## BGP super-blunder: How Verizon today sparked a 'cascading catastrophic failure' that knackered Cloudflare, Amazon, etc

'Normally you'd filter it out if some small provider said they own the internet'

By [Kieren McCarthy](#) in [San Francisco](#) 24 Jun 2019 at 19:01 61 [SHARE](#) ▼

**Updated** Verizon sent a big chunk of the internet down a black hole this morning – and caused outages at Cloudflare, Facebook, Amazon, and others – after it wrongly accepted a network misconfiguration from a small ISP in Pennsylvania, USA.

THANKS, BGP. —

## BGP event sends European mobile traffic through China Telecom for 2 hours

Improper leak to Chinese-government-owned telecom lasts up to two hours.

## BGP super-blunder: How Verizon

“It all started when new internet routes for more than **20,000 IP address prefixes** – roughly two per cent of the internet – were wrongly announced...”

'Normally you'd filter it out if some small provider said they own the internet'

## BGP event sends European mobile traffic through China Telecom for 2 hours

“...Safe Host improperly updated its routers to advertise it was the proper path to reach what eventually would become more than **70,000 Internet routes**...”

## Prefix count is one-dimensional and lacks nuance

*“more than 20,000 IP address prefixes”*

*“more than 70,000 Internet routes”*

Weaknesses of a one-dimensional measure of a leak

- Not every leaked route is accepted by the same number of ASes
- Not every leaked route is in circulation for the same amount of time
- There is often a long tail of prefixes that didn't propagate far or for very long, but are included in the “prefix count” metric.

# “There has to be a better way!”

*“more than 20,000 IP address prefixes”*

*“more than 70,000 Internet routes”*

- Need to include propagation and duration to improve our understanding
- Resulting in a 3-dimensional view of an incident:
  - prefixes (x-axis), duration (y-axis), propagation (z-axis)

