

A Learning Destination for Sustainable Buildings

Central Park Office is committed to sustainability and actively promotes public education on green building practices. The project welcomes professionals, students, and the general public to learn about the design, operation, and management of a high-performance building certified under both LEED and WELL standards.

Visitors can explore how the building integrates energy- and water-efficient design strategies while creating a healthy, people-centered environment. The project demonstrates how high standards of indoor air quality, water quality, thermal and acoustic comfort, lighting, and other occupant-focused features contribute to improved health, well-being, and productivity. It also showcases strategies that encourage movement, support mental well-being, and enhance the overall user experience.

Beyond design, Central Park Office provides insights into building operation and maintenance practices that help optimize building performance, maximize resource efficiency, and ensure that the building continues to deliver long-term environmental and occupant benefits.
