

Reporting under the Habitat Regulations (as amended)¹

2019-2024

Draft conclusions for the species:

S1349 - Bottlenose dolphin

(Tursiops truncatus)

**Offshore Channel and South West England
Management Unit**

NOT WHOLE UK ASSESSMENT

¹ Habitat Regulations (as amended):

- The Conservation of Habitats and Species Regulations 2017 (as amended), Regulation 9A
- The Conservation of Offshore Marine Habitats and Species Regulations 2017 (as amended), Regulation 6A
- Report under The Conservation (Natural Habitats, &c.) Regulations 1994 (as amended), regulation 3ZA
- The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended), regulation 3ZA

For further information please contact:

Joint Nature Conservation Committee. Quay House, 2 East Station Road, Fletton Quays, Peterborough, PE2 8YY. <https://jncc.gov.uk>

This report was produced by JNCC in collaboration with the UK Country Nature Conservation Bodies (CNCBs) and country governments.

This document should be cited as:

JNCC, Department of Agriculture, Environment and Rural Affairs, Natural England, Natural Resources Wales & NatureScot. (2026). Conservation status assessment for the species: S1349 Bottlenose dolphin (*Tursiops truncatus*). MU Offshore Channel and South West England.

This resource is published by Natural England under the [Open Government Licence v3.0](#) for public sector information. You are encouraged to use and reuse information subject to certain conditions. Note that some images, maps or tables may not be copyright Natural England; please check sources for conditions of re-use. © Natural England 2026.

The views and recommendations presented in this resource do not necessarily reflect the views and policies of JNCC.

Important note - Please read

- The information in this document represents the draft conclusions for the MU Offshore Channel and South West England Reporting under the Habitat Regulations (as amended)¹, for the period 2019-2024. These conclusions are indicative only, and intended to help agencies add any nuance they feel is appropriate for country-level reporting. These assessments will not be published alongside official UK reporting. The guidance has been applied in the same way as for UK-level assessments.
- It is based on supporting information provided by Joint Nature Conservation Committee and UK Country Nature Conservation Bodies (CNCBs), which is documented separately.
- The Habitats Regulations reporting 2019-2024 Approach Document provides details on how this supporting information contributed to the UK Report and the fields that were completed for each parameter.
- Explanatory notes (where provided) are included at the end. These provide additional audit trail information to that included within the assessments. Further underpinning explanatory notes are available in the related country reports.
- Some of the reporting fields have been left blank because either: (i) there was insufficient information to complete the field; (ii) completion of the field was not obligatory; and/or (iii) the field was not relevant to this species (section 12 National Site Network coverage for Annex II species).

Further details on the approach to the Habitats Regulations Reporting 2019-2024 are available on the [JNCC website](#).

Assessment Summary: Bottlenose dolphin

Table 1: Table summarising the conservation status for S1349 - Bottlenose dolphin (*Tursiops truncatus*). Overall conservation status for species is based on assessments of range, population, habitat for the species, and future prospects.

Overall Conservation Status (see section 11)

Unknown (XX)

Breakdown of Overall Conservation Status

Range (see section 5)	Unknown (XX)
Population (see section 6)	Favourable (FV)
Habitat for the species (see section 7)	Unknown (XX)
Future prospects (see section 10)	Unknown (XX)

3. Information related to Annex V Species

3.1 Is the species taken in the wild / exploited?

3.2 What measures have been taken?

a) Regulations regarding access to property

b) Temporary or local prohibition on the taking of specimens in the wild and exploitation

c) Regulation of the periods and/or methods of taking specimens

d) Application of hunting and fishing rules which take account of the conservation of such populations

e) Establishment of a system of licences for taking specimens or of quotas

f) Regulation of the purchase, sale, offering for sale, keeping for sale, or transport for sale of specimens

g) Breeding in captivity of animal species as well as artificial propagation of plant species

Other measures

Other measures description

3.3: Hunting bag or quantity taken in the wild for Mammals and Acipenseridae (Fish)

a) Unit

Table 2: Quantity taken from the wild during the reporting period (see 3.3a for units). For species with defined hunting seasons, Season 1 refers to 2018/2019 (autumn 2018 to spring 2019), and Season 6 to 2023/2024. For species without hunting seasons, data are reported by calendar year: Year 1 is 2019, and Year 6 is 2024.