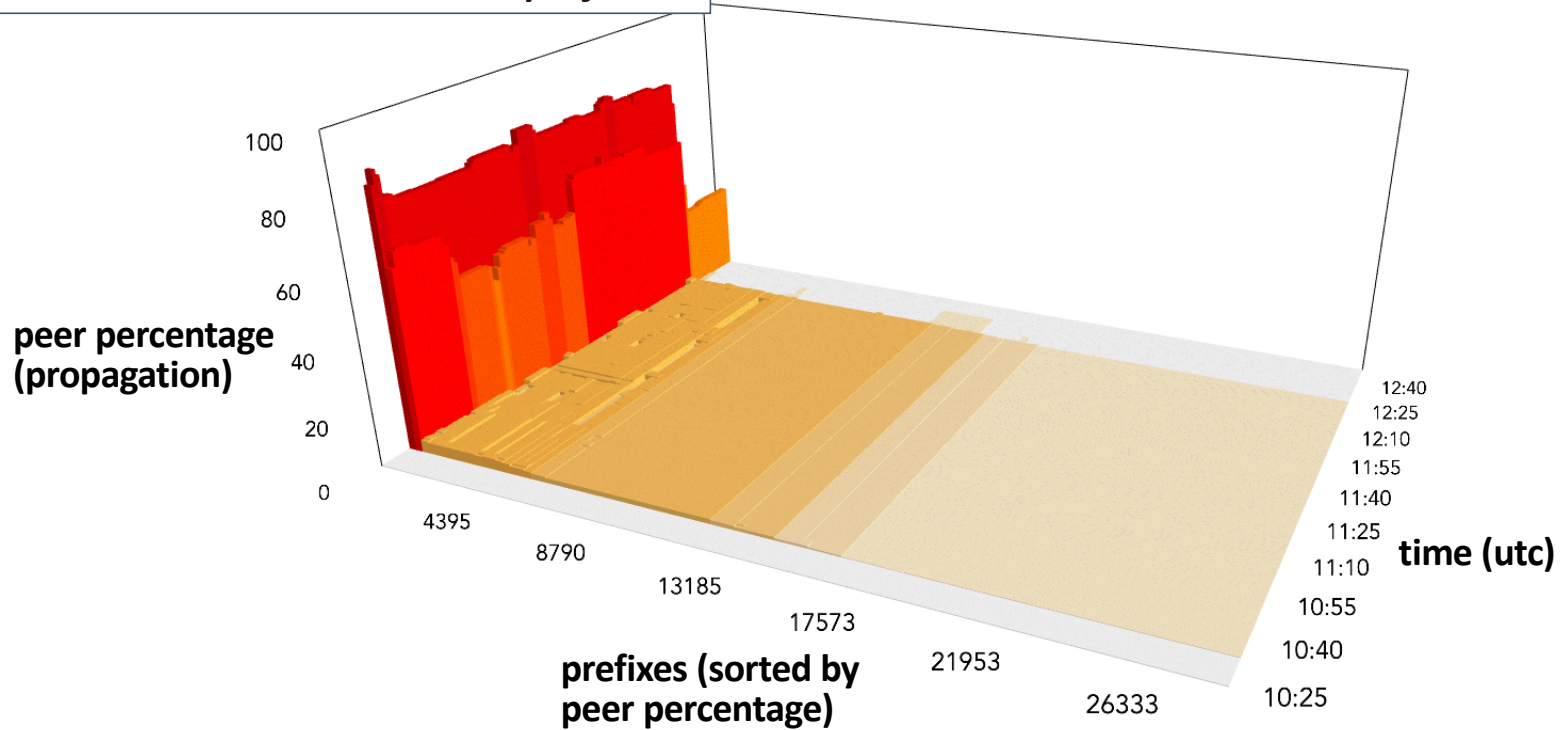

*Global propagation of all routes for duration of leak would be a solid box:*

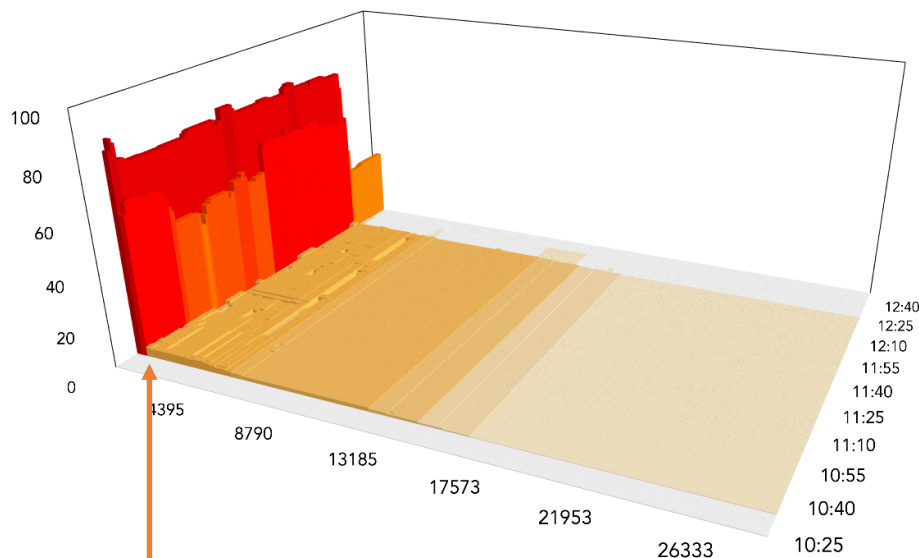

# 3-dimensional view of routing leak

*“more than 20,000 IP address prefixes”*

# Analysis of potential RPKI filtering

*“more than 20,000 IP address prefixes”*

Optimizer generated ~263 more-specifics that were widely circulated.

