The rand is trading at R18.44 against the dollar 34 cents stronger in the last week. The rand has managed to break key support levels of the 100- and 200-day moving averages, as well as the R18.55 level. The rand is buoyed by a weaker dollar accompanied by high commodity prices. The market will now await the release of the US inflation figures today as well as the Fed's minutes. The beforementioned will provide guidance on when possible rate cuts could happen.

Soya bean meal:

Soya bean meal for May 2024 is currently trading at 336.5 dollars per short ton up 8.8 dollars which is 2.69% higher from last week. Soya beans are up 0.43% while oil prices are down by 2.09% on the nearby. Commodity prices remain under pressure as ample supplies accompanied by sluggish demand continues to keep price pressure under containment.

Jul is trading at 339.4

Weather:

Available at: https://www.wpc.ncep.noaa.gov/qpf/p168i.gif?1633499969

Midwest:

Moderate rain fell across parts of the region Sunday and Monday and another system will bring widespread showers again by the middle of this week. Heavier rainfall will mainly impact the Eastern Midwest later this week. The active pattern is helping build soil moisture ahead of spring planting. The soils have been mostly dry enough to soak it all in, although there are some wetness and flooding concerns along the Ohio River, Illinois River, and Wabash River. If the pattern continues to be very active with little breaks in the precipitation, we may see some areas having to push back planting, but that risk still seems low.

Southern Plains:

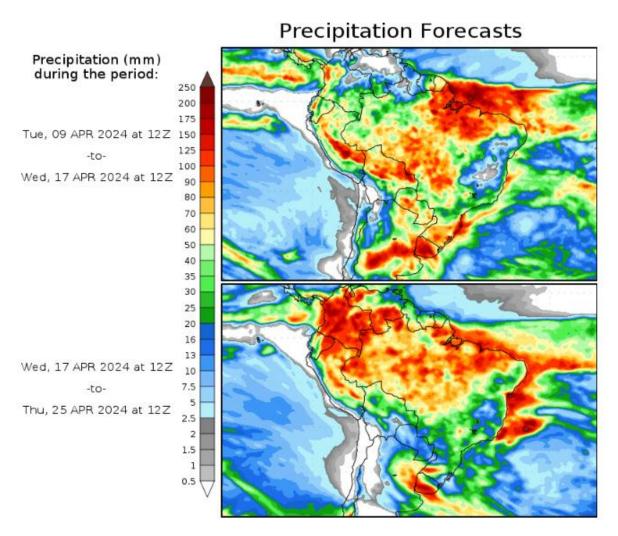

This past weekend, blizzard conditions in western Nebraska and severe thunderstorms impacted the Central Plains. Scattered rain showers and the threat of severe thunderstorms will continue across the Southern Plains early this week. Quieter conditions return briefly during the second half of this week. However, the pattern will remain active through mid-April, bringing multiple chances at building soil moisture as spring planting gets started. Even so, there are no areas in the region that are overly wet, so spring planting is likely to be on time. Instead, some areas are missing the active pattern and drier conditions have developed for wheat in the southwest.

Northern Plains:

A system brought gusty winds, rain and some heavy snow to the High Plains this past weekend with lingering precipitation on Monday. Another round of light showers is possible by midweek. Drier conditions return for the second half of the week before another large system may impact the area early next week. The increasing precipitation should help with building soil moisture and the lack of snowpack should lead to on-time planting, even if the pattern stays active this spring.

Delta:

Soil is in good shape across most areas as spring planting starts and rain returned on Monday as a cold front was draped across the Southern Delta. More widespread, heavy rain showers and thunderstorms are expected through Wednesday which could lead to areas of flooding. There are some wetter areas from the active storm track which could delay planting progress.

Brazil:

Scattered showers will likely continue across central and northern Brazil through this week and this weekend. More showers will impact southern Brazil later this week with the passage of another cold front. The more active period this week is going to be important as rainfall is forecast to be more limited afterward with the wet season winding down and the country being more reliant on fronts moving through.

Argentina:

A front moved through Argentina this past weekend providing more scattered rain showers. The active pattern continues with showers expected by midweek and again this upcoming weekend before starting to dry early next week. Filling corn and soybeans have had stable conditions for the last couple of weeks, which continues to be the case with much of the crop maturing. Forecasts for large corn and soybean crops, about double last year's drought-reduced amount, seem very likely at this point in the year.

South Africa:

Mainly dry conditions are expected throughout the producing areas the rest of this week and the weekend. From late Saturday a combination of northern tropical moisture and a southern frontal event will bring rain to parts of the interior well into next week. The first is snow expected in the Drakensberg region during the next 48-hour window. Cooler day conditions are in store the next few days with the first sow expected in the Drakensberg region.
