NPCC, Inc.

1040 Avenue of the Americas - 10th Floor
New York, New York 10018-3703

NPCC Regional Standards Committee
Preliminary Agenda--Draft
Meeting # 11-6

December 1, 2011 8:00 a.m. - 5:00 p.m.
December 2, 2011 8:00 a.m. - 3:00 p.m. (joint meeting with the CC 10:00 - noon)

Toronto Marriott Bloor Yorkville
90 Bloor Street East, Toronto, Ontario

Dress Business Casual

RSC@npcc.org

Call in 719-785-1707, Guest Code 8287#

Web Conference

Note: Glossary of Terms Used in NERC Reliability Standards dated October 26, 2011 included in the Meeting Materials.

1. **Introductions-Agenda Review-Roster**
   a. RSC membership changes.

2. **RSC October, 2011 Meeting Minute Approval and Antitrust Guidelines** (in Meeting Materials Package)
   a. Discussion of the October, 2011 RSC Meeting minutes.

3. **Action Item Assignment List and Ongoing Assignments** (in Meeting Materials Package), (Refer to Action Item Table [Item 65] at the back of Agenda)
   a. NPCC Members on NERC Drafting Teams

4. **Items Requiring RSC Approval**

5. **Executive Tracking Summary** (in Meeting Materials Package)
   a. Review entries.

6. **FERC** (in Meeting Materials Package)

   a. FERC Public Meeting--November 17, 2011.

.

NOPRs					
Item	NOPR	Docket No.	Posted	End Date	When Effective
6-1	Automatic Underfrequency Load Shedding and Load Shedding Plans Reliability Standards	RM11–20–000	10/26/11	12/27/11	
6-2	Transmission Planning Reliability Standards	RM11-18-000	10/26/11	12/27/11	

Letters of Approval			
Item	Docket No.	Posted	Summary
6-11	RD11-10-000		FERC approved Reliability Standard FAC-008-3 and the retirement of FAC-008-1 and FAC-009-1. Also approved the associated VRFs with one modification, and the associated VSLs. The new Reliability Standard, FAC-008-3 will be effective, and Reliability Standards FAC-008-1 and FAC-009-1 will be retired on the first day of the first calendar quarter that is twelve months after issuance of this order, as requested by NERC.
6-22	RD11-3-000	11/22/11	FERC found revised Reliability Standard FAC-013-2 (including the associated new Glossary terms and implementation plan) just, reasonable, not unduly discriminatory or preferential and in the public interest. FERC also accepted the violation risk

			factors and violation severity levels associated with the standard as proposed by NERC three exceptions. FERC denied a request by the Electric Reliability Council of Texas (ERCOT) for an exemption from Reliability Standard FAC-013-2.
6-33	RR11-5-000		NERC filed a petition requesting approval of proposed amendments to the NERC Rules of Procedure. FERC approved the proposed Amendments.

Petitions			
Item	Docket No.	Posted	Title
6-111	RR11-2-000	11/15/11	Petition for Approval of Compliance Monitoring and Enforcement Agreement Between Northeast Power Coordinating Council, Inc. and Western Electricity Coordinating Council and Related Amendments to Delegation Agreements

Motion To Defer Further Action			
Item	Docket No.	Posted	Summary

Compliance Filing			
Item	Docket No.	Posted	Summary

Final Rule			
Item	Docket No.	Posted	Summary

Other

Item	Docket No.	Posted	Summary
6-O1	AD12-1-000 RC11-6-000 EL11-62-000	11/14/11	Request For Evidence Of Commissioner Philip D. Moeller On EPA Issues For The November 2011 Reliability
6-O2	RM11-11-000	11/21/11	Comments Of The North American Electric Reliability Corporation In Response To Notice Of Proposed Rulemaking Regarding Version 4 CIP Reliability Standards
6-O3	RM11-16-000	11/21/11	Comments Of The North American Electric Reliability Corporation In Response To Notice Of Proposed Rulemaking Regarding The Transmission Relay Loadability Standard PRC-023-2.
6-O4	AD12–5–000	11/22/11	Voltage Coordination on High Voltage Grids; Notice of Reliability Workshop Agenda. Workshop Dec. 1, 2011.

7. Current and Pending Ballots:

a.	Project 2007-12 - Frequency Response	Initial Ballot and Non-Binding Poll	11/30/11	12/8/11
b.	Project 2009-01 - Disturbance and Sabotage Reporting - CIP-001 and EOP-004	Initial Ballot and Non-Binding Poll	12/2/11	12/12/11
c.	Project 2008-06 - Cyber Security - Order 706 - CIP-002 through CIP)-009 (Version 5 CIP Standards)	Initial Ballots Please Vote for each of the 10 CIP Standards Separately	12/16/11	1/6/12

8. Overlapping Postings (in Meeting Materials Package)

a.				

9. Join Ballot Pools:

a.	Project 2008-06 - Cyber Security - Order 706 - CIP-002 through CIP)-009 (Version 5 CIP Standards)	Join Ballot Pool	11/7/11	12/15/11

12. Concluded Ballots (in Meeting Materials Package)

https://standards.nerc.net/Ballots.aspx (clicking in the column to the right of "Ballot Periods" column links to the Ballot Results)					Results of Ballot	RSC Recommend/Date
a.	Project 2010-11 - TPL Table 1, Footnote B	Recirculation Ballot	1/26/11	2/5/11	Quorum: 93.61% Approval: 86.54%	Yes 1/5/11
b.	Project 2007-07 - Vegetation Management - FAC-003	Successive Ballot and Non-Binding Poll	2/18/11	2/28/11	Quorum: 79.28% Approval: 79.34%	Yes 2/22/11
c.	Project 2006-06 - Reliability Coordination - COM-001, COM-002, IRO-001, and IRO-014	Initial Ballot	2/25/11	3/7/11	Quorum: 87.10% Approval: 49.54%	Yes 3/2/11
d.	Project 2007-23 - Violation Severity Levels	Non-binding Poll	2/9/11	2/18/11	Ballot Pool: 310 Opinions: 141 72% Support	Yes 10/28/10
e.	Project 2010-13 - Relay Loadability Order - PRC-023	Successive Ballot and Non-Binding Poll	1/24/11	2/13/11	Quorum: 83.95% Approval: 65.71%	Yes 2/11/11

f.	Project 2010-13 - Relay Loadability Order - PRC-023	Recirculation Ballot	2/24/11	3/6/11	Quorum: 87.35% Approval: 68.83%	Yes 2/11/11
g.	Project 2010-15 - Urgent Action Revisions to CIP-005-3	Successive Ballot and Non-Binding Poll	4/19/11	4/28/11	Quorum: 79.66% Approval: 38.00%	No 4/19/11
h.	Project 2009-06 - Facility Ratings	Cast Ballot	4/21/11	5/2/11	Quorum: 86.01% Approval: 48.74%	Abstain 4/26/11
i.	Project 2007-17 - Protection System Maintenance and Testing - PRC-005	Successive Ballot and Non-Binding Poll	5/3/11	5/12/11	Quorum: 78.33% Approval: 67.00%	No Recommendation
j.	Project 2009-06 - Facility Ratings - FAC-008 and FAC-009	Recirculation Ballot	5/12/11	5/23/11	Quorum: 91.25% Approval: 78.92%	Yes 5/12/11
k.	Project 2006-02 - Assess Transmission and Future Needs - TPL-001 through TPL-006	Successive Ballot and Non-Binding Poll	5/18/11	5/31/11	Quorum: 92.07% Approval: 73.99	----
l.	Project 2007-03 - Real-time Operations - TOP-001 through TOP-008 and PER-001	Initial Ballot and Non-Binding Poll	5/31/11	6/9/11	Quorum: 88.47% Approval: 48.64%	Reject 5/31/11
m.	Project 2007-09 – Generator Verification – MOD-026-1 Ballot Results Revised because of NERC IT problem	Cast Ballot	7/22/11	8/1/11	Quorum: 90.25% Approval: 46.53%	No Consensus 7/28/11
n.	Project 2007-09 – Generator Verification – MOD-026-1	Cast Non-Binding Poll Opinion	7/22/11	8/1/11	Quorum: 88.75% Approval: 56.00%	----
o.	Project 2007-09 – Generator Verification – PRC-024-1 Ballot Results Revised because of NERC IT problem	Cast Ballot	7/22/11	8/1/11	Quorum: 90.82% Approval: 18.23%	No Consensus 7/28/11
p.	Project 2007-09 – Generator Verification – PRC-024-1	Cast Non-Binding Poll Opinion	7/22/11	8/1/11	Quorum: 88.35% Approval: 20.79%	----

q.	Project 2007-17 – Protection System Maintenance and Testing – PRC-005	Recirculation Ballot and Non-Binding Poll	6/20/11	6/30/11	Quorum: 82.97% Approval: 64.76%	Yes 6/28/11
r.	Project 2006-02 - Assess Transmission and Future Needs	Cast Ballot	7/13/11	7/22/11	Quorum: 94.33% Approval: 75.37%	----
s.	Project 2006-06 - Reliability Coordination - IRO-002-3	Cast Ballot	7/15/11	7/25/11	Quorum: 94.13% Approval: 76.99%	Yes 7/22/11
t.	Project 2006-06 - Reliability Coordination - IRO-005-4	Cast Ballot	7/15/11	7/25/11	Quorum: 94.13% Approval: 75.17%	Yes 7/22/11
u.	Project 2006-06 - Reliability Coordination - IRO-014-2	Cast Ballot	7/15/11	7/25/11	Quorum: 94.13% Approval: 76.27%	Yes 7/22/11
v.	Project 2006-06 - Reliability Coordination - IRO-002-3	Cast Non-Binding Poll Opinion	7/15/11	7/25/11	Quorum: 75.37% Approval: 93%	----
w.	Project 2006-06 - Reliability Coordination - IRO-005-4	Cast Non-Binding Poll Opinion	7/15/11	7/25/11	Quorum: 75.66% Approval: 93%	----
x.	Project 2006-06 - Reliability Coordination - IRO-014-2	Cast Non-Binding Poll Opinion	7/15/11	7/25/11	Quorum: 75.37% Approval: 89%	-----
y.	Project 2007-17 - Protection System Maintenance and Testing - PRC-005	Initial Ballot	9/19/11	9/28/11 9/29/11-- Technical Difficulties	Quorum: 84.86% Approval: 61.10%	Yes 9/21/11
z.	Project 2007-17 - Protection System Maintenance and Testing - PRC-005	Non-Binding Poll VRFs and VSLs	9/19/11	9/28/11 9/29/11-- Technical Difficulties	Quorum: 83.13% Approval: 68.68%	----
aa.	Project 2010-17 - Definition of Bulk Electric System - Initial Ballot of Definition of BES	Initial Ballot	9/30/11	10/10/11	Quorum: 92.97% Approval: 71.68%	No Consensus 10/3/11

bb.	Project 2010-17 - Definition of Bulk Electric System - Initial Ballot of Detailed Information to Support BES Exceptions Request	Initial Ballot	9/30/11	10/10/11	Quorum: 89.53% Approval: 64.03%	No Consensus 10/7/11
cc.	Project 2007-07 - Vegetation Management	Recirculation Ballot	10/4/11	10/13/11	Quorum: 87.17% Approval: 86.25%	Yes 2/22/11
dd.	Project 2011-INT-01 - Interpretation of MOD-028 for Florida Power & Light Company	Initial Ballot	11/7/11	11/16/11	Quorum: Approval:	Yes 11/8/11
ee.	Project 2009-22 - Interpretation of COM-002-2 R2 by the IRC	Initial Ballot	11/8/11	11/18/11	Quorum: Approval:	Yes 11/8/11
ff.	Project 2010-07 - Generator Requirements at the Transmission Interface	Initial Ballot	11/9/11	11/18/11	Quorum: Approval:	Yes 11/10/11
gg.	Project 2010-17 - Definition of Bulk Electric System and Implementation Plan	Recirculation Ballot	11/10/11	11/21/11	Quorum: 95.92% Approval: 81.32%	Yes 10/3/11
hh.	Project 2010-17 - Detailed Information to Support an Exception Request	Recirculation Ballot	11/10/11	11/21/11	Quorum: 93.02% Approval: 81.48%	
ii.	Project 2008-10 - Interpretation of CIP-006-x R1 for Progress Energy	Successive Ballot	11/11/11	11/21/11	Quorum: Approval:	Yes 11/14/11

25. NY adoption of more stringent/specific NPCC Criteria

a. The New York filing (as well as an update to the applicable NPCC Criteria in Nova Scotia that were approved by the Nova Scotia Utility and Review Board earlier this year), will be filed by the end of October, 2011.

26. Directory and Regional Work Plan Status

a.

Directory Number	Title	Lead Group, Status	Current Activity
#1 (A-2)	Design and Operation of the Bulk Power System	Approved on 12/1/2009	TFCP has charged CP11 with a comprehensive review of Directory #1 to include the triennial document review, an examination of the NERC TPL standards, the existing NPCC planning criteria, and the implementation of Phase 2 of the Directory Project which will reformat existing Directory criteria into NERC style requirements. TFCO has assigned CO-8 to review the TO requirements within the Directory #1 criteria. TFCP/CP-11 is ready to post the document for its initial Open Process posting upon conclusion of the TFCO/CO-8 review. Open Process posting expected in mid December, 2011.
#2 (A-3)	Emergency Operation	Approved on 10/21/08.	Automatic UFLS language transferred to Directory #12. Next TFCO review Oct. 21, 2011.
#3 (A-4)	Maintenance Criteria for BPS Protection.	Approved on 7/11/08.	Phase 2 reformatting pending.
#4 (A-5)	Bulk Power System Protection Criteria	Approved on 12/1/09.	TFSP expects to begin Phase 2 review of Directory #4 in early 2012.
#5 (A-6)	Operating Reserve	TFCO	Directory#5 was approved by the Full Members on December 2, 2010. TFCO is working to resolve several open issues including how imports from HQ are wheeled within the Region. A TFCO special meeting is scheduled for Dec. 6, 2011 to finalize proposed revisions to Directory #5 in advance of an Open Process posting.
#6 New	Reserve Sharing	TFCO	TFCO has posted a draft of a new Directory#6 on Regional Reserve Sharing which would replace C-38 until a Regional Standard is developed. An Open Process posting for Directory #6 concluded on Oct. 24, 2011.
#7 (A-11)	Special Protection Systems	Approved on 12/27/07.	TFSP, TFSS, and TFCP are revising Directory #7. TFSP to incorporate current NRAP revisions (including Appendix A) of the document into a Phase 2 version and post for member comment after the November, 2011 TFSP Meeting.
#8 (A-12)	System Restoration	Approved on 10/21/08.	CO-11 has recently made revisions to the Directory #8 criteria. These revisions will be incorporated into the draft Phase 2 reformatting of Directory #8 which will be addressed by CO-8 early next year.
#9 (A-13)	Verification of Generator Real Power Capability	Approved on 12/22/08.	TFCO has posted the initial Phase 2 drafts of both Directories #9 and #10 to the Open Process. The initial open process concluded on June 14, 2011. TFCO reviewed comments and posted the revised Directories for a second posting which concluded on 10/24/2011. TFCO expects to present Directories #9 and #10 to the RCC in November, 2011, and anticipates a Full Member ballot of both Directories #9 and #10 in December, 2011.

#10(A14)	Verification of Generator Reactive Power Capability	Approved on 12/22/08.	Refer to Directory #9 preceding.
#12	UFLS Program Requirements	Approved on 6/26/09.

TFSP	Nov. 15-17

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council Inc.

Northeast Power Coordinating Council, Inc. (NPCC)
Antitrust Compliance Guidelines

It is NPCC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment. Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.

Any NPCC meeting participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Secretary, Andrianne S. Payson at 212-259-8218.

Action Item List

Action Item Number	Agenda Item Number	Description	Owner	Due	Status
August 20-21, 2008					
Feb. 17-18, 2009					
June 17-18, 2009

October 26-27, 2011					
77	22d	If a term defined in one document, should it be included in the NPCC Glossary?	Guy Zito/Gerry Dunbar	RSC Meeting	Ongoing.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Glossary of Terms Used in NERC Reliability Standards

Updated October 26, 2011

Introduction:

This Glossary lists each term that was defined for use in one or more of NERC's continent-wide or Regional Reliability Standards and adopted by the NERC Board of Trustees from February 8, 2005 through August 4, 2011.

This reference is divided into two sections, and each section is organized in alphabetical order. The first section identifies all terms that have been adopted by the NERC Board of Trustees for use in continent-wide standards; the second section identifies all terms that have been adopted by the NERC Board of Trustees for use in regional standards. (WECC, NPCC and ReliabilityFirst are the only Regions that have definitions approved by the NERC Board of Trustees. If other Regions develop definitions for approved Regional Standards using a NERC-approved standards development process, those definitions will be added to the Regional Definitions section of this glossary.)

Most of the terms identified in this glossary were adopted as part of the development of NERC's initial set of reliability standards, called the "Version 0" standards. Subsequent to the development of Version 0 standards, new definitions have been developed and approved following NERC's Reliability Standards Development Process, and added to this glossary following board adoption, with the "FERC approved" date added following a final Order approving the definition.

Immediately under each term is a link to the archive for the development of that term.

Definitions that have been adopted by the NERC Board of Trustees but have not been approved by FERC, or FERC has not approved but has directed be modified, are shaded in blue. Definitions that have been remanded or retired are shaded in orange.

Any comments regarding this glossary should be reported to the following: sarcomm@nerc.com with "Glossary Comment" in the subject line.

Continent-wide Definitions:

Regional Definitions

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Adequacy [Archive]		2/8/2005	3/16/2007	The ability of the electric system to supply the aggregate electrical demand and energy requirements of the end-use customers at all times, taking into account scheduled and reasonably expected unscheduled outages of system elements.
Adjacent Balancing Authority [Archive]		2/8/2005	3/16/2007	A Balancing Authority Area that is interconnected another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.
Adverse Reliability Impact [Archive]		2/7/2006	3/16/2007	The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.
Adverse Reliability Impact [Archive]		8/4/2011		The impact of an event that results in Bulk Electric System instability or Cascading.
After the Fact [Archive]	ATF	10/29/2008	12/17/2009	A time classification assigned to an RFI when the submittal time is greater than one hour after the start time of the RFI.
Agreement [Archive]		2/8/2005	3/16/2007	A contract or arrangement, either written or verbal and sometimes enforceable by law.
Altitude Correction Factor [Archive]		2/7/2006	3/16/2007	A multiplier applied to specify distances, which adjusts the distances to account for the change in relative air density (RAD) due to altitude from the RAD used to determine the specified distance. Altitude correction factors apply to both minimum worker approach distances and to minimum vegetation clearance distances.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Ancillary Service [Archive]		2/8/2005	3/16/2007	Those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Service Provider's transmission system in accordance with good utility practice. (*From FERC order 888-A.*)
Anti-Aliasing Filter [Archive]		2/8/2005	3/16/2007	An analog filter installed at a metering point to remove the high frequency components of the signal over the AGC sample period.
Area Control Error [Archive]	ACE	2/8/2005	3/16/2007	The instantaneous difference between a Balancing Authority's net actual and scheduled interchange, taking into account the effects of Frequency Bias and correction for meter error.
Area Interchange Methodology [Archive]		08/22/2008	11/24/2009	The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.
Arranged Interchange [Archive]		5/2/2006	3/16/2007	The state where the Interchange Authority has received the Interchange information (initial or revised).
Automatic Generation Control [Archive]	AGC	2/8/2005	3/16/2007	Equipment that automatically adjusts generation in a Balancing Authority Area from a central location to maintain the Balancing Authority's interchange schedule plus Frequency Bias. AGC may also accommodate automatic inadvertent payback and time error correction.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Available Flowgate Capability [Archive]	AFC	08/22/2008	11/24/2009	A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.
Available Transfer Capability [Archive]	ATC	2/8/2005	3/16/2007	A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin.
Available Transfer Capability [Archive]	ATC	08/22/2008	11/24/2009	A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less Existing Transmission Commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Available Transfer Capability Implementation Document [Archive]	ATCID	08/22/2008	11/24/2009	A document that describes the implementation of a methodology for calculating ATC or AFC, and provides information related to a Transmission Service Provider's calculation of ATC or AFC.
ATC Path [Archive]		08/22/2008	Not approved; Modification directed 11/24/09	Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path[1].

[1] See 18 CFR 37.6(b)(1)

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Balancing Authority [Archive]	BA	2/8/2005	3/16/2007	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
Balancing Authority Area [Archive]		2/8/2005	3/16/2007	The collection of generation, transmission, and loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains load-resource balance within this area.
Base Load [Archive]		2/8/2005	3/16/2007	The minimum amount of electric power delivered or required over a given period at a constant rate.
Blackstart Capability Plan [Archive]		2/8/2005 Approved Retirement when EOP-005-2 becomes effective 8/5/2009	3/16/2007	A documented procedure for a generating unit or station to go from a shutdown condition to an operating condition delivering electric power without assistance from the electric system. This procedure is only a portion of an overall system restoration plan.
Blackstart Resource [Archive]		8/5/2009		A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Block Dispatch [Archive]		08/22/2008	11/24/2009	A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).
Bulk Electric System [Archive]		2/8/2005	3/16/2007	As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.
Burden [Archive]		2/8/2005	3/16/2007	Operation of the Bulk Electric System that violates or is expected to violate a System Operating Limit or Interconnection Reliability Operating Limit in the Interconnection, or that violates any other NERC, Regional Reliability Organization, or local operating reliability standards or criteria.
Business Practices [Archive]		8/22/2008	Not approved; Modification directed 11/24/09	Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices.
Bus-tie Breaker [Archive]		8/4/2011		A circuit breaker that is positioned to connect two individual substation bus configurations.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Capacity Benefit Margin [Archive]	CBM	2/8/2005	3/16/2007	The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs), whose loads are located on that Transmission Service Provider's system, to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.
Capacity Benefit Margin Implementation Document [Archive]	CBMID	11/13/2008	11/24/2009	A document that describes the implementation of a Capacity Benefit Margin methodology.
Capacity Emergency [Archive]		2/8/2005	3/16/2007	A capacity emergency exists when a Balancing Authority Area's operating capacity, plus firm purchases from other systems, to the extent available or limited by transfer capability, is inadequate to meet its demand plus its regulating requirements.
Cascading [Archive]		2/8/2005	3/16/2007	The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Cascading Outages [Archive]		11/1/2006 Withdrawn 2/12/2008	FERC Remanded 12/27/2007	~~The uncontrolled successive loss of Bulk Electric System Facilities triggered by an incident (or condition) at any location resulting in the interruption of electric service that cannot be restrained from spreading beyond a pre-determined area.~~
Clock Hour [Archive]		2/8/2005	3/16/2007	The 60-minute period ending at :00. All surveys, measurements, and reports are based on Clock Hour periods unless specifically noted.
Cogeneration [Archive]		2/8/2005	3/16/2007	Production of electricity from steam, heat, or other forms of energy produced as a by-product of another process.
Compliance Monitor [Archive]		2/8/2005	3/16/2007	The entity that monitors, reviews, and ensures compliance of responsible entities with reliability standards.
Confirmed Interchange [Archive]		5/2/2006	3/16/2007	The state where the Interchange Authority has verified the Arranged Interchange.
Congestion Management Report [Archive]		2/8/2005	3/16/2007	A report that the Interchange Distribution Calculator issues when a Reliability Coordinator initiates the Transmission Loading Relief procedure. This report identifies the transactions and native and network load curtailments that must be initiated to achieve the loading relief requested by the initiating Reliability Coordinator.
Consequential Load Loss [Archive]		8/4/2011		All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.
Constrained Facility [Archive]		2/8/2005	3/16/2007	A transmission facility (line, transformer, breaker, etc.) that is approaching, is at, or is beyond its System Operating Limit or Interconnection Reliability Operating Limit.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Contingency [Archive]		2/8/2005	3/16/2007	The unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element.
Contingency Reserve [Archive]		2/8/2005	3/16/2007	The provision of capacity deployed by the Balancing Authority to meet the Disturbance Control Standard (DCS) and other NERC and Regional Reliability Organization contingency requirements.
Contract Path [Archive]		2/8/2005	3/16/2007	An agreed upon electrical path for the continuous flow of electrical power between the parties of an Interchange Transaction.
Control Performance Standard [Archive]	CPS	2/8/2005	3/16/2007	The reliability standard that sets the limits of a Balancing Authority's Area Control Error over a specified time period.
Corrective Action Plan [Archive]		2/7/2006	3/16/2007	A list of actions and an associated timetable for implementation to remedy a specific problem.
Cranking Path [Archive]		5/2/2006	3/16/2007	A portion of the electric system that can be isolated and then energized to deliver electric power from a generation source to enable the startup of one or more other generating units.
Critical Assets [Archive]		5/2/2006	1/18/2008	Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.
Critical Cyber Assets [Archive]		5/2/2006	1/18/2008	Cyber Assets essential to the reliable operation of Critical Assets.
Curtailment [Archive]		2/8/2005	3/16/2007	A reduction in the scheduled capacity or energy delivery of an Interchange Transaction.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Curtailment Threshold [Archive]		2/8/2005	3/16/2007	The minimum Transfer Distribution Factor which, if exceeded, will subject an Interchange Transaction to curtailment to relieve a transmission facility constraint.
Cyber Assets [Archive]		5/2/2006	1/18/2008	Programmable electronic devices and communication networks including hardware, software, and data.
Cyber Security Incident [Archive]		5/2/2006	1/18/2008	Any malicious act or suspicious event that: • Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or, • Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Delayed Fault Clearing [Archive]		11/1/2006	12/27/2007	Fault clearing consistent with correct operation of a breaker failure protection system and its associated breakers, or of a backup protection system with an intentional time delay.
Demand [Archive]		2/8/2005	3/16/2007	1. The rate at which electric energy is delivered to or by a system or part of a system, generally expressed in kilowatts or megawatts, at a given instant or averaged over any designated interval of time. 2. The rate at which energy is being used by the customer.
Demand-Side Management [Archive]	DSM	2/8/2005	3/16/2007	The term for all activities or programs undertaken by Load-Serving Entity or its customers to influence the amount or timing of electricity they use.
Direct Control Load Management [Archive]	DCLM	2/8/2005	3/16/2007	Demand-Side Management that is under the direct control of the system operator. DCLM may control the electric supply to individual appliances or equipment on customer premises. DCLM as defined here does not include Interruptible Demand.
Dispatch Order [Archive]		08/22/2008	11/24/2009	A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.
Dispersed Load by Substations [Archive]		2/8/2005	3/16/2007	Substation load information configured to represent a system for power flow or system dynamics modeling purposes, or both.
Distribution Factor [Archive]	DF	2/8/2005	3/16/2007	The portion of an Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate).

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Distribution Provider [Archive]		2/8/2005	3/16/2007	Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the Distribution function at any voltage.
Disturbance [Archive]		2/8/2005	3/16/2007	1. An unplanned event that produces an abnormal system condition. 2. Any perturbation to the electric system. 3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.
Disturbance Control Standard [Archive]	DCS	2/8/2005	3/16/2007	The reliability standard that sets the time limit following a Disturbance within which a Balancing Authority must return its Area Control Error to within a specified range.
Disturbance Monitoring Equipment [Archive]	DME	8/2/2006	3/16/2007	Devices capable of monitoring and recording system data pertaining to a Disturbance. Such devices include the following categories of recorders[2]: • Sequence of event recorders which record equipment response to the event • Fault recorders, which record actual waveform data replicating the system primary voltages and currents. This may include protective relays. • Dynamic Disturbance Recorders (DDRs), which record incidents that portray power system behavior during dynamic events such as low-frequency (0.1 Hz – 3 Hz) oscillations and abnormal frequency or voltage excursions

[2] Phasor Measurement Units and any other equipment that meets the functional requirements of DMEs may qualify as DMEs.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Dynamic Interchange Schedule or Dynamic Schedule [Archive]		2/8/2005	3/16/2007	A telemetered reading or value that is updated in real time and used as a schedule in the AGC/ACE equation and the integrated value of which is treated as a schedule for interchange accounting purposes. Commonly used for scheduling jointly owned generation to or from another Balancing Authority Area.
Dynamic Transfer [Archive]		2/8/2005	3/16/2007	The provision of the real-time monitoring, telemetering, computer software, hardware, communications, engineering, energy accounting (including inadvertent interchange), and administration required to electronically move all or a portion of the real energy services associated with a generator or load out of one Balancing Authority Area into another.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Economic Dispatch [Archive]		2/8/2005	3/16/2007	The allocation of demand to individual generating units on line to effect the most economical production of electricity.
Electrical Energy [Archive]		2/8/2005	3/16/2007	The generation or use of electric power by a device over a period of time, expressed in kilowatthours (kWh), megawatthours (MWh), or gigawatthours (GWh).
Electronic Security Perimeter [Archive]		5/2/2006	1/18/2008	The logical border surrounding a network to which Critical Cyber Assets are connected and for which access is controlled.
Element [Archive]		2/8/2005	3/16/2007	Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.
Emergency or BES Emergency [Archive]		2/8/2005	3/16/2007	Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.
Emergency Rating [Archive]		2/8/2005	3/16/2007	The rating as defined by the equipment owner that specifies the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar or other appropriate units, that a system, facility, or element can support, produce, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.
Emergency Request for Interchange (Emergency RFI) [Archive]		10/29/2008	12/17/2009	Request for Interchange to be initiated for Emergency or Energy Emergency conditions.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Energy Emergency [Archive]		2/8/2005	3/16/2007	A condition when a Load-Serving Entity has exhausted all other options and can no longer provide its customers' expected energy requirements.
Equipment Rating [Archive]		2/7/2006	3/16/2007	The maximum and minimum voltage, current, frequency, real and reactive power flows on individual equipment under steady state, short-circuit and transient conditions, as permitted or assigned by the equipment owner.
Existing Transmission Commitments [Archive]	ETC	08/22/2008	11/24/2009	Committed uses of a Transmission Service Provider's Transmission system considered when determining ATC or AFC.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Facility [Archive]		2/7/2006	3/16/2007	A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)
Facility Rating [Archive]		2/8/2005	3/16/2007	The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.
Fault [Archive]		2/8/2005	3/16/2007	An event occurring on an electric system such as a short circuit, a broken wire, or an intermittent connection.
Fire Risk [Archive]		2/7/2006	3/16/2007	The likelihood that a fire will ignite or spread in a particular geographic area.
Firm Demand [Archive]		2/8/2005	3/16/2007	That portion of the Demand that a power supplier is obligated to provide except when system reliability is threatened or during emergency conditions.
Firm Transmission Service [Archive]		2/8/2005	3/16/2007	The highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.
Flashover [Archive]		2/7/2006	3/16/2007	An electrical discharge through air around or over the surface of insulation, between objects of different potential, caused by placing a voltage across the air space that results in the ionization of the air space.
Flowgate [Archive]		2/8/2005	3/16/2007	A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Flowgate [Archive]		08/22/2008	11/24/2009	1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.
Flowgate Methodology [Archive]		08/22/2008	11/24/2009	The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).
Forced Outage [Archive]		2/8/2005	3/16/2007	1. The removal from service availability of a generating unit, transmission line, or other facility for emergency reasons. 2. The condition in which the equipment is unavailable due to unanticipated failure.
Frequency Bias [Archive]		2/8/2005	3/16/2007	A value, usually expressed in megawatts per 0.1 Hertz (MW/0.1 Hz), associated with a Balancing Authority Area that approximates the Balancing Authority Area's response to Interconnection frequency error.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Frequency Bias Setting [Archive]		2/8/2005	3/16/2007	A value, usually expressed in MW/0.1 Hz, set into a Balancing Authority ACE algorithm that allows the Balancing Authority to contribute its frequency response to the Interconnection.
Frequency Deviation [Archive]		2/8/2005	3/16/2007	A change in Interconnection frequency.
Frequency Error [Archive]		2/8/2005	3/16/2007	The difference between the actual and scheduled frequency. ($F_A - F_S$)
Frequency Regulation [Archive]		2/8/2005	3/16/2007	The ability of a Balancing Authority to help the Interconnection maintain Scheduled Frequency. This assistance can include both turbine governor response and Automatic Generation Control.
Frequency Response [Archive]		2/8/2005	3/16/2007	(Equipment) The ability of a system or elements of the system to react or respond to a change in system frequency. (System) The sum of the change in demand, plus the change in generation, divided by the change in frequency, expressed in megawatts per 0.1 Hertz (MW/0.1 Hz).

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Generator Operator [Archive]		2/8/2005	3/16/2007	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
Generator Owner [Archive]		2/8/2005	3/16/2007	Entity that owns and maintains generating units.
Generator Shift Factor [Archive]	GSF	2/8/2005	3/16/2007	A factor to be applied to a generator's expected change in output to determine the amount of flow contribution that change in output will impose on an identified transmission facility or Flowgate.
Generator-to-Load Distribution Factor [Archive]	GLDF	2/8/2005	3/16/2007	The algebraic sum of a Generator Shift Factor and a Load Shift Factor to determine the total impact of an Interchange Transaction on an identified transmission facility or Flowgate.
Generation Capability Import Requirement [Archive]	GCIR	11/13/2008	11/24/2009	The amount of generation capability from external sources identified by a Load-Serving Entity (LSE) or Resource Planner (RP) to meet its generation reliability or resource adequacy requirements as an alternative to internal resources.
Host Balancing Authority [Archive]		2/8/2005	3/16/2007	1. A Balancing Authority that confirms and implements Interchange Transactions for a Purchasing Selling Entity that operates generation or serves customers directly within the Balancing Authority's metered boundaries. 2. The Balancing Authority within whose metered boundaries a jointly owned unit is physically located.
Hourly Value [Archive]		2/8/2005	3/16/2007	Data measured on a Clock Hour basis.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Implemented Interchange [Archive]		5/2/2006	3/16/2007	The state where the Balancing Authority enters the Confirmed Interchange into its Area Control Error equation.
Inadvertent Interchange [Archive]		2/8/2005	3/16/2007	The difference between the Balancing Authority's Net Actual Interchange and Net Scheduled Interchange. ($I_A - I_S$)
Independent Power Producer [Archive]	IPP	2/8/2005	3/16/2007	Any entity that owns or operates an electricity generating facility that is not included in an electric utility's rate base. This term includes, but is not limited to, cogenerators and small power producers and all other nonutility electricity producers, such as exempt wholesale generators, who sell electricity.
Institute of Electrical and Electronics Engineers, Inc. [Archive]	IEEE	2/7/2006	3/16/2007	
Interchange [Archive]		5/2/2006	3/16/2007	Energy transfers that cross Balancing Authority boundaries.
Interchange Authority [Archive]		5/2/2006	3/16/2007	The responsible entity that authorizes implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communication of Interchange information for reliability assessment purposes.
Interchange Distribution Calculator [Archive]	IDC	2/8/2005	3/16/2007	The mechanism used by Reliability Coordinators in the Eastern Interconnection to calculate the distribution of Interchange Transactions over specific Flowgates. It includes a database of all Interchange Transactions and a matrix of the Distribution Factors for the Eastern Interconnection.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Interchange Schedule [Archive]		2/8/2005	3/16/2007	An agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.
Interchange Transaction [Archive]		2/8/2005	3/16/2007	An agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.
Interchange Transaction Tag or Tag [Archive]		2/8/2005	3/16/2007	The details of an Interchange Transaction required for its physical implementation.
Interconnected Operations Service [Archive]		2/8/2005	3/16/2007	A service (exclusive of basic energy and transmission services) that is required to support the reliable operation of interconnected Bulk Electric Systems.
Interconnection [Archive]		2/8/2005	3/16/2007	When capitalized, any one of the three major electric system networks in North America: Eastern, Western, and ERCOT.
Interconnection Reliability Operating Limit [Archive]	IROL	2/8/2005	3/16/2007 Retired 12/27/2007	The value (such as MW, MVar, Amperes, Frequency or Volts) derived from, or a subset of the System Operating Limits, which if exceeded, could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages.
Interconnection Reliability Operating Limit [Archive]	IROL	11/1/2006	12/27/2007	A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading Outages that adversely impact the reliability of the Bulk Electric System.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Interconnection Reliability Operating Limit T_v [Archive]	IROL T_v	11/1/2006	12/27/2007	The maximum time that an Interconnection Reliability Operating Limit can be violated before the risk to the interconnection or other Reliability Coordinator Area(s) becomes greater than acceptable. Each Interconnection Reliability Operating Limit's T_v shall be less than or equal to 30 minutes.
Intermediate Balancing Authority [Archive]		2/8/2005	3/16/2007	A Balancing Authority Area that has connecting facilities in the Scheduling Path between the Sending Balancing Authority Area and Receiving Balancing Authority Area and operating agreements that establish the conditions for the use of such facilities
Interruptible Load or Interruptible Demand [Archive]		11/1/2006	3/16/2007	Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment.
Joint Control [Archive]		2/8/2005	3/16/2007	Automatic Generation Control of jointly owned units by two or more Balancing Authorities.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Limiting Element [Archive]		2/8/2005	3/16/2007	The element that is 1.)Either operating at its appropriate rating, or 2,) Would be following the limiting contingency. Thus, the Limiting Element establishes a system limit.
Load [Archive]		2/8/2005	3/16/2007	An end-use device or customer that receives power from the electric system.
Load Shift Factor [Archive]	LSF	2/8/2005	3/16/2007	A factor to be applied to a load's expected change in demand to determine the amount of flow contribution that change in demand will impose on an identified transmission facility or monitored Flowgate.
Load-Serving Entity [Archive]		2/8/2005	3/16/2007	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.
Long-Term Transmission Planning Horizon [Archive]		8/4/2011		Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.
Market Flow [Archive]		11/4/2010	4/21/2011	The total amount of power flowing across a specified Facility or set of Facilities due to a market dispatch of generation internal to the market to serve load internal to the market.
Misoperation [Archive]		2/7/2006	3/16/2007	▪ Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection. ▪ Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone). ▪ Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Native Load [Archive]		2/8/2005	3/16/2007	The end-use customers that the Load-Serving Entity is obligated to serve.
Near-Term Transmission Planning Horizon [Archive]		1/24/2011		The transmission planning period that covers Year One through five.
Net Actual Interchange [Archive]		2/8/2005	3/16/2007	The algebraic sum of all metered interchange over all interconnections between two physically Adjacent Balancing Authority Areas.
Net Energy for Load [Archive]		2/8/2005	3/16/2007	Net Balancing Authority Area generation, plus energy received from other Balancing Authority Areas, less energy delivered to Balancing Authority Areas through interchange. It includes Balancing Authority Area losses but excludes energy required for storage at energy storage facilities.
Net Interchange Schedule [Archive]		2/8/2005	3/16/2007	The algebraic sum of all Interchange Schedules with each Adjacent Balancing Authority.
Net Scheduled Interchange [Archive]		2/8/2005	3/16/2007	The algebraic sum of all Interchange Schedules across a given path or between Balancing Authorities for a given period or instant in time.
Network Integration Transmission Service [Archive]		2/8/2005	3/16/2007	Service that allows an electric transmission customer to integrate, plan, economically dispatch and regulate its network reserves in a manner comparable to that in which the Transmission Owner serves Native Load customers.
Non-Consequential Load Loss [Archive]		8/4/2011		Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Non-Firm Transmission Service [Archive]		2/8/2005	3/16/2007	Transmission service that is reserved on an as-available basis and is subject to curtailment or interruption.
Non-Spinning Reserve [Archive]		2/8/2005	3/16/2007	1. That generating reserve not connected to the system but capable of serving demand within a specified time. 2. Interruptible load that can be removed from the system in a specified time.
Normal Clearing [Archive]		11/1/2006	12/27/2007	A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.
Normal Rating [Archive]		2/8/2005	3/16/2007	The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.
Nuclear Plant Generator Operator [Archive]		5/2/2007	10/16/2008	Any Generator Operator or Generator Owner that is a Nuclear Plant Licensee responsible for operation of a nuclear facility licensed to produce commercial power.
Nuclear Plant Off-site Power Supply (Off-site Power) [Archive]		5/2/2007	10/16/2008	The electric power supply provided from the electric system to the nuclear power plant distribution system as required per the nuclear power plant license.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Nuclear Plant Licensing Requirements (NPLRs) [Archive]		5/2/2007	10/16/2008	Requirements included in the design basis of the nuclear plant and statutorily mandated for the operation of the plant, including nuclear power plant licensing requirements for: 1) Off-site power supply to enable safe shutdown of the plant during an electric system or plant event; and 2) Avoiding preventable challenges to nuclear safety as a result of an electric system disturbance, transient, or condition.
Nuclear Plant Interface Requirements (NPIRs) [Archive]		5/2/2007	10/16/2008	The requirements based on NPLRs and Bulk Electric System requirements that have been mutually agreed to by the Nuclear Plant Generator Operator and the applicable Transmission Entities.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Off-Peak [Archive]		2/8/2005	3/16/2007	Those hours or other periods defined by NAESB business practices, contract, agreements, or guides as periods of lower electrical demand.
On-Peak [Archive]		2/8/2005	3/16/2007	Those hours or other periods defined by NAESB business practices, contract, agreements, or guides as periods of higher electrical demand.
Open Access Same Time Information Service [Archive]	OASIS	2/8/2005	3/16/2007	An electronic posting system that the Transmission Service Provider maintains for transmission access data and that allows all transmission customers to view the data simultaneously.
Open Access Transmission Tariff [Archive]	OATT	2/8/2005	3/16/2007	Electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.
Operating Plan [Archive]		2/7/2006	3/16/2007	A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Operating Procedure [Archive]		2/7/2006	3/16/2007	A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a system operator to take in removing a specific transmission line from service is an example of an Operating Procedure.
Operating Process [Archive]		2/7/2006	3/16/2007	A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating Process.
Operating Reserve [Archive]		2/8/2005	3/16/2007	That capability above firm system demand required to provide for regulation, load forecasting error, equipment forced and scheduled outages and local area protection. It consists of spinning and non-spinning reserve.
Operating Reserve – Spinning [Archive]		2/8/2005	3/16/2007	The portion of Operating Reserve consisting of: • Generation synchronized to the system and fully available to serve load within the Disturbance Recovery Period following the contingency event; or • Load fully removable from the system within the Disturbance Recovery Period following the contingency event.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Operating Reserve – Supplemental [Archive]		2/8/2005	3/16/2007	The portion of Operating Reserve consisting of: • Generation (synchronized or capable of being synchronized to the system) that is fully available to serve load within the Disturbance Recovery Period following the contingency event; or • Load fully removable from the system within the Disturbance Recovery Period following the contingency event.
Operating Voltage [Archive]		2/7/2006	3/16/2007	The voltage level by which an electrical system is designated and to which certain operating characteristics of the system are related; also, the effective (root-mean-square) potential difference between any two conductors or between a conductor and the ground. The actual voltage of the circuit may vary somewhat above or below this value.
Operational Planning Analysis [Archive]		10/17/2008		An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).
Outage Transfer Distribution Factor [Archive]	OTDF	8/22/2008	11/24/2009	In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system Facilities removed from service (outaged).
Overlap Regulation Service [Archive]		2/8/2005	3/16/2007	A method of providing regulation service in which the Balancing Authority providing the regulation service incorporates another Balancing Authority's actual interchange, frequency response, and schedules into providing Balancing Authority's AGC/ACE equation.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Participation Factors [Archive]		8/22/2008	11/24/2009	A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.
Peak Demand [Archive]		2/8/2005	3/16/2007	1. The highest hourly integrated Net Energy For Load within a Balancing Authority Area occurring within a given period (e.g., day, month, season, or year). 2. The highest instantaneous demand within the Balancing Authority Area.
Performance-Reset Period [Archive]		2/7/2006	3/16/2007	The time period that the entity being assessed must operate without any violations to reset the level of non compliance to zero.
Physical Security Perimeter [Archive]		5/2/2006	1/18/2008	The physical, completely enclosed (“six-wall”) border surrounding computer rooms, telecommunications rooms, operations centers, and other locations in which Critical Cyber Assets are housed and for which access is controlled.
Planning Assessment [Archive]		8/4/2011		Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.
Planning Authority [Archive]		2/8/2005	3/16/2007	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
Planning Coordinator [Archive]		8/22/2008	11/24/2009	See Planning Authority.
Point of Delivery [Archive]	POD	2/8/2005	3/16/2007	A location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Point of Receipt [Archive]	POR	2/8/2005	3/16/2007	A location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a Generator delivers its output.
Point to Point Transmission Service [Archive]	PTP	2/8/2005	3/16/2007	The reservation and transmission of capacity and energy on either a firm or non-firm basis from the Point(s) of Receipt to the Point(s) of Delivery.
Postback [Archive]		08/22/2008	Not approved; Modification directed 11/24/09	Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.
Power Transfer Distribution Factor [Archive]	PTDF	08/22/2008	11/24/2009	In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system Facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer
Pro Forma Tariff [Archive]		2/8/2005	3/16/2007	Usually refers to the standard OATT and/or associated transmission rights mandated by the U.S. Federal Energy Regulatory Commission Order No. 888.
Protection System [Archive]		2/7/2006	3/17/07	Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Protection System [Archive]		11/19/2010		Protection System – • Protective relays which respond to electrical quantities, • Communications systems necessary for correct operation of protective functions • Voltage and current sensing devices providing inputs to protective relays, • Station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and • Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.
Pseudo-Tie [Archive]		2/8/2005	3/16/2007	A telemetered reading or value that is updated in real time and used as a "virtual" tie line flow in the AGC/ACE equation but for which no physical tie or energy metering actually exists. The integrated value is used as a metered MWh value for interchange accounting purposes.
Purchasing-Selling Entity [Archive]		2/8/2005	3/16/2007	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
Ramp Rate or Ramp [Archive]		2/8/2005	3/16/2007	(Schedule) The rate, expressed in megawatts per minute, at which the interchange schedule is attained during the ramp period. (Generator) The rate, expressed in megawatts per minute, that a generator changes its output.
Rated Electrical Operating Conditions [Archive]		2/7/2006	3/16/2007	The specified or reasonably anticipated conditions under which the electrical system or an individual electrical circuit is intend/designed to operate

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Rating [Archive]		2/8/2005	3/16/2007	The operational limits of a transmission system element under a set of specified conditions.
Rated System Path Methodology [Archive]		08/22/2008	11/24/2009	The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.
Reactive Power [Archive]		2/8/2005	3/16/2007	The portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive losses on transmission facilities. Reactive power is provided by generators, synchronous condensers, or electrostatic equipment such as capacitors and directly influences electric system voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar).
Real Power [Archive]		2/8/2005	3/16/2007	The portion of electricity that supplies energy to the load.
Reallocation [Archive]		2/8/2005	3/16/2007	The total or partial curtailment of Transactions during TLR Level 3a or 5a to allow Transactions using higher priority to be implemented.
Real-time [Archive]		2/7/2006	3/16/2007	Present time as opposed to future time. (From Interconnection Reliability Operating Limits standard.)
Real-time Assessment [Archive]		10/17/2008		An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Receiving Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority importing the Interchange.
Regional Reliability Organization [Archive]		2/8/2005	3/16/2007	1. An entity that ensures that a defined area of the Bulk Electric System is reliable, adequate and secure. 2. A member of the North American Electric Reliability Council. The Regional Reliability Organization can serve as the Compliance Monitor.
Regional Reliability Plan [Archive]		2/8/2005	3/16/2007	The plan that specifies the Reliability Coordinators and Balancing Authorities within the Regional Reliability Organization, and explains how reliability coordination will be accomplished.
Regulating Reserve [Archive]		2/8/2005	3/16/2007	An amount of reserve responsive to Automatic Generation Control, which is sufficient to provide normal regulating margin.
Regulation Service [Archive]		2/8/2005	3/16/2007	The process whereby one Balancing Authority contracts to provide corrective response to all or a portion of the ACE of another Balancing Authority. The Balancing Authority providing the response assumes the obligation of meeting all applicable control criteria as specified by NERC for itself and the Balancing Authority for which it is providing the Regulation Service.
Reliability Adjustment RFI [Archive]		10/29/2008	12/17/2009	Request to modify an Implemented Interchange Schedule for reliability purposes.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Reliability Coordinator [Archive]		2/8/2005	3/16/2007	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
Reliability Coordinator Area [Archive]		2/8/2005	3/16/2007	The collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.
Reliability Coordinator Information System [Archive]	RCIS	2/8/2005	3/16/2007	The system that Reliability Coordinators use to post messages and share operating information in real time.
Remedial Action Scheme [Archive]	RAS	2/8/2005	3/16/2007	See "Special Protection System"
Reportable Disturbance [Archive]		2/8/2005	3/16/2007	Any event that causes an ACE change greater than or equal to 80% of a Balancing Authority's or reserve sharing group's most severe contingency. The definition of a reportable disturbance is specified by each Regional Reliability Organization. This definition may not be retroactively adjusted in response to observed performance.
Request for Interchange [Archive]	RFI	5/2/2006	3/16/2007	A collection of data as defined in the NAESB RFI Datasheet, to be submitted to the Interchange Authority for the purpose of implementing bilateral Interchange between a Source and Sink Balancing Authority.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Reserve Sharing Group [Archive]		2/8/2005	3/16/2007	A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g., ten minutes). If the transaction is ramped in quicker (e.g., between zero and ten minutes) then, for the purposes of Disturbance Control Performance, the Areas become a Reserve Sharing Group.
Resource Planner [Archive]		2/8/2005	3/16/2007	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
Response Rate [Archive]		2/8/2005	3/16/2007	The Ramp Rate that a generating unit can achieve under normal operating conditions expressed in megawatts per minute (MW/Min).
Right-of-Way (ROW) [Archive]		2/7/2006	3/16/2007	A corridor of land on which electric lines may be located. The Transmission Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Scenario [Archive]		2/7/2006	3/16/2007	Possible event.
Schedule [Archive]		2/8/2005	3/16/2007	(Verb) To set up a plan or arrangement for an Interchange Transaction. (Noun) An Interchange Schedule.
Scheduled Frequency [Archive]		2/8/2005	3/16/2007	60.0 Hertz, except during a time correction.
Scheduling Entity [Archive]		2/8/2005	3/16/2007	An entity responsible for approving and implementing Interchange Schedules.
Scheduling Path [Archive]		2/8/2005	3/16/2007	The Transmission Service arrangements reserved by the Purchasing-Selling Entity for a Transaction.
Sending Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority exporting the Interchange.
Sink Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority in which the load (sink) is located for an Interchange Transaction. (This will also be a Receiving Balancing Authority for the resulting Interchange Schedule.)
Source Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority in which the generation (source) is located for an Interchange Transaction. (This will also be a Sending Balancing Authority for the resulting Interchange Schedule.)

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Special Protection System (Remedial Action Scheme) [Archive]		2/8/2005	3/16/2007	An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme.
Spinning Reserve [Archive]		2/8/2005	3/16/2007	Unloaded generation that is synchronized and ready to serve additional demand.
Stability [Archive]		2/8/2005	3/16/2007	The ability of an electric system to maintain a state of equilibrium during normal and abnormal conditions or disturbances.
Stability Limit [Archive]		2/8/2005	3/16/2007	The maximum power flow possible through some particular point in the system while maintaining stability in the entire system or the part of the system to which the stability limit refers.
Supervisory Control and Data Acquisition [Archive]	SCADA	2/8/2005	3/16/2007	A system of remote control and telemetry used to monitor and control the transmission system.
Supplemental Regulation Service [Archive]		2/8/2005	3/16/2007	A method of providing regulation service in which the Balancing Authority providing the regulation service receives a signal representing all or a portion of the other Balancing Authority's ACE.
Surge [Archive]		2/8/2005	3/16/2007	A transient variation of current, voltage, or power flow in an electric circuit or across an electric system.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Sustained Outage [Archive]		2/7/2006	3/16/2007	The deenergized condition of a transmission line resulting from a fault or disturbance following an unsuccessful automatic reclosing sequence and/or unsuccessful manual reclosing procedure.
System [Archive]		2/8/2005	3/16/2007	A combination of generation, transmission, and distribution components.
System Operating Limit [Archive]		2/8/2005	3/16/2007	The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to: • Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings) • Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits) • Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) • System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)
System Operator [Archive]		2/8/2005	3/16/2007	An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Telemetering [Archive]		2/8/2005	3/16/2007	The process by which measurable electrical quantities from substations and generating stations are instantaneously transmitted to the control center, and by which operating commands from the control center are transmitted to the substations and generating stations.
Thermal Rating [Archive]		2/8/2005	3/16/2007	The maximum amount of electrical current that a transmission line or electrical facility can conduct over a specified time period before it sustains permanent damage by overheating or before it sags to the point that it violates public safety requirements.
Tie Line [Archive]		2/8/2005	3/16/2007	A circuit connecting two Balancing Authority Areas.
Tie Line Bias [Archive]		2/8/2005	3/16/2007	A mode of Automatic Generation Control that allows the Balancing Authority to 1.) maintain its Interchange Schedule and 2.) respond to Interconnection frequency error.
Time Error [Archive]		2/8/2005	3/16/2007	The difference between the Interconnection time measured at the Balancing Authority(ies) and the time specified by the National Institute of Standards and Technology. Time error is caused by the accumulation of Frequency Error over a given period.
Time Error Correction [Archive]		2/8/2005	3/16/2007	An offset to the Interconnection's scheduled frequency to return the Interconnection's Time Error to a predetermined value.
TLR Log [Archive]		2/8/2005	3/16/2007	Report required to be filed after every TLR Level 2 or higher in a specified format. The NERC IDC prepares the report for review by the issuing Reliability Coordinator. After approval by the issuing Reliability Coordinator, the report is electronically filed in a public area of the NERC Web site.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Total Flowgate Capability [Archive]	TFC	08/22/2008	11/24/2009	The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.
Total Transfer Capability [Archive]	TTC	2/8/2005	3/16/2007	The amount of electric power that can be moved or transferred reliably from one area to another area of the interconnected transmission systems by way of all transmission lines (or paths) between those areas under specified system conditions.
Transaction [Archive]		2/8/2005	3/16/2007	See Interchange Transaction.
Transfer Capability [Archive]		2/8/2005	3/16/2007	The measure of the ability of interconnected electric systems to move or transfer power *in a reliable manner* from one area to another over all transmission lines (or paths) between those areas under specified system conditions. The units of transfer capability are in terms of electric power, generally expressed in megawatts (MW). The transfer capability from "Area A" to "Area B" is *not g*enerally equal to the transfer capability from "Area B" to "Area A."
Transfer Distribution Factor [Archive]		2/8/2005	3/16/2007	See Distribution Factor.
Transmission [Archive]		2/8/2005	3/16/2007	An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Transmission Constraint [Archive]		2/8/2005	3/16/2007	A limitation on one or more transmission elements that may be reached during normal or contingency system operations.
Transmission Customer [Archive]		2/8/2005	3/16/2007	1. Any eligible customer (or its designated agent) that can or does execute a transmission service agreement or can or does receive transmission service. 2. Any of the following responsible entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.
Transmission Line [Archive]		2/7/2006	3/16/2007	A system of structures, wires, insulators and associated hardware that carry electric energy from one point to another in an electric power system. Lines are operated at relatively high voltages varying from 69 kV up to 765 kV, and are capable of transmitting large quantities of electricity over long distances.
Transmission Operator [Archive]		2/8/2005	3/16/2007	The entity responsible for the reliability of its “local” transmission system, and that operates or directs the operations of the transmission facilities.
Transmission Operator Area [Archive]		08/22/2008	11/24/2009	The collection of Transmission assets over which the Transmission Operator is responsible for operating.
Transmission Owner [Archive]		2/8/2005	3/16/2007	The entity that owns and maintains transmission facilities.
Transmission Planner [Archive]		2/8/2005	3/16/2007	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Transmission Reliability Margin [Archive]	TRM	2/8/2005	3/16/2007	The amount of transmission transfer capability necessary to provide reasonable assurance that the interconnected transmission network will be secure. TRM accounts for the inherent uncertainty in system conditions and the need for operating flexibility to ensure reliable system operation as system conditions change.
Transmission Reliability Margin Implementation Document [Archive]	TRMID	08/22/2008	11/24/2009	A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.
Transmission Service [Archive]		2/8/2005	3/16/2007	Services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.
Transmission Service Provider [Archive]		2/8/2005	3/16/2007	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.
Vegetation [Archive]		2/7/2006	3/16/2007	All plant material, growing or not, living or dead.
Vegetation Inspection [Archive]		2/7/2006	3/16/2007	The systematic examination of a transmission corridor to document vegetation conditions.
Wide Area [Archive]		2/8/2005	3/16/2007	The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Year One [Archive]		1/24/2011		The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For an assessment started in a given calendar year, Year One includes the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One includes the forecasted peak Load period for either 2012 or 2013.

ReliabilityFirst Regional Definitions

The following definitions were developed for use in ReliabilityFirst Regional Standards.

RFC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Resource Adequacy [Archive]		08/05/2009	03/17/2011	The ability of supply-side and demand-side resources to meet the aggregate electrical demand (including losses)
Net Internal Demand [Archive]		08/05/2009	03/17/2011	Total of all end-use customer demand and electric system losses within specified metered boundaries, less Direct Control Management and Interruptible Demand
Peak Period [Archive]		08/05/2009	03/17/2011	A period consisting of two (2) or more calendar months but less than seven (7) calendar months, which includes the period during which the responsible entity's annual peak demand is expected to occur
Year One [Archive]		08/05/2009	03/17/2011	The planning year that begins with the upcoming annual Peak Period

NPCC Regional Definitions

The following definitions were developed for use in NPCC Regional Standards.

NPCC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Current Zero Time [Archive]		11/04/2010	10/20/2011	The time of the final current zero on the last phase to interrupt.
Generating Plant [Archive]		11/04/2010	10/20/2011	One or more generators at a single physical location whereby any single contingency can affect all the generators at that location.

WECC Regional Definitions

The following definitions were developed for use in WECC Regional Standards.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Area Control Error† [Archive]	ACE	3/12/2007	6/8/2007	Means the instantaneous difference between net actual and scheduled interchange, taking into account the effects of Frequency Bias including correction for meter error.
Automatic Generation Control† [Archive]	AGC	3/12/2007	6/8/2007	Means equipment that automatically adjusts a Control Area's generation from a central location to maintain its interchange schedule plus Frequency Bias.
Automatic Time Error Correction [Archive]		3/26/2008	5/21/2009	A frequency control automatic action that a Balancing Authority uses to offset its frequency contribution to support the Interconnection's scheduled frequency.
Average Generation† [Archive]		3/12/2007	6/8/2007	Means the total MWh generated within the Balancing Authority Operator's Balancing Authority Area during the prior year divided by 8760 hours (8784 hours if the prior year had 366 days).
Business Day† [Archive]		3/12/2007	6/8/2007	Means any day other than Saturday, Sunday, or a legal public holiday as designated in section 6103 of title 5, U.S. Code.
Disturbance† [Archive]		3/12/2007	6/8/2007	Means (i) any perturbation to the electric system, or (ii) the unexpected change in ACE that is caused by the sudden loss of generation or interruption of load.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Extraordinary Contingency† [Archive]		3/12/2007	6/8/2007	Shall have the meaning set out in Excuse of Performance, section B.4.c. language in section B.4.c: *means any act of God, actions by a non-affiliated third party, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, earthquake, explosion, accident to or breakage, failure or malfunction of machinery or equipment, or any other cause beyond the Reliability Entity's reasonable control; provided that prudent industry standards (e.g. maintenance, design, operation) have been employed; and provided further that no act or cause shall be considered an Extraordinary Contingency if such act or cause results in any contingency contemplated in any WECC Reliability Standard (e.g., the "Most Severe Single Contingency" as defined in the WECC Reliability Criteria or any lesser contingency).*
Frequency Bias† [Archive]		3/12/2007	6/8/2007	Means a value, usually given in megawatts per 0.1 Hertz, associated with a Control Area that relates the difference between scheduled and actual frequency to the amount of generation required to correct the difference.
Generating Unit Capability† [Archive]		3/12/2007	6/8/2007	Means the MVA nameplate rating of a generator.
Non-spinning Reserve† [Archive]		3/12/2007	6/8/2007	Means that Operating Reserve not connected to the system but capable of serving demand within a specified time, or interruptible load that can be removed from the system in a specified time.
Normal Path Rating† [Archive]		3/12/2007	6/8/2007	Is the maximum path rating in MW that has been demonstrated to WECC through study results or actual operation, whichever is greater. For a path with transfer capability limits that vary seasonally, it is the maximum of all the seasonal values.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Operating Reserve† [Archive]		3/12/2007	6/8/2007	Means that capability above firm system demand required to provide for regulation, load-forecasting error, equipment forced and scheduled outages and local area protection. Operating Reserve consists of Spinning Reserve and Nonspinning Reserve.
Operating Transfer Capability Limit† [Archive]	OTC	3/12/2007	6/8/2007	Means the maximum value of the most critical system operating parameter(s) which meets: (a) precontingency criteria as determined by equipment loading capability and acceptable voltage conditions, (b) transient criteria as determined by equipment loading capability and acceptable voltage conditions, (c) transient performance criteria, and (d) post-contingency loading and voltage criteria.
Primary Inadvertent Interchange [Archive]		3/26/2008	5/21/2009	The component of area (n) inadvertent interchange caused by the regulating deficiencies of the area (n).
Secondary Inadvertent Interchange [Archive]		3/26/2008	5/21/2009	The component of area (n) inadvertent interchange caused by the regulating deficiencies of area (i).
Spinning Reserve† [Archive]		3/12/2007	6/8/2007	Means unloaded generation which is synchronized and ready to serve additional demand. It consists of Regulating reserve and Contingency reserve (as each are described in Sections B.a.i and ii).
WECC Table 2† [Archive]		3/12/2007	6/8/2007	Means the table maintained by the WECC identifying those transfer paths monitored by the WECC regional Reliability coordinators. As of the date set out therein, the transmission paths identified in Table 2 are as listed in Attachment A to this Standard.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Functionally Equivalent Protection System [Archive]	FEPS	10/29/2008	4/21/2011	A Protection System that provides performance as follows: • Each Protection System can detect the same faults within the zone of protection and provide the clearing times and coordination needed to comply with all Reliability Standards. • Each Protection System may have different components and operating characteristics.
Functionally Equivalent RAS [Archive]	FERAS	10/29/2008	4/21/2011	A Remedial Action Scheme ("RAS") that provides the same performance as follows: • Each RAS can detect the same conditions and provide mitigation to comply with all Reliability Standards. • Each RAS may have different components and operating characteristics.
Security-Based Misoperation [Archive]		10/29/2008	4/21/2011	A Misoperation caused by the incorrect operation of a Protection System or RAS. Security is a component of reliability and is the measure of a device's certainty not to operate falsely.
Dependability-Based Misoperation [Archive]		10/29/2008	4/21/2011	Is the absence of a Protection System or RAS operation when intended. Dependability is a component of reliability and is the measure of a device's certainty to operate when required.
Commercial Operation [Archive]		10/29/2008	4/21/2011	Achievement of this designation indicates that the Generator Operator or Transmission Operator of the synchronous generator or synchronous condenser has received all approvals necessary for operation after completion of initial start-up testing.
Qualified Transfer Path Curtailment Event [Archive]		2/10/2009	3/17/2011	Each hour that a Transmission Operator calls for Step 4 or higher for one or more consecutive hours (See Attachment 1 IRO-006-WECC-1) during which the curtailment tool is functional.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Relief Requirement [Archive]		2/10/2009	3/17/2011	The expected amount of the unscheduled flow reduction on the Qualified Transfer Path that would result by curtailing each Sink Balancing Authority's Contributing Schedules by the percentages listed in the columns of WECC Unscheduled Flow Mitigation Summary of Actions Table in Attachment 1 WECC IRO-006-WECC-1.
Transfer Distribution Factor [Archive]	TDF	2/10/2009	3/17/2011	The percentage of USF that flows across a Qualified Transfer Path when an Interchange Transaction (Contributing Schedule) is implemented. [See the WECC Unscheduled Flow Mitigation Summary of Actions Table (Attachment 1 WECC IRO-006-WECC-1).]
Contributing Schedule [Archive]		2/10/2009	3/17/2011	A Schedule not on the Qualified Transfer Path between a Source Balancing Authority and a Sink Balancing Authority that contributes unscheduled flow across the Qualified Transfer Path.
Qualified Transfer Path [Archive]		2/10/2009	3/17/2011	A transfer path designated by the WECC Operating Committee as being qualified for WECC unscheduled flow mitigation.
Qualified Controllable Device [Archive]		2/10/2009	3/17/2011	A controllable device installed in the Interconnection for controlling energy flow and the WECC Operating Committee has approved using the device for controlling the USF on the Qualified Transfer Paths.

Endnotes

[†] FERC approved the WECC Tier One Reliability Standards in the Order Approving Regional Reliability Standards for the Western Interconnection and Directing Modifications, 119 FERC ¶ 61,260 (June 8, 2007). In that Order, FERC directed WECC to address the inconsistencies between the regional definitions and the NERC Glossary in developing permanent replacement standards. The replacement standards designed to address the shortcomings were filed with FERC in 2009.

AGREEMENT
ON THE DEVELOPMENT OF ELECTRIC POWER TRANSMISSION RELIABILITY STANDARDS AND OF PROCEDURES AND A PROGRAM FOR THE MONITORING OF THE APPLICATION OF THESE STANDARDS FOR QUÉBEC

BETWEEN

Régie de l'énergie, a public body established under the *Act respecting the Régie de l'énergie* (R.S.Q., c. R-6.01) with headquarters at Tour de la Bourse, P.O. Box 001, 800 Place Victoria, 2nd floor, Suite 2.55, Montréal, Québec H4Z 1A2, acting through Jean-Paul Théorêt, Chairman, duly authorized pursuant to subsection 85.4 of the *Act respecting the Régie de l'énergie* (R.S.Q., c. R-6.01),

hereinafter referred to as "the Régie"

AND

North American Electric Reliability Corporation, a corporate body established under the *New Jersey Nonprofit Corporation Act*, New Jersey Statutes Title 15A, with headquarters at 116-390 Village Boulevard, Princeton, New Jersey, United States, 08540-5721, acting through Richard P. Sergel, President and Chief Executive Officer, duly authorized pursuant to Article VI, Section 1, of the Bylaws of the North American Electric Reliability Corporation,

hereinafter referred to as "NERC"

AND

Northeast Power Coordinating Council, Inc., a corporate body established under Section 402 of the *New York State Not-for-Profit Corporation Law*, with headquarters at 1515 Broadway, 43rd floor, New York, New York, United States, 10036, acting through Edward A. Schwerdt, President and Chief Executive Officer, duly authorized pursuant to the Amended and Restated Bylaws of the Northeast Power Coordinating Council, Inc.,

hereinafter referred to as "NPCC."

WHEREAS subsection 85.2 of the *Act respecting the Régie de l'énergie* (the "Act") provides for the Régie to ensure that electric power transmission in Québec is carried out in accordance with the reliability standards it adopts;

WHEREAS reliability refers to the degree of performance of an electric power transmission system that results in electricity being delivered to customers within accepted standards and in the amount desired and may be measured by the frequency, duration, and magnitude of adverse effects on the electric supply;

WHEREAS subsection 85.4 of the Act further provides that the Régie, with the authorization of the Government of Québec, may enter into an agreement with a body that proves it has the expertise to establish or monitor the application of electric power transmission reliability standards for the purpose of developing such standards for Québec, carrying out inspections and investigations as part of plans to monitor compliance with the reliability standards that the Régie adopts, and providing the Régie with opinions and recommendations;

WHEREAS NERC is a New Jersey, United States (U.S.), not-for-profit corporation sponsored by all sectors of the utility industry, including those in Québec, whose mission is the development and enforcement of reliability standards to protect the reliability, adequacy, and security of the bulk power system in North America. NERC is the successor to the North

American Electric Reliability Council. NERC coordinates its activities with eight (8) regional entities in North America, including NPCC;

WHEREAS NERC has established the *NERC Reliability Standards Development Procedure,* in which all Québec entities subject to the reliability standards referred to in subsection 85.3 of the Act may participate;

WHEREAS the American National Standards Institute ("ANSI") has accredited the *NERC Reliability Standards Development Procedure* as being consistent with ANSI's standards development principles;

WHEREAS the U.S. Federal Energy Regulatory Commission ("FERC") has certified NERC as the Electric Reliability Organization, in accordance with the *Electricity Modernization Act of 2005*, to develop, submit to it for approval and enforce reliability standards for the bulk power system in the United States, subject to certain delegation provisions for the eight (8) regional entities in North America, including the delegation provisions for NPCC described below;

WHEREAS by means of legislation or other provisions, Ontario, New Brunswick, Manitoba, British Columbia, Alberta, Saskatchewan and Nova Scotia, have made or will make mandatory the NERC reliability standards;

WHEREAS the Régie has concluded that NERC has proven that it has the expertise to develop and monitor the application of electric power transmission reliability standards;

WHEREAS NPCC is a not-for-profit corporation in New York State, United States, having the purpose of promoting and enhancing the reliable and efficient operation of the international, interconnected bulk power systems in northeastern North America through the development of regional reliability standards and compliance assessment and enforcement of continent-wide and regional reliability standards, coordination of system planning, design and operations, and assessment of reliability, pursuant to an agreement with NERC which designates NPCC as a cross-border regional entity for the northeastern United States and delegates authority from FERC. Additionally, NPCC establishes regionally specific, more stringent reliability criteria and monitors and enforces compliance with such criteria;

WHEREAS NPCC has developed the *NPCC Regional Reliability Standards Development Procedure*, approved by NERC on October 23, 2007 and adopted by FERC on March 21, 2008, for the purpose of developing specific reliability standards for interconnected networks in northeastern North America in which Québec entities subject to the reliability standards referred to in subsection 85.3 of the Act may participate;

WHEREAS the Régie has concluded from NPCC's more than four decades of international reliability assurance that NPCC has the expertise to develop, monitor the application of, and assess compliance with electric power transmission reliability standards and criteria;

WHEREAS the Régie has resolved, for the reasons set out above, to mandate NERC and NPCC to develop reliability standards that the Régie adopts for electric power transmission in Québec and the procedures and a program for the monitoring of the application of these standards, and provide the Régie with opinions and recommendations pursuant to the present agreement (the "Agreement");

WHEREAS pursuant to subsection 85.5 of the Act, the Régie designated a reliability coordinator for Québec in its Decision D-2007-95;

WHEREAS pursuant to subsection 85.6 of the Act, the said reliability coordinator must file with the Régie the reliability standards proposed by a body that has entered into an agreement with the Régie under subsection 85.4 of the Act, as well as any variant or other standard the reliability coordinator considers necessary, an evaluation of the relevance and impact of the standards filed and the identification of the entities that may be subject to the reliability standards;

WHEREAS pursuant to subsection 85.7 of the Act, the Régie may request the reliability coordinator to modify a standard filed or submit a new one;

WHEREAS pursuant to subsection 85.7 of the Act, the Régie shall adopt the reliability standards and set the date for their coming into force;

WHEREAS pursuant to subsection 85.7 of the Act, the reliability standards may provide for a schedule of sanctions, including financial penalties, that apply if standards are not complied with and refer to reliability standards set by a standardization agency that has entered into an agreement with the Régie;

WHEREAS pursuant to subsection 85.8 of the Act, the reliability coordinator shall submit to the Régie a guide describing criteria to be taken into account in determining the sanction for non-compliance with a reliability standard;

WHEREAS pursuant to subsection 85.9 of the Act, if an entity is the object of a violation allegation to a reliability standard, it has at least twenty (20) days to submit observations to the body mandated by the Régie for the monitoring of the application of the reliability standards before this body reports to the Régie and recommends the application of a sanction, if need be;

WHEREAS pursuant to subsection 85.13 of the Act, the reliability coordinator must submit to the Régie, for approval, a register identifying the entities subject to the reliability standards adopted by the Régie;

WHEREAS the parties to the Agreement recognize the need to coordinate and to cooperate for the enhancement of the reliability of the North American bulk power system, including Québec's electric power transmission system, and to facilitate the exchange of experience, information and data related to that system;

WHEREAS the Québec electric power transmission system is an asynchronous interconnection and NERC and NPCC have recognized it as an Interconnection, it may, therefore, require reliability standards or variants of such standards specific to this Interconnection;

NOW THEREFORE, the Régie, NERC and NPCC agree as follows:

1. INTERPRETATION

1.1 Exclusivity of Agreement

This Agreement constitutes the entire agreement between the parties with respect to the development of reliability standards applicable to Québec and of the procedures and a program for the monitoring of the application of such standards, and opinions and recommendations provided by NERC or NPCC with respect to such standards and the electric power transmission reliability in Québec. It supersedes all prior agreements and understandings, both written and oral, among the parties with respect to the subject matter of this Agreement.

1.2 Governing law and competent jurisdiction

This Agreement shall be governed by the laws of Québec, and the courts of Québec shall have exclusive jurisdiction to settle any disputes arising herefrom.

1.3 Headings

The headings of this Agreement are for convenience of reference only and shall not define, limit, or otherwise affect any of the terms or provisions hereof.

2. REPRESENTATIVES

For the purposes of the application of the Agreement, the Régie designates Gilbert Neveu, Executive Director, as its representative; NERC designates David Cook, Vice President, as its

representative; and NPCC designates Edward A. Schwerdt, President, as its representative. Each of the parties undertakes to expeditiously advise the other parties of any change in its representative.

3. PURPOSE OF AGREEMENT

3.1 The Régie hereby retains the services of NERC and NPCC as experts in the development of electric power transmission reliability standards. NERC and NPCC shall develop, in accordance with their standards development procedures, electric power transmission reliability standards applicable to Québec, and propose them to the reliability coordinator for adoption by the Régie. The services of NERC and NPCC are also required as technical experts to advise the Régie with respect to the review of the reliability standards and of the sanction guide which will be filed by the reliability coordinator, and to provide the Régie with opinions and recommendations.

3.2 The Régie also retains the services of NERC and NPCC as experts in the monitoring of the application of electric power transmission reliability standards. NERC and NPCC shall develop, taking into account Québec's legal and regulatory environment and in accordance with their applicable compliance monitoring procedures, specific procedures and a program for the monitoring of the application of electric power transmission reliability standards in Québec which they are able to implement. The Régie shall be responsible for the said procedures and program.

3.3 The said specific procedures and program for the monitoring of the application of electric power transmission reliability standards in Québec will be submitted to a consultation with the entities subject to the reliability standards.

3.4 Subsequent to the said consultation and upon authorization from the Government of Québec, a second agreement shall detail the mandates granted by the Régie to NERC and to NPCC with respect to the implementation of the said procedures and program for the monitoring of the application of electric power transmission reliability standards in Québec and the provision of opinions and recommendations to the Régie in this regard.

4. UNDERTAKINGS OF NERC AND NPCC

4.1 NERC and NPCC undertake to develop electric power transmission reliability standards applicable to Québec in accordance with their procedures, namely the *NERC Reliability Standards Development Procedure* and the *NPCC Regional Reliability Standards Development Procedure*. To this end, NERC and NPCC undertake, within the framework of their respective procedures, to take note of the comments and opinions submitted by the Québec reliability coordinator, the electric power carriers and users of electric power transmission services in Québec.

4.2 NERC and NPCC undertake to ascertain that any electric power transmission reliability standards specific to Québec, and/or any variant of such standards specific to Québec, which the reliability coordinator deems necessary to ensure the reliability of electric power transmission in Québec, is as stringent as the NERC reliability standards applicable in the rest of North America.

4.3 NERC and NPCC undertake to develop, in accordance with their compliance monitoring procedures, namely the *NERC Rules of Procedures,* the *NERC Uniform Compliance Monitoring and Enforcement Program* and the *NPCC Compliance Monitoring and Enforcement Program,* specific program and procedures for the monitoring of the application of electric power transmission reliability standards adapted to Québec's legal and regulatory environment.

4.4 NERC and NPCC undertake to have representatives present or, as necessary, to testify as technical experts at the hearings the Régie will hold, if need be, when filings regarding reliability standards are examined by the Régie pursuant to subsections 85.6 and 85.7 of the Act, and when the sanction guide filed by the reliability coordinator pursuant to subsection 85.8 of the Act is reviewed.

4.5 NERC and NPCC undertake to submit to the Régie, at the Régie's request, opinions or recommendations during the proceedings referred to in Article 4.4, including but not limited to opinions or recommendations respecting matters submitted to the Régie's consideration by the reliability coordinator.

4.6 NERC and NPCC undertake to inform the Régie promptly of potential threats to the reliability of the electric power transmission system in Québec.

4.7 NERC and NPCC undertake to submit to the Régie, at the Régie's request or on their own initiative, opinions or recommendations on all matters related to the reliability of electric power transmission in Québec.

4.8 NERC and NPCC undertake to collaborate closely with the Régie on the implementation of this Agreement and to take into consideration all instructions and recommendations from the Régie related to this Agreement.

4.9 NERC and NPCC undertake to develop the procedures and a program for the monitoring of the application of the electric power transmission reliability standards for Québec which they will be able to implement, and to provide the Régie with opinions and recommendations.

4.10 NERC and NPCC hereby represent and warrant that during the term of this Agreement each of them shall remain validly existing and in good standing pursuant to all applicable laws relevant to this Agreement.

5. REMUNERATION

5.1 The total remuneration received by NERC and NPCC for, among other things, developing and monitoring the application of electric power transmission reliability standards in the United States and Canada (and, in the case of NERC only, in Mexico) is allocated in accordance with the currently effective calculation method approved by the NERC Board of Trustees.

5.2 Québec's share of that total remuneration is currently paid by Hydro-Québec TransÉnergie, Québec's electric power carrier, as approved by the Régie in its decisions in which it fixes or modifies the electric power carrier's rates pursuant to section 49 of the Act.

5.3 Québec's share of the total remuneration approved by NERC's Board of Trustees in consideration of the monitoring of the application of electric power transmission reliability standards in Québec by NERC and NPCC will be paid by the Régie as of the date of signing the Agreement and shall cover all the services they undertake to provide to the Régie under this Agreement.

5.4 Québec's share of the total remuneration will continue to be paid by Hydro-Québec TransÉnergie, as approved by the Régie, with the exception of the portion of Québec's share, referred to in Article 5.3, which will be paid by the Régie as of the date of signing the Agreement.

5.5 NERC and NPCC agree that this remuneration shall cover all the services they undertake to provide under this Agreement.

5.6 NERC and NPCC shall provide the Régie with the draft versions of their respective annual Business Plans and Operating Budgets by May 31st of each year and with the final versions of the said documents by August 15th of each year.

5.7 By December 1st of each year, at the latest, NERC and NPCC shall provide the Régie with their final budgets for the coming calendar year for the portion of Québec's share that will be paid by the Régie, in order to allow the Régie to prepare its own budget.

5.8 If the Régie objects to the budgets or any invoice(s) submitted under this Agreement, it shall promptly notify NERC and/or NPCC in writing. The parties agree that, should the

Régie object to an invoice, payment shall be effected under protest and the objection resolved pursuant to Article 9.

6. DECLARATIONS

NERC and NPCC do hereby declare that no applicable law, contract or other legal obligation prevents them from executing this Agreement and fulfilling their obligations hereunder.

The Régie declares that it has been duly authorized by the Government of Québec to make this Agreement, pursuant to subsection 85.4 of the Act.

7. TERM OF AGREEMENT AND TERMINATION

This Agreement is effective as of the date of the last signing by the parties.

Either party may terminate this Agreement upon one year's notice to the other party.

8. DEFAULT AND CURE

Upon the failure of a party to perform or observe any material term, condition or covenant of the Agreement, the non-breaching party shall give written notice of such breach to the breaching party (the "Default Notice"). Subject to a suspension of the following deadlines as specified below, the breaching party shall have thirty (30) days from receipt of the Default Notice within which to cure such breach; provided however, that if such breach is not capable of cure within thirty (30) days, the breaching party shall commence such cure within thirty (30) days after notice and continuously and diligently complete such cure within ninety (90) days from receipt of the Default Notice; and, if cured within such time, the breach specified in such notice shall cease to exist. Subject to the limitation specified in the following sentence, if a breach is not cured as provided in this Article, or if a breach is not capable of being cured within the period provided for herein, the nonbreaching party shall have the right to declare a default and resiliate this Agreement by written notice at any time until cure occurs, and be relieved of any further obligation hereunder. The deadlines for cure and the right to declare a default and terminate this Agreement shall be suspended during the pendency of any efforts or proceedings in accordance with Article 9 of this Agreement to resolve a dispute as to whether a breach has occurred. Resiliation of this Agreement does not extinguish any obligation existing at the time of the resiliation.

9. DISPUTE RESOLUTION

In the event a dispute arises under this Agreement between the Régie, NERC and/or NPCC, representatives of the parties with authority to settle the dispute shall meet and confer in good faith in an effort to resolve the dispute in a timely manner. In the event the designated representatives are unable to resolve the dispute within thirty (30) days or such other period as the parties may agree upon, each party shall have all rights to pursue all remedies, except as expressly limited by the terms of this Agreement. Neither party shall have the right to pursue other remedies until the Dispute Resolution procedures of this Article 9 have been exhausted. This Article 9 shall not apply to enforcement actions against registered entities.

10. LIMITATION OF LIABILITY

The Régie agrees not to sue NERC or NPCC or their directors, officers, employees, and persons serving on their committees and subgroups based on any act or omission of any of the foregoing in the performance of duties pursuant to this Agreement or in conducting activities under the authority of the Act, except to the extent that NERC or NPCC is found liable for gross negligence or intentional misconduct.

11. ASSIGNMENT

NERC and NPCC may not assign their rights and obligations under this Agreement without the consent of the Régie. However, nothing in this provision shall prohibit NERC or NPCC from contracting with other entities to assist them in carrying out their responsibilities under

the Agreement. NERC and NPCC shall, however, remain responsible for their obligations under this Agreement.

12. CONFIDENTIALITY

The information contained in the opinions and recommendations of NERC or NPCC to the Régie may not be copied, disclosed or distributed without the prior written permission of the Régie. In their opinions and recommendations, NERC and NPCC may identify the information they deem to be confidential.

During the course of the parties' performance under this Agreement, a party may receive Confidential Information, as defined in Section 1500 of NERC's Rules of Procedure or information of the same nature considered confidential by the Régie. Except as set forth herein, the parties agree to keep in confidence and not to copy, disclose, or distribute any Confidential Information or any part thereof, without the prior written permission of the issuing party, unless disclosure is required by subpoena, law, or other directive of a court, administrative agency, or arbitration panel, in which event the recipient hereby agrees to provide the party that provided the Confidential Information with prompt notice of such request or requirement in order to enable such issuing party to (a) seek an appropriate protective order or other remedy, (b) consult with the recipient with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Article. In the event a protective order or other remedy is not obtained or the issuing party waives compliance with the provisions, the recipient agrees to furnish only that portion of the Confidential Information which the recipient's counsel advises is legally required and to exercise best efforts to obtain assurance that confidential treatment will be accorded to such Confidential Information. In addition, each party shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom Confidential Information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

13. NO THIRD PARTY BENEFICIARIES

Nothing in this Agreement shall be construed to create any duty to, any standard of care with reference to, or any liability to any third party.

14. NOTICE

Whether expressly so stated or not, all notices, demands, requests, and other communications required or permitted by or provided for in this Agreement shall be given in writing to a party at the address set forth below, or at such other address as a party shall designate for itself in writing in accordance with this Article, and shall be delivered by hand or reputable overnight courier.

15. EXECUTION OF COUNTERPARTS

This Agreement is executed in four (4) counterparts in French and four (4) counterparts in English and each has the same force and effect as the original.

IN WITNESS WHEREOF, the parties have caused the Agreement, in French and in English, both versions being regarded as equally authentic and valid, to be executed by their duly authorized representatives.

a-beneath--CIP 706 Drafting Team Meeting Notes, September, 2011.
b-beneath--PRC-024 variance--Hydro-Quebec.
c-beneath--Protection and Control Subcommittee Joint Meetings--materials.
Discussion of SPS and related items.
d-beneath--FERC Technical Conference--CIP-006-2, Oct. 25, 2011.
e-beneath--CAN Comment Form--template.

Item 9a--Brian Evans-Mongeon reported that for the comment period that closed Oct. 10, 2011 NERC received over 1000 pages of comments for both of the documents that were posted. The responses to the comments rest with the Standard Drafting Team members. Anticipate that the responses will be made public the week of Oct. 31, 2011. An updated definitions document was sent out. The NERC BOT is scheduled to meet Nov. 3, 2011, and this will be on the agenda. There will be a recirculation ballot, and the NERC Board of Trustees will give guidance to the NERC Staff. David Ramkalawan remarked that black start facilities were mentioned in many of the comments submitted. Brian Evans-Mongeon said that black start facilities are essential to the restoration of the power system, thus making them needed for overall reliability. Everyone who submitted a comment will receive a response. David Ramkalawan observed that non-retail load was not addressed, but was mentioned in comments. Comments will be addressed globally. Greg Campoli commented that UFLS relays are not considered BES. Brian Evans-Mongeon responded that equipment that deals with non-BES facilities is not considered BES. In addition to UFLS relays, this includes UVLS relays. Chris de Graffenried questioned radial designs as being non-conforming.

The Standard Drafting Team is not anticipating another meeting until the next phase. Compliance developed a straw man transition plan to provide guidance on how to conform to a new BES definition. Transition plans were discussed. Looking for draft transition plans from New York Transmission Operators.

Are the Canadians included? The feeling was that the Canadian entities were being ignored.

Guy Zito explained why he cast an affirmative vote during the last ballot. There were no "deal breakers" that would justify a "No" vote. The NPCC Board of Directors had discussed the BES definition. The NPCC was restricted to only voting on the definitions in Order 743. If the Standard Drafting Team had met that, the ballot would be "Yes". Guy Zito explained he had a responsibility to the NPCC Board of Directors and the NPCC Executive Management to vote appropriately. Sylvain Clermont commented that he was only considering voting "No", and not abstaining. Everyone except the NYISO and NPCC voted "No". Guy Zito did not disagree with the NPCC Board of Directors. He had sent out a letter with the issues, and got no responses. At the RSC Executive Committee Meeting Sept. 14, 2011 there were no deal breakers identified. Kathleen Goodman commented that on the one hand NPCC should be able to vote as an individual entity, and on the other it is important for the RSC's feelings to be made known.

The assembled were asked why they cast "No" votes. David Ramkalawan indicated that it is known that the process will be going to a Phase 2, and the feeling was that the industry was being pushed. Phase 2 should have been completed before a ballot was conducted. Guy Zito replied that because of a tight time constraint that would not have been possible. Sylvain Clermont commented that even though the comments submitted were agreeable to the members, the members viewed them as not being favorable to casting a "Yes" ballot. Kathleen Goodman commented that she disagreed with the implemented concurrent balloting and commenting. She cannot vote when she doesn't know how submitted comments will be addressed. Sylvain Clermont suggested that Guy Zito speak with Ed Schwerdt about this. Guy Zito agreed to that. Guy Zito commented

that it is important to understand how each one of the member's votes, and how the voting positions are developed. The vote needs to be coordinated. Lee Pedowicz sent out the Comment Form (due Oct. 27, 2011) with the draft responses for a final review before submission.

Kathleen Goodman, the IESO, Saurabh Saksena, and Michael Schiavone asked that their names not be included on the final submission to NERC.

Item 9b--there were no comments at the time of the Meeting.

Item 9c--there were no comments at the time of the Meeting.

Item 9d--waiting for comments from the ISO/RTO Council. Per Sylvain Clermont and David Kiguel, wind farms will be tapping in. David Kiguel is concerned about loads tapping in because of the regulating governance where the tap is made. Kathleen Goodman to send Lee Pedowicz comments by Nov. 10, 2011.

Item 9e--Greg Campoli sent comments.

Item 9f--CAN-0011 appears to go beyond what the requirement says. Mike Garton commented that the Standard refers to the BES, yet the CAN changed it to BPS. Why?

Item 9g--A discussion took place over the meaning of "annual". The CAN raised the question of how can compliance be retroactive? David Kiguel offered to come up with a comment for the RSC to consider. There is an attempt being made to state when a Standard becomes effective.

Item 9h--there were no comments at the time of the Meeting.

Item 9i--Pertains to NERC software tools. Bullet 2 on page 3 of 5 of the CAN suggests accomplishing the availability objective of the Standard, but not the requirement.

Item 9j--Both Ron Falsetti and Kathleen Goodman commented that the CAN had no apparent value. There were no comments from the RSC as a group. The question was asked if the CAN expanded the scope or changed the Standard, and the answer was no that it didn't. Michael Lombardi reported that Northeast Utilities will comment individually.

Item 9k--the comments submitted by TFIST were looked at. It was explained by Howard Gugel that a data diode takes available material, and converts it to one way serial data. It does involve routable protocol. It was agreed that the comments submitted by RSC would be those provided by TFIST.

Item 9l--the CAN, by the way it is written, says that the RC, etc. should communicate relay characteristics to operating personnel. Lee Pedowicz to generate comments to this CAN.

Item 9m--there were no comments at the time of the meeting.

Item 9n--TFIST to provide comments.

Item 9o--Kathleen Goodman to provide comments.

Item 9p--it was questioned whether or not this CAN is expanding a requirement. Randy MacDonald to review.

Item 9q-- were no comments at the time of the meeting.

Note: for CAN Items 9e through 9m, RSC members reviewed and were given the opportunity to send to Lee Pedowicz. Lee Pedowicz reviewed the comments and submitted to NERC Oct. 31, 2011.

Item 9b-beneath--Hydro-Quebec has a variance for PRC-006. PRC-024 should have the curve from PRC-006. Guy Zito commented that NERC Staff should be able to coordinate getting this done. Guy Zito gave it to Howard Gugel. Si-Truc Phan to send E-mail with the specific information to Howard Gugel. Howard Gugel commented that the change should be easy to implement because the Standard is in development.

For Item 13oo--Draft letter from Jerry Mosier regarding CAN-0006. No comments for CAN-0006 had been received for CAN-0006 or submitted by RSC. Soliciting RSC input.

a-beneath--Project 2008-06 Cyber Security Order 706 – Draft Version 5 (CIP-002-CIP-011) Webinar August 24, 2011.

Item 13oo--Jerry Mosier called in. the Restoration Working Group reviewed CAN-0006: EOP-005-1 R7 Verification of Restoration. Comments were that this CAN introduced contradictions. Jerry Mosier discussed a letter that he authored detailing the Group's concerns. The letter was drafted because the Group was not able to submit its comments by the Sept. 21, 2011 deadline. Guy Zito suggested that the letter be signed by the Chair of CO-11 sign the letter. It was suggested that both the TFCO and CO-11 chairs sign the letter, but it was decided that just the CO-11 chair should sign it. Jerry Mosier wanted to insert introductory remarks and re-send to the RSC alter in the day for its review and input. A comment was made that the letter has to be closed with a suggestion, a statement indicating what is felt needs to be done. The letter should also say that table top exercises achieve the results desired in the Standard. Jerry Mosier revised the letter and re-sent it to the RSC. Guy Zito read the letter. It was discussed, and revised. CO-11 went beyond their authority. The letter was revised and sent back to Jerry Mosier.

19. SPCS Meeting (in Meeting Materials Package)

a.

20. NERC Compliance Application Notices (CANs) (in Meeting Materials Package--see sections 9 and 13 above)

a. Compliance Application Notices (CANs) and Bulletins (see Items 9 and 13).
b. General discussion (CO-11 request).
c. Updated CAN Status Spreadsheet.
d. Final dispositions of:
   1. CAN Process.
   2. CAN-0016: CIP-001 R1 Sabotage Reporting Procedure.
e. NERC Compliance Announcement Oct. 19, 2011.
   1. CIP Table Three Entities

21. NERC Bulk Electric System Definition (in Meeting Materials Package)

a. August 8-11, 18 meetings. Presentation to NERC Standards Committee August 18, 2011.

b. Bulk Electric System Definition Project - Fact Sheet, Fact Sheet with revisions.
c. NARUC Resolution on BES Definition.
d. Webinar--September 28, 2011.
e. Hydro-Quebec request for discussion of ballot decisions.
f. October 18-20, 2011 Definition of BES Drafting Team Meeting.
g. Updated Definitions of Terms Used in Standard.

22. NPCC Regional Standards, and More--Update (in Meeting Materials Package)

a. Disturbance Monitoring (PRC-002-NPCC-01)
   1. FERC approval October 20, 2011.
b. Underfrequency Load Shedding
   1. Authorization to Post CEAP and Pre Ballot for UFLS PRC -006-01.
c. Regional Reserve Sharing Groups
   1. Draft RSAR developed
   2. TFCO will be the Drafting Team. NPCC, and NERC soliciting for additional Drafting Team members.
d. NPCC Glossary of Terms--for RSC approval, retirement of Criteria A-7 NPCC Glossary of Terms.

Item 22b--RSC was reminded to encourage submission of response to the Cost Effectiveness Questions. Information is needed from the Generator Forum. A CEAP report is to be generated before PRC-006-NPCC-01 is posted for ballot.

Item 22c--Guy Zito stated that there is no NERC Standard to address the issues contained therein. The Regional Reserve Sharing Groups Regional Standard is intended to fill that gap. Guy Zito wants to have the Standard posted. The posting is not intended to be the go ahead for the Standard's development. It is intended to get industry input to assist in the determination of a future course of action. The Standard applies to Balancing Authorities. A directory is being developed in parallel with the Standard. It is hoped that the Standard will encourage the submission or more comments from industry. This was brought to the RSC for its approval for a 45 day posting for comments. Development of the Standard is also a goal of the NPCC Board of Directors (third Regional Standard). The TFCO also requested the development of this "fill in the blank" Standard. Ben Wu asked if NERC was heading towards eliminating Regional Standards. Howard Gugel responded that Regional Standards are needed for a Region to close Regional reliability gaps. Ron Falsetti commented that Ontario market rules were introduced to allow the IESO to participate. Mike Garton made a motion to approve the draft Standard for posting. Seconded by Brian Evans-Mongeon. With the exception of two abstentions, all others were in favor. Regional Reserve Sharing Groups will be posted for a 45 day comment period.

Item 22d--The NPCC Glossary is a tool that the Task Forces will use to check for discrepancies in "in use" definitions. The Glossary will contain all approved terms. The document has been posted for comments. RSC will have to approve. The Glossary will improve efficiency by not having to have the entire document approved when there is a change as had to be done with Criteria A-7. David Kiguel questioned how to ensure consistency in the use of terms. That will be resolved in the Directory approval process. If here is a change in the Glossary, will then have to go back to affected Directories? Under discussion is how to show defined terms in the Directories. If a definition is only in one document, it was suggested that the definition only be identified in that document, and not in the Glossary. Si-Truc Phan made a motion to approve the Glossary, seconded by Bruce Metruck. All were in favor.

Action Item--further discussion required regarding how to show a definition that may only be used in one document (see Action Item List).

23. NPCC Cost Effectiveness Analysis, Triage Process (in Meeting Materials Package)

a. Cost Effectiveness Analysis Procedure.
b. Triage process--discuss for posting.

Item 23a--Guy Zito discussed the intent, and the methods detailed in the CEAP. FERC, and NERC are interested in the development of this document. The NPCC Staff will generate reports from the data received. The comments that Michael Lombardi submitted were acknowledged. Si-Truc Phan commented that he was concerned that would use the CEAP as a vehicle for going against a Standard. The CEAP is not intended to be an analytical tool, just a means for organizing data. Tina Teng asked how an Entity can provide cost data in Phase 1 (Cost Benefit Analysis stage) when only a RSAR exists. Suggested not to ask about cost. It was felt that some entities might not be comfortable answering Question 3--"What approximate one-time and ongoing estimated potential costs would be associated with compliance with the proposed Standard?" It was reiterated that all submitted information will be held in strictest confidence. Guy Zito proposed approving the document as proposed considering comments that Maureen Long had sent in to use as a pilot. Sylvain Clermont made a motion to approve the CEAP, seconded by Greg Campoli. The CEAP will be used for Regional Standards. David Kiguel remarked that the NPCC Board of Directors' position is that cost must be taken into consideration when considering reliability. The CEAP will be piloted on the Underfrequency Load Shedding Regional Standard. All were in favor of approving the CEAP.

Item 23b--The Triage Process was brought up for approval. It was noted that it relies heavily on the RSC Executive Committee. Guy Zito reported that he hasn't received further comments. Michael Lombardi made a motion to approve the RSC Triage Process as written. Mike Garton seconded the motion. All were in favor.

24. NY adoption of more stringent/specific NPCC Criteria

a. The New York filing (as well as an update to the applicable NPCC Criteria in Nova Scotia that were approved by the Nova Scotia Utility and Review Board earlier this year), will be filed by the end of October, 2011.

No updated information was available for the meeting.

25. Directory and Regional Work Plan Status

a. Directory Development and Revision Manual--for RSC approval.

Directory Number	Title	Lead Group, Status	Current Activity
#1 (A-2)	Design and Operation of the Bulk Power System	Approved on 12/1/2009	TFCP has charged CP11 with a comprehensive review of Directory #1 to include the triennial document review, an examination of the NERC TPL standards, the existing NPCC planning criteria, and the implementation of Phase 2 of the Directory Project which will reformat existing Directory criteria into NERC style requirements. TFCO has assigned CO-8 to review the TO requirements within the Directory #1 criteria. TFCP/CP-11 is ready to post the document for its initial Open Process posting upon conclusion of the TFCO/CO-8 review. Open Process posting expected in mid December, 2011.
#2 (A-3)	Emergency Operation	Approved on 10/21/08.	Automatic UFLS language transferred to Directory #12. Next TFCO review Oct. 21, 2011.
#3 (A-4)	Maintenance Criteria for BPS Protection.	Approved on 7/11/08.	Phase 2 reformatting pending.
#4 (A-5)	Bulk Power System Protection Criteria	Approved on 12/1/09.	TFSP expects to begin Phase 2 review of Directory #4 in early 2012.
#5 (A-6)	Operating Reserve	TFCO	Directory#5 was approved by the Full Members on December 2, 2010. TFCO is working to resolve several open issues including how imports from HQ are wheeled within the Region. A TFCO special meeting is scheduled for Dec. 6, 2011 to finalize proposed revisions to Directory #5 in advance of an Open Process posting.
#6 New	Reserve Sharing	TFCO	TFCO has posted a draft of a new Directory#6 on Regional Reserve Sharing which would replace C-38 until a Regional Standard is developed. An Open Process posting for Directory #6 concluded on Oct. 24, 2011.
#7 (A-11)	Special Protection Systems	Approved on 12/27/07.	TFSP, TFSS, and TFCP are revising Directory #7. TFSP to incorporate current NRAP revisions (including Appendix A) of the document into a Phase 2 version and post for member comment after the November, 2011 TFSP Meeting.

#8 (A-12)	System Restoration	Approved on 10/21/08.	CO-11 has recently made revisions to the Directory #8 criteria. These revisions will be incorporated into the draft Phase 2 reformatting of Directory #8 which will be addressed by CO-8 early next year.
#9 (A-13)	Verification of Generator Real Power Capability	Approved on 12/22/08.	TFCO has posted the initial Phase 2 drafts of both Directories #9 and #10 to the Open Process. The initial open process concluded on June 14, 2011. TFCO reviewed comments and posted the revised Directories for a second posting which concluded on 10/24/2011. TFCO expects to present Directories #9 and #10 to the RCC in November, 2011, and anticipates a Full Member ballot of both Directories #9 and #10 in December, 2011.
#10(A14)	Verification of Generator Reactive Power Capability	Approved on 12/22/08.	Refer to Directory #9 preceding.
#12	UFLS Program Requirements	Approved on 6/26/09.	

Item 25a--Guy Zito, Gerry Dunbar, and Michael Lombardi worked on developing the Directory Development and Revision Manual. Gerry Dunbar reported that the Task Forces jurisdictional questions, and a need for rules. The RSC was to vote to approve the document, and then have it presented to the RCC for information. David Kiguel commented that NERC is flooded with requests for interpretations, and "Am I compliant?" questions. The process to verify a request for an interpretation is legitimate (refer to the Interpretation: Response to Request for an Interpretation of Directory XX for the XXXX Corporation) section of the Manual. This appears to be the intent of the Manual. Words should be added to the second paragraph of Section 5 to address David Kiguel's concerns. Greg Campoli suggested publishing a list containing informational data. The RSC would be responsible for this. A motion was made by Michael Lombardi to approve the Directory Development and Revision Manual contingent upon incorporating David Kiguel's suggestion, and develop a separate spreadsheet. It was seconded by Mike Garton. All were in favor.

Gerry Dunbar discussed the status of the Directories.

26. Review RFC, MRO Standards Relevant to NPCC (in Meeting Materials Package)

a. RFC Standards Under Development webpage
https://rsvp.rfirst.org/default.aspx

b. RFC Standard Voting Process (RSVP) webpage
ReliabilityFirst Corporation - Reliability Standards Voting Process

	Standard Under Development	Status	Start Date	End Date

2.				

e. As of June 14, 2010 MRO suspended its regional standards development.

27. Report on NERC, NAESB and Regional Activities (in Meeting Materials Package)

a. Report on NERC, NAESB and Regional Activities
1. August, 2011.
2. September, 2011.

28. Task Force Assignments, et al. (in Meeting Materials Package)

a.

From the May 18-19, 2011 RSC Meeting--The Regions are discussing how to report misoperations. NPCC uses the CDAA. If there is no access to the CDAA then E-mail

can be used to report. An Action Item will be created to put questions together regarding misoperations.

Guy Zito raised the question of who should develop RSAWs. It was suggested that the Drafting Team do it, but they most likely are not familiar with compliance issues.

Ron Falsetti inquired about the criteria for categorizing events. Do Regions develop their own criteria? Ralph Rufrano said no, but Ron believed they did. Ron Falsetti and Ralph will discuss outside the meeting.

Additional information from Ben Eng (NPCC) (refer to the sample letter in the Meeting Materials)--

- The notes are correct in that misoperations are currently being emailed to me (and copied to Henry) for the short term. The long term goal is to modify CDAA so that the reminders and capture mechanism are automated.
- RSAWs already exist for PRC-004. The requirements are that analysis, corrective action plans and implementation must be done by the entity to prevent recurrence. The RSAW/Standard is not prescriptive in describing how, or to what degree, analysis should be done, and the correct actions to resolve the misoperation. Nor should it, since protective relaying is an "art"
- The criteria for the categories were established by the SPCS in the NERC Misoperation Reporting Template, and do not conflict with the NERC Glossary. A NERC webinar on Misoperation Reporting was conducted and an extensive list of Questions and Answers was developed into a document. The references and guidance for Misoperation Reporting are posted on NPCC's public website "Documents; Compliance; CDAA": https://www.npcc.org/Compliance/CDAA/Forms/Public%20List.aspx
- The process is in place to capture misoperation reports. Improvements to the process are planned.
- Initial notification for 3rd Quarter Misoperation Reports sent about 3 weeks prior to the due date.
- Follow up reminder sent the week before the due date
- The notification contained the link to the pertinent materials on the new NPCC Website
- SP-7 has been compiling and reviewing the misoperations and formalizing reports to NERC as scheduled.
- Ensuring that all reportable misoperations that happen in NPCC's footprint has been the biggest challenge.

29. Future Meetings and Other Issues (in Meeting Materials Package)

a. Filings and rulings regarding the NERC and NPCC applications for approval of Reliability Standards and Criteria in Nova Scotia.

b. FERC, NERC joint inquiry into Sept. 8, 2011 Southwest power outage.

1. Blackout news.

c. Balloting, voting process (WECC).

dd. New Brunswick Energy Blueprint.

ee. NERC 2012 Actively Monitored List of Reliability Standards and 2012 ERO CMEP Implementation Plan.

ff. WECC Newsletter--September/October 2011.

gg. Regional Reliability Standards Announcement
Comment Period Open for VAR-001-2 WECC Variance
October 20 – December 5, 2011.

hh. NERC--Conference Calls and Meeting Agendas.
   1. Standards Oversight and Technology Committee Meeting--Nov. 2, 2011.
   2. Compliance Committee Meeting--Nov. 2, 2011.
   3. Member Representatives Committee Meeting--Nov. 2, 2011.
   4. NERC Board of Trustees Meeting--Nov. 3, 2011.

Item 29s--The Work Plan 2012-2013 has been sent out several times to the RSC for comments. Guy Zito inquired if there were any additional revisions necessary. He wants to present it to the NPCC Board of Directors. The ninth bullet on page 1 was intended to mean RSC support. David Kiguel suggested that bullet 9 on page 1 be made to read "Monitor and coordinate NERC's CEO top reliability related issues and priorities". A motion was made by Michael Lombardi to approve the Work Plan. It was seconded by Sylvain Clermont. All voted in favor. The Work Plan 2012-2013 will now be presented to the NPCC Board of Directors.

Item 29w--Proposed RSC Meeting dates for 2012:

February 22-23, 2012--NPCC Offices
May 2-3, 2012--Dominion Offices
July 18-19, 2012--New England location
September 5-6, 2012--Montreal
October 17-18, 2012--Toronto
December, 2012 Meeting to coincide with the NPCC General Meeting

David Kiguel suggested that a Webex be used for future RSC Meetings. Guy Zito responded that it can be tried. It is preferable to have face to face meetings, and the option of a Webex should discourage in person attendance. It was agreed to have a Webex in Toronto.

RSC 2011 Meeting Dates

Dec. 1-2, 2011--Joint Meeting with the CC Dec. 2, 2011 Toronto, Ontario

2011 RSC Conference Call Schedule
(call 719-785-1707, Guest Code 8287#)

RCC	Nov. 29, 2011
	2012-- March 1, June 6, Sept. 6, Nov. 27
CC	Nov. 16, Dec. 13-15
TFSS	
TFCP	Nov. 2
TFCO	
TFIST	
TFSP	Nov. 15-17

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council Inc.

Northeast Power Coordinating Council, Inc. (NPCC)

Antitrust Compliance Guidelines

It is NPCC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment. Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.

Any NPCC meeting participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Secretary, Andrianne S. Payson at 212-259-8218.

Action Item List

Action Item Number	Agenda Item Number	Description	Owner	Due	Status
32 (To be deleted)	16b	To discuss with Herbert Schrayshuen how HQ, because of its unique operational requirements, will be addressed in standards development	Guy Zito--member of Standards Committee Process Subcommittee	RSC Meeting	Ongoing as of 2/10/10. Sylvain Clermont, and David Kiguel working with Guy Zito. Herbert Schrayshuen replaced Gerry Adamski at NERC. The new NERC management team will have to be made familiar with this item.
August 20-21, 2008					
Feb. 17-18, 2009					
June 17-18, 2009					
August 6-7, 2009					
60	3a	NPCC representatives from NERC drafting teams that have documents posted for comments report at RSC Meetings	Lee Pedowicz	RSC Meeting	Ongoing.
Sept. 24-25, 2009					

Action Item Number	Agenda Item Number	Description	Owner	Due	Status
Nov. 4-5, 2009					
April 21-22, 2010					
63	----	Coordination with the Compliance Committee to develop Joint Activity Action List	Greg Campoli	RSC Meeting	Outgrowth of RSC/CC joint session April 21, 2010. Ongoing. Joint RSC/CC Meeting this meeting. Ralph Rufrano rejoined the RSC in the capacity of NPCC Compliance liaison. Comments not to be submitted on the CCEP.
June 29-30, 2010					
65	----	RSC to review the NPCC Members on NERC Drafting Teams list. Saurabh Saksena to maintain. Will get input from Carol Sedewitz.	RSC	RSC Meeting	Ongoing.
August 18-19, 2010					
66	----	Status of Memorandum of Understanding	Sylvain Clermont	RSC Meeting	Provide update. (MOU in Meeting Materials Package)

Action Item Number	Agenda Item Number	Description	Owner	Due	Status
Nov. 30, 2010,					
Dec. 2, 2010					
69	----	Revise RSC Scope	Guy Zito	RSC Meeting	Approved at the August 3, 2011 RSC Meeting. To be presented to the NPCC Board of Directors.
Feb. 2-3, 2011					
71	----	Talk to Compliance about Regional Reliability Standard RSAWs. There should be a Compliance Committee representative on the Drafting Team.	Guy Zito	RSC Meeting	Ongoing.
73	----	Discuss consistency with the RSG.	Guy Zito	RSC Meeting	Ongoing.
March 16-17, 2011					
75	11f	Non-convergent contingencies enumerated in Project 2010-13 - Relay Loadability Order - PRC-023 Attachment B4a.	Guy Zito	RSC Meeting	To be discussed with Sal Buffamante.

Action Item Number	Agenda Item Number	Description	Owner	Due	Status
August 3-4, 2011					
76 (To be deleted)	18a	Handling of definitions	Guy Zito	RSC Meeting	To discuss with Pete Heidrich
October 26-27, 2011					
77	22d	If a term only defined in one document, should it be included in the NPCC Glossary?	Guy Zito/Gerry Dunbar	RSC Meeting	Ongoing.

Action Item 32--will be deleted. Hydro-Quebec has interconnection status.

Action Item 60--Lee Pedowicz contacted Brian Evans-Mongeon about discussing the progress of Project 2010-17 - Bulk Electric System.

Action Item 63--Guy Zito won't be at the December, 2011 Compliance Committee Workshop. It is important that Compliance Committee members are aware of what's going on with Standards. Gerry Dunbar and Lee Pedowicz will give a classroom session on Regional Standards. Guy Zito mentioned that it will be helpful to know what standards are coming, and what's on the prioritized list for standards development. David Kiguel discussed CIP versions 4 and 5. There will possibly be no version 4.

David Kiguel will put together an agenda for the joint RSC/CC Meeting Dec. 2, 2011. David Kiguel also reported that the Compliance staff is writing papers focusing on a new definition of BES.

Action Item 65--Saurabh Saksena checked with Carol Sedewitz regarding updates to the NPCC members on NERC Drafting Teams listing. There have been no changes over the past two months. Saurabh Saksena will look into the "holes" in the listing.

Action Item 66--ongoing.

Action Item 69--Guy Zito to present the RSC Scope to the NPCC Board of Directors.

Action Item 71--Topic for the December, 2011 RSC/CC Meeting.

Action Item 73--ongoing.

Action Item 75--nothing additional to report.
Action Item 76--a process is in place, approved by FERC. This item will be deleted.

Meeting adjourned at 16:30.
Meeting adjourned at 11:50.

Date:	Thursday, November 10, 2011 6:32:47 PM

Mike,

Timing was against us today. At the SC teleconference today, the appointment was not approved. However, they are encouraging you to attend as an observer. The Chair of the drafting team indicated he would seek your appointment in a "couple of months" if you were beneficial to the team. I hope you will consider attending as an observer until such time as you can be formally appointed. Let me know if NU would allow you to participate as an observer, temporarily. The main issue for denial at this time is that there are supposedly about 24 people on the team which is probably one of the largest teams NERC ever formed and they are very relunctant to add more to this unweildy amount of people, usually there are a dozen or less.

Keep me informed. If you aren't able to participate please let me know and I may need to provide one of my staff to "observe" and monitor the team.

Thanks very much,

Guy V. Zito

George,

Yes he would be a good candidate. He doesn’t need to be serving NPCC on any TF or Comm. Please fill out the attached form ASAP and return to me. I will work with our SC rep and NERC staff to see if he can be added to the slate of candidates.

Thanks,

Guy V. Zito

Hi Guy:

Mike Gerken, our Manager of Transmission Test and Maintenance is interested in serving on this SDT. He presently does not serve on any NPCC task force or committee so I'm not sure if that is a prerequisite that would prevent him from serving. Would he be a viable candidate?

Thanks,

George Wegh, P.E.

TFSP Members,

Seems we are lacking NPCC representation on the subject drafting team slate of candidates. We are attempting to solicit an opening and would like TFSP to solicit their members for any interest. Please let me know as soon as possible if anyone has interest and is able to participate on behalf of the Region.

Thanks,

Guy V. Zito

Subject: SDT candidates for Project 2007-17 Protection System Maintenance and Testing

Hi Guy,

I received today the proposed agenda and the confidential information for the drafting teams that are up for discussion on the SC meeting next week.

I noticed that on the "Project 2007-17 Protection System Maintenance and Testing Standard Drafting Team Candidates" there are none from NPCC. In the past John Ciufo(Hyrdo One) and Len Swanson(National Grid) had participated on the team.

I'm pretty sure that Len Swanson does not have the availability to continue with the team (I have reached out to confirm).

It may be too late since no one nominated themselves from NPCC, but I am happy to bring up at the SC meeting that we should reach out and get a member from NPCC to participate and we would like an opportunity to do that.

Let me know if you are comfortable with that approach and if you might be able to reach out to TFSP members to see if there might be someone interested in participating on this SDT from our region.

Thanks,

Carol

18	Project 2009-20 — Interpretation of BAL-003-0 R2 and R5 by Energy Mark, Inc.	No	BAL-003-0.1b	x	x	Yes (Recirc Thru 2/26/10)	Yes (2/26/10)					Under Development
19	Project 2007-03 — Real-time Operations	High	TOP-001-2, TOP-002-3 and TOP-003-2	Yes 2nd (Thru 9/07/07)	Yes 5th (Formal Thru 6/9/11)	Yes 1st (Intitial Thru 6/9/11)						Under Development
20	Project 2007-09 — Generator Verification	High	MOD-026-1 and PRC-024-1* MOD-024-2** MOD-025-2, MOD-027-1, PRC-019-1***	Yes 1st (Thru 5/21/07)	*Yes 2nd (Thru 8/1/11) **Yes 1st (Thru 2/18/10) ***Yes 1st (Thru 7/15/11)	*Yes 1st (Thru 8/1/11)						Under Development
21	Project 2007-12 — Frequency Response	High	BAL-003-1	Yes 3rd (Thru 3/09/07)	Yes 2nd (45 Day Formal Thru 12/8/11)	Yes 1st (Initial Thru 12/8/11)						Under Development
22	Project 2007-17 — Protection System Maintenance & Testing RE-INITIATED	High	PRC-005-2	Yes 1st (Thru 9/28/11)	Yes 1st (Thru 9/28/11)	Yes 1st (Initial Thru 9/28/11)						Under Development

NERC Reliability Standards Executive Tracking Summary

Revised: 11/18/2011

Line No.	Project No. / Title	High Priority?	Associated Standard	SAR Posted?	Posted for Comment?	Posted For Ballot?	Industry Approved?	NERC BOT Approved?	Petitioned for FERC Approval?	FERC Approved	Comments	Project Status
23	Project 2008-10 — Interpretation of CIP-006-1 R1.1 by Progress Energy	No	CIP-006, R1.1	x	x	Yes 2nd (Initial Thru 10/12/09)					Since at least one negative ballot included a comment, the results are not final. A second (or recirculation) ballot must be conducted.	Under Development
24	Project 2009-01 — Disturbance and Sabotage Reporting	High	EOP-004-2	Yes 1st (Thru 5/21/09)	Yes 3rd (45 Day Formal Thru 12/12/11)	Yes 1st (Initial Thru 12/12/11)						Under Development
25	Project 2009-22 — Interpretation of COM-002-2 R2 by the IRC	High - Interp.	COM-002-2	x	2nd (45 day Formal thru 11/17/11)	Yes 1st (Intitial Thru 11/17/11)						Under Development
26	Project 2009-24 — Interpretation of EOP-005-1 R7 by FMPA	No	EOP-005-1, R7	x	x	Yes 1st (Intitial Thru 1/15/10)					Balloting Deferred per Standards Committee	Under Development
27	Project 2009-26 — Interpretation of CIP-004-1 by WECC	No	CIP-004-1, R2, R3 and R4	x	x	Yes 1st (Intitial Thru 1/19/10)					Balloting Deferred per Standards Committee	Under Development
28	Project 2010-07 — Generator Requirements at the Transmission Interface	High	FAC-001-1, FAC-003-3, FAC-003-X	Yes 1st (Thru 3/15/10)	Yes 3rd (45 Day Formal Thru 11/18/11)	Yes 1st (Intitial Thru 11/18/11)						Under Development
29	Project 2010-07 — Generator Requirements at the Transmission Interface	High	PRC-004-2	Yes 1st (Thru 3/15/10)	Yes 1st (45 Day Formal Thru 11/18/11)	Yes 1st (Intitial Thru 11/18/11)					9/8/11 - SC waived initial 30 day comment period	Under Development
30	Project 2010-17 — Definition of Bulk Electric System	High	NERC Glossary Of Terms	Yes 1st (Thru 1/21/11)	- Yes 3rd (Definition Thru 10/10/11) - Yes 2nd (ROP & Tech Principles Thru 10/10/11)	Yes 2nd (Definiton Intitial Thru 10/10/11) Yes 2nd (Tech Principles Thru 10/10/11) Yes 2nd (ROP Thru 10/27/11)						
31	Project 2011-INT-01 Interpretation of MOD-028 for FPL	No	MOD-028	Yes 1st (Thru 11/16/11)	Yes 1st (Thru 11/16/11)	Yes 1st (Thru 11/16/11)						Under Development
32	Project 2007-02 — Operating Personnel Communications Protocols	High	COM-003-1 and COM-002-2	Yes 2nd (Thru 5/2/07)	Yes 1st (Thru 1/15/10)							Under Development
33	Project 2007-06 — System Protection Coordination	High	PRC-001-1	Yes 1st (Thru 7/10/07)	Yes 1st (Thru 10/26/09)							Under Development
34	Project 2007-11 — Disturbance Monitoring	No	PRC-002-1 and PRC-018-1	Yes 1st (Thru 4/20/07)	Yes 1st (Thru 3/18/09)							Under Development
35	Project 2008-12 — Coordinate Interchange Standards	No	INT-004-, INT-006-4, INT-009-2, INT-010-2 and INT-011-1	Yes 1st (Thru 7/31/08)	Yes 1st (Thru 12/11/09)							Under Development
36	Project 2009-02 — Real-time Reliability Monitoring and Analysis Capabilities	No	"New"	Yes 2nd (Thru 2/18/10)	Yes 1st (Informal Thru 4/4/11)						Concept White Paper posted for informal comment period	Under Development
37	Project 2010-05.1 — Protection Systems: Phase 1 (Misoperations)	High	PRC-004-3	Yes 1st (Informal Thru 7/11/11)	Yes 1st (30 Day Formal Thru 7/11/11)						".1" refers to Phase 1 of the Project	
38	Project 2010-16 — Definition of System Operator	No	NERC Glossary Of Terms	Yes 1st (Thru 12/3/10)	Yes 1st (Thru 12/3/10)							Under Development
39	Project 2010-INT-05 CIP-002-1 Requirement R3 for Duke Energy	No	CIP-002-1, R3	x	Yes 1st (Thru 10/8/10)						To be worked in parallel with Project 2009-26	Under Development
40	Project 2008-01 — Voltage and Reactive planning and control	No	VAR-001 and VAR-002	Yes 2nd (Thru 3/26/10)								Under Development
41	Project 2008-02 — Undervoltage Load Shedding	No	PRC-010-0 and PRC-022-1	Yes 1st (Thru 02/19/10)							June 2010 SC meeting - Project deferred until Higher Priority projects are completed	Project Deferred
42	Project 2009-03 — Emergency Operations	No	EOP-001, EOP-002, EOP-003 and IRO-001	Yes 1st (Thru 1/15/10)								Under Development
43	Project 2009-05 — Resource Adequacy Assessments	No	"New"	Yes 2nd (Thru 3/30/06)								Under Development
44	Project 2009-07 — Reliability of Protection Systems	No	"New"	Yes 1st (Thru 2/18/09)							Pending prioritization - may be postponed	Under Development
45	Project 2010-08 — Functional Model Glossary Revisions	No		Yes 1st (Thru 2/22/10)							June 2010 SC meeting - Project deferred until Higher Priority projects are completed	Project Deferred
46	Project 2008-06 — Cyber Security — Order 706 -- CIP Version 5 Standards										Posting for comment and ballot planned for November 2011	Under Development
47	Project 2009-04 — Phasor Measurement Units	No										Project has not started
48	Project 2010-01 — Support Personnel Training	No										Project has not started
49	Project 2010-02 — Connecting New Facilities to the Grid	No										Project has not started
50	Project 2010-03 — Modeling Data	No										Project has not started
51	Project 2010-04 — Demand Data	No										Project has not started
52	Project 2010-06 — Results-based Reliability Standards	No	Results-based Reliability Standards Transistion Plan								Transistion Plan posted 7/26/10	
53	Project 2010-14 — Balancing Authority Reliability-based Control	No									As of July 28, 2010 this project has merges Project 2007-18 - Reliability-based Controls and is now Project 2010-14 - Balancing Authority Reliability-based Control into a single project	Under Development
54	Project 2010-INT-01 Interpretation of TOP-006-2 R1.2 and R3 for FMPP	No	TOP-006-2, R1.2 and R3								Requester has been contacted to see if CAN provides necessary clarication - awaiting response	On Hold
55	Project 2010-INT-02 Interpretation of TOP-003-1 R2 for FMPP	No	TOP-003-1, R2								Requester has been contacted to see if a CAN would satisfy their concerns until the standard is revised - awaiting response	On Hold
56	Project 2010-INT-03 Interpretation of TOP-002-2a R2, R8, and R19 for FMPP	No	TOP-002-2a, R2, R8 and R19								Requester has been contacted to see if a CAN would satisfy their concerns until the standard is revised - awaiting response	On Hold
57	Project 2012-01 Equipment Monitoring and Diagnostic Devices	No	FUTURE									
58	Project 2012-02 Physical Protection	No	FUTURE									
59	Pre-2006 — Operate Within Interconnection Reliability Operating Limits	No	IRO-008-1, IRO-009-1 and IRO-010-1a	Yes 2nd (Thru 9/23/02)	Yes 9th (Thru 4/25/08)	Yes 1st (Recirc Thru 8/21/08)	Yes (8/21/08)	Yes (10/17/08)	Yes (12/31/09)	Yes (3/17/11)	- Order on Rehearing published in Federal Register on July 19, 2011 - Rule published in Federal Register on March 23, 2011	Completed

NERC Reliability Standards Executive Tracking Summary

Revised: 11/18/2011

Line No.	Project No. / Title	High Priority?	Associated Standard	SAR Posted?	Posted for Comment?	Posted For Ballot?	Industry Approved?	NERC BOT Approved?	Petitioned for FERC Approval?	FERC Approved	Comments	Project Status
60	Project 2006-01 — System Personnel Training	No	PER-004-2 and PER-005-1	Yes 2nd (Thru 3/20/06)	Yes 4th (Thru 7/17/08)	Yes 5th (Recirc Thru 12/22/08)	Yes (12/22/08)	Yes (04/01/09)	Yes (9/30/09)	Yes (11/18/10)		Completed
61	Project 2006-03 — System Restoration and Blackstart	No	EOP-001-1, EOP-005-2 and EOP-006-2	Yes 2nd (Thru 3/09/07)	Yes 4 th (Thru 11/18/08)	Yes 5th (Recirc Thru 5/18/09)	Yes (5/18/09)	Yes (8/5/09)	Yes (12/31/09)	Yes (3/17/11)	- Order on Rehearing published in Federal Register on July 19, 2011 (Effective Std EOP-001-2) - Rule published in Federal Register on March 23, 2011	Completed
62	Project 2006-04 — Backup Facilities	No	EOP-008-1	Yes 2nd (Thru 3/16/07)	Yes 5th (Thru 3/8/10)	Yes 7th (Recirc Thru 7/26/10)	Yes (7/26/10)	Yes (8/5/010)	Yes (2/11/11)	Yes (4/21/11)	Posted in Federal Register on 4/28/11	Completed
63	Project 2006-08 — Transmission Loading Relief	No	IRO-006-5 and IRO-006-East-1	Yes (For DT Nomination 1/12/07)	Yes 4th (Thru 11/30/09)	Yes 6th (Recirc Thru 8/30/10)	Yes (8/30/10)	Yes (11/4/10)	Yes (1/13/11)	Yes (4/21/11)		Completed
64	Project 2007-04 — Certifying System Operators	Normal	PER-003-1	Yes 2nd (Thru 1/31/08)	Yes 1st (Thru 11/20/09)	Yes 3rd (Recirc Thru 12/13/10)	Yes (12/31/10)	Yes (2/17/11)	Yes (4/29/11)	Yes (9/15/11)		Completed
65	Project 2007-05 — Balancing Authority Controls	No	NA	NA	NA	NA	NA	NA	NA	NA	As of July 28, 2010 this project has been merged with Project 2007-18 - Reliability-based Controls and is now Project 2010-14 - Balancing Authority Reliability-based Control	NA
66	Project 2007-17 — Protection System Maintenance & Testing	High	PRC-005-2	Yes 1st (Thru 7/10/07)	Yes 4th (30 day formal Thru 5/12/11)	Yes 8th (Recirculation Thru 6/30/11)	Failed to reach ballot pool aproval	NA	NA	NA	After PRC-005-2 failed to reach ballot pool approval in the recirculation ballot that ended on 6/30/11, the drafting team revised the standard. The Standards Committee authorized re-initiating the project with a posting of the SAR and revised standard for a 45-day comment period, with an initial ballot of the standard conducted during the last 10 days of the comment period.	Re-initiated
67	Project 2007-18 — Reliability-based Control	No	NA	NA	NA	NA	NA	NA	NA	NA	As of July 28, 2010 this project has been merged with Project 2007-18 - Reliability-based Controls and is now Project 2010-14 - Balancing Authority Reliability-based Control	NA
68	Project 2007-23 — Violation Severity Levels	No	Six sets of VSLs for various standards	Yes 2nd "Supp" (Thru 9/16/10)	Yes 6th (Thru 2/18/11)	Yes (Non-Binding Poll Thru 2/18/11	NA - Non Binding Poll Only	Yes (3/10/11)	Yes (3/21/11)	Yes (5/19/11)		Completed
69	Project 2007-24 - Interpretation of TPL-002 and TPL-003	No	TPL-002-0a and TPL-003-0a	x	x	Yes 2nd (Thru 7/7/08)	Yes (7/7/08)	Yes (7/30/08)	Yes (10/24/08)	Yes (4/23/10)		Completed
70	Project 2007-27 — Interpretation of CIP-006 R1.1 by SCE&G	No	CIP-006, R1.1	x	x	Yes (Recirc Thru 12/4/07)	Yes (12/4/07)	Yes (2/12/08)	Yes (12/22/09)	Yes (5/19/11)		Completed
71	Project 2008-06 — Cyber Security — Order 706 (VRFs and VSLs)	No	CIP VRFs and VSLs	x	Yes 1st (Thru 4/20/09)	Yes (Recirc Thru 11/12/09)	Yes (11/12/09)	Yes (12/16/09)	Yes (12/18/09)	Yes (1/20/11)		Completed
72	Project 2008-07 — Interpretation of EOP-002-2 R6.3 and R7.1 by Brookfield Power	No	EOP-002-2, R6.3 and R7.1	x	x	Yes (Recirc Thru 8/31/09)	Yes (8/31/09)	No (Remanded 2/16/10)	NA	NA	2/16/10 NERC BOT: (1) Remands the proposed interpretation of EOP-002-2, Requirements R6.3 and R7.1, to the Standards Committee because the proposed interpretation adds requirements not in the standard, thereby exceeding the permissible scope of an interpretation, and (2) Directs the Standards Committee to initiate action to revise EOP-002-2 as appropriate	NA
73	Project 2008-08 — EOP VSL Revisions	No	EOP family of standards	Yes 1st (Thru 5/19/08)	Yes 2nd (Thru 12/3/09)	Yes (Non-Binding Poll Thru 2/18/11	NA - Non Binding Poll Only	Yes (3/10/11)	Yes (3/21/11)	Yes (5/19/11)		Completed
74	Project 2008-11 — Interpretation of VAR-002a by ICF Consulting	No	VAR-002-1.1b	x	x	Yes (Recirc Thru 1/6/09)	Yes (1/6/09)	Yes (2/10/09)	Yes (3/5/09)	Yes (9/16/10)		Completed
75	Project 2008-15 — Interpretation of CIP-006-1a By US Army Corps of Engineers	No	CIP-006-1a, R4	x	x	Yes (Recirc Thru 2/16/09)	Yes (2/16/09)	Yes (8/5/09)	Yes (12/22/09)	Yes (5/19/11)		Completed
76	Project 2008-18 — Interpretation of TOP-005-1 and IRO-005-1 by Manitoba Hydro	No	TOP-005-1 , R3 and IRO-005-1, R12	x	x	Yes (Recirc Thru 4/27/09)	Yes (4/27/09)	Yes (11/5/09)	Yes (11/24/09)	Yes (4/21/11)	Posted in Federal Register on 4/26/11	Completed
77	Project 2009-08 — Nuclear Plant Interface Coordination	No	NUC-001-2	Yes 1st (Thru 3/18/09)	Yes 1st (Thru 3/18/09)	Yes (Recirc Thru 7/20/09)	Yes (7/20/09)	Yes (8/5/09)	Date?	Yes (1/21/10)		Completed
78	Project 2009-09 — Interpretation of CIP-001-1 by Covanta	No	CIP-001-1a	x	x	Yes (Recirc Thru 10/9/09)	Yes (10/09/09)	Yes (2/16/10)	Yes (4/21/10)	Yes (2/2/11)	Approved by Letter Order	Completed
79	Project 2009-11 — Interpretation of IRO-010-1 R1.2 and R3 by WECC Reliability Coordination Subcommittee	No	IRO-010-1 R1.2 and R3 --> IRO-010-1a	x	x	Yes (Recirc Thru 6/5/09)	Yes (6/5/09)	Yes (8/5/09)	Yes (12/31/09)	Yes (3/17/11)	NOPR issued 11/18/10, Comments were due 1/24/11	Completed
80	Project 2009-12 — Interpretation of CIP-005-1 by PacifiCorp	No	CIP-005-3a	x	x	Yes (Recirc Thru 10/26/09)	Yes (10/26/09)	Yes (2/16/10)	Yes (4/21/10)	Yes (2/2/11)	Approved by Letter Order	Completed
81	Project 2009-13 — interpretation of CIP-006-1 by PacifiCorp	No	CIP-006-2c	x	x	Yes (Recirc Thru 12/23/09)	Yes (12/23/09)	Yes (2/16/10)	Yes (4/20/10)	Yes (7/15/10)		Completed
82	Project 2009-14 — Interpretation of TPL-002-0 R1.3.10 by PacifiCorp	No	TPL-002-0, R1.3.10	x	x	Yes (Recirc Thru 8/6/09)	Yes (8/6/09)	Yes (11/5/09)	Yes (11/17/09)	Yes (9/15/11)	Posted in Federal Register on 9/22/11 - Effective Date: This rule will become effective October 24, 2011	Completed
83	Project 2009-15 — Interpretation of MOD-001-1 R2 and R8 and MOD-029-1 R5 and R6 by NYISO	No	MOD-001-1, R2 and R8 and MOD-029-1 R5 and R6	x	x	Yes (Recirc Thru 7/17/09)	Yes (7/17/09)	Yes (11/5/09)	Yes (12/2/09)	Yes (9/16/10)		Completed
84	Project 2009-16 — Interpretation - CIP-007-1, R2 — Systems Security Management	No	CIP-007-2a	x	x	Yes (Initial Thru 9/21/09)	Yes (9/21/09)	Yes (11/5/09)	Yes (11/17/09)	Yes (3/18/10)		Completed
85	Project 2009-18 — Withdraw Three Midwest ISO Waivers	No	BAL-006-2 and INT-003-3	x	x	Yes (Initial Thru 9/8/09)	Yes (9/8/09)	Yes (11/5/09)	Yes (11/20/09)	Yes (1/6/11)		Completed
86	Project 2009-19 — Interpretation of BAL-002-0 R4 and R5 by NWPP Reserve Sharing Group	No	BAL-002-0 R4 and R5	x	x	Yes (Initial Thru 2/26/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
87	Project 2009-21 — Cyber Security Ninety-day Response — CIP Family of Standards	No	CIP-002 through CIP-009, V3	Yes 1st (Thru 11/12/09)	Yes 1st (Thru 11/12/09)	Yes (Recirc Thru 12/14/09)	Yes (12/14/09)	Yes	Yes (1/19/10)	Yes (3/18/10)		Completed
88	Project 2009-23 — Interpretation of CIP-004-2 R3 by Army Corps of Engineers	No	CIP-004-2	x	x	Yes 2nd (Intitial Thru 4/8/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
89	Project 2009-25 — Interpretation of BAL-001-01 and BAL-002-0 by BPA	No	BAL-001-0.1a and BAL-002-0	x	x	Yes 1st (Intitial Thru 1/15/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
90	Project 2009-29 — Interpretation of TOP-002-2a R6 by FMPP	No	TOP-002-2a, R6	x	x	Yes 1st (Intitial Thru 2/22/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
91	Project 2009-30 — Interpretation of PRC-001-1 R1 by WPSC	No	PRC-001-1	x	x	Yes 1st (Intitial Thru 2/26/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11

Voltage Coordination on High Voltage Grids; Notice of Reliability Workshop Agenda

As announced in the Notice of Staff Workshop issued on November 8, 2011, the Commission will hold a workshop on Thursday, December 1, 2011, from 9 a.m. to 4:30 p.m. to explore the interaction between voltage control, reliability, and economic dispatch. In addition, the Commission will consider how improvements to dispatch and voltage control software could improve reliability and market efficiency. This event will consist of two panels of industry participants. The first panel will address how entities currently coordinate economic dispatch and voltage control. The second panel will address the capability of existing and emerging software to improve coordination and optimization of the Bulk-Power System from a reliability and economic perspective. The agenda for this workshop is attached. Members of the Commission may attend the workshop.

Commission conferences are accessible under section 508 of the Rehabilitation Act of 1973. For accessibility accommodations, please send an email to accessibility@ferc.gov or call toll free 1-(866) 208-3372 (voice) or (202) 208-1659 (TTY), or send a FAX to (202) 208-2106 with the required accommodations.

Information on this event will be posted on the Calendar of Events on the Commission's Web site, http://www.ferc.gov, prior to the event.

For more information about this conference, please contact: Sarah McKinley, Office of External Affairs, Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426, (202) 502-8368, sarah.mckinley@ferc.gov.

Dated: November 16, 2011.
Kimberly D. Bose,
Secretary.

Staff Workshop on Voltage Coordination on High Voltage Grids

December 1, 2011

9 a.m.-4:30 p.m.

Agenda

9-9:15 a.m.--Greeting and Opening Remarks by David Andrejcak.

9:15-11:30 a.m.--Current approaches and challenges to analyzing voltage support and reactive margin during operations planning and real-time.

Presentations: Panelists will be asked to describe how their companies currently coordinate the dispatch of reactive resources to support forecasted loads, generation and interchange transactions during operations planning and real-time. Panelists should address the following in their presentations:

a. Describe the pre-scheduling and real-time processes that involve the commitment or dispatch of reactive resources from a reliability perspective. What applications or tools are used to evaluate reactive or voltage support needs from this perspective?

b. Describe the pre-scheduling and real-time processes that involve the commitment or dispatch of reactive resources from an economic perspective. What applications or tools are used to evaluate reactive or voltage support needs from this perspective?

c. Explain whether and how pre-scheduling, real-time and post analysis evaluations are performed on the bulk electric system or on lower voltage systems to maximize opportunities for additional reliability or economic transactions.

d. Describe the situations where the dispatch of reactive resources may limit System Operating Limits or whether and how more transactions could be supported.

e. Describe how reactive power needs of the distribution system or loads are coordinated or optimized.

Panelists:

Khaled Abdul-Rahman, California Independent System Operator

Xiaochuan Luo, ISO New England

Wes Yeomans, New York Independent System Operator

Dave Zwergel, Midwest ISO

Chantal Hendrzak, PJM Interconnection

Bruce Rew, Southwest Power Pool

11:30 a.m.-1 p.m.--Lunch Break.

1-4 p.m.--The next generation of voltage support and reactive margin applications used during operations planning and real-time.

Presentations: Panelists will be asked to describe capabilities of the present and anticipated future software that can be used as decision tools to help system operators optimize voltage support resources to preserve and protect

[[Page 72204]]

reliability and support market-based economic transactions. Panelists should address the following in their presentations:

a. What are the objectives of software products available to industry that optimize the system for operations planning and real-time? (Minimize losses, maximize transfer capability, and/or minimize production costs?)

b. Describe the system optimization software products currently used or tested in industry. Discuss how widely these are used in industry.

c. Describe how these software products are evaluated and validated using a post analysis process.

d. What effort is involved in implementing the application for use in industry?

e. Discuss whether the application can be used on an interconnection-wide, Balancing Authority or local distribution system basis and, if so, how the application would be utilized.

f. Discuss whether the applications can be used to optimize reactive power resources in the distribution system or loads and coordinate with higher voltage systems.

Panelists:

Kedall Demaree, Alstom

Rod Sulte, GE

Soorya Kuloor, Gridiant

Marija Ilic, New Electricity Transmission Software Solutions (NETSS)

Dan French, Siemens

4:00-4:30 p.m.--Summary Remarks by David Andrejcak.

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of Proposed Rulemaking.

SUMMARY: Under section 215 of the Federal Power Act, the Federal Energy Regulatory Commission (Commission) proposes to approve Reliability Standards PRC-006-1 (Automatic Underfrequency Load Shedding) and EOP-003-2 (Load Shedding Plans), developed and submitted to the Commission for approval by the North American Electric Reliability Corporation (NERC), the Electric Reliability Organization certified by the Commission. The proposed Reliability Standards establish design and documentation requirements for automatic underfrequency load shedding programs that arrest declining frequency and assist recovery of frequency following system events leading to frequency degradation. The Commission also proposes to approve the related Violation Risk Factors and Violation Severity Levels, implementation plan, and effective date proposed by NERC.

DATES: Comments are due December 27, 2011.

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:
Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE., Washington, DC 20426.
Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

FOR FURTHER INFORMATION CONTACT:
Stephanie Schmidt (Technical Information), Office of Electric Reliability, Division of Reliability Standards, Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426, (202) 502-6568, Stephanie.Schmidt@ferc.gov.
Matthew Vlissides (Legal Information), Office of the General Counsel, Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426, (202) 502-8408, Matthew.Vlissides@ferc.gov.

SUPPLEMENTARY INFORMATION:
1. Under section 215 of the Federal Power Act (FPA),\1\ the Commission proposes to approve proposed Reliability Standards PRC-006-1

[[Page 66221]]

(Automatic Underfrequency Load Shedding) and EOP-003-2 (Load Shedding Plans). The proposed Reliability Standards were developed and submitted for approval to the Commission by the North American Electric Reliability Corporation (NERC), which the Commission certified as the Electric Reliability Organization (ERO) responsible for developing and enforcing mandatory Reliability Standards.\2\ The proposed Reliability Standards establish design and documentation requirements for automatic

underfrequency load shedding (UFLS) programs, which are meant to arrest declining frequency and assist recovery of frequency following underfrequency events and provide last resort system preservation measures.

---

2. The Commission proposes to approve the related Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs), implementation plan, and effective date proposed by NERC. The Commission also proposes to approve the retirement of the currently effective Reliability Standards PRC-007-0, PRC-009-0, and EOP-003-1, and the NERC-approved Reliability Standard PRC-006-0.

3. The Commission seeks comments from NERC and other interested persons on specific issues concerning the proposed Reliability Standards.

I. Background

A. Underfrequency Load Shedding

4. An interconnected electric power system must balance load and generation in order to maintain frequency within a reliable range.\3\ The balance between generation and load within an interconnected electric power system is shown in the frequency of the system.\4\ Underfrequency protection schemes are drastic measures employed if the system frequency falls below a specified value.\5\ The Blackout Report provides the following explanation:

\3\ Electric Power Research Institute, EPRI Power Systems Dynamics Tutorial, Chapter 4 at page 4-78 (2009), available at http://www.epri.com (EPRI Tutorial).
\4\ Id.
\5\ Id.

[A]utomatic under-frequency load-shedding (UFLS) is designed for use in extreme conditions to stabilize the balance between generation and load after an electrical island has been formed, dropping enough load to allow frequency to stabilize within the island. All synchronous generators in North America are designed to operate at 60 cycles per second (Hertz) and frequency reflects how well load and generation are balanced--if there is more load than generation at any moment, frequency drops below 60 Hz, and it rises above that level if there is more generation than load. By dropping load to match available generation within the island, UFLS is a safety net that helps to prevent the complete blackout of the island, which allows faster system restoration afterward. UFLS is not effective if there is electrical instability or voltage collapse within the island.\6\

---

5. UFLS programs are designed for each defined area or system, and they are commonly implemented with devices installed on the distribution side of the power system.\7\ Factors considered in developing a UFLS program include: (1) Underfrequency set point, (2) minimum amount of load to shed, and (3) what load and at what locations to shed.

\7\ UFLS programs are designed to maintain a balance between resources and demand in a defined area (e.g., Interconnection, Regional Entity area, or planning coordinator area).

---

1. Underfrequency Set Point

6. The underfrequency set point is the frequency at which a specified load will disconnect from the system in a UFLS program.\8\ Separately, generators have their own underfrequency set points, which will disconnect them from the system if the frequency drops to a certain value, thus protecting them from damage.\9\ Underfrequency set

points for load shedding are set above the frequencies at which generators disconnect.\10\ This is done to prevent losing additional resources that would exacerbate the imbalance between resources and demand, resulting in further frequency declines. UFLS programs initiate at a specified point to shed the first load block, and if necessary additional load blocks at other lower set points, to arrest system frequency decline prior to the loss of additional resources.\11\

\8\ In Order No. 693-A, the Commission directed NERC to collect the frequency and magnitude of load in UFLS systems. Mandatory Reliability Standards for the Bulk-Power System, Order No. 693, FERC Stats. & Regs.] 31,242, order on reh'g, Order No. 693-A, 120 FERC] 61,053, at P 145 (2007). NERC submitted a response to this request on February 1, 2008 that included the underfrequency set points and magnitude of load shed in each Regional Entity. NERC, Response to FERC Supplemental Request for Information on the Status of Underfrequency Load Shedding, Docket No. RM06-16-000 (filed Feb. 1, 2008).

\10\ Id.

\11\ Id. at P 4-78, 4-79.

---

7. Once a frequency threshold \12\ is identified, the balance of resources and demand to be maintained to prevent the system from reaching that frequency threshold is determined. UFLS programs use validated models of the power system, which consist of mathematical representations of static (e.g., transformers and transmission lines) and dynamic (e.g., generators and motor loads) components of the power system aggregated to simulate how the system performs during system operations.\13\ Models are validated, typically, by comparing actual system operations against simulated system operations to ensure the simulated system operations are within a defined and acceptable margin of tolerance relative to actual system operations. Inaccurate power system models may result in a UFLS program that does not perform as desired, thus undermining the reliability objective of UFLS.

\12\ A frequency threshold is a pre-determined frequency that UFLS programs are designed to avoid reaching, as the system may become unstable at this frequency.

\13\ See, e.g., PowerTech Labs Inc., 2010 Evaluation and Assessment of Southwest Power Pool (SPP) Under-Frequency Load Shedding Scheme, available at http://www.spp.org/publications/SPP-2010-UFLS-Final.pdf.

---

8. A UFLS program is designed to shed sufficient load to arrest system frequency decline without shedding too much load such that frequency increases above 60 Hz. If a UFLS program is not effective, either because of invalid power system models or miscoordination of the UFLS program with entities inside and outside of the intended island, it may not achieve the reliability objective of preventing cascading outages. This, in turn, could further undermine reliability and recovery of the Bulk-Power System during a system emergency.\14\

\14\ For example, if not enough load is shed to arrest frequency decline, additional resources may disconnect from the Interconnection to prevent damage to generators, and thus system frequency will continue to collapse. Conversely, if too much load is shed, the system frequency could exceed 60 Hz also causing resources to disconnect from the Interconnection to prevent damage to generators. EPRI Tutorial at page 4-78.

---

2. Minimum Amount of Load to Shed

9. The amount of load to disconnect is the amount of load shed at each underfrequency set point, typically expressed in megawatts or percent of system peak load or both.\15\

\15\ EPRI Tutorial at page 4-78.

---

3. What Load to Shed

10. In addition to determining the amount of load to disconnect based on validated power system models, a UFLS program identifies what loads to shed

[[Page 66222]]

and their locations. Therefore, in deciding what specific loads to shed, consideration is given to whether the load is critical (e.g., hospitals, police stations, or fire stations). These loads would typically not be included in a UFLS program.

B. Mandatory Reliability Standards

11. Section 215 of the FPA requires a Commission-certified ERO to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. Once approved, the Reliability Standards may be enforced by the ERO, subject to Commission oversight, or by the Commission independently.\16\

\16\ See 16 U.S.C. 824o(e).

---

12. Pursuant to section 215 of the FPA, the Commission established a process to select and certify an ERO \17\ and, subsequently, certified NERC as the ERO.\18\ On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 Reliability Standards filed by NERC, including Reliability Standards PRC-007-0, PRC-009-0, and EOP-003-1.\19\ The Commission neither approved nor remanded NERC-approved Reliability Standard PRC-006-0 in Order No. 693.\20\

C. NERC-Approved Reliability Standard

1. PRC-006-0

13. NERC-approved Reliability Standard PRC-006-0 addresses the development of a regional UFLS program that is used as a last resort to preserve islanding operation following a major system event on the Bulk-Power System that could otherwise cause the island system frequency to collapse. PRC-006-0 requires regional reliability organizations to develop, coordinate, document and assess UFLS program design and effectiveness at least every five years. In Order No. 693, the Commission determined neither to approve nor remand this ``fill-in-the-blank'' Reliability Standard because the regional procedures had not been submitted, and the Commission held that it would not propose to approve or remand PRC-006-0 until the ERO submitted the additional information.\21\

\21\ Id. P 1477, 1479.

D. Currently Effective Reliability Standards

1. PRC-007-0

14. Reliability Standard PRC-007-0 requires transmission owners, transmission operators, load serving entities (LSEs) and distribution providers to provide, and annually update, their underfrequency data to facilitate the regional reliability organization's maintenance of the UFLS program database.

2. PRC-009-0

15. Reliability Standard PRC-009-0 requires that the performance of a UFLS system be analyzed and documented following an underfrequency event by requiring the transmission owner, transmission operator, LSE and distribution provider to document the deployment of their UFLS systems in accordance with the regional reliability organization's program.

3. EOP-003-1

16. Reliability Standard EOP-003-1 addresses load shedding plans and requires that balancing authorities and transmission operators operating with insufficient transmission and/or generation capacity have the capability and authority to shed load rather than risk a failure of the system. It includes requirements to establish plans for automatic load shedding for underfrequency or undervoltage, manual load

shedding to respond to real-time emergencies, and communication with other balancing authorities and transmission operators.

II. Proposed Reliability Standards

17. On March 31, 2011, NERC filed a petition seeking Commission approval of proposed Reliability Standards PRC-006-1 and EOP-003-2 and requesting the concurrent retirement of the currently effective Reliability Standards PRC-007-0, PRC-009-0, and EOP-003-1 and NERC-approved Reliability Standard PRC-006-0.\22\ NERC requests an effective date for PRC-006-1 and EOP-003-2 of one year following the first day of the first calendar quarter after applicable regulatory approvals with respect to all Requirements of the proposed Reliability Standards except Parts 4.1 through 4.6 of Requirement R4 of PRC-006-1. With respect to Parts 4.1 through 4.6 of Requirement R4 of PRC-006-1, NERC requests an effective date of one year following the receipt of generation data as would be required in draft Reliability Standard PRC-024-1 \23\ but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approvals of PRC-006-1.