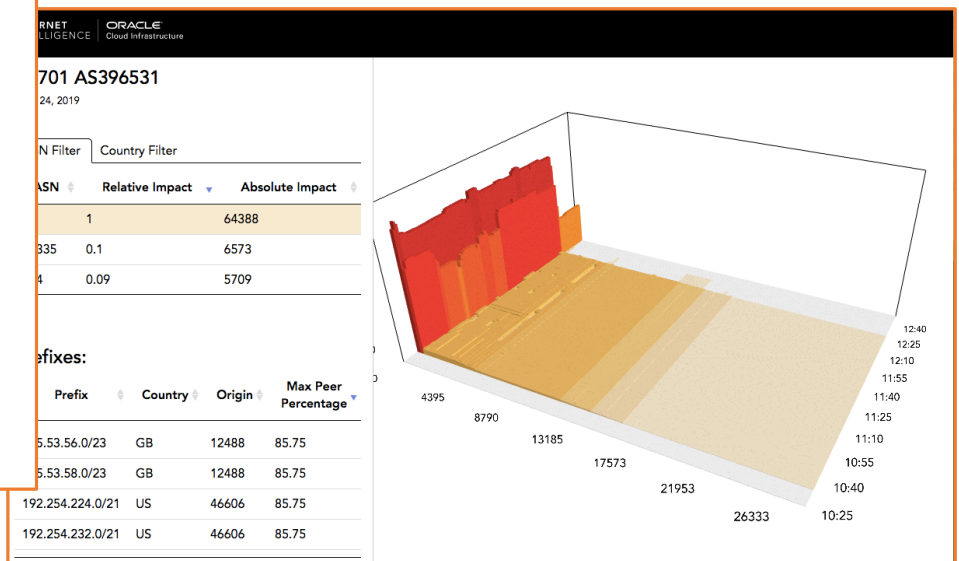

- Had RPKI invalids been dropped during the leak, here's how the 29k leaked routes would have fared:
  - 26873 RPKI:UNKNOWN
  - 2145 RPKI:VALID
  - 130 RPKI:INVALID\_LENGTH**
  - 28 RPKI:INVALID\_ASN**
- RPKI would have only filtered 158 leaked routes (0.5%)
  - 66 of 80 Cloudflare prefixes
- A lot of work remains to be done to reduce the incidences of RPKI:UNKNOWN, but there were 13x more RPKI:VALID than RPKI:INVALID

# This analysis can be automated!!

- New website will be available at: <https://map.internetintel.oracle.com/leaks#/>
- Will publish interactive autopsies of significant routing leaks soon after they occur.\*
- In addition, a history of previous incidents will be available for comparison and research.

\*Significant = More than 100 prefixes and seen by at least 10% of our peer set  
 \*Soon = As soon as we can verify the analysis.

# Explore a routing incident using filters

- Interface includes filters by origin & country-level geo.
- Lists most affected prefixes by max peer percentage for any selected origin or country.
- List of most impacted origins and countries by impact:
  - Impact = sum(area under curve for selected filter)
- Absolute impacts from different incidents can be directly compared.

# The Ultimate Routing Leak Myth: China Telecom (April 2010)

[BIZ & IT](#) [TECH](#) [SCIENCE](#) [POLICY](#) [CARS](#) [GAMING & CULTURE](#) [STORE](#)

*BIZ & IT* —

## How China swallowed 15% of 'Net traffic for 18 minutes

In April 2010, 15 percent of all Internet traffic was suddenly diverted ...

**NATE ANDERSON** - 11/17/2010, 2:45 PM

 In a [300+ page report](#) (PDF) today, the US-China Economic and Security Review Commission provided the US Congress with a detailed overview of what's been happening in China—including a curious incident in which 15 percent of the world's Internet traffic suddenly passed through Chinese servers on the way to its destination.

Here's how the Commission describes the incident, which took place earlier this year:

“

For about 18 minutes on April 8, 2010, China Telecom advertised erroneous network traffic routes that instructed US and other foreign Internet traffic to travel through Chinese servers. Other servers around the world quickly adopted these paths, routing all

# The Ultimate Routing Leak Myth: China Telecom (April 2010)

“15% of internet traffic for 18 minutes”

- Obviously, biggest problem: **routes != traffic**
- But also, not all of the routes were widely circulated
- For argument’s sake, let’s we assume routes = traffic
  - If 15% of all traffic was redirected, each route would need to be propagated to 100% of the internet. Like this →
- It was isn’t even close.

