TURN OFF EXTERIOR FAUCETS

Turn off all exterior faucets and drain water from outdoor pipes, valves and sprinkler heads to prevent pipe bursts.

If your home is 10 years or older, consider installing frost-proof faucets.

PERFORM A ROOF INSPECTION & REPAIR LOOSE SHINGLES

Check your roof to ensure your shingles are intact.

Make sure your gutters and downspouts are free and clear of leaves and branches.

Apply roof repair glue to any loose shingles in order to help avoid leaks or damage.

SEAL GAPS AND CRACKS

Sealing the gaps and cracks around your windows and doors is essential to keeping your home warm and using less energy this winter.

Any gaps wider than the width of a nickel between your siding and window or door frames should have caulking applied to them.

Use your finger or a wet caulk-smoothing tool within 2 to 5 minutes of application to smooth your caulk seal.

CLEAN GUTTERS AND ADD GUTTER GUARDS

Clean gutters allow water to easily flow down from your rooftops and away from your home, preventing damage to your foundation and ice buildup on your roof.

Installing gutter guards is a great way to prevent a buildup of leaves and other debris in your gutters.

WINDOW AND DOOR WEATHER STRIPPING

Weather stripping your windows and doors is another great way to keep the cold out.

To find out where weather stripping is needed, wet your hand and run it along your door seam or window casing. The moisture on your hand will help you detect any incoming drafts. Door sweeps and adhesive backed insulation foam are also very effective draft deterrents.

If you notice gaps that are wider than the width of a nickel between your siding and window or door frames, reapply exterior caulking to seal the gaps.

BOOK AN HVAC MAINTENANCE APPOINTMENT

Regular maintenance of your HVAC unit can improve performance, increase the life of your unit and save you money.

Some common signs of required maintenance include leaking around the outside unit, inconsistent temperatures or if your system constantly turns on and off.

UPGRADE INSULATION

Insulating is the first step to ensuring your home stays warm and cozy for the winter.

For a larger project, such as a basement, you'll get even better results by installing fireproof or sound proof insulation. R-value measures how well certain building insulation materials can resist heat.

The higher the R-value, the greater the performance of the insulation.

REPLACE FURNACE FILTERS

Replace the furnace filter monthly to ensure efficiency and keep dust particles from penetrating the clean, heated air. Inspect your furnace for leaks and test for carbon monoxide.

If your furnace is older, cracks can form and cause harmful gas to escape into your home. It is also recommended you invest in carbon monoxide detectors to monitor the air in your home.

To keep your home nice and toasty and to help curb high electric bills, install a smart thermostat. Keep your heat settings lower while you are asleep and program it to raise just before you wake.

CHECK TOILETS AND FAUCETS FOR LEAKS

A leaky toilet can waste energy and water. Check for leaks by dropping some food coloring into your tank, and then checking your bowl a short while later, if there is colored water you have a leak and need maintenance.

Leaky faucets can also waste water and can often be repaired by simply replacing washers or rubber seals.

CLEAN LAUNDRY MACHINE DUCTS

Dryer lint built up in the duct behind the machine not only reduces the efficiency of your dryer but can also cause fires in the home -- and should therefore be inspected regularly.

If you notice that there is a buildup, be sure to clean it or hire a professional to do the job for you.

CHECK FIRE ALARMS & EXTINGUISHERS

Test smoke alarms monthly and vacuum dust from beneath the cover every six months. Replace batteries as per manufacturer's instructions.

Keep fire extinguishers on every floor of the house and in the kitchen. Make yourself familiar with how they work now so you can move quickly if you need to use them.

RESET THE HUMIDITY LEVEL

Use humidifiers with controls to reset the humidity level based on the outside air temperature. This combination will keep frost from forming as the chosen humidity level will be lowered while outside temperatures fall and be restored to normal during less severe weather.

We recommend a normal humidity level of 35 to 45 percent. However, as temperatures dip into single digits, it should be set closer to 20 percent.

INSTALL A PROGRAMMABLE THERMOSTAT

A programmable thermostat makes life a little bit easier by allowing you to set your desired temperature and then not have to worry about it anymore.

In the winter, a programmable thermostat allows you to save money on your energy bills. In fact, studies show that you can save one percent for every eight hours you set your thermostat down.

FLUSH THE WATER HEATER

Particles and sediment can collect over time in the bottom of your water heater, hindering the unit's efficiency.

Flush the water through the drain valve to clear out the material and keep your heater functioning at its best.

CLOCKWISE CEILING FANS

Ceiling fans are everyone's favorite summer budget-saver. But they can help out in the winter as well!

Have your ceiling fans move in a clockwise direction so they push hot air along the ceiling towards the floor. If they're going counterclockwise, they won't be as effective.

DRAFT GUARDS

In a drafty room, heat escapes under the door. When winterizing your house, place draft guards by the doors to prevent heat loss.

It's a simple solution that keeps your house warm and saves you from wasting energy.

KNOW WHERE THE WATER SHUT-OFF IS

Let's say a pipe does become frozen and it causes a back up of water flow in your basement. Now your basement is flooding, and you need to know where to turn the water off quickly.

With that in mind, take some time to locate where the main water-valve is in your home. In Canada this valve is usually in the basement somewhere.

CHECK YOUR FIREPLACE

Animal nests or creosote buildup in your fireplace can be hazardous.

Have an annual inspection before building your first fire of the season. Also, soot and other debris build up in the chimney. Call a chimney sweep to thoroughly clean the chimney before your first winter use.

You should also vacuum or sweep out any accumulated ash from the firebox.

LUBRICATE DOOR LOCKS

RESTOCK EMERGENCY KITS FOR CAR AND HOME

REMOVE THE LAST OF THE FALL LEAVES

CLEAR SNOW AND ICE FROM WALKWAY

SWITCH OUT OLD CHRISTMAS LIGHT BULBS WITH LED

CHECK PATHS, STAIRS AND RAILINGS FOR SAFETY

PREPARE FOR POWER OUTAGES

INSULATE EXPOSED WATER PIPES UNDER HOUSE

DISCONNECT AND DRAIN GARDEN HOSES

THANK YOU!

I HOPE THIS GUIDE SERVES YOU WELL. THE HOME
SELLING & BUYING PROCESS CAN BE OVERWHELMING
AND I AM HERE TO HELP AND SERVE WITH ANY
QUESTIONS YOU HAVE!
