Learn Anywhere: The Big Bang
How to use this lesson plan

This plan takes you on an exciting journey with plenty of links through to amazing online content so no need to print. This lesson plan is suitable for anyone but we recommend it for ages 11 to 14. It's a lot of fun to go on this journey with parents, teachers or your friends, but it is designed so you can explore independently at your own pace. There are different types of questions to answer: can you discover, explore and invent? We think so.

Check in with your parents or teacher if you need to, but you'll need a tablet, computer or smartphone. You can do this Learn Anywhere lesson on almost any device as long as you can get online and use a web browser.

There are 3 Chapters:

Chapter 1 - The Big Bang 45 minutes
Chapter 2 - All About Particles 45 minutes
Chapter 3 - Extra Discovery 45 minutes

You'll see some helpful signs on the way:

- Useful information to guide you through the lesson.
- Things you'll need to watch, read, learn and make things with during the lesson.
- Digital activity time. Take quizzes and explore.
- Estimated time to do a section of this lesson.
- Explore online content. Discover videos, stories, or go and look at and zoom around pictures.
- Activity time. This is where you get to design, make or write something of your own.
- Headphones to listen to videos and audio.
Things you'll need

Things that will help you during this *Learn Anywhere* lesson.

- Scrap Paper
- Scissors
- Brush and Paint
- Notepad
- Tablet or Computer
- Pens and Pencils
Welcome to *Learn Anywhere: The Big Bang*

In this *Learn Anywhere* lesson, you are going to learn all about the origins of the universe itself. At least, the theory of the origin of the universe... you'll go on an adventure back to the dawn of space and time, learn about where this is being studied and think about if we are really alone in this vast cosmos. Get ready to investigate...

**What will you do?**

1. Go on an adventure to discover the origin of the universe.
2. Hunt for facts and stories about the Big Bang theory.
3. Write a story or draw a picture of your own about the origin of the universe.
4. Discover what particles are and how we study them.
5. Discover the remarkable beauty of the universe.
6. Explore if we really are alone.
What will you learn?
1. Discover the origins of the Big Bang theory and how it describes the origin of the universe.
2. Understand what happened in the very first few minutes of the universe.
3. Understand what particles are and how we study them.
4. Explore how space telescopes can tell us about the universe.
5. Understand what exoplanets are.
6. Practice writing.
7. Practice art and design.
8. Understand the long-term planning that goes into space projects.

After studying this lesson, you will be able to:
1. Describe the Big Bang theory.
2. Understand the origin of the universe.
3. Understand different types of particles.
4. Write a story about being at the origin of the universe.
5. Create your own exoplanet.

Vocabulary: atom, Big Bang, cosmos, ESA, exoplanet, habitable, helium, Higgs Boson, Hubble, NASA, neutrino, neutrons, observatory, particle, protons, quark, telescope, universe.
There’s one more thing to know before you go on your lesson. Google Arts & Culture pictures are big. So big that you can zoom in. Explore. Sometimes right down to a particle.

So you just need to click on a link, then on the Magnifying Glass symbol and zoom in with the Zoom Slider. Drag the white box around and you can explore the picture. You’ll find out for yourself. Here’s an example of a Google Arts & Culture picture and the zoom slider.

Pieter Bruegel the Elder, The Harvesters, 1565, The Metropolitan Museum of Art
Chapter 1

What's this chapter about?
The Big Bang

What will I do?
Learn about the Big Bang theory
Describe the origin of the universe

How long will this chapter take?
45 minutes
What is this "Big Bang", anyway?

Well, everything has to start somewhere, right? The Big Bang is just that, except it is the starting point for the universe itself.

That's right, the universe that our planet is a tiny part of, the vast cosmos that you can see when you look up at night, full of stars and planets and galaxies, has a birthday, just like you. It was a moment, about 13.8 billion years ago, when a tiny speck of energy suddenly expanded, giving birth to space and time, and our universe.

There are many reasons why the Big Bang theory is now widely accepted as the origin point of the universe. The first reason why we think the universe had a point of origin is that it is expanding. It is logical that the universe was smaller in the past, and looking further back in time, even smaller.

In 1927, Georges Lemaître, a Belgian Catholic priest, astronomer, and professor of physics at the Catholic University of Louvain became the first person to identify that the movement of galaxies near to our own could be explained by an expanding universe. He also proposed what later became known as the "Big Bang theory" of the origin of the universe, initially calling it the "hypothesis of the primeval atom". Edwin Hubble, an American astronomer, confirmed these findings two years later through his observations of the universe at the Mt Wilson Observatory.

Click here to watch a video about our expanding universe.
There are other reasons we think the universe had a point of origin, a Big Bang.

Click here to read more about them.
If we accept that the universe had a starting point, we must know what existed before it. Well, not so fast. We don’t know. Albert Einstein, the scientist you learned about in the video earlier, argued that time was born with the Big Bang, therefore there is no "before"... Click [here](#) to find out more about this idea of before the Big Bang.
Questions for Chapter 1

Let's finish the chapter with some questions. When you Discover, you are comprehending and remembering. When you Explore, you are really able to understand it and think it through. When you Invent, you are able to comprehend, understand, remember, analyse and do something cool with your new knowledge.

Discover:
How old do we think the universe is?

Explore:
Why do you think we need to know about the origins of the universe?