5.9 Long-term trend; Method used

5.10 Favourable Reference Range (FRR)

a) Area (km²)	214,549
b) Pre-defined increment	
c) Unknown	No
d) Method used	Reference-based approach
e) Quality of information	high

5.11 Change and reason for change in surface area of range

a) Change	Yes
b) Genuine change	No
c) Improved knowledge or more accurate data	Yes
d) Different method	No
e) No information	No
f) Other reason	No
g) Main reason	Improved knowledge/more accurate data

5.12 Additional information

The FRR and present range is based on the Management Units published by the UK Interagency Marine Mammal Working Group first defined in 2015, and reviewed in 2019 and 2023. These Management Units are biologically relevant geographical areas based on best understanding of the population structure of species, considering jurisdictional boundaries and divisions already used for the management of human activities (IAMMWG, 2023).

The inshore waters have been identified as the home range for a coastal bottlenose dolphin population. Through photo identification research offshore bottlenose dolphin ecotypes are considered rare visitors to these inshore waters (Corr, et al. 2024). This has led to a decrease in the offshore Management Unit size proportionate to the creation of the inshore Coastal West Channel Management Unit.

6. Population

6.1 Year or period 2022

6.2 Population size (in reporting unit)

a) Unit number of individuals

b) Minimum 7,861

c) Maximum 29,433

d) Best single value 15,210

6.3 Type of estimate 95% confidence interval

6.4 Quality of extrapolation to reporting unit high

6.5 Additional population size (using population unit other than reporting unit)

a) Unit

b) Minimum

c) Maximum

d) Best single value

e) Type of estimate

6.6 Population size; Method used Complete survey or a statistically robust estimate used

6.7 Short-term trend; Period 2016-2022

6.8 Short-term trend; Direction Increasing

6.9 Short-term trend; Magnitude

a) Estimated minimum

b) Estimated maximum

c) Pre-defined range Increasing > 100%

d) Unknown No

e) Type of estimate 95% confidence interval

f) Rate of decrease	
6.10 Short-term trend; Method used	Complete survey or a statistically robust estimate used
6.11 Long-term trend; Period	2005-2022
6.12 Long-term trend; Direction	Increasing
6.13 Long-term trend; Magnitude	
a) Minimum	
b) Maximum	
c) Confidence interval	
d) Rate of decrease	
6.14 Long-term trend; Method used	Complete survey or a statistically robust estimate used
6.15 Favourable Reference Population (FRP)	
ai) Population size	2,560
aii) Unit	number of individuals
b) Pre-defined increment	
c) Unknown	No
d) Method used	Model-based approach
e) Quality of information	moderate
6.16 Change and reason for change in population size	
a) Change	Yes
b) Genuine change	Yes
c) Improved knowledge or more accurate data	No
d) Different method	No
e) No information	No

f) Other reason	No
g) Main reason	Genuine change

6.17 Additional information

The change in the proportion of population within Offshore Channel and Southwest England is likely to represent a shift in the interannual distribution of the offshore ecotype (Gilles et al., 2023; Giralt Paradell et al. 2024) with immigration of animals into the region, rather than an increase in the overall population as the rate in growth is greater than natural growth rates for a closed population (Geelhoed et al., 2022). Wider context on recent population distribution and abundance will be provided from recent surveys by NAMMCO and ObSERVE which are yet to be published.

