

Infrared/Raman Microscope AIRsight

for Researchers

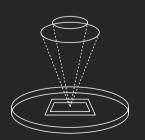

AlRsight[™]

Raman and FTIR microscopy in perfect harmony

Infrared Spectroscopy and Raman Spectroscopy

Infrared and Raman Microscope Based on a Combination of Two Analytical Techniques to Provide Complementary Molecular Information

This simple system improves the efficiency of analytical operations by making it easy to perform all process steps from sample observation to data analysis.

Same position is measured by IR and Raman

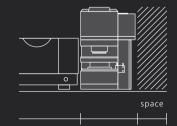

No need to search for the same position

35 Microscope

Smart software controls IR and Raman

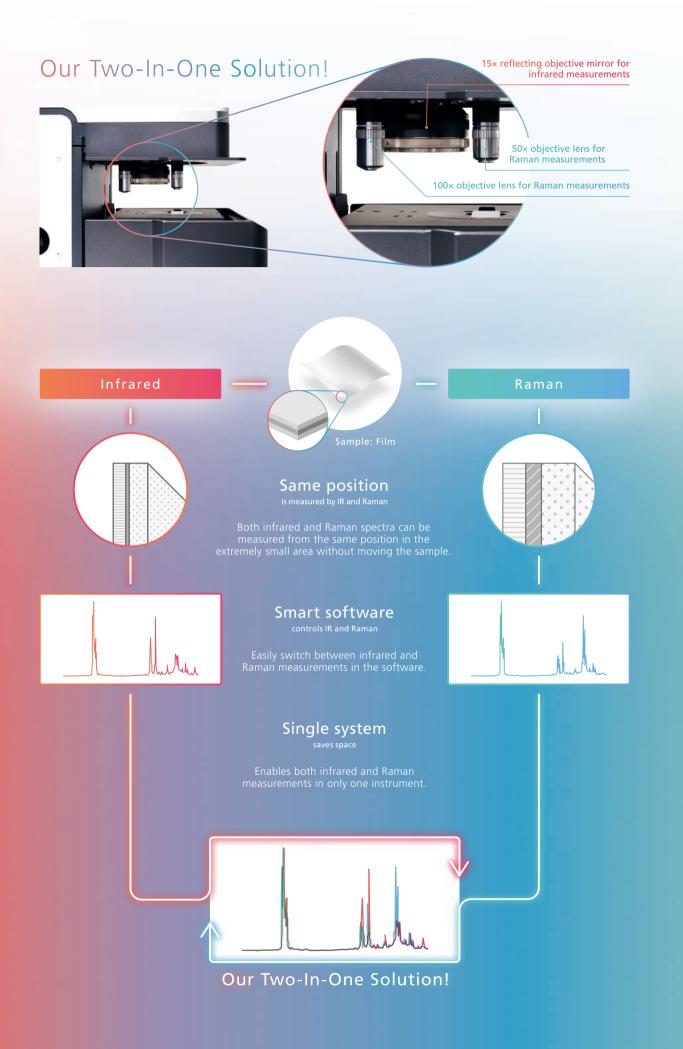

One easy-to-use software

REHIMADZU

Single system

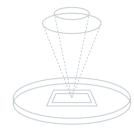

Small footprint

AlRsight Characteristic Features

Same position

is measured by IR and Raman

Both FTIR and Raman Spectra Can Be Measured without Moving Samples

Because samples do not need to be moved, both infrared and Raman spectra can be measured from the same position in an extremely small area. That means information about both organic and inorganic substances can be obtained from the same position, which can significantly improve the accuracy of qualitative analysis. In addition, Shimadzu's proprietary wide-view camera and microscope camera (for infrared measurements) or objective lens (for Raman measurements) help improve sample observation efficiency. The wide-view camera not only enables observation of large areas up to 10 × 13 mm, but it also supports variable digital zooming. Furthermore, it shares positional information with the microscope camera and objective lenses.

The microscope camera can be used to observe areas as small as 30 × 40 μ m, the 50× objective lens to observe areas as small as 15 x 20 μ m, and the 100× objective lens to observe extremely small areas as small as 7.5 x 10 μ m.

Smart software

One Software to Measure and Analyze Both FTIR and Raman Spectra

You can easily switch between infrared and Raman measurements with a click. In addition, infrared and Raman spectra can be superimposed and displayed, and various analyses can be performed.

Single system

saves space

Obtain Organic and Inorganic Information with One Instrument

Infrared microscopes can analyze organic substances, but it is difficult to obtain information for many inorganic substances.

On the other hand, Raman microscopes can obtain information about inorganic substances such as titanium oxide and carbon, in addition to organic substances. In contrast, a single AIRsight unit can analyze mixtures of both organic and inorganic substances.

AIRsight Software

AMsolution

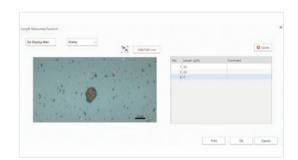

AMsolution includes measurement software (AMsolution Measurement) and analysis software (AMsolution Analysis). The measurement software can control both infrared and Raman measurements via the same window. That means all processes, from image acquisition to measuring infrared and Raman spectra at the same location, can be performed smoothly. The analysis software can overlay and search infrared and Raman spectra, create libraries, and so on.

Length Measurement Function

Infrared Raman

AMsolution software now includes functionality for measuring lengths, including the lengths of objects in infrared Raman microscope images. Also, length measurement results can be output with a single button click.