\22\ NERC Petition at 1. The proposed new Reliability Standards are not attached to the NOPR. They are, however, available on the Commission's eLibrary document retrieval system in Docket No. RM11-20-000 and are available on the ERO's Web site, http://www.nerc.com. Reliability Standards approved by the Commission are not codified in the CFR.

\23\ PRC-024-1 addresses ``Generator Performance During Frequency and Voltage Excursions'' and is currently being developed in the NERC standard drafting process.

A. PRC-006-1

18. Proposed Reliability Standard PRC-006-1 would apply to planning coordinators, ``UFLS entities,'' \24\ and transmission owners that ``own Elements identified in the UFLS program established by the Planning Coordinators.'' NERC states that the primary purpose of the proposed Reliability Standard is the establishment of design and document requirements for UFLS programs that arrest declining frequency and assist recovery of frequency following system events leading to frequency degradation.

\24\ PRC-006-1 defines ``UFLS entities'' as: ``All entities that are responsible for the ownership, operation, or control of UFLS equipment as required by the UFLS program established by the Planning Coordinators.''

---

19. NERC states that PRC-006-1 satisfies the Commission's criteria, set forth in Order No. 672, for determining whether a proposed Reliability Standard is just, reasonable, not unduly discriminatory or preferential and in the public interest.\25\

\25\ Order No. 672, FERC Stats. & Regs.] 31,204 at P 323-37.

---

20. According to NERC, PRC-006-1 is designed to achieve a specific reliability goal by establishing design and documentation requirements for automatic UFLS programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures. NERC contends that PRC-006-1 contains a technically sound method to achieve its reliability goal by establishing a framework for developing, designing, assessing and coordinating UFLS programs, and that PRC-006-1 is clear and unambiguous regarding what is required and who is required to comply with the Reliability Standard.

21. NERC states that PRC-006-1 does not reflect ``best practices'' without regard to implementation cost.\26\ NERC contends that it achieves a specific reliability goal of establishing design

[[Page 66223]]

and documentation requirements for automatic UFLS programs to arrest declining frequency and assist recovery following underfrequency events, and that UFLS programs provide last resort system preservation measures by shedding load during system disturbances that result in substantial imbalance between load and generation. NERC also maintains

that PRC-006-1 does not aim at a ``lowest common denominator'' but instead establishes common performance characteristics that all UFLS programs must meet to effectively protect Bulk-Power System reliability.\27\

\26\ NERC Petition at 24.
\27\ Id. at 26.

---

22. NERC states that PRC-006-1 does not include any differentiation in requirements based on entity size, though it provides the opportunity for planning coordinators to consider input from smaller entities when developing the UFLS program. NERC further explains that PRC-006-1 would apply throughout North America, with variances for entities within the Western Electricity Coordinating Council (WECC) and the Quebec Interconnections.

23. As proposed by NERC, PRC-006-1 has 14 requirements and 19 sub-requirements, summarized as follows:

Requirement R1: Requires each planning coordinator to develop and document criteria to identify portions of the bulk electric system that may form islands.

Requirement R2: Requires each planning coordinator to identify the islands to serve as a basis for designing its UFLS program. Sub-Requirements 2.1, 2.2, and 2.3 serve as a checklist of items that the entity must consider when identifying islands.

Requirement R3: Requires each planning coordinator to develop a UFLS program, including notification of and a schedule for implementation by the UFLS entities within its area, that meets the specific performance characteristics set forth in sub-Requirements 3.1 through 3.3 in simulations of underfrequency conditions resulting from an imbalance of up to 25 percent within the identified island.

Requirement R4: Requires each planning coordinator to conduct and document a UFLS design assessment at least once every five years that determines through dynamic simulation whether the UFLS program design meets the performance characteristics in Requirement R3 for each island identified in Requirement R2, with sub-Requirements 4.1 through 4.7 specifying items that the simulation must model.

Requirement R5: Requires each planning coordinator to coordinate its UFLS design with all other planning coordinators whose areas or portions of whose areas are also part of the same identified island through specific actions identified in Requirement R5.

Requirement R6: Requires each planning coordinator to maintain a UFLS database containing data necessary to model its UFLS program for use in event analyses and assessments of the UFLS program at least once each calendar year, with no more than 15 months between maintenance activities.

Requirement R7: Requires each planning coordinator to provide its UFLS database to other planning coordinators within its Interconnection within 30 calendar days of request.

Requirement R8: Requires each UFLS entity to provide data to its planning coordinator(s) according to the format and schedule specified by the planning coordinator(s) to support maintenance of the UFLS database.

Requirement R9: Requires each UFLS entity to provide automatic tripping of load in accordance with the UFLS program design and schedule for application determined by its planning coordinator(s) in each planning coordinator area in which it owns assets.

Requirement R10: Requires each transmission owner to provide automatic switching of its existing capacitor banks, transmission lines, and reactors to control overvoltage as a result of underfrequency load shedding if required by the UFLS program and schedule for application determined by the planning coordinator(s) in each planning coordinator area in which the transmission owner owns transmission.

Requirement R11: Requires each planning coordinator, in whose area a bulk electric system islanding event results in system frequency excursions below the initializing set points of the UFLS program, to conduct and document an assessment of the event within one year of event actuation that evaluates the performance of the UFLS equipment (sub-Requirement 11.1), and the effectiveness of the UFLS program (sub-Requirement 11.2).

Requirement R12: Requires each planning coordinator, in whose islanding event assessment (Requirement R11) UFLS program deficiencies are identified, to conduct and document a UFLS design assessment to consider the identified deficiencies within two years of event actuation.

Requirement R13: Requires each planning coordinator, in whose area a bulk electric system islanding event occurred that also included the area(s) or portions of area(s) of other planning coordinator(s) in the same islanding event and that resulted in system frequency excursions

below the initializing set points of the UFLS program, to coordinate its event assessment (in accordance with Requirement R11) with all other planning coordinators whose areas or portions of whose areas were also included in the same islanding event by either: (i) Conducting a joint event assessment per Requirement R11 among the planning coordinators whose areas or portions of whose areas were included in the same islanding event; or (ii) conducting an independent event assessment per Requirement R11 that reaches conclusions and recommendations consistent with those of the event assessments of the other planning coordinators whose areas or portions of whose areas were included in the same islanding event; or (iii) conducting an independent event assessment per Requirement R11 and where the assessment fails to reach conclusions and recommendations consistent with those of the event assessments of the other planning coordinators whose areas or portions of whose areas were included in the same islanding event, identifying differences in the assessments that likely resulted in the differences in the conclusions and recommendations and report these differences to the other planning coordinators whose areas or portions of whose areas were included in the same islanding event and to the ERO.

Requirement R14: Requires the planning coordinator to respond to written comments submitted by UFLS entities and transmission owners within its planning coordinator area following a comment period and before finalizing its UFLS program, indicating in the written response to comments whether changes will be made or reasons why changes will not be made to the UFLS program, including a schedule for implementation (sub-Requirement 14.1) and the UFLS design assessment (sub-Requirement 14.2).

B. EOP-003-2

24. Proposed Reliability Standard EOP-003-2 would apply to balancing authorities and transmission operators. NERC states that EOP-003-2 makes minimal changes to EOP-003-1 by removing references to UFLS, which NERC describes as redundant in light of proposed Reliability Standard PRC-006-1, and instead focuses proposed Reliability Standard EOP-003-2 on undervoltage conditions.

[[Page 66224]]

III. Discussion

25. Pursuant to section 215(d)(2) of the FPA, the Commission proposes to approve Reliability Standard PRC-006-1 and EOP-003-1 as just, reasonable, not unduly discriminatory or preferential, and in the public interest. The Commission believes that the UFLS program addressed in the proposed Reliability Standards is important to arresting declining frequency and assisting recovery of frequency following system events that lead to system instability, which can result in a blackout. The Commission finds that the proposed Reliability Standards are necessary for reliability because UFLS is used in extreme conditions to stabilize the balance between generation and load after an electrical island has been formed, dropping enough load to allow frequency to stabilize within the island. Reliability Standard PRC-006-1, in conjunction with the conforming changes to EOP-003-2, provides last resort Bulk-Power System preservation measures by establishing the first national Reliability Standard of common performance characteristics that all UFLS programs must meet. In addition, the Commission proposes to approve the related VRFs and VSLs, implementation plan, and effective date proposed by NERC. Finally, the Commission proposes to approve the retirement of the currently effective Reliability Standards PRC-007-0, PRC-009-0, and EOP-003-1, and the NERC-approved Reliability Standard PRC-006-0.

26. The Commission addresses or seeks comments from the ERO and other interested persons on aspects of the proposed Reliability Standards. Specifically, we address or seek comments on the following issues: (A) Impact of resources not connected to the bulk electric system; (B) validation of power system models used to simulate ULFS programs; (C) scope of UFLS events assessments; (D) impact of generator owner trip settings outside of the UFLS program; (E) UFLS program coordination with other protection systems; (F) identification of island boundaries in UFLS programs; (G) automatic load shedding in PRC-006-1 and manual load shedding in EOP-003-2; (H) elimination of balancing authority responsibilities in EOP-003-2; and (I) the ``Lower VSL'' for Requirement R8 and the ``Medium'' VRF for Requirement R5 of PRC-006-1. These issues also apply to the corresponding Requirements in the requested regional variance for WECC in PRC-006-1.

A. Impact of Resources Not Connected to Bulk Electric System Facilities

27. As described above, UFLS programs are designed to maintain

balance between resources and load in a defined area (e.g., an Interconnection, Regional Entity area, or planning coordinator area). When a resource is lost, load exceeds supply causing frequency to decrease below its scheduled value (e.g., 60 Hz in the United States). Conversely, a loss of load or excess supply can result in higher frequencies than scheduled, resulting in an overfrequency condition. As a last resort, UFLS programs are initiated during extreme underfrequency conditions to reestablish balance by shedding load at predetermined frequencies and times to prevent system-wide blackouts.

28. Requirement R2 of PRC-006-1 requires planning coordinators to identify islands to serve as a basis for designing UFLS programs. Requirement R3 addresses performance characteristics for UFLS programs. Requirement R4 requires each planning coordinator to conduct and document the assessment of its UFLS design and determine if the UFLS program meets the performance characteristics in Requirement R3 for each island identified in Requirement R2.

29. The simulations outlined in Requirement R4 all concern individual generating units greater than 20 MVA gross nameplate rating or generating plants/facilities greater then 75 MVA ``connected to the bulk electric system.'' However, some generation that meets the 20 MVA and 75 MVA criteria is not connected to bulk electric system facilities. Accordingly, those resources not connected to bulk electric system facilities would not be modeled pursuant to Requirement R4. However, a resource not connected to the bulk electric system may serve load designed to be shed in a UFLS program. The Commission is concerned that failure to account for resources not connected to the bulk electric system in a planning coordinator's UFLS program could result in the planning coordinator being unaware of how such resources respond to underfrequency conditions. If the planning coordinator is unaware of how these facilities have responded, it may plan to shed more load than is required for an area's frequency to return to normal. This could lead to an unintended overfrequency condition if the plan is carried out in the operating timeframe. These conditions, in turn, could lead the plan to violate the performance characteristics specified in Requirement R3.

30. The performance characteristics identified in Requirement R3 provide acceptable parameters for developing UFLS programs that are designed to restore balance between resources and load. However, the Commission is concerned that generation resources or facilities that are not connected to the bulk electric system may not be considered during the development of UFLS programs.

31. The Commission seeks comments from the ERO and other interested persons as to whether and how all resources required for the reliable operation of the bulk electric system, including resources not connected to bulk electric system facilities, are considered in the development of UFLS programs under Requirements R3 and R4.

B. Validation of Power System Models

32. Power systems consist of static components (e.g., transformers and transmission lines) and dynamic components (e.g., generators and motor loads). Mathematical representations of these components are aggregated to create an area's power system model. Power system planners \28\ and system operators base decisions on simulations, both static and dynamic, using area power system models to meet requirements in both Commission-approved planning and operational Reliability Standards.\29\

\28\ Power system planners may include functional entities such as transmission planners and planning coordinators.

\29\ See, e.g., Reliability Standards MOD-010-0, MOD-012-0 and TOP-002-2a, Requirement R19.

---

33. Requirements R4 and R11 of PRC-006-1 require applicable entities to use dynamic simulations to design and assess the effectiveness of UFLS programs. As previously discussed, UFLS programs are designed to provide last resort system preservation measures by: (1) Arresting declining frequency; and (2) assisting recovery of frequency following underfrequency events. Dynamic simulations that do not accurately represent the power system can result in an UFLS program that is ineffective.

34. The Commission believes that the UFLS program design requirements established in Requirement R2 and the required assessments established in Requirements R4 and R11 of PRC-006-1 are generally acceptable and include improvements above the current Reliability Standards. Accordingly, the Commission believes that the language in the proposed Requirements is appropriate.

[[Page 66225]]

C. UFLS Event Assessments

1. Assessments in the Absence of Island Formation

35. Requirement R11 of PRC-006-1 requires planning coordinators to conduct assessments after a ``BES islanding event results in system frequency excursion below the initializing set points of the UFLS program.'' The Commission is concerned whether the phrase ``BES islanding event'' could be interpreted to mean that a planning coordinator only has to assess an event if it meets both of the following requirements: (1) System frequency excursions fall below the initializing set point for UFLS; and (2) bulk electric system islands form within the Interconnection. If the frequency falls below the initializing UFLS set point but islands do not form (e.g., because the event was not severe enough to isolate portions of the Interconnection, or UFLS or other protection systems failed to operate properly to form islands), an assessment of the performance of the UFLS program for this event is still useful because it can determine if the UFLS program operated as expected.

36. The Commission seeks clarification from the ERO regarding what actions must planning coordinators take under Requirement R11 if an event results in system frequency excursions falling below this initializing set point for UFLS but without the formation of a bulk electric system island.

2. Coordination of Assessments and Results

37. Requirements R5 and R13 of PRC-006-1 require planning coordinators that share identified islands to coordinate UFLS program design and event assessment. The options for coordinating designs of UFLS programs in Requirement R5 include: (1) Developing a common program; (2) conducting a joint UFLS design assessment among the planning coordinators whose area or portions of whose areas are part of the same identified island; or (3) conducting an independent design assessment and, in the event the UFLS design assessment fails to meet Requirement R3, identify modifications to the UFLS program(s) to meet Requirement R3 and report these modifications as recommendations to the other planning coordinators.

38. The options for coordinating event assessments in Requirement R13 include: (1) Conducting a joint event assessment per Requirement R11 among planning coordinators whose areas were affected; (2) conducting an independent event assessment per Requirement R11 that reaches conclusions and recommendations consistent with other planning coordinators whose areas were affected; or (3) conducting an independent event assessment per Requirement R11 and where the assessment fails to reach conclusions and recommendations consistent with those of the other planning coordinators whose areas were affected by the same islanding event, identify differences in the assessments and report these differences to the other affected planning coordinators. The Commission seeks comments from the ERO and other interested persons as to whether the differences should be subsequently reported to the reliability coordinator for resolution in the event that the process does not resolve differences in the assessments.

39. The Commission believes that Requirements R5 and R13 provide flexibility in coordinating UFLS design programs and event assessments among planning coordinators whose areas fall within the same island or whose areas are affected by the same event. Accordingly, the Commission believes that the language in the proposed Requirements is appropriate.

3. Assessment Timeline for Completion

40. Requirement R11 of Reliability Standard PRC-006-1 requires a planning coordinator to perform an island event assessment within one year of an event. If the planning coordinator identifies program deficiencies, Requirement R12 requires the planning coordinator to conduct and document UFLS design assessments, which are meant to consider the deficiencies, within two years of an event. The Commission is concerned that this time frame may be too long since it appears that island event assessments and consideration of deficiencies could reasonably be conducted in a much shorter time frame. Under NERC's proposal, deficiencies could remain within a UFLS program for two years from an event exposing the Bulk-Power System to instability, uncontrolled separation and cascading outages should a frequency event occur that the UFLS program mishandles. NERC provided no explanation of its basis for the proposed two-year time frame.

41. The Commission asks the ERO and other interested persons what the basis is for proposing a two-year time frame. In addition, the Commission seeks clarification from the ERO as to how soon after event actuation would an entity need to implement corrections in response to any deficiencies identified in the event assessment under Requirement R11.

D. Generator Owner Trip Settings Outside of the UFLS Program

42. Requirements 4.1 through 4.7 of Reliability Standard PRC-006-1

are intended to capture the effects of generators that trip prior to UFLS initiation. As previously discussed, a generator trip normally creates an imbalance between resources and load causing system frequency to decline. Some generators may need to disconnect from the system prior to reaching underfrequency set points to protect their components from permanent damage. If this loss occurs during a system event, the generator can no longer provide a response to assist in arresting frequency decline. This resource loss also counteracts the response provided by other resources to arrest frequency decline, increasing the likelihood of instability, uncontrolled separation, and cascading outages.

43. We agree that planning coordinators should consider generators that trip prior to underfrequency set points when developing their UFLS programs. The Commission seeks comments from the ERO and other interested persons on how generation losses outside of the UFLS set points (i.e., generators having trip settings prior to the UFLS underfrequency set points) should be accounted for in UFLS programs (e.g., generator owners who trip outside of the UFLS set points could procure load to shed to account for the loss in generation).

E. UFLS Program Coordination With Other Protection Systems

44. Recommendation 21C of the Blackout Report addresses the coordination of protection systems.\30\ The recommendation states that NERC shall ``determine the goals and principles needed to establish an integrated approach to relay protection for generators and transmission lines and the use of underfrequency and undervoltage load shedding (UFLS and UVLS) programs. An integrated approach is needed to ensure that at the local and regional levels, these interactive components provide an appropriate balance of risks and benefits in terms of protecting specific assets and facilitating overall grid survival.'' \31\ Accordingly, an integrated approach requires coordination of all types of protection systems (e.g., UFLS, UVLS), internally and externally to an entity's

[[Page 66226]]

area, to be responsive to the Blackout Report.

\30\ Blackout Report at 159.

\31\ Id.

---

45. While PRC-006-1 requires coordination of UFLS programs among planning coordinators in Requirements R5, R7, and R13, it does not appear to capture the same level of coordination with other protection systems as in Requirement R1.2.8 of PRC-006-0.\32\ The Commission seeks comments from NERC and other interested persons on whether and how coordination with other protection systems is or is not achieved under the new requirements.

\32\ Requirement 1.2.8 of PRC-006-0 encompasses ``[a]ny other schemes that are part of or impact the UFLS program.''

F. Identification of Island Boundaries

46. Requirement R1 of PRC-006-1 directs planning coordinators to develop criteria to select areas that may form islands based on historical events and system studies. Historical events and system studies provide planning coordinators with the data necessary to determine where islands will occur based on the physics of the system. Requirement R2.3 clarifies that islands identified in Requirement R1, which span two or more Regional Entity areas, should be broken up such that each Regional Entity area forms an island. Requirement R2.3 allows planning coordinators to ``adjust the island boundaries to differ from the Regional Entity area boundaries by mutual consent where necessary'' to preserve contiguous island boundaries that better reflect simulations. The Commission agrees that identifying island boundaries based on where they are likely to occur due to system characteristics, as opposed to maintaining rigid Regional Entity area boundaries, should result in more effective UFLS programs. Accordingly, the Commission encourages cooperation among entities to create UFLS programs that set island boundaries based on where separations are expected to occur during an underfrequency event.

47. In its petition, NERC states that the Requirements allow planning coordinators to ``select islands including interconnected portions of the bulk electric system in adjacent Planning Coordinator areas and Regional Entity areas, without the need for coordinating this

selection with Planning Coordinators in neighboring regions.'' \33\ Requirement R2.3 of PRC-006-1, however, requires ``mutual consent'' to adjust island boundaries from Regional Entity boundaries. The Commission seeks clarification from the ERO concerning the required degree of cooperation and/or ``mutual consent'' between planning coordinators under the proposed Reliability Standard in order for island boundaries to be set so that, while deviating from Regional Entity boundaries, they better approximate actual island separation boundaries.

\33\ NERC Petition at 75-76.

G. Automatic Load Shedding and Manual Load Shedding

48. Proposed Reliability Standard PRC-006-1 requires automatically shedding predetermined amounts of load if frequency declines to the UFLS set point in order to rebalance resources and demand and prevent frequency decline that might cause instability, uncontrolled separation, or cascading outages. Proposed Reliability Standard EOP-003-2 requires manual load shedding plans, which may be employed in addition to the automatic load shedding in the UFLS program, or to mitigate other reliability issues. If load allocated to be shed automatically is also planned for manual load shedding, then that load resource would be double-counted. Once load is disconnected from the system, either automatically or manually, it cannot be used again to arrest frequency decline. In the event that a load resource is double-counted and removed during automatic UFLS, the manual load shedding cannot be completed if called upon. Even if additional load is located and shed to compensate for this missing load, the system would be put into an un-studied state and could have unpredicted, negative responses. Accordingly, resources allocated to each type of load shedding (i.e., automatic and manual) should not overlap.

49. There are no requirements in PRC-006-1 to coordinate automatic load shedding by UFLS and manual load shedding under EOP-003-2. The Commission seeks comments from the ERO and other interested persons on how the coordination of automatic and manual load shedding is considered in light of the fact that the proposed Reliability Standards do not explicitly require coordination.

H. Elimination of Requirements for Balancing Authorities in EOP-003-2

50. Requirements R2, R4, and R7 of the currently-effective Reliability Standard EOP-003-1 apply to transmission operators and balancing authorities. Proposed Reliability Standard EOP-003-2 proposes to eliminate balancing authorities from Requirements R2, R4, and R7.

51. Under the proposed modification, balancing authorities would no longer: (i) Establish plans for automatic load shedding for underfrequency or undervoltage conditions (Requirement R2); (ii) consider factors (including frequency, rate of frequency decay, voltage level, rate of voltage decay, or power flow levels) in designing an automatic undervoltage load shedding scheme (Requirement R4); and (iii) coordinate automatic load shedding throughout its area with underfrequency isolation of generating units, tripping of shunt capacitors, and other automatic actions that will occur under abnormal frequency, voltage, or power flow conditions (Requirement R7). In its petition, NERC explains that balancing authorities were deleted from Requirements R2 and R4 ``because the frequency related aspects of these requirements were removed, leaving only consideration of automatic undervoltage load shedding in these two requirements.'' \34\ NERC's petition, however, does not explain why balancing authorities were removed from Requirement R7. Moreover, given that balancing authorities would no longer be subject to Requirements R2, R4, and R7 of EOP-003-2 and are not listed as applicable entities in PRC-006-1, the proposed Reliability Standards do not preserve these existing balancing authority responsibilities.

\34\ NERC Petition at 42.

---

52. The Commission seeks clarification from the ERO as to why these existing balancing authority responsibilities were not incorporated into Reliability Standards PRC-006-1 or EOP-003-2. The Commission also seeks comments from the ERO and other interested persons as to why balancing authorities should not be informed of UFLS program plans that directly impact balancing authority functions.

I. Violation Risk Factors and Violation Severity Levels

53. NERC states that each primary requirement in PRC-006-1 and EOP-003-2 is assigned a Violation Risk Factor (VRF) and Violation Severity Level (VSL) and that these elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in Commission-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

54. The Commission proposes to approve the VRFs and VSLs in PRC-006-1 and EOP-003-2. However, the Commission seeks comments from the ERO and other interested persons regarding one proposed VSL and one proposed VRF for PRC-006-1.

55. The ``Lower VSL'' assignment for Requirement R8 in PRC-006-1 applies

[[Page 66227]]

when a UFLS entity fails to provide data to its planning coordinator for 5 to 10 calendar days following the schedule specified by the planning coordinator. Requirement R8 of PRC-006-1 does not include a 5-day grace period for providing data to planning coordinators. Accordingly, the subject VSL assignment may be inconsistent with the Commission's VSL Guideline 3. The guideline states that a VSL ``should not appear to redefine or undermine the requirement.'' \35\ The five-day grace period implicit in the proposed VSL appears to be inconsistent with this guideline. In addition, the proposed VSL creates a compliance issue. Specifically, it is unclear where a UFLS entity falls in the VRF and VSL matrices if it fails to provide data to its planning coordinator within 1 to 5 days of its scheduled date.

\35\ North American Electric Reliability Corp., 123 FERC] 61,284, at P 32 (2008).

---

56. The VRF for Requirement R5, which requires planning coordinators to coordinate their UFLS program design with other planning coordinators whose area is in part of the same identified island, is proposed as ``Medium.'' NERC states that Requirement R5 is ``not related to similar reliability goals in other standards.'' \36\ However, coordination of load shedding plans is required in a similar manner in Requirement R3 of currently effective Reliability Standard EOP-003-1,\37\ which includes a VRF of ``High.'' The lack of coordination of UFLS programs among planning coordinators within the same identified island could lead to ineffective UFLS operations and further cascading outages within the island when UFLS is activated.

\36\ NERC Petition at 46.

\37\ Proposed Reliability Standard EOP-003-2 includes the same VRF assignment of ``High'' for Requirement R3.

---

57. Guideline 3 of the Commission's VRF Guidelines states that ``[a]bsent justification to the contrary, the Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.'' \38\ The Commission seeks clarification from the ERO why coordination of load shedding plans is a ``High'' VRF for transmission operators and balancing authorities in EOP-003-2 but NERC proposes a ``Medium'' VRF for planning coordinators in, PRC-006-1.

\38\ North American Electric Reliability Corp., 119 FERC] 61,145, at P 25 (2007).

J. Implementation Plan and Effective Date

58. NERC requests an effective date for PRC-006-1 and EOP-003-2 of one year following the first day of the first calendar quarter after applicable regulatory approvals with respect to all Requirements of the proposed Reliability Standards except Parts 4.1 through 4.6 of Requirement R4 of PRC-006-1. With respect to Parts 4.1 through 4.6 of Requirement R4 of PRC-006-1, NERC requests an effective date of one year following the receipt of generation data as required in Reliability Standard PRC-024-1,\39\ but no sooner than one year following the first day of the first calendar quarter after applicable regulatory approvals of PRC-006-1.

\39\ PRC-024-1 addresses ``Generator Performance During Frequency and Voltage Excursions'' and is currently being developed

in the NERC standard drafting process under Project 2007-09 (Generator Verification), which is one of NERC's priority projects.

---

59. NERC contends that the proposed implementation plan is not excessively long and allows sufficient time for entities to transition and install the necessary processes to become compliant. NERC maintains that the one year phase-in for compliance provides planning coordinators sufficient time: (1) To develop, modify, or validate (to determine that an existing program meets required performance characteristics) existing UFLS programs; and (2) to establish a schedule for implementation, or validate a schedule for completion of program revisions already in progress. Moreover, NERC states that transmission owners and distribution providers will comply with the schedule determined by planning coordinators but no sooner than the effective date of the standard.

60. The Commission proposes to accept the implementation plan and effective date proposed by the ERO for PRC-006-1 and EOP-003-2. However, the Commission seeks comments from the ERO and other interested persons about any potential reliability gaps that may occur during the development and implementation of PRC-024-1, such as how the planning coordinators will adequately determine and apply UFLS simulations and plans in the absence of generator trip settings.

IV. Information Collection Statement

61. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping (collections of information) imposed by an agency.\40\ Upon approval of a collection(s) of information, OMB will assign an OMB control number and expiration date. Respondents subject to the filing requirements of this rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

\40\ 5 CFR 1320.11.

---

62. The Commission is submitting these reporting and recordkeeping requirements to OMB for its review and approval under section 3507(d) of PRA. Comments are solicited on the Commission's need for this information, whether the information will have practical utility, the accuracy of provided burden estimate, ways to enhance the quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques.

63. This Notice of Proposed Rulemaking proposes to approve Reliability Standards PRC-006-1 and EOP-003-2, which would replace currently effective Reliability Standards PRC-007-0, PRC-009-0, EOP-003-1 and NERC-approved Reliability Standard PRC-006-0.\41\ As noted previously, Reliability Standard PRC-006-0 was never approved by the Commission, and therefore has never been mandatory and enforceable. On the other hand, Reliability Standards PRC-007-0 and PRC-009-0 were approved by the Commission and are currently mandatory and enforceable. Because Proposed Reliability Standard PRC-006-1 incorporates the requirements from Reliability Standards PRC-006-0, PRC-007-0, and PRC-009-0 some of the existing requirements will become mandatory and enforceable (where previously they were voluntary), while others continue to be so. To properly account for the burden on respondents, the Commission will treat the burden resulting from NERC-approved Reliability Standard PRC-006-0 as essentially new to the industry, even though it is likely that most applicable entities have already been complying.\42\

\41\ PRC-006-0 was not approved by the Commission but remained effective as a NERC-approved standard (but not mandatory or enforceable). The other three standards were approved by the Commission. Mandatory Reliability Standards for the Bulk-Power System, Order No. 693, FERC Stats. & Regs.] 31,242, order on reh'g, Order No. 693-A, 120 FERC] 61,053 (2007).

\42\ This statement is made because currently effective Reliability Standards PRC-007-0 and PRC-009-0 required UFLS entities to follow the UFLS program implemented by Reliability Standard PRC-006-0. Therefore, it is likely that entities have already been following the requirements contained in Reliability Standard PRC-006-0.

---

64. The reporting requirements in proposed Reliability Standard

EOP-

003-2 are virtually the same as those in currently effective Reliability Standard EOP-003-1. The difference is that proposed Reliability Standard EOP-003-2 proposes to eliminate balancing authorities from Requirements R2 and from Measure M1.\43\ This requirement and measure deal with establishing and documenting automatic load shedding plans.

\43\ Balancing authorities are also removed from Requirements R4 and R7, but these do not have reporting requirements associated with them.

---

65. Public Reporting Burden: Our estimate below regarding the number of respondents is based on the NERC compliance registry as of 7/29/11. According to the NERC compliance registry, there are 72 planning coordinators and 126 balancing authorities. The individual burden estimates are based on the time needed to gather data, run studies, and analyze study results to design or update the UFLS programs. Additionally, documentation and the review of UFLS program results by supervisors and management is included in the administrative estimations. These are consistent with estimates for similar tasks in other Commission approved standards.

	Number of respondents annually	Number of responses per respondent		Average burden hours per response	Total annual burden hours
	(1)	(2)		(3)	(1)x(2)x(3)
PRC-006-1 (Automatic underfrequency load shedding) \44\					
PCs *: Design and document Automatic UFLS Program					120
					8,640
PCs: Management Review of Documentation	72	1			40
					2,880
PCs: Record Retention					16
					1,152
Total					12,672
EOP-003-2 (Load Shedding Plans) \45\					
Removal of BAs * from Reporting Requirements in R2 and M1 (Burden Reduction)	126	1	Reporting		-10
					-1260
			Record Retention		-1
					-126
Total					-1,386
Net Change in Burden					11,286

* PC = Planning Coordinator; BA = Balancing Authority.

Total Annual Hours for Collection: (Compliance/Documentation) = 11,286 hours.
Total Reporting Cost for Planning Coordinators: = 11,520 hours @ $120/hour = $1,382,400.
Total Record Retention Cost for Planning Coordinators: 1,152 hours @ $28/hour = $32,256.
Total Reporting and Record Retention Cost Savings for Balancing Authorities: = (1,260 hours @ $120/hour) + (126 hours @ $28/hour) = $154,728.

\44\ Proposed Reliability Standard PRC-006-1 applies to both planning coordinators and to UFLS entities. However, the burden associated with the UFLS entities is not new because it was accounted for under Commission approved Reliability Standards PRC-007-0 and PRC-009-0.
\45\ Transmission operators also have to comply with Reliability Standard EOP-003-2 but since the applicable reporting requirements (and associated burden) have not changed from the existing standard to the proposed standard these entities are not included here.

Total Annual Cost (Reporting + Record Retention) \46\: = $1,414,656-$154,728 = $1,259,928.

\46\ The hourly reporting cost is based on the cost of an engineer to implement the requirements of the rule. The record retention cost comes from Commission staff research on record retention requirements.

Title: Mandatory Reliability Standards for the Bulk-Power System.
Action: Proposed Collection FERC-725A.
OMB Control No.: 1902-0244.
Respondents: Businesses or other for-profit institutions; not-for-profit institutions.
Frequency of Responses: On occasion.
Necessity of the Information: This proposed rule proposes to approve the requested modifications to Reliability Standards pertaining to automatic underfrequency load shedding. The proposed Reliability Standards help ensure the reliable operation of the bulk electric system by arresting declining frequency and assisting recovery of frequency following system events leading to frequency degradation.
Internal Review: The Commission has reviewed the proposed Reliability Standards and made a determination that its action is necessary to implement section 215 of the FPA. These requirements, if accepted, should conform to the Commission's expectation for UFLS programs as well as procedures within the energy industry.
66. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE. Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].
67. For submitting comments concerning the collection(s) of information and the associated burden estimate(s), please send your comments to the Commission and to the Office of Management and Budget, Office of Information and Regulatory Affairs, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission, phone: (202) 395-4638, fax: (202) 395-7285]. For security reasons, comments to OMB should be submitted by e-mail to: oira_submission@omb.eop.gov. Comments submitted to OMB should include Docket Number RM11-20 and OMB Control Number 1902-0244.

V. Environmental Analysis

68. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement

[[Page 66229]]

for any action that may have a significant adverse effect on the human environment.\47\ The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.\48\ The actions proposed here fall within this categorical exclusion in the Commission's regulations.

\47\ Order No. 486, Regulations Implementing the National Environmental Policy Act of 1969, FERC Stats. & Regs., Regulations Preambles 1986-1990] 30,783 (1987).
\48\ 18 CFR 380.4(a)(2)(ii).

VI. Regulatory Flexibility Act Certification

69. The Regulatory Flexibility Act of 1980 (RFA) \49\ generally requires a description and analysis of final rules that will have significant economic impact on a substantial number of small entities. The RFA mandates consideration of regulatory alternatives that accomplish the stated objectives of a proposed rule and that minimize any significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.\50\ The SBA has established a size standard for electric utilities, stating that a firm is small if, including its affiliates, it is primarily engaged in the transmission, generation and/or distribution of electric energy for sale and its total electric output for the preceding twelve months did not exceed four million megawatt hours.\51\

\49\ 5 U.S.C. 601-612.
\50\ 13 CFR 121.101.
\51\ 13 CFR 121.201, Sector 22, Utilities & n.1.

---

70. Proposed Reliability Standard PRC-006-1 proposes to establish design, assessment, and documentation requirements for automatic UFLS program. It will be applicable to planning coordinators and entities that are responsible for the ownership, operation, or control of UFLS equipment. Proposed Standard EOP-003-2 proposes to remove balancing authorities from having to comply with R2 and M1 of the standard. Comparison of the NERC compliance registry with data submitted to the Energy Information Administration on Form EIA-861 indicates that perhaps as many as 8 small entities are registered as planning coordinators and 18 small entities are registered as balancing authorities. The Commission estimates that the small planning coordinators to whom the proposed Reliability Standard will apply will incur compliance and recordkeeping costs of $157,184 ($19,648 per planning coordinator) associated with the Standard's requirements. The small balancing authorities will receive a savings of $154,728 ($8,596 per balancing authority). Accordingly, proposed Reliability Standards PRC-006-1 and EOP-003-2 should not impose a significant operating cost increase or decrease on the affected small entities.

71. Based on this understanding, the Commission certifies that these Reliability Standards will not have a significant economic impact on a substantial number of small entities. Accordingly, no regulatory flexibility analysis is required.

VII. Comment Procedures

72. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due December 27, 2011. Comments must refer to Docket No. RM11-20-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

73. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's Web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

74. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE., Washington, DC 20426.

75. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VIII. Document Availability

76. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the

Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5 p.m. Eastern time) at 888 First Street, NE., Room 2A, Washington, DC 20426.

77. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

78. User assistance is available for eLibrary and the Commission's Web site during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or e-mail at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

List of Subjects in 18 CFR Part 40

Electric power; Electric utilities; Reporting and recordkeeping requirements.

By direction of the Commission. Commissioner Spitzer is not participating.

Nathaniel J. Davis, Sr.,

Deputy Secretary.

BILLING CODE 6717-01-P

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426
OFFICE OF ELECTRIC RELIABILITY

North American Electric Reliability Corporation
Docket No. RR11-2-000

November 15, 2011

Schiff Hardin LLP
1666 K Street, N.W., Suite 300
Washington, D.C. 20036-4390

Attention: Owen E. MacBride
Attorney for North American Electric Reliability Corporation

Reference: Petition for Approval of Compliance Monitoring and Enforcement Agreement Between Northeast Power Coordinating Council, Inc. and Western Electricity Coordinating Council and Related Amendments to Delegation Agreements

Dear Mr. MacBride:

1. On May 25, 2011, the North American Electric Reliability Corporation (NERC) submitted a petition requesting approval of: (1) an agreement between Northeast Power Coordinating Council, Inc. (NPCC) and Western Electricity Coordinating Council (WECC) concerning compliance monitoring and enforcement of WECC registered functions; (2) an agreement between NERC and WECC regarding termination of the existing agreement concerning compliance monitoring and enforcement of WECC registered functions; and (3) related amendments to delegation agreements between NERC and NPCC, and NERC and WECC. NERC requests an effective date of January 1, 2012.

2. NERC states that the purpose of its petition is to provide for NPCC to assume responsibility for performing Regional Entity compliance monitoring and enforcement program functions with respect to those reliability functions for which WECC is the registered entity within the United States portion of the WECC region. Currently, NERC acts as the Compliance Enforcement Authority for WECC registered functions in the United States portion of the WECC region, pursuant to an agreement between NERC and WECC.

3. Notice of this filing was issued on May 25, 2011, with comments, protests or motions to intervene due on or before June 15, 2011. No protests or adverse comments were filed.

4. NERC's uncontested filing is accepted pursuant to the authority delegated to the Director, Office of Electric Reliability, under 18 C.F.R. § 375.303, effective January 1, 2012.

5. This action shall not be construed as accepting any other contingency plan pursuant to 18 C.F.R. § 375.303(a)(1)(i) or any other data or report pursuant to C.F.R. § 375.303(b)(3)(iv). This action shall not be construed as approving any other application including Electric Reliability Organization or Regional Entity Rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such acceptance or approval shall not be deemed as recognition of any claimed right or obligation associated therewith; and such acceptance or approval is without prejudice to any findings or orders which have been or which may hereafter be made by the Commission in any proceeding now or pending or hereafter instituted by or against NERC.

6. This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order, pursuant to 18 C.F.R. § 385.713.

Sincerely,

Joseph H. McClelland, Director
Office of Electric Reliability

Document Content(s)

FEDERAL ENERGY REGULATORY COMMISSION

Before Commissioners: Jon Wellinghoff, Chairman;
Philip D. Moeller, John R. Norris,
and Cheryl A. LaFleur.

North American Electric Reliability Corporation Docket No. RD11-10-000

ORDER APPROVING RELIABILITY STANDARD

(Issued November 17, 2011)

1. The North American Electric Reliability Corporation (NERC) filed a petition requesting approval, pursuant to section 215(d)(1) of the Federal Power Act (FPA) and section 39.5 of the Commission's regulations,[1] of Reliability Standard FAC-008-3 (Facility Ratings), the associated Violation Risk Factors (VRF) and Violation Severity Levels (VSL), and retirement of Reliability Standards FAC-008-1 (Facility Ratings Methodology) and FAC-009-1 (Establish and Communicate Facility Ratings). Reliability Standard FAC-008-3 presents clear, measurable, and enforceable Requirements that obligate transmission owners and generator owners to develop facility ratings methodologies for its facilities. Reliability Standard FAC-008-3 combines currently effective standards FAC-008-1 and FAC-009-1 into a single standard.

2. As discussed in this order, we approve Reliability Standard FAC-008-3 and the retirement of FAC-008-1 and FAC-009-1. We also approve the associated VRFs with one modification, and approve the associated VSLs. The new Reliability Standard, FAC-008-3 will be effective, and Reliability Standards FAC-008-1 and FAC-009-1 will be retired on the first day of the first calendar quarter that is twelve months after issuance of this order, as requested by NERC.

I. Background

A. EPAct 2005 and Mandatory Reliability Standards

3. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, which

[1] 16 U.S.C. § 824o(d)(2) (2006) and 18 C.F.R. § 39.5 (2011).

provide for the reliable operation of the Bulk-Power System, subject to Commission review and approval.[2] Section 215(d)(2) of the FPA states that the Commission may approve, by rule or order, a proposed Reliability Standard or modification to a Reliability Standard if it determines that the Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. Once approved, the Reliability Standards may be enforced by the ERO, subject to Commission oversight, or by the Commission independently.[3] On February 3, 2006, the Commission issued Order No. 672 to implement the requirements of section 215 of the FPA governing electric reliability.[4] In July 2006, the Commission certified NERC as the ERO.[5]

4. On March 16, 2007, the Commission issued Order No. 693 approving 83 Reliability Standards proposed by NERC, including Reliability Standard FAC-008-1.[6] In Order No. 693, the Commission also directed the ERO to modify Reliability Standard FAC-008-1 to: (1) document underlying assumptions and methods used to determine normal and emergency facility ratings; (2) develop facility ratings consistent with industry standards developed through an open, transparent and validated process, and (3) for each facility, identify the limiting component and, for critical facilities, the resulting increase in rating if that component is no longer limiting.[7]

[7] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 771.

B. NERC Filing

5. On June 15, 2011, NERC filed a petition requesting approval of Reliability Standard FAC-008-3, the associated VRFs and VSLs for this Reliability Standard, and retirement of Reliability Standards FAC-008-1 and FAC-009-1. NERC states that it developed Reliability Standard FAC-008-3 using the NERC Reliability Standards Development Procedure, and further states that FAC-008-3 addresses all three Commission directives from Order No. 693. Proposed Reliability Standard FAC-008-3 was approved by the NERC Board of Trustees.

6. NERC states that FAC-008-3 addresses the important reliability goal of improving uniformity and transparency in the facility ratings process. NERC avers that the Reliability Standard presents clear, measurable, and enforceable requirements that each transmission owner develop facility ratings methodologies for its facilities, which are essential for the determination of system operating limits.[8] NERC further states that FAC-008-3 requires transmission owners and generator owners to document underlying assumptions and methods used to determine normal and emergency facility ratings. NERC maintains that this added transparency will allow customers, regulators and other affected users, owners, and operators of the Bulk-Power System to understand how facility owners set facility ratings through differing methods that provide equivalent results. NERC notes that FAC-008-3 requires transmission owners and generator owners to make their facility ratings documentation and methodologies available for inspection and technical review, thereby contributing to the important reliability goal of improving uniformity and transparency in the facility ratings process.

7. NERC describes each of the eight FAC-008-3 Requirements as follows.[9]

- Requirement R1 establishes the documentation requirements placed upon a generator owner for determining the facility ratings of its solely and jointly owned generator facility(ies).

---

[8] NERC defines System Operating Limits as "The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria." *Glossary of Terms Used in NERC Reliability Standards* at 42, updated Aug. 4, 2011, *available at:* http://www.nerc.com/files/Glossary_of_Terms_2011August4.pdf (*NERC Glossary*) (examples of the operating criteria omitted).

[9] NERC Petition at 18-20.

- Requirement R2 requires each generator owner to have a documented methodology for determining facility ratings of its solely and jointly owned equipment connected between the location specified in Requirement R1 and the point of interconnection with the transmission owner.

- Requirement R3 requires each transmission owner to have documented methodology for determining facility ratings (Facility Ratings Methodology) of its solely and jointly owned Facilities.

- Requirement R4, which is carried over from Requirement R2 of the currently-effective FAC-008-1 standard, requires each entity to make its documentation and methodology available to other reliability entities for inspection and technical review.

- Requirement R5 revises the currently-effective FAC-008-1, Requirement R3, and requires generator owners and transmission owners that receive comments from another entity as a result of that entity's technical review of a transmission owner's facility ratings methodology or generator owner's documentation for determining its facility ratings and its facility rating methodology, to respond to the commenting entity within 45 calendar days of receipt of those comments. The response must indicate whether a change will be made to the facility ratings methodology and, if no change will be made, the reasons for that decision.

- Requirement R6 carries forward currently-effective FAC-009-1, Requirement R1, and requires that the generator owner and transmission owner also establish facility ratings for their solely and jointly owned facilities that are consistent with the associated facility rating methodology or documentation for determining their facility ratings.

- Requirement R7 provides that the ratings must be provided to other entities as specified in the requirements.

- Requirement R8 requires the identification and documentation of the limiting component for all facilities and the increase in rating if that component were no longer the limiting component, i.e., the rating for the second most limiting component, for facilities associated with an

Interconnection Reliability Operating Limit,[10] a limitation of Total Transfer Capability, an impediment to generator deliverability, or an impediment to service to a major load center.

- Requirement R8 requires entities to provide information to requesting entities regarding their facilities. Sub-requirement R8.1 requires an entity to provide the identity of the most limiting equipment of a facility as well as the facility rating to requesting entities. Sub-requirement R8.2 requires the identity of the next most limiting equipment of a facility as well as the thermal rating of that equipment.

8. NERC states that proposed Reliability Standard FAC-008-3 addresses the three directives in Order No. 693 related to FAC-008-1. In response to the first directive, that the Reliability Standard document underlying assumptions and methods used to determine normal and emergency facility ratings, FAC-008-3 requires transmission owners and generator owners to document underlying assumptions and methods used to determine normal and emergency facility ratings. NERC notes this added transparency will allow customers, regulators, and other affected users, owners, and operators of the Bulk-Power System to understand how facility owners set facility ratings through differing methods that provide equivalent results. Additionally, NERC states FAC-008-3 requires transmission owners and generator owners to make their facility ratings documentation and methodologies available for inspection and technical review, which will improve uniformity and transparency in the facility ratings process.

9. In response to the second Order No. 693 directive that facility ratings be developed consistent with industry standards developed through an open, transparent, and validated process, proposed Reliability Standard FAC-008-3 requires that the methodology used to establish the facility ratings of the equipment that comprises the facilities be consistent with at least: (1) ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating; (2) one or more industry standards developed through an open process such as the Institute of Electrical and Electronic Engineers (IEEE) or International Council on Large Electric Systems (CIGRE); or (3) a practice that has been verified by testing, performance history, or engineering analysis. NERC states that these requirements will ensure that a

[10] NERC defines Interconnection Reliability Operating Limit as "A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading Outages that adversely impact the reliability of the Bulk Electric System." *NERC Glossary* at 24.

methodology chosen by a facility owner is consistent with industry standards developed through an open, transparent, and validated process.

10. Finally, to address the third Order No. 693 directive, that for each facility, the limiting component be identified and, for critical facilities, the resulting increase in rating if that component is no longer limiting, FAC-008-1 is modified to require transmission owners and generator owners to calculate the increase in rating if the first-limiting element is removed only for those facilities for which thermal ratings cause: (1) an Interconnection Reliability Operating Limit; (2) a limitation of Total Transfer Capability; (3) an impediment to generation deliverability; or (4) an impediment to service to major cities or load pockets. NERC states that the standard drafting team interpreted this directive to allow reliability entities to take rating information and prepare operating plans or planning assessments prior to real-time, which could allow for better situational awareness and improved reliability of the bulk electric system.

11. The proposed effective date for mandatory compliance with proposed Reliability Standard FAC-008-3 is the first day of the first calendar quarter that is twelve months following the effective date of Commission approval. NERC states that this effective date will allow applicable entities adequate time to develop the documentation and other evidence necessary to exhibit compliance with the standard.

12. Finally, NERC states that proposed Reliability Standard FAC-008-3 includes clear and understandable consequences for a violation by assigning a VRF and VSL to each main requirement. With respect to the VSL assignments for FAC-008-3, for each Requirement in FAC-008-3, NERC carried forward the approved VSLs from the corresponding Requirements in FAC-008-1 and FAC-009-1.

13. With respect to the VRF assignments for FAC-008-3, NERC assigned a VRF to each main Requirement. The VRFs assigned to Requirements R4 through R8 are carried forward from the approved VRFs for the corresponding Requirements from Reliability Standards FAC-008-1 and FAC-009-1. Requirements R1 through R3 of FAC-008-3, correspond to Requirement R1 of currently effective Reliability Standard FAC-008-1. NERC developed VRFs for proposed FAC-008-3, Requirements R1 through R3 that vary from the currently approved VRFs assigned to FAC-008-1, Requirement 1 and its sub-requirements. NERC states that FAC-008-3, Requirements R1 and R2, which apply to generator owners and radial facilities only are planning-related requirements, are administrative in nature and, if violated, would not under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Accordingly, NERC proposes these two Requirements be assigned a VRF of "Lower." FAC-008-3, Requirement 3 which pertains to transmission owners, is assigned a VRF of "Medium" consistent with the existing approved VRF for Sub-requirements R1.1 through R1.2.2 of FAC-008-1.

II. Notice of Filing and Comments

14. Notice of NERC's Filing was published in the *Federal Register,* 76 Fed. Reg. 53,119 (2011), with interventions and protests due on or before September 16, 2011. American Municipal Power, Inc. filed a motion to intervene. International Transmission Company d/b/a/ ITC*Transmission*, Michigan Electric Transmission Company, LLC, ITC Midwest LLC, and ITC Great Plains, LLC (ITC Companies) filed comments but did not seek to intervene in this proceeding.

III. Discussion

15. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.214 (2011), the timely, unopposed motions to intervene serve to make the entities that filed them parties to this proceeding.

16. We approve Reliability Standard FAC-008-3 as just, reasonable, not unduly discriminatory or preferential, and in the public interest. We believe that the modifications are an improvement to the currently-effective Reliability Standard and adequately address the Commission's directives set forth in Order No. 693 that NERC develop certain modifications to FAC-008-1.[11] In several instances, NERC developed alternative approaches to address the concerns articulated in Order No. 693. As discussed below, we find that the proposed Reliability Standard, FAC-008-3 adequately addresses the Commission's Order No. 693 directives by providing equally effective and efficient approaches. Below, we discuss three aspects of NERC's filing: (1) normal and emergency ratings; (2) methodology options for developing facility ratings; and (3) requests for facility ratings data.

A. Normal Rating and Emergency Rating Glossary Terms

17. In Order No. 693, the Commission directed the ERO to submit a modification to FAC-008-1 "that requires transmission and generation facility owners to document underlying assumptions and methods used to determine normal and emergency facility ratings."[12] NERC states that this directive is addressed in Requirements R2.4.2 and R3.4.2 of FAC-008-3,[13] each of which requires that, in developing a documented rating methodology, "the scope of Ratings addressed shall include, as a minimum, both Normal

[11] *See* Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 771.

[12] *Id*. P 739.

[13] NERC Petition at 10.

and Emergency Ratings."[14] We find that the above provisions adequately address the Commission's directive in Order No. 693. Further, the language of Requirements R2.4.2 and R3.4.2 of FAC-008-3 is beneficial because it makes clear that applicable entities must develop documented methods for calculating normal ratings and, separately, emergency ratings; a distinction that may have been somewhat blurred in the past.

B. Methodology Options for Specific Types of Equipment

18. NERC states in its petition that proposed FAC-008-3, Requirement R3.1 achieves the Commission's Order No. 693 directive that *facility ratings* be based on a "methodology chosen by a facility owner be consistent with industry standards developed through an open process such as IEEE or CIGRE."[15] A facility rating is determined by the individual equipment rating of the most limiting element that comprises that facility.[16] Requirement R3.1 provides:

> The methodology used to establish the Ratings of the equipment that comprises the Facility shall be consistent with at least one of the following:
>
> • Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

[14] NERC defines Normal Rating as "[t]he rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life." NERC defines Emergency Rating as "[t]he rating as defined by the equipment owner that specifies the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar or other appropriate units, that a system, facility, or element can support, produce, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved." *NERC Glossary* at 17 and 28.

[15] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 742.

[16] *See* FAC-008-3, Requirement R3.3. Requirement R3.3 provides that the transmission owner's documented methodology for determining facility ratings must include a statement that "a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility."

> • One or more industry standards developed through an open process such as Institute of Electrical and Electronics Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).
>
> • A practice that has been verified by testing, performance history or engineering analysis.

The Commission believes that Requirement R3 adequately satisfies the Commission's directive in Order No. 693, however, there is one potential application of the new provision that is worthy of discussion. In particular, Requirement R3 allows an applicable entity to determine equipment ratings using manufacturer nameplate ratings, which ratings reflect the manufacturer's design conditions. With regard to the option of using nameplate ratings for setting an equipment rating under Requirement R3.1, the Commission notes that the ERO issued a recommendation to consider actual field conditions when determining facility ratings for transmission facilities in its October 7, 2010 Alert titled "Consideration of Actual Field Conditions in Determination of Facility Ratings."[17] This Alert recommends that recipients review their current facility ratings methodology for their solely and jointly owned transmission lines to verify that the methodology used to determine facility ratings is based on actual field conditions. The Alert further recommends that entities should determine if their facility ratings methodology will produce appropriate ratings, even when considering differences between design and actual field conditions.

C. Request for Facility Ratings Data

19. In their comments, the ITC Companies raise a concern regarding Sub-requirement R8.1, which requires transmission owners and certain generator owners to provide facility ratings and the identity of the most limiting equipment of the facilities, "as scheduled by the requesting entities." The ITC Companies believe the language "as scheduled by the requesting entities" is too open-ended such that there could be repeated and frequent requests for this data. The ITC Companies state this could result in burdensome "nuisance" data requests. The ITC Companies propose revising Sub-requirement R8.1 to make the schedule for ratings requests be mutually agreed between requester and the transmission owner or generator owner rather than solely the requester's schedule.

20. The Commission notes that the phrase "as scheduled by the requesting entities" is virtually identical to language in Requirement R2 of currently effective Reliability

[17] The October 7, 2010 Alert is *available on-line at:* http://www.nerc.com/fileUploads/File/Events%20Analysis/Ratings_Recommendation_to_Industry_20100929Final.pdf.

Standard FAC-009-1,[18] which requires transmission owners and generator owners to provide facility ratings "as scheduled by such requesting entities." Requirement R2 of FAC-009-1 has been in effect since October 2006,[19] and the Commission is not aware that the use of similar language in FAC-009-1, Requirement 2 has been a source of concern for applicable entities. [20] Thus, we are not persuaded by ITC Companies' pleading that FAC-008-3, Sub-requirement R8.1 will result in an unreasonable or unmanageable number of requests for facility ratings or the identity of limiting equipment.

21. Based on the foregoing, the Commission finds that Reliability Standard FAC-008-3 is just, reasonable, not unduly discriminatory or preferential, and in the public interest. Accordingly, the Commission approves Reliability Standard FAC-008-3. As requested by NERC, Reliability Standard FAC-008-3 will be effective on the first day of the first calendar quarter twelve months following the date of this order. Concurrent with the effective date of FAC-008-3, Reliability Standards FAC-008-1 and FAC-009-1 shall retire.

D. VRFs and VSLs

22. The Commission also finds that the VSLs assigned to the Reliability Standard FAC-008-3 Requirements are consistent with the Commission's established guidelines

---

[18] FAC-009-1, Requirement 2 provides:

> R2. The Transmission Owner and Generator Owner shall each provide Facility Ratings for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities to its associated Reliability Coordinator(s), Planning Authority(ies), Transmission Planner(s), and Transmission Operator(s) as scheduled by such requesting entities.

[19] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 773-774.

[20] Based on the development record for FAC-008-3 provided by NERC, it does not appear that the ITC Companies or any other stakeholder raised this issue during the comment periods. The ITC Companies cast affirmative votes to approve FAC-008-3, without comment, in both the initial ballot (April 21, 2011 to May 2, 2011) and the recirculation ballot (May 12, 2011 to May 23, 2011). *See* NERC Petition, Exhibit E at 845 and 1010.

for review of proposed VSLs.[21] With respect to the VRF assignments, the Commission approves NERC's proposed VRF designations for FAC-008-3, subject to one modification discussed below.

23. The Commission agrees that the VRFs assigned to FAC-008-3, Requirements R4 through R8 are carried forward from and match the approved VRFs for the corresponding Requirements from Reliability Standards FAC-008-1 and FAC-009-1.[22] However, as NERC explained in its filing, while Requirements R1 through R3 of FAC-008-3 correspond to Requirement R1 of currently effective Reliability Standard FAC-008-1, they do not directly align. Thus, NERC developed VRFs for proposed FAC-008-3, Requirements R1 through R3 that vary from the currently approved VRFs assigned to FAC-008-1, Requirement 1 and its sub-requirements. NERC proposes to assign Requirements R1 and R2 a VRF of "Lower," and to assign Requirement 3 a VRF of "Medium."

24. We agree with the "Lower" VRF for Requirement R1 and the "Medium" VRF for Requirement R3. However, we reject NERC's proposed "Lower" VRF for FAC-008-3, Requirement R2. Unlike FAC-008-3, Requirement R1, which applies, generally, to generator facilities behind the main step up transformer,[23] Requirement R2 applies to radial feed facilities which are more likely than "behind-the-transformer" generator facilities to directly affect the electric state of the bulk electric system. Further, while Requirement R1 is a documentation-only requirement, Requirement R2 imposes more than documentation requirements. Specifically, Requirement R2 mandates the provision of the underlying assumptions and methods used to determine the equipment ratings (Sub-requirement R2.2) and the process for determining the equipment rating (Sub-requirement R2.4). Thus, Requirement R2 while a planning requirement is not merely administrative in nature. It therefore falls outside of NERC's definition of "Lower Risk Requirements," which defines a "Lower" Requirement as one that is "administrative in

[21] *See North American Electric Reliability Corp.*, 123 FERC ¶ 61,284, at P 20-35, *order on reh'g & compliance*, 125 FERC ¶ 61,212 (2008) (VSL Guidance Order).

[22] *See North American Electric Reliability Corp.*, 119 FERC ¶ 61,145, *order on reh'g*, 120 FERC ¶ 61,145, at P 8-13 (2007) (VRF Guidance Order).

[23] Specifically, Requirement R1 applies to generator facilities up to the low side terminals of the main step up transformer if the generator owner does not own the main step up transformer, and the high side terminals of the main step up transformer if the generator owner owns the main step up transformer.

nature."[24] The Commission's VRF guidelines require consistency with NERC's definition of the VRF level. Accordingly, the Commission directs the ERO to modify the VRF assignment for FAC-008-3, Requirement R2 to "medium" and to submit the modification in a compliance filing within 60 days from the date this order issues.

The Commission orders:

(A) Reliability Standard FAC-008-3, the assigned VSLs, and the implementation plan proposed by NERC are approved, as discussed in this order.

(B) Reliability Standards FAC-008-1 and FAC-009-1 shall be retired upon the effective date of Reliability Standard FAC-008-3, as discussed in the body of this order.

(C) The VRF assignments for Reliability Standard FAC-008-3, Requirements R1, and R3 through R8 are approved. The Commission directs the ERO to modify the VRF for Requirement R2 as discussed in this order.

---

[24] The approved NERC definition for a "lower" VRF designation is as follows:

> Lower Risk Requirement: is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

See North American Electric Reliability Corporation, 119 FERC ¶ 61,145, at P 9, *order on compliance,* 121 FERC ¶ 61,179, at P 2 and Appendix A (2007).

(D) NERC is directed to file a compliance filing within 60 days of the date of this order, as discussed in the body of this order.

By the Commission. Commissioner Spitzer is not participating.

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

18 CFR Part 40

[Docket No. RM11-18-000]

Transmission Planning Reliability Standards

AGENCY: Federal Energy Regulatory Commission, DOE.

ACTION: Notice of proposed rulemaking.

SUMMARY: Transmission Planning (TPL) Reliability Standards are intended to ensure that the transmission system is planned and designed to meet an appropriate and specific set of reliability criteria. Reliability Standard TPL-002-0a references a table which identifies different categories of contingencies and allowable system impacts in the planning process. The table includes a footnote regarding planned or controlled interruption of electric supply where a single contingency occurs on a transmission system. North American Electric Reliability Corporation (NERC), the Commission-certified Electric

[[Page 66230]]

Reliability Organization, requests approval of a revision to the footnote. In this notice, the Commission proposes to remand NERC's proposed revision to the footnote.

DATES: Comments are due December 27, 2011.

ADDRESSES: You may submit comments, identified by docket number by any of the following methods:

Agency Web Site: http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.

Mail/Hand Delivery: Commenters unable to file comments electronically must mail or hand deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE., Washington, DC 20426.

FOR FURTHER INFORMATION CONTACT:

Robert T. Stroh (Legal Information), Office of the General Counsel, Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426, Telephone: (202) 502-8473.
Eugene Blick (Technical Information), Office of Electric Reliability, Federal Energy Regulatory Commission, 888 First Street, NE., Washington, DC 20426, Telephone: (202) 502-8066.

SUPPLEMENTARY INFORMATION:

Notice of Proposed Rulemaking

October 20, 2011.

1. On March 31, 2011, the North American Electric Reliability Corporation (NERC) filed a petition seeking approval of Table 1, footnote `b' of four Reliability Standards: Transmission Planning: TPL-001-1--System Performance Under Normal (No Contingency) Conditions (Category A), TPL-002-1b--System Performance Following Loss of a Single Bulk Electric System Element (Category B), TPL-003-1a--System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), and TPL-004-1- System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D).\1\ Pursuant to section 215(d)(4) of the Federal Power Act (FPA) \2\, the Commission proposes to remand the proposed Table 1, footnote b. As discussed below, the Commission believes that

the proposed Reliability Standard does not meet the statutory criteria for approval that it be just, reasonable, not unduly discriminatory or preferential, and in the public interest.\3\ The Commission seeks comments on its proposal.

\1\ While footnote `b' appears in all four of the above referenced TPL Reliability Standards, its relevance and practical applicability is limited to TPL-002-0a.

\2\ 18 U.S.C. 824o(d)(4) (2006).

\3\ 16 U.S.C. 824o(d)(2) (2006).

I. Background

2. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. Approved Reliability Standards are enforced by the ERO, subject to Commission oversight, or by the Commission independently.

3. Pursuant to section 215 of the FPA, the Commission established a process to select and certify an ERO \4\ and, subsequently, certified NERC as the ERO.\5\ On March 16, 2007, the Commission issued Order No. 693, approving 83 of the 107 Reliability Standards filed by NERC, including Reliability Standard TPL-002-0, Table 1, footnote `b.' \6\ In addition, pursuant to section 215(d)(5) of the FPA,\7\ the Commission directed NERC to develop modifications to 56 of the 83 approved Reliability Standards, including footnote `b' of Reliability Standard TPL-002-0.\8\

\4\ Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards, Order No. 672, FERC Stats. & Regs.] 31,204, order on reh'g, Order No. 672-A, FERC Stats. & Regs.] 31,212 (2006).

\8\ Order No. 693, FERC Stats & Regs.] 31,242 at P 1797.

A. Transmission Planning (TPL) Reliability Standards

4. Currently-effective Reliability Standard TPL-002-0a addresses Bulk-Power System planning and related system performance for single element contingency conditions. Requirement R1 of TPL-002-0a requires that each Planning Authority and Transmission Planner ``demonstrate through a valid assessment that its portion of the interconnected transmission system is planned such that the Network can be operated to supply projected customer demands and projected Firm Transmission Services, at all demand levels over the range of forecast system demands, under the contingency conditions as defined in Category B of Table I.'' \9\ Table I identifies different categories of contingencies and allowable system impacts in the planning process. With regard to system impacts, Table I further provides that a Category B (single) contingency must not result in cascading outages, loss of demand or curtailed firm transfers, system instability or exceeded voltage or thermal limits. With regard to the clause regarding loss of demand, current footnote `b' of Table 1 states:

\9\ Reliability Standard TPL-002-0a, Requirement R1.

Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.

B. Order No. 693 Directive

5. In Order No. 693, the Commission stated that it believes that the transmission planning Reliability Standard should not allow an

entity to plan for the loss of non-consequential firm load in the event of a single contingency.\10\ The Commission directed the ERO to develop certain modifications, including a clarification of Table 1, footnote `b'. The Commission stated that:

\10\ See Order No. 693, FERC Stats. & Regs.] 31,242 at P 1794. Non-consequential load loss includes the removal, by any means, of any planned firm load that is not directly served by the elements that are removed from service as a result of the contingency. Currently-effective footnote `b' deals with both consequential load loss and non-consequential load loss. NERC's proposed footnote `b' characterizes both types of load loss as ``Firm Demand.'' The focus of this NOPR is NERC's proposed treatment of non-consequential load loss or planned interruption of ``Firm Demand.''

Based on the record before us, we believe that the transmission planning Reliability Standard should not allow an entity to plan for the loss of non-consequential load in the event of a single contingency. The Commission directs the ERO to clarify the Reliability Standard. Regarding the comments of Entergy and Northern Indiana that the Reliability Standard should allow entities to plan for the loss of firm service for a single contingency, the Commission finds that their comments may be considered through the Reliability Standards development process. However, we strongly discourage an approach that reflects the lowest common denominator. The Commission also clarifies that an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances.\11\

\11\ Order No. 693, FERC Stats. & Regs.] 31,242 at P 1794 (footnotes omitted).

[[Page 66231]]

6. In a subsequent clarifying order, the Commission stated that it believed that a regional difference, or a case-specific exception process that can be technically justified, to plan for the loss of firm service ``at the fringes of various systems'' would be an acceptable approach in limited circumstances.\12\ Specifically, the Commission clarified that:

\12\ Mandatory Reliability Standards for the Bulk Power System, 131 FERC] 61,231, at P 21 (2010) (June 2010 Order).

Moreover, the Commission, in * * * Order No. 693, then provided a clarification that an entity may seek a regional difference to the Reliability Standard from the ERO for case-specific circumstances. We believe that a regional difference, or a case-specific exception process that can be technically justified, to plan for the loss of firm service ``at the fringes of various systems'' would be an acceptable approach. Thus, the Commission did not dictate a single solution as NERC and others now claim. In any event, NERC must provide a strong technical justification for its proposal.\13\

\13\ Id.

C. NERC's Petition for Approval of TPL-002-0a, Footnote b

7. On March 31, 2011, NERC filed a petition seeking approval of its proposal to revise and clarify footnote `b' ``in regard to load loss following a single contingency.'' \14\ NERC stated that it did not eliminate the ability of an entity to plan for the loss of non-consequential load in the event of a single contingency but drafted a footnote that, according to NERC, ``meets the Commission's directive while simultaneously meeting the needs of industry and respecting jurisdictional bounds.'' \15\ NERC states that its proposed footnote `b' establishes the requirements for the limited circumstances when and how an entity can plan to interrupt Firm Demand for Category B contingencies. It allows for planned interruption of Firm Demand when ``subject to review in an open and transparent stakeholder process.'' \16\ NERC's proposed footnote `b' states:

\14\ NERC Petition at 10.

\15\ Id.
\16\ Id.

An objective of the planning process should be to minimize the likelihood and magnitude of interruption of firm transfers or Firm Demand following Contingency events. Curtailment of firm transfers is allowed when achieved through the appropriate redispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in the shedding of any Firm Demand. It is recognized that Firm Demand will be interrupted if it is: (1) Directly served by the Elements removed from service as a result of the Contingency, or (2) Interruptible Demand or Demand-Side Management Load. Furthermore, in limited circumstances Firm Demand may need to be interrupted to address BES performance requirements. When interruption of Firm Demand is utilized within the planning process to address [Bulk Electric System] performance requirements, such interruption is limited to circumstances where the use of Demand interruption are documented, including alternatives evaluated; and where the Demand interruption is subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.

D. Supplemental Information

8. On June 7, 2011, in response to a Commission deficiency letter, NERC explained that ``the approach proposed in footnote `b' is equally efficient because many of the stakeholder processes that will be used in footnote `b' planning decisions are already in place, as implemented by FERC in Order No. 890 and in state regulatory jurisdictions.'' \17\ NERC also pointed to state public utility commission processes or processes existing in local jurisdictions that address transmission planning issues that could serve to provide a case-specific review of the planned interruption of Firm Demand. NERC added that an ERO-sponsored planning process is not likely to be efficient or effective because of extensive jurisdictional issues between NERC, the Commission, and the many authorities having jurisdiction that would have to be resolved before implementation could occur. NERC added that an ERO-specific process would lead to conflicts among federal, provincial, state and local governing bodies that have jurisdiction over various parts of the planning, siting and construction process. NERC also believes that a NERC-centered process would duplicate planning actions occurring elsewhere (e.g., where resource allocation decisions are actually being made), and such a process could lead to inconsistent results. NERC concluded that a more reasonable and expeditious path would be to rely on existing stakeholder processes. According to NERC, such processes would more likely engage the appropriate local-level decision-makers and policy-makers.

\17\ NERC Data Response at 4.

---

9. With respect to review and oversight by NERC and the Regional Entities, NERC submitted that an ERO-specific process would place the ERO in the position of managing and actively participating in a planning process, which conflicts with its role as the compliance monitor and enforcement authority. NERC also stated that neither the ERO nor the Regional Entities will review decisions regarding planned interruptions. Their role will be limited to reviewing whether the registered entity participated in a stakeholder process when planning to interrupt Firm Demand. NERC explained that Regional Entities will have oversight after-the-fact by auditing the entity's implementation of footnote `b' to determine if the entity planned on interrupting Firm Demand and whether the decision by the entity to rely on planned interruption of Firm Demand was vetted through the stakeholder process and qualified as one of the situations identified in footnote b.

10. Furthermore, NERC stated that an objective of the planning process should be to minimize the likelihood and magnitude of planned Firm Demand interruptions. NERC recognizes that there may be topological or system configurations where allowing planned interruptions of Firm Demand may provide more reliable service. NERC contends that due to the wide variety of system configurations and regulatory compacts, it is not feasible for the ERO to develop a one-size-fits-all criterion for limiting the planned firm load interruptions for Category B events. According to NERC, the standards drafting team evaluated setting a certain magnitude of planned interruption of Firm Demand, but there was no analytical data to support a single value, and it would be viewed as arbitrary.

II. Discussion

11. The Commission proposes to remand NERC's proposal to modify Reliability Standard TPL-002-0a, Table 1, footnote `b.' The Commission believes that NERC's proposal does not meet the directives in Order No. 693 and the June 2010 Order and does not clarify or define the circumstances in which an entity can plan to interrupt Firm Demand for a single contingency. Specifically, the Commission is concerned that the procedural and substantive parameters of NERC's proposed stakeholder process are too undefined to provide assurances that the process will be effective in determining when it is appropriate to plan for interrupting Firm Demand, does not contain NERC-defined criteria on circumstances to determine when an exception for planned interruption of Firm Demand is permissible, and could result in inconsistent results in implementation. In proposing a stakeholder process without specification of any technical means by which exceptions are to be evaluated,

[[Page 66232]]

the proposed footnote effectively turns the processes into a reliability standards development process outside of NERC's existing procedures. Furthermore, the Commission believes that regardless of the process used, the result could lead to inconsistent reliability requirements within and across reliability regions. While the Commission recognizes that some variation among regions or entities is reasonable given varying grid topography and other legitimate considerations, there are no technical or other criteria to determine whether varied results are arbitrary or based on meaningful distinctions. While the Commission acknowledges that NERC has flexibility in developing alternative approaches, we believe that the proposed approach is not equally efficient or effective as the Commission's directives and that NERC has failed to provide a strong technical justification for its proposal.

12. As an initial matter, the Commission is concerned that the process lacks parameters. The standard requires that, when planning to interrupt Firm Demand, the Firm Demand interruption must be ``subject to review in an open and transparent stakeholder process that includes addressing stakeholder comments.'' \18\ However, without any substantive parameters governing the stakeholder process, the enforceability of this obligation by NERC and the Regional Entities' would be limited to a review to ensure only that a stakeholder process occurred. Indeed, NERC's explanation appears to confirm this concern, as NERC explained that Regional Entities' involvement is limited to oversight after-the-fact by auditing the entity's implementation of footnote `b' to determine if the entity planned on interrupting Firm Demand and whether the decision by the entity to rely on planned interruption of Firm Demand was vetted through the stakeholder process and qualified as one of the situations identified in footnote `b'.

\18\ NERC Petition at 10.

---

13. Further, the Commission is concerned that the NERC proposal leaves undefined the circumstances in which it is allowable to plan for Firm Demand to be interrupted in response to a Category B contingency. The TPL-002-0a Reliability Standard requires Planning Authorities and Transmission Planners to demonstrate through a valid assessment that the transmission system is planned and can be operated to supply projected Firm Demand at all demand levels over a range of forecasted system demands.\19\ Moreover, the planner must consider all single contingencies applicable to Table I, Category B and demonstrate that system performance is met. For those instances where system performance is not met, the planner must provide a written summary of its plans to achieve system performance including implementation schedules, in service dates of facilities and implementation lead times.\20\ In regard to NERC's proposal, the Commission is concerned that footnote `b' would function as a means to override the reliability objective and system performance requirements of the TPL Reliability Standard without any technical or other criteria specified to determine when planning to interrupt Firm Demand would be allowable. In this case NERC has provided no technically sound means of determining situations in which planning to interrupt Firm Demand would be allowable, and instead has removed such decision-making to an unspecified stakeholder process without any assurance that such processes will deploy technically sound means of approving or denying exceptions. Without any technical or other criteria specified to determine when planning to interrupt Firm Demand would be allowable, the Commission is concerned that multiple stakeholder processes across the country engaging in such determinations could lead to inconsistent and arbitrary exceptions

including, potentially, allowing entities to plan to interrupt any amount of Firm Demand in any location and at any voltage level. While the Commission recognizes that some variation among regions or entities is reasonable given varying grid topography and other legitimate considerations, there are no technical or other criteria to determine whether varied results are arbitrary or based on meaningful distinctions. The Commission is thus concerned that there may be a lack of consistency in determinations to allow the planned interruption of Firm Demand. The proposed stakeholder process does not have any parameters except for openness and transparency. As a result, multiple processes that could be adopted across the country would likely lead to inconsistent determinations to allow for the planned interruption of Firm Demand.

\19\ Reliability Standard TPL-002-0a, Requirement R1.
\20\ Reliability Standard TPL-002-0a, Requirements R1.5 and R2.

---

14. The Commission believes that a remand would give NERC and industry flexibility to develop an approach that would address the issues identified by the Commission with the proposed footnote `b' stakeholder process including, as discussed below, definition of the process and criteria or guidelines for the process.

A. Lack of Technical or Other Criteria

15. NERC's proposal does not prescribe the criteria that would define the parameters of permissible interruption of Firm Demand. In Order No. 693 the Commission expressed concern that, as a general rule, footnote `b' should not allow an entity to plan for the loss of non-consequential load in the event of a single contingency and directed NERC to clarify the standard. The Commission stated in the June 2010 Order that a regional difference or a case-specific exception process that could be technically justified would be acceptable. While the Commission allows NERC to propose an equally effective and efficient solution to a Commission's proposed solution, the Commission does not believe that the proposal is equally effective and efficient. First, NERC's proposed footnote `b' contains no constraints and could allow an entity to plan to interrupt any amount of Firm Demand, in any location or at any voltage level as needed for any single contingency, provided that it is documented and subjected to a stakeholder process. This result is contrary to the underlying standard and our prior orders.\21\ Further, NERC did not technically justify its proposal, instead relying on the benefit of having transparency in the process. The Commission does not believe transparency in this instance can substitute for a technical justification.

\21\ See Order No. 693, see also June 2010 Order.

---

16. In its supplemental filing, NERC states that it is not feasible for the ERO to develop a one-size-fits-all criterion for limiting the planned interruption of Firm Demand due to the wide variety of system configurations and regulatory compacts.\22\ NERC states that the standards drafting team believes there is no analytical data to support a single level and therefore any single value was viewed as arbitrary.

\22\ NERC Data Response at 6.

---

17. We are not persuaded by NERC's reasoning. First, both NERC and the Commission have developed thresholds in other reliability contexts that have overcome similar claims of arbitrariness. For example, the threshold for conducting vegetation management pursuant to Reliability Standard FAC-003-1 applies to all transmission lines operated at 200 kV and above.\23\ In the

[[Page 66233]]

same vein, NERC's Statement of Compliance Registry Criteria has numerous thresholds for determining eligibility for registration.\24\ The Commission did not suggest a one size fits all exceptions process. If the ERO were to perform an exception process, it might include flexibility in decisions based on disparate topology or on other matters since it could utilize its technical expertise to determine the reliability impact from one region to another. Moreover, the Commission's proposal to remand revised footnote `b' due to a lack of criteria does not preclude NERC from developing another alternative,

provided that it is equally ``efficient and effective.''

\23\ Reliability Standard FAC-003-1.

\24\ See, e.g., NERC Statement of Registry Criteria, Section III. The Commission approved Statement of Registry Criteria in Order No. 693.

18. Finally, the Commission understands that there are a wide variety of system configurations and regulatory compacts. NERC indicates that the standards drafting team considered a variety of limits; however, it is not clear whether NERC considered a blend of quantitative and qualitative thresholds. For example, a standard could require a process with a quantitative limitation on how much Firm Demand could be planned for interruption and that standard could provide an exception process where a registered entity would submit documents and explanation to the ERO or a Regional Entity for approval based upon certain considerations.\25\ In short, we believe that a more defined process would be needed but, by itself, would not be adequate without NERC-defined technical or other criteria to determine planned interruption of Firm Demand. The Commission seeks comment on these proposals.

\25\ While we encourage NERC to exercise flexibility in designing an appropriate standard, under this example, the exception process could consist of a stakeholder process that has some level of due process as long as that process does not allow the entity that proposes its exception to make the decision on whether to grant the exception.

B. Stakeholder Process

19. The Commission believes that NERC's proposed footnote `b' stakeholder process does not meet Order No. 693 and the June 2010 Order directive. According to NERC, the type of stakeholder process used under its proposed footnote `b' can vary from one planning entity to the next. NERC offers several stakeholder processes as examples, such as the Order 890-type process, a state public utility commission or local jurisdiction process, or a Regional Transmission Organization/ Independent System Operator (RTO/ISO) stakeholder process.

20. First, because NERC's proposed footnote `b' does not define the stakeholder process, the express terms of the standard would allow an applicable entity to form or participate in any stakeholder process and be compliant with the proposed standard. Second, as we have mentioned, NERC has offered no technical justification for exceptions to be granted through the stakeholder process and therefore no means for the Commission to judge whether the process will protect the reliability of the Bulk-Power System. Nothing in the proposed footnote `b' restricts the stakeholder process, other than that it must be an open and transparent stakeholder process that includes addressing stakeholder comments. The Commission is concerned that any meeting that is open to stakeholders could meet this standard. Further, because the stakeholder process is not defined, the proposal could allow a transmission planner to develop a process that provides insufficient process and transparency and still comply with the standard. The Commission believes that such process would be insufficient because it allows any stakeholder process to essentially become a reliability standards development processes outside of NERC's existing procedures. Furthermore, the Commission believes that regardless of the stakeholder process used, the outcome could lead to inconsistent results, with no technical or other criteria to determine whether varied results are arbitrary or based on meaningful distinctions. The Commission seeks comment on whether a stakeholder process is the appropriate vehicle to approve or deny exceptions to allow entities to plan to interrupt Firm Demand for a single contingency and if so, whether the proposed footnote `b' would require any stakeholder due process.

21. Nor does the standard describe what would be entailed in addressing the stakeholder comments. As described above, the process under the standard does not provide for any technical rigor to address stakeholder concerns. While the standard requires transparency and an opportunity for stakeholder comments on the transmission planner's proposed plan to interrupt Firm Demand, it does not mandate any particular stakeholder involvement, nor does it mandate that interested governmental authorities be afforded notice and an opportunity to comment. As we read the proposed standard, a responsible entity could define when it would plan to interrupt Firm Demand on its own, then ask for stakeholder input on that plan. While the standard requires the responsible entity to ``address'' stakeholder comments, the responsible

entity is not required to specify or support the technical basis upon which it rendered a decision. The Commission believes that the stakeholder process in proposed footnote `b' would allow the transmission planner to define the circumstances when it would rely on planned interruption of Firm Demand, provide that definition for review by regulators and other stakeholders, receive comments from regulators and stakeholders requesting a more narrow definition, and explain to the regulators and stakeholders why it is declining the request and maintaining the broader definition, even if every other transmission planner facing similar circumstances would reach the opposite conclusion.

22. In Order No. 693 and the June 2010 Order, the Commission stated that a regional difference or a case-specific exception process, among other things, would be an acceptable approach. With regard to a case-specific process, NERC replied it would ``create undesirable delays and uncertainty in the transmission planning process.'' \26\ However, the proposed footnote `b' does not provide a time limitation by which planning decisions to interrupt Firm Demand must be made. The Commission is not persuaded that NERC's proposed approach ameliorates this concern. The Commission seeks comment on whether an exceptions process that provides defined criteria, with some allowance or consideration for unique circumstances, could be crafted that would resolve NERC's concerns of ``undesirable delays'' and ``uncertainty.''

\26\ NERC Data Response at 2.

---

23. In sum, the Commission is concerned that the stakeholder process set forth in the NERC proposal is not sufficiently defined, rendering it potentially unenforceable. As mentioned above, the proposed stakeholder process includes no parameters other than openness and transparency. NERC states that it and the Regional Entities will review a responsible entity's decision to plan to interrupt Firm Demand using an after-the-fact audit, to determine if the entity's implementation of footnote `b' to plan Firm Demand interruption and whether the decision by the entity was vetted through the stakeholder process and qualified as one of the situations

[[Page 66234]]

identified in footnote `b.' \27\ The Commission believes that this could result in a transmission planner invoking a process that provides for minimal stakeholder involvement, providing scant reasons to reject any stakeholder input and then defending its decision by claiming that it has satisfied the provision. While the Compliance Enforcement Authority would verify that the process fulfilled the letter of NERC's proposed footnote `b'--that some open, transparent stakeholder process was involved and that the responsible entity in some way addressed stakeholder concerns--there is no mechanism for the ERO or a Regional Entity to enforce a finding that the evidence does not support an acceptable instance of planned interruption of Firm Demand. The Commission seeks comment on the concerns raised above.

\27\ NERC Data Response at 7-8.

C. Commission Proposal

24. The Commission believes that NERC's proposed footnote `b' does not meet the Commission's Order No. 693 directives, nor is it an equally effective and efficient alternative. On this basis, the Commission proposes to remand the proposal to NERC.

25. The Commission also proposes to provide further guidance on acceptable approaches to footnote `b'. We seek comment on all of the options below. In addition, while the Commission is proposing certain options for revising footnote `b', we also seek comment on other potential options to solve the concerns outlined in this NOPR. As noted above, the Commission understands that there are a wide variety of system configurations and regulatory compacts. We believe that a more defined process than that provided in the proposed footnote `b' would be needed but, by itself, would not be adequate without NERC-defined technical or other criteria to determine an acceptable planned interruption of Firm Demand at the fringes of the system.\28\

\28\ Any exceptions process to determine specific requests for planned interruption of Firm Demand may not necessarily be limited to the fringes of the system.

---

26. We acknowledge that the standards drafting team considered a variety of limits; however, setting some form of criteria within the standard itself for planning to interrupt Firm Demand may be an acceptable approach to setting criteria for footnote `b' and would be an option for NERC to consider. We also seek comment on whether existing protocols could provide guidance to NERC in devising criteria. For example, the Department of Energy's Electric Emergency Incident and Disturbance Report (Form OE-417) requires, among other things, an entity to report the uncontrolled loss of 300 Megawatts or more of firm system loads for more than 15 minutes from a single incident, load shedding of 100 Megawatts or more implemented under emergency operational policy, and the loss of service for more than 1 hour to 50,000 customers. While these are reporting requirements for the operational timeframe, and may include distribution level load shedding, the Commission requests comments on whether they could also serve as a basis for setting limits on when an entity can plan to interrupt Firm Demand on the Bulk-Power System. Another existing document that could provide guidance on how to set a limit on the planned interruption of Firm Demand is NERC's Statement of Compliance Registry Criteria, which uses, for example, 25 MW as a threshold in determining when a load-serving entity or distribution provider should register with NERC. We seek comments on this proposed option, and any other external documents that could be used to guide a revision to footnote `b.'

27. Second, as stated above, it is not clear whether NERC considered a blend of quantitative and qualitative thresholds. The Commission seeks comments on whether this would be an option for providing criteria that would be generally applicable, but also for allowing for certain cases that may exceed the criteria. For example, a standard could require a process with a quantitative limitation on how much Firm Demand could be planned for interruption and that standard could provide an exception process where a registered entity would submit documents and explanation to the ERO or a Regional Entity for approval based upon certain considerations. NERC has raised concerns about conflicts among federal, provincial, state and local governing bodies that have jurisdiction over various parts of the planning, siting and construction process. The Commission believes that this approach may satisfy the need for technical criteria that we have described, while accounting for NERC's concerns about the difficulty of developing a one-size-fits-all criterion for limiting planned Firm Demand interruptions and the appropriateness and feasibility of managing and actively participating in each planning process. As NERC states, the objective of footnote `b' should be to minimize the likelihood and magnitude of planned Firm Demand interruptions. The Commission believes that setting generally applicable criteria for when an applicable entity can plan to shed Firm Demand, coupled with an exceptions process overseen by NERC and the Regional Entities, could mean that few exception requests must be processed by NERC and the Regional Entities. We seek comment on this option, and which entities should be involved in the review and subsequent determination as to whether an exception should be allowed.

28. NERC has raised concerns about conflicts among federal, provincial, state and local governing bodies that have jurisdiction over various parts of the planning, siting and construction process. There also may be concerns about the costs of planning to avoid Firm Demand shedding. The Commission seeks comment on whether a feasible option would be to revise footnote `b' to allow for the planned interruption of Firm Demand in circumstances where the transmission planner can show that it has customer or community consent and there is no adverse impact to the Bulk-Power System. This presumably would not require affirmative consent by every individual retail customer, but we recognize that either term, customer or community, would need to be adequately defined. The Commission therefore seeks comments on who might be able to represent the customer or community in this option and how customer or community consent might be demonstrated. Additionally, we seek comment on how it would be determined that firm demand shedding with customer consent would not adversely impact the Bulk-Power System. However, we also seek comment on whether a customer who would otherwise consent to having its planning authority or transmission planner plan to interrupt Firm Demand pursuant to this option could instead select interruptible or conditional firm service under the tariff to address cost concerns.

29. Finally, regardless of how NERC revises footnote `b' to resolve the concerns outlined in this NOPR and in previous orders, the Commission notes that NERC will need to support the revision to footnote `b.' If there is a threshold component to the revised footnote, the Commission believes that NERC would need to support the threshold and show that instability, uncontrolled separation, or cascading failures of the system will not occur as a result of planning to shed Firm Demand up to the threshold. In addition, if there is an

individual exception option, the Commission

[[Page 66235]]

believes that the applicable entities should be required to find that there is no adverse impact to the Bulk-Power System from the exception and that it is considered in wide-area coordination and operations. Further, we believe that any exception should be subject to further review by the Regional Entity, NERC, and the Commission. This does not necessarily mean that the Regional Entity, NERC, or the Commission should have to approve the exception, but that any of the three could later audit its implementation.

30. In conclusion, while the Commission provides three options for revising footnote `b' in this Notice of Proposed Rulemaking, we seek comments on the feasibility of the options and on ways in which the options might be improved. In addition, we seek comment on whether there are other ways for NERC to solve the concerns outlined above in an equally effective and efficient manner.

III. Information Collection Statement

31. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping (collections of information) imposed by an agency.\29\ The information contained here is also subject to review under section 3507(d) of the Paperwork Reduction Act of 1995.\30\

\29\ 5 CFR 1320.11.
\30\ 44 U.S.C. 3507(d).

---

32. As stated above, the subject of this NOPR is NERC's proposed modification to Table 1, footnote `b' applicable in four TPL Reliability Standards. This NOPR proposes to remand the footnote `b' modification to NERC. By remanding footnote `b' the applicable Reliability Standards and any information collection requirements are unchanged. Therefore, the Commission will submit this NOPR to OMB for informational purposes only.

33. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE. Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: data.clearance@ferc.gov, phone: (202) 502-8663, or fax: (202) 273-0873].

IV. Regulatory Flexibility Act

34. The Regulatory Flexibility Act of 1980 (RFA) \31\ generally requires a description and analysis of final rules that will have significant economic impact on a substantial number of small entities. The RFA mandates consideration of regulatory alternatives that accomplish the stated objectives of a proposed rule and that minimize any significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.\32\ The SBA has established a size standard for electric utilities, stating that a firm is small if, including its affiliates, it is primarily engaged in the transmission, generation and/or distribution of electric energy for sale and its total electric output for the preceding twelve months did not exceed four million megawatt hours.\33\ The RFA is not implicated by this NOPR because the Commission is remanding footnote' b' and not proposing any modifications to the existing burden or reporting requirements. With no changes to the Reliability Standards as approved, the Commission certifies that this NOPR will not have a significant economic impact on a substantial number of small entities.

\32\ 13 CFR 121.201.
\33\ Id. n.22.

V. Comment Procedures

35. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due 60 days from publication in the Federal Register. Comments must refer to Docket No. RM11-18-000, and must include the commenter's name, the organization they represent, if

applicable, and their address in their comments.

36. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's Web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

37. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE., Washington, DC 20426.

38. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VI. Document Availability

39. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through FERC's Home Page (http://www.ferc.gov) and in FERC's Public Reference Room during normal business hours (8:30 a.m. to 5 p.m. Eastern time) at 888 First Street, NE., Room 2A, Washington, DC 20426.

40. From FERC's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

41. User assistance is available for eLibrary and the FERC's Web site during normal business hours from FERC Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or e-mail at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[137 FERC] 61,131; Docket No. RD11-3-000]

Before Commissioners: Jon Wellinghoff, Chairman; Philip D. Moeller, John R. Norris, and Cheryl A. LaFleur; North American Electric Reliability Corporation; Order Approving Reliability Standard

1. On January 28, 2011, the North American Electric Reliability Corporation (NERC) submitted a petition seeking approval of a revised Facilities Design, Connections, and Maintenance (FAC) Reliability Standard FAC-013-2--Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon, pursuant to section 215(d)(1) of the Federal Power Act (FPA) \1\ and section 39.5 of the Commission's regulations.\2\ The revised Reliability Standard requires planning coordinators to have a transparent methodology for, and to annually perform, an assessment of transmission transfer capability for the Near-Term Transmission Planning Horizon, as a basis for identifying system weaknesses or limiting facilities that could limit energy transfers in the future. NERC also requests approval of two new terms utilized in the proposed Reliability Standard, to be included in NERC's Glossary of Terms Used in NERC Reliability Standards (NERC Glossary or Glossary). Finally, NERC requests approval of its implementation plan for Reliability Standard FAC-013-2, setting an effective date that will allow planning coordinators a reasonable time, after certain related Modeling, Data, and Analysis (MOD) Reliability Standards have gone into effect, to meet the requirements of the revised Reliability Standard.

\1\ 16 U.S.C. 824o(d)(1) (2006).
\2\ 18 CFR 39.5 (2011).

---

2. As explained below, we find that revised Reliability Standard FAC-013-2 (including the associated new Glossary terms and implementation plan) is just, reasonable, not unduly discriminatory or preferential and in the public interest. We accept the violation risk factors and violation severity levels associated with the standard as proposed by NERC, with three exceptions described below. We also deny a request by the Electric Reliability Council of Texas (ERCOT) for an exemption from Reliability Standard FAC-013-2.

I. Background

3. The Commission certified NERC as the Electric Reliability Organization (ERO), as defined in section 215 of the FPA, in July 2006.\3\ In Order No. 693, the Commission reviewed an initial set of Reliability Standards as developed and submitted for review by NERC, accepting 83 standards as mandatory

[[Page 72198]]

and enforceable.\4\ In Order No. 693, the Commission, inter alia, accepted Reliability Standard FAC-013-1, which sets out requirements for communication of transfer capability calculations. In addition, the Commission directed NERC to modify FAC-013 so that it would apply to all reliability coordinators.\5\

\3\ North American Electric Reliability Corp., 116 FERC] 61,062, order on reh'g and compliance, 117 FERC] 61,126 (2006), order on compliance, 118 FERC] 61,190, order on reh'g 119 FERC] 61,046 (2007), aff'd sub nom. Alcoa Inc. v. FERC, 564 F.3d 1342 (DC Cir. 2009).
\4\ Mandatory Reliability Standards for the Bulk-Power System, Order No. 693, FERC Stats. & Regs.] 31,242, order on reh'g, Order No. 693-A, 120 FERC] 61,053 (2007).
\5\ Id. P 790, 794.

---

4. Also related to NERC's immediate proposal, the Commission, in Order No. 693, neither approved nor remanded Reliability Standard FAC-012-1, which set out proposed requirements for documenting the methodologies used by reliability coordinators and planning authorities in determining transfer capability.\6\ Because additional information was needed regarding the standards' reference to regional implementation, the Commission did not act on proposed FAC-012-1, but directed certain changes to be included in a revised version of FAC-012-1. In particular, the Commission stated that the standard should provide a framework for the calculation of transfer capabilities, including data inputs and modeling assumptions.\7\ Further, the Commission stated that the process and criteria used to determine transfer capabilities must be consistent with the process and criteria used in planning and operating the system.\8\

\6\ Id. P 776, 782. See also id. P 287 (discussing ``fill-in-the-blank'' standards). NERC's proposed FAC-013-2 addresses directives pertaining to related to both FAC-013-1 and FAC-012-1.

\7\ Id. P 779.

\8\ Id. P 782.

---

5. Subsequently, as part of its submission of revised Modeling, Data, and Analysis (MOD) Reliability Standards, which govern the calculation of Available Transfer Capability (ATC), NERC requested that it be permitted to withdraw FAC-012-1 and retire FAC-013-1. In Order No. 729, the Commission found that FAC-012-1 and FAC-013-1 had not been wholly superseded by the revised MOD Reliability Standards because the revised MOD Reliability Standards did not address the calculation of transfer capabilities in the planning horizon.\9\ Moreover, the Commission found that the existing versions of FAC-012-1 (as adopted by NERC) and FAC-013-1 (as approved by FERC) were insufficient to address the Commission's concerns as stated in Order No. 693, and ordered NERC to develop specific modifications to comply with those outstanding directives.\10\

\9\ Mandatory Reliability Standards for the Calculation of Available Transfer Capability, Capacity Benefit Margins, Transmission Reliability Margins, Total Transfer Capability and Existing Transmission Commitment and Mandatory Reliability Standards for the Bulk-Power System, Order No. 729, 129 FERC] 61,155, at P 291 (2009); order on reh'g, Order No. 729-A, 131 FERC] 61,109, order on reh'g, Order No. 729-B, 132 FERC] 61,027 (2010).

\10\ Id.

---

6. The Commission explained in Order No. 729 the potential value of assessing transfer capabilities in the planning horizon, as a means of improving the long-term reliability of the Bulk-Power System:

The Commission recognizes that the calculation of transfer capabilities in the planning horizon (years one thorough five) may not be so accurate to support long-term scheduling of the transmission system but we do believe that such forecasts will be useful for long-term planning, in general, by measuring sufficient long-term capacity needed to ensure the reliable operation of the Bulk-Power System. Although regional planning authorities have developed similar efforts in response to Order No. 890, we believe that the requirements imposed by FAC-012 and FAC-013 need not be duplicative of those existing efforts and, by contrast, should be focused on improving the long-term reliability of the Bulk-Power System pursuant to the ERO's Reliability Standards.\11\

\11\ Id. P 290.

Thus, the Commission directed NERC to develop modifications to FAC-012-1 and FAC-013-1 to comply with the directives of Order No. 693 and to otherwise revise those Standards to be consistent with the revised MOD Reliability Standards.\12\

\12\ Id. P 291.

II. NERC's Petition

7. In its Petition, NERC explains that FAC-013-2 was developed in response to Commission directives in Order Nos. 693 and 729 (as discussed above) to require appropriate entities to perform an annual assessment of transfer capability in the planning horizon and to do so using data inputs and modeling assumptions that are consistent with other planning uses. Under Requirement R1, each planning coordinator must have a documented methodology for performing an annual assessment of transfer capability in the Near-Term Transmission Planning Horizon. Under Requirement R2, each planning coordinator must share its methodology with adjacent planning coordinators and transmission planners, and with other functional entities with a reliability-related need for the information. Under Requirement R3, planning coordinators must provide a documented response to comments made by an interested party about the methodology. Under Requirement R4, planning coordinators must conduct and document an annual simulation or assessment of transfer capability for at least one year in the Near-Term Transmission Planning Horizon. Under Requirement R5, planning coordinators must make the results of the assessment available to the same types of parties identified in Requirement R2. Finally, under Requirement R6, planning coordinators must provide data to support the assessment if requested by identified interested parties.\13\

\13\ See NERC Petition at 8-10, Ex. A.

---

8. NERC explains in its Petition that the proposed Reliability Standard addresses the Commission's directives by requiring planning coordinators to undertake an annual assessment of transfer capability in the planning horizon, and by requiring the use of certain data inputs and modeling assumptions to identify future transmission system weaknesses or limiting facilities.

9. NERC also requests approval of the terms ``Near-Term Transmission Planning Horizon'' and ``Year One'' to be added to the NERC Glossary. Finally, NERC proposes an implementation plan that includes an effective date for the revised Reliability Standard that is the later of (1) the first day of the calendar quarter twelve months after Commission approval of FAC-013-2, or (2) the first day of the calendar quarter six months after Reliability Standards MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 go into effect.\14\ At that time, the plan calls for the retirement of existing Reliability Standards FAC-012-1 and FAC-013-1.\15\

\14\ The relevant MOD Reliability Standards went into effect on April 1, 2011.

\15\ NERC Petition at Ex. B.

III. Notice of Filing and Responsive Pleading

10. Notice of NERC's Petition was issued on Feb. 2, 2011 and published on Feb. 10, 2011 in the Federal Register, with comments, protests and motions to intervene due on or before Feb. 28, 2011.\16\ Two sets of comments were received. The Midwest Independent Transmission System Operator, Inc. (MISO) and the New York Independent System Operator, Inc. (NYISO) filed a joint set of comments asking the Commission to reject FAC-013-2 as duplicative of the now-effective Transmission Planning (TPL) Standards. In addition, the ERCOT filed a motion to intervene out-of-time, asking the Commission to find that ERCOT should

[[Page 72199]]

be exempt from FAC-013-2's requirements.

\16\ 76 FR 7557 (2011).

---

11. MISO and NYISO state that Reliability Standard FAC-013-2 will not provide any reliability benefits beyond those conferred by the current TPL Reliability Standards, arguing that proposed Reliability Standard FAC-013-2 is ``substantially similar'' to the approved TPL Reliability Standards in purpose and in the assessments required.\17\ MISO and NYISO further argue that both the proposed Reliability Standard and the TPL Reliability Standards (particularly TPL-002) require an assessment of system conditions over the Near-Term Transmission Planning Horizon using similar assumptions or inputs, including contingencies, system conditions, projected firm transfers or transmission uses, and system demand levels.\18\

\17\ MISO and NYISO Comments at 3-4.
\18\ Id. at 4.

---

12. MISO and NYISO note that the TPL Reliability Standards require applicable entities not only to perform system simulations and related annual assessments to identify reliability issues based on current and projected firm transmission commitments, but also to take affirmative action to address any identified reliability issues based on those commitments. MISO and NYISO argue that the very similar assessment required under Reliability Standard FAC-013-2, which is intended ``to identify potential future Transmission System weaknesses and limiting Facilities that could impact the Bulk Electric System's (BES) ability to reliability transfer energy,'' does not provide a similar obligation to rectify any deficiencies identified from the assessment as is found in the TPL Standards, and therefore has questionable value.\19\ As an example, MISO and NYISO note that if an assessment performed under Reliability Standard FAC-013-2 found that incremental transfer capability was 0 MW at some point within the Near-Term Transmission Planning Horizon, FAC-013-2 does not provide any guidance about steps to be taken to address the identified weaknesses. Accordingly, MISO and NYISO argue that Reliability Standard FAC-013-2 is unnecessary and could lead to confusion with respect to the responsible entities' obligations to preserve the reliability of the BES.\20\

\19\ Id. at 5.
\20\ Id.

---

13. Finally, MISO and NYISO note that a calculation of transfer capability that is set one to five years in the future (i.e., the Near-Term Transmission Planning Horizon) does not provide any useful information for the future reliable operation of the system, because system conditions are likely to be significantly different than those assumed for the required assessment.\21\

\21\ Id. at 6.

---

14. ERCOT initially notes its support for MISO and NYISO's position that FAC-013-2 is unnecessary given its overlap with the requirements of the TPL Reliability Standards.\22\ However, if Reliability Standard FAC-013-2 is approved over MISO and NYISO's objections, ERCOT asks the Commission to provide an exemption for the ERCOT region. ERCOT notes that the revised Reliability Standard was developed in response to the Commission's directive to apply the transfer capability methodology requirements, as implemented in the MOD Reliability Standards, to the planning horizon.\23\ ERCOT states that the Commission has already found that the requirements of the MOD Reliability Standards governing the calculation of ATC provide no reliability benefit in the ERCOT region, essentially recognizing that ERCOT has no transmission market (and instead manages congestion through re-dispatch of generation), and that ERCOT has no interchange with neighboring regions. ERCOT argues that the same rationale applies for Reliability Standard FAC-013-2 with respect to the planning horizon, as ERCOT's reliability planning analyses are performed using the same assumptions as are used for operations.\24\

\22\ ERCOT Comments at 2.
\23\ Id. at 3.
\24\ Id. at 3-4 (noting that the Commission agreed with ERCOT's position that applying the MOD Reliability Standards to ERCOT would not provide any reliability benefits due to physical differences in ERCOT's transmission system (citing Order No. 729, 129 FERC] 61,155 at P 292-93, 296 and 298)).

---

15. ERCOT notes that the Texas Reliability Entity, Inc. (Texas RE) \25\ supported ERCOT's position on the propriety of an ERCOT exemption through comments submitted during NERC's Standards Development Process. Texas RE provided the following rationale for the exemption: ``ERCOT does not need to address transmission allocation issues either in the operating horizon or in the planning horizon. To the extent that ERCOT does planning studies to examine transfers, those studies are related more to economic planning than to reliability.'' \26\ ERCOT further argues that the Standards Drafting Team failed to draw a meaningful

distinction between the MOD requirements regarding calculation of transfer capabilities in the operating horizon, which are not applicable to ERCOT by virtue of a FERC-granted exemption, and FAC-013-2's requirements related to assessment of transfer capabilities in the planning horizon.\27\

\25\ Texas RE is the approved regional entity, as defined under FPA section 215(e)(4), for the ERCOT region, with delegated authority from NERC to develop, monitor, assess, and enforce compliance with NERC Reliability Standards within that region.

\26\ ERCOT Comments at 5 (quoting from Texas RE Comments submitted to NERC in the Standards Development Process).

\27\ Id. at 6.

IV. Discussion

16. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, 18 CFR 385.214, the timely joint motion to intervene filed by MISO and NYISO serves to make them parties to this proceeding. Pursuant to Rule 214(d) of the Commission's Rules of Practice and Procedure, 18 CFR 385.214(d), the Commission will grant ERCOT's late-filed motion to intervene, given its interest in the proceeding, the early stage of the proceeding, and the absence of undue prejudice or delay.

A. Reliability Standard FAC-013-2

17. We approve Reliability Standard FAC-013-2 and find that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. We also approve the proposed implementation plan for Reliability Standard FAC-013-2, which would retire Reliability Standards FAC-012-1 and FAC-013-1 when FAC-013-2 becomes effective. We accept the addition of the terms ``Near-Term Transmission Planning Horizon'' and ``Year One'' to the NERC Glossary. Finally, we find that the proposed Reliability Standard satisfies our outstanding directives in Order Nos. 693 and 729 regarding the non-discriminatory assessment of transfer capability in the planning horizon.\28\

\28\ See Background Section above describing the pending Commission directives from Order No. 693 and Order No. 729.

---

18. Contrary to the arguments of MISO and NYISO, we find that Reliability Standard FAC-013-2 provides a unique reliability benefit beyond that conferred by the TPL Standards. Reliability Standard FAC-013-2 is designed to ensure that planning coordinators perform annual assessments to identify potential weaknesses and limiting facilities of the bulk electric system. Such potential weaknesses and limitations could ultimately affect reliable transfers of energy. Further, in performing the required annual assessment, the

[[Page 72200]]

planning coordinator must consider both current approved and projected transmission uses.\29\

\29\ See proposed Reliability Standard FAC-013-2 R.1.4.4.

---

19. By contrast, the TPL Reliability Standards set out specific performance requirements for all transmission planners (as well as planning authorities and coordinators), requiring among other things a demonstration that each transmission planner's portion of the bulk electric system is designed to maintain system stability and to stay within thermal and voltage limits, while serving forecast customer demand and all projected firm (non-recallable) reserved transmission services.\30\ Thus, the TPL Reliability Standards do not require a planning assessment that reflects all projected transmission uses but, rather, an assessment that reflects only projected firm reserved transmission uses. In other words, Reliability Standard FAC-013-2 differs from the TPL standards because the former focuses on identifying potential weaknesses that could limit energy transfers across a broader region and requires the planning coordinator to consider any expected transmission uses, regardless of whether they have been scheduled or otherwise reserved, and thereby allows for an assessment that may be more accurate in the outer years of the planning

horizon.

\30\ See Reliability Standard TPL-001-0.1 R1.

20. As MISO and NYISO note, Reliability Standard FAC-013-2 does not impose an obligation to develop a plan to address identified limitations in transfer capability in the Near-Term Transmission Planning Horizon. However, the lack of such an obligation does not detract from the Reliability Standard's value as an informational tool for the early identification of inter-regional or intra-regional limitations on transfers. In Order No. 729, the Commission recognized that the calculation of transfer capabilities in the planning horizon (years one through five) may not be accurate enough to support long-term scheduling of the transmission system.\31\ The Commission nonetheless determined that such forecasts would be useful ``for long-term planning, in general, by measuring sufficient long-term capacity needed to ensure the reliable operation of the Bulk-Power System.'' \32\

\31\ Order No. 729, 129 FERC] 61,155 at P 290.
\32\ Id.

21. Consistent with its purpose as a planning tool with a regional focus, rather than a mechanism for ensuring that individual systems are planned to reliably meet projected load and known transmission uses, Reliability Standard FAC-013-2 provides the planning coordinator flexibility in determining what transfers to assess. Moreover, an assessment conducted pursuant to FAC-013-2 may include transmission uses that are expected but which are not yet scheduled or reserved (e.g., expected interconnection of a large group of renewable generators), and can be used as a regional coordination tool rather than as a means of ensuring adequate planning for reliable system performance. Accordingly, we find that Reliability Standard FAC-013-2 does confer reliability benefits beyond those provided by the TPL Reliability Standards, and we are not persuaded by the arguments of MISO and NYISO on this issue.

22. We further find that Reliability Standard FAC-013-2 satisfies certain outstanding directives from Order Nos. 693 and 729 which are not satisfied by the TPL Reliability Standards. Reliability Standard FAC-013-2 requires the planning coordinator to perform an annual assessment of transfer capability for at least one year in the Near-Term Transmission Planning Horizon, and to document that the assumptions and criteria used to perform the assessment are consistent with the planning coordinator's planning practices. By contrast, the TPL Reliability Standards impose system performance requirements under various conditions, and do not require a specific assessment of transfer capabilities within a single system or across interconnected transmission systems. While we agree that Reliability Standard FAC-013-2 and the TPL Reliability Standards are designed primarily to encourage adequate longer-term planning rather than to generate accurate measures of ATC or total transfer capability (TTC), we believe that our outstanding directives regarding the review of transfer capability within the planning horizon are not satisfied by the TPL Reliability Standards.

B. Violation Risk Factors and Violation Severity Levels

23. We find that the violation risk factors (VRFs) assigned to Requirements R2, R3, R5 and R6 are consistent with the Commission's established guidelines and approve them as filed.\33\ However, we find that NERC has not adequately justified its proposed ``lower'' VRF designation for Requirements R1 and R4, and direct NERC to either provide additional justification for these VRF designations or propose a revised VRF designation that addresses our concerns.

\33\ See North American Electric Reliability Corp., 119 FERC] 61,145, order on reh'g, 120 FERC] 61,145, at P 8-13 (2007); North American Electric Reliability Corp., 123 FERC] 61,284, at P 20-35, order on reh'g & compliance, 125 FERC] 61,212 (2008); North American Electric Reliability Corp., 135 FERC] 61,166 (2011). Given the significant change in the scope of FAC-013-2 as compared to the original standards from which its requirements derive (FAC-012-1 and FAC-013-2), a reduction in the assigned VRF levels appears to be warranted for at least some of the requirements.

24. NERC states that Requirements R1 and R4 meet the definition of a ``lower'' risk requirement because they are ``strictly administrative in nature and are in the planning timeframe,'' and because ``it is not anticipated that under emergency, abnormal or restorative conditions violation of this requirement would affect the electric state or capability of the BES.'' \34\

\34\ NERC Petition at 33-34. The approved NERC definition for a ``lower'' VRF designation is as follows:

Lower Risk Requirement: Is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

See North American Electric Reliability Corporation, 119 FERC] 61,145, at P9, order on compliance, 121 FERC] 61,179, at P 2 and Appendix A (2007).

---

25. Requirement R4 does not appear to be ``administrative in nature,'' in that it requires the planning coordinator to annually conduct a simulation assessing transfer capability on its system during at least one year in the near-term planning time frame. Requirement R4 requires an affirmative action by the applicable entity, and not merely documentation of the results of the study.

26. We have similar concerns with respect to R1, as it is a substantive requirement to adopt and document a methodology for assessing transfer capability that is consistent with the specific criteria set out in sub-requirements R1.1.2-1.5. This requirement goes further than mere documentation, and instead establishes the criteria that must be incorporated into a compliant methodology.

27. Finally, we approve the violation severity levels (VSLs) for FAC-013-2 as proposed, with the exception of the VSL triggers for R1, which appear to contain a typographical error. The VSL language for R1, as filed by NERC, uses the same description for ``medium,'' ``high,'' and ``severe'' violations, as follows:

The Planning Coordinator has a Transfer Capability methodology, but failed to

[[Page 72201]]

incorporate one of [sub-requirements 1.1 through 1.5] of Requirement R1 into that methodology.

It appears that these triggers were intended to be progressive, i.e., the failure to incorporate one component was intended to be a medium level violation, as is currently stated in NERC's filed version of FAC-013-2, but a high level violation should require a failure to incorporate two components, and so on. Accordingly, we will direct NERC to modify the VSL language for Requirement R1 to correct this apparent error.

28. For the reasons stated above, we direct NERC to submit a compliance filing within 60 days of issuance of this order, that (1) either proposes a ``medium'' VRF designation for Requirements R1 and R4, or provides additional justification for a ``lower'' VRF level; and (2) corrects the proposed VSL language for R1.

C. Applicability to ERCOT

29. For the reasons discussed below, we are not persuaded by ERCOT's arguments and, therefore, deny ERCOT's request for an exemption. ERCOT points out that the Commission granted an exemption to ERCOT regarding certain modeling, data and analysis, or MOD, Reliability Standards and believes that the Commission should grant ERCOT a similar exemption regarding compliance with FAC-013-2. Reliability Standard FAC-013-2, however, is distinguishable from the MOD Reliability Standards because the MOD Reliability Standards address methodologies for calculating ATC and total transfer capability (TTC) for the purpose of allocating transmission capacity. In Order No. 729, the Commission agreed that the MOD Reliability Standards would not provide any reliability benefit to ERCOT due to physical differences in ERCOT's transmission system.\35\

\35\ Order No. 729, 129 FERC] 61,155, at P 292-93, 296 (noting, inter alia, that ERCOT does not have a transmission market and manages transmission congestion through redispatch of generation).

---

30. In contrast to the MOD Reliability Standards, FAC-013-2 is not designed primarily to ensure non-discriminatory allocation of transmission capacity among transmission market participants, but is instead a planning tool, with a particular focus on identifying weaknesses or limitations in transfer capability between regions (including constrained regions within a single market such as ERCOT). We believe ERCOT, like other regions, will benefit from the assessment of potential limitations in transfer capability in the planning horizon over the Near-Term Transmission Planning Horizon that is required under FAC-013-2.

31. Moreover, ERCOT concedes that it currently has a planning process in place that allows it to address ``prospective weaknesses and limiting facilities that may arise under all probable prospective operating conditions.'' \36\ That ERCOT already undertakes these kinds of planning assessments leads to the conclusion that such assessments are in fact useful to ERCOT. Incorporating an obligation to continue performing such an assessment as part of a mandatory and enforceable Reliability Standard, especially one that will provide for greater levels of transparency as to how the assessments are done, will not only provide a meaningful reliability benefit but also would presumably impose little additional burden on ERCOT.

\36\ ERCOT Comments at 7.

V. Information Collection Statement

32. The Office of Management and Budget (OMB) regulations require approval of certain information collection requirements imposed by agency action.\37\ Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of this Order will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

\37\ 5 CFR 1320.11.

---

33. The Commission will submit these reporting and recordkeeping requirements to OMB for its review and approval under section 3507(d) of the Paperwork Reduction Act. Comments are solicited within 60 days of the date this order is published in the Federal Register on the Commission's need for this information, whether the information will have practical utility, the accuracy of provided burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques. Comments should be submitted following the Commission's submission guidelines at http://www.ferc.gov/help/submission-guide.asp and should reference Docket No. RD11-3.

34. Rather than creating entirely new obligations with respect to the assessment of transfer capability for the near-term transmission planning horizon, Reliability Standard FAC-013-2 upgrades the existing planning requirements contained in FAC-013-1 and specifically requires planning coordinators to have a methodology for and to perform an annual assessment identifying potential future transmission system weaknesses and limiting facilities that could impact the bulk electric system's ability to reliably transfer energy in the near-term transmission planning horizon. Thus, this Order does not impose entirely new burdens on the affected entities. For example, FAC-013-1 requires each applicable entity to have a documented methodology for assessing transfer capability and to share the results of that assessment with specific entities. FAC-013-2 imposes relatively minimal new requirements regarding the information that must be included in the documented methodology, the frequency of the assessment and the number of days allocated to make the assessment results available to other entities.

35. Burden Estimate: Our estimate below regarding the number of respondents is based on the NERC compliance registry as of August 29, 2011. According to the registry, there are 80 planning authorities \38\ that will be involved in providing information. This Order will require applicable entities to review their transfer capability methodologies and document compliance with the Reliability Standard's requirements. For those planning coordinators that do not already comply with the

Standard's requirement for having a documented methodology for assessing transfer capability in the Near-Term Transmission Planning Horizon, they will be required to update their methodology documents and compliance protocols. In addition, planning coordinators must ensure that the required assessment will be performed at least once per calendar year.\39\ The estimated burden for the requirements in this Order follow:

\38\ The term ``planning coordinator'' is synonymous with the term ``planning authority,'' in the NERC Glossary.

\39\ While the document retention requirements are being increased under the new Reliability Standard (from one to three years), the usual and customary practice currently is to retain documentation needed to demonstrate compliance for the period since the last audit, which is on a three year schedule. In addition, while planning coordinators must ensure that they perform an appropriate transfer capability assessment at least once per year, they are already required to establish transfer capabilities and disseminate information about those capabilities. Thus, there should be no increase in burden other than the one-time cost of (1) setting up a procedure to ensure that the assessment will be performed at least once per year, and (2) adjusting the methodology (if needed) to comply with the more specific requirements set out in the new Reliability Standard.

Procedure to perform the Transfer Capability Assessment annually (one-time).....	80	1	80	6,400
Total.....	.....	.....	.....	8,000

\40\ Requirement R1 applies to planning coordinators. We estimate that 25 percent of all planning coordinators will have to update their methodology documents.

Information Collection Costs: The Commission seeks comments on the costs to comply with these requirements and recordkeeping burden associated with Reliability Standard FAC-013-2.

Total Burden Hours for Collection: (Compliance/Documentation) = 8,000 hours.

Burden Hours Averaged Over Three Years \41\ = 2,667.

\41\ While this is a one-time burden, information collections tend to be on a three year approval cycle. Therefore, we are averaging the one-time burden estimate over three years.

Total One-Time Compliance Cost = 8,000 hours @ $120/hour = $960,000.

Total First Year Cost = $960,000.

Title: Order Approving Reliability Standard.

Action: Proposed Collection in FERC-725A.
OMB Control No: 1902-0244.
Respondents: Business or other for profit, and/or not for profit institutions.
Frequency of Responses: On occasion.
Necessity of the Information: Reliability Standard FAC-013-2 satisfies certain directives the Commission issued in Order No. 729 requiring applicable entities to specify the framework used for calculating transfer capabilities in the Near-Term Transmission Planning Horizon and to ensure that the framework is consistent with the processes and criteria used for other operating and planning purposes. It also requires some entities to update their Transfer Capability methodology documents and procedures to perform assessments annually.

36. Interested persons may obtain information on the reporting requirements by contacting: Federal Energy Regulatory Commission, 888 First Street NE., Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, email: DataClearance@ferc.gov, Phone: (202) 502-8663, fax: (202) 273-0873].

VI. Effective Date

37. This order will become effective January 23, 2012.

The Commission orders:

(A) Reliability Standard FAC-013-2 is hereby approved as just, reasonable, not unduly discriminatory, and in the public interest.

(B) NERC's addition of the terms ``Year One'' and ``Near-Term Transmission Planning Horizon'' to the NERC Glossary is hereby approved.

(C) NERC's proposed implementation plan for Reliability Standard FAC-013-2 is hereby approved, including the retirement of existing Reliability Standards FAC-012-1 and FAC-013-1 upon the effective date of Reliability Standard FAC-013-2.

(D) The VRF levels and VSL levels proposed for FAC-013-2 are approved with the exceptions discussed above, and NERC is directed to submit a compliance filing within 60 days of this order addressing the Commission's stated concerns with respect to the VRF levels of R1 and R4 and the VSL language of R1.

By the Commission. Commissioner Spitzer is not participating.

Dated: Issued November 17, 2011.

Nathaniel J. Davis, Sr.,
Deputy Secretary.

and Cheryl A. LaFleur.

North American Electric Reliability Corporation Docket No. RD11-3-000

ORDER APPROVING RELIABILITY STANDARD

(Issued November 17, 2011)

1. On January 28, 2011, the North American Electric Reliability Corporation (NERC) submitted a petition seeking approval of a revised Facilities Design, Connections, and Maintenance (FAC) Reliability Standard FAC-013-2 – Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon, pursuant to section 215(d)(1) of the Federal Power Act (FPA)[1] and section 39.5 of the Commission's regulations.[2] The revised Reliability Standard requires planning coordinators to have a transparent methodology for, and to annually perform, an assessment of transmission transfer capability for the Near-Term Transmission Planning Horizon, as a basis for identifying system weaknesses or limiting facilities that could limit energy transfers in the future. NERC also requests approval of two new terms utilized in the proposed Reliability Standard, to be included in NERC's Glossary of Terms Used in NERC Reliability Standards (NERC Glossary or Glossary). Finally, NERC requests approval of its implementation plan for Reliability Standard FAC-013-2, setting an effective date that will allow planning coordinators a reasonable time, after certain related Modeling, Data, and Analysis (MOD) Reliability Standards have gone into effect, to meet the requirements of the revised Reliability Standard.

2. As explained below, we find that revised Reliability Standard FAC-013-2 (including the associated new Glossary terms and implementation plan) is just, reasonable, not unduly discriminatory or preferential and in the public interest. We accept the violation risk factors and violation severity levels associated with the standard as proposed by NERC, with three exceptions described below. We also deny a request

[1] 16 U.S.C. § 824o(d)(1) (2006).

[2] 18 C.F.R. § 39.5 (2011).

by the Electric Reliability Council of Texas (ERCOT) for an exemption from Reliability Standard FAC-013-2.

I. Background

3. The Commission certified NERC as the Electric Reliability Organization (ERO), as defined in section 215 of the FPA, in July 2006.[3] In Order No. 693, the Commission reviewed an initial set of Reliability Standards as developed and submitted for review by NERC, accepting 83 standards as mandatory and enforceable.[4] In Order No. 693, the Commission, *inter alia*, accepted Reliability Standard FAC-013-1, which sets out requirements for communication of transfer capability calculations. In addition, the Commission directed NERC to modify FAC-013 so that it would apply to all reliability coordinators.[5]

4. Also related to NERC's immediate proposal, the Commission, in Order No. 693, neither approved nor remanded Reliability Standard FAC-012-1, which set out proposed requirements for documenting the methodologies used by reliability coordinators and planning authorities in determining transfer capability.[6] Because additional information was needed regarding the standards' reference to regional implementation, the Commission did not act on proposed FAC-012-1, but directed certain changes to be included in a revised version of FAC-012-1. In particular, the Commission stated that the standard should provide a framework for the calculation of transfer capabilities, including data inputs and modeling assumptions.[7] Further, the Commission stated that the process

[7] *Id.* P 779.

and criteria used to determine transfer capabilities must be consistent with the process and criteria used in planning and operating the system.[8]

5. Subsequently, as part of its submission of revised Modeling, Data, and Analysis (MOD) Reliability Standards, which govern the calculation of Available Transfer Capability (ATC), NERC requested that it be permitted to withdraw FAC-012-1 and retire FAC-013-1. In Order No. 729, the Commission found that FAC-012-1 and FAC-013-1 had not been wholly superseded by the revised MOD Reliability Standards because the revised MOD Reliability Standards did not address the calculation of transfer capabilities in the planning horizon.[9] Moreover, the Commission found that the existing versions of FAC-012-1 (as adopted by NERC) and FAC-013-1 (as approved by FERC) were insufficient to address the Commission's concerns as stated in Order No. 693, and ordered NERC to develop specific modifications to comply with those outstanding directives.[10]

6. The Commission explained in Order No. 729 the potential value of assessing transfer capabilities in the planning horizon, as a means of improving the long-term reliability of the Bulk-Power System:

> The Commission recognizes that the calculation of transfer capabilities in the planning horizon (years one thorough five) may not be so accurate to support long-term scheduling of the transmission system but we do believe that such forecasts will be useful for long-term planning, in general, by measuring sufficient long-term capacity needed to ensure the reliable operation of the Bulk-Power System. Although regional planning authorities have developed similar efforts in response to Order No. 890, we believe that the requirements imposed by FAC-012 and FAC-013 need not be duplicative of those existing efforts and, by contrast, should be focused

[8] *Id.* P 782.

[10] *Id.*

> on improving the long-term reliability of the Bulk-Power System pursuant to the ERO's Reliability Standards.[11]

Thus, the Commission directed NERC to develop modifications to FAC-012-1 and FAC-013-1 to comply with the directives of Order No. 693 and to otherwise revise those Standards to be consistent with the revised MOD Reliability Standards.[12]

II. NERC's Petition

7. In its Petition, NERC explains that FAC-013-2 was developed in response to Commission directives in Order Nos. 693 and 729 (as discussed above) to require appropriate entities to perform an annual assessment of transfer capability in the planning horizon and to do so using data inputs and modeling assumptions that are consistent with other planning uses. Under Requirement R1, each planning coordinator must have a documented methodology for performing an annual assessment of transfer capability in the Near-Term Transmission Planning Horizon. Under Requirement R2, each planning coordinator must share its methodology with adjacent planning coordinators and transmission planners, and with other functional entities with a reliability-related need for the information. Under Requirement R3, planning coordinators must provide a documented response to comments made by an interested party about the methodology. Under Requirement R4, planning coordinators must conduct and document an annual simulation or assessment of transfer capability for at least one year in the Near-Term Transmission Planning Horizon. Under Requirement R5, planning coordinators must make the results of the assessment available to the same types of parties identified in Requirement R2. Finally, under Requirement R6, planning coordinators must provide data to support the assessment if requested by identified interested parties.[13]

8. NERC explains in its Petition that the proposed Reliability Standard addresses the Commission's directives by requiring planning coordinators to undertake an annual assessment of transfer capability in the planning horizon, and by requiring the use of certain data inputs and modeling assumptions to identify future transmission system weaknesses or limiting facilities.

9. NERC also requests approval of the terms "Near-Term Transmission Planning Horizon" and "Year One" to be added to the NERC Glossary. Finally, NERC proposes

---

[11] *Id.* P 290.

[12] *Id.* P 291.

[13] *See* NERC Petition at 8-10, Ex. A.

an implementation plan that includes an effective date for the revised Reliability Standard that is the later of (1) the first day of the calendar quarter twelve months after Commission approval of FAC-013-2, or (2) the first day of the calendar quarter six months after Reliability Standards MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-1 go into effect.[14] At that time, the plan calls for the retirement of existing Reliability Standards FAC-012-1 and FAC-013-1.[15]

III. Notice of Filing and Responsive Pleading

10. Notice of NERC's Petition was issued on Feb. 2, 2011 and published on Feb. 10, 2011 in the *Federal Register*, with comments, protests and motions to intervene due on or before Feb. 28, 2011.[16] Two sets of comments were received. The Midwest Independent Transmission System Operator, Inc. (MISO) and the New York Independent System Operator, Inc. (NYISO) filed a joint set of comments asking the Commission to reject FAC-013-2 as duplicative of the now-effective Transmission Planning (TPL) Standards. In addition, the ERCOT filed a motion to intervene out-of-time, asking the Commission to find that ERCOT should be exempt from FAC-013-2's requirements.

11. MISO and NYISO state that Reliability Standard FAC-013-2 will not provide any reliability benefits beyond those conferred by the current TPL Reliability Standards, arguing that proposed Reliability Standard FAC-013-2 is "substantially similar" to the approved TPL Reliability Standards in purpose and in the assessments required.[17] MISO and NYISO further argue that both the proposed Reliability Standard and the TPL Reliability Standards (particularly TPL-002) require an assessment of system conditions over the Near-Term Transmission Planning Horizon using similar assumptions or inputs, including contingencies, system conditions, projected firm transfers or transmission uses, and system demand levels.[18]

12. MISO and NYISO note that the TPL Reliability Standards require applicable entities not only to perform system simulations and related annual assessments to identify reliability issues based on current and projected firm transmission commitments, but also

---

[14] The relevant MOD Reliability Standards went into effect on April 1, 2011.

[15] NERC Petition at Ex. B.

[16] 76 Fed. Reg. 7557 (2011).

[17] MISO and NYISO Comments at 3-4.

[18] *Id.* at 4.

to take affirmative action to address any identified reliability issues based on those commitments. MISO and NYISO argue that the very similar assessment required under Reliability Standard FAC-013-2, which is intended "to identify potential future Transmission System weaknesses and limiting Facilities that could impact the Bulk Electric System's (BES) ability to reliability transfer energy," does not provide a similar obligation to rectify any deficiencies identified from the assessment as is found in the TPL Standards, and therefore has questionable value.[19] As an example, MISO and NYISO note that if an assessment performed under Reliability Standard FAC-013-2 found that incremental transfer capability was 0 MW at some point within the Near-Term Transmission Planning Horizon, FAC-013-2 does not provide any guidance about steps to be taken to address the identified weaknesses. Accordingly, MISO and NYISO argue that Reliability Standard FAC-013-2 is unnecessary and could lead to confusion with respect to the responsible entities' obligations to preserve the reliability of the BES.[20]

13. Finally, MISO and NYISO note that a calculation of transfer capability that is set one to five years in the future (i.e., the Near-Term Transmission Planning Horizon) does not provide any useful information for the future reliable operation of the system, because system conditions are likely to be significantly different than those assumed for the required assessment.[21]

14. ERCOT initially notes its support for MISO and NYISO's position that FAC-013-2 is unnecessary given its overlap with the requirements of the TPL Reliability Standards.[22] However, if Reliability Standard FAC-013-2 is approved over MISO and NYISO's objections, ERCOT asks the Commission to provide an exemption for the ERCOT region. ERCOT notes that the revised Reliability Standard was developed in response to the Commission's directive to apply the transfer capability methodology requirements, as implemented in the MOD Reliability Standards, to the planning horizon.[23] ERCOT states that the Commission has already found that the requirements of the MOD Reliability Standards governing the calculation of ATC provide no reliability benefit in the ERCOT region, essentially recognizing that ERCOT has no transmission market (and instead manages congestion through re-dispatch of generation), and that

---

[19] *Id.* at 5.

[20] *Id.*

[21] *Id.* at 6.

[22] ERCOT Comments at 2.

[23] *Id.* at 3.

ERCOT has no interchange with neighboring regions. ERCOT argues that the same rationale applies for Reliability Standard FAC-013-2 with respect to the planning horizon, as ERCOT's reliability planning analyses are performed using the same assumptions as are used for operations.[24]

15. ERCOT notes that the Texas Reliability Entity, Inc. (Texas RE)[25] supported ERCOT's position on the propriety of an ERCOT exemption through comments submitted during NERC's Standards Development Process. Texas RE provided the following rationale for the exemption: "ERCOT does not need to address transmission allocation issues either in the operating horizon or in the planning horizon. To the extent that ERCOT does planning studies to examine transfers, those studies are related more to economic planning than to reliability."[26] ERCOT further argues that the Standards Drafting Team failed to draw a meaningful distinction between the MOD requirements regarding calculation of transfer capabilities in the operating horizon, which are not applicable to ERCOT by virtue of a FERC-granted exemption, and FAC-013-2's requirements related to assessment of transfer capabilities in the planning horizon.[27]

IV. Discussion

16. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.214, the timely joint motion to intervene filed by MISO and NYISO serves to make them parties to this proceeding. Pursuant to Rule 214(d) of the Commission's Rules of Practice and Procedure, 18 C.F.R § 385.214(d), the Commission will grant ERCOT's late-filed motion to intervene, given its interest in the proceeding, the early stage of the proceeding, and the absence of undue prejudice or delay.

---

[24] *Id.* at 3-4 (noting that the Commission agreed with ERCOT's position that applying the MOD Reliability Standards to ERCOT would not provide any reliability benefits due to physical differences in ERCOT's transmission system (citing Order No. 729, 129 FERC ¶ 61,155 at P 292-93, 296 and 298)).

[25] Texas RE is the approved regional entity, as defined under FPA section 215(e)(4), for the ERCOT region, with delegated authority from NERC to develop, monitor, assess, and enforce compliance with NERC Reliability Standards within that region.

[26] ERCOT Comments at 5 (quoting from Texas RE Comments submitted to NERC in the Standards Development Process).

[27] *Id.* at 6.

A. Reliability Standard FAC-013-2

17. We approve Reliability Standard FAC-013-2 and find that the standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest. We also approve the proposed implementation plan for Reliability Standard FAC-013-2, which would retire Reliability Standards FAC-012-1 and FAC-013-1 when FAC-013-2 becomes effective. We accept the addition of the terms "Near-Term Transmission Planning Horizon" and "Year One" to the NERC Glossary. Finally, we find that the proposed Reliability Standard satisfies our outstanding directives in Order Nos. 693 and 729 regarding the non-discriminatory assessment of transfer capability in the planning horizon.[28]

18. Contrary to the arguments of MISO and NYISO, we find that Reliability Standard FAC-013-2 provides a unique reliability benefit beyond that conferred by the TPL Standards. Reliability Standard FAC-013-2 is designed to ensure that planning coordinators perform annual assessments to identify potential weaknesses and limiting facilities of the bulk electric system. Such potential weaknesses and limitations could ultimately affect reliable transfers of energy. Further, in performing the required annual assessment, the planning coordinator must consider both current approved and *projected* transmission uses.[29]

19. By contrast, the TPL Reliability Standards set out specific performance requirements for all transmission planners (as well as planning authorities and coordinators), requiring among other things a demonstration that each transmission planner's portion of the bulk electric system is designed to maintain system stability and to stay within thermal and voltage limits, while serving forecast customer demand and all projected firm (non-recallable) reserved transmission services.[30] Thus, the TPL Reliability Standards do not require a planning assessment that reflects all projected transmission uses but, rather, an assessment that reflects only projected *firm reserved* transmission uses. In other words, Reliability Standard FAC-013-2 differs from the TPL standards because the former focuses on identifying potential weaknesses that could limit energy transfers across a broader region and requires the planning coordinator to consider any expected transmission uses, regardless of whether they have been scheduled or

---

[28] *See* Background Section above describing the pending Commission directives from Order No. 693 and Order No. 729.

[29] *See* proposed Reliability Standard FAC-013-2 R.1.4.4.

[30] *See* Reliability Standard TPL-001-0.1 R1.

otherwise reserved, and thereby allows for an assessment that may be more accurate in the outer years of the planning horizon.

20. As MISO and NYISO note, Reliability Standard FAC-013-2 does not impose an obligation to develop a plan to address identified limitations in transfer capability in the Near-Term Transmission Planning Horizon. However, the lack of such an obligation does not detract from the Reliability Standard's value as an informational tool for the early identification of inter-regional or intra-regional limitations on transfers. In Order No. 729, the Commission recognized that the calculation of transfer capabilities in the planning horizon (years one through five) may not be accurate enough to support long-term scheduling of the transmission system.[31] The Commission nonetheless determined that such forecasts would be useful "for long-term planning, in general, by measuring sufficient long-term capacity needed to ensure the reliable operation of the Bulk-Power System."[32]

21. Consistent with its purpose as a planning tool with a regional focus, rather than a mechanism for ensuring that individual systems are planned to reliably meet projected load and known transmission uses, Reliability Standard FAC-013-2 provides the planning coordinator flexibility in determining what transfers to assess. Moreover, an assessment conducted pursuant to FAC-013-2 may include transmission uses that are expected but which are not yet scheduled or reserved (*e.g.*, expected interconnection of a large group of renewable generators), and can be used as a regional coordination tool rather than as a means of ensuring adequate planning for reliable system performance. Accordingly, we find that Reliability Standard FAC-013-2 does confer reliability benefits beyond those provided by the TPL Reliability Standards, and we are not persuaded by the arguments of MISO and NYISO on this issue.

22. We further find that Reliability Standard FAC-013-2 satisfies certain outstanding directives from Order Nos. 693 and 729 which are not satisfied by the TPL Reliability Standards. Reliability Standard FAC-013-2 requires the planning coordinator to perform an annual assessment of transfer capability for at least one year in the Near-Term Transmission Planning Horizon, and to document that the assumptions and criteria used to perform the assessment are consistent with the planning coordinator's planning practices. By contrast, the TPL Reliability Standards impose system performance requirements under various conditions, and do not require a specific assessment of transfer capabilities within a single system or across interconnected transmission systems.

---

[31] Order No. 729, 129 FERC ¶ 61,155 at P 290.

[32] *Id.*

While we agree that Reliability Standard FAC-013-2 and the TPL Reliability Standards are designed primarily to encourage adequate longer-term planning rather than to generate accurate measures of ATC or total transfer capability (TTC), we believe that our outstanding directives regarding the review of transfer capability within the planning horizon are not satisfied by the TPL Reliability Standards.

B. Violation Risk Factors and Violation Severity Levels

23. We find that the violation risk factors (VRFs) assigned to Requirements R2, R3, R5 and R6 are consistent with the Commission's established guidelines and approve them as filed.[33] However, we find that NERC has not adequately justified its proposed "lower" VRF designation for Requirements R1 and R4, and direct NERC to either provide additional justification for these VRF designations or propose a revised VRF designation that addresses our concerns.

24. NERC states that Requirements R1 and R4 meet the definition of a "lower" risk requirement because they are "strictly administrative in nature and are in the planning timeframe," and because "it is not anticipated that under emergency, abnormal or restorative conditions violation of this requirement would affect the electric state or capability of the BES."[34]

---

[33] *See North American Electric Reliability Corp.*, 119 FERC ¶ 61,145, *order on reh'g*, 120 FERC ¶ 61,145, at P 8-13 (2007); *North American Electric Reliability Corp.*, 123 FERC ¶ 61,284, at P 20-35, *order on reh'g & compliance*, 125 FERC ¶ 61,212 (2008); *North American Electric Reliability Corp.*, 135 FERC ¶ 61,166 (2011). Given the significant change in the scope of FAC-013-2 as compared to the original standards from which its requirements derive (FAC-012-1 and FAC-013-2), a reduction in the assigned VRF levels appears to be warranted for at least some of the requirements.

[34] NERC Petition at 33-34. The approved NERC definition for a "lower" VRF designation is as follows:

> Lower Risk Requirement: is administrative in nature and (a) is a requirement that, if violated, would not be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or (b) is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to affect the electrical state or capability of the Bulk-Power System, or the ability to

(continued…)

25. Requirement R4 does not appear to be "administrative in nature," in that it requires the planning coordinator to annually conduct a simulation assessing transfer capability on its system during at least one year in the near-term planning time frame. Requirement R4 requires an affirmative action by the applicable entity, and not merely documentation of the results of the study.

26. We have similar concerns with respect to R1, as it is a substantive requirement to adopt and document a methodology for assessing transfer capability that is consistent with the specific criteria set out in sub-requirements R1.1.2 – 1.5. This requirement goes further than mere documentation, and instead establishes the criteria that must be incorporated into a compliant methodology.

27. Finally, we approve the violation severity levels (VSLs) for FAC-013-2 as proposed, with the exception of the VSL triggers for R1, which appear to contain a typographical error. The VSL language for R1, as filed by NERC, uses the same description for "medium," "high," and "severe" violations, as follows:

> The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate one of [sub-requirements 1.1 through 1.5] of Requirement R1 into that methodology.

It appears that these triggers were intended to be progressive, i.e., the failure to incorporate one component was intended to be a medium level violation, as is currently stated in NERC's filed version of FAC-013-2, but a high level violation should require a failure to incorporate *two* components, and so on. Accordingly, we will direct NERC to modify the VSL language for Requirement R1 to correct this apparent error.

28. For the reasons stated above, we direct NERC to submit a compliance filing within 60 days of issuance of this order, that (1) either proposes a "medium" VRF designation for Requirements R1 and R4, or provides additional justification for a "lower" VRF level; and (2) corrects the proposed VSL language for R1.

> effectively monitor, control, or restore the Bulk-Power System.

See North American Electric Reliability Corporation, 119 FERC ¶ 61,145, at P9, *order on compliance*, 121 FERC ¶ 61,179, at P 2 and Appendix A (2007).

C. Applicability to ERCOT

29. For the reasons discussed below, we are not persuaded by ERCOT's arguments and, therefore, deny ERCOT's request for an exemption. ERCOT points out that the Commission granted an exemption to ERCOT regarding certain modeling, data and analysis, or MOD, Reliability Standards and believes that the Commission should grant ERCOT a similar exemption regarding compliance with FAC-013-2. Reliability Standard FAC-013-2, however, is distinguishable from the MOD Reliability Standards because the MOD Reliability Standards address methodologies for calculating ATC and total transfer capability (TTC) for the purpose of allocating transmission capacity. In Order No. 729, the Commission agreed that the MOD Reliability Standards would not provide any reliability benefit to ERCOT due to physical differences in ERCOT's transmission system.[35]

30. In contrast to the MOD Reliability Standards, FAC-013-2 is not designed primarily to ensure non-discriminatory allocation of transmission capacity among transmission market participants, but is instead a planning tool, with a particular focus on identifying weaknesses or limitations in transfer capability between regions (including constrained regions within a single market such as ERCOT). We believe ERCOT, like other regions, will benefit from the assessment of potential limitations in transfer capability in the planning horizon over the Near-Term Transmission Planning Horizon that is required under FAC-013-2.

31. Moreover, ERCOT concedes that it currently has a planning process in place that allows it to address "prospective weaknesses and limiting facilities that may arise under all probable prospective operating conditions."[36] That ERCOT already undertakes these kinds of planning assessments leads to the conclusion that such assessments are in fact useful to ERCOT. Incorporating an obligation to continue performing such an assessment as part of a mandatory and enforceable Reliability Standard, especially one that will provide for greater levels of transparency as to how the assessments are done, will not only provide a meaningful reliability benefit but also would presumably impose little additional burden on ERCOT.

---

[35] Order No. 729, 129 FERC ¶ 61,155, at P 292-93, 296 (noting, *inter alia*, that ERCOT does not have a transmission market and manages transmission congestion through redispatch of generation).

[36] ERCOT Comments at 7.

V. Information Collection Statement

32. The Office of Management and Budget (OMB) regulations require approval of certain information collection requirements imposed by agency action.[37] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of this Order will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

33. The Commission will submit these reporting and recordkeeping requirements to OMB for its review and approval under section 3507(d) of the Paperwork Reduction Act. Comments are solicited within 60 days of the date this order is published in the Federal Register on the Commission's need for this information, whether the information will have practical utility, the accuracy of provided burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques. Comments should be submitted following the Commission's submission guidelines at http://www.ferc.gov/help/submission-guide.asp and should reference Docket No. RD11-3.

34. Rather than creating entirely new obligations with respect to the assessment of transfer capability for the near-term transmission planning horizon, Reliability Standard FAC-013-2 upgrades the existing planning requirements contained in FAC-013-1 and specifically requires planning coordinators to have a methodology for and to perform an annual assessment identifying potential future transmission system weaknesses and limiting facilities that could impact the bulk electric system's ability to reliably transfer energy in the near-term transmission planning horizon. Thus, this Order does not impose entirely new burdens on the affected entities. For example, FAC-013-1 requires each applicable entity to have a documented methodology for assessing transfer capability and to share the results of that assessment with specific entities. FAC-013-2 imposes relatively minimal new requirements regarding the information that must be included in the documented methodology, the frequency of the assessment and the number of days allocated to make the assessment results available to other entities.

35. Burden Estimate: Our estimate below regarding the number of respondents is based on the NERC compliance registry as of August 29, 2011. According to the registry, there are 80 planning authorities[38] that will be involved in providing

[37] 5 CFR 1320.11.

[38] The term "planning coordinator' is synonymous with the term "planning authority," in the NERC Glossary.

information. This Order will require applicable entities to review their transfer capability methodologies and document compliance with the Reliability Standard's requirements. For those planning coordinators that do not already comply with the Standard's requirement for having a documented methodology for assessing transfer capability in the Near-Term Transmission Planning Horizon, they will be required to update their methodology documents and compliance protocols. In addition, planning coordinators must ensure that the required assessment will be performed at least once per calendar year.[39] The estimated burden for the requirements in this Order follow:

Data Collection	No. of Respondents (A)	No. of Responses Per Respondent (B)	Hours Per Respondent Per Response (C)	Total Annual Hours (A x B x C)
Review and possible revision of methodology (one-time)	20[40]	1	80	1,600
Procedure to perform the Transfer Capability Assessment	80	1	80	6,400

[39] While the document retention requirements are being increased under the new Reliability Standard (from one to three years), the usual and customary practice currently is to retain documentation needed to demonstrate compliance for the period since the last audit, which is on a three year schedule. In addition, while planning coordinators must ensure that they perform an appropriate transfer capability assessment at least once per year, they are already required to establish transfer capabilities and disseminate information about those capabilities. Thus, there should be no increase in burden other than the one-time cost of (1) setting up a procedure to ensure that the assessment will be performed at least once per year, and (2) adjusting the methodology (if needed) to comply with the more specific requirements set out in the new Reliability Standard.

[40] Requirement R1 applies to planning coordinators. We estimate that 25 percent of all planning coordinators will have to update their methodology documents.

annually (one-time)				
Total				8,000

Information Collection Costs: The Commission seeks comments on the costs to comply with these requirements and recordkeeping burden associated with Reliability Standard FAC-013-2.

- Total Burden Hours for Collection: (Compliance/Documentation) = 8,000 hours.
- Burden Hours Averaged over Three Years[41] = 2,667 .
- Total One-Time Compliance Cost = 8000 hours @ $120/hour = $960,000.
- Total First Year Cost = $960,000
- Title: Order Approving Reliability Standard
- Action: Proposed Collection in FERC-725A
- OMB Control No: 1902-0244
- Respondents: Business or other for profit, and/or not for profit institutions.
- Frequency of Responses: On occasion.
- Necessity of the Information: Reliability Standard FAC-013-2 satisfies certain directives the Commission issued in Order No. 729 requiring applicable entities to specify the framework used for calculating transfer capabilities in the Near-Term Transmission Planning Horizon and to ensure that the framework is consistent with the processes and criteria used for other operating and planning purposes. It also requires some entities to update their Transfer Capability methodology documents and procedures to perform assessments annually.

36. Interested persons may obtain information on the reporting requirements by contacting: Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, Phone: (202) 502-8663, fax: (202) 273-0873].

VI. Effective Date

37. This order will become effective [**insert date 60 days from publication in the Federal Register**].

[41] While this is a one-time burden, information collections tend to be on a three year approval cycle. Therefore, we are averaging the one-time burden estimate over three years.

The Commission orders:

(A) Reliability Standard FAC-013-2 is hereby approved as just, reasonable, not unduly discriminatory, and in the public interest.

(B) NERC's addition of the terms "Year One" and "Near-Term Transmission Planning Horizon" to the NERC Glossary is hereby approved.

(C) NERC's proposed implementation plan for Reliability Standard FAC-013-2 is hereby approved, including the retirement of existing Reliability Standards FAC-012-1 and FAC-013-1 upon the effective date of Reliability Standard FAC-013-2.

(D) The VRF levels and VSL levels proposed for FAC-013-2 are approved with the exceptions discussed above, and NERC is directed to submit a compliance filing within 60 days of this order addressing the Commission's stated concerns with respect to the VRF levels of R1 and R4 and the VSL language of R1.

By the Commission. Commissioner Spitzer is not participating.

(S E A L)

Nathaniel J. Davis, Sr.,
Deputy Secretary.

and Cheryl A. LaFleur.

North American Electric Reliability Corporation Docket No. RR11-5-000

ORDER APPROVING AMENDMENTS TO RULES OF PROCEDURE

(Issued November 17, 2011)

1. On June 13, 2011, the North American Electric Reliability Corporation (NERC) filed a petition requesting approval of proposed amendments to the NERC Rules of Procedure. As discussed below, pursuant to section 215(f) of the Federal Power Act (FPA) and section 39.10(a) of the Commission's regulations, we approve the proposed amendments.[1]

I. Background

A. Section 215

2. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards, which are subject to Commission review and approval. The statute also requires, *inter alia*, that the ERO establish Rules that: (1) assure independence, while assuring fair stakeholder representation and balanced decision-making; (2) equitably allocate reasonable dues, fees and other charges; (3) provide fair and impartial procedures for enforcing Reliability Standards through imposition of penalties; and (4) provide reasonable notice and opportunity for public comment, due process and balance in developing Reliability Standards.

3. Section 215(f) provides that the ERO shall file with the Commission any proposed rule or proposed rule change, accompanied by an explanation of its basis and purpose. Similarly, the Commission, upon its own motion or complaint, may propose a change to the rules of the ERO. A proposed rule or proposed rule change shall take effect upon a finding by the Commission "after notice and opportunity for comment that the change is

[1] 16 U.S.C. § 824o(f)(2006) and 18 C.F.R. § 39.10(a) (2011).

just, reasonable, not unduly discriminatory or preferential, is in the public interest and satisfies the requirements of subsection (c)."[2]

B. Order No. 672 and NERC's Certification as the ERO

4. On February 3, 2006, the Commission issued Order No. 672 to implement the requirements of section 215 of the FPA.[3] Order No. 672, *inter alia*, sets forth the process for certifying an ERO to develop and enforce compliance with mandatory Reliability Standards, subject to Commission approval and oversight.