The FRV (2560; CV: 3.05; CI: 839-7813) for population was calculated based on estimates from SCANS II in 2005 (Hammond, et al., 2021) and CODA in 2007 (Hammond, et al., 2009), supplemented with density estimates from neighbouring regions to fill data gaps within the UK EEZ and limit extrapolation where possible; ObSERVE in Irish waters (Rogan, et al., 2018), NASS (Pike, et al., 2019a; Pike, et al., 2019b) and NILS (Leonard and Øien, 2020a; Leonard and Øien, 2020b) surveys in the NAMMCO region.

As short-term trend in population has been determined as increasing, the pre-defined range field has been used to indicate a magnitude. However, population estimates have been calculated from large-scale surveys at approximately decadal intervals, and the confidence intervals associated with population estimates are wide. Thus, confidence in the magnitude is low.

6.18 Age structure, mortality and reproduction deviation	Unknown
---	---------

7. Habitat for the species

7.1 Sufficiency of area and quality of occupied habitat (for long-term survival)

a) Is area of occupied habitat sufficient?	Unknown
b) Is quality of occupied habitat sufficient?	Unknown

c) If No or Unknown, is there a sufficiently large area of unoccupied habitat of suitable quality?	Unknown
---	---------

7.2 Sufficiency of area and quality of occupied habitat; Method used

a) Sufficiency of area of occupied habitat; Method used	Based mainly on expert opinion with very limited data
--	---

b) Sufficiency of quality of occupied habitat; Method used	Based mainly on expert opinion with very limited data
---	---

7.3 Short-term trend; Period

7.4 Short-term trend; Direction	Unknown
--	---------

7.5 Short-term trend; Method used	Based mainly on expert opinion with very limited data
--	---

7.6 Long-term trend; Period

7.7 Long-term trend; Direction	Unknown
---------------------------------------	---------

7.8 Long-term trend; Method used	Based mainly on expert opinion with very limited data
---	---

7.9 Additional information

Direct evidence of cetacean habitat quality is limited as presently, a comprehensive understanding of the key elements important to the species is undetermined. In some cases, conclusions for species range and population could be indicative of habitat quality by proxy, however confidence in assessment outputs would be low.

The population of bottlenose dolphin using the Offshore Channel and South West England Management Unit has continued to increase since 2005 and the range has remained stable beyond reallocation of the coastal area for a coastal bottlenose dolphin population (see assessment for *Tursiops truncatus* (MU Coastal West Channel)).

8. Main pressures

8.1 Characterisation of pressures

Table 3: Pressures affecting the species, including timing and importance/impact ranking. Pressures are defined as factors acting currently and/or during the reporting period (2019–2024). Rankings are: High

(direct/immediate influence and/or large spatial extent) and Medium (moderate direct/immediate influence, mainly indirect and/or regional extent).

Pressure	Timing	Ranking
PF12: Residential, commercial and industrial activities and structures generating noise, light, heat or other forms of pollution	Ongoing and likely to be in the future	Medium (M)
PE02: Shipping lanes and ferry lanes transport operations	Ongoing and likely to be in the future	Medium (M)
PH02: Military, paramilitary or police exercises and operations in the marine environment	Ongoing and likely to be in the future	Medium (M)
PK02: Mixed source marine water pollution (marine and coastal)	Ongoing and likely to be in the future	Medium (M)
PJ12: Decline or extinction of related species (e.g. food source / prey, predator / parasite, symbiote, etc.) due to climate change	Ongoing and likely to be in the future	Medium (M)
PG01: Marine fish and shellfish harvesting causing reduction of species/prey populations and disturbance of species (professional)	Ongoing and likely to be in the future	Medium (M)
PG13: Bycatch and incidental killing (due to fishing and hunting activities)	Ongoing and likely to be in the future	Medium (M)
PD01: Wind, wave and tidal power (including infrastructure)	Ongoing and likely to be in the future	Medium (M)
PC07: Geotechnical surveying	Ongoing and likely to be in the future	Medium (M)
PI04: Plant and animal diseases, pathogens and pests	Ongoing and likely to be in the future	Medium (M)