Depth Measurements Raman Enables Analysis in the Depth Direction (Z-Direction)

Example of Depth Measurements (at Line)

Raman measurements can measure depth either at a single point or along a line*. If a transparent sample, such as plastic or glass, has a thickness (depth) dimension, the laser light components that can penetrate the sample can be used to measure the sample interior. Even if the sample is colored or cloudy, measurements are generally possible as long as the interior can be observed.

* Measuring depth (at a line) requires using a separate mapping program (P/N 206-35093-41).

AIRsight Applications

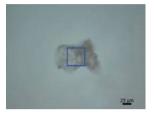

Microplastic

Infrared Raman

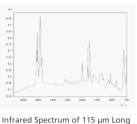

For more details, click here.

Application News

This is an example of analyzing a microplastic particle. The ability to measure infrared and Raman spectra from a wide range of microplastic particle sizes, from a few micrometers to several tens of micrometers in diameter, makes the system ideal for monitoring survey and research applications.

Application News No.01-00395

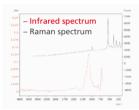

This is an example of analyzing pigment applied to wood. Because AIRsight microscopes can measure trace quantities, they are especially useful for measuring precious samples with historical value.

Appearance of Pigment Applied to Wood

Microscope Image of Pigment Applied to a Wood Surface

Infrared and Raman Spectra of Pigment with BaSO₄ Identified from the IR Spectrum and Pb₃O₄ from the Raman Spectrum

Multilayer Film

This is an example of analyzing a multilayer film.

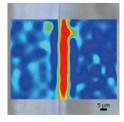

Microscope Image of Multilayer Film Cross Section

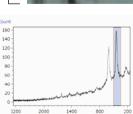

Infrared Area Mapping Results Chemical Image of Phthalate Esters

Chemical Image Created from Peak Areas between 1551 and 1624 cm⁻¹

Raman Area Mapping Results Chemical Image of Titanium Oxide (Rutile)

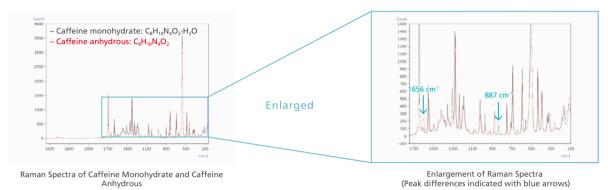

Chemical Image Created from Peak Area Values between 345 and 508 cm⁻¹

Polymorphic Crystal

Raman

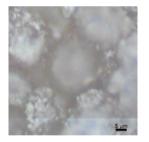

This is an example of analyzing monohydrate and anhydrous forms of caffeine. Raman spectra can differentiate between compounds that have identical chemical structures but with different crystal polymorphisms. Evaluating the crystal form of substances with different solubility or efficacy characteristics is useful for controlling crystal formation during pharmaceutical manufacturing processes.

Li-Ion Battery

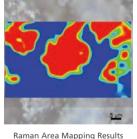

This is an example of analyzing the negative electrode material from a lithium-ion battery. Raman area mapping can be used to visualize the detailed distribution of components and structural characteristics in substances (crystallinity, defects, etc.). Therefore, it is useful for evaluating products and materials in R&D applications. Note: In the chemical image shown, the red areas indicate high concentrations of the component and blue areas indicate low concentrations.

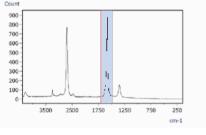

Microscope Image of Negative Electrode Material

Carbon Material

Chemical Image of Graphite (G-Band)

Raman

Chemical Image Created from Peak Area Values between 1482 and 1703 cm⁻¹

This is an example of analyzing a diamond-like carbon (DLC) film. Raman measurements can determine bonds and structures in carbon materials with high sensitivity for use in quality control of DLC films.

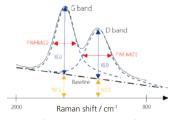

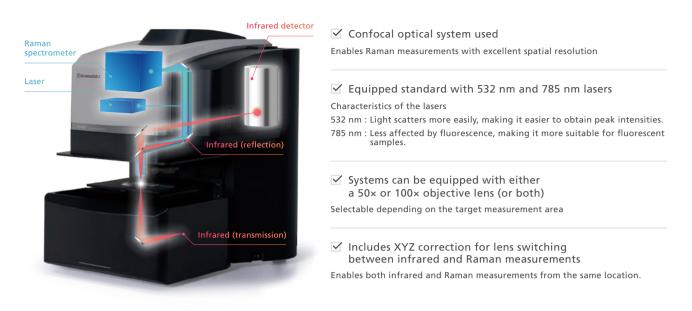

Diagram of Evaluation Parameters for Raman Spectrum of a DLC Film

	l(D)/l(G) Disturbances in Crystal Structure	FWHM(G) Crystallinity, Young's Modulus, and Density	log(N(G)/I(G)) Hydrogen Concentration
CH ₄ _center	0.32	182.17	-0.29
CH ₄ _periphery	0.32	181.40	-0.28
C ₂ H ₂ center	0.34	190.85	-0.44
C_2H_{2} periphery	0.34	190.25	-0.44

Results from Evaluating DLC Film (Formed with Either CH_4 or C_2H_2 Gas) on Two Types of Silicon Wafers (Measured in Two Locations—Near the Sample Center and Periphery)

AlRsight

AIRsight Features for Raman Measurements

FTIR Systems Connectable with AIRsight and System Sizes

FTIR	System size (FTIR with AIRsight)
IRTracer-100	W1136 mm x D705 mm x H604 mm
IRXross	W1086 mm x D668 mm x H604 mm
IRAffinity-1S	W1055 mm x D668 mm x H604 mm
