

# The Vanguard Study

Testing a new way to screen for cancer

The **Multi-Cancer Detection (MCD)** test is a new type of test that uses a blood sample to look for signs that there may be cancer somewhere in the body. More information is needed to better understand if these tests can help us find cancer earlier when it may be easier to treat.

We need **your participation** in this important study!

By joining this study, you can help scientists and doctors learn more about whether MCD tests can help people from all backgrounds find cancer early when it may be easier to treat. **Joining this study is a simple way to make a big impact on the future of cancer screening.**

## Who can participate:

You may be able to participate if you:

- Are between 45 to 75 years old
- Have not had a cancer diagnosis in the past 5 years
- Can give 2 blood samples and answer surveys