8.2 Sources of information

See section 14 References

8.3 Additional information

No additional information

9. Conservation measures

9.1: Status of measures

a) Are measures needed?	Yes
b) Indicate the status of measures	Measures identified and taken
9.2 Main purpose of the measures taken	Maintain the current range, population and/or habitat for the species
9.3 Location of the measures taken	Both inside and outside National Site Network
9.4 Response to measures	Medium-term results (within the next two reporting periods, 2025–2036)

9.5 List of main conservation measures

Table 4: Key conservation measures addressing current pressures and/or anticipated threats during the next two reporting periods (2025–2036). Measures are ranked by importance/impact: High (direct/immediate influence and/or large spatial extent) and Medium (moderate direct/immediate influence, mainly indirect and/or regional extent).

Conservation measure	Ranking
MC02: Adapt/manage exploitation of energy resources	High (H)
MG04: Control/eradication of illegal killing, fishing and harvesting of wild plants, fungi and animals	High (H)
MG05: Reduce bycatch and incidental killing of non-target species	High (H)
MH01: Reduce impact of military installations and activities	High (H)
MK01: Reduce impact of mixed source pollution	High (H)
MC03: Adapt/manage renewable energy installation, facilities and operation (excl. hydropower and abstraction activities)	High (H)
MG01: Management of professional/commercial fishing, shellfish and seaweed harvesting (incl. restoration of habitats)	High (H)

9.6 Additional information

As a European Protected Species, protection is provided throughout UK waters and it is an offence to kill, injure or disturb. The UK remains committed to the conservation of marine mammals in UK waters and the implementation of measures to mitigate the impact of pressures and conservation measures have been undertaken in the UK and adjacent waters as part of the requirements of the Habitats Regulations. Such measures include monitoring bycatch, monitoring strandings data to monitor current and identify emerging pressures, application of appropriate management measures, and noise

monitoring and mitigation with regards to offshore industry. This is reflected in the list of conservation measures under field 9.5. The UK also supports a range of international agreements and conventions on the conservation of marine mammals and the marine environment in general. For example: The Convention on Migratory Species and its Agreement on the Conservation of Small Cetaceans of the Baltic, North East Atlantic, Irish and North Seas (ASCOBANS); the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR). The UK has several voluntary wildlife watching guidelines/codes of conduct which are publicly available however, while these are endorsed by the UK government and devolved administrations, there is no mandate for operators or individuals to adopt them. A UK Cetacean Conservation Strategy is currently in development, due for publication shortly. The strategy is intended to support decision making and identify actions necessary to maintain or improve the conservation status of cetaceans in UK waters. Defra and devolved administrations fund national strandings schemes for cetaceans which aim to: collate, analyse and report data for all cetacean strandings around the coast of the UK; determine the causes of death (both natural and anthropogenic) in stranded cetaceans, including bycatch and physical trauma and; undertake surveillance on the incidence of disease in stranded cetaceans in order to identify any substantial new threats to their conservation status.

10. Future prospects

10.1a Future trends of parameters

ai) Range	Unknown
bi) Population	Overall stable
ci) Habitat for the species	Unknown

10.1b Future prospects of parameters

aii) Range	Unknown
bii) Population	Good
cii) Habitat for the species	Unknown

10.2 Additional information

No additional information

11. Conclusions

11.1 Range	Unknown (XX)
11.2 Population	Favourable (FV)
11.3 Habitat for the species	Unknown (XX)
11.4 Future prospects	Unknown (XX)
11.5 Overall assessment of Conservation Status	Unknown (XX)
11.6 Overall trend in Conservation Status	Unknown

11.7 Change and reason for change in conservation status

This field is not reported as the period 2019-2024 marks the first instance in which conservation status has been assessed at the national level, meaning no comparisons to previous reports can be drawn.

