

General information on mounted points

Norton's mounted points are designed in terms of shape, hardness and coarseness for all general applications.

The mounted points are made of aluminium oxide and are ceramic bound. The highest permitted speed is dependent on the shape, amongst other things, of the mounted point and is stated for each type and for a free spindle length of 13 mm. Information about the maximum speed for free spindle lengths other than 13 mm will be provided on request.
