

## Dressing and forming tools in general

When a grinding wheel, ceramic or organic bonded wears, its cutting capacity is impaired and its profile can change. In order to restore the grinding wheel's shape and efficiency dressing and forming tools are used, these can be made up of ceramic bonded dressing rods or other tools. Dressing means to restore the grinding wheel's roundness or shape or to give the grinding rim a new profile.

Sharpening is to restore the grinding wheel's cutting characteristics. Diamond tools are used to dress and shapen grinding wheels for precision grinding. Diamond and boron nitride abrasive wheels are dressed using ceramic bonded dressing rods.
