

## Catapults Experiment Tips

Read below for extra tips to help you complete your science experiments.

### Catapult Workshop

- Weather may affect drying times for glue. Be sure to allow enough time for the glue to dry and the wooden pieces to set before moving to next steps.
- Gently stretch out the rubber bands before wrapping them around the craft sticks to help prevent them from breaking.

### Stained Glass

- Before you start, place the designs on the plastic sheet to help keep your surface clean as you glue.
- Don't forget to draw a larger outline around the traced sections of your design. This will give you space to glue the tissue paper to the design.
- Remember if sections of your design are side by side and the same color. Draw one larger outline around all those sections rather than cutting out each piece individually (though, that will work too!).
- Weather may affect drying times for glue. Be sure to allow enough time for the glue to dry before displaying on a window.