11.7 Change and reason for change in conservation status trend

This field is not reported as the period 2019-2024 marks the first instance in which conservation status has been assessed at the national level, meaning no comparisons to previous reports can be drawn.

11.8 Additional information

Summarising bottlenose dolphin at Management Unit (MU) scale is a new inclusion for reporting under the Habitats Regulations.

Conclusion on Range reached because: (i) the short-term trend direction in Range surface area is decreasing and (ii) while the current Range surface area is less than the Favourable Reference Range, this is due to changing of the MU CWC boundaries rather than a known decline in the offshore ecotype in this region

Conclusion on Population reached because: (i) the short-term trend direction in Population size is increasing; and (ii) the best estimate for population size is greater than the Favourable Reference Population.

Conclusion on Habitat for the species reached because: (i) it is unknown whether the area of habitat is sufficiently large; (ii) it is unknown if habitat quality is sufficient for the

long-term survival of the species; and (iii) the short-term trend in area and quality of habitat is unknown.

Conclusion on Future prospects reached because: (i) the Future prospects for Range are Unknown; (ii) the Future prospects for Population are good; and (iii) the Future prospects for Habitat for the species are Unknown.

Overall assessment of Conservation Status is Unknown because two or more conclusions are Unknown with no Unfavourable conclusions.

Overall trend in Conservation Status is based on the combination of the short-term trends for Range - stable, Population - unknown, and Habitat for the species - unknown.

12. UK National Site Network (pSCIs, SCIs, SACs) coverage for Annex II species

12.1 Population size inside the pSCIs, SCIs and SACs network

a) Unit number of individuals

b) Minimum

c) Maximum

d) Best single value

12.2 Type of estimate

12.3 Population size inside the network; Method used Insufficient or no data available

12.4 Short-term trend of population size within the network; Direction

12.5 Short-term trend of population size within the network; Method used Insufficient or no data available

12.6 Short-term trend of habitat for the species inside the pSCIs, SCIs and SACs network; Direction

12.7 Short-term trend of habitat for the species inside the pSCIs, SCIs and SACs network; Method used

Insufficient or no data available

12.8 Additional information

There is no SAC designated for bottlenose dolphin in this management unit

Main pressures

8.2 Sources of information

No sources of information

15. Explanatory Notes

Field label	Note
8.1: Characterisation of pressures	<p>PK02 Mixed source marine water pollution (marine and coastal). The general impact of contaminants on cetaceans is well documented, including impacts on the immune system and reproduction (Jepson et al., 2016). The concentration is highly dependent on the age, sex, reproductive state and nutritional condition of the animals in addition to the intake via the food web. Coastal populations of bottlenose dolphin have much more higher levels of exposure than animals offshore and evidence exists for several coastal populations of bottlenose dolphin (Stylos et al., 2022; Corr et al., 2023; Zanuttini et al., 2019). Bottlenose dolphin was one of four species found to have PCB levels significantly higher than other species, which is linked with possible low reproductive capacity consistent with PCB-induced toxicity (Jepson et al., 2016; Williams et al., 2023).</p>
8.1: Characterisation of pressures	<p>PJ12 Decline or extinction of related species (e.g. food source / prey, predator / parasite, symbiot, etc.) due to climate change. There is no current evidence for the effects of climate change on bottlenose dolphins. The effect is likely to be mediated through variation in prey resource initially. Lassalle et al (2012) noted that bottlenose dolphin may be more susceptible to a decline in food source due to the required prey biomass for their survival in comparison to other species. However, their varied diet will likely reduce impact of changing availability of species through diversification. There are a few reports of starvation in bottlenose dolphin in annual reports from the UK Cetacean Strandings Investigation Programme but it is not possible to determine whether this is a representative sample of the population and if this is due to climate change of fishing pressures (Deaville, 2018:2024).</p>
8.1: Characterisation of pressures	<p>PH02 Military, paramilitary or police exercises and operations in the marine environment. The general risk of military activities (e.g., sonar exercises) to the bottlenose</p>

dolphin population(s) around the UK is low. However, consensus among marine mammal advisers, highlight potential regional risks during military exercises. These more commonly occur off the northwest of Scotland and in the southwest approaches (from UK Porpoise, Dolphin and Whale, in prep).

