

Buoyancy Test Chart

Buoyancy describes an object's ability to float or rise when submerged in a liquid. If the object floats, it's considered buoyant. If the object sinks, it is not buoyant. Fill a large bowl or bucket with water, collect water-safe items from around your home and experiment to see which items float and which items sink. Use the chart below to record the results.

	Sketch	Hypothesis	Observation and Results
1	Sketch the object and label characteristics that might affect buoyancy. Name of Item: _____	Will it sink or float? Explain your reasoning. 	Is your hypothesis confirmed or disproven?
2	Name of Item: _____	 	
3	Name of Item: _____	 	
4	Name of Item: _____	 	
5	Name of Item: _____
