

Verifiable scales

Verifiable (can be calibrated) scales means the scales have EU-approved for the whole of the EU area as well as in countries with a local collective agreement, for example, Norway and with that are prepared for verification.

Verification is general required when the weight forms the basis for charging, where scales are used for diagnosis/treatment and other application areas. Example areas are retail trade, healthcare, industry, customs, etc. Certified companies and organizations also frequently include clauses in regulations that verifiable scales must be used in the different processes. This is also true of different industries with optional agreements concerning the use of verifiable scales. All our verifiable scales are also available in enclosure protection classes IP-65, -66, -67 and -68, to withstand rugged environments with moisture, water and dust, etc. These are usually in stainless steel designs. Available on request.
