attitude, 40 had positive attitude and 25 had neutral attitude.

Table 14: Association between Attitude and Selected socio demographic variables.

0.05- level of significance

NS- non-significant

From the above statistical data, it was clear that there is no significant association of attitude among mothers of adolescent girls regarding sex education with demographic variable. And it is also clear that there was no association of attitude among mothers of adolescent girls regarding sex education with demographic variable
such as age, religion, education, occupation, income and type of family.

## DISCUSSION

The present study was conducted to assess the knowledge and attitude among mother's of adolescent
girls regarding sex education at pallithottam coastal community area, Kollam. In order to achieve the objectives of the study non experimental research design was adopted. The Sample was selected by the nonprobability convenient sampling. The sample consisted of 150 mothers adolescent girls. The findings of the study have been discussed in relation to objectives and other similar studies.

## Objectives

The objectives of the study were
$>$ To assess the knowledge among mothers of adolescent girls regarding sex education.
$>$ To assess the attitude among the mothers of adolescent girls regarding sex education.
$>$ To find the association between knowledge among mothers of adolescent girls regarding sex education with selected socio - demographic variables.
$>$ To find the association between attitude among mothers of adolescent girls regarding sex education with selected socio -demographic variables.
> To develop an instructional module for mothers regarding sex education of their adolescent girls.

## Discussion of findings with other studies based on objectives

- To assess the knowledge among mothers of adolescent girls regarding sex education
The present study revealed that $29.3 \%$ mothers had adequate knowledge, $62.6 \%$ had moderately adequate knowledge and $8 \%$ had inadequate knowledge.

The above findings are supported by a qualitative study conducted in Enugu state from June 20 to September 10, 2020. Samples was selected by simple random technique and the sample size was 30 mothers. Data were collected by a semi structured questionnaire to assess the knowledge among mothers of adolescent girls regarding sex education. The findings of the study indicate that $21.5 \%$ mothers had adequate knowledge. $69.9 \%$ had moderately adequate knowledge. $8.6 \%$ had inadequate knowledge.

- To assess the attitude among the mothers of adolescent girls regarding sex education
The study revealed that $38 \%$ mothers of adolescent girls had highly positive attitude, $34 \%$ had positive attitude, $27.3 \%$ had neutral attitude and $0.6 \%$ had negative attitude.
The above findings are supported by a qualitative research study conducted in Hyderabad. The sample was selected by random sampling technique and the sample size was 200 and Interview method was used to collect the data. Data was collected by a interview and semistructured questionnaire. The findings of the study indicates that $42 \%$ mothers of adolescent girls had Highly positive attitude, $32 \%$ had Positive attitude, $22.3 \%$ had Neutral attitude and $3.7 \%$ had Negative attitude towards sex education
- To find the association between knowledge among mothers of adolescent girls regarding sex education with selected socio-demographic variables
The present study showed significant association between knowledge and socio -demographic variables like age, education and type of family. Regarding age the calculated value 14.086 is greater than table value 9.49 at 0.05 level of significance. Regarding education, the calculated value 40.5 is greater than table value 12.59 at 0.05 level of significance. Regarding type of family the calculated value 12.23 is greater than table value 5.99 at 0.05 level of significance. There was no significant association between knowledge and socio - demographic variables like religion,occupation and income. Regarding religion the calculated value 2.32 is less than table value 9.49 at 0.05 level of significance. Regarding occupation the calculated value 5.76 is less than table value 9.49 at 0.05 level of significance. Regarding income, the calculated value 8.24 is less than table value 15.51 at 0.05 level of significance. In short significant association was found between knowledge and demographic variables like age, education and type of family. No significant association was found between knowledge and demographic variables such as religion, occupation and income.

The above finding is supported by a convenient crosssectional survey which was conducted in urban area of chennai to assess the knowledge among parent's of adolescents. Samples was selected by simple random technique and sample size was 346 . The study showed that the majority of the participants $83.8 \%$ belong to Hindu religion, $82.7 \%$ were living in a nuclear family, $68.7 \%$ of students' monthly family income was less than Rs. 25,000 and the mothers ( $76.7 \%$ ) was home makers. Regarding age the calculated value 16.56 is greater than table value 10.49 at 0.05 level of significance. Regarding education, the calculated value 49.5 is greater than table value 14.61 at 0.05 level of significance. There was no significant association between knowledge and socio demographic variables like religion and income. Regarding religion the calculated value 6.32 is less than table value 15.23 at 0.05 level of significance. Regarding income, the calculated value 13.25 is less than table value 17.51 at 0.05 level of significance. In short significant association was found between knowledge and demographic variables like age and education. No significant association was found between knowledge and demographic variables such as religion and income.

- To find the association between attitude among mothers of adolescent girls regarding sex education with selected socio demographic variables
The present study showed no significant association between attitude and socio demographic variables like age, religion, education, occupation, income and type of family. Regarding age, the calculated value 7.183 is less than table value 12.9 at 0.05 level of significance.

Regarding religion, the calculated value 3.304 is less than table value 12.59 at 0.05 level of significance. Regarding education, the calculated value 9.2 is less than table value 16.92 at 0.05 level of significance. Regarding occupation, the calculated value 0.375 is less than table value 12.59 at 0.05 level of significance. Regarding income, the calculated value 15.22 is less than table value 21.03 at 0.05 level of significance. Regarding type of family, calculated value 2.79 is less than table value 7.82 at 0.05 level of significance. In short, no significant association was found between attitude of mothers towards sex education and demographic variables such as age, religion, education, occupation, income and type of family. It is revealed that $38 \%$ mothers of adolescent girls had highly positive attitude, $34 \%$ had positive attitude, $27.3 \%$ had neutral attitude and $0.6 \%$ had negative attitude. The above finding was supported by a convenient cross-sectional survey which was conducted in urban area of chennai. Samples was selected by simple random technique and sample size was 346 . . The study showed that $43 \%$ mothers of adolescent girls had highly positive attitude, $33 \%$ had positive attitude, $23.3 \%$ had neutral attitude and $0.7 \%$ had negative attitude. Regarding age, the calculated value 9.81 is less than table value 16.1 at 0.05 level of significance. Regarding education, the calculated value 6.2 is less than table value 15.85 at 0.05 level of significance. Regarding their occupation, calculated value 2.79 is less than table value 7.82 at 0.05 level of significance. There is no association between attitude and socio-demographic variables such as age, education and their occupation