5. On July 20, 2006, the Commission certified NERC as the ERO under section 215(c) of the FPA.[4] The Commission found that NERC satisfies the criteria to be the ERO responsible for developing and enforcing mandatory Reliability Standards for the United States except for Alaska and Hawaii. Further, the Commission approved NERC's Rules of Procedure and, in addition, identified needed revisions to the NERC Rules. Through a series of subsequent filings, NERC refined its Rules of Procedure, including NERC's Reliability Standards Development Procedure, and Compliance Monitoring and enforcement program.[5]

II. Proposed Amendments to NERC Rules of Procedure

6. In its June 13, 2011 petition, NERC proposes to amend *Appendix 3B Election Procedure for Members of NERC Standards Committee* of the NERC Rules of Procedure. Specifically, NERC's proposed amendments: (1) require the Chair and Vice Chair of the NERC Standards Committee to serve as non-voting members; (2) add a criterion for the Canadian representative on the Standards Committee to require that the representative is an individual that has Canadian citizenship and resides in Canada; (3) simplify the process for managing special Standards Committee elections to fill vacant positions that

[3] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[4] *North American Electric Reliability Corp*., 116 FERC ¶ 61,062 (ERO Certification Order), *order on reh'g & compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom*. *Alcoa, Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

[5] *E.g., North American Electric Reliability Corp.*, 118 FERC ¶ 61,030 (2007).

occur mid year by eliminating the need to collect petitions and hold a ratifying vote; and (4) make additional minor conforming changes.

7. Regarding the proposal to require the Chair and Vice Chair of the NERC Standards Committee to serve as non-voting members, NERC explains that during the past year, the elected officers on the Standards Committee faced a conflict of interest when determining whether to vote on behalf of the industry segment that elected them or on behalf of the industry as a whole. NERC states that the purpose of the proposed change is to eliminate this conflict of interest, to ensure that each industry segment maintains two representatives on the Standards Committee and to clarify that the officers of the Standards Committee are expected to act on behalf of the industry as a whole rather than on behalf of any particular industry segment.

8. NERC states that its clarification to add a criterion for the Canadian Representative of the Standards Committee is consistent with the definition of "Canadian" in section 200 of the NERC Rules of Procedure, and that the purpose of this change is to increase the likelihood that the Canadian Representative is familiar with Canadian issues. NERC further states that the purpose of its proposal is to simplify the process for managing special Standards Committee elections and to improve efficiency and result in shorter vacancies for these positions.

9. NERC also proposes to incorporate new *Appendix 3D Registered Ballot Body Criteria* into the NERC Rules of Procedure. NERC explains that on September 3, 2010, the Commission approved NERC's Standards Process Manual to replace the Reliability Standards Development Procedure Version 7, and that the Standards Process Manual did not include registered ballot body criteria.[6] NERC believes that it is appropriate to re-incorporate the Registered Ballot Body Criteria into the NERC Rules of Procedure with certain modifications that are intended to add clarity and bring the criteria up to date with changes in the industry.

10. The proposed changes include: (1) replacing the term "persons" (in addition to entities) with "individuals" in the criteria of potential Registered Ballot Body members for clarity purposes; (2) clarifying the segment qualification guidelines to state that after members of each segment are selected, registered participants may apply to change those segments annually on a schedule determined by the Standards Committee; (3) expanding the criteria for Regional Transmission Organizations to include Independent System Operators; (4) allowing agents or associations to represent groups of load serving entities; (5) allowing agents or associations to represent groups of electricity generators; and (6) allowing agents or associations to represent groups of electricity brokers, aggregators, or marketers, and also a new provision for inclusion of demand-side management providers.

[6] *North American Electric Reliability Corp.*, 132 FERC ¶ 61,200 (2010).

11. In addition, NERC proposes to add a provision to clarify that: (1) individuals or entities such as consultants, vendors, or trade associations, providing products or services related to Bulk-Power System reliability within the previous 12 months to another entity eligible to join Segments 1 through 7 (and that are therefore eligible to join one of these segments) are not eligible to join Segment 8; (2) individuals or entities that elect to participate in Segment 8 are not eligible to participate in multiple segments; and (3) individuals who are employed by an entity registered in another segment are not eligible to join Segment 8.[7] NERC also proposes to add a new criterion in Segment 5 – Electric Generators allowing agents or associations to represent groups of electric generators and, for clarity, to expand the language to expressly include variable and other renewable resources. Also, NERC proposes to replace the phrase Regional Reliability Organizations in Segment 10 with Regional Entities.[8]

III. Notice and Responsive Pleadings

12. Notice of NERC's June 13, 2011, Filing was published in the *Federal Register*, 76 Fed. Reg. 35,876 (2011), with interventions and protests due on or before July 5, 2011. A motion to intervene was timely filed by American Municipal Power, Inc. (AMP). Louisville Gas and Electric Company and Kentucky Utilities Company (LG&E) filed a timely comment but did not seek to intervene in this proceeding.

13. LG&E supports NERC's proposal except for two specific changes to the *Appendix 3D Registered Ballot Body Criteria*. LG&E indicates that it does not support the proposed language regarding Segment 5 – Electric Generators. Specifically, LG&E states that the phrase "including variable and other renewable resources" is unnecessary, only serves to make such generators a special class without justification, and believes the inclusion of this language creates the opportunity to discriminate against those generators

[7] In accordance with *Appendix 3D*, each participant chooses which of the Segments it wishes to join. NERC reviews the choices and makes a determination of whether the selection satisfies at least one of the guidelines to belong to that Segment. If a guideline is satisfied, the entity or individual will then be "credentialed" to participate as a voting member of that Segment. The Segments include: Segment 1 - Transmission Owners, Segment 2 - Regional Transmission Organizations and Independent System Operators, Segment 3 - Load-Serving Entities, Segment 4 - Transmission Dependent Utilities, Segment 5 - Electric Generators, Segment 6 - Electricity Brokers, Aggregators, and Marketers, Segment 7 - Large Electricity End Users, Segment 8 - Small Electricity Users, Segment 9 - Federal, State and Provincial Regulatory or other Government Entities, and Segment 10 - Regional Entities.

[8] NERC Petition at 5.

that do not fit within this special class. LG&E states that if such generators produce energy, then they fall into this segment without the additional language.

14. In addition, LG&E suggests that "agents or associations" representing groups of Segment-Eligible entities should be precluded from casting ballots where the agent or association's membership consists of entities eligible to cast their own individual ballots as a Segment-Eligible entity. LG&E suggests that this would prevent a registered ballot body member from having more than one vote. LG&E suggests that the provision should state that "(a) affiliated entities may collectively be registered only once within a segment; (b) agents and associations may not register within the same segment in which any entity or individual represented by the agent or association is also registered; and (c) consultants, employees and vendors providing services related to bulk power system reliability within the previous 12 months to another entity or individual may not register within the same segment in which the entity or individual receiving those products or services is also registered."[9]

IV. Discussion

A. Procedural Matters

15. Pursuant to Rule 214 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.214 (2011), the timely, unopposed motion to intervene filed by AMP serves to make it a party to this proceeding. In addition, we accept LG&E's timely filed comments.

B. Commission Determination

16. Pursuant to the Commission's authority under section 215(f) of the FPA and section 39.10(a) of the Commission's regulations, we approve the proposed modifications to the NERC Rules of Procedure. We agree with NERC that the modifications to *Appendix 3B* relative to the changes to the roles of the Chair and Vice Chair of the Standards Committee will eliminate the potential conflict of interest and ensure that each industry segment maintain the appropriate number of representative on the Standards Committee. In addition, we accept as reasonable NERC's addition of a criterion to ensure that each Canadian representative on the Standards Committee has Canadian citizenship and resides in Canada. We also agree with NERC that the amendments simplify the process for managing special elections to fill vacant positions that occur during the course of the year.

[9] LG&E Comments at 3-4.

17. With regard to LG&E's comment, we are not persuaded that the language "including variable and other renewable resources" creates the opportunity to discriminate against other generators who do not fit within this class. Rather, it is reasonably understood that this language helps to clarify the qualifications for membership in Segment 5 by providing one example of acceptable types of generation and additionally signals to variable and other renewable resource generators that they are able to participate in this voting Segment.

18. Further, we accept NERC's proposal to include "agents and associations" in the individual Segments in *Appendix 3D* of the NERC Rules of Procedure. While the Commission agrees that the addition of Agents or Trade Associations as voting members may impact several of the smaller segments, we are not persuaded that the proposed changes will have a material impact on the balance or fairness of those individual voting segments. Rather, NERC's addition of these entities is consistent with the Commission's general policy of inclusiveness with regard to the NERC Standards Development Process.[10] Recognizing that Agents and Trade Associations may provide additional perspectives of their members, some of which may not be participating in, or represented by the NERC Standards Development Process, we believe that the addition of these entities to the Registered Ballot Body Criteria may ultimately lead to the creation of more balanced Reliability Standards. For these reasons, we will not adopt LG&E's suggestions with regard to this issue.

The Commission orders:

NERC's petition is hereby approved, as discussed in the body of this order.

By the Commission. Commissioner Spitzer is not participating.

(S E A L)

Kimberly D. Bose,
Secretary.

Document Content(s)

November 2011
Meeting Summaries

These are summaries of orders voted by the Federal Energy Regulatory Commission at its November 17, 2011 public meeting. The summaries are produced by FERC's Office of External Affairs and are intended to provide only a general synopsis of the orders. These are not intended as a substitute for the Commission's official orders. To determine the specific actions and the Commission's reasoning, please consult the individual orders when they are posted to FERC's eLibrary found at www.ferc.gov.

G-1, Press Release

G-2, 3, 4, Press Release

H-1, Press Release

FERC accepts filing

E-1, *PJM Interconnection, L.L.C.; Trans-Allegheny Interstate Line Company*, Docket No. ER11-4574-000. This order accepts Trans-Allegheny Interstate Line Company's (TrAILCo) proposed modifications to TrAILCo's Attachment H-18 to the PJM OATT. As a result of the merger between Allegheny Energy, Inc. and FirstEnergy Corp., TrAILCo is now affiliated with FirstEnergy's operating companies (FirstEnergy affiliates). The proposed changes reflect the additional PJM transmission zones of the FirstEnergy affiliates in which TrAILCo may construct facilities.

FERC denies request for rehearing

E-2, *Nebraska Public Power District, Southwest Power Pool Regional Entity*, Docket No. RR11-1-002. This order denies Nebraska Public Power District's (NPPD) and Southwest Power Pool Regional Entity's (SPP RE) requests for rehearing of a Commission order upholding the North American Electric Reliability Corporation's denial of the request to transfer the compliance registrations of NPPD and several other registered entities located within Nebraska (together the "Nebraska Entities") from Midwest Reliability Organization to SPP RE. The order reaffirms that the transfer of the Nebraska Entities' compliance registration to SPP RE would likely result in compliance auditing inefficiencies and the need for increased coordination between Regional Entities.

FERC approves reliability standard, denies request for an exemption

E-4, *North American Electric Reliability Corporation,* Docket No. RD11-3-000. This order approves a revised Reliability Standard (FAC-013-2), which was developed in response to prior Commission directives regarding the need for transparency and consistency in assessing Transfer Capability. The proposed standard requires Planning Coordinators to have a transparent methodology for, and to annually perform, an assessment of transmission Transfer Capability over the near-term planning horizon. The order also denies ERCOT's request for an exemption from the requirements of the revised Reliability Standard, and requests further support for, or a modification of, certain Violation Risk Factors assigned to the revised Standard.

FERC approves reliability standard

E-5, *North American Electric Reliability Corp.*, Docket No. RD11-10-000. The order approves Reliability Standard FAC-008-3 (Facility Ratings) and the retirement of Reliability Standards FAC-008-1 (Facility Ratings Methodology) and FAC-009-1 (Establish and Communicate Facility Ratings). The order finds that FAC-008-3 presents measurable and enforceable requirements that obligate transmission owners and generator owners to develop facility ratings methodologies for its facilities. The order also approves the assigned Violation Severity Levels and the associated Violation Risk Factors (VRFs) with one modification. Specifically, the order directs NERC to change the VRF assigned to FAC-008-3, Requirement R2, from "Lower" to "Medium."

FERC denies rehearing; clarifies prior order

E-6, *Cedar Creek Wind Energy, LLC, Milford Wind Corridor Phase I, LLC*, Docket Nos. RC11-1-001 and RC11-2-001. This order denies rehearing and provides clarification of the Commission's order denying the appeals of two NERC registry decisions in which NERC found that Cedar Creek Wind Energy, LLC and Milford Wind Corridor Phase I, LLC were properly included on the NERC Compliance Registry as transmission owners and transmission operators.

FERC denies, in part, and grants, in part, request for clarification

E-7, *Northeast Transmission Development, LLC*, Docket No. EL11-33-001. This order denies in part and grants in part the Designated PJM Transmission Owners' request for clarification of the Commission's June 16, 2011 order on Northeast Transmission's petition for transmission rate incentives.

FERC grants petition seeking a declaratory order

E-8, *Duke Energy Ohio, Inc.*, Docket No. EL11-58-000 *et al.* The order grants the petition of Duke Energy Ohio, Inc. seeking a declaratory order finding that its proposed payment of dividends from equity accounts will not violate section 305(a) of the Federal Power Act.

FERC grants, in part, and denies, in part, request for rehearing and directs further revision

E-10, *Westar Energy, Inc.*, Docket No. ER09-1273-002 *et al.* This order grants in part and denies in part American Wind Energy Association's and the Wind Coalition's request for rehearing of the Commission's March 18, 2010 order in this proceeding. The March 18, 2010 order accepted Westar Energy, Inc.'s proposed *pro forma* Balancing Area Services Agreement and Schedule 3A, Generator Regulation and Frequency Response Service, which enabled Westar to charge for and provide generation regulation and frequency response services to generators located in Westar's balancing area whose output is delivered outside Westar's balancing area or to Southwest Power Pool, Inc.'s energy imbalance market. The order also institutes a proceeding under section 206 of the FPA, establishes a refund effective date, and directs Westar to submit a compliance filing within thirty days that would require Westar to aggregate certain data in calculating the Schedule 3A regulation requirements.

FERC acts on rehearing requests, technical conference, and compliance filing

E-11, *PJM Interconnection, L.L.C.*, Docket No. ER11-2875-001, *et al*. The order addresses PJM's Minimum Offer Price Rule (MOPR) - a mechanism that seeks to prevent the exercise of buyer market power in the forward capacity market by ensuring that all new resources are offered into PJM's Reliability Pricing Model (RPM) on a competitive basis. The order addresses requests for rehearing and clarification of an earlier order, issued April 12, 2011, a technical conference established to consider a rehearing issue relating to self-supply, and a PJM compliance filing. The Commission generally affirms its acceptance of PJM's proposed revisions to the MOPR, finding that the MOPR helps ensure that wholesale prices are just and reasonable and should elicit new entry when new capacity is needed. The Commission finds that PJM's proposal to permit suppliers to justify their costs on a project-specific basis will allow reasonable consideration of the cost and revenue characteristics and business models of individual projects.

FERC denies request for rehearing; conditionally accepts compliance filing and directs Commission staff to commence a technical conference

E-12, *California Independent System Operator Corporation*, Docket Nos. ER10-1706-001 and ER10-1706-002. This order denies the California Independent System Operator Corporation's (CAISO) request for rehearing of the Commission's August 31, 2010 order accepting, in part, and rejecting, in part, certain tariff revisions proposed by CAISO relating to interconnection requirements applicable to large asynchronous generators, primarily wind and solar photovoltaic resources. The order finds that CAISO did not provide sufficient evidence to justify its requested tariff revisions, and that the August 31, 2010 order was not in conflict with the Commission's order approving the North American Electric Reliability Corporation's interpretation of the Commission-approved Voltage and Reliability Standard designated VAR-002-1.1b, and does not arbitrarily discriminate against existing conventional generators. The order conditionally accepts CAISO's September 30, 2011 compliance filing, subject to a subsequent compliance filing. The order also directs Commission staff to commence a technical conference to consider the reactive power provisions of Order No. 661-A and the evidentiary requirements necessary to make a showing under that order.

FERC approves proposed amendments to NERC's Rules of Procedure

E-13, *North American Electric Reliability Corporation*, Docket No. RR11-5-000. This order approves NERC's proposed amendments to the NERC Rules of Procedure. The amendments modify the Election Procedure for Members of NERC Standards Committee and the Registered Ballot Body Criteria.

FERC accepts and suspends a request

E-14, *Nevada Power Company*, Docket No. EL11-4215-000. The order accepts and suspends a request for cancellation of rate schedule, and sets the matter for hearing and settlement procedures.

FERC rejects motion for clarification and request for rehearing

H-2, *FirstLight Hydro Generating Company*, Project No. 2576-151. This order rejects the Candlewood Lake Authority's motion for clarification and request for rehearing of a September 23, 2011 Commission staff order approving the request of FirstLight Hydro Generating Company to modify the nuisance plant monitoring plan for its Housatonic Project No. 2576 located in Connecticut, because the Authority is not a party to the proceeding. For clarity, however, the order also addresses Candlewood's substantive concerns.

FERC denies rehearing

H-3, *Duke Energy Carolinas, LLC,* Project No. 2601-015. The order denies a request for rehearing by Paulette Smart of a September 20, 2011, notice denying her late motion to intervene in the relicensing proceeding for the Bryson Hydroelectric Project No. 2601 located in North Carolina. The order concludes that Ms. Smart has not provided good cause for intervening late and that she is not aggrieved by the underlying order, but, for clarity, addresses her substantive concerns.

FERC denies rehearing

H-4, *The Nevada Hydro Company, Inc.*, Project No. 11858-004. This order denies Nevada Hydro Company's request for rehearing of an order issued July 12, 2011, in which the Director of FERC's Office of Energy Projects dismissed the license application filed by Nevada Hydro and its co-applicant, Elsinore Valley Municipal Water District, for the proposed Lake Elsinore Advanced Pumped Storage Project, in California. The Director dismissed the application based on his conclusion that the co-applicants, which have had ongoing disagreements regarding the status of a transmission line included in the project description, would be unlikely to be able to work together as co-licensees.

In its order denying rehearing, the Commission finds the Director correctly concluded that the disagreements between the co-applicants were such that the Commission could not rely on them to be cooperating co-licensees, and that his dismissal of the application was within his discretion.

FERC authorizes revised protective buffer zone for a storage facility in NY

C-2, *Dominion Transmission Inc.*, Docket No. CP11-493-000. The order authorizes Dominion Transmission, Inc. to revise the active boundary and to establish a 2,000-foot buffer zone around its Woodhull Storage Pool located in Steuben County, New York. The order finds that the proposed protective buffer should protect the Woodhull Storage Pool from potential breaches that may be caused from the hydraulic fracturing used in the drilling of Marcellus Shale wells in the vicinity of the Pool.

FERC approves construction of certain natural gas facilities in PA

C-3, *Texas Eastern Transmission, LP,* Docket Nos. CP11-67-000 and 001.

The order authorizes, subject to conditions, a proposal by Texas Eastern to construct, operate, and abandon certain facilities on its mainline in Greene and Lancaster Counties, Pennsylvania.

FERC grants clarification and rehearing

C-4, *Tennessee Gas Pipeline Company*, Docket No. CP11-36-001. This order grants Tennessee Gas Pipeline Company's request for clarification and rehearing of the Commission's August 24, 2011 Order Issuing Certificate. This order clarifies that a provision in Tennessee's binding precedent agreement with The Berkshire Gas Company is not non-conforming, as originally determined in the August 24 Order. This order also grants Tennessee's request for rehearing to allow it until November 1, 2012 to place the Northampton Expansion Project into service. The project would be located in Southwick, Massachusetts.

Of Note:

FERC approves reliability standard, denies request for an exemption

E-4, *North American Electric Reliability Corporation*, Docket No. RD11-3-000. This order approves a revised Reliability Standard (FAC-013-2), which was developed in response to prior Commission directives regarding the need for transparency and consistency in assessing Transfer Capability. The proposed standard requires Planning Coordinators to have a transparent methodology for, and to annually perform, an assessment of transmission Transfer Capability over the near-term planning horizon. The order also denies ERCOT's request for an exemption from the requirements of the revised Reliability Standard, and requests further support for, or a modification of, certain Violation Risk Factors assigned to the revised Standard.

FERC approves reliability standard (attached)

E-5, *North American Electric Reliability Corp.*, Docket No. RD11-10-000. The order approves Reliability Standard FAC-008-3 (Facility Ratings) and the retirement of Reliability Standards FAC-008-1 (Facility Ratings Methodology) and FAC-009-1 (Establish and Communicate Facility Ratings). The order finds that FAC-008-3 presents measurable and enforceable requirements that obligate transmission owners and generator owners to develop facility ratings methodologies for its facilities. The order also approves the assigned Violation Severity Levels and the associated Violation Risk Factors (VRFs) with one modification. Specifically, the order directs NERC to change the VRF assigned to FAC-008-3, Requirement R2, from "Lower" to "Medium."

November 17, 2011

Commissioner Philip D. Moeller

STATEMENT

FEDERAL ENERGY REGULATORY COMMISSION

Docket Nos. AD12-1-000

Statement of Commissioner Philip D. Moeller on FERC's Upcoming Reliability Conference

"On Monday I released a comprehensive list of questions related to whether or not reliability might be impacted by upcoming rules of the EPA. While I am certain that all of my fellow Commissioners could have arrived at an equally comprehensive list, I wanted to circulate my thoughts on this topic well in advance of the technical conference.

By circulating these questions in advance, I hope to provide interested people with an opportunity to provide "hard" and "real" evidence of reliability problems. The debate over EPA and reliability is too often a debate lacking in substance, where one person might say this nation has a reliability problem, and another person will say the opposite. So the purpose of these detailed questions is to move the debate away from mere allegations, and into the substantive analysis of reliability issues and how to resolve them.

Just as I firmly believe that reliability issues associated with renewable energy can be adequately resolved, I believe that given enough time and study, any reliability issues associated with EPA rules can be resolved. Since its inception, electricity providers have been continuously addressing reliability issues and overcoming them. In the early days it was a debate between direct current and alternating current. During the Second World War transmission lines became one of the many solutions to the risk of sabotage and the problems of energy shortages that were fueled by wartime demand. After the war, the reliability problem of integrating increasingly large power plants, including nuclear plants, resulted in the development of many large pumped-storage facilities.

All of these earlier challenges to reliability were addressed successfully, and I have no doubt that any new challenges that we face can also be addressed. To clarify a few details on my list of questions:

> First, these are my questions alone, and not an official request by the Commission. Thus, as should be obvious, any response is optional and intended to help guide the public on the issues that could become important for the written record.
>
> Second, I have suggested no due date --- and that is intentional. To the extent that anybody can provide their responses before the technical conference, that would help me prepare for the conference. But given the importance of reliability to the power grid, I'd rather have complete and accurate responses than anything rushed or uncertain.
>
> Third, I don't expect, and would actually be surprised if anybody answered every question asked. I've asked a variety of questions that are based upon conversations that I've had over the past year or so on this topic. But a conversation is not evidence in the record that can be acted upon, and that's why decisions aren't based upon mere conversations. Thus, my questions are an opportunity to submit evidence into the record. And importantly, when evidence is submitted into the record, that evidence then provides people who have differing views an opportunity to challenge that evidence with their own evidence.

I look forward to the upcoming conference.

UNITED STATES OF AMERICA
FEDRAL ENERGY REGULATORY COMMISSION

Reliability Technical Conference	Docket No. AD12-1-000
North American Electric Reliability Corporation	Docket No, RC11-6-000
Public Service Commission of South Carolina and the South Carolina Office of Regulatory Staff	Docket No. EL11-62-000

(Not consolidated)

REQUEST FOR EVIDENCE OF COMMISSIONER PHILIP D. MOELLER ON EPA ISSUES FOR THE NOVEMBER 2011 RELIABILITY CONFERENCE

At the upcoming technical conference, the Commission will consider, among other things, how certain rules under consideration by the Environmental Protection Agency (EPA) could impact the reliability of electric supply in this nation.

Because of its responsibility for reliability and for wholesale electric markets, this Commission needs to both understand and take appropriate actions to ensure that prices for electricity are just and reasonable --- and that sufficient electricity is reliably available across our nation. Our effort to accommodate the changing power grid requires us to actively consider reliability issues that arise from actions of the EPA. In July of this year, we recognized that our acting on upcoming changes to the power grid is "critical":

> The need for additional transmission facilities is being driven in large part, by changes in the generation mix… early retirements of coal-fired generation, an increasing reliance on natural gas, and large-scale integration of renewable generation… It is therefore critical that the Commission act now to address deficiencies to ensure that more efficient or cost-effective investments are made as the industry addresses its challenges."[1]

In fact, the Commission has dedicated a substantial portion of our time to understanding the gradual integration of wind and other renewables onto the power grid, and we frequently issue orders and adopt regulations that relate to this topic.[2] In contrast to the

[1] Order No. 1000, 136 FERC ¶ 61,051, at P 45-46.

[2] In addition to the 600-plus pages of Order No. 1000, FERC staff recently issued a report on the "frequency response" of the power grid. This report, which was initiated and funded by FERC's Office of Electric Reliability, helps the public understand how renewable power sources such as

gradual integration of wind and solar, and our careful work studying that topic, upcoming EPA rules are expected to quickly remove, or "dis-integrate," significant amounts of coal power from the power grid.

For this reason, I am interested in receiving evidence on the following topics at our upcoming reliability conference:

1. Can the Commission agree that upcoming EPA rules, if enacted, would present a reliability problem? What evidence supports the assertion of a reliability problem? What evidence mitigates concerns about reliability? Some view the recent study by FERC staff as "informal" or as "irrelevant" --- but to the extent that staff's study is informal or irrelevant, then what other evidence available at this time can FERC rely upon to consider reliability issues?

2. Are the current tools and authority of the North American Electric Reliability Corporation (NERC) sufficient to assess and act upon reliability issues raised by upcoming EPA rules and regulations? What other resources does NERC need to fulfill its oversight role for reliability?

3. In general, are NERC's mandatory reliability standards sufficient? Should any new standards be considered under the NERC process as a result of EPA rules?

4. Will financial issues create risks of "mothballing" power plants that would otherwise be retrofitted to comply with upcoming EPA regulations? In particular, are market prices for energy and capacity sufficient at this time to attract investors to risk their capital on projects designed to meet EPA standards? Has the economy recovered sufficiently for investors to consider an investment in power plants as a good long-term investment? To what extent would reliability be impacted if power plants are "mothballed"?

5. Will it make more sense for investors to "mothball" power plants until the full scope of the upcoming EPA regulations is known? In other words, will significant numbers of investors prefer to retire power plants now, as a means to lower the risk that investments into pollution controls will be stranded by future EPA regulations? More broadly, do investors perceive regulators at either EPA or FERC as increasing or decreasing their investment risk? To what extent would reliability be impacted if power plants are "mothballed"?

---

wind and solar can be integrated into the power grid at the same time that coal and older fuel sources are retired. As stated in a press release issued by FERC on January 20, 2011, "[t]his study is valuable in that it gives us the tools to help determine how to manage operation and expansion of the grid, regardless of which resources the electric industry uses to generate power."

6. Given the findings in the recent report that was issued by FERC staff on the "frequency response" of the power grid, are the NERC standards related to frequency response sufficient to ensure adequate voltage support given the expected retirements of coal plants across the power grid?

7. Will the loss of the system inertia that is supplied by coal plants impact the power grid in unforeseen ways? Does the topic of inertia require further study?

8. Because "blackstart" power plants are needed to re-start the power grid after a blackout, will blackstart standards and planning require further study before the retirement of blackstart units?

9. Are the NERC modeling and planning standards robust enough to ensure that the nation understands how simultaneous retirements of longstanding power plants will impact the power grid?

10. Are the models used for contingency planning capable of accommodating the different types of power plants that are expected to remain on the power grid after small coal plants are retired? That is, do the models need to be modified to handle the bigger contingencies that would be expected if the remaining power plants tend to be larger plants? Do the contingency models need to be modified because of the differing reliability characteristics of a resource base with more renewable power?

11. To the extent that the operating characteristics at power plants change as a result of EPA rules, how would changes in those characteristics impact how the operators of the system dispatch power plants? In particular, how would changes to start-up and malfunction procedures at generating plants impact operational decisions?

12. Do any policies in the Commission's recent Order No. 1000 merit further consideration with respect to how planners of the transmission grid should work together with those who are investing in generation resources? Specifically, since modifying the transmission network can impact whether a power plant should retire, and since modifying which power plants retire can impact whether to invest in certain transmission assets, are the planning approaches in Order No. 1000 sufficient to address the simultaneous retirement of large numbers of power plants?

13. What knowledge do the regional operators of the power system, including Regional Transmission Organizations (RTOs), need so that they can make decisions on whether to invest in transmission assets? Would they be helped if they had more advance notice of a decision to retire a power plant?

14. What knowledge do the owners of generation plants need so that they can make decisions on whether to retire a power plant? Would they be helped if they had more advance notice of a decision to invest in new transmission?

15. What existing legal and policy obstacles prevent generators and transmission owners from coordinating their work more closely? Given the interdependence of decisions to invest in generation with decisions to invest in transmission, does a "safety-valve" approach help or hinder the needed coordination of investment?

16. With respect to ramping the system up or down after many smaller coal-powered generators are retired, how should ramping procedures change to reflect larger sizes of operating units?

17. Should NERC consider any new standards with respect to minimum voltage? What is the expected impact of EPA rules on voltage support?

18. Given the economic weakness over the past several years, how would the demand for electricity differ under a rapidly growing economy? That is, if the economy begins to recover over the next few years, can the generation fleet serve demand if significant numbers of existing power plants are retired?

19. The EPA apparently made statements that appear to question whether "fracking" of natural gas will be permitted in the future,[3] which raises the question of whether future regulatory requirements imposed on fracking will allow access to sufficient quantities of natural gas to replace coal. Does this issue present a reliability concern?

20. Do investors and managers who are expecting to replace coal plants with new gas-powered plants believe that natural gas pipelines can be authorized and built in a manner that will allow new gas plants to enter service when needed for reliability? Has this matter been studied sufficiently?

---

[3] See a 41-page document identified as EPA-HQ-OAR-2009-0234- 3003.2, a "Response to 03/04/11 Interagency Comments" and a 7-page document identified as EPA-HQ-OAR-2009-0234-3025.1, "Response to 03/09/11 Interagency Comments". These documents contain the following two statements, apparently made by EPA:

> *"EPA could remove this from the justification for the rejecting the beyond-the-floor analysis if FERC believes there is sufficient gas for all coal- and oil-fired electric generation to be replaced by natural gas without the use of hydraulic fracturing."*
>
> *"We presented the discussion in addition to our concerns with the costs of fuel switching and about the available supply of natural gas (which FERC contests)."*

21. Are any regions of this nation expecting particularly harsh impacts from the retirement of generating plants? That is, are some parts of the nation largely served by one or two critical power plants, which if retired, would present reliability problems that impose extreme hardship on the economic vitality of a community or region?

22. Should the Commission consider any other evidence related to EPA matters?

To the extent that the public has evidence to offer for the record on these issues, please file that evidence, together with any comments, in the above-listed dockets and in accordance with usual FERC procedures. In addition, please send a courtesy copy to my office:

TABLE OF CONTENTS

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[1] hereby provides these comments in response to the Federal Energy Regulatory Commission's ("FERC" or "Commission") Notice of Proposed Rulemaking ("NOPR")[2] regarding the Version 4 Critical Infrastructure Protection ("CIP") Reliability Standards. In the NOPR, the Commission proposed to approve eight modified CIP Reliability Standards (CIP-002-4 through CIP-009-4), the accompanying Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") with modifications, the implementation plan, and the effective date developed and approved by NERC. The Commission seeks comments from interested parties on the proposed approval of the Version 4 CIP standards.

The purpose of the Version 4 CIP Reliability Standards is to provide a cybersecurity framework for the identification and protection of "Critical Cyber Assets" to support the reliable operation of the Bulk Power System.

By this filing, NERC submits its response to the NOPR.

[1] The Federal Energy Regulatory Commission ("FERC" or "Commission") certified NERC as the electric reliability organization ("ERO") in its order issued on July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corporation*, "Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing," 116 FERC ¶ 61,062 (July 20, 2006).

III. DISCUSSION

A. The Proposed Reliability Standards

In a February 10, 2011 filing,[3] NERC requested Commission approval of the proposed Version 4 CIP Reliability Standards to replace the currently effective Version 3 CIP Reliability Standards. The Version 4 CIP Reliability Standards were developed in response to directives in Order No. 706[4] and propose to modify CIP-002-4 to include "bright line" criteria for the identification of Critical Assets, replacing the current entity-developed risk-based assessment methodology. NERC also developed conforming changes to the seven remaining Version 3 CIP Reliability Standards.

[3] *See Petition of the North American Electric Reliability Corporation for Approval of Critical Infrastructure Protection (CIP) Reliability Standards Version 4*, Docket No. RM011-11-000 (February 10, 2011) ("NERC Petition").
[4] *Mandatory Reliability Standards for Critical Infrastructure Protection*, Order No. 706, 122 FERC ¶ 61,040, *order on reh'g*, Order No. 706-A, 123 FERC ¶ 61,174 (2008).

NERC recognized in its original petition for approval that the Version 4 CIP Reliability Standards serve as an "interim step"[5] to addressing the complete set of directives in Order No. 706. NERC has not yet addressed all of the directives in Order No. 706 in the Version 4 CIP Reliability Standards but anticipates responding to all of the Order No. 706 directives in the Version 5 CIP Reliability Standards. The standard drafting team continues to develop solutions to the directives in a "phased" approach.

By this filing, NERC responds to the NOPR and urges the Commission to promptly approve the Version 4 CIP Reliability Standards.

B. Responses to Specific Matters Identified by the Commission

1. Whether Additional Critical Assets Can be Identified

In the NOPR, FERC is requesting comments on whether, under CIP Version 4, a responsible entity retains the flexibility to identify assets that, although outside of the bright line criteria, are essential to bulk power system reliability.[6] Additionally, FERC is requesting comments on whether NERC and/or the Regional Entities will have the ability, either in an event-driven investigation or compliance audit, to identify specific assets that fall outside the bright-line criteria yet are still essential to Bulk-Power System reliability and should be subject prospectively to compliance with the CIP standards.[7]

FERC is also requesting that NERC provide a method for review and approval of Critical Cyber Asset lists from external sources such as the Regional Entities or NERC.[8] FERC notes that the Regional Entities must have a role in the external review to ensure that there is sufficient

[5] NERC Petition at p. 6
[6] CIP V4 NOPR at P 31.
[7] *Id.*
[8] *Id.* at P 45.

accountability in the process and because the Regional Entities and NERC are ultimately responsible for ensuring compliance with Reliability Standards.[9] FERC states that, looking forward, it will be essential for NERC and the Regional Entities to actively review the designation of cyber assets that are subject to the CIP Reliability Standards, including those which span regions, in order to determine whether additional cyber assets should be protected.[10]

The proposed Version 4 CIP Reliability Standards present a bright-line for defining Critical Assets that provides certainty and clarity regarding those assets that should be identified as critical. In developing the proposed CIP-002-4 standard, the drafting team considered adding criteria that would allow entities to identify additional facilities falling outside of the bright-line criteria that they believe are essential to bulk power system reliability. Because of potential variances in application of additional facilities subject to the CIP standards, the drafting team made a determination not to add additional criteria beyond the bright-line criteria. However, responsible entities are permitted to apply any or all of the requirements in the CIP standards to assets that do not meet the bright-line thresholds.

The development of CIP Version 4 is an interim step to addressing all of the remaining Order No. 706 directives. The drafting team has used some post-version 4 information (*e.g.*, the results of the FERC-requested survey[11] and further industry discussions) to further refine the bright-line criteria with the intent to categorize assets as being of low, medium, or high impact that are "critical" to bulk power system reliability. NERC anticipates this will be reflected in the proposed CIP Version 5 standards scheduled to be filed for Commission approval in 2012.

[9] *Id.* at P 59.
[10] *Id.* at P 61.
[11] *See*, FERC's April 12, 2011 data request to NERC regarding the CIP V4 Reliability Standards, and NERC's May 27, 2011 response to the FERC data request, filed in FERC Docket No. Rm11-11-000.

In the interim period, if there are assets that NERC and the Regional Entities later determine should be treated as critical but do not meet the CIP Version 4 criteria, NERC has the authority under Section 810 of the NERC Rules of Procedure to issue a Level 2 (Recommendation) or Level 3 (Essential Action) Alert. Section 810 of the NERC Rules of Procedure provides the following:

> **810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions**
>
> 1. Members of NERC and bulk power system owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.
> 2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the reliability assessment program.
> 3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:
>
>   3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the bulk power system of findings and lessons learned;
>
>   3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of owners, operators, and users of the bulk power system according to each entity's facts and circumstances;
>
>   3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the bulk power system to take to ensure the reliability of the bulk power system. Such Essential Actions require NERC board approval before issuance.
>
> 4. The bulk power system owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such bulk power system owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.
>
> 5. NERC will advise the Commission and other applicable governmental authorities of its intent to issue all Level 1 Advisories, Level 2 Recommendations, and Level 3

> Essential Actions at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other applicable governmental authorities no later than thirty (30) days following the date by which NERC has requested the bulk power system owners, operators, and users to which a Level 2 Recommendation or Level 3 Essential Action issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other applicable governmental authorities will describe the actions taken by the relevant owners, operators, and users of the bulk power system and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for confidential or critical infrastructure information.

Level 3 Alerts, issued pursuant to NERC Rule of Procedure Section 810, allow NERC (following NERC Board of Trustees approval) to recommend that specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the bulk power system be taken to ensure the reliability of the bulk power system. Additionally, Rule 810 states that bulk power system owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) Alerts apply shall provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions consistent with reporting dates specified by NERC. Therefore, NERC can use Level 2 Recommendations and Level 3 Essential Actions as a tool to address assets that NERC and Regional Entities later determine should be treated as critical but do not fall into the CIP Version 4 criteria.

In Order No. 706-A,[12] FERC states "that oversight of a responsible entity's identification of critical cyber assets would occur at the compliance audit stage." The Version 4 standards work within that framework by providing the bright-line criteria for the identification of Critical Assets and providing for further oversight at the compliance audit stage.

[12] Order No. 706 at P. 50.

The Version 5 standards modify this approach by characterizing "BES Cyber Systems" as "High Impact," "Medium Impact," or "Low Impact" based on the impact of the cyber system to the reliable operation of the bulk power system. This characterization makes use of a bright-line concept similar to Version 4, but requires responsible entities to determine the impact of loss, compromise or misuse of a given BES Cyber System using a bright-line impact filter.

1. Whether the VSLs for CIP-002-4, Requirements R1 and R2 Should be Modified

In the NOPR, FERC expresses concern that the proposed Version 4 VSLs for CIP-002-4, Requirements R1 and R2 do not adequately address the purpose of NERC's proposed bright-line criteria: to ensure accurate and complete identification of all Critical Assets, so that all associated Critical Cyber Assets become subject to the protections required by the CIP Standards.[13] FERC states that neither set of VSLs address the failure to properly identify either Critical Assets or Critical Cyber Assets in the first place.[14] FERC therefore proposes to direct NERC to modify the VSLs for CIP-002-4, Requirements R1 and R2, to address a failure to identify either Critical Assets or Critical Cyber Assets, as shown in Appendix 1 of the NOPR.[15]

NERC agrees with FERC that the VSLs for CIP-002-4, Requirements R1 and R2 should be modified, and proposes to add the word "complete" in the front of the list in the VSL language to ensure that the list of identified Critical Assets from each Responsible Entity is a complete list. The new language would read as follows: "The Responsible Entity did not

[13] NOPR at P 35.
[14] *Id.* at P 36.
[15] *Id.* at P 37.

develop a complete list of its identified Critical Assets even if such list is null." This would keep the requirements binary, consistent with FERC's guidance on this issue.[16]

In order to modify the VSLs for CIP-002-4, Requirements R1 and R2, NERC will have to conduct a non-binding poll, present the proposed changes to the NERC Board of Trustees for approval, and then file the proposed changes with FERC for approval, which could take NERC several months to complete.

2. Proposed CIP Version 4 Implementation Plan

In the NOPR, FERC proposes to approve the proposed Implementation Plan for CIP V4 as filed.[17]

NERC agrees with FERC's proposal to approve the proposed Implementation Plan for the Version 4 CIP Reliability Standards as filed.

3. Deadline to Respond to Order No. 706 Directives

FERC is proposing in the NOPR to direct NERC to submit modified CIP Reliability Standards that address the outstanding directives from Order No. 706, using NERC's development timeline included in the petition.[18] This timeline specifies that NERC submit a modified set of CIP Reliability Standards to the NERC Board for approval by the end of second quarter 2012, and file with FERC by the end of third quarter 2012.[19]

NERC appreciates FERC's acknowledgement that Version 4 is an interim step in addressing outstanding directives from Order No. 706, and is working to develop the CIP Version 5 Reliability Standards by the timeline NERC proposed in the petition. As long as a

[16] *See, Mandatory Reliability Standards for Critical Infrastructure Protection, Order Addressing Violation Severity Level Assignments for Critical Infrastructure Protection Reliability Standards,* 130 FERC ¶61,211, at P 14 (March 18, 2011).
[17] NOPR at PP 38-39.
[18] *Id.* at P 41.
[19] *Id.* at PP 41, 66-67.

FERC Order on the CIP Version 4 standards does not add to or expand directives from Order No. 706 or include directives that add to that timeline, the proposed deadline to file the Version 5 standards by third quarter 2012 is acceptable to NERC, subject to the discussion that follows. A FERC Order must be conditioned upon NERC's use of the FERC-approved standards development process as implemented, which requires industry approval and NERC Board of Trustees approval, before filing with FERC.

FERC is correct that, under the timeline to address all outstanding Order No. 706 directives, NERC anticipates a filing of Version 5 with FERC by the end of the third quarter of 2012. These projected timelines for standards development projects are routinely prepared to assist in resource planning within its standards development process, and by general practice, they do not include more than one successive ballot period

A 60-day initial posting period for formal comment and initial ballot of the Version 5 CIP Reliability Standards began November 7, 2011, and ends on January 6, 2012. In recognition of the volume of standards requirements and the scope of changes in Version 5 from Version 4, that posting period is longer than the more common 45-day initial posting period for formal comment. A second formal posting for comment and successive ballot period is scheduled to begin on March 26, 2012. However, the timing of that formal posting and successive ballot period depends on the number of industry comments received in response to the November 7 posting and the number of changes that may need to be made to the language in the standards as a result of those comments. In the event there is strong stakeholder opposition to the proposed standards, resulting in a failed ballot of any or all of the Version 5 CIP standards, NERC may not be able to file the Version 5 CIP standards by the third quarter 2012. Even though the drafting team has removed standard-to-standard dependencies in Version 5, the Version 5 standards must

be filed together because they collectively represent a significant change from previous versions. While NERC will make every effort to address stakeholder concerns before the successive ballot, the nature of the standards development process, and ultimately a favorable outcome on the proposed standards, is in the hands of the registered ballot body, which will in turn, affect the final delivery of the proposed CIP Version 5 standards to FERC for approval.

Thus, if a deadline must be established, NERC urges FERC to consider that a filing resulting from the FERC-approved standards development process by the end of the third quarter 2012 is only possible if the implementation of the standards development process requires only one successive ballot.

NERC notes that its anticipated timeline to file the Version 5 CIP Standards, in conjunction with the Implementation Plan proposed in the initial draft of Version 5, may present the opportunity to suggest an extension of Version 3 until Version 5 can be implemented, thereby eliminating the need for implementing Version 4, to be followed only a short time later by implementation of Version 5. That suggestion is not being made now, and it could be considered only if the industry moves promptly on Version 5. If Version 5 is not approved by the industry, filed by NERC, and approved by the Commission within that anticipated schedule, or reasonably thereafter, it is unlikely that Version 3 could be extended in a manner that eliminates the need for implementation of Version 4.

4. Identification of Critical Cyber Assets Based Upon a Cyber Asset's Connectivity and Potential to Compromise the Reliable Operation of the Bulk Power System

In the NOPR, FERC states that, in light of recent cybersecurity vulnerabilities and threats and attacks that have exploited the interconnectivity of cyber system, FERC is seeking comments regarding the method of identification of Critical Cyber Assets to ensure sufficiency and

accuracy.[20] FERC states that it believes that any criteria adopted for the purposes of identifying a Critical Cyber Asset under CIP-002 should be based upon a Cyber Asset's connectivity and its potential to compromise the reliable operation of the bulk power system, rather than focusing on the operation of any specific Critical Assets.[21] FERC is requesting comments on this approach.[22]

The Version 5CIP Reliability Standards drafting team is aware of recent cybersecurity vulnerabilities that may have the potential to exploit the interconnectivity of cyber systems. While the Version 5 CIP Reliability Standards drafting team recognizes the importance of the connectivity issue and is looking at this in the development of the Version 5 standards, this issue was not raised in FERC's Order No. 706. The drafting team is assessing FERC's suggested approach. However, it is unlikely that this work can be completed before the Version 5 CIP Reliability Standards are presented to the NERC Board of Trustees for approval.

Importantly, the proposed Version 5 CIP Reliability Standards remove the blanket exemption for non-routably connected cyber systems, and instead move the connectivity attribute to specific requirements. Additionally, the draft standard proposes to apply electronic perimeter protections of some form to all BES Cyber Systems.

5. NIST Risk Management Framework

FERC is requesting comments on whether NERC should consider applicable features of the National Institute of Standards and Technology (NIST) Risk Management Framework to ensure protection of all cyber systems connected to the bulk power system, including

[20] *Id.* at P 43.
[21] *Id.*
[22] *Id.*

establishing CIP requirements based on entity functional characteristics rather than focusing on Critical Asset size.[23]

In Paragraph 25 of Order No. 706, the Commission stated:

> 25. The Commission believes that the NIST standards may provide valuable guidance when NERC develops future iterations of the CIP Reliability Standards. Thus, as discussed below, we direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework. However, in response to Applied Control Solutions, we will not delay the effectiveness of the CIP Reliability Standards by directing the replacement of the current CIP Reliability Standards with others based on the NIST framework.

Consistent with this direction, NERC is considering applicable features of the NIST Risk Management Framework in the development of the Version 5 CIP Reliability Standards. One of the fundamental differences between CIP Version 4 and CIP Version 5 is the shift from identifying Critical Cyber Assets to identifying BES Cyber Systems. This change resulted from the standard drafting team's review of the NIST Risk Management Framework and the use of an analogous term of "information system" as the target for categorizing and applying security controls.

However, although the standard drafting team is considering changes in the Version 5 CIP Reliability Standards that are reflective of the NIST Risk Management Framework, it is important to highlight differences between NERC's and NIST's approaches. At the root of these differences are divergent responsibilities and goals between NERC and NIST. NIST develops standards and guidance for U.S. Federal Agencies to manage risks to their information and systems in support of their unique missions. NERC, on the other hand, has the role of setting standards for managing risks to systems in support of a shared community mission to ensure the reliability of the BES. This difference is important because it enables the industry to develop better detail about the impacts that they need to prevent or protect against in order to achieve the

[23] *Id.* at PP 45-52.

reliability of the BES. In contrast, NIST is developing standards for almost two hundred different organizations, each with vastly different missions. The advantage of the NERC standards is a focus on a relatively small number of reliability services that need to be protected. This ultimately means that the NERC standards can be more tailored to the industry than a wholesale adoption of the NIST Risk Management Framework.

Four key features of the NIST Risk Management Framework were incorporated into the proposed CIP Version 5 Standards: (1) ensuring that all BES Cyber Systems associated with the Bulk-Power System, based on their function and impact, receive some level of protection; (2) customizing protection to the mission of the cyber systems subject to protection; (3) a tiered approach to security controls which specifies the level of protection appropriate for systems based upon their importance to the reliable operation of the Bulk-Power System; and (4) the concept of the BES Cyber System itself. Features 2 and 3 above are tightly coupled.

The criteria defined in Attachment 1 of the proposed CIP-002-5 standard are used to categorize BES Cyber Systems and their BES Cyber Assets into impact categories, resulting in all BES Cyber Systems and BES Cyber Assets being included in scope. Requirement R1 only requires the discrete identification of BES Cyber Systems and BES Cyber Assets for those in the "High" and "Medium" categories. All other BES Cyber Systems are deemed to be "Low" impact. This general process of categorization of BES Cyber Systems and BES Cyber Assets based on impact to the reliability of the BES is consistent with risk management approaches for the purpose of application of cyber security controls in the rest of the Version 5 CIP standards.

In the NIST Risk Management Framework, there is a concept of tailoring and scoping which allows the organization to determine which controls are applicable to its specific environment and make modifications to those controls. However, in the NERC compliance

framework, all requirements are mandatory and enforceable. As such, the customization of protections by mission is based upon the environment that the BES Cyber System supports (control center, transmission facility, generation facility) and utilizes the tiered model and the requirement applicability to provide this customization to the individual environments that together support a combined mission of bulk power system reliability.

While it may appear that the standard drafting team's approach to categorization is based on an asset's "size," in reality, the characterization is based on the "impact" of a misuse or compromise, or of the scope of control, of the BES Cyber System. Additionally, because electronic perimeter protections are now required surrounding all BES Cyber Systems (with specific requirements for High Impact, Medium Impact, and programmatic requirements for Low Impact), the connectivity issue FERC discussed in the NOPR should be largely addressed.

6. Potentially Unprotected Control Centers

In the NOPR, FERC expresses concern that the proposed CIP-002-4 bright line criteria do not adequately address FERC's Order No. 706 directive regarding the classification of control centers or take the potential misuse of control systems into account in the identification of Critical Assets.[24] FERC states as an example that the proposed bright line criteria leave a number of Critical Assets with potentially unprotected cyber assets, including a total of 222 control centers, with no legal obligation to apply cybersecurity measures.[25] FERC states that these potentially unprotected control centers involve an unknown number of associated control systems, and that therefore "[i]t is critical…that the Commission's concerns regarding the

[24] *Id.* at 56.
[25] *Id.*

potential misuse of control centers and associated control systems be addressed in the CIP Reliability Standards." [26]

Under the Version 5 CIP Reliability Standards, every control center will be covered by either the "Medium" or "High" criteria, which requires a greater level of protection. Because of their impact and size, no control center will qualify under the "Low" criteria. Version 5 also includes a responsibility entity's consideration of cyber misuse as part of its BES Cyber System classification. Furthermore, several of the Version 5 standards' requirements are specifically made applicable to not only "High" impact BES Cyber Systems, but also to "Medium" impact BES Cyber Systems at Control Centers. Through the use of both classification and applicability, certain requirements apply to all Control Centers, regardless of classification.

Additionally, there is not a universally accepted definition of "control center" (although the Version 5 CIP Reliability Standards drafting team has proposed one). However, by the current working definition, particularly for generation, some "control centers" have a span of control that is below the NERC Registration criteria for generators (*i.e.*, 20 MVA unit, 75 MVA plant) that only communicate with the other generators within its control. Therefore, it is difficult to imagine scenarios where cyber assets at these locations have a greater impact to reliability, simply because they meet the definition of "control center," than much larger, single-unit generators that do not meet the bright-line criteria for medium impact.

IV. CONCLUSION

For the reasons stated above, NERC respectfully requests that the Commission take prompt action in approving the proposed Version 4 CIP Reliability Standards consistent with these comments when it issues its Final Rule in this proceeding.

TABLE OF CONTENTS

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC") hereby provides these comments in response to the Federal Energy Regulatory Commission's ("FERC" or "Commission") Notice of Proposed Rulemaking ("NOPR")[1] regarding a proposed Reliability Standard PRC-023-2 — Transmission Relay Loadability.[2] In the NOPR, the Commission proposed to approve Reliability Standard PRC-023-2 and the NERC Rules of Procedure Section 1700 – Challenges to Determinations. The Commission sought comments from interested parties on the proposed standard.

The purpose of PRC-023-2 is to ensure that protective relay settings shall: not limit transmission loadability; not interfere with system operators' ability to take remedial action to protect system reliability; and be set to reliably detect all fault conditions and protect the electrical network from these faults. The NERC Rules of Procedure Section 1700 – Challenges to Determinations was formed in response to the Commission directive to develop a mechanism for entities to challenge critical determinations and provides an appeals process for determinations made by Planning Coordinators under the PRC-023-2 Reliability Standard. The Commission proposes to approve both the PRC-023-2 Reliability Standard and NERC Rules of Procedure Section 1700. NERC supports the Commission's proposals in the September 15, 2011 NOPR.

By this filing, NERC submits its response to the NOPR.

III. DISCUSSION

NERC has committed to applying the test set forth in Attachment B to PRC-023-2 to a representative sample of utilities from each of the three Interconnections and will file the results of these tests in a report on or before February, 2013 ("NERC Report").[3] FERC seeks comments regarding three issues for the ERO to address in the NERC Report related to the test to determine critical sub-200 kV facilities in Attachment B to PRC-023-2.

Responses to Specific Matters Identified by the Commission

[3] The Commission directed NERC:

> to specify the test that planning coordinators must use to determine whether a sub-200kV facility is critical to the reliability of the Bulk-Power System [and to] file its test, and the results of applying the test to a representative sample of utilities from each of the three Interconnections for Commission approval.

Transmission Relay Loadability Reliability Standard. 130 FERC ¶ 61,221, (2010) ("Order No. 733") at P 69. This directive was later modified in *Transmission Relay Loadability Standard*, 134 FERC ¶ 61,127, (2011) ("Order No.733-A") at P 78, which extended the deadline for filing the test and results to twenty-four months from the date of Order No. 733-A.

Issue 1

In the NOPR, the Commission identifies concern with "the rigor of the simulations" in criterion B4, noting that Planning Coordinators are required to apply their engineering judgment.[4] Therefore, the Commission proposes that the NERC Report address:

> whether the power system assessment proposed in criterion B4 includes the critical system conditions utilized under Reliability Standard TPL-003-0 Requirement R1.3.2 and whether applicable entities evaluate relay loadability under the B4 criterion consistent with Requirement R1 which requires, in part, that they 'evaluate relay loadability at 0.85 per unit voltage and a power factor angle of 30 degrees' in addition to applicable current criteria. If the evaluation uses other per unit voltage and power factor angle assumptions, [the Commission] propose[d] that the Report include a comparison of results obtained from those that would be achieved were the assumptions consistent with Requirement R1.[5]

NERC Response:

The intent of the power flow analysis, defined in Attachment B to PRC-023-2, is to have Planning Coordinators utilize the base cases that are used for demonstrating compliance with the TPL standards. NERC proposes to include in the NERC Report a summary of the base cases used in applying the criteria to a representative sample of utilities and an assessment of how the base cases used related to the TPL-003-0, Requirement R1.3.2.

While the measures in Criterion B4 of Attachment B do not explicitly reference voltage or power factor, the measures were derived from the conditions in PRC-023-2, Requirement R1 – specifically, 0.85 per unit voltage and 30 degree power factor angle. This allows the Planning Coordinators to make a comparison of the loading in the power flow simulation against a threshold based on the Facility Rating assigned for that circuit, without regard to the simulated voltage and power factor angle. This achieves two purposes: (i) it simplifies the test - because entities can efficiently perform the assessment using standard screening tools provided in the

[4] NOPR at P 43.
[5] *Id.*

power flow software, and (ii) it provides for a conservative test - because the measures are based on 0.85 per unit voltage and 30 degree power factor angle. A more detailed assessment that accounts for simulated voltage and power factor angle would demonstrate a greater margin against undesired tripping because the simulated apparent impedance will be a higher value when simulated voltage is greater than 0.85 per unit, and the trip threshold for a phase distance relay will be a lower value when power factor angle is less than 30 degrees. It is therefore unnecessary for NERC to include in the NERC Report a comparison of results obtained to those that would be achieved based on assumptions consistent with Requirement R1.

Issue 2

The NOPR proposes that the NERC Report should comment on what other types of technical studies or assessments the Planning Coordinators may use to identify critical facilities in Criterion B5. Specifically, the Commission states:

> Criterion B5 of Attachment B requires compliance with the proposed Reliability Standard with respect to a "circuit … selected by the Planning Coordinator based on technical studies or assessments, other than those specified in criteria B1 through B4, in consultation with the Facility owner." The Commission proposes that the Report comment on what "technical studies or assessments" planning coordinators use to identify critical facilities.[6]

NERC Response:

NERC included Criterion B5 in Attachment B to address situations where Criteria B1 through B4 do not identify a circuit for compliance with PRC-023-2, but the Planning Coordinator can demonstrate, based on other technical studies or assessments, that PRC-023-2 should apply to the circuit. Attachment B does not specify a finite list to avoid unnecessarily limiting the technical studies or assessments the Planning Coordinators may use to identify

[6] *Id.* at P 44.

circuits. However, NERC proposes to discuss in the NERC Report the types of studies that Planning Coordinators may use.

Issue 3

In the NOPR, the Commission proposes:

> Notwithstanding the various phrases used to describe the reliability objective, the NERC Petition indicates that the test is intended to identify all circuits in a planning coordinator's area that could have an operational impact on the reliability of the bulk electric system. The Commission proposes that the Report assess whether Attachment B is sufficiently comprehensive to capture all such circuits.[7]

NERC Response:

NERC proposes to include in the NERC Report an assessment that demonstrates whether Attachment B is sufficiently comprehensive to capture all circuits in a Planning Coordinator's area that could have an operational impact on the reliability of the Bulk Electric System in the context of transmission relay loadability.

[7] *Id.* at P 45.

IV. CONCLUSION

For the reasons stated above, NERC respectfully requests that the Commission take action consistent with these comments when it issues its Final Rule regarding the proposed Reliability Standard PRC-023-2.

Attachment A

BAL-003-1 Frequency Response & Frequency Bias Setting Standard

Supporting Document

Background

This document outlines the ERO process for supporting the Frequency Response Standard (FRS).

Event Selection Criteria

The ERO will use the following criteria to select FRS frequency excursion events for analysis.

1. The evaluation period for performing the annual Frequency Bias Setting and the Frequency Response Measure (FRM) calculation is December 1 of the prior year through November 30 of the current year.
2. The ERO will identify at least 25 frequency excursion events in each Interconnection for calculating the Frequency Bias Setting and the FRM. If the ERO cannot identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying listed criteria will be included with the data set by the ERO for determining FRS compliance.
3. The ERO will use two limits to determine if an acceptable frequency excursion event for determining FRM has occurred:
    a. The change in frequency (delta F) and the arresting frequency (Point C) must exceed the excursion threshold values specified for the Interconnection in Table 1 below. Point C is the arrested value of frequency observed within 8 seconds following the start of the excursion.

		Point C	
Interconnection	**Delta F**	**Under Frequency**	**Over Frequency**
East	0.04Hz	< 59.97	> 60.03
West	0.05Hz	< 59.97	> 60.03
Texas	0.15Hz	< 59.90	> 60.10
HQ	0.20Hz	< 59.85	> 60.15

Table 1: Interconnection Frequency Excursion Threshold Values

    b. The time from the start of the rapid change in frequency until the point at which Frequency has stabilized within a narrow range should be less than 18 seconds.

4. Pre-disturbance frequency should be relatively steady and near 60.000 Hz. The A Value is computed as an average over the period from -16 seconds to 0 seconds before the frequency transient begins to decline.
5. Events that coincide with a second event that does not stabilize before the first scan used in the B-Value will not be considered.
6. Frequency excursion events occurring during periods when large interchange schedule ramping or load change is happening, and frequency excursion events occurring within 5 minutes of the top of the hour, should be excluded from consideration if other acceptable frequency excursion events can be used for analysis.
7. Select the cleanest 2 or 3 frequency excursion events occurring monthly that satisfy selection criteria. If there are not 2 frequency excursion events satisfying selection criteria occurring during the month, then other frequency excursion events from the same season of the year satisfying selection criteria should be considered for use if necessary.

To assist Balancing Authority preparation for complying with this standard, the ERO will provide quarterly posting of candidate frequency excursion events for the current year FRM calculation. The ERO will post the final list of frequency excursion events used for standard compliance by December 15 each year. Balancing Authorities are encouraged to develop scanning tools that identify candidate frequency excursion events so they are ready to access data files when needed.

NOTE: *The ERO may use for analysis of Interconnection frequency performance, but not for Balancing Authority Frequency Response, additional frequency excursion events not satisfying the criteria specified.*

Frequency Response Obligation (FRO) for the Interconnection

Each Interconnection will establish target contingency protection criteria. The default target listed in Table 2 is based on the largest category C (N-2) event identified. However, this contingency protection criterion includes a safety margin to prevent Point C from encroaching on the interconnection's highest Under Frequency Load Shed (UFLS) step for credible contingencies.

	Eastern	Western	Texas	HQ	
Starting Frequency	60	60	60	60	Hz
*Highest UFLS	59.6	59.5	59.3	58.5	Hz
Contingency Protection Criteria	4500	2740	2750	1700	MW
**Base Obligation	1125	548	229	113	MW/0.1Hz
With 25% Safety Margin	1406	685	286	141	MW/0.1Hz

Table 2: Interconnection Frequency Response Obligations

*The Eastern Interconnection set point listed is a compromise value for the highest UFLS step setting of 59.5Hz used in the east and the special protection scheme's highest UFLS step setting of 59.7Hz used in Florida. It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".

**In the Base Obligation measure for Texas, 1150 MW (Load Resources triggered by Under Frequency Relays at 59.70 Hz) was reduced from its Contingency Protection Criteria level of 2750 MW to get 229 MW/0.1 Hz. This was reduced to accurately account for designed response from Load Resources within 30 cycles.

An Interconnection may propose alternate FRO protection criteria to the ERO. The ERO will confirm the proposed alternate FRO protection criteria.

Balancing Authority Frequency Response Obligation (FRO) and Frequency Bias Setting

The ERO will manage the administrative procedure for annually assigning an FRO and Frequency Bias Setting to each Balancing Authority.

For a multiple Balancing Authority interconnection, the Interconnection Frequency Response Obligation is allocated based on either the Balancing Authority Peak Demand or peak generation. Initial FRO allocation will be based on the following method:

$$\left[\frac{\text{Projected BA Peak Load + BA installed capacity}}{\text{Projected Interconnection Peak Load + Interconnection installed capacity}}\right] \times \text{Interconnection FRO}$$

Each Balancing Authority shall report its previous year's Frequency Response Measure (FRM), Frequency Bias Setting and Frequency Bias type (fixed or variable) to the ERO on FRS Form 1 by January 10 each year. If the ERO posts the official list of events after December 10, Balancing Authorities will be given 30 days from the date the ERO posts the official list of events to submit their FRS Form 1.

Once the ERO validates the data for all Balancing Authorities, the ERO will use FRS Form 1 data to post the following information for each Balancing Authority for the upcoming year:

- Frequency Bias Setting
- Frequency Response Obligation (FRO)

Frequency Bias Setting will be the greater of (in absolute terms) the FRM or the Interconnection minimum (as defined in Attachment B). FRS Form 1 will automatically calculate the Balancing Authority's Bias Settings. Balancing Authorities that provide Overlap Regulation will submit a FRS Form 1 that represents both the provider's and the recipient(s)' footprint. Once the data listed above is fully posted, the ERO will announce the implementation date for changing the Frequency Bias Setting.

Frequency Response Measure (FRM)

The FRM will be computed from Single Event Frequency Response Data (SEFRD), defined as: "the data from an individual event from a Balancing Authority that is used to calculate its Frequency Response, expressed in MW/0.1Hz" as calculated on FRS Form 2. The SEFRD for a typical Balancing Authority in an Interconnection with more than one Balancing Authority is basically the change in its Net Actual Interchange on its tie lines with its adjacent Balancing Authorities divided by the change in Interconnection frequency. (Some Balancing Authorities may choose to apply corrections to their Net Actual Interchange values to account for factors such as nonconforming loads. FRS Form 1 shows the types of adjustments that are allowed.) The ERO will use a standardized sampling interval of 20 to 52 seconds in the computation of SEFRD values.

Assuming data entry is correct FRS Form 1 will automatically calculate the Balancing Authority's FRM for the past 12 months as the median of the SEFRD values. A Balancing Authority electing to report as an RSG or a provider of Overlap Regulation Service will provide an FRS Form 1 for the aggregate of its participants.

BAL-003-1 Frequency Response & Frequency Bias Setting Standard
Attachment B

Process for Adjusting Minimum Frequency Bias Setting

Interconnection frequency performance is improved the closer all Balancing Authorities' (BAs') natural Frequency Response is to Frequency Bias Setting (Cohn, 1966).

The BA calculates its natural Frequency Response based on the events in FRS Form 1. The BA will set its Frequency Bias Setting to the greater of (in absolute value):

- Natural Frequency Response
- Interconnection Minimum (initially 1% of peak in BAL-003-0.1b).

For purposes of calculating the minimum Frequency Bias Setting, a Reserve Sharing Group or a Balancing Authority providing Overlap Regulation will report the projected peak demand and generation of its combined BAs' areas on FRS Form 1.

This attachment outlines the process the ERO is to use for modifying minimum Frequency Bias Settings to better meet reliability needs. The ERO may adjust the Frequency Bias Setting minimum in accordance with this Attachment B.

The ERO will post the minimum Frequency Bias Setting values on the ERO website along with other balancing standard limits.

The initial minimum Frequency Bias Settings are outlined in the following table.

Interconnection	Minimum Frequency Bias Setting (in MW/0.1Hz)
Eastern	0.8% of peak load or generation
Western	0.8% of peak load or generation
Texas	0.8% of peak load or generation
HQ	0.8% of peak load or generation

Table 1. Initial Frequency Bias Setting Minimums

The ERO will annually review Frequency Bias Setting data submitted by BAs. If an Interconnection's total minimum Frequency Bias Setting exceeds (in absolute value) the Interconnection's total natural Frequency Response by more (in absolute value) than 0.2 percentage points (of peak load expressed in MW/0.1Hz), the ERO may reduce (in absolute value) the minimum Frequency Bias Setting for BAs within that Interconnection, by 0.1 percentage point to better match that Frequency Bias Setting and natural Frequency Response.

A. Introduction

1. **Title:** **Frequency Response and Bias**

2. **Number:** BAL-003-0.1b

3. **Purpose:** This standard provides a consistent method for calculating the Frequency Bias component of ACE.

4. **Applicability:**

   4.1. Balancing Authorities.

5. **Effective Date:** Immediately after approval of applicable regulatory authorities.

B. Requirements

R1. Each Balancing Authority shall review its Frequency Bias Settings by January 1 of each year and recalculate its setting to reflect any change in the Frequency Response of the Balancing Authority Area.

R1.1. The Balancing Authority may change its Frequency Bias Setting, and the method used to determine the setting, whenever any of the factors used to determine the current bias value change.

R1.2. Each Balancing Authority shall report its Frequency Bias Setting, and method for determining that setting, to the NERC Operating Committee.

R2. Each Balancing Authority shall establish and maintain a Frequency Bias Setting that is as close as practical to, or greater than, the Balancing Authority's Frequency Response. Frequency Bias may be calculated several ways:

R2.1. The Balancing Authority may use a fixed Frequency Bias value which is based on a fixed, straight-line function of Tie Line deviation versus Frequency Deviation. The Balancing Authority shall determine the fixed value by observing and averaging the Frequency Response for several Disturbances during on-peak hours.

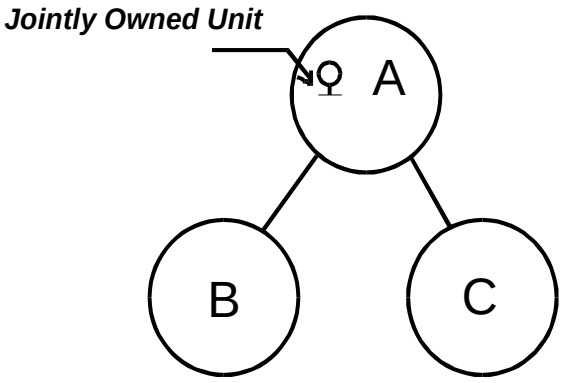
R2.2. The Balancing Authority may use a variable (linear or non-linear) bias value, which is based on a variable function of Tie Line deviation to Frequency Deviation. The Balancing Authority shall determine the variable frequency bias value by analyzing Frequency Response as it varies with factors such as load, generation, governor characteristics, and frequency.

R3. Each Balancing Authority shall operate its Automatic Generation Control (AGC) on Tie Line Frequency Bias, unless such operation is adverse to system or Interconnection reliability.

R4. Balancing Authorities that use Dynamic Scheduling or Pseudo-ties for jointly owned units shall reflect their respective share of the unit governor droop response in their respective Frequency Bias Setting.

R4.1. Fixed schedules for Jointly Owned Units mandate that Balancing Authority (A) that contains the Jointly Owned Unit must incorporate the respective share of the unit governor droop response for any Balancing Authorities that have fixed schedules (B and C). See the diagram below.

R4.2. The Balancing Authorities that have a fixed schedule (B and C) but do not contain the Jointly Owned Unit shall not include their share of the governor droop response in their Frequency Bias Setting.



R5. Balancing Authorities that serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of the Balancing Authority's estimated yearly peak demand per 0.1 Hz change.

R5.1. Balancing Authorities that do not serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of its estimated maximum generation level in the coming year per 0.1 Hz change.

R6. A Balancing Authority that is performing Overlap Regulation Service shall increase its Frequency Bias Setting to match the frequency response of the entire area being controlled. A Balancing Authority shall not change its Frequency Bias Setting when performing Supplemental Regulation Service.

C. Measures

M1. Each Balancing Authority shall perform Frequency Response surveys when called for by the Operating Committee to determine the Balancing Authority's response to Interconnection Frequency Deviations.

D. Compliance

Not Specified.

E. Regional Differences

None identified.

F. Associated Documents

1. Appendix 1 — Interpretation of Requirement R3 (October 23, 2007).

2. Appendix 2 — Interpretation of Requirements R2, R2.2, R5, and R5.1 (February 12, 2008).

Appendix 1

Interpretation of Requirement 3

Request: *Does the WECC Automatic Time Error Control Procedure (WATEC) violate Requirement 3 of BAL-003-0?*

Interpretation:

Requirement 3 of BAL-003-0 — Frequency Response and Bias deals with Balancing Authorities using Tie-Line Frequency Bias as the normal mode of automatic generation control.

> **BAL-003-0**
> **R3.** Each Balancing Authority shall operate its Automatic Generation Control (AGC) on Tie Line Frequency Bias, unless such operation is adverse to system or Interconnection reliability.

- Tie-Line Frequency Bias is one of the three foundational control modes available in a Balancing Authority's energy management system. (The other two are flat-tie and flat-frequency.) Many Balancing Authorities layer other control objectives on top of their basic control mode, such as automatic inadvertent payback, CPS optimization, time control (in single BA Interconnections).
- As long as Tie-Line Frequency Bias is the underlying control mode and CPS1 is measured and reported on the associated ACE equation, there is no violation of BAL-003-0 Requirement 3:

$$ACE = (NI_A - NI_S) - 10B\,(F_A - F_S) - I_{ME}$$

Appendix 2

Interpretation of Requirements R2, R2.2, R5, R5.1

Request: *ERCOT specifically requests clarification that a Balancing Authority is entitled to use a variable bias value as authorized by Requirement R2.2, even though Requirement 5 seems not to account for the possibility of variable bias settings.*

Interpretation:

The consensus of the Resources Subcommittee is that BAL-003-0 — Frequency Response and Bias — Requirement R2 does not conflict with BAL-003-0 Requirement R5.

BAL-003-0 — Frequency Response and Bias Requirement 2 requires a Balancing Authority to analyze its response to frequency excursions as a first step in determining its frequency bias setting. The Balancing Authority may then choose a fixed bias (constant through the year) per Requirement 2.1, or a variable bias (varies with load, specific generators, etc.) per Requirement 2.2.

BAL-003-0

R2. Each Balancing Authority shall establish and maintain a Frequency Bias Setting that is as close as practical to, or greater than, the Balancing Authority's Frequency Response. Frequency Bias may be calculated several ways:

- **R2.1.** The Balancing Authority may use a fixed Frequency Bias value which is based on a fixed, straight-line function of Tie Line deviation versus Frequency Deviation. The Balancing Authority shall determine the fixed value by observing and averaging the Frequency Response for several Disturbances during on-peak hours.
- **R2.2.** The Balancing Authority may use a variable (linear or non-linear) bias value, which is based on a variable function of Tie Line deviation to Frequency Deviation. The Balancing Authority shall determine the variable frequency bias value by analyzing Frequency Response as it varies with factors such as load, generation, governor characteristics, and frequency.

BAL-003-0 — Frequency Response and Bias Requirement 5 sets a minimum contribution for all Balancing Authorities toward stabilizing interconnection frequency. The 1% bias setting establishes a minimum level of automatic generation control action to help stabilize frequency following a disturbance. By setting a floor on bias, Requirement 5 also helps ensure a consistent measure of control performance among all Balancing Authorities within a multi-Balancing Authority interconnection. However, ERCOT is a single Balancing Authority interconnection. The bias settings ERCOT uses do produce, on average, the best level of automatic generation control action to meet control performance metrics. The bias value in a single Balancing Authority interconnection does not impact the measure of control performance.

BAL-003-0

R5. Balancing Authorities that serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of the Balancing Authority's estimated yearly peak demand per 0.1 Hz change.

- **R5.1.** Balancing Authorities that do not serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of its estimated maximum generation level in the coming year per 0.1 Hz change.

Introduction

This document provides background on the development, testing and implementation of BAL-003-1 - Frequency Response Standard (FRS). The intent is to explain the rationale and considerations for the Requirements and their associated compliance information. The document also provides good practices and tips for Balancing Authorities with regard to Frequency Response.

In Order No. 693, the FERC directed additional changes to BAL-003-0.1b. This document explains how those directives are met by BAL-003-1.

The original Standards Authorization Request (SAR), finalized on June 30, 2007~~, assumed~~, assumed the Frequency Response currently available to be adequate in all the North American Interconnections. The goal of the SAR was to update the Standard to make the measurement process more objective and to provide this objective data to Planners and Operators for improved modeling. The improved models will improve understanding of the trends in Frequency Response to determine if reliability limits were being approached. The Standard would also lay the process groundwork for a transition to a performance-based Standard if reliability limits were approached.

This document will be periodically updated by the FRS Drafting Team until the Standard is approved (expected to occur during ~~Spring~~spring of 2012). Once approved, this document will then be maintained and updated by the ERO and the NERC Resources Subcommittee.

Background and Rationale by Requirement

Requirement 1

R1. Each Balancing Authority (BA) or Reserve Sharing Group (RSG) shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency Response in the Interconnection.

Background and Rationale

R1 is intended to meet the following primary objectives:

- Determine whether a Balancing Authority (BA) has sufficient Frequency Response for reliable operations.
- Provide the feeder information needed to calculate CPS limits and Frequency Bias Settings.

With regard to the first objective, FRS Form 1 and the process in Attachment A provide the method for determining the Interconnections' necessary amount of Frequency Response and allocating it to the Balancing Authorities. The field trial for BAL-003-1 is testing an allocation methodology based on the amount of load and generation in the BA. This is to accommodate the wide spectrum of BAs from generation-only all the way to load-only.

The basic Frequency Response Obligation is based on non-coincident peak load and generation data reported in FERC Form 714 for the previous full calendar year. The basic allocation formula used by NERC is:

$$FRO_{BA} = FRO_{Int} \times \frac{Peak\ Gen_{BA} + Peak\ Load_{BA}}{Peak\ Gen_{Int} + Peak\ Load_{Int}}$$

Where:

- Peak GenBA is the average of monthly "Output of Generating Plants", FERC Form 714, column f of Part II - Schedule 3.
- Peak LoadBA is the average of "Monthly Peak Demand (MW)", FERC Form 714, column j of Part II - Schedule 3.
- Peak GenInt is the sum of all BAs' in that interconnection reported average monthly peak generation.
- Peak LoadInt is the sum of all BAs in that interconnection reported average monthly peak demand.

Balancing Authorities can approximate their FRO by multiplying their Interconnection's FRO by their share of Interconnection bias.

Balancing Authorities that merge or that transfer load or generation need to notify the ERO of the change in footprint and corresponding changes in allocation such that the net obligation for the Interconnection remains the same.

Note: The methodology for determining the Interconnection's Frequency Response Obligation and allocating it to BAs may change on the basis of field trial results. The drafting team is evaluating a risk-based approach for basing the Interconnection Frequency Response Obligation on an historic probability density of frequency error, and for allocating the obligation on the basis of the Balancing Authority's average annual ACE share of frequency error.

Attachment A proposes the following Interconnection event criteria as a basis to determine an Interconnection's Frequency Response Obligation:

- Largest category C loss-of-resource (N-2) event
- Largest total generating plant with common voltage switchyard
- Largest loss of generation in the interconnection in the last 10 years

Given the fact that the Interconnections currently have sufficient Frequency Response, few BAs should encounter problems meeting R1, particularly with the options the Standard provides with regard to obtaining Frequency Response.

With regard to the second objective above (determining Frequency Bias Settings and CPS limits), Balancing Authorities have been asked to perform annual reviews of their Frequency Bias Settings by measuring their Frequency Response, dating back to Policy 1. This obligation

was carried forward into BAL-003-01.b. While the associated training document provided useful information, it left many of the details to the judgment of the person doing the analysis. The FRS Form 1 and FRS Form 2 provide a consistent, objective process for calculating Frequency Response to develop an annual measure, the FRM.

The FRM will be computed from Single Event Frequency Response Data (SEFRD), defined as: "the data from an individual event from a Balancing Authority that is used to calculate its Frequency Response, expressed in MW/0.1Hz". The SEFRD for a typical Balancing Authority in an Interconnection with more than one Balancing Authority is basically the change its Net Actual Interchange on its tie lines with its adjacent Balancing Authorities divided by the change in Interconnection frequency. (Some Balancing Authorities may choose to apply corrections to their Net Actual Interchange values to account for factors such as nonconforming loads. FRS Form 1 shows the types of adjustments that are allowed.)

A standardized sampling interval of 20 to 52 seconds will be used in the computation of SEFRD values. Microsoft Excel® spreadsheet interfaces for EMS scan rates of 2 through 6 seconds will be provided to support the computation. During the field trial, other sampling intervals will be evaluated as well to determine if another sampling interval is more appropriate.

In an attempt to balance the workload of Balancing Authorities with the need for accuracy in the FRM, the field trial will require at least 25 samples selected during the course of the year to compute the FRM. Research conducted by the Frequency Responsive Reserve Standard Drafting Team (FRSDT) indicated that a Balancing Authority's FRM will converge to a reasonably stable value with 20 to 25 samples. The FRSDT will re-evaluate the required number of samples during the field trial.

The FRSDT also evaluated different approaches for "averaging" individual event observations to compute a technically sound estimate of Frequency Response Measure (FRM). The MW contribution for a single BA in a multi-BA Interconnection is small compared to the minute to minute changes in load, interchange and generation. For example, a 3000 MW BA in the east may only be called on to contribute 10MW for the loss of a 1000MW. The 10 MW of governor and load response may easily be masked ay a coincident change in load. Because of this large "noise to signal" ratio, the mean did not prove to be an appropriate measure of true typical performance.

In general, statisticians use the median as the best measure of central tendency when a population has outliers. Two independent reviews by the FRSDT has shown the Median to be less influenced by noise in the measurement process and the team has chosen the median as the initial metric for calculating the BAs' Frequency Response Measure.
In addition, The FRSDT is evaluating the linear regression as a means to estimate the BA's typical frequency response. This calculation is embedded in FRS Form 1 and will be evaluated during the field trial. Initial review implies that the linear regression tends to skew calculated FRM due to the influence of outliers. The outliers are being evaluated by the FRSDT as they may point to needed improvements in the measurement process or training issues for the BA in question.

In order to support field trial evaluations of sample size, sampling intervals, and aggregation techniques, the FRSDT will be retrieving scan rate data from the Balancing Authorities for each SEFRD. Additional frequency events may also be requested for research purposes, though they will not be included in the FRM computation.

FERC Order No. 693 directed the ERO to define the number of Frequency Response surveys that were conducted each year and to define a necessary amount of Frequency Response. R1 addresses both of these directives:

- There is a single annual survey of at least 25-30 events each year.
- The FRM calculated on FRS Form 1 is compared by the ERO against the FRO determined 12 months earlier (when the last FRS Form 1 was submitted) to verify the Balancing Authority provided its share of Interconnection Frequency Response.

FERC Order No. 693 also directed that the Standard should identify methods for Balancing Authorities to obtain Frequency Response. Requirement R1 allows Balancing Authorities to participate in Reserve Sharing Groups (RSGs) to provide or obtain Frequency Response. These may be the same RSGs that cooperate for BAL-002-0 or may be RSGs that form for the purposes of BAL-003-1.

If BAs participate as an RSG for BAL-003-1, compliance is based on the sum of the participants' performance.

Two other ways that BAs could obtain Frequency Response are through Supplemental Service or Overlap Regulation Service:

- No special action is needed if a BA provides or receives supplemental regulation. If the regulation occurs via Pseudo Tie, the transfer occurs automatically as part of Net Actual Interchange (NIA) and in response to information transferred from recipient to provider.
- If a BA provides overlap regulation, its FRS Form 1 will include the Frequency Bias setting as well as peak load and generation of the combined Balancing Authority Areas. The FRM event data will be calculated on the sum of the provider's and recipient's performance.

In the Violation Severity Levels for Requirement R1, the impact of a BA not having enough frequency response depends on two factors:

- Does the Interconnection have sufficient response?
- How short is the BA in providing its FRO?

The VSL takes these factors into account.

Requirement 2

R2. Each Balancing Authority not participating in Overlap Regulation Service shall implement the Frequency Bias Setting (fixed or variable) validated by the ERO, into its Area Control Error

(ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control.

Background and Rationale

Attachment A of the Standard discusses the process the ERO will follow to validate the BA's FRS Form 1 data and publish the official Frequency Bias Settings. Historically, it has taken multiple rounds of validation and outreach to confirm each BA's data due to transcription errors, misunderstanding of instructions, and other issues. While BAs historically submit Bias Setting data by January 1, it often takes one or more months to complete the process.

The target is to have BAs submit their data by January 10. The BAs are given 30 days to assemble their data since the BAs are dependent on the ERO to provide ~~them with~~them with FRS Form 1, and there may be process delays in distributing the forms since they rely on identification of frequency events through November 30 of the preceding year.

Frequency Bias Settings generally change little from year to year. Given the fact that BAs can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date.

To recap the annual process:

1. The ERO posts the official list of frequency events to be used for this Standard in early December. The FRS Form 1for each Interconnection will be posted shortly thereafter.
2. The Balancing Authority submits its revised annual Frequency Bias Setting value to NERC by January 10.
3. The ERO and the Resources Subcommittee validate Frequency Bias Setting values, perform error checking, and calculate, validate, and update CPS2 L10 values. This data collection and validation process can take as long as two months.
4. Once the L10 and Frequency Bias Setting values are validated, The ERO posts the values for the upcoming year and also informs the Balancing Authorities of the date on which to implement revised Frequency Bias Setting values. Implementation typically would be on or about March 1st of each year.

Requirement 3

R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area.

Background and Rationale

This requirement serves several functions. The primary reason for operating in Tie Line Bias is so ACE is calculated properly for performance purposes. Even if a BA temporarily operated in manual mode, as long as CPS is properly calculated and the BA met CPS, it is operating reliably.

There are legitimate reasons for taking AGC out of Tie Line Bias or operating manually including:

- Telemetry problems that lead the operator to believe ACE is significantly in error.
- The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection).
- During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them).
- For training purposes.
- Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems.
- For single BA Interconnections, Flat Frequency and Tie Line Bias are equivalent.

Because it is rare that temporary operation out of Tie Line Bias can lead to reliability problems, the VSLs for this requirement are structured accordingly.

Requirement 4

R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO or calculate the Frequency Bias Setting based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled.

Background and Rationale

This requirement reflects the operating principles first established by NERC Policy 1 and is similar to Requirement R6 of the approved BAL-003-0.1b standard. Overlap Regulation Service is a method of providing regulation service in which the Balancing Authority providing the regulation service incorporates another Balancing Authority's actual interchange, frequency response, and schedules into the providing Balancing Authority's AGC/ACE equation.

As noted earlier, a BA that is providing Overlap Regulation will report the sum of the Bias Settings in its FRS Form 1. Balancing Authorities receiving Overlap Regulation Service have an ACE and Frequency Bias Setting equal to zero (0).

Requirement 5

R5. In order to ensure adequate control response each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following:

- *The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B.*

- *The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation- only BA, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.*

Background and Rationale

BAL-003-0.1b standard requires a minimum Frequency Bias Setting equal in absolute value to one percent of the Balancing Authority's estimated yearly peak demand (or maximum generation level if native load is not served). For most Balancing Authorities this calculated amount of Frequency Bias is significantly greater in absolute value than their actual Frequency Response characteristic (which represents an over-bias condition) resulting in over-control since a larger magnitude response is realized. This is especially true in the Eastern Interconnection where this condition requires excessive secondary frequency control response which degrades overall system performance and increases operating cost as compared to requiring an appropriate balance of primary and secondary frequency control response.

Balancing Authorities were given a minimum Frequency Bias Setting obligation because there had never been a mandatory Frequency Response Obligation. This historic "one percent of peak per 0.1Hz" obligation, dating back to NERC's predecessor, NAPSIC, was intended to ensure all BAs provide some support to Interconnection frequency.

The ideal system control state exists when the Frequency Bias Setting of the Balancing Authority exactly matches the actual Frequency Response characteristic of the Balancing Authority. If this is not achievable, over-bias is significantly better from a control perspective than under-bias with the caveat that Frequency Bias is set relatively close in magnitude to the Balancing Authority actual Frequency Response characteristic. Setting the Frequency Bias to better approximate the Balancing Authority natural Frequency Response characteristic will improve the quality and accuracy of ACE control, CPS & DCS and general AGC System control response. This is the technical basis for recommending an adjustment to the long standing "1% of peak/0.1Hz" Frequency Bias Setting. Attachment B is intended to bring the Balancing Authorities' Frequency Bias Setting closer to their natural Frequency Response. Attachment B balances the following objectives:

- Bring the Frequency Bias Setting and Frequency Response closer together.
- Ensure there is no negative impact on other Standards (CPS, BAAL and to a lesser extent DCS) by adjustments in the minimum Frequency Bias Setting, by accommodating only minor adjustments.
- Do not allow the Frequency Bias Setting minimum to drop below natural Frequency Response, because under-biasing could affect an Interconnection adversely.

Finally, for BAs using variable bias, FRS Form 1 has a data entry location for the previous year's average monthly bias. The Balancing Authority and the ERO can compare this value to the previous year's Frequency Bias Setting minimum to ensure R5 has been met.

How this Standard Meets the FERC Order 693 Directives

FERC Directive

The following is the relevant paragraph of Order No. 693.

> *Accordingly, the Commission approves Reliability Standard BAL-003-0 as mandatory and enforceable. In addition, the Commission directs the ERO to develop a modification to BAL-003-0 through the Reliability Standards development process that: (1) includes Levels of Non-Compliance; (2) determines the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and to modify Measure M1 based on that determination and (3) defines the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved.*

1. Levels of Non-Compliance

VRFs and VSLs are an equally effective way of assigning compliance elements to the standard.

2. Determine the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other Requirements of the Reliability Standard are met

BAL-003 V0 R2 (the basis of Order No. 693) deals with the calculation of Frequency Bias Setting such that it reflects natural Frequency Response.

The drafting team has determined that a sample size on the order of at least 25-30 events is necessary to have a high confidence in the estimate of a BA's Frequency Response. Selection of the frequency excursion events used for analysis will be done via a method outlined in Attachment A to the Standard.

On average, these events will represent the largest 2-3 "clean" frequency excursions occurring each month.

Since Frequency Bias Setting is an annual obligation, the survey of the at least 25-30 frequency excursion events will occur once each year.

3. Define the necessary amount of Frequency Response needed for Reliable Operation for each Balancing Authority with methods of obtaining and measuring that the frequency response is achieved

Necessary Amount of Frequency Response

The drafting team has proposed the following approach to defining the necessary amount of frequency response. In general, the goal is to avoid triggering the first step of under-frequency load shedding (UFLS) in the given Interconnection for reasonable contingencies expected. The

methodology for determining each Interconnection's and Balancing Authority's obligation is outlined in Attachment A to the Standard.

It should be noted that the standard cannot guarantee that there will never be a triggering of UFLS as the magnitude of "point C" differs throughout an interconnection during a disturbance and there are local areas that see much wider swings in frequency.

The contingency protection criterion is the largest reasonably expected contingency in the Interconnection. This can be based on the largest observed credible contingency in the previous 10 years or the largest Category C event for the Interconnection.

The Safety Margin included addresses the difference between Points B and C and accounts for variables.

For multiple BA interconnections, the Frequency Response Obligation is allocated to BAs based on size. This allocation will be based on the following calculation:

$$FRO_{BA} = FRO_{Int} \times \frac{Peak\ Gen_{BA} + Peak\ Load_{BA}}{Peak\ Gen_{Int} + Peak\ Load_{Int}}$$

Methods of Obtaining Frequency Response

The drafting team believes the following are valid methods of obtaining Frequency Response:

- Supplemental regulation.
- Overlap regulation.
- Contractual service (The drafting team has developed an approach to obtain a contractual share of Frequency Response from Adjacent Balancing Authorities. See FRS Form 1). While the final rules with regard to contractual services are being defined, the current expectation is that the ERO and the associated Region(s) should be notified beforehand and that the service be at least 6 months in duration.
- Through a tariff (e.g. Frequency Response and regulation service).
- From generators through an interconnection agreement.
- Contract with an internal resource or loads (The drafting team encourages the development of a NAESB business practice for Frequency Response service for linear (droop) and stepped (e.g. LaaR in Texas) response).

Measuring that the Frequency Response is Achieved

FRS Form 1 and the underlying data retained by the BA will be used for measuring whether Frequency Response was provided. FRS Form 1 will provide the guidance on how to account for and measure Frequency Response.

Going Beyond the Directive

Based on the combined operating experience of the SDT, the drafting team believes each Interconnection has sufficient Frequency Response. If margins decline, there may be a need for additional standards or tools. The drafting team and the Resources Subcommittee are working with the ERO on its Frequency Response Initiative to develop processes and good practices so the Interconnections are prepared. These good practices and tools are described in the following section.

The drafting team is also evaluating a risk-based approach for basing the Interconnection Frequency Response Obligation on an historic probability density of frequency error, and for allocating the obligation on the basis of the Balancing Authority's average annual ACE share of frequency error. This allocation method uses the inverse of the rationale for allocating the CPS1 epsilon requirement by Bias share.

Good Practices

Knowing the quantity and depth of frequency responsive reserves in real time is a possible next step to being better prepared for the next event. The challenge in achieving this is having the knowledge of the capabilities of all sources of frequency response. Presently the primary source of frequency response remains with the generation resources in our fleets. Understanding how each of these sources performs to changes in system frequency and knowing their limitations would improve the BA's ability to measure frequency responsive reserves. Presently there are only guidelines, criteria and protocols in some regions of the industry that identify specific settings and performance expectations of primary frequency response of resources. One method of gaining better understanding of performance is to measure performance during actual events that occur on the system. This approach would only provide feedback for performance during that specific event and would not provide insight into depth of response or other limitations. Repeated measurements will increase confidence in expected performance. NERC modeling standards are in process to be revised that will improve the BA's insight into predicting available frequency responsive reserves. However, knowing how resources are operated, what modes of operation provide sustained primary frequency response and knowing the operating range of this response would give the BA the knowledge to accurately predict frequency response and the amount of frequency responsive reserves available in real time.

Some benefits on several interconnections have been realized by communicating to generation resources (GO) the importance of operating in modes that allow primary frequency response to be sustained by the control systems of the resource. Other improvements in implementation of primary frequency response have been achieved through improved settings on turbine governors through the elimination of "step" frequency response with the simultaneous reduction in governor dead-band settings. Improvements in the full AGC control loop of the

generating resource, which accounts for the expected primary frequency response, have improved the delivery of quality primary frequency response while minimizing secondary control actions of generators. Some of these actions can provide quick improvement in delivery of primary frequency response.

Once primary frequency response sources are known the BA could calculate available reserves that are frequency responsive. Planning for these reserves during normal and emergency operations could be developed and added to the normal planning process.

Tools

Single generating resource primary frequency response performance evaluation tools for steam turbine, combustion turbine (simple cycle or combined cycle) and for intermittent resources are available at the following link.
http://texasre.org/standards_rules/standardsdev/rsc/sar003/Pages/Default.aspx.

These tools and the regional standard associated with them are in their final stages of development in the Texas region.

These tools will be posted on the NERC website.

Field Trial

This section is a summary of the Field Trial activities that have been or will be conducted by the ERO, the Resources Subcommittee and the FRS Drafting Team.

1. The NERC BA recommendation (alert) and observations.√
2. The NERC governor recommendation (alert) and observations.√
3. The 2011 bias calculation √
    1. Evaluate measurement methodology√
    2. Serve as initial training for BAs√
    3. Evaluate median, mean, regression and possibly other measures√
    4. Evaluate sample size (to address the directive of frequency of surveys) √
    5. Evaluate impact of inclusion/exclusion of internal contingencies √
    6. Improve FRS Form 1√
4. Create supporting process for FRS Form 1 √
    1. For Interconnection benchmarking (proving adequacy of frequency response)
    2. Evaluating trend
    3. Test process for developing candidate list for FRS Form 1
5. 2012 bias calculation
    1. Further refinement of items in 2011 bias calculation
    2. Test the FRO allocation methodology
    3. Test approach for handling variable bias
    4. Evaluate 12 month vs. 24 month rolling average approach to performance
6. Evaluate reduction in bias setting floor below 1% (initially 0.8% in 2012) to evaluate impact on frequency and calculated CPS and BAAL performance.
7. Evaluate effectiveness of administrative process to support the standard.
8. Evaluate a risk-based approach for basing the Interconnection Frequency Response Obligation on an historic probability density of frequency error, and for allocating the obligation on the basis of the Balancing Authority's average annual ACE share of frequency error.

DRAFT:DNC:March 2, 2005

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Interconnection for Wind Energy And Other Technologies	Docket No. RM05-4-000

COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY COUNCIL

The North American Electric Reliability Council, a New Jersey non-profit corporation ("NERC")[1], is pleased to provide these comments in response to the issues and questions raised in the Commission's January 24, 2005 Notice of Proposed Rulemaking, Interconnection for Wind Energy and Other Alternative Technologies. NERC supports the Commission's initiatives to assure that wind generation plays an appropriate role in the Nation's mix of generation resources. NERC believes that significant amounts of wind generation can reliably be added to the bulk electric system, so long as all those involved in the planning and operation of these wind plants (generator owners, generator operators, transmission owners, transmission planners and transmission operators) adhere to established reliability standards.

[1] NERC was formed after the Northeast blackout in 1965 to promote the reliability of the interconnected electric systems in North America. Its mission is to ensure that the bulk electric systems that serve North America are adequate, reliable, and secure. It works with all segments of the electric industry as well as customers to "keep the lights on" by developing and encouraging compliance with rules for the reliable operation and adequacy of supply of these systems. NERC comprises ten regional Reliability Councils that account for virtually all the electricity supplied in the United States, Canada, and a portion of Baja California Norte, Mexico.

NERC's comments address several technical questions[2] raised in the NOPR:

1. Low Voltage Ride Through Standard
2. Supervisory Control and Data Acquisition ("SCADA") Capability
3. Power Factor Design Criteria (Reactive Power)
4. Other Generating Technologies

As a general matter, NERC believes that standards for the reliable planning and operation of bulk electric system facilities should be contained in the standards set by NERC and the regional reliability councils. Such standards may then be incorporated by reference into various agreements. The Commission has already followed that approach in the pro forma Large Generator Interconnection Agreement adopted in Order No. 2003, by including provisions requiring the Parties to abide by Good Utility Practice. The Commission recently concluded that the term Good Utility Practice includes compliance with NERC's new reliability standards. [3]

1. Low Voltage Ride Through Standard

The NOPR would require wind generator plants to have the low voltage ride through capabilities described in Figure 1 of the proposed Appendix G of the Interconnection Requirements for Wind Generators. NERC agrees with a requirement that wind generator plants have the ability to ride through low-voltage transients, but NERC does not agree that Figure 1 properly states the requirement.

NERC Reliability Standard TPL–002-0, System Performance Following Loss of a Single BES [Bulk Electric System] Element, requires the Planning Authority and the Transmission Planner to ensure that the bulk electric system will remain stable with

[2] NERC is not providing comments on the questions related to requiring the transmission provider to participate in updating the models for assessing the interconnection impacts and the wind plant's self-study of the feasibility of an interconnection.

[3] Supplement to Policy Statement on Matters Relating to Bulk Power System Reliability, Docket No. PL04-5-001, issued February 9, 2005.

thermal and voltage limits within applicable ratings, and with no loss of demand or curtailed firm transfers, for a normally cleared fault on a single element (an interval of several cycles). If a fault occurs on a transmission line near a wind plant, the voltage measured at that point could drop instantaneously to 0 for the short interval required to clear the fault. Figure 1 would permit a wind generator to trip offline if voltage drops below 15 % of nominal voltage. Unless the wind plant stays on line through a normally cleared fault, its capacity will be lost to the system, in effect creating a double contingency (loss of the line and loss of the plant) and a violation of TPL-002-0.

Including Figure 1 in the Commission's regulations has other disadvantages. NERC understands that the intent of Figure 1 is to have a reasonable requirement for system reliability and also meet the physical capabilities of existing generation technology. But wind technology is advancing rapidly. If Figure 1 is included in the Commission's rule, it is likely to be static over time and may limit technological development. Figure 1 also may not be appropriate for every application of wind generation at every wind plant location, because reliability needs may require different engineering or operating procedures over the North American electric system. Protection schemes especially must be coordinated across regional areas.

For these reasons, NERC does not believe that Figure 1 should be part of Appendix G. Instead, it should be replaced with a requirement that wind plants directly connected to the bulk transmission system meet the requirements of NERC and regional council reliability standards.

2. Supervisory Control and Data Acquisition ("SCADA") Capability

The NOPR would require the Transmission Provider[4] and the wind generator owner to determine the SCADA requirements for each interconnection of a wind generator to the transmission system. SCADA capability is necessary to facilitate the required exchange of data and control between the wind generation plant and the Transmission Provider. SCADA also provides critical information that the balancing authority needs to minimize the balancing area's area control error and that the transmission operator needs to maintain transmission voltage within acceptable limits. NERC agrees with the requirement that the wind generator owner provide SCADA information to the Transmission Provider and the balancing authority. The specific SCADA requirements should be established between the wind generator owner and the Transmission Provider and the balancing authority, which would make it unnecessary to establish a minimum SCADA requirement for Appendix G.

3. Power Factor Design Criteria (Reactive Power)

The NOPR would require a wind generator (1) to maintain a power factor range from 0.95 lagging to 0.95 leading, measured at the high voltage side of the substation transformer, and (2) to have sufficient dynamic reactive support to interconnect to the transmission system, based on the results of the System Impact Study. NERC agrees with the requirement that a wind generator plant be able to operate at a power factor range between 0.95 lagging and 0.95 leading, measured at the high side of the step-up transformer. This requirement is consistent with NERC guidelines for synchronous generators and the requirements the Commission has already adopted in Order No. 2003 for large generators. The wind generator plant should also maintain the voltage schedule

[4] NERC considers the FERC-defined Transmission Provider as the combination of the transmission operator, transmission owner, and the transmission service provider, or tariff administrator.

requirements of the transmission system operator. The wind generation plant should have adequate dynamic reactive capability to respond dynamically to transient voltages on the transmission system.

The transmission provider's decision to waive dynamic support requirements can be viewed as a commercial decision between the transmission provider and the wind generator owner, and NERC has no comment on this issue. However, that transmission provider, in conjunction with the transmission owner, continues to be responsible for ensuring that the dynamic reactive support requirements of the transmission system are provided to meet NERC and regional council reliability standards.

4. Other Generating Technologies

The NOPR asks if there are other generation technologies that should comply with the provisions of the proposed Appendix G. NERC believes that the proposed Appendix G, with the recommendations NERC has provided in this document, could be appropriate for any generation device other than a synchronous generator. However, NERC will reserve judgment on this question, preferring to review the other generation technologies as they develop before providing a definitive answer.

Conclusion

NERC is dedicated to improving the reliability and security of the bulk power system and looks forward to working with FERC and electric industry stakeholders in the development of appropriate interconnection requirements for groupings of wind generators.

Respectfully submitted,

NORTH AMERICAN
ELECTRIC RELIABILITY COUNCIL

NERC Recommended Changes to the FERC/AWEA LVRT Standard

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard in Figure 1, below, ~~if the Transmission Provider's System Impact Study shows that low voltage ride-through capability is required to ensure safety or reliability.~~ unless clearing the fault effectively disconnects the wind generating plant from the system.

The standard applies to voltage measured at the high side of the wind generating plant step-up transformer(s) ~~Point of Interconnection as defined in this LGIA~~. The figure shows the ratio of actual to nominal voltage (on the vertical axis) over time (on the horizontal axis). Before time 0.0, the voltage at the high side of the wind generating plant step-up transformer(s) is the nominal voltage. At time 0.0, the voltage may drop~~s~~ to zero (0). The wind plant must stay connected to the system if the voltage drops to zero (0) during the system fault normal clearing period (not to exceed 9.0 cycles: 0.15 seconds). ~~If the voltage remains at a level greater than 15 percent of the nominal voltage for a period that does not exceed 0.625 seconds, the plant must stay online.~~ Further, ~~if the voltage returns to 90 percent of the nominal voltage within 3.0 seconds of the beginning of the voltage drop (with the voltage at any given time never falling below the minimum voltage indicated by the solid line in Figure 1), the plant must stay online.~~ if the voltage at any given time remains at or above the curve proposed by NERC in Figure 1, the wind generating plant must stay online. After 3 seconds, the wind plant must not trip if the voltage remains at or above 90%. The Interconnection Customer may not disable low voltage ride-through equipment while the wind plant is in operation. Two key features of this regulation that are applicable to voltages measured at the high side of the wind generating plant step-up transformers are:

1. A wind generating plant must have low voltage ride-through capability down to ~~15 percent~~ zero (0) volts of the rated line voltage ~~for 0.625 seconds~~ during the system fault normal clearing period (not to exceed 9 cycles: 0.15 seconds);

2. ~~A wind generating plant must be able to operate continuously at 90 percent of the rated line voltage, measured at the high voltage side of the wind plant substation transformer(s).~~ If the voltage at any given time remains at or above the curve proposed by NERC in Figure 1, the wind generating plant must stay online.

Interconnection for Wind Energy Docket No. RM05-4-000

ORDER NO. 661

FINAL RULE

(Issued June 2, 2005)

1. In this Final Rule, to meet our responsibility under sections 205 and 206 of the Federal Power Act (FPA)[1] to remedy undue discrimination, the Commission adopts standard procedures and technical requirements for the interconnection of large wind plants. The Commission requires all public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce to append to the Large Generator Interconnection Procedures (LGIPs) and Large Generator Interconnection Agreements (LGIAs) in their Open Access Transmission Tariffs (OATTs) the Final Rule Appendix G adopted here. These standard technical requirements provide just and reasonable terms for the interconnection of wind plants.[2] The rule recognizes the technical differences of

[1] 16 U.S.C. §§ 824d-e (2000).

[2] As discussed in greater detail below, the Final Rule Appendix G applies only to wind plants, due to the unique characteristics of wind generating technology.

wind generating technology, and benefits customers by removing unnecessary obstacles to further development of wind generating resources while ensuring that reliability is protected.

I. Introduction

2. In Order No. 2003,[3] the Commission adopted standard procedures and a standard agreement for the interconnection of large generation facilities. The Commission required public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce to file revised OATTs containing these standard provisions, and use them to provide interconnection service to generating facilities having a capacity of more than 20 megawatts.

3. In Order No. 2003-A, on rehearing, the Commission noted that the standard interconnection procedures and agreement were based on the needs of traditional synchronous generation facilities and that a different approach might be more appropriate for generators relying on non-synchronous technologies,[4] such as wind plants.[5]

---

[3] Standardization of Generator Interconnection Agreements and Procedures, Order No. 2003, 68 Fed. Reg. 49,845 (Aug. 19, 2003), FERC Stats. & Regs., Regulations Preambles ¶ 31,146 (2003) (Order No. 2003), order on reh'g, 69 Fed. Reg. 15,932 (Mar. 24, 2004), FERC Stats & Regs., Regulations Preambles ¶ 31,160 (2004) (Order No. 2003-A), order on reh'g, 70 Fed. Reg. 265 (January 4, 2005), FERC Stats & Regs., Regulations Preambles ¶ 31,171 (2004) (Order No. 2003-B), reh'g pending; see also Notice Clarifying Compliance Procedures, 106 FERC ¶ 61,009 (2004).

[4] A wind generator is considered non-synchronous because it does not run at the same speed as a traditional generator. A non-synchronous generator possesses significantly different characteristics and responds differently to network disturbances.

Accordingly, the Commission granted certain clarifications, and also added a blank Appendix G (Requirements of Generators Relying on Non-Synchronous Technologies) to the standard LGIA for future adoption of requirements specific to non-synchronous technologies.[6]

4. Therefore, in a Notice of Proposed Rulemaking (NOPR), the Commission proposed technical standards applicable to the interconnection of large wind generating plants[7] to be included in Appendix G of the LGIA.[8] We proposed the standards in light of our findings in Order No. 2003-A noted above and in response to a petition submitted by the American Wind Energy Association (AWEA) on May 20, 2004.[9] The Commission proposed to adopt certain technical requirements that Transmission Providers would be required to apply to interconnection service for wind generation plants, which are different from those required of traditional synchronous generating plants. These standard technical requirements are now needed because of the increased

[7] Large wind generating plants are those with an output rated over 20 MW at the point of interconnection.

[8] See Interconnection for Wind Energy and Other Alternative Technologies, Notice of Proposed Rulemaking, 110 FERC ¶ 61,036 (2004) (NOPR).

[9] See Petition for Rulemaking or, in the Alternative, Request for Clarification of Order No. 2003-A, and Request for Technical Conference of the American Wind Energy Association (May 20, 2004), filed in Docket Nos. RM02-1-005 and PL04-15-000.

presence of larger aggregated wind plants on many Transmission Providers' systems. The NOPR stated that, except for those articles of the LGIA for which wind plants have been exempted,[10] these requirements would supplement the standard interconnection procedures and requirements adopted by the Commission in Order No. 2003. Additionally, the NOPR sought comments on certain specific issues, including whether there are other non-synchronous technologies, or other technologies in addition to wind, that should also be covered by the proposed Appendix G.

II. Background

5. In Order No. 2003, to meet our responsibility under sections 205 and 206 of the FPA to remedy undue discrimination, the Commission required all public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce to append to their OATTs the LGIP and LGIA. To achieve greater standardization of interconnection terms and conditions, Order No. 2003 required such public utilities to file revised OATTs containing the LGIP and LGIA included in Order No. 2003.

6. As explained above, because some of the technical requirements in the LGIA were inappropriate for non-synchronous technologies (such as wind generators), the Commission clarified in Order No. 2003-A that LGIA article 5.4 (Power System Stabilizers), LGIA article 5.10.3 (Interconnection Customer's Interconnection Facilities

[10] LGIA article 5.4 (Power System Stabilizers), LGIA article 5.10.3 (Interconnection Customer's Interconnection Facilities Construction), and LGIA article 9.6.1 (Power Factor Design Criteria).

Construction) and LGIA article 9.6.l (Power Factor Design Criteria) would not be applied to wind generators.[11] Additionally, the Commission noted that "there may be other areas of the LGIP and LGIA that may call for a slightly different approach for a generator relying on newer technology because it may have unique electrical characteristics."[12]

7. On May 20, 2004, in Docket No. RM02-1-005, AWEA submitted a petition for rulemaking or, in the alternative, request for clarification of Order No. 2003-A, and a request for a technical conference. AWEA asked the Commission to adopt in Appendix G certain standards for the interconnection of wind generation plants. Specifically, AWEA submitted a proposed Appendix G that it argues addresses the concerns of both Transmission Providers and the wind generation industry. AWEA's proposed Appendix G included a low voltage ride-through capability standard that would allow the Transmission Provider to require as a condition of interconnection that wind generation facilities have the ability to continue operating or "ride through" certain low voltage conditions on the transmission systems to which they are interconnected. AWEA's proposed Appendix G also included that as a condition of interconnection, wind plants would install equipment enabling remote supervisory control and data acquisition (SCADA) that would limit the maximum plant output during system emergency and

[11] Id. at P 407, n. 85.

[12] Id.

system contingency events and telemetry communication between the system operator and the wind plant for automatic forecasting and scheduling. Additionally, AWEA proposed that the power factor design criteria of up to 0.95 leading/lagging (required in Order No. 2003) be applied to wind generation plants, with flexibility regarding whether the reactive support equipment would be located at the common point of interconnection of all the generators in the plant rather than at the high side of the wind plant substation transformers. Further, AWEA proposed that the Commission require Transmission Providers and wind generator manufacturers to participate in a formal process to develop, update, and improve the engineering models and specifications used in modeling wind plant interconnections. Finally, AWEA proposed to include language in Appendix G allowing the wind Interconnection Customer to "self-study" interconnection feasibility by entering the interconnection queue without providing certain power and load flow data required of other large generators, receiving certain information from the Transmission Provider, and conducting its own Feasibility Study.

8. On September 24, 2004, the Commission held a Technical Conference to discuss the issues raised by AWEA's petition, including the technical requirements for the interconnection of wind plants and other such alternative technologies and the need for specific requirements for their interconnection. Additionally, the Technical Conference considered how wind and other alternative generator technologies may respond differently to transmission grid disturbances and have different effects on the

transmission grid. The Commission also solicited and received post-Technical Conference comments from interested persons.

9. As noted above, the Commission's NOPR proposed to adopt in Appendix G to the LGIA a somewhat modified version of the low voltage ride-through, SCADA and power factor design standards proposed by AWEA in its May 20, 2004 petition. Specifically, the NOPR proposed to establish uniform standards in Appendix G that would require large wind plants seeking to interconnect to the grid to (1) demonstrate low voltage ride-through capability; in other words, show that the plant can remain on line during voltage disturbances up to specified time periods and associated voltage levels; (2) possess SCADA capability to transmit data and receive instructions from the Transmission Provider; and (3) maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the high voltage side of the substation transformers. In the case of the low voltage ride-through requirement, the Commission proposed to permit the Transmission Provider to waive the requirement on a comparable and not unduly discriminatory basis for all wind plants. In the case of the power factor requirement, the Commission proposed to permit the Transmission Provider to waive or defer compliance with the requirement where it is not necessary. The Commission declined, however, to adopt AWEA's proposal to allow a wind generator to "enter the interconnection queue and conduct its own Feasibility Study, having obtained the information necessary to do so

upon paying the initial deposit and submitting its interconnection application."[13] We asked for comments on how to balance the need of wind generators to obtain certain data from the Transmission Provider before completing their Interconnection Requests with the need to protect critical energy infrastructure information and commercially sensitive data against unwarranted disclosure.

III. Discussion

10. Based on AWEA's petition, the comments received during and after the Technical Conference, and the comments filed in response to the NOPR, the Commission is adopting certain standard procedures and technical requirements for the interconnection of wind generating plants, as discussed in greater detail below. These procedures and technical requirements will be appended, as Appendix G, to both the LGIP and the LGIA.[14]

[13] See AWEA Petition at 13.

[14] In the NOPR, the Commission proposed to include Appendix G as an attachment to the LGIA only. Upon further consideration, the Commission directs that the Final Rule Appendix G provisions related to completion of the Interconnection Request by a wind plant interconnection customer be appended to the LGIP, since they are procedural in nature, and that the remaining technical requirements be appended to the LGIA, to ensure that the provisions adopted here are applied throughout the interconnection process.

11. These technical requirements for the interconnection of wind plants recognize the unique design and operating characteristics of wind plants,[15] their increasing size and increasing level of penetration on some transmission systems (in terms of the wind generating capacity's percentage contribution to total system generating capacity), and the effects they have on the transmission system. In Order No. 2003, the Commission noted that in the past, requests for interconnection frequently resulted in complex and time-consuming disputes over technical matters such as feasibility, cost, and cost responsibility.[16] That is true for wind interconnection as well as interconnection of more conventional generation. The special standard procedures we are adopting for the interconnection of large wind plants will minimize opportunities for undue discrimination by Transmission Providers and remove unnecessary obstacles to the development of wind generation, while protecting system reliability.[17] Like the LGIP and LGIA in Order No. 2003, the Final Rule Appendix G is to be added to the OATT of each public utility that

[15] As noted above, wind plants over 20 MW in total size are subject to the standard technical requirements in the Final Rule Appendix G. These wind plants are generally made up of several small induction wind generating turbines, laid out over a large area, and connected through a medium-voltage collector system. This collector system is connected to the low voltage side of the step-up transformer, which is then connected to the transmission system at a single Point of Interconnection.

[16] Order No. 2003 at P 11.

[17] See id. at P 11-12.

owns, controls, or operates facilities for transmitting electric energy in interstate commerce.

12. The Final Rule Appendix G we adopt here applies only to the interconnection of wind plants. As discussed further below, the Commission does not believe at this time that the standard procedures and technical requirements in this Final Rule are appropriate for other alternative generating technologies that may supply over 20 MW at one Point of Interconnection. The standard procedures and technical requirements adopted here recognize the unique characteristics of wind plants, including the fact that they use induction generators, consist of several or numerous small generators connected to a collector system, and do not respond to grid disturbances in the same manner as large conventional generators.

13. The Appendix G procedures and technical requirements for the interconnection of wind generation plants are not the sole interconnection requirements for wind plants; large wind plants are subject to the other standard interconnection procedures and requirements adopted by the Commission in Order No. 2003, unless wind plants are exempted from such procedures and requirements by Order No. 2003 and its rehearing orders, and this order.

14. Additionally, as discussed further below, the Commission adopts a reasonable transition period for the technical requirements adopted in the Final Rule. Specifically, the standard technical requirements, if applicable, for low voltage ride-through capability, SCADA capability, and power factor design criteria apply only to LGIAs signed, filed

with the Commission in unexecuted form, or filed as a non-conforming agreement, on or after January 1, 2006, or the date six months after publication of the Final Rule in the Federal Register, whichever is later. The procedural requirements related to the completion of the Interconnection Request by a wind plant Interconnection Customer, however, apply when the Final Rule takes effect, which is 60 days after the date of publication in the Federal Register.[18]

A. Low Voltage Ride-Through Capability

15. As the Commission stated in the NOPR, early wind generator technology would shut down the wind generating unit if there was a sudden change in voltage on the transmission system. With the increasing number and size of wind plants in the United States, there is a concern that wind plants tripping off-line during a low voltage situation could raise significant reliability concerns. As a result, Transmission Providers state that they need large wind plants to remain on-line during low voltage occurrences to maintain reliability. Further, in the past, Transmission Providers would often shut down wind units during a system disturbance. Wind generators would prefer to stay on-line, but they are concerned that having each Transmission Provider design its own low voltage ride-

[18] As discussed in greater detail below, in this Final Rule the Commission is adopting procedures that permit a wind plant Interconnection Customer to provide in the Interconnection Request a set of electrical design specifications that depict the wind plant as a single generator. These procedures recognize that the unique characteristics of wind plants do not permit them to submit a detailed electrical design in the initial Interconnection Request stage, and allow wind plants to enter the queue and receive the base case data necessary to provide a detailed design to the Transmission Provider.

through requirement would greatly affect wind turbine manufacturing costs. As a result, both wind generators and most Transmission Providers support having a low voltage ride-through standard for large wind plants.

16. The NOPR proposed to require that large wind plants seeking to interconnect to the transmission system demonstrate low voltage ride-through capability, unless waived by the Transmission Provider on a comparable and not unduly discriminatory basis for all wind plants. Specifically, the NOPR Appendix G would require that wind generating plants demonstrate the ability to remain on-line during voltage disturbances up to the time periods and associated voltage levels set forth in Figure 1 of the NOPR. We proposed to measure voltage levels at the high voltage side of the wind plant substation transformer. The NOPR noted that while low voltage ride-through capability is needed for wind plants, it is less of a concern for large synchronous generating facilities because most of these facilities are equipped with automatic voltage control devices to increase output during low voltage events.

17. The NOPR sought comments on the proposed low voltage ride-through standard. In particular, the Commission was interested in comments addressing whether it should adopt a low voltage ride-through standard at all, whether the proposed standard or another standard is appropriate, and whether the proposed standard is specific enough. Specifically, the Commission sought comments on whether the required time periods and associated voltage levels proposed in Figure 1 of the NOPR Appendix G were appropriate or should be modified.

1. Comments

18. Several commenters, including AWEA,[19] Western, FirstEnergy, and the Midwest ISO, state that they support the low voltage ride-through standard in Figure 1 of the NOPR. Midwest Reliability Organization suggests, however, that the standard could be in article 9.6 of the LGIA. CenterPoint contends that the reliability concerns presented by the failure of a large wind plant to ride through a low voltage event also exist if other generators also fail to ride through such events, and thus would apply a low voltage ride-through requirement to all generators. Western supports the standard as proposed, with the understanding that it may need to be modified later if it causes unforeseen problems on the transmission system.

19. Numerous other entities support the proposed low voltage ride-through requirement with modifications. For instance, numerous commenters, including AWEA, PacifiCorp-PPM Energy, FPL Energy, Southern California Edison, AEP, Xcel, PJM, National Grid and Southern, believe that the required voltage should be measured at the point of interconnection, as opposed to the high side of the wind plant substation transformer.

20. Additionally, several entities dispute the specific time periods and associated voltage levels set forth in Figure 1 of the proposed Appendix G. American

[19] See AWEA Reply Comments (April 1, 2005) at 10. Specifically, AWEA asks that the proposed low voltage ride-through standard be adopted, specifically the proposed standard of Figure 1.

Superconductor states generally that the proposed low voltage ride-through curve in Figure 1 of the NOPR is unrealistic and does not resemble voltage situations that wind plants are likely to encounter. It also argues that the low voltage requirement proposed in the NOPR is not comparable to what is required of conventional generators. Midwest ISO TOs, CenterPoint and Xcel assert that requiring the low voltage ride-through capability to go only to 15 percent of the rated line voltage (as set out in Figure 1 of the NOPR) may be too high and may present reliability problems. They recommend that the Figure 1 low voltage ride-through profile require the wind turbine to ride through low voltage at zero percent of the rated line voltage for 150 milliseconds. NUSCo recommends that the Commission require wind generators to ride through a fault with zero percent of the rated line voltage at the point of interconnection for 250 milliseconds (15 cycles). American Transmission argues that the low voltage ride-through curve of Figure 1 should show the voltage to be at 0.90 per unit prior to time zero. ISO New England states that to the extent the Commission adopts a low voltage ride-through requirement, it should require wind plants to remain connected to the transmission system for a zero voltage level for the time period associated the typical time it takes to clear a normal design contingency fault.[20]

[20] NERC similarly states that to meet its general reliability standards for system performance, wind plants should remain online "through a normally cleared fault." NERC Comments at 3. Also, PJM states that wind plants should be required to operate during a zero voltage level at the Point of Interconnecton until the fault is cleared by primary protective devices on the Transmission System.

21. Several of the commenters, including AWEA, Gamesa, and GE suggest that the low voltage ride-through standard should be clarified to apply only to three-phase faults. AWEA also asks that the requirement be clarified to state that a wind plant would not be expected to continue to operate in low voltage situations where the wind farm is tripped off-line following a fault if (a) this action is performed intentionally under a special protection scheme, or (b) if the fault is on the Transmission Provider's side of the Point of Interconnection and clearing the fault would effectively disconnect the wind plant from the system. Midwest ISO TOs and Montana-Dakota Utilities also seek clarification regarding application of the proposed standard to unbalanced phase voltages.

22. Many commenters, while supportive of requiring wind plants to possess low voltage ride-through capability, argue that the specific standard should be permitted to vary based on reliability needs. For example, the New York PSC, while agreeing that large wind plants should possess low voltage ride-through capability, argues that the specific voltage-time standard should be developed on a case-by-case basis to reflect system needs. Midwest ISO TOs similarly contend that Transmission Providers should be able to establish different low voltage ride-through standards on a case-by-case basis. NYISO asserts that the low voltage ride-through standard proposed by the Commission should be a minimum performance requirement, and that Transmission Providers should have the flexibility to require a higher low voltage ride-through standard if the particular site location or wind plant design requires a higher standard to protect system reliability. Similarly, LIPA suggests that the Commission adopt a two-part low voltage ride-through

standard; the first part would be the standard proposed in the NOPR, while the second part would apply a more stringent low voltage ride-through standard where the studies indicate that the NOPR requirements are inadequate, such as in locations with special reliability concerns. ISO New England recommends that the Commission not adopt a specific standard for low voltage ride-through capability, or alternatively, that the standard serve only as a guideline for wind turbine manufacturers. BPA and NERC contend that the development of low voltage ride-through standards should be left to the Western Electricity Coordinating Council, NERC, regional reliability councils, the Institute of Electrical and Electronics Engineers (IEEE), and the American National Standards Institute.[21] American Superconductor, Nevada Power, and NUSCo, among others, assert that the low voltage ride-through standard should be based on established regional reliability standards. Likewise, NorthWestern Energy asks that the standard be modified to allow the Transmission Provider to use the reliability council standard in effect when the LGIA is signed.

23. FPL Energy asks that the proposed low voltage ride-through requirement be modified so that the determination of whether a wind plant must have low voltage ride-through capability is made on a case-by case basis. According to FPL Energy, the NOPR would have the "unintended consequence" of mandating costly low voltage ride-through

[21] Similarly, EEI suggests that the Commission adopt standards on an interim basis, until NERC, the regional reliability councils, or IEEE establish formal standards.

technology for all wind plants because Transmission Providers will not be able to determine that the capability will never be needed.[22] FPL Energy argues that the Commission's Final Rule should require the Transmission Provider to determine through the System Impact Study, on a case-by-case basis, whether the wind plant is required to possess low voltage ride-through capability. It notes that currently, Transmission Providers may not require an Interconnection Customer to be responsible for Network Upgrades that are not identified in the studies as necessary, and that a similar process should apply to the low voltage ride-through requirement. Finally, FPL Energy expresses concern that the use of the term "demonstrate" in the proposed requirement could be interpreted to require the wind plant to physically demonstrate the capability, risking harm to its electrical equipment.

24. With regard to the Commission's proposal to permit the Transmission Provider to waive the low voltage ride-through requirement, NUSCo and Tucson Electric both argue that no waiver of the low voltage ride-through requirement should be permitted. NUSCo asserts that the reliability of one Transmission Provider's system may be affected by the grant of a waiver by a neighboring Transmission Provider.

[22] FPL Energy estimates that for a 100 MW wind farm, the cost of low voltage ride-through exceeds $1.5 million.

25. Xcel and LIPA believe there should also be a high voltage ride-through standard for wind plants, comparable to the high voltage ride-through standards for conventional generators.

2. Commission Conclusion

26. As discussed further below, we adopt the low voltage ride-through standard proposed in the NOPR, but will not require that it be met unless the System Impact Study shows that it is needed. Specifically, under the requirement we adopt in this Final Rule, a wind plant is required to satisfy the low voltage ride-through standard if the Transmission Provider shows, through the System Impact Study, that such capability is required to ensure safety or reliability. This differs from the NOPR, which proposed to require low voltage ride-through capability in all cases, except when the Transmission Provider waived the requirement on a comparable and not unduly discriminatory basis for all wind plants. Additionally, the Final Rule adopts the Point of Interconnection as the point of measurement for the low voltage ride-through standard, instead of the proposed high side of the wind plant substation transformers, and replaces the term "demonstrate" with "possess." We also grant certain clarifications, as discussed further below.

27. The Commission believes that establishing the achievable low voltage ride-through standard in this Final Rule if the Transmission Provider shows that it is necessary to maintain safety or reliability provides certainty to wind plant developers that their interconnection to the grid will not be frustrated, and limits opportunities for undue discrimination. A requirement based on a uniform standard ensures that wind developers

are not faced with widely varying interconnection standards in different areas of the country, which would increase manufacturing costs needlessly. We believe that in the long run this is in the best interests of the wind industry and customers, as it helps provide a secure and reliable power supply, and will facilitate increased use of wind as a generation resource while ensuring that reliability is protected.

28. As noted above, the Commission requires low voltage ride-though capability only if the Transmission Provider shows that it is needed on a case-by-case basis, as FPL Energy requests. Specifically, low voltage ride-through capability is required only if the Transmission Provider shows, through the System Impact Study, that it is required to ensure the safety or reliability of the Transmission Provider's transmission system. Given that Transmission Providers have responsibility for ensuring the reliable operation of their systems (pursuant to NERC and regional reliability council standards), the Commission believes that they are in the best position to establish whether low voltage ride-through capability is needed in individual circumstances. The System Impact Study is the best vehicle for assessing the need for such capability, and this study should determine if there is a need for a wind plant to remain on-line during low voltage events to ensure the safety or reliability of the system. Requiring low voltage ride-through capability only if the System Impact Study shows it to be necessary ensures that the increased reliance on wind plants does not degrade system safety or reliability. It also ensures that the Transmission Provider does not require a wind plant to install costly equipment that is not needed for grid safety or reliability. This limits the opportunities

for undue discrimination; a wind plant Interconnection Customer will not have its interconnection frustrated by unnecessary requirements to install costly equipment that is not needed for safety or reliability. Should the wind plant Interconnection Customer disagree with the Transmission Provider that the System Impact Study shows that low voltage ride-through capability is needed, it may challenge the Transmission Provider's conclusion through dispute resolution or appeal to the Commission.

29. Given our decision to apply the low voltage ride-through capability standard only on a case-by-case basis if the Transmission Provider shows, through the System Impact Study, that it is needed to ensure safety or reliability, there is no need for the waiver provision in the NOPR. As a result, issues raised by commenters regarding the waiver provision are moot.

30. As noted above, many entities representing a broad mix of market participants request that the low voltage ride-through requirement be modified to require that the voltage be measured at the Point of Interconnection, as opposed to the high voltage side of the wind plant substation transformer. Given the need to protect grid safety and reliability by having wind plants ride through low voltage events where necessary, and continue to provide output at the point where the plant and its associated interconnection facilities join the grid, we will do so. Use of this measurement point recognizes that the Point of Interconnection is the point at which the Interconnection Customer's responsibility ends and the Transmission Provider's responsibility begins. Additionally, this change to the NOPR is broadly supported, and simplifies the interconnection process

by maintaining the same Point of Interconnection definition adopted in Order No. 2003.

31. We also find convincing FPL Energy's argument that using the term "demonstrate the ability" could be interpreted to require the wind plant to physically demonstrate that it has low voltage ride-through capability and thus could lead to unnecessary tests that could harm the wind plant electrical equipment. Accordingly, we replace the term "demonstrate the ability" with "be able."

32. We also clarify certain portions of the low voltage ride-through standard. First, we clarify that the low voltage ride-through requirement, and the time periods and associated voltage levels set forth in Appendix G, Figure 1, apply to three-phase faults.[23] This is because three-phase faults are the most severe, whereas two-phase or single-phase faults drop the voltage to a level not as low as that specified in Figure 1. Further, in response to AWEA, we clarify that a wind plant is not required to satisfy the standard in Appendix G, Figure 1 if the wind plant is intentionally tripped off line following a fault under a "special protection scheme"[24] agreed to by the Transmission Provider. These

[23] A three-phase fault is an unintentional short circuit condition involving all three phases in an electric system. It is the most severe in its impact, but occurs least frequently. For complete reliability, it is virtually universal to design an electric system for three-phase faults. Other types of faults are: single line-to-ground fault, line-to-line fault, and double line-to-ground fault.

[24] A special protection scheme is an automatic protection scheme designed to detect abnormal or predetermined system conditions and take corrective actions to

(continued)

situations may include a fault on the Transmission Provider's side of the Point of Interconnection, as well as a fault other than a three-phase fault covered by the low voltage ride-through standard.

33. We reject the requests that the standards be only guidelines. The Commission sets forth in this Final Rule a low voltage ride-through standard that it believes, after consideration of the comments from all interested entities, including the wind industry, is achievable and will maintain grid safety and reliability while facilitating the increased use of wind resources. As noted above, the Commission is setting a standard for low voltage ride-through to provide certainty and diminish the opportunities for undue discrimination. Permitting Transmission Providers to set their own specific low voltage ride-through standards would create too great a risk that this opportunity would be used to frustrate wind plant interconnections or to favor a Transmission Provider's wind generating affiliate.

34. In response to comments suggesting that we should allow NERC and the regional reliability councils to establish low voltage ride-through standards, we are aware of the work being done by these organizations to address wind plant interconnection standards. However, no such standards are available today, and Transmission Providers and wind Interconnection Customers are looking for interconnection standards to apply now. If

---

maintain system reliability. Such actions may include changes in demand, generation, or system configuration to maintain acceptable voltage or power flows.

other entities develop an alternate standard, a Transmission Provider may seek to justify adopting them as variations from Appendix G, as discussed below. Additionally, the Commission would consider a future industry petition to revise Appendix G to conform to NERC developed standards.

35. With respect to Midwest ISO TOs' concern that Appendix G, Figure 1 does not contain information on how the standard would apply to unbalanced voltages in close proximity to the point of interconnection,[25] we note that it is impossible to identify all possible conditions and circumstances that may arise on the transmission system. The low voltage ride-through standard is a general one that will be adequate under most circumstances. We recognize that special circumstances may occur. These may be identified by the System Impact Study, which should identify any additional protection requirements in addition to this standard. We also note that, as discussed below, the Commission permits variations from the Final Rule Appendix G that are "consistent with or superior to" the standard provisions, that are based on regional reliability council requirements, or that are offered by independent entities such as Regional Transmission Organizations (RTOs) or Independent System Operators (ISOs).

36. Similarly, we are not persuaded to alter the specific time periods and associated voltage levels in Figure 1 of the NOPR Appendix G. The low voltage ride-through

[25] Additionally, a number of commenters suggest low voltage ride-through levels and timing or cycling standards different from those reflected in the NOPR Appendix G, Figure 1.

standard proposed in that figure and adopted here is close to the standard used in other countries and was presented to the Commission by representatives of the wind industry as an achievable requirement. Several commenters, including Transmission Providers, support the standard as one that would safeguard reliability. The Western Electricity Coordinating Council (WECC), a regional reliability council, has approved a similar low voltage ride-through standard. The standard we adopt in this Final Rule is an international standard that has been accepted for use by the Alberta Electric System Operator and Germany, and was developed following detailed study. We do not believe it would be appropriate to deviate from such a widely-accepted and achievable standard in this rulemaking.

37. We are not convinced of a need for a separate high voltage ride-through standard for wind generators. The record developed here does not indicate that this is a general concern across the country. Parties that believe a high voltage ride-through standard is required should ask NERC or the regional reliability councils to address this need. A Transmission Provider may seek to justify variations from Appendix G to establish these requirements under the variation provisions of Order No. 2003 and its rehearing order, as briefly summarized below in section III.G, "Variations from the Final Rule."

B. Power Factor Design Criteria (Reactive Power)

38. The Commission stated in the NOPR that until recently, Transmission Providers did not require wind generators to have the capability to provide reactive power because the generators were generally small and had little effect on the transmission grid.

However, because of the larger size of many of the wind plants being built and the increased presence of wind energy on various transmission systems, the Commission proposed to require wind plants to operate within a specified power factor range to help balance the reactive power needs of the transmission system.

39. Specifically, the NOPR proposed to require that large wind plants maintain a power factor within the range of 0.95 leading to 0.95 lagging (as required by Order No. 2003), to be measured at the high voltage side of the wind plant substation transformer.[26] In Appendix G of the NOPR, we further proposed to allow wind plants flexibility in how they meet the power factor requirement; for example, using either power electronics designed to supply this level of reactive capability, fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two.[27] Additionally, the NOPR proposed to allow the Transmission Provider to waive the power factor requirement for wind plants where it is not needed at that location or for a generating facility of that size, provided that such waiver is not unduly discriminatory (that is, is offered on a comparable basis to similarly situated wind plants). The NOPR stated, however, that if the Transmission Provider waived the power factor requirement, the

[26] This proposed measurement point is different from Order No. 2003, which measures the power factor at the Point of Interconnection.

[27] Conventional generators inherently provide reactive power, whereas most induction-type generators used by wind plants currently can only provide reactive power through the addition of external devices.

interconnection agreement would be considered a non-conforming agreement under section 11.3 of the LGIP and thus would have to be filed with the Commission. The NOPR also proposed to require that wind plants have the capability to provide sufficient dynamic (as opposed to static) voltage support to interconnect to the transmission system, if the System Impact Study shows that dynamic capability is necessary for system reliability.[28]

40. The NOPR sought comments about whether the proposed power factor range should be increased or decreased for wind generating plants. It also sought comments as to whether any dynamic (i.e., controllable) reactive capability should be required of wind plants, and if so, how much. Finally, the NOPR sought comments on the proposed waiver provision.

41. The comments received fall into several categories, including the general application of a power factor requirement to wind plants and the waiver provisions, the power factor range and operation within that range, measurement of the power factor requirement at the point of interconnection, and whether dynamic reactive power capability should be a requirement. These subcategories are separately addressed below.

[28] NOPR at P 18.

1. Comments – Power Factor Range and General Application of the Requirement

42. Western, NERC, BPA and Great River support the proposed power factor range of 0.95 leading to 0.95 lagging (hereinafter stated as +/- 0.95). Southern California Edison agrees that the proposed power factor range is appropriate unless it is waived by the Transmission Provider.

43. Numerous other commenters state that they support the standard, but that the Transmission Provider should be allowed to impose a wider power factor range on a wind generating plant to maintain the reliability of the transmission system. American Superconductor, for instance, believes that the +/- 0.95 power factor range should be adopted as a standard except in cases where the Transmission Provider's System Impact Study indicates that additional reactive support is needed. Similarly, EEI asserts that the wind plant should operate within the +/- 0.95 power factor range unless the Transmission Provider has established a different standard that applies to all generators in its control area. New York PSC agrees with the NOPR power factor range, but argues that the Transmission Provider should be able to require a power factor of 0.90 lagging if the System Impact Study indicates it is needed for system reliability. FirstEnergy and American Transmission believe that to ensure a greater level of reliability, the Commission should adopt a power factor range of 0.90 lagging to 0.95 leading. NRECA-APPA maintains that while most Transmission Providers impose the +/- 0.95 power factor requirement on conventional generators, some impose a larger range, such

as 0.90 lagging to 0.95 leading, to meet reliability criteria. In that situation, they contend that the Transmission Provider should be allowed to impose that same wider power factor range on wind generating plants. In similar comments, NYISO urges the Commission to (1) consider the power factor standard a minimum requirement, as opposed to a maximum, and (2) find that the large wind farms should not be able to depend on the transmission system interconnection for the plants' excitation power.

44. NRECA-APPA and Xcel also state that the standard is unclear about whether the wind generator can operate anywhere in the +/- 0.95 range. Xcel asks that the Commission clarify whether the wind generator is expected to operate over the entire +/- 0.95 power factor range or at a specified point within that range.

45. Several commenters assert that the adherence to the Transmission Provider's voltage schedule is more important than merely maintaining a power factor within the specified range. NRECA-APPA asks that the wind plant be required to comply with the Transmission Provider’s voltage schedule directives. PacifiCorp/PPM Energy asks the Commission to revise the proposed power factor standard to require the Transmission provider to specify a power factor or voltage control set point within the 0.95 leading to 0.95 lagging range. PacifCorp/PPM Energy also contends that the parenthetical in the proposed Appendix G (stating “taking into account any limitations due to voltage level, real power output, etc.”) is ambiguous and should be eliminated.

46. AWEA argues that we should specify the minimum real power output of the wind facility at which the +/- 0.95 power factor range would apply. It states that to be clear

about the limits of this standard, the reactive power output criteria should use a minimum real power output set at greater than 10 percent of the rated output of the generator. FPL Energy states that General Electric wind turbines cannot meet the proposed power factor standard over the full range of real power output, and that dynamic VAR control (DVAR) banks or static capacitors would have to be installed at an additional expense to meet the proposed power factor over the entire range. FPL Energy asserts that such costs would provide limited reliability benefits.

47. Zilkha, FirstEnergy, NorthWestern Energy, and BPA indicate that the Transmission Provider should be allowed to waive the power factor requirement where it is not required. NUSCo, ISO New England and Midwest ISO TOs oppose allowing such a waiver. Midwest ISO TOs argue that if the Commission allows waiver, it should require that, where the Transmission Provider granting the waiver is not also the owner, the Transmission Owner approve the waiver. AWEA asserts that the proposed requirement that an interconnection agreement be filed with the Commission as a non-conforming agreement if the Transmission Provider has waived the reactive power requirement is inappropriate and inconsistent with Order No. 2003-A.

48. AWEA and FPL Energy ask that the +/- 0.95 power factor standard not be required of a wind plant unless the Transmission Provider shows that it is needed for system safety or reliability. FPL Energy states that the Transmission Provider should have the burden of demonstrating that the reactive power standard is needed. It suggests that the Commission use the same test it used in the NOPR for dynamic voltage support,

which requires that the Transmission Provider, before requiring such capability, must show that it is necessary for system reliability. The CPUC recommends a "least cost, best fit" approach to dealing with the reactive power requirement needs of wind farms.

49. Southern California Edison states that because reactive power at wind generating plants may be produced from devices external to the generator, a time delay may be necessary to allow for switching of reactive resources to enable the wind generator to operate at the appropriate power factor within the +/- 0.95 power factor range. It states, however, that exempting the wind generating plant altogether from the power factor requirement is inappropriate.

2. Commission Conclusion - Power Factor Range and General Application of the Requirement

50. We adopt the power factor range of +/- 0.95 for large wind generating plants. We modify other parts of the proposed requirements. First, this Final Rule requires the wind plant to maintain the required power factor range only if the Transmission Provider shows, through the System Impact Study, that such capability is required of that plant to ensure safety or reliability. This differs from the NOPR, which required the wind plant to maintain the required power factor in all cases, except if the Transmission Provider waived or deferred compliance with the reactive power standard. Establishing an achievable reactive power standard if it is needed for safety or reliability provides assurance to wind plant developers that their interconnection to the grid will not be frustrated or face uncertainty due to a lack of standards, and thus will limit opportunities

for undue discrimination. This uniform standard ensures that wind developers, when they seek to interconnect, are not faced with widely varying standards in different areas, or for different wind technologies, manufacturers, or plant owners. This should remove unnecessary obstacles to the increased growth of wind generation. Furthermore, ensuring that a large wind plant provides reactive support to the transmission grid if needed will ensure that safety and reliability is protected.

51. Specifically, the Commission revises the proposed power factor standard to require that the wind plant maintain the required power factor only on a case-by-case basis if the Transmission Provider, in the System Impact Study, shows that it is necessary to ensure safety or reliability. The reactive power standard adopted here properly requires the Transmission Provider to show that reactive power capability is needed for each wind plant Interconnection Customer. As we noted with regard to low voltage ride-through capability, because the Transmission Provider is responsible for the safe and reliable operation of its transmission system (pursuant to NERC and regional reliability council standards), it is in the best position to establish if reactive power is needed in individual circumstances. The System Impact Study is the appropriate study for assessing the need for reactive power capability, and this study should determine if there is a need for a wind plant to have reactive power capability to ensure that the safety or reliability of the system is maintained. Also, as we reasoned above with regard to low voltage ride-through, requiring wind plants to maintain the required power factor only if the System Impact Study shows it to be necessary ensures that the increased reliance on

wind plants does not degrade system safety or reliability. It also ensures that the Transmission Provider does not require a wind plant to install costly equipment that is not needed for grid safety or reliability. Furthermore, requiring that the System Impact Study find a need for reactive power will limit the opportunities for undue discrimination; a wind plant Interconnection Customer will not have its interconnection frustrated by unnecessary requirements that are not necessary to maintain safety or reliability. Should a wind plant Interconnection Customer disagree with the Transmission Provider that the System Impact Study shows that the power factor requirement is needed, it may challenge the Transmission Provider's conclusion through dispute resolution or appeal to the Commission.

52. Given our decision to require that a wind plant maintain the power factor standard only on a case-by-case basis where the Transmission Provider shows, through the System Impact Study, that reactive power is needed to ensure reliability, there is no need to retain the waiver provisions proposed in the NOPR. As a result, issues raised by commenters regarding the waiver provisions are moot.

53. We clarify that the wind generating plant, if required to provide reactive power capability as described above, should be able to operate anywhere in the +/- 0.95 power factor range.

54. We reject proposals to change the power factor range standard in Appendix G to 0.90 lagging to 0.95 leading. Adopting such a standard would make the power factor requirement more onerous for wind plants than for conventional generators. Concerning

NYISO's request that the Commission consider the standard as a minimum requirement as opposed to a maximum, as we declined to do so in Order No. 2003, we decline to do so here for the same reasons.

55. In response to those who assert that adherence to the voltage schedule is more important than merely maintaining a power factor within the specified range, we note that article 9.6.2 of the LGIA already requires that the "Interconnection Customer . . . . operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection." This language applies to wind plants and addresses this concern.

56. We disagree with PacifiCorp/PPM Energy that the parenthetical statement in the NOPR, "taking into account any limitations due to voltage level, real power output …," is ambiguous and unnecessary. AWEA explains that the stated power factor range cannot be accomplished by all equipment vendors at all levels of output, and asks that the wind plant be held to the +/- 0.95 power factor range only when it is generating above 10 percent of its rated output. The parenthetical statement is necessary due to the technical differences of wind plants, which cannot meet the power factor standard below certain levels of output, and addresses the concern raised by the wind industry.

57. We disagree with the CPUC's recommendation of a "least cost, best fit" approach. Such a "standard" is not a standard at all. Adopting such a least cost approach would result in widely varying "standards" for wind turbines and related equipment. This would not only open the door further for the undue discrimination that this rule is designed to

eliminate, but also would lead to high cost individualized generator designs by equipment manufacturers that would not serve the long-term needs of the wind industry.

3. Comments - Point of Interconnection

58. In the NOPR, the Commission proposed to measure the required power factor at the high side of the wind plant substation transformers, as opposed to the Point of Interconnection measurement point used in Order No. 2003. Numerous commenters, including NUSCo, Southern, National Grid, PacifiCorp/PPM Energy, and Southern California Edison request that the power factor be measured at the Point of Interconnection, as opposed to at the high voltage side of the wind plant substation transformer. FPL Energy notes that while meeting the power factor requirement at the Point of Interconnection may be more costly for wind plants that have long generation tie lines, reliability requirements will not be met by measuring the power factor at a different point. AWEA states that the appropriate point of measurement is either at the Point of Interconnection or at the high side of the wind plant's transformer, depending upon the particular electrical circumstances. It adds that the point of measurement should be determined based on the Transmission Provider's System Impact Study.

4. Commission Conclusion - Point of Interconnection

59. We adopt the Point of Interconnection as the appropriate measurement point for the power factor standard. We agree that adopting the Point of Interconnection as the measurement point will better protect system reliability because it is closer to the bulk electrical power system, and will be consistent with Order No. 2003. In addition,

numerous Transmission Providers and wind energy developers including PPM Energy and FPL Energy endorse establishing the point of measurement at the Point of Interconnection, instead of the high side of the substation transformers, as proposed in the NOPR. Moreover, FPL Energy supports this measurement point, even though it may be more costly for plants with long generation tie lines, because it is necessary for system safety and reliability.

5. Comments - Dynamic Reactive Power Capability

60. The Commission proposed in the NOPR to require wind plants to be able to provide sufficient dynamic voltage support if the System Impact Study shows that it is needed to maintain system reliability. Several commenters assert that wind generators should have dynamic reactive capability for the entire power factor range, and that dynamic reactive capability must be required in every instance. Midwest ISO TOs assert that the System Impact Study may show that no such capability is needed at the time of the study, but the need may arise later. They contend that at a minimum, a wind plant should not degrade the transient under-voltage performance of the transmission system at the Point of Interconnection.

61. Midwest ISO points to language from NERC standards[29] and argues that the need for dynamic reactive power capability cannot be determined by the System Impact Study because it is almost impossible to conceive of every possible disturbance scenario ahead of time. AEP argues that dynamic reactive capability must be required and that the specific level of dynamic capability should be determined on a need basis. ISO New England states that the wind plant's rate of response for dynamic voltage control should be comparable to that provided by a conventional synchronous generator using an automatic voltage regulator.

62. FirstEnergy and FPL Energy ask the Commission to clarify what it meant by the term "sufficient dynamic voltage support." It claims that the term "sufficient" is vague and requires clarification. Similarly, FPL Energy contends that the term "sufficient" is ambiguous, and should be clarified or removed from the Final Rule.

63. Further, FPL Energy notes that only one wind turbine manufacturer currently holds the patent for the variable speed wind turbine electronics that allow the turbine to produce dynamic reactive power. According to FPL Energy, the Commission, as a

[29] Specifically, Midwest ISO cites the following language: "Dynamic reactive power support and voltage control are essential during power system disturbances. Synchronous generators, synchronous condensers, and static var compensators (SVCs and STATCOMs) can provide dynamic support." See Comments of Midwest ISO at 5-6, citing NERC Planning Standard I. D., System Adequacy and Security – Voltage Support and Reactive Power, approved by the NERC Board of Trustees on September 16, 1997.

matter of public policy, should consider whether it is appropriate to set a power factor standard that will give one turbine manufacturer a significant competitive advantage.

64. American Superconductor argues that based on its experience of integrating wind generating plants into transmission systems, it is not always necessary to install dynamic capability for all of the reactive compensation required at a wind generating plant. It reports that all eight of the reactive compensation systems it has provided to wind generating plants used a combination of dynamic and static reactive capability. These hybrid systems consist of a small STATCOM device (with full dynamic capability)[30] that controls a number of switched shunt capacitors or reactors. They have proven to be very sound technically, as well as good economic choices, according to American Superconductor. It asks the Commission to recognize that the benefits of dynamic reactive capability can be achieved, often at substantially lower cost, by such systems.

65. NorthWestern Energy argues that dynamic reactive capability should not be required if the wind developer demonstrates that the wind generating plant will not cause voltage fluctuations greater than the "Border Line of Irritation," as identified in Section 10.5.1 of the IEEE's Standard 519, measured at the Point of Interconnection. The wind developer should also demonstrate that its addition will not diminish the rating of an

[30] A Static Compensator (STATCOM) provides voltage support to the electric system in a manner similar to a synchronous condenser and therefore is superior to Static VAR compensators or switched capacitor banks. Hybrid systems consist of a small STATCOM device and a number of switched capacitors or reactors.

existing transmission line by reducing reactive voltage support, according to NorthWestern Energy. It agrees that wind generators should be allowed to use a combination of fixed and/or switched capacitors and reactors in combination with dynamic capability to control the voltage. It states that dynamic capability would allow for the smooth switching of these devices, as well as the energizing and de-energizing of the wind turbines, without affecting the quality of power delivered to customers.