Invent:
What do you think the origin of the universe looked like? The actual Big Bang itself? Draw a picture or write 100-200 words describing it.
Chapter 2

What's this chapter about?
Particles

What will I do?
Learn what particles are and why they are important
Explore what particle accelerators are
Describe how you might feel visiting the Large Hadron Collider

How long will this chapter take?
45 minutes
We've looked at the Big Bang itself, the origin point of the universe. But what happened next? Less than a trillionth of a second after the Big Bang itself, its energy is transformed into tiny particles and radiation. Particles are the tiniest known building blocks of our universe. They make up everything - dust, gas, stars, planets, galaxies, and all objects and living things in the universe.

These particles formed a very dense and hot particle ‘soup’. From this soup came everything that is in the universe today.

Some particles are called "quarks" and some of these combined to form protons and neutrons. These protons and neutrons fused to form the lightest atomic nuclei - the stuff at the very centre of an atom. This whole process stopped about 15 minutes after the Big Bang.

The universe was still a soup at this very early stage. A soup of protons, helium nuclei, and electrons. Over the next hundreds of thousands of years, the universe expanded and cooled down, but its composition stayed the same. Eventually, stars, planets and galaxies formed.

Particle physics isn't as hard as you might think - click here to see a history of it (and a cat explaining particles).
Now let's try and catch some particles from the other side of the universe. Click here to discover how scientists in Japan are using a particle detector a kilometre underground to do this.
Now we can look at one of the engineering wonders of the modern world.

CERN, the European Organization for Nuclear Research, has the world's largest and most complex scientific instruments to study particles (the acronym CERN originally represented the French words for "Conseil Européen pour la Recherche Nucléaire" which translates as the (European Council for Nuclear Research). Particles are made to collide together at close to the speed of light. The speed of light is approximately 299,792,458 metres per second, so these particles are moving very quickly indeed. This process gives the physicists clues about how the particles interact, and provides information about the laws of nature.

Founded in 1954, the CERN laboratory sits across the French and Swiss border (known as the Franco-Swiss border) near Geneva. It was one of Europe's first joint ventures and now has 22 member states.

It houses the Large Hadron Collider (LHC), the world’s largest and most powerful particle accelerator. It is a 27km ring of superconducting magnets, chilled to -271.3°C, colder than space.

For part of each year the LHC collides lead ions to recreate the conditions of the early universe, fractions of a second after the Big Bang.

Click [here](#) to take a street view tour of CERN and its huge machines. And click [here](#) to see 10 things you may not know about CERN.
Questions for Chapter 2

Time for some questions. Here’s a reminder of how it works. When you **Discover**, you are comprehending and remembering. When you **Explore**, you are really able to understand it and think it through. When you **Invent**, you are able to comprehend, understand, remember, analyse and do something cool with your new knowledge.

**Discover:**
How far underground is the Super Kamiokande facility in Japan?

**Explore:**
What are quarks and how many types are there?

**Invent:**
How would you feel walking through the Large Hadron Collider? Write 100-200 words describing it.

GSFC. Best-Ever Snapshot of a Black Hole’s Jets, 2017, NASA
Chapter 3

What's this chapter about?
Extra Discovery

What will I do?
Explore the wonder of the universe from the Hubble Space Telescope
Discover what the James Webb Space Telescope will tell us
Explore if we are alone in the universe...

How long will this chapter take?
45 minutes
The Hubble Space Telescope is another wonder of the modern world. For over 30 years it has helped us discover secrets of the universe. Click here to explore some its greatest and most beautiful discoveries.
The James Webb Space Telescope is a successor to the Hubble and will be able to observe some of the most distant events and objects in the universe, such as the formation of the first galaxies. Click here to find out more.
And to finish, the final question of this lesson is: "Are we alone in the Universe?" What do you think? Click here to find out more.
Questions for Chapter 3

Time for some questions. Here's a reminder of how it works. When you **Discover**, you are comprehending and remembering. When you **Explore**, you are really able to understand it and think it through. When you **Invent**, you are able to comprehend, understand, remember, analyse and do something cool with your new knowledge.

**Discover:**
What does "habitable" mean?

**Explore:**
Which was your favourite image from the Hubble telescope and why?

**Invent:**
Imagine your own planet - can you draw a picture of it or describe it. What would it feel like to walk there?
Congratulations. You have proven yourself an inventive student of the Big Bang.

Now it's time to continue your journey into science [here](#).
Answers to all the questions

Chapter 1
Discover: How old do we think the universe is?
Answer: 13.8 billion years

Explore: Why do you think we need to know about the origins of the universe?
Answers can vary but can refer to the quest for knowledge, our need to understand the laws that govern the universe and where we fit.

Invent: What do you think the origin of the universe looked like? The actual Big Bang itself? Draw a picture or write 100-200 words describing it.
Answers will vary but any form of description is acceptable of surroundings and feelings.

Chapter 2
Discover: How far underground is the Super Kamiokande facility in Japan?
Answer: 1 kilometre, 1,000 metres

Explore: What are quarks and how many types are there?
Quarks are fundamental particles and there are six types: up, down, strange, charm, bottom, and top.

Invent: How would you feel walking through the Large Hadron Collider? Write 100-200 words describing it.
Answers will vary but should convey a sense of wonder and awe.

Chapter 3
Discover: What does "habitable" mean?
Answer: The habitable zone is the zone that is just right for planets to support life.

Explore: Which was your favourite image from the Hubble telescope and why?
Answers can vary but should give reasons for choosing an image.

Invent: Imagine your own planet - can you draw a picture of it or describe it. What would it feel like to walk there?
Answers will vary but should give a sense of the type of atmosphere - is it Earth-like, blue with oceans and green with forests and vegetation, or is it desert, arid and barren, like Mars? Or something else? The description of walking on the surface should be imaginative and might include a discovery about other species in the universe, or perhaps relics and archaeological ruins from some long dead alien species.