8.1: Characterisation of pressures

PF12 Industrial or commercial activities and structures generating noise, light, heat or other forms of pollution. Cetaceans rely on echolocation for navigation, foraging and communication, making them sensitive to noise in the marine environment. Although different sources of disturbance have been identified as potential pressures in the pre-defined EU list, these pressures independently have not been identified as Medium or High risk to bottlenose dolphins in UK waters. However, the cumulative impact of activities can affect distribution and communication of animals (Heiler et al., 2016). Commercial activities such as a dredging have the potential to cause displacement of coastal bottlenose dolphin populations (Pirodda et al., 2013; Todd et al., 2015; Tillin et al., 2011). An acoustic disturbance was unable to be ruled out as a potential contributor to a mass stranding event involving bottlenose dolphin in the Cromarty Firth in 2021 (Scottish Marine Animal Stranding Scheme, 2022). Impacts are likely greater for the coastal bottlenose dolphin compared to its offshore counterpart . This pressure expected to continue in the longer term.

8.1: Characterisation of pressures

PG01 Marine fish and shellfish harvesting (professional, recreational) causing reduction of species/prey populations and disturbance of species. A lack of food has a direct and immediate influence on the individual. Starvation is identified as an important cause of death for bottlenose dolphins in UK waters through post mortem investigations (Deaville 2011:2024). There is evidence to suggest that bottlenose dolphin may be the species of toothed cetacean most sensitive to resource depletion with a food-energy requirement three times that of the species with next highest requirement, the common dolphin (Lassalle et al.,

2012). There is also a direct overlap identified between bottlenose dolphin diet preferences and commercially targeted species (Lassalle et al., 2012). However, no link has been identified between commercial fishing practices and the cases of cetacean starvation in UK waters. Studies have also highlighted the potential for acoustic deterrent devices on fishing equipment/aquaculture to impact on cetacean movement patterns, and in some cases result in habitat exclusion (ICES, 2015; Deng et al., 2014; Leeney et al., 2008).

8.1: Characterisation of pressures

PG13 Bycatch and incidental killing (due to fishing and hunting activities). Bottlenose dolphin bycatch is been reoprt in set net fisheries (Northridge et al., 2016; Deaville, 2018) and studies on the prevalence of epidermal conditions, deformities and injurries in bottlenose dolphins have noted that the most notable lesions were all linked to bycatch/entanglement in fishing gear (Stylos et al., 2022). Current evidence suggest that the consequence of bycatch may be higher in small coastal populations and less for larger offshore populations but for offshore populations the chance of this issue being observed is small given limited bycatch observer effort and the reduced chance of dead animals stranding.

8.1: Characterisation of pressures

PE02 Shipping lanes and ferry lanes transport operations. Recent modelling of the relative collision risk by species and sea region found moderate collision risk in the English Channel, Bay of Biscay, Celtic Sea, Irish Sea, Bristol Channel and the Wider North Atlantic (Robbins, 2022). The risk of collision risk was also highlighted by Corr et al. (2023), particular for coastal populations with high volumes of recreational activities and/or fishing vessels. However, to date only one animal necropsied through the UK Cetacean Strandings Investigation Programme (CSIP) has a recorded cause of death has ship/boat strike. Shipping lanes and ferry lanes transport operations may also cause changes in moverment patterns, acoustic behaviours and habitat use (Mills et al., 2023; Luis et al., 2014; Bas et al., 2014), although evidence of this is currently limited in UK waters.