6. Commission Conclusion – Dynamic Reactive Power Capability

66. The Commission adopts the language in the NOPR regarding dynamic reactive power capability. The Final Rule Appendix G, as explained above, requires that a wind plant have reactive power capability if the Transmission Provider shows, in the System Impact Study, that it is needed for safety or reliability. The Final Rule does not require that the reactive power capability installed by the wind plant be dynamic unless the System Impact Study also shows that this type of capability is needed for system reliability. We are not convinced that dynamic reactive capability is needed in every case, and we permit the Transmission Provider to make that determination on a case-by-case basis through the System Impact Study. We believe that the Transmission Provider is best situated to determine in the first instance whether dynamic reactive capability is needed, and what level of dynamic capability is necessary. We emphasize, however, that Transmission Providers must assess the need for dynamic reactive power capability on a comparable and not unduly discriminatory basis.

67. We reject requests that the Final Rule require that the reactive capability possessed by the wind plant be dynamic in every case. We conclude that the Transmission Provider's System Impact Study should show that dynamic reactive capability is needed in a particular case. If the wind plant Interconnection Customer disagrees with the Transmission Provider that the System Impact Study shows that dynamic reactive power capability is needed, it may challenge the Transmission Provider's conclusion through dispute resolution or appeal to the Commission. We disagree with Midwest ISO TOs that a System Impact Study can account only for the need of the dynamic reactive capability on the day of the study; the study should be able to make reasonable assumptions about future days.

68. We disagree with FirstEnergy and FPL Energy that the term "sufficient" requires clarification. The Final Rule allows the Transmission Provider to determine the sufficient level of dynamic reactive capability on a case-by-case basis through the System Impact Study. As noted above, if the wind plant Interconnection Customer disagrees with the Transmission Provider's determination, it may challenge the Transmission Provider's conclusion through dispute resolution or appeal to the Commission.

69. We acknowledge that dynamic reactive capability can be achieved, often at substantially lower cost, by systems with a combination of true dynamic capability plus switched shunt capacitors and reactors. The Final Rule Appendix G gives wind plants the flexibility to use a variety of combinations to provide the reactive capability necessary.

70. In response to FPL Energy's concern regarding wind turbine supply competition, we note that the wind turbine industry is highly competitive and that manufacturers are continually improving their designs. Although one manufacturer may have a competitive advantage right now, other manufacturers have indicated that they can rapidly improve their designs as required. Also, no manufacturer took exception to the Commission's proposed requirements. Furthermore, as described in detail below, there will be a transition period before the Appendix G standards will apply.

C. Supervisory Control and Data Acquisition Capability

71. We noted in the NOPR that in the past, Transmission Providers generally did not require wind generators to have remote supervisory control and data acquisition (SCADA) capability because of their small size and minimal effects on the transmission system. Many Transmission Providers now argue that with the increasing number of large wind plants connecting to transmission systems, SCADA capability is needed to acquire wind facility operating data and ensure the safety and reliability of the transmission system during normal, system emergency, and system contingency conditions.

72. The NOPR proposed to require that a large wind plant seeking to interconnect to the transmission grid possess SCADA capability to transmit data and receive instructions from the Transmission Provider. Additionally, Appendix G would have required that the Transmission Provider and the wind plant owner determine the type of SCADA information and equipment that is essential for the proposed wind plant, taking into

account the size of the plant, its characteristics, its location, and its importance in maintaining generation resource adequacy and transmission system reliability.[31]

73. The NOPR sought comments regarding the proposed SCADA capability requirements, specifically on whether there is any essential SCADA information that large wind plants should be required to provide, such as information needed to determine how the plant's maximum megawatt output and megawatt ramp rate vary over time with changes in the wind speed or information needed to forecast the megawatt output of the plant.

1. Comments

74. Great River, Midwest ISO, First Energy and Southern California Edison support the SCADA requirement in the NOPR. Ohio Consumer's Council, while also supportive, suggests that the Commission clarify the SCADA requirement so that future disputes regarding interpretation of it are minimized.

75. Numerous other commenters support the requirement with certain modifications. For example, EEI states that the requirement should require the parties to adhere to good utility practice, as that term is refined over time. It also asserts that the Commission

[31] Unlike synchronous generating plants, which generally have SCADA capability, can respond to automatic generation control signals from the control center and are often staffed, wind generating plants consist of numerous induction generators connected through a medium-voltage collector system, and are often remote, unmanned, and characterized by an unpredictable rate of change of output, thus making it difficult for the Transmission Provider to limit the output of the wind plant when necessary for system reliability.

should recognize that NERC and other regional reliability councils are the appropriate entities to determine how to support real-time operations associated with data acquisition and data exchange. Western and Gamesa, among others, believe that SCADA capability, at a minimum, should include real-time and hourly real power output and reactive power output information and interconnection facility status information. Gamesa and NorthWestern Energy also argue that third parties who have experience with wind energy forecasting, not the Transmission Provider or the control area operator, should develop wind forecasting models and paradigms. NorthWestern Energy further asserts that the wind plant should be manned at all times. Similarly, Xcel supports a requirement that wind plants provide a leased voice line from the Transmission Control Center to a manned wind plant control center for voltage support.

76. Xcel, New York PSC, AEP, NERC and LIPA, among others, support a SCADA requirement, but generally contend that the type of SCADA capability required should be determined between the individual Transmission Provider and the wind plant, based on local system requirements. LIPA, New York PSC and Southern assert that the right to determine what SCADA capability is required should not be delegated in whole or part to the wind plant developer. Southern is also concerned that limiting SCADA information requirements to only what is “essential” for the wind plant may be interpreted to jeopardize reliability. It suggests eliminating the term “essential” and replacing it with “required” to ensure that reliability is not jeopardized.

77. NRECA-APPA generally support the Commission's proposed SCADA requirement, but they question the Commission's statement in footnote 13 of the NOPR that it is difficult for the Transmission Provider to limit the output of a wind plant when necessary for reliability. They state that according to General Electric, wind farms in Europe are installing communications and control equipment (including turbine blades that can be adjusted to reduce the output of the wind generator at various wind speeds) to allow this to be done. They note that while not all wind plants need this capability, it may be needed at some plants, depending on the size of the plant or the number of wind plants on a transmission system, or other system characteristics.

78. AWEA and FPL Energy both express concern that the requirement in the NOPR that wind plants have the capability to "receive instructions" through SCADA could be interpreted to require control of the wind plant by the Transmission Provider, for example, to curtail the wind plant remotely at any time. FPL Energy asks the Commission to revise the requirement that the wind plant be able to "receive instructions" through SCADA to apply only during Emergency Conditions, as defined in the LGIA. AWEA asks that the Commission clarify that the proposed SCADA requirement does not establish a presumption that output controls are part of the standard, and that it state clearly that the terms and conditions for use of SCADA capability is a separate transmission service issue, not an interconnection issue, and must be resolved by contract or Commission-approved transmission tariff. Conversely, BPA asserts that direct SCADA control by the Transmission Provider is preferable and that the final

SCADA requirement should permit a Transmission Provider to exercise supervisory control over a wind plant.

79. Southern, Nevada Power and American Transmission maintain that the SCADA requirement for wind generators should be the same as that for synchronous generators.

2. Commission Conclusion

80. We adopt the SCADA requirement proposed in the NOPR. In response to AWEA and FPL Energy, however, we clarify that Appendix G requires the wind plant to have only the capability to receive instructions. Nothing in this Final Rule authorizes a Transmission Provider to control a wind plant. Any such authorization would be subject to separate negotiation and agreement between the Interconnection Customer and the Transmission Provider.

81. Under the SCADA requirement adopted here, the wind Interconnection Customer will provide SCADA capability, with the specific SCADA information and control capability required to be agreed to by the wind plant Interconnection Customer and the Transmission Provider. This flexible requirement ensures that wind plants have SCADA capability, which we believe is necessary to ensure that system reliability is protected, and permits the wind plant Interconnection Customer and the Transmission Provider to negotiate the specific SCADA capability that meets the needs of the transmission system at the specific location of the wind plant. We expect Transmission Providers to be reasonable in these negotiations and not to use their control over the Transmission System to unnecessarily burden wind plants. Should the wind plant Interconnection

Customer disagree with the Transmission Provider about the level of SCADA capability required, it may challenge the Transmission Provider's conclusion through dispute resolution or appeal to the Commission.

82. In response to EEI's request, the SCADA requirement does not need to be revised explicitly to require adherence to good utility practice. We note that Appendix G is a component of the LGIA, and the LGIA itself already requires the parties to adhere to good utility practice.

83. With respect to comments concerning the type of SCADA information needed for wind plants, the SCADA requirement in the NOPR allows the Parties to decide what information should be provided and the equipment to be installed at the site. We adopt this policy in this Final Rule. We are not deciding such issues as whether third parties should be used to develop wind forecasting models and paradigms. We simply require that some SCADA capability be installed for operation and reliability purposes. The flexible nature of the requirement we adopt here recognizes, as NERC states, that other entities are more appropriate to determine how best to support real-time operation with data acquisition and exchange. We agree with AWEA and others that this Final Rule only requires that SCADA capability be provided by the wind plant, and that the type of SCADA information supplied and control exercised can be negotiated and set forth in a separate agreement between the wind plant Interconnection Customer and the Transmission Provider.

84. Similarly, we deny requests that the Transmission Provider have the sole authority to determine the type of SCADA equipment to be installed at the wind plant. To ensure that unnecessary SCADA equipment is not required of the wind plant, the parties must determine together the SCADA capability and equipment needed, taking into account the size, location and characteristics of the wind plant and the safety and reliability of the transmission system. Southern has not shown that replacing the term "essential" with "required" would add any clarity to the requirement.

85. We are not convinced by arguments that the SCADA requirements for wind plants should be the same as for conventional generators. Since wind is different from conventional generators (as discussed above), information exchanged between the Transmission Provider and the wind plant may be of a different nature. As a result, it is appropriate to have different, more flexible SCADA requirements for wind plants.

D. Wind Plant Interconnection Modeling

86. In its May 20, 2004 petition, AWEA proposed that Transmission Providers be required to "participate in a formal process for updating, improving, and validating the engineering models used for modeling the interconnection impacts of wind turbines."[32] The Commission did not propose such a requirement in the NOPR, because such a process should take place outside the Commission, through industry technical groups or the regional reliability councils. The Commission recognized, however, that

[32] See Petition of AWEA at 5.

improvements in the way that wind interconnections are modeled would be beneficial, and encouraged the industry to address this issue.

1. Comments

87. Those submitting comments regarding wind plant interconnection modeling generally support the Commission's conclusion that the issue is best addressed through industry technical groups, NERC, and regional reliability councils.

2. Commission Conclusion

88. As we stated in the NOPR, we recommend that wind developers, wind turbine manufacturers, Transmission Providers and affected parties form technical groups and participate in a formal process to address, update, improve and validate wind turbine engineering models. We remain convinced, however, that the Commission is not the appropriate forum for such a process.

E. Self-Study of Interconnection Feasibility

89. In the NOPR, the Commission rejected a proposal by AWEA that would permit a wind plant Interconnection Customer to enter the interconnection queue and receive the base case data to "self-study" the feasibility of its proposed interconnection without having first submitted an Interconnection Request that includes power and load flow data and fully completed plant electric design specifications, as required under Order No. 2003.[33] The Commission noted that Order No. 2003 requires that a valid and complete

[33] See id. at 13-14.

Interconnection Request be on file with the Transmission Provider before the Interconnection Customer may receive Base Case data.[34] We further noted, however, that Section 2.3 of the LGIP did not address situations where the Interconnection Customer might need access to the Base Case data before it could complete its Interconnection Request. The Commission therefore sought comments on how to balance the need of wind generators to receive the base case data and "self-study" before filing a completed Interconnection Request with the need to protect this critical energy infrastructure information and commercially sensitive data against unwarranted disclosure.

1. Comments

90. Several entities, including Tucson Electric, Midwest Reliability Organization, Montana-Dakota Utilities, New York PSC, Nevada Power, Great River, LIPA, BPA, American Transmission, NUSCo, Xcel, and Midwest ISO TOs oppose AWEA's proposal to allow wind generators to be placed in the queue, receive the base case data and "self-study" before filing completed electric design specifications and other related technical data. They generally argue that wind plants should be treated no differently from other generating plants. Montana-Dakota Utilities suggests that wind plant developers use generic power flow network models before filing Interconnection Requests, since these models would not likely reveal commercially sensitive data or critical energy

[34] See NOPR at P 22, citing LGIP, section 2.3; see also Order No. 2003 at P 77-84.

infrastructure information. BPA does state, however, that while it supports the Commission's decision not to alter the LGIA timelines, the requirement that wind plants provide detailed project specifications could be relaxed at the Feasibility Study stage, and that it is willing to work with wind developers to ensure that they have the information necessary to develop their Interconnection Requests. It asserts that the Commission should allow Transmission Providers the flexibility to determine when wind developers should submit turbine specifications and detailed electrical design data. LIPA argues that all generators should have comparable access to base case data, subject to their willingness to sign a confidentiality agreement, and that discussion of how to accommodate alternative plant designs (such as wind plants) in the interconnection process should be left to the Transmission Provider and the generator.

91. NRECA-APPA state that while they are willing to accept AWEA's proposal, they do not object to the NOPR proposal. Numerous other commenters, including Western, PacifiCorp/PPM Energy, FPL Energy, and the Ohio Consumer's Council indicate that they generally support the AWEA "self-study" proposal, or offer suggestions to balance the need of wind plants to obtain base case data with the need to protect such data from unwarranted release. Western has no objection to allowing wind generators to self-study if the Transmission Provider is given final approval before the Interconnection Request is completed. It asserts that wind plants should request base case data directly from the regional reliability council, execute a confidentiality agreement and pay a fee. PJM similarly contends that allowing wind plants to obtain base case data from the regional

reliability councils will allow sufficient self-study by the developer while also limiting the need for multiple restudies by the Transmission Provider. Western contends that self-study and base case information should be available to all prospective Interconnection Customers.

92. Ohio Consumer's Council asks that the Commission seriously consider AWEA's proposal that wind projects not be required to provide some detailed design data as a condition of obtaining a place in the interconnection queue. It states that large wind projects are based on complex and variable site work compared to the more traditional generating plants that are studied for selected locations based on transportation needs and access to water for cooling purposes. It stresses that the Commission's requirements regarding the submission of design data for entry in the interconnection queue should reflect these differences in technologies.

93. AWEA and PacifiCorp/PPM Energy ask the Commission to reconsider its proposal not to adopt AWEA's self-study proposal. PacifiCorp/PPM Energy state that wind turbine performance varies significantly by manufacturer and that wind plant developers necessarily typically negotiate turbine selection and evaluate the configuration of the facility throughout the interconnection study period. AWEA similarly notes the complexities involved in laying out the medium voltage collector systems used by wind plants, and states the layout cannot be finalized until the Point of Interconnection is firmly established. It states that consequently, the detailed design and data for the collector system, which many Transmission Providers assert is required by the

Interconnection Request, cannot be available when the Interconnection Request is submitted. AWEA suggests that, rather than requiring that the generating plant design be "substantially completed" at the time the Interconnection Request is submitted, the Commission should allow a wind plant to file an Interconnection Request with the generating plant design data and other related data depicting the wind plant as "a single generating unit connected through step-up transformation, with the equivalent power output characteristics (MW output and MVAR range) as the total net MW output of the wind generating facility in question."[35] Under this proposal, the wind plant developer would be required to provide a "substantially completed" generating plant design before the System Impact Study, along with either the power system load flow data sheets or the newly developed machine models with substantially complete input data to those models. AWEA states that many, but not all, Transmission Providers now accept such data as satisfying the requirements of the Interconnection Request.

2. Commission Conclusion

94. In this Final Rule, we allow a wind plant Interconnection Customer to satisfy the requirements of the Interconnection Request by providing a set of preliminary electric design specifications depicting the wind plant as a single equivalent generator, as explained below. Once completing the Interconnection Request in this manner, the wind plant may enter the queue and receive the base case data as provided for in Order No.

[35] Comments of AWEA at 10-11.

2003. The Commission directs that these provisions be attached as Appendix G to the LGIP in the OATTs of all public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce.[36]

95. In the NOPR, we noted that Section 2.3 of the LGIP did not address situations in which the Interconnection Customer needs the Base Case data before it can complete its Interconnection Request. We sought comments on how to balance the need of wind generators to have this information before filing a completed Interconnection Request with the need to protect this critical energy infrastructure information and commercially sensitive data against unwarranted disclosure. In addition, we sought to ensure that one class of customers was not being given undue preferential treatment.

96. We note that many Transmission Providers, non-wind generators, and a state regulatory commission oppose allowing wind generators to file Interconnection Requests, and hence be given a place in the queue, before submitting their final plant designs and related technical data. However, some trade organizations, wind developers, and Transmission Providers with substantial experience interconnecting wind plants, including AWEA, FPL Energy, PacifiCorp/PPM Energy, Western and Ohio Consumer's

[36] The Commission requires that these procedural provisions be separately appended as Appendix G to the LGIP, because they are procedural in nature, and to ensure that they are in force during the initial stages of the interconnection process. We are retaining the Appendix G moniker to ensure that these procedural provisions are recognized as applicable only to the interconnection of large wind plants, the subject of this Final Rule. The remaining technical requirements adopted in this Final Rule must be appended as Appendix G to the LGIA.

Council, support the AWEA proposal or some accommodation of wind's special needs.

97. We are persuaded that wind projects are not the same as conventional generators with regard to Interconnection Requests. Large conventional generators are generally standard in design, and their design specifications and configurations do not necessarily change as a result of where they are located on the Transmission Provider's transmission system. Large wind plants, on the other hand, are located on sites made up of several acres of land. Their physical layout often consists of hundreds of wind turbines in the more remote areas of a Transmission Provider's system, and that layout can extend for several miles. The physical placement of the turbines, transformers and voltage support devices that affect the electrical characteristics created by the medium voltage collector system depend on the size and location of the wind plant and the location of other generators on the Transmission Provider's system. For these reasons, wind plant developers are unable to submit completed design specifications for individual wind turbines until much later in the interconnection process, in comparison with other developers.

98. However, a wind plant developer can provide at the time the Interconnection Request is submitted design specifications for the wind generating plant based on its aggregate output, though perhaps not for the individual wind turbines. As we stated in Order No. 2003-A and in the NOPR, the Appendix G we adopt in this rule is designed to account for these unique technical characteristics of wind plants. Recognizing these

unique characteristics is not favoring one form of generation over others; it simply removes barriers to wind plant development that are not necessary to protect safety or reliability.

99. In short, we are persuaded that the technical characteristics of wind plants prevent them from providing certain detailed design specifications and other information at the time of the Interconnection Request. Therefore, the Commission adopts provisions in the Final Rule Appendix G permitting the wind developer to satisfy the requirements of the Interconnection Request by providing a set of preliminary electrical design specifications depicting the wind plant as a single equivalent generator.[37] Upon satisfying these and other applicable Interconnection Request requirements in Order No. 2003, the wind plant may enter the queue and receive the base case data as provided for all large generators in Order No. 2003. However, no more than six months later, the wind plant must submit completed detailed design specifications and other data (including collector system layout data) needed to allow the Transmission Provider to complete its System Impact Study. This information must be provided before the System Impact Study can begin. This deadline provides a date certain regarding when the final design specifications must be submitted to the Transmission Provider to avoid having uncertain projects in the queue.

[37] "Single equivalent generator" information is design data that represents the aggregate electrical characteristics of the individual wind generators as a single generator.

100. Permitting wind plants to provide single-generator-equivalent specifications at the Interconnection Request stage appropriately balances the need of a Transmission Provider to have adequate data in the Interconnection Request and the difficulty that a wind plant developer has in completing its detailed design before entering the queue and receiving access to the base case data. This provision also protects critical energy infrastructure information by making none of it available to anyone who has not made a satisfactory Interconnection Request. Wind plants will follow all other requirements of the queue and study processes set forth in Order No. 2003, including the timelines and confidentiality provisions.

F. Applicability to Other Generating Technologies

101. In the NOPR, the Commission sought comments as to whether there are other alternative technologies that should be covered by Appendix G.

1. Comments

102. Numerous entities state that other alternative technologies should be made subject to Appendix G.[38] Southern California Edison asserts that all non-synchronous generators should be subject to Appendix G. Tucson Electric submits that solar generators without fueled backup should be included in Appendix G. Other commenters, including Midwest Reliability Organization, National Grid, Xcel, the CPUC and Great River generally state

[38] These entities include PJM, BPA, ISO New England, NYISO, Southern California Edison, CenterPoint, the NARUC, LIPA, New York PSC, Nevada Power, NUSCo and Tucson Electric.

that they do not necessarily support including other alternative technologies within the coverage of Appendix G. The CPUC, for example, does not believe that Appendix G should be expanded to apply to "renewable" technologies other than those that are intermittent or geographically constrained. National Grid states that these proceedings have focused exclusively on wind generation and thus does not support applying Appendix G more broadly. Xcel states that other non-synchronous technologies have not matured sufficiently to operate on a scale greater than 20 MW, and therefore should not be able to use Appendix G.

103. American Transmission asserts that the Commission should adopt the Alberta Electric System Operator definition of asynchronous generation, which is "a type of generator that produces alternating electric current that matches the frequency of an interconnected power system and the mechanical rotor of the generator does not rotate in synchronism with the system frequency." It argues that the Alberta Electric System Operator definition is superior because it is used in the electric power technical community to refer to the type of generator to which the NOPR is directed and because it compares the speed of an asynchronous generator to that of a traditional generator.

2. Commission Conclusion

104. The Commission concludes that the Final Rule Appendix G exceptions to the LGIP and LGIA apply only to large wind plants. As discussed above, the Appendix G was designed around the special needs and design characteristics of wind generators. The NOPR asked whether there were other generators that have similar characters and require

similar technical requirements to those contained in Appendix G. Although numerous commenters suggested that other generators may have special needs and suggested that they should be made subject to Appendix G, none other than Tucson (who suggested solar generators without fueled backup) offered a specific induction generator technology with similar characteristics to wind as an Appendix G candidate. The Appendix G provisions adopted here focuses on the special characteristics of large wind plants, particularly the fact that they utilize many induction generators connected to the transmission system at a single point through a medium-voltage collector system. The Commission has not found at this time that any other technologies, including the solar generators without fueled backup offered by Tucson, have similar characteristics.

105. The Commission does not adopt American Transmission's proposed definition of "asynchronous generation" in the Final Rule. The Commission is not relying on the concept of asynchronous generation in this Final Rule, and we do not believe that this characteristic appropriately identifies the interconnection needs of large wind plants addressed by the Final Rule Appendix G. Accordingly, we do not make any definitional changes.

106. While we are not applying the Final Rule Appendix G to non-wind technologies, we may do this in the future, or take other generic or case-specific actions, if another technology emerges for which a different set of interconnection requirements is necessary.

G. Variations from the Final Rule

107. The NOPR proposed to permit Transmission Providers to justify variations from the Final Rule Appendix G using the same three variation standards in Order No. 2003. First, public utilities may seek variations from the Final Rule Appendix G based on regional reliability council requirements.[39] Second, we proposed that public utilities may argue that proposed variations are "consistent with or superior to" the Final Rule Appendix G.[40] Third, we proposed to permit independent public utility Transmission Providers, such as Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs), greater flexibility in adopting Appendix G(the "independent entity variation").[41]

1. Comments

108. Numerous entities request that they be permitted to justify variations from the Appendix G requirements. Several ask the Commission to clarify that the Appendix G performance standards are minimum requirements, as noted elsewhere.[42] Some commenters encourage the Commission to use NERC or regional reliability councils to

[39] See NOPR at P 25, citing Order No. 2003 at P 823-24.

[40] See NOPR at P 25, citing Order No. 2003 at P 816.

[41] See NOPR at P 25, citing Order No. 2003 at P 822-27 and Order No. 2003-A at P 48.

[42] These entities include Midwest ISO TOs, FirstEnergy, NYISO, LADWP, NorthWestern Energy, CPUC and Southern, among others.

develop necessary technical standards and requirements applicable to wind generation and its effect on reliability, including the incorporation of NERC's American National Standards Institute-approved standards, field tests and other requirements.

2. Commission Conclusion

109. As we proposed in the NOPR, we apply here all three of the variation standards in Order No. 2003. If a Transmission Provider seeks to justify variations from Appendix G, it may do so in its compliance filing. A Transmission Provider may propose to include standards developed by NERC or a regional reliability council in its own Appendix G. The Commission is mindful of the work being done by these organizations in developing standards for the interconnection of wind plants, and we strongly encourage all interested parties, including Transmission Providers, wind plant developers and wind turbine manufacturers, to continue to participate in developing these standards. The Commission will consider them in any request for a variation from the Final Rule Appendix G by an individual Transmission Provider, or a request by many to revise Appendix G.

H. Transition Period

110. In the NOPR, the Commission did not propose a transition period before the technical requirements in Appendix G would take effect.

1. Comments

111. AWEA, FPL Energy, and PacifiCorp/PPM Energy ask that there be a transition period so Appendix G would apply only to LGIAs signed or unexecuted LGIAs filed with the Commission after January 1, 2006, or six months after the issuance of this Final

Rule, whichever is later. FPL Energy asserts that a transition period is needed to prevent added costs and delays to protect previously executed wind equipment purchase agreements and power purchase arrangements. PacifiCorp/PPM Energy add that wind turbines are already in the process of being manufactured that would require substantial changes to their electronics to meet the proposed requirements. AWEA asserts that the Commission has historically provided a transition period in similar circumstances, including in Order No. 2003.

112. AWEA also asks that all wind plants that are interconnected to the transmission system when Appendix G is adopted, or that have executed an LGIA or filed an unexecuted LGIA with the Commission before January 1, 2006 or six months after the issuance of this Final Rule, whichever is later, be exempted from the Appendix G requirements for the remaining life of the existing wind generator equipment. Likewise, Ohio Consumer's Council, LIPA and Xcel support a transition period and state that existing wind projects or those in advanced planning should be exempt from the Appendix G requirements.

113. BPA and American Transmission are opposed to any transition period. American Transmission states that once Appendix G is adopted, no deviations should be permitted unless otherwise agreed to by the Transmission Provider. BPA states that installing outdated or inferior wind equipment that is incapable of complying with reliability criteria is contrary to the intent of this proceeding. American Transmission also maintains that existing interconnection agreements with wind plants must be amended to

conform to the requirements adopted in this proceeding. It argues that technical requirements for similar generating facilities should not be based merely on the timing of the interconnection.

2. Commission Conclusion

114. For the low voltage ride-through, SCADA, and power factor design criteria requirements adopted in the Final Rule Appendix G, which are substantive technical requirements, the Commission adopts the transition period requested by AWEA and others. Accordingly, these technical requirements in the Final Rule Appendix G, if applicable, apply only to LGIAs signed, filed with the Commission in unexecuted form, or filed as non-conforming agreements, on or after January 1, 2006, or the date six months after publication of the Final Rule in the Federal Register, whichever is later. The procedures permitting the wind plant Interconnection Customer to complete the Interconnection Request with single-generator equivalent design specifications apply immediately when the Final Rule becomes effective, 60 days after its publication in the Federal Register. This effective date also applies for purposes of public utilities making compliance filings to meet this Final Rule, as discussed further below.

115. It would be unfair and unreasonable to apply the low voltage ride-through, SCADA and power factor requirements in the Final Rule immediately or retroactively. The reasonable transition period we establish in this Final Rule allows wind equipment currently in the process of being manufactured to be completed without delay or added expense. This ensures that the Final Rule does not interrupt the supply of wind turbines.

Further, we disagree with BPA that the transition period will undermine the reliability of a Transmission Provider's system. We note that during the transition period, our large generator interconnection rule applies to wind plants. Even though article 9.6.1 (Power Factor Design Criteria) of the LGIA does not apply to wind plants, the other provisions of that rule are adequate to prevent an interconnection that would undermine reliability of a Transmission Provider's system

116. Consistent with our action grandfathering existing interconnection agreements in Order No. 2003,[43] the Commission is not requiring modifications to existing interconnection agreements, and is not requiring that interconnection agreements signed, filed with the Commission in unexecuted form, or filed as a non-conforming agreement before January 1, 2006, or the date six months after publication of the Final Rule in the Federal Register, whichever is later, comply with the low voltage ride-through, SCADA and power factor requirements of the Final Rule Appendix G, if applicable.

I. Miscellaneous Comments

117. The Fertilizer Institute notes that wind generators and generators that use waste heat have several things in common; for example, both produce electricity without any fuel consumption or air emissions. It states that through no fault of their own, neither wind generators nor fertilizer-fired generators can meet the rigorous balancing and scheduling requirements imposed by Transmission Provider's. It urges the Commission

[43] See Order No. 2003 at P 911.

to exempt both from any requirement to balance their power deliveries and power receipts during any time period shorter than the peak and non-peak periods of a given day.

118. Also, American Transmission contends that Transmission Owners who are part of an RTO/ISO should be allowed to pursue ADR before an LGIA is filed with the Commission on an unexecuted basis.

1. Commission Conclusion

119. In response to the comments of the Fertilizer Institute, we note that the Commission recently issued a NOPR in Docket No. RM05-10-000 to address generator imbalance penalties assessed to intermittent generating resources.[44] We will consider the Fertilizer Institute's comments in that proceeding.

120. Further, in response to American Transmission's request that ADR be permitted before an unexecuted LGIA is filed, we note that the LGIP already provides dispute resolution procedures that apply to wind plant interconnections.[45]

---

[44] Imbalance Provisions for Intermittent Resources Assessing the State of Wind Energy in Wholesale Electricity Markets, Notice of Proposed Rulemaking, 70 Fed. Reg. 21,349 (Apr. 26, 2005), 111 FERC ¶ 61,026 (2005).

[45] See LGIP § 13.5.

J. Compliance Issues

121. As in Order No. 2003,[46] the Commission is requiring all public utilities that own, control, or operate transmission facilities in interstate commerce to adopt the Final Rule Appendix G as amendments (as discussed above) to the LGIP and LGIA in their OATTs 60 days after publication of the Final Rule in the Federal Register. Public utilities subject to this Final Rule are directed to adopt the low voltage ride-through, SCADA, and power factor design criteria requirements of the Final Rule Appendix G as amendments to their LGIAs, and to adopt the procedural provisions in the Final Rule Appendix G concerning completion of the Interconnection Request by the wind plant Interconnection Customer as amendments to their LGIPs. Further, consistent with our approach in Order No. 2003 and as discussed above,[47] we are not requiring retroactive changes to wind plant interconnection agreements that are already in effect. Also, as noted above, the low voltage ride-through, SCADA and power factor requirements adopted in the Final Rule Appendix G, if applicable, do not apply to LGIAs signed, filed with the Commission in unexecuted form, or filed as a non-conforming agreement, on or before January 1, 2006 or six months after the publication of this Final Rule in the Federal Register, whichever is later. As we state above, however, the procedures adopted in the Final Rule Appendix G

[46] See Order No. 2003 at P 910.

[47] Id. at P 911.

regarding completion of the Interconnection Request by a wind plant Interconnection Customer apply beginning on the effective date of this Final Rule.

IV. Information Collection Statement

122. Office of Management and Budget (OMB) regulations require OMB to approve certain information collection requirements imposed by agency rule.[48] The Commission solicited comments on the Commission's need for this information, whether the information would have practical use, the accuracy of provided burden estimates, ways to enhance the quality, utility and clarity of the information to be collected, and any suggested methods for minimizing respondents' burden, including the use of automated information techniques. With the exception of BPA, which supported the objectives of the Paperwork Reduction Act, the Commission did not receive any comments concerning its burden or cost estimates. Therefore, the Commission retains the estimates proposed in the NOPR.

123. Public Reporting Burden:

Data Collection	No. of Respondents	No. of Responses	Hours Per Response	Total Annual Hours
FERC-516	238	1	18	4,284

Title: FERC-516, Electric Rate Schedule Filings

Action: Proposed Information Collection.

[48] 5 CFR § 1320.11 (2004).

OMB Control No.: 1902-0096

The applicant shall not be penalized for failure to respond to this collection of information unless the collection of information displays a valid OMB control number.

Respondents: Business or other for profit.

Frequency of Responses: On occasion.

Necessity of Information: The regulations revise the requirements contained in 18 CFR Part 35. The Commission is revising its standardized interconnection procedures and agreements to adopt standard technical requirements and procedures specifically applicable to wind generating plants. In particular, the Commission requires that public utilities add to their standard interconnection procedures and agreements standard technical requirements and procedures for the interconnection of wind generation plants. The Final Rule requires that each public utility that owns, operates, or controls transmission facilities make filings incorporating these technical requirements into its open access transmission tariff.

Internal Review: The Commission has assured itself, by means of internal review, that there is specific, objective support for the burden estimates associated with the information collection requirements. The Commission's Office of Market, Tariffs and Rates uses the data included in filings under section 203 and 205 of the Federal Power to evaluate efforts for interconnection and coordination of the U.S. electric transmission system as well as for general industry oversight. These information requirements conform to the Commission's plan for efficient information collection, communication,

and management within the electric power industry. Interested persons may obtain information on the reporting requirements by contacting the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426, Attention: Michael Miller, Office of the Executive Director, phone: (202) 502-8415, fax: (202) 273-0873, e-mail: michael.miller@ferc.gov. Comments on the requirements of the subject rule may also be sent to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, D.C. 20503, Attention: Desk Officer for the Federal Energy Regulatory Commission, phone: (202) 395-4650.

V. Environmental Analysis

124. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[49] As we stated in the NOPR, the Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in this categorical exclusion are rules that are clarifying, corrective, or procedural, or that do not substantially change the effect of the regulations being amended.[50] The categorical exclusion also includes information

[49] Order No. 486, Regulations Implementing the National Environmental Policy Act, 52 Fed. Reg. 47897 (Dec. 17, 1987), FERC Stats. & Regs. Preambles 1986-1990 ¶ 30,783 (Dec. 10, 1987).

[50] 18 CFR § 380.4(a)(2)(ii) (2004).

gathering, analysis, and dissemination.[51] This Final Rule updates and clarifies the application of the Commission's standard interconnection requirements to wind generating plants. Further, this Final Rule involves information gathering, analysis, and dissemination regarding the interconnection of wind generators. Therefore, the rule falls within the categorical exemptions provided in the Commission's Regulations, and as a result neither an environmental impact statement nor an environmental assessment is required. Additionally, we note that this rule removes unnecessary obstacles to the development and interconnection of wind plants, eliminating the airborne and other emissions that would otherwise result from the construction of fossil fuel generating plants.

VI. Regulatory Flexibility Act Certification

125. The Regulatory Flexibility Act of 1980 (RFA)[52] generally requires a description and analysis of final rules that have significant economic impact on a substantial number

[51] 18 CFR § 380.4(a)(5) (2004).

[52] 5 U.S.C. § 601-612 (2000).

of small entities.[53] The Commission is not required to make such analyses if a rule would not have such an effect.

126. The Commission does not believe that this Final Rule will have such an impact on small entities. Most filing companies subject to the Commission's jurisdiction do not fall within the RFA's definition of a small entity. Further, the filing requirements contain standard generator interconnection procedures and agreement for interconnecting wind plants larger than 20 MW, which exceeds the threshold of the Small Business Size Standard of NAICS. Therefore, the Commission certifies that this rule will not have a significant economic impact on a substantial number of small entities.

VII. Document Availability

127. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through FERC's Home Page (http://www.ferc.gov) and in FERC's Public Reference Room during normal business

[53] The RFA definition of "small entity" refers to the definition provided in the Small Business Act, which defines a "small business concern" as a business that is independently owned and operated and that is not dominant in its field of operation. 15 U.S.C. § 632 (2000). The Small Business Size Standards component of the North American Industry Classification System defines a small electric utility as one that, including its affiliates, is primarily engaged in the generation, transmission, and/or distribution of electric energy for sale and whose total electric output for the preceding fiscal years did not exceed 4 million MWh. 13 CFR § 121.201 (Section 22, Utilities, North American Industry Classification System, NAICS) (2004)).

hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, N.E., Room 2A, Washington, D.C. 20426.

128. From the Commission's Home Page on the Internet, this information is available in the Commission's document management system, eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

129. User assistance is available for eLibrary and the FERC's website during normal business hours. For assistance, please contact FERC Online Support at 1-866-208-3676 (toll free) or 202-502-6652 (e-mail at FERCOnlineSupport@FERC.gov), or the Public Reference Room at 202-502-8371, TTY 202-502-8659 (e-mail at public.referenceroom@ferc.gov).

VIII. Effective Date and Congressional Notification

130. This Final Rule will take effect [insert date that is 60 days after date of publication in the **FEDERAL REGISTER].** However, as noted above (under "Transition Period"), the technical requirements in the Final Rule LGIA Appendix G will apply only to LGIAs signed, or agreements filed with the Commission in unexecuted form, on or after January 1, 2006, or the date six months from the date of publication of this Final Rule in the Federal Register, whichever is later. The Commission has determined with the concurrence of the Administrator of the Office of Information and Regulatory Affairs, Office of Management and Budget, that this rule is not a major rule within the meaning

of section 251 of the Small Business Regulatory Enforcement Fairness Act of 1996.[54] The Commission will submit the Final Rule to both houses of Congress and the General Accountability Office.[55]

Electric power rates; Electric utilities.

By the Commission.

Linda Mitry,
Deputy Secretary.

[54] See 5 U.S.C. 804(2) (2000).

[55] See 5 U.S.C. 801(a) (1) (A) (2000).

In consideration of the foregoing, the Commission revises part 35, Chapter I, Title 18 of the Code of Federal Regulations, as follows.

PART 35 – FILING OF RATE SCHEDULES

1. The authority citation for part 35 continues to read as follows:

Authority: 16 U.S.C. §§ 791a-825r, §§ 2601-2645; 31 U.S.C. § 9701; 42 U.S.C. §§ 7101-7352.

2. In § 35.28, the first sentences of currently existing paragraphs (f)(1) and (f)(1)(iii) are revised, a new paragraph (f)(1)(iii) is added, and currently existing paragraph (f)(1)(iii) is renumbered to account for new paragraph (f)(1)(iii) all to read as follows:

§ 35.28 Non-discriminatory open access transmission tariff.

* * * * *

(f) Standard generator interconnection procedures and agreements.

(1) Every public utility that is required to have on file a non-discriminatory open access transmission tariff under this section must amend such tariff by adding the standard interconnection procedures and agreement contained in Order No. 2003, FERC Stats. & Regs. ¶ 31,146 (Final Rule on Generator Interconnection), as amended by the Commission in Order No. 661, FERC Stats. & Regs. ¶ _____ (Final Rule on Interconnection for Wind Energy), and the standard small generator interconnection procedures and agreement contained in Order No. 2006, FERC Stats. & Regs. ¶ _____

(Final Rule on Small Generator Interconnection), or such other interconnection procedures and agreements as may be approved by the Commission consistent with Order No. 2003, FERC Stats. & Regs. ¶ 31,146 (Final Rule on Generator Interconnection) and Order No. 2006, FERC Stats. & Regs. ¶ _____ (Final Rule on Small Generator Interconnection).

(i) The amendment to implement the Final Rule on Generator Interconnection required by the preceding subsection must be filed no later than January 20, 2004.

(ii) The amendment to implement the Final Rule on Small Generator Interconnection required by the preceding subsection must be filed no later than [insert date 60 days after publication in the FEDERAL REGISTER].

(iii) The amendment to implement the Final Rule on Interconnection for Wind Energy required by the preceding subsection must be filed no later than [insert date 60 days after publication in the FEDERAL Register].

(iv) Any public utility that seeks a deviation from the standard interconnection procedures and agreement contained in Order No. 2003, FERC Stats. & Regs. ¶ 31,146 (Final Rule on Generator Interconnection), as amended by the Commission in Order No. 661, FERC Stats. & Regs. ¶ _____ (Final Rule on Interconnection for Wind Energy), or the standard small generator interconnection procedures and agreement contained in Order No. 2006, FERC Stats. & Regs. ¶ _____ (Final Rule on Small Generator

Interconnection), must demonstrate that the deviation is consistent with the principles of either Order No. 2003, FERC Stats. & Regs. ¶ 31,146 (Final Rule on Generator Interconnection) or Order No. 2006, FERC Stats. & Regs. ¶ _____ (Final Rule on Small Generator Interconnection).

Appendix B

[NOTE: THESE PROVISIONS TO BE ADOPTED AS APPENDIX G TO THE LGIA]

APPENDIX G

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard in Figure 1, below, if the Transmission Provider's System Impact Study shows that low voltage ride-through capability is required to ensure safety or reliability.

The standard applies to voltage measured at the Point of Interconnection as defined in this LGIA. The figure shows the ratio of actual to nominal voltage (on the vertical axis) over time (on the horizontal axis). Before time 0.0, the voltage at the transformer is the nominal voltage. At time 0.0, the voltage drops. If the voltage remains at a level greater than 15 percent of the nominal voltage for a period that does not exceed 0.625 seconds, the plant must stay online. Further, if the voltage returns to 90 percent of the nominal voltage within 3 seconds of the beginning of the voltage drop (with the

voltage at any given time never falling below the minimum voltage indicated by the solid line in Figure 1), the plant must stay online. The Interconnection Customer may not disable low voltage ride-through equipment while the wind plant is in operation. Two key features of this regulation are:

1. A wind generating plant must have low voltage ride-through capability down to 15 percent of the rated line voltage for 0.625 seconds;
2. A wind generating plant must be able to operate continuously at 90 percent of the rated line voltage, measured at the high voltage side of the wind plant substation transformer(s).

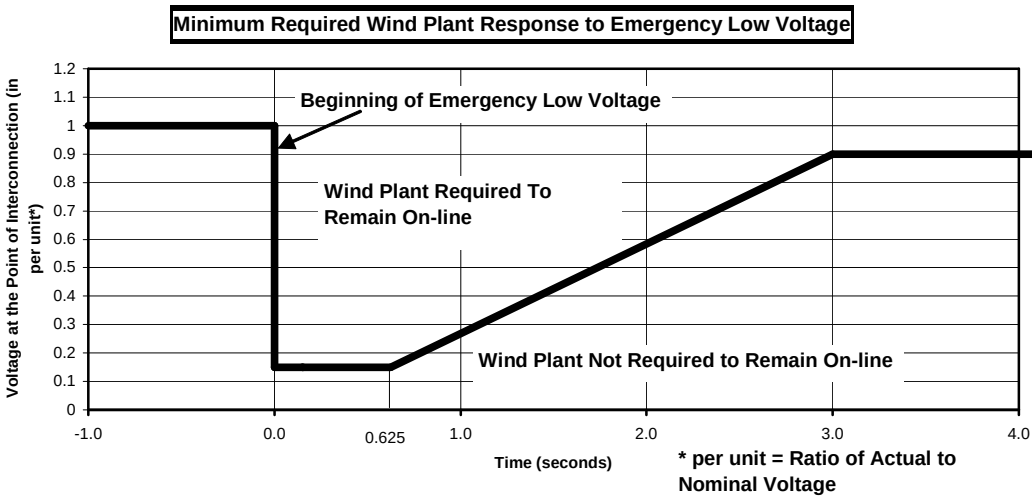

Figure 1 Proposed low voltage ride-through standard

ii. Power Factor Design Criteria (Reactive Power)

A wind generating plant shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the Point of Interconnection as defined in this LGIA,

if the Transmission Provider's System Impact Study shows that such a requirement is necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

20050602-3073 Issued by FERC OSEC 06/02/2005 in Docket#: RM05-4-000

Appendix C

[NOTE: THESE PROVISIONS TO BE ADOPTED AS APPENDIX G TO THE LGIP]

APPENDIX G

INTERCONNECTION PROCEDURES FOR A WIND GENERATING PLANT

Appendix G sets forth procedures specific to a wind generating plant. All other requirements of this LGIP continue to apply to wind generating plant interconnections.

A. Special Procedures Applicable to Wind Generators

The wind plant Interconnection Customer, in completing the Interconnection Request required by section 3.3 of this LGIP, may provide to the Transmission Provider a set of preliminary electrical design specifications depicting the wind plant as a single equivalent generator. Upon satisfying these and other applicable Interconnection Request conditions, the wind plant may enter the queue and receive the base case data as provided for in this LGIP.

No later than six months after submitting an Interconnection Request completed in this manner, the wind plant Interconnection Customer must submit completed detailed electrical design specifications and other data (including collector system layout data) needed to allow the Transmission Provider to complete the System Impact Study.

(Docket No. RM05-4-001; Order No. 661-A)

Interconnection for Wind Energy

(Issued December 12, 2005)

AGENCY: Federal Energy Regulatory Commission

ACTION: Order on Rehearing and Clarification

SUMMARY: The Federal Energy Regulatory Commission is granting in part and denying in part the requests for rehearing and clarification of its Final Rule on Interconnection for Wind Energy, Order No. 661. Order No. 661 requires public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce to append to their standard large generator interconnection procedures and large generator interconnection agreements in their open access transmission tariffs standard procedures and technical requirements for the interconnection of large wind generation.

EFFECTIVE DATE: Changes made to Order No. 661 in this order on rehearing and clarification will become effective on [insert date 30 days after publication in the Federal Register].

Interconnection for Wind Energy Docket No. RM05-4-001

ORDER NO. 661-A

ORDER ON REHEARING AND CLARIFICATION

(Issued December 12, 2005)

1. On June 2, 2005, the Commission issued Order No. 661, the Final Rule on Interconnection for Wind Energy (Final Rule).[1] Several entities have filed timely requests for rehearing and clarification of the Final Rule.[2] In this order, the Commission grants in part and denies in part the requests for rehearing and clarification.

I. Background

2. In Order No. 2003,[3] the Commission adopted standard procedures and a standard

[1] Interconnection for Wind Energy, Order No. 661, 70 FR 34993 (June 16, 2005), FERC Stats. & Regs. ¶ 31,186 (2005) (Final Rule); see also Order Granting Extension of Effective Date and Extending Compliance Date, 70 FR 47093 (Aug. 12, 2005), 112 FERC ¶ 61,173 (2005).

[2] Those entities requesting rehearing and/or clarification, and the acronyms used to refer to them in this order, are listed in Appendix A to this order.

[3] Standardization of Generator Interconnection Agreements and Procedures, Order No. 2003, 68 FR 49845 (Aug. 19, 2003), FERC Stats. & Regs., Regulations Preambles ¶ 31,146 (2003) (Order No. 2003), order on reh'g, 69 Fed. Reg. 15,932 (Mar. 24, 2004), FERC Stats & Regs., Regulations Preambles ¶ 31,160 (2004) (Order No. 2003-A), (continued)

agreement for the interconnection of large generation facilities. The Commission required public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce to file revised Open Access Transmission Tariffs (OATTs) containing these standard provisions, and use them to provide interconnection service to generating facilities having a capacity of more than 20 megawatts.

3. In Order No. 2003-A, on rehearing, the Commission noted that the standard interconnection procedures and agreement were based on the needs of traditional generation facilities and that a different approach might be more appropriate for generators relying on other technologies, such as wind plants.[4] Accordingly, the Commission granted certain clarifications, and also added a blank Appendix G to the standard Large Generation Interconnection Agreement (LGIA) for future adoption of requirements specific to other technologies.[5]

4. The Commission issued a Notice of Proposed Rulemaking (NOPR) that proposed technical standards applicable to the interconnection of large wind generating plants[6] to

---

order on reh'g, 70 Fed. Reg. 265 (January 4, 2005), FERC Stats & Regs., Regulations Preambles ¶ 31,171 (2004) (Order No. 2003-B), order on reh'g, 70 FR 37661 (June 30, 2005), FERC Stats. & Regs. ¶ 31,190 (2005) (Order No. 2003-C); see also Notice Clarifying Compliance Procedures, 106 FERC ¶ 61,009 (2004).

[4] Order No. 2003-A at P 407, n.85.

[5] Id.

[6] Large wind generating plants are those with an output rated at more than 20 MW at the point of interconnection. The interconnection requirements for small generators rated at 20 MW or less are set forth in Standardization of Small Generator

(continued)

be included in Appendix G of the LGIA.[7] We proposed the standards in light of our findings in Order No. 2003-A noted above and in response to a petition submitted by the American Wind Energy Association (AWEA).[8] Specifically, the Commission proposed to establish uniform standards in Appendix G that would require large wind plants seeking to interconnect to the grid to: (1) demonstrate low voltage ride-through capability; in other words, show that the plant can remain on line during voltage disturbances up to specified time periods and associated voltage levels; (2) have supervisory control and data acquisition (SCADA) capability to transmit data and receive instructions from the Transmission Provider; and (3) maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the high voltage side of the substation transformers. The Commission proposed to permit the Transmission Provider to waive the low voltage ride-through requirement on a comparable and not unduly discriminatory basis. We proposed to permit the Transmission Provider to waive or defer compliance with the power factor requirement where it is not necessary. The Commission did not

---

Interconnection Agreements and Procedures, Order No. 2006, 70 FR 34190 (June 13, 2005), FERC Stats. & Regs. ¶ 31,180 (2005), reh'g pending.

[7] See Interconnection for Wind Energy and Other Alternative Technologies, Notice of Proposed Rulemaking, 70 FR 4791 (Jan. 31, 2005), 110 FERC ¶ 61,036 (2005) (NOPR).

[8] See Petition for Rulemaking or, in the Alternative, Request for Clarification of Order No. 2003-A, and Request for Technical Conference of the American Wind Energy Association (May 20, 2004), filed in Docket Nos. RM02-1-005 and PL04-15-000 (AWEA Petition).

propose to adopt a proposal by AWEA to allow a wind generator to "enter the interconnection queue and conduct its own Feasibility Study, having obtained the information necessary to do so upon paying the initial deposit and submitting its interconnection application" (referred to as "self-study" provisions).[9] The Commission did, however, ask for comments on how to balance the need of wind generators to obtain certain data from the Transmission Provider before completing their Interconnection Requests with the need to protect critical energy infrastructure information and commercially sensitive data against unwarranted disclosure.

5. In the Final Rule, the Commission adopted final standard procedures and technical requirements for the interconnection of large wind plants in Appendix G, and required all public utilities that own, control, or operate facilities for transmitting electric energy in interstate commerce to append Appendix G to the Large Generator Interconnection Procedures (LGIPs) and LGIAs in their OATTs. As described in more detail below, the Commission adopted provisions establishing standards for low voltage ride-through and power factor design criteria, and requiring that wind plants meet those standards if the Transmission Provider shows, in the System Impact Study, that they are needed to ensure the safety or reliability of the transmission system. Additionally, the Appendix G adopted by the Commission included a SCADA requirement applicable to all wind

[9] See AWEA Petition at 13.

plants. Finally, as described in more detail below, the Commission adopted in Appendix G to the LGIP limited special interconnection procedures applicable to wind plants.

II. Requests for Rehearing and Clarification and Commission Conclusions

A. Low Voltage Ride-Through Provisions

6. In the Final Rule, the Commission adopted a low voltage ride-through standard, but provided that a wind plant is required to meet the standard only if the Transmission Provider shows, in the System Impact Study, that low voltage ride-through capability is needed to ensure safety or reliability. The standard (adopted in Figure 1 of Appendix G to the LGIA), if applicable, requires the wind plant to stay online for specified time periods and at associated voltage levels where there is a disturbance on the transmission system. The Final Rule requires that the required voltage levels be measured at the Point of Interconnection.

7. Several entities requested rehearing of various aspects of the low voltage ride-through requirement and standard included in the Final Rule, including: (1) provisions that require low voltage ride-though only when the System Impact Study shows that such capability is necessary for safety or reliability; (2) the specific low voltage ride-through standard adopted in the Final Rule; (3) the point of measurement for the standard; and (4) arguments that Transmission Providers should be permitted to adopt other provisions of the German low voltage ride-through standard (which the Commission referenced in the Final Rule).

8. However, as described in more detail below, NERC and AWEA jointly requested

that the Commission delay the effective date of the Final Rule to give them time to resolve concerns expressed by NERC regarding the low voltage ride-through provisions. The Commission granted this extension, and on September 19, 2005, NERC and AWEA submitted a joint report with recommended revisions.

1. Case-by-Case Application/Burden of Proof for Applying the Low Voltage Ride-Through Standard

9. Prior to the NERC/AWEA joint report, several entities objected on rehearing to the Final Rule's adoption of a low voltage ride-through requirement on a case-by-case basis, placing the burden of proof on the Transmission Provider to show that low voltage ride-through capability is needed. ATC, EEI, NERC, NRECA/APPA, and SCE, among others, urged the Commission to return to the approach in the NOPR, which would have required low voltage ride-through for all wind plants unless waived by the Transmission Provider on a not unduly discriminatory basis. ATC noted that interconnection studies only consider a snapshot of the transmission system, and do not take into account changes in the future that may cause a need for low voltage ride-through capability to ensure reliability. ATC, as well as EEI and SCE, argued that under the case-by-case approach adopted in the Final Rule, Transmission Providers will need to perform additional analyses to determine if a reliability need will exist over the life of the wind plant. SCE, for example, noted that while a particular System Impact Study may not conclusively demonstrate that low voltage ride-through is needed at that time, if other generation projects are built, the first wind plant may come to need low voltage ride-

through. According to various entities, the additional analyses needed to take these scenarios into account will increase the time, cost and complexity of wind plant interconnections and could be a barrier to their development.[10]

10. Furthermore, ATC asserted that the case-by-case approach imposes the responsibility for resolving reliability concerns that arise in the future on the Transmission Provider because wind generating plants cannot be retrofitted with low voltage ride-through capability. Similarly, NRECA/APPA argued that this approach unduly discriminates in favor of wind plants in that low voltage ride-through capability may not be "necessary" (and therefore required) for a specific plant because other generators or Transmission Providers can "make up the difference."[11] ATC also contended that the case-by-case approach may require the Transmission Provider to incur capital costs that should have been incurred by the wind plant.

11. EEI and NU argued that the case-by-case approach adopted by the Commission in the Final Rule "lowers the bar for reliability."[12] NERC similarly asserted that requiring Transmission Providers to justify common elements of good utility practice on a case-by-

[10] New York ISO asserts that the case-by-case approach could lead to acute problems in New York, where it has received interconnection applications from wind plants totaling over 5000 MW of generation. According to New York ISO, conducting case-by-case reviews for each of these projects could greatly complicate the study process and result in substantial delays.

[11] Request for Rehearing of NRECA/APPA at 6.

[12] Request for Rehearing of EEI at 8.

case basis is unwise and may deter Transmission Providers from implementing and following good utility practice.[13] Southern Company states that the Transmission Provider, as the entity responsible for maintaining reliability, should not bear the burden of proof to establish what is required to maintain system reliability. Southern Company states that it supports the Commission's statement that Transmission Providers should not be permitted to require wind plants to install costly equipment that is not needed for reliability, but argues that the burden of proof should be shifted, and the System Impact Study should establish that such equipment is not required. Also, NRECA/APPA argued that the case-by-case approach imposes unreasonable reliability risks, and effectively voids the requirement that wind plants have low voltage ride-through capability "in a broad range of circumstances."[14]

12. Those requesting rehearing raised several other arguments regarding the case-by-case approach and burden of proof for applying the low voltage ride-through standard. NERC believed that the case-by-case approach could unintentionally create a "patchwork" of varying requirements. EEI and NU also suggested that requiring a showing of need may introduce prolonged uncertainties into the interconnection process if parties disagree as to the study assumptions. SCE asserted that rather than limiting opportunities for undue discrimination, the requirement of a showing of need could result

[13] New York ISO states that it adopts NERC's position on this issue.

[14] Request for Rehearing of NRECA/APPA at 6.

in discriminatory treatment in areas with large amounts of wind generation because projects lower in the queue may be responsible for additional costs since the need for low voltage ride-through could not be demonstrated for earlier projects. EEI contended that Order No. 2003 already contains provisions allowing the parties to an interconnection to exercise their discretion in complying with system reliability obligations, and that there is no evidence of problems with these procedures that justifies such a significant departure from them in the Final Rule. Further, EEI argued that the Final Rule was a significant departure from the NOPR and that the Commission should not adopt it without providing an opportunity for comments on it. Finally, NRECA/APPA argued that the Commission has not explained how this approach is consistent with NERC and WECC standards.

2. Specific Low Voltage Ride-Through Standard

13. Certain requests for rehearing and clarification also addressed the specific low voltage ride-through standard adopted by the Commission in the Final Rule. In its request for rehearing, NERC asserted that the standard in Figure 1 of the Final Rule is not appropriate. More specifically, NERC contended that Figure 1, by allowing a wind plant to disconnect from the transmission system when the voltage drops below 15 percent of the nominal voltage, could result in violation of NERC Reliability Standard TPL-002-0. This standard requires transmission planners to ensure that the system will remain stable and within applicable thermal and voltage ratings, with no loss of demand or curtailment of firm transfers, where there is a normally cleared fault on a single element, which is typically four to eight cycles or 0.067 to 0.133 seconds (67 to 133 milliseconds).

According to NERC, a fault occurring on a transmission line near a wind plant could cause the voltage at that point to drop to zero for this clearing time. NERC stated that because Figure 1 would allow the wind plant to disconnect when the voltage drops below 15 percent of the nominal voltage, the loss of the single grid element (the transmission line) would be compounded by the loss of the real power (and any reactive power) produced by the wind plant. This "double contingency event" (loss of both the transmission line and wind plant) violates Reliability Standard TPL-002-0, NERC asserted.

14. To remedy this problem, NERC requested that the Commission simply require wind plants to meet NERC and regional reliability council requirements.[15] Alternatively, NERC argued that the rule should be modified to require wind plants to remain connected through a normally cleared single line to ground or three phase fault. Specifically, NERC asserted that Figure 1 should be altered to require a wind plant to remain online for 0.167 seconds (167 milliseconds), or ten cycles, if voltage at the high side of the wind plant step-up transformer is reduced to zero. After 0.167 seconds (167 milliseconds), but before 0.625 seconds (625 milliseconds), NERC argued that Figure 1 should require the wind plant to stay connected as long at the voltage is at or above 15 percent of the

[15] ISO-NE argued that the Commission should have required wind plants to be subject to the same system performance standards that are applied to other generating technologies.

nominal voltage. NERC contended that these modifications would reduce the risk to the reliability of the electric system to an acceptable level.[16]

15. Similarly, NU asserted that wind plants should be required to "remain on-line for all faults cleared by normal operation of all protective equipment unless clearing the fault . . . isolates the plant from the rest of the grid."[17] According to NU, this change would require generators to have low voltage ride-through capability down to zero percent of the nominal voltage at the Point of Interconnection. CenterPoint also contend that wind plants should be required to maintain low voltage ride-through capability down to zero percent of the rated line voltage 150 milliseconds (.150 seconds) (the time generally needed for the transmission system protective equipment to clear the fault). NU and CenterPoint argued that this change would reduce the likelihood that a low voltage event would escalate to a cascading outage or voltage collapse. NU also asserted that this requirement is similar to those applicable to other generators, and could be achieved by wind turbines that are currently available. NU stated that the standard adopted in the Final Rule would threaten reliability by allowing a wind plant to reduce output, or trip offline, simply due to a typical system fault.

---

[16] ISO-NE also suggested that, if the Commission adopted a low voltage ride-through standard, it be modified to require the wind plant to be connected at zero voltage for "a time period associated with the typical clearing time of a normal design contingency fault." Request for Rehearing of ISO-NE at 4.

[17] Request for Rehearing of NU at 5.

16. NRECA/APPA also objected to the low voltage ride-through standard adopted in the Final Rule. Specifically, they contended that the Final Rule should not have established the low voltage ride-through curve as an absolute standard, and instead should have permitted Transmission Providers to adopt an alternative curve (subject to review by the Commission if there is a dispute) when the System Impact Study shows that it is necessary. ISO-NE, going further, requested that if the Commission adopted a low voltage ride-through standard, it should be only a guideline for wind turbine manufacturers. NRECA/APPA asserted that the Final Rule did not conclude that the low voltage ride-through standard will protect reliability or address the technical concerns raised by comments, and, by stating that the Commission might consider an alternative low voltage ride-through standard, recognizes that it may not be adequate to preserve reliability in all circumstances. Alternatively, NRECA/APPA asked that the Commission clarify that Transmission Providers may support variations from the low voltage ride-through curve in the Final Rule, based on local and subregional reliability conditions, under the three variation standards adopted in the Final Rule.

17. EEI asserted that the technical challenges presented by wind generation are being considered by the industry worldwide, and that many international standards differ from the Commission's Final Rule. Both EEI and SCE objected to the specific low voltage ride-through standard through comparison to the German interconnection guidelines. Particularly, EEI noted that the German grid code requires wind plants to remain connected to the grid following a fault that results in the voltage at the Point of

Interconnection dropping to 15 percent of the nominal voltage for as long as 0.15 seconds. According to EEI, revisions to the German grid code are nearing completion that will require wind plants to remain connected to the transmission system following a fault that drops the voltage at the Point of Interconnection to zero percent of the nominal voltage for as long at 0.15 seconds. Further, EEI reported that the Hydro-Québec requirements for wind farm interconnection are stricter than the Commission's Final Rule; they require wind plants to ride through a fault resulting in a voltage drop to zero percent of nominal voltage for as long as 0.15 seconds. Finally, EEI noted that Ireland requires wind plants to stay online after a fault that drops the voltage to 15 percent of nominal voltage for as long as 0.15 seconds. SCE additionally asserted that the requirement that low voltage ride-through be shown to be necessary in the System Impact Study conflicts with the German wind interconnection guidelines because those guidelines assume that all generation will meet the low voltage ride-through standard. SCE stated that the Final Rule should adopt low voltage ride-through capability as a governing standard, with exceptions approved by the governing technical body (NERC or the Western Electricity Coordinating Council (WECC), a regional reliability council), as in the German standard.

18. In the Final Rule, the Commission stated that "the low voltage ride-through requirement, and the time periods and associated voltage levels set forth in Appendix G, Figure 1, apply to three-phase faults." ATC sought clarification as to whether the low voltage ride-through requirement applied only to three-phase faults. Assuming that is the

case, ATC asked whether there was a requirement for single-phase and double-phase faults.

3. Point of Measurement for the Low Voltage Ride-Through Standard

19. NERC argued on rehearing that because the Point of Interconnection may be some distance from a wind plant, the plant might actually disconnect at voltages higher than 15 percent of the nominal voltage at the high side of the wind plant step-up transformer. According to NERC, this could create a further risk of a double contingency event.[18] To avoid this risk, NERC contended that low voltage ride-through capability should be measured at the high voltage terminal of the wind plant step-up transformer. Southern Company stated that a revision to section A.i.2 of the LGIA Appendix G was necessary to reflect the Commission's decision in the Final Rule to adopt the Point of Interconnection as the measurement point.

4. Adoption of Other Provisions from the German Standards

20. SCE noted that while the Final Rule adopted a low voltage ride-through standard based on the German wind interconnection guidelines, the Commission did not adopt the related requirements in the German guidelines. It noted several provisions of the German guidelines that it stated go hand-in-hand with the low voltage ride-through standard.[19]

---

[18] See supra, P 13.

[19] See Request for Rehearing and Clarification of SCE at 9-10.

SCE asked the Commission to clarify that Transmission Providers may implement these other guidelines in the German standard.

5. NERC/AWEA Recommended Revisions to Low Voltage Ride-Through Provisions

21. As noted above, NERC filed a request for rehearing of the Final Rule contending, in part, that the specific low voltage ride-through standard adopted by the Commission would permit violations of a NERC system performance standard.[20] On August 4, 2005, NERC and AWEA filed a request to extend the effective date of the Final Rule to allow for discussions to resolve the reliability concerns expressed by NERC. They committed to submitting to the Commission a joint final report on their discussions. On August 5, 2005, the Commission issued an order granting this request.[21]

22. On September 19, 2005, NERC and AWEA submitted their joint final report, which recommended revisions to the low voltage ride-through provisions of the Final Rule. They state that the recommended revisions are supported by the NERC Planning Committee and AWEA members. NERC states that the concerns expressed in its request for rehearing will be resolved if the Commission adopts the recommended revisions.

23. Specifically, NERC and AWEA recommend a different low voltage ride-through

---

[20] See supra, P 13.

[21] Interconnection for Wind Energy, 70 FR 47093 (Aug. 12, 2005), 112 FERC ¶ 61,173 (2005).

section to be inserted in Appendix G. The recommended provisions include a transition period standard, which would apply to wind plants that either: (a) have interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007; or (b) involve wind turbines subject to a procurement contract executed before December 31, 2005 for delivery through 2007. During this transition period, wind plants would be required to ride through low voltage events down to 0.15 per unit for normal clearing times up to a maximum of nine cycles.

24. Following this transition period, the NERC/AWEA proposal would require wind plants to ride through low voltage events down to a zero voltage level for "location-specific" clearing times up to a maximum of nine cycles. If the fault on the transmission system remained after this clearing time, the joint recommendation would permit the wind plant to disconnect from the system.

25. Under the joint recommendation of NERC and AWEA, during both the transition period and after, low voltage ride-through capability would be required for all new wind plant interconnections, instead of only when the System Impact Study shows that such capability is needed for safety or reliability, as in the Final Rule. Additionally, in both cases the point of measurement for the requirement would be at the high side of the wind plant step-up transformer, instead of at the Point of Interconnection, as in the Final Rule. NERC and AWEA also recommend eliminating Figure 1 during both the transition

period and after the transition period because the low voltage ride-through standard described in their Joint Report replaces the voltage trace represented by Figure 1.

26. Finally, NERC and AWEA recommend limiting the variations to the low voltage ride-through provisions that were permitted by the Final Rule. The Final Rule permits Transmission Providers to justify variations between their pro forma tariff and the Final Rule Appendix G based on the regional reliability, the "consistent with or superior to," or the independent entity variation standards in Order No. 2003.[22] NERC and AWEA recommend that variations to their proposed low voltage ride-through provisions be permitted on an interconnection-wide basis only, reasoning that such a limitation is appropriate because the provisions are intended to satisfy a NERC reliability standard, and because wind generators could incur significant additional costs if they had to meet many different standards. NERC and AWEA note that limiting variations would not restrict the ability to request a deviation in a specific non-conforming agreement filed with the Commission (as opposed to a variation built into a pro forma tariff).

27. The Commission issued notice of the NERC/AWEA joint report on September 21, 2005, and provided interested parties with the opportunity to submit comments on or before October 3, 2005. FPL Energy, National Grid, New York ISO and PJM all filed comments supporting the technical recommendations in the joint report.

28. National Grid also asks that the Commission make two clarifications. First, it asks

[22] Final Rule at P 107, 109.

the Commission to clarify that while the point of measurement for compliance with the low voltage ride-through standard would be at the high side of the step-up transformer, the point of measurement for reactive power would remain at the Point of Interconnection. Second, National Grid requests that the nine cycle maximum clearing time in the low voltage ride-through provision applies only to three-phase faults. It says that single line-to-ground faults are typically much longer than nine cycles, so a general, non-specified standard is more appropriate for such faults.

29. New York ISO, while strongly supporting the technical aspects of the NERC/AWEA joint recommendations, urges the Commission to reject the proposal that variations to the low voltage ride-through provision be permitted only on an interconnection-wide basis or through individually-filed interconnection agreements. It argues that this could hamper efforts to preserve reliability in individual regions, and asserts that satisfying NERC planning standards is not sufficient to preserve reliability because New York State, as well as other regions, sometimes need more stringent reliability requirements than those of NERC. New York ISO says that the Commission has viewed NERC's criteria as being minimum reliability requirements, which individual regions may exceed if necessary. Therefore, New York ISO argues that at a minimum, the Commission should permit independent entities to seek variations from the low voltage ride-through standards recommended by NERC and AWEA.

30. Finally, New York ISO asks the Commission to clarify that, assuming the NERC/AWEA recommendations are adopted, the "filing date" for purposes of the

proposed transition period includes the date that conforming interconnection agreements are fully and finally executed. New York ISO notes that executed conforming agreements need not be filed with the Commission. Therefore, it contends that the transition period should apply to agreements executed within its timeframe but not filed with the Commission.

Commission Conclusion on Low Voltage Ride-Through Provisions

31. The Commission grants rehearing with regard to the low voltage ride-through provisions, and adopts the joint recommendation of NERC and AWEA without modification. This provides a standard that will ensure that wind plants are interconnected to the grid in a manner that will not degrade system reliability. Furthermore, this standard satisfies the reliability concerns expressed by NERC, and either satisfies or renders moot many of the rehearing requests described above, including those related to the case-by-case application of the low voltage ride-through standard and point of measurement for the low voltage ride-through standard. Additionally, the joint recommendation also responds to the arguments on rehearing of EEI and SCE regarding comparison to the German interconnection guidelines.

32. We are eliminating Figure 1 from Appendix G because the standard we are adopting in Appendix G replaces that figure. Accordingly, all references to Figure 1 in the preamble to the Final Rule should be read to apply to the standard now described in Appendix G.

33. We also adopt the NERC/AWEA proposal to permit variations to the low voltage ride-through provisions of Appendix G only on an interconnection-wide basis. The low voltage ride-through provisions we adopt in this order on rehearing were crafted specifically, after negotiation among the wind industry and NERC, to ensure that NERC Reliability Standard TPL-002-0 is met in all regions. While other interconnection standards may be more susceptible to variation among Transmission Providers or independent entities, the close connection of this standard to an industry-wide reliability standard persuades us that limiting variations to those made on an interconnection-wide basis will best ensure that reliability is protected. Accordingly, we reject SCE's request that we clarify that Transmission Providers may implement other guidelines from the German interconnection standard. Adoption of other guidelines from the German standard on a Transmission Provider-specific basis could result in varying requirements that may not meet established reliability standards. For the same reasons, we also reject New York ISO's assertion that the Commission should continue to permit variations to the low voltage ride-through provisions under the three variation standards in the Final Rule, and particularly the independent entity variation. We note, however, that under section 1211 of the Energy Policy Act of 2005, the State of New York "may establish rules that result in greater reliability within that State, as long as such action does not result in lesser reliability outside the State than that provided by the reliability

standards."[23] Therefore, the Commission will consider proposed variations from the State of New York under this statutory provision.

34. In response to the arguments of NRECA/APPA that the Final Rule should have permitted Transmission Providers to adopt alternative low voltage ride-through standards, and ISO-NE's contention that the standard in the Final Rule should be only a guideline, we find that the definitive standard we adopt here will provide certainty to wind developers and manufacturers and ensure that reliability is maintained and NERC planning standards are met. If another standard is necessary for a specific wind plant interconnection to maintain reliability, a non-conforming agreement may be filed with the Commission.

35. In response to ATC and National Grid, we clarify that the low voltage ride-through provisions we are adopting apply to all types of faults, not just to three-phase faults. The standard refers to three-phase faults with normal clearing as well as single line to ground faults with delayed clearing. In response to National Grid's specific concern, we clarify that the nine cycle maximum clearing time expressed in the low voltage ride-through provisions applies only to three-phase faults. Single line to ground faults have typically much longer clearing times, as National Grid notes, and the low voltage ride-through provisions adopted here recognize this difference by specifically

[23] Energy Policy Act of 2005, Pub. L. No. 109-58, § 1211, 119 Stat. 594, 945 (2005).

referring to "single line to ground faults with delayed clearing." This non-specified standard is appropriate for those types of faults.

B. Power Factor (Reactive Power) Provisions

36. In the Final Rule, the Commission adopted in Appendix G to the LGIA a power factor standard applicable to wind plants. The Final Rule provides that wind plants are required to meet this standard only if the Transmission Provider shows, in the System Impact Study, that reactive power capability is necessary to ensure the safety or reliability of the transmission system. The specific power factor standard in Appendix G to the LGIA, if applicable, requires a wind plant to maintain a power factor within the range of 0.95 leading to 0.95 lagging (hereinafter +/- 0.95), to be measured at the Point of Interconnection.

37. Requests for rehearing and/or clarification of these provisions concern whether wind plants should have to maintain a required power factor only where the System Impact Study shows that it is required for reliability or safety, and whether the power factor standard and point of measurement adopted by the Commission in the Final Rule are appropriate.

1. Case-by-Case Application/Burden of Proof for Applying the Power Factor Standard

38. Several entities object to the provisions in the Final Rule that require wind plants to maintain the required power factor only when the Transmission Provider, in the System Impact Study, shows that it is necessary to ensure safety or reliability. NERC

objects to this approach because it may deter Transmission Providers from implementing and following good utility practice and could create a "patchwork" of varying requirements. NU argues that this approach "lowers the bar for reliability," and will add complexity, cost and delay to the generator interconnection process because Transmission Providers will be required to perform more studies to determine whether reactive power capability is necessary for reliability or safety. Southern Company states that the Transmission Provider, as the entity responsible for maintaining reliability, should not bear the burden of proof to establish what is required to maintain system reliability. It supports the Commission's statement that Transmission Providers should not be permitted to require wind plants to install costly equipment that is not needed for reliability, but argues that the burden of proof should be shifted to the generator.

39. NRECA/APPA notes that traditional generators are required to meet the power factor standard not because reactive power is needed in every case to preserve reliability, but instead because the transmission system is dynamic and requires flexibility over time to maintain reliability. They state that the need for reactive power in the future under a variety of operating conditions cannot be determined with perfect certainty in the System Impact Study. The case-by-case approach, they contend, grants an undue preference to wind plants, imposes risks to system reliability, and shifts costs to consumers and other generating plants. The risk to system reliability is that the Final Rule may only require a wind plant to provide reactive power after other wind plants have been installed without such capability, and that at that point the resources from that single plant may not be

enough to protect the transmission system. NRECA/APPA also asserts that the case-by-case approach increases uncertainty, contrary to the Commission's conclusion in the Final Rule, because each wind plant will face different requirements based on the outcome of the System Impact Study. Additionally, it contends that this approach creates more opportunities for discrimination because it would permit wind plants to be treated differently.

40. ATC contends that the Commission has offered no guidance as to what power factor range would be acceptable if a reliability need is not identified (and thus reactive power is not required), and whether wind plants in this instance must operate within any particular reactive power operating band. Similarly, NU expresses concern that wind plants could operate at any power factor in the absence of a showing of need in the System Impact Study, and thus avoid a physical requirement for delivering power onto the transmission system. According to ATC, the rule could be interpreted to permit wind plants to operate at any power factor they choose. It claims that reactive power is needed for each generator, and that each generator should be obligated to operate within a range of power factors, regardless of whether the transmission system as a whole needs additional reactive power capability. ATC recommends that at a minimum, the Commission require all wind plants to meet a power factor range of 0.95 leading to 1.0 (unity), and allow the Transmission Provider to require a range of 1.0 (unity) to 0.95 lagging if the System Impact Study shows that there is a reliability need.

Commission Conclusion

41. The Commission will not modify the Final Rule to require wind plants to meet the power factor standard without a showing by the Transmission Provider, through the System Impact Study, that it is needed for safety or reliability. The case-by-case approach to a reliability needs assessment adopted in the Final Rule will not threaten reliability, as several of those seeking rehearing argue. As we noted in the Final Rule, if reactive power is necessary to maintain the safety or reliability of the transmission system, the System Impact Study performed by the Transmission Provider will establish that need.[24] We stated in the Final Rule, and reiterate here, that the System Impact Study is the appropriate study for determining whether reactive power capability is needed.[25] Furthermore, we reasoned in the Final Rule that requiring wind plants to maintain the power factor standard only if the System Impact Study shows it to be necessary will not only ensure that increased reliance on wind power will not degrade system safety or reliability, but also will limit opportunities for undue discrimination by ensuring that Transmission Providers do not require costly equipment that is not necessary for reliability.[26]

---

[24] Final Rule at P 51.

[25] Id.

[26] Id.

42. NERC states that the decision in Order No. 661 to use a case-by-case approach may deter Transmission Providers from following Good Utility Practice, and may have the unintended consequence of spawning a patchwork of varying requirements. We agree with NERC that Transmission Providers must follow Good Utility Practice when interconnecting all generating plants, including wind plants, and that not following Good Utility Practice when performing System Impact Studies could lead to problems. However, the Commission points out that every Transmission Provider is required under Order No. 2003 to follow Good Utility Practice. Transmission Providers are required to complete a detailed System Impact Study, and are required to ensure that NERC reliability standards are met in all instances. This includes performing studies to determine what is necessary to ensure that the interconnection of a wind generating facility does not degrade grid reliability. The Commission recognizes that the industry (and particularly NERC) is continuing to address technical issues involved in the interconnection of wind plants. If NERC through its stakeholders and Board approval process develops a new standard, the Commission will entertain such a standard. Finally, we disagree with NRECA/APPA's suggestion that the Final Rule threatens the reliability of the transmission system because it may require only wind plants later in the queue to provide reactive power, which may not be sufficient to protect the grid. The System Impact Study will take into account the system's need for reactive power, both as it exists today and under reasonable anticipated assumptions. NRECA/APPA has not explained how assessing the need for reactive power through the System Impact Study process will

result in too little reactive power being available in the future. Whenever a new generator is added to its system, the Transmission Provider must complete a new System Impact Study to ensure that reliability requirements are met; this may require a new wind generator later in the queue to meet the reactive power requirement.

43. We also reject arguments that the case-by-case approach is inappropriate because of the dynamic nature of the transmission system. The fact that the transmission system is constantly changing is not new or unique to the study of wind plant interconnections. The studies that are part of the interconnection process should take into account likely circumstances that could occur on the Transmission Provider's system, whether the studies are conducted in connection with a proposed wind plant or another type of generating facility.

44. Furthermore, we are not persuaded that the approach adopted in the Final Rule will result in additional studies, increased costs and delays, and cost shifts. First, as noted previously, the System Impact Study, as well as the other interconnection studies, should take into account a variety of assumptions concerning anticipated transmission system conditions. If additional or expanded studies are needed to determine whether the power factor standard is necessary, the Commission does not believe that the additional burden will outweigh the cost considerations underlying the case-by-case approach. Finally, although the case-by-case approach may result in some delay, we remind the parties to a wind plant interconnection, like other interconnections, that they are still required to meet the milestones set forth in the LGIP. Any increased costs from completing expanded or

additional studies within the timeframe required by this rule will be borne by the wind plant Interconnection Customer, as provided in Order No. 2003, which will leave other generators and the Transmission Provider unharmed.

45. The Commission also rejects arguments that the case-by-case approach provides more opportunities for discrimination. As we noted in the Final Rule Appendix G was adopted to take into account the technical differences between wind plants and traditional generating plants. One of these differences is that for wind plants, reactive power capability is a significant added cost, while it is not a significant additional cost for traditional generators. Given these technical differences, treating wind plants differently with regard to reactive power requirements is not unduly discriminatory or preferential. Additionally, we note that the outcome of the System Impact Study, which determines whether reactive power will be required, can be challenged, which will serve to minimize the opportunities for discrimination by the Transmission Provider. Also, the wind plant Interconnection Customer will have recourse to the Commission if it believes the Transmission Provider has acted in a discriminatory manner.

46. The Commission declines to adopt ATC's request that all wind plants, at a minimum, operate within a power factor range of 0.95 leading to 1.0 (unity). This requirement would essentially require reactive power in every case, which we have already rejected. If reactive power capability is needed, including a power factor range of 0.95 leading to 1.0 (unity), the System Impact Study will demonstrate this need.

2. Specific Power Factor Standard

47. NRECA/APPA argues that the Commission should clarify that wind generators must meet the same reactive power requirements as other generators, provided the requirements are imposed in a nondiscriminatory manner. It notes that some Transmission Providers impose a power factor range wider that +/- 0.95 on all new generation, and argues that in such cases, the same range should be applied to wind plants. It argues that not imposing the same range threatens reliability and shifts the costs of preserving reliability to customers or competing generators.

48. EEI and NU assert that wind plants should regulate voltage to a set point established by the Transmission Provider, as do synchronous generators. EEI contends that the language it offered in its initial comments would provide this necessary clarity, while also maintaining the flexibility provided in Order No. 2003 so that individual, site-specific conditions may be addressed.[27] NU states that wind turbines have this capability, either inherently (doubly fed induction generators) or through external equipment.

49. NRECA/APPA also expresses concern that the phrase "taking into account any limitations due to voltage level, real power output, etc." in the power factor requirements

[27] EEI's March 2, 2005 comments in this proceeding suggest that we require the wind plant to maintain a power factor within the range specified by the Transmission Provider "from time to time," but would not require that it operate outside of the 0.95 leading to 0.95 lagging range. See Comments of EEI (March 2, 2005) at 5-6.

section of Appendix G could create operational problems for Transmission Providers with wind plants on their systems. Specifically, it is concerned that this language could exempt wind plants from their reactive power requirements during startup and low output periods, which could degrade reliability during a system contingency.

Commission Conclusion

50. With regard to NRECA/APPA's request for clarification that wind generators must meet a wider power factor range because some Transmission Providers impose a power factor range wider that +/- 0.95 on all new generation, we note that if we were to allow the Transmission Provider to impose a wider power factor range as a matter of routine, that would defeat the purpose of adopting a reactive power standard for wind generators. However, we note that if the System Impact Study shows the need for a power factor range wider than +/- 0.95 for safety or reliability, the Transmission Provider must file a non-conforming agreement, as Order No. 2003 permits. The Commission will consider these non-conforming agreements on a case by case basis. If a Transmission Provider has a different power factor range in its LGIA and wishes to apply that same range in Appendix G, it may seek a variation from the Commission under the variation standards approved in the Final Rule.[28] We remind Transmission Providers, however, that the Commission has adopted a specific power factor standard for wind plants because of their technical differences. Any proposed variations will be viewed in light of

[28] Final Rule at P 109.

these technical differences.

51. In response to the assertion of EEI and NU that wind plants should regulate voltage to a set point established by the Transmission Provider, we note that in the Final Rule we concluded that article 9.6.2 of the LGIA (which applies to all plants, including wind plants) already requires that the "Interconnection Customer . . . operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection."[29]

52. Finally, the Commission addressed in the Final Rule the concerns raised by NRECA/APPA regarding the phrase "taking into account any limitations due to voltage level, real power output, etc." We stated that this language was necessary due to the technical limitations of wind generating technology.[30] We noted that all wind generating equipment vendors cannot meet the required power factor range at all levels of output. We reiterate that these technical differences make the disputed language necessary. Furthermore, without this language, a Transmission Provider could discriminate against a wind plant by requiring that it operate at the stated power factor at voltages where it is technically infeasible to do so.

3. Point of Measurement of Power Factor

53. National Grid asks that if the Commission adopts the recommended revisions to

[29] Id. at P 55.

[30] Id. at P 56.

the low voltage ride-through provisions filed jointly by AWEA and NERC, it clarify that while the point of measurement for compliance with the low voltage ride-through standard would be at the high-side of the step-up transformer, the point of measurement for reactive power is at the Point of Interconnection.

Commission Conclusion

54. We clarify that the point of measurement for the reactive power standard is at the Point of Interconnection.

C. Self-Study of Interconnection Feasibility

55. In the Final Rule, the Commission adopted special interconnection procedures that allow the wind plant Interconnection Customer, when completing the Interconnection Request form required by section 3.3 of the LGIP, to provide the Transmission Provider with a simplified set of preliminary data depicting the wind plant as a single equivalent generator.[31] Once the wind generator has provided this data and satisfied all other applicable Interconnection Request conditions, the special procedures permit the wind plant to enter the queue and receive the base case data as provided for in the LGIP. Finally, the special procedures adopted in the Final Rule require the wind plant Interconnection Customer to submit, within six months of submitting the Interconnection Request, completed detailed electrical design specifications and other data (including

[31] "Single equivalent generator" information is design data that represents the aggregate electrical characteristics of the individual wind generators as a single generator.

collector system layout data) needed by the Transmission Provider to complete the System Impact Study.

56. Southern Company argues on rehearing that these provisions give wind developers a special preference that unfairly disfavors other generating technologies.

57. EEI, NU and Southern Company contend that the "self-study" provisions of the Final Rule will add further complexity and uncertainty to the queue process and make queue management and assignment of cost responsibilities more difficult for Transmission Providers with large wind-powered generation projects in their queue. Southern Company adds that the self-study provisions could increase costs to market participants because the Transmission Provider will have to run multiple studies. EEI argues that until the industry can fully address the issues raised by these provisions in a technical forum, the Commission should remove the provisions from Appendix G. EEI and NU assert that the provisions do not protect against a wind plant Interconnection Customer making significant revisions to its project proposal. If the Commission does not remove the provisions entirely, EEI and NU suggest that the Commission allow the Transmission Provider to determine whether the detailed electrical design specifications later submitted by the wind plant Interconnection Customer are a material modification to the initial proposal, which would result in the initial Interconnection Application being withdrawn.

58. Midwest ISO agrees with the Commission that a wind plant should be able to enter

the queue and receive base case data based on preliminary design specifications. However, it seeks rehearing of the provision that permits a wind plant to wait up to six months before submitting final design specifications. It argues that this procedure promotes inefficiency because the Transmission Provider may be able to evaluate the proposed interconnection, but cannot do so because it lacks necessary data. Midwest ISO requests that the Commission revise the Appendix G self-study provisions to permit the Transmission Provider to notify the wind plant Interconnection Customer of its intent to start the System Impact Study. Once this notice is given, the wind plant developer would have five business days to "submit either actual design specifications or generic specifications based on typical equipment used in the industry."[32] Further, Midwest ISO proposes that if the wind plant Interconnection Customer submits generic specifications, it should have to accept cost uncertainty, because additional facilities may be required when the actual design specifications are taken into account. Midwest ISO asserts that this would limit delays in the study process and would allow the Transmission Provider to identify potential problems or eliminate tenuous or technically deficient projects earlier and to better use its resources to study proposed interconnections.

Commission Conclusion

59. The Commission will deny these requests for rehearing. We will make one minor revision to label these special interconnection procedures for wind plants as "Appendix

[32] Request for Rehearing of Midwest ISO at 4.

7" to the LGIP, as discussed in more detail below.

60. In response to arguments that the self-study procedures for wind plants give these plants a preference, we reiterate that these procedures were developed to recognize the technical differences of wind plants. Unlike conventional generators, wind plant design specifications and configurations can change significantly based on their placement on the transmission system.[33] For example, the placement of wind turbines, voltage support devices, transformers, and other equipment (including the layout of the medium voltage collector system) depend on the location of the wind plant, the location of other generators on the transmission system, and other information included in the base case data.[34] To accommodate these differences, the Final Rule permits wind plants to enter the interconnection queue with a set of preliminary electrical design specifications depicting the wind plant as a single generator, instead of providing detailed design specifications as required by Order No. 2003. Treating wind plants differently in this regard is not unduly discriminatory or preferential, but as noted elsewhere, simply recognizes that wind plants have different technical characteristics than the more traditional forms of generation that the LGIP and LGIA were designed to accommodate. We continue to believe that without this reasonable accommodation, Transmission Providers could frustrate the interconnection of wind plants by requiring them to submit

[33] Final Rule at P 97.

[34] Id.

detailed design data, which they cannot do until later in the interconnection process.

61. We are not persuaded that the reasonable self-study provision we adopted will make the interconnection queue process significantly more difficult or complex. Wind plant Interconnection Customers who provide the preliminary single generator equivalent data are required to provide final detailed electrical design specifications no later than six months after submitting the initial Interconnection Request. This six-month time period takes into account the procedures needed before the start of the System Impact Study, including the Feasibility Study and negotiation of study agreements. Therefore, the Transmission Provider will receive from the wind plant the detailed design information needed to conduct the System Impact Study. For this reason, we also deny Midwest ISO's request to modify the six-month deadline. If we adopted Midwest ISO's proposed modifications, the Transmission Provider could request that the wind plant provide detailed design specifications at any time it believes it is ready to begin the System Impact Study, even a day after the initial Interconnection Request is submitted. As a result, this modification would defeat the purpose of permitting wind plants to submit preliminary design specifications, and could allow Transmission Providers to frustrate the interconnection of wind plants.

62. With respect to the alternative suggestion by EEI and NU that the Transmission Provider be permitted to determine that a detailed design specification later submitted by the wind plant Interconnection Customer is a material modification of the Interconnection Request, we note that section 4.4 of the LGIP already addresses modifications and will

apply to wind plants as well as other generating technologies. When applying this section to wind plant Interconnection Requests that first submit preliminary design specifications, Transmission Providers are not to consider the detailed design data provided later by the wind plant Interconnection Customer to be a material modification unless it significantly departs from the preliminary specifications provided. In other words, the detailed design provided later should be substantially the same as the initial single-generator equivalent design in terms of its costs and effect on the transmission system.

63. Finally, to avoid confusion, the Commission will rename the Appendix G to the LGIP it adopted in the Final Rule as "Appendix 7, Interconnection Procedures for a Wind Generating Plant." Accordingly, when complying with the Final Rule and this order on rehearing, public utilities must adopt the special interconnection procedures applicable to wind plants as Appendix 7 to their LGIPs. The low voltage ride-through, power factor design criteria and SCADA provisions should continue to be labeled "Appendix G" to the LGIA.

D. Adoption of Appendix G on an Interim Basis Only

64. EEI and NU each generally argue that the Commission should apply Appendix G only on an interim basis, and should defer to NERC and Institute of Electrical and Electronics Engineers (IEEE) processes to develop formal technical standards. Southern Company argues that the Commission should defer to NERC, regional reliability councils, and other technical organizations to develop technical requirements for wind

plants, and should suspend application of the Final Rule and formally request that these entities develop technical standards. Southern Company argues that this would avoid the problems that result from having the Commission review each variation to Appendix G as the technical standards are developed and revised. It also asserts that the Commission should not be the arbiter of technical disputes, such as the outcome of the System Impact Study or specific SCADA requirements, as the Final Rule provides.

65. As noted above, NERC similarly argues that the Commission should only require wind plants to meet NERC and regional reliability council requirements, noting that Figure 1 is likely to remain static over time, which could hamper the development of wind generator technology. EEI notes that NERC has established a Wind Generator Task Force that is examining existing standards and will make proposals later this year. It states that the industry worldwide is addressing technical challenges presented by wind generation. Significant modifications are being developed for the German grid code, and Hydro-Québec is considering several reliability issues regarding wind generator interconnection. NERC further notes that Hydro-Québec requires the same dynamic performance of wind plants that it requires of other generating facilities, and that major wind turbine manufacturers have shown that they can meet this requirement. EEI proposes that the industry conduct a technical forum to resolve issues related to wind plant interconnection, concluding with formal recommendations to the Commission that could be used in a new NOPR, or to develop formal proposals for NERC or IEEE standards.

Commission Conclusion

66. The Commission denies these requests for rehearing, and others noted earlier, that ask us to adopt Appendix G only on an interim basis. Standards are needed today because no nationwide standard is currently in place and it is uncertain when such a standard will be finalized. Without a firm standard in place, the current ad hoc practices for wind interconnection requirements may frustrate the interconnection of wind plants. As we noted in the Final Rule, Appendix G is necessary to recognize the technical differences between wind plants and traditional plants to ensure that the entry of wind generation into markets is not unnecessarily inhibited.

67. We recognize, however, that the industry continues to study and address issues raised by the interconnection and operation of wind plants. For that reason, the Commission stated in the Final Rule that if another entity develops an alternate standard, a Transmission Provider may seek to justify adopting it as a variation from Appendix G.[35] We also stated that we would consider a future industry petition to revise Appendix G to conform to a NERC-developed standard.[36] We reiterate both of those statements

[35] Id. at P 34. We note that in this order on rehearing, variations to the low voltage ride-through standard will only be permitted on an interconnection-wide basis. As we note above, however, non-conforming agreements may be submitted to the Commission. See P 33-34, supra.

[36] Id.

here, and also note that under the Energy Policy Act of 2005, the Commission will be addressing mandatory reliability standards.[37]

E. Transition Period

68. In the Final Rule, the Commission adopted a transition period that applies to the low voltage ride-through, power factor design criteria and SCADA requirements. These technical requirements in the Final Rule Appendix G, if applicable, apply only to LGIAs signed, filed with the Commission in unexecuted form, or filed as non-conforming agreements, on or after January 1, 2006, or the date six months after publication of the Final Rule in the Federal Register, whichever is later.[38] The Commission adopted this transition period to allow wind equipment currently in the process of being manufactured to be completed without delay or added expense, and to ensure that the Final Rule did not interrupt the supply of wind turbines.

69. NRECA/APPA argues that the transition period is arbitrary, capricious, and unduly discriminatory. NRECA/APPA asserts that the Commission adopted the

---

[37] See Energy Policy Act of 2005, Pub. L. No. 109-58, § 1211, 119 Stat. 594, 941 (2005).

[38] The Final Rule was published in the Federal Register on June 16, 2005. Thus, the low voltage ride-through, power factor design criteria and reactive power provisions in the Final Rule, as revised herein, will apply to LGIAs signed, filed with the Commission in unexecuted form, or filed as non-conforming agreements, on or after January 1, 2006.

transition period with no technical justification and no explanation of how the transition period will maintain the reliability of the transmission system. They contend that the transition period requires transmission customers and competing generators to bear the reliability effects of wind plants interconnected during the transition period. While NRECA/APPA state that there are "valid commercial considerations" that should be taken into account for the existing inventory of wind equipment, they contend that such determinations should be made on a case-by-case basis.

Commission Conclusion

70. The Commission declines to remove the transition period as NRECA/APPA request. We adopted this reasonable transition mechanism to allow wind turbines in the process of being manufactured to be completed without delay or additional expense.[39] The transition period ensures that the supply of wind turbines is not unfairly or unreasonably interrupted.[40] Furthermore, contrary to NRECA/APPA's contention, the Commission considered the possible reliability effects of the transition period, and concluded that the remaining provisions of Order No. 2003 will adequately protect reliability.[41] The remaining provisions of Order No. 2003 will also ensure that other generators or the Transmission Provider will not bear the reliability effects of a wind

[39] Final Rule at P 115.

[40] Id.

[41] Id.

plant because that rule, and the LGIA and LGIP contained in it, ensure that generating facilities are not interconnected in a manner that degrades reliability.

III. Document Availability

71. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through FERC's Home Page (http://www.ferc.gov) and in FERC's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, N.E., Room 2A, Washington, D.C. 20426.

72. From the Commission's Home Page on the Internet, this information is available in the Commission's document management system, eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

73. User assistance is available for eLibrary and the Commission's website during normal business hours. For assistance, please contact FERC Online Support at 1-866-208-3676 (toll free) or 202-502-6652 (e-mail at FERCOnlineSupport@FERC.gov), or the Public Reference Room at 202-502-8371, TTY 202-502-8659 (e-mail at public.referenceroom@ferc.gov).

IV. Effective Date

74. As noted above, on August 5, 2005, the Commission issued an order extending the

effective date of the Final Rule to October 14, 2005.[42] Those provisions of the Final Rule not revised in this order on rehearing and clarification are effective as of that date. Changes made to the Final Rule in this order on rehearing and compliance will become effective on [**INSERT DATE 30 DAYS AFTER DATE OF PUBLICATION IN THE FEDERAL REGISTER**].

V. Compliance with the Final Rule and Order on Rehearing and Clarification

75. In the Commission's August 5, 2005 order extending the effective date of the Final Rule, the Commission also extended to November 14, 2005, the date by which all public utilities that own, control, or operate transmission facilities in interstate commerce are to adopt, in their OATTS, the Final Rule Appendix 7 (as described above)[43] as an amendment to the LGIP, and Final Rule Appendix G as an amendment to the LGIA. By further notice issued October 28, 2005, the Commission extended this date further, to December 30, 2005. Public utilities who have already filed a Final Rule Appendix G as amendments to the LGIPs and LGIAs in their OATTs must file, by December 30, 2005, the revisions to the Final Rule Appendix G to the LGIA made in this order on rehearing.

[42] Order Granting Extension of Effective Date and Extending Compliance Date, 70 FR 47093 (Aug. 12, 2005), 112 FERC ¶ 61,173 (2005).

List of Subjects in 18 C.F.R. Part 35

Electric power rates; Electric utilities.

By the Commission. Chairman Kelliher dissenting in part with a separate statement attached.

(S E A L)

Magalie R. Salas,
Secretary.

In consideration of the foregoing, the Commission revises part 35, Chapter I, Title 18 of the Code of Federal Regulations as follows.

PART 35 B FILING OF RATE SCHEDULES

1. The authority citation for part 35 continues to read as follows:

Authority: 16 U.S.C. §§ 791a-825r, §§ 2601-2645; 31 U.S.C. § 9701; 42 U.S.C. §§ 7101-7352.

2. In § 35.28, the first sentences of currently existing paragraphs (f)(1) and (f)(1)(iii) are revised, a new paragraph (f)(1)(iii) is added, and currently existing paragraph (f)(1)(iii) is renumbered to account for new paragraph (f)(1)(iii), all to read as follows:

§ 35.28 Non-discriminatory open access transmission tariff.

* * * * *

(f) Standard generator interconnection procedures and agreements.

(1) Every public utility that is required to have on file a non-discriminatory open access transmission tariff under this section must amend such tariff by adding the standard interconnection procedures and agreement contained in Order No. 2003, FERC Stats. & Regs. & 31,146 (Final Rule on Generator Interconnection), as amended by the Commission in Order No. 661, FERC Stats. & Regs. ¶ 31,186 (Final Rule on Interconnection for Wind Energy), and the standard small generator interconnection

procedures and agreement contained in Order No. 2006, FERC Stats. & Regs. ¶ 31,180 (Final Rule on Small Generator Interconnection), or such other interconnection procedures and agreements as may be approved by the Commission consistent with Order No. 2003, FERC Stats. & Regs. & 31,146 (Final Rule on Generator Interconnection) and Order No. 2006, FERC Stats. & Regs. ¶ 31,180 (Final Rule on Small Generator Interconnection).

(i) The amendment to implement the Final Rule on Generator Interconnection required by the preceding subsection must be filed no later than January 20, 2004.

(ii) The amendment to implement the Final Rule on Small Generator Interconnection required by the preceding subsection must be filed no later than August 12, 2005.

(iii) The amendment to implement the Final Rule on Interconnection for Wind Energy required by the preceding subsection must be filed no later than December 30, 2005.

(iv) Any public utility that seeks a deviation from the standard interconnection procedures and agreement contained in Order No. 2003, FERC Stats. & Regs. & 31,146 (Final Rule on Generator Interconnection), as amended by the Commission in Order No. 661, FERC Stats. & Regs. ¶ 31,186 (Final Rule on Interconnection for Wind Energy), or the standard small generator interconnection procedures and agreement contained in

Order No. 2006, FERC Stats. & Regs. ¶ 31,180 (Final Rule on Small Generator Interconnection), must demonstrate that the deviation is consistent with the principles of either Order No. 2003, FERC Stats. & Regs. & 31,146 (Final Rule on Generator Interconnection) or Order No. 2006, FERC Stats. & Regs. ¶ 31,180 (Final Rule on Small Generator Interconnection).

Appendix B

[NOTE: THESE PROVISIONS TO BE ADOPTED AS APPENDIX G TO THE LGIA]

APPENDIX G

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard below. The LVRT standard provides for a transition period standard and a post-transition period standard.

Transition Period LVRT Standard

The transition period standard applies to wind generating plants subject to FERC Order 661 that have either: (i) interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007, or (ii) wind

generating turbines subject to a wind turbine procurement contract executed prior to December 31, 2005, for delivery through 2007.

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles at a voltage as low as 0.15 p.u., as measured at the high side of the wind generating plant step-up transformer (i.e. the transformer that steps the voltage up to the transmission interconnection voltage or "GSU"), after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system.
2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU or to faults that would result in a voltage lower than 0.15 per unit on the high side of the GSU serving the facility.
3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator, etc.) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

Post-transition Period LVRT Standard

All wind generating plants subject to FERC Order No. 661 and not covered by the transition period described above must meet the following requirements:

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles after which, if the fault remains following the

location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system. A wind generating plant shall remain interconnected during such a fault on the transmission system for a voltage level as low as zero volts, as measured at the high voltage side of the wind GSU.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

ii. Power Factor Design Criteria (Reactive Power)

A wind generating plant shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the Point of Interconnection as defined in this LGIA, if the Transmission Provider's System Impact Study shows that such a requirement is

necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability 606 (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

Appendix C

[NOTE: THESE PROVISIONS TO BE ADOPTED AS APPENDIX G TO THE LGIP]

APPENDIX 7

INTERCONNECTION PROCEDURES FOR A WIND GENERATING PLANT

Appendix G sets forth procedures specific to a wind generating plant. All other requirements of this LGIP continue to apply to wind generating plant interconnections.

A. Special Procedures Applicable to Wind Generators

The wind plant Interconnection Customer, in completing the Interconnection Request required by section 3.3 of this LGIP, may provide to the Transmission Provider a set of preliminary electrical design specifications depicting the wind plant as a single equivalent generator. Upon satisfying these and other applicable Interconnection Request conditions, the wind plant may enter the queue and receive the base case data as provided for in this LGIP.

No later than six months after submitting an Interconnection Request completed in this manner, the wind plant Interconnection Customer must submit completed detailed electrical design specifications and other data (including collector system layout data) needed to allow the Transmission Provider to complete the System Impact Study.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Interconnection for Wind Energy Docket No. RM05-4-001

(Issued December 12, 2005)

Joseph T. KELLIHER, Chairman, *dissenting in part*:

I vote for this order because it constitutes an improvement over the final rule. I agree with the Commission's decision to grant rehearing with respect to the low voltage ride-through (LVRT) provisions and to adopt the joint recommendation of NERC and AWEA. As the order points out, by adopting a definitive, uniform, LVRT standard, the Commission "provide[s] certainty" to the industry and "ensure[s] that reliability is maintained and NERC planning standards are met."[1]

Unfortunately, the Commission's decision on LVRT contrasts with its decision to exempt wind generators from compliance with the same power factor standard as all other generators. The Commission requires all non-wind generators to maintain a power factor within the range of 0.95 leading to 0.95 lagging, which NERC has determined to be "within a range required by Good Utility Practice."[2] Order No. 661, however, singles out wind generators for special treatment by exempting them from meeting the standard power factor requirement unless the Transmission Provider demonstrates in the System Impact Study that reactive power capability is necessary to ensure the safety or reliability of the transmission system. In my view, exempting only wind generators from the power factor standard does not provide certainty to the industry, results in an undue preference for wind generators and does not adequately ensure that reliability of the transmission system is maintained.

Section 205 of the Federal Power Act broadly precludes public utilities, in any transmission or sale subject to the Commission's jurisdiction, from "mak[ing] or grant[ing] any undue preference or advantage to any person or subject[ing] any person to any undue prejudice or disadvantage. . . ."[3] In my view, Order No. 661 gives preferential treatment to

[1] Order at P34.

[2] Order No. 2003 at P541.

[3] 16 U.S.C. § 824d(b).

wind generators, since it exempts wind generators from meeting the same power factor requirement as all other non-wind generators. The issue is whether the preferential treatment afforded to wind generators is undue.

I do not believe that either the record or the explanation offered in this order provides a basis for giving preferential treatment to wind generators when it comes to meeting the power factor requirement. The order's attempt to justify discriminating in favor of wind generators as an accommodation for "technical differences"[4] is not convincing. The only "technical" difference identified is the assertion that compliance with reactive power capability is more expensive for wind generators than for other generator resources.[5] While one can understand why wind generators would like to be relieved of the added cost of complying with the same power factor standard as all other non-wind generators, I fail to see how the desire to avoid incurring the costs of complying with the Commission's standardized power factor requirement constitutes a technological difference warranting discriminatory treatment.

Equally troubling, I disagree with the Commission's decision to brush aside the concerns raised by NERC and other protesters that the Commission has "lowered the bar" for reliability by shifting the burden to the Transmission Provider to justify the need for wind generators to comply with the same power factor requirement as non-wind generators. I find little comfort in the Commission's view that any reliability concerns can be addressed in the System Impact Study if the Transmission Provider proves that a wind generator's compliance with the reactive power factor standard is necessary. In my view, shifting the burden to Transmission Providers to make such a showing simply cannot be reconciled with the approach taken by the Commission in Order No. 2003 which presumes the need for all generators to comply with power factor requirement under "Good Utility Practice." [6]

As a result, I would have granted rehearing and returned to the approach proposed by the Commission in the NOPR of requiring all generators to meet the same power factor

---

[4] Order at P45.

[5] *Id*. ("One of these [technical] differences is that for wind plants, reactive power capability is a significant added cost, while it is not a significant additional cost for traditional generators.").

[6] Order No. 2003 at PP541-42.

standard absent a waiver by the Transmission Provider. Accordingly, I dissent in part from the order.

Joseph T. Kelliher

Standard: BAL-003-1 Frequency Response and Frequency Bias Setting		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in BAL-003-1/Comments**
R1. Each Balancing Authority shall review its Frequency Bias Settings by January 1 of each year and recalculate its setting to reflect any change in the Frequency Response of the Balancing Authority Area. R1.1. The Balancing Authority may change its Frequency Bias Setting, and the method used to determine the setting, whenever any of the factors used to determine the current bias value change. R1.2. Each Balancing Authority shall report its Frequency Bias Setting, and method for determining that setting, to the NERC Operating Committee.	This Requirement has been moved into BAL-003-1 Attachment A & FRS Form 1	Attachment A Each Balancing Authority shall report its previous year's Frequency Response Measure (FRM), Frequency Bias Setting and Frequency Bias type (fixed or variable) to the ERO on FRS Form 1 by January 10 each year. If the ERO posts the official list of events after December 10, Balancing Authorities will be given 30 days from the date the ERO posts the official list of events to submit their FRS Form 1. AND FRS Form 1 Note : Balancing Authorities with variable Frequency Bias Settings shall calculate monthly average Frequency Bias Settings. The previous year's monthly averages will be reported annually on FRS Form 1.
R2. Each Balancing Authority shall establish and maintain a Frequency	This Requirement	R2. Each Balancing Authority not participating in Overlap Regulation Service shall implement the Frequency Bias Setting

Standard: BAL-003-1 Frequency Response and Frequency Bias Setting		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in BAL-003-1/Comments**
Bias Setting that is as close as practical to, or greater than, the Balancing Authority's Frequency Response. Frequency Bias may be calculated several ways: **R2.1.** The Balancing Authority may use a fixed Frequency Bias value which is based on a fixed, straight-line function of Tie Line deviation versus Frequency Deviation. The Balancing Authority shall determine the fixed value by observing and averaging the Frequency Response for several Disturbances during on-peak hours. **R2.2.** The Balancing Authority may use a variable (linear or non-linear) bias value, which is based on a variable function of Tie Line deviation to Frequency Deviation. The Balancing Authority shall determine the variable frequency bias value by	is included in BAL-003-1 as described in the Proposed Language Section.	(fixed or variable) validated by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control. AND Attachment A Each Balancing Authority shall report its previous year's Frequency Response Measure (FRM), Frequency Bias Setting and Frequency Bias type (fixed or variable) to the ERO on FRS Form 1 by January 10 each year. If the ERO posts the official list of events after December 10, Balancing Authorities will be given 30 days from the date the ERO posts the official list of events to submit their FRS Form 1. AND FRS Form 1 Note : Balancing Authorities with variable Frequency Bias Settings shall calculate monthly average Frequency Bias Settings. The previous year's monthly averages will be reported annually on FRS Form 1. AND

Authorities that have fixed schedules (B and C). R4.2. The Balancing Authorities that have a fixed schedule (B and C) but do not contain the Jointly Owned Unit shall not include their share of the governor droop response in their Frequency Bias Setting.		
R5. Balancing Authorities that serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of the Balancing Authority's estimated yearly peak demand per 0.1 Hz change. **R5.1.** Balancing Authorities that do not serve native load shall have a monthly average Frequency Bias Setting that is at least 1% of its estimated maximum generation level in the coming year per 0.1 Hz change.	This Requirement has been moved into BAL-003-1 Requirement R5.	R5. Each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: • The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.
R6. A Balancing Authority that is performing Overlap Regulation Service shall increase its Frequency	This Requirement has been	R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to the sum of the

Standard: BAL-003-1 Frequency Response and Frequency Bias Setting		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Proposed Language in BAL-003-1/Comments**
Bias Setting to match the frequency response of the entire area being controlled. A Balancing Authority shall not change its Frequency Bias Setting when performing Supplemental Regulation Service.	moved into BAL-003-1 Requirement R4.	Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO or calculate the Frequency Bias Setting based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled.

Subject: NERC: Standards Announcement - Project 2007-12 Frequency Response | Ballot Pools, Formal Comment Period and Initial Ballot and Non-Binding Poll Information
Date: Tuesday, October 25, 2011 12:03:36 PM

Standards Announcement

Project 2007-12 Frequency Response

Ballot Pool Windows Now Open: Oct. 25 – Nov. 23, 2011
Formal Comment Period Open: Oct. 25 – Dec. 8, 2011
Initial Ballot and Non-Binding Poll Window: Nov. 29 – Dec. 8, 2011

Available Now

BAL-003-1 – Frequency Response and Frequency Bias Setting, an implementation plan and several additional associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Thursday, December 8, 2011. Ballot pools are being formed and the ballot pool windows are open through 8 a.m. Eastern on Wednesday, November 23.

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document – Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A – ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B – ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions – two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second and five second intervals) – Both forms are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.
- Unofficial comment form in Word format – This is for informal use when compiling

responses – the final must be submitted electronically

Instructions for Joining Ballot Pools for BAL-003-1 and Associated VRFs/VSLs
Two separate ballot pools are being formed – one ballot pool for Registered Ballot Body (RBB) members interested in balloting of BAL-003-1, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with BAL-003-1. RBB members who join the ballot pool for the standard **will not** be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pools to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)
The list server for the initial ballot is: bp-2007-12_Freq_Resp_in@nerc.com
Non-Binding Poll list server: bp-2007-12_NB_OCT2011_in@nerc.com

Instructions for Commenting
Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps
The drafting team is planning a webinar in November to explain changes to the most recent draft of BAL-003-1. The date and registration information will be announced as soon as the details are finalized. An initial ballot of BAL-003-1 will be conducted beginning on Tuesday, November 29, 2011 through 8 p.m. Eastern on Thursday, December 8, 2011.

Background
Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the reasons for the decline in Frequency Response can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability.

Additional information is available on the project webpage.

A stakeholder interested in following the Frequency Response Standard Drafting Team's development of BAL-003-1 may monitor meeting agendas and notes on the team's "Related Files" web page or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" e-mail list, send an e-mail to: sarcomm@nerc.com. Please include the drafting team name in

your e-mail request.

Standards Development Process

Discussion To Support The Development Of NPCC Industry Comments

For BAL-003-1 – Frequency Response and Frequency Bias Setting

Mike Potishnak

November 17, 2011

Introduction

Industry comments and initial balloting are due by December 8, 2001. As NPCC's representative on the Frequency Responsive Reserve Standard Drafting Team (FRSDT), perhaps sharing my perspectives on the development and merits of the version of BAL-003-1 under review may expedite the production of comments and balloting positions for the NPCC Balancing Authorities.

BAL-003-1 is the only standard being offered at this time in response to the Standard Authorization Request Form for Frequency Response. BAL-003-1 is applicable only to Balancing Authorities and Reserve Sharing Groups. A common concern that has been expressed in the industry is that the burden of compliance is being placed solely on Balancing Authorities while the main sources of discretional frequency response are generators. The next section of this document will address that concern.

The technical merits of BAL-003-1 of setting requirements for frequency response and frequency bias settings are discussed in the third section of this document. Implicit in this discussion is that requirements for Balancing Authorities to provide sufficient frequency response and have proper frequency bias settings in their AGC systems are necessary.

Summary recommendations concerning the support for this version of BAL-003-1 are provided in the final section of this document.

Requirements for Generators To Provide Frequency Response

The Standard Authorization Request Form (SAR) identifies the following entities to be within its scope: Reliability Authority, Balancing Authority, Generator Owner, Generator Operator, and Load-Serving Entity. However, the detailed description refers to generators only in item 6, which requires the collection of per generator performance data, but only when the Balancing Authority is deficient in meeting its Frequency Response Obligation.

While it is not clear whether the development of performance requirements for generators' governor response fits within this SAR, the FRSDT discussed such requirements at length during the development process. While sentiment was split, a key point made during the discussions was that innovative alternative sources for frequency response may be on the horizon. (ERCOT is already obtaining frequency response from loads.) And in the spirit of result-based standards, the Balancing Authority would have requirements for WHAT level of frequency response needs to be achieved, and they are free to determine HOW to achieve the targeted performance level. For example, ISOs that do not own generation may meet the requirement by placing the obligation solely on generation resources. However, a vertically integrated utility that owns generation and is also a Balancing Authority may seek alternative, more cost-effective methods than eliminating sliding pressure control in its conventional thermal generation fleet to restore governor response, given the heat rate improvements and dollars associated with sliding pressure control operation.

It has also been noted that ISOs not owning generation are subjected to compliance with CPS 1 and CPS 2 for regulation, and DCS for contingency reserve. So why should frequency response be any different? ISOs would need to find a

way to get adequate frequency response just as they have found ways to obtain adequate regulation and contingency reserve to be deployed.

In an attempt to find some middle ground, I have advocated the development of a generator governor response standard in which Balancing Authorities have the option of waiving the requirements to pursue the use of alternative resources. While discussions with WECC personnel indicated an interest in co-sponsorship of such a standard, no other NPCC Balancing Authority offered support during an informal TFCO discussion on the topic.

Technical Merits of BAL-003-1

Four documents will be discussed: the standard itself, its Attachments A and B, and its background document. The comments on each document will be sorted as either a "virtue" or a "vice".

BAL-003-1- Frequency Response and Frequency Bias Setting – **VIRTUES**

1. The 3 definitions offered are good, though the FRM definition should not refer to FORM 1.
2. An effective date for meeting the Frequency Response Obligation has a 2 year lead time.
3. Requirements R1 through R5 and their corresponding measures seem appropriate and clearly written.
4. The information in the compliance section seems reasonable.

BAL-003-1- Frequency Response and Frequency Bias Setting – **VICES**

1. The FRM definition should not refer to FORM 1.

2. The FRSDT should address the possibility for abuse by a Balancing Authority that is for the most part a generation only Balancing Authority, but they acquire a small amount of load to qualify under the first bullet of R5.
3. The violation severity levels for R1 seem to be reasonable. However, the technical writing needs to be enhanced for clarity.

BAL-003-1- Attachment A – **VIRTUES**

1. The event selection criteria are well-chosen.
2. The basic process for determining the Frequency Response Obligation is adequate.
3. The use of the median instead of the mean or linear aggression is the appropriate choice.
4. The standardized 18 to 52 second metric is appropriate for the Balancing Authorities of the Eastern Interconnection.

BAL-003-1- Attachment A – **VICES**

1. Criterion 5 needs to be re-written for clarity.
2. Criterion 7 refers to the "cleanest events". Perhaps a statement of what constitutes a "clean event" is needed to avoid possible controversy in the future.
3. The use of 59.6 Hz as the highest UFLS setting seems flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or, it should be 59.5 Hz without concern for Florida's unique settings.
4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer "alternate FRO protection criteria". It seems that the Interconnection should have been an integral part of establishing its obligation. Also, it states that the "ERO will confirm" the "alternate FRO protection criteria". Does this mean

the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify.

5. In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. Also, the background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify.
6. Very recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection.
7. Attachment A needs to define the point A sampling interval.

BAL-003-1- Attachment B – **VIRTUES**

1. The process promotes better interconnected operations and has sufficient checks and balances to avoid an adverse reliability outcome.

BAL-003-1- Attachment B – **VICES**

1. None.

Frequency Response Standard Background Document – **VIRTUES**

1. This is a very useful document that should be maintained over time.

Frequency Response Standard Background Document – **VICES**

1. Cite Attachment B in addition to Attachment A in the discussion of requirement 1.
2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A.
3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12.
4. On page 6, drop the inappropriate recommendation of getting frequency response through supplemental regulation. It is inappropriate to try to substitute a "minute plus" product that is deployed centrally by the Balancing Authority for a "sub-minute" product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it! This comment also applies to the mentioning of supplemental regulation on page 11 as well.
5. On page 7, the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the requirement. The requirement says that any time within the designated date is acceptable.
6. On page 8, the inclusion of "for training purposes" as a reason to not operate in tie line bias control should be dropped. This sort of training can be done in a training simulator. Alternatively, if it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly.

7. On page 14, the sentence: “This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations” is difficult to understand. The paragraph would read better by simply dropping it.

Summary Of Recommendations

Of the 17 “vices” cited above, 13 of them are of a technical writing nature. The four substantive problems are:

- Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz
- Using installed capacity in determining the Frequency Response Obligation
- The sampling interval needs to be tuned on a per Interconnection basis to support HQTE’s characteristics
- Do not advocate the use of supplemental regulation as a method of procuring frequency response

I recommend supporting the standard, contingent upon resolving the above four substantive problems.

I recommend continuing to support the development of a governor response standard for generators that may be waived by Balancing Authorities at their option. Realistically, I do not believe that such a standard would be passed by the industry without such a waiver capability.

I do not recommend opposing BAL-003-1 solely because a governor response standard is not provided along with it at this time. FERC and NERC are committed to such a standard. If we do not work constructively to remove its present rough

edges, we may be forced to accept an inferior standard. Another risk is that FERC may impose its own standard should the industry fail to deliver, and that standard may be more onerous, noting the imposition of 1% of peak load level of governor response on Florida in a recent settlement.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee approved the SAR for posting on January 13, 2005.
2. The SAR was posted for industry comment from January 17, 2005 through February 17, 2005.
3. Reply comments and a revised SAR were posted for a second industry comment period from April 4, 2006 through May 3, 2006.
4. Reply comments and a revised SAR were posted for a third industry comment period from February 8, 2007 through March 9, 2007.
5. Standards Committee approved moving the project into the standards development phase on July 12, 2007.
6. The Standards Committee appointed the Standard Drafting Team on August 13, 2007.
7. The draft standard was posted for a 30 day formal comment period from February 4, 2011 through March 7, 2011.

Proposed Action Plan and Description of Current Draft:

This is the second posting of the proposed standard and its associated documents for a 45 day formal comment period and a successive 10 day ballot, from October ~~21~~24, 2011through December ~~5~~7, 2011.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Respond to comments submitted within the comment period and with the successive ballot.	December, 2011
2. Conduct a recirculation ballot for ten days.	January, 2012
3. BOT adoption.	March, 2012

Definitions of Terms used in the Standard

~~**Single Event Frequency Response Data (SEFRD)**~~

~~The individual sample of event data from a Balancing Authority which represents the change in Net Actual Interchange (NI_A), divided by the change in frequency, expressed in MW/0.1Hz.~~

Frequency Response Measure (FRM)

The median of all the Frequency Response ~~Single Event Frequency Response Data~~ observations reported annually on FRS Form 1.

Frequency Response Obligation (FRO)

The Balancing Authority's share of the required Frequency Response ~~contribution to the total aggregate Frequency Response~~ needed for the reliable operation of an Interconnection ~~assigned by the ERO~~.

Frequency Bias Setting

A number~~value~~, ~~(~~either ~~a~~ fixed or variable ~~Frequency Bias)~~, usually expressed in MW/0.1 Hz, included in~~set into~~ a Balancing Authority's Area Control Error equation to account for~~that allows~~ the Balancing Authority's Frequency Response contribution ~~to contribute its Frequency Response~~ to the Interconnection, and discourage response withdrawal through secondary control systems.

A. Introduction

Title: Frequency Response and Frequency Bias Setting

Number: BAL-003-1

Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations and supporting frequency until the frequency is restored. To ~~schedule and~~ provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

Applicability:

1.1. Balancing Authority

1.2. Reserve Sharing Group (where applicable)

Effective Date:

1.3. In those jurisdictions where regulatory approval is required, Requirements R2, R3 ~~and~~ R4 and R5 of this standard shall become effective the first calendar day of the first calendar quarter 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R2, ~~and~~ R3, R4 and R5 of this standard shall become effective the first calendar day of the first calendar quarter 12 months after Board of Trustees adoption.

1.4. In those jurisdictions where regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1 of this standard shall become effective the first calendar day of the first calendar quarter 24 months after Board of Trustees adoption.

B. Requirements

R1. Each Balancing Authority (BA) or Reserve Sharing Group (RSG) shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency Response in the Interconnection. *[Risk Factor: Medium][Time Horizon: Operations Assessment]*

~~**R1.**~~**R2.** Each Balancing Authority not participating in Overlap Regulation Service shall implement the Frequency Bias Setting (fixed or variable) validated~~provided~~ by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias~~secondary~~ control~~, using the results from the calculation methodology detailed in Attachment A~~. *[Risk Factor: Medium][Time Horizon: Operations Planning]*

~~R2.~~**R3.** Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in~~on~~ Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. *[Risk Factor: Medium][Time Horizon: Real-time Operations]*

R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify~~increase~~ its Frequency Bias Setting in its ACE calculation to be equivalent to the sum of ~~by combining~~ the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO or calculate the Frequency Bias Setting based on the entire area being combined and thereby represent the Frequency Response for the combined~~entire~~ area being controlled. *[Risk Factor: Medium][Time Horizon: Operations Planning]*

R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: *[Risk Factor: Medium][Time Horizon: Operations Planning]*

- The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B.
- The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.

C. Measures

~~Measures for each Requirement will be provided in the second posting of the proposed standard.~~

M1. The Balancing Authority or Reserve Sharing Group shall have FRS Form 1 with data to show that its FRM is equal to or more negative than FRO to demonstrate compliance with Requirement R1.

M2. The Balancing Authority shall have evidence such as a dated document in hard copy or electronic format showing the ERO validated Frequency Bias Setting was entered into its ACE calculation on the date specified or other evidence to demonstrate compliance with Requirement R2.

M3. The Balancing Authority shall have evidence such as a dated operating log, database or list in hard copy or electronic format or operator interviews supported by other evidence showing the AGC operating mode including explanation when operating in other than Tie Line Bias mode to demonstrate compliance with Requirement R3.

M4. The Balancing Authority shall have evidence such as a dated operating log, database or list in hard copy or electronic format showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4.

~~M1.~~M5. The Balancing Authority shall have evidence such as dated data plus documented formula to support the calculation retained in either hardcopy or electronic format showing the monthly average Frequency Bias Setting or other evidence to demonstrate compliance with Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity is the Compliance Enforcement Authority except where the responsible entity works for the Regional Entity. Where the responsible entity works for the Regional Entity, the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity), to be responsible for compliance enforcement.~~Regional Entity shall serve as the Compliance Enforcement Authority.~~

1.2. Compliance Monitoring and Assessment Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

Periodic Data Submittals

1.3. Data Retention

The Balancing Authority shall retain data or evidence to show compliance with Requirements R1, R2, R3, R4 and R5, Measures M1, M2, M3, M4, and M5 for the current year plus three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

The Reserve Sharing Group shall retain data or evidence to show compliance with Requirement R1 and Measure M1 for the current year plus three calendar years unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If a Balancing Authority or Reserve Sharing Group is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all subsequent requested and submitted records.

1.4. Additional Compliance Information

~~**R1 Supplemental Information**~~

~~Each Balancing Authority shall report its previous year's Frequency Response Measure (FRM) to the ERO on Form 1 by January 10 each year. If the ERO posts the official list of events after December 10, Balancing Authorities will be given 45 days from the date the ERO posts the official list of events to submit their FRS Form 1.~~

~~A Balancing Authority may elect to fulfill its Frequency Response Obligation by participating as a member of a Reserve Sharing Group (RSG). If a Balancing Authority elects to report as an RSG, the total of the participating Balancing Authorities' FRO will be compared to the total of the participating Balancing Authorities' FRM.~~

~~**R2 Supplemental Information.**~~

~~Each Balancing Authority shall report its current year requested Frequency Bias Setting and Frequency Bias type (fixed or variable) to the ERO on FRS Form 1 by January 10 each year. If the ERO posts the official list of events after December 10, Balancing Authorities will be given 45 days from the date NERC posts the official list of events to submit their FRS Form 1. Once the FRM and Frequency Bias Settings have been validated by the ERO, the ERO will disseminate the Frequency Bias Settings Report for all Balancing Authorities in each Interconnection along with the implementation date.~~

~~Balancing Authorities with variable Frequency Bias Settings shall calculate monthly average Frequency Bias Settings. The previous year's monthly averages will be reported annually on FRS Form 1.~~ For Interconnections that are also Balancing Authorities, Tie Line Bias control and Flat Frequency control are equivalent and either is acceptable.

2.0 Violation Severity Levels

Implementation Plan for BAL-003-1 – Frequency Response & Frequency Bias Setting Standard

Prerequisite Approvals

There are no other reliability standards or Standard Authorization Requests (SARs), in progress or approved, that must be implemented before this standard can be implemented.

Modified Standards

BAL-003-0.1b ~~Requirements R1, R2, R3, R4 and R6~~ should be retired midnight of the day immediately prior to the Effective Date of~~when~~ BAL-003-1 in the Jurisdiction in which the new standard is becoming ~~becomes~~ effective.

~~BAL-003-0 Re1quirement R5 should be retired as outlined in the following table.~~

~~For those Balancing Authorities that serve native load:~~

- ~~May 2011 through December 2011 -0.8% of peak/0.1 Hz~~
- ~~January 2012 through December 2012 -0.6% of peak/0.1 Hz~~
- ~~January 2013 through December 2013 -0.4% of peak/0.1 Hz~~
- ~~January 2014 through December 2014 -0.2% of peak/0.1 Hz~~
- ~~January 2015 through -0.0% of peak/0.1 Hz~~

~~For those Balancing Authorities that do not serve native load:~~

- ~~May 2011 through December 2011 -0.8% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2012 through December 2012 -0.6% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2013 through December 2013 -0.4% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2014 through December 2014 -0.2% of upcoming years maximum generation/0.1 Hz~~
- ~~January 2015 through -0.0% of upcoming years maximum generation/0.1 Hz~~

~~The FRR drafting team, NERC and the NERC Resources Subcommittee will observe the impact on frequency and will implement a reversion plan should frequency performance decline.~~

New or Modified Definitions

The following definitions shall become effective when BAL-003-1 Requirements R2, R3, R4 and R5 become effective:

116-390 Village Boulevard, Princeton, New Jersey 08540-5721
Phone: 609.452.8060 ▪ Fax: 609.452.9550 ▪ www.nerc.com

Frequency Response Measure (FRM): The median of all the Frequency Response observations reported annually on FRS Form 1.

Frequency Response Obligation (FRO): The Balancing Authority's share of the required Frequency Response needed for the reliable operation of an Interconnection.

Frequency Bias Setting: A number, either a fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems.

The existing definition of Frequency Bias Setting should be retired midnight of the day immediately prior to the Effective Date of BAL-003-1 in the Jurisdiction in which the new standard is becoming effective.

The proposed revised definition for "Frequency Bias Setting" is incorporated in the following NERC approved standards:

- BAL-001-0.1a Real Power Balancing Control Performance
- BAL-004-0 Time Error Correction
- BAL-004-1 Time Error Correction
- BAL-005-0.1b Automatic Generation Control

Compliance with Standards

Once this standard becomes effective, the responsible entities identified in the applicability section of the standard must comply with the requirements. These include:

- Balancing Authorities
- Reserve Sharing Groups

Proposed Effective Date

Compliance with BAL-003-1 shall be implemented over a two-year period, as follows:

- In those jurisdictions where regulatory approval is required, Requirements R2~~1~~, R3, R4 and R5~~4~~ of this standard shall become effective the first calendar day of the first calendar quarter 12 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R2~~1~~, R3, R4 and R5~~4~~ of this standard shall become effective the first calendar day of the first calendar quarter 12 months after Board of Trustees adoption.
- In those jurisdictions where regulatory approval is required, Requirements R1~~2~~ of this standard shall become effective the first calendar day of the first calendar quarter 24 months after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, Requirements R1~~2~~ of this standard shall become effective the first calendar day of the first calendar quarter 24 months after Board of Trustees adoption.

Fax	(317) 249-5994		
E-mail	tbilke@midwestiso.org	☐	Urgent Action

Purpose/Industry Need

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately model existing Frequency Response. There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be modeled, and the reasons for the decline in Frequency Response can be identified. Once the reasons for the decline in Frequency Response are confirmed, requirements can be written to control Frequency Response to within defined reliability parameters.

Reliability Functions

The Standard will Apply to the Following Functions *(Check box for each one that applies by double clicking the grey boxes.)*		
☒	Reliability Authority	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports interconnection frequency in real time
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation valid and balanced Interchange Schedules between Balancing Authority Areas.
☐	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >1year plan for the resource adequacy of its specific loads within a Planning Authority area.
☐	Transmission Planner	Develops a >1 year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator Area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☐	Transmission Owner	Owns and maintains transmission facilities
☐	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☒	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles

Applicable Reliability Principles *(Check boxes for all that apply by double clicking the grey boxes.)*	
☒	1. Interconnected bulk electric systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk electric systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk electric systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk electric systems shall be developed, coordinated, maintained and implemented.
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk electric systems.
☒	6. Personnel responsible for planning and operating interconnected bulk electric systems shall be trained, qualified and have the responsibility and authority to implement actions.
☒	7. The security of the interconnected bulk electric systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles? *(Select 'yes' or 'no' from the drop-down box by double clicking the grey area.)*
1. The planning and operation of bulk electric systems shall recognize that reliability is an essential requirement of a robust North American economy. Yes
2. An Organization Standard shall not give any market participant an unfair competitive advantage.Yes
3. An Organization Standard shall neither mandate nor prohibit any specific market structure. Yes
4. An Organization Standard shall not preclude market solutions to achieving compliance with that Standard. Yes
5. An Organization Standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards. Yes

Detailed Description (Provide enough detail so that an independent entity familiar with the industry could draft, modify, or withdraw a Standard based on this description.)

The proposed technical/preparedness standard will require or provide the following:

1. Each Balancing Authority shall collect and provide data [scan rate tie deviation and frequency for up to 5* minutes per event] needed to model its sub-minute Frequency Response to loss of large generating units and load.

2. Each Balancing Authority shall report each loss of generation or load greater than the respective Interconnection reporting threshold to its Reliability Coordinator.

3. Each Reliability Coordinator will relay Frequency Response Standard (FRS) event information to other Reliability Coordinators in its Interconnection. The Interconnection Time Monitor will maintain a log of FRS events.

4. NERC will annually post a list of FRS events. These events will be used by Balancing Authorities to calculate and report their annual Frequency Response and Bias.

5. NERC, in conjunction with the respective Regions, will establish a Target Frequency Response for each Interconnection. Absent an agreement, the observed Frequency Response in the first year of the FRS will be used as a target.

6. Balancing Authorities with less than [75%]* of their share of Target Frequency Response shall provide generation-level data to their Region for use by Transmission Planners and Planning Coordinators.

    a. Each Generator Operator that operates a generator larger than [10 MW]*, shall provide data to its Balancing Authority, as required in item 6, to support this standard and for use in developing models of Frequency Response in the associated Interconnection.

    b. Load Serving Entities shall provide data, as required in item 6, to their BA and Region to support the standard.

*These values are representative and will be refined based on stakeholder input during the standard drafting phase.

Standards Announcement

Project 2007-12 Frequency Response

Ballot Pool Windows Now Open: Oct. 25 – Nov. 23, 2011
Formal Comment Period Open: Oct. 25 – Dec. 8, 2011
Initial Ballot and Non-Binding Poll Window: Nov. 29 – Dec. 8, 2011

Available Now

BAL-003-1 – Frequency Response and Frequency Bias Setting, an implementation plan and several additional associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Thursday, December 8, 2011. Ballot pools are being formed and the ballot pool windows are open through 8 a.m. Eastern on Wednesday, November 23.

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document – Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A – ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B – ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions – two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second and five second intervals) – Both forms are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.

- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically

Instructions for Joining Ballot Pools for BAL-003-1 and Associated VRFs/VSLs

Two separate ballot pools are being formed – one ballot pool for Registered Ballot Body (RBB) members interested in balloting of BAL-003-1, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with BAL-003-1. RBB members who join the ballot pool for the standard **will not** be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pool to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)
The list server for the initial ballot is: bp-2007-12_Freq_Resp_in@nerc.com
Non-Binding Poll list server: bp-2007-12_NB_OCT2011_in@nerc.com

Instructions for Commenting

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team is planning a webinar in November to explain changes to the most recent draft of BAL-003-1. The date and registration information will be announced as soon as the details are finalized. An initial ballot of BAL-003-1 will be conducted beginning on Tuesday, November 29, 2011 through 8 p.m. Eastern on Thursday, December 8, 2011.

Background

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the

reasons for the decline in Frequency Response can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability.

Additional information is available on the project webpage.

A stakeholder interested in following the Frequency Response Standard Drafting Team's development of BAL-003-1 may monitor meeting agendas and notes on the team's "Related Files" web page or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" e-mail list, send an e-mail to: sarcomm@nerc.com. Please include the drafting team name in your e-mail request.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SC approved SAR for initial posting (April, 2009).
2. SAR posted for comment (April 22 – May 21, 2009).
3. SC authorized moving the SAR forward to standard development (September 2009).
4. Concepts Paper posted for comment (March 17 – April 16, 2010).
5. Initial Informal Comment Period (September 15 – October 15, 2010)
6. Second Comment Period (Formal) (March 9 – April 8, 2011)

Proposed Action Plan and Description of Current Draft

This is the ~~first~~third posting of the proposed standard in accordance with Results-Based Criteria. The drafting team requests posting for a ~~30~~45-day formal comment period concurrent with the formation of the ballot pool and the initial ballot.

Future Development Plan

Anticipated Actions	Anticipated Date
Drafting team considers comments, makes conforming changes~~, and proceed to~~ on second ~~comment~~posting	April - October ~~2010 – February~~ 2011
~~Second Comment Period~~	~~March – May 2011~~
Third Comment/Ballot period	~~June - July~~November-December 2011
Recirculation Ballot period	~~July - August~~December 2011
Receive BOT approval	~~September 2011~~February 2012

Effective Dates

~~1. The standard~~EOP-004-2 shall become effective on the first ~~calendar~~ day of the third calendar quarter after ~~the date of the order providing~~ applicable regulatory approval.

~~2.~~ In those jurisdictions where no regulatory approval is required, ~~the~~this standard shall become effective on the first ~~calendar~~ day of the third calendar quarter after Board of Trustees ~~adoption~~approval.

Version History

Version	Date	Action	Change Tracking
2		Merged CIP-001-~~1~~2a Sabotage Reporting and EOP-004-1 Disturbance Reporting into EOP-004-2 Impact Event Reporting; Retire CIP-001-~~1a~~2a Sabotage Reporting and Retired EOP-004-1 Disturbance Reporting.~~–~~ Retire CIP-008-4, Requirement 1, Part 1.3.	Revision to entire standard (Project 2009-01)

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

~~**Impact Event: Any event which has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action.**~~

None

When this standard has received ballot approval, the text boxes will be moved to the Guideline and Technical Basis Section.

A. Introduction

1. Title: ~~Impact~~ Event Reporting

2. Number: EOP-004-2

3. Purpose: To improve industry awareness and the reliability of the Bulk Electric System by requiring the reporting of ~~Impact Events~~events with the potential to impact reliability and their causes, if known, by the Responsible Entities.

4. Applicability

4.1. Functional Entities: Within the context of EOP-004-2, the term "Responsible Entity" shall mean:

4.1.1. Reliability Coordinator

4.1.2. Balancing Authority

4.1.3. Interchange ~~Authority~~Coordinator

4.1.4. Transmission Service Provider

4.1.5. Transmission Owner

4.1.6. Transmission Operator

4.1.7. Generator Owner

4.1.8. Generator Operator

4.1.9. Distribution Provider

4.1.10. ~~4.1.10~~ Load Serving Entity

4.1.11. Electric Reliability Organization

4.1.12. Regional Entity

5. Background:

NERC established a SAR Team in 2009 to investigate and propose revisions to the CIP-001 and EOP-004 Reliability Standards. The team was asked to consider the following:

1. CIP-001 ~~may~~could be merged with EOP-004 to eliminate redundancies.
2. Acts of sabotage have to be reported to the DOE as part of EOP-004.
3. Specific references to the DOE form need to be eliminated.
4. EOP-004 ~~has~~had some 'fill-in-the-blank' components to eliminate.

The development ~~may include~~included other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards ~~(see tables for each standard at the end of this SAR for more detailed information).~~.

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC SC in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009. ~~A "concepts paper" was designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.~~

~~The~~
The DSR SDT developed a concept paper to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT had developed. The posting of the concept paper sought comments from stakeholders on the "road map" that will be used by the ~~SDR~~DSR SDT in updating or revising CIP-001 and EOP-004. The concept paper provided stakeholders the background information and thought process of the ~~SDR~~DSR SDT.

The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC issues database and FERC Order 693 Directives in order to determine a prudent course of action with respect to revision of these standards.

~~The DSR SDT has used a working definition for "Impact Events" to develop Attachment 1 as follows:~~

> ~~"An Impact Event is any event that has either impacted or has the potential to impact the reliability of the Bulk Electric System. Such events may be caused by equipment failure or mis-operation, environmental conditions, or human action."~~

~~The DSR SDT has proposed this definition for~~

Summary of Key Concepts

The DSRSDT identified the following principles to assist them in developing the standard:

- Develop a single form to report disturbances and events that threaten the reliability of the bulk electric system
- Investigate other opportunities for efficiency, such as development of an electronic form and possible inclusion ~~in the NERC Glossary for "Impact Event". The types of Impact Events that are required to be reported are contained within Attachment 1. Only these events are required to be reported under this Standard. The DSR SDT~~ of regional reporting requirements
- Establish clear criteria for reporting
- Establish consistent reporting timelines
- Provide clarity around who will receive the information and how it will be used

During the development of concepts, the DSR SDT considered the FERC directive to "further define sabotage~~" and~~". There was concern among stakeholders that a definition may be ambiguous and subject to interpretation. Consequently, the DSR SDT decided to eliminate the term sabotage from the standard. The team felt that it was almost impossible to determine if an act or event was ~~that of~~ sabotage or ~~merely~~ vandalism without the intervention of law enforcement~~ after the fact. This will~~. The DSR SDT felt that attempting to define sabotage would result in further ambiguity with respect to reporting events. The term "sabotage" is no longer included in the standard~~ and therefore it is inappropriate to attempt to define it.~~. The ~~Impact Events~~events listed in Attachment 1 were developed to provide guidance for reporting both actual events as well as events which may have an impact on the Bulk Electric System. The DSR SDT believes that this is an equally effective and efficient means of addressing the FERC Directive. ~~Attachment 1, Part A is to be used for those actions that have impacted the electric system and in particular the section "Damage or destruction to equipment" clearly defines that all equipment that intentional or non intentional human error be reported. Attachment 1, Part B covers the similar items but the action has not fully occurred but may cause a risk to the electric system and is required to be reported.~~

~~To support this concept, the~~ The types of events that are required to be reported are contained within Attachment 1. The DSR SDT has ~~provided specific event for reporting including types of Impact~~coordinated with the NERC Events ~~and timing thresholds pertaining to~~ Analysis Working Group to develop the ~~different types of Impact Events and who's responsibility for reporting~~list of events that are to be reported under ~~the different Impact Events. This information is outlined in Attachment 1 to the proposed~~ this standard. Attachment 1, Part A pertains to those actions or events that have impacted the Bulk Electric System. These events were previously reported under EOP-004-1, CIP-001-1 or the Department of Energy form OE-417. Attachment 1, Part B covers similar items that may have had an impact on the Bulk Electric System or has the potential to have an impact and should be reported.

The DSR SDT wishes to make clear that the proposed ~~changes do~~Standard does not include any real-time operating notifications for the ~~types of~~ events ~~covered by CIP-001, EOP-004. This~~listed in Attachment 1. Real-time reporting is achieved through the RCIS and is covered in other standards (e.g. ~~TOP~~the TOP family of standards). The proposed standard deals exclusively with after-the-fact reporting.

~~The DSR SDT is proposing to consolidate disturbance and Impact Event reporting under a single standard. These two components and other key concepts are discussed in the following sections.~~

~~**Summary of Concepts**~~

- ~~A single form to report disturbances and Impact Events that threaten the reliability of the bulk electric system~~
- ~~Other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements~~
- ~~Clear criteria for reporting~~
- ~~Consistent reporting timelines~~
- ~~Clarity around of who will receive the information and how it will be used~~

Data Gathering

The requirements of EOP-004-1 require that entities "promptly analyze Bulk Electric System disturbances on its system or facilities" (Requirement R2). The requirements of EOP-004-2 specify that certain types of events are to be reported but do not include provisions to analyze events. Events reported under EOP-004-2 may trigger further scrutiny by the ERO Events Analysis Program. If warranted, the Events Analysis Program personnel may request that more data for certain events be provided by the reporting entity or other entities that may have experienced the event. Entities are encouraged to become familiar with the Events Analysis Program and the NERC Rules of Procedure to learn more about with the expectations of the program.

Law Enforcement Reporting

The reliability objective of EOP-004-2 is to prevent outages which could lead to Cascading by effectively reporting ~~Impact Events.~~events. Certain outages, such as those due to vandalism and terrorism, ~~are~~may not be reasonably preventable. These are the types of events that should be reported to law enforcement. Entities rely upon law enforcement agencies to respond to and investigate those ~~Impact Events~~events which have the potential ~~of~~to impact a wider area ~~affect upon the industry which~~of the BES. The inclusion of reporting to law enforcement enables and supports reliability principles such as protection of bulk power systems from malicious physical or cyber attack. The Standard is intended to reduce the risk of Cascading ~~involving Impact Events.~~events. The importance of BES awareness of the threat around them is essential to the effective operation and planning to mitigate the potential risk to the BES.

Stakeholders in the Reporting Process

- Industry
- NERC (ERO~~)~~), Regional Entity
- FERC
- DOE
- NRC
- DHS – Federal
- Homeland Security- State
- State Regulators
- Local Law Enforcement
- State or Provincial Law Enforcement
- FBI
- Royal Canadian Mounted Police (RCMP)

The above stakeholders have an interest in the timely notification, communication and response to an incident at an industry facility. The stakeholders have various levels of accountability and have a vested interest in the protection and response to ensure the reliability of the BES.

Present expectations of the industry under CIP-001-1a:

It has been the understanding by industry participants that an occurrence of sabotage has to be reported to the FBI. The FBI has the jurisdictional requirements to investigate acts of sabotage and terrorism. The ~~present~~ CIP-001-1-1a standard requires a liaison relationship on behalf of the industry and the FBI or RCMP. Annual requirements, under the standard, of the industry have not been clear and have lead to misunderstandings and confusion in the industry as to how to demonstrate that the liaison is in place and effective. ~~FBI offices~~ As an example of proof of compliance with Requirement R4, responsible entities have ~~been~~ asked FBI Office personnel to ~~confirm~~provide, on FBI letterhead, confirmation of the existence of a working relationship to report acts of sabotage ~~to include references to~~, , the number of years the liaison relationship has been in existence, and ~~confirming~~the validity of the telephone numbers for the FBI.

Coordination of Local and State Law Enforcement Agencies with the FBI

The Joint Terrorism Task Force (JTTF) came into being with the first task force being established in 1980. JTTFs are small cells of highly trained, locally based, ~~passionately~~ committed investigators, analysts, linguists, SWAT experts, and other specialists from dozens of U.S. law enforcement and intelligence agencies. The JTTF is a multi-agency effort led by the Justice Department and FBI designed to combine the resources of federal, state, and local law enforcement. Coordination and communications largely through the interagency National Joint Terrorism Task Force, working out of FBI Headquarters, which makes sure that information and intelligence flows freely among the local JTTFs. This information flow can be most beneficial to the industry in analytical intelligence, incident response and investigation. Historically, the most immediate response to an industry incident has been local and state law enforcement agencies to suspected vandalism and criminal damages at industry facilities. Relying upon the JTTF coordination between local, state and FBI law enforcement would be beneficial to effective communications and the appropriate level of investigative response.

Coordination of Local and Provincial Law Enforcement Agencies with the RCMP

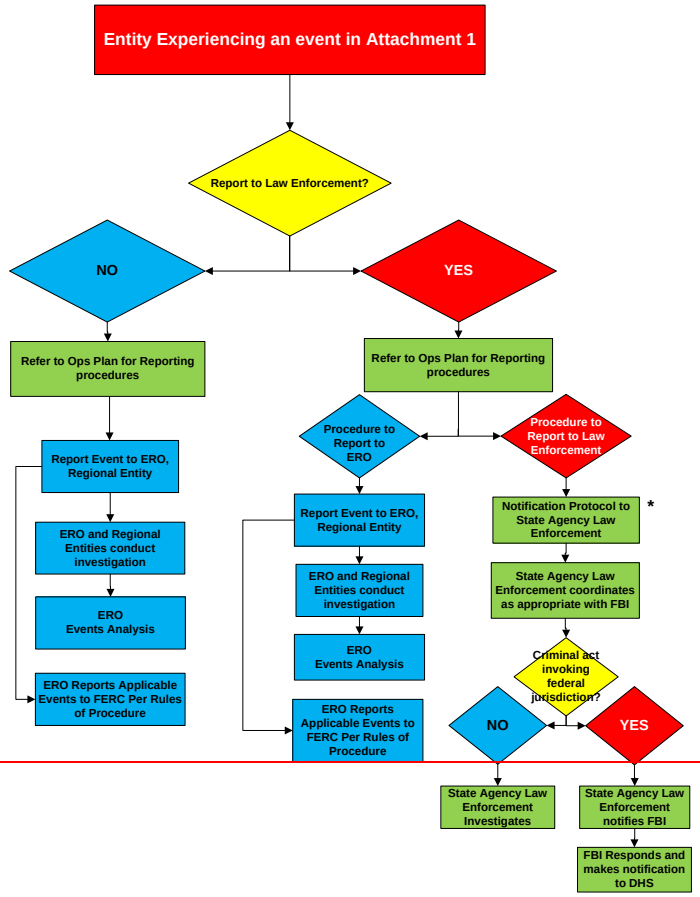
A similar law ~~enforecment~~enforcement coordination hierarchy exists in Canada. Local and Provincial law enforcement coordinate to investigate suspected acts of vandalism and sabotage. The Provincial law enforcement agency has a reporting relationship with the ~~Royla~~Royal Canadian Mounted Police (RCMP).