# The Ultimate Routing Leak Myth: China Telecom (April 2010)

## AS4134 AS23724

April 8, 2010

ASN Filter Country Filter

ASN	Prefixes	Relative Impact	Absolute Impact
All	54165	1	3742097
4134	10384	0.7	2619090
4538	562	0.03	114953

### Prefixes:

Prefix	Country	Origin	Max Peer Percentage
202.100.192.0/19	CN	4134	97.05
202.100.224.0/19	CN	4134	

# The Ultimate Routing Leak Myth: China Telecom (April 2010)

- Better than simply counting prefixes, we can measure “impact” by aggregate propagation:

$$\text{pfx\_count} * \text{duration} * \text{peer\_percentage}$$

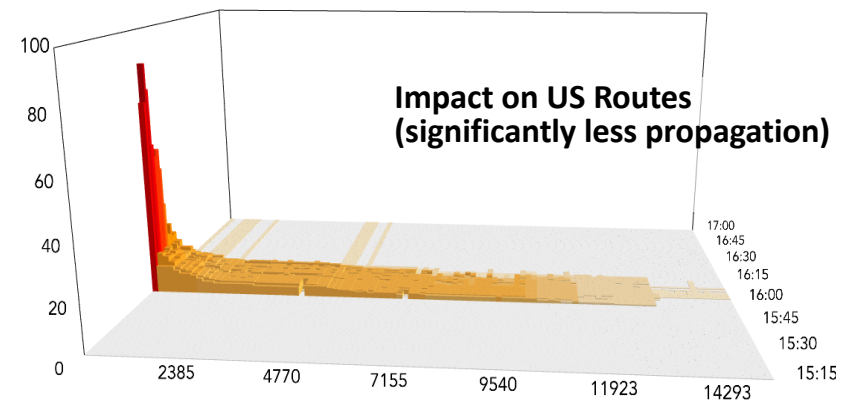

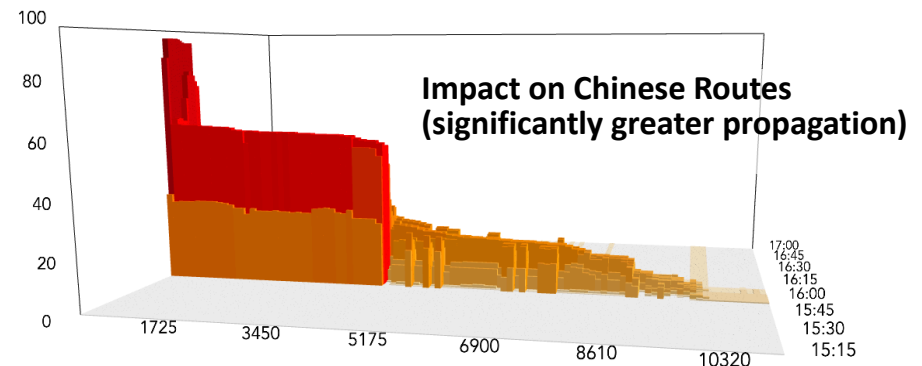

April 8, 2010

ASN Filter Country Filter

ASN	Prefixes	Relative Impact	Absolute Impact
All	54165	1	3742097
CN	11460	0.74	2756164
US	15873	0.08	290987

- 74% (CN) vs 8% (US)
- Impact was only 4.6% of theoretical max

“15% **0.07%** of internet traffic **route propagation** for 18 minutes”

\* Widely propagated US prefixes due to prepending

# Revisiting big leaks from the past: Indosat, April 2014

CN	13808	0.21	28454289
AU	11494	0.15	20520048

### Prefixes:

Prefix	Country	Origin	Max Peer Percentage
58.26.216.0/22	MY	4788	98.17
1.32.104.0/22	MY	4788	97.65

## Observations from 3D analysis

- “Widely propagated” part of the leak is generally the most damaging.
- Leaks routes get widely propagated because:
  1. Is a more-specific of existing route (generated by route optimizer or traffic eng)
  2. Existing route has limited propagation (regional route)
  3. Existing route is excessively prepended (see *Excessive Prepending*)

## Conclusion

- We need to include the dimensions of propagation and duration.
- It's time we had a better metric than simply prefix count.
  - Suggestion: Count of leaked prefixes seen by >1% of peers.
  - More esoteric suggestion: Impact as measured by aggregate propagation
- RPKI can help contain leaks but needs greater participation
  - More signed routes & more dropping of invalids
- We hope that these interactive routing leak autopsies will help inform discussion around routing leaks.

*Stop saying China Telecom hijacked 15% of internet! 😊*