	The risk would be higher in coastal regions and busy shipping lanes.
8.1: Characterisation of pressures	PI04 Plant and animal diseases, pathogens and pests. Necropsies of stranded animals highlights consistent evidence of parasitic infestation and infection from pathogens (Deaville 2011:2024).
9.5: List of main conservation measures	MJ01 Reduce impact of mixed source pollution: The impact of chemical pollution on bottlenose dolphins remains an issue (Jepson et al, 2016), however, establishing measures beyond the historic ban on PCB use, has not been achieved to date. Further information is required to understand where exposure is occurring to be able to identify appropriate measures.
9.5: List of main conservation measures	MH01 Reduce impact of military installations and activities: To reduce the risk of noise impact on marine mammals, the UK Ministry of Defence (MOD) has a Statement of Intent with UK Statutory Nature Conservation Bodies concerning conduct in relation to marine disturbance. The MOD has developed a real-time alert procedure for naval training operations. This enables localised information on cetacean sightings to be incorporated into the training schedule and for operations to be relocated if necessary.
9.5: List of main conservation measures	MG04 Control/eradication of illegal killing, fishing and harvesting: The Habitats Directive is transposed into UK law under the Habitat Regulations (HR) for England and Wales (as amended) and the Offshore Marine Conservation (Natural Habitats, &c.) Regulations 2007 (as amended), which make it an offence to kill, injure, capture or disturb European marine protected species. Similar legislation exists for Scottish and Northern Irish inshore waters.
9.5: List of main conservation measures	MG05 Reduce bycatch and incidental killing of non-target species: The UK is implementing the EU Technical Conservation Measures Regulation transposed into UK regulations which lays down measures concerning incidental catches of vulnerable species in fisheries, and more generally the bycatch obligations within the Habitats Regulations. Since 2004, a dedicated bycatch monitoring programme has been in place, with both dedicated and

non-dedicated onboard observers collecting data on bycatch numbers. These data inform implementation and potential effectiveness of measures such as pingers. There is a requirement for all fishing vessels over 12m using gill nets or entanglement nets to use pingers under the criteria laid out in the regulation. Inshore Vessel Monitoring System (iVMS) devices are being implemented for under-12 metre fishing vessels, allowing data on latitude, longitude, course and speed to be recorded and help improve the management and sustainability of the marine environment. Legislation to make iVMS mandatory on under-12 metre vessels is expected to come into effect in 2024 in England. In Scotland, consultation on the introduction mandatory electronic tracking for under-12 metre vessels was carried out in late 2023. Legislation requiring iVMS for under-12 metre vessels operating in Welsh waters has been in place since 2022. Since February 2022 it has been mandatory for under-10 metre fishing vessels in English and Welsh waters to create and submit a catch record for every fishing trip through the Catch Recording Application (Catch App or Record your Catch). Data is collected on vessel, trip, gear, area fished and catch and can be used to inform on fishing activity by gear type and species. Furthermore, the UK Marine Wildlife Bycatch Mitigation Initiative (published August 2022) aims to improve our understanding of bycatch and entanglement of sensitive marine species through monitoring and scientific research, identify 'hotspot' or high-risk areas/gear types/fisheries in which to focus monitoring and mitigation, and develop and implement effective measures to minimise bycatch/entanglement. Currently work is progressing towards development of a bycatch risk framework across all PET species to apply all available evidence and support targeted monitoring.

9.5: List of main conservation measures

MC02 Adapt/manage exploitation of energy resources: Guidance for the protection of marine European Protected Species from deliberate injury, killing and disturbance has been drafted (JNCC 2010a; Marine Scotland, 2014). Marine Industries generate a variety of noise through activities such as geophysical surveys (e.g. seismic

surveys), construction (e.g. pile driving) and decommissioning (e.g. use of explosives). As part of the licencing procedures, developers and operators are required to utilise JNCC guidelines to minimise the risk of injury to cetaceans when undertaking such activities (JNCC 2010b, 2010c; 2017; 2023; 2025; JNCC, Natural England & Cefas, 2025). The guidelines advise on conducting marine mammal observations prior to and during the activity and, where suitable, utilising procedures such as soft start (gradual introduction of the sound) to reduce and avoid direct harm to animals. A review of the marine mammal observer data (e.g Stone, 2015) demonstrated the effectiveness of soft start approach (Stone et al. 2017). Habitats Regulations Assessments (HRA) and Environmental Impact Assessments (EIA) processes are also applied where plans/projects present the risk of injury, mortality or disturbance within SACs or wider seas as part of the UK's consenting process.