A Reporting Process Solution – EOP-004

A proposal discussed with the FBI, FERC Staff, NERC Standards Project Coordinator and the SDT Chair is reflected in the flowchart below (Reporting Hierarchy for ~~Impact Event EOP-004-2~~Reportable Events). Essentially, reporting an ~~Impact Event~~event to law enforcement agencies will only require the industry to notify the state or provincial or local level law enforcement agency. The state or provincial or local level law enforcement agency will coordinate with ~~local~~ law enforcement with jurisdiction to investigate. If the state or provincial or local level law enforcement agency decides federal agency law enforcement or the RCMP should respond and

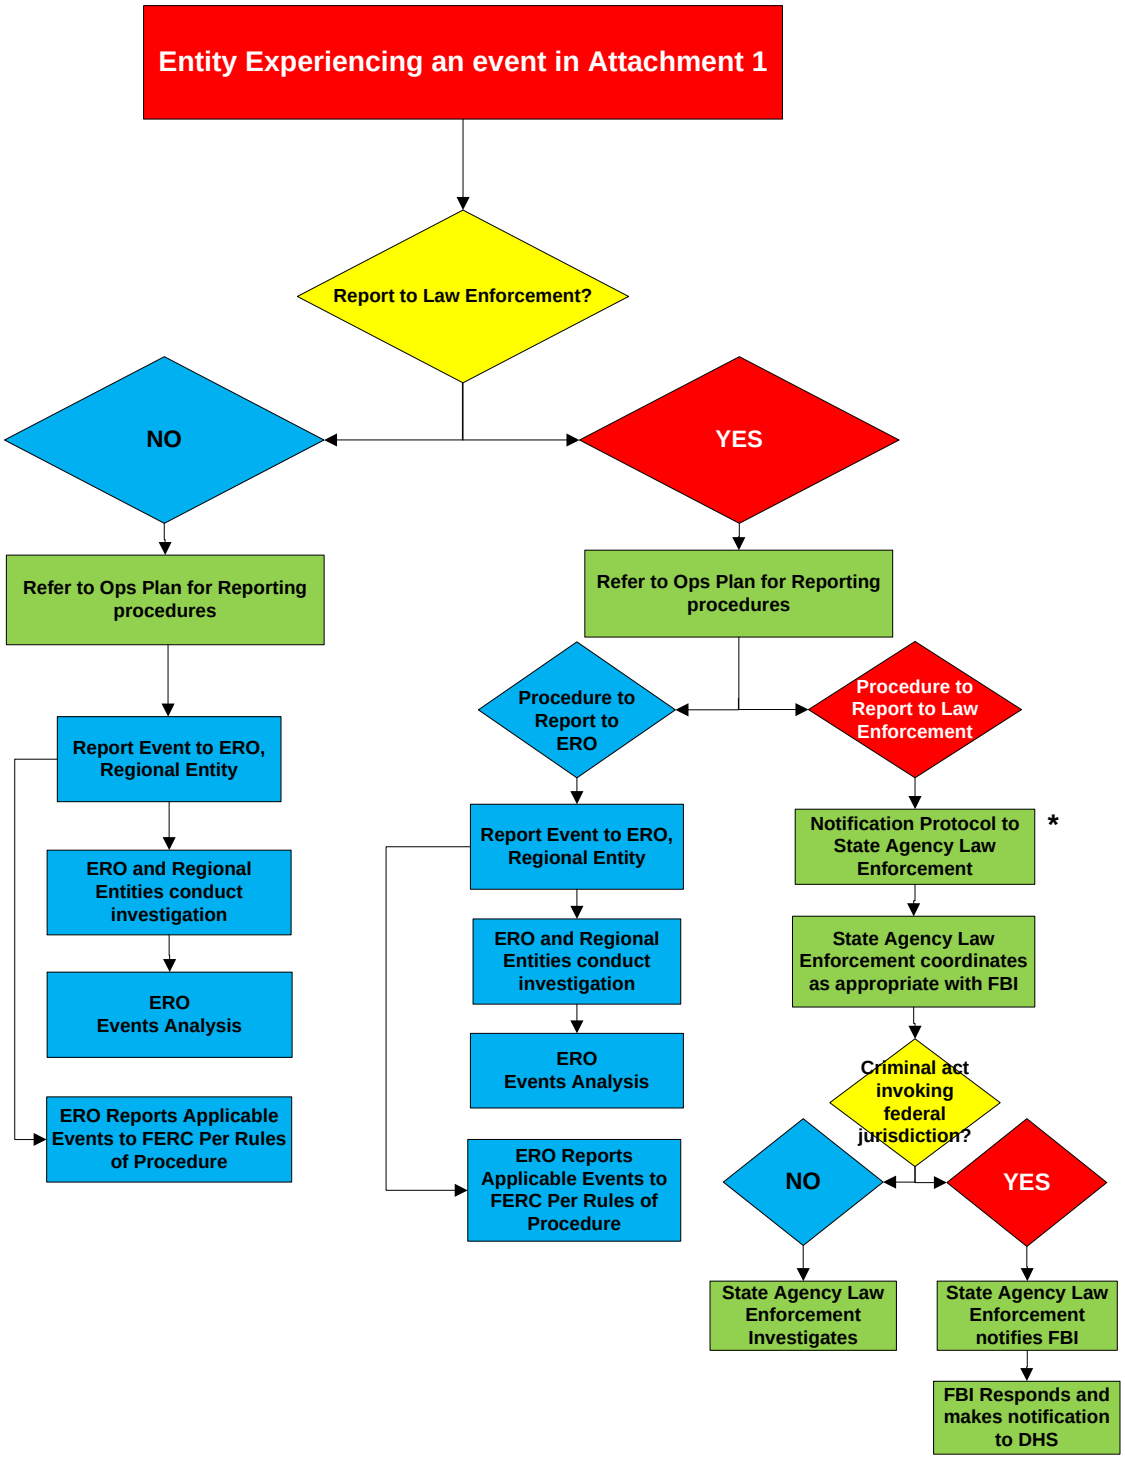
investigate, the state or provincial or local level law enforcement agency will notify and coordinate with the FBI or the RCMP.

Reporting Hierarchy for Reportable Events



*Canadian entities will follow law enforcement protocols applicable in their jurisdictions

Reporting Hierarchy for Reportable Events



*Canadian entities will follow law enforcement protocols applicable in their jurisdictions

B. Requirements and Measures

R1. Each Responsible Entity shall have an ~~Impact Event~~ Operating Plan that includes: *[Violation Risk: Factor ~~Medium~~: Lower] [Time Horizon: ~~Long-term~~Operations Planning]*

1.1. ~~An Operating Process~~A process for identifying ~~Impact Events~~events listed in Attachment 1.

1.2. ~~An Operating Procedure~~A process for gathering information for Attachment 2 regarding ~~observed Impact Events~~events listed in Attachment 1.

1.3. ~~An Operating Process~~A process for communicating ~~recognized Impact Events~~ events listed in Attachment 1 to the Electric Reliability Organization, the Responsible Entity's Reliability Coordinator and the following as appropriate:

- Internal company personnel ~~notification(s).~~
- ~~External organizations to notify to include but not limited to the Responsible Entities' Reliability Coordinator, NERC,~~ The Responsible ~~Entities'~~Entity's Regional Entity~~,~~
- Law ~~Enforcement, and~~ enforcement
- Governmental or ~~Provincial Agencies.~~provincial agencies

1.4. Provision(s) for updating the ~~Impact Event~~ Operating Plan within 90 calendar days of any change ~~to its content.~~ in assets, personnel, other circumstances that may no longer align with the Operating Plan; or incorporating lessons learned pursuant to Requirement R3.

1.5. A Process for ensuring the responsible entity reviews the Operating Plan at least annually (once each calendar year) with no more than 15 months between reviews.

~~1.4.~~

~~Rationale for R1~~

~~Every industry participant that owns or operates elements or devices on the grid has a formal or informal process, procedure, or steps it takes to gather information regarding what happened and why it happened when Impact Events occur. This requirement has the Registered Entity establish documentation on how that procedure, process, or plan is organized.~~

~~For the Impact Event Operating Plan, the DSR SDT envisions that Part 1.2 includes performing sufficient analysis and information gathering to be able to complete the report for reportable Impact Events. The main issue is to make sure an entity can a) identify when an Impact Event has occurred and b) be able to gather enough information to complete the report.~~

~~Part 1.3 could include a process flowchart, identification of internal positions to be notified and to make notifications, or a list of personnel by name as well as telephone numbers.~~

~~The Impact Event Operating Plan may include, but not be limited to, the following: how the entity is notified of event's occurrence, person(s) initially tasked with the overseeing the assessment or analytical study, investigatory steps typically taken, and documentation of the assessment / remedial action plan.~~

M1. Each Responsible Entity ~~shall~~will provide the current, dated, in force ~~Impact Event~~ Operating Plan ~~to the Compliance Enforcement Authority~~which includes Parts 1.1 - 1.5 as requested.

R2. Each Responsible Entity shall implement the parts of its ~~Impact Event~~ Operating Plan ~~documented in~~that meet Requirement R1~~ for Impact Events listed in Attachment 1 (~~, Parts ~~A~~1.1 and ~~B).~~1.2 for an actual event and Parts 1.4 and 1.5 as specified. *[Violation Risk~~:~~ Factor: Medium] [Time Horizon: ~~Real-time~~ Operations ~~and Same-day Operations]~~Assessment]*.

M2. ~~To the extent that an~~ Responsible ~~Entity has an Impact Event on its Facilities, the Responsible Entity~~Entities shall ~~documentation of~~ provide evidence that it implemented the ~~implementation~~parts of its ~~Impact Event~~ Operating ~~Plans. Such evidence could~~Plan to meet Requirement R1, Parts 1.1 and 1.2 for an actual event and Parts, 1.4 and 1.5 as specified. Evidence may include, but is not limited to, an event report form (Attachment 2) or the OE-417 report submitted, operator logs, voice recordings, or ~~other notations and documents retained by the Registered Entity for each Impact Event.~~ dated documentation of review and update of the Operating Plan. (R2)

Rationale for R2
Each Responsible Entity must implement the various parts of Requirement R1. Parts 1.1 and 1.2 call for identifying and gathering information for actual events. Parts 1.4 and 1.5 require updating and reviewing the Operating Plan.

R3. Each Responsible Entity shall ~~conduct a test of~~ report events in accordance with its Operating ~~Process~~Plan developed to address the events listed in Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Operations Assessment]*.

M3. Responsible Entities shall provide a record of the type of event experienced; a dated copy of the Attachment 2 form or OE-417 report; and dated and time-stamped transmittal records to show that the event was reported. (R3)

~~Rationale for R3~~
~~The DSR SDT intends for each Responsible Entity to verify that its Operating Process for communicating recognized Impact Events is correct so that the entity can respond appropriately in the case of an actual Impact Event. The Responsible Entity may conduct a drill or exercise of its Operating Process for communicating recognized Impact Events as often as it desires but the time period between such drill or exercise can be no longer than 15 months from the previous drill/exercise or actual Impact Event (i.e., if you conducted an exercise/drill/actual employment of the Operating Process in January of one year, there would be another exercise/drill/actual employment by March 31 of the next calendar year)). Multiple exercises in a 15 month period are not a violation of the requirement and would be encouraged to improve reliability.~~

R4. Each Responsible Entity shall verify (through actual implementation for ~~communicating recognized Impact~~

R
E ing
P
e tual
e or
e g
e veen
te n the
p
c e
Operating Plan in January of one year, there would be another exercise/drill/actual employment by March 31 of the next calendar year). Multiple exercises in a 15 month period are not a violation of the requirement and would be encouraged to improve reliability.
Evidence showing that an entity used the communication process in its Operating Plan for an actual event qualifies as evidence to meet this requirement.

~~Events~~an event, or through a drill or exercise) the communication process in its Operating Plan, created pursuant to Requirement ~~R1~~1, Part 1.3, at least annually~~, (once per calendar year),~~ with no more than 15 calendar months between ~~tests.~~verification or actual implementation. *[Violation Risk~~:~~ Factor: Medium] [Time Horizon: ~~Long-term~~Operations Planning]*

~~**M3.** In the absence of an actual Impact Event, the~~**M4.** The Responsible Entity shall provide evidence that it ~~conducted a mock Impact Event and followed~~verified the communication process in its Operating ~~Process~~Plan for ~~communicating recognized Impact Events~~events created pursuant to Requirement R1, Part 1.3. Either implementation of the communication process as documented in its Operating Plan for an actual event or documented evidence of a drill or exercise may be used as evidence to meet this requirement. The time period between an actual ~~and~~event or ~~mock Impact Events~~verification shall be no more than 15 months. Evidence may include, but is not limited to, operator logs, voice recordings, or dated documentation~~.~~ of a verification. (R3)

~~**R4.** Each Responsible Entity shall review its Impact Event Operating Plan with those personnel who have responsibilities identified in that plan at least annually with no more than 15 calendar months between review sessions *[Violation Risk: Factor Medium] [Time Horizon: Long-term Planning].*~~

~~**M4.** Responsible Entities shall provide the materials presented to verify content and the association between the people listed in the plan and those who participated in the review, documentation showing who was present and when internal personnel were trained on the responsibilities in the plan.~~

~~**R5.** Each Responsible Entity shall report Impact Events in accordance with the Impact Event Operating Plan pursuant to Requirement R1 and Attachment 1 using the form in Attachment 2 or the DOE OE-417 reporting form. *[Violation Risk: Factor: Medium] [Time Horizon: Real-time Operations and Same-day Operations].*~~

~~**M5.** Responsible Entities shall provide evidence demonstrating the submission of reports using the plan created pursuant to Requirement R1 and Attachment 1 using either the form in Attachment 2 or the DOE OE-417 report. Such evidence will include a copy of the Attachment 2 form or OE-417 report submitted, evidence to support the type of Impact Event experienced; the date and time of the Impact Event; as well as evidence of report submittal that includes date and time.~~

C. Compliance

1. Compliance Monitoring Process

1.1 Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.~~;~~ or

~~**Compliance Monitoring and Enforcement Processes:**~~

- ~~Compliance Audits~~
- ~~Self-Certifications~~
- ~~Spot Checking~~
- ~~Compliance Violation Investigations~~
- ~~Self-Reporting~~
- ~~Complaints~~

Third-party monitor without vested interest in the outcome for the ERO

.

1.2 Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Responsible Entity shall retain the current, in force document plus the 'dated revision history' from each version issued since the last audit for 3 calendar years for Requirement R1 and Measure M1.

Each Responsible Entity shall retain evidence from prior 3 calendar years for Requirements R2, R3, R4, and Measures M2, M3, M4.

Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.

If a Registered Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3 Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting

Complaints

1.4 Additional Compliance Information

Guideline and Technical Basis (attached).

EOP-004 - Attachment 1: ~~Impact~~ Events Table

NOTE: Under certain adverse conditions~~,~~ (e.g. severe weather, multiple events) it may not be possible to report the damage caused by an ~~Impact Event~~event and issue a written ~~Impact~~ Event Report within the timing in the table below. In such cases, the affected Responsible Entity shall notify ~~its Regional Entity(ies) and NERC, (e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422)~~parties per R1 and provide as much information as is available~~.~~ at the time of the notification. The affected Responsible Entity shall ~~then~~ provide periodic verbal updates until adequate information is available to issue a written ~~Impact~~ Event report.

~~EOP-004 — Attachment 1 – Actual Reliability Impact – Part A~~			
~~Event~~	~~Entity with Reporting Responsibility~~	~~Threshold for Reporting~~	~~Time to Submit Report~~
~~Energy Emergency requiring Public appeal for load reduction~~	~~Initiating entity is responsible for reporting~~	~~Each public appeal for load reduction~~	~~Within 1 hour of issuing a public appeal~~
~~Energy Emergency requiring system-wide voltage reduction~~	~~Initiating entity is responsible for reporting~~	~~System-wide voltage reduction of 3% or more~~	~~Within 1 hour after event is initiated~~
~~Energy Emergency requiring manual firm load shedding~~	~~Initiating entity is responsible for reporting~~	~~Manual firm load shedding ≥ 100 MW~~	~~Within 1 hour after event is initiated~~
~~Energy Emergency resulting in automatic firm load shedding~~	~~Each DP or TOP that experiences the Impact Event~~	~~Firm load shedding ≥ 100 MW (via automatic undervoltage or underfrequency load shedding schemes, or SPS/RAS)~~	~~Within 1 hour after event is initiated~~
~~Voltage Deviations on BES Facilities~~	~~Each RC, TOP, GOP that experiences the Impact Event~~	~~± 10% sustained for ≥ 15 continuous minutes~~	~~Within 24 hours after 15 minute threshold~~
~~IROL Violation~~	~~Each RC, TOP that experiences the Impact Event~~	~~Operate outside the IROL for time greater than IROL Tv~~	~~Within 24 hours after Tv threshold~~
~~Loss of Firm load for ≥ 15 Minutes~~	~~Each RC, BA, TOP, DP that experiences the Impact Event~~	~~• ≥ 300 MW for entities with previous year's demand ≥ 3000 MW~~ ~~• ≥ 200 MW for all other entities~~	~~Within 1 hour after 15 minute threshold~~
~~System Separation~~	~~Each RC, BA, TOP, DP that~~	~~Each separation resulting in an island of~~	~~Within 1 hour after occurrence is~~

EOP-004 – Attachment 1 – Actual Reliability Impact – Part A			
Event	**Entity with Reporting Responsibility**	**Threshold for Reporting**	**Time to Submit Report**
(Islanding)	experiences the Impact Event	generation and load ≥ 100 MW	identified
Generation loss	Each RC, BA, GOP that experiences the Impact Event	• ≥ 2,000 MW for entities in the Eastern or Western Interconnection • ≥ 1000 MW for entities in the ERCOT or Quebec Interconnection	Within 24 hours after occurrence
Loss of Off-site power to a nuclear generating plant (grid supply)	Each RC, BA, TO, TOP, GO, GOP that experiences the Impact Event	Affecting a nuclear generating station per the Nuclear Plant Interface Requirement	Report within 24 hours after occurrence
Transmission loss	Each RC, TOP that experiences the Impact Event	Three or more BES Transmission Elements	Within 24 hours after occurrence
Damage or destruction of BES equipment[1]	Each RC, BA, TO, TOP, GO, GOP, DP that experiences the Impact Event	Through operational error, equipment failure, external cause, or intentional or unintentional human action.	Within 1 hour after occurrence is identified
Damage or destruction of Critical Asset	Applicable Entities under CIP-002 or its successor.	Through operational error, equipment failure, external cause, or intentional or unintentional human action.	Within 1 hour after occurrence is identified
Damage or destruction of a Critical Cyber Asset	Applicable Entities under CIP-002 or its successor.	Through intentional or unintentional human action.	Within 1 hour after occurrence is identified

[1] BES equipment that: i) Affects an IROL; ii) Significantly affects the reliability margin of the system (e.g., has the potential to result in the need for emergency actions); iii) Damaged or destroyed due to intentional or unintentional human action; or iv) Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly e.g., removal of grounding straps rendering protective relaying inoperative.

~~EOP-004 – Attachment 1 – Potential Reliability Impact – Part B~~			
~~Event~~	~~Entity with Reporting Responsibility~~	~~Threshold for Reporting~~	~~Time to Submit Report~~
~~Unplanned Control Center evacuation~~	~~Each RC, BA, TOP that experiences the potential Impact Event~~	~~Unplanned evacuation from BES control center facility~~	~~Report within 24 hour after occurrence~~
~~Fuel supply emergency~~	~~Each RC, BA, GO, GOP that experiences the potential Impact Event~~	~~Affecting BES reliability[2]~~	~~Report within 1 hour after occurrence~~
~~Loss of all monitoring or voice communication capability~~	~~Each RC, BA, TOP that experiences the potential Impact Event~~	~~Affecting a BES control center for ≥ 30 continuous minutes~~	~~Report within 24 hours after occurrence~~
~~Forced intrusion[3]~~	~~Each RC, BA, TO, TOP, GO, GOP that experiences the potential Impact Event~~	~~At a BES facility~~	~~Report within 1 hour after verification of intrusion~~

~~[2] Report if problems with the fuel supply chain result in the projected need for emergency actions to manage reliability.~~

~~[3] Report if you cannot reasonably determine likely motivation (i.e., intrusion to steal copper or spray graffiti is not reportable unless it effects the reliability of the BES).~~

~~Risk to BES equipment~~[4]	~~Each RC, BA, TO, TOP, GO, GOP, DP that experiences the potential Impact Event~~	~~From a non-environmental physical threat~~	~~Report within 1 hour after identification~~
~~Detection of a reportable Cyber Security Incident.~~	~~Each RC, BA, TO, TOP, GO, GOP, DP that experiences the potential Impact Event~~	~~That meets the criteria in CIP-008 (or its successor)~~	~~Report within 1 hour after detection~~

~~[4] Examples include a train derailment adjacent to BES equipment, that either could have damaged the equipment directly or has the potential to damage the equipment (e.g. flammable or toxic cargo that could pose fire hazard or could cause evacuation of a BES facility control center) and report of suspicious device near BES equipment).~~

EOP-004 - Attachment 2: Impact Event Reporting Form

This form is to be used to report Impact Events Reports to the ERO. NERC will accept the DOE OE-417 form in lieu of this form if the entity is required to submit an OE-417 report. Reports should be submitted viato one of the following: e-mail: esisac@nerc.com, Facsimile: 609-452-9550, Voice: 609-452-1422.

Attachment 1 – Reportable Events			
Event	**Entity with Reporting Responsibility**	**Impact Event Threshold for Reporting for EOP-004-2**	**Submit Attachment 2 or DOE OE-417 Report to:**
Task		**Comments**	
1. Destruction of BES equipment[5]	Entity filing the report (include company name and Compliance Registration ID number):Each RC, BA, TO, TOP, GO, GOP, DP that experiences the destruction of BES equipment	Initial indication the event was due to operational error, equipment failure, external cause, or intentional or unintentional human action.	The parties identified pursuant to R1.3 within 1 hour of recognition of event.
2. Damage or destruction of Critical Asset per	Applicable Entities under CIP-002	Initial indication the event was due to operational error, equipment failure, external	Date and Time of Impact Event.

[5] BES equipment that: i) Affects an IROL; ii) Significantly affects the reliability margin of the system (e.g., has the potential to result in the need for emergency actions); iii) Damaged or destroyed due to intentional or unintentional human action which removes the BES equipment from service. Do not report copper theft from BES equipment unless it degrades the ability of equipment to operate correctly (e.g., removal of grounding straps rendering protective relaying inoperative).

~~Attachment 1 - Reportable Events~~				
~~Event~~	~~Entity with Reporting Responsibility~~	Impact Event ~~Threshold for~~ Reporting for EOP-004-2	~~Submit Attachment 2 or DOE OE-417 Report to:~~

Guideline and Technical Basis

Disturbance and Sabotage Reporting Standard Drafting Team (Project 2009-01) - Reporting Concepts

Introduction

The SAR for Project 2009-01, Disturbance and Sabotage Reporting was moved forward for standard drafting by the NERC Standards Committee in August of 2009. The Disturbance and Sabotage Reporting Standard Drafting Team (DSR SDT) was formed in late 2009 and ~~is progressing toward developing standards based on the SAR. This concepts paper is designed to solicit stakeholder input regarding the proposed reporting concepts that the DSR SDT has developed.~~has developed updated standards based on the SAR.

The standards listed under the SAR are:

- CIP-001 — Sabotage Reporting
- EOP-004 — Disturbance Reporting

~~The DSR SDT also proposed to investigate incorporation of the cyber incident reporting aspects of CIP-008 under this project. This will be coordinated with the Cyber Security – Order 706 SDT (Project 2008-06).~~

~~The DSR SDT has reviewed the existing standards, the SAR, issues from the NERC database and FERC Order 693 Directives to determine a prudent course of action with respect to these standards.~~

~~This concept paper provides stakeholders with a proposed "road map" that will be used by the DSR SDT in updating or revising CIP-001 and EOP-004. This concept paper provides the background information and thought process of the DSR SDT.~~

~~The proposed~~The changes do not include any real-time operating notifications for the types of events covered by CIP-001 and EOP-004. The real-time reporting requirements are achieved through the RCIS and are covered in other standards (e.g. EOP-002-Capacity and Energy Emergencies). ~~The proposed standards deal~~These standard deals exclusively with after-the-fact reporting.

The DSR SDT ~~is proposing to consolidate~~has consolidated disturbance and sabotage event reporting under a single standard. These two components and other key concepts are discussed in the following sections.

Summary of Concepts and Assumptions:

The Standard ~~Will:~~ ~~Require use~~**:**

- Requires reporting of ~~a single form to report disturbances and "Impact Events~~"events" that ~~threaten~~impact or may impact the reliability of the bulk electric system
- ~~Provide~~Provides clear criteria for reporting
- ~~Include~~Includes consistent reporting timelines
- ~~Identify~~Identifies appropriate applicability, including a reporting hierarchy in the case of disturbance reporting
- ~~Provide~~Provides clarity around of who will receive the information

~~The drafting team will explore other opportunities for efficiency, such as development of an electronic form and possible inclusion of regional reporting requirements~~

Discussion of Disturbance Reporting

Disturbance reporting requirements ~~currently exist~~existed in the previous version of EOP-004. The current approved definition of Disturbance from the NERC Glossary of Terms is:

1. An unplanned event that produces an abnormal system condition.
2. Any perturbation to the electric system.
3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

Disturbance reporting requirements and criteria ~~are~~were in the ~~existing~~previous EOP-004 standard and its attachments. The DSR SDT discussed the reliability needs for disturbance reporting and developed the list of ~~Impact Events~~events that are to be reported under this standard (attachment 1).

Discussion of ~~"Impact~~ Event~~"~~ Reporting

There are situations worthy of reporting because they have the potential to impact reliability. ~~The DSR SDT proposes calling such incidents 'Impact Events' with the following concept:~~

> ~~An Impact Event is any situation that has the potential to significantly impact the reliability of the Bulk Electric System. Such events may originate from malicious intent, accidental behavior, or natural occurrences.~~

~~Impact~~t Event reporting facilitates industry awareness, which allows potentially impacted parties to prepare for and possibly mitigate ~~the~~any associated reliability risk. It also provides the raw material, in the case of certain potential reliability threats, to see emerging patterns.

Examples of ~~Impact Events~~such events include:

- Bolts removed from transmission line structures
- Detection of cyber intrusion that meets criteria of CIP-008 or its successor standard
- Forced intrusion attempt at a substation

- Train derailment near a transmission right-of-way
- Destruction of Bulk Electrical System equipment

What about sabotage?

One thing became clear in the DSR SDT's discussion concerning sabotage: everyone has a different definition. The current standard CIP-001 elicited the following response from FERC in FERC Order 693, paragraph 471 which states in part: *". . . the Commission directs the ERO to develop the following modifications to the Reliability Standard through the Reliability Standards development process: (1) further define sabotage and provide guidance as to the triggering events that would cause an entity to report a sabotage event."*

Often, the underlying reason for an event is unknown or cannot be confirmed. The DSR SDT believes that by reporting material risks to the Bulk Electrical System using the ~~Impact Event~~event categorization in this standard, it will be easier to get the relevant information for mitigation, awareness, and tracking, while removing the distracting element of motivation.

~~The DST SDT discussed the reliability needs for Impact Event reporting and will consider guidance found in the document "NERC Guideline: Threat and Incident Reporting" in the development of requirements, which will include clear criteria for reporting.~~

Certain types of ~~Impact Events~~events should be reported to NERC, the Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and/or Provincial or local law enforcement. Other types of ~~Impact Events~~impact events may have different reporting requirements. For example, an ~~Impact Event~~event that is related to copper theft may only need to be reported to the local law enforcement authorities.

Potential Uses of Reportable Information

Event analysis, correlation of data, and trend identification are a few potential uses for the information reported under this standard. ~~As envisioned, the~~The standard ~~will only require~~requires Functional entities to report the incidents and provide known information ~~or~~at the time of the report. Further data gathering necessary for ~~these analyses~~event analysis is provided for under the Events Analysis Program and the NERC Rules of Procedure. Other entities (e.g. – NERC, Law Enforcement, etc) will be responsible for performing the analyses. The NERC Rules of Procedure (section 800) provide an overview of the responsibilities of the ERO in regards to analysis and dissemination of information for reliability. Jurisdictional agencies (which may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE) have other duties and responsibilities.

Collection of Reportable Information or "One stop shopping"

~~The goal of the DSR SDT is to have one reporting form for all functional entities (US, Canada, Mexico) to submit to NERC. Ultimately, it may make sense to develop an electronic version to expedite completion, sharing and storage. Ideally, entities would complete a single form which could then be distributed to jurisdictional agencies and functional entities as appropriate.~~

~~Specific reporting forms[9] that exist today (i.e. - OE-417, etc) could be included as part of the electronic form to accommodate US entities with a requirement to submit the form, or may be removed (but still be mandatory for US entities under Public Law 93-275) to streamline the proposed consolidated reliability standard for all North American entities (US, Canada, Mexico). Jurisdictional agencies may include DHS, FBI, NERC, RE, FERC, Provincial Regulators, and DOE. Functional entities may include the RC, TOP, and BA for industry awareness. Applicability of the standard will be determined based on the specific requirements.~~

The DSR SDT recognizes that some regions require reporting of additional information beyond what is in EOP-004. The DSR SDT ~~is planning to update~~has updated the listing of reportable events ~~from~~in Attachment 1 based on discussions with jurisdictional agencies, NERC, Regional Entities and stakeholder input. There is a possibility that regional differences ~~may~~ still exist.

The reporting ~~proposed~~required by ~~the DSR SDT~~this standard is intended to meet the uses and purposes of NERC. The DSR SDT recognizes that other requirements for reporting exist (e.g., DOE-417 reporting), which may duplicate or overlap the information required by NERC. To the extent that other reporting is required, the DSR SDT envisions that duplicate entry of information ~~is~~should not be necessary, and the submission of the alternate report will be acceptable to NERC so long as all information required by NERC is submitted. For example, if the NERC Report duplicates information from the DOE form, the DOE report may be included or attached to the NERC report, in lieu of entering that information on the NERC report.

~~[9] The DOE Reporting Form, OE-417 is currently a part of the EOP-004 standard. If this report is removed from the standard, it should be noted that this form is still required by law as noted on the form: NOTICE: This report is mandatory under Public Law 93-275. Failure to comply may result in criminal fines, civil penalties and other sanctions as provided by law. For the sanctions and the provisions concerning the confidentiality of information submitted on this form, see General Information portion of the instructions. Title 18 USC 1001 makes it a criminal offense for any person knowingly and willingly to make to any Agency or Department of the United States any false, fictitious, or fraudulent statements as to any matter within its jurisdiction.~~

Unofficial Comment Form

Disturbance and Sabotage Reporting (Project 2009-01)

Please **DO NOT** use this form to submit comments. Please use the electronic comment form to submit comments on the first formal posting for Project 2009-01—Disturbance and Sabotage Reporting. The electronic comment form must be completed by **December 12, 2011.**

2009-01 Project Page

If you have questions please contact Stephen Crutchfield at stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

Background

The DST SDT posted the draft standard EOP-004-2 for a formal comment period from March 9, 2011 through April 8, 2011. Based on stakeholder feedback, the DSR SDT made several revisions to the standard to improve clarity and address other concerns identified by stakeholders. The main stakeholder concerns were addressed as follows:

Definition of Impact Event. Many stakeholders disagreed with the need for the definition of "Impact Event" and felt that that the definition was ambiguous and created confusion. The DSR SDT agrees and has deleted the proposed definition from the standard. The list of events that are to be reported in Attachment 1 is inclusive and no further attempts to define "Impact Event" are necessary.

Timeframe for Reporting and Event. Many stakeholders raised concerns with the one-hour reporting requirement for certain types of events. The commenters believed that the restoration of service or the return to a stable bulk power system state may be jeopardized by having to report certain events within one hour. The DSR SDT agreed and revised the reporting time to 24 hours for most events, with the exception of damage to or destruction of BES equipment, forced intrusion or cyber related incidents.

VRFs. Many stakeholders suggested that the reporting of events after the fact only justified a VRF of "lower" for each requirement. With the revised standard, there are now three requirements. Requirement 1 specifies that the responsible entity have an Operating Plan for identifying and reporting events listed in Attachment A. This is procedural in nature and justifies a "lower" VRF, as this requirement deals with the means to report events after the fact. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis of reported events is addressed through the NERC Events Analysis Program in accordance with the NERC Rules of Procedure.

The three remaining requirements in EOP-004-2 require entities affected by events to report those events based on the specifics in Attachment A (Requirement R3) and to test the communications protocol of their Operating Plan once per year (R4). Requirement R2 provides for implementation of the Operating Plan as it relates to Requirement R1, Parts 1.1, 1.2, 1.4 and 1.5. Requirement R3 specifies that an entity is responsible for reporting events to the appropriate entities in accordance with the Operating Plan based on Attachment A. Requirement R4 is intended to ensure that an entity can communicate information about events. Some of these events are potential sabotage events, and communicating these events is intended to make other entities aware to help prevent further sabotage events from occurring. Existing CIP-001-1a deals with sabotage events,

and the approved VRFs for each of the requirements is "medium." The proposed VRFs for EOP-004-2 are consistent with the existing approved VRFs for both EOP-004 and CIP-001.

Applicability. Commenters also had concerns about the applicability of the standard to Load Serving Entities, who may not own physical assets, as well as to the ERO and Regional Entity. The DSR SDT agrees that the Distribution Provider owns the assets per the Functional Model, however the LSE is an applicable entity under CIP-002, and under the CIP standards is responsible for reporting cyber security incidents. The ERO and RE are also responsible for reporting cyber security incidents under CIP-002. Therefore, the SDT determined that it was appropriate to include LSEs, the ERO and the RE in the applicability of EOP-004-2.

After the drafting team completed its consideration of stakeholder comments, the standards and implementation plan were submitted for quality review. Based on feedback from the quality review, the drafting team has made two significant revisions to the standard. The first revision is to add a requirement for implementation of the Operating Plan listed in Requirement R1. There was only a requirement to report events, but no requirement specifically calling for updates to the Operating Plan or the annual review. This was accomplished by having two requirements. The first is Requirement R2 which specifies that an entity must implement the Operating Plan per Requirement R1, Parts 1.1, 1.2, 1.4 and 1.5:

> R2. Each Responsible Entity shall implement the parts of its Operating Plan that meet Requirement R1, Parts 1.1 and 1.2 for an actual event and Parts 1.4 and 1.5 as specified.

The second Requirement is R3 which addresses Part 1.3:

> R3. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.

The second revision based on the quality review pertains to Requirement R4. The quality review suggested revising the requirement to more closely match the language in the Rationale box that the drafting team developed. This would provide better guidance for responsible entities as well as provide more clear direction to auditors. The revised requirement is:

> R4. Each Responsible Entity shall verify (through actual implementation for an event, or through a drill or exercise) the communication process in its Operating Plan, created pursuant to Requirement 1, Part 1.3, at least annually (once per calendar year), with no more than 15 calendar months between verification or actual implementation.

You do not have to answer all questions. Enter all comments in Simple Text Format.

1. The DSR SDT has revised EOP-004-2 to remove the training requirement R4 based on stakeholder comments from the second formal posting. Do you agree this revision? If not, please explain in the comment area below.

☐ Yes
☒ No

Comments: We do not believe R4 is necessary, whether or not the process, plan, procedure, etc. is "verified" is of no consequence; if it is not viable upon event and when it is needed, as entity would not be able to meet R3. Therefore, it is in the best interest of the Responsible Entity to *periodically* review the process.

2. The DSR SDT includes two requirement regarding implementation of the Operating Plan specified in Requirement R1. The previous version of the standard had a requirement to implement the Operating plan as well as a requirement to report events. The two requirements R2 and R3 were written to delineate implementation of the Parts of R1. Do you agree with these revisions? If not, please explain in the comment area below.

R2. Each Responsible Entity shall implement the parts of its Operating Plan that meet Requirement R1, Parts 1.1 and 1.2 for an actual event and Parts 1.4 and 1.5 as specified.

R3. Each Responsible Entity shall report events in accordance with its Operating Plan developed to address the events listed in Attachment 1.

☐ Yes
☒ No

Comments: The only true requirement that is results-based, not administrative and is actually required to support the Purpose of the Standard is R3. We strongly urge the SDT to delete the other Requirements.

3. The DSR SDT revised reporting times for many events listed in Attachment 1 from one hour to 24 hours. Do you agree with these revisions? If not, please explain in the comment area below.

☒ Yes
☐ No

Comments:

4. Do you have any other comment, not expressed in questions above, for the DSR SDT?

Subject: NERC: Standards Announcement - Project 2009-01 Disturbance and Sabotage Reporting | Ballot Pool, Initial Ballot and Formal Comment Period Information
Date: Friday, October 28, 2011 11:26:43 AM

Standards Announcement

Project 2009-01 Disturbance and Sabotage Reporting
Ballot Pool Window Now Open: Oct. 28 – Nov. 28, 2011
Formal Comment Period Open: Oct. 28 – Dec. 12, 2011
Initial Ballot Window: Dec. 2 – 12, 2011

Available Now

EOP-004-2 – Event Reporting (clean and redline showing changes to the last posting), an implementation plan (clean and redline to the last posting), and several associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Monday, December 12, 2011. Two ballot pools are being formed – one for balloting the standard, and a separate ballot pool for the non-binding poll of the associated VRFs and VSLs. The ballot pool window is open through 8 a.m. Eastern on Monday, November 28. ***(Please note that this is 8 a.m. on the Monday following Thanksgiving weekend – Registered Ballot Body members interested in joining the ballot pools for this project should plan accordingly).***

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended April 8, 2011
- Mapping Document - Identifies each requirement in the two already-approved standards that are being consolidated into EOP-004-2 (EOP-004-1 and CIP-001-1a), and identifies how the requirement has been treated in the revisions proposed Draft 3 of EOP-004-2
- VRF/VSL Justification – Explains how the VRFs and VSLs the drafting team has proposed for EOP-004-2 comply with guidelines that FERC and NERC have established for VRFs and VSLs
- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically

Instructions for Joining Ballot Pools for EOP-004-2 and Associated VRFs/VSLs
Two separate ballot pools are being formed – one ballot pool for Registered Ballot Body (RBB) members interested in balloting of EOP-004-2, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with EOP-004-2. RBB members who join the ballot pool for the standard **will not** be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pool to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)

The ballot pool list server for the initial ballot is: bp-2009-01_DSR_in@nerc.com
The ballot pool list server for the non-binding poll is:
bp-2009-01_DSR_NB_2011_in@nerc.com

Instructions for Commenting
Please use this electronic form ONLY to submit comments. In order to avoid duplication, please indicate "submitted comments electronically" on the ballot and non-binding poll comment section to avoid duplication.

If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps
An initial ballot of EOP-004-2 will be conducted beginning on Friday, December 2, 2011 through 8 p.m. Eastern on Monday, December 12, 2011.

Background
Stakeholders have indicated that identifying potential acts of "sabotage" is difficult to do in real time, and additional clarity is needed to identify thresholds for reporting potential acts of sabotage in CIP-001-1. Stakeholders have also reported that EOP-004-1 has some requirements that reference out-of-date Department of Energy forms, making the requirements ambiguous. EOP-004-1 also has some 'fill-in-the-blank' components to eliminate.

The project will include addressing previously identified stakeholder concerns and FERC directives; will bring the standards into conformance with the latest approved version of the ERO Rules of Procedure; and may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.
Additional information is available on the project webpage.

A stakeholder interested in following the Disturbance and Sabotage Reporting Drafting Team's development of EOP-004-2 may monitor meeting agendas and notes on the team's "Related Files" webpage or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" email list, send an email request to: sarcomm@nerc.net. Please indicate the drafting team's name in the subject line of the email.

Standards Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on

stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

A. Introduction

1. Title: **Sabotage Reporting**

2. Number: CIP-001-1

3. Purpose: Disturbances or unusual occurrences, suspected or determined to be caused by sabotage, shall be reported to the appropriate systems, governmental agencies, and regulatory bodies.

4. Applicability

4.1. Reliability Coordinators.

4.2. Balancing Authorities.

4.3. Transmission Operators.

4.4. Generator Operators.

4.5. Load Serving Entities.

5. Effective Date: January 1, 2007

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection.

R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection.

R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall provide its operating personnel with sabotage response guidelines, including personnel to contact, for reporting disturbances due to sabotage events.

R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances.

C. Measures

M1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement 1

M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements 2 and 3.

M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited to procedures, policies, a letter of understanding, communication records, or other equivalent evidence that will be used to confirm that it has established communications contacts with the applicable, local FBI or RCMP officials to communicate sabotage events (Requirement 4).

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to verify compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator, Transmission Operator, Generator Operator, Distribution Provider, and Load Serving Entity shall have current, in-force documents available as evidence of compliance as specified in each of the Measures.

If an entity is found non-compliant the entity shall keep information related to the non-compliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance:

2.1. Level 1: There shall be a separate Level 1 non-compliance, for every one of the following requirements that is in violation:

2.1.1 Does not have procedures for the recognition of and for making its operating personnel aware of sabotage events (R1).

2.1.2 Does not have procedures or guidelines for the communication of information concerning sabotage events to appropriate parties in the Interconnection (R2).

2.1.3 Has not established communications contacts, as specified in R4.

2.2. Level 2: Not applicable.

2.3. Level 3: Has not provided its operating personnel with sabotage response procedures or guidelines (R3).

2.4. Level 4:.Not applicable.

E. Regional Differences

None indicated.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata
1	November 1, 2006	Adopted by Board of Trustees	Amended

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan

Project 2009-01 Disturbance and Sabotage Reporting

Implementation Plan for EOP-004-2 – Event Reporting

Approvals Required

EOP-004-2 – Event Reporting

Prerequisite Approvals

Revisions to Sections 807 and 808 of the NERC Rules of Procedure
Addition of Section 812 to the NERC Rules of Procedure

Revisions to Glossary Terms

None

Applicable Entities

Reliability Coordinator
Balancing Authority
Interchange Coordinator
Transmission Service provider
Transmission Owner
Transmission Operator
Generator Owner
Generator Operator
Distribution Provider
Load-Serving Entity
Electric Reliability Organization
Regional Entity

Conforming Changes to Other Standards

None

Effective Dates

EOP-004-2 shall become effective on the first day of the third calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the third calendar quarter after Board of Trustees approval.

Retirements

EOP-004-1 – Disturbance Reporting and CIP-001-2a – Sabotage Reporting should be retired at midnight of the day immediately prior to the Effective Date of EOP-004-2 in the particular jurisdiction in which the new standard is becoming effective.

CIP-008-4 – Cyber Security - Incident Reporting and Response Planning: Retire R1.3 which contains provisions for reporting Cyber Security Incidents. This is addressed in EOP-004-2, Requirement 1, Part 1.3.

A. Introduction

1. Title: Disturbance Reporting

2. Number: EOP-004-1

3. Purpose: Disturbances or unusual occurrences that jeopardize the operation of the Bulk Electric System, or result in system equipment damage or customer interruptions, need to be studied and understood to minimize the likelihood of similar events in the future.

4. Applicability

4.1. Reliability Coordinators.

4.2. Balancing Authorities.

4.3. Transmission Operators.

4.4. Generator Operators.

4.5. Load Serving Entities.

4.6. Regional Reliability Organizations.

5. Effective Date: January 1, 2007

B. Requirements

R1. Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports.

R2. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall promptly analyze Bulk Electric System disturbances on its system or facilities.

R3. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity experiencing a reportable incident shall provide a preliminary written report to its Regional Reliability Organization and NERC.

R3.1. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall submit within 24 hours of the disturbance or unusual occurrence either a copy of the report submitted to DOE, or, if no DOE report is required, a copy of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report form. Events that are not identified until some time after they occur shall be reported within 24 hours of being recognized.

R3.2. Applicable reporting forms are provided in Attachments 1-EOP-004 and 2-EOP-004.

R3.3. Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by a disturbance and issue a written Interconnection Reliability Operating Limit and Preliminary Disturbance Report within 24 hours. In such cases, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall promptly notify its Regional Reliability Organization(s) and NERC, and verbally provide as much information as is available at that

time. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall then provide timely, periodic verbal updates until adequate information is available to issue a written Preliminary Disturbance Report.

R3.4. If, in the judgment of the Regional Reliability Organization, after consultation with the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity in which a disturbance occurred, a final report is required, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall prepare this report within 60 days. As a minimum, the final report shall have a discussion of the events and its cause, the conclusions reached, and recommendations to prevent recurrence of this type of event. The report shall be subject to Regional Reliability Organization approval.

R4. When a Bulk Electric System disturbance occurs, the Regional Reliability Organization shall make its representatives on the NERC Operating Committee and Disturbance Analysis Working Group available to the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity immediately affected by the disturbance for the purpose of providing any needed assistance in the investigation and to assist in the preparation of a final report.

R5. The Regional Reliability Organization shall track and review the status of all final report recommendations at least twice each year to ensure they are being acted upon in a timely manner. If any recommendation has not been acted on within two years, or if Regional Reliability Organization tracking and review indicates at any time that any recommendation is not being acted on with sufficient diligence, the Regional Reliability Organization shall notify the NERC Planning Committee and Operating Committee of the status of the recommendation(s) and the steps the Regional Reliability Organization has taken to accelerate implementation.

C. Measures

M1. The Regional Reliability Organization shall have and provide upon request as evidence, its current regional reporting procedure that is used to facilitate preparation of preliminary and final disturbance reports. (Requirement 1)

M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity that has a reportable incident shall have and provide upon request evidence that could include, but is not limited to, the preliminary report, computer printouts, operator logs, or other equivalent evidence that will be used to confirm that it prepared and delivered the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports to NERC within 24 hours of its recognition as specified in Requirement 3.1.

M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and/or Load Serving Entity that has a reportable incident shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it provided information verbally as time permitted, when system conditions precluded the preparation of a report in 24 hours. (Requirement 3.3)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations.

Regional Reliability Organizations shall be responsible for compliance monitoring of Reliability Coordinators, Balancing Authorities, Transmission Operators, Generator Operators, and Load-serving Entities.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Regional Reliability Organization shall have its current, in-force, regional reporting procedure as evidence of compliance. (Measure 1)

Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and/or Load Serving Entity that is either involved in a Bulk Electric System disturbance or has a reportable incident shall keep data related to the incident for a year from the event or for the duration of any regional investigation, whichever is longer. (Measures 2 through 4)

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

See Attachments:

- EOP-004 Disturbance Reporting Form
- Table 1 EOP-004

2. Levels of Non-Compliance for a Regional Reliability Organization

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: No current procedure to facilitate preparation of preliminary and final disturbance reports as specified in R1.

3. Levels of Non-Compliance for a Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load- Serving Entity:

3.1. Level 1: There shall be a level one non-compliance if any of the following conditions exist:

3.1.1 Failed to prepare and deliver the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports to NERC within 24 hours of its recognition as specified in Requirement 3.1

3.1.2 Failed to provide disturbance information verbally as time permitted, when system conditions precluded the preparation of a report in 24 hours as specified in R3.3

3.1.3 Failed to prepare a final report within 60 days as specified in R3.4

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable

3.4. Level 4: Not applicable.

E. Regional Differences

None identified.

Version History

Attachment 1-EOP-004
NERC Disturbance Report Form

Introduction

These disturbance reporting requirements apply to all Reliability Coordinators, Balancing Authorities, Transmission Operators, Generator Operators, and Load Serving Entities, and provide a common basis for all NERC disturbance reporting. The entity on whose system a reportable disturbance occurs shall notify NERC and its Regional Reliability Organization of the disturbance using the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report forms. Reports can be sent to NERC via email (esisac@nerc.com) by facsimile (609-452-9550) using the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report forms. If a disturbance is to be reported to the U.S. Department of Energy also, the responding entity may use the DOE reporting form when reporting to NERC. Note: All Emergency Incident and Disturbance Reports (Schedules 1 and 2) sent to DOE shall be simultaneously sent to NERC, preferably electronically at esisac@nerc.com.

The NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports are to be made for any of the following events:

1. The loss of a bulk power transmission component that significantly affects the integrity of interconnected system operations. Generally, a disturbance report will be required if the event results in actions such as:
   a. Modification of operating procedures.
   b. Modification of equipment (e.g. control systems or special protection systems) to prevent reoccurrence of the event.
   c. Identification of valuable lessons learned.
   d. Identification of non-compliance with NERC standards or policies.
   e. Identification of a disturbance that is beyond recognized criteria, i.e. three-phase fault with breaker failure, etc.
   f. Frequency or voltage going below the under-frequency or under-voltage load shed points.
2. The occurrence of an interconnected system separation or system islanding or both.
3. Loss of generation by a Generator Operator, Balancing Authority, or Load-Serving Entity — 2,000 MW or more in the Eastern Interconnection or Western Interconnection and 1,000 MW or more in the ERCOT Interconnection.
4. Equipment failures/system operational actions which result in the loss of firm system demands for more than 15 minutes, as described below:
   a. Entities with a previous year recorded peak demand of more than 3,000 MW are required to report all such losses of firm demands totaling more than 300 MW.
   b. All other entities are required to report all such losses of firm demands totaling more than 200 MW or 50% of the total customers being supplied immediately prior to the incident, whichever is less.
5. Firm load shedding of 100 MW or more to maintain the continuity of the bulk electric system.

6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in:
   a. Sustained voltage excursions equal to or greater than ±10%, or
   b. Major damage to power system components, or
   c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance as defined by steps 1 through 5 above.
7. An Interconnection Reliability Operating Limit (IROL) violation as required in reliability standard TOP-007.
8. Any event that the Operating Committee requests to be submitted to Disturbance Analysis Working Group (DAWG) for review because of the nature of the disturbance and the insight and lessons the electricity supply and delivery industry could learn.

NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report

☐ Check here if this is an Interconnection Reliability Operating Limit (IROL) violation report.

1.	Organization filing report.		
2.	Name of person filing report.		
3.	Telephone number.		
4.	Date and time of disturbance. Date:(mm/dd/yy) Time/Zone:		
5.	Did the disturbance originate in your system?	Yes ☐ No ☐	
6.	Describe disturbance including: cause, equipment damage, critical services interrupted, system separation, key scheduled and actual flows prior to disturbance and in the case of a disturbance involving a special protection or remedial action scheme, what action is being taken to prevent recurrence.		
7.	Generation tripped. MW Total List generation tripped		
8.	Frequency. Just prior to disturbance (Hz): Immediately after disturbance (Hz max.): Immediately after disturbance (Hz min.):		
9.	List transmission lines tripped (specify voltage level of each line).		
10.		FIRM	INTERRUPTIBLE
	Demand tripped (MW):		
	Number of affected Customers:		

	Demand lost (MW-Minutes):		
11.	Restoration time.	INITIAL	FINAL
	Transmission:		
	Generation:		
	Demand:		

Attachment 2-EOP-004
U.S. Department of Energy Disturbance Reporting Requirements

Introduction

The U.S. Department of Energy (DOE), under its relevant authorities, has established mandatory reporting requirements for electric emergency incidents and disturbances in the United States. DOE collects this information from the electric power industry on Form EIA-417 to meet its overall national security and Federal Energy Management Agency's Federal Response Plan (FRP) responsibilities. DOE will use the data from this form to obtain current information regarding emergency situations on U.S. electric energy supply systems. DOE's Energy Information Administration (EIA) will use the data for reporting on electric power emergency incidents and disturbances in monthly EIA reports. In addition, the data may be used to develop legislative recommendations, reports to the Congress and as a basis for DOE investigations following severe, prolonged, or repeated electric power reliability problems.

Every Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity must use this form to submit mandatory reports of electric power system incidents or disturbances to the DOE Operations Center, which operates on a 24-hour basis, seven days a week. All other entities operating electric systems have filing responsibilities to provide information to the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity when necessary for their reporting obligations and to file form EIA-417 in cases where these entities will not be involved. EIA requests that it be notified of those that plan to file jointly and of those electric entities that want to file separately.

Special reporting provisions exist for those electric utilities located within the United States, but for whom Reliability Coordinator oversight responsibilities are handled by electrical systems located across an international border. A foreign utility handling U.S. Balancing Authority responsibilities, may wish to file this information voluntarily to the DOE. Any U.S.-based utility in this international situation needs to inform DOE that these filings will come from a foreign-based electric system or file the required reports themselves.

Form EIA-417 must be submitted to the DOE Operations Center if any one of the following applies (see Table 1-EOP-004-0 — Summary of NERC and DOE Reporting Requirements for Major Electric System Emergencies):

1. Uncontrolled loss of 300 MW or more of firm system load for more than 15 minutes from a single incident.
2. Load shedding of 100 MW or more implemented under emergency operational policy.
3. System-wide voltage reductions of 3 percent or more.
4. Public appeal to reduce the use of electricity for purposes of maintaining the continuity of the electric power system.
5. Actual or suspected physical attacks that could impact electric power system adequacy or reliability; or vandalism, which target components of any security system. Actual or suspected cyber or communications attacks that could impact electric power system adequacy or vulnerability.

6. Actual or suspected cyber or communications attacks that could impact electric power system adequacy or vulnerability.
7. Fuel supply emergencies that could impact electric power system adequacy or reliability.
8. Loss of electric service to more than 50,000 customers for one hour or more.
9. Complete operational failure or shut-down of the transmission and/or distribution electrical system.

The initial DOE Emergency Incident and Disturbance Report (form EIA-417 – Schedule 1) shall be submitted to the DOE Operations Center within 60 minutes of the time of the system disruption. Complete information may not be available at the time of the disruption. However, provide as much information as is known or suspected at the time of the initial filing. If the incident is having a critical impact on operations, a telephone notification to the DOE Operations Center (202-586-8100) is acceptable, pending submission of the completed form EIA-417. Electronic submission via an on-line web-based form is the preferred method of notification. However, electronic submission by facsimile or email is acceptable.

An updated form EIA-417 (Schedule 1 and 2) is due within 48 hours of the event to provide complete disruption information. Electronic submission via facsimile or email is the preferred method of notification. Detailed DOE Incident and Disturbance reporting requirements can be found at: http://www.eia.doe.gov/cneaf/electricity/page/form_417.html.

Table 1-EOP-004-0 Summary of NERC and DOE Reporting Requirements for Major Electric System Emergencies				
Incident No.	**Incident**	**Threshold**	**Report Required**	**Time**
1	Uncontrolled loss of Firm System Load	≥ 300 MW – 15 minutes or more	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
2	Load Shedding	≥ 100 MW under emergency operational policy	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
3	Voltage Reductions	3% or more – applied system-wide	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
4	Public Appeals	Emergency conditions to reduce demand	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
5	Physical sabotage, terrorism or vandalism	On physical security systems – suspected or real	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
6	Cyber sabotage, terrorism or vandalism	If the attempt is believed to have or did happen	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
7	Fuel supply emergencies	Fuel inventory or hydro storage levels ≤ 50% of normal	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
8	Loss of electric service	≥ 50,000 for 1 hour or more	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
9	Complete operation failure of electrical system	If isolated or interconnected electrical systems suffer total electrical system collapse	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
All DOE EIA-417 Schedule 1 reports are to be filed within 60-minutes after the start of an incident or disturbance All DOE EIA-417 Schedule 2 reports are to be filed within 48-hours after the start of an incident or disturbance				

All entities required to file a DOE EIA-417 report (Schedule 1 & 2) shall send a copy of these reports to NERC simultaneously, but no later than 24 hours after the start of the incident or disturbance.				
Incident No.	**Incident**	**Threshold**	**Report Required**	**Time**
1	Loss of major system component	Significantly affects integrity of interconnected system operations	NERC Prelim Final report	24 hour 60 day
2	Interconnected system separation or system islanding	Total system shutdown Partial shutdown, separation, or islanding	NERC Prelim Final report	24 hour 60 day
3	Loss of generation	≥ 2,000 – Eastern Interconnection ≥ 2,000 – Western Interconnection ≥ 1,000 – ERCOT Interconnection	NERC Prelim Final report	24 hour 60 day
4	Loss of firm load ≥15-minutes	Entities with peak demand ≥3,000: loss ≥300 MW All others ≥200MW or 50% of total demand	NERC Prelim Final report	24 hour 60 day
5	Firm load shedding	≥100 MW to maintain continuity of bulk system	NERC Prelim Final report	24 hour 60 day
6	System operation or operation actions resulting in:	• Voltage excursions ≥10% • Major damage to system components • Failure, degradation, or misoperation of SPS	NERC Prelim Final report	24 hour 60 day
7	IROL violation	Reliability standard TOP-007.	NERC Prelim Final report	72 hour 60 day
8	As requested by ORS Chairman	Due to nature of disturbance & usefulness to industry (lessons learned)	NERC Prelim Final report	24 hour 60 day
All NERC Operating Security Limit and Preliminary Disturbance reports will be filed within 24 hours after the start of the incident. If an entity must file a DOE EIA-417 report on an incident, which requires a NERC Preliminary report, the Entity may use the DOE EIA-417 form for both DOE and NERC reports.				
Any entity reporting a DOE or NERC incident or disturbance has the responsibility to also notify its Regional Reliability Organization.				

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2009-01 Disturbance and Sabotage Reporting
Ballot Pool Window Now Open: Oct. 28 – Nov. 28, 2011
Formal Comment Period Open: Oct. 28 – Dec. 12, 2011
Initial Ballot Window: Dec. 2 – 12, 2011

Available Now

EOP-004-2 – Event Reporting (clean and redline showing changes to the last posting), an implementation plan (clean and redline to the last posting), and several associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Monday, December 12, 2011. Two ballot pools are being formed – one for balloting the standard, and a separate ballot pool for the non-binding poll of the associated VRFs and VSLs. The ballot pool window is open through 8 a.m. Eastern on Monday, November 28. ***(Please note that this is 8 a.m. on the Monday following Thanksgiving weekend – Registered Ballot Body members interested in joining the ballot pools for this project should plan accordingly).***

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended April 8, 2011
- Mapping Document - Identifies each requirement in the two already-approved standards that are being consolidated into EOP-004-2 (EOP-004-1 and CIP-001-1a), and identifies how the requirement has been treated in the revisions proposed Draft 3 of EOP-004-2
- VRF/VSL Justification – Explains how the VRFs and VSLs the drafting team has proposed for EOP-004-2 comply with guidelines that FERC and NERC have established for VRFs and VSLs
- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically

Instructions for Joining Ballot Pools for EOP-004-2 and Associated VRFs/VSLs

Two separate ballot pools are being formed – one ballot pool for Registered Ballot Body (RBB) members interested in balloting of EOP-004-2, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with EOP-004-2. RBB

members who join the ballot pool for the standard **will not** be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pool to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)

The ballot pool list server for the initial ballot is: bp-2009-01_DSR_in@nerc.com

The ballot pool list server for the non-binding poll is:
bp-2009-01_DSR_NB_2011_in@nerc.com

Instructions for Commenting

Please use this electronic form ONLY to submit comments. In order to avoid duplication, please indicate "submitted comments electronically" on the ballot and non-binding poll comment section to avoid duplication.

If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An initial ballot of EOP-004-2 will be conducted beginning on Friday, December 2, 2011 through 8 p.m. Eastern on Monday, December 12, 2011.

Background

Stakeholders have indicated that identifying potential acts of "sabotage" is difficult to do in real time, and additional clarity is needed to identify thresholds for reporting potential acts of sabotage in CIP-001-1. Stakeholders have also reported that EOP-004-1 has some requirements that reference out-of-date Department of Energy forms, making the requirements ambiguous. EOP-004-1 also has some 'fill-in-the-blank' components to eliminate.

The project will include addressing previously identified stakeholder concerns and FERC directives; will bring the standards into conformance with the latest approved version of the ERO Rules of Procedure; and may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.

Additional information is available on the project webpage.

A stakeholder interested in following the Disturbance and Sabotage Reporting Drafting Team's development of EOP-004-2 may monitor meeting agendas and notes on the team's "Related Files" web page or may submit a request to join the team's "plus" e-mail list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" e-mail list, send an e-mail request to: sarcomm@nerc.net. Please indicate the drafting team's name in the subject line of the e-mail.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Violation Risk Factor and Violation Severity Level Assignments

Project 2009-01 – Disturbance and Sabotage Reporting

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in

EOP-004-2 — Event Reporting

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors in EOP-004-2

The Disturbance and Sabotage Reporting Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements in EOP-004-2:

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for EOP-004-2:

There are four requirements in EOP-004-2. Requirement R1 was assigned a "Lower" VRF while Requirements R2, R3 and R4 were assigned a "Medium" VRF.

VRF for EOP-004-2, Requirements R1:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The Requirement specifies which functional entities are required to have procedure(s) for recognition of events, gather information for completing an event report, and communicating with other entities. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC's Guideline 3 — Consistency among Reliability Standards. This requirement calls for an entity to have procedure(s) for recognition of events, gather information for completing an event report, and communicating with other entities. This requirement is administrative in nature and deals with the means to report events after the fact. Most event reporting requirements in Attachment 1 are

for 24 hours after an event has occurred. The current approved VRFs for EOP-004-1 are all lower with the exception of Requirement R2 which is a requirement to analyze events. This standard relates only to reporting events. The analysis portion is addressed through the NERC Rules of Procedure and the Events Analysis Program.

- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to have a procedure(s) is not likely to directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system if an entity cannot report an event and that event led to other preventable events on the BES had the report been made in a timely fashion. Development of the procedure(s) is a requirement that is administrative in nature and is in a planning time frame that, if violated, would not, under emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system.. Therefore this requirement was assigned a lower VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R1 contain only one objective which is to have procedure(s). The content of the procedure is specified in Parts 1.1-1.5. Since the requirement is to have a procedure(s), only one VRF was assigned.

VRF for EOP-004-2, Requirement R2:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. EOP-004-2, Requirement R4 is a requirement for entities to report events using the procedure(s) for recognition of events per Requirement R1. The Standard Drafting Team views this as an aspect of implementing the Operating Plan for reporting events. The act of reporting in and of itself is not likely to "directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system." However, violation of a medium risk requirement should also be "unlikely to lead to bulk electric system instability, separation, or cascading failures…" Such an instance could occur if personnel do not report events. Therefore, this requirement was assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. EOP-004-2, Requirement R5 mandates that report events per their procedure(s). Bulk power system instability, separation, or cascading failures are not likely to occur due to a failure to notify another entity of the event failure, but there is a slight chance that it could occur. Therefore, this requirement was assigned a Medium VRF.

- FERC's Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R5 addresses a single objective and has a single VRF.

VRF for EOP-004-2, Requirement R3:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. EOP-004-2, Requirement R4 is a requirement for entities to report events using the procedure(s) for recognition of events per Requirement R1. The act of reporting in and of itself is not likely to "directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system." However, violation of a medium risk requirement should also be "unlikely to lead to bulk electric system instability, separation, or cascading failures…" Such an instance could occur if personnel do not report events. Therefore, this requirement was assigned a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. EOP-004-2, Requirement R5 mandates that report events per their procedure(s). Bulk power system instability, separation, or cascading failures are not likely to occur due to a failure to notify another entity of the event failure, but there is a slight chance that it could occur. Therefore, this requirement was assigned a Medium VRF.
- FERC's Guideline 5 - Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R5 addresses a single objective and has a single VRF.

VRF for EOP-004-2, Requirement R4:

- FERC's Guideline 2 — Consistency within a Reliability Standard. The requirement has no sub-requirements; only one VRF was assigned so there is no conflict.
- FERC's Guideline 3 — Consistency among Reliability Standards. EOP-004-2, Requirement R3 specifies a time frame in which to verify the communications protocols developed in the procedures pursuant to Requirement R1. Both requirements have a Medium VRF.
- FERC's Guideline 4 — Consistency with NERC's Definition of a VRF. Failure to verify a communications protocol could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system if an entity cannot report an event and that event led to other preventable events on the BES had the report been made in a timely fashion. Therefore this requirement was assigned a medium VRF.
- FERC's Guideline 5 — Treatment of Requirements that Co-mingle More Than One Objective. EOP-004-2, Requirement R3 addresses a single objective and has a single VRF.

Justification for Assignment of Violation Severity Levels for EOP-004-2:

In developing the VSLs for the EOP-004-2 standard, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in EOP-004-2 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

> Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

> A violation of a "binary" type requirement must be a "Severe" VSL.
>
> Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for EOP-004-2 Requirements R1:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is a revision of CIP-001-1, R1-R4, and EOP-004-1, R2. Since the Requirement has four Parts, the VSLs were developed to count a violation of each Part equally. Therefore, four VSLs were developed.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for EOP-004-2 Requirement R2:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is for entities to implement the Operating Plan for event reporting. There are four Parts that are addressed under this requirement. Parts 1.1 and 1.2 are only applicable for an actual event and are binary in nature. Parts 1.4 and 1.5 require updates or reviews based on certain intervals. Based on the VSL Guidance, the DSR SDT developed four VSLs based on tardiness of the submittal of the report. If the update or review is not performed, then the VSL is Severe.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for EOP-004-2 Requirement R3:

R#	Compliance with NERC's VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	Meets NERC's VSL guidelines. There is an incremental aspect to the violation and the VSLs follow the guidelines for incremental violations.	The proposed requirement is a revision of EOP-004-1, R3. There is only a Severe VSL for that requirement. However, the reporting of events is based on timing intervals listed in attachment 1. Based on the VSL Guidance, the DSR SDT developed four VSLs based on tardiness of the submittal of the report. If a report is not submitted, then the VSL is Severe. This maintains the current VSL.	The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement.	The VSL is based on a single violation and not cumulative violations.

VSLs for EOP-004-2 Requirement R4:

R#	Compliance with NERC's Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	Meets NERC's VSL guidelines - Severe: The performance or product measured does not substantively meet the intent of the requirement.	The most comparable VSLs for a similar requirement is EOP-008-0, R1.7 which calls for an annual update to a plan. Based on the VSL Guidance, the DSR SDT developed four VSLs based on tardiness of the verification of the communication protocol. If the verification is not achieved, then the VSL is Severe.	The proposed VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.	The proposed VSLs use the same terminology as used in the associated requirement, and are, therefore, consistent with the requirement.	The VSLs are based on a single violation and not cumulative violations.

Definitions of Terms Used in Version 5 CIP Cyber Security Standards

This section includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards and proposes terms for retirement. Terms already defined in the Glossary of Terms used in NERC Reliability Standards are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary. New defined terms are underscored. For existing glossary terms, new language is shown as underscored, while deleted language is shown as stricken. The list of terms proposed for retirement is at the end of the document.

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

BES Cyber Asset

A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the BES Reliability Operating Services. The timeframe is not in respect to any cyber security events or incidents, but is related to the time between when the Cyber Asset can send or receive instructions to operate and the time in which that operation occurs and impacts the BES. Redundancy shall not be considered when determining availability. A Transient Cyber Asset is not considered a BES Cyber Asset.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

BES Cyber Security Incident

~~Any~~ A malicious act or suspicious event that:

- Compromises, or was an attempt to compromise, the Electronic Security Perimeter ~~or Physical Security Perimeter of a Critical Cyber Asset~~, or~~,~~
- Disrupts, or was an attempt to disrupt, the operation of a ~~Critical Cyber Asset~~ BES Cyber System, or
- Results in unauthorized physical access into a Defined Physical Boundary .

BES Cyber System

One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services. A Maintenance Cyber Asset is not considered part of a BES Cyber System.

BES Cyber System Information

Information, about one or more BES Cyber Systems or BES Cyber Assets, that include one or more of the following: security procedures developed by the responsible entity; network topology or similar diagrams; BES Cyber System, Electronic Access Control System, and Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); floor plans that contain BES Cyber System Impact designations; equipment layouts that contain BES Cyber System Impact designations; BES Cyber System disaster recovery plans; and BES Cyber System incident response plans.

BES Reliability Operating Services

BES Reliability Operating Services are those services contributing to the real-time reliable operation of the Bulk Electric System (BES). They include the following Operating Services:

Dynamic Response to BES conditions

Actions performed by BES Elements, Facilities or systems automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition.

Aspects of BES Dynamic Response include, but are not limited to:

- Spinning reserve (contingency reserves)
  - Providing actual reserves
  - Monitoring that reserves are sufficient
- Governor Response
  - Control system used to actuate governor response

- Protection Systems (transmission & generation)
  - Line, bus, x-former, generator
  - Zone protection
  - Breaker protection
  - Current, frequency, speed, phase
- Special Protection Systems or Remedial Action Schemes
  - Sensors, relays & breakers, possibly software
- Under and Over Frequency relay protection (includes automatic load shedding)
  - Sensors, relays & breakers
- Under and Over Voltage relay protection (includes automatic load shedding)
  - Sensors, relays & breakers
- Power System Stabilizers

Balancing Load and Generation

Activities, actions and conditions necessary for monitoring and controlling generation and load in the operations planning horizon and in real-time.

Aspects of the Balancing Load and Generation Operating Service include, but are not limited to:

- Calculation of ACE
  - Field data sources (real time tie flows, frequency sources, time error, etc)
  - Software used to perform calculation
- Unit commitment
  - Know generation status & capability & restrictions (must runs, minimum run times, ramp, heat rates, etc), load schedules
- Load management
  - Ability to identify load change need
  - Ability to implement load changes
- Demand Response
  - Ability to identify load change need
  - Ability to implement load changes
- Manually Initiated Load shedding
  - Ability to identify load change need
  - Ability to implement load changes
- Non-spinning reserve (contingency reserve)
  - Know generation status, capability, ramp rate, start time

- Start units and provide energy

Controlling Frequency (Real Power)

Activities, actions and conditions which ensure, in real time, that frequency remains within bounds acceptable for the reliability or operability of the BES.

Aspects of the Controlling Frequency Operating Service include, but are not limited to:

- Generation Control (such as AGC)
  - ACE, current generator output, ramp rate, unit characteristics
  - Software to calculate unit adjustments
  - Transmit adjustments to individual units
  - Unit controls implementing adjustments
- Regulation (regulating reserves)
  - Frequency source, schedule
  - Governor control system

Controlling Voltage (Reactive Power)

Activities, actions and conditions which ensure, in real time, that voltage remains within bounds acceptable for the reliability or operability of the BES.

Aspects of the Controlling Voltage Operating Service include, but are not limited to:

- AVR (Automatic Voltage Regulation)
  - Sensors, stator control system, feedback
- Capacitive resources
  - Status, control (manual or auto), feedback
- Inductive resources (transformer tap changer, or inductors)
  - Status, control (manual or auto), feedback
- SVC (Static VAR Compensators)
  - Status, computations, control (manual or auto), feedback

Managing Constraints

Activities, actions and conditions that are necessary to ensure that elements of the BES operate within design limits and constraints established for the reliability and operability of the BES.

Aspects of the Managing Constraints include, but are not limited to:

- Available Transfer Capability (ATC)

- Interchange schedules
- Generation re-dispatch and unit commit
- Identify and monitor SOL's & IROL's

Identify and monitor Flowgates

Monitoring & Control

Activities, actions, and conditions that provide monitoring and control of BES elements.

An example aspect of the Monitoring and Control Service is, but is not limited to:

- All methods of operating breakers and switches (such as SCADA)

Restoration of BES

Activities, actions and conditions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance.

Aspects of the Restoration of BES Operating Service include, but are not limited to:

- Blackstart restoration including planned cranking path
- Off-site power for nuclear facilities.

Situational Awareness

Activities, actions and conditions necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes to conditions.

Aspects of the Situation Awareness Operating Service include, but are not limited to:

- Monitoring and alerting (such as EMS alarms)
- Change management
- Current Day & Next Day planning
- Contingency Analysis
- Frequency monitoring

Inter-Entity Real-Time Coordination and Communication

Activities, actions, and conditions necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES.

Aspects of the Inter-Entity Coordination and Communication Operating Service include, but are not limited to:

- Scheduled interchange
- Facility operational data and status
- Operational directives

CIP Exceptional Circumstance

A situation that involves one or more of the following conditions: a risk of injury or death, a natural disaster, civil unrest, a Cyber Security Incident requiring emergency assistance, a response by emergency services, the enactment of a mutual assistance agreement, or an impediment of large scale workforce availability.

CIP Senior Manager

A single senior management official with overall authority and responsibility for leading and managing implementation of the requirements within the NERC CIP Standards.

Control Center

One or more facilities hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for two or more BES generation facilities or transmission facilities, at two or more locations:

- Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems,
- Inter-utility exchange of BES reliability or operability data,
- Providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES,
- Alarm monitoring and processing specific to the reliable operation of the BES and BES restoration function,
- Presentation and display of BES reliability or operability data for monitoring, operating, and control of the BES
- Coordination of BES restoration activities.

Cyber Assets

Programmable electronic devices ~~and communication networks~~ including the hardware, software, and data in those devices.

Defined Physical Boundary ("DPB")

The physical border surrounding locations in which BES Cyber Assets, BES Cyber Systems, or Electronic Access Control Systems reside and for which access is controlled.

Change Rationale: "Defined Physical Boundary (DPB)" replaces "Physical Security Perimeter." *Previous versions of the CIP standard focused on the development of a completely enclosed Physical Security Perimeter (PSP) ("six-wall" border) and managing access though this boundary. This has proven difficult due to the nature of the operating environment for many electrical utilities, especially in field locations. The intent of this standard is to focus on the controls put in place to restrict access rather than solely focusing on the PSP and a boundary protection model for physical security.*

Electronic Access Control or Monitoring Systems

Cyber Assets used in the access control or monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems

Electronic Access Point ("EAP")

An interface on a Cyber Asset that restricts routable or dial-up data communications between Cyber Assets.

Electronic Security Perimeter ("ESP")

~~The logical border surrounding a network to which Critical Cyber Assets are connected and for which access is controlled.~~
A collection of Electronic Access Points that protect one or more BES Cyber Systems.

External Connectivity

Routable or dial-up data communication through an Electronic Access Point between a BES Cyber Asset and a device external to the Electronic Security Perimeter.

External Routable Connectivity

The BES Cyber System is accessible from any Cyber Asset that is outside its associated ESP via a routable protocol.

Interactive Remote Access

Any user interactive access by a person that originates from a Cyber Asset that is not an Intermediate Device and not located within any of the Responsible Entity's Electronic Security Perimeter(s), whether network-based or dial-up access. Remote access can be initiated from: 1) Cyber Assets used by the Responsible Entity, 2) Cyber Assets used by employees, and 3) Cyber Assets used by vendors, contractors, or consultants.

Intermediate Device

A Cyber Asset that 1) may be used to provide the required multi-factor authentication for the interactive remote access; 2) may be a termination point for required encrypted communication; and 3) may restrict the interactive remote access to only authorized users. Intermediate devices are sometimes called proxy systems. The functions of an intermediate device may be implemented on one or more Cyber Assets. The intermediate device may be located outside the Electronic Security Perimeter, as part of the Electronic Access Point, or in a DMZ network.

Physical Access Control Systems

Cyber Assets that control, alert, or log access to the Defined Physical Boundary(s), exclusive of locally mounted hardware or devices at the Defined Physical Boundary such as motion sensors, electronic lock control mechanisms, and badge readers.

Protected Cyber Asset

A Cyber Asset connected using a routable protocol within an Electronic Security Perimeter that is not part of the BES Cyber System. A Transient Cyber Asset is not considered a Protected Cyber Asset.

Reportable BES Cyber Security Incident

Any BES Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service.

Transient Cyber Asset

A Cyber Asset that is: 1) directly connected for 30 calendar days or less to a BES Cyber Asset or Protected Cyber Asset, 2) used for data transfer, maintenance, or troubleshooting purposes, and 3) capable of altering the configuration of or introducing malicious code to the BES Cyber System.

Terms to be retired from the *Glossary of Terms used in NERC Reliability Standards* once the standards that use those terms are replaced:

Critical Assets

Critical Cyber Assets

Physical Security Perimeter

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-4

3. Purpose: NERC Standards CIP-002-4 through CIP-009-4 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-4 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of the criteria in Attachment 1.

4. Applicability:

4.1. Within the text of Standard CIP-002-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the criteria contained in *CIP-002-4 Attachment 1 – Critical Asset Criteria*. The Responsible Entity shall update this list as necessary, and review it at least annually.

R2. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R1, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. The Responsible Entity shall update this list as necessary, and review it at least annually.

For each group of generating units (including nuclear generation) at a single plant location identified in Attachment 1, criterion 1.1, the only Cyber Assets that must be considered are those shared Cyber Assets that could, within 15 minutes, adversely impact the reliable operation of any combination of units that in aggregate equal or exceed Attachment 1, criterion 1.1.

For the purpose of Standard CIP-002-4, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

- The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,
- The Cyber Asset uses a routable protocol within a control center; or,
- The Cyber Asset is dial-up accessible.

R3. Annual Approval — The senior manager or delegate(s) shall approve annually the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1 and R2 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

M1. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its records of approvals as specified in Requirement R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 The Regional Entity shall serve as the Compliance Enforcement Authority with the following exceptions:

- For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.
- For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

- For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.2. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.3. Data Retention

1.3.1 The Responsible Entity shall keep documentation required by Standard CIP-002-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.3.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Additional Compliance Information

1.4.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	January 16, 2006	R3.2 — Change “Control Center” to “control center”	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.

CIP-002-4 - Attachment 1

Critical Asset Criteria

The following are considered Critical Assets:

1.1. Each group of generating units (including nuclear generation) at a single plant location with an aggregate highest rated net Real Power capability of the preceding 12 months equal to or exceeding 1500 MW in a single Interconnection.

1.2. Each reactive resource or group of resources at a single location (excluding generation Facilities) having aggregate net Reactive Power nameplate rating of 1000 MVAR or greater.

1.3. Each generation Facility that the Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

1.4. Each Blackstart Resource identified in the Transmission Operator's restoration plan.

1.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, or up to the point on the Cranking Path where two or more path options exist, as identified in the Transmission Operator's restoration plan.

1.6. Transmission Facilities operated at 500 kV or higher.

1.7. Transmission Facilities operated at 300 kV or higher at stations or substations interconnected at 300 kV or higher with three or more other transmission stations or substations.

1.8. Transmission Facilities at a single station or substation location that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by the Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

1.10. Transmission Facilities providing the generation interconnection required to connect generator output to the transmission system that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in the loss of the assets identified by any Generator Owner as a result of its application of Attachment 1, criterion 1.1 or 1.3.

1.11. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

1.12. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations for failure to operate as designed.

1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program.

1.14. Each control center or backup control center used to perform the functional obligations of the Reliability Coordinator.

1.15. Each control center or backup control center used to control generation at multiple plant locations, for any generation Facility or group of generation Facilities identified in criteria 1.1, 1.3, or 1.4. Each control center or backup control center used to control generation equal to or exceeding 1500 MW in a single Interconnection.

1.16. Each control center or backup control center used to perform the functional obligations of the Transmission Operator that includes control of at least one asset identified in criteria 1.2, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11 or 1.12.

1.17. Each control center or backup control center used to perform the functional obligations of the Balancing Authority that includes at least one asset identified in criteria 1.1, 1.3, 1.4, or 1.13. Each control center or backup control center used to perform the functional obligations of the Balancing Authority for generation equal to or greater than an aggregate of 1500 MW in a single Interconnection.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees	Update
3	3/31/10	Approved by FERC	
4	12/30/10	Modified to add specific criteria for Critical Asset identification	Update
4	1/24/11	Approved by the NERC Board of Trustees	Update
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — BES Cyber Asset and BES Cyber System Categorization

2. **Number:** CIP-002-5

3. **Purpose:** To identify and categorize BES Cyber Assets and BES Cyber Systems that execute or enable functions essential to reliable operation of the BES, for the application of cyber security requirements commensurate with the adverse impact that loss, compromise or misuse of those BES Cyber Assets and BES Cyber Systems could have on the reliability of the BES.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

   - A UFLS program required by a NERC or Regional Reliability Standard
   - A UVLS program required by a NERC or Regional Reliability Standard
   - A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
   - A Transmission Protection System required by a NERC or Regional Reliability Standard
   - Its Transmission Operator's restoration plan

   4.1.3 Generator Operator

   4.1.4 Generator Owner

   4.1.5 Interchange Coordinator

   4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

   - A UFLS program required by a NERC or Regional Reliability Standard
   - A UVLS program required by a NERC or Regional Reliability Standard

   4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-002-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

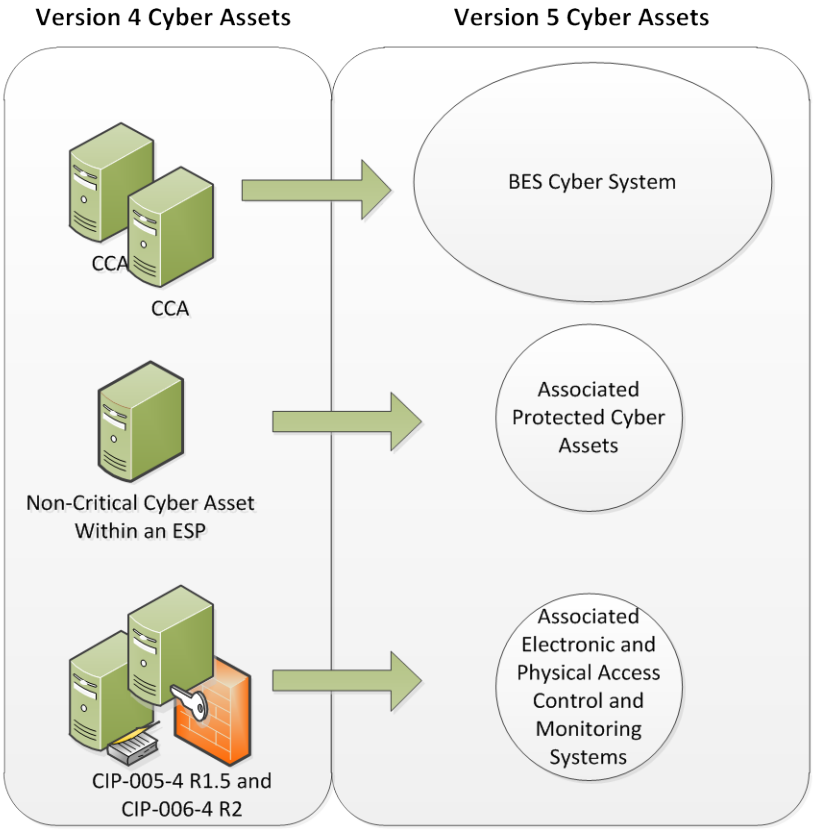
4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Background:

This standard provides “bright-line” criteria for applicable Responsible Entities to categorize their BES Cyber Systems and BES Cyber Assets based on their impact on the real-time operation of the Bulk Electric System (BES). Several concepts provide the basis for the approach to the standard.

BES Cyber Systems

One of the fundamental differences between Versions 4 and 5 of the CIP Cyber Security Standards is the shift from identifying Critical Cyber Assets to identifying BES Cyber Systems. This change results from the drafting team's review of the NIST Risk Management Framework and the use of an analogous term "information system" as the target for categorizing and applying security controls.



In transitioning from Version 4 to Version 5, a BES Cyber System can be viewed simply as a grouping of Critical Cyber Assets. The CIP Cyber Security Standards use this term primarily to provide a higher level for referencing the object of a requirement. For example, it becomes possible to apply requirements dealing with recovery and malware protection to a grouping rather than individual Cyber Assets. So it becomes clearer in the requirement that malware protection applies to the system as a whole and may not be necessary for every individual device to comply.

Another reason for using the term BES Cyber System is to provide a convenient level at which a Responsible Entity can organize their documented implementation of the requirements and compliance evidence. Responsible Entities can use the well-developed concept of a *security plan* for each BES Cyber System to document the programs, processes and plans in place to comply with security requirements.

It is left up to the Responsible Entity to determine the level of granularity at which to identify a BES Cyber System. For example, the Responsible Entity might choose to view an entire plant control system as a single BES Cyber System or they might choose to view certain components of the plant control system as distinct BES Cyber Systems. The Responsible Entity should take into consideration the operational environment and scope of management when defining the BES Cyber System boundary in order to maximize efficiency in secure operations. Defining the boundary too tightly may result in redundant paperwork and authorizations, while defining the boundary too broadly could make the secure operation of the BES Cyber System difficult to monitor and assess.

BES Reliability Operating Services

The scope of the CIP Cyber Security Standards is restricted to BES Cyber Assets and BES Cyber Systems that would impact the reliable operation of the BES. In order to identify them, Responsible Entities determine whether the BES Cyber Assets perform or support any BES Reliability Operating Service. These services are functions that provide services for the reliable operation of the BES and are based on the functions defined in the NERC Functional Model. This ensures that the initial scope for consideration includes only those BES Cyber Assets and BES Cyber Systems that perform or support BES Reliability Operating Services. The definition of BES Cyber Asset provides the basis for this scoping.

Real-time Operations

One characteristic of the BES Cyber Asset is a real-time scoping characteristic. The time horizon that is significant for BES Cyber Systems and BES Cyber Assets subject to the application of these Version 5 CIP Cyber Security Standards is defined as that which is material to real-time operations for the reliability and operability of the BES. To provide a better defined time horizon than “real-time”, BES Cyber Assets are those cyber assets that, if rendered unavailable, degraded, or misused, would impact the BES Reliability Operating Services within 15 minutes of the activation or exercise of the compromise. This time window must not include in its consideration the activation of redundant BES cyber assets or BES Cyber Systems: from the cyber security standpoint, redundancy does not mitigate cyber security vulnerabilities.

Categorization Criteria

The criteria defined in Attachment 1 are used to categorize BES Cyber Systems and their BES Cyber Assets into impact categories. Requirement 1 only requires the discrete identification of BES Cyber Systems and BES Cyber Assets for those in the High and Medium categories. All other BES Cyber Systems are deemed to be Low Impact.

This general process of categorization of BES Cyber Systems and BES Cyber Assets based on impact on the BES Reliability Operating Services is consistent with risk management approaches for the purpose of application of cyber security controls in the rest of Version 5 cyber security standards.

Requirements and Measures

Rationale – R1:

Cyber Assets and Cyber Systems have varying impact on the reliability and operability of the BES. Once they have been identified, they must be categorized according to their impact so that the appropriate measures can be applied, commensurate with their impact. Attachment I provides a set of "bright-line" criteria that the Responsible Entity must use to categorize these BES Cyber Assets and BES Cyber Systems in accordance with their impact on the BES. These impact categories will be the basis for the application of appropriate requirements in CIP-003-CIP-011.

The configuration of the BES is subject to changes due to new demands and requirements for Bulk Power and to environmental changes and operational events. When changes to the BES are planned, the effect of these changes on the set of identified and categorized BES Cyber Assets and BES Cyber Systems must be analyzed to ensure that the adequate level of protection is still applied to them.

R1. Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in *CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems.* All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification. *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

1.1. Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities is placed into operation, that is intended to be in service for more than 6 calendar months and that causes a change in the identification or categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category.

M1. Acceptable evidence includes, but is not limited to, dated electronic or physical lists identifying the categorization of each of its BES Cyber Assets and BES Cyber Systems in the High and Medium categories as required in R1 and list of changes to the BES (with a date for each change) that cause a change in the identification or categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category. Evidence of categorization of Low Impact BES Cyber Assets and BES Cyber Systems may be demonstrated by the application of the required controls.

Rationale – R2

The lists required by R1 are reviewed once a year to ensure that all BES Cyber Systems required to be categorized have been properly identified and categorized. The mis-categorization or non-categorization of a BES Cyber System or BES Cyber Asset can lead to the application of inadequate or non-existent cyber security controls that can lead to compromise or misuse that can affect the real-time operation of the BES. The CIP Senior Manager's approval ensures proper oversight of the process by the appropriate Responsible Entity personnel.

R2. The Responsible Entity shall have its CIP Senior Manager or delegate approve the identification and categorization required by R1 initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between approvals, even if it has no identified High or Medium BES Cyber Assets or BES Cyber Systems. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Acceptable evidence includes but is not limited to electronic or physical dated and signed records to demonstrate that the Responsible Entity has had its CIP Senior Manager review and update, where applicable, the identification and categorization of BES Cyber Assets and BES Cyber Systems initially upon the effective date of the standard and at least once each subsequent calendar year, not to exceed 15 calendar months between occurrences, even if it has no identified High or Medium BES Cyber Assets or BES Cyber Systems. (R2)

B. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e., another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

CIP-002-5 - Attachment I

Impact Categorization of BES Cyber Assets and BES Cyber Systems

1. High Impact Rating (H)

Each BES Cyber Asset or BES Cyber System that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more BES Reliability Operating Services used by and located at:

1.1. Each Control Center or backup Control Center used to perform the functional obligations of the Reliability Coordinator.

1.2. Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority.

1.3. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator or Transmission Owner that includes control of one or more of the assets identified in criteria 2.2, 2.5, 2.6, 2.7, 2.8, 2.9, 2.10, 2.11 or 2.12 below.

1.4 Each Control Center or backup Control Center used to perform the functional obligations of the Generation Operator that includes control of one or more of the assets identified in criteria 2.1, 2.3, 2.4, or 2.12, below.

2. Medium Impact Rating (M)

Each BES Cyber Asset or BES Cyber System, not included in Section 1, above, that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more BES Reliability Operating Services for:

2.1. Generation with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single Interconnection.

2.2. An aggregate net Reactive Power nameplate rating of 1000 MVAR or greater (excluding those at generation Facilities).

2.3. Each generation Facility that its Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

2.4. Each Blackstart Resource identified in its Transmission Operator's restoration plan.

2.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource

- Up to and including the first interconnection point of the generation unit(s) to be started, or

- up to the point on the Cranking Path where two or more path options exist and including any single failure points in the Cranking Path to and including the first interconnection point of the generation unit(s) to be started, or
- up to and including the point on the Cranking Path where two or more path options exist to two or more independent generation unit(s) to be started as identified in its Transmission Operator's restoration plan.

2.6. Transmission Facilities operated at 500 kV or higher.

2.7. Transmission Facilities operating at 200 kV or higher, but at less than 500 kV, at a single station or substation that is connected to three or more transmission stations or substations and where the "total weighted aggregate value" of all BES Transmission Lines at a single station or substation operated at 200 KV or higher connected to other transmission stations or substations, including incoming and outgoing lines, exceeds a value of 3,000. The following "weight value per line" operated at the associated voltage value of a line will be used for the determination of the total weighted aggregate value.

Voltage Value of a Line	Weight Value per Line
200 kV to 299 kV	700
300 kV to 499 kV	1300

2.8. Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.

In the WECC Region, Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of SOLs and their contingencies for transmission paths listed in the most current Table titled "Major WECC Transfer Paths in the Bulk Electric System".

2.9. Flexible AC Transmission Systems (FACTS), at a single station or substation location, that are identified by its Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs), and their associated contingencies.

In the WECC Region, Flexible AC Transmission Systems (FACTS), at a single station or substation location that are identified by its Reliability Coordinator, Planning Authority or Transmission Planner as critical to the derivation of SOLs and their contingencies for transmission paths listed in the most current Table titled "Major WECC Transfer Paths in the Bulk Electric System."

2.10. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.

2.11. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations.

In the WECC Region, each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system that operates BES Elements that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more System Operating Limits (SOLs) violations for transmission paths listed in the most current Table titled "Major WECC Transfer Paths in the Bulk Electric System" and each RAS listed in the most current table titled " Major WECC Remedial Action Schemes (RAS)."

2.12. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by its regional load shedding program.

2.13. Control Centers not included in High Impact Rating (H), above, that perform (1) the functional obligations of Transmission Operators or Transmission Owners; or (2) generation control centers that control 300 MW or more of generation.

3. Low Impact Rating (L)

All other BES Cyber Assets and BES Cyber Systems not categorized in Section 1 as having a High Impact Rating (H) or Section 2 Medium Impact Rating (M).

Guidelines and Technical Basis

CIP-002-5 requires that applicable Responsible Entities categorize their BES Cyber Systems and BES Cyber Assets according to the criteria in Attachment 1. A BES Cyber Asset includes in its definition "…that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more **BES Reliability Operating Services**." The new term BES Reliability Operating Service is a defined NERC Glossary term that in turn includes a number of defined named BES Reliability Operating Services. These named, defined services include:

Dynamic Response to BES conditions
Balancing Load and Generation
Controlling Frequency (Real Power)
Controlling Voltage (Reactive Power)
Managing Constraints
Monitoring & Control
Restoration of BES
Situational Awareness
Inter-Entity Real-Time Coordination and Communication

Responsibility for the reliable operation of the BES is spread across all Entity Registrations. Each entity registration has its own special contribution to reliable operations and the following discussion helps identify which entity registration performs which reliability operations service, which determines what each entity needs to address with their CIP program. The following provides guidance for Responsible Entities to determine applicable Reliability Operations Services according to their Function Registration type.

Entity Registration	RC	BA	TOP	TO	DP	GOP	GO
Dynamic Response		X	X	X	X	X	X
Balancing Load & Generation	X	X	X	X	X	X	X
Controlling Frequency		X				X	X
Controlling Voltage			X	X	X		X
Managing Constraints	X		X			X	
Monitoring and Control			X			X	
Restoration			X			X	
Situation Awareness	X	X	X			X	
Inter-Entity coordination	X	X	X	X		X	X

Dynamic Response

The Dynamic Response Operating Service includes those actions performed by BES elements or subsystems which are automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition. The types of dynamic responses that should be considered as potentially having an impact on the BES are:

- Spinning reserves (contingency reserves)
  - Providing actual reserve generation when called upon (GO,GOP)
  - Monitoring that reserves are sufficient (BA)
- Governor Response
  - Control system used to actuate governor response (GO)
- Protection Systems (transmission & generation)
  - Lines, buses, x-formers, generators (TO, GO)
  - Zone protection for breaker failure (TO)
  - Breaker protection (TO)
  - Current, frequency, speed, phase (TO, GO)
- Special Protection Systems or Remedial Action Schemes
  - Sensors, relays & breakers, possibly software (TO)
- Under and Over Frequency relay protection (includes automatic load shedding)
  - Sensors, relays & breakers (DP)
- Under and Over Voltage relay protection (includes automatic load shedding)
  - Sensors, relays & breakers (DP)
- Power System Stabilizers (GO)

Balancing Load and Generation

The Balancing Load and Generation Operations Service includes activities, actions and conditions necessary for monitoring and controlling generation and load in the operations planning horizon and in real-time. Aspects of the Balancing Load and Generation function include, but are not limited to:

- Calculation of Area Control Error (ACE)
  - Field data sources (real time tie flows, frequency sources, time error, etc) (TO, TOP)
  - Software used to perform calculation (BA) (RC)

- Demand Response
  - Ability to identify load change need (BA)
  - Ability to implement load changes (TOP,DP)
- Manually Initiated Load shedding
  - Ability to identify load change need (BA)
  - Ability to implement load changes (TOP, DP)
- Non-spinning reserve (contingency reserve)
  - Know generation status, capability, ramp rate, start time (GO, BA)
  - Start units and provide energy (GOP)

Controlling Frequency (Real Power)

The Controlling Frequency Operations Service includes activities, actions and conditions which ensure, in real time, that frequency remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Frequency function include, but are limited to:

- Generation Control (such as AGC)
  - ACE, current generator output, ramp rate, unit characteristics (BA, GOP, GO)
  - Software to calculate unit adjustments (BA)
  - Transmit adjustments to individual units (GOP)
  - Unit controls implementing adjustments (GOP)
- Regulation (regulating reserves)
  - Frequency source, schedule (BA)
  - Governor control system (GO)

Controlling Voltage (Reactive Power)

The Controlling Voltage Operations Service includes activities, actions and conditions which ensure, in real time, that voltage remains within bounds acceptable for the reliability or operability of the BES. Aspects of the Controlling Voltage function include, but are not limited to:

- Automatic Voltage Regulation (AVR)
  - Sensors, stator control system, feedback (GO)
- Capacitive resources
  - Status, control (manual or auto), feedback (TOP, TO,DP)

- Inductive resources (transformer tap changer, or inductors)
  - Status, control (manual or auto), feedback (TOP,TO,DP)
- Static VAR Compensators (SVC)
  - Status, computations, control (manual or auto), feedback (TOP, TO,DP)

Managing Constraints

Managing Constraints includes activities, actions and conditions that are necessary to ensure that elements of the BES operate within design limits and constraints established for the reliability and operability of the BES. Aspects of the Managing Constraints include, but are not limited to:

- Available Transfer Capability (ATC) (TOP)
- Interchange schedules (TOP, RC)
- Generation re-dispatch and unit commit (GOP)
- Identify and monitor SOL's & IROL's (TOP, RC)
- Identify and monitor Flowgates (TOP, RC)
-

Monitoring and Control

Monitoring and Control includes those activities, actions and conditions that provide monitoring and control of BES elements. An example aspect of the Control and Operation function is:

- All methods of operating breakers and switches
  - SCADA (TOP, GOP)
  - Substation automation (TOP)

Restoration of BES

The Restoration of BES Operations Service includes activities, actions and conditions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance. Aspects of the Restoration of BES function include, but are not limited to:

- Restoration including planned cranking path
  - Through black start units (TOP, GOP)
  - Through tie lines (TOP, GOP)
- Off-site power for nuclear facilities. (TOP)
- Coordination

Situational Awareness

The Situational Awareness function includes activities, actions and conditions necessary to assess the current condition of the BES and anticipate effects of planned and unplanned changes to conditions. Aspects of the Situation Awareness function include, but are not limited to:

- Monitoring and alerting (such as EMS alarms) (TOP, GOP, RC,BA)
- Change management (TOP,GOP,RC,BA)
- Current Day & Next Day planning (TOP)
- Contingency Analysis (RC)
- Frequency monitoring (BA, RC)

Inter-Entity Coordination and Communication

The Inter-Entity coordination and communication function includes activities, actions and conditions necessary for the coordination and communication between Responsible Entities to ensure the reliability and operability of the BES. Aspects of the Inter-Entity Coordination and Communication function include, but are not limited to:

- Scheduled interchange (BA,TOP,GOP,RC)
- Facility operational data and status (TO, TOP, GO, GOP, RC, BA)
- Operational directives (TOP, RC)

Applicability to Distribution Providers and Load Serving Entities

It is expected that only Distribution Providers that own or operate facilities that qualify in the Applicability section will be subject to these Version 5 Cyber Security Standards. Distribution Providers that do not own or operate any facility that qualifies are not subject to these standards. The qualifications are based on the requirements for registration as a Distribution Provider and on the requirements applicable to Distribution Providers in NERC standard EOP-005.

Similarly, it is expected that only Load Serving Entities that own or operate facilities that qualify in the Applicability section will be subject to these Version 5 Cyber Security Standards. These qualifications are based on the requirements for registration as a Load Serving Entity.

Requirement R1:

R1 implements the methodology for the categorization of BES Cyber Systems and BES Cyber Assets according to their impact on the BES. Using the traditional risk assessment equation, it reduces the measure of the risk to an impact (consequence) assessment, assuming the vulnerability index of 1 (the systems are assumed to be vulnerable) and a probability of threat

of 1 (100%). The criteria in attachment 1 provide a measure of the impact on the reliability and operability of the BES.

Responsible Entities are required to identify and categorize those systems that have high and medium impact. Other BES Systems and BES Cyber Assets are deemed to be low impact.

Attachment 1

Overall Application

In the application of the criteria in Attachment 1, Responsible Entities should note that the approach used is based on the impact of the BES Cyber System. While the criteria are based on the scope of the BES asset, this is used here as a measure of the impact of the BES Cyber System for the purpose of categorization.

- When the drafting team uses the term "Facilities", it leaves some latitude to Responsible Entities to determine included Facilities. The term Facility is defined in the NERC Glossary of Terms as "A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)." In most cases the criteria refer to a group of Facilities in a given location that support the reliable operation of the BES. For example, for Transmission assets, the substation may be designated as the group of Facilities. However, in a substation that includes equipment that supports BES operations along with equipment that only supports Distribution operations, the Responsible Entity may be better served to consider only the group of Facilities that supports BES operation. In that case, the Responsible Entity may designate the group of Facilities by location, with qualifications on the group of Facilities that support reliable operation of the BES, as the Facilities that are subject to the criteria for categorization of BES Cyber Systems . Generation Facilities are separately discussed in the Generation section below.
- In certain cases, a BES Cyber System may be categorized by meeting multiple criteria. In such cases, the Responsible Entity may choose to document all criteria result in the categorization. This will avoid inadvertent miscategorization when it no longer meets one of the criteria, but still meets another.
- A BES Cyber System should be listed by only one Responsible Entity. Where there is joint ownership, it is advisable that the owning Responsible Entities should formally agree on the designated Responsible Entity responsible for compliance with the standards.

High Impact

This category includes those BES Cyber Systems, used by and at Control Centers, that perform the functional obligations of the Reliability Coordinator (RC), Balancing Authority (BA), Transmission Operator (TOP), Transmission Owner (TO) or Generation Operator (GOP), as defined in the NERC Functional Model. While those entities that have been registered as the above named Functional Entities are specifically referenced, it must be noted that there may agreements where some of the functional obligations of a Transmission Operator may be delegated to a Transmission Owner (TO). In these cases, BES Cyber Systems at these TO Control

Centers that perform these functional obligations must be subject to categorization as High Impact. The criteria notably specifically emphasize functional obligations, not necessarily the RC, BA, TOP or GOP facilities.

Medium Impact

Generation

The criteria in Attachment 1, Medium Impact that generally apply to Generation Owner and Operator (GO/GOP) Registered Entities are parts 2.1, 2.3, 2.4, 2.5, 2.11 and 2.13.

- Part 2.1 designates as medium impact those BES Cyber Systems that impact generation with a net Real Power capability exceeding 1500 MW. The 1500 MW criterion is sourced partly from the Contingency Reserve requirements in NERC standard BAL-002 whose purpose is "to ensure the Balancing Authority is able to utilize its Contingency Reserve to balance resources and demand and return Interconnection frequency within defined limits following a Reportable Disturbance". In particular, it requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." The drafting team used 1500 MW as a number derived from the most significant Contingency Reserves operated in various BAs in all regions.

  In the use of net Real Power capability, the drafting team sought to use a value that could be verified through existing requirements as proposed by NERC standard MOD-024 and current development efforts in that area.

  By using 1500 MW as a bright-line, the intent of the drafting team was to ensure that BES Cyber Systems with common mode vulnerabilities that could result in the loss of generation capability higher than 1500 MW are adequately protected.

  The drafting team also used additional time and value parameters to ensure the bright-lines and the values used to measure against them were relatively stable over the review period. Hence, where multiple values of net Real Power capability could be used for the Facilities' qualification against these bright-lines, the highest value was used.

- In part 2.3, the drafting team sought to ensure that BES Cyber Systems for those generation Facilities that have been designated by the Planning Coordinator as necessary to avoid BES Adverse Reliability Impacts in the long term planning horizon are categorized as Medium Impact. These Facilities may be designated as "Reliability Must Run" and this designation is distinct from those generation Facilities designated as "must run" for market stabilization purposes. Because the use of the term "must run" creates some confusion in many areas, the drafting team chose to avoid using this term and instead drafted the requirement in more generic reliability language. In particular, the focus on preventing an Adverse Reliability Impact dictates that these units are designated as must run for reliability purposes beyond the local area. Those units designated as must run for voltage support in

the local area would not generally be given this designation. In cases where there is no designated Planning Coordinator, the Transmission Planner is included as the Registered Entity that performs this designation.

In the specification of the "long-term planning horizon" in this criterion, the drafting team sought to ensure that such BES facilities would be designated in the time horizon described in the NERC document "Time Horizons", which defines long-term planning horizon as "a planning horizon of one year or longer".

If it is determined through system studies that a unit must run in order to preserve the reliability of the BES, such as due to a category C3 contingency as defined in TPL-003 or a category D contingency as defined in TPL-004, then BES Cyber Systems for that unit must be categorized as Medium Impact.

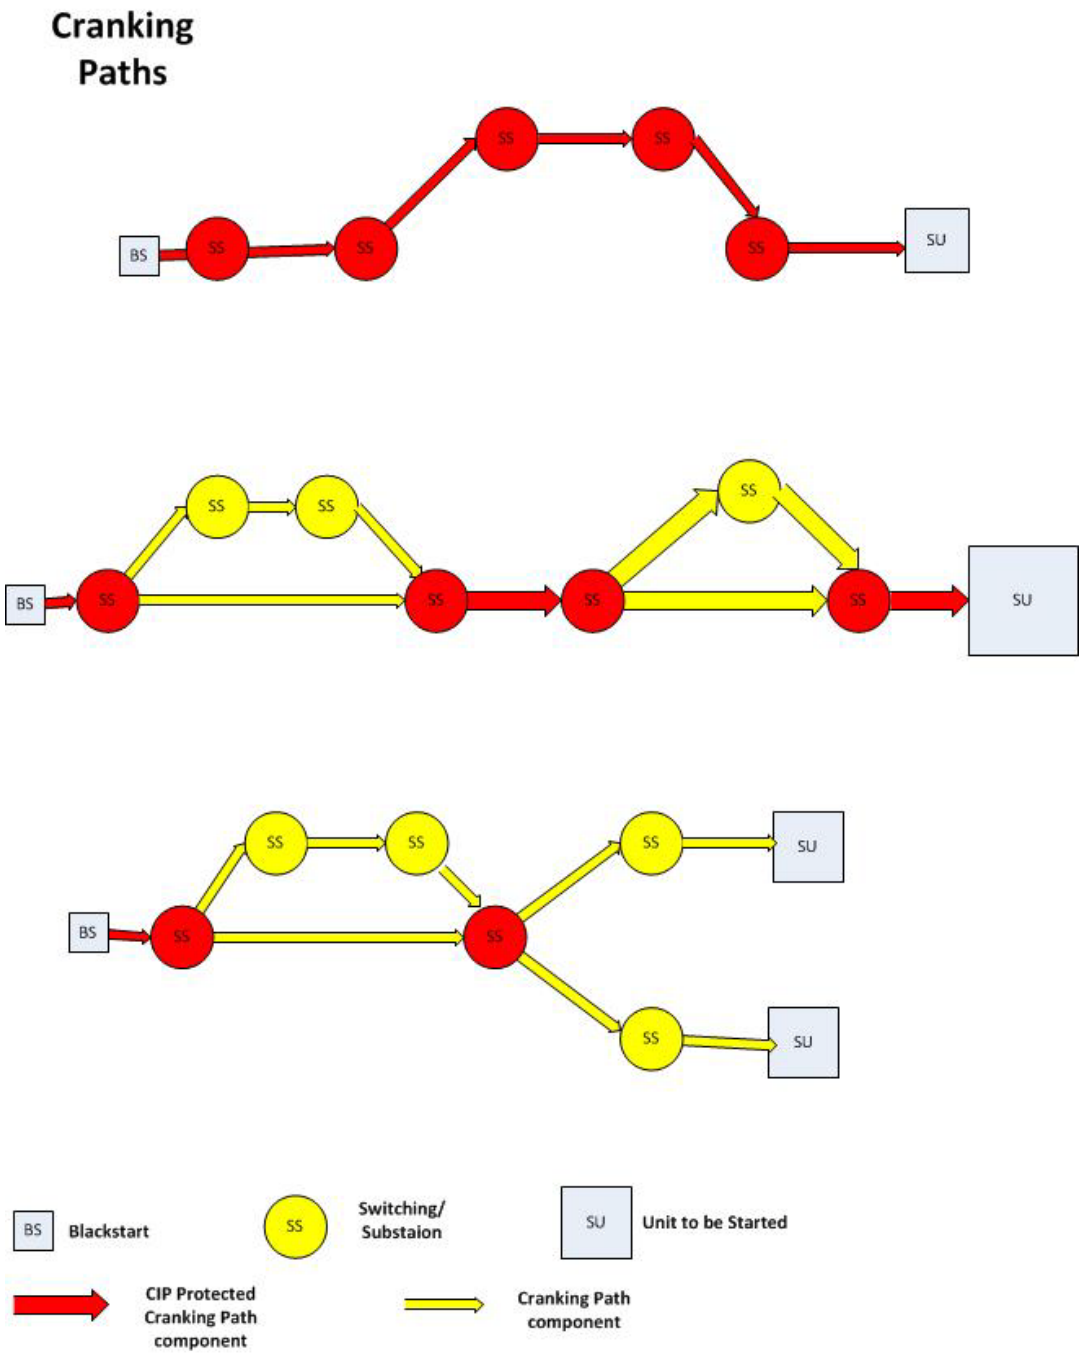
- In part 2.4, BES Cyber Systems for generation resources that have been designated as Blackstart Resources in the Transmission Operator's restoration plan are categorized as Medium Impact. NERC standard EOP-005-2 requires the Transmission Operator to have a Restoration Plan and to list its Blackstart Resources in its plan as well as requirements to test these Resources. This criterion designates only those generation Blackstart Resources that have been designated as such in the Transmission Operator's restoration plan. The glossary term Blackstart Capability Plan has been retired. While the definition of Blackstart Resource includes the fact that it is in a Transmission Operator's Restoration Plan, the drafting team included the term in the criterion for clarity.

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in NERC standard EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 2.5 categorizes BES Cyber Systems for Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource to the first interconnection point of the generation unit(s) to be started, as identified in the Transmission Operator's restoration plan, with the qualifications stated in the requirement part. This criterion is sourced from requirements in NERC standard EOP-005-2, which requires the Transmission Operator to include in its Restoration Plan the Cranking Paths and initial switching requirements from the Blackstart Resource and the unit(s) to be started. The drafting team further qualified the Facilities to be designated as subject to BES Cyber System categorization as only those in the Cranking Path up to the point where two or more paths exist to the units to be started and subject to the qualifications in the requirement part.

  Distribution Providers should note that they may have BES Cyber Systems that must be categorized as Medium Impact if they have facilities listed in the Transmission Operator's Restoration Plan.

The following illustrates the parts of the Cranking Path that are subject to CIP Cranking Path criterion.



- Part 2.11 categorizes BES Cyber Systems for Special Protection Systems and Remedial Action Schemes as Medium Impact. Special Protection Systems and Remedial Action Schemes may be implemented to prevent disturbances that would result in exceeding IROLs if they do not provide the function required at the time it is required or if it

operates outside of the parameters it was designed for. Generation Owners and Operators which own BES Cyber Systems for such systems and schemes must designate them as Medium Impact.

- Part 2.13 categorizes as Medium Impact BES Cyber Systems used by and at Control Centers that perform the functional obligations of the Generation Operator for an aggregate generation of 300 MW or higher. The value of 300 MW is the same value used for UFLS and UVLS. This ensures that Control Centers for significant impact are included. Smaller Control Centers that qualify for the definition of generation Control Centers, but which are really controlling local generation for small downstream generation facilities and do not meet the 300 MW threshold are categorized as Low.

Transmission

Parts 2.1, 2.2, 2.5-2.13 in Attachment 1 are the criteria that are applicable to Transmission Owners and Operators. In many of the criteria, the impact threshold is defined as the capability of the failure or compromise of a system to result in exceeding one or more Interconnection Reliability Operating Limits (IROLs). For the WECC region where IROLs are not defined, alternative criteria are defined.

- Part 2.1 designates as medium impact those BES Cyber Systems that impact generation with a net Real Power capability exceeding 1500 MW. In the case of BES Cyber Systems and BES Cyber Assets owned by Transmission Owners and Operators, this part identifies as Medium Impact those BES Cyber Systems for Transmission Facilities that provide the generation interconnection for Generation of 1500 MW or more to the Transmission system. The intent is to ensure the availability of Facilities necessary to support those generation facilities.

- Part 2.2 includes BES Cyber Systems for those Facilities in Transmission systems that provide reactive resources to enhance and preserve the reliability of the BES. The nameplate value is used here because there is no NERC requirement to verify actual capability of these Facilities. The value of 1000 MVARs used in this criterion is a value deemed reasonable for the purpose of determining criticality.

- In Part 2.5, the intent is to ensure that BES Cyber Systems for the Cranking Paths and other BES Transmission Facilities required to support the Transmission Operator's restoration plan required by EOP-005-2 receive consideration for protection from cyber threats. Transmission Owners and Operators own and operate a large number of these Facilities. EOP-005-2 specifies Facilities that comprise the "Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started".

  Regarding concerns of communication to BES Asset Owners and Operators of their role in the Restoration Plan, Transmission Operators are required in EOP-005-2 to "provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan."

- Part 2.6 includes BES Cyber Systems for any Transmission Facility at a substation operated at 500 kV or higher. While the drafting team felt that Facilities operated at 500 kV or higher did not require any further qualification for their role as components of the backbone on the Interconnected BES, Facilities in the lower EHV range should have additional qualifying criteria for inclusion in the Medium Impact category.

  It must be noted that if the collector bus for a generation plant (i.e. the plant is smaller in aggregate than the threshold set for generation in Part 1.1) is operated at 500kV, the collector bus should be considered a Generation Interconnection Facility and not a Transmission Facility, according to the "Final Report from the Ad Hoc Group for Generation Requirements at the Transmission Interface". This collector bus would not be a facility for a Medium Impact BES Cyber System because it doesn't significantly affect the 500kV Transmission grid; it only affects a plant which is below the generation threshold.

- Part 2.7 includes BES Cyber Systems for facilities at the lower end of BES Transmission with qualifications for inclusion if they are deemed highly likely to have significant impact on the BES. While the criterion has been specified as part of the rationale for requiring protection for significant impact on the BES, the drafting team included, in this criterion, additional qualifications that would ensure the required level of impact to the BES. The drafting team:

  - Excluded radial facilities that would only provide support for single generation facilities.
  - Specified interconnection to at least three transmission stations or substations to ensure that the level of impact would be appropriate.

  The total aggregated weighted value of 3,000 was derived from weighted values related to three connected 345 kV lines and five connected 230 kV lines at a transmission station or substation. The total aggregated weighted value is used to account for the true impact to the BES, irrespective of line kV rating and mix of multiple kV rated lines.

  Additionally, in NERC's document "Integrated Risk Assessment Approach – Refinement to Severity Risk Index", Attachment 1, the report used an average MVA line loading based on kV rating:

  - 230 kV –> 700 MVA
  - 345 kV –> 1,300 MVA
  - 500 kV –> 2,000 MVA
  - 765 kV –> 3,000 MVA

- Parts 2.8 and 2.9 include BES Cyber Systems for those Transmission Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as

specified by FAC-014-2, **Establish and Communicate System Operating Limits**, R5.1.1 and R5.1.3.

Alternate thresholds are used for WECC, where IROLs are not used.

- Part 2.10 is sourced from the NUC-001 NERC standard for the support of Nuclear Facilities. NUC-001 ensures that reliability of NPIR's are ensured through adequate coordination between the Nuclear Generator Owner/Operator and its Transmission provider "for the purpose of ensuring nuclear plant safe operation and shutdown". In particular, there are specific requirements to coordinate physical and cyber security protection of these interfaces.

- Part 2.11 designates as Medium Impact those BES Cyber Systems for those Special Protection Systems (SPS), Remedial Action Schemes (RAS), or automated switching systems installed to ensure BES operation within IROLs. The degradation, compromise or unavailability of these BES Cyber Systems would result in exceeding IROLs if they fail to operate as designed. By the definition of IROL, the loss or compromise of any of these have Wide Area impacts.

  For the WECC region, alternative thresholds are defined because IROLs are not defined for the region.

- Part 2.12 designates as Medium Impact those BES Cyber Systems for systems or Facilities that are capable of performing automatic load shedding, without human operator initiation, of 300 MW or more. The SDT spent considerable time discussing the wording of criterion 2.13, and chose the term "Each" to represent that the criterion applied to a discrete system or Facility. In the drafting of this criterion, the drafting team sought to include only those systems that did not require human operator initiation, and targeted in particular those Under Frequency Load Shedding (UFLS) facilities and systems and Under Voltage Load Shedding (UVLS) facilities and systems that would be implemented as part of a regional load shedding requirement to prevent Adverse Reliability Impact. These include automated Under Frequency Load Shedding systems or Under Voltage Load Shedding Systems that are capable of load shedding 300 MW or more. It should be noted that those qualifying systems which require a human operator to arm the system, but once armed, trigger automatically, are still to be considered as not requiring human operator initiation and should be designated as Medium Impact.

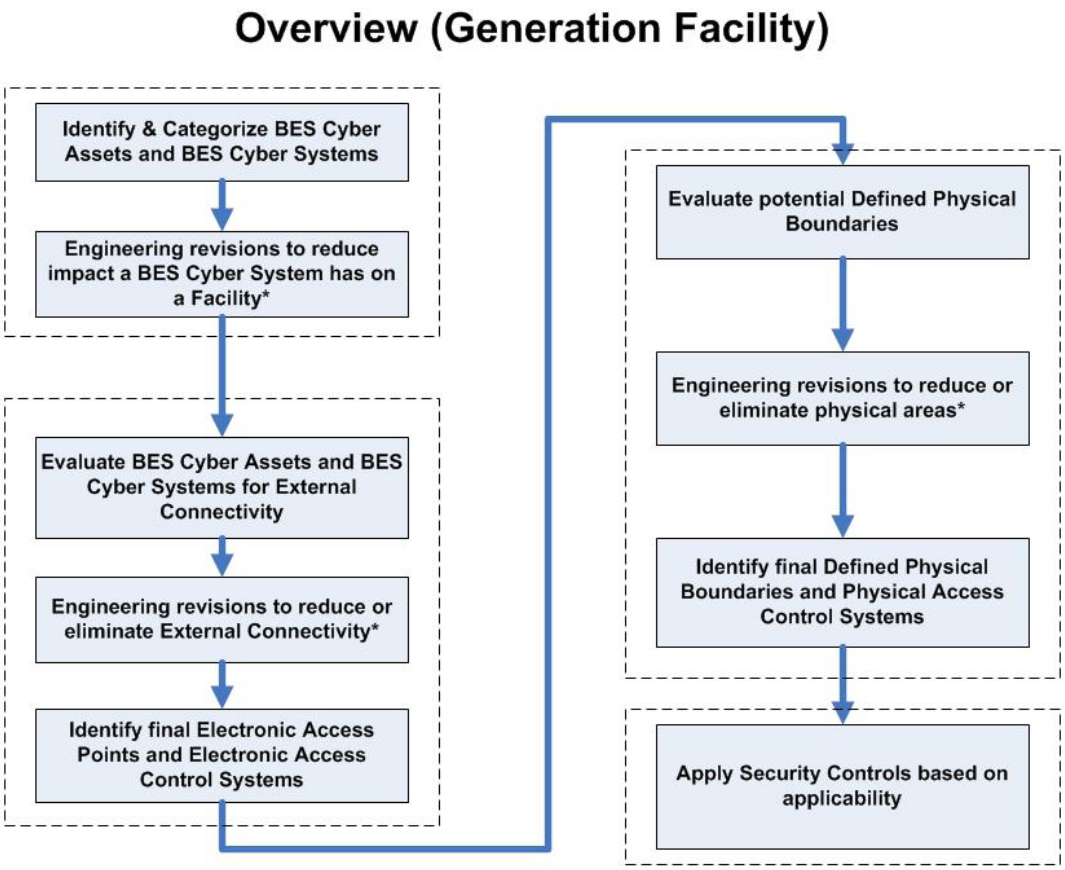
  Within an operational environment the drafting team understands that the real-time impact to the Bulk Electric System of a loss of load, or the equivalent amount of generation, will be similar, with loss of load resulting in a frequency high condition and a loss of generation resulting in a frequency low condition. This particular threshold (300 MW) was provided in CIP version 1. The SDT believes that the threshold should be lower than the 1500MW generation requirement since it is specifically addressing UVLS and UFLS, which are last ditch efforts to save the Bulk Electric System and hence requires a lower threshold.

In ERCOT, the Load acting as a Resource ("LaaR") Demand Response Program is not part of the regional load shedding program, but an ancillary services market.

- Part 2.13 categorizes as Medium Impact those cyber systems used by and at Transmission Operators and Owners Control Centers not already categorized as High Impact.

Use Case: CIP Process Flow

The following CIP use case process flow for a generator Operator/Owner was provided by a participant in the development of the Version 5 standards and is provided here as an example of a process used to identify and categorize BES Cyber Systems and BES Cyber Assets; review, develop and implement strategies to mitigate overall risks; and apply applicable security controls.



* - Engineering revisions will need to be reviewed for cost justification, operational\safety requirements, support requirements, and technical limitations.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-4

3. Purpose: Standard CIP-003-4 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-003-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-4 Requirement R2.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Requirement R2 applies to all Responsible Entities, including Responsible Entities which have no Critical Cyber Assets. Modified the personnel identification information requirements in R5.1.1 to include name, title, and the information for which they are responsible for authorizing access (removed the business phone information). Changed compliance monitor to Compliance	

		Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees	
3	3/31/10	Approved by FERC	
4	1/24/11	Update version from "3" to "4". Approved by the NERC Board of Trustees	Update to conform to changes to CIP-002-4 (Project 2008-06)
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-5

3. Purpose: Standard CIP-003-5 requires that Responsible Entities have minimum security management controls in place to protect BES Cyber Assets and BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-003-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Except for R1, R5 and R6, Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems

5. Background:

Standard CIP-003-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural

controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with

a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale – R1:

The identification and documentation of the single CIP Senior Manager and any delegations ensures that there is clear authority and ownership for the CIP program within an organization, as called for in Blackout Report Recommendation 43.

In FERC Order 706, paragraph 296, it requests that the SDT consider whether the single senior manager should be a corporate officer or equivalent. The SDT believes that the requirement that the senior manager have "the overall authority and responsibility for leading and managing implementation of the requirements within this set of standards" ensures that the senior manager is of the sufficient position in the responsible entity to ensure that cyber security receives the prominence that is necessary. In addition, given the range of business models for responsible entities, from municipal, cooperative, federal agencies, investor owned utilities, privately owned utilities, and everything in between, the SDT believes that requiring the senior manager to be a "corporate officer or equivalent" would be extremely difficult to interpret and enforce on a consistent

R1. Each Responsible Entity shall identify, by name, a CIP Senior Manager. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Evidence may include, but is not limited to:

- A dated and signed document from a high level official designating the name of the individual identified as the CIP Senior Manager
- A dated organizational chart designating the name of the individual identified as the CIP Senior Manager.

Rationale – R2:

One or more security policies enable effective implementation of the standard's requirements. The purpose of policies is to provide a management and governance

R2 Each Responsible Entity shall implement one or more documented cyber security policies that represents the Responsible Entity's commitment to the protection of its BES Cyber Systems and addresses the following topics: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

- **1.1.** Personnel Security
- **1.2.** Electronic Security Perimeters
- **1.3.** Remote Access
- **1.4.** Physical Security
- **1.5.** System Security
- **1.6.** Incident Response
- **1.7.** Recovery Plans
- **1.8.** Configuration Change Management
- **1.9.** Information Protection
- **1.10.** Provisions for declaring and responding to CIP Exceptional Circumstances

M2. Evidence may include, but is not limited to:

1. One or more documented cyber security policies, and
2. Records that indicate the required ten topics were implemented.

Rationale – R3:

Annual review and approval of the cyber security policy ensures that the policy is kept up-to-date and periodically reaffirms management's commitment to the

R3. Each Responsible Entity shall review each of its cyber security policies and obtain the approval of its CIP Senior Manager, initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between reviews and between approvals. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Evidence may include, but is not limited to:

1. Revision history, records of review, or workflow evidence from a document management system that indicate annual review of each cyber security policy, and
2. A dated signature by the CIP Senior Manager for each cyber security policy that indicates annual approval.

Rationale – R4:

The intent of the SDT is to ensure that the responsible entity takes sufficient measures to make its cyber security policy available and accessible to personnel. It is not the intent of the SDT for the responsible entity to have the burden of proving that each and every individual can access the document.

R4. Each Responsible Entity shall make individuals who have access to BES Cyber Systems aware of elements of its cyber security policies appropriate for their job function. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Evidence may include, but is not limited to:

- Policies are accessible on the corporate Intranet site
- Documented records that policies have been provided to contactors where access to BES Cyber Systems is authorized
- Policies are posted on company bulletin boards
- Policies are accessible to individuals with all types of job functions that have access to BES Cyber Systems
- Dated training records to show that individuals have received periodic training on necessary elements of the cyber security policy

Rationale – R5:

In FERC Order 706, paragraphs 379 and 381, the Commission notes that Recommendation 43 of the 2003 Blackout Report calls for "clear lines of authority and ownership for security matters." With this in mind, the Standard Drafting Team has sought to provide clarity in the requirement for delegations in order that this line of authority is clear and apparent from the documented delegations.

R5 The CIP Senior Manager shall be responsible for all approvals and authorizations required in the CIP standards. The CIP Senior Manager may delegate the authority for any approvals and authorizations required in the CIP standards with the exception of the approval of the Cyber Security Policy required in CIP-003-5 R3. The authority for subsequent delegations may also be delegated. These delegations shall be documented (by position or name of the delegate), dated, and approved and shall specify the authority that is being delegated. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M5. Evidence may include, but is not limited to:

- A dated document, signed by the CIP Senior Manager listing personnel (by title) who are delegated the authority to approve or authorize specifically identified items (i.e. substation maintenance manager may authorize unescorted physical access to substation control houses), or
- A dated document, signed by the CIP Senior Manager listing individuals who are delegated the authority to approve or authorize specific actions by requirement (i.e., 'name of individual' who may approve CIP-002-5 R3), or
- A dated document, signed by the CIP Senior Manager delegating to a named individual the authority for all approvals in CIP-002-5 and CIP-004-5 through CIP-011-1 as well as the authority to approve subsequent delegations; a dated document, signed by the previous named individual delegating to a 3rd named individual the authority for all approvals in CIP-004-5 through CIP-011-1 as well as the authority to approve subsequent delegations; and a dated document, signed by the 3rd named individual delegating to each of the plant managers (by title) the authority for all approvals and authorizations required in CIP-004-5 through CIP-011-1 for each of the their plants, respectively.

Rationale – R6:

The intent of the SDT is to ensure that delegations are kept up-to-date and that individuals do not assume undocumented authoritv.

R6. Changes to the CIP Senior Manager and any delegations shall be documented within thirty calendar days of the change[2]. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M6. Evidence may include, but is not limited to, dated documentation that includes the name of the CIP Senior Manager or documentation that includes the names or positions of any delegations, that is current to within 30 days with the name or position of anyone who performed a required approval or authorization.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity.
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- For NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.

[2] Delegations do not need to be reinstated with a change in the CIP Senior Manager position or other position with delegation authority.

Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.

If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	**N/A**	**N/A**	**N/A**	The Responsible Entity has not identified, by name, a single senior management official ("the CIP Senior Manager") with overall authority and responsibility for leading and managing implementation of the requirements within the CIP group of standards.
R2	**Operations Planning**	**Medium**	N/A	N/A	The Responsible Entity has implemented at least one cyber security policy, but has failed to address one of the required parts 2.1 to 2.10.	The Responsible Entity has not implemented any cyber security policy, Or The Responsible Entity has implemented at least one policy but has failed to address two or more of the required parts 2.1 to 2.10.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	**Operations Planning**	**Lower**	N/A	N/A	The Responsible Entity has reviewed its cyber security policy or policies, but not all of them have been approved by the CIP Senior Manager within the required time period.	The Responsible Entity has not reviewed the cyber security policy or policies and the CIP Senior Manager has not approved all of them within the required time period.
R4	**Operations Planning**	**Lower**	N/A	N/A	The Responsible Entity has made some but not all individuals who have access to BES Cyber Systems aware of elements of the cyber security policies appropriate for their job function.	The Responsible Entity has not made any individuals who have access to BES Cyber Systems aware of elements of the cyber security policies appropriate for their job function.
R5	**Operations Planning**	**Lower**	N/A	The Responsible Entity failed to document the approval and authorization of one delegation (by position or name of the delegate) as required.	The Responsible Entity failed to document the approval and authorization of two delegations (by position or name of the delegate) as required.	The Responsible Entity failed to document the approval and authorization of three or more delegations (by position or name of the delegate) as required.

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R6	**Operations Planning**	**Lower**	N/A	NA	Change to one delegation was not documented within 30 calendar days of the effective date.	A change to the CIP Senior Manager, Or more than one delegation was not documented within 30 calendar days of the effective date.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Requirement R2:

The number of policies and their specific language would be guided by a Responsible Entity's management structure and operating conditions. Policies might be included as part of a general information security program for the entire organization, or as components of specific programs. The cyber security policy must cover in sufficient detail the ten topical areas required by CIP-003-5 R2. The Responsible Entity has the flexibility to develop a single comprehensive cyber security policy covering these topics or may choose to develop a single high-level umbrella policy and provide additional policy detail in lower level documents in its documentation hierarchy. In this case of a high-level umbrella policy, it would be expected that the entity provide the high-level policy as well as the additional documentation in order to prove compliance with CIP-003-5 R2. The Responsible Entity should consider the following for each of the required topics in its cyber security policy:

2.1 Personnel Security

- Organization position on acceptable background investigations
- Identification of possible disciplinary action for violating this policy
- Account Management

2.2 Electronic Security Perimeters

- Organization stance on use of wireless networks
- Identification of acceptable authentication methods
- Identification of trusted and untrusted resources
- Monitoring and logging of ingress and egress at Electronic Access Points

2.3. Remote Access

- Maintaining up-to-date anti-malware software before initiating interactive remote access
- Maintaining up-to-date patch levels for operating system and applications used to initiate the interactive remote access before initiating interactive remote access
- Disabling VPN “split-tunneling” or “dual-homed” workstations before initiating interactive remote access
- For vendors, contractors, or consultants: include language in contracts that requires adherence to the Responsible Entity’s interactive remote access controls

2.4 Physical Security

- Strategy for protecting cyber assets from unauthorized physical access
- Acceptable physical access control methods
- Monitoring and logging of physical ingress and egress

2.5 System Security

- Strategies for system hardening
- Acceptable methods of authentication and access control
- Password policies including length, complexity, enforcement, prevention of brute force attempts
- Monitoring and logging of BES Cyber Systems

2.6 Incident Response

- Recognition of Cyber Security Incidents
- Appropriate notifications upon discovery of an incident
- Obligations to report Cyber Security Incidents

2.7 Recovery Plans

- Availability of spare components
- Availability of system backups

2.8 Configuration Change Management

- Initiation of change requests
- Approval of changes
- Break-fix processes

2.9 Information Protection

- Information access control methods
- Notification of unauthorized information disclosure
- Information access on a need-to-know basis

2.10 Provisions for CIP Exceptional Circumstances

- Processes to invoke special procedures in the event of a CIP Exceptional Circumstance
- Processes to allow for exceptions to policy that do not violate CIP requirements

The SDT has removed requirements relating to exceptions to Responsible Entity's security policies since it considers this a general management issue that is not within the scope of a compliance requirement. The SDT considers this an internal policy requirement and not a reliability requirement. However, the SDT encourages Responsible Entities to continue this practice as a component of its cyber security policy

Requirement R3:

In this and all subsequent required approvals in the NERC CIP Standards, the Responsible Entity may elect to use hardcopy or electronic approvals to the extent that there is sufficient evidence to ensure the authenticity of the approving party.

Requirement R5:

As indicated in the rationale for CIP-003-5 R5, this requirement is intended to demonstrate a clear line of authority and ownership for security matters. The intent of the Standard Drafting Team was not to impose any particular organizational structure, but rather the Responsible Entity should have significant flexibility to adapt this requirement to their existing organizational structure. As detailed in the examples provided in the Measure, this requirement may be met through a single delegation document or through multiple delegation documents. The Responsible Entity can make use of the delegation of the delegation authority itself to increase the flexibility in how this applies to their organization. In such a case, delegations may exist in numerous documentation records as long as the collection of these documentation records provides a clear line of authority back to the CIP Senior Manager. In addition, the CIP Senior Manager could also choose not to delegate any authority and meet this requirement without such delegation documentation.

A. Introduction

1. Title: Cyber Security — Personnel & Training

2. Number: CIP-004-4

3. Purpose: Standard CIP-004-4 requires that personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness. Standard CIP-004-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-004-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-004-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Awareness — The Responsible Entity shall establish, document, implement, and maintain a security awareness program to ensure personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets receive on-going reinforcement in sound security practices. The program shall include security awareness reinforcement on at least a quarterly basis using mechanisms such as:

- Direct communications (e.g., emails, memos, computer based training, etc.);

- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

R2. Training — The Responsible Entity shall establish, document, implement, and maintain an annual cyber security training program for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. The cyber security training program shall be reviewed annually, at a minimum, and shall be updated whenever necessary.

R2.1. This program will ensure that all personnel having such access to Critical Cyber Assets, including contractors and service vendors, are trained prior to their being granted such access except in specified circumstances such as an emergency.

R2.2. Training shall cover the policies, access controls, and procedures as developed for the Critical Cyber Assets covered by CIP-004-4, and include, at a minimum, the following required items appropriate to personnel roles and responsibilities:

R2.2.1. The proper use of Critical Cyber Assets;

R2.2.2. Physical and electronic access controls to Critical Cyber Assets;

R2.2.3. The proper handling of Critical Cyber Asset information; and,

R2.2.4. Action plans and procedures to recover or re-establish Critical Cyber Assets and access thereto following a Cyber Security Incident.

R2.3. The Responsible Entity shall maintain documentation that training is conducted at least annually, including the date the training was completed and attendance records.

R3. Personnel Risk Assessment —The Responsible Entity shall have a documented personnel risk assessment program, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements, for personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets. A personnel risk assessment shall be conducted pursuant to that program prior to such personnel being granted such access except in specified circumstances such as an emergency.

The personnel risk assessment program shall at a minimum include:

R3.1. The Responsible Entity shall ensure that each assessment conducted include, at least, identity verification (e.g., Social Security Number verification in the U.S.) and seven-year criminal check. The Responsible Entity may conduct more detailed reviews, as permitted by law and subject to existing collective bargaining unit agreements, depending upon the criticality of the position.

R3.2. The Responsible Entity shall update each personnel risk assessment at least every seven years after the initial personnel risk assessment or for cause.

R3.3. The Responsible Entity shall document the results of personnel risk assessments of its personnel having authorized cyber or authorized unescorted physical access to Critical Cyber Assets, and that personnel risk assessments of contractor and service vendor personnel with such access are conducted pursuant to Standard CIP-004-4.

R4. Access — The Responsible Entity shall maintain list(s) of personnel with authorized cyber or authorized unescorted physical access to Critical Cyber Assets, including their specific electronic and physical access rights to Critical Cyber Assets.

R4.1. The Responsible Entity shall review the list(s) of its personnel who have such access to Critical Cyber Assets quarterly, and update the list(s) within seven calendar days of any change of personnel with such access to Critical Cyber Assets, or any change in the access rights of such personnel. The Responsible Entity shall ensure access list(s) for contractors and service vendors are properly maintained.

R4.2. The Responsible Entity shall revoke such access to Critical Cyber Assets within 24 hours for personnel terminated for cause and within seven calendar days for personnel who no longer require such access to Critical Cyber Assets.

C. Measures

M1. The Responsible Entity shall make available documentation of its security awareness and reinforcement program as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of its cyber security training program, review, and records as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the personnel risk assessment program and that personnel risk assessments have been applied to all personnel who have authorized cyber or authorized unescorted physical access to Critical Cyber Assets, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of the list(s), list review and update, and access revocation as needed as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep personnel risk assessment documents in accordance with federal, state, provincial, and local laws.

1.4.2 The Responsible Entity shall keep all other documentation required by Standard CIP-004-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.2.4 — Insert the phrase "for cause" as intended. "One instance of personnel termination for cause…"	03/24/06
1	06/01/06	D.2.1.4 — Change "access control rights" to "access rights."	06/05/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Reference to emergency situations. Modification to R1 for the Responsible Entity to establish, document, implement, and maintain the awareness program. Modification to R2 for the Responsible Entity to establish, document, implement, and maintain the training program; also stating the requirements for the cyber security training program. Modification to R3 Personnel Risk Assessment to clarify that it pertains to personnel having authorized cyber or authorized unescorted physical access to "Critical Cyber Assets". Removal of 90 day window to complete training and 30 day window to complete personnel risk assessments. Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from "3" to "4"	Update to conform to changes to CIP-002-4 (Project 2008-06)

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of the *Version 5 CIP Cyber Security Standards* for a 45-day formal comment period. An initial concept paper, *Categorizing Cyber Systems — An Approach Based on BES Reliability Functions,* was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees	
3	3/31/10	Approved by FERC	
4	12/30/10	Modified to add specific criteria for Critical Asset identification	Update
4	1/24/11	Approved by the NERC Board of Trustees	Update
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Personnel & Training

2. **Number:** CIP-004-5

3. **Purpose:** Standard CIP-004-5 requires that personnel having authorized cyber or authorized unescorted physical access to BES Cyber Assets and BES Cyber Systems, including contractors and service vendors, have an appropriate level of personnel risk assessment, training, and security awareness.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

   - A UFLS program required by a NERC or regional Reliability Standard
   - A UVLS program required by a NERC or regional Reliability Standard
   - A Special Protection System or Remedial Action Scheme required by a NERC or regional Reliability Standard
   - A Transmission Protection System required by a NERC or regional Reliability Standard
   - Its Transmission Operator's restoration plan

   4.1.3 Generator Operator

   4.1.4 Generator Owner

   4.1.5 Interchange Coordinator

   4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

   - A UFLS program required by a NERC or regional Reliability Standard
   - A UVLS program required by a NERC or regional Reliability Standard

   4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or regional Reliability Standard
- A UVLS program required by a NERC or regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or regional Reliability Standard
- A UVLS program required by a NERC or regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or regional Reliability Standard
- A Transmission Protection System required by a NERC or regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-004-5:

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-004-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1

require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for R1: Ensures that personnel who have authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems maintain awareness of best security practices.

Summary of Changes: Reformatted into table structure.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-004-5 Table R1 – Security Awareness Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-004-5 Table R1 – Security Awareness Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-5 Table R1 – Security Awareness Program			
Part	**Applicability**	**Requirements**	**Measures**
1.1	All Responsible Entities	A security awareness program that conveys security awareness concepts and provides on-going reinforcement of such concepts on at least a quarterly basis.	Evidence must include the documented security awareness program, and additional evidence to demonstrate that this program was implemented such as, but not limited to, the quarterly reinforcement material that has been distributed.
Reference to prior version: *CIP-004-4 R1*		**Change Rationale:** *Changed to remove the need to ensure everyone with authorized access receives this awareness. Moved example mechanisms to guidance.*	

Rationale for R2: To ensure that the Responsible Entity's training program for personnel who need authorized electronic access and/or authorized unescorted physical access to BES Cyber Systems contains the proper policies, access controls, and procedures to protect BES Cyber Systems.

Based on their role, some personnel may not require training on all topics.

Summary of Changes:

1. Addition of specific role training for
   - the visitor control program;
   - electronic interconnectivity supporting the operation and control of BES Cyber Systems
   - storage media as part of the handling of BES Cyber Systems information
2. Change references from Critical Cyber Assets to BES Cyber Systems

R2. Each Responsible Entity shall have a role-based cyber security training program for personnel who need authorized electronic access or authorized unescorted physical access to BES Cyber Systems that includes each of the applicable items in *CIP-004-5 Table R2 – Cyber Security Training Program*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include the training program that includes each of the applicable items in *CIP-004-5 Table R2 – Cyber Security Training Program*.

CIP-004-5 Table R2 – Cyber Security Training Program			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Define the roles that require training.	Acceptable evidence must include a list of roles and what training is needed for each role.
Reference to prior version: NEW		**Change Rationale:** *The first thing needed in a role based training program is to understand what roles your people have to help plan what training modules you need to provide.*	

CIP-004-5 Table R2 – Cyber Security Training Program			
Part	**Applicability**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on the security controls protecting the Responsible Entity's BES Cyber Systems.	Evidence may include, but is not limited to, training material on the security controls that have been implemented to protect BES Cyber Systems.
Reference to prior version: *CIP004-4 R2.2.1*		**Change Rationale:** *Minor wording changes. Changed to address cyber security issues, not the business or functional use of the BES Cyber System.*	
2.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on the proper use of physical access controls protecting the Responsible Entity's BES Cyber Systems.	Evidence may include, but is not limited to, training material on the proper use of physical access controls for BES Cyber Systems.
Reference to prior version: *CIP004-4 R2.2.2*		**Change Rationale:** *Minor wording changes.*	
2.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on the electronic access controls protecting the Responsible Entity's BES Cyber Systems.	Evidence may include, but is not limited to, training material on the electronic access controls to protect BES Cyber Systems.
Reference to prior version: *CIP004-4 R2.2.2*		**Change Rationale:** *Minor wording changes.*	
2.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on the visitor control program.	Evidence may include, but is not limited to, training material on the visitor control program.
Reference to prior version: *NEW*		**Change Rationale:** *Personnel administering the* ***visitor control program*** *and/or providing escort should be part of the core training; FERC Order 706 - paragraph 432.*	

CIP-004-5 Table R2 – Cyber Security Training Program			
Part	**Applicability**	**Requirements**	**Measures**
2.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on handling of BES Cyber System Information and storage media.	Evidence may include, but is not limited to, training material on the handling of BES Cyber System Information, including storage media.
Reference to prior version: *CIP004-4 R2.2.3*		**Change Rationale:** *Core training on the **handling of BES Cyber System (**not Critical Cyber Assets**) Information**, with the addition of **storage media;** FERC Order 706 -paragraph 413 and paragraphs 632-634, 688, 732-734; DHS 2.4.16)*	
2.7	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on identification of a potential BES Cyber Security Incident and associated notifications.	Evidence may include, but is not limited to, training material on the identification of a potential BES Cyber Security Incident and associated notifications.
Reference to prior version: *CIP004-4 R2.2.4 (new; implied but not stated in CIP-004 or CIP-008)*		**Change Rationale:** *Core training on the identification and reporting of a Cyber Security Incident; FERC Order 706 - paragraph 413; Related to CIP-008 & DHS Incident Reporting requirements for those with roles in incident reporting.*	
2.8	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on recovery plans for BES Cyber Systems.	Evidence may include, but is not limited to, training material on recovery plans for BES Cyber Systems.
Reference to prior version: *CIP004-4 R2.2.4*		**Change Rationale:** *Core training on the action plans and procedures to recover or re-establish BES Cyber Systems for personnel having a role in the recovery; FERC Order 706 - paragraph 413.*	

CIP-004-5 Table R2 – Cyber Security Training Program			
Part	**Applicability**	**Requirements**	**Measures**
2.9	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on response to BES Cyber Security Incidents.	Evidence may include, but is not limited to, training material on the response to a BES Cyber Security Incident.
Reference to prior version: *CIP004-4 R2.2.4*		**Change Rationale:** *Minor wording changes.*	
2.10	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Training on BES Cyber System's electronic interconnectivity and interoperability with other Cyber Assets.	Evidence may include, but is not limited to, training material on the electronic interconnectivity and interoperability with other Cyber Assets.
Reference to prior version: *NEW*		**Change Rationale:** *Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems; FERC Order 706 - paragraph 434.*	

Rationale for R3: To ensure that personnel with authorized electronic access or authorized unescorted physical access are trained in the policies, access controls, and procedures to protect the BES Cyber Systems.

Summary of Changes: Re-organization of the training requirements into the respective requirements for "program" and "implementation" of the training.

R3. Each Responsible Entity shall implement its documented cyber security training program for each individual needing authorized electronic or unescorted physical access that includes each of the applicable items in *CIP-004-5 Table R3 - Cyber Security Training. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations]*

M3. Evidence must include, but is not limited to, documentation that the training was provided as defined in *CIP-004-5 Table R3 - Cyber Security Training*.

CIP-004-5 Table R3 – Cyber Security Training			
Part	**Applicability**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Require completion of the training specified in CIP-004-5 R2 prior to granting authorized access, except during CIP Exceptional Circumstances.	Evidence may include, but is not limited to, for each individual requiring access, dated individual training records, the date access was first granted, or a dated log or documentation of when CIP Exceptional Circumstances were invoked and revoked.
Reference to prior version: *CIP004-4 R2.1*		**Change Rationale:** *Addition of exceptional circumstances parameters as directed in FERC Order 706 - paragraph 431 is detailed in CIP-003-5..*	

CIP-004-5 Table R3 – Cyber Security Training			
Part	**Applicability**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Require completion of the training specified in CIP-004-5, Requirement R2 at least once every calendar year, but not to exceed 15 calendar months.	Evidence may include, but is not limited to, dated individual training records.
Reference to prior version: *CIP004-4 R2.3*		**Change Rationale:** *Updated to further define what "Annual" training means.*	

Rationale for R4: To ensure that individuals who need authorized electronic or unescorted physical access to BES Cyber Systems have been assessed for risk.

Summary of Changes: Specify that the seven year criminal history check covers all locations where the individual has resided, been employed, and/or attended school for six months or more, including current residence regardless of duration.

R4. Each Responsible Entity shall have one or more documented personnel risk assessment programs for individuals needing authorized electronic or unescorted physical access that collectively includes each of the applicable items in *CIP-004-5 Table R4 – Personnel Risk Assessment Program*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M4. Evidence must include the documented personnel risk assessment program that collectively includes each of the applicable items in *CIP-004-5 Table R4 – Personnel Risk Assessment Program*.

CIP-004-5 Table R4 – Personnel Risk Assessment Program			
Part	**Applicability**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	An initial personnel risk assessment that includes identity verification.	Acceptable evidence must include the documented risk assessment program with a requirement for an initial personnel risk assessment that includes identity verification.
Reference to prior version: *CIP004-4 R3.1*		**Change Rationale:** *Addressed interpretation request in guidance. Specified that identify verification is only required for each individual's initial assessment.*	

CIP-004-5 Table R4 – Personnel Risk Assessment Program			
Part	**Applicability**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Seven year criminal history records check including current residence, regardless of duration, and covering at least all locations where, during the previous seven years up to the current time, the subject has resided, been employed, and/or attended school for six months or more. If it is not possible to perform a full seven year criminal history records check, conduct as much of the seven year criminal history records check as possible and document the reason the full seven year criminal history records check could not be performed.	Acceptable evidence must include the documented risk assessment program with a requirement for a seven year criminal history record check in accordance with Requirement R4, Part 4.2.
Reference to prior version: *CIP004-4 R3.1*		**Change Rationale:** *Specify that the seven year criminal history check covers all locations where the individual has resided, been employed, and/or attended school for six months or more, including current residence regardless of duration. Added additional wording based on interpretation request. Provision is made for when a full seven year check cannot be performed.*	

CIP-004-5 Table R4 – Personnel Risk Assessment Program			
Part	**Applicability**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Criteria or process used to evaluate personnel risk assessments to determine when to deny authorized access.	Acceptable evidence must include the documented risk assessment program with the criteria or process identified in Requirement R4, Part 4.3.
Reference to prior version: *NEW*		**Change Rationale:** *There should be documented criteria or a process used to evaluate personnel risk assessments.*	
4.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Criteria or process for verifying that personnel risk assessments performed for contractors or service vendors are conducted pursuant to CIP-004-5 R4.	Acceptable evidence must include the documented risk assessment program with the criteria or process identified in Requirement R4, Part 4.4.
Reference to prior version: *CIP-004-4 R3.3*		**Change Rationale:** *Separated into its own table item.*	

Rationale for R5: To ensure that individuals who have authorized access to BES Cyber Systems have been assessed for risk.

R5. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable elements in *CIP-004-5 Table R5 – Personnel Risk Assessment.[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations]*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-004-5 Table R5 – Personnel Risk Assessment* and additional evidence to demonstrate that these processes were implemented as described in the Measures column of the table.

CIP-004-5 Table R5 – Personnel Risk Assessment			
Part	**Applicability**	**Requirement**	**Measures**
5.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Perform a personnel risk assessment as specified in CIP-004-5 R4 prior to being granted authorized electronic or unescorted physical access, except for CIP Exceptional Circumstances.	Evidence may include, but is not limited to: • Dated records showing that personnel risk assessments were completed before access was authorized; • Dated documentation or attestations from contractors or service vendors verifying that personnel risk assessments were conducted pursuant to CIP-004-5 R4 before access was authorized.
Reference to prior version: *CIP-004-3 R3, R3.3*		**Change Rationale**: *Minor wording changes and added the ability to accept attestations from contractors or vendors.*	

CIP-004-5 Table R5 – Personnel Risk Assessment			
Part	**Applicability**	**Requirement**	**Measures**
5.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Update each personnel risk assessment at least once every seven calendar years after the initial personnel risk assessment.	Evidence may include, but is not limited to, current and former personnel risk assessment records.
Reference to prior version: *CIP-004-4 R3.2*		**Change Rationale:** *Eliminated the "for cause" renewal.*	

Rationale for R6: To ensure that individuals with access to BES Cyber Systems have been properly authorized for such access. "Authorization" should be considered to be a grant of permission by a person or persons empowered by the Responsible Entity to perform such grants and part of the delegations referenced in CIP-003-5.

