

BUFFALOGRASS

Buchloe dactyloides

DESCRIPTION

Buffalograss is a perennial, low-growing, warm-season grass. Leaf blades are 10 to 12 inches long but they fall over and give the turf a short appearance. This grass occurs naturally and grows best on clay loam to clay soils and is not adapted to shaded sites. It has a low fertility requirement and it often will maintain good density without supplemental fertilization. Buffalograss is a native sod-forming grass found throughout the Midwest.

APPLICATION

- Turf

GEOGRAPHICAL ADAPTATION

Warm-season zone & Midwest region

MATURE HEIGHT

- 10 – 12 in.

SEEDS PER POUND (APPROXIMATE)

~50,000

FEATURES & BENEFITS

- Low fertility requirement
- Maintains good density
- Performs well in Wheatgrass turf blends
- Excellent drought tolerance
- Low water requirements

RATE*

- 2 – 3 lbs./1,000 ft².

*Local conditions vary and dictate rates