9.5: List of main conservation measures

MC03 Adapt/manage renewable energy installation, facilities and operation (excl. hydropower and abstraction activities): Guidance for the protection of marine European Protected Species from deliberate injury, killing and disturbance has been drafted (JNCC 2010a; Marine Scotland, 2014). Marine Industries generate a variety of noise through activities such as geophysical surveys (e.g. seismic surveys (JNCC 2017)), construction (e.g. pile driving (JNCC 2010b)) and decommissioning (e.g. use of explosives (2010c)). As part of the licencing procedures, developers and operators are required to utilise JNCC guidelines to minimise the risk of injury to cetaceans when undertaking such activities (JNCC, 2010b, 2010c; 2017; 2023; 2025; JNCC, Natural England & Cefas, 2025). The guidelines advise on conducting marine mammal observations prior to and during the activity and, where suitable, utilising procedures such as soft start (gradual introduction of the sound) to reduce and avoid direct harm to animals. A review of the marine mammal observer data demonstrated the effectiveness of soft start approach (Stone et al., 2017).

9.5: List of main conservation measures	<p>MG01 Management of professional/commercial fishing, shellfish and seaweed harvesting (incl. restoration of habitats). Fisheries Management Plans (FMPs) are currently being developed across all administrations for fisheries with perceived threats or pressures to the marine environment. FMPs are required under the Fisheries Act 2020 which provides the framework for management fisheries outside the EU Common Fisheries Policy. The Joint Fisheries Statement (agreeing the delivery of the 8 objectives of the Fisheries Act 2020) sets out plans for 43 FMPs. Publication of FMPs started last year and is expected to continue for 2-3 years. Some are being jointly developed, others by a single authority for its own waters. 6 FMPs have now been published.</p>
8.1: Characterisation of pressures	<p>PD01 Wind, wave and tidal power, including infrastructure. Pile driving during the construction phase for renewable infrastructure is a known cause of disturbance/displacement of bottlenose dolphins (David, 2006; Graham et al., 2017; Fernandez-Betelu et al., 2021). The influence of this pressure is indirect with evidence of recovery/return once the pressure is removed. Bottlenose dolphins are also at risk from collision with sub-surface marine renewable devices such as tidal turbines (Malinka et al., 2018). Exposure to these pressures is likely to be of higher risk to coastal populations than offshore populations due to higher site fidelity and more frequent exposure to infrastructure developments. There are considerable legal and societal obligations to meet clean energy requirements which will result in the increased development of the renewable energy industry. Novel industries such as tidal and wave power also have the potential to introduce new impacts, such as collision risk (Malinka et al., 2018).</p>
8.1: Characterisation of pressures	<p>PC07 Geotechnical surveying. JNCC advice on geotechnical surveying covers all marine mammals in UK waters (Stone, 2015; JNCC, 2017, 2010b, 2010c) and several studies suggest that loud, impulsive noises are likely to have an immediate influence on this species, with strong avoidance responses noted by studies (Stone, 2015;</p>

Stone et al. 2017, Stone, 2003; Stone & Tasker, 2006; JNCC, 2007; Fernandez-Betelus et al., 2021). Close proximity to noise created by geotechnical activity also has potential to cause injury, although evidence for the impact and level of risk is limited. This is also mitigated through guidance on operations such as soft start and on board marine mammal observers. Pressures are likely to be higher in the North Sea and Celtic and Irish Seas.