Access is considered to be physical, logical, and remote permissions granted to all Cyber Assets comprising or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e.: physical access control system, remote access system, directory services).

CIP Exceptional Circumstances are defined in a Responsible Entity's policy from CIP-003-5 and allow an exception to the requirement for authorization to BES Cyber Systems and BES Cyber System Information.

Quarterly reviews in 6.4 are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in R6 are not applicable. However, the Responsible Entity should document such configurations.

Summary of Changes: The primary change here involves pulling the access management requirements from CIP-003-4, CIP-004-4 and CIP-007-4 into a single requirement. The requirements from version 4 remain largely unchanged except to clarify some terminology. The purpose for combining these requirements is to remove the perceived redundancy in authorization and review. The requirement in CIP-004-4 R4 to maintain a list of authorized personnel has been removed because the list represents only one form of evidence to demonstrate compliance that only authorized persons have access.

R6. Each Responsible Entity shall implement one or more documented access management programs that collectively include each of the applicable elements in *CIP-004-5 Table R6 – Access Management Program. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Same Day Operations]*

M6. Evidence must include the documented processes that collectively include each of the applicable items in *CIP-004-5 Table R6 – Access Management Program* and additional evidence to demonstrate that the access management program was implemented as described in the Measures column of the table.

CIP-004-5 Table R6 – Access Management Program			
Part	**Applicability**	**Requirements**	**Measures**
6.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	The CIP Senior Manager or delegate shall authorize electronic access, except for CIP Exceptional Circumstances. Access permissions shall be the minimum necessary for performing assigned work functions.	Evidence may include, but is not limited to: (i) a system-generated list of people with electronic access and a sampling of accounts to verify unauthorized users do not have access, (ii) a signed document, workflow or email showing such persons have authorization and (iii) similar or the same records showing the consideration of appropriate privileges on the basis of need in performing a work function were considered as part of the authorization.
Reference to prior version: *CIP 007-4 R5.1, CIP 004-4 R4*		**Change Rationale:** *CIP-003-4, CIP-004-4 CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.*	

CIP-004-5 Table R6 – Access Management Program			
Part	**Applicability**	**Requirements**	**Measures**
6.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	The CIP Senior Manager or delegate shall authorize unescorted physical access to BES Cyber Systems, except for CIP Exceptional Circumstances. Access permissions shall be the minimum necessary for performing assigned work functions.	Evidence may include, but is not limited to: (i) a system generated list of people with unescorted physical access through the Defined Physical Boundary and a sampling of accounts (for automated physical access control) to verify unauthorized users do not have access, (ii) a signed document, workflow or email showing such persons have authorization and (iii) similar or the same records showing the consideration of appropriate privileges on the basis of need in performing a work function were considered as part of the authorization.
Reference to prior version: *CIP-006-4 R1.5*		**Change Rationale:** *CIP-003-4, CIP-004-4, CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.*	

CIP-004-5 Table R6 – Access Management Program			
Part	**Applicability**	**Requirements**	**Measures**
6.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	The CIP Senior Manager or delegate shall authorize access to BES Cyber System Information, except for CIP Exceptional Circumstances. Access permissions shall be the minimum necessary for performing assigned work functions.	Evidence may include, but is not limited to: (i) a list of people with access to BES Cyber System Information and a sampling of accounts (on electronic document systems) to verify unauthorized users do not have access, (ii) a signed document, workflow or email showing such persons have authorization and (iii) similar or the same records showing the consideration of appropriate privileges on the basis of need in performing a work function were considered as part of the authorization.
Reference to prior version: *CIP-003-4 R5.2*		**Change Rationale:** *CIP-003-4, CIP-004-4, CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003 and CIP-007 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.*	

CIP-004-5 Table R6 – Access Management Program			
Part	**Applicability**	**Requirements**	**Measures**
6.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Verify at least once each calendar quarter that individuals provisioned for unescorted physical or electronic access to BES Cyber Systems were authorized for such access.	Evidence may include, but is not limited to: • Dated documentation of the verification between the system generated list of individuals who have been authorized for access and a system generated list of personnel who have access • Documentation of the dated verification between a list of individuals who have been authorized for access and a list of individuals provisioned for access.
Reference to prior version: *CIP 004-4 R4.1*		**Change Rationale:** *Feedback among team members, observers, and regional CIP auditors indicates there has been confusion in implementation around what the term "review" entailed in CIP-004-4 R4.1. This requirement clarifies the review should occur between the provisioned access and authorized access.*	

CIP-004-5 Table R6 – Access Management Program			
Part	**Applicability**	**Requirements**	**Measures**
6.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Verify at least once each calendar year, not to exceed 15 calendar months between verifications, that all accounts/account groups or role categories and their specific, associated privileges are correct and the minimum necessary for performing assigned work functions.	Evidence may include, but is not limited to, documentation of the review including (i) a dated listing of all accounts/account groups or roles within the system, (ii) a summary description of privileges associated with each group or role, (iii) accounts assigned to the group or role and (iv) dated evidence showing verification of the privileges for the group are authorized and appropriate to the work function performed by people assigned to each account.
Reference to prior version: *CIP 007-4 R5.1.3*		**Change Rationale:** *Moved requirements to ensure consistency and eliminate the cross-referencing of requirements. Clarified what was necessary in performing verification by stating the objective was to confirm that access privileges are correct and the minimum necessary for performing assigned work functions.*	

CIP-004-5 Table R6 – Access Management Program			
Part	**Applicability**	**Requirements**	**Measures**
6.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Verify at least once per calendar year, but not to exceed 15 calendar months between verifications, of access privileges to BES Cyber System Information to confirm that access privileges are correct and the minimum necessary for performing assigned work functions.	Evidence may include, but is not limited to documentation of the review including (i) a dated listing of authorizations for BES Cyber System information, (ii) any privileges associated with the authorizations, and (iii) dated evidence showing a verification of the authorizations and any privileges were confirmed correct and the minimum necessary for performing assigned work functions.
Reference to prior version: *CIP-003-4 R5.1.2*		**Change Rationale:** *Moved requirement to ensure consistency among access reviews. Clarified precise meaning in the term annual. Clarified what was necessary in performing a verification by stating the objective was to confirm access privileges are correct and the minimum necessary for performing assigned work functions.*	

Rationale for R7: The timely revocation of electronic access to cyber systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform his or her assigned functions, that access should be revoked. This is of particular importance in situations where a change of assignment or employment is involuntary, as there is a risk the individual(s) involved will react in a hostile or destructive manner.

In considering how to address the FERC Order directing immediate revocation of access for involuntary separation, the SDT chose not to specify hourly time parameters in the requirement (i.e. revoking access within 1 hour). The point in time at which an organization terminates a person cannot generally be determined down to the hour. However, most organizations have formal termination processes, and the timeliest revocation of access occurs in concurrence with the initial processes of termination.

Access is considered to be physical, logical, and remote permissions granted to all Cyber Assets comprising or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e.: physical access control system, remote access system, directory services).

Summary of Changes: Paragraphs 460 and 461 of FERC Order 706 state the following: The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination).

As a general matter, the Commission believes that revoking access when an employee no longer needs it, either because of a change in job or the end of employment, must be immediate.

R7. Each Responsible Entity shall implement one or more documented access revocation programs that collectively include each of the applicable items in *CIP-004-5 Table R7 – Access Revocation*. *[Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Operations Planning]*

M7. Evidence must include each of the applicable documented programs that collectively include each of the applicable items in *CIP-004-5 Table R7 – Access Revocation* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-004-5 Table R7 – Access Revocation			
Part	**Applicability**	**Requirements**	**Measures**
7.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For resignations or terminations, revoke the individual's unescorted physical access and Interactive Remote Access to BES Cyber Systems at the time[2] of the resignation or termination.	Evidence may include, but is not limited to (i) workflow or sign-off form verifying access removal associated with the terminations and dated concurrent or prior to the date of the termination action, and (ii) a system-generated listing of user accounts or other demonstration showing such persons no longer have access.
Reference to prior version: *CIP 004-4 R4.2*		**Change Rationale:** *The FERC Order 706 Paragraph 460 and 461 directs modifications to the Standards to require immediate revocation for any person no longer needing access. To address this directive, this requirement specifies revocation concurrent with the termination instead of within 24 hours.*	

[2] Since a termination action is often recorded without consideration to the time of day, "at the time" does not require a to-the-minute or to-the-hour time-stamped comparison of access logs and the termination action.

CIP-004-5 Table R7 – Access Revocation			
Part	**Applicability**	**Requirements**	**Measures**
7.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For reassignments or transfers, revoke the individual's unneeded electronic and physical access to BES Cyber Systems by the end of the next calendar day.	Evidence may include, but is not limited to, (i) workflow or sign-off form showing the review of logical and physical authorizations dated on the same calendar day as the transfer or reassignment and (ii) a system-generated listing of user accounts or other demonstration showing such persons no longer have access where the review determined it was no longer needed.
Reference to prior version: *CIP-004-4 R4.2*		**Change Rationale:** *The FERC Order 706 Paragraph 460 and 461 directs modifications to the Standards to require immediate revocation for any person no longer needing access, including transferred employees. In reviewing how to modify this requirement, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement from NIST 800-53 version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers.*	

CIP-004-5 Table R7 – Access Revocation			
Part	**Applicability**	**Requirements**	**Measures**
7.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For resignations or terminations, revoke the individual's access to BES Cyber System Information by the end of the next calendar day following the resignation or termination.	Evidence may include, but is not limited to, workflow or sign-off form verifying access removal to designated physical areas or cyber systems containing BES Cyber System information associated with the terminations and dated within the next calendar day of the termination action.
Reference to prior version: *NEW*		**Change Rationale:** *The FERC Order 706 Paragraph 386 directs modifications to the Standards to require prompt revocation of access to protected information. To address this directive, Responsible Entities are required to revoke access to areas designated for BES Cyber System Information. This could include records closets, substation control houses, records management systems, file shares or other physical and logical areas under the Responsible Entity's control.*	

CIP-004-5 Table R7 – Access Revocation			
Part	**Applicability**	**Requirements**	**Measures**
7.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For resignations or terminations, revoke the individual's user accounts on BES Cyber Assets (unless already revoked in accordance with R7.1 or 7.3) within thirty (30) calendar days of the date of initial access revocation.	Evidence may include, but is not limited to, workflow or sign-off form showing access removal for any individual BES Cyber Assets and software applications as determined necessary to completing the revoking of access and dated within thirty calendar days of the termination.
Reference to prior version: *NEW*		**Change Rationale:** *The FERC Order 706 Paragraph 460 and 461 directs modifications to the Standards to require immediate revocation for any person no longer needing access. In order to meet the immediate timeframe, Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate access revocation on individual Cyber Assets and applications without affecting reliability. This requirement provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.*	

CIP-004-5 Table R7 – Access Revocation			
Part	**Applicability**	**Requirements**	**Measures**
7.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For terminations, resignations, reassignments, or transfers, change passwords for shared account(s) known to the user within thirty (30) calendar days of the termination, resignation, reassignment, or transfer of the user. In extenuating circumstances that require a longer time period, document the extenuating circumstances and change the password(s) within ten calendar days following the end of the extenuating circumstances.	Evidence may include, but is not limited to: • Workflow or sign-off form showing password reset within thirty calendar days of the termination • Workflow or sign-off form showing password reset within thirty calendar days of the reassignments or transfers.
Reference to prior version: *CIP-007 R5.2.3*		**Change Rationale:** *To provide clarification of expected actions in managing the passwords*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

Guidelines and Technical Basis

Requirement R1:

The security awareness program is intended to be an informational program, not a formal training program. It should reference sound security practices to ensure that personnel maintain awareness of best practices for both physical and electronic security to protect its BES Cyber Systems. The Responsible Entity is not required to provide records that show that each individual received or understood the information, but they must maintain documentation of the program materials utilized in the form of posters, memos, and/or presentations.

Examples of possible mechanisms which can be used are:

- Direct communications (e.g., emails, memos, computer based training, etc.);
- Indirect communications (e.g., posters, intranet, brochures, etc.);
- Management support and reinforcement (e.g., presentations, meetings, etc.).

Guidance: Describe example mechanisms used to demonstrate the availability of this information

Requirement R2:

Training shall cover the policies, access controls, and procedures as developed for the BES Cyber Systems and include, at a minimum, the following required items appropriate to personnel roles and responsibilities from Table R4. The training may consist of multiple modules and multiple delivery mechanisms.

Note: Provide guidance or a local definition of “role appropriate” as it is used in this standard.

Requirement R3:

Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access, except for program specified exceptional circumstances that are approved by the single senior management official identified in Requirement R1 or their delegate and impact the reliability of the BES or emergency response.

NOTE: Program specified exceptional circumstances can include a specified individual to declare an emergency.

Requirement R4:

Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being granted authorized access when called for in CIP-011-1 Table R4 – Personnel Risk Assessment, except for program specified exceptional circumstances that are approved by the single senior management official identified in Requirement R1 or their delegate and impact the reliability of the BES or emergency response, to ensure that personnel who have such access have had their

identity verified, then been assessed for risk, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements.

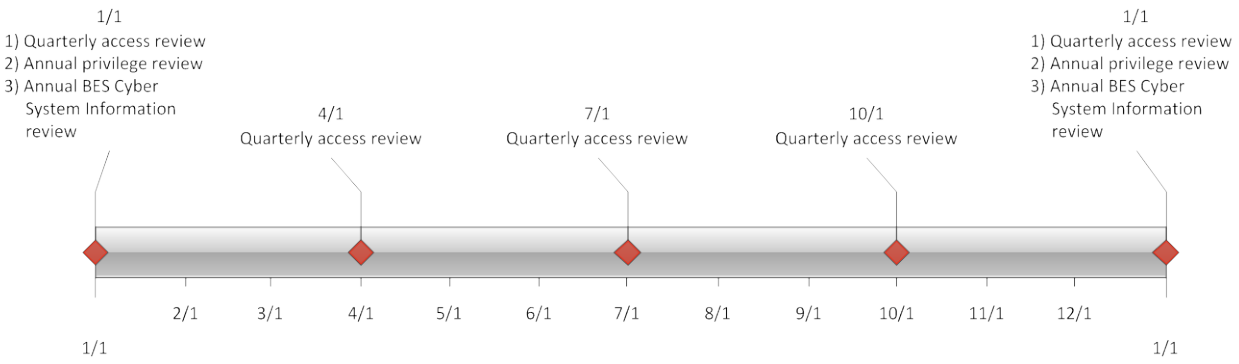
When it is not possible to perform a full seven year criminal history check, documentation must be made of what criminal history check was performed, and the reasons a full seven year check could not be performed. Examples of this could include individuals under the age of 25 where a juvenile criminal history may be protected by law, or individuals who may have resided in locations from where it is not possible to obtain a criminal history records check.

Requirement R6:

Authorization for electronic and unescorted physical access and access to BES Cyber System information must be on the basis of necessity in the individual performing a work function. Documentation showing the authorization should have some justification of the business need included. To ensure proper segregation of duties, access authorization and provisioning should not be performed by the same person.

This requirement specifies both quarterly and annual reviews. Quarterly reviews are to perform a validation that only authorized users have been granted access to BES Cyber Systems. This is achieved by comparing individuals actually provisioned to a BES Cyber System against records of individuals authorized to the BES Cyber System. The focus of this requirement is on the integrity of provisioning access rather than individual accounts on all BES Cyber Assets. The list of provisioned individuals can be an automatically generated account listing. However, in a BES Cyber System with several account databases, the list of provisioned individuals may come from other records such as provisioning workflow or a user account database where provisioning typically initiates.

The annual privilege review is more detailed to ensure an individual's associated privileges are the minimum necessary to perform their work function (i.e. least privilege). Entities can more efficiently perform this review by implementing role-based access. This involves determining the specific roles on the system (e.g. system operator, technician, report viewer, administrator, etc.) then grouping access privileges to the role and assigning users to the role. Role-based access does not assume any specific software and can be implemented by defining specific provisioning processes for each role where access group assignments cannot be performed. Role-based access permissions eliminate the need to perform the privilege review on individual accounts. An example timeline of all the reviews in R6 is included below.



Separation of duties should be considered when performing the reviews in R6. The person reviewing should be different than the person provisioning access.

If the results of quarterly or annual account reviews indicate an administrative or clerical error in which access was not actually provisioned, then the error should not be considered a violation of this requirement.

For BES Cyber Systems that do not have user accounts defined, the controls listed in R6 are not applicable. However, the Responsible Entity should document such configurations.

Requirement R7:

The requirement to revoke access at the time of the termination action includes procedures showing revocation of access concurrent with the termination action. This requirement recognizes that the timing of the termination action may vary depending on the circumstance. Some common examples and possible processes on when the termination action occurs are provided in the following table.

Scenario	Possible Process
Immediate involuntary termination	Human resources or corporate security escorts the individual off site and the supervisor or human resources personnel notify the appropriate personnel to begin the revocation process.
Scheduled involuntary termination	Human resource personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Termination prior to notification	Human resource personnel are notified of the termination and work with appropriate personnel to schedule the revocation of access at the time of termination.
Voluntary termination	Human resource personnel are notified of the termination and works with appropriate personnel to schedule the revocation of access at the time of termination.
Retirement where the last working day is several weeks prior to the termination date	Human resource personnel coordinate with manager to determine the final date access is no longer needed and schedule the revocation of access on the determined day.
Death	No action is required.

Revocation of electronic access should be understood to mean a process with the end result that electronic access to BES Cyber Systems is no longer possible using credentials assigned to or known by the individual(s) whose access privileges are being revoked. Steps taken to accomplish this outcome may include deletion or deactivation of accounts used by the individual(s), but no specific actions are prescribed. Entities should consider the ramifications

of deleting an account may include incomplete event log entries due to an unrecognized account or system services using the account to log on.

The initial revocation required in 7.1 includes unescorted physical access and Interactive Remote Access. These two actions should prevent any further access by the individual after termination. If an individual still has local access accounts on BES Cyber Assets, then the Entity has 30 days to complete the revocation process for those accounts. However, nothing prevents an Entity from performing all of the access revocation at the time termination.

For transferred or reassigned individuals, the requirement states a review of access privileges must be performed. This review could entail a simple listing of all authorizations for an individual and working with the respective managers to determine which access will still be needed in the new position. For instances in which the individual still needs to retain access as part of a transitory period, the entity should schedule a time to review these access privileges or include the privileges in the quarterly account review or annual privilege review.

Revocation of access to shared accounts is called out separately to prevent the situation where passwords on substation and generation devices are constantly changed due to staff turnover.

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-4a

3. Purpose: Standard CIP-005-4a requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005-4a should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability

4.1. Within the text of Standard CIP-005-4a, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-005-4a:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

4.2.4 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4a.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4a Requirements R2 and R3; Standard CIP-006-4c Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings;

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4a.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4a reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4a at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.

C. Measures

M1. The Responsible Entity shall make available documentation about the Electronic Security Perimeter as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its annual vulnerability assessment as specified in Requirement R4.

M5. The Responsible Entity shall make available access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.1 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.1 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.2 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless: a) longer retention is required pursuant to Standard CIP-008-4, Requirement R2; b) directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005-4a from the previous full calendar year.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (Developed separately.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change “Critical Assets,” to “Critical Cyber Assets” as intended.	03/24/06
2	Approved by NERC Board of	Modifications to clarify the requirements and to bring the compliance elements into	Revised.

	Trustees 5/6/09	conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Revised the wording of the Electronic Access Controls requirement stated in R2.3 to clarify that the Responsible Entity shall "implement and maintain" a procedure for securing dial-up access to the Electronic Security Perimeter(s). Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Changed CIP-005-2 to CIP-005-3. Changed all references to CIP Version "2" standards to CIP Version "3" standards. For Violation Severity Levels, changed, "To be developed later" to "Developed separately."	Conforming revisions for FERC Order on CIP V2 Standards (9/30/2009)
2a	02/16/10	Added Appendix 1 — Interpretation of R1.3 approved by BOT on February 16, 2010	Addition
4a	01/24/11	Adopted by the NERC Board of Trustees	Update to conform to changes to CIP-002-4 (Project 2008-06) Update version number from "3" to "4a"

Appendix 1

Requirement Number and Text of Requirement
Section 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. **Requirement R1.3** Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).
Question 1 (Section 4.2.2)
What kind of cyber assets are referenced in 4.2.2 as "associated"? What else could be meant except the devices forming the communication link?
Response to Question 1
In the context of applicability, associated Cyber Assets refer to any communications devices external to the Electronic Security Perimeter, i.e., beyond the point at which access to the Electronic Security Perimeter is controlled. Devices controlling access into the Electronic Security Perimeter are not exempt.
Question 2 (Section 4.2.2)
Is the communication link physical or logical? Where does it begin and terminate?
Response to Question 2
The drafting team interprets the data communication link to be physical or logical, and its termination points depend upon the design and architecture of the communication link.
Question 3 (Requirement R1.3)
Please clarify what is meant by an “endpoint”? Is it physical termination? Logical termination of OSI layer 2, layer 3, or above?
Response to Question 3
The drafting team interprets the endpoint to mean the device at which a physical or logical communication link terminates. The endpoint is the Electronic Security Perimeter access point if access into the Electronic Security Perimeter is controlled at the endpoint, irrespective of which Open Systems Interconnection (OSI) layer is managing the communication.
Question 4 (Requirement R1.3)
If “endpoint” is defined as logical and refers to layer 3 and above, please clarify if the termination points of an encrypted tunnel (layer 3) must be treated as an “access point? If two control centers are

owned and managed by the same entity, connected via an encrypted link by properly applied Federal Information Processing Standards, with tunnel termination points that are within the control center ESPs and PSPs and do not terminate on the firewall but on a separate internal device, and the encrypted traffic already passes through a firewall access point at each ESP boundary where port/protocol restrictions are applied, must these encrypted communication tunnel termination points be treated as "access points" in addition to the firewalls through which the encrypted traffic has already passed?
Response to Question 4
In the case where the “endpoint” is defined as logical and is >= layer 3, the termination points of an encrypted tunnel must be treated as an “access point.” The encrypted communication tunnel termination points referred to above are “access points.”

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of the *Version 5 CIP Cyber Security Standards* for a 45-day formal comment period. An initial concept paper, *Categorizing Cyber Systems — An Approach Based on BES Reliability Functions,* was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees	
3	3/31/10	Approved by FERC	
4	12/30/10	Modified to add specific criteria for Critical Asset identification	Update
4	1/24/11	Approved by the NERC Board of Trustees	Update
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. **Title:** Cyber Security — Electronic Security Perimeter(s)

2. **Number:** CIP-005-5

3. **Purpose:** Standard CIP-005-5 requires the identification of all Electronic Access Points on the Electronic Security Perimeter(s), the protection of the communication through those points, and specific protections for interactive user remote access.

4. **Applicability:**

   4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

   - A UFLS program required by a NERC or Regional Reliability Standard
   - A UVLS program required by a NERC or Regional Reliability Standard
   - A Special Protection System or Remedial Action Scheme required by a NERC or Regional reliability standard
   - A Transmission Protection System required by a NERC or Regional Reliability Standard
   - Its Transmission Operator's restoration plan

   4.1.3 Generator Operator

   4.1.4 Generator Owner

   4.1.5 Interchange Coordinator

   4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

   - A UFLS program required by a NERC or Regional Reliability Standard
   - A UVLS program required by a NERC or regional Reliability Standard

   4.1.7 NERC

   4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-005-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-005-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural

controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.

- **High Impact BES Cyber Systems** – Applies to each BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.
- **Medium Impact BES Cyber Systems** – Applies to each BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems.
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These

hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for R1: The Electronic Security Perimeter serves to control and monitor traffic at the external boundary of the BES Cyber System. It provides a first layer of defense for network based attacks as it limits reconnaissance of targets, restricts and prohibits traffic to a specified rule set, and assists in containing any successful attacks.

Summary of Changes: CIP-005 R1 has taken more of a focus on the discrete Electronic Access points rather than the logical "perimeter".

CIP-005 R1.2 has been deleted. This requirement was definitional in nature and used to bring dialup modems using non-routable protocols into the scope of CIP-005. The non-routable protocol exclusion no longer exists, therefore there is no need for this requirement.

CIP-005 R1.1 and 1.3 were also definitional in nature and have been deleted as separate requirements but the concepts were integrated into the definitions of ESP and EAP.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-005-5 Table R1 – Electronic Security Perimeter*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-005-5 Table R1 – Electronic Security Perimeter* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-5 Table R1 – Electronic Security Perimeter			
Part	**Applicability**	**Requirements**	**Measures**
1.1	Low Impact BES Cyber Systems with External Routable Connectivity	Define technical or procedural controls to restrict unauthorized electronic access.	Evidence may include, but is not limited to, documented technical and procedural controls that exist and have been implemented.
Reference to prior version: *CIP-005 R1*		**Change Rationale:** *Entities are to document perimeter type security controls they have implemented to segment low impact BES Cyber Systems from public or other less trusted network zones and to prevent access to an aggregation of enough low impact BES Cyber Systems at various locations to a degree that can cause higher level impacts to the BES.*	
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Protected Cyber Assets	Control and secure all routable and dial-up connectivity through the use of identified Electronic Access Points (EAPs).	Evidence may include, but is not limited to: • Network diagrams showing EAP identification or • A list of uniquely identifiable Cyber Assets within the BES Cyber System and associated EAPs.
Reference to prior version: *CIP-005 R1*		**Change Rationale:** *Changed to refer to the defined term Electronic Access Point and BES Cyber System*	

CIP-005-5 Table R1 – Electronic Security Perimeter			
Part	**Applicability**	**Requirements**	**Measures**
1.3	Electronic Access Points at High Impact BES Cyber Systems Electronic Access Points at Medium Impact BES Cyber Systems with External Routable Connectivity.	Require explicit inbound and outbound access permissions at each identified Electronic Access Point using routable protocols, including explicit criteria for granting or denying access permissions.	Evidence may include, but is not limited to, a list of rules (firewall, access control lists, etc.) that demonstrate that only explicit access is allowed and that each access rule has a documented reason.
Reference to prior version: *CIP-005 R2.1*		**Change Rationale:** *Changed to refer to the defined term Electronic Access Point and to focus on the entity knowing and having justification for what it allows through the EAP.*	
1.4	Electronic Access Points that use dial-up access for non-Interactive Remote Access at High Impact BES Cyber Systems Electronic Access Points that use dial-up access for non-Interactive Remote Access at Medium Impact BES Cyber Systems.	Perform authentication when establishing dial-up connectivity with the BES Cyber System, where technically feasible.	Evidence may include, but is not limited to a documented process identified in Requirement R1, Part 1.4 that describes how the Responsible Entity is providing authenticated access through each dial up Electronic Access Point.
Reference to prior version: *CIP-005 R2.3*		**Change Rationale:** *Changed to refer to the defined term Electronic Access Point. Added clarification as to the goal of "secure", which is that the BES Cyber System should not be directly accessible with a phone number only*	

CIP-005-5 Table R1 – Electronic Security Perimeter			
Part	**Applicability**	**Requirements**	**Measures**
1.5	Electronic Access Points with External Routable Connectivity at High Impact BES Cyber Systems Electronic Access Points with External Routable Connectivity at Medium Impact BES Cyber Systems at Control Centers.	A documented method for detecting malicious communications at each EAP.	Evidence may include, but is not limited to: • Configuration files of an intrusion detection systems deployed at an EAP • Logs that were generated by an intrusion detection system • Documentation showing where intrusion detection systems were deployed.
Reference to prior version: *CIP-005 R1*		**Change Rationale:** *Per FERC Order 706, p 496-503, ESP's need two distinct security measures such that the cyber assets do not lose all perimeter protection if one measure fails or is mis-configured. The Order makes clear this is not simple redundancy of firewalls, thus the drafting team has decided to add the security measure of malicious traffic inspection (*intrusion detection systems / intrusion protection systems*) a requirement for these ESPs.*	

Rationale for R2: Discovery and announcement of vulnerabilities for remote access methods and technologies, that were previously thought secure and in use by a number of large electric sector entities, necessitate changes to industry security control standards. Currently, no requirements or guidance documents are available to either require or recommend how secure remote access to BES Cyber Systems can or should be accomplished. Inadequate safeguards for remote access can allow unauthorized access to the organization's network, with potentially serious consequences.

Remote access control procedures must provide adequate safeguards through robust identification, authentication and encryption techniques. Remote access to the organization's network and resources will only be permitted providing that authorized users are authenticated, data is encrypted across the network, and privileges are restricted.

Additional information is provided in ***Guidance for Secure Interactive Remote Access*** published by NERC in July 2011.

Summary of Changes: This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

R2. Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement one or more documented processes that collectively include the applicable items, where technically feasible, in *CIP-005-5 Table R2 – Remote Access Management*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same Day Operations]*

M2. Evidence must include the documented processes that collectively address each of the applicable items in *CIP-005-5 Table R2 – Remote Access Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-005-5 Table R2 – Remote Access Management			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Protected Cyber Assets	Require an Intermediate Device such that the Cyber Asset initiating Interactive Remote Access does not directly access a BES Cyber System or Protected Cyber Asset.	Evidence may include, but is not limited to, network diagrams or architecture documents.
Reference to prior version: *New*		**Change Rationale:** *This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.*	
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Protected Cyber Assets	Require encryption for all Interactive Remote Access sessions to protect the confidentiality and integrity of each Interactive Remote Access session.	Evidence may include, but is not limited to, architecture documents detailing where encryption initiates and terminates.
Reference to prior version: *CIP-007 R3.1*		**Change Rationale:** *This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.*	
2.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Protected Cyber Assets	Require multi-factor authentication for all Interactive Remote Access sessions.	Evidence may include, but is not limited to, architecture documents detailing the authentication factors used. Note that a UserID is not considered an authentication factor.
Reference to prior version: *CIP-007 R3.2*		**Change Rationale:** *This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- For NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning and Same Day Operations**	**Medium**	N/A	N/A	N/A	The Responsible Entity did not define any technical or procedural controls to restrict unauthorized electronic access OR The Responsible Entity did not establish Electronic Access Points to control and secure access to its BES Cyber Systems OR The Responsible Entity did not establish explicit inbound and outbound access permissions at each identified EAP that utilizes routable protocols OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Responsible Entity did not perform authentication before establishing connectivity with the BES Cyber System for an EAP that uses dial-up access OR The Responsible Entity did not deploy methods to detect malicious communications.
R2	**Operations Planning and Same Day Operations**	**Medium**	N/A	N/A	N/A	The Responsible Entity did not implement an Intermediate Device between the Interactive Remote Access cyber asset and the BES Cyber System or Protected Cyber Asset OR

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						The Responsible Entity did not implement encryption to protect the confidentiality and integrity of all Interactive Remote Access sessions OR The Responsible Entity did not implement multifactor authentication for all Interactive Remote Access sessions.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Requirement R1:

CIP-005 R1 requires that BES Cyber Systems must be segmented from other systems of differing trust levels by requiring controlled electronic access points between the different trust zones. ESP's also are used as a primary defense layer for some BES Cyber Systems that may not inherently have sufficient cyber security functionality, such as devices that lack authentication capabilities.

BES Cyber Systems are to be protected by Electronic Access Points (EAP's) that control traffic into and out of the BES Cyber System. Responsible Entities (RE's) should know what traffic needs to cross an EAP and document those justifications and insure the EAP's limit the traffic to only those known, justified communication needs. These include, but are not limited to, communications needed for normal operations, emergency operations, support, maintenance, and troubleshooting.

This requirement applies only to communications for which 'deny by default' type requirements can be universally applied, which today are those that employ routable protocols and dialup modems. Direct serial, non-routable connections are not included.

The intent of securing dialup connectivity is to prevent situations where connectivity is established directly to the BES Cyber Asset with only a phone number. If a dialup modem is implemented in such a way that it simply answers the phone and connects the line to the BES Cyber Asset with no authentication of the calling party, it is not functioning as an Electronic Access Point. The requirement calls for some form of authentication of the calling party when connectivity is granted to the BES Cyber Asset. Some examples of acceptable methods include dial-back modems, modems that must be remotely enabled or powered up, and modems that are only powered on by onsite personnel when needed along with policy that states they are disabled after use.

Since low impact BES Cyber Systems can impact BES Reliability Operating Services in real time, they should not be located directly on public networks or other networks of lesser trust. The intent is to prevent access to an aggregation of enough low impact BES Cyber Systems at various locations to a degree that can cause higher level impacts to the BES. Entities are to document perimeter type security controls they have implemented to segment low impact BES Cyber Systems from public or other less trusted network zones.

Requirement R2:

See Secure Remote Access Reference Document (see remote access alert).

A. Introduction

1. Title: Cyber Security — Physical Security of Critical Cyber Assets

2. Number: CIP-006-4c

3. Purpose: Standard CIP-006-4 is intended to ensure the implementation of a physical security program for the protection of Critical Cyber Assets. Standard CIP-006-4c should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-006-4c, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator

4.1.2 Balancing Authority

4.1.3 Interchange Authority

4.1.4 Transmission Service Provider

4.1.5 Transmission Owner

4.1.6 Transmission Operator

4.1.7 Generator Owner

4.1.8 Generator Operator

4.1.9 Load Serving Entity

4.1.10 NERC

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-006-4c:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Physical Security Plan — The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.

R1.2. Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.

R1.3. Processes, tools, and procedures to monitor physical access to the perimeter(s).

R1.4. Appropriate use of physical access controls as described in Requirement R4 including visitor pass management, response to loss, and prohibition of inappropriate use of physical access controls.

R1.5. Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-4 Requirement R4.

R1.6. A visitor control program for visitors (personnel without authorized unescorted access to a Physical Security Perimeter), containing at a minimum the following:

R1.6.1. Logs (manual or automated) to document the entry and exit of visitors, including the date and time, to and from Physical Security Perimeters.

R1.6.2. Continuous escorted access of visitors within the Physical Security Perimeter.

R1.7. Update of the physical security plan within thirty calendar days of the completion of any physical security system redesign or reconfiguration, including, but not limited to, addition or removal of access points through the Physical Security Perimeter, physical access controls, monitoring controls, or logging controls.

R1.8. Annual review of the physical security plan.

R2. Protection of Physical Access Control Systems — Cyber Assets that authorize and/or log access to the Physical Security Perimeter(s), exclusive of hardware at the Physical Security Perimeter access point such as electronic lock control mechanisms and badge readers, shall:

R2.1. Be protected from unauthorized physical access.

R2.2. Be afforded the protective measures specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4a Requirements R2 and R3; Standard CIP-006-4c Requirements R4 and R5; Standard CIP-007-4; Standard CIP-008-4; and Standard CIP-009-4.

R3. Protection of Electronic Access Control Systems — Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall reside within an identified Physical Security Perimeter.

R4. Physical Access Controls — The Responsible Entity shall document and implement the operational and procedural controls to manage physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. The Responsible Entity shall implement one or more of the following physical access methods:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.
- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access to the Critical Cyber Assets.

R5. Monitoring Physical Access — The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the

Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in Requirement CIP-008-4. One or more of the following monitoring methods shall be used:

- Alarm Systems: Systems that alarm to indicate a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by authorized personnel as specified in Requirement R4.

R6. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R4.

R7. Access Log Retention — The Responsible Entity shall retain physical access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.

R8. Maintenance and Testing — The Responsible Entity shall implement a maintenance and testing program to ensure that all physical security systems under Requirements R4, R5, and R6 function properly. The program must include, at a minimum, the following:

R8.1. Testing and maintenance of all physical security mechanisms on a cycle no longer than three years.

R8.2. Retention of testing and maintenance records for the cycle determined by the Responsible Entity in Requirement R8.1.

R8.3. Retention of outage records regarding access controls, logging, and monitoring for a minimum of one calendar year.

C. Measures

M1. The Responsible Entity shall make available the physical security plan as specified in Requirement R1 and documentation of the implementation, review and updating of the plan.

M2. The Responsible Entity shall make available documentation that the physical access control systems are protected as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation that the electronic access control systems are located within an identified Physical Security Perimeter as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation identifying the methods for controlling physical access to each access point of a Physical Security Perimeter as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation identifying the methods for monitoring physical access as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation identifying the methods for logging physical access as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation to show retention of access logs as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation to show its implementation of a physical security system maintenance and testing program as specified in Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documents other than those specified in Requirements R7 and R8.2 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not make exceptions in its cyber security policy to the creation, documentation, or maintenance of a physical security plan.

1.5.2 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006-4c for that single access point at the dial-up device.

2. Violation Severity Levels (Under development by the CIP VSL Drafting Team)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	May 2, 2006	Adopted by NERC Board of Trustees	
1	January 18, 2008	FERC Order issued approving CIP-006-1	
	February 12, 2008	Interpretation of R1 and Additional Compliance Information Section 1.4.4 adopted by NERC Board of Trustees	Project 2007-27
2		Updated version number from -1 to -2 Modifications to remove extraneous information from the requirements, improve readability, and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards.	Project 2008-06
2	May 6, 2009	Adopted by NERC Board of Trustees	
	August 5, 2009	Interpretation of R4 adopted by NERC Board of Trustees	Project 2008-15
2	September 30, 2009	FERC Order issued approving CIP-006-2	
3	November 18, 2009	Updated version number from -2 to -3 Revised Requirement 1.6 to add a Visitor Control program component to the Physical Security Plan, in response to FERC order issued September 30, 2009. In Requirement R7, the term "Responsible Entity" was capitalized. Updated Requirements R1.6.1 and R1.6.2 to be responsive to FERC Order RD09-7	Project 2009-21
3	December 16, 2009	Adopted by NERC Board of Trustees	
	February 16, 2010	Interpretation of R1 and R1.1 adopted by NERC Board of Trustees	Project 2009-13
3	March 31, 2010	FERC Order issued approving CIP-006-3	
2a/3a	July 15, 2010	FERC Order issued approving the Interpretation of R1 and R1.1. Updated version numbers from -2/-3 to -2a/-3a.	
4	January 24,	Adopted by NERC Board of Trustees	

	2011		
3c/4c	May 19, 2011	FERC Order issued approving two interpretations: 1) Interpretation of R1 and Additional Compliance Information Section 1.4.4; and 2) Interpretation of R4. Updated version number from -3/-4 to -3c/-4c.	

Appendix 1

Requirement Number and Text of Requirement
R1. Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following: R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.
Question
If a completely enclosed border cannot be created, what does the phrase, "to control physical access" require? Must the alternative measure be physical in nature? If so, must the physical barrier literally prevent physical access e.g. using concrete encased fiber, or can the alternative measure effectively mitigate the risks associated with physical access through cameras, motions sensors, or encryption? Does this requirement preclude the application of logical controls as an alternative measure in mitigating the risks of physical access to Critical Cyber Assets?
Response
For Electronic Security Perimeter wiring external to a Physical Security Perimeter, the drafting team interprets the Requirement R1.1 as not limited to measures that are "physical in nature." The alternative measures may be physical or logical, on the condition that they provide security equivalent or better to a completely enclosed ("six-wall") border. Alternative physical control measures may include, but are not limited to, multiple physical access control layers within a non-public, controlled space. Alternative logical control measures may include, but are not limited to, data encryption and/or circuit monitoring to detect unauthorized access or physical tampering.

Appendix 2

Interpretation of Requirement R1.1.

Request: *Are dial-up RTUs that use non-routable protocols and have dial-up access required to have a six-wall perimeters or are they exempted from CIP-006-1 and required to have only electronic security perimeters? This has a direct impact on how any identified RTUs will be physically secured.*

Interpretation:

Dial-up assets are Critical Cyber Assets, assuming they meet the criteria in CIP-002-1, and they must reside within an Electronic Security Perimeter. However, physical security control over a critical cyber asset is not required if that asset does not have a routable protocol. Since there is minimal risk of compromising other critical cyber assets dial-up devices such as Remote Terminals Units that do not use routable protocols are not required to be enclosed within a "six-wall" border.

CIP-006-1 — Requirement 1.1 requires a Responsible Entity to have a physical security plan that stipulate cyber assets that are within the Electronic Security Perimeter also be within a Physical Security Perimeter.

R1. Physical Security Plan — The Responsible Entity shall create and maintain a physical security plan, approved by a senior manager or delegate(s) that shall address, at a minimum, the following:

R1.1. Processes to ensure and document that all Cyber Assets within an Electronic Security Perimeter also reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to the Critical Cyber Assets.

CIP-006-1 — Additional Compliance Information 1.4.4 identifies dial-up accessible assets that use non-routable protocols as a special class of cyber assets that are not subject to the Physical Security Perimeter requirement of this standard.

1.4. Additional Compliance Information

1.4.4 For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall not be required to comply with Standard CIP-006 for that single access point at the dial-up device.

Appendix 3

The following interpretation of CIP-006-1a — Cyber Security — Physical Security of Critical Cyber Assets, Requirement R4 was developed by the standard drafting team assigned to Project 2008-14 (Cyber Security Violation Severity Levels) on October 23, 2008.

Request:

1. *For physical access control to cyber assets, does this include monitoring when an individual leaves the controlled access cyber area?*
2. *Does the term, "time of access" mean logging when the person entered the facility or does it mean logging the entry/exit time and "length" of time the person had access to the critical asset?*

Interpretation:

No, monitoring and logging of access are only required for ingress at this time. The term "time of access" refers to the time an authorized individual enters the physical security perimeter.

Requirement Number and Text of Requirement

R4. Logging Physical Access — Logging shall record sufficient information to uniquely identify individuals and the time of access twenty-four hours a day, seven days a week. The Responsible Entity shall implement and document the technical and procedural mechanisms for logging physical entry at all access points to the Physical Security Perimeter(s) using one or more of the following logging methods or their equivalent:

R4.1. Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and monitoring method.

R4.2. Video Recording: Electronic capture of video images of sufficient quality to determine identity.

R4.3. Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access as specified in Requirement R2.3.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).
3. CSO706 SDT appointed (August 7, 2008)
4. Version 1 of CIP-002 to CIP-009 approved by FERC (January 18, 2008)
5. Version 2 of CIP-002 to CIP-009 approved by FERC (September 30, 2009)
6. Version 3 of CIP-002 to CIP-009 approved by FERC (September 30, 2009)
7. Version 4 of CIP-002 to CIP-009 approved by NERC Board of Trustees (January 24, 2011) and filed with FERC (February 10, 2011)
8. Version 5 of CIP-002 to CIP-011 posted for formal comment and ballot (mm-dd-yy)

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to	

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version	Date	Action	Change Tracking
		FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees	
3	3/31/10	Approved by FERC	
4	1/24/11	Approved by the NERC Board of Trustees	
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Physical Security of BES Cyber Systems

2. Number: CIP-006-5

3. Purpose: Standard CIP-006-5 requires the implementation of a physical security plan for the protection of BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-006-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-006-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural

controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required. in the documented processes.. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Low Impact BES Cyber Systems** – Applies to BES Cyber Systems not categorized as High Impact or Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These

hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale: Each Responsible Entity shall ensure that physical access to all BES Cyber Systems is restricted and appropriately managed.

Summary of Changes: The entire contents of CIP-006-5 were intended to constitute a physical security program, though there was no specific requirement dictating the need for such a program, only physical security plans.

Added details to address FERC Order 706, paragraph 572 directives for physical security defense in depth.

Additional guidance on physical security defense in depth provided to address FERC Order 706 p575 directive.

R1. Each Responsible Entity shall implement one or more documented physical security plans that include each of the applicable items in *CIP-006-5 Table R1 – Physical Security Plan*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning and Same Day Operations]*

M1. Evidence must includes each of the documented physical security plan or plans that collectively include each of the applicable items in *CIP-006-5 Table R1 – Physical Security Plan* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicability**	**Requirements**	**Measures**
1.1	Associated Physical Access Control Systems Low Impact BES Cyber Systems.	Define operational or procedural controls to restrict physical access.	Evidence may include, but is not limited to, documented operational and procedural controls exist and have been implemented.
Reference to prior version: *CIP-006-4c R2.1 for Physical Access Control Systems* *New Requirement for Low Impact BES Cyber Systems*		**Change Description and Justification:** *To allow for programmatic protection controls as a baseline, this includes how the entity plans to protect Low Impact BES Cyber Systems and does not require detailed list of individuals with access.*	

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicability**	**Requirements**	**Measures**
1.2	Medium Impact BES Cyber Systems. Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Utilize at least one physical access control to establish one or more Defined Physical Boundaries that restricts access to only those individuals that are authorized.	Evidence may include, but is not limited to, language in the physical security plan that describes the physical boundaries and how ingress and egress is controlled by one or more different methods and proof that access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by card reader logs.
Reference to prior version: *CIP006-4c R3 & R4*		**Change Description and Justification:** *This requirement has been made more general to allow for alternate measures of restricting physical access to reflect the change from Physical Security Perimeter to Defined Physical Boundary. The specific examples that specify methods a Responsible Entity can take to restricting access to BES Cyber Systems has been moved to the Guidelines and Technical Basis section .*	

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicability**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Utilize two or more different and complementary physical access controls to establish one or more Defined Physical Boundaries that restricts physical access to only those users that are authorized, where technically feasible.	Evidence may include, but is not limited to, language in the physical security plan that describes the physical boundaries and how ingress and egress is controlled by two or more different methods and proof that access is restricted to only authorized individuals, such as a list of authorized individuals accompanied by card reader logs.
Reference to prior version: CIP006-4c R3 & R4		**Change Description and Justification:** *The specific examples that specify methods a Responsible Entity can take to restricting access to BES Cyber Systems has been moved to the Guidelines and Technical Basis section. This requirement has been made more general to allow for alternate measures of controlling physical access.* *Added to address FERC Order 706 p572 related directives for physical security defense in depth.* *FERC Order 706 p575 directives addressed by providing the examples in the guidance document of physical security defense in depth via multifactor authentication or layered defined physical boundary(s).*	

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicability**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access through any access point in a Defined Physical Boundary.	Evidence may include, but is not limited to, language in the physical security plan that describes the issuance of alerts in response to unauthorized physical access through any access point in a Defined Physical Boundary and additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs, or other evidence that documents that these alerts were generated.
Reference to prior version: *CIP006-4c R5*		**Change Description and Justification:** *Examples of monitoring methods have been moved to the Guidelines and Technical Basis section..*	
1.5	Associated Physical Access Control Systems	Issue real-time alerts (to individuals responsible for response) in response to unauthorized physical access to Physical Access Control Systems.	Evidence may include, but is not limited to, language in the physical security plan that describes the issuance of alerts in response to unauthorized physical access to Physical Access Control Systems and additional evidence that these alerts were issued, such as alert logs, cell phone or pager logs or other evidence that these alerts were generated
Reference to prior version: CIP006-4c R2.2		**Change Description and Justification:** *Addresses the old CIP-006-4c R5 requirement for Physical Access Control Systems.*	

CIP-006-5 Table R1 – Physical Security Plan			
Part	**Applicability**	**Requirements**	**Measures**
1.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Log (through automated means or by personnel who control entry) of physical entry into each Defined Physical Boundary protecting applicable BES Cyber Systems or Electronic Access Control or Monitoring Systems, which records sufficient information to uniquely identify the individual and date of entry.	Evidence may include, but is not limited to, language in the physical security plan that describes logging and recording of physical entry into Defined Physical Boundaries and additional evidence to demonstrate that this logging and recording has been implemented, such as logs of physical access into Defined Physical Boundaries that show the date of entry into Defined Physical Boundaries.
Reference to prior version: CIP-006-4c R6		**Change Description and Justification:** *CIP-006-4c R6 was specific to the logging of access at identified access points. This requirement more generally requires logging of authorized physical access into the* Defined Physical Boundary*.* *Examples of logging methods have been moved to the Guidelines and Technical Basis section .*	

Rationale: To control when personnel without authorized unescorted physical access can be in any Defined Physical Boundaries protecting BES Cyber Systems or Electronic Access Control Systems as applicable in table R2.

Summary of Changes: Reformatted into table structure. Originally added in Version 3 per FERC Order issued September 30, 2009.

R2. Each Responsible Entity shall implement its documented visitor control program that includes each of the applicable items in *CIP-006-5 Table R2 – Visitor Control Program. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations]*

M2. Evidence must include the documented visitor control program that collectively includes each of the applicable items in *CIP-006-5 Table R2 – Visitor Control Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R2 – Visitor Control Program			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Require continuous escorted access of visitors (individuals not authorized for unescorted physical access) within any Defined Physical Boundary.	Evidence may include, but is not limited to, language in a visitor control program that requires continuous escorted access of visitors within Defined Physical Boundaries and additional evidence to demonstrate that the process was implemented, such as visitor logs.
Reference to prior version: *CIP-006-4c R1.6.2*		**Change Description and Justification:** *No change.*	

CIP-006-5 Table R2 – Visitor Control Program			
Part	**Applicability**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	A process requiring manual or automated logging of the entry and exit of visitors that includes date and time of the entry and exit on a per 24-hour basis, the visitor's name, and individual point of contact.	Evidence may include, but is not limited to, a visitor control program that provides logging of the entry and exit of visitors including date, time, and visitor name along with the individual point of contact; dated visitor logs for each Defined Physical Boundary that include the same required information.
Reference to prior version: *CIP-006-4c R1.6.1*		**Change Description and Justification:** *Addressed multi entry requirements and added the point of contact which is the person who can be considered the sponsor for the visitor. There is no need to document the escort or handoffs between escorts.*	

Rationale: To ensure all Physical Access Control Systems and devices continue to function properly.

Summary of Changes: Reformatted into table structure.

Added details to address FERC Order 706, paragraph 581 directives for test more frequently than every three years.

R3. Each Responsible Entity shall implement one or more documented maintenance and testing programs that collectively include each of the applicable items in *CIP-006-5 Table R3 – Maintenance and Testing Program*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*

M3. Evidence must include each of the documented maintenance and testing programs that collectively include each applicable item in *CIP-006-5 Table R3 – Maintenance and Testing Program* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-006-5 Table R3 – Maintenance and Testing Program			
Part	**Applicability**	**Requirement**	**Measures**
3.1	Associated Physical Access Control Systems Locally mounted hardware or devices associated with Defined Physical Boundaries	Prior to commissioning, and at least once every 24 calendar months thereafter, maintenance and testing of the Physical Access Control Systems and locally mounted hardware or devices at the Defined Physical Boundary to ensure the required functionality is being provided.	Evidence may include, but is not limited to a maintenance and testing program that provides for testing the Physical Access Control Systems and locally mounted hardware or devices associated with Defined Physical Boundaries prior to commissioning and at least once every 24 calendar months thereafter, and provides additional evidence to demonstrate that this testing was done, such as dated maintenance records, or other documentation showing testing and maintenance has been performed at least once on each applicable device or system at least once every 24 calendar months.
Reference to prior version: *CIP-006-4c R8.1*		**Change Description and Justification:** *Added details to address FERC Order 706 p581 directives to test more frequently than every three years. It was felt annually testing was too often.*	
3.2	Associated Physical Access Control or Monitoring Systems	Log dates, time, and duration for failures or outages of access control, logging, and alerting systems.	Evidence may include, but is not limited to, availability of the outage records.
Reference to prior version: *CIP-006-4c R8.3*		**Change Description and Justification:** *Outage records shall be generated but the retention period is addressed in the retention section.*	

C. Compliance

1. Compliance Monitoring Process

5.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- For responsible entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- For NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

5.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

5.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

5.4. Additional Compliance Information

Guidelines and Technical Basis

While the focus is shifted from the definition and management of a completely enclosed "six-wall" boundary, it is expected in many instances this will remain a primary control for controlling, alerting and logging access to BES Cyber Systems. Taken together, these controls will effectively constitute the physical security plan to manage physical access to BES Cyber Systems.

Requirement R1:

Methods to restrict physical access include:

- Card Key: A means of electronic access where the access rights of the card holder are predefined in a computer database. Access rights may differ from one perimeter to another.
- Special Locks: These include, but are not limited to, locks with "restricted key" systems, magnetic locks that can be operated remotely, and "man-trap" systems.
- Security Personnel: Personnel responsible for controlling physical access who may reside on-site or at a monitoring station.
- Other Authentication Devices: Biometric, keypad, token, or other equivalent devices that control physical access into the Defined Physical Boundary.

Methods to alert on physical access include:

- Alarm Systems: Systems that alarm to indicate interior motion or when a door, gate or window has been opened without authorization. These alarms must provide for immediate notification to personnel responsible for response.
- Human Observation of Access Points: Monitoring of physical access points by security personnel who are also controlling physical access.

Methods to log physical access include:

- Computerized Logging: Electronic logs produced by the Responsible Entity's selected access control and alerting method.
- Video Recording: Electronic capture of video images of sufficient quality to determine identity.
- Manual Logging: A log book or sign-in sheet, or other record of physical access maintained by security or other personnel authorized to control and monitor physical access.

The FERC Order 706 p572 directive, directed the intent of utilizing two or more different and complementary physical access controls to provide defense in depth. It does not require two or more Defined Physical Boundaries, nor does it exclude the use of layered perimeters. Use of two-factor authentication would be acceptable at the same entry points for a non-layered single perimeter. For example, a sole perimeter's controls could include either a combination of card key and pin-code (something you know and something you have), or a card key and biometric scanner (something you have and something you are), or a physical key in

combination with a guard-monitored remote camera and door release, where the “guard” has adequate information to authenticate the person they are observing or talking to prior to permitting access (something you have and something you are). The two-factor authentication could be implemented using a single Physical Access Control System but more than one authentication method must be utilized. For physically layered protection, a locked gate in combination with a locked control-building could be acceptable, provided no single authenticator (i.e. key or card key) would provide access through both.

Typically any opening greater than 96 square inches with one side greater than six inches in length would be considered an access point into the Defined Physical Boundary. Protective measures such as bars, wire mesh or other permanently installed metal barrier could be used to reduce the opening size as long as it is leaves no opening greater 96 square inches or no more than six inches on its shortest side.

Requirement R2:

The logging of visitors should capture each visit of the individual and does not need to capture each entry or exit during that visit. This is meant to allow a visitor to temporarily exit the Defined Physical Boundary to obtain something they left in their vehicle or outside the area without requiring a new log entry for each and every entry during the visit.

It is also felt a Point of Contact should be documented who can provide additional details about the visit if questions arise in the future. The point of contact could be the escort but there is no need to document everyone that acted as an escort for the visitor.

Requirement R3:

This includes the testing of locally mounted hardware or devices used in controlling, alerting or logging access to the Defined Physical Boundary. This includes motion sensors, electronic lock control mechanisms and badge readers which are not deemed to be part of the Physical Access Control System but are required for the protection of the BES Cyber Systems.

Outage records should address when the installed control, monitor and logging systems or hardware at access points are broken or unavailable.

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-4

3. Purpose: Standard CIP-007-4 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-007-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-4, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-4 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-4 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards.	

		Removal of reasonable business judgment and acceptance of risk. Revised the Purpose of this standard to clarify that Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing Cyber Assets and other (non-Critical) Assets within an Electronic Security Perimeter. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. R9 changed ninety (90) days to thirty (30) days Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of the *Version 5 CIP Cyber Security Standards* for a 45-day formal comment period. An initial concept paper, *Categorizing Cyber Systems — An Approach Based on BES Reliability Functions,* was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3	12/16/09	Updated version number from -2 to -3 Approved by the NERC Board of Trustees	
3	3/31/10	Approved by FERC	
4	12/30/10	Modified to add specific criteria for Critical Asset identification	Update
4	1/24/11	Approved by the NERC Board of Trustees	Update
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — System Security Management

2. Number: CIP-007-5

3. Purpose: Standard CIP-007-5 requires the implementation of technical mechanisms for reducing the risk of loss of availability due to degradation and misuse of BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-007-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-007-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.
- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization

processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for R1: The requirement is intended to minimize the attack surface of BES Cyber Systems through disabling or limiting access to unnecessary network accessible logical ports and physical I/O ports.

Summary of Changes: Changed the 'needed for normal or emergency operations' to those ports that are documented with reasons why they are necessary. In the March 18, 2010 FERC issued an order to approve NERC's interpretation of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports and services" refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the drafting team to address unused physical ports.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in CIP-007-5 Table R1 – Ports and Services. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations]*

M1. Evidence must include the documented processes that collectively include each of the applicable items in CIP-007-5 Table R1 – Ports and Services and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-5 Table R1– Ports and Services			
Part	**Applicability**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems with External Routable Connectivity Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Disable or restrict access to unnecessary logical network accessible ports and document the need for any remaining logical network accessible ports.	Evidence may include, but is not limited to, documentation of the need for each network-accessible port and screen shots showing the accessible ports of BES Cyber Assets.
Reference to prior version: *CIP-007-4 R2.1 and R2.2*		**Change Description and Justification:** *The requirement focuses on the entity knowing and only allowing those ports that are necessary. The additional classification of 'normal or emergency' added no value and has been removed.*	
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers	Disable or restrict the use of unnecessary physical input/output ports used for network connectivity, console commands, or removable media.	Evidence may include, but is not limited to, documentation stating specific or types of physical input/output ports to restrict and screen shots or pictures showing the ports restricted either logically through system configuration or physically using a port lock or signage.
Reference to prior version: *NEW*		**Change Description and Justification:** *In the March 18, 2010 FERC issued an order to approve NERC's interpretation of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports and services" refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the drafting team to address unused physical ports.*	

Rationale for R2: Security patch management is a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner to gain control of or render a BES Cyber Asset or BES Cyber System inoperable.

The remediation plan can be updated as necessary to maintain the reliability of the BES, including an explanation of any rescheduling of the remediation actions.

Summary of Changes: The existing wordings of CIP-007, Requirements R3, R3.1, and R3.2, were separated into individual line items to provide more granularity. The documentation of a source (s) to monitor for release of security related patches, hotfixes, and/or updates for BES Cyber System or BES Cyber Assets was added to provide context as to when the "release" date was. The current wording stated "document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades" there has been confusion as to what constitutes the availability. Due to issues that may occur regarding Control System vendor license and service agreements flexibility must be given to Responsible Entities to define what sources are being monitored for BES Cyber Assets.

R2. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in CIP-007-5 Table R2 – Security Patch Management. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in CIP-007-5 Table R2 – Security Patch Management and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-5 Table R2 – Security Patch Management			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Identify a source or sources that are monitored for the release of security related patches, or updates for all software and firmware associated with BES Cyber System or BES Cyber Assets.	Evidence may include, but is not limited to, a list of sources that are monitored on an individual BES Cyber System or BES Cyber Asset basis. The list could be sorted by BES Cyber System or source.
Reference to prior version: *New*		**Change Rationale:** *Defining the source(s) that a Responsible Entity monitors for the release of security related patches, hotfixes, and/or updates will provide a starting point for assessing the effectiveness of the patch management program. Documenting the source is also used to determine when the assessment timeframe clock starts. This requirement also handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system.*	

CIP-007-5 Table R2 – Security Patch Management			
Part	**Applicability**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Identify applicable security-related patches or updates and create a remediation plan, or revise an existing remediation plan, within 30 days of release from the identified source that addresses the vulnerabilities within a defined timeframe.	Evidence may include, but is not limited to, an assessment conducted by, referenced by, or on behalf of a Registered Entity of security-related patches or updates released by the documented sources, and a dated remediation plan showing how the vulnerability will be addressed.
Reference to prior version: *CIP-007 R3.1*		**Change Rationale:** *Similar to the current wording but added "from the identified source" to establish where the release is from. The current wording: "The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades" has led to varying opinions as to what constitutes "availability" of the patches or upgrades. The addition attempts to clarify where the release is from.*	

CIP-007-5 Table R2 – Security Patch Management			
Part	**Applicability**	**Requirements**	**Measures**
2.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	A process for remediation, including any exceptions for CIP Exceptional Circumstances.	Evidence may include, but is not limited to: • Exports from automated patch management tools that provide installation date; • Verification screen captures that show BES Cyber System Component software revision; • Registry exports that show software has been installed; • Evidence that affected services have been disabled; • Implementation evidence of software configuration changes recommended by the operating system or Control System vendors.

CIP-007-5 Table R2 – Security Patch Management			
Part	**Applicability**	**Requirements**	**Measures**
Reference to prior version: *CIP-007 R3.2*		**Change Rationale:** This is the same concept as in the current CIP-007 R3.2 wording however a 30 day window was given to allow for documentation of the actual implementation in a less time constrained manner where manual processes are used. Splitting the implementation of security related patches, hotfixes, and/or updates into a separate item from compensating measures will provide granularity. Automated processes allow the implementation to be documented and confirmed electronically in a short time period. Manual processes may take an extended period of time to complete documentation of the installation. Priority should be given to the implementation rather than the documentation.	

Rationale for R3: Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable components of a BES Cyber system. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System.

The requirement for Maintenance Cyber Assets or media in 3.4 is intended to ensure that devices used for maintenance do not accidently introduce malicious code into the BES Cyber System or introduce an unauthorized external access point to the BES Cyber System.

This requirement also clarifies that these devices may be temporarily connected to the BES Cyber System, but do not become a part of the BES Cyber System, nor are they considered Protected Cyber Assets. These devices may be temporarily connected locally to the BES Cyber System for maintenance, but must be protected from introducing malicious code.

Summary of Changes: In prior versions, this requirement has arguably been the single greatest generator of TFE's as it prescribed a particular technology to be used on every CCA regardless of that asset's susceptibility or capability to use that technology. As the scope of cyber assets in scope of these standards expands to more field assets, this issue will only grow exponentially. The drafting team is taking the approach of making this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every component. The BES Cyber System is the object of protection.

Beginning in paragraph 619-622 of FERC Order 706, and in particular 621, FERC agrees that the standard "does not need to prescribe a single method…However, how a responsible entity does this should be detailed in its cyber security policy so that it can be audited for compliance…"

In paragraph 622, FERC directs that the requirement be modified to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software through remote access, electronic media, or other means. The drafting team believes that addressing this issue holistically at the BES Cyber System level and regardless of technology, along with the enhanced change management requirements, meets this directive.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-007-5 Table R3 – Malicious Code Prevention*. *[Violation Risk Factor: Medium] [Time Horizon: Same Day Operations]*

M3. Evidence must include each of the documented processes that collectively include each of the applicable items in CIP-007-5 Table R3 – Malicious Code Prevention and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-5 Table R3 – Malicious Code Prevention			
Part	**Applicability**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Deploy method(s) to deter, detect, or prevent malicious code.	Evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (i.e. through traditional antivirus, system hardening, policies, etc.).
Reference to prior version: *CIP-007-4 R4* *CIP-007-4 R4.1*		**Change Rationale:** *See the Summary of Changes.*	
3.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Disarm or remove identified malicious code.	Evidence may include, but is not limited to: • Predetermined response actions for malicious code detection; • Configuration of anti-virus response actions (i.e. quarantine, alert, etc.) to detected malicious code; • Configuration of white-listing application to notify appropriate personnel of unauthorized applications.

CIP-007-5 Table R3 – Malicious Code Prevention			
Part	**Applicability**	**Requirements**	**Measures**
Reference to prior version: *CIP-007-4 R4* *CIP-007-4 R4.1*		**Change Rationale:** *See the Summary of Changes.*	
3.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Update malicious code protections within 30 calendar days of signature or pattern update availability (where the malicious code protections use signatures or patterns).	Evidence may include, but is not limited to, (i) current signature or pattern updates, and (ii) either screen shots showing the configuration of signature, or pattern updates for automated controls, or work logs showing the signature, or pattern updates for manual controls.
Reference to prior version: *CIP-007-4 R4* *CIP-007-4 R4.2*		**Change Rationale:** *See the Summary of Changes.*	
3.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Deploy method(s) to deter, detect, or prevent malicious code on Transient Cyber Assets and removable media when connecting them to BES Cyber Assets or Protected Cyber Assets.	Evidence may include, but is not limited to, logs showing when Transient Cyber Assets and removable media were connected to BES Cyber Assets or Protected Cyber Assets, and an inventory of Transient Cyber Assets and the methods used to detect, deter, or prevent malicious code.

CIP-007-5 Table R3 – Malicious Code Prevention			
Part	**Applicability**	**Requirements**	**Measures**
Reference to prior version: *New*		**Change Rationale:** *FERC Order 706 paragraph 621 states the standards development process should decide to what degree to protect BES Cyber Systems from personnel introducing malicious software. In addition, a common interpretation of the current standards is that any device connecting inside the ESP must at that point be in compliance with the full set of Standards. This requirement makes clear that the device performing maintenance is not considered a part of the BES Cyber System.*	
3.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Log each Transient Cyber Asset connection.	Evidence may include, but is not limited to, logs showing when Transient Cyber Assets were connected to BES Cyber Assets or Protected Cyber Assets.
Reference to prior version: *New*		**Change Rationale:** *FERC Order 706 paragraph 621 states the standards development process should decide to what degree to protect BES Cyber Systems from personnel introducing malicious software. In addition, a common interpretation of the current standards is that any device connecting inside the ESP must at that point be in compliance with the full set of Standards. This requirement makes clear that the device performing maintenance is not considered a part of the BES Cyber System.*	

Rationale for R4: Security event monitoring has the purpose of detecting unauthorized access, reconnaissance and other malicious activity on BES Cyber Systems and comprises of the activities involved with the collection, processing, alerting and retention of security-related computer logs. These logs can provide both (1) the immediate detection of an incident and (2) useful evidence in the investigation of an incident. The retention of security-related logs is intended to support post-event data analysis.

Audit processing failures are not penalized in this requirement. Instead, the requirement specifies processes which must be in place to monitor and respond to audit processing failures.

Summary of Changes: Beginning in paragraph 525 and also 628 of the FERC Order 706, the commission directs a manual review of security event logs on a more periodic basis. This requirement combines CIP-005-4 R5 and CIP-007-4 R6 and addresses both directives from a system-wide perspective. The primary feedback received on this requirement from the informal comment period was the vagueness of terms “security event” and “monitor”.

The term “security event” or “events related to cyber security” is problematic because it does not apply consistently across all platforms and applications. To resolve this term, the requirement takes an approach similar to NIST 800-53 and requires the entity to define the security events relevant to the system.

In addition, this requirement sets up parameters for the monitor and review processes. It is rarely feasible or productive to look at every security log on the system. Paragraph 629 of the FERC Order 706 acknowledges this reality when directing a manual log review. As a result, this requirement allows the manual review to consist of a sampling or summarization of security events occurring since the last review.

R4. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in CIP-007-5 Table R4 – Security Event Monitoring. [Violation Risk Factor: Medium] [Time Horizon: Same Day Operations and Operations Assessment]

M4. Evidence must include each of the documented processes that collectively include each of the applicable items in CIP-007-5 Table R4 – Security Event Monitoring and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-5 Table R4 – Security Event Monitoring			
Part	**Applicability**	**Requirements**	**Measures**
4.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Log generated events for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Any detected failed access attempts at Electronic Access Points 4.1.2. Any detected successful and failed login attempts 4.1.3. Any detected malware 4.1.4. Any detected potential malicious activity.	Evidence may include, but is not limited to, a paper or system generated listing of event classes for which the BES Cyber System is configured to generate logs. This listing must include the required event types.
Reference to prior version: *CIP-005-4 R3, CIP-007-4 R5, R5.1.2 R6.1, R6.3*		**Change Description and Justification:** *This requirement is derived from NIST 800-53 version 3 AU-2, which requires organizations to determine system events to audit for incident response purposes. The industry expressed confusion in the term "system events related to cyber security" from informal comments received on CIP-011. Changes made here clarify this term by allowing entities to first define these security events. Access logs from the ESP as required in CIP-005-4 R3 and user access and activity logs as required in CIP-007-5 R5 are also included here.*	

CIP-007-5 Table R4 – Security Event Monitoring			
Part	**Applicability**	**Requirements**	**Measures**
4.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems with External Routable Connectivity Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Generate alerts for events that the Responsible Entity determines to necessitate a real-time alert.	Evidence may include, but is not limited to paper or system-generated listing of event classes and conditions which necessitate real-time alerts; Assessment documentation or report showing analysis was performed to determine which events the Responsible Entity determines necessitate a real-time alert; Screen-shots showing how real-time alerts are configured.
Reference to prior version: *CIP-005-4 R3.2, CIP-007-4 R6.2*		**Change Description and Justification:** *This requirement is derived from alerting requirements in CIP-005-4 R3.2 and CIP-007-4 R6.2 in addition to NIST 800-53 version 3 AU-6. Previous CIP Standards required alerting on unauthorized access attempts and detected Cyber Security Incidents, which can be vast and difficult to determine from day to day. Changes to this requirement allow the entity to determine events that necessitate an immediate response.*	

CIP-007-5 Table R4 – Security Event Monitoring			
Part	**Applicability**	**Requirements**	**Measures**
4.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems with External Routable Connectivity Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Detect and activate a response to event logging failures before the end of the next calendar day.	Evidence may include, but is not limited to, (i) dated event logging failures and screen-shots showing how real-time alerts were configured (ii) dated records showing that personnel were dispatched or a work ticket was opened to review and repair logging failures.
Reference to prior version: *New Requirement*		**Change Rationale:** *This requirement was derived from NIST 800-53 version 3 AU-5, which addresses response to audit processing failures. Some interpretations of version 4 CIP Cyber Security Standards considered the failure of the security event monitoring and alerting system to be a violation. The purpose of this requirement is to have mitigation in place rather than penalizing audit processing failures.*	
4.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Retain BES Cyber System security-related event logs identified in 4.1 for at least the last 90 consecutive calendar days, where technically feasible.	Evidence may include, but is not limited to, security-related event logs from the past ninety days and records of disposition of security-related event logs beyond ninety days up to the evidence retention period.
Reference to prior version: *CIP-005-4 R3.2, CIP-007-4 R6.4*		**Change Rationale:** *No substantive change.*	

CIP-007-5 Table R4 – Security Event Monitoring			
Part	**Applicability**	**Requirements**	**Measures**
4.5	High Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Review a summarization or sampling of logged events every two weeks to identify unanticipated BES Cyber Security Incidents and potential event logging failures. Activate a response to rectify any deficiency identified from the review before the end of the next calendar day.	Evidence may include, but is not limited to, documentation describing the review, any findings from the review (if any), signed and dated documentation showing the review occurred, and dated evidence showing that personnel were dispatched or a work ticket was opened to rectify the deficiency.
Reference to prior version: *CIP-005-4 R3.2, CIP-007-4 R6.5*		**Change Description and Justification:** *Beginning in paragraph 525 and also 628 of the FERC Order 706, the commission directs a manual review of security event logs on a more periodic basis and suggests a weekly review. The Order acknowledges it is rarely feasible to review all system logs. Indeed, log review is a dynamic process that should improve over time and with additional threat information. Changes to this requirement allow for a weekly summary or sampling review of logs.*	

Rationale for R5: To help ensure that no authorized individual can gain electronic access to a BES Cyber System until the individual has been authenticated, i.e., until the individual's logon credentials have been validated. R5 also seeks to reduce the risk that static passwords, where used as authenticators, may be compromised.

Changing default passwords closes an easily exploitable vulnerability in many systems and applications.

For password-based user authentication, using strong passwords and changing them periodically helps mitigate the risk of successful password cracking attacks and the risk of accidental password disclosure to unauthorized individuals. In these requirements, the drafting team considered multiple approaches to ensuring this requirement was both effective and flexible enough to allow Responsible Entities to make good security decisions. One of the approaches considered involved requiring minimum password entropy, but the calculation for true information entropy is more highly complex and makes several assumptions in the passwords users choose. Users can pick poor passwords well below the calculated minimum entropy.

The drafting team also chose to not require technical feasibility exceptions for devices that cannot meet the length and complexity requirements in password parameters. The objective of this requirement is to apply a measurable password policy to deter password cracking attempts, and replacing devices to achieve a specified password policy does not meet this objective. At the same time, this requirement has been strengthened to require account lockout or alerting for failed login attempts, which in many instances better meets the requirement objective.

The requirement to change passwords exists to address password cracking attempts if an encrypted password were somehow attained and also to refresh passwords which may have been accidentally disclosed over time. The requirement permits the entity to specify the periodicity of change to accomplish this objective. Specifically, the drafting team felt determining the appropriate periodicity based on a number of factors is more effective than specifying the period for every BES Cyber System in the Standard. In general, passwords for user authentication should be changed at least annually. The periodicity may increase in some cases. For example, application passwords that are long and pseudo-randomly generated could have a very long periodicity. Also, passwords used only as a weak form of application authentication, such as accessing the configuration of a relay may only need to be changed as part of regularly scheduled maintenance.

The Cyber Asset should automatically enforce the password policy for individual user accounts. However, for shared accounts in which no mechanism exists to enforce password policies, the Responsible Entity can enforce the password policy procedurally and through internal assessment and audit.

Summary of Changes (From R5): CIP-007-4 R5.2.2 and R5.2.3 requiring the identification and management of shared account access have been removed. These requirements already exist in the authorization, security event monitoring and revocation of access, and guidance for these requirements makes clear the consideration of shared accounts. The requirement to identify and determine acceptable use for these accounts remains and the Standard includes additional guidance on types of accounts to identify and appropriate use of these account types.

CIP-007-4 R5.3 requires the use of passwords and specifies a specific policy of 6 characters or more with a combination of alpha-numeric and special characters. The level of detail in these requirements can restrict more effective security measures. For example, many have interpreted the password for tokens or biometrics must satisfy this policy and in some cases prevents the use of this stronger authentication. Also, longer passwords may preclude the use of strict complexity requirements. The password requirements have been changed to allow the entity to specify the most effective password parameters based on the impact of the BES Cyber System, the way passwords are used, and the significance of passwords in restricting access to the system. The SDT feels these changes strengthen the authentication mechanism by requiring entities to look at the most effective use of passwords in their environment. Otherwise, prescribing a strict password policy has the potential to limit the effectiveness of security mechanisms and preclude better mechanisms in the future.

R5. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-007-5 Table R5 – System Access Controls*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M5. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in CIP-007-5 Table 5 – System Access Controls and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-007-5 Table R5 – System Access Control			
Part	**Applicability**	**Requirements**	**Measures**
5.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Validate credentials before granting electronic access to each BES Cyber System.	Evidence may include, but is not limited to, documentation describing how users are authenticated before being granted access and demonstrations showing authenticated access enforcement of internal and remote paths to the BES Cyber System.
Reference to prior version: *CIP-007-4 R5*		**Change Rationale:** *The requirement to enforce authentication for all user access is included here. The requirement to establish, implement, and document controls is included in this introductory requirement. The requirement to have technical and procedural controls was removed because technical controls suffice when procedural documentation is already required. The phrase "that minimize the risk of unauthorized access" was removed and more appropriately captured in the rationale statement.*	

CIP-007-5 Table R5 – System Access Control			
Part	**Applicability**	**Requirements**	**Measures**
5.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	The CIP Senior Manager or delegate must authorize the use of administrator, shared, default, and other generic account types.	Evidence may include, but is not limited to, a listing of accounts by account types and signed documentation or workflow by a CIP Senior Manager or delegate showing the approval of account types in use for the BES Cyber System.
Reference to prior version: *CIP-007-4 R5.2, R5.2.1*		**Change Rationale:** *CIP-007-4 requires entities to minimize and manage the scope and acceptable use of account privileges. The requirement to minimize account privileges has been removed because the implementation of such a policy is difficult to measure at best.*	
5.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Identify individuals who have authorized access to shared accounts.	Evidence may include, but is not limited to, listing of shared accounts and the individuals who have access to each shared account.
Reference to prior version: *CIP-007-4 R5.2.2*		**Change Rationale:** *No significant changes. Added "authorized" access to make clear that individuals storing, losing or inappropriately sharing a password is not a violation of this requirement.*	

CIP-007-5 Table R5 – System Access Control			
Part	**Applicability**	**Requirements**	**Measures**
5.4	All Responsible Entities	Procedural controls for initially changing default passwords, where technically feasible, unless the default password is unique to the device or instance of the application, on BES Cyber Assets, Electronic Access Control or Monitoring Systems, Physical Access Control Systems, and Protected Cyber Assets. For the purposes of this requirement an inventory of Cyber Assets is not required.	Evidence may include, but is not limited to: • Demonstration showing default vendor passwords have been changed, sampled on a locational basis. • Records of a procedure that passwords are changed when new devices are deployed. • Documentation in system manuals or other vendor documents showing default vendor passwords were generated pseudo-randomly and are thereby unique to the device.
Reference to prior version: *CIP-007-4 R5.2.1*		**Change Rationale:** *The requirement for the "removal, disabling or renaming of such accounts where possible" has been removed and incorporated into guidance for acceptable use of account types. This was removed because those actions are not appropriate on all account types. Added the option of having unique default passwords to permit cases where a system may have generated a default password or a hard-coded uniquely generated default password was manufactured with the BES Cyber System.*	

CIP-007-5 Table R5 – System Access Control			
Part	**Applicability**	**Requirements**	**Measures**
5.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For password-based user authentication, either technically or procedurally enforce the following password parameters: 5.5.1. Password length that is the lesser of at least eight characters or the maximum length supported by the BES Cyber System. 5.5.2. Minimum password complexity of three or more different types of characters (e.g., uppercase alphabetic, lowercase alphabetic, numeric, non-alphanumeric) or the maximum complexity supported by the BES Cyber System. 5.5.3. Password change or an obligation to change the password on an entity-specified time frame based on the impact level of the BES Cyber System, the significance of passwords in the set of controls used to prevent unauthorized access to the BES Cyber System and existing service agreements, warranties or licenses.	Evidence may include, but is not limited to: • System-generated reports or screen-shots of the system-enforced password parameters, including length, complexity and periodicity of changing passwords. • Attestations by individuals that the procedurally enforced passwords meet the password parameters.

CIP-007-5 Table R5 – System Access Control			
Part	**Applicability**	**Requirements**	**Measures**
Reference to prior version: *CIP-007-4 R5.3*		**Change Rationale:** *CIP-007-4 R5.3 requires the use of passwords and specifies a specific policy of 6 characters or more with a combination of alpha-numeric and special characters. The level of detail in these requirements can restrict more effective security measures. The password requirements have been changed to permit the maximum allowed by the device in cases where the password parameters could otherwise not achieve a stricter policy. This change still achieves the requirement objective to minimize the risk of unauthorized disclosure of password credentials while recognizing password parameters alone do not achieve this. The drafting team felt allowing the Responsible Entity the flexibility of applying the strictest password policy allowed by a device outweighed the need to track a relatively minimally effective control through the TFE process..*	
5.6	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	A process to limit, where technically feasible, the number of unsuccessful authentication attempts or generating alerts after a threshold of unsuccessful login attempts.	Evidence may include, but is not limited to: • Screen-shots of the account-lockout parameters • Rules in the alerting configuration showing how the system notified individuals after a determined number of unsuccessful login attempts.
Reference to prior version: *New Requirement*		**Change Rationale:** *Minimizing the number of unsuccessful login attempts significantly reduces the risk of live password cracking attempts. This is a more effective control in live password attacks than password parameters.*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

Guidelines and Technical Basis

Requirement R1:

Requirement 1 exists to reduce the attack surface of BES Cyber Assets by requiring entities to disable known unnecessary ports. The intent is for the entity to know what is accessible on their assets and systems, why they are needed, and disable or restrict access to all other ports.

1.1. For the logical network ports this is most often accomplished by disabling the corresponding service or program that is listening on the port. It can also be accomplished through using host-based firewalls or other means on the device to restrict access. This control is another layer in the defense against network-based attacks, therefore it is the intent that the control be on the device itself; blocking ports at a perimeter does not satisfy this requirement. If a device has no provision for disabling or restricting logical ports on the device (example - purpose built devices that run from firmware with no port configuration available) then those ports that are open are deemed necessary.

1.2. Examples of physical I/O ports include network, serial and USB ports external to the device casing. BES Cyber Systems should exist within a Defined Security Boundary in which case the physical I/O ports have protection from unauthorized access, but it may still be possible for accidental use such as connecting a modem or inserting a USB drive with auto-run capability. In cases where the Component cannot logically restrict physical ports, entities should have clear signs or obstructions indicating the unnecessary ports are not to be used.

Requirement R2:

The intent of R2 is to require entities to know, track, and mitigate the known software vulnerabilities associated with their BES Cyber Assets. It is not strictly an "install every security patch" requirement; its main intention is to "be aware of in a timely manner and manage all known vulnerabilities" requirement.

Patch management is required for BES Cyber Systems that are accessible remotely as well as standalone systems. Stand alone systems are vulnerable to intentional or unintentional introduction of malicious code. A sound defense-in-depth security strategy employs additional measures such as physical security, malware prevention software, and software patch management to reduce the introduction of malicious code or the exploit of known vulnerabilities.

One or multiple processes could be utilized. An overall assessment process may exist in a top tier document with a low tier documents establishing the more detailed process followed for individual systems. Low tier documents could be used to cover BES Cyber System nuances that may occur at the system level.

2.1. *Documenting the source is required to determine when the assessment timeframe clock starts. This requirement handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system.* The source can take many forms. The National Vulnerability Database, Operating System vendors, or Control System vendors

could all be sources to monitor for release of security related patches, hotfixes, and/or updates. In the event that software or firmware is no longer supported by a software or firmware vendor or Control System vendor it can be noted in your source document. Considerable care must be taken in applying security related patches, hotfixes, and/or updates or applying compensating measures to BES Cyber System or BES Cyber Assets that are no longer supported by vendors. The security patches, hotfixes, and/or updates or compensating measures may reduce the reliability of the system. The Responsible Entity must be allowed to evaluate their individual risk exposure and determine if actions must be taken to secure the system.

2.2. The intent is for Responsible Entities to perform an assessment of security related patches as they are released from their monitored source and create a remediation plan for applicable patches as to how the vulnerability will or has already been remediated. An assessment should consist of determination of the applicability of the entity's specific environment and systems. IF the patch is determined to be non-applicable, that is documented with the reasons why and the entity is compliant. If the patch is applicable, the assessment can include a determination of the risk involved, how the vulnerability can be remediated, and the steps the entity has previously taken or will take. If the entity has to take steps to mitigate this new vulnerability, the remediation plan will include a timeframe. Timeframes do not have to be designated as a particular calendar day but can have event designations such as "at next scheduled outage of at least two days duration". The Responsible Entities can use the information provided in the Department of Homeland Security "Quarterly Report on Cyber Vulnerabilities of Potential Risk to Control Systems" as a source. The DHS document "Recommended Practice for Patch Management of Control Systems" provides guidance on an evaluative process. It uses severity levels determined using the Common Vulnerability Scoring System Version 2. Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.

When documenting the remediation plan measures it may not be necessary to document them on a one to one basis. The remediation plan measures may be cumulative. A measure to address a software vulnerability may involve disabling a particular service. That same service may be exploited through other software vulnerabilities. Therefore disabling the single service has addressed multiple patched vulnerabilities.

2.3. The entity has been notified of, has assessed, and has developed a plan to remediate the known risk and that plan must be implemented. Remediation plans that only include steps that have been previously taken are considered implemented upon completion of the documentation. Remediation plans that have steps to be taken to remediate the vulnerability must be implemented by the timeframe the entity documented in their plan. There is no maximum timeframe in this requirement as patching and other system changes carries its own risk to the availability and integrity of the systems and may require waiting until a planned outage. In periods of high demand or threatening weather, changes to systems may be curtailed or denied due to the risk to reliability.

Requirement R3:

Common malware introduction methods include web browsing, email attachments, and portable storage media. Due to the wide range of equipment comprising the BES Cyber Systems and the wide variety of vulnerability and capability of that equipment to malware, it is not practical within the standard to prescribe how malware is to be addressed on each component. Rather, the Responsible Entity determines on a BES Cyber System basis which components have susceptibility to malware intrusions and documents their plans and processes for addressing those risks and provides evidence that they follow those plans and processes. There are numerous options available including traditional anti-virus solutions for common operating systems, white-listing solutions, network isolation techniques, portable storage media policies, Intrusion Detection/Prevention (IDS/IPS) solutions, etc. If an entity has numerous BES Cyber Systems or components that are of identical architecture, they may provide one process that describes how all the components are covered.

For malware detection technologies that are updated in response to evolving threats or depend on signatures of known attacks, the entity must specify how those updates are tested before implementation. The testing should not negatively impact the reliability of the BES. The testing is focused on the update itself and if it will have an adverse impact on the BES Cyber System. The testing in no way implies that the entity is testing to ensure that malware is indeed detected by introducing malware into the environment. It is strictly focused on insuring that the update does not negatively impact the BES Cyber System before those updates are placed into production. This includes the instance where the update may provide a "false positive."

Requirement R4:

Refer to NIST 800-92 for additional guidance in security event monitoring.

4.1. In a complex computing environment and faced with dynamic threats and vulnerabilities, it is not practical within the Standard to enumerate all security-related events necessary to support the activities for alerting and incident response. Rather, the Responsible Entity determines which computer generated events are necessary to log, provide alerts and monitor for their particular BES Cyber System environment.

Specific security events already required in version 4 of the CIP Standards carry forward in this version. This includes access attempts at the Electronic Access Points, if any have been identified for a BES Cyber Systems. Examples of access attempts include: (i) blocked network access attempts, (ii) successful and unsuccessful remote user access attempts, (iii) blocked network access attempts from a remote VPN, and (iv) successful network access attempts or network flow information.

User access and activity events include those events generated by Cyber Assets within the Electronic Security Perimeter that have access control capability. These types of events include: (i) successful and unsuccessful authentication, (ii) account management, (iii) object access, and (iv) processes started and stopped.

It is not the intent that if a device cannot log a particular event that a TFE must be generated. The intent is that if any of the items in the bulleted list (for example, user logouts) can be

logged by the device, but the entity disables or neglects to enable that logging, it is a violation. If the device does not have the capability of logging that event, the entity remains compliant.

4.2. Real-time alerting allows the cyber system to automatically communicate events of significance to designated responders. This involves configuration of a communication mechanism and log analysis rules. Alerts can be configured in the form of an email, text message, or system display and alarming. The log analysis rules can exist as part of the operating system, specific application or a centralized security event monitoring system. On one end, a real-time alert could consist of a set point on an RTU for a login failure, and on the other end, a security event monitoring system could provide multiple alerting communications options triggered on any number of complex log correlation rules.

The events triggering a real-time alert may change from day to day as system administrators and incident responders better understand the types of events that might be indications of a cyber-security incident. Configuration of alerts also must balance the need for responders to know an event occurred with the potential inundation of insignificant alerts. The following list includes examples of events a Responsible Entity should consider in configuring real-time alerts:

- Detected known or potential malware or malicious activity
- Login failures for critical accounts
- Interactive login of system accounts
- Enabling of accounts
- Newly provisioned accounts
- System administration or change tasks by an unauthorized user
- Authentication attempts on certain accounts during non-business hours
- Unauthorized configuration changes
- Insertion of removable media in violation of a policy

4.3. Event logging failures occur when the components of the BES Cyber System cannot log events the Responsible Entity designated in 4.1. The most common reason for event logging failures is the event log being filled up beyond its configured storage threshold. However, there may be any number of other reasons for event logging failures.

For centralized logging systems, it should not be considered a failure if communication goes down between the cyber asset and the logging system if the cyber asset can store the logs locally for a period of time until the communication comes back up.

4.5. Reviewing logs every two weeks can consist of analyzing a summarization or sampling of logged events. NIST SP800-92 provides a lot of guidance in periodic log analysis. If a centralized security event monitoring system is used, log analysis can be performed top-down starting with a review of trends from summary reports. The log review can also be an extension of the exercise in identifying those events needing real-time alerts by analyzing events that are not fully understood or could possibly inundate the real-time alerting.

Requirement R5:

Account types referenced in this guidance typically include:

- Shared user account: An account used by multiple users for normal business functions by employees or contractors. Usually on a device that does not support Individual User Accounts.
- Individual user account: An account used by a single user.
- Administrative account: An account with elevated privileges for performing administrative or other specialized functions. These can be individual or shared accounts.
- System account: Accounts used to run services on a system (web, DNS, mail etc). No users have access to these accounts.
- Application account: A specific system account, with rights granted at the application level often used for access into a Data Base.
- Guest account: An individual user account not typically used for normal business functions by employees or contractors and not associated with a specific user. May or may not be shared by multiple users.
- Remote access account: An individual user account only used for obtaining Interactive Remote Access to the BES Cyber System.

5.3. Where possible, any accounts provided by a vendor should be removed, renamed, or disabled prior to production use of the Cyber Asset or BES Cyber System. If this is not possible, the passwords must be changed from the default provided by the vendor. Default passwords can be commonly published in vendor documentation that is readily available to all customers using that type of equipment and possibly published online.

The requirement option to have unique password addresses cases where the Cyber Asset generates or has assigned pseudo-random default passwords at the time of production or installation. In these cases, the default password does not have to change because the system or manufacturer created it specific to the Cyber Asset.

5.5. Technical or procedural enforcement of password parameters are required where passwords are the only credential used to authenticate individuals. Technical enforcement of the password parameters means a Cyber Asset verifies an individually selected password meets the required parameters before allowing the account to authenticate with the selected password. Technical enforcement should be used in most cases when the authenticating Cyber Asset supports enforcing password parameters. Likewise, procedural enforcement means requiring the password parameters through procedures. Individuals choosing the passwords have the obligation of ensuring the password meets the required parameters.

Password complexity refers to the policy set by a Cyber Asset to require passwords to have one or more of the following types of characters: (1) lowercase alphabetic, (2) uppercase alphabetic, (3) numeric, and (4) non-alphanumeric or “special” characters (e.g. #, $, @, &), in various combinations.

The requirement to change passwords permits the Responsible Entity to determine the periodicity of the password change in their policies and procedures based on a number of factors. The following table suggests appropriate periodicity requirements for passwords based on these factors.

Account Type	Impact Level	Significance of passwords in preventing unauthorized access	Existing Service Agreements	Suggested Periodicity of Password Change
User account password	High	Primary access path	None.	90 days
User account password	Medium	Primary access path	None.	180 days
Shared account Password for a microprocessor relay, PLC, RTU, etc.	Medium	Local access path. Individuals must authenticate at an upstream device prior to gaining access.	None.	During regularly scheduled maintenance
Shared account password for a generation control system	Medium	Local access path. Individuals must authenticate at an upstream device prior to gaining access.	None.	During scheduled plant outages
Administrative account passphrase with 15+ characters	High or Medium	Local access path. Remote user must be authenticated using a different account	None.	1 year
System account password with 25+ pseudo-random characters	High or Medium	Local access path	None.	2 years or more

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-4

3. Purpose: Standard CIP-008-4 ensures the identification, classification, response, and reporting of Cyber Security Incidents related to Critical Cyber Assets. Standard CIP-008-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability

4.1. Within the text of Standard CIP-008-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-008-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Incident Response Plan — The Responsible Entity shall develop and maintain a Cyber Security Incident response plan and implement the plan in response to Cyber Security Incidents. The Cyber Security Incident response plan shall address, at a minimum, the following:

R1.1. Procedures to characterize and classify events as reportable Cyber Security Incidents.

R1.2. Response actions, including roles and responsibilities of Cyber Security Incident response teams, Cyber Security Incident handling procedures, and communication plans.

R1.3. Process for reporting Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC). The Responsible Entity must ensure that all reportable Cyber Security Incidents are reported to the ES-ISAC either directly or through an intermediary.

R1.4. Process for updating the Cyber Security Incident response plan within thirty calendar days of any changes.

R1.5. Process for ensuring that the Cyber Security Incident response plan is reviewed at least annually.

R1.6. Process for ensuring the Cyber Security Incident response plan is tested at least annually. A test of the Cyber Security Incident response plan can range from a paper drill, to a full operational exercise, to the response to an actual incident.

R2. Cyber Security Incident Documentation — The Responsible Entity shall keep relevant documentation related to Cyber Security Incidents reportable per Requirement R1.1 for three calendar years.

C. Measures

M1. The Responsible Entity shall make available its Cyber Security Incident response plan as indicated in Requirement R1 and documentation of the review, updating, and testing of the plan.

M2. The Responsible Entity shall make available all documentation as specified in Requirement R2.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation other than that required for reportable Cyber Security Incidents as specified in Standard CIP-008-4 for the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 The Responsible Entity may not take exception in its cyber security policies to the creation of a Cyber Security Incident response plan.

1.5.2 The Responsible Entity may not take exception in its cyber security policies to reporting Cyber Security Incidents to the ES ISAC.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated Version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008)
2. SC authorized moving the SAR forward to standard development (July 10, 2008)
3. CSO706 SDT appointed (August 7, 2008)
4. Version 1 of CIP-002 to CIP-009 approved by FERC (January 18, 2008)
5. Version 2 of CIP-002 to CIP-009 approved by FERC (September 30, 2009)
6. Version 3 of CIP-002 to CIP-009 approved by FERC (September 30, 2009)
7. Version 4 of CIP-002 to CIP-009 approved by NERC Board of Trustees (January 24, 2011) and filed with FERC (February 10, 2011)
8. Version 5 of CIP-002 to CIP-011 posted for formal comment and ballot (mm-dd-yy)

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees	Update
3	3/31/10	Approved by FERC	
4	12/30/10	Modified to add specific criteria for Critical Asset identification	Update
4	1/24/11	Approved by the NERC Board of Trustees	Update
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Incident Reporting and Response Planning

2. Number: CIP-008-5

3. Purpose: Standard CIP-008-5 requires the identification, classification, response, and reporting of BES Cyber Security Incidents related to BES Cyber Assets and BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-008-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-008-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.
- **High Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization

processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

- **Medium Impact BES Cyber Systems –** Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers –** Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity –** Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems –** Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems –** Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets –** Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Plans associated with High Impact BES Cyber Systems or Medium Impact BES Cyber Systems -a**pplies to any plan associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points –** Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a

Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for R1: So that consistent responses to BES Cyber Security Incidents involving BES Cyber Assets and BES Cyber Systems occur. Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned incident response capability is therefore necessary for rapidly detecting incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services. Once the number and severity of events rises to the level of becoming a reportable incident NERC EOP 4 directs further external reporting actions and timing requirements. When a requirement applies to All Responsible Entities, the drafting team proposes that an enterprise or single incident response plan for all BES Cyber Systems may be submitted. An organization may have a common plan for multiple registered entities it owns.

Summary of Changes: (FERC directives, most significant items, summary of smaller items)

R1. Each Responsible Entity shall have one or more BES Cyber Security Incident response plan(s) that collectively include each of the applicable items in *CIP-008-5 Table R1 – BES Cyber Security Incident Response Plan Specifications*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*

M1. Evidence must include each of the documented plan(s) that collectively include each of the applicable items in *CIP-008-5 Table R1 – BES Cyber Security Incident Response Plan Specifications*.

CIP-008-5 Table R1 – BES Cyber Security Incident Response Plan Specifications			
Part	**Applicability**	**Requirements**	**Measures**
1.1	All Responsible Entities	Processes to identify, classify, and respond to BES Cyber Security Incidents.	Evidence may include, but is not limited to, dated copies of BES Cyber Security Incident response plan(s) that include how to identify, classify, and respond to BES Cyber Security Incidents targeting the Electronic Security Perimeter or Defined Physical Boundary of a BES Cyber System and covers incidents that impact the reliability of BES.
Reference to prior version: *CIP-008 R1.1*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	
1.2	All Responsible Entities	A process to determine if an identified BES Cyber Security Incident is a Reportable BES Cyber Security Incident.	Evidence may include, but is not limited to, dated documentation of process(es) that provide guidance or thresholds for determining which BES Cyber Security Incidents are also Reportable BES Cyber Security Incidents.
Reference to prior version: *CIP-008 R1.1*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	

CIP-008-5 Table R1 – BES Cyber Security Incident Response Plan Specifications			
Part	**Applicability**	**Requirements**	**Measures**
1.3	All Responsible Entities	Define: 1.3.1. The roles and responsibilities of BES Cyber Security Incident response personnel; 1.3.2. The BES Cyber Security Incident handling procedures; 1.3.3. Internal staff and external organizations that should receive communication of the incident.	Evidence may include, but is not limited to, dated BES Cyber Security Incident response process(es) or procedure(s) that addresses roles and responsibilities of BES Cyber Security Incident response personnel, BES Cyber Security Incident handling processes or procedures, and communication processes or procedures.
Reference to prior version: *CIP-008 R1.2*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	

Rationale for R2: Added testing requirements to verify the REs response plan's effectiveness and consistent application in responding to a BES Cyber Security Incident(s) impacting a BES Cyber System.

R2. Each Responsible Entity shall implement its documented BES Cyber Security Incident response plan(s) to collectively include each of the applicable items in *CIP-008-5 Table R2 – BES Cyber Security Incident Response Plan Implementation and Testing. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning and Real-Time Operations]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable items in *CIP-008-5 Table R2 – BES Cyber Security Incident Response Plan Implementation and Testing*.

CIP-008-5 Table R2 – BES Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicability**	**Requirements**	**Measures**
2.1	All Responsible Entities	When a BES Cyber Security Incident occurs, the incident response plans must be used when incidents occur and include recording of deviations taken from the plan during the incident or test.	Evidence may include, but is not limited to, incident reports, logs, and notes that were kept during the incident response process, and documentation that lists and justifies deviations taken from the plan during the incident.
Reference to prior version: *CIP-008 R1.6*		**Change Description and Justification:** *Minor wording changes; essentially unchanged. Allows deviation from plan during actual events or testing if deviations are recorded for review.*	

CIP-008-5 Table R2 – BES Cyber Security Incident Response Plan Implementation and Testing			
Part	**Applicability**	**Requirements**	**Measures**
2.2	All Responsible Entities	Implement the BES Cyber Security Incident response plan(s) initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between executions of the plan(s): • by responding to an actual incident, or • with a paper drill or table top exercise, or • with a full operational exercise.	Evidence may include, but is not limited to, dated evidence of implementing the BES Cyber Security Incident response plan(s) initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months, from response to an actual incident, or with a paper drill or table top exercise, or with a full operational exercise.
Reference to prior version: *CIP-008 R1.6*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	
2.3	All Responsible Entities	Retain relevant documentation related to Reportable BES Cyber Security Incidents for three calendar years.	Evidence may include, but is not limited to, dated documentation related to Reportable BES Cyber Security Incidents.
Reference to prior version: *CIP-008 R2*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	

Rationale for R3: Conduct sufficient reviews, updates and communications to verify the REs response plan's effectiveness and consistent application in responding to a Cyber Security Incident(s) impacting a BES Cyber System.

Summary of Changes: Addressed BES Cyber Security Incident response plan review, update, and communication specifications to ensure that BES Cyber Security Incident response plans remain updated and individuals are aware of the updates.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable items in *CIP-008-5 Table R3 – BES Cyber Security Incident Response Plan Review, Update, and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Assessment and Real-Time Operations]*

M3. Evidence must include each of the applicable documented processes that include each of the applicable items in *CIP-008-5 Table R3 – BES Cyber Security Incident Response Plan Review, Update and Communication* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-008-5 Table R3 – BES Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicability**	**Requirements**	**Measures**
3.1	All Responsible Entities	Review each BES Cyber Security Incident response plan for accuracy and completeness initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between reviews, and update if necessary.	Evidence may include, but is not limited to, dated documentation of a review of each BES Cyber Security Incident response plan(s) at least once every calendar year, not to exceed 15 calendar months, and an updated BES Cyber Security Incident response plan if necessary.
Reference to prior version: *CIP-008 R1.5*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	

CIP-008-5 Table R3 – BES Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Applicability**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Review the results of BES Cyber Security Incident Response Plan(s) test or actual incident response within thirty calendar days of the execution, documenting any lessons learned associated with the response plan.	Evidence may include, but is not limited to dated documentation of a review of the BES Cyber Security Incident Response Plan(s) test or actual incident response within thirty calendar days of the execution, including dated documentation of any lessons learned associated with the response plan.
Reference to prior version: *CIP-008 R1.5*		**Change Description and Justification:** *Included requirement for review after testing or actual response based on review of DHS controls*	
3.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Update the BES Cyber Security Incident response plan based on any documented lessons learned within sixty calendar days of the completion of the review of that plan.	Evidence may include, but is not limited to dated, documented lessons learned from the results of the BES Cyber Security Incident response plan and the dated, revised plan.
Reference to prior version: *CIP-008 R1.4*		**Change Description and Justification:** *Included additional specification on update of response plan Addresses FERC Requirement (686) to modify on lessons learned and aspects of the DHS Controls*	

CIP-008-5 Table R3 – BES Cyber Security Incident Response Plan Review, Update, and Communication			
Part	**Part**	**Part**	**Part**
3.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Update the BES Cyber Security Incident response plan(s) within thirty calendar days of any organizational, or technology changes that impact that plan.	Acceptable evidence may include, but is not limited to, updated documentation reflecting changes made to the BES Cyber Security Incident response plan in response to organizational or technology changes.
Reference to prior version: *CIP-008 R1.4*		**Change Description and Justification:** *Included additional specification on update of response plan Addresses FERC Requirement (686) to modify on lessons learned and aspects of the DHS Controls*	
3.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems	Communicate each update to the BES Cyber Security Incident response plan to each person with a defined role in the BES Cyber Security Incident response plan within thirty calendar days of the completion of the update of that plan.	Evidence of communication of updates may include, but is not limited to: • Emails • USPS or other mail service • Electronic distribution system • Training sign-in sheets.
Reference to prior version: *New Requirement*		**Change Description and Justification:** *Added specific timing requirement on communication of plan changes based on review of the DHS Controls*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long Term Planning**	**Lower**	N/A	N/A	The Responsible Entity has developed a BES Cyber Security Incident response plan, but the plan does not define the roles and responsibilities of response personnel, or does not define incident handling procedures, or does not communicate the incident to appropriate organizations.	The Responsible Entity has not developed a BES Cyber Security Incident response plan to identify, classify, and respond to BES Cyber Security Incidents. OR The Responsible Entity has developed a BES Cyber Security Incident response plan, but the plan does not identify Reportable BES Cyber Security Incidents.
R2	**Operations Planning** **Real-time Operations**	**Lower**	N/A	N/A	N/A	The Responsible Entity does not use its BES Cyber Security Incident response plan when an incident occurs. OR The Responsible Entity

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						has not tested the execution of its BES Cyber Security Incident response plan once each calendar year, not to exceed 15 calendar months between executions of the plan.
R3	**Operations Assessment** **Real-time Operations**	**Lower**	N/A	N/A	The Responsible Entity has reviewed but not updated each of its BES Cyber Security Incident response plans based on lessons learned within 30 calendar days of execution. OR The Responsible Entity has reviewed but not updated each of its BES Cyber Security Incident response plans within 30 calendar days of any	The Responsible Entity has not reviewed the results of each of its BES Cyber Security Incident response plan(s), test or actual incident response, within 30 calendar days of execution. OR The Responsible Entity has reviewed and updated each of its BES Cyber Security Incident response plans but has not communicated all

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
					system, organizational, or technology change that impacts one of the response plans.	updates to all responsible personnel.

Guidelines and Technical Basis

FAQ, SP99, ISA, US-CERT, NIST Guidelines, etc. as a source of materials

Requirement R1:

A Reportable BES Cyber Security Incident is a BES Cyber Security Incident that results in a necessary response action. A response action can fall into one of two categories: necessary or elective. The distinguishing characteristic is whether or not action was taken in response to an event. Precautionary measures that are not in response to any persistent damage or effects may be designated as elective. All other response actions should be designated as necessary.

A. Introduction

1. Title: Cyber Security — Recovery Plans for Critical Cyber Assets

2. Number: CIP-009-4

3. Purpose: Standard CIP-009-4 ensures that recovery plan(s) are put in place for Critical Cyber Assets and that these plans follow established business continuity and disaster recovery techniques and practices. Standard CIP-009-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-009-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator

4.1.2 Balancing Authority

4.1.3 Interchange Authority

4.1.4 Transmission Service Provider

4.1.5 Transmission Owner

4.1.6 Transmission Operator

4.1.7 Generator Owner

4.1.8 Generator Operator

4.1.9 Load Serving Entity

4.1.10 NERC

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-009-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Recovery Plans — The Responsible Entity shall create and annually review recovery plan(s) for Critical Cyber Assets. The recovery plan(s) shall address at a minimum the following:

R1.1. Specify the required actions in response to events or conditions of varying duration and severity that would activate the recovery plan(s).

R1.2. Define the roles and responsibilities of responders.

R2. Exercises — The recovery plan(s) shall be exercised at least annually. An exercise of the recovery plan(s) can range from a paper drill, to a full operational exercise, to recovery from an actual incident.

R3. Change Control — Recovery plan(s) shall be updated to reflect any changes or lessons learned as a result of an exercise or the recovery from an actual incident. Updates shall be communicated to personnel responsible for the activation and implementation of the recovery plan(s) within thirty calendar days of the change being completed.

R4. Backup and Restore — The recovery plan(s) shall include processes and procedures for the backup and storage of information required to successfully restore Critical Cyber Assets. For example, backups may include spare electronic components or equipment, written documentation of configuration settings, tape backup, etc.

R5. Testing Backup Media — Information essential to recovery that is stored on backup media shall be tested at least annually to ensure that the information is available. Testing can be completed off site.

C. Measures

M1. The Responsible Entity shall make available its recovery plan(s) as specified in Requirement R1.

M2. The Responsible Entity shall make available its records documenting required exercises as specified in Requirement R2.

M3. The Responsible Entity shall make available its documentation of changes to the recovery plan(s), and documentation of all communications, as specified in Requirement R3.

M4. The Responsible Entity shall make available its documentation regarding backup and storage of information as specified in Requirement R4.

M5. The Responsible Entity shall make available its documentation of testing of backup media as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-009-4 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Communication of revisions to the recovery plan changed from 90 days to 30 days. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).
3. CSO706 SDT appointed (August 7, 2008)
4. Version 1 of CIP-002 to CIP-009 approved by FERC (January 18, 2008)
5. Version 2 of CIP-002 to CIP-009 approved by FERC (September 30, 2009)
6. Version 3 of CIP-002 to CIP-009 approved by FERC (September 30, 2009)
7. Version 4 of CIP-002 to CIP-009 approved by NERC Board of Trustees (January 24, 2011) and filed with FERC (February 10, 2011)
8. Version 5 of CIP-002 to CIP-011 posted for formal comment and ballot (mm-dd-yy)

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	1/16/06	R3.2 — Change "Control Center" to "control center"	3/24/06
2	9/30/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3 In Requirement 1.6, deleted the sentence pertaining to removing component or system from service in order to perform testing, in response to FERC order issued September 30, 2009.	
3	12/16/09	Approved by the NERC Board of Trustees	Update
3	3/31/10	Approved by FERC	
4	12/30/10	Modified to add specific criteria for Critical Asset identification	Update
4	1/24/11	Approved by the NERC Board of Trustees.	
5	TBD	Modified to coordinate with other CIP standards and to revise format to use RBS Template	

Definitions of Terms Used in the Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Recovery Plans for BES Cyber Assets and Systems

2. Number: CIP-009-5

3. Purpose: Standard CIP-009-5 ensures that recovery plan(s) related to the storing of backup information are put in place for BES Cyber Assets and BES Cyber Systems and that these plans support and follow established business continuity and disaster recovery techniques and practices.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-009-5

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-009-5 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The

referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.
- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For

example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems with External Routable Connectivity** – Only applies to Medium Impact BES Cyber Systems with External Routable Connectivity. This also excludes Cyber Assets in the BES Cyber System that cannot be directly accessed through External Routable Connectivity.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale for R1: Preventative activities can lower the number of incidents, but not all incidents can be prevented. A preplanned recovery capability is therefore necessary for rapidly recovering from incidents, minimizing loss and destruction, mitigating the weaknesses that were exploited, and restoring computing services so that planned and consistent recovery action to restore BES Cyber Assets and BES Cyber Systems occurs.

Summary of Changes:

Added provisions to protect data that would be useful in the investigation of an event that results in the need for a cyber system recovery plan to be utilized.

R1. Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable items in *CIP-009-5 Table R1 – Recovery Plan Specifications*. *[Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]*

M1. Evidence must include the documented recovery plan(s) that collectively include the applicable items in CIP-009-5 Table R1 – Recovery Plan Specifications.

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicability**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Conditions for activation of the recovery plan(s).	Evidence may include, but is not limited to one or more plans that include language identifying specific conditions for activation of the recovery plan(s).
Reference to prior version: *CIP-009 R1.1*		**Change Description and Justification:** *Reworded to address FERC Order 706 P694 and simplify the wording.*	

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Applicability**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Roles and responsibilities of responders, including identification of the individuals, either by name or by title, responsible for recovery efforts.	Evidence may include, but is not limited to, one or more recovery plans that include language identifying the roles and responsibilities of responders, including identification of the individuals responsible for recovery efforts.
Reference to prior version: *CIP-009 R1.2*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	
1.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	One or more processes for the backup, storage, and protection of information required to restore BES Cyber System functionality.	Evidence may include, but is not limited to, documentation of specific processes for the backup, storage, and protection of information required to successfully restore a BES Cyber System.
Reference to prior version: *CIP-009 R4*		**Change Description and Justification:** *Minor wording changes; essentially unchanged.*	

CIP-009-5 Table R1 – Recovery Plan Specifications			
Part	**Part**	**Part**	**Part**
1.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Information essential to BES Cyber System recovery that is stored on backup media shall be verified initially after backup to ensure that the backup process completed successfully.	Evidence may include, but is not limited to, dated evidence of the verification that the backup process completed successfully.
Reference to prior version: *New Requirement*		**Change Description and Justification:** *Addresses FERC Order Section 739 and 748.*	
1.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Preserve data, where technically feasible, for analysis or diagnosis of the cause of any event that triggers activation of the recovery plan(s) as required in Requirement R1.	Evidence may include, but is not limited to, procedures to preserve data, such as preserving a corrupted drive, making a data mirror of the system before proceeding with recovery, or taking the important assessment steps necessary to avoid reintroducing the precipitating or corrupted data.
Reference to prior version: *New Requirement*		**Change Description and Justification:** *Added requirement to address FERC Order 706, paragraph 706.*	

Rationale for R2: To verify the Responsible Entities Recovery Plan's effectiveness. Planned and unplanned maintenance activities may also present opportunities to execute and document an Operational Exercise (see NIST SP 800-84, Functional Exercise). This is often applicable to operational systems where it may be otherwise disruptive to test certain aspects of the system or contingency plan. NIST SP 800-53, Appendix I, contains supplemental guidance.

NIST SP 800-84 identifies the following types of exercises widely used in information system programs by single organizations:

Tabletop Exercises. Tabletop exercises are discussion-based exercises where personnel meet in a classroom setting or in breakout groups to discuss their roles during an emergency and their responses to a particular emergency situation. A facilitator presents a scenario and asks the exercise participants questions related to the scenario, which initiates a discussion among the participants of roles, responsibilities, coordination, and decision making. A tabletop exercise is discussion-based only and does not involve deploying equipment or other resources.

Functional Exercises. Functional exercises allow personnel to validate their operational readiness for emergencies by performing their duties in a simulated operational environment. Functional exercises are designed to exercise the roles and responsibilities of specific team members, procedures, and assets involved in one or more functional aspects of a plan (e.g., communications, emergency notifications, system equipment setup). Functional exercises vary in complexity and scope, from validating specific aspects of a plan to full-scale exercises that address all plan elements.28 Functional exercises allow staff to execute their roles and responsibilities as they would in an actual emergency situation, but in a simulated manner.

Summary of Changes. Added operational testing for recovery of BES Cyber Systems.

R2. Each Responsible Entity shall implement its documented recovery plan(s) to collectively include each of the applicable items in *CIP-009-5 Table R2 – Recovery Plan Implementation and Testing [Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*

M2. Evidence must include, but is not limited to, documentation that collectively demonstrates implementation of each of the applicable items in *CIP-009-5 Table R2 – Recovery Plan Implementation and Testing.*

CIP-009-5 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Implement the recovery plan(s) referenced in R1 initially upon the effective date of the standard and at least once each calendar year thereafter, not to exceed 15 calendar months between executions of the plan: • by recovering from an actual incident, or • with a paper drill or tabletop exercise, or • with a full operational exercise.	Evidence may include, but is not limited to, dated evidence of a test (by recovering from an actual incident, with a paper drill or tabletop exercise, or with a full operational exercise) of the recovery plan at least once each calendar year, not to exceed 15 calendar months. For the paper drill or full operational exercise, evidence may include meeting notices, minutes, or other records of exercise findings.
Reference to prior version: *CIP-009 R2*		**Change Description and Justification:** *Minor wording change; essentially unchanged.*	
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Test any information used in the recovery of BES Cyber systems that is stored on backup media initially and at least once each calendar year, not to exceed 15 calendar months between tests, to ensure that the information is useable and reflects current configurations.	Evidence may include, but is not limited to, dated evidence of a test of any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least once each calendar year, not to exceed 15 calendar months between tests, to ensure that the information is useable and reflects current configurations.

CIP-009-5 Table R2 – Recovery Plan Implementation and Testing			
Part	**Applicability**	**Requirements**	**Measures**
Reference to prior version: *CIP-009 R5*		**Change Description and Justification:** *Combined Requirement from CIP-009 R5 included requirement to test when initially stored. Addresses FERC Requirements (739, 748) related to testing of backups.*	
2.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Test each of the recovery plans referenced in Requirement R1, initially upon the effective date of the standard, and at least once every 39 calendar months thereafter through an operational exercise of the recovery plans in a representative environment that reflects the production environment. An actual recovery response may substitute for an operational exercise.	Evidence may include, but is not limited to: • Dated evidence of an operational exercise initially upon the effective date of the standard and at least once every 39 calendar months between exercises, that demonstrates recovery in a representative environment; • An actual incident response occurred within the 39 calendar month timeframe that implemented the recovery plans.
Reference to prior version: *CIP-009 R2*		**Change Description and Justification:** *Addresses FERC Requirement (725) to add the requirement that the recovery plan test be a full operational test once every 3 years.*	

Rationale for R3: To enable the continued effectiveness of the Responsible Entities response plan's for planned and consistent restoration of BES Cyber System(s).

Summary of Changes:

Addressed recovery plan review, update, and communication specifications to ensure that recovery plans remain updated and individuals are aware of the updates.

R3. Each Responsible Entity shall maintain each of its recovery plans in accordance with each of the applicable items in *CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication*. *[Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]*

M3. Acceptable evidence includes, but is not limited to, each of the applicable items in *CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication.*

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicability**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Review the recovery plan(s) initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between reviews, or when BES Cyber Systems are replaced, and document any identified deficiencies or lessons learned.	Evidence may include, but is not limited to, dated evidence of a review of the recovery plan(s) initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between reviews, or when BES Cyber Systems are replaced, including documentation of any identified deficiencies.
Reference to prior version: *CIP-009 R1*		**Change Description and Justification:** *Added the requirements to additionally review plans after system replacement. Also added requirement for documentation of any identified deficiencies or lessons learned.*	

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Applicability**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Review the results of each recovery plan test or actual incident recovery within thirty calendar days of the completion of the exercise, documenting any identified deficiencies or lessons learned.	Evidence may include, but is not limited to, dated evidence of a review of the results of each recovery plan test or actual incident recovery within thirty calendar days of the of the completion of the exercise, documenting any identified deficiencies or lessons learned.
Reference to prior version: *CIP-009 R3*		**Change Description and Justification:** *Added the timeframe for update.*	
3.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Update the recovery plan(s) based on any documented deficiencies or lessons learned within thirty calendar days of the review required in Requirement R3, Part 3.2.	Evidence may include, but is not limited to, dated documentation of updates to the recovery plan(s).
Reference to prior version: *CIP-009 R3*		**Change Description and Justification:** *Added the timeframe for update.*	

CIP-009-5 Table R3 – Recovery Plan Review, Update and Communication			
Part	**Part**	**Part**	**Part**
3.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Update recovery plan(s) to address any organizational or technology changes within thirty calendar days of such change.	Evidence may include, but is not limited to, dated documentation of organizational or technology changes, and dated documentation updates to the recovery plan(s).
Reference to prior version: *New Requirement*		**Change Description and Justification:** *Ensures that recovery plans stay updated.*	
3.5	High Impact BES Cyber Systems Medium Impact BES Cyber Systems at Control Centers. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems	Communicate all recovery plan updates to each individual responsible under R1.2 for the recovery plan efforts within thirty calendar days of the update being completed.	Evidence of communication of updates may include, but is not limited to: • Emails • USPS or other mail service • Electronic distribution system • Training sign-in sheets.
Reference to prior version: *New Requirement*		**Change Description and Justification:** *Ensures that recovery personnel are aware of any changes to recovery plans.*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	TBD	Developed to define the configuration management and vulnerability assessment requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706	

Definitions of Terms Used in Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Configuration Management and Vulnerability Assessments

2. Number: CIP-010-1

3. Purpose: Standard CIP-010-1 requires that Responsible Entities have minimum configuration management and vulnerability assessment controls in place to protect BES Cyber Assets and BES Cyber Systems.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 Exemptions: The following are exempt from Standard CIP-010-1

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-010-1 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural

controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.

- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale – R1:

The configuration change management processes are intended to prevent unauthorized modifications to BES Cyber Systems.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-010-1 Table R1 – Configuration Change Management*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-010-1 Table R1 – Configuration Change Management* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-1 Table R1 – Configuration Change Management			
Part	**Applicability**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Develop a baseline configuration of the BES Cyber System, which shall include the following for each BES Cyber Asset identified, individually or by specified grouping: 1.1.1. Physical location; 1.1.2. Operating system(s) (including version); 1.1.3. Any commercially available application software (including version) intentionally installed on the BES Cyber Asset; 1.1.4. Any custom software and scripts developed for the entity; 1.1.5. Any logical network accessible ports; and 1.1.6. Any security-patch levels.	Evidence may include, but is not limited to: • A spreadsheet identifying the required items of the baseline configuration for each BES Cyber Asset in the BES Cyber System; • A record in an asset management system that identifies the required items of the baseline configuration for each BES Cyber Asset in the BES Cyber System.
Reference to prior version: *New Requirement*		**Change Rationale:** *The baseline configuration requirement was incorporated from the DHS Catalog for Control Systems Security. The baseline requirement is also intended to clarify precisely when a change management process must be invoked and which elements of the configuration must be examined.*	

CIP-010-1 Table R1 – Configuration Change Management			
Part	**Applicability**	**Requirements**	**Measures**
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Authorization, by the CIP Senior Manager or delegate, and document changes to the BES Cyber System that deviate from the existing baseline configuration.	Evidence may include, but is not limited to: • A change request record and associated electronic approval (performed by the individual with the authority to authorize the change) in a change management system for each change; • A record of each change performed along with the minutes of a "change advisory board" meeting (that indicate authorization of the change) where an individual with the authority to authorize the change was in attendance.
Reference to prior version: *CIP-007-3 R9* *CIP-003-3 R6*		**Change Rationale:** *The SDT added requirement to explicitly authorize changes. This requirement was previously implied by CIP-003-3 R6.*	

CIP-010-1 Table R1 – Configuration Change Management			
Part	**Applicability**	**Requirements**	**Measures**
1.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Update the baseline configuration and other documentation required by a NERC CIP Standard, including identification and categorization of the BES Cyber Systems, as necessary within 30 calendar days of completing the change.	Evidence may include, but is not limited to: • For changes that impacted the categorization of a BES Cyber System, dated categorization documents, with a date that is within 30 days of the date of the completion of the change; • For changes that impacted the CIP-009-required recovery plan of a BES Cyber System, a dated recovery plan, with a date that is within 30 days of the date of the completion of the change.
Reference to prior version: *CIP-007-3 R9*		**Change Rationale:** *Document maintenance requirement due to a BES Cyber System change is equivalent to the requirements in the previous versions of the standard.*	

CIP-010-1 Table R1 – Configuration Change Management			
Part	**Applicability**	**Requirements**	**Measures**
1.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	For a change to the BES Cyber System that deviates from the existing baseline configuration: 1.4.1. Prior to the change, determine required cyber security controls that could be impacted by the change; 1.4.2. Following the change, verify these required controls and the BES Cyber System availability are not adversely affected; and 1.4.3. Document the results of the verification.	Evidence includes, but is not limited to a list of security controls verified or tested along with the dated test results.
Reference to prior version: *CIP-007-3 R1*		**Change Rationale:** *The SDT attempted to provide clarity on when testing must occur and removed requirement for specific test procedures because it is implicit in the performance of the requirement.*	

CIP-010-1 Table R1 – Configuration Change Management			
Part	**Applicability**	**Requirements**	**Measures**
1.5	High Impact BES Cyber System	For each change that deviates from the existing baseline configuration for Control Centers: 1.5.1. Prior to implementing any change in the production environment, test the changes to the BES Cyber System in a test environment that models the baseline configuration of the BES Cyber System to ensure that required cyber security controls are not adversely affected; and 1.5.2. Document the results of the testing and the differences between the test environment and the production environment, including a description of the measures used to account for any differences in operation between the test and production environments.	Evidence includes, but is not limited to, a list of security controls tested along with successful test results and a list of differences between the production and test environments with descriptions of how any differences were accounted for, including of the date of the test.
Reference to prior version: *CIP-007-3 R1*		**Change Rationale:** *This requirement provides clarity on when testing must occur and requires additional testing to ensure that accidental consequences of planned changes are appropriately managed.* *This change addresses FERC Order ,paragraphs 397, 609, 610, and 611*	

Rationale – R2:

The configuration monitoring processes are intended to detect unauthorized modifications to BES Cyber Systems.

R2. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-010-1 Table R2 – Configuration Monitoring. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-010-1 Table R2 – Configuration Monitoring* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-1 Table R2 – Configuration Monitoring			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Where technically feasible, monitor for changes to the baseline configuration (as defined per CIP-010 R1, Part 1.1) and document and investigate the detection of any unauthorized changes.	Evidence may include, but is not limited to, logs from a system that is monitoring the configuration of the BES Cyber System along with records of investigation for any unauthorized changes that were detected by the system.
Reference to prior version: *New Requirement*		**Change Rationale:** *The monitoring of the configuration of the BES Cyber System provides an express acknowledgement of the need to consider malicious actions along with intentional changes.* *This requirement was added after review of the DHS Catalog of Control System Security and to address FERC Order 706, paragraph 397.DHS Catalog & addresses FERC Order 706, paragraph 397.*	

Rationale – R3:

The vulnerability assessment processes are intended to act as a component in an overall program to periodically ensure the proper implementation of security controls as well as to continually improve the security posture of BES Cyber Systems.

R3. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-010-1 Table R3– Vulnerability Assessments*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M3. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-010-1 Table R3 – Vulnerability Assessments* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-010-1 Table R3 – Vulnerability Assessments			
Part	**Applicability**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Initially upon the effective date of the standard and at least every calendar year thereafter, not to exceed 15 calendar months between assessments, conduct a paper or active assessment of the security controls to determine the extent to which the controls are implemented correctly and operating as designed.	Evidence may include, but is not limited to: • A document listing the date of the assessment (performed at least each calendar year, not to exceed 15 calendar months between assessments), the controls assessed for each BES Cyber System along with the method of assessment, and the individuals who performed the assessment; • A document listing the date of the assessment and the output of the tools used to perform the assessment.
Reference to prior version: *CIP-005-4, R4 and CIP-007-4, R8*		**Change Rationale:** *As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.*	

CIP-010-1 Table R3 – Vulnerability Assessments			
Part	**Applicability**	**Requirements**	**Measures**
3.2	High Impact BES Cyber Systems	Initially upon the effective date of the standard and at least once every 3 calendar years thereafter, not to exceed 39 calendar months between assessments, perform an active vulnerability assessment in a test environment that models the baseline configuration of the BES Cyber System in a production environment. Document the differences between the test environment and the production environment including a description of the measures used to account for any differences in operation between the test and production environments.	Evidence may include, but is not limited to, a document listing the date of the assessment (performed within 39 calendar months of the previous assessment), the output of the tools used to perform the assessment, and a list of differences between the production and test environments with descriptions of how any differences were accounted for in conducting the assessment.
Reference to prior version: *New Requirement*		**Change Rationale:** *FERC Order 706 p. 541, 542, 544, 547* *As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.*	
3.3	High Impact BES Cyber Systems Associated Electronic Access Control or Monitoring Systems	Except for CIP Exceptional Circumstances, prior to adding a new Cyber Asset to a BES Cyber System or Electronic Access Control or Monitoring System, perform an active vulnerability assessment of the Cyber Asset.	Evidence may include, but is not limited to, a document listing the date of the assessment (performed prior to the commissioning of the new BES Cyber Asset) and the output of the tools used to perform the assessment.

CIP-010-1 Table R3 – Vulnerability Assessments			
Part	**Applicability**	**Requirements**	**Measures**
Reference to prior version: *New Requirement*		**Change Rationale:** *FERC Order 706 p. 541, 542, 544, 547*	
3.4	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Document the results of the assessments and the action plan to remediate or mitigate vulnerabilities identified in the assessments including the planned date of completing the action plan and the execution status of that action plan.	Evidence may include, but is not limited to, a document listing the results or the review or assessment, a list of action items with proposed dates of completion, and records of the status of the action items (such as minutes of a status meeting, updates in a work order system, or a spreadsheet tracking the action items).
Reference to prior version: *CIP-005-3 R4.5* *CIP-007-3 R8.4*		**Change Rationale:** *Added a requirement for an entity planned date of completion as per the FERC directive in Order 706, paragraph 643.*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was complaint for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for since the last completed audit or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Registered Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Guidelines and Technical Basis

Requirement R1:

The physical location referred to in the baseline configuration is geographically where the BES Cyber Asset is located (e.g. Pine Valley Control Room, Generator X, Substation Y) and should be used to ensure that BES Cyber Systems receive the controls that are applicable to the environment in which the components are located (e.g. control center, transmission facility, generation facility). The physical location is not intended to be a specific floor plan location (e.g., panel A, rack B). As such, the physical location of virtual component should identify where the virtual components are being executed (e.g. Pine Valley Control Room, Generator X, Substation Y).

The Control Center test environment should model the baseline configuration, but may have a different set of components. For instance, an entity may have a BES Cyber System that runs a database on one component and a web server on another component. The test environment may have the same operating system, patch level, network accessible ports, and software, but have both the database and web server running on a single component instead of multiple.

Additionally, the entity should note that wherever a test environment is mentioned, the requirement is to "model" the baseline configuration and not duplicate it exactly. This language was chosen deliberately in order to allow for individual elements of a control center BES Cyber System which may not be able to be replicated such as a legacy map-board controller or the numerous data communication links from the field or to other control centers (such as by ICCP).

Requirement R2:

It should be understood that the intent of R2 is to require automated monitoring of the BES Cyber System. However, the Standards Drafting Team understands that there may be some Cyber Assets where automated monitoring may not be possible (such as a GPS time clock). It is for this reason that automated technical monitoring was not explicitly required and an entity may choose to accomplish this requirement through manual procedural controls.

Requirement R3:

The Responsible Entity should not that the requirement provides a distinction between paper and active vulnerability assessments. The justification for this distinction is well documented in the initial NOPR from FERC as well as FERC Order 706. In developing their Vulnerability Assessment processes, Responsible Entities are strongly encouraged to include at least the following elements:

Paper Vulnerability Assessment

1. Network Discovery - A review of all Electronic Access Points to the Electronic Security Perimeter
2. Network Port and Service Identification - A review to verify that all enabled ports and services have an appropriate business justification

3. Vulnerability Review - A review of security rule-sets and configurations including controls for default accounts, passwords, and network management community strings
4. Wireless Review - Identification of common types of wireless networks (such as 802.11a/b/g/n) and a review of their controls if they are in any way used for BES Cyber System communications

Active Vulnerability Assessment

1. Network Discovery - Use of active discovery tools to discover active devices and identify communication paths in order to verify that the discovered network architecture matches the documented architecture.
2. Network Port and Service Identification – Use of active discovery tools (such as Nmap) to discover open ports and services.
3. Vulnerability Scanning – Use of a vulnerability scanning tool to identify network accessible ports and services along with the identification of known vulnerabilities associated with services running on those ports.
4. Wireless Scanning – Use of a wireless scanning tool to discover wireless signals and networks in the physical perimeter of a BES Cyber System. Serves to identify unauthorized wireless devices within the range of the wireless scanning tool.

In addition, Responsible Entities are strongly encouraged to review NIST SP800-115 for additional guidance on how to conduct a vulnerability assessment.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed

1. SAR posted for comment (March 20, 2008).
2. SC authorized moving the SAR forward to standard development (July 10, 2008).

Description of Current Draft

This is the first posting of Version 5 of the CIP Cyber Security Standards for a 45-day formal comment period. An initial concept paper, Categorizing Cyber Systems — An Approach Based on BES Reliability Functions, was posted for public comment in July 2009. An early draft consolidating CIP-002 – CIP-009, numbered CIP-010-1 and CIP-011-1, was posted for public informal comment in May 2010. This version (Version 5) reverts to the original organization of the standards with some changes and addresses the balance of the FERC directives in its Order 706 approving Version 1 of the standards.

Anticipated Actions	Anticipated Date
45-day Formal Comment Period with Parallel Initial Ballot	11/03/2011
30-day Formal Comment Period with Parallel Successive Ballot	March 2012
Recirculation ballot	June 2012
BOT adoption	June 2012

Effective Dates

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[1]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

[1] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

Version History

Version	Date	Action	Change Tracking
1	TBD	Developed to define the information protection requirements in coordination with other CIP standards and to address the balance of the FERC directives in its Order 706	

Definitions of Terms Used in Standard

See the associated "Definitions of Terms Used in Version 5 CIP Cyber Security Standards," which consolidates and includes all newly defined or revised terms used in the proposed Version 5 CIP Cyber Security Standards.

When this standard has received ballot approval, the text boxes will be moved to the Application Guidelines Section of the Standard.

A. Introduction

1. Title: Cyber Security — Information Protection

2. Number: CIP-011-1

3. Purpose: Standard CIP-011-1 requires that Responsible Entities have protection controls in place to protect BES Cyber System Information.

4. Applicability:

4.1. Functional Entities: For the purpose of the requirements contained herein, the following list of Functional Entities will be collectively referred to as "Responsible Entities." For requirements in this standard where a specific Functional Entity or subset of Functional Entities are the applicable entity or entities, the Functional Entity or Entities are specified explicitly.

4.1.1 Balancing Authority

4.1.2 Distribution Provider that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.1.3 Generator Operator

4.1.4 Generator Owner

4.1.5 Interchange Coordinator

4.1.6 Load-Serving Entity that owns Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.1.7 NERC

4.1.8 Regional Entity

4.1.9 Reliability Coordinator

4.1.10 Transmission Operator

4.1.11 Transmission Owner

4.2. Facilities:

4.2.1 Load Serving Entity: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard

4.2.2 Distribution Providers: One or more Facilities that are part of any of the following systems or programs designed, installed, and operated for the protection or restoration of the BES:

- A UFLS program required by a NERC or Regional Reliability Standard
- A UVLS program required by a NERC or Regional Reliability Standard
- A Special Protection System or Remedial Action Scheme required by a NERC or Regional Reliability Standard
- A Transmission Protection System required by a NERC or Regional Reliability Standard
- Its Transmission Operator's restoration plan

4.2.3 All other Responsible Entities: **All BES Facilities**

4.2.4 The following are exempt from Standard CIP-011-1:

4.2.4.1 Cyber Assets at Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.4.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.4.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

4.2.4.4 Responsible Entities that, in compliance with Standard CIP-002-5, identify that they have no BES Cyber Systems.

5. Background:

Standard CIP-011-1 exists as part of a suite of CIP Standards related to cyber security. CIP-002-5 requires the initial identification and categorization of BES Cyber Systems. CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1 and CIP-011-1 require a minimum level of organizational, operational and procedural controls to mitigate risk to BES Cyber Systems. This suite of CIP Standards is referred to as the *Version 5 CIP Cyber Security Standards*.

Each requirement opens with "*Each Responsible Entity shall implement one or more documented processes that include the required items in [Table Reference].*" The referenced table requires the specific elements in the procedures for a common subject matter as applicable.

Measures for the initial requirement are simply the documented processes themselves. Measures in the table rows provide examples of evidence to show documentation and implementation of specific elements required in the documented processes. A numbered list in the measure means the evidence example includes all of the items in the list. In contrast, a bulleted list provides multiple options of acceptable evidence. These measures serve to provide guidance to entities in acceptable records of compliance and should not be viewed as an inclusive list.

The term *documented processes* refers to a set of required instructions specific to the Responsible Entity and to achieve a specific outcome. This term does not infer any naming or approval structure beyond what is stated in the requirements. An entity should include as much as they feel necessary in their documented processes, but they must address the applicable requirements in the table.

The terms *program* and *plan* are sometimes used in place of *documented processes* where it makes sense and is commonly understood. For example, documented processes describing a response are typically referred to as *plans* (i.e. incident response plans and recovery plans). Likewise, a security plan can describe an approach involving multiple procedures to address a broad subject matter.

Similarly, the term *program* may refer to the organization's overall implementation of its policies, plans and procedures involving a subject matter. Examples in the Standards include the personnel risk assessment program and the personnel training program. The full implementation of the CIP Cyber Security Standards could also be referred to as a program. However, the terms *program* and *plan* do not imply any additional requirements beyond what is stated in the Standards.

Applicability

Each table row has an applicability column to further define the scope to which a specific requirement row applies. The CSO706 SDT adapted this concept from the NIST Risk Management Framework as a way of applying requirements more appropriately based on impact and connectivity characteristics. The following conventions are used in the applicability column as described.

- **All Responsible Entities** – Applies to all Responsible Entities listed in the Applicability section of the Standard. This requirement applies at an organizational level rather than individually to each BES Cyber System. Requirements having this applicability comprise basic elements of an organizational CIP cyber security program.
- **High Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as High Impact according to the CIP-002-5 identification and categorization

processes. Responsible Entities can implement common controls that meet requirements for multiple High and Medium Impact BES Cyber Systems. For example, a single training program could meet the requirements for training personnel across multiple BES Cyber Systems.

- **Medium Impact BES Cyber Systems** – Applies to BES Cyber Systems categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Medium Impact BES Cyber Systems at Control Centers** – Only applies to BES Cyber Systems located at a Control Center and categorized as Medium Impact according to the CIP-002-5 identification and categorization processes.
- **Low Impact BES Cyber Systems with External Routable Connectivity** – Applies to each Low Impact BES Cyber Systems with External Routable Connectivity according to the CIP-002-5 identification and categorization process, which includes all other BES Cyber Systems not categorized as High or Medium.
- **Associated Electronic Access Control or Monitoring Systems** – Applies to each Electronic Access Control or Monitoring System associated with a corresponding High or Medium Impact BES Cyber Systems. Examples include, but are not limited to firewalls, authentication servers, and log monitoring and alerting systems
- **Associated Physical Access Control Systems** – Applies to each Physical Access Control System associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Associated Protected Cyber Assets** – Applies to each Protected Cyber Asset associated with a corresponding High or Medium Impact BES Cyber Systems.
- **Electronic Access Points** – Applies at Electronic Access Points (with External Routable Connectivity or dial-up connectivity) associated with a referenced BES Cyber System.
- **Electronic Access Points with External Routable Connectivity** – Applies at Electronic Access Points with External Routable Connectivity. This excludes those Electronic Access Points with dial-up connectivity.
- **Locally Mounted Hardware or Devices Associated with Defined Physical Boundaries** – Applies to the locally mounted hardware (e.g. such as motion sensors, electronic lock control mechanisms, and badge readers) associated with a Defined Physical Boundary for High or Medium Impact BES Cyber Systems. These hardware and devices are excluded in the definition of Physical Access Control Systems.

B. Requirements and Measures

Rationale – R1:

The intent of the information protection processes is to prevent unauthorized access to BES Cyber System Information.

Summary of Changes:

Requirement R4.1 was moved to the definition of BES Cyber System Information.

R1. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in *CIP-011-1 Table R1 – Information Protection*. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Evidence must include each of the applicable documented processes that collectively include the applicable items in *CIP-011-1 Table R1 – Information Protection* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-1 Table R1 – Information Protection			
Part	**Applicability**	**Requirements**	**Measures**
1.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	One or more methods to identify BES Cyber System Information.	Evidence may include, but is not limited to, • Indications on information (e.g., labels) that identify it as BES Cyber System Information; • Training materials that provide personnel with sufficient knowledge to recognize BES Cyber Security Information.
Reference to prior version: *CIP-003-3 R4* *CIP-003-3 R4.2*		**Change Rationale:** *The SDT removed the explicit requirement for classification as there was no requirement to have multiple levels of protection. This modification does not prevent having multiple levels of classification, allowing more flexibility for entities to incorporate the CIP information protection program into their normal business.*	

CIP-011-1 Table R1 – Information Protection			
Part	**Part**	**Part**	**Part**
1.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Access control and handling procedures for BES Cyber System Information.	Evidence may include, but is not limited to: • Records indicating information that is stored, transported, and disposed in a manner consistent with the documented process; • Records from an information management system containing electronic copies of BES Cyber System Information with user access implemented on a need-to-know basis; • Hardcopies of information stored in a locked file cabinet with keys provided to only authorized individuals.
Reference to prior version: *CIP-003-3 R4* *CIP-003-3 R5.3*		**Change Rationale:** *The SDT removed the language to "protect" information and replaced it with "Implement handling and access control" to clarify the protection that is required.*	

CIP-011-1 Table R1 – Information Protection			
Part	**Part**	**Part**	**Part**
1.3	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Initially upon the effective date of the standard and at least once every calendar year thereafter, not to exceed 15 months between assessments, assess adherence to its BES Cyber System Information protection process, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.	Evidence may include, but is not limited to, documented review, assessment results, action plan, and evidence to demonstrate that the action plan was implemented.
Reference to prior version: *CIP-003-3 R4.3*		**Change Rationale:** *No significant changes*	

Rationale – R2:

The intent of the media reuse and disposal processes is to prevent the unauthorized dissemination of BES Cyber System Information upon media reuse or disposal.

R2. Each Responsible Entity shall implement one or more documented processes that collectively include the applicable items in *CIP-011-1 Table R2 – Media Reuse and Disposal*. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M2. Evidence must include each of the applicable documented processes that collectively include each of the applicable items in *CIP-011-1 Table R2 – Media Reuse and Disposal* and additional evidence to demonstrate implementation as described in the Measures column of the table.

CIP-011-1 Table R2 – Media Reuse and Disposal			
Part	**Applicability**	**Requirements**	**Measures**
2.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Prior to the release for reuse of BES Cyber Asset media[2], the Responsible Entity shall take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.	Evidence may include, but is not limited to, records that indicate that BES Cyber Asset media was cleared prior to its reuse.
Reference to prior version: *CIP-007-3 R7.2*		**Change Rationale:** *(FERC Order 706 - p. 631) Consistent with FERC Order 706, paragraph 631, the SDT clarified that the goal was to prevent the unauthorized retrieval of information from the media, removing the word "erase" since, depending on the media itself, erasure may not be sufficient to meet this goal.*	

[2] For the purposes of this Standard, media should be considered to be any mass storage device onto which information from a BES Cyber Asset is recorded and stored electronically, including, but not limited to, magnetic tapes, optical disks, solid-state drives, and magnetic disks.

CIP-011-1 Table R2 – Media Reuse and Disposal			
Part	**Applicability**	**Requirements**	**Measures**
2.2	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Prior to the disposal of BES Cyber Asset media, the Responsible Entity shall destroy or take action to prevent the unauthorized retrieval of BES Cyber System Information from the media.	Evidence may include, but is not limited to, records that indicate that BES Cyber Asset media was purged or destroyed prior to its disposal.
Reference to prior version: *CIP-007-3 R7.1*		**Change Rationale:** *Consistent with FERC Order 706, paragraph 631, the SDT clarified that the goal was to prevent the unauthorized retrieval of information from the media, removing the word "erase" since, depending on the media itself, erasure may not be sufficient to meet this goal.* *The SDT also removed the requirement explicitly requiring records of destruction/redeployment as this was seen as demonstration of the existing requirement and not a requirement in and of itself.*	

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

- Regional Entity; or
- If the Responsible Entity works for the Regional Entity, then the Regional Entity will establish an agreement with the ERO or another entity approved by the ERO and FERC (i.e. another Regional Entity) to be responsible for compliance enforcement.
- If the Responsible Entity is also a Regional Entity the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
- If the Responsible Entity is NERC, a third-party monitor without vested interest in the outcome for NERC shall serve as the Compliance Enforcement Authority.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Each Responsible Entity shall retain data or evidence for three calendar years or for the duration of any regional or Compliance Enforcement Authority investigation; whichever is longer.
- If a Responsible Entity is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the duration specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Operations Planning**	**Medium**	**N/A**	**N/A**	The Responsible Entity has implemented one or more BES Cyber System Information protection processes that include one or more methods to identify BES Cyber System Information and one or more access control and handling procedures for BES Cyber System Information, but has failed to assess adherence, either initially upon the effective date of the standard or periodically, to its BES Cyber System Information protection processes.	The Responsible Entity has not implemented one or more BES Cyber System Information protection processes. OR The Responsible Entity has implemented one or more BES Cyber System Information protection processes, but has not included one or more methods to identify BES Cyber System Information OR The Responsible Entity has implemented one or more BES Cyber System Information protection processes, but has not included one or more access control and handling

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
						procedures for BES Cyber System Information.
R2	**Operations Planning**	**Lower**	N/A	N/A	The Responsible Entity has documented or implemented one or more media disposal or reuse processes to prevent the unauthorized retrieval of BES Cyber System Information from the media, but the media disposal or reuse processes, including the recording of the media purge or destruction, were not followed.	The Responsible Entity has not documented or implemented any media disposal or reuse process to prevent the unauthorized retrieval of BES Cyber System Information from the media.

D. Regional Variances

None.

E. Interpretations

None.

F. Associated Documents

None.

Guidelines and Technical Basis

Requirement R1:

Assumptions: Entities are free to utilize existing change management and asset management systems. However, the information contained within these systems must be evaluated as the information protection requirements still apply.

While separating BES Cyber System Information into separate classifications is not required as it was in version 4, responsible entities still have the flexibility to do this if they so desire. As long as the entity's information protection program includes all required elements, additional classification levels can be created that go above and beyond the requirements.

This requirement is not intended to cover publicly available information such as vendor manuals that are available via public websites or information that is deemed to be publicly releasable.

Information protection pertains to both digital and hardcopy information. Information handling procedures should detail access, sharing, copying, transmittal, distribution, and disposal or destruction of BES Cyber System Information.

Requirement R2:

Media sanitization is generally classified into 4 categories: disposal, clearing, purging, and destroying. For the purposes of this requirement, disposal by itself, with the exception of certain special circumstances such as the use of strong encryption on a drive used in a SAN, should never be considered acceptable. The use of clearing techniques may provide a suitable method of sanitization for media that is to be reused whereas purging techniques may be more appropriate for media which is ready for disposal. Entities are strongly encouraged to review NIST SP800-88 for guidance on how to develop acceptable media sanitization processes.

This requirement allows for BES Cyber Systems to be removed from service and analyzed with their media intact as this should not constitute a release for reuse. However, following the analysis, if the media is to be reused outside of a BES Cyber System or disposed of, it should be properly erased using a method to prevent the unauthorized retrieval of BES Cyber System Information from the media.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Project 2008-06 Cyber Security Order 706
Draft CIP-002-4 Informal Review

The Cyber Security Order 706 Standard Drafting Team thanks all commenters who submitted comments on the proposed CIP-002-4 changes. These standards were posted for a 30-day informal comment period from May 4, 2010 through June 3, 2010. The stakeholders were asked to provide feedback on the standards through a special Electronic Comment Form. There were 119 sets of comments. The complete record of comments submitted is posted on the Project 2008-06 Version 4 CIP Standards page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards, Herb Schrayshuen at (404) 446-2560 or at Herb.Schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Reliability Standards Development Procedures: http://www.nerc.com/standards/newstandardsprocess.html.

1. **Do you agree with the adoption of the following new or revised terms and their definitions for inclusion in the NERC Glossary: BES Cyber System Component, BES Cyber System, and Control Center? If not, please explain and supply your proposed modification.**

   1.a. **BES Cyber System Component — One or more programmable electronic devices (including hardware, software and data) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which respond to a BES condition or Disturbance; or enable control and operation.**

Summary Consideration:

Many commenters expressed concerns about the inclusion of software and data within the definition of BES Cyber System Component. One commenter observed that the definition should only include devices with routable connectivity. Many observed the laundry list of functions should be removed and replaced with the function that is more specific to the operation of the BES. A number of commenters proposed alternative language for the definition.

The SDT considered these comments and decided to define the term BES Cyber Asset to focus on the "real-time" impact on the "Reliability Operating Services" of the BES, which include those functions performed for the reliable operation of the BES. This definition now provides the foundation for the definition of BES Cyber Systems. In addition, the SDT has included clarification in the definition on the 15-minute characterization of "real-time."

The new proposed definition of **BES Cyber System** is: *One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services. A Maintenance Cyber Asset is not considered part of a BES Cyber System.*

The new proposed definition of **BES Cyber Asset** is: *A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services. This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the BES Reliability Operating Services. The timeframe is not in respect to any cyber security events or incidents, but is related to the time between when the Cyber Asset can send or receive instructions to operate and the time in which that operation occurs and impacts the BES. Redundancy shall not be considered when determining availability. A Transient Cyber Asset is not considered a BES Cyber Asset.*

The SDT has also modified the definition of Cyber Asset to make it more specific to the device and remove ambiguity on the exact nature of what is included in the definition of the Cyber Asset.

#	Organization	Yes or No	Question 1.a. Comment
1.a	WECC		Although this language is directly from the Federal Power Act, describing electronic devices as “hardware, software and data” is redundant and inaccurate. Electronic software and data reside on some type of hardware in all cases. Suggest removing the parenthetical as it is confusing and data is addressed later in the definition and the definition is clearer without it.If data is to be addressed in the standard it should be defined and addressed separately. The word “organized” is imprecise in this context; “Implemented,” “deployed,” or “utilized” may be a better word.The following rewrite is one proposed alternative.BES Cyber System Component - A programmable electronic device utilized in a BES Cyber System.
2.a	BGE	Agree with proposed definition	1.a and 1.b should be reversed. Disposition should be defined.
3.a	Old Dominion Electric Cooperative	Agree with proposed definition	Agreement is under the assumption that the present NERC definition of BES (e.g. =>100 kV) stands.
4.a	Progress Energy - Nuclear Generation	Agree with proposed definition	Define Disturbance
5.a	Florida Municipal Power Agency	Agree with proposed definition	FMPA agrees with the intent of the definition but believes that the definition can be improved significantly. FMPA offers the following simpler definition:”A programmable electronic device which responds to a BES condition or Disturbance, or enables control and operation of the BES.”For the following reasons: (i) “one or more” seems to

#	Organization	Yes or No	Question 1.a. Comment
			describe a system, not a singular component; (ii) we do not understand how “data” can be a component; and (iii) we do not understand the value of the “laundry list” of things components do and believe the focus should be on how the component impacts the BES.
6.a	Bonneville Power Administration	Agree with proposed definition	Greatly improved. Use of "...which respond..." clarifies that the standard is talking about control systems. However, please leave the parenthetical "(including hardware, software and data)" out. It is a bit confusing since data can't do any of the things listed. By definition a cyber system is made up of the hardware, the software and the data that allows it to operate. It appears that the punctuation in this definition is incorrect. We suggest:”One or more programmable electronic devices organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data which respond to a BES condition or Disturbance or enables control and operation.”
7.a	Dynegy Inc.	Agree with proposed definition	I agree but request additional detail examples be provided to determine specifically what these items are.
8.a	National Grid	Agree with proposed definition	National Grid agrees with the definition but seeks clarification from the SDT if the examples cited below will be considered as BES Cyber System Component:1) As part of the Burn Management System (BMS) in the power plant, the programmable PLC device is used along with the connected thermo-couples to monitor the temperature for fuel burning. If the temperature readings are wrong, the PLC can be programmed to take action to increase the fuel input or to limit/shutoff the fuel. This could have an immediate or short term effect (within 15 minutes). The amount of fuel determines what the output of the unit will be. Is the PLC or the entire BMS (including the PLC) BES Cyber Component? 2) Generating plant connects to Transmission Substation. There are programmable microprocessor relays installed within the substation for power plant / transmission line protection. Are these microprocessor relays BES Cyber Components?

#	Organization	Yes or No	Question 1.a. Comment
			3) The new BES Cyber System Component could also include the Exciter system that exists at Northport PS. Once again, could the PLC or the entire system, including the computer, be part of the BES Cyber Systems? 4) Another system that potentially could be included under the newer broad definition would be the Precipitator Rapper system. This system has a PLC that handles the Rappers. The system is not critical to Operations, however, under a broad definition that includes the 15-minute rule, if the Rappers failed, the unit(s) could be limited due to environmental compliance. The Precipitator Rappers are not connected to any network and are isolated.
9.a	Dairyland Power Cooperative	Agree with proposed definition	Shorten the name to BES Cyber Component.
10.a	Reliability & Compliance Group	Agree with proposed definition	The definition is O.K. Need to add BES to Disturbance and BES to enable control and operation. It would be more helpful if the definition “BES” were included in this document
11.a	Black Hills Corporation	Agree with proposed definition	The definition should include tie back to “BES Cyber System” as inserted above.
12.a	FEUS	Agree with proposed definition	The drafting team should consider clarifying; or enable or control and operation "of BES" or "greater than xxkV" This could be interpreted as an RTU in a 13.8kv sub serving only customer load.
13.a	PacifiCorp	Disagree with	: PacifiCorp agrees with EEI’s suggested alternative definition::BES Cyber System Component - One or more programmable electronic devices (including hardware)

#	Organization	Yes or No	Question 1.a. Comment
		proposed definition	organized for the processing, or display of BES operating status or condition; which respond to a BES condition or Disturbance; or that enable BES control and operation. The following elements are excluded from this definition: o Voice Communication systems o media (fiber, wiring, etc.) and transport devices (SONET, Microwave Equipment, etc.) installed between BES Cyber System Components as long as all access points are controlled by firewall devices. Explanation:"Software" has no function or purpose in the absence of an electronic host upon which it operates. To the degree that it is appropriate to identify controls or security objectives associated with software operating on [hardware] BES Cyber System Components, requirements should address software issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to the reliability of the BES."Data" is an extremely broad term that has very different meanings depending on the specific context within which it is used. To the degree that it is appropriate to identify controls or security objectives associated with data used for real time BES system operations, those requirements should address data integrity, availability, or confidentiality issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance the reliability of the BES. The terms storage, maintenance, disposition do not add clarity to the definition of BES Cyber System Component, and should be removed. In addition, the definition of "programmable" should be provided. Is a device that is "set" considered to be programmable?
14.a	Allegheny Energy Supply	Disagree with proposed definition	1) Does this definition need to cover more than a single device since a BES Cyber System is a collection of these? 2) Software and data should not be included in this definition. Protection of the software and data should be included in security requirements but not in the definition itself. Additionally these are both terms that are easily interpreted in different ways.3) It is difficult to get a clear understanding of what the terms "disposition" and "maintenance" mean in this context.4) Suggest: BES Cyber System Component - A programmable electronic device (including hardware), that is part of a BES Cyber System, providing input/output, processing, information storage, communications, human interaction (display, trending, alarming / alerting, input, etc.),

#	Organization	Yes or No	Question 1.a. Comment
			or maintenance, which is necessary for a BES Cyber System to fully perform its function.
15.a	Consultant	Disagree with proposed definition	1. Inclusion of the word 'communication' would seem to imply that communication equipment is included in the definition. Should be clarified to clearly state what aspects of communication, if any, is included.2. A 'component' would seem to be inconsistent with 'organized for the...' A component performs an activity, the 'system' would consist of 'components organized for the...'3. Software and Data are not programmable devices. Device implies hardware; if software and data are to be included the component definition should be clarified. What is software in terms of the definition? Operating system, application, database, word processing, executable files, scripts, and batch files...4. Component is singular - programmable electronic devices is plural. This is inconsistent. Suggest identifying a component (hardware, software, or data) as singular terms.5. I think "data" should be removed from this definition. Suggested new definition: BES Cyber System Component: hardware or software that performs one of the following functions (1) input, (2) processing, (3) storage, or (4) output of data that enables control or operation of a BES Cyber System.5.BES condition has no meaning. It is not a defined term, and therefore is vague. Suggest removing this wording or clarifying the intent.6. "... enable control or operation." - Of what, and when. All the time or only during a Disturbance? Needs clarification of the intent of this phrase.7. devices... for... display of data..." It is unclear how a display device could be compromised resulting in a degradation of the BES? 8. There is published literature that addresses the concepts of Cyber-Physical Systems that distinguishes between 'hardware components', 'software components', and 'bridge components' as the makeup of cyber-physical systems. This would appear to be a better framework for defining components than the listing of multiple functions, which dims the "bright lines" for consistently defining and categorizing the many variations and configurations within the industry.
16.a	Progress Energy (non-Nuclear)	Disagree with proposed	1. We feel programmable electronic devices is too broad. Also, it seems that there should be a distinction between firmware versus a traditional OS.2. From a generation perspective, these would be likely be in scope and shouldn't be - foundation field bus, device Net, smart transmitters (Rosemount), RS232/485 Serial connections and

#	Organization	Yes or No	Question 1.a. Comment
		definition	electronic protection relaying. We need to know if this would include DCS “Smart” field instrumentation using non-routable network protocols such as Foundation Fieldbus, DeviceNet, Hart, etc. Just about every instrument connected to plant automation system is a programmable electronic device. Per CIP 11 definitions of routable and non-routable they would be considered non-routable. We need examples of components included and components that would not be included. Possibly include examples for generation facilities, ECC’s and transmission. This could include Generator Protection Panels, PLC’s, EX2000 Generator exciter, Bentley Nevada vibration system, Medium Voltage Switch gear protective relays, motor protection relays, etc, etc. These are all “Programmable” and can be accessed via non-routable, ISO layer 1&2 hardware programming by MODBUS. All these devices are already INSIDE the protected Electric and Physical perimeter umbrella.3. The Standards definitions still seem to still be written to traditional PC and IT Business platforms. The standards need to be written to target single use industrial control systems.4. Based on this definition a microprocessor relay associated with a transmission line would be in consideration as a cyber component. If a device has burned in programming, maybe it is considered but classified low impact. User programmable devices may be a higher impact. Many programmable devices may not support use banners. Redundancy will not allow us to remove devices from scope.5. This reads like an ‘or’ definition. In that case, communication connectivity is not required for a device to be considered as a cyber system component. That needs to be very clear since with past standards we were evaluating based on external connectivity and routable vs. non-routable protocols.6. What constitutes a BES "condition"? 7. If definition is limited to the "organized" Cyber subsystems (e.g. 1.b. below) we can work with that. Attachment II appears to define the impact per Cyber System not component level. Suggest removal of component level definition and focus on system level issues.8. Proprietary protocols should not be included.9.Need clarification on what ‘programmable’ means. Recommended definition: Capable of dynamically accepting a sequence of operations to be automatically performed (a device which includes only firmware defined logic which cannot be dynamically changed - such as an EPROM - would not be included). Consider clarification between

#	Organization	Yes or No	Question 1.a. Comment
			programmable and configurable.10. Strike “one or more” because “one or more” implies a system not a component
17.a	Platte River Power Authority	Disagree with proposed definition	A “System Component” should be singular. For example: BES Cyber System Component - A programmable electronic device (to include the hardware, software and data) used for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which responds to a BES condition or disturbance; or enables control and operation.
18.a	LCEC	Disagree with proposed definition	A BES Cyber System Component should not be described as "One or more". Systems can contain more than one component but components should not consist of more than one device. Enable control and operation needs to describe what is being controlled or operated.
19.a	USACE - Omaha Anchor	Disagree with proposed definition	A) This definition could include phone systems - which according to the committee were not meant to be included in this standard. Has any thought been given to an exclusion table or specifically excluding telephone systems? B) Has any thought been given to separating out classification by operating system (OS)? - Ex. Windows, Unix, Solaris - high OS; PLC - low OS or general computing device. We are still going to have TFE issues with a lot of the low OS components.
20.a	Nuclear Energy Institute	Disagree with proposed definition	Agree with the exception that: Question 2 indicates that the definition of BES Cyber System bounds the scope to real-time operations systems, yet it is not clear from the proposed definition of BES Cyber System Component. Consider revising to:”One or more programmable electronic devices (including hardware, software and data) organized for the real-time collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which respond to a BES condition or Disturbance; or enable control and operation.”Lastly, the term “organize for” should be clarified by description such that a set of one-or-more programmable electronic devices constituting a BES Cyber System Component may be treated as a single system with respect to the application of requirements in CIP 011-1. This would preclude a debate

#	Organization	Yes or No	Question 1.a. Comment
			about how far down into an electronic device(s) the analysis must be performed. For example, a device with two programmable logic controllers on a single board may be treated as one BES Cyber System Component rather than individually as two BES Cyber System Components. Another example might include a turbine control system with vibration monitors. The collection of programmable electronic devices supporting the turbine control system including the monitors is a single BES Cyber System Component.
21.a	NextEra Energy Corporate Compliance	Disagree with proposed definition	At the workshop the drafting team requested that the industry point out comments that move the Version 4 forward, and any fatal flaws. The comments of NextEra Energy (and its affiliates, which include NextEra Resources and Florida Power & Light Company) (NextEra) will focus on constructive comments and fatal flaws. At this time, it appears that CIP-010 does not provide the proper foundation to build a CIP Standard that is well defined, so that the industry, the Regional Entities, NERC and FERC can all understand what is being protected, what is not being protected, or what should be protected via CIP-011. CIP-010 is thus fatally flawed. It is our opinion that CIP-010 should not offer the industry, auditors and regulators such flexibility to second guess each other, which is seen currently. Rather CIP-010 should have very clear definitions of what is the Control Center, what are the Transmission and Generation Cyber Systems that need to be protect and what are the BES Cyber System Components that must be protected for the identified Cyber Systems associated with Control Centers, Generators and Transmission. The flexibility protective options and performance based approach should be in CIP-011. Accordingly, NextEra requests that the drafting team develop a specific definition of what is and is not a BES Cyber System for Control Centers, for Generators, for Transmission - and list for each the BES Cyber Components that need to be protected in each. Given the short period of time from the workshop to these comments, NextEra was not able to propose definitions or lists, but NextEra will be working such and proposing them in the future. NextEra strongly recommends that the drafting team reconsider its flexibility approach in CIP-010 and requests, from the industry, specific definitions of what is and is not a BES Cyber System for Control Centers, for Generators, and for Transmission and a list for each of the BES Cyber Components that need to be protected in each. In this spirit, NextEra recommends the following edits.BES Cyber

#	Organization	Yes or No	Question 1.a. Comment
			System Component - A programmable electronic device (including hardware, software and data) listed below. At Control Centers, BES Cyber System Components are:(List)At Transmission Facilities, BES Cyber Systems Components are:(List)At Generation Facilities, BES Cyber Systems Components are:(List)
22.a	BCTC	Disagree with proposed definition	BCTC does not consider this a good definition as more clarity is required. The following are specific areas where BCTC feels the definition should be revised: - removal of the word “communication” “software” and “data” are not programmable devices. Their placement within the definition is confusing The definition is very “loose”. BCTC would like the definition to be more clear as to what is a cyber system component (i.e. must such a component have a routable protocol, etc.) - right now we find it difficult to grasp this concept based on the current definition When referring to BES System Components (and BES System) clarification is required as to whether we are referring to just ‘production’ environments; development or quality assurance environments are excluded from scope? If you have components of the BES Cyber System (i.e. EMS) which are considered LOW impact, can you segregate/ isolate these devices on a separate network segment w/ firewall so that these components remain categorized as LOW or must everything be considered HIGH impact if any of the components are classified as HIGH?
23.a	Manitoba Hydro	Disagree with proposed definition	BES Cyber System Component” definition needs to be clarified. The defining characteristics of the device should be clearly enumerated by using appropriate punctuation. Placement of semi-colons is confusing as drafted. Example: “A programmable electric device that: (a) is organized for the collection of... and (b) either: (i) responds to a BES condition or Disturbance; or ii) enables control and operation.
24.a	Luminant	Disagree with proposed definition	Better definition on "Data” should potentially be limited to the hardware that stores the data and not the data itself. This should exclude Black start radio systems and in plant personnel communications systems such as 450 Mhz radio systems. The semicolon after Disturbance should be removed.

#	Organization	Yes or No	Question 1.a. Comment
25.a	City Utilities of Springfield, Missouri	Disagree with proposed definition	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
26.a	ERCOT ISO	Disagree with proposed definition	Consider: "One or more programmable electronic devices (including hardware, software and data) designed for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which respond to a BES condition or Disturbance; or enable control and operation."
27.a	Tenaska	Disagree with proposed definition	Data integrity is out of scope because SCADA, EMS and DCS systems have software to recognize bad data. Also the display of data should be out of scope there are BES Cyber System Components that if compromised will not affect the reliability of the BES i.e. PI historian's. The Pi Historian is used to display and store data and is not used respond to a BES condition or Disturbance; or enable control and operation.
28.a	CWLP Electric Transmission, Distribution and Operations Department	Disagree with proposed definition	Data should not be included as part of a device. Communications paths should not be included.
29.a	US Army Corps of Engineers, Omaha District	Disagree with proposed definition	define term disposition [of data]
30.a	Constellation Energy Control and Dispatch, LLC	Disagree with proposed definition	Delete the term BES condition from the definition.

#	Organization	Yes or No	Question 1.a. Comment
31.a	Constellation Energy Commodities Group Inc.	Disagree with proposed definition	Delete the term maintenance and condition from the definition. The term maintenance, as used in the BES Cyber System Component statement, does not have direct impact to the reliability of the BES. Define the term disposition and describe how it applies to BES Cyber System Component.
32.a	CenterPoint Energy	Disagree with proposed definition	Disagree - CenterPoint Energy believes the definition should include a reference to an external communication connection. A disconnected cyber system component is secure. An unintended consequence of this definition may be that entities will install communication connections to isolated cyber system components to remotely manage access requirements of the standard. This defeats the benefits of isolation as a security measure. This definition as currently written would also include programmable electronic devices located in control cabinets mounted on yard equipment within the substation yard. Applying certain requirements of the current draft standards to such equipment is extremely problematic.
33.a	E.ON U.S.	Disagree with proposed definition	E ON U.S believes one or more electronic devices used exclusively to display data should not be considered a BES Cyber System Component
34.a	FirstEnergy Corporation	Disagree with proposed definition	FirstEnergy Summary Response: FirstEnergy (FE) appreciates the hard work of the CIP Standards Drafting Team in developing the version 2 CIP standards and the quick implementation of Commission directed changes reflected in version 3 CIP standards. FE strongly supports the work of the CIP SDT to develop further enhancements to the cyber security standards that improve reliability while providing clarity and certainty. Protecting and guarding against unauthorized access to cyber systems used in the protection and control of the bulk electric system is a reliability priority that FE shares. It is clear that the NERC CIP standards drafting team's fundamental approach is well-intentioned, but will result in a significant diversion of resources away from making concrete, tangible enhancements to the existing framework of cyber protections. FE

#	Organization	Yes or No	Question 1.a. Comment
			fundamentally endorses enhancements to the critical infrastructure protection standards that improve security, clarity, and certainty, but strongly believes that wholesale restructuring of the existing CIP standards is not necessary and may be counter-productive to those goals. While there are some that conclude it is not feasible to sufficiently enhance the underlying approach embodied in the existing CIP standards, these conclusions disregard the considerable investment in people, tools, and processes to address these requirements that would be abandoned in favor of an alternate formulation. Building from the existing CIP approved standards and implementation investments, while strengthening the standards to provide needed clarity and certainty offers a far expedited path to enhance cyber security, also providing greater confidence in the strength of the cyber protections in effect across the industry. A fundamental aspect the SDT proposed abandoning is the Critical Asset determination approach in favor of a wholesale impact categorization structure that introduces different terminology, concepts, and uncertainties, while offering little added clarity. We support the teams guiding principles - leveraging investments in current standards, minimizing the need for TFEs, reducing administrative overhead, etc. - however the proposed standards do not seem to practically meet the primary need for BES security. The key guiding principal for the enhanced cyber standards is clarity to which assets of the bulk electric infrastructure require cyber risk protection. The impact categorization depicted in Attachment II is a significant improvement in achieving a consistent approach for determining high impact critical assets representing the backbone of the bulk electric system. FE encourages the drafting team to focus its efforts on further developing Attachment II to obtain industry consensus on high impact assets and incorporate the work into the existing CIP-002 for consistent Critical Asset determination. To the extent essential, this work could further be integrated within the existing standards to determine another category of less-critical assets to the security of the BES, requiring respectively lesser degree of cyber security protection. Enhancing bulk electric system cyber security does not require a paradigm shift from approaches integrated into existing cyber security programs. We encourage the drafting team to maintain continuity and leverage significant industry investments in implementation of cyber

#	Organization	Yes or No	Question 1.a. Comment
			security protections undertaken over the last half-decade to achieve conformance with the CIP standards. The underlying work of the SDT reflected in the proposed CIP-010 and CIP-011 standards represent important enhancements that can, and should, be integrated with the existing CIP standard architecture, and avoid introducing new set of methodologies, definitions, and requirements that will require virtually every aspect of utility implementation to be restructured - policies, procedures, training, systems, drawings, contracts, data, compliance monitoring tools, forms, etc. These proposed changes offer little improvement in cyber security protection over what can be promptly gained by enhancing the existing standards. While the multilevel categorization is well intended, we believe the maximum security improvements can be more promptly achieved by integrating with the existing infrastructure protection requirements. In sum, FirstEnergy endorses an approach that allows for enhancements of existing implementation that affords more certainty and clarity, and avoids approaches that involve revamping the entire design of cyber protection implementation. Namely, we would like to see the SDT: Discard the concept of a wholesale rewrite of the CIP standards -- using the standards drafting team work as an input to the enhancements of the existing standards. Enhance the existing CIP-002 through CIP-009 standards to clarify and improve upon the established approach. Retain the fundamental terms, concepts, and standards numbering scheme to enable continuity. This approach would more effectively build upon the work that has already been accomplished, while allowing the industry to continue to improve on security and compliance related to critical infrastructure. We appreciate the drafting team's careful consideration of FE's views on the appropriate path forward in further enhancing the bulk electric system protections against unauthorized access to cyber assets. Although FE does not align with the team's overall approach we have thoroughly reviewed the proposed standards and offer constructive feedback to the specific questions asked by the drafting team. It's noted that our individual question responses in many instances do not reflect our primary position of enhancing BES cyber security in a manner that retains the framework and terminology of the existing standards. These responses are provided in order to provide clarity to the extent the concepts may be incorporated into revision of

#	Organization	Yes or No	Question 1.a. Comment
			the CIP-002 through CIP-009 standards. - - - - - - - - - - - - - Question 1.a Response: Suggested alternative definition:"BES Cyber System Component - One or more programmable electronic devices (hardware or software) relied upon to respond to a BES Contingency or Disturbance and supports control and operation of a critical BES Facility."Reasons for suggested changes: o The middle portion of the BES Cyber System Component definition is confusing and provides little value for distinguishing BES Cyber System Components from other components. The terms collection, storage, processing, maintenance, use, sharing, communication, disposition, or display do not add clarity and can be removed to simplify. The inclusion of the term "data" requires clarification. It's not clear how data can be considered a programmable electronic device. FE's proposal removes this term. The term 'BES condition' is vague and open to interpretation. We suggest use of the NERC defined term for Contingency. The team should also clarify for industry if configurable, but non-programmable devices are to be considered as BES Cyber System Components. Also it should be clear that communication media (fiber, wiring) and transport devices (SONET, Microwave, etc) installed between BES Cyber System Components are excluded.
35.a	ReliabilityFirst Staff	Disagree with proposed definition	For clarity, ReliabilityFirst suggests the following revision to the language of this requirement, ". . . (including each device's hardware, software and data). . ."
36.a	GTC & GSOC	Disagree with proposed definition	GTC and GSOC are concerned that there may be a component of a BES Cyber System which does not meet this definition of a BES Cyber System Component. If the intent is to apply a cyber security control to a BES Cyber System Component, the SDT should be careful that the definition indeed captures all of the individual devices that make up a BES Cyber System. We recommend the following definition. "A programmable electronic device (including the hardware, software and data necessary for the proper performance of its function) necessary for a BES Cyber System to perform its core functions."

#	Organization	Yes or No	Question 1.a. Comment
37.a	Matrikon Inc.	Disagree with proposed definition	I agree with this definition, but ask for a label/definition/category for those cyber systems that do not “respond to a BES condition or Disturbance; or enable control and operation” as they will exist in the field and will need to be labeled consistently across different entities/regions. Case and point, Responsible Entities could call them “Cyber System Components” or “Cyber Components” or “Discrete Cyber Assets” or “Cyber Assets”, all having the same meaning but different label for the Auditors to understand. I understand it is not a priority for the SDT to label those cyber assets not subject to NERC CIP compliance, but it would provide consistency for labeling those systems which have been evaluated, and confirmed no relationship to the Bulk Electric System.
38.a	American Municipal Power	Disagree with proposed definition	I disagree with the definition on the terms that it may introduce unnecessary or inappropriate interpretations.
39.a	Southwestern Power Administration	Disagree with proposed definition	I disagree with the proposed definition and offer a simpler one that clearly identifies what is in scope.BES Cyber System Component - A programmable electronic device that has the ability to control a BES Facility and/or process data for the real time operation of the BES.
40.a	Wolverine Power	Disagree with proposed definition	I have a concern relating to the definition of "BES generation" vs. "BES transmission”. The NERC definition for BES transmission is clear (100kV+), but NERC defers to each regional entity to define "BES generation “Acknowledgment of the regional entity's right to define what constitutes "BES generation" is important to the application of CIP-010 and CIP-011:As I read the standard, any generation determined to be "BES" in CIP-010/-011 must then automatically be categorized as "high, medium, or low" critical impact (per Attachment 2 of CIP-010). - Even the "low" impact introduces and mandates several cyber controls be in place. So my question is: (How do you objectively determine if specific generation resources really have a material effect on the BES? Some situations are obvious (reliability "must-run" resources on the grid for example) - But just because

#	Organization	Yes or No	Question 1.a. Comment
			a generation facility eventually interconnects with BES doesn't necessarily mean it's material to the BES. So the question of what constitutes "BES generation" is an important to clarify with respect to the application and ramifications of these proposed standards. Proposed Solution: Make reference to (explicitly mention in the standards) each regional entity's definition of "BES generation". In RFC's case, BES generation is defined as: (1) individual generation resources larger than 20 MVA or a generation plant with aggregate capacity greater than 75 MVA that is connected via a step-up transformer(s) to facilities operated at voltages of 100 kV or higher. This provides necessary clarity with respect to applying these standards. Generation listed as "blackstart" for a small TOP's restoration plan isn't necessarily material to the BES just because it can be argued that it eventually interconnects somehow with the BES - Clarity and bright line definition of BES generation is important to interpretation of this standard. The regional entities have provided clarification, and it should be acknowledged in these standards.
41.a	Green Country Energy	Disagree with proposed definition	I suggest adding "primary level" to the phrase enable control and operation. So that it would read enable primary level control and operation. I also request a definition of "respond to a BES condition" from a generator operator perspective.
42.a	Lincoln Electric System	Disagree with proposed definition	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
43.a	MidAmerican Energy Company	Disagree with proposed definition	MidAmerican Energy agrees with EEI's suggested alternative definition: BES Cyber System Component - One or more programmable electronic devices (including hardware) organized for the processing, or display of BES operating status or condition; which respond to a BES condition or Disturbance; or that enable BES control and operation. The following elements are excluded from this definition: Voice Communication systems media (fiber, wiring, etc.) and transport devices (SONET,

#	Organization	Yes or No	Question 1.a. Comment
			Microwave Equipment, etc.) installed between BES Cyber System Components as long as all access points are controlled by firewall devices. Explanation:"Software" has no function or purpose in the absence of an electronic host upon which it operates. To the degree that it is appropriate to identify controls or security objectives associated with software operating on [hardware] BES Cyber System Components, requirements should address software issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES."Data" is an extremely broad term that has very different meanings depending on the specific context within which it is used. To the degree that it is appropriate to identify controls or security objectives associated with data used for real time BES system operations, those requirements should address data integrity, availability, or confidentiality issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the Bested terms storage, maintenance, disposition do not add clarity to the definition of BES Cyber System Component, and should be removed.
44.a	The Empire District Electric Company	Disagree with proposed definition	Please consider the more simple definition: BES Cyber System Component - A programmable electronic device that has the ability to control a BES Facility and/or process data for the real time operation of the BES.
45.a	US Army Corps of Engineers	Disagree with proposed definition	Please define the term disposition [of data].
46.a	Puget Sound Energy	Disagree with proposed definition	Puget Sound Energy feels that "as owned or operated by the entity" needs to be added to the definition. As the definition is currently written, the standard could be applied to telecommunication links (or the Internet) that are completely out of an entity's control to implement requirements mandated in CIP-011. Also please provide examples of how "data" is a "programmable electronic device". It seems that the hardware and software

#	Organization	Yes or No	Question 1.a. Comment
			can be programmable, but the data itself must actually reside on hardware so it's unclear how to consider it a component solely by itself.
47.a	Madison Gas and Electric Company	Disagree with proposed definition	Recommend that the word "Disturbance" be removed from the definition since the NERC definition broadens the full meaning of BES Cyber System Component. A BES condition contains both normal and emergency statuses of the BES and a disturbance is a sub component of a BES condition (taking a normal condition to an emergency condition). Disturbance reporting is currently contained in EOP-004-1 and the reporting requirements of EOP-004-1 go beyond this Project and will lead to more confusion and redundancy within the NERC Standards. Recommend that the modifier of BES be added to "or enable control and operation of the BES". Recommend changing the phrase, "display of data" to "display of data about the BES" as it is BES data and BES operation that are of interest. The new definition should read: One or more programmable electronic devices (including hardware, software and data) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of BES data; which respond to a BES condition; or enable control and operation of the BES.
48.a	Hydro One	Disagree with proposed definition	Recommend the following definition - "A programmable electronic device (including hardware and software) organized as a part of a BES Cyber System".
49.a	ISO New England Inc	Disagree with proposed definition	Recommend the following definition - A programmable electronic device (including hardware and software) utilized as a part of a BES Cyber System.
50.a	Northeast Power Coordinating Council	Disagree with proposed	Recommend the following definition - A programmable electronic device (including hardware and software) organized as a part of a BES Cyber System.

#	Organization	Yes or No	Question 1.a. Comment
		definition	
51.a	San Diego Gas and Electric Co.	Disagree with proposed definition	SDG&E recommends removing “data” and “display of data” from the definition because these terms are too vague and can potentially include many devices that should not be in-scope with these Standards (TV Monitors, strip chart recorders, digital displays, and other lower-level devices that have very little or no impact on cyber security or the reliability of the BES).SDG&E recommends the removal of the term “enable control or operation”. This seems vague and may unnecessarily roll up isolated devices (especially at substations or at Generating stations) that “enable control and operation” but have very little to do with the reliability of the BES. Many of these devices are isolated and have a very low risk of impacting the reliability of the BES.SDG&E also recommends the removal of the terms “collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data”. These terms do not help to clearly identify in-scope components and just confuse the issue as entities brainstorm all the nuances of those terms. In exchange for removing the terms identified above, we are suggesting a new revised definition for BES Cyber System Component. The centerpiece of our new suggested definition revolves around the use of a routable protocol or dialup connection, which has strong ties back to CIP-002-2 and contains terms that compliant entities are already familiar with. Suggested Revised Definition for BES Cyber System Component - One or more programmable electronic devices utilizing a routable protocol or dialup connection (including software) which is used to monitor, control, or operate the BES. In addition to revising this definition, SDG&E also recommends that the drafting team release a document (perhaps a FAQ or Guideline) that steps through examples for various entities to show what devices / facilities would be in-scope with the requirements in CIP-010. We suggest this because we believe that the current Standard as proposed will bring an enormous amount of components and systems into scope that will require substantial resources to be compliant with the Standard. Will the reliability of the BES increase by the same substantial amount?
52.a	Regulatory Compliance	Disagree with	Some components such as the display of data may not impact real time operation. More

#	Organization	Yes or No	Question 1.a. Comment
		proposed definition	clarification is needed or strike the display of data from the definition.
53.a	IRC Standards Review Committee	Disagree with proposed definition	Some devices may meet the definition of BES Cyber System Component, particularly "enable control and operation" but have little to no impact to the BES if unavailable or compromised because operators may have alternative means to provide the same functionality. Is the intent of this phrase in the definition to expand the applicability of the term to components that are not related to BES condition or Disturbance? Or is it meant to apply only to those components that respond to BES condition or Disturbance?
54.a	Network & Security Technologies Inc	Disagree with proposed definition	Suggest striking "data" from the proposed definition. Cyber Systems and/or their components perform various operations with data (create it, store it, modify it, send or receive it, etc.), and data is of course fundamental to reliable, computer-aided or controlled operation of the BES, but it is not a "programmable electronic device."
55.a	Entergy	Disagree with proposed definition	Suggest: "or more" should be stricken; 'component' should be singular - a discrete unit. "Or more" is appropriate in the BES Cyber System definition below.
56.a	Allegheny Power	Disagree with proposed definition	Suggested alternative definition: BES Cyber System Component - One or more programmable electronic devices (including hardware) organized for the processing, or display of BES operating status or condition; which respond to a BES condition or Disturbance; or that enable BES control and operation. The following elements are excluded from this definition: Voice Communication systems media (fiber, wiring, etc.) and transport devices (SONET, Microwave Equipment, etc.) installed between BES Cyber System Components as long as all access points are controlled by firewall devices. Explanation:"Software" has no function or purpose in the absence of an electronic host upon which it operates. To the degree that it is appropriate to identify controls or security objectives associated with software operating on [hardware] BES Cyber System

#	Organization	Yes or No	Question 1.a. Comment
			Components, requirements should address software issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES."Data" is an extremely broad term that has very different meanings depending on the specific context within which it is used. To the degree that it is appropriate to identify controls or security objectives associated with data used for real time BES system operations, those requirements should address data integrity, availability, or confidentiality issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES. The terms storage, maintenance, disposition do not add clarity to the definition of BES Cyber System Component, and should be removed.
57.a	EEI	Disagree with proposed definition	Suggested alternative definition: BES Cyber System Component - One or more programmable electronic devices (including hardware) organized for the processing, or display of BES operating status or condition; which respond to a BES condition or Disturbance; or that enable BES control and operation. The following elements are excluded from this definition: Voice Communication systems media (fiber, wiring, etc.) and transport devices (SONET, Microwave Equipment, etc.) installed between BES Cyber System Components as long as all access points are controlled by firewall devices. Alternatively, BES Cyber System could be defined before BES Cyber System Component. This would follow a top town approach. Explanation:"Software" has no function or purpose in the absence of an electronic host upon which it operates. To the degree that it is appropriate to identify controls or security objectives associated with software operating on [hardware] BES Cyber System Components, requirements should address software issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES."Data" is an extremely broad term that has very different meanings depending on the specific context within which it is used. To the degree that it is appropriate to identify controls or security objectives associated with data used for real time BES system operations, those requirements should address data integrity, availability, or confidentiality issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES. The terms storage,

#	Organization	Yes or No	Question 1.a. Comment
			maintenance, disposition do not add clarity to the definition of BES Cyber System Component, and should be removed. SUGGESTION: Reorder positions to place "BES Cyber System" prior to "BES Cyber System Component", this follows a top down approach. BES Cyber System - A system performing one or more BES functions identified in CIP-010 Attachment 1 and which if rendered unavailable, degraded, compromised, or misused would, within 15 minutes, adversely impact the real-time operational control of the BES.BES Cyber System Component - One or more programmable electronic devices that are a component of a BES Cyber System and which if rendered unavailable, degraded, compromised, or misused would adversely impact a BES Cyber System. Control Center - A location where one or more BES Cyber Systems are used to perform BA, RC, or TOP functions for generation Facilities or Transmission Facilities at multiple sites. Also consider removing the word communications. This would include any connection via leased lines or other third party data circuits.
58.a	Duke Energy	Disagree with proposed definition	Suggested clarifying change as follows: "One or more electronically programmable devices (including hardware, software and data) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which respond to a BES condition or Disturbance; or enable control and operation."
59.a	Alberta Electric System Operator	Disagree with proposed definition	The AESO would like to see a more detailed definition of "enable control and operation" and a definition of "BES condition".
60.a	APPA Task Force	Disagree with proposed definition	The APPA Task force disagrees with the current definition and would like to point out areas where it can be improved. Foremost, we feel the whole standard revolves around the concept of routable protocol. Since this is a common theme of a number of the requirements we feel this should be included in the definition. Also we think the current definition tries to cover a laundry list of functions which complicates the definition. We provide the following edited version for the drafting team's

#	Organization	Yes or No	Question 1.a. Comment
			consideration: BES Cyber System Component -A programmable electronic device connected via routable protocol, which responds to a BES condition or Disturbance, or enables control and operation of the BES. If the drafting team does not use this version we at least request that adding “connected via routable protocol” be included in some manner in the definition that is used.
61.a	Wolverine Power	Disagree with proposed definition	The concepts of "BES" and "critical", as they relate to generation, need to be revisited and clarified -For example - A BES generator, that is used only occasionally, for peaking purposes, and is not black start capable, may logically be declared as "non critical" using the current NERC CIP guidelines - but under these proposed standards, as I read them, this example might be forced to be considered as "low impact".(low criticality vs. not critical)The existing CIP standards allow for a logical separation between "BES and Critical" (i.e. just because a generator is BES doesn't automatically mean it's critical to the BES - how it's used should be taken into consideration) Under these proposed standards, as I read them, any generation resource identified as BES, automatically must be characterized as "low impact" at a minimum. I believe there should be some language in the standard that 1) takes into account the regional entity's right to define what constitutes BES generation; and 2) Doesn't force a "low impact" by default on any and all "BES" generation, without due consideration of its actual use and true impact on the BES.
62.a	Cogeneration Association of California and Energy Producers & Users Coalition	Disagree with proposed definition	The current standard limits its applicability to those systems with routable protocols or dial-up access. That limits the applicability of the CIP standards to those systems that are accessible and therefore vulnerable. This proposed standard will impose the CIP requirements on all programmable equipment regardless of its accessibility to external forces. A cyber system inside a generator accessible only to generator staff is as critical to its function as any pump or valve. The security measures safeguarding the pump and the valve should also be sufficient for the cyber system. Only those cyber systems accessible to the outside world require additional, special security requirements. Similar comments were made by many parties in response to the definitions in the proposed

#	Organization	Yes or No	Question 1.a. Comment
			version 4 CIP standards.
63.a	Southwest Power Pool Regional Entity	Disagree with proposed definition	The definition as written could be read to imply that data is a BES Cyber System Component. Data is not a programmable electronic device; however data can reside on a programmable electronic device. The definition should be clarified to make it clear to the reader that the programmable electronic device includes any software and/or data residing on the hardware. Also, consider changing “or enable control and operation” to “or enable control, operation, and/or situational awareness.”
64.a	MWDSC	Disagree with proposed definition	The definition is confusing with disconnected phrases and will be subject to many interpretations. What’s the difference between a “condition” and a Disturbance? The NERC Glossary defines Disturbance as 3 events which should cover all relevant conditions. The proposed definition may be interpreted to include a condition on a local BES system which will not create a Disturbance to an interconnected system. For example, a relay for a transmission/distribution bank breaker may operate and drop the distribution voltage load connected to that BES substation, but not create any Disturbance to other systems. The term "control and operation" was changed from prior draft to "monitoring and control" -see Attachment I under CIP-010. Also, it is unclear who controls and operates the component. In the extreme, a smart grid meter on a distribution circuit could be a “programmable electronic device” which responds to or enables control of a BES condition by reducing or dropping load. Suggest changing definition as follows: "BES Cyber System Component - One or more programmable electronic devices connected to the BES (including hardware, software and data), organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data, and which respond to a BES Disturbance affecting an interconnected BES system or enable monitoring and control of the BES by a Transmission Operator, Generator Operator, or Balancing Authority."
65.a	USACE HQ	Disagree with proposed	The definition is still too broad. The definition includes “software and data” as devices, but when someone thinks of a device usually it is a physical component. I think the intended of the team is to state that the software and the data must be included as part

#	Organization	Yes or No	Question 1.a. Comment
		definition	of the device definition, therefore I suggest changing the definition from a "programmable electronic devices (including hardware, software and data)" to "programmable electronic devices (including its components such as hardware, software and data)". Also, the definition is broad enough that test environments and maintenance devices can be included in the definition. CIP-011-1, page 22, states that "devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System". I suggest that the exclusion of devices "not permanently connected to (the) BES Cyber Systems" be explicitly present in the definition of BES Cyber System Component. Lastly, I suggest that all the definitions, in both CIP-010-1 and CIP-011-1 be present together to make it easier for the reader to understand all the new language introduced to the standards
66.a	Kansas City Power & Light	Disagree with proposed definition	The definition is too broad regarding the application of the data used by programmable devices. The proposed definition would include devices used for system analysis or system maintenance with historical data (e.g. Disturbance Monitoring Equipment (DME)). The important considerations are for those devices for the processing and use of data in the real time control of the BES. Recommend modification of the current definition to: One or more programmable electronic devices (including hardware, software and data) organized for the processing and use of data for the purpose of control and operation of the BES.
67.a	US Bureau of Reclamation	Disagree with proposed definition	The definition needs to clarify that the phrase "or enable control and operations" applies only to Cyber System Components that enable the control or operation of BES Assets. It will also need to define the term BES Assets.
68.a	Exelon Corporation	Disagree with proposed definition	The definition should only contain elements that are directly associated with obtaining and using data in support of reliable real-time operations or a device that would automatically respond to an adverse condition on the BES. Specifically the elements in the proposed definition of storage, maintenance, sharing and disposition should not be included. The display of data is also not needed as the display of data would be covered

#	Organization	Yes or No	Question 1.a. Comment
			by the "use" element. The definition needs to be more definitive with the term "programmable electronic devices" and their potential to impact the BES. The definition should consider whether a device can be controlled or operated via remote communication. Disturbance (as defined in the Glossary of Terms Used in NERC Reliability Standards April 20, 2010) is too vague and casts too wide a net and is not in synch with EOP-004. The term "BES condition or disturbance" needs to be clarified. Exelon has a concern that this definition may be interpreted differently in each region.
69.a	Con Edison of New York	Disagree with proposed definition	The Drafting Team (DT) should not include collection, storage, maintenance, use; sharing, communication, disposition, and display of data in the definition because these components cannot respond to a BES condition and may add ambiguity to the definition. By including these words, the Standard is implying that company networks outside of the EMS (e.g. PI) may be included as BES Cyber Systems. Suggested alternative definition: "Any microprocessor-based programmable electronic device used to enable control and operation of a BES element."
70.a	Electricity Consumers Resource Council (ELCON)	Disagree with proposed definition	The existing standard applies to systems with routable protocols or dial-up access. That limits the application of the CIP standards to systems that are accessible and therefore vulnerable. The proposed new standard will impose the CIP requirements on all programmable equipment regardless of its accessibility by external threats. Only those cyber systems accessible to the outside world require special security requirements.
71.a	SCE&G	Disagree with proposed definition	The language "enable control and operation" needs to be better defined. What constitutes control?
72.a	Indeck Energy Services, Inc	Disagree with proposed	The phrase "which respond to a BES condition or Disturbance" doesn't differentiate a component that takes action directly because of the BES condition or Disturbance and one that takes action when told to do so following a BES condition or Disturbance. For example, an under-frequency relay will take action on its own (e.g. trip) upon measuring

#	Organization	Yes or No	Question 1.a. Comment
		definition	the frequency and time corresponding to its setpoint, whereas, a generating unit without a governor will increase generation when the ISO, RTO or TO requests it to do so following the BES condition or Disturbance. The second system shouldn't be categorized as a BES Cyber System Component based on its action following a BES condition or Disturbance. --------- [suggestion] "One or more programmable electronic devices (including hardware, software and data) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which independently respond to a BES condition or Disturbance."
73.a	Oncor Electric Delivery LLC	Disagree with proposed definition	The purpose of a "component" is to collect, store, process, etc DATA. Data should not be included in the specification of a "component". It should read, "One or more programmable electronic devices (including hardware and software) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; which respond to a BES condition or Disturbance; or enable control and operation."
74.a	LADWP	Disagree with proposed definition	The term "organized" seems to broaden the scope of a BES Cyber System Component to any device that may not be utilized but could be utilized in the BES system. A clearer definition needs to be made.
75.a	American Electric Power	Disagree with proposed definition	The term "programmable electronic devices" is general and vague. For example, based on this definition it is not clear how it will align with transmitters and other microprocessor systems. AEP suggests that the drafting team develop a definition that provides more clarity as to what is to be considered in scope. AEP suggests using the wording of NIST SP800-82 sections 2.3.1 and 2.3.2 to clarify the control system components that need to be evaluated for security controls.
76.a	Public Service Enterprise Group companies	Disagree with proposed	The text in brackets "(including hardware, software and data)" is not clear. These items are not types of "programmable electronic devices". Does a specific piece "software" or "data" collection constitute a "BES Cyber System Components"? This text needs to be

#	Organization	Yes or No	Question 1.a. Comment
		definition	dropped or a clearer definition is required.
77.a	Minnesota Power	Disagree with proposed definition	This definition is generally acceptable, with clarification or correction regarding the following items: o What if the device is not programmable, rather defined to perform one function (i.e., coded in firmware)? These types of devices still could have security flaws. What is meant by “disposition” of data? Disposition of data is typically a maintenance function performed after-the-fact which would not have a real-time impact on the BES. There are corporate system which ultimately receive, display and/or act upon data pertaining to the BES. These are not for real-time operations, and should immediately be recognized as out of scope. This definition should reference “real-time operations” or “BES Reliability” to clarify the intended scope. Minnesota Power recommends the following revised definition:"One or more programmable electronic devices (including hardware, software and data) organized for the collection, storage, processing, maintenance, use, sharing, communication, or display of data which, in real-time, respond to a BES condition or Disturbance or enable control and operation."
78.a	Ameren	Disagree with proposed definition	This definition is overbroad and potentially brings in an inappropriate number of devices that should be excluded from the scope of this definition, e.g. display terminals, personal cell phones, pagers etc. The last sentence "which respond to a BES condition" is too encompassing, and the term Disturbance is also. Also, if “communication” devices are going to be included in this definition, then communication devices need to be more precisely defined. The definition of BES Cyber System Component includes “disposition.” This phrase should either be defined more precisely or removed.
79.a	Midwest ISO	Disagree with proposed definition	This definition is overly broad and seems to miss the point that the information technology is there to support the operation of the BES and not vice versa. For example, collection and storage of data does not impact the operation of the BES and should not even be considered unless the facility can be used to control or manipulate the operation. Furthermore, what does it mean to respond to a BES condition? Suggest modifying the definition to: One or more programmable electronic devices (including

#	Organization	Yes or No	Question 1.a. Comment
			hardware and software) organized to enable control, operation and protection of equipment.
80.a	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree with proposed definition	This is a vast improvement over "Bulk Electric System Subsystem," and agrees with the focus on the cyber system up front rather than round about. However, there is room for further improvement. The present proposed definition can include programmable relays with no network connection at all - serial or addressable - to cell phones used to receive SCADA alarms. The main focus of the Standard is to protect BES Cyber Systems that are vulnerable to network/Internet based attack, or infection from malicious software. Secondary is the need for physical protection; however, all critical facilities whether cyber or not in nature need physical protection. Therefore in light of this, restricting to components that are vulnerable to remote attack via a network, the Internet, or the inadvertent infection of malware is advised. It should be recognized that not all programmable electronic devises are subject to "cyber attack," and should be excluded. "including hardware" may fail to clarify what is included; does this include a network and supporting equipment connected to the BES Cyber System Component such as a printer, or does it imply only the programmable electronic device itself? The use of "respond to" implies automatic operations the BES Cyber System performs and the additional qualifiers "control and operation" implies programmable equipment that only supplies monitoring data of the BES is outside the CIP scope. This does not appear to cover the required need for BES operator situational awareness of the electrical condition of the BES, and partially negates the BES Cyber System definition below.CIP-011-1 R26 considers maintenance devices to not be part of a BES Cyber System. These devices should be excluded from the proposed definition to be consistent.CIP-011-1 R11 considers devices used to remotely access BES Cyber Systems to be external to those BES Cyber Systems. These devices should be excluded from the proposed definition to be consistent.
81.a	Pepco Holdings, Inc. - Affiliates	Disagree with proposed	We agree with EEI's comments including the position on software and data. In addition, there seems to be a potential for confusion by including "one or more" in the definition. Because there does not seem to be a clear distinction between BES Cyber System

#	Organization	Yes or No	Question 1.a. Comment
		definition	Component and a BES Cyber System, it would seem like a BES Cyber System Component could qualify as a BES Cyber System.
82.a	We Energies	Disagree with proposed definition	We Energies agrees with the EEI Suggested alternative definition and explanation: BES Cyber System Component - One or more programmable electronic devices (including hardware) organized for the processing, or display of BES operating status or condition; which respond to a BES condition or Disturbance; or that enable BES control and operation. The following elements are excluded from this definition: o Voice Communication systems media (fiber, wiring, etc.) and transport devices (SONET, Microwave Equipment, etc.) installed between BES Cyber System Components as long as all access points are controlled by firewall devices. Explanation:"Software" has no function or purpose in the absence of an electronic host upon which it operates. To the degree that it is appropriate to identify controls or security objectives associated with software operating on [hardware] BES Cyber System Components, requirements should address software issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES."Data" is an extremely broad term that has very different meanings depending on the specific context within which it is used. To the degree that it is appropriate to identify controls or security objectives associated with data used for real time BES system operations, those requirements should address data integrity, availability, or confidentiality issues specifically, rather than generally which may lead to inappropriate and ineffective controls which will not enhance to reliability of the BES. The terms storage, maintenance, disposition do not add clarity to the definition of BES Cyber System Component, and should be removed.
83.a	Garland Power and Light	Disagree with proposed definition	We have concerns about data being included in the definition - Many of the CIP requirements are difficult to document or comply with for the data.

#	Organization	Yes or No	Question 1.a. Comment
84.a	Southern Company	Disagree with proposed definition	We recommend the following definition: One or more programmable electronic devices that are a component of a BES Cyber System and which if rendered unavailable, degraded, compromised, or misused would adversely impact a BES Cyber System. This definition should be moved to after the definition of BES Cyber System to reflect a top-down approach. If the list of functions is found to be necessary, communication should be removed or, at least, limited to communication outside the BES Cyber System.
85.a	Alliant Energy	Disagree with proposed definition	We think the existing definition is too broad and propose the following: One or more programmable electronic devices (including hardware and software) organized to enable control, operation and protection of BES equipment.
86.a	MRO's NERC Standards Review Subcommittee	Disagree with proposed definition	We think the existing definition is too broad and propose the following: One or more programmable electronic devices (including hardware and software) organized to enable control, operation and protection of BES equipment.
87.a	Constellation Power Source Generation	Disagree with proposed definition	What is the definition of the term “BES condition”? It is not a term in NERC’s Glossary of Terms. It needs a local definition much like other terms have been defined in these standards. Using the definition proposed for a BES Cyber System Component, is the intent to include electronic meters such as Nexus Meters? They do not respond to a BES condition, but they do display data. Constellation’s interpretation would be that they are out of scope, but that may not be the intent of the SDT.
88.a	Verizon Business	Disagree with proposed definition	The definition should be specific to the Bulk Electric System to ensure that it does not include generation facilities used on distribution systems or non-BES facilities. This change could be accomplished by adding to the end of the sentence "... on the Bulk Electric System (>100 kv)."

1.b. BES Cyber System — One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES.

Summary Consideration:

Many conmmentors observed that the definition of the 15-minute window was too ambiguous. Others observed that a 30-minute window would be more in alignment with other reliability standards. Many commenters observed that the impact was too vaguely described in the definition, and the scope was too broad.

The SDT has carefully reviewed the 15-minute window and has concluded that 15 minutes was more representative of a real-time impact. Some reliability standards cite 30 minutes as recovery times, others cite 15 minutes. The SDT believes that a 30 minute window may include more systems that would not have a "real-time" effect on the reliability of the BES. The SDT has shifted the BES impact aspect of the definition of BES Cyber Systems to the definition of BES Cyber Assets, with clearer definitions of the impact, with respect to "BES Reliability Operating Services", and specific reference to BES "real-time" reliability operations.

The new definition of **BES Cyber System** is:

One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services. A Maintenance Cyber Asset is not considered part of a BES Cyber System.

#	Organization	Yes or No	Question 1.b. Comment
1.b	BGE	Agree	1.a and 1.b should be reversed.
2.b	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the definition but believes that the definition can be improved significantly. FMPA offers the following simpler definition:"One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could cause a Disturbance to the BES, or restrict control and operation of the BES within 30 minutes."For the following reasons: (i) see comments to Question 2 for time considerations; and (ii) including that phrase loss of situational awareness is superfluous since it restricts control and operation of the BES and is therefore included in that term.

#	Organization	Yes or No	Question 1.b. Comment
3.b	Puget Sound Energy	Agree	Generally agree, however it is unclear how to use the 15 minutes very meaningfully and how that will be tested in an audit.
4.b	Dynegy Inc.	Agree	I agree but request additional detail examples be provided to determine specifically what these items are.
5.b	Green Country Energy	Agree	Please define "affect situational awareness"
6.b	Reliability & Compliance Group	Disagree	: There needs to be more clarification about what it means to “restrict control and operation.” If you lose backup control, does this restrict control and operation if you still have primary control? Also, provide a definition of situational awareness in the standard at this point and capitalize the term.
7.b	Oncor Electric Delivery LLC	Disagree	“Systems” are categorized as high, medium and low, entities will tend to identify “Cyber System” at the lowest level possible. We need more clarity (white paper) to assist in how utility equipment should be identified as components or systems.
8.b	Indeck Energy Services, Inc	Disagree	1) The phrase “if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause” is too broad with the word “could”. The proper standard should be “is highly likely to cause.” 2) Situational Awareness is defined as the state of the BES. If this means that it includes systems and data used in the State Estimator, then it should specify that. The more specific the definition, the more certainty that BES ALR will be assured. 3) In FERC Order 706, NERC was required to “provide sufficient guidelines to inform generation owners and operators on how to determine whether it should identify a facility as a critical asset.” The only guideline that this definition provides is that the Cyber System could cause a disturbance. Spread across the nine Functions in Attachment I, this is patently incomplete as guidelines. For each of the Functions, some basis for a risk assessment should be outlined. [suggestion] “As to function Controlling Voltage (Reactive Power), any BES facility (asset) capable of providing <100 MVARS is not a BES Cyber Asset as to this function.” 4) [suggested replacement language] "As determined through the application of the Registered

#	Organization	Yes or No	Question 1.b. Comment
			Entity's risk based assessment methodology, one or more BES Cyber System Components which, if rendered unavailable, degraded, compromised, or misused, is highly like to cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES."
9.b	Progress Energy (non-Nuclear)	Disagree	1. Need a better statement of what 'within 15 minutes' means. Is 15 minutes considered real time operation? Most disturbances will occur in milliseconds. Is there a basis for 15 minutes? A malicious code could lie dormant for extended periods of time, but if activated may have an immediate impact. The term misused is very subjective and may need clarification. The 15 minute window may be good in that it possibly excludes equipment such as circuit breaker hydraulic, pneumatic and gas systems which may cause a breaker to be removed from service but not within 15 minutes. 2. With the 15 minute definition and using organized subsystem concept from 1.a. we can design Cyber (sub)Systems' delineation to effectively minimize impact on BES (see question 7 below). Limit Medium, High impact to a select few subsystems with the rest Low impact. Alternatively the entire plant control system would be viewed as one large Cyber System (High Impact) with the resultant full CIP requirements.3. Rules regarding redundancy need to be clearly defined. The 15 minute window brings redundancy into the picture.4. Need clarification of the terms 'compromised' and 'misuse'.5. Need to know if this would include DCS networks that do "batch" (non-continuous) type control. Some examples would include coal/limestone/gypsum conveying, limestone slurry processing, etc. These processes have inherent storage capabilities that far exceed the 15 minute rule.
10.b	Consultant	Disagree	1. The term would appear to imply that the "one or more BES Cyber System Components" perform a function related to the BES, for example, voltage control, generation control, transmission control, etc. The definition does not appear to address a "Cyber System", it appears to address just a "pile of components". If the answer is just the impact as it applies to a "pile of components", then this term would seem unnecessary as the "pile of components" is covered by the BES Cyber System Components term. It would seem that this definition should distinguish between

#	Organization	Yes or No	Question 1.b. Comment
			components, such as multiple desktop computers and servers as individual devices and their installed software (BES Cyber System Components), and the collection of those components networked and programmed to function as an Energy Management System (BES Cyber System).2. This clarification then raises the question whether the threat ("degraded, compromised, or misused") is a threat to components or a threat to systems. If the component is threatened then the system is threatened, but is there a mechanism to threaten the system without threatening the components? 3. This clarification would have an impact on the methodology for identifying affected assets.
11.b	Entergy	Disagree	A) How is “restrict” defined? How will this be audited? Suggest: Consider deletion B) Many things can “affect” situational awareness of the BES? Suggest “could...adversely affect.” C) How much loss of situational awareness does it take to adversely affect the BES? We lose it all the time and keep on running (e.g., temporarily using state estimators) Suggest: Consider deletion D) How much of the BES is at issue? Suggest: “...could, within 15 minutes, cause a Disturbance in that part of the BES falling under the aegis of the Responsible Entity.”
12.b	Nuclear Energy Institute	Disagree	Agree with the exception that: The word “could” is ambiguous. Propose changing could to would. Additionally, this definition does not maintain alignment with the definition of “reliable operation” provided in Section 215 of the Federal Powers Act: “The term “reliable operation” means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.” The definition of BES Cyber System should be revised. An acceptable definition would be:”One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused would, within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.” Lastly, it should

#	Organization	Yes or No	Question 1.b. Comment
			also be clarified that a single facility may have BES Cyber Systems that have different impact categorizations. Upon initial read, it would seem that if the one system in a generating station has a power capability of 2,000MW, then every BES Cyber System at the station is High Impact, which is inappropriate.
13.b	GTC & GSOC	Disagree	Although we appreciate that it is extremely difficult to define this concept, the current definition is too expansive. The phrase "affect situational awareness of the BES" could be interpreted to include the loss of a single status point. Such a minor outage would "affect situational awareness of the BES" but only to a trivial extent. The same could be said with respect to control. We suggest an alternative below. In addition, CIP 010 creates the definition above and then qualifies it in R1 to include only the BES Cyber Systems that "enable one or more functions defined in CIP 010 -1 Attachment I". But CIP 011 has no such qualification (except in its purpose statement), so in theory CIP 011 could apply to a more expansive set of assets than CIP 010. We recommend that the qualifications in R1 be incorporated into the definition. The clarification regarding maintenance devices that is currently in the local definition for maintenance devices (R26) should be part of this definition. Finally, the term "owned" is too narrow; theoretically an entity could absolve itself of all CIP compliance responsibility by leasing its systems. As noted in response to question 10 below, perhaps the concept of “responsible for” would be more appropriate than “owns.” We recommend the following definition: One or more BES Cyber System Components which: 1) Performs one of the following functions-Dynamic Response-Balancing Load and Generation-Controlling Frequency (Real Power-Controlling Voltage (Reactive Power)-Managing Constraints-Monitoring & Control-Restoration of BES-Situational Awareness-Inter-Entity Real-Time Coordination, and 2) if rendered unavailable, degraded, compromised, or misused, could, within 15 minutes: (a) cause a disturbance to the BES; (b) restrict control and operation of the BES to the extent an entity can no longer fulfill its obligations under Reliability Standards; or (c) degrade situational awareness to the extent that an entity can no longer maintain an accurate view of the operational status of the portion of the BES it is responsible for. 3) Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered

#	Organization	Yes or No	Question 1.b. Comment
			part of a BES Cyber System.
14.b	BCTC	Disagree	BCTC recommends the following aspects of this definition be revisited: Â reword "within 15 minutes" to "15 minutes or less" the 15 minute threshold is considered adequate for high impact systems but feel that the threshold would not be the same for medium and low impact systems; for low impact systems, for example, the threshold could be as high as 24 hours before any potential impact to the BES would be realized.
15.b	Network & Security Technologies Inc	Disagree	Believe the 15-minute threshold, while intended to distinguish systems required for and/or affecting real-time ops from others, could have a number of unintended consequences. Entities inclined to "game the system" could declare none of their cyber systems would impact the BES if lost or compromised for at least 20 minutes. How would such a claim be verified or disproven? Moreover, wouldn't a 15-minute threshold compel the establishment of cyber security incident response and/or recover plans with an often unrealistic time to complete of 15 minutes? That this is a difficult problem is understood - at a minimum the SDT might consider adding language to CIP-010 and 011 indicating this definition should not be interpreted as requiring a 15-minute recovery time interval for BES Cyber Systems.
16.b	Platte River Power Authority	Disagree	BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could cause a real-time deadline to be missed resulting in a Disturbance to the BES, or restricting control and operation of the BES, or affecting situational awareness of the BES.
17.b	Minnesota Power	Disagree	BES Cyber System should be defined as "physical or logical set of one or more BES Cyber System Components which if rendered unavailable, degraded or compromised, could, within an operational time horizon of 15 minutes, cause a Disturbance to the BES or restrict control and operation of the BES."
18.b	WECC	Disagree	Change "affect situational awareness" to "loss of situational awareness". Also is Situational Awareness defined? The 15-minute criterion seems arbitrary and unneeded.

#	Organization	Yes or No	Question 1.b. Comment
			The ability to negatively impact the BES is an attribute that either exists or does not regardless of time factors. The time element should be removed.Bulletizing the list of impacts would better format the definition.The following rewrite is proposed; BES Cyber System - One or more BES Cyber System Components deployed for: The control and operation of the BES; or Collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data used in control and operation decision making for the BES. These systems, if rendered unavailable, degraded, compromised, or misused could cause one or more of the following; A Disturbance to the BES; or Restrict control and operation of the BES; or o Affect situational awareness of the BES.
19.b	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
20.b	Cogeneration Association of California and Energy Producers & Users Coalition	Disagree	Comments to Question 1.a above apply here also. Additionally, this definition would be difficult to apply for many entities. For example, how would a GOP determine if a problem at a generation plant would, within 15 minutes, cause a Disturbance to the BES if a BES Cyber System is rendered unavailable, degraded, compromised, or misused? In most cases, our experience with plant trips, equipment malfunctions and forced shoutdowns has indicated no effect on the interconnected grid.Guidance will be needed on how entities who do not operate the BES and do not have access to BES studies can determine if their facility will cause a Disturbance to the BES within 15 minutes when a Cyber System is unavailable, degraded, compromised, or misused.
21.b	ERCOT ISO	Disagree	Comments: The 15 minute requirement does not align to the other reliability standards. Recommend changing to 30 minutes to align with the EOP standards.
22.b	Southwest Power Pool Regional Entity	Disagree	Consider changing “One or more BES Cyber System Components...” to “One or more logically related BES Cyber System Components...” Also, is the term “Disturbance” well understood? The three definitions found in the NERC Glossary of Terms (April 20, 2010) use vague terms that may be open to interpretation by the reader. Similarly, the term “affect situational awareness” is sufficiently vague to be unclear exactly what is meant.

#	Organization	Yes or No	Question 1.b. Comment
			Without precise definitions, the entity and auditor may have different interpretations of the terms.
23.b	Constellation Energy Commodities Group Inc.	Disagree	Cyber systems used for monitoring and/or situational awareness that do not actually control BES equipment should be out of scope for this standard because they are not going to directly result in a Disturbance condition in real time. In many cases loss of communication processes and procedures would be applied in situations where there is a complete loss of such a tool. At a minimum the monitoring and situational awareness tools subject to inclusion as a BES Cyber System should be limited to systems that provide data for monitoring and/or situational awareness that will be solely relied upon to directly operate equipment.Suggest that the time horizon be changed to within 10 minutes to remain consistent with the Area Control Error requirements. As stated in NERC documentation: DCS measures if a control area is meeting its reserve requirements. These reserves include contingency reserve and regulating reserve. The control area must: 1) recover from the contingency and 2) regulate to load changes over the ten minutes, but the control area need not correct control error that existed before the contingency.If the control area or reserve sharing group recovers ACE to zero or to the level of ACE prior to the first contingency within ten minutes of the start of the second contingency then count two contingencies as recovered 100% within 10 minutes. BAL-001-0.1a - Real Power Balancing Control PerformanceIn order to ensure that the average ACE calculated for any ten-minute interval is representative of that ten-minute interval, it is necessary that at least half the ACE data samples are present for that interval.
24.b	Constellation Energy Control and Dispatch, LLC	Disagree	Cyber systems used for monitoring and/or situational awareness that do not actually control BES equipment should be out of scope for this standard because they are not going to directly result in a Disturbance condition in real time. In many cases loss of communication processes and procedures would be applied in situations where there is a complete loss of such tool. At a minimum the monitoring and situational awareness tools subject to inclusion as a BES Cyber System should be limited to systems that provide data for monitoring and/or situational awareness that will be solely relied upon

#	Organization	Yes or No	Question 1.b. Comment
			to directly operate equipment.
25.b	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes this definition is ambiguous. The NERC glossary definition of "Disturbance" is very broad and "affect situational awareness" is also ambiguous. In addition the word “could” as used in “...could, within 15 minutes, cause a Disturbance...” is problematic. “Could”, under what circumstances or what system conditions? Further clarification is required.
26.b	Turlock Irrigation District	Disagree	Disagree because this definition would include communication systems which are currently exempt from the CIP Standards and would therefore represent a major expansion of the cope of the CIP Standards. Was this the intention of the SDT?
27.b	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	Disturbance has no metrics in its definition: “1. An unplanned event that produces an abnormal system condition. 2. Any perturbation to the electric system. 3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.” Therefore any “unplanned event that produces an abnormal system condition” on the BES must be included. Coupled with the broad definition of BES Cyber System Component, almost all programmable electronic devices will be included. Consider the following: loss of a programmable relay and its redundant backup will create the loss of protection on the BES facilities it is assigned to; these relays are not networked with any other cyber systems. The loss, say from malicious physical tampering from a disgruntled employee within the substation, is the unplanned event; and the resulting loss of BES transmission protection is the abnormal system condition. Therefore, it appears that the programmable relays must be included as a BES Cyber System even though the only way to compromise these components is through direct physical contact.If the definition of BES Cyber System Component is expanded to include monitoring ability, “situational awareness of the BES” should be clarified to encompass the electrical status of the BES. Otherwise, situational awareness can include video surveillance and security equipment that is programmable. Security systems should not be considered except where they help protect Medium or High Impact BES Cyber System Components and BES facilities. The cell phone

#	Organization	Yes or No	Question 1.b. Comment
			mentioned in 1.a. above is a BES Cyber System if it displays BES alarms. CIP-011-1 R26 considers maintenance devices to not be part of a BES Cyber System. These devices should be excluded from the proposed definition to be consistent. CIP-011-1 R11 considers devices used to remotely access BES Cyber Systems to be external to those BES Cyber Systems. These devices should be excluded from the proposed definition to be consistent.
28.b	National Grid	Disagree	Do not have a clear understanding of the "within 15-minutes" interval to have an impact on the system. It appears that this clause applies only to control operations such as opening and closing of a breaker. In substations where protection and control are integrated it would be possible to make changes that will take longer than 15 minutes to impact the BES. What type of contingencies will be considered for the 15 minute time horizon? (n-1, n-2 or none). Also, many of the cyber systems are programmable devices. The cyber security could be compromised in real time and the detrimental effect can be achieved after a programmed time interval. This issue requires to be addressed in the definition. There is also no link between attachment I and definition of BES Cyber System. Suggest tying attachment I with definition of BES Cyber System. National Grid proposes the following definition: One or more BES Cyber System Components which execute(s) or enable(s) one or more functions essential to the reliable operation of the BES and which, if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause a disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness.
29.b	Dominion Resources Services, Inc.	Disagree	Dominion supports the inclusion of "within 15 minutes". It is important to establish a reasonable boundary condition for real-time or near real-time effects of the BES Cyber System and 15 minutes provides adequate time for the effects to be mitigated to prevent further harm to the BES. In addition, Dominion proposes to replace the phrase "or affect situational awareness of the BES" with "or affect BES situational awareness of one or more of the following: Balancing Authority, Transmission Operator, Reliability Coordinator." This modification is reflected in the revised definition below: BES Cyber System - One or more BES Cyber System Components which if rendered unavailable,

#	Organization	Yes or No	Question 1.b. Comment
			degraded, compromised, or misused could, within 15 minutes, cause a Disturbance to the BES; or restrict control and operation of the BES; or affect BES situational awareness of one or more of the following: Balancing Authority, Transmission Operator, Reliability Coordinator.
30.b	E.ON U.S.	Disagree	E ON U.S. believes the term "affect situational awareness" is overbroad. E.ON U.S. suggests that this term should be rewritten as "degrade situational awareness." Also, "Unavailable" is not clearly defined. E.ON U.S. believes that it would be helpful if one could determine "no impact" assessments
31.b	Exelon Corporation	Disagree	Exelon suggests that the time period should not be stated in specific minutes. The standard should be revised to "One or more BES..., or misused could, without sufficient time to take mitigating action, cause a disturbance to the BES,..."
32.b	Progress Energy - Nuclear Generation	Disagree	For nuclear purposes the use of the word "component" conflicts with the definition in 1a. A system contains components rather than a component being a system.
33.b	USACE - Omaha Anchor	Disagree	Further clarify Disturbance to the BES - potentially consider "negative Disturbance"
34.b	USACE HQ	Disagree	Given that BES Cyber System is based on the definition of BES Cyber System Components, which I disagree with, I must also disagree with this one. Furthermore, the use of a time limit to represent real-time should not be present given that is lacking documentation support for the number. Either introduce a definition for real time for CIP purposes or provide support for the risk-informed dentition of using 15 minutes as the limit.
35.b	Southwestern Power Administration	Disagree	I disagree with the proposed definition and offer a simpler one that clearly identifies what is in scope.BES Cyber System - A collection of one or more BES Cyber System Components which control a BES Facility(s) and/or process data for the real time operation of the BES. To define the scope of applicability for the CIP standards, real time is considered to be the operational time horizon of approximately 15 minutes.

#	Organization	Yes or No	Question 1.b. Comment
36.b	The Empire District Electric Company	Disagree	I disagree with the proposed definition please consider the simpler one that clearly identifies what is in scope.BES Cyber System - A collection of one or more BES Cyber System Components and associated communication network(s), which control a BES Facility(s) and/or gather data for the real time operation of the BES.
37.b	Kansas City Power & Light	Disagree	Including "within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES" in the definition provides a difficult set of parameters that encourages issues with interpretation of what would constitute the situations under which "within 15 minutes" applies, as well as, what constitutes "restricted control or generation"? It is understood the Drafting Team is trying to capture the essence of those systems that have a real-time impact on the BES, however, it is recommended to limit the scope of the applicable "BES Cyber System" to those systems that support facilities that are identified as critical to the reliability of the transmission grid determined by regional system study. Recommend the following definition for consideration: One or more BES Cyber System Components that provide support for facilities that have been identified as critical to the reliability of the BES.
38.b	Ingleside Cogeneration, LP	Disagree	Ingleside Cogeneration, LP believes that this definition is still too vague to make a determination of whether a system meets the threshold of a BES Cyber System and can be assigned a "No-Impact" rating. This is in stark contrast with the "bright line" delineation between High Impact systems and Medium Impact systems provided in Attachment II of CIP-010-1. The components of the definition in question are "restrict control and operation of the BES" and "affect situational awareness of the BES". Both seem to be Control Center concepts and could be interpreted to mean that any system supporting multiple generation or transmission facilities at multiple locations would automatically carry at least a "Low-Impact" rating. However, this does not speak to the associated generation or transmission facilities that may be "No-Impact" if a cyber intrusion cannot cause a Disturbance - a term which is very well defined in EOP-004-1. Ingleside's concern is that recent rulings by FERC concerning the definition of the BES

#	Organization	Yes or No	Question 1.b. Comment
			and the applicability of PRC-023-1 to facilities under 200 kV, indicate they are pushing a stricter level of adherence to Reliability Standards across the board. If this continues, Functional Entities with “No-Impact” systems once considered compliant with CIP-010-1, may be considered non-compliant at a future date. This could lead to the assessment of violations and fines, even though the Standard has not changed.
39.b	Emerson Process Management	Disagree	It could be more appropriate to state that the unavailable component(s) can not be recovered within 15 miuntes.
40.b	Bonneville Power Administration	Disagree	It is not clear that this definition limits the scope and applicability of CIP-010-1 (and CIP-011-1) to real-time operations systems as indicated in Attachment I and Question #2 of this comment form. Situational Awareness is too broad and all the commas in the definition can lead to numerous interpretations of the sentence. Recommend changing the definition to the following: "One or more BES Cyber System Components which if rendered unavailable, degraded compromised, or misussed could, within 15 minutes: (1) cause a Disturbance to the BES; or (2) restrict real-time control and operation of the BES; that could cause a Disturbance in 15 minutes, or (3) affect situational awareness of the BES that would lead to a Disturbance required for real-time control of the BES. "What is real-time operations? To fully understand the definition of a BES Cyber System, the reader must pull out the NERC Glossary for the definition of Disturbance, BES, and ACE. Recommend an explicit definition that doesn't contain words from the NERC Glossary of Terms.NERC defines Disturbance as: 1. An unplanned event that produces an abnormal system condition. 2. Any perturbation to the electric system; or 3. The unexpected change to ACE (Area Control Error) that is caused by the sudden failure of generation or interruption of load.
41.b	CWLP Electric Transmission, Distribution and Operations Department	Disagree	It is unclear how the 15 minute time frame is to be construed for the purpose of defining a BES Cyber System. The 15 minute time frame appears arbitrary.

#	Organization	Yes or No	Question 1.b. Comment
42.b	FirstEnergy Corporation	Disagree	It is unclear if systems such as HP OpenView or a centralized logging system, which monitor alerts, are outside the scope of a BES Cyber System or if they are considered to affect situational awareness of a BES. As written, the definition could encourage entities to not install alerts so as not to have additional cyber systems. FE proposed change: "... or impact situational awareness that is deemed essential to the reliability of the BES". As an alternate, FE also supports EEI's suggested change to " ... materially disrupt situational awareness of the BES"The SDT should clarify how redundancy may impact the classification of BES Cyber Systems. For example, in a highly redundant architecture, there are many components whose loss would not impact or render essential systems as unavailable.The team should consider leveraging its work in developing the BES Cyber System and BES Cyber System Components to revise the existing Critical Cyber Asset.
43.b	Dairyland Power Cooperative	Disagree	It seems likely that a component could belong to multiple systems. How does this fit with the compliance regulations? Sentences are a little confusing with nested commas... It seems the intent is that 15 minutes applies to causing a disturbance, but it could be argued that it is ambiguous.
44.b	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
45.b	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's suggested alternative definition: BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes (15 minutes in this context is used to address real time operations and control of the BES), cause a Disturbance to the BES, or prevent control and operation of the BES, or materially disrupt situational awareness of the BES.
46.b	US Army Corps of Engineers, Omaha Distirc	Disagree	Need definitions of "restrict control and operation" and "affect situational awareness. These are very broad. If the intent of the standard is to create groups of cyber system

#	Organization	Yes or No	Question 1.b. Comment
			components and evaluate them based on their impact to system reliability why not state the definition in terms of the impacts. Suggest alternative wording - A Cyber System Component or logical grouping of Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, negatively impact one of the functions essential to the operation of the BES (Dynamic Response, Balancing Load and Generation, Controlling Frequency, Controlling Voltage, Managing Constraints, Monitoring & Control, Restoration of BES, Situational Awareness, Inter-Entity Real-Time Coordination and Communication, other functions as needed).
47.b	Garland Power and Light	Disagree	Need to add "scoping filter" as described on slide 31 of the NERC Workshop (May 19-20) Presentation on CIP 10 as presented by Jackie Collett. There already has been a Regional Entity Auditor make a presentation that he intended to audit beyond the scope of what is in the current standard - he (the auditor) may apply the same approach to the new standard if the filter is not stated with the definition - not adding the clarification (scoping filter) just adds the potential for alleged violations and all the baggage that goes with that until one can hopefully get resolved - If you add the filter which states "typically excludes business, market function systems, and non real-time systems", then it is a good definition and we would agree.
48.b	The United Illuminating Co	Disagree	Not clear if the rendering unavailable, degraded, compromised or misused applies to the Cyber System or to the individual components of the Cyber System.Suggest: BES Cyber System - Comprised of One or more BES Cyber System Components. If a BES Cyber System when rendered unavailable, degraded, compromised, or misused could, within 15 minutes of such act, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES.
49.b	PacifiCorp	Disagree	PacifiCorp agrees with EEI's suggested alternative definition:BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes (15 minutes in this context is used to address real time operations and control of the BES), cause a Disturbance to the BES, or prevent control and operation of the BES, or materially disrupt situational awareness

#	Organization	Yes or No	Question 1.b. Comment
			of the BES. In addition, the phrase "situational awareness of the BES" needs some more clarity to derive determine what is intended.
50.b	Public Service Enterprise Group companies	Disagree	Please clarify that the 15 minute threshold means that if the cyber component would not cause a disturbance in the BES, or restrict control and operation, or affect situational awareness, within 15 minutes, the aggregation of BES Cyber System Components is not deemed to be a BES Cyber System and thus out of scope of Version 4.
51.b	Hydro One	Disagree	Recommend the following definition - A set of one or more programmable electronic device(s) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; and which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES for the support of real-time operations. The SDT should consider 30 minutes instead of 15 as this time is consistent with requirements of EOP-001 and IRO-001.
52.b	ISO New England Inc	Disagree	Recommend the following definition - A set of one or more programmable electronic device(s) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; and which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES for the support of real-time operations. - Recommend "30 minutes" to align with EOP standards - Please provide background for where the 15 minute recommendation came from.
53.b	Northeast Power Coordinating Council	Disagree	Recommend the following definition - A set of one or more programmable electronic device(s) organized for the collection, storage, processing, maintenance, use, sharing, communication, disposition, or display of data; and which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of

#	Organization	Yes or No	Question 1.b. Comment
			the BES for the support of real-time operations.
54.b	Con Edison of New York	Disagree	Regarding the BES Cyber System definition, specifically the qualification criteria “within 15 minutes could impact BES operation”, it is not clear how an entity will determine / distinguish which BES Cyber Systems could impact operation within 15 minutes versus which will not. This may be more challenging than distinguishing which Cyber Assets are essential to operation or not, as we do for version 2 of the CIPs. Our understanding is that the purpose of including the 15 minute period is to limit the application of CIP-010 to BES Cyber Systems impacting real time operations. An alternate way to address BES Cyber Systems impacting real time operations would be to look to the existing NERC Reliability Standards. The following definition language is recommended: “The following operating functions are essential to real-time reliable operation of the Bulk Electric System (BES). To define the scope of applicability of CIP Standards, the functions of relevance are only those that can have an effect on real-time operation of the BES within the time period established in the applicable Reliability Standard(s), or if no time period exists, within 15 minutes of the BES Cyber System failure.”The following are examples of Reliability Standard citations: Standard BAL-005-0.1b - Automatic Generation Control R6. ... If a Balancing Authority is unable to calculate ACE for more than 30 minutes it shall notify its Reliability Coordinator. Standard EOP-001-0 - Emergency Operations Planning R2. The Transmission Operator shall have an emergency load reduction plan for all identified IROLs. ... The load reduction plan must be capable of being implemented within 30 minutes.
55.b	MWDSC	Disagree	Same general comments as for BES Cyber System Component. Also, "situational awareness" is redundant with the "monitoring and control" function as specified in Attachment 1 - see comment to Question 3 and suggested combination of terms. Disturbance reporting is required under EOP-004 - to avoid confusion or a conflict, definition needs a cross reference. Suggest changing last part of definition as follows:"... within 15 minutes, cause a Disturbance to the BES that requires a report pursuant to EOP-004, or affect the monitoring and control of the BES by a Transmission Operator,

#	Organization	Yes or No	Question 1.b. Comment
			Generator Operator, or Balancing Authority.
56.b	San Diego Gas and Electric Co.	Disagree	SDG&E is supportive of the "15 minute" criteria to help focus CIP-010 attention on real-time BES Cyber Systems. SDG&E recommends clarifying the categorization levels in conjunction with the 15 minute criteria, if the architecture or design includes the concept of redundant BES Systems (per Attachment I & II). Example: If a given BES System is potentially classified as a High BES System; but where an Entity has designed and operates a redundant BES System to enhance reliability of the BES Systems; and one which is in place to mitigate or reduce negative impacts to the BES, then the combined redundant system would not meet the criteria of a High BES System. Suggestions include incorporating a third classification category or filter which identifies potential High BES Systems which are treated separately, but have security controls applied.In the definition for a Component, the language states how a cyber system component "responds" to a BES condition or Disturbance or "enables" control and operation, but when talking about the System, a Component is spoken of in terms of a "causing" a disturbance, or "restricting" operation. Why is the piece of the whole (the component) "responding or enabling" yet when used in the context of "the whole" (the system) the piece is now labeled as "causing or restricting"? It is a bit confusing and redundant that a cyber system may also be a cyber system component. SDG&E is not certain what the value is with this level of granularity, and we are not certain that a "system component" definition is necessary. In addition, SDG&E suggests additional clarification on what "affect situational awareness of the BES" means.
57.b	Electricity Consumers Resource Council (ELCON)	Disagree	See comment on 1.a above.
58.b	Wolverine Power	Disagree	See comments listed for 1a
59.b	NextEra Energy Corporate Compliance	Disagree	See comments to 1.a. Furthermore, NextEra questions why there needs to be qualifiers like Disturbance. The industry understands which components need to be protected to safeguard Control Centers, Transmission and Generation. There would be a minimum

#	Organization	Yes or No	Question 1.b. Comment
			list developed that must be protected without qualifiers that could be misunderstood. In this regard, it is recommended that the following approach be adopted: BES Cyber System - A BES Cyber System Control Center, Transmission or Generation as defined in Section XX.
60.b	EEI	Disagree	See EEI's suggested wording in 1.a. Alternatively, EEI suggests: BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes (15 minutes in this context is used to address real time operations and control of the BES), cause a Disturbance to the BES, or prevent control and operation of the BES, or materially disrupt situational awareness of the BES.
61.b	Tenaska	Disagree	Should only say: A grouping of one or more BES Cyber System Components. All other qualifiers should be in tables for Medium and High requirements. Careful consideration should be given to the "within 15 minutes" phrase, this time period may be too long or too short depending on the severity of the event, type of cyber asset, or the type of BES entity.
62.b	Madison Gas and Electric Company	Disagree	Suggest replacing the phrase, "cause a Disturbance on the BES, or restrict control and operation of the BES, or affect situational awareness of the BES" with "cause an abnormal BES condition, degrade control and operation of the BES, or degrade situational awareness of the BES." The definition of Disturbance when used in this context is overly broad, for it includes "a perturbation to the electric system" or "the unexpected change in ACE that is caused by the sudden failure of generation or interruption of load." A perturbation to the electric system and a change is ACE are not qualified as to materiality. For example, a responsible entity's programmable device may be used in normal operation to curtail or interrupt relatively small amounts of load; such control of load (even simply for economic reasons) perturbs the electric system and affects ACE to some extent. Yet such effects are part of normal operation of the electric system. In addition, control and operation of the BES are always restricted to some extent; the concern is whether or not control and operation are degraded.

#	Organization	Yes or No	Question 1.b. Comment
			Likewise, the concern is whether or not situational awareness is degraded ("affect" could be in a way that is good or bad). New definition should read: One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause an abnormal BES condition, degrade control and operation of the BES, or degrade situational awareness of the BES.
63.b	ReliabilityFirst Staff	Disagree	Suggest thefollowing definition: "One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could impact realtime operation of the BES such as; cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES."
64.b	Allegheny Energy Supply	Disagree	Suggest: BES Cyber System - One or more BES Cyber System Components, performing one or more functions essential to the reliable operation of the BES, which if unable to perform its function, is misused, or operated by unauthorized personnel, could within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES that could lead to a BES Disturbance, or affect situational awareness of the BES that could lead to a BES disturbance.
65.b	Allegheny Power	Disagree	Suggested alternative definition: BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes (15 minutes in this context is used to address real time operations and control of the BES), cause a Disturbance to the BES, or prevent control and operation of the BES, or materially disrupt situational awareness of the BES.
66.b	SCE&G	Disagree	The 15 minute timeframe should be eliminated. There are too many variables in determining whether a system will have a 15-minute impact.
67.b	APPA Task Force	Disagree	The APPA Task force disagrees with the current definition for similar reasons stated above in regard to 1a. We offer the following simpler definition: “One or more BES Cyber System Components connected via routable protocol, which if rendered unavailable, degraded, compromised, or misused could cause an Adverse Reliability

#	Organization	Yes or No	Question 1.b. Comment
			Impact to the BES, or restrict control and operation of the BES for 30 minutes."See comments to Question 2 for time considerations. If the drafting team does not use this version we at least request that adding "connected via routable protocol" be included in some manner in the definition that is used.
68.b	US Bureau of Reclamation	Disagree	The identification of a BES cyber system based on the 15 minute criteria established here could be difficult to ascertain by those entities that do not directly operate or control the BES. Most entities can determine if it could compromize their respective BES assets. Further, this definition, if it does not establish additional qualifying criteria, would generally establish all Components identified under part 1.a., as Cyber Systems. As an example, an isolated single function cyber-based protective relay would qualify as a BES Cyber System Component under 1.a., but it would also qualify under criteria identified here in 1.b., since it is one or more "components" which could cause a disturbance if compromised - irrespective of the fact that it is not tied to any other components. Was this the intent of the drafting team?
69.b	LADWP	Disagree	The relative nature of the 15 minute criteria. What is the definition of a "Disturbance"?
70.b	Manitoba Hydro	Disagree	The term "misuse" in this definition is inappropriate. The definition misuse n. Improper, unlawful, or incorrect use; misapplication. 1. To use incorrectly. 2. To mistreat or abuse. The misuse of an asset describes the type of human action leading an effect on an asset, while the other terms unavailable, degraded or compromise describe more appropriately the state of the asset. The term misuse might lead into the area where analysis of one asset might cause an effect on another asset which is part of the BES Cyber System Component - secondary effects. Rather than using this approach the drafting team should list the types cyber assets which need consideration. i.e. support systems, HVAC, security, etc.) There may be Cyber system components linked to monitoring and/or network control that may operate periodically that could affect BES with disturbances. If there are any Cyber components that are not continuously or periodically (within 15 minute intervals) monitored for operational status that could either create or incorrectly not mitigate a network disturbance when they are

#	Organization	Yes or No	Question 1.b. Comment
			unavailable, they would not fit into the proposed definition. The definition needs clarification to include reference to all normal modes of operation of the BES Cyber System. For example, a protective relay has normal modes of operation of trip and restrain to trip. The 15 minute “real-time” criterion applies to both the trip and restrain to trip modes of operation. If a digital relay which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes of its trip mode or within 15 minutes of its restrain to trip mode (within 15 minutes of any normal mode of operation), cause or fail to mitigate a Disturbance to the BES, or restrict control and operation of the BES, it is a BES Cyber System.
71.b	American Electric Power	Disagree	The terms "situational awareness" is ambiguous; systems that are not needed for operating the BES, but provide information would be in scope. This definition appears to include items such as all meters, instruments, and transducers.
72.b	Seattle City Light	Disagree	The terms BES condition or Disturbance need to be further defined and clarified.
73.b	LCEC	Disagree	The time frame reference of "Within 15 minutes" could cause a great deal of confusion in identifying BES Cyber Systems. What is the basis for 15 minutes? How will the 15 minute test be audited?
74.b	Ameren	Disagree	The words “A Responsible Entity’s” should be added before the words “BES Cyber System Components” to make it clear that this only includes BES Cyber Systems components under the control of the Responsible Entity and specifically excludes entities such as Verizon. The last sentence the term Disturbance is too encompassing. Consider revising for more exact situations. The flow of the definition is difficult to read.
75.b	Matrikon Inc.	Disagree	This definition calls out those cyber systems that affect the BES in some way. During the application of CIP-010-1 there will be the need to classify and label those cyber systems that do not have any impact on the BES. That is the value of keeping the definition “Cyber Asset”, because it does not care about the relationship to BES

#	Organization	Yes or No	Question 1.b. Comment
			reliability, only to define the types of electronic systems to be evaluated as part of CIP-010-1 R1. My suggestion is to provide a label/definition for those systems that have no affect on BES, and allow "cyber assets" to remain.My second challenge when trying to apply this definition is how a "component" becomes a "system". The security controls of CIP-011 will be applied to individual cyber assets, and evaluating their individual impact on the BES is of ultimate importance. The need to apply the Impact requirements of CIP-011 appropriately will be satisfied when cyber assets share the same boundary access point, and all will have to inherit/conform to the same, and uppermost security controls criteria.In our CIP-002 definitions, we have defined a "system" as a group of cyber assets performing similar and/or cooperative activities in order to support a function. A similar definition can be used to support BES Cyber System, and the difference from BES Cyber System Component.
76.b	Duke Energy	Disagree	This definition is too broad. The phrase "compromised, or misused" could render compliance an impossibility, since administrators must have access to, and could misuse their access. Also, the phrase "situational awareness" should be clarified to include only that awareness required by System Operators to perform their reliability-related functions. Suggested clarifying change as follows: "One or more BES Cyber System Components which if rendered unavailable or degraded, could, within 15 minutes,: cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES required by System Operators to perform their reliability-related functions." Also, It is not clear if there will be any guidance around how 15 minutes threshold should be measured to ensure that numbers of interpretations for this threshold are limited.
77.b	Midwest ISO	Disagree	We agree that the time frame should be limited to the present but question the use of 15 minutes. Real-Time is a term that is included in the NERC Glossary. Why not use this term?
78.b	Pepco Holdings, Inc. -	Disagree	We appreciate the desire of the SDT to narrow BES Cyber Systems to real-time operations and understand the purpose of including 15 minutes to make that

#	Organization	Yes or No	Question 1.b. Comment
	Affiliates		distinction. We are not sure what the appropriate time frame would be and/or if 15 minutes is the correct time. So a Digital Fault Recorder which is traditionally used for after the fact analysis would not fall within the 15 minute window while and EMS/SCADA system which provides alarms and allows control of the BES would fall within the 15 minute window. Would a system that is compromised with a Trojan months or years ago but no action has been taken yet to compromise the BES meet the 15 minute window. Another possible approach is to list the real-time systems that need to be in-scope or considered.Because there does not seem to be a clear distinction between a BES Cyber System and a BES Cyber System Component, it would seem like a BES Cyber System could qualify as a BES Cyber System Component
79.b	Alliant Energy	Disagree	We believe the definition should be revised to: "One or more BES Cyber System Components which if rendered unavailable, degraded, or compromised could, within an operational time horizon of 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES."
80.b	Independent Electricity System Operator	Disagree	We do not agree with the 15-minute qualifier. Any BES cyber system components that if tampered with can cause a disturbance to the BES or restrict control and operation of the BES, etc. should fall into this category since some components may have an impact on the BES if tampered with by more than 15 minutes before real time. To qualify the components to be only those that affect real time operation, we suggest wording such as "for the current hour and next hour operations" at the end of the sentence. Further, the term "misused" can be subject to a wide range of interpretation, and hence we suggest that it be replaced with "tampered with" or any term that the SDT thinks is more clear and appropriate.
81.b	We Energies	Disagree	We Energies agrees with the EEI Suggested alternative definition with minor modifications: BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes (15 minutes in this context is used to address real time operations and control of the BES), cause a Disturbance to the BES, or prevent control and operation of the BES, or

#	Organization	Yes or No	Question 1.b. Comment
			materially disrupt situational awareness of the BES.
82.b	MRO's NERC Standards Review Subcommittee	Disagree	We feel “affect situational awareness of the BES” should be removed, as this is already covered under “operation of the BES”. As written, situational awareness is so ambiguous that any meter, instrument, transducer, etc. could possibly be interpreted as included, even if these devices are not required for operation of the BES. We also feel “misused” should be removed, as this is already covered under “compromised”.As currently worded, we also believe the intent of the 15 minute time frame is ambiguous. We would propose incorporating what we believe to be the drafting team’s true intent directly in to the definition, along with our other suggestions, as follows: One or more BES Cyber System Components which if rendered unavailable, degraded, or compromised could, within an operational time horizon of 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES.
83.b	IRC Standards Review Committee	Disagree	We question the technical basis for a 15 minute time frame applied to any component that may cause a “Disturbance” to the BES. Without careful understanding of how the failure of the component could impact the BES 15 minutes may be too long or too short a time frame to allow recovery of the component or enable a mitigation solution. Further, we disagree that the disabling or degradation of any BES Cyber System Component would cause a “Disturbance” that is of significance to the integrity of the interconnected BES. To qualify the components to be only those that affect real-time operation reliability, we suggest wording such as “for the current hour and next hour operations” at the end of the sentence.The term “misused” can be subject to a wide range of interpretation, and hence we suggest that it be replaced with "tampered with" or any term that the SDT thinks is more clear and appropriate.
84.b	Southern Company	Disagree	We recommend the following definition: A system performing one or more BES functions identified in CIP-010 Attachment 1 and which if rendered unavailable, degraded, compromised, or misused would, within 15 minutes, adversely impact the real-time operational control of the BES.

#	Organization	Yes or No	Question 1.b. Comment
85.b	Covanta Energy	Disagree	Without a clear understanding of why '15 minutes' is the defined measure, it is difficult to support the definition.
86.b	Verizon Business	Agree	The “15 minute” criterion should be expanded in writing by the drafting team to provide a better sense of when the time starts. This could be done in an associated guideline or “Frequently Asked Question”

1.c. Control Center — A set of one or more BES Cyber Systems capable of performing one or more of the following functions for multiple (i.e., two or more) BES generation Facilities or Transmission Facilities, at multiple (i.e., two or more) locations:

- Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems,
- Acquisition, aggregation, processing, inter-utility exchange, or display of BES reliability or operability data for the support of real-time operations,
- BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES),
- Alarm monitoring and processing specific to operation and restoration function, or
- Coordination of BES restoration activities.

Summary Consideration:

Many entities expressed concerns that the proposed definition of Control Center was too broad and could include various types of facilities not commonly considered control centers. Others questioned whether a Control Center should be defined as a collection of systems versus a physical facility housing such systems. Many entities indicated that the definition should be restricted to the functions of Reliability Coordinator, Balancing Authority, or Transmission Operator. Some expressed concerns about including situational awareness in the definition.

The SDT has modified the definition of Control Center to clarify that it is one or more facilities hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more functions that support System Operators in the real-time operation of the BES. In consideration of the possible configurations where multiple locations may host such systems, the SDT used 'one or more' facilities. The SDT declined to limit the definition to of Control Center to facilities operated by RCs, BAs, or TOPs, since there are Control Centers operated by TOs and GOs/GOPs as well that must be protected.

The revised definition of **Control Center** is as follows:

One or more facilities hosting a set of one or more BES Cyber Assets or BES Cyber Systems performing one or more of the following functions that support real-time operations by System Operators for two or more BES generation facilities or transmission facilities, at two or more locations:

- *Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems,*

- *Inter-utility exchange of BES reliability or operability data,*
- *Providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES,*
- *Alarm monitoring and processing specific to the reliable operation of the BES and BES restoration function,*
- *Presentation and display of BES reliability or operability data for monitoring, operating, and control of the BES*
- *Coordination of BES restoration activities.*

#	Organization	Yes or No	Question 1.c. Comment
1.c	BCTC		BCTC recommends the following aspects of this definition be revisited:Â Recommend the first bullet point be broken into three:ï,§ Supervisory Controlï,§ AGCï,§ Automatic Load SheddingÂ Recommend that the functions be categorized as “mandatory” for defining a facility as a control centre. These would include:ï,§ Supervisory controlï,§ BES and system status monitoringï,§ Alarm monitoringï,§ Coordination of BES restoration activitiesÂ To be considered a control centre the facility should have “two or more” of the functions listedÂ Remove “or” and replace with “and”Â For BES restoration a Utility may have workstations at an alternate site that by our everyday definition is not considered a control centre (i.e. alternate office building); how would these be classified within this definition? One of the questions we struggled with when looking as this definition was how to define a facility based on the number of RTUs present within them (i.e. one versus many) ... any advice?
2.c	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group		With no metrics defining anything upfront, it is possible to include applicability to very small entities. Control of two or more BES generation or Transmission Facilities with a combined historical demand of less than 500 MW should not be included in this definition. At some point, a defining line needs to be established to effectively define the bounds of the BES “castle” where defense of BES reliability is cost effective. Adding undue BES reliability compliance burdens on smaller DP/LSEs will ultimately add no BES reliability, and will hurt local distribution reliability efforts. If 500 MW is too large, then a conservative value can be agreed to and later revised as engineering studies become

#	Organization	Yes or No	Question 1.c. Comment
			available to justify a larger value.If that cell phone from 1.a. receives alarms from two or more locations and is used to make real time decisions it becomes a Control Center although it performs no control function and is not a center. Suggest that a Control Center be defined as a fixed server location.From the workshop, we realize that the lines separating the Component from the System and from the Center were intended to be flexible and up to the entity to consider system designs. The standard, however, does not read that way. We are concerned that based on the written standard the REs will not allow flexibility or even lines. All BES cyber devices, including every BES alarm displaying cell phone will be cast into all three buckets.
3.c	Dynegy Inc.	Agree with proposed definition	I agree but request additional detail examples be provided to determine specifically what these items are.
4.c	Southern California Edison Company	Agree with proposed definition	SCE requests clarification on systems and components that: (1) facilitate inter-utility exchange; and (2) devices that enable system status monitoring. Would devices such as email systems used for messaging and IP telephony systems in facilities be considered a “control center” or a BES Cyber System? The drafting team should issue guidelines on systems that directly perform BES reliability functions and systems/devices that are used by human operators for feedback prior to the manipulation of cyber components that directly impact the BES. It would also be beneficial for telecommunications equipment, which support a BES Critical Cyber system, be applicable only to COM-001 R2. If the intent of the drafting team is to limit the scope of cyber security controls to systems where real time BES impact is caused by direct human supervisory control over devices and systems, it should be clearly stated as such.
5.c	FEUS	Agree with proposed definition	What would it be considered if it only performed one function for a single BES facility at a single location? It would not be a control center.

#	Organization	Yes or No	Question 1.c. Comment
6.c	Minnesota Power	Agree with proposed definition	While Minnesota Power generally agrees with the proposed definition, it recommends that “(i.e., two or more)” be removed from the definition.
7.c	National Grid	Disagree with proposed definition	1. A control center is usually considered as a physical place with operators using various tools like EMS. The definition implies that a control center is a cyber asset. Isn't the Control Center much more than that? Maybe SDT is trying to define a "Control Center Cyber Asset". If so then SDT should use the term Control Center Cyber Asset. 2. National Grid seeks clarification on "Reliability" or Operability Data" since they can be subject to interpretation. 3. In bullet 3, the asset management piece should not be included. Also, if bullet 3 is indicating statuses like breaker status, then it is not required since it is covered in the preceding bullet. If not, then this should be better defined. 4. In bullet 4, there is no need to include "restoration function" as this is included in "operation" 5. In bullet 5, operators "coordinate" the BES restoration activities and not the cyber systems.
8.c	Progress Energy (non-Nuclear)	Disagree with proposed definition	1. From the definition, the ECC, DCC and the back-up control facilities would definitely be included. A substation that has a LAN connecting several cyber components would not be included. 2. Is a single generating facility the same as a single generating plant? Is a single generating plant a generating unit or a collection of generating units at 1 physical plant site? Clarify that a generating station control room is not a control center. 3. We need to be careful with definition of supervisory control as one possible interpretation of what the control room operator does is supervise the distributed control platforms that make up the plant control system. 4. These systems are independent only controlling one at a time. The key word here is “multiple”. Control rooms at some generation plants house multiple DCS systems. But, by design, each DCS controls its respective unit independently and are considered separate entities. I do not think this example would qualify as a Control Center. We can agree with this concept if they are talking about large regional control like the PJM interconnect or an ECC which it sounds like and NOT plant level Control Rooms. 5. A Control Center would operate

#	Organization	Yes or No	Question 1.c. Comment
			multiple generating Units with one control system.
9.c	Consultant	Disagree with proposed definition	1. The definition should identify that the "set of one or more BES Cyber Systems capable of performing..." are at a single location. If there are multiple locations where this capability exists then each location should be identified as a Control Center. 2. As stated, the definition creates a Control Center at every location where the capability "exists", whether this is a normal operation for each of those locations or is an emergency capability of each of those locations. If that is not the intent of the definition, then the distinction between normal and emergency (backup, off-normal) operations should be included in the definiton.
10.c	Progress Energy - Nuclear Generation	Disagree with proposed definition	A control center at a nuclear facility is different than this definition. I do not belive it is intended to apply to nuclear generation facilities, but rather the energy control centers that supervise bulk power loading functions.
11.c	Dairyland Power Cooperative	Disagree with proposed definition	A control center sound intuitively like a type of facility, but here is used as a term for a system(s) affecting multiple facilities. This will be confusing terminology.
12.c	Indeck Energy Services, Inc	Disagree with proposed definition	A control system that monitors through read-only access should not be categorized as a Control Center under CIP-010. A load aggregator is not identified as a potential Control Center.
13.c	Nuclear Energy Institute	Disagree with proposed definition	Agree with the exception that: The term “multiple locations” should be clarified to “multiple geographically distinct locations” to preclude confusion with a single facility with multiple generating units from being inappropriately identified as a control center.

#	Organization	Yes or No	Question 1.c. Comment
14.c	Alliant Energy	Disagree with proposed definition	Alliant Energy agrees with the EEI comments.
15.c	Pacific Gas & Electric Company	Disagree with proposed definition	Appears that under this definition of Control Center, several BES Cyber Systems or Components would be considered Control Centers such as:Distributed EMS or SCADA front-end processors Transfer Trip Protection Systems located at a specific substation control house that control other subs and/or generationSpecial Protection Schemes that control devices at multiple substations.Don't disagree on the importance of the items above to BES, just that defining them as a Control Center likely will lead to confusion.
16.c	City Utilities of Springfield, Missouri	Disagree with proposed definition	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
17.c	Ameren	Disagree with proposed definition	Clarify the definition to explain if it covers Power Plant control rooms, or if this is limited to transmission dispatching. Please clarify if “locations” refers to physical or electrical locations. Does “generation plants” refer to a Power Plant or generation “Facility” as defined by NERC; there use of plant vs. Facility is inconsistent. The definition appears to automatically cover all plant control rooms for any generator that see’s or controls the switchyard, is this the intent? In the third bullet, the term “and asset management” needs to be removed. As currently written, the inclusion of this term improperly suggests that facilities used for commercial and market purposes are covered by this definition.The definition of Control Center should only include those facilities where NERC certified operators are required for its operation.
18.c	CenterPoint Energy	Disagree with	Disagree - Control Center is a common industry term that often refers to a physical location. It should not be redefined under the CIP standards and should be deleted.

#	Organization	Yes or No	Question 1.c. Comment
		proposed definition	However, if the SDT feels a strong need to include this definition CenterPoint Energy suggest the following: A set of one multiple (i.e. two or more) BES Cyber Systems, located together at the same physical location, capable of performing one or more of the following functions for multiple (i.e., two or more) BES generation Facilities or Transmission Facilities, at multiple (i.e., two or more) locations: o Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems, o Acquisition, aggregation, processing, inter-utility exchange, or display of BES reliability or operability data for the support of real-time operations, o BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES), o Alarm monitoring and processing specific to operation and restoration function, or o Coordination of BES restoration activities.
19.c	Tenaska	Disagree with proposed definition	Display and Inter-utility should be left out. Just display of will not hurt the reliability of the BES (PI data). Loss of inter-utility data need to have an N-11 type requirement with it. The loss of some percentage of data is tolerated in normal operation every day. The EMS/SCADA accounts for bad data. Consider using the definitions for Reliability Coordinator and Balancing Authority for clarity.
20.c	E.ON U.S.	Disagree with proposed definition	E.ON U.S. does not believe that the "display of BES reliability or operability data for the support of real-time operations" alone should qualify a locale as a control center. For example, view only information is often made available to plant operators Does "Alarm Monitoring" in the Control Center definition include sending alarms to remote ends of a transmission line from a substation? For example, carrier check-back and breaker failures. In addition how is transfer trip being addressed.?
21.c	Southern Company	Disagree with proposed	EOP-008, which is focused on control centers and control center functionality, does not contain or need a definition of the term. This implies that the CIP standards may not require a definition, either, and that any definition which is constructed must be done in light of the contents of EOP-008.If a definition is needed, we recommend the following

#	Organization	Yes or No	Question 1.c. Comment
		definition	definition:A location where one or more BES Cyber Systems are used to perform BA, RC, or TOP functions for generation Facilities or Transmission Facilities at multiple locations.If, for some reason, the existing definition must be modified, the following factors should be taken into consideration:Definition of Control Center - its our understanding that the Control Center definition is to be used to scope requirements based on 'environmental' factors and to differentiate it from generating plants and substations (field locations). So Control Center 'environment' is a 'data center' environment consisting of mostly traditional servers and workstations, Generation environment was a campus, plant type environment, and Transmission is an environment with unmanned field locations and mostly purpose built devices. These environments are then used to scope requirements appropriately based on the types of devices and the physical environment prevalent in that situation. The current definition of control center will pull in devices and systems from all the above environments and loses what we considered was the reason the environments were created and defined.For bullet 2...This clause pulls in far more facilities than are either intended or generally thought of as control centers. Things that would qualify: o An unattended remote data acquisition node o A standalone ICCP server feeding data to neighboring utilities o An RTU receiving data from multiple generating unitsThe definition should be modified to require multiple functions for a facility to qualify as a Control Center, and the second bullet, which includes many facilities which are not actually Control Centers and which does not add any additional facilities which should be considered as Control Centers, should be removed.In general, and in particular on bullet 4, processing is not a function of a control center; it's a function of the underlying cyber systems. The actual alarm monitoring, for example, is the key piece, and the wording about "processing" should be removed.For bullet 5...The fluid nature of disaster recovery makes this one worrisome. A makeshift command center set up in the wake of a natural disaster would qualify, even if all they had were laptops with no external network connection, creating some difficult access tracking issues. In general, the inclusion of BES restoration, if necessary, will need to be bounded carefully - one solution would be include the phrase "BES restoration specific to situational awareness".In addition, there are concerns about

#	Organization	Yes or No	Question 1.c. Comment
			small hydro units which can send control signals to other small hydro units being classified as control center locations.
22.c	Oncor Electric Delivery LLC	Disagree with proposed definition	Exclude “display” of data. Inclusion would allow an auditor to assess that the simple display of Responsive Reserve in an office constitutes a “control center”.
23.c	Southwestern Power Administration	Disagree with proposed definition	For the purpose of this standard it would be clearer if the definition would just identify what NERC functions are performed in the control center environment. This will also lessen the chance for confusion going forward with non-CIP reliability standards usage of the term “Control Center”. BES Control Center - A site where personnel can perform one or more of the following functions:Reliability CoordinatorBalancing AuthorityTransmission Operator
24.c	USACE HQ	Disagree with proposed definition	Given that Control Center is based on the definition of BES Cyber System Components and BES Cyber System, which I disagree with both, I must also disagree with this one.
25.c	Edison Mission Marketing and Trading	Disagree with proposed definition	I don't agree that status and alarm monitoring has anything to do with relaibility
26.c	San Diego Gas and Electric Co.	Disagree with proposed definition	If an asset to be evaluated for Control Center status is only one BES Cyber System, it does not seem to meet the definition of “a set”. Therefore, SDG&E suggests that the first sentence of the definition should be changed to read “One or more BES Cyber Systems capable of ...”Is a control center appropriately defined as one or more “BES Cyber Systems capable of performing...”, or would is it more appropriately defined as “A location where one or more BES Cyber Systems are monitored for proper performance

#	Organization	Yes or No	Question 1.c. Comment
			of one or more of the following functions (i.e., two or more)..."Why is control of two or more facilities required for this definition? How does a backup control center factor into this definition? In the past, the "two or more facilities" piece was part of the differentiation between a control room and a control center, but we don't see a definition of "control room" in this draft.
27.c	Dominion Resources Services, Inc.	Disagree with proposed definition	It is not clear whether the control center is the aggregate of the BES Cyber Systems or the physical space containing them. There is ambiguity as to whether the last phrase (at multiple...) belongs to the set of BES Cyber Systems or to the multiple facilities. Other definitions are of the form that "if it does this" then it is "this". It should be clarified that the presence of one or more of these functions does not make it a Control Center. For example, using a conference room or field office to direct BES restoration activities during an emergency does not make that conference room or field office a Control Center. The term should be limited to only those physical spaces used by a Balancing Authority, Reliability Coordinator and/or Transmission Operator in the performance of real-time functions, since these are the 3 entities charged with overall reliability functions for the BES. Dominion proposes the following definition of a Control Center: Control Center - The space where a Balancing Authority, Reliability Coordinator and/or Transmission Operator uses one or more BES Cyber Systems to perform one or more of the following functions for two or more geographically dispersed BES Generation or Transmission Facilities: o Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems, o Acquisition, aggregation, processing, inter-utility exchange, or display of BES reliability or operability data for the support of real-time operations, o BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES), o Alarm monitoring and processing specific to operation and restoration function, or o Coordination of BES restoration activities.

#	Organization	Yes or No	Question 1.c. Comment
28.c	Emerson Process Management	Disagree with proposed definition	It is very unclear how this term could be interpred for typical power generation plants. Very rarely, multiple generation facilities at different locations will be controlled under one physical control center. Control systems and control rooms are mostly located at the same place with the generation units.So, the term of Control Center in this standard may be totally inapplicable to BES generation facilities or entities.
29.c	Liberty Electric Power, LLC	Disagree with proposed definition	Many generation plants are not part of the current definition of BES. This standard is not the correct place to redefine BES, and any language which does so will force "No" votes on the standard, regardless of the merits of the rest of the document.
30.c	MidAmerican Energy Company	Disagree with proposed definition	MidAmerican Energy agrees with EEI's suggested modification to “Alarm monitoring” below:BES Alarm monitoring and processing specific to BES real-time operation or BES restoration function, or
31.c	Public Service Enterprise Group companies	Disagree with proposed definition	Mostly agree with the definition. However, the applicability of the first qualifier “(i.e., two or more)” is not clear. Does the qualifier apply to only “BES generation Facilities” or to “BES generation Facilities or Transmission Facilities”? Please clarify the language.
32.c	Regulatory Compliance	Disagree with proposed definition	Please clarify - for any control room at a generating facility that can remotely operate another site, whether or not it would be classified as a control center.
33.c	MWDSC	Disagree with proposed definition	Proposed definition conflicts with industry understanding and potentially with other standards. Attachment II assumes a Control Center is not just a collection of BES Cyber Systems gathering data, but rather a 24/7 facility staffed with certified power operators who take appropriate actions. Someone has to make decisions using the information being sent over cyber systems. Suggest changing definition as follows:"Control Center -

#	Organization	Yes or No	Question 1.c. Comment
			A facility staffed by a Transmission Operator, Generator Operator, or Balancing Authority who makes decisions based on information received from a set of one or more BES Cyber Systems capable of performing one or more of the following functions for multiple (i.e., two or more) BES generation Facilities or Transmission Facilities, at multiple (i.e., two or more) locations.
34.c	Con Edison of New York	Disagree with proposed definition	Regarding the definition of Control Center, as written, it appears that any facility can be deemed a Control Center. If a Transmission, Generation or other facility has a BES Cyber System that controls more than 1 generation or transmission facility it would be a Control Center. If so, this may be conflicting when addressing CIP-011-1 requirements that distinguish between Control Center and other facilities. This may also cause a transmission station that is connected to a generating station to be a Control Center if the station has an RTU cyber asset (with or maybe without an HMI) that can trip all station breakers (impacting the transmission station) and thereby trip the generator (impacting the generating station).
35.c	Wolverine Power	Disagree with proposed definition	See comments listed for 1.a
36.c	EEI	Disagree with proposed definition	See EEI's suggested wording in 1.a. Alternatively, EEI suggests:A modification to "Alarm monitoring":BES Alarm monitoring and processing specific to BES real-time operation or BES restoration function, or
37.c	WECC	Disagree with proposed definition	Seems to define the control center to try and exclude control rooms that only affect local facilities. Suggest rewriting to scope all bulleted functions performed inside a single location and EXCLUDING locations that only affect location facility operation.Based on the previously defined term "BES Cyber Systems" it is redundant to characterize a Control Center as a "set of one or more."The following rewrite is

#	Organization	Yes or No	Question 1.c. Comment
			proposed;Control Center - A facility used to implement a BES Cyber System(s) to perform one or more of the following functions for BES Generation Facilities, BES Transmission Facilities, and/or Distribution Facilities located at two or more locations: o Supervisory control of BES assets, including generation plants, transmission facilities, substations, Automatic Generation Control systems or automatic load-shedding systems, o Acquisition, aggregation, processing, inter-utility exchange, or display of BES reliability or operability data for the support of real-time operations, o BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES), o Alarm monitoring and processing specific to operation and restoration function, or o Coordination of BES restoration activities.Distribution is included in this suggested rewrite based on its inclusion in the Applicability List as “Distribution Provider.”
38.c	Madison Gas and Electric Company	Disagree with proposed definition	Suggest removing the comma after "Transmission Facilities." With the comma, the subsequent phrase, "at multiple (i.e., two or more) locations," could be interpreted to apply to "one or more BES Cyber Systems" rather than BES Generation or Transmission Facilities.The term "location" is ambiguous in the context of the definition. For example, multiple generators at the same generating plant are placed in multiple locations (unless they impossibly occupy the same physical space). The intent of the qualification "at multiple locations" seems to be to exclude generating plant control systems, yet the definition could be read to potentially include generating plant control systems as Control Centers. Recommend modifying the definition to provide more specificity.Similar to the definition of BES Cyber System, the definition of Control Center does not provide criteria for aggregating BES Cyber Systems to define the "set of one or more BES Cyber Systems" that comprise a Control Center.New definition should read:Control Center - A set of one or more BES Cyber Systems capable of performing one or more of the following functions for multiple (i.e., two or more) BES generation Facilities or Transmission Facilities, at multiple (i.e., two or more) locations:

#	Organization	Yes or No	Question 1.c. Comment
39.c	Entergy	Disagree with proposed definition	Suggest: A) Changing definition to speak specifically to "Functions" in Attachment I; and delete "for multiple (i.e., two or more) BES generation Facilities or Transmission Facilities, at multiple (i.e., two or more) locations." B) Delete all bullets and rely on list of Functions as sole qualifiers. C) Note: close scrutiny of this definition is needed relative to EOP-008 (Project 2006-04: Backup Facilities; nearing final ballot) to avoid conclusion.
40.c	Green Country Energy	Disagree with proposed definition	Suggested definition:Control Center - A set of one or more BES Cyber Systems capable of performing one or more of the following functions at two or more BES generation Facilities, or Transmission Facilities at two or more locations:
41.c	Allegheny Power	Disagree with proposed definition	Suggested modification to "Alarm monitoring" o BES Alarm monitoring and processing specific to BES real-time operation or BES restoration function, or
42.c	Allegheny Energy Supply	Disagree with proposed definition	Suggested modification to "Alarm monitoring"- BES Alarm monitoring and processing specific to BES real-time operation or BES restoration function, or
43.c	Constellation Power Source Generation	Disagree with proposed definition	The "Acquisition, aggregation, processing..." function that a Generation Management System (GMS) or a marketing system would fall under scope of a "control center" though it would make more sense (in reliability terms) for it to be just a BES cyber system. A clarifying statement is needed to exclude marketing and GMS systems from this control center definition. The definition of control center is too broad in only requiring performance of one of the functions to meet the definition. A control center is commonly understood to be a location, not a system, where at least 4 of the 5 functions are performed, if not all 5 functions. This definition eliminated the concept of a control center as a defined space with operating systems and instead identifies a control center

#	Organization	Yes or No	Question 1.c. Comment
			as cyber systems which pull in work spaces that should not be in scope.
44.c	APPA Task Force	Disagree with proposed definition	The APPA Task force is concerned that under the proposed definition, a substation control room could be considered a "Control Center." Therefore, we offer the following clarification for your consideration:"A set of one or more BES Cyber Systems at centralized, primary or back-up locations that enable centralized operation of a Reliability Coordinator, Balancing Authority or Transmission Operator."
45.c	Xcel Energy	Disagree with proposed definition	The definition needs to clarify that it applies to interconnected control systems. For example, two independent control systems with no interdependency that operate generation units at separate locations should not be defined as a control center.
46.c	Constellation Energy Control and Dispatch, LLC	Disagree with proposed definition	The definition of Control Center is too broad in only requiring performance of one of the functions to meet the definition. A Control Center is commonly understood to be a location not a system, where at least four of the five functions are performed, if not all. This definition eliminates the concept of a control center as a defined space with operating systems and instead identifies a control center as systems which would pull in work spaces that should not be considered Control Centers. Remove AGC Systems from function 1. Automatic Generation Control is defined to be Equipment (not a system) that automatically adjusts generation in a Balancing Authority from a central location to maintain the BAs interchange schedule plus Frequency Bias. The Equipment that automatically adjust generation is located at the generation site not in the Control Center. The Control Center EMS has the ability to send a signal to a generator, but not to automatically adjust the generation. Rather the generator is set up to pick up the signal in a central control system at the site and use the signal to change its operating level with in established operating parameters in accordance with established capability. The definition of Control Center should focus on the systems in a Control Center that can actually automatically operate equipment, i.e. Supervisory control of BES assets at generating plants, transmission facilities and substations is a sufficient description of these type of Control Center functions.Remove asset management from function 3.

#	Organization	Yes or No	Question 1.c. Comment
			Unless this term is defined to narrow the scope as related to Control Center functions, this term is loosely used in the industry and would result in too broad of an application of this function.It may be worth including a data acquisition timing reference to appropriately narrow the scope as well. Control Centers are processing data in terms of cycles or seconds and many of the function described may be performed by systems using longer intervals and these longer interval systems should not be pulled into the definition.
47.c	Constellation Energy Commodities Group Inc.	Disagree with proposed definition	The definition of... "capable of performing one or more..." should be changed to "capable of performing four or more..."The definition of Control Center is too broad in only requiring performance of one of the functions to meet the definition. A Control Center is commonly understood to be a location not a system, where at least four of the five functions are performed, if not all. This definition eliminates the concept of a control center as a defined space with operating systems and instead identifies a control center as systems, which would pull in work spaces that should not be considered Control Centers. Remove AGC Systems from function 1. Control Centers

#	Organization	Yes or No	Question 1.c. Comment
			are processing data in terms of cycles or seconds and many of the function described may be performed by systems using longer intervals and these longer interval systems should not be pulled into the definition.Typically, BES restoration processes are coordinated with manual processes, and are not Cyber System related.
48.c	Platte River Power Authority	Disagree with proposed definition	The function"BES and system status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES)," doesn't clearly represent the real-time nature of the function. "System" is already included in BES. Suggested revision:BES real-time status monitoring and processing for reliability and asset management purposes (e.g., providing information used by Responsible Entities to make real-time operational decisions regarding reliability and operability of the BES),
49.c	CWLP Electric Transmission, Distribution and Operations Department	Disagree with proposed definition	The last two bullet points should be removed. The first is redundant and the last muddies the concept of control center. Restoration activities could be coordinated from a bucket truck or a temporary command center. These functions are actually human interactions not cyber systems.
50.c	US Bureau of Reclamation	Disagree with proposed definition	The term "BES asset" is not defined. The requirement should either propose a definition or the language in the requirement should be modified to refer to "BES Facilities" both of which are defined in the NERC Glossary of Terms.
51.c	LCEC	Disagree with proposed definition	The term "locations" needs to be defined. Should the human/machine interface be considered in defining a control center? Ensure that control rooms are not considered as control centers per this definition.
52.c	Southwest Power Pool Regional Entity	Disagree with	The use of "multiple (i.e., two or more)" twice in the same sentence is confusing. Consider changing the definition to read "A set of one or more BES Cyber Systems

#	Organization	Yes or No	Question 1.c. Comment
		proposed definition	capable of performing one or more of the following functions for multiple (i.e., two or more) geographically disperse BES generation Facilities or Transmission Facilities:"
53.c	Hydro One	Disagree with proposed definition	There is a gap regarding centralized configuration of BES Cyber Systems. The current definition of control center does not include a centralized system used for maintaining or configuring remote equipment such as RTUs or relays.Based on the control centre proposed definition all hub sites would be deemed within the definition of control centers. We would like the clarification if the auxiliary systems (High pressure air systems, cable temperature monitoring, QFW sag monitoring, DC inverters, PLCs, substations WANs, teleprotections, synchrophasors etc.) would be considered as BES Cyber System Components. As proposed, this definition would have massive implications to Hydro One in terms of implementation, capital cost, OM&A expenses etc.
54.c	Northeast Power Coordinating Council	Disagree with proposed definition	There is a gap regarding centralized configuration of BES Cyber Systems. The current definition of control center does not include a centralized system used for maintaining or configuring remote equipment such as RTUs or relays.
55.c	Bonneville Power Administration	Disagree with proposed definition	Third bullet should make it more clear that only real-time management (control and operation) is relevant. The example is for real time control; changing "e.g." to "i.e" would be sufficient. In addition, the way the definition is written it is possible that a substation could end up being identified as a Control Center. The definition needs to be clear that these are facilities whose prime purpose is to be control centers, not just substations that happen to have information covering other substations, or even possibly the ability to exercise some control over another substation.
56.c	Exelon Corporation	Disagree with proposed	This definition does not align with the commonly understood definition of control center and could be interpreted to apply to multiple unmanned locations housing servers.

#	Organization	Yes or No	Question 1.c. Comment
		definition	
57.c	NextEra Energy Corporate Compliance	Disagree with proposed definition	This definition needs to be more specific. NextEra suggest removing "capable" in the first line and removing or better defining "coordination" and "restore BES activities." NextEra also recommends defining control center as having the "Primary function."NextEra also suggests being clear on whether remote Control Centers are included, and, if so, CIP-011 needs to be very clear on any differences in the protection of remote control centers versus primary control centers. NextEra will be providing additional comments in the future.
58.c	Reliability & Compliance Group	Disagree with proposed definition	This definition seems to include control room as a Control Center. Does this mean a control room can be considered as a control center? Normally a Control Center requires having real time operation functions. The way it is stated above if you meet one of the last two functions, it is qualifies as a control center
59.c	Duke Energy	Disagree with proposed definition	This definition should be revised to clarify that a Control Center only includes facilities required to be staffed by NERC-certified operators. The revised definition should explicitly clarify that the term Control Center does not include the control room for a multiple generating unit site. Also, the use of the capitalized term "Facilities" continually causes confusion during audits, because, as the term is defined, even a single generating unit site could contain multiple "Facilities" (e.g. a line, a generator, a shunt compensator, transformer, etc.)Also, the phrase "capable of" is open to interpretation, and should be replaced with the phrase "operationally responsible for". Also, the phrase "for the support of" in the second bullet is open to interpretation, and should be replaced with the phrase "essential to".
60.c	Old Dominion Electric Cooperative	Disagree with proposed definition	This seems to widen the definition of control center to the point of being overreaching.

#	Organization	Yes or No	Question 1.c. Comment
61.c	Pepco Holdings, Inc. - Affiliates	Disagree with proposed definition	We agree with EEI's comments. Do transmission facilities include substations or does it reference just the transmission line components?
62.c	FirstEnergy Corporation	Disagree with proposed definition	We are unclear why 'control center' is being redefined as a logical set of cyber systems rather than a physical site which accommodates the functions traditionally identified with control centers. This definition appears to align with legacy architectures, where the control center serves as a communications hub and data center, thus creating a single point of failure. Modern architectures that employ best practices for reliability, redundancy, and diversity do not employ that structure. Since this is a significant departure from the commonly understood definition of 'control center', it is unclear how this definition will impact compliance to the newly proposed standards.
63.c	GTC & GSOC	Disagree with proposed definition	We do not agree with this definition. We believe that it will capture a large number of systems that are not part of what is commonly understood to be a control center. For example, an RTU acting as a data concentrator acquires data from multiple locations and supports real-time operations, but is not itself a control center. In addition, the term "BES assets" is an artifact of the version 1, 2, and 3 CIP standards and should either be replaced or clarified. More basically, though, we question the need for this definition. Its primary function appears to be as a scoping criterion for CIP-011 in the same manner that generation [sic] Facility and Transmission Facility are. However, the SDT did not feel the need to define either of those terms. We recommend that this definition may be better suited for a guidance document.
64.c	We Energies	Disagree with proposed definition	We Energies agrees with EEI Suggested modification to "Alarm monitoring" with minor modifications: o BES Alarm monitoring and processing specific to BES real-time operation or BES restoration function, or Suggested modification to "Acquisition" bullet o Acquisition, aggregation, processing, inter-utility exchange or display of BES reliability or operability data for the support of real-time BES operations.

#	Organization	Yes or No	Question 1.c. Comment
65.c	Independent Electricity System Operator	Disagree with proposed definition	We generally agree with the description in the definition, but do not agree with the term “control centre” as it confuses with the traditional control centre of BES operations. We suggest the term be changed, for example, to “BES Cyber Cluster”, or “BES Cyber Control Cluster”.
66.c	IRC Standards Review Committee	Disagree with proposed definition	We generally agree with the description in the definition, but do not agree with the term “control centre” as it confuses with the traditional control centre of BES operations. We suggest the term be changed, for example, to “BES Cyber Cluster”, or “BES Cyber Control Cluster” or “BES Control System”.
67.c	Midwest ISO	Disagree with proposed definition	What is really being described is a control system and not a control center. A control center implies physical attributes that are not described in this definition. We suggest to modify the definition to control system rather than control center.
68.c	Florida Municipal Power Agency	Disagree with proposed definition	With this definition, a substation control room can be a “Control Center”. A Control Center has other characteristics associated with it that make it a control center, i.e., “centralized operation”, the reverse of the term. FMPA suggests a simpler definition:”A set of one or more BES Cyber Systems at centralized, primary or back-up locations that enable centralized operation of a Reliability Coordinator, Balancing Authority or Transmission Operator.”

2. **The definition of BES Cyber System limits the scope of the definition and the applicability of CIP-010-1 (and CIP-011-1) to real-time operations systems with an operational time horizon of 15 minutes. Do you agree with this scope of applicability? If not, please explain why and provide specific suggestions for improvement.**

Summary Consideration:

While there was general agreement with scoping the applicability of the standards to "real-time" systems, many entities questioned the source of 15 minutes as the scoping time. Some commenters expressed concerns about the auditability of this qualification in defining the scope of applicability.

In selecting the 15-minutewindow, the SDT reviewed various reliability standards and identified two widely used time horizons: 30 minutes and 15 minutes. The intent of the SDT is to include those systems that impact "real-time" operation of the BES. The SDT used a 15-minute window to qualify the "real-time" nature of the impact and felt that a 30-minute window would include those systems that might not be considered as "real-time".

The proposed definition of a **BES Cyber System** has been revised as follows:

One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services. A Maintenance Cyber Asset is not considered part of a BES Cyber System.

#	Organization	Yes or No	Question 2 Comment
2.1	USACE HQ		I disagree with the scope and disagree with expanding the scope. The use of a time limit to represent real-time should not be present given that is lacking documentation support for the number. Either introduce a definition for real time for CIP purposes or provide support for the risk-informed dentition of using 15 minutes as the limit
2.2	Arizona Public Service Company		The 15-minute criteria specified as part of the definition of a BES Cyber System may both lead to confusion and/or act as a loophole to exclude BES Cyber System Components from further consideration. Confusion may be caused by likely differing interpretations of "restrict control and operation of the BES, or affect situational awareness of the BES". Without more specific definitions, each Entity may utilize different criteria for determining whether control and operation has been 'restricted' or whether situational awareness has been 'affected'. Such potential ambiguity may also allow Entities to utilize

#	Organization	Yes or No	Question 2 Comment
			excess discretion in this determination in order to 'exclude' Cyber System Components from categorization. A suggestion would be to attempt to avoid such vague terms if a timeline is specified in the definition at all, or to avoid a timeline in the definition and add time windows to the Impact Categorizations. Examples of terminology changes include using the term 'impede' rather than 'restrict' (as some restriction may be tolerable, but impede strengthens the concept being conveyed) or using the phrase 'impact operational decision making' rather than 'affect situational awareness' (as such a phrase might be less likely to be misinterpreted outside of Power Operations expertise).
2.3	Nuclear Energy Institute	Agree with scope	A recommended change to BES Cyber System Component has been proposed to clarify that the intent is to protect real-time operations. NEI recommends examples of systems that would fall in and outside this scope.
2.4	US Army Corps of Engineers, Omaha Distirc	Agree with scope	Agree with limiting scope to real-time systems with an operational time horizon of 15 minutes. However the wording of the definition needs to be strengthened because the intended meaning of the definition as "real-time" systems with an operational time horizon of 15 minutes" was not clear until.
2.5	Entergy	Agree with scope	Agree with scope limitation to "real-time operations." Suggest: Rule 706 be carefully reviewed to assure this is not countervailing to FERC directives; their directives suggest a broader scope of applicability.
2.6	Allegheny Power	Agree with scope	Agree with the intended scope. It is appropriate to focus and prioritize the establishment of security controls to address real-time operations of the BES. It may be appropriate to add language explaining why certain items are in or out of scope. For example, computers that are used to perform long term system modeling and engineering design should not be subject to the same security requirements as real-time systems.
2.7	EEI	Agree with	Agree with the intended scope. It is appropriate to focus and prioritize the establishment of security controls to address real-time operations of the BES. It may be

#	Organization	Yes or No	Question 2 Comment
		scope	appropriate to add language explaining why certain items are in or out of scope. For example, computers that are used to perform long term system modeling and engineering design should not be subject to the same security requirements as real-time systems.
2.8	MWDSC	Agree with scope	Also need to identify who makes the real-time operational decisions, i.e., Transmission or Generator Operator or Balancing Authority. See suggested changes in comments to question 1.b.
2.9	City Utilities of Springfield, Missouri	Agree with scope	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
2.10	Dominion Resources Services, Inc.	Agree with scope	Dominion supports the inclusion of "within 15 minutes". It is important to establish a reasonable boundary condition for the real-time or near real-time effects of the BES Cyber System and 15 minutes provides adequate time for the effects to be mitigated to prevent further harm to the BES.
2.11	Southwest Power Pool Regional Entity	Agree with scope	Entities today eliminate assets from the Critical Asset list because they assume a mitigation to a voltage instability or thermal overload is available and will always be successful. Consider modifying the definition to read "...could, if not mitigated within 15 minutes,..."
2.12	Southwestern Power Administration	Agree with scope	Fifteen minutes seems to be a reasonable operational horizon, but should the language be modified in such a way to allow for an operational time horizon of approximately 15 minutes in order to discourage "clock watching" by entities and/or auditors to reach a conclusion of either fourteen or sixteen minutes.
2.13	Platte River Power Authority	Agree with scope	I agree so long as the BES Cyber System definition is updated to more clearly explain the horizon. For example:BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within an

#	Organization	Yes or No	Question 2 Comment
			operational time horizon of 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES.
2.14	MidAmerican Energy Company	Agree with scope	MidAmerican Energy agrees with EEI's affirmation below:Agree with the intended scope. It is appropriate to focus and prioritize the establishment of security controls to address real-time operations of the BES. It may be appropriate to add language explaining why certain items are in or out of scope. For example, computers that are used to perform long term system modeling and engineering design should not be subject to the same security requirements as real-time systems.
2.15	Progress Energy (non-Nuclear)	Agree with scope	See comment for question 1b.
2.16	APPA Task Force	Agree with scope	The APPA Task force agrees with the proposed definition, but offers the following suggestions:It seems that the 15 minute horizon is arbitrary. We suggest aligning the time to an already determined time limit in the standards. For instance, TOP-004-2, R4 allows 30 minutes for a Transmission Operator to restore the system to a known operating state within operational limits from an “unknown operating state”, which seems to be a good metric to use since loss of situational awareness at a Control Center results in an “unknown operating state”, which seems to correspond with the longest time frame of Attachment I to CIP-010. We understand that other commenters are submitting alternative language. We can support alternative options if they are based on existing NERC defined terms or already determined time limits.
2.17	Bonneville Power Administration	Agree with scope	The definition clearly ties the scope of the standard to real-time control. The time limit clearly separates real-time from long-term. The choice of 15 minutes versus some other duration is not as important as limiting the duration.While we agree with the scope, we don't believe the definition of BES Cyber System makes it clear that the scope is limited to real-time operation systems. The definition of BES Cyber System doesn't include the words real-time. For CIP-002, BPA identifies only control center systems used for real-

#	Organization	Yes or No	Question 2 Comment
			time controls as Critical Cyber Assets. This scope is consistent with what BPA does now for control center cyber systems.
2.18	Southern California Edison Company	Agree with scope	The drafting team should provide justification on the use of a 15 minute window for a BES cyber system to cause a Disturbance. Is the drafting team suggesting registered entities simulate disturbance events in 15 minute increments as a criterion in engineering studies to assess device capability that may be the justification for an impact based assessment methodology? If so, the drafting team needs to clarify this.SCE suggests removal of the 15 minute qualifier if no clear operational justification exists for the choice of such timeframe. While a three year timeframe for engineering studies is an acceptable, the constraints necessary for inclusion within the study, to look for specific disturbance conditions, may be difficult to implement.
2.19	Midwest ISO	Agree with scope	We agree in general. However, we do not necessarily agree with 15 minutes. Please see our response to Question 1.b.
2.20	Pepco Holdings, Inc. - Affiliates	Agree with scope	We agree with EEI's comments regarding the intended scope (i.e. limit to systems that impact the real-time real-time operations of the BES) and suggestions. Please also reference response to 1b.
2.21	We Energies	Agree with scope	We Energies agrees with EEI comments. Agree with the intended scope. It is appropriate to focus and prioritize the establishment of security controls to address real-time operations of the BES. It may be appropriate to add language explaining why certain items are in or out of scope. For example, computers that are used to perform long term system modeling and engineering design should not be subject to the same security requirements as real-time systems.
2.22	GTC & GSOC	Agree with scope	We understand the intent of the 15 minute aspect of the defined scope, but believe it will be difficult to implement and audit. Otherwise, we recommend the revised definition in 1b

#	Organization	Yes or No	Question 2 Comment
2.23	Duke Energy	Agree with scope	With the clarifications we've made above, we agree with the scope of applicability.
2.24	ISO New England Inc	Disagree with scope	- Recommend "30 minutes" to align with EOP standards- Please provide background for where the 15 minute recommendation came from
2.25	ReliabilityFirst Staff	Disagree with scope	Assuming the 15 minutes identified here is the same 15 minutes used in question 1.b above, we believe the scope should be 5 minutes.
2.26	Tenaska	Disagree with scope	Careful consideration should be given to the "within 15 minutes" phrase, this time period may be too long or too short depending on the severity of the event, type of cyber asset, or the type of BES entity. The Operational Time Horizon should be based on the potential severity of the event as well as the availability of other systems that can provide the same functionality.
2.27	Cogeneration Association of California and Energy Producers & Users Coalition	Disagree with scope	Comments to Questions 1.a and 1.b apply here also.
2.28	ERCOT ISO	Disagree with scope	Comments: The 15 minute requirement does not align to the other reliability standards. Recommend changing to 30 minutes to align with the EOP standards.
2.29	CenterPoint Energy	Disagree with scope	Disagree - CenterPoint Energy is concerned with the definition as stated above in response to 1.b. In addition, the SDT has offered no basis for the 15 minute time horizon.

#	Organization	Yes or No	Question 2 Comment
2.30	E.ON U.S.	Disagree with scope	E.ON U.S. seeks clarification of whether the 15 minutes captures the intent of the 'Restoration of BES" function identified in Attachment 1 of CIP-010
2.31	Exelon Corporation	Disagree with scope	Exelon suggests that the time period should not be stated in specific minutes. The standard should be revised to "One or more BES..., or misused could, without sufficient time to take mitigating action, cause a disturbance to the BES,..." The 15 minute timeframe is inconsistent with other standard language. Specifically, TOP-004-2 R.4. has a 30 minute response requirement.
2.32	LCEC	Disagree with scope	I am concerned that a time based definition will lead to confusion and create a difficult situation from an audit perspective. I agree that the standard should exclude "situational awareness" related functions that are not real-time in nature and do not provide the primary operational monitoring or control function of the BES.
2.33	Matrikon Inc.	Disagree with scope	I am trying to determine where to insert this operational time horizon into the evaluation criteria. Due to the room for interpretation, I don't yet support or reject the use of 15-minutes, or an appropriate duration. Fundamentally, there is no clear definition or instruction on how this can be used as criteria for determining Impact Level of cyber systems.I worry there is room for different interpretations, putting an entity trying to comply with the new CIP-01x standard at a competitive disadvantage to another entity that takes a different approach. I foresee 2-3 places where the time horizon could be inserted into a Responsible Entity's interpretation of BES Cyber Systems, I am hoping a tighter definition will address this issue.First Interpretation Scenario:1. The entity first determines the Impact Rating of each individual Cyber System using Attachment 2.2. Do they now evaluate the impact rating against the time horizon? Let us assume the Cyber System has High Impact. But if there is no effect in 15 minutes, does that mean: 2a. I automatically assign a Medium impact Rating? 2b. Or, I now evaluate it against the Medium impact criteria?3. If it continues to have no impact in 15 minutes to the Medium criteria, then is it a Low Impact BES Cyber System?Second

#	Organization	Yes or No	Question 2 Comment
			Interpretation Scenario:1. The entity first determines the Impact Rating of each individual Cyber System using Attachment 2. 1a. Let's now assume that the rating of High/Medium/Low is assigned to each BES Cyber Component and cannot be changed.2. Do they now go through the complete list of Cyber Systems looking for those which could affect any reliability function within 15 minutes? 2a. This may bring in other support systems like HVAC, UPS, CEMS opacity readings for generation, water supply and others that are not explicitly named in Attachment 1.Third Interpretation Scenario:1. An event has occurred at the facility that some action needs to be taken. There is the capability to notify the authority, and shutdown/bypass safely within 5-10 minutes.2. If the Responsibility Entity has the ability to exceed 15-minutes before taking action, then is this no longer an impact to the BES, and subsequently falls to the bottom and become Low Impact. 2a. For example, coal handling is down but we have some coal left on the conveyor, and the boiler is still hot so we have time to respond. 2b. For example, water supply is dropping but do not have to take action within 15 minutes. 2c. For example, vibration or emissions data is high, but we don't have to take action, within 15 minutes.Please provide additional information and guidance on how the 15-minute time horizon is to be applied to systems.
2.34	CWLP Electric Transmission, Distribution and Operations Department	Disagree with scope	It is unclear how the 15 minute time frame is to be applied.
2.35	Emerson Process Management	Disagree with scope	It really depends on how we view this issue. If I understand this intent correctly, the current language is trying to state that the BES reliability will be suffered if the BES cyber system is unavailable for more than 15 minutes. In another word, if the BES cyber system is failed for more than 15 minutes and the BES is not suffered, this system will be not categorized as BES Cyber System. This definition is very difficult in interpretation for power generation. If a plant has a 2000MW generation capacity and its water treatment cyber system is failed, the plant itself can sustain for a while, but not too long. After this grace period, the unit(s) will be shut down. The 2000MW will be lost. Does this affect

#	Organization	Yes or No	Question 2 Comment
			BES reliability? This is the confusion.
2.36	Florida Municipal Power Agency	Disagree with scope	It seems that the 15 minutes is arbitrary. FMPA suggests aligning the time to an already determined time limit in the standards. For instance, TOP 004 2, R4 allows 30 minutes for a Transmission Operator to restore the system to a known operating state within operational limits from an "unknown operating state", which seems to be a good metric to use since loss of situational awareness at a Control Center results in an "unknown operating state", which seems to correspond with the longest time frame of Attachment I to CIP-010.
2.37	Seattle City Light	Disagree with scope	It will be difficult to quantify the impact of systems within a window of time - this would be a qualitative assessment which invites a tremendous amount of subjectivity.
2.38	Garland Power and Light	Disagree with scope	Need to add "scoping filter" as described on slide 31 of the NERC Workshop (May 19-20) Presentation on CIP 10 as presented by Jackie Collett. There already has been a Regional Entity Auditor make a presentation that he intended to audit beyond the scope of what is in the current standard - he (the auditor) may apply the same approach to the new standard if the filter is not stated with the definition - not adding the clarification (scoping filter) just adds the potential for alleged violations and all the baggage that goes with that until one can hopefully get resolved - If you add the filter which states "typically excludes business, market function systems, and non real-time systems", then it is a good scope and we would agree
2.39	Kansas City Power & Light	Disagree with scope	No. Including "within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES" in the definition provides a difficult set of parameters that encourages issues with interpretation of what would constitute the situations under which "within 15 minutes" applies, as well as, what constitutes "restricted control or generation"? It is understood the Drafting Team is trying to capture the essence of those systems that have a real-time impact on the BES, however, it is recommended to limit the scope of the applicable "BES Cyber

#	Organization	Yes or No	Question 2 Comment
			System" to those systems that support facilities that are identified as critical to the reliability of the transmission grid determined by regional system study.
2.40	Covanta Energy	Disagree with scope	Not clear as to why 15 minutes is the optimal number... would like more basis information prior to supporting.
2.41	IRC Standards Review Committee	Disagree with scope	Please see our comments under Q1b
2.42	Independent Electricity System Operator	Disagree with scope	Please see our comments under Q1b.
2.43	Public Service Enterprise Group companies	Disagree with scope	PSEG agrees that cyber protections should be mandated only for real-time operations systems.
2.44	National Grid	Disagree with scope	Real time operation of the system typically implies SCADA. If protection systems are part of the real time operations then as stated in 1b, the 15 minute time horizon may not be adequate. 15 minute time limitation also does not appear realistic. The vulnerability can exist beyond this timeline and can be equally catastrophic.
2.45	Electricity Consumers Resource Council (ELCON)	Disagree with scope	See comment on 1.a above.
2.46	NextEra Energy Corporate Compliance	Disagree with scope	See comments to 1a. NextEra believes if this approach is maintained despite these concerns, then this section needs clarity regarding 15 minute time horizon regarding recoverability. As written, the definition encompasses and overlaps normal operations

#	Organization	Yes or No	Question 2 Comment
			systems and recovery timeframes and does not address impacts to the BES beyond normal reliability operations.
2.47	Manitoba Hydro	Disagree with scope	See comments to Question 1.6
2.48	BCTC	Disagree with scope	See previous response
2.49	Network & Security Technologies Inc	Disagree with scope	See response to 1.b., previous
2.50	Puget Sound Energy	Disagree with scope	See response to question 1b. While it seems realistic, it is unclear how to prove something is within the 15 minute timeframe or not and unclear how this could be tested during an audit that something should have been included or not included. Some examples would be beneficial. Also PSE agrees with the scope of the definition, but is concerned with the vagueness of two of the terms used in the definition: “restrict” and “affect”. PSE agrees with the definitive language of “cause a Disturbance”, as that is a measurable level of compliance. The current standard has too many vague terms that are left open for interpretation.
2.51	WECC	Disagree with scope	Suggest SDT re-evaluate if reliability coordination systems such as Coordinated Outages, Historian, or Next Day Studies should be excluded from scope of these standards.Also, see response to 1c
2.52	Indeck Energy Services, Inc	Disagree with scope	The 15 minute time horizon needs to exclude events that the BES normally resolves within 15 minutes. Many events could take place in significantly less time. Normal operations work within the 10 minute horizon for measurements such as controlling

#	Organization	Yes or No	Question 2 Comment
			ACE. Not everything that happens within 15 minutes necessarily affects BES ALR. A single 15 minute time horizon appears to cast the net too widely. The time horizon needs to be specified for each of the Functions in Attachment I.
2.53	FirstEnergy Corporation	Disagree with scope	The 15 minute time limit causes confusion on how the definition will be applied in practice, since in most cases the loss of a component creates a probabilistic risk and not a certain risk.FE suggest that the SDT avoid the use of the 15 minute reference and consider incorporating the existing NERC glossary terms of "Real-time" and "Real-time Assessment". We offer the following definition for BES Cyber System:BES Cyber System - One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could cause a BES Disturbance or impact the Real-time Assessment capability, Real-time control and operation, or materially impact situational awareness of the BES.Situation awareness is somewhat vague and may mean different things to different people. The team should consider taking the description of situational awareness as shown in Attachment I - "Functions Essential to Reliable Operation of the Bulk Electric System" and making it a NERC Glossary of Terms definition.
2.54	LADWP	Disagree with scope	The 15 minute window is relative. The industry needs to define what is an acceptable time horizon.
2.55	Dairyland Power Cooperative	Disagree with scope	The 15-minute rule seems arbitrary and one dimensional. How does the availability of using a system for control relate to this time frame? I'm having trouble relating this to for instance a telemetry/control function. It would be possible that long periods of down time could pass without impact to the BES system... but under certain conditions it would be critical to have the monitoring and control functions.
2.56	Constellation Energy Commodities Group Inc.	Disagree with	The definition of a Disturbance includes a concept, as applied by Balancing Authorities of sudden failures of generation or interruption of load. The fifteen minute window is generally viewed as the length of time in which recovery should take place. The drafting

#	Organization	Yes or No	Question 2 Comment
		scope	team should look at narrowing the time horizon further to capture BES Cyber Systems that will directly control equipment and result in immediate system impacts. The definitions of Disturbance and Emergency reflect events that immediately impact the system; the fifteen minute window is viewed as the point in time by which the system should be recovered.
2.57	Constellation Energy Control and Dispatch, LLC	Disagree with scope	The definition of a Disturbance includes a concept, as applied by Balancing Authorities of sudden failures of generation or interruption of load. The fifteen minute window is generally viewed as the length of time in which recovery should take place. The drafting team should look at narrowing the time horizon further to capture BES Cyber Systems that will directly control equipment and result in immediate system impacts. The definitions of Disturbance and Emergency reflect events the immediately impact the system, the fifteen minute window is viewed as the point in time by which the system should be recovered.
2.58	San Diego Gas and Electric Co.	Disagree with scope	The phrase "real-time" doesn't have a definitive industry-wide connotation, although for collecting field data it usually means seconds instead of minutes. In general, SDG&E supports the inclusion of real-time operations systems being in-scope, but we support a shorter operational time horizon (such as 5 minutes) to make the definition more immediate, with more high value BES Cyber assets being part of the scope.
2.59	Minnesota Power	Disagree with scope	The scope of applicability and operational time horizon of 15 minutes appears arbitrary and Minnesota Power is unsure as to how the Standards Drafting Team envisions that a Registered Entity will be able to show and document (i.e., prove for audit purposes) that a particular Cyber System will or will not have an effect on the BES in a certain time period. If the intent is "real-time operations," then state that and drop "within 15 minutes."
2.60	Consultant	Disagree with	The scope statement should clarify the inclusion or exclusion (or alternative treatment) of backup systems, development systems and environments, quality assurance systems and environments, testing systems and environments.As stated the only systems that

#	Organization	Yes or No	Question 2 Comment
		scope	appear to be "in scope" are live production systems.
2.61	US Bureau of Reclamation	Disagree with scope	This requirement puts a premium on the definition of what the BES is. There are components of the power system that are not "BES" and therefore do not qualify under these Standards. This issue needs to be further addressed. Further, the term "operational time horizon" needs further definition. Is this 15 minute criterium to be applied under normal operation conditions, or only those that COULD be experienced if the Cyber System were to be compromised?
2.62	Ameren	Disagree with scope	We disagree with the scope; the 15 minutes should only apply if the disturbance is not recoverable.
2.63	Southern Company	Disagree with scope	While we understand the intent of the 15-minute scope, we feel that the inclusion of this factor causes too much vagueness in the interpretation of the definition. We recommend that the focus be limited to real-time operations only.
2.64	Verizon Business	Agree	The “15 minute” criterion needs to be expanded – perhaps in an associated guideline or “Frequently Asked Question”

3. **Requirement R1 of draft CIP-010-1 states, "Each Responsible Entity shall identify and document each of the BES Cyber Systems that it owns to execute or enable one or more functions defined in CIP-010 – 1 Attachment I – Functions Essential to the Reliable Operation of the BES to identify BES Cyber Systems for the application of security requirements." Do you agree with the proposed Requirement R1? If not, please explain why and provide specific suggestions for improvement.**

Summary Consideration:

Many entities expressed concerns on the broad implication associated with the phrase "execute or enable…". Entities generally agreed with the assignment of compliance responsibility to owners, but many others expressed concerns for jointly owned facilities or facilities that may be operated by other than owners. There were many concerns expressed about the Functions and their description and definition. Others expressed concerns about the differences between systems and their components.

CIP-010-1 Requirement R1 has been replaced by CIP-002-5, which reads:

Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in *CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems*. All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification. *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

Additional guidance for jointly owned facilities has been provided in the Application Guidelines section of the standard. The reliability functions have been redefined as Reliability Operating Services to avoid any confusion with the use of the term Functions as used in the Functional model.

#	Organization	Yes or No	Question 3 Comment
3.2	WECC		Agree with the concept however, "...to execute or enable..." or "...which execute and/or enable." "to" can be construed as passive. It is redundant to utilize the phrasing "...to identify BES Cyber Systems for the application of security requirements."The following rewrite is proposed;R1. Each Responsible Entity shall identify and document each BES Cyber System(s) that it owns, which execute and/or enable one or more functions defined in CIP-010 - 1 Attachment I - Functions Essential to the Reliable Operation of the BES. (Violation Risk Factor: High)
3.3	Entergy	Agree	Agree that applicability should be strictly focused on "owned" assets.

#	Organization	Yes or No	Question 3 Comment
3.4	US Army Corps of Engineers, Omaha Distirc	Agree	Agree with R1 requirement - Find the measures for R1 - R3 troublesome. Measures are stated in terms of number of BES cyber systems. It is conceivable that plant SCADA systems could be considered a single system or a group of a few systems. How is a missed component handled? Is it another system or is a component. It appears like the violation measures are being handled as a count of BES cyber system components not BES cyber systems. Feel the measures should be revisited with the low number of systems likely to be identified in mind. Seems odd that any additional system is a sever violation if you have identified fewer than 6 systems.
3.5	Florida Municipal Power Agency	Agree	Although FMPA agrees with the requirements, FMPA suggests that naming Attachment I "Functions ...." will add confusion with the "Functional Model". FMPA suggests renaming Attachment I to "Activities Essential to the Reliable Operation of the BES", and of course modify R1 to reflect this change. Additional comments on Attachment I are included below in Question 6.
3.6	Garland Power and Light	Agree	Definitely agree with the words "it owns"
3.7	SCE&G	Agree	Guidelines should be provided to assist entities in determining how BES Cyber System Components should be grouped into BES Cyber Systems. Can a single component reside in two cyber systems?
3.8	Dynegy Inc.	Agree	I agree but request additional detail examples be provided to determine specifically what these items are.
3.9	Reliability & Compliance Group	Agree	Is the assumption that the initial list needs to contain both BES and non-BES Cyber Systems? It would be better if the standard was even more proscriptive here.
3.10	Con Edison of New York	Agree	Please note comments to question 6. It may be easier if the DT reference functions as detailed by FERC-approved NERC Reliability Standards. The definitions in Attachment I will ultimately lead to many requests for interpretation. R1 requires identification and documentation of BES Cyber Systems. There is no requirement to identify BES Cyber

#	Organization	Yes or No	Question 3 Comment
			System Components within CIP-010. However, CIP-011-1 R23 requires that you develop an inventory of these Components. Should this be a CIP-010 requirement? Then CIP-011 can expand on the Change Management Controls.
3.11	San Diego Gas and Electric Co.	Agree	SDG&E agrees with the wording in R1, but has additional comments and requests for clarification. Specifically, we request clarification regarding the "situational awareness" reference in Attachment I. In our case, as many other entities, we use Remote Terminal Units to gather data from BES substations and present that data to the operators to improve their Situational Awareness. Loss of a single RTU vs. loss of multiple RTUs affects the presentation of this data to operators to varying degrees (with associated effects on monitoring the BES), but the Standards don't address quantitative issues such as this.In a similar vein, SDG&E also requests clarification regarding the term "inter-entity real-time coordination and communication" in Attachment I. For example, are inter-entity telephone systems in-scope or is this referring to electronic data exchange between entities such as ICCP data links?Probably SDG&E's largest concern with CIP-010-1 R1 is the sheer amount of effort and resources it will take to build the lists of BES Cyber Systems and the impact categorizations. While there are some loose parallels with the current CIP-002 Standard, we won't be able to re-use the bulk of the work already done in our Risk-Based Assessment to identify Critical Cyber Assets. SDG&E's opinion is that CIP-010 doesn't leverage as much of CIP-002 as we'd like to see. We'd like to take advantage of what already has been produced to become Compliant with the existing Standards, and we see these new draft Standards as going in a new direction with many of the requirements. We would feel better about it if the new Standards were bringing substantial additional reliability and security to the BES, but that is not apparent.
3.12	Minnesota Power	Agree	With the previously stated recommendations regarding the definition of BES Cyber System (see Question 1.b.) and the changes indicated below, Minnesota Power generally agrees with the proposed Requirement R1. "Each Responsible Entity shall identify and document each of the BES Cyber Systems that it owns which execute or enable one or more functions defined in CIP-010 - 1 Attachment I, Functions Essential to the Reliable

#	Organization	Yes or No	Question 3 Comment
			Operation of the BES, for the purpose of applying the security requirements."
3.13	BCTC	Disagree	- Recommend removal of the “Inter-Entity Real-Time Coordination and Communication” (Attachment 1) point as this is covered under the COM domain
3.14	Bonneville Power Administration	Disagree	"...that it owns to execute or enable..." is somewhat unclear. It appears the intent is the equivalent of "that it owns that is able to execute or enable...". As it is written, it can give the impression that the purpose of owning the system is to execute or enable the functions. That is too narrow. Another possible interpretation is that the "to execute or enable..." refers to the objective of the requirement. If that is so, then please break the objective out separately:"Objective: To execute or enable...Requirement: Each Responsible Entity..."Many of the other requirements include "to..." at the end of the requirement. These are clearly objective statements. They should be broken out separately, into an "Objective" and "Requirement", as stated above. The last phrase in Requirement 1 is “for the application of security requirements.” In Requirement 2 the last phrase is “for the application of Cyber Security requirements . . . .” Are these two phrases supposed to have the same meaning? If so, shouldn’t they use identical words? If not, what does “for the application of security requirements” mean? Is it referring to some or all of the requirements in CIP-011-1? If so, it should clearly state that and, if not the entire standard, which specific requirements it is referring to.It seems that it should read as follows: “for the application of the Requirements contained in Standard CIP-011-1.”
3.15	Consultant	Disagree	1. I think the standards should provide some distinction between ownership responsibility and operations responsibility, or provide a mechanism to identify the responsibility for the requirements based on each specific situation. (Technical Feasibility Exception for owner versus operator responsibility?) This may include split responsibility for different aspects of the requirements. (This comment probably applies to more than just this requirement in both CIP-010 and CIP-011.)2. Wording is confusing regarding systems for application of security requirements. Suggest ending the requirement statement after "...Reliable Operation of the BES."3. Suggest using the complete title of

#	Organization	Yes or No	Question 3 Comment
			Attachment I: "Bulk Electric System" not "BES".4. In all locations in both CIP-010 and CIP-011 suggest removing references to specific revisions (e.g. CIP-010-1). This requires all standards to be changed for a change in any one standard. The documentation of which revision was used at the time of implementation should be included in the Responsible Entity's documentation or compliance.
3.16	Dairyland Power Cooperative	Disagree	A Responsible Entity should be responsible for any systems used for their operation regardless of ownership. Basing responsibility based on the ownership of a system creates a big loophole. It is possible an interfacing utility or service provider could be involved. Basing responsibility on the ownership of the facility containing the systems make more sense.
3.17	Duke Energy	Disagree	Additional clarification is needed on the process for identifying and categorizing BES Cyber Systems. Requirement R2 should really come first, and require that Responsible Entities identify their BES Cyber Systems that meet the criteria in Attachment II (i.e., that can affect operations for the listed facilities/functions). Requirement R1 should come second, and require documentation of the functions affected for each BES Cyber system identified. Attachment I is not needed as part of the standard, but should be included in a guidance document.Much more clarification is needed to Attachment I. As described, the functions are far too broad. Specific language issues: o Monitoring & Control - Activities, actions and conditions that provide both monitoring and control of BES elements. o Situational Awareness - too broad as stated. Should be limited to situational awareness of the BES required by System Operators to perform their reliability-related functions o Inter-Entity Real-Time Coordination and Communication - too broad as stated; would seem to possibly include telephone lines
3.18	Arizona Public Service Company	Disagree	Additional verbiage needs to be included in order to clearly delineate which entity is responsible for an asset/system when it is jointly owned. Is it the majority owner? The operator? Where is the line?”

#	Organization	Yes or No	Question 3 Comment
3.19	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	Again, no defining metrics. Small DP/LSEs will unnecessarily be required to comply with no BES reliability return.
3.20	IRC Standards Review Committee	Disagree	At the NERC CIP workshop in May 2010, there were so many examples brought forth where it could not be determined with exactness which components are part of a BES Cyber System or not because of the flexibility built into the requirements. "It depends" was often the response from the panels. So although the intent of CIP-010 is to provide more concrete guidance for registered entities to define BES Cyber Systems, in practice it may introduce just as many new questions about applicability as it may solve. It would be better to develop a performance based approach to define BES Cyber Systems rather than use bright line definitions to identify BES Cyber Systems. The proposed definitions of High and Medium include criteria that describe facilities, by KV level, MW size etc. But these are really proxies for an underlying intent of trying to describe a certain level of operational performance. For example, higher KV levels are assumed to reflect greater impacts on neighbors. And higher MW levels of generation are assumed to reflect greater risk of disturbance to load. Rather than use these proxies, the ratings High and Medium should instead employ descriptors related to a desired level of performance, for example, "...a loss of a facility that does not cause a IROL violation two systems away." Such an approach in defining the BES Cyber System would better focus the CIP-011 requirements and compliance efforts of both NERC and the registered entity on only those components that truly have a significant impact on the interconnected BES and not include facilities and components that although meet a bright line definition, really have minimal impact on the BES because of its particular location or configuration.
3.21	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
3.22	ERCOT ISO	Disagree	Comments: It should be stated that the Responsible Entity is allowed to perform R1 and R2 in the order they deem appropriate. Consider: "Each Responsible Entity shall

#	Organization	Yes or No	Question 3 Comment
			document each identified BES Cyber Systems that it owns which support the functions defined in CIP-010-1 Attachment I - Functions Essential to the Reliable Operation of the BES, for the application of security requirements.”
3.23	LCEC	Disagree	Concerned with the word "owns". Recommend "owns or operates" or a statement referencing operational responsibility.With the current definition of BES Cyber System Components including "one or more" devices, a lot of guidance will be needed to determine what constitutes a system versus a number of components. Most of the standards currently reference the system versus the component which could leave a gap in applicability. Is it assumed that all components must be a system or part of a system? Modifying the BES Cyber System Component definition to exclude "one or more" will help but entities will still need clarification on the grouping of components to form systems. An implementation guideline will help address this.
3.24	Constellation Power Source Generation	Disagree	Constellation believes that this requirement is too broad in terms of auditability. The proposed verbiage of CIP-010 is flexible in terms of how to define cyber systems, but is it implying that a methodology is needed to identify cyber systems? Or is it implying that each Responsible Entity define cyber systems as they see fit, without an explanation? For a company such as Constellation, which owns a fleet of diverse generation facilities, this flexibility will cause each plant to have its own unique methodology for developing cyber systems, which vastly increases the procedural burden of this standard when compared to the current version of CIP-002. A suggestion would be to clarify this requirement in a guidance by stating whether or not a methodology is needed to define cyber systems, and if not, what type of evidence would be suggested for showing that a cyber system has been identified correctly.
3.25	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy does not agree with the direction of the SDT and believes it is pre-mature to discard the current CIP requirements with a completely new philosophy. Most entities are in the compliance phase of implementation of the current CIP requirements and have yet to be audited. To have a fundamental shift in approach before the current requirements have been evaluated as to effectiveness and

#	Organization	Yes or No	Question 3 Comment
			compliance is unwarranted. In addition, CenterPoint Energy does not agree with the expansion of the CIP requirements to facilities that do not have a high impact on the reliable operation of the Bulk Electric System. CIP-010-1 and CIP-011-1 would apply some cyber security requirements to facilities and systems that the draft Standard would identify as having a medium to low impact to the reliable operation of the Bulk Electric System. While CenterPoint Energy agrees that some set of minimal security criteria should be used to protect facilities from malicious behavior, vandalism, or simply the curious, CenterPoint Energy believes these efforts are more accurately characterized as Good Business Practice and as such should not be auditable under mandatory reliability standards. Stated another way; those facilities and systems that have been identified as medium to low impact, using the draft standard methodology, by the nature of having little or no impact to reliable operation of the Bulk Electric System, should not be protected under auditable, mandatory, requirements.
3.26	Constellation Energy Control and Dispatch, LLC	Disagree	Disagree based on concerns with Attachment 1 Propose definitions for Attachment 1:Dynamic Response functions: BES equipment that reacts automatically to a BES Disturbance.Balancing Load and Generation: BES equipment that directly controls generation or load.Controlling Frequency: BES equipment that directly controls frequency (Does control of generation already cover this function?)Controlling Voltage: BES equipment that directly controls reactive power resources.Managing Constraints: (Delete this function) - Cyber systems used for monitoring and/or situational awareness that do not actually control BES equipment should be out of scope for this standard because they are not going to directly result in a Disturbance condition in real time. In many cases loss of communication processes and procedures would be applied in situations where there is a complete loss of such tool. At a minimum the monitoring and situational awareness tools subject to inclusion as a BES Cyber System should be limited to systems that provide data for monitoring and/or situational awareness that will be solely relied upon to directly operate equipment. Monitoring & control: Delete Monitoring and limit the BES equipment that control actions such as open and closing switches or relays, motor starts/stops, etc. Cyber systems used for monitoring and/or situational awareness that do not actually control BES equipment should be out of scope

#	Organization	Yes or No	Question 3 Comment
			for this standard because they are not going to directly result in a Disturbance condition in real time. 			directly result in a Disturbance condition in real time. In many cases loss of communication processes and procedures would be applied in situations where there is a complete loss of such a tool. At a minimum the monitoring and situational awareness tools subject to inclusion as a BES Cyber System should be limited to systems that provide data for monitoring and/or situational awareness that will be solely relied upon to directly operate equipment.Define the term Situation Awareness and how it applies to BES Cyber System or components required for system restoration.
3.28	Dominion Resources Services, Inc.	Disagree	Dominion agrees with R1, but is concerned with the functions listed in Attachment 1. Please see Dominion's response to Question 6.
3.29	E.ON U.S.	Disagree	E ON U.S. notes the absence of any study to assess whether identifying and categorizing all BES Cyber Systems as required by R.1 provides for material enhancement of BES reliability relative to the current Critical Asset identification methodologies allowed under CIP-002. E ON U.S. is also not aware of any effort to objectively quantify the costs that will result from R.1. Given the likely significant costs to consumers it would behoove the SDT and NERC to make an effort to understand the costs and incremental improvement to BES reliability associated with the sweeping changes proposed in CIP-010, R.1.The proposal does not allow for "no impact" assessments to be determined through engineering evaluation or other approved methods. E ON U.S. believes it would be an improvement to include language similar to that in existing CIP-002 R1.2.
3.30	EEI	Disagree	EEI generally agrees with R1, however, all owners of jointly owned facilities may not be responsible for protecting the BES Cyber Systems. For example, there are many Generating Units that are owned by multiple parties. The entity that performs operations (e.g. the licensed operator of a generating unit) is responsible for the requirements identified by CIP-010-1. As a result, the drafting team should clarify what is meant by "owns" (i.e. how should GOs and GOPs collectively assess BES Cyber Systems).
3.31	ReliabilityFirst Staff	Disagree	For clarity, ReliabilityFirst suggests the following revision to the language of this requirement, "BES Cyber Systems that the entity owns, operates, or is otherwise

#	Organization	Yes or No	Question 3 Comment
			responsible for. . .”
3.32	American Municipal Power	Disagree	I agree with the intent, but I disagree with the structure of CIP-010. The applicability section should not include Distribution Providers (DP), since many DP will have little to no impact to the reliability of the BES from a cyber standpoint and will have to comply with many burdensome and unnecessary requirements in CIP-010 and CIP-011 that will be performed by other entities. I feel the purpose of the standard should directly relate to an increase in reliability. I feel the CIP-010 standard is solely based upon documenting existing or planned systems, so the purpose should correlate documenting the cyber systems with an increase in reliability. There should only be two requirements. R1: Document BES Cyber Systems. R2: Review documented BES Cyber Systems. Please add sub-requirements only as necessary to fulfill the purpose.
3.33	USACE HQ	Disagree	I disagree with the new approach the team is presenting of substituting the risk-based assessment methodology with a list of essential function without any support of why they are essential. Order 706, page 70 - 72, recognize the need for risk-based assessment methodology guidance, therefore recognizing that the use of a quantifiable methodology based on risk is the right way to assess criticality of assets or systems present in the community. To create a list of functions and stating that they are essential without having done some type of study looking into what are really essential functions supporting the BES are only limits the protection of each asset to what a small group of people think is critical without taking into consideration the individual circumstances each asset brings to the table. I suggest that either the team moves back to the original intent in CIP-002 versions 1 - 3 and re-institute the language of risk-based methodology to create the list of BES Cyber Systems OR the team does a risk-based study on the BES to establish the “functions essential to the reliable operation of the BES”.
3.34	Pepco Holdings, Inc. - Affiliates	Disagree	In general we agree with R1 when there is only one owner of a BES Cyber System. However we also agree with EEI’s comments that owners of jointly owned facilities may not be responsible for BES Cyber Systems to be protected. For example, there are

#	Organization	Yes or No	Question 3 Comment
			Transmission Lines and/or Substations that are owned by multiple parties but one party is responsible for the operation and maintenance. Suggest considering adding language to R1 to cover joint owned facilities (e.g. In cases of joint owned BES Cyber Systems, the assigned Responsible Entity or Entities shall...).
3.35	Southern California Edison Company	Disagree	It is not clear how this requirement differs from CIP-002, R3. While the description of CIP-011 states the intent to retire CIP-003 through CIP-009, CIP-002 would still be in place. It is also not clear how these CIP-010-1 and CIP-002 would work together.
3.36	SPS Consulting Group Inc.	Disagree	It is unclear how the list of Essential Functions in Attachment 1 correlates to the categorization in Attachment II, which does not mention essential functions. I believe that Attachment I can be deleted and that Attachment II is fully sufficient for the categorization exercise. The stated purpose of Attachment I to define the scope of the CIP standards is unnecessary because the CIP standards do not apply to functions, they apply to registered entities, which are quite clearly stated.
3.37	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
3.38	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's recommendation to change owner to the owner-operator that performs operations as described below:Owners of jointly owned facilities may not be responsible for BES Cyber Systems to be protected. For example, there are many Generating Units that are owned by multiple parties. The owner-operator that performs operations (e.g. the licensed operator of a generating unit) is responsible for the requirements identified by CIP-010-1.
3.39	Michigan Public Power Agency	Disagree	MPPA is one of many organization that are co-owners of facilities that do not maintain operational control of the facility. MPPA suggests that the word "owns" in "...Systems that it owns to execute..." be changed to "operates."
3.40	Tenaska	Disagree	No R1 should be to identify BES assets that cyber systems are a part of. Consider

#	Organization	Yes or No	Question 3 Comment
			replacing attachment 1 with better definitions in the body of the standard.
3.41	Progress Energy (non-Nuclear)	Disagree	One major issue is that we do not have a clear definition of the BES. How do we define the BES? Is it all lines over 100kV excluding transmission feeders? It appears that some reliability groups are presently trying to define the BES clearly. If the BES includes >100kV import/tie lines, nuclear off-site power path, cranking path, quite a few T/T substations with microprocessor relays on lines could be put in scope of identification. These might be excluded or classified low impact if no communication is provided. Will power line carrier, transfer trip, etc. be in scope? This could turn into a very large list to develop and maintain.
3.42	Allegheny Energy Supply	Disagree	Owners of jointly owned facilities may not be responsible for BES Cyber Systems to be protected. For example, there are many Generating Units that are owned by multiple parties. The entity that performs operations (e.g. the licensed operator of a generating unit) is responsible for the requirements identified by CIP-010-1.
3.43	Allegheny Power	Disagree	Owners of jointly owned facilities may not be responsible for BES Cyber Systems to be protected. For example, there are many Generating Units that are owned by multiple parties. The entity that performs operations (e.g. the licensed operator of a generating unit) is responsible for the requirements identified by CIP-010-1.
3.44	PacifiCorp	Disagree	PacifiCorp agrees with EEI's recommendation to change owner to entity that performs operations as described below:Owners of jointly owned facilities may not be responsible for BES Cyber Systems to be protected. For example, there are many Generating Units that are owned by multiple parties. The entity that performs operations (e.g. the licensed operator of a generating unit) is should be identified as responsible for the requirements identified by CIP-010-1.
3.45	Regulatory Compliance	Disagree	Please clarify - Attachment I - The function identified for Inter-entity Real-time Coordination and Communication: Is the coodination between the Responsible Entities' associated System operators or between BAs? Also what specific equipment is brought

#	Organization	Yes or No	Question 3 Comment
			into scope? Is it only for data communcation or voice communication as well?
3.46	Puget Sound Energy	Disagree	Puget Sound Energy feels that, without clarity (as commented in question 2 above), the scope of BES Cyber Systems can not be uniformly agreed upon and, as such, defendable metrics to prove compliance will not be able to be establish. For example, corporate email can be used to provide efficient communications between operators of the BES. The loss of corporate email, which in no way could cause a disturbance to the BES (and is physically and logically separated from all BES Cyber Systems), could "restrict" or "affect" the real-time operations of the BES through degradation in efficient communications. As well in order to prove compliance the unintended consequence of this requirement is a massive work effort to evaluate all the BES Cyber Systems in order to then establish or demonstrate which enable or execute essential functions.
3.47	Alliant Energy	Disagree	R1 is ambiguous when referring to "Joint-Owned Units", and we believe that the word "owns" should be replaced with "owns and operates." In a joint-owned facility, the operator typically has responsibility for compliance with NERC standards.
3.48	Wolverine Power	Disagree	See comments listed for 1.a
3.49	NextEra Energy Corporate Compliance	Disagree	See comments to 1a. In addition, NextEra believes if the introduction of "functions" is another area that could lead to misunderstanding. If left, we recommend it only be for "informational purposes" and not controlling. As stated above, the specific list of components in BES Cyber Systems of Control Centers, Generators and Transmission should be what is controlling and protected. Also, as the drafting team will see throughout these comments, language that can be misunderstood will be proposed to be changed. The drafters often spoke of their intent, and while this term is widely used by the industry and it always means well, it is not a compliance/regulatory term the serves the industry, NERC or FERC well. The intent of the drafting team is not recognized as record evidence, nor is it controlling in an audit or before NERC or FERC. Thus, preambles should be clear. For example, "Purpose: To provide clear understanding of what BES Cyber System Components must be protected consistent with CIP-011-

#	Organization	Yes or No	Question 3 Comment
			1.”Similarly, NextEra is not supportive of using technical guidance papers to supplement the Standards. NextEra believes the Standards are what NextEra will need to comply with and the guidance papers, unless approved by FERC, are not controlling from a compliance perspective. Moreover, guidance papers tend to be loosely written and subject to being misunderstood. NextEra would rather see the specifics in the Standards.
3.50	MWDSC	Disagree	Situational Awareness is a new term that will be confused with Monitoring and Control function in Attachment I. The term "Control and Operation" was changed from prior draft to "Monitoring and Control". Shouldn't situational awareness be performed by the same operator? Suggest deleting Situational Awareness and revising the Monitoring and Control function as follows:"Activities, actions and conditions that provide monitoring and control of BES elements, including the assessment of current, expected, and anticipated state of the BES.
3.51	Matrikon Inc.	Disagree	Still open for interpretation, in its most simple form the only action words are “execute” or “enable” that correspond the cyber system to each of the functions. Please provide further definition or guidance on its application.
3.52	Southwest Power Pool Regional Entity	Disagree	The ability of the entity to group its cyber assets into cyber systems as it sees fit potentially offers an opportunity to game the system by dissecting legitimate cyber systems into smaller groups of components with less span of control and thus lower impact. There needs to be some sort of sufficiency criteria to ensure proper logical grouping. Additionally, a concern to the auditor is the ability to ascertain that the entity has identified all of the pertinent cyber systems and that all of the necessary cyber system components have been accounted for. Lastly, consider modifying the phrase “...that it owns to execute or enable...” to read “...that it owns to execute, enable, or support...”
3.53	APPA Task Force	Disagree	The APPA Task force disagrees with the proposed requirement but we offer the following suggestions:We suggest that naming Attachment I “Functions ....” will create

#	Organization	Yes or No	Question 3 Comment
			confusion with the "Functional Model". We suggest renaming Attachment I "Activities Essential to the Reliable Operation of the BES", and of course modify R1 to reflect this change. Additional comments on Attachment I are included below in response to Question 6. There are many different business models in our industry, and "ownership" may not mean "owns and operates." Therefore we would propose replacing the word "owns" with "owns and operates". As currently written, this requirement would force each owner to individually catalogue all of the BES Cyber Systems at a jointly owned facility, even though typically only the actual operator of the facility has any control of the BES Cyber Systems installed, and/or the related day-to-day compliance with NERC standards.
3.54	Nuclear Energy Institute	Disagree	The current CIP-002 provides a risk-informed approach to the identification of assets critical to the reliability of the bulk-power system. The current practice is for a generator owner/operator to coordinate with the local transmission owner/operator to determine if the generator is critical to maintaining the reliable operation of the Bulk-Power system.The proposed CIP-010-1 eliminates this risk-informed approach, and would require all generators of any size to be required to comply with the CIP Standards even if the BES would not be adversely affected by the loss of the generating facility.NEI believes that the proposed methodology in CIP-010-1 is contrary to the intent of section 215 of the Federal Power Act (FPA) (16 U.S.C. 824o) which is to prevent instability, uncontrolled separation, or cascading failures as the result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.In order for CIP-010-1, R1 to be acceptable, reliance on an analysis by the transmission system owner/operator must be performed to determine if the generator operator/owner facilities are critical to the reliability of the bulk-power system.
3.55	GTC & GSOC	Disagree	The definition unnecessarily restates detail that should be in the definition of BES Cyber Systems. We recommend it be simplified to state the following "Each Responsible Entity shall identify and document each of its BES Cyber Systems in order to apply Cyber security requirements."

#	Organization	Yes or No	Question 3 Comment
3.56	FirstEnergy Corporation	Disagree	The definitional terms for Control Center, BES Cyber System and BES Cyber System Components in conjunction with the Requirement R2 "Impact Categorization (Attachment II)" should provide sufficient direction to the "programmable devices" that are within in scope and require protection under the proposed CIP standard. The R1 requirement places an unwarranted compliance documentation burden on the industry with questionable reliability payback. FE suggests that R1 and its corresponding Attachment I can be eliminated from the standard.Secondly, the requirement describes two unique actions - identify and document - BES Cyber Systems. "Documenting" the identified BES Cyber Systems is actually evidence of compliance that should be left to the Measures and not explicitly stated in the requirement. Failure to identify a BES Cyber System poses a real reliability risk to the BES, however, identifying and protecting a BES Cyber System but only neglecting to include it in a documented report is an administrative task with no reliability risk.
3.57	USACE - Omaha Anchor	Disagree	The owner may be a distant owner - I feel it should be operators - or the owner in conjunction with the operator.
3.58	Detroit Edison	Disagree	The phrase "to identify BES Cyber Systems for the application of security requirements" at the end of R1 is a restatement of the purpose of CIP-010 and should be removed. Consider changing R1 to: Each Responsible Entity shall identify and document each of the BES Cyber Systems that it owns to execute or enable one or more functions defined in CIP-010-1 Attachment I - Functions Essential to the Reliable Operation of the BES.
3.59	Indeck Energy Services, Inc	Disagree	The R1 requirement ignores the risk based assessment methodology that is required by FERC-see Order 706. [suggested replacement language] "Each Responsible Entity shall identify and document each of the BES Cyber Systems that it owns to execute or enable one or more functions, defined in CIP-010 - 1 Attachment I - Functions Essential to the Reliable Operation of the BES, and perform a risk assessment according to its risk based assessment methodology of the impact on the reliability of the BES to identify a BES Cyber Systems for the application of security requirements."

#	Organization	Yes or No	Question 3 Comment
3.60	US Bureau of Reclamation	Disagree	The unclear definition for "could have an effect on real-time operation..." as used in the opening of Attachment I, needs to be clarified/quanitized or defined. Almost any of these functions (and many more), at any facility - no matter the size - could have an effect. The effect needs to be characterized as more than trivial to be deemed essential to reliable BES operation. Whether the changes are made to the Attachment or within this requirement is immaterial. The language in the requirement needs to be cleaned up as follows: "Each Responsible Entity shall catgorize and document such categorization for each BES Cyber System identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachement II - Impact Categorization of BES Cyber Systems." The title of Attachment to is incorrect in the requirement.
3.61	Platte River Power Authority	Disagree	There can be some confusion regarding who is responsible for implementing and demonstrating compliance with the CIP standards under certain circumstances (e.g. joint ownership). It would be helpful if there was a mechanism to identify the “Responsible Entity” responsible for implementing and demonstrating compliance for various Assets. The “Responsible Entity” designation could also include operators and could vary based on standard\requirement. For example:The designated Responsible entity is the owner unless specified otherwise.For Assets where an owner is not the designated Responsible Entity:- The owner must document an agreement with the designated Responsible Entity including the Asset(s) and requirements the designated Responsible Entity is responsible for.- The designation must be to a NERC Registered Entity.- The designation must be reviewed and reaffirmed annually
3.62	Manitoba Hydro	Disagree	This is satisfactory if identifying the cyber system with a reasonably short descriptive overall functional summary is sufficient. It is unsatisfactory if each and every single component of the cyber system must be described in some detail. Since some of the requirements in CIP-011 are at the BES Cyber System Component level, the need to identify the components should be explicitly required in the standard. Requirement R1 is unclear as drafted. It is not clear if the phrase “to execute or enable one or more functions...” describes the purpose of identifying BES Cyber Systems, or if it describes a

#	Organization	Yes or No	Question 3 Comment
			necessary characteristic of the BES Cyber Systems. Note that in Measure M1, "to" is replaced with "that", creating an inconsistency between Requirement R1 and Measure M1. Measure M1 is not a complete sentence. What needs to be documented?.
3.63	Southwestern Power Administration	Disagree	Though identification of BES Cyber Systems may be beneficial, adding prescriptive categories such as those included in Attachment I only add another layer of administrative "check-listing" for compliance purposes and do not actually have a positive effect on reliability. If Attachment I is intended as guidance in understanding the functions essential to reliable operation of the BES, it would be more appropriately included in a guidance document.
3.64	Midwest ISO	Disagree	We do not believe that it is necessary to document what function its BES Cyber Systems perform in attachment I. We believe that it is only necessary to test them against the criteria established in Attachment II. Developing inventory lists of what BES Cyber Systems performs what functions in Attachment I would increase the risk of a coordinate attacks should the information get into the wrong hands.
3.65	We Energies	Disagree	We Energies agrees with EEI comments. Owners of jointly owned facilities may not be responsible for BES Cyber Systems to be protected. For example, there are many Generating Units that are owned by multiple parties. The entity that performs operations (e.g. the licensed operator of a generating unit) is responsible for the requirements identified by CIP-010-1.
3.66	Madison Gas and Electric Company	Disagree	We feel R1 is ambiguous as written when referring to assets of joint ownership, and would propose replacing the word "owns" with "owns and operates". As currently written, this requirement would force each owner to individually catalogue all of the BES Cyber Systems at a jointly owned facility, even though typically only the actual operator of the facility has anything to do with the BES Cyber Systems installed, or the related day-to-day compliance with NERC standards. Attachment 1 requires clarification.Balancing Load and Generation, Controlling Frequency (Real Power) and Controlling Voltage (Reactive Power) are Functions Essential to Reliability Operation of

#	Organization	Yes or No	Question 3 Comment
			the Bulk Electric System but do not contain the modifier of BES as in Monitoring and Control does. Is it implied that the listed functions are only those functions Essential to Reliability Operation of the Bulk Electric System? Please clarify.
3.67	MRO's NERC Standards Review Subcommittee	Disagree	We feel R1 is ambiguous as written when referring to assets of joint ownership, and would propose replacing the word "owns" with "owns and operates". As currently written, this requirement would force each owner to individually catalogue all of the BES Cyber Systems at a jointly owned facility, even though typically only the actual operator of the facility has anything to do with the BES Cyber Systems installed, or the related day-to-day compliance with NERC standards.
3.68	The Empire District Electric Company	Disagree	We feel R1 is ambiguous as written when referring to assets of joint ownership, and would propose replacing the word "owns" with "operates". As currently written, this requirement would force each owner to individually catalogue all of the BES Cyber Systems at a jointly owned facility, even though typically only the actual operator of the facility has anything to do with the BES Cyber Systems installed, or the related day-to-day compliance with NERC standards.
3.69	Alberta Electric System Operator	Disagree	We find the current wording somewhat confusing. Consider rewording the sentence. As a suggestion, "...that it owns that executes or enables one of..."
3.70	Oncor Electric Delivery LLC	Disagree	We need more clarity (white paper) to assist in how utility equipment should be identified as components or systems. Is the relaying scheme at a single substation a "system" and all the individual relays are "components", or is the primary and backup relays for a single line terminal, bus, or transformer the "system" and the individual primary/backup relay is a "component". This is basic to the implementation of this standard and needs to more fully defined.

4. **Requirement R2 of draft CIP-010-1 states, "Each Responsible Entity shall categorize and document such categorization for each BES Cyber System identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachment II – Impact Categorization of BES Cyber Systems to categorize the BES Cyber Systems identified in Requirement R1 for the application of Cyber Security requirements commensurate with the potential impact on the BES." Do you agree with the proposed Requirement R2? If not, please explain why and provide specific suggestions for improvement.**

Summary Consideration:

The majority of the concerns raised in the comments were related to Appendix 2, the criteria used for categorization.

Specific concerns about categorization are addressed in the responses to Q7 and in the criteria which were approved by industry for Version 4 of CIP-002.

In CIP-002-5, this requirement has been consolidated with Requirement R1 of the previously posted CIP-010-1, to create CIP-002-5 Requirement R1 as follows:

Each Responsible Entity that owns BES Cyber Assets and BES Cyber Systems shall identify and categorize its High and Medium Impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in *CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems.* All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be Low Impact and do not require discrete identification. *[Violation Risk Factor: High][Time Horizon: Operations Planning]*.

#	Organization	Yes or No	Question 4 Comment
4.1	WECC	Agree	Agree with the comment but it is unnecessary to utilize the phrasing "...for the application of Cyber Security requirements commensurate with the potential impact on the BES." The following rewrite is proposed;R2. Each Responsible Entity shall categorize and document such categorization for each BES Cyber System(s) identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachment II - Impact Categorization of BES Cyber Systems to categorize the BES Cyber Systems identified in Requirement R1. (Violation Risk Factor: High)
4.2	LCEC	Agree	Agree with the intent of the requirement but need to clarify the content of the attachment.

#	Organization	Yes or No	Question 4 Comment
4.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
4.4	FirstEnergy Corporation	Agree	FE supports R2 and the Impact Categorization achieved through Attachment II. Attachment II provides much needed clarity, compliance certainty but most importantly a consistent application of the critical infrastructure required to be secured within the context of the proposed CIP requirements.Suggested improvements to Attachment II are provided in our Question 7 response.As described in Question 3 above FE believes that R1 and Attachment I are not needed within the standard and that terminology for Control Center, BES Cyber System and BES Cyber System Components is sufficient. Therefore, conforming changes would be needed in R2 for a removal of R1/Attachment I. For example, "Each Responsible Entity shall document an impact categorization of its BES Cyber Systems consistent with CIP-010 Attachment ...."Requirement R2 and its corresponding Attachment II provides no guidance on whether digital relays colocated at a Transmission Facility need to be treated as individual BES Cyber Systems. FE recommends that the team clarify that a responsible entity could generically reference "Digital Relay Protection System" as a BES Cyber System located at a particular Transmission Facility (substation). There should be no need to identify/document each individual digital relay as a separate and unique BES Cyber System. Rather, the digital relay would be viewed as BES Cyber System Component of the Transmission Facility protection system. This will simplify compliance documentation, particularly for devices that may be associated with a Low Impact categorization.
4.5	Dynegy Inc.	Agree	I agree but request additional detail examples be provided to determine specifically what these items are.
4.6	NextEra Energy Corporate Compliance	Agree	In general, NextEra is supportive of the high, medium and low impact approach. However, in response to question 7, NextEra addresses concerns of the low impact approach.

#	Organization	Yes or No	Question 4 Comment
4.7	Minnesota Power	Agree	In order to increase clarity, Minnesota Power recommends the following changes to the language of Requirement R2: "Each Responsible Entity shall categorize and document such categorization for each BES Cyber System identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachment II, Impact Categorization of BES Cyber Systems. Each BES Cyber System's impact category will require the application of specific Cyber Security requirements commensurate with their potential impact on the BES."Minnesota Power believes that if a Registered Entity can support the exclusion of specific criteria identified in Attachment II with study data, then the Registered Entity should be allowed to exclude such criteria from further analysis.
4.8	Puget Sound Energy	Agree	Puget Sound Energy agrees with the language in R2, provided the language in attachment II is addressed (comments provided in question 7).
4.9	Con Edison of New York	Agree	See comments on question 7.
4.10	Platte River Power Authority	Agree	Suggest Revising:Each Responsible Entity shall categorize and document such categorization for each BES Cyber System identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachment II - Impact Categorization of BES Cyber Systems for the application of Cyber Security requirements commensurate with the potential impact on the BES.
4.11	Reliability & Compliance Group	Agree	The categorization seems pretty straight forward however, it appears that you will be now excluding lots of "BES Cyber Systems" that were identified as CCA's originally and now will be just medium impact BES cyber systems.
4.12	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	The Requirement is sound in and of its self.
4.13	Bonneville Power	Agree	There need to be definitions of "High", "Medium", and "Low" impact. Attachment II describes how to determine whether a system meets the criteria for one of the impacts,

#	Organization	Yes or No	Question 4 Comment
	Administration		but doesn't give an overall explanation of what they mean. The CIP-002-4 draft included level definitions and that was a good idea. That level of detailed definition is not required; that detail is in Attachment II. But, a general impact level definition is needed, for example:"High: Loss of availability of the system leads to an unacceptable risk to the BES. Medium: Loss of availability of the system has a direct impact on the BES.Low: Anything else"These definitions will be used in answering the various questions about the tables.The objective of this requirement ("to categorize the BES Cyber Systems identified in Requirement R1 for the application of Cyber Security requirements commensurate with the potential impact on the BES") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action(s) that the Responsible Entity must take.In Requirement 2 the last phrase is "for the application of Cyber Security requirements . . . ." The last phrase in Requirement 1 is "for the application of security requirements." Are these two phrases supposed to have the same meaning? If so, shouldn't they use identical words? If not, what does "for the application of Cyber Security requirements . . . ." mean? Is it referring to some or all of the requirements in CIP-011-1? If so, it should clearly state that and, if not the entire standard, which specific requirements it is referring to.It seems that it should read as follows: "For the application of the Requirements contained in Standard CIP-011-1 . . . ."
4.14	Western Area Power Administration	Agree	Why is Cyber Security capitalized?
4.15	Independent Electricity System Operator	Disagree	(i) Medium impact categorization is based on an arbitrary generator nameplate rating of 1000 MVA, or voltage level of 200 kV and number of lines, with no regard to actual impact. The same is true of Special Protection Systems. Thresholds should be determined according to studies or other criteria determined by the Reliability Coordinator. As currently drafted, these criteria would significantly reduce the MW currently identified as 'Critical Assets' and protected within our Reliability Coordinator

#	Organization	Yes or No	Question 4 Comment
			area. (ii) The 3 impact levels (H, M, L) create additional layers of management complexity to implement and maintain security processes and monitor compliance, with no commensurate improvement to reliability. Based on the proposed applicability of CIP 11 for H,M & L categories, it seems likely that the number of BES assets afforded the maximum level of protection will decrease from the current standards.
4.16	E.ON U.S.	Disagree	: CIP-010-1 Attachment II - Impact Categorization of BES Cyber Systems currently lists 14 "High Impact Ratings" of the categorization of the BES Cyber Systems. E ON U.S. proposes that the Standard include only Control Centers and Backup Control Centers in the High Impact Rating category; all other points listed in the High Impact Rating category should be moved to the Medium Impact Rating category, and all points currently listed in the Medium Impact Rating category should be moved to the Low Impact Rating category.
4.17	BCTC	Disagree	Â Recommend sample BES Cyber Systems be provided for each impact categorization to help guide UtilitiesÂ (Attachment 2) Cost should not be a consideration as the focus is the reliable operation of the BES(Attachment 2) the impact categorizations are good for directing Utilities on how to categorize their BES Cyber Systems ... nice job!
4.18	USACE HQ	Disagree	As same as for question 3, I disagree with the new approach the team is presenting of substituting the risk-based assessment methodology with a list of thresholds to assign risk levels to assets. Again, Order 706, page 70 - 72, recognize the need for risk-based assessment methodology guidance, therefore recognizing that the use of a quantifiable methodology based on risk is the right way to assess criticality of assets or systems present in the community. I suggest that either the team moves back to the original intent in CIP-002 versions 1 - 3 and re-institute the language of risk-based methodology to create the list of BES Cyber Systems OR the team does a risk-based study on the BES to establish real threshold levels to assing risk to the different assets and/or systems in the community.

#	Organization	Yes or No	Question 4 Comment
4.19	Entergy	Disagree	Asset categorization in Attachment II may be valid for any number of purposes, but cyber security is not one of them. Size does not matter in terms of potential adverse impact to the BES as a functioning whole from cyber threats. Connectivity and network navigability are what matter in terms of the ability to adversely affect the bulk electric system through cyber means. Size matters for grid engineering and nominal-state operational grid management, physical security attacks (e.g. terrorist attack), and destruction by weather conditions (e.g. tornado). The cyber attack surface salient to integrity of the BES as a functioning system is primarily where routable protocols (e.g., TCP/IP) are used to connect operating sites, e.g., substations to control centers, regardless of size. The correlation between asset size and potential risk to the functioning BES as a whole is a misapplication of an electrical engineering frame of reference to what is fundamentally a networked-computing security engineering problem. The current approach brings great numbers of asset sites in-scope for required application of cyber defense countermeasures where the threat does not warrant it, e.g., substations of any size that are only connected back to a control/data center using legacy serial communications lines. If the paradigm of size-based impact categorization is to remain in the final Standard, specific requirements also should be established for each different type of network connectivity employed between sites, i.e., routed, legacy serial, dial-up, wired/wireless LAN, etc. One size fits all requirements such as that currently drafted will require overkill in far too many instances relative to genuine threat. As written, the standards are binary in terms of applicability across the spectrum of size-based impact categories, resulting in unnecessary requirements for some asset sites, generally medium impact sites with serial line communications only. This approach is not supported by any evidence in the administrative record. By bringing a large number of low-risk asset sites (i.e., substations using legacy serial communication lines only) into the scope of the requirements, they are imposing significant costs which do not address the real risks. Conversely, too little emphasis in the Requirements is placed upon “low impact” sites where routable protocols are used, which present a clear and present danger for which heightened security measures are certainly warranted.

#	Organization	Yes or No	Question 4 Comment
4.20	Madison Gas and Electric Company	Disagree	Attachment 2 requires clarification. Criteria Number 1.3, per the NERC Glossary, Wide Area is: The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits. Please give and state the reference of “must run” and how entities should interpret what “must run” is. Must run is a market issue, and could be designated as must run but for only a week. Criteria Number 1.11, is the intent that the automatic aggregate load shedding be under a common control system as is stated in the current CIP 002 Standard? If that is the case, adding a comment to clarify the criteria would provide clarity as in criteria 1.2 "(if using a shared BES Cyber System)"?
4.21	IRC Standards Review Committee	Disagree	Attachment II - Impact Categorization of BES Cyber Systems does not recognize that there is another dimension of risk or impact that must be considered. The availability of alternative tools that provide the same functionality should be considered when categorizing these components (e.g. a High Impact BES Cyber System with a viable substitute could reduce it to a Medium Impact).
4.22	Garland Power and Light	Disagree	Attachment II 1.4 Should state that it is the Primary Black Start Unit and does not include the Next Start Unit.1.5 Multiple circuits between two substations should count as a single transmission line.General CommentNeed to add “scoping filter” as described on slide 31 of the NERC Workshop (May 19-20) Presentation on CIP 10 as presented by Jackie Collett. There already has been a Regional Entity Auditor make a presentation that he intended to audit beyond the scope of what is in the current standard - he (the auditor) may apply the same approach to the new standard if the filter is not stated with the definition - not adding the clarification (scoping filter) just adds the potential for alleged violations and all the baggage that goes with that until one can hopefully get resolved - If you add the filter which states “typically excludes business, market function systems, and non real-time systems”, then it is a good scope and we would agree
4.23	Southern California Edison	Disagree	Attachment II defines the amount of generation under control as the rated capacity of

#	Organization	Yes or No	Question 4 Comment
	Company		the resource. This is not accurate for some systems which can only control the resource between certain points (e.g. minimum operational output [Pmin] and maximum operational output [Pmax]). This could drastically overstate the impact of the cyber system on the BES. For example, suppose that a cyber system controlled a generating resource with maximum capacity of 2,000 MW. According to attachment II, this would then categorize as "high impact rating". However, suppose further that the system can only control the unit between its Pmin and Pmax which are 1,500 and 2,000, respectively. This would place the system in a "low impact rating" according to the attachment. The Attachment II should be modified to account for only the capacity that can be controlled by the system.In addition, Attachment II designates as a high impact rating, "Each BES Cyber System that can affect operations for Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan." This should be clarified to show only BES Cyber Systems will be utilized during the period of time that the resource is providing actual Blackstart service. In SCE's case, if a Blackstart unit is on GMS during normal operating conditions, this should not make it a high impact rating in and of itself. If GMS will be used in the Blackstart plan to restore the system, then it should be included.
4.24	ERCOT ISO	Disagree	Comments: It should be stated that the Responsible Entity is allowed to perform R1 and R2 in the order they deem appropriate. Consider: "Each Responsible Entity shall document categorization of each BES Cyber System identified in Requirement R1. Categorization must address the criteria contained in CIP-010-1 Attachment II - Impact Categorization of BES Cyber Systems."
4.25	Tenaska	Disagree	Dependent on R1
4.26	Constellation Energy Control and Dispatch, LLC	Disagree	Disagree based on concerns with Attachment 2. Attachment 2, 1.1. As drafted BES Cyber Systems associated with generating facilities that have a Contingency Reserve obligation lower than their net Real Power capability would be forced to be in the High Impact Rating even though they may be only capable of producing 600 MW. I do not believe the drafting team is intending to capture generators at this capability level. I recommend

#	Organization	Yes or No	Question 4 Comment
			having a specific net real power generation threshold that could result in frequency decay to underfrequency load shedding levels and elimination of the term Contingency Reserve to ensure that a larger threshold is captured.Attachment 2, 1.8 1.8 Transmission Facilities and Generation Facilities are capitalized terms in parts of the draft but not defined terms in the NERC Glossary. Based on their use in the standard a definition should be established. For example, the debate on whether operation of generator interconnection facilities qualifies the operator for transmission operator status may lead to confusion as to who is responsible to categorize Transmission Facilities under this standard.Atachment 2, 1.12, 1.13, and 1.14 - delete and replace with the following: A Control Center that directly operate BES equipment to support the functions (as modified per suggestions) listed in Attachment 1, and whose operation could result in the loss of X MWs in the Eastern Interconnection, X MWs in the Western Interconnection or X MWs in the Texas and Quebec Interconnections. The Interconnection megawatt thresholds should be treated seperatly and not combined.
4.27	Constellation Energy Commodities Group Inc.	Disagree	Disagree based on concerns with Attachment 2. Attachment 2, 1.12, 1.13, and 1.14 - delete and replace with the following: A Control Center that directly operate BES equipment to support the functions (as modified per suggestions) listed in Attachment 1, and whose operation could result in the loss of X MWs in a balancing authorities' interconnection. The Balancing Authority megawatt thresholds should be treated separately and not combined.Request clarification and definition for the term Generation Aggregation and shared BES Cyber System.
4.28	Exelon Corporation	Disagree	Exelon does not agree with all of the specific criteria in Attachment II. Each of the criteria needs to either align with the other existing standard requirements, or have a technical basis or business risk mitigation basis to be defined as criteria. It would be very beneficial to the industry's understanding of each requirement if the basis for each was included in the Attachment or supporting documentation. One result of a deterministic criteria, in terms of a lost MW threshold and assuming all generators employing a common cyber system are lost "in combination" is that detailed studies of cyber impact on equipment are avoided. That is, it is no longer necessary to identify specifically which

#	Organization	Yes or No	Question 4 Comment
			critical assets are affected. With the change in paradigm, a simple identification that a cyber system is common to multiple generators will result in a determination of "High Impact".
4.29	Allegheny Energy Supply	Disagree	Generally agree with intent, however there should be a "None" category in addition to High, Medium, and Low. For example there are likely Cyber Systems on very small generators connected to low voltage transmission that could not have any adverse impact on the BES.
4.30	Oncor Electric Delivery LLC	Disagree	High, Medium, Low is not granular enough. An entity which operates a facility which has no IP based communication should not be required to comply with the cyber security requirements of this proposed standard.
4.31	American Municipal Power	Disagree	I disagree with the structure of CIP-010, but I agree with the intent. The applicability section should not include Distribution Providers (DP), since many DP will have little to no impact to the reliability of the BES from a cyber standpoint and will have to comply with many burdensome and unnecessary requirements in CIP-010 and CIP-011 that will be performed by other entities. I feel the purpose of the standard should directly relate to an increase in reliability. I feel the CIP-010 standard is solely based upon documenting existing or planned systems, so the purpose should correlate documenting the cyber systems with an increase in reliability. There should only be two requirements. R1: Document BES Cyber Systems. R2: Review documented BES Cyber Systems. Please add sub-requirements only as necessary to fulfill the purpose.
4.32	Progress Energy - Nuclear Generation	Disagree	If a plant system at a nuclear facility is in scope for NERC CIP Standards, additional categorization is not needed.
4.33	Public Service Enterprise Group companies	Disagree	In general there is agreement with the R2 text. However, in Attachment II, statement 1.4 entails categorizing all Blackstart Units with a "High Impact Rating", while statement 1.6 requires that only the "primary cranking path" transmission facilities need to be categorized with a "High Impact Rating". Statement 1.6 implies that some Blackstart

#	Organization	Yes or No	Question 4 Comment
			Units, although categorized with a “High Impact Rating” would not be afforded transmission facilities with the same risk categorization. We recommend changing statement 1.6 to include only Blackstart Units that are in the primary cranking path.
4.34	National Grid	Disagree	In lieu of the BES NOPR and the exemption process currently proposed, if facilities above 100 kV are exempted by NERC and FERC, will those facilities automatically be exempted from CIP standards? Currently, as per the standards, all the BES systems which are not categorized high impact or medium impact will be defaulted to LOW IMPACT category regardless of how the facility is impacting the Bulk power system. There are facilities >100kV having very localized impact and minimal impact to the reliability of the BES system for which entities will request for exemption. National Grid requests the SDT to clarify this issue.
4.35	Luminant	Disagree	Medium Impact: an item for TO, TOP, GO, GOP Functions performed at primary or backup control centers has been left off of attachment 2. This was in the previous posting as item 2.6"Control Centers and backup Control Centers controlling transmission ... This should be reinstated.
4.36	Matrikon Inc.	Disagree	My suggestion is that the term “system” is replaced with “component”, as that is how the security controls of CIP-011 will be applied (to individual cyber components). A typical control system is built of multiple components, and some are more important than others (eg. operator stations versus controllers). As a whole, they work together to control generation or transmission, and identifying impact of each component will help with the application of CIP-011-1.
4.37	Seattle City Light	Disagree	NERC should first assess the effectiveness of the existing standards before proposing replacements. The current Requirements haven’t yet had the chance to undergo a full assessment for effectiveness. The impact of adopting CIP Requirements was tremendous and forced utilities to develop and implement new operational processes at a great expense. The first round of CIP Spot Checks is just now underway and is providing the first validation point for interpretations of the standards (and our first

#	Organization	Yes or No	Question 4 Comment
			round of significant penalties.) Utilities are now at a pivotal point in maturing their CIP compliance programs. Drastically changing the requirements now is a common reaction to newly introduced regulatory compliance frameworks and NERC should learn from the mistakes of other regulatory bodies that now have mature compliance frameworks (i.e., PCI, HIPAA, SOX.) Opportunities to further mature and improve the effectiveness of our CIP compliance programs will not happen if the proposed methodology is adopted in the near future. The cost and resource expense will shift to adapting to the new standards which carries a significant opportunity cost from a risk perspective.
4.38	Duke Energy	Disagree	R1 and R2 should be reordered and reworded (see comment on Question #3 above). Also, the quantities identified on Attachment II appear arbitrary, and need an engineering basis. We suggest an approach based upon Violation Risk Factor language, such that for the High Impact Rating, the qualifier should be whether or not the BES Cyber System could directly cause or contribute to Bulk Power System instability, separation, or a cascading sequence of failures, or could place the Bulk Power System at an unacceptable risk of instability, separation, or cascading failures. For the Medium Impact Rating, the qualifier should be whether or not the BES Cyber System could directly affect the electrical state or the capability of the Bulk Power System, or the ability to effectively monitor and control the Bulk Power System, but is unlikely to lead to Bulk Power System instability, separation, or cascading failures.
4.39	San Diego Gas and Electric Co.	Disagree	SDG&E recommends aiming for a limitation of scope related to those assets that are truly high and medium impact categorizations. Some of the high and medium items could have “BES outage” implications but not necessarily result in instability of the BES. We recommend having consistency in the application of the assets included in the impact categories to the BES as a whole. Do the HIGH or MEDIUM impact categorizations consider redundancy and functionally equivalent back-ups? SDG&E recommends that this be taken into account during the categorization process.SDGE is concerned about the sheer number of assets that will be tagged “High impact” with the definitions presented in Attachment II, leading to a much larger compliance workload by entities with these new CIP Standards. Will all of these efforts bring significant additional

#	Organization	Yes or No	Question 4 Comment
			reliability to the BES?In paragraph 1.14, SDG&E has a concern about the last portion of the last sentence that reads "functionality that remotely controls a BES Cyber System with a High Impact Rating." That verbiage has the capability of causing many additional assets to fall in-scope that do not necessarily need to be. Suggest striking those words out of 1.14 since there are other protections in place within other requirements to protect the BES Cyber Systems with a High Impact rating.
4.40	Wolverine Power	Disagree	See comments listed for 1.a
4.41	Manitoba Hydro	Disagree	See comments to Question 3.
4.42	Indeck Energy Services, Inc	Disagree	The Impact Characterization of BES Cyber Systems is arbitrary and overly simplistic. It groups all facilities, regardless of the functions from Attachment I that they may or may not be able to perform and the significance of that type of facility to providing that function, in three arbitrary categories, LOW, MEDIUM and HIGH. The LOW category sweeps too broad a stroke. For generators, it arbitrarily includes, as a minimum, all generators less than 1,000 MW, regardless of type or capability to provide any or all of the functions from Attachment I. For example, one 150 MW generator providing "Controlling Voltage (Reactive Power)" has much less, probably a de minimis level, of support compared to a 999 MW generator. Wind generators are intermittent and non-dispatchable and, unlike dispatchable generators which are almost all running at high loads at high load times, when Controlling Voltage is a problem, are unlikely to be running near full load at those times. The categorization needs to be much more specific to the facility being categorized under CIP-010 and the function to be performed. Although the CIP-010 and CIP-011 are already voluminous, in order to positively affect BES ALR, they need to be restructured to reflect the complexity of the BES and not arbitrarily set LOW, MEDIUM and HIGH categories. [suggestion] There should be 5 categories: VERY HIGH, HIGH, MEDIUM, LOW and VERY LOW based upon the relative impact on the BES ALR, for each of the functions in Attachment I.

#	Organization	Yes or No	Question 4 Comment
4.43	PacifiCorp	Disagree	The initial wording “Each BES Cyber System that can affect operations for” should be clarified or additional clarification added to some of the following items. For example the wording above, together with the wording associated with 1.8 give fairly good guidance, but the wording applied to items 1.4 and 1.5 are not as clear. The wording “affect operations” can have many meanings ranging from minor operational issues to total loss of the facility. The phrase “singularlity or in combination” in Item 1.1 of Attachment II seems to be attempting to incorporate multiple units of an integrated plant, but the parenthetical does not effectively convey that concept. While item 1.1 ties back to the Contingency Reserve and the Reserve Sharing Group, it does not provide definitive guidance regarding which Facilities are meant to be incorporated into the requirement since this value is not easy to obtain and may by definition change year to year. Also, item 1.3 seems to be an “either/or” catch-all related to item 1.1, but there is no indication of who determines which units are “must-run” units. It is unclear how A BES Cyber System, if rendered unavailable, degraded, compromised, or misused, within 15 minutes, cause a disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES could fall into anything other than High or Medium impacts.
4.44	US Bureau of Reclamation	Disagree	The language in the requirement needs to be cleaned up as follows: "Each Responsible Entity shall catgorize and document such categorization for each BES Cyber System identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachement II - Impact Categorization of BES Cyber Systems." The remaining parts of sentence should be deleted.
4.45	Detroit Edison	Disagree	The phrase “to categorize the BES Cyber Systems identified in Requirement R1 for the application of Cyber Security requirements commensurate with the potential impact on the BES” at the end of R2 is a restatement of the purpose of CIP-010 and should be removed. Consider changing R2 to:Each Responsible Entity shall categorize and document such categorization of each BES Cyber System identified in Requirement R1 according to the criteria contained in CIP-010-1 Attachment II - Impact Categorization of

#	Organization	Yes or No	Question 4 Comment
			BES Cyber Systems.
4.46	Progress Energy (non-Nuclear)	Disagree	This is a good approach to apply protection based on an impact level vs. an all or nothing approach. The trigger levels (MW, MVar, etc) need to be reassessed - are these realistic / practical? This requirement is going to involve extensive effort and coordination between work groups. The DSCADA master that could control all T/D substation capacitor banks would be included. The term misused shows up a couple more times in Attachment II. It would appear that 1.11 includes the T/D Substation under frequency relaying. This is installed in almost every T/D substation which would require some level of access control.What is a generation facility versus a unit?Do we need to identify each cyber component of the BES Cyber System or just the (sub)system itself? Our interpretation of R1, R2, & R3 is that the requirements are driving us to identify Cyber subsystems. If we design small Cyber subsystem architectures we could get to Low impact categorization for each defined subsystems?Are the requirements aimed at subsystem level or overall system? An example would be to design a simple cycle Cyber system (Siemens T3000) architecture for combustion turbines alone and a second Cyber system (Ovation) for the balance of plant. We can make these independent systems at the process level and thereby minimize their respective impacts on the BES. Is that NERC's intent?
4.47	Southwestern Power Administration	Disagree	This requirement seems to be an excellent candidate for performance/results-based criteria rather than numerous bright line requirements that may or may not actually have a significant effect on the BES, depending on the surrounding topology, operating procedures, or configuration of a particular Responsible Entity.
4.48	MWDSC	Disagree	Unclear how much supporting documentation or explanation is required to demonstrate how your system applies or doesn't apply to each of the subcategories. For example, would a table with "yes", "no", or "not applicable" and certified by a SME be sufficient?
4.49	Turlock Irrigation District	Disagree	We agree with the principle of the Requirement, however, we disagree with some of the

#	Organization	Yes or No	Question 4 Comment
			High Impact Rating criteria in Attachment II, as explained in question 7 below.
4.50	Midwest ISO	Disagree	We do not believe the drafting team has developed a justification for moving away from the Critical Asset concept. We understand that the regulators have a concern about the level of Critical Assets identified but that could mean the criteria simply needs to be more stringent for selecting Critical Assets. If the categorization approach is maintained, at a minimum, a no or negligible impact category should be adopted. There are BES Cyber Systems that simply cannot have an impact on reliability and therefore the CIP standards should not apply to them.
4.51	Ameren	Disagree	We generally agree with the criteria used to identify "High" impact facilities, but believe that the item 1.5 criterion should be expanded to include EHV transformers, and not limited to 4 EHV lines. However, there are too many EHV facilities in item 2.6 that would be classified as "Medium" impact, but should be classified as "Low" impact. It is suggested that EHV facilities with three or less EHV lines and transformers should be considered as "Low" impact, as they likely have little impact on the BES.
4.52	Verizon Business	Disagree	In Attachment II, Item 1.1 regarding Generation Facilities, references to "Contingency Reserve" or "Reserve Sharing Group" should be removed. Specifically, any Generation Facility, singularly or in combination with aggregate higher than 2,000 MW, should be included as a High Impact Rating. Referring to the "Contingency Reserve" is confusing and could result in the incorrect or inconsistent declaration of a generation asset as a High or Medium impact.

5. **Requirement R3 of draft CIP-010-1 states, "To ensure the application of adequate requirements on its BES Cyber Systems, each Responsible Entity shall:**

   3.1 review the identification and categorization of its BES Cyber Systems within 36 months of the last identification and categorization

   3.2 review the identification and categorization of its BES Cyber Systems as a result of any planned change to the portion of the BES that it owns

   3.3 update, when applicable, the documentation specified in Requirements R1 and R2 within 45 calendar days of the completion of such change to the BES."

   Do you agree with the proposed Requirement R3? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration:

Many entities expressed concerns about the requirement to review the categorization following a planned change. Others expressed concerns again on the emphasis on ownership, but asked for the addition of "or operates".

In response to these comments, the requirement has been restructured, separating changes to the BES and categorization, and periodic reviews and approvals. More specificity has been added in the requirements as to when the categorization has to be updated upon a change. The SDT continues to believe that owners should be responsible for compliance and that the responsibility to operators should be the subject of agreements between the owners and operators.

#	Organization	Yes or No	Question 5 Comment
5.1	Progress Energy (non-Nuclear)		Agree that there needs to be a periodic review set cycle as well as a process to assess the impact for current projects. One concern could be how we deal with multi-phase projects that may extend over years.3.2 should not require that the whole identification and categorization process be redone for any 'planned changed'. Suggest changing the wording to 'review the identification and categorization of its affected BES Cyber Systems as a results of any planned change to the portion of the BES that it owns.'
5.2	MWDSC		Although R3 generally appears reasonable, cannot comment on specified times until all the requirements are finalized.

#	Organization	Yes or No	Question 5 Comment
5.3	National Rural Electric Cooperative Association (NRECA)		In R 3.3, please provide an explanation on "when applicable" -- explain this so that both the auditor and a registered entity can understand the "when applicable" circumstances.In R 3.3, what is meant by "such change" -- is it referring to actions related to R 3.1 and 3.2? If yes, ensure the standard is clear about this in order to minimize confusion about what is required.
5.4	Arizona Public Service Company		Potential confusion may exist without guidance or criteria that indicate how, specifically, a BES Cyber System Component should be identified. This is a problem of specificity in uniquely identifying a Component versus generically categorizing types of Components. This also relates to CIP-011 R23 and the inventory. Some potential options for specificity include manufacturer, model, serial number, assigned name or unique identifier, and location (logical and/or physical). Concerns with inventory management and uniquely identifying include how to better determine if a Cyber System Component has been modified or replaced with a different one, etc.
5.5	FEUS	Agree	3.2 is not clear when the entity is required to review the identification and categorization as a result of a planned change. 3.3 require documentation to be updated relative of changes from R1 and R2 within 45 calendar days. The drafting team should consider clarification for 3.2 either prior to implementation/completion of the planned change or within xx days.
5.6	Constellation Energy Commodities Group Inc.	Agree	Add a materiality component in 3.2.; review identification and categorization of BES Cyber Systems upon significant planned changes. Also recommend adding provisions for re-evaluating new systems prior to going live.
5.7	Constellation Energy Control and Dispatch, LLC	Agree	Add a materiality component in 3.2.; review identification and categorization of BES Cyber Systems upon significant planned changes.
5.8	WECC	Agree	Agree with the general requirements, but for clarity and auditability the following rewrite is suggested.R3 Perform a documented review the identification and categorization of its BES Cyber Systems within 36 months of the last identification and

#	Organization	Yes or No	Question 5 Comment
			categorization. R4 Perform a documented review the identification and categorization of its BES Cyber Systems as a result of any planned or unplanned change to the portion of the BES that it owns.R5 Update or reaffirm the documentation specified in Requirements R1 and R2 within 45 calendar days from the completion of reviews as required by R3 and R4.Also suggest that the SDT consider requiring documentation be updated PRIOR to completion of the change.
5.9	Florida Municipal Power Agency	Agree	Although FMPA agrees with the intent of this requirement, we believe that 3.2 and 3.3 are duplicative and confusing from a monitoring perspective. We also note that there seems to be a gap for significant changes to BES Cyber Systems. In addition, ownership of BES Facilities seems to be the incorrect determining factor, especially since the definition of BES Cyber Systems is focused on operations and it would seem that the focus ought to be on the BES Cyber Systems owned by the System Operator to operate the BES within its operational scope. FMPA recommends deleting 3.3 and replacing 3.2 with the following:"3.2 Review the identification and categorization of its BES Cyber Systems as a result of any planned change to the portion of the BES that it operates. The effective date of any changes to BES Cyber System identification or categorization shall be the in service date of such change."Such language would result in the need to plan ahead of time and ensure the documentation is developed, but not necessary implemented until the in- service date of the new equipment.FMPA also recommends adding a new 3.3 to address significant changes to BES Cyber Systems that may impact identification and categorization, such as:"3.3 Review the identification and categorization of its BES Cyber Systems as a result of change in BES Cyber System configuration or scope. The effective date of associated changes to BES Cyber System identification or categorization shall be the in service date of such change."
5.10	Minnesota Power	Agree	Minnesota Power recommends the following wording change to increase the clarity of Part 3.2, "...as a result of any planned and implemented change..."
5.11	PNGC-Cowtitz-Central Lincoln-Benton-Clallam	Agree	Need to clarify what is required for temporary situations, such as a normal open closed to allow maintenance. The closing of the open would be a "planned change," but only

#	Organization	Yes or No	Question 5 Comment
	Group		temporary. The Change in status of a BES Cyber System would be a wasted compliance effort for only a short duration.
5.12	US Army Corps of Engineers, Omaha Distirc	Disagree	"planned change" in 3.2 needs to be qualified. Suggest changing to "planned change likely to alter the impact of the associated BES cyber systems." Changes to BES Cyber Systems that could change their impact on the BES should also be considered.
5.13	Covanta Energy	Disagree	3.1 - If no changes have been made to any BES Cyber Systems, would suggest changing review period from 36 months to 60 months.... need to reduce administrative activities to allow more focus on reliability based activities.
5.14	Duke Energy	Disagree	3.1 is part of change control. Do we still need this review? Also, 3.2 implies that ALL BES Cyber Systems would need to be reviewed as a result of any planned change to the portion of the BES that it owns. Need to bound this review to only BES cyber systems that are affected by the change.
5.15	Southwest Power Pool Regional Entity	Disagree	3.2 assumes that the BES Cyber System owner is also the owner of the BES assets being changed. This is not always the case. There are, for example, numerous instances where the Balancing Authority, Transmission Operator, and / or Generation Operator is not the Transmission and / or Generation Owner. Some sort of mandatory coordination is required to avoid this important requirement from falling through the cracks. 3.3 only requires a documentation update to be completed upon a change to the BES. This requirement should be modified to also require a documentation update upon a change to the BES Cyber System configuration, including adjustments to the list of components and supporting networks.
5.16	LCEC	Disagree	3.2 Change "owns" to "owns or operates". "Any planned change" may not be signficant enough to justify a full review.
5.17	Hydro One	Disagree	A local definition of “planned change” is needed. Suggest this definition excludes planned outages or maintenance. “Modification to facilities” as used in FAC-009 should

#	Organization	Yes or No	Question 5 Comment
			be considered.
5.18	Northeast Power Coordinating Council	Disagree	A local definition of “planned change” is needed. Suggest this definition excludes planned outages or maintenance. “Modification to facilities” as used in FAC-009 should be considered.
5.19	BCTC	Disagree	Â Preference would be to retain the current process of an annual review BES Cyber Systems and impact categorizationsÂ Please consider that if a change occurs that results in a BES Cyber System’s impact categorization increasing (i.e. from medium to high) the resulting effort to bring this system into compliance could be substantial (i.e. 6 to 12 months); how are these types of scenarios covered under Version 4?
5.20	USACE - Omaha Anchor	Disagree	A) 3.2 - any planned changes to the “cyber-system” portion of the BES that it owns. Otherwise you would be continually reviewing the plansB) 3.1 - would prefer to strike 3.2 and change 3.1 to 12 months.
5.21	Ameren	Disagree	Ameren feels that 45 days is too short and is also an uneven boundary that is hard to track. We would recommend changing it to a more even boundary such as bi-monthly (60 days) or quarterly (90 days). In the case of a complex merger or acquisition between responsible entities there needs to be additional guidance, longer timelines established, etc. to allow sufficient time before and/or after the completion of the transaction for compliance to be achieved and implies a perfectly complied with Configuration Change Management Program. Suggest adding “or as a result of the periodic review” at the end of R3.3.
5.22	E.ON U.S.	Disagree	CIP-010-1, R3.2 creates arguments that parties must constantly assess and re-assess their Impact Ratings of facilities. This is particularly true given that changes to the BES occur on a daily basis. Parties should be permitted expressly to engage in an annual assessment and a reassessment should only be required for “any major planned change to the portion of the BES that it owns prior to implementation of such plan.”CIP-010-1, R3.3 should read, “Update, when applicable, the documentation specified in

#	Organization	Yes or No	Question 5 Comment
			Requirements R1 and R2 within 45 calendar days of the completion of such major changes to the BES."
5.23	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
5.24	PacifiCorp	Disagree	Comments: The term "Any any planned change" used in 3.2 is terribly open-endedshould be more specific to avoid including small planned changes that have a de minimis impact on the identification and categorization of BES Cyber Systems. There must be some operationally prudent, de-minimus changes that can be made without triggering the 45 day change reviewIn addition, PacifiCorp suggests the following:. Change Modify item 3.3 to state Update documentation specified in Requirements R1 and R2 within 45 calendar days of any categorization changes caused by modifications to the BES.
5.25	Black Hills Corporation	Disagree	Define "change" in terms of those alterations to BES Cyber Systems which may modify the functional identification or an impact categorization. There are numerous minor changes which clearly will not change either Attachment I or II assignments and would not need to be tracked. If they are not tracked, an entity will not be able to prove compliance.
5.26	Exelon Corporation	Disagree	Exelon is concerned that this Requirement implies that each BES Cyber System Component will need to be classified as High, Medium or Low Impact. If this is the case, this will result in a major change management initiative with field personnel and add unnecessary administrative burden and expense with no resulting benefit to the reliability of the BES. Given that concern, Exelon suggest that Requirement 3.2 be modified to read "review the identification and categorization of its applicable BES Cyber Systems as a result of any planned change to the portion of the BES that it owns." Exelon has several concerns as to how this Requirement would be audited. As written, Requirement 3.2 could be interpreted to mean that ANY change to the BES, whether it impacted a BES Cyber System or not, would necessitate a 45 day review and documentation. Furthermore, what is the definition of "planned"? Exelon is concerned

#	Organization	Yes or No	Question 5 Comment
			that like-for-like emergent equipment replacements would likewise necessitate a 45 day review and documentation.
5.27	Dominion Resources Services, Inc.	Disagree	Extending the window for periodic validation of the identification and categorization of BES Cyber Systems is an improvement given the additional requirement to review the impact of planned changes. The current language implies that all identified and categorized BES Cyber Systems must be reviewed each time a change occurs to any single system, although the intent is only to determine the impact of the change. How that determination is made should be at the discretion of the Responsible Entity. The wording for R3.2 should be changed to more accurately represent the intent as follows:"...determine whether planned changes to the portion of the BES it owns, requires the identification of additional BES Cyber Systems or changes or impacts the categorization of any existing BES Cyber System."
5.28	ReliabilityFirst Staff	Disagree	For clarity, ReliabilityFirst suggests the following revision to the language of these requirements, 3.2 ". . . of any planned change to the portion of the BES that it owns or operates", 3.3 "Update within 45 calendar days, the documentation specified in Requirements R1 and R2 when the review required in 3.1 or 3.2 indicates a change."
5.29	MRO's NERC Standards Review Subcommittee	Disagree	For item 3.2, we believe the word "planned" should be replaced with "incorporated". Otherwise, an entity could end up identifying and categorizing BES Cyber Systems that never actually end up getting installed.
5.30	Oncor Electric Delivery LLC	Disagree	High, Medium, Low is not granular enough. An entity which operates a facility which has no IP based communication should not be required to comply with the cyber security requirements of this proposed standard.
5.31	American Municipal Power	Disagree	I agree with the intent, but I disagree with the structure of CIP-010. The applicability section should not include Distribution Providers (DP), since many DP will have little to no impact to the reliability of the BES from a cyber standpoint and will have to comply with many burdensome and unnecessary requirements in CIP-010 and CIP-011 that will

#	Organization	Yes or No	Question 5 Comment
			be performed by other entities. I feel the purpose of the standard should directly relate to an increase in reliability. I feel the CIP-010 standard is solely based upon documenting existing or planned systems, so the purpose should correlate documenting the cyber systems with an increase in reliability. There should only be two requirements. R1: Document BES Cyber Systems. R2: Review documented BES Cyber Systems. Please add sub-requirements only as necessary to fulfill the purpose.
5.32	Constellation Power Source Generation	Disagree	It seems the intent of R3.2 and R3.3 is to review and document any changes to a BES Cyber System that an entity owns, but instead it states "a change to the BES." An ownership change of a generation facility, or the change of an electromechanical overcurrent relay to a microprocessor overcurrent relay would change a BES Cyber System, but that doesn't change the BES. These requirements need to be rewritten to state BES Cyber Systems in place of BES.
5.33	Green Country Energy	Disagree	It would be nice to add a bit more definition to the timeframe. 3.1 within 36 months of last completed identification... 3.3 within 45 days of approved completion of such change...
5.34	Luminant	Disagree	Item 3.2 is unclear and very broad. Any planned change to the BES that it owns could simply be the changeout of an oil pump or boiler tubes. Luminant proposes two possible fixes. First, limit the review to changes that impact the BES Cyber Systems, or impact the High, Medium or Low rating. Even this is problematic in execution and enforcement. S
5.35	MidAmerican Energy Company	Disagree	Item 3.3 is not clear what does "update, when applicable, the documentation specified in Requirements R1 and R2 within 45 calendar days of the completion of such change to the BES." mean. Change item 3.3 to state Update documentation specified in Requirements R1 and R2 within 45 calendar days of any categorization changes caused by modifications to the BES.
5.36	National Grid	Disagree	National Grid recommends a local definition of "planned change". Also, clarify if planned change refers to an "approved" change. There are scenarios when planned changes are

#	Organization	Yes or No	Question 5 Comment
			not approved by Senior Management for various reasons. Should the planned change still be “reviewed”? What about “unplanned changes”?
5.37	NextEra Energy Corporate Compliance	Disagree	NextEra suggests combining 3.2 & 3.3 as follows:3.2 For any planned change that results in a BES cyber system re-categorization (low, medium, high) the documentation specified in R1 & R2 will be updated within 45 days of the completion of such change.NextEra also suggest eliminating or specifically defining what constitutes a change that needs to be documented, such as a hardware modification, or change to network connectivity.
5.38	Progress Energy - Nuclear Generation	Disagree	Nuclear facilities are required by multiple the Code of Federal Regulation (CFR)requirements to maintain configuration control of components. Plant systems and components subject to Cyber Security regulation, either by FERC/NERC or other regulatory agencies are maintained under configuration control due to the CFR programs. Revisiting the classification of assets is not needed to enhance configuration control as on-going design control and configuration management processes are applied to meet the legal requirements implemented by CFR.
5.39	The United Illuminating Co	Disagree	Proposed R3.3 uses the term “such change to the BES” is not clear. The use of the phrase leads to the belief it applies only to 3.2, Did the SDT intends R3.3 to apply to both R3.1 and R.32?Suggest rewording 3.3 to: Update, when applicable, the documentation specified in Requirements R1 and R2 within 45 calendar days of the completion of reviews required by R3.1 and R3.2.
5.40	Pacific Gas & Electric Company	Disagree	R 3.2 Understand the overall intent of 3.2, however "...any planned change to the portion of the BES..." essentially occurs on a daily basis so unclear on the overall feasibility of this requirement. Suggest 3.2 be more refined than "any planned change to the portion of the BES".
5.41	Reliability & Compliance Group	Disagree	R3.1 is unnecessary with a proscriptive program for identifying BES cyber systems. Therefore, you should only need to review the identification and categorization of your BES cyber systems if there is a planned change to the system or if there is a change to

#	Organization	Yes or No	Question 5 Comment
			the standard's definition of what is or is not a BES cyber system or system component.
5.42	American Electric Power	Disagree	R3.2 and R3.3 are triggered from changes to the BES. Depending upon what constitutes a change to the BES, there could be daily triggering events that would require the review and updates as stated in these two requirements. Will every BES Cyber System (including those not associated with the BES change) need to be reviewed and possibility updated for each and every change to the BES?Furthermore, it appears that it would be possible that a Responsible Entity could be in violation of R3 the Responsible Entity could also be in violation of R1 and/or R2 as well. It appears that R1 and R2 are one-time initial events and that R3 is the on-going requirement replacing those events; however, if that is the intent it is not clear in that regard.
5.43	Consultant	Disagree	R3.2 'any' planned change is probably too broad. Should include addition or removal of BES assets, whether by construction, retirement, purchase, or sale of assets. Some qualification of the changes BES assets that would require review of the identification and categorization of a BES asset would be better. Possible wording "changes to cyber systems or physical protection cyber systems associated with BES assets...", which would appear to be consistent with R23 in CIP-011.Possible "unintended consequence" - requirement R3.2 as stated, and in the suggested changes, requires change control for all BES cyber assets regardless of impact categorization.
5.44	SCE&G	Disagree	R3.2 needs to be clarified regarding "any planned change to the portion of the BES that it owns". What constitutes a change? Is this a Transmission/Generation factility change, operational change, or a cyber systems change, or all three? This has the potential to be interpreted by auditors as needing to be reviewed anytime equipment is replaced.
5.45	Madison Gas and Electric Company	Disagree	R3.2 states " review the identification and categorization of BES Cyber Systems of any planned change to a portion of the BES that it owns". It is unclear how an entity will accomplish a review of a "planned" change. Recommend the "planned" be removed and supplement with "incorporated". R3.2 should read as:"review the identification and categorization of its BES Cyber Systems as a result of any incorporated change to the

#	Organization	Yes or No	Question 5 Comment
			portion of the BES that it owns".
5.46	ERCOT ISO	Disagree	R3.2: Consider: review and document the identification and categorization of its BES Cyber Systems as a result of any planned change to its BES Cyber Systems or BES Cyber System ComponentsR3.3: Recommend that the 45 days be changed to 30 days to align with the changes recommended under FERC Order 706 (i.e., section 651).
5.47	BGE	Disagree	Recommend adding provisions for re-evaluating new systems prior to going live.
5.48	ISO New England Inc	Disagree	Recommend that a local definition of "planned change" is needed. Suggest this definition excludes planned outages or maintenance. Possibly use "modification to Facilitiies" per FAC-009 as a starting point.
5.49	Detroit Edison	Disagree	Remove the "planned change" verbiage in R3.2. Consider changing R3 subrequirement 3.2 to:Each Responsible Entity shall: 3.2 Review the identification and categorization of its BES Cyber Systems as a result of any change to the portion of the BES that it owns that affects the classification of a BES Cyber System or causes the addition or removal of BES Cyber Systems
5.50	Nuclear Energy Institute	Disagree	Requirement 3.2 implies that ALL BES Cyber Systems would need to be reviewed as a result of any planned change to the portion of the BES that it owns. Need to bound this review to only BES cyber systems that are affected by the change. Also, it would be helpful to clarify the term "change" to preclude the triggering of a review for something like a password change.Additionally, the phrase "adequate requirements" in the R3 introductory paragraph should be clarified to "adequate security requirements."
5.51	Southern California Edison Company	Disagree	SCE's concerns regarding Requirement 3.2 are three-fold: (1) Requirement 3.2 appears to require review of all BES cyber systems whenever any change in ownership of any portion of the BES occurs. SCE recommends the drafting team clarify that the review should only occur for systems that are impacted by the ownership change.(2) It is unclear whether Requirement 3.2 adds significant value to the reliability of BES because

#	Organization	Yes or No	Question 5 Comment
			planned changes may not be always approved or implemented as designed and actual changes made would, regardless, have to be documented by R3.3 within 45 calendar days.Finally, the drafting team should make the period after an unplanned change "time-bound" obligating RE's to develop plans to address compliance with CIP standards within a specific timeframe after which R3.2 would become applicable. This approach would be in agreement with the intent of Order 706 which places paramount importance on the reliability of the BES. It is also unclear from this requirement that the timeframe within which a system or component identified in R3 has to adhere to CIP-011. Such a timeframe should be clearly stated within the standard.
5.52	San Diego Gas and Electric Co.	Disagree	SDG&E doesn't necessarily have issues with the 36-month review requirement in R3.1. However, we do have a concern about the 45-day requirement in R3.3 due to the sheer number of BES Cyber Systems that could change. We suggest that this requirement be changed to 90 days so that entities will have adequate time to update appropriate documentation.
5.53	Network & Security Technologies Inc	Disagree	Suggest adding a requirement to review the identification and categorization of its BES Cyber Systems as a result of any planned changes to one or more of its BES Cyber Systems. "Planned changes" include but are not limited to hardware and/or software upgrades adding new functionality, addition of new BES Cyber Systems, retirement or redeployment of existing BES Cyber Systems.
5.54	Allegheny Energy Supply	Disagree	Suggested modification to 3.2:review the identification and categorization of its BES Cyber Systems as a result of changes to the portion of the BES that it operates.
5.55	Allegheny Power	Disagree	Suggested modification to 3.2:review the identification and categorization of its BES Cyber Systems as a result of changes to the portion of the BES that it operates.
5.56	Dynegy Inc.	Disagree	The 3.3 update should be extended to 6 months. This type of update could be detailed and require more than 45 days.

#	Organization	Yes or No	Question 5 Comment
5.57	APPA Task Force	Disagree	The APPA Task force agrees with some parts of the proposed requirement but we offer the following suggestions:We believe that 3.2 and 3.3 are duplicative and confusing from a monitoring perspective. We also note that there seems to be a gap that does not cover significant changes to BES Cyber Systems. In addition, “ownership” of BES Facilities seems to be the incorrect determining factor, especially since the definition of BES Cyber Systems is focused on operations. It would seem that the focus ought to be on the BES Cyber Systems owned by the System Operator that it uses to operate the BES within its operational scope. We recommend deleting 3.3 and replacing 3.2 with the following:”3.2 Review the identification and categorization of its BES Cyber Systems as a result of any planned change to the portion of the BES that it operates. The effective date of any changes to BES Cyber System identification or categorization shall be the in-service date of such change.”Such language would result in the need to plan ahead of time and ensure the documentation is developed, but that it need not be implemented until the in- service date of the new equipment.We also recommend adding a new 3.3 to address significant changes to BES Cyber Systems that may impact identification and categorization, such as:”3.3 Review the identification and categorization of its BES Cyber Systems as a result of change in BES Cyber System configuration or scope. The effective date of associated changes to BES Cyber System identification or categorization shall be the in-service date of such change.”
5.58	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The change management requirements of CIP-011 necessitate lengthening the time to document completed changes to 60 days or more.
5.59	ReymannGroup, Inc.	Disagree	The dynamic and real-time nature of cyber security threats requires a minimum review cycle for identifying and classifying new or changing BES Cyber Systems to 12 months or less as determined by planned or unplanned changes to the BES. Therefore, we recommend revising 3.1 to a 12-month cycle and revising 3.2 to include planned and unplanned changes.

#	Organization	Yes or No	Question 5 Comment
5.60	Bonneville Power Administration	Disagree	The objective of this requirement (“To ensure the application of adequate requirements on its BES Cyber Systems") should be clearly labeled as “Objective of Requirement” and shown as a separate sentence. The Requirement should not include the objective. That would clearly separate the objective from the action(s) that the Responsible Entity must take.3.2 doesn't define the magnitude of "planned change". As defined, it includes routine maintenance such as replacing conductors on a line. A better definition would be "...planned change to the architecture of the portion...". In any event, there must be some way for entities to determine which change triggers a review.
5.61	Manitoba Hydro	Disagree	The requirement needs to include a review of the categorization of the BES Cyber System as a result of a change in the BES Cyber System. Is the intent of Requirement 3.2 to review the identification and categorization of ALL its BES Cyber Systems as a result of ANY planned change to the portion of the BES that it owns? If so, this is excessive and should be limited to BES Cyber Systems impacted by the planned change. If the intent is to limit the review in Requirement 3.2 to the BES Cyber Systems impacted by the change, then the 36 month review in Requirement 3.1 could be continually reset, and an overall review never completed. The period for an overall review should be a fixed interval of every 36 months. Requirement 3.3 language is vague when referring to “such change”. If the intent is to update the documentation in when triggered by events in 3.1 and 3.2, then the language of 3.3 needs to be added to both 3.1 and 3.2. As a result, 3.3 can be deleted. Requirement R3.3 is incomplete or inconsistent as drafted. The first portion of Requirement R 3.3 refers to updating documentation specified in Requirements R1 and R2, which includes a 3 year review, yet the latter portion of Requirement 3.3 specifies that updating must be done within 45 days of a change. It is not clear when updates must be done after a three year review.
5.62	Alberta Electric System Operator	Disagree	The wording of R3.3 implies it is a sub-requirement of R3.2 because of the wording “such change.” Consider revising to “... within 45 calendar days of the completion of such review.”

#	Organization	Yes or No	Question 5 Comment
5.63	EEI	Disagree	There are no boundaries around what constitutes a change to the BES in R3.2 and R3.3. As written, every change to a breaker setting in a BES substation would cause the RE to have to perform a review. The requirement should be rewritten so that only changes which cause a reclassification under Attachment II should be included in this requirement. In addition, the review period should be specified as 45 days from deployment of the change. The change has to be material to the classification criterion in Attachment 2 in order to trigger a review.As noted in EEI's response to Question 3, a Responsible Entity may not need to characterize all the BES Cyber Systems it owns (for example, jointly owned units). EEI suggests the following modification to 3.2:"review the identification and categorization of its BES Cyber Systems as a result of material changes to the portion of the BES that it operates."
5.64	Southern Company	Disagree	There are no boundaries around what constitutes a change to the BES in R3.2 and R3.3. As written, every change to a breaker setting in a BES substation would cause the RE to have to perform a review. The requirement should be rewritten so that only changes which cause a reclassification under Attachment II should be included in this requirement. In addition, the review period should be specified as 45 days from deployment of the change.R.3.2 requires the review of identification and categorization for planned changes. R3.3 requires an update of documentation related to these changes within 45 days of completion. The requirements of R3.2 would be difficult to audit and are better covered under R3.3.
5.65	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
5.66	Independent Electricity System Operator	Disagree	We agree with R3 and its sub-requirements except R3.2. Specifically, we do not agree with the term "the portion of the BES that it owns" since some Responsible Entities do not own any BES facilities. We suggest replacing this term with "the portion of the BES that it owns or operates".

#	Organization	Yes or No	Question 5 Comment
5.67	IRC Standards Review Committee	Disagree	We agree with R3 and its sub-requirements except R3.2. Specifically, we do not agree with the term "the portion of the BES that it owns" since some Responsible Entities do not own any BES facilities but do own Cyber Systems with which they operate the BES. We suggest to replace this term with "the BES Cyber Systems or the portion of the BES that it owns".
5.68	GTC & GSOC	Disagree	We are concerned with requiring an update of all BES Cyber System categorizations whenever planned changes are made to the BES. First, there is a gap here with respect to capturing the changes to the BES Cyber Systems themselves that may affect categorization. Also, this will likely create a complicated compliance tracking scenario for the entity who will be required to track a number of activities to ensure they are completed "within 12 months" of the categorization. We recommend replacing "within 36 months" in R3.1 with "annually" and completely removing both R3.2 & R3.3. This will allow the tracking of compliance activities to occur more on a programmatic basis rather than necessarily on a device by device basis.
5.69	Xcel Energy	Disagree	We believe 60 days is a more appropriate time to allow updating of document under Requirement 3.3. During certain times of the year, (i.e. end of year holidays and financial close out activities) 45 days can be challenging.
5.70	Alliant Energy	Disagree	We believe Article 3.1 is unnecessary and should be deleted. If an entity does an initial assessment and identifies and categorizes its BES Cyber Systems, the only time there would be a change to the listing is if the BES Cyber Systems were modified, which is covered in Articles 3.2 and 3.3. If the SDT determines that Article 3.1 is required, the timeframe should be revised to 60 months to correspond to other summary reviews required by NERC (ie; 5-year analysis of Black-Start capabilities).In Article 3.2 the word "planned" should be replaced with "installed" or "incorporated". There are many modifications planned that never get installed, so it is not reasonable to require all "planned" items to be included.In Article 3.3 the update period should be 90 days not 45, to allow the Registered Entity time to make the necessary changes. 45 days is not

#	Organization	Yes or No	Question 5 Comment
			adequate time to do the updates at the end of a project.
5.71	FirstEnergy Corporation	Disagree	We do not agree with the VRF of High assigned to this requirement and believe a Medium VRF is more appropriate. Violating R3 does not pose the same risk to the BES as violating R1 and R2.As written, 3.2 implies that every change to the BES would trigger a documented review of the cyber system list and becomes a burdensome compliance task. As a compromise we propose that you simplify R3 such that a review/update is required every 18 months.
5.72	We Energies	Disagree	We Energies agrees with EEI suggested modification to 3.2:"review the identification and categorization of its BES Cyber Systems as a result of changes to the portion of the BES that it operates."
5.73	Midwest ISO	Disagree	We request that 3.3 be modified to 60 days rather than 45 days. We believe 45 days will be a challenge for most entities to meet as this effort will likely be incorporated into an entity's broader business continuity efforts.
5.74	Verizon Business	Agree	The requirement should provide guidance relating to when a utility needs to add a new BES system or component and what the timelines are for implementation of the CIP-010, R3 requirements.

6. **CIP-010-1 Attachment I contains a listing and brief description of Functions Essential to Reliable Operation of the Bulk Electric System. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement.**

Summary Consideration:

Many entities expressed concerns that Attachment I is part of the standard and includes the use of many undefined terms. Others expressed concerns about the vagueness of many of the terms.

In response to these comments, the SDT has changed the definition of the Reliability Functions to **BES Reliability Operating Services**, and has included these terms in the Glossary. Some modifications have been made to more precisely define the context in many sub-definitions.

#	Organization	Yes or No	Question 6 Comment
6.1	Madison Gas and Electric Company		Recommend eliminating the word "conditions" used in the descriptions of the functions. It's not clear what "conditions" means in the context in which it is used in Attachment I. A function is a set of activities and actions to accomplish an objective or purpose. Such activities and actions may be automatic or manual or a combination of the two and certain tools and infrastructure may be inherently needed to fully execute the functions. In contrast, conditions are states that result from the execution of functions and/or the effects of external, sometimes uncontrollable, factors.Recommend Function section to read:CIP-010-1 - Attachment I Functions Essential to Reliable Operation of the Bulk Electric System The following operating functions are essential to real-time reliable operation of the Bulk Electric System (BES). To define the scope of applicability of CIP Standards, the functions of relevance are only those that can have an effect on real-time operation of the BES within 15 minutes. Dynamic Response - Actions performed by BES elements or Facilities which are automatically triggered to initiate a response to a BES activity or action Balancing Load and Generation- Activities and actions for monitoring and controlling generation and load. Controlling Frequency (Real Power)- Activities and actions to control frequency within defined bounds. Controlling Voltage (Reactive Power) - Activities and actions to control voltage within defined bounds. Managing

#	Organization	Yes or No	Question 6 Comment
			Constraints- Activities and actions to maintain operation of BES elements within their design limits and constraints. Monitoring & Control - Activities and actions that provide monitoring and control of BES elements. Restoration of BES- Activities and actions necessary to go from a shutdown condition to an operating condition delivering electric power without external assistance. Situational Awareness - Activities and actions to assess the current, expected, and anticipated state of the BES. Inter-Entity Real-Time Coordination and Communication- Activities and actions for real-time coordination and communication between Responsible Entities' System Operators.
6.2	ISO New England Inc	No	- Recommend "30 minutes" to align with EOP standards- Please provide background for where the 15 minute recommendation came from
6.3	Progress Energy (non-Nuclear)	No	A concern is that depending on how we identify the BES, the 'monitoring & control' function may be associated with many transmission lines that utilize microprocessor relays. Based on the definitions of BES Cyber System Component and the monitoring and control function, this could be interpreted as to being in consideration regardless of whether or not we connect communications to the relay.CIP-010-1 Attachment I - More guidance needed - There needs to be guidance on the definition of 'can have an effect on real-time operation of the BES within 15 minutes'. This leaves too much ambiguity in defining the Cyber Systems that could potentially be covered by the standards and at which level. It could even be interpreted to include systems which may even be beyond the control of the Responsible Entity. The definition needs to provide a bright line of distinction so that systems which have the highest potential of presenting a risk receive the greatest attention to enhanced security - rather than requiring finite resources to be spent filling notebooks with information about low risk Systems/Components.
6.4	Duke Energy	No	Attachment I should not be part of the standard, but should be in a guidance document.
6.5	Kansas City Power & Light	No	Do not agree with the "Inter-Entity Real-Time Coordination and Communication" as the description appears directed toward the devices and systems utilized for verbal communications between Regional Entities and the coordination that occurs as a result

#	Organization	Yes or No	Question 6 Comment
			of those interactions and is outside of the scope of cyber control systems that monitor and control the BES.
6.6	Con Edison of New York	No	One general comment is that CIP-010 should avoid using undefined terms, and use NERC Glossary Terms and cross-references to other Reliability Standards wherever possible.Attachment I is a list of "Functions Essential to Reliable Operation of the BES". The DT has attempted to re-define functions that are already documented in Standards. The definitions should be enhanced to reference the applicable Reliability Standards. o Dynamic Response: The only actions automatically triggered on BES elements are protection systems (see PRC Standards), UFLS systems (see PRC Standards), AGC systems (see BAL Standards), Special Protection Systems and AVR's (see VAR Standards). Everything else is manual operation. It is recommended that the term "Dynamic Response" be removed and replaced with "Automatic Response" and reference the applicable Standards. o "Balancing Load and Generation" and "Controlling Frequency (Real Power)" are the same action. This activity should reference the BAL standards which require BA's to balance generation and tie lines. o "Controlling Voltages (Reactive Power)": This function is addressed by VAR, TOP, and IRO Standards. o "Managing Constraints": If included, this action falls within BAL, INT and TOP standards which should be referenced. o "Monitoring and Control": The definition of the "BES Cyber System" is monitoring and control. Remove this and use the term in the introduction to Attachment I. o "Restoration of BES": This function is addressed by the EOP standards. o "Situational Awareness": Eliminate the "Situational Awareness" function, as this category is too broad and general. o "Inter-Entity Real Time Coordination and Communication": Reference the applicable FERC approved Standards.Also the phrase: "activities, actions, and conditions" at the start of each items is not clear. For example, is an alarm panel an activity, action or condition? Is an HMI computer an activity, action or condition?
6.7	Regulatory Compliance	No	Please see response to question 3.

#	Organization	Yes or No	Question 6 Comment
6.8	Southwestern Power Administration	No	Requiring Responsible Entities to utilize categories which are intended for guidance in identifying BES Cyber Systems, within the reliability standard; and then requiring Entities to be measured by having evidence that those Cyber Systems tie to the functions listed in Attachment I does not further the goal of maintaining reliability and adds complexity and confusion to the process. Attachment I should be converted to a guidance document.
6.9	San Diego Gas and Electric Co.	No	SDG&E would like to request clarification on a definition of the "situational awareness" function. It is too broad for us to effectively determine what assets might be in scope for this requirement. Similarly, we'd also like to request a definition of the term "BES element" in the Monitoring and Control section.SDG&E would also like to request clarification on the "Inter-Entity Real-Time Coordination and Communication" function. Is this meant to cover voice communication between entities or would it also cover electronic data communication between entities such as ICCP data links? We'd suggest that the ICCP links be specifically excluded because it doesn't fit the wording of "real-time coordination or communication between System Operators"
6.10	IRC Standards Review Committee	No	The descriptions for most of the functions in Attachment I are too vague that they cannot serve as a guideline for identifying which components whose Cyber Systems should be included. For example, Dynamic Response" can cover a very wide range of facilities from generator excitation system, stabilizers, governors, AVRs, to SVCs, HVDC controls, switchable shunts, series compensation devices, even under-load tap changers and phase angle regulators, etc. Every one of them has an effect on real-time operations but not all of them, when tempered with, have significant adverse impacts on BES reliability. The list in Attachment I renders almost all facilities to qualify as essential to reliable operation of the BES, but not all of them have any significant impacts on reliability.Attachment II provides a list of facilities to be categorized under various impact levels. We believe this list is more useful in assisting Responsible Entities in identifying facilities whose Cyber Systems are subject to the security requirements. Further, we believe the establishment of this list already had the built-in assumption that

#	Organization	Yes or No	Question 6 Comment
			they perform one or more of the functions listed in Attachment I.
6.11	E.ON U.S.	No	The inclusion within the function "Situational Awareness" of current state of the BES creates an unnecessary overlap with the "Monitoring and Control" function. In addition, this inclusion appears to require tools such as a video wall fall within the scope of CIP standards despite it not being necessary to perform state estimation or operator monitoring of real-time events. E ON U.S. suggests the "Monitoring and Control" function explicitly include real-time monitoring of real-time or current state of the BES and "Situational Awareness" be limited to assessment of the expected and/or anticipated state of the BES. E ON U.S. also notes that in most cases "Restoration of BES" would be greater than 15 minutes The term "effect" in paragraph 1 of Attachment 1 should be defined.
6.12	Nuclear Energy Institute	No	The introductory paragraph should be revised to be more precise. First, "could" should be replaced with "would". Second, it is not clear what "within 15 minutes" constitutes. Leveraging the definition of BES Cyber System, an acceptable opening paragraph would be:The following operating functions are essential to real-time reliable operation of the Bulk Electric System (BES). To define the scope of applicability of CIP Standards, the functions of relevance are only those that would have an effect on real-time operation of the BES within 15 minutes of the BES Cyber Systems that implement them being rendered unavailable, degraded, compromised, or misused.
6.13	Manitoba Hydro	No	The second sentence of Attachment I is unclear. Within 15 minutes of what? Is the reference to "real-time" necessary given the requirement to have an effect on the BES within 15 minutes?
6.14	Midwest ISO	No	We do not believe Attachment I is needed for anything more than a starting point for identifying BES Cyber Systems per Attachment II. Thus, it is not necessary to expand this any further.
6.15	PacifiCorp	Yes	- PacifiCorp agrees with EEI's suggested improvements for Attachment I below:The

#	Organization	Yes or No	Question 6 Comment
			"Situational Awareness" description should be modified as shown below:Situational Awareness -Activities, actions and conditions to assess the current (real-time) state
6.16	Cogeneration Association of California and Energy Producers & Users Coalition	Yes	1. The first paragraph of Attachment 1 to CIP-010 states:". . . the functions of relevance are only those that can have an effect on real-time operation of the BES within 15 minutes." This is a vague statement. Every device connected to the BES will have an effect on real-time operation but some device's effects will be negligible. Clarification is needed on how entities can determine if their assets have a material, non-negligible effect on real-time operation of the BES within 15 minutes when a Cyber System is unavailable, degraded, compromised, or misused.2. In Attachment 1 of CIP-010, Dynamic Response is defined as:"Actions performed by BES elements or Facilities which are automatically triggered to initiate a response to a BES condition. These actions are triggered by a single element or control device or a combination of these elements or devices in concert to perform an action or cause a condition in reaction to the triggering action or condition." Examples or guidance on what is covered by Dynamic Response areneeded. For instance, would Automatic Generation Control be considered a Dynamic Response action?3. Attachment 1 of CIP-010 describes Controlling Frequency and Controlling Voltage as functions essential to reliable operation of the Bulk Electric System. Generators provide Real Power (Controlling Frequency) and Reactive Power (Controlling Voltage). However, we are aware of no disturbance to the BES due to loss of Real Power output or Reactive Power output from our generators. Further clarification is required regarding how impact on grid operations should be determined and measured when determining if a function is "essential" to reliable operation.
6.17	Florida Municipal Power Agency	Yes	Although FMPA agrees with the intent of Attachment I, we believe the definitions contained in the attachment can be significantly improved.As discussed in response to Question 3, FMPA recommends using the word "activities" (or other suitable synonym) for the word "function" to avoid confusion with the Functional Model.The description of situational awareness is too ambiguous and can be interpreted in multiple ways. For further clarification, FMPA suggests:"Information processing and presentation within a Control Center to enable operators to assess the current, expected, and anticipated

#	Organization	Yes or No	Question 6 Comment
			state of the BES."FMPA has other recommended changes to help simplify and clarify the definition of terms used:"Dynamic Response - Actions performed by Protection Systems, control systems, and/or BES Cyber Systems which automatically trigger to initiate a response to a BES Disturbance." (Facilities and Elements do not perform any action, protection, control and cyber systems perform the action)Balancing Supply and Load - Activities, actions and conditions for monitoring and controlling supply and Load. (supply is a more encompassing term that includes energy storage, such as batteries, that may not be included in the term "generation", and Load should be capitalized since it is in the Glossary)Managing Constraints - Activities, actions and conditions to maintain operation of the BES within SOLs and IROLs. (by definition, a BES Element is a Facility; hence, if this suggestion is not taken, then BES element ought to be eliminated from the bullet. Additionally, SOLs and IROLs ought to be discussed in this context and those terms subsume Facility design limits)Restoration of BES - Activities, actions and conditions necessary to go from a shutdown condition to an operating condition. (the phrase "delivering electric power without external assistance" adds no value and is not supported by EOP-005).
6.18	Tenaska	Yes	As long as these functions are applied to High and maybe medium BES assets then the cyber system attached to them. Clarification to "monitoring" should be considered to limit applicability.
6.19	FirstEnergy Corporation	Yes	As stated in our response to Question 3 FE believes that adequate critical infrastructure protection and BES reliability can be accomplished without a need for burdensome compliance documentation of functions described in Attachment I. We encourage the team to carefully review its need and consider removing this aspect from the standard. Please see our response to Question 3 for more details.
6.20	Progress Energy - Nuclear Generation	Yes	Attachment 1 needs to clarify that nuclear generating stations defer to the principles of nuclear security first before consideration is given to the bulk electric system.

#	Organization	Yes or No	Question 6 Comment
6.21	Southern Company	Yes	Broad use of Situational Awareness and System Restoration in the BES functions list and definitions cause the scope of the standards to be overly broad, well beyond the point where there is any reliability benefit. Because there are very few programmable devices in any BES facility that do not have some relevance to one of the listed BES functions, the number of devices included in the standard compliance effort will mushroom unmanageably. The large majority of these newly-included devices pose no significant threat to the BES, but the effort of bringing them into compliance will both distract from the efforts to improve security and will reduce reliability by slowing emergency restoration response time.The function list and other parts of the standards should be modified so that only systems which are used directly in regional or larger Situational Awareness efforts or are relevant to the Entity's System Restoration Plan are included.In addition, the definition of "Restoration of the BES" is vague - does "a shutdown condition" refer to the BES being shut down or a BES component is shut down. The wording should be changed to clarify that it is the BES that is in a shutdown condition."have an effect on real-time operation" should be replaced by "have an adverse effect on real-time operation".
6.22	City Utilities of Springfield, Missouri	Yes	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
6.23	LCEC	Yes	Concerned about the 15 minute threshold.All functions should state: Activities, actions OR conditionsSituational awareness: What is the difference between expected and anticipated? This function could reference real-time system operations of the BES instead of the proposed BES Cyber System definition.
6.24	Southwest Power Pool Regional Entity	Yes	Consider modifying the opening statement to read "...can have an effect on real-time operation of the BES within 15 minutes if not mitigated. Clarify that the expectation is to assume the mitigation is not available or fails for the purposes of the BES Cyber System identification."

#	Organization	Yes or No	Question 6 Comment
6.25	Idaho Power Company	Yes	Controlling voltage needs to reference the voltage on the BES, not just voltage in general which could include distribution level. Situational awareness would seem to include a time window beyond the 15 minute criteria especially as it relates to anticipated state of the BES. Inter-entity Real-Time Coordination and Communication is very broad and pulls in communication systems that are required by other reliability standards to be redundant with plans in place to deal with loss of the primary communication channels. Unless all of the redundant systems are compromised, communication can still be accomplished between entities.
6.26	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Yes	Defining metrics is needed somewhere. For instance, requiring Low Impact compliance over Monitoring & Control of a 20 MW cumulative BES system would be outrageous. If real-time operation is interpreted by the auditor as isolation of a faulted line and Dispatch awareness that the line needs to be fixed, what reliability objective is obtained for the BES? Only local level of service is affected.Concerning “without external assistance” for Restoration of BES is not clear. A boundary is not defined so as to know what external help would be. Would this be the Balancing Authority boundary, or the Reliability Coordinator boundary?
6.27	ReliabilityFirst Staff	Yes	Definition of “BES Elements”, What does “external assistance” mean (restoration)?, Sit Awareness: what is “anticipated state”, does communication include functions such as phones or email?
6.28	Puget Sound Energy	Yes	Dynamic Response: This is a poor title, as dynamic response has a specific meaning in Electrical Engineering. The definition is too vague and could be interpreted to include a breaker operation due to a line fault, as this is a “response to a BES condition”. This definition would include the auto switching controls at nearly every distribution substation with a looped transmission line as a BES Cyber System.Controlling Frequency & Controlling Voltage: This definition would include Under Frequency Load Shedding (UFLS) and Under Voltage Load Shedding (UVLS) schemes, which in many cases only drop single distribution banks, effecting 15 MW of load, which has negligible impact on the

#	Organization	Yes or No	Question 6 Comment
			BES.Managing Constraints: This definition would include overcurrent relays, which may only trip a single 115 kV line that serves local load and has negligible impact on the BES.
6.29	EEI	Yes	EEI suggests that the term “Situation Awareness” be deleted because the term is vague and duplicative of the term “Monitoring & Control.” In the alternative, the “Situational Awareness” description should be modified as shown below:Situational Awareness - Activities, actions and conditions essential for assessing the current (real-time) state of the BES.It is not appropriate to treat any or every item that provides some level of information about the status of the BES as high level impact. Certain components are simply informational and not required for real time operations.
6.30	Exelon Corporation	Yes	Generation functions are not explicit in the Attachment I functions, but are embedded/inherent. As a generation owner/operator, Exelon could review the functions of Attachment I and conclude that generation is not a required function, a reasonable approach if considering loss of a single unit or station out of the entire BES. If adopting the proposed CIP-010 approach, we recommend explicit inclusion of generation as necessary to ensure the Adequate Level of Reliability of the BES.
6.31	The Empire District Electric Company	Yes	I disagree with keeping Attachment I in the standard. The conceptual discussion of functions only adds redundancy, complexity and confusion. The suggested changes to the definition of BES Cyber System and BES Control Center should be enough guidance to identify what is in scope. Therefore, I recommend that the SDT either eliminate Attachment I or convert it to a reference/guidance document supporting the standard
6.32	Consultant	Yes	I think the "15 minute" criteria needs additional clarification. As stated, "an effect on real-time operation of the BES within 15 minutes." is very broad. Suggest limiting to "adverse effect". Also could include some terminology about "adverse effect preventing or limiting the capability of BES assets to perform the listed functions."Suggest numbering the defined functions to allow easier cross-reference to this attachment.
6.33	Alliant Energy	Yes	In paragraph 1 the phrase “that can have an effect on real-time operation” needs to be

#	Organization	Yes or No	Question 6 Comment
			clarified. We believe it should be tied to and IROL, SOL, or degradation of the reliability of the BES. As written it is undefined and too ambiguous.In the item listed "Monitoring & Control" we do not believe monitoring should be included as listed it is too ambiguous and could be interpreted to include every meter, instrument transformer, etc, even if it is not needed for protection of the BES.
6.34	Luminant	Yes	Is it possible to have a real time impact (15 minute time horizon) related to Situational Awareness for Generation? If not it should be removed. At most it should be scoped to BA, RC,TOP and then only to a subset of data.The definitions in Attachment I are very broad. Could the SDT include examples or a reference document that provides more details for the functions in Attachment I?
6.35	Detroit Edison	Yes	It is not clear how the list in attachment 2 was created. Consider leveraging other NERC documents such as the Definition of Adequate Level of Reliability located at http://www.nerc.com/docs/pc/Definition-of-ALR-approved-at-Dec-07-OC-PC-mtgs.pdf.
6.36	Reliability & Compliance Group	Yes	It needs to be more clearly defined what it means to have an effect on real-time operation of the BES. There are many things that can have an effect on the BES that occur even during normal operations. Recommend that the effect be defined as a reduction in the stability of the BES and that level of reduction needs to have a quantifiable measure.
6.37	US Army Corps of Engineers, Omaha Distirc	Yes	It seemes clear from the workshop that the committee intends for protective relay systems to be include for consideration. That was not clear prior to the workshop. They appear to fall under the category of Dynamic Response. Suggest strengthening the definition and include the term "protective relay."
6.38	US Bureau of Reclamation	Yes	It would be helpful to provide a example list of some of the elements which provide the related functions. Further, the unclear definition for "could have an effect on real-time operation..." as used in the opening of Attachment I, needs to be clarified/quanitized or defined. Almost any of these functions (and many more), at any facility - no matter the

#	Organization	Yes or No	Question 6 Comment
			size - could have an effect. The effect needs to be characterized as more than trivial to be deemed essential to reliable BES operation. Rather that attempt to define Restoration of the BES in the Attachment, would it be better to refer to other Standards?
6.39	Lincoln Electric System	Yes	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
6.40	MidAmerican Energy Company	Yes	MidAmerican Energy agrees with EEI's suggested improvements below:The "Situational Awareness" description should be modified as shown below:Situational Awareness - Activities, actions and conditions essential for assessing the current (real-time) state of the BES.It is not appropriate to treat any or every item that provides some level of information about the status of the BES as high level impact. Certain components are simply informational and not required for real time operations.Suggest the following addition for Attachment I:Plant cyber systems or cyber components that do not provide or support BES Cyber System (CIP-010 definition) functions (CIP-010, Attachment I) and which logically are external to the electronic boundary (ESP) protecting a BES Cyber System are excluded from the CIP-011 requirements. Examples of excluded components and systems are those that 1) support balance-of-plant functions and operations that cannot directly result in the loss of generating capacity within 15 minutes, and 2) are logically external to the electronic boundary (ESP) protecting a BES Cyber System.
6.41	Oncor Electric Delivery LLC	Yes	Need more clarity on the "15-minute" criteria. Is this ADVERSE effect? Is this RESTORATIVE effect?
6.42	USACE HQ	Yes	Please read answer to question 3.
6.43	BGE	Yes	Provide examples or definitions of actions, activities and automatically triggered.Add the words "to the BES" after "delivering electrical power" in the definition of Restoration of BES to clarify. Further define the Inter-Entity Real Time Coordination and Communication Function (currently implicates, phone system, harmony, email, PJM all

#	Organization	Yes or No	Question 6 Comment
			call system, 800 MHz devices used to communicate to field personnel and notifind)
6.44	SCE&G	Yes	Remove the 15 minute timeframe.
6.45	Southern California Edison Company	Yes	SCE's concerns with the proposed criteria are two-fold. First, it is unclear whether the term "effect" and "disturbance" refer to the same event. Thus, SCE asks the Standards Drafting Team to clarify. As the criterion is currently written, Attachment I states, "To define the scope of applicability of CIP Standards, the functions of relevance are only those that can have an effect on real-time operation of the BES within 15 minutes." However, the definition of BES cyber system in this standard states, "One or more BES Cyber System Components which if rendered unavailable, degraded, compromised, or misused could, within 15 minutes, cause a Disturbance to the BES, or restrict control and operation of the BES, or affect situational awareness of the BES." If "effect" means "disturbance to the BES, restricted control and operation of the BES, or affecting situational awareness of the BES", then the definitions are consistent. This being said, it is not clear that these have the same meaning. An extreme definition of "effect real-time operation" could be virtually anything whether the impact on operations will be significant or not.Additionally, SCE recommends treating control and monitoring as separate functions. Systems that are only capable of monitoring BES elements should be treated differently from systems that are able to perform control functions. SCE suggests the drafting team add an additional function that is based on "actual device capability" rather than "how it has been implemented" by a particular registered entity. For instance, HMI's providing electronic output have a different real-time impact on BES reliability than HMI's designed as I/O devices. The task of reviewing data on a "view only" capable system resulting in human action on another system that could potentially cause BES reliability issues is a distinctly different function than the task of initiating actions. In this case, the monitoring system and the control system are both "real-time" but with very different BES impact potential.
6.46	Constellation Energy	Yes	See answer to Question 3.

#	Organization	Yes or No	Question 6 Comment
	Control and Dispatch, LLC		
6.47	Constellation Energy Commodities Group Inc.	Yes	See answer to Question 3.Provide examples or definitions of “actions”, “activities” and “automatically triggered” as provided in Attachment I.Add the words “to the BES” after “delivering electrical power” in the definition of Restoration of BES to clarify. Further define the Inter-Entity Real Time Coordination and Communication Function (currently implicates, phone system, harmony, email, PJM all call system, 800 MHz devices used to communicate to field personnel and notifying).Please define the industry use for the term Generation Management System (“GMS”). We believe there are two categories of GMS, Regulated and non-Regulated Utilities since they could be use differently or have different functionality.
6.48	MWDSC	Yes	See comments for question 3 above.
6.49	Wolverine Power	Yes	See comments listed for 1.a
6.50	BCTC	Yes	See previous response 0n CIP-010-1-R1
6.51	Dynegy Inc.	Yes	Show examples of how the identification and categorization and tie-in to Attachment 1 would work.
6.52	Constellation Power Source Generation	Yes	Some of the terms are ambiguous. What is meant by monitoring and control? As written, it is an AND statement, meaning that a BES Cyber System would have to do both monitoring AND control to be labeled a BES Cyber System. What about electronic metering at a plant? That provides monitoring, but not control. So is it excluded?Situational Awareness should be clarified. A suggestion would have the following statement attached to the current definition: “and cause an action without further analysis.” This would exclude metering that, if rendered unavailable, would not be detrimental to the BES as phone communication would be used in the event of metering errors.

#	Organization	Yes or No	Question 6 Comment
6.53	Platte River Power Authority	Yes	Suggest removing “Inter-Entity Real-Time Coordination and Communication” until there is a mechanism to define a single BES Cyber System that includes BES Cyber System Components from multiple Entities. The mechanism should include documentation of coordination with implementing the CIP standards for the BES Cyber System.
6.54	SPS Consulting Group Inc.	Yes	Suggestion number one is to get rid of the list, as previously stated. Failing that my other question is about Dynamic Response. I assume this refers to things like UFLS, UVLS and runbacks initiated by SPS. Also assume this does not include things like AGC, AVR, and governor response from generators since these actions are not triggered by a single element or control device, or a combination of devices, but rather are initiated by operating condition fluctuations. Is that true?
6.55	Dairyland Power Cooperative	Yes	Systems used to communicate between entities are not mentioned, yet many of these are critical to the operation of the BES. Imagine the impact to the BES of an ISO/RTO without ICCP communications. How can these systems be ignored?
6.56	Allegheny Energy Supply	Yes	The “Situational Awareness” description should be modified as shown below:Situational Awareness -Activities, actions and conditions essential for assessing the current (real-time) state of the BES.It is not appropriate to treat any or every item that provides some level of information about the status of the BES as high level impact. Certain components are simply informational and not required for real time operations.Suggest that the definitions for "Dynamic Response" and "Balancing Load and Generation" be more specific.
6.57	Allegheny Power	Yes	The “Situational Awareness” description should be modified as shown below:Situational Awareness -Activities, actions and conditions essential for assessing the current (real-time) state of the BES.It is not appropriate to treat any or every item that provides some level of information about the status of the BES as high level impact. Certain components are simply informational and not required for real time operations.

#	Organization	Yes or No	Question 6 Comment
6.58	APPA Task Force	Yes	The APPA Task force agrees with the intent of Attachment I. We believe, however, the definitions contained in the attachment can be substantially refined and improved.As discussed in response to Question 3, we recommend using the word “activities” (or other suitable synonym) for the word “function” to avoid confusion with the Functional Model.The description of situational awareness is too ambiguous and can be interpreted in multiple ways. For further clarification, We suggest:Situational Awareness - Information processing and presentation within a Control Center to enable operators to assess the current, expected, and anticipated state of the BES.Other recommended changes to help simplify and clarify the definition of terms used:Facilities and Elements do not perform any action, protection, or control; rather cyber systems perform the action. Therefore we propose:Dynamic Response - Actions performed by Protection Systems, control systems, and/or BES Cyber Systems which automatically trigger to initiate a response to a BES Disturbance. Supply is a more encompassing term that includes energy storage, such as batteries, that may not be included in the term “generation.” Therefore we propose:Balancing Supply and Load - Activities, actions and conditions for monitoring and controlling supply and load. SOLs and IROLs should be discussed in this context. If this suggestion is not taken, then “BES element” should be eliminated from the definition. Therefore we propose:Managing Constraints - Activities, actions and conditions to maintain operation of the BES within SOLs and IROLs. The phrase “delivering electric power without external assistance” is not supported by EOP-005 and should be removed from this definition. Therefore we propose:Restoration of BES - Activities, actions and conditions necessary to go from a shutdown condition to an operating condition. As written, the term “monitoring” is so ambiguous that any meter, instrument, transducer, etc. could possibly be interpreted as included, even if these devices are not required for control of the BES and should therefore be removed from the Monitoring and Control function. Therefore we propose:Control - Activities, actions and conditions that provide control of BES elements.
6.59	Arizona Public Service Company	Yes	The APS review team had the following comment: The document heading is “Function Essential to Reliable Operation of the Bulk Electric System.” Typically restoration of BES

#	Organization	Yes or No	Question 6 Comment
			is a completely different activity than the normal or emergency operation of the BES. The document includes restoration which is typically not essential to the reliable operation of the BES. This is not a contradiction but the operation is being defined more broadly than typical. This broad function description can create ambiguity.
6.60	Independent Electricity System Operator	Yes	The descriptions for most of the functions are too vague that they cannot serve as a guideline to identifying those components whose Cyber Systems should be included. For example, Dynamic Response" can cover a very wide range of facilities from generator excitation system, stabilizers, governors, AVRs, to SVCs, HVDC controls, switchable shunts, series compensation devices, even under-load tap changers and phase angle regulators, etc. Every one of them has an effect on real-time operations but not all of them, when tampered with, have significant adverse impacts on BES reliability. The list in Attachment I renders almost all facilities to qualify as essential to reliable operation of the BES, but not all of them have any significant impacts on reliability.Attachment II provides a list of facilities to be categorized under various impact levels. We believe this list is more useful in assisting Responsible Entities in identifying facilities whose Cyber Systems are subject to the security requirements. Further, we believe the establishment of this list already had the built-in assumption that they perform one or more of the functions listed in Attachment I.We suggest Attachment I be eliminated.
6.61	Entergy	Yes	The Functions as identified in Attachment I are far too general in nature and thereby leave too much latitude in interpretation in audit, i.e., creates a risk that if the Responsible Entity excludes a system(s) from scope and the auditor disagrees, this could be a very significant adverse finding. Entergy recommends that general Function descriptors be augmented with specific examples of applications that execute the stated functions 'essential to reliable operation of the BES', e.g., ACE, AGC, state estimator, etc., to help avoid as this dilemma to the extent foreseeable.
6.62	NextEra Energy Corporate Compliance	Yes	The standard should clarify those functions and provide examples specific to Generation, Transmission and Control Center Facilities. These clarifications, we believe, should be contained in the body of the standard as opposed to a reference attachment.

#	Organization	Yes or No	Question 6 Comment
			Attachments should be used to add specific examples or propose exclusions.With respect to the Inter-Entity real time coordination and communication function, the standard should specifically exclude voice communications systems due to the fact that they are covered under separate standards (i.e. COM Standards)
6.63	American Electric Power	Yes	The terms "Dynamic Response" appears to be a very broad function. Is it the intent that this would include all devices such as relays?The "monitoring" portion of function "Monitoring & Control" is too ambiguous. We would propose using the following: "Control - Activities, actions and conditions that provide control of BES elements."In addition, "Situational Awareness" is ambiguous; systems that are not needed for operating the BES, but provide information would be in scope. This definition appears to include items such as all meters, instruments, and transducers.
6.64	Dominion Resources Services, Inc.	Yes	There is overlap among the many functions listed. The list can be reduced to only Monitoring & Control with many of the others listed as examples of this function. As examples; Balancing Load and Generation and Controlling Frequency (Real Power) are essentially the same. Frequency is a direct result of the balance between supply (generation) and demand (load). It is redundant to list both, and doubly redundant since both are covered by Monitoring & Control. Monitoring & Control touches or covers most of the other listed functions. Any portion of Dynamic Response, Controlling Frequency (Real Power), Controlling Voltage (Reactive Power), and Managing Constraints not captured in the Monitoring & Control function should be identified and listed separately, but not those entire functions. Also, some of the definitions are too broad and encompass functions that are not required for the reliability of the BES.Facilities must have ratings per FAC-008 and must be operated within those ratings in other reliability standards. Please refer to “ratings” rather than “design limits and constraints.”Dominion requests that the functions be reduced to: Monitoring & Control - Activities, actions, or conditions that provide real-time operation and control to maintain BES elements within their ratings. Restoration of BES (as defined).Situational Awareness - Activities, actions, or conditions required by the BA, RC, or TOP for real-time operational decision-making associated with the BES.Inter-Entity Real-Time Coordination

#	Organization	Yes or No	Question 6 Comment
			and Communication (as defined).
6.65	Pepco Holdings, Inc. - Affiliates	Yes	We agree with EEI's comments.
6.66	We Energies	Yes	We Energies agrees with EEI comments. The "Situational Awareness" description should be modified as shown below:Situational Awareness -Activities, actions and conditions essential for to assessing the current (real-time) state of the BES.It is not appropriate to treat any or every item that provides some level of information about the status of the BES as high level impact. Certain components are simply informational and not required for real time operations.We Energies agrees with EEI Suggest the following addition for Attachment I:Plant cyber systems or cyber components that do not provide or support BES Cyber System (CIP-010 definition) functions (CIP-010, Attachment I) and which logically are external to the electronic boundary (ESP) protecting a BES Cyber System are excluded from the CIP-011 requirements. Examples of excluded components and systems are those that 1) support balance-of-plant functions and operations that cannot directly result in the loss of generating capacity within 15 minutes, and 2) are logically external to the electronic boundary (ESP) protecting a BES Cyber System. Additionally, We Energies does not understand the inclusion of "Real "Power" and "Reactive Power" in the context of the functions "Controlling Frequency" and "Controlling Voltage" respectively. It is suggested that these qualifiers be eliminated.
6.67	Bonneville Power Administration	Yes	We find the guidance on Attachment I confusing. The statement "The following operation functions are essential to real-time reliable Operation of the Bulk Electric System" makes the explicit statement that all the functions listed below are essential to real-time operation; and the second sentence doesn't do a good job of clarifying that it is only those BES Cyber Systems for which the loss of the functions listed below (Dynamic Response, Balancing Load and Generation, Situational Awareness, etc.) can have an effect on real-time operations of the BES within 15 minutes.For example, the loss of a cyber system used for situation awareness of lightning strikes would not have an effect on real-time control and operations of the BES within 15 minutes. As such, it is NOT a

#	Organization	Yes or No	Question 6 Comment
			BES Cyber System.It would be helpful if this statement in Attachment I and the definition of BES Cyber System were more consistent with each other."Situational Awareness" is too broad. Refer to comments in Question 1.b.
6.68	American Transmission Company	Yes	We propose to remove “monitoring” from the Monitoring and Control function. As written, the term “monitoring” is so ambiguous that any meter, instrument, transducer, etc. could possibly be interpreted as included, even if these devices are not required for control of the BES.We would propose using the following:Control - Activities, actions and conditions that provide control of BES elements.
6.69	MRO's NERC Standards Review Subcommittee	Yes	We propose to remove “monitoring” from the Monitoring and Control function. As written, the term “monitoring” is so ambiguous that any meter, instrument, transducer, etc. could possibly be interpreted as included, even if these devices are not required for control of the BES.We would propose using the following:Control - Activities, actions and conditions that provide control of BES elements.
6.70	WECC	Yes	While scoping the CIP standards to only cover functions within a 15-minute event time frame is appropriate for generation, transmission, and other operations it is not appropriate for Reliability Coordination functions such as situational awareness. There are many cases of critical systems to support a reliability coordination function that do not fall within a 15 minute time horizon such as next day studies, coordinated outages, and contingency planning. Suggest that the SDT redefine functions for situational awareness and communication between entities to not be restricted to a 15 minute time period.The opening paragraph again refers to a 15-minute time period to be used in the identification of BES Cyber Systems. It appears that an effort is being made to restrict applicability of this standard to real-time systems. Section 215 of the Federal Power Act does not include such a restriction; therefore, this should be removed from the standard. Any cyber system that could affect the reliability of the bulk electric system, regardless of timeframe, should be in-scope.Dynamic ResponseThe second sentence is poorly worded and does not appear to add anything. This language should be clear and concise.Restoration of BESThere are a significant number of restoration plans at the

#	Organization	Yes or No	Question 6 Comment
			Balancing Area and Transmission Operator level that hinge on external assistance. In many cases these areas play a significant role in delivering power across the transmission system during restoration, but do require external assistance. As drafted, the functional characterization for restoration of the BES, may fail to identify systems critical to system restoration and is seemingly inconsistent with Attachment II, specifically Item 1.6.
6.71	Ameren	Yes	Would change the second sentence defining the scope to read "To define the scope of applicability of CIP Standards, the below functions are relevant only if they can have an effect on real-time operation of the BES within 15 minutes.Would suggest to impose limits on the definitions for example Controlling Voltage (Reactive Power) is partially dependent on hydrogen pressure for hydrogen cooled generators. We would also suggest adding the word "grid" in front of voltage.Change the first sentence of Dynamic Response to read "Actions performed by BES elements or Facilities which are automatically triggered to initiate a response to mitigate the impact to a BES condition". Is it the SDT intent to implement physical and cyber security of any tertiary systems for example, Controlling Frequency (Real Power) is also dependent upon coal mills providing enough fuel to the boiler, do these systems also need to be secured?The "Controlling Frequency" section needs some clarification. Governor controls on all generating units have built mechanisms whether mechnical or electronic that act to control or balance frequency during a disturbance. The current definition would lead to inclusion of all generating units regardless of any other factor. â€,The last section on communication needs to be clarified to explicitly address voice communication vs. data communication and the expectations of both.
6.72	Verizon Business	Yes	The criteria should include major systems needed for the essential operation of such systems as control centers. For example, Heating, Ventilation and Air Conditioning (HVAC) systems are essential to the operation of a control center. The failure of the HVAC could lead to shutdown of the control center within the 15 minute time frame.

7. CIP-010-1 Attachment II contains criteria for categorization of BES Cyber Systems for High, Medium and Low impact categories. The criteria were originally developed in collaboration with representatives of the Operating and Planning Committees, some of whom continued to provide input during the drafting of Attachment II. Do you have any suggestions that would improve the proposed criteria? If so, please explain and provide specific suggestions for improvement.

Summary Consideration:

The summary of responses to Question 7 was previously posted on the NERC website prior to the posting of Version 4 of the CIP-002 through CIP-009 standards.

#	Organization	Yes or No	Question 7 Comment
7.1	Platte River Power Authority		1.1 is confusing. Consider revising: For the preceding 12 months did the Generation Facility's net Real Power capability (rated net) exceeds the largest value of either the Contingency Reserve or the Reserve Sharing Group's total reserve sharing obligation. In the case where no Contingency Reserve or total reserve sharing obligations have been established, Generation Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate higher of the most current and prior to the most current rated net Real Power capability of 2,000 MW. 2.7. "switching stations operated at 200kV or above" should read "switching stations operated between 200kV and 299kV"
7.2	National Rural Electric Cooperative Association (NRECA)		In 1.1, "must run" must be more clearly defined and there needs to be language to make clear how Generation Facilities are labeled "must run" -- i.e., who determines the "must run" status? In 1.5 and other places in this document, the term Transmission lines is used. What does "lines" mean? One wire? One three-phase circuit? One single phase of a three phase circuit? Please make this clear so there is no confusion for registered entities when determining High, Medium or Low. In 1.10, please provide an explanation of what "impact" and "local area" means in the phrase "have impact beyond the local area." Add language to 1.10 as needed to make

#	Organization	Yes or No	Question 7 Comment
			this more clear.
7.3	Emerson Process Management		It is only uncertain how the criteria of 2000MW and 1000MW were chosen for generation facilities.
7.4	Arizona Public Service Company		These criteria are closely related to the definition of a BES Cyber System and the feedback for question #2. If the intent is to categorize the majority of BES Cyber Systems into the Low, Medium and High Impact Categories, with the current timeline specified in the definition of a BES Cyber System, it may lead Entities to exclude from Impact Categorization (by the Definition) Cyber System Components that the drafting team did not intend. A preferred approach may be to eliminate the time windows from the definition, causing all BES Cyber Systems to be inventoried, and enhancing the Impact Categories with additional time window criteria. For example, a High category may be further refined by specifying an impact window of 0-15 minutes, a Medium of 16-240 minutes, a Low of 241-1440 minutes (24 hours), etc. Additionally, a further Impact Category of 'None' may be beneficial if the 15-minute time windows is removed from the definition. This would allow a floor to be utilized in the Impact Categorization of 'Low' so that it would not result in unintended consequences of including undesired BES Cyber System Components in a category with Standard applicability. Further comments regarding the (as-of-yet undefined) implementation schedule include concerns that a long implementation schedule or different implementation schedules for High, Medium and Low both raise the risk of confusion as well as the risk or FERC disapproval. An alternate method, in conjunction with the definition and Impact Category adjustments mentioned, of creating a phased implementation schedule, by time period (12 months, 24 months, 36 months, for example) would allow the applicable standards to increase over time for the lower categories. This would also allow for some Standards to be applied earlier than other Standards in the same Impact Category.
7.5	ISO New England Inc	No	"Must run" in 1.3 and 2.3 is a phase should not be used, even if quotations are around it, because it is a regulatory mechanism, used in some areas of the country, to ensure generators receive adequate payments. Other generators - that are equally important

#	Organization	Yes or No	Question 7 Comment
			to grid operation - may not have reliability must-run agreements. In short, these agreements are established simply as a function of market payments and current grid operations, and are therefore inappropriate for establishing criteria around determining which generators are impactive on the bulk electric system. If the Standard Drafting Team insists on using the term, it must, at a minimum, define what it means by this phrase.
7.6	Madison Gas and Electric Company	No	1.3 and 2.3 utilize the words “must run”. Must run is used in many markets whereby a GO may designate a unit to be online outside the need for reliable operations of the BES. Since “must run” is not defined, it is recommend that the SDT remove the term “must run”.
7.7	Progress Energy (non-Nuclear)	No	All T/D substation capacitor banks that provide system reactive support are controlled through a capacitor bank control program residing on the substation gateway device. However the DSCADA master may be included in 1.2 (more than 1000 MVAR). 2.4 will bring many T/T substations into consideration with the four or more lines >200kV. Also see comment 4. Attachment II defines "Each Cyber System that can affect operations for..." as it relates to Impact Rating on BES. For new combined cycle facilities which will include diverter dampers to allow simple cycle operation can we designate separate Cyber systems for simple cycle operation (approximately 70% of total plant output) and combined cycle operation (approximately 30% of total plant output). Potentially that would define each system as a "Low " impact versus a combined Medium to High. The plants are being designed to go from combined cycle to simple cycle operation in less than 15 minutes. We will need to know whether this designation is allowed and then design the cyber system(s) architectures appropriately.
7.8	Consultant	No	Attachment II - Section 1.1 & 1.2 To avoid confusion, suggest consistent wording in the parenthetical phrases following the words "singularly or in combination" in these sections.

#	Organization	Yes or No	Question 7 Comment
			Section 1.2 - Similar to section 1.1, should there be a 12 month component to the Reactive Power criteria in addition to the 1,000 MVAR. Section 1.3 & 2.3 - The term "pre-designated" doesn't make sense. A facility is not in the "must run" status unless it is "designated". Additionally, the statement has "must run" units both "designated" and "assigned", and semantically these are two different conditions. Section 1.3 & 2.3 - Further, the reliability "must run" status is an economic and contractual condition rather than a BES operational condition. It would seem that the plants that would be designated as reliability "must run" should have a BES operational or reliability criteria, independent of their "must run" status, which should be the criteria used to include or exclude these facilities. Section 1.6 - suggest including the title of EOP-005 in the statement as a complete reference citation. Section 1.9 - suggest including the title of NUC-001 in the statement as a complete reference citation. Section 1.10 - suggest clarifying which entity makes the determination that a RAS has "impact beyond the local area." - RAS Owner, RAS Operator, or appropriate regional entity. Section 1.11 (& throughout CIP-011) - BES Elements, BES elements, and elements are used throughout this standard. It is not clear if all are intended to be the glossary definition of 'Elements', or if 'BES elements' or 'BES Elements' are new definitions or incorrect application of the glossary term 'Elements'. Please clarify the usage. Sections 1.8, 1.13, 2.5 - These sections include the words "singularly or in combination" without a subsequent parenthetical qualifier. Suggest consistency with sections 1.1 & 1.2 as discussed above. Section 2.1 - See comments on sections 1.1 and 1.2 regarding consistency of parenthetical statement.

#	Organization	Yes or No	Question 7 Comment
			Section 1.1, 1.3, 1.4, 1.5, 1.7, 2.1, etc. - Multiple sections use the terms Generation Facilities or Transmission Facilities with capitalization that should indicate a defined term, either by this standard or in the current glossary. These terms are not defined in the current glossary. Suggest consistency of using defined terms throughout the standard. Section 2.1 - The criteria in this section are not parallel to the criteria in section 1.1 with a 'downsized' value. The term "most current and prior to most current rated" is not defined, or included in the glossary. Suggest clarifying this section, and defining or referencing the terminology.
7.9	E.ON U.S.	No	CIP-010-1 Attachment II - Impact Categorization of BES Cyber Systems currently lists 14 “High Impact Ratings” of the categorization of the BES Cyber Systems. E ON U.S. proposes that only Control Centers and Backup Control Centers fall into the High Impact Rating category. All other points listed in the High Impact Rating category should be moved to the Medium Impact Rating category, and all points currently listed in the Medium Impact Rating category should be moved to the Low Impact Rating category. More generally, “reliable operation” of the interconnected BES is defined in Section 215(a)(4) as:” . . . operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements.” Attachment II’s low impact category appears completely untethered to the statutory definition of reliable operation of the bulk power system. Attachment II also appears to introduce an ill-defined set of multiple contingencies or sequence of events that needs more definition and boundaries to be of any practical use and to provide a reasonable means for compliance cost quantification.
7.10	Kansas City Power & Light	No	Do not agree with several of the items listed in Attachment II.

#	Organization	Yes or No	Question 7 Comment
			Items 1.7 & 1.8 are too broad. There are any number of combinations of transmission facilities that can be removed from service such that the undesirable effect of exceeding an IROL limit or the loss or reduction of generation would occur. Recommend their removal as the remaining items left in Attachment II are sufficient to capture the HIGH impact areas. Item 1.10 regarding SPS is too broad. SPS systems are in place for a number of different reasons, including the protection of facilities from damage. The SPS that should be considered here are only the SPS that are intended to prevent cascading, uncontrolled separation, or instability. Item 1.14 is too broad and would include facilities that are unnecessary. Recommend tying Control Centers in where facilities are identified in 1.5. Recommend the following language for consideration: Transmission Operator functions performed by primary or backup Control Centers that remotely control two or more Transmission substations or switching stations for transmission facilities identified by 1.5.
7.11	FirstEnergy Corporation	No	FE suggests that item 1.5 be removed such that it is effectively reclassified as a medium impact and covered by item 2.4. Within the High Impact category, items 1.6, 1.7 and 1.8 appropriately cover those situations where Transmission Facilities should rise to a High Impact level. Consider removing item 1.9. This delves into a nuclear plant safety concern that is covered by the NUC-001 standard and not directly associated with BES reliability. If in item 1.1 a 2000MW level adequately depicts a High Impact generation facility hurdle then transmission facilities associated with a 900MW nuclear plant should not be deemed High Impact for BES reliability. In item 1.10 the term “local area” is vague and open to interpretation. Its suggested to simplify such that all SPS and RAS systems would be treated as High Impact. If the intent is to exclude SPS or RAS associated with limiting generation output under contingency loss of certain Transmission Facilities then consider a separate Medium Impact SPS or RAS describing those instances and rewrite 1.10 to say “Special Protection Schemes,

#	Organization	Yes or No	Question 7 Comment
			Remedial Action Schemes (RAS) or automated switching of BES elements not include in Section 2, item 2.x" However, the preference is to keep it simple and just treat all SPS and RAS items as High Impact. Suggest adding thresholds below which no measures need to be taken. The low impact rating as written could require significant effort for negligible security and reliability improvement.
7.12	National Grid	No	In lieu of the BES NOPR and the exemption process currently proposed, if facilities above 100 kV are exempted by NERC and FERC, will those facilities automatically be exempted from CIP standards? Currently, as per the standards, all the BES systems which are not categorized high impact or medium impact will be defaulted to LOW IMPACT category regardless of how the facility is impacting the Bulk power system. There are facilities >100kV having very localized impact and minimal impact to the reliability of the BES system for which entities will request for exemption. National Grid requests the SDT to clarify this issue. National Grid recommends a tabular format similar to the tables in CIP-011-1 with various criteria listed under Low Impact, Medium Impact, and High Impact. This will help in understanding the key differences among the three categories efficiently."Must run" in 1.3 and 2.3 is a phase should not be used, even if quotations are around it, because it is a regulatory mechanism, used in some areas of the country, to ensure generators receive adequate payments. Other generators - that are equally important to grid operation - may not have reliability must-run agreements. In short, these agreements are established simply as a function of market payments and current grid operations, and are therefore inappropriate for establishing criteria around determining which generators are impactive on the bulk electric system. If the Standard Drafting Team insists on using the term, it must, at a minimum, define what it means by this phrase.
7.13	American Electric Power	No	Overall we like the concept of these gradients, but need more time to fully ascertain the validity of the breakpoints. It is uncertain what engineering analysis drove these specific categorization levels. We assume that there could be a significant difference from region

#	Organization	Yes or No	Question 7 Comment
			to region, and the SDT should consider regional impacts for the categorization.
7.14	Regulatory Compliance	No	Qualifier should include capacity factors averaged over the last five years - otherwise it will require some large plants that are only on-line several days a year to remediate to the "High Impact" category
7.15	Manitoba Hydro	No	Regarding criterion 1.1, the phrase “with aggregate higher of the most current and prior to the most current rated net Real Power capability of 2,000 MW” is difficult to understand. For some utilities, the required reserve obligations could be a small value which would not compare very well to the proposed 2000 MW limit for utilities with NO reserve obligations (such as small utilities). A related minimum value for utilities with reserve obligations should be provided, or the greater value of the required reserve obligations and 2000 MW should be used .Regarding criteria 1.5 and 2.4, clarify the requirements through the appropriate use of colons, semi-colons and numbers. It is not clear as drafted whether phrase “with four or more transmission lines” applies to Texas and Quebec.
7.16	Seattle City Light	No	see prior comments
7.17	Indeck Energy Services, Inc	No	The system of 3 categories oversimplifies the BES. 1) The grouping of, for example, all generators of capacity less than 1,000 MW (except for special cases like Must Run units) as LOW needs to be further subdivided. The categorization ignores the Functions in Attachment I. Not all generators have the same impact on the BES ALR for all functions. Different types of generators have different effects on the BES ALR. This isn’t to say that all generators should not be categorized, but not all require the same LOW level of requirements. Choosing only 3 categories was highly arbitrary. The LOW category should be subdivided into 3 or more groups reflecting the relative impact on BES ALR that was used to differentiate the HIGH and MEDIUM groups. 2) Additionally, the standards ignore the fact that access to BES cyber facilities can be

#	Organization	Yes or No	Question 7 Comment
			controlled at either end of a communications path. If it is adequately controlled at one end, then controlling the other end or the middle is less important, if not unimportant. For example, an RTU at a small generator that is a window to the BES cyber facilities at the control center is a bigger risk for BES ALR at the control center than it is at the generator. Any effect on the generator may be insignificant, whereas, access to the control center could be critical. Applying controls at the control center takes away the need to control all of the insignificant RTU's, but not the ones affecting other parts of the BES. 3) Nowhere in the categorization process is the potential impact on BES ALR assessed by Function. Attachment II makes arbitrary categories that may be appropriate for the HIGH and MEDIUM categories, but has not been done for the remainder that are lumped in the LOW category. The concept of impact to the BES ALR is missing from the categorization process. The impact on the BES ALR of, for example a 999 MW generator versus a 499 MW generator versus a 299 MW generator are very different and different by Function as well. The impact on the BES ALR should be assessed for all facilities in the LOW category to differentiate them. All of the facilities should be categorized as to the impact on the BES ALR by function. [suggestion] There should be 5 categories: VERY HIGH, HIGH, MEDIUM, LOW and VERY LOW based upon the relative impact on the BES ALR, with various combinations of facility types and functions from Attachment I.
7.18	Reliability & Compliance Group	No	These criteria do now however, exclude many systems that were previously identified as CCA's. However they also include many systems that registered entities eliminated using the RBAM.
7.19	BCTC	No	This looked very thorough. Great job!
7.20	Xcel Energy	No	While the draft provides guidance in Attachment II as to which BES elements are classified as High, Medium, and Low impact, no criteria is provided for why each element was assigned into the specific impact category. The decision to place each element into

#	Organization	Yes or No	Question 7 Comment
			a category is not based on any identified objective criteria. The SDT should publish the criteria used to place each item under the assigned category.
7.21	Independent Electricity System Operator	Yes	(1) We support explicitly including Restoration of BES as a critical function. However, in the proposed standard it is limited to blackstart generation and transmission subsystem cranking paths (impact level H, items 1.4 and 1.6 in Attachment II). The impact criteria do not include a requirement to protect sufficient generation capacity to allow restoration to proceed to a point of relative assurance of stability and resiliency (not necessarily all load served). With these criteria, in Ontario we would drop 6 generating stations (a total of over 3000 MW capacity) from a High impact (current Critical Assets) to a Low impact category. We suggest to add a requirement in the High category for generation essential to facilitate restoration as determined by the RC. (2) 1.3 “Generator pre-designated as must run”: In some developed markets, must run generators change from time to time and often are not determined (designated) until week/day ahead of real time. We do not believe facilities of this dynamic nature should be included. If we want to include generators having a significant impact on reliability in this category, we need only to say: “Generation Facilities that have Wide Area reliability impacts when removed from service”. (3) 1.7: Violating IROL does not result in instability, uncontrolled separation or cascading. In everyday operations, IROLs are exceeded from time to time due to changing system conditions and external impacts. For so long as such exceedances are corrected within Tv, the BES is deemed to be reliable. We suggest the first part of this category be removed. Keeping the second part “Transmission Facilities, including FACTS, that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in instability, uncontrolled separation or Cascading would suffice. (4) 1.13: BA does not operates transmission facilities or generators; it only balances load/generation/interchange and maintain frequency by entering schedules onto the EMS. If the intent of R1.13 is to stipulate the primary and backup control centres of a BA that balances load and generation for a BA Area of the MW size as noted in 1.13, then

#	Organization	Yes or No	Question 7 Comment
			simply say so. (5) 2.3: See our comments on 1.3. We do not see the need for this category. (6) 2.8: See our comments on 1.13. The BA does not operate transmission facilities or generators. Suggest to reword it in a similar fashion.
7.22	IRC Standards Review Committee	Yes	(i) There are "bright-line" cutoffs for the range of violations for MW of generation (1.1, 2.1) and voltage levels (1.5, 2.4). Although these cutoffs are appropriate for most of the Interconnection(s), there may be local configurations that warrant that BES Cyber System to be rated other than what is defined with the "bright-line" cutoff. CIP-010-1 should either allow for a documented alternative rating or waivers be allowed to diverge from the cutoff limits. (ii) 1.3: "Generator pre-designated as must run": In some developed markets, must run generators change from time to time and often are not determined (designated) until week/day ahead of real time. We do not believe facilities of this dynamic nature should be included. If we want to include generators having a significant impact on reliability in this category, we need only to say: "Generation Facilities that have Wide Area reliability impacts when removed from service". (iii) 1.7: Violating IROL does not result in instability, uncontrolled separation or cascading. In everyday operations, IROLs are exceeded from time to time due to changing system conditions and external impacts. For so long as such exceedances are corrected within Tv, the BES is deemed to be reliable. We suggest the first part of this category be removed. Keeping the second part "Transmission Facilities, including FACTS, that, if destroyed, degraded, misused, or otherwise rendered unavailable, would result in instability, uncontrolled separation or Cascading would suffice. (iv) 1.13: A BA does not operates transmission facilities or generators; it only balances load/generation/interchange and maintain frequency by entering schedules onto the EMS. If the intent of R1.13 is to stipulate the primary and backup control centres of a BA that balances load and generation for a BA Area of the MW size as noted in 1.13, then

#	Organization	Yes or No	Question 7 Comment
			simply say so. (v) 2.3: See our comments on 1.3. We do not see the need for this category. (vi) 2.8: See our comments on 1.13. The BA does not operate transmission facilities or generators. Suggest to reword it in a similar fashion.
7.23	FEUS	Yes	*1.1; clarify 'if the Generation Facilities capability exceeds the largest value of the Contingency Reserve or reserve sharing obligations for the Reserve Sharing Group' the Contingency Reserve is also relative to the Reserve Sharing Group. *1.10: The drafting team should consider allowing for voltage differentiations for High and Medium SPS, RAS, or automated switching stations similar to that used in 1.5 and 1.14
7.24	Hydro One	Yes	"Must run" in 1.3 and 2.3 is a phrase that we strongly disagree with, and should not be used, because it is a regulatory mechanism, and used in some areas of the country to ensure generators receive adequate payments. Other generators - that are equally important to grid operation - may not have reliability must run agreements. These agreements are established as a function of market payments and current grid operations, and are therefore inappropriate for establishing criteria around determining which generators impact the bulk electric system. If the Standard Drafting Team insists on using the term it must, at a minimum, define what it means by this phrase. We strongly suggest that a fourth category of NO IMPACT is included as follows: No Impact contains all other documented BES Cyber Systems that have no affect on operation and are not categorized as having either High, Medium or Low Impact rating.
7.25	Northeast Power Coordinating Council	Yes	"Must run" in 1.3 and 2.3 is a phrase that we strongly disagree with, and should not be used, because it is a regulatory mechanism, and used in some areas of the country to ensure generators receive adequate payments. Other generators - that are equally important to grid operation - may not have reliability must run agreements. These agreements are established as a function of market payments and current grid

#	Organization	Yes or No	Question 7 Comment
			operations, and are therefore inappropriate for establishing criteria around determining which generators impact the bulk electric system. If the Standard Drafting Team insists on using the term it must, at a minimum, define what it means by this phrase.
7.26	Florida Municipal Power Agency	Yes	1.1, 1.8, 1.11 and 1.13 ought to be combined into a single supply-demand mismatch metric. Also, in 1.1, 2000 MW is arbitrary and in 1.13 4000 MW is arbitrary. And in 1.11, 300 MW is arbitrary and seems to coincide with DOE reporting requirements associated with EOP-004 which has nothing to do with BES Reliability. FMPA suggests: "Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple Facilities) or Control Centers that if destroyed, degraded, misused, or otherwise rendered unavailable, can cause a supply-demand mismatch exceeding the largest value, for the 12 months preceding the categorization, of the Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group. Net Winter Real Power capabilities of generators are to be used in determining the supply side of determining the mismatch. The greater of actual coincident peak load, or forecasted peak load for the next year, of the Reliability Coordinator is to be used for the demand side of the equation. In the case where no Contingency Reserve or total reserve sharing obligations have been established, the supply-demand mismatch metric shall be equal to the largest loss of source plus 50% of the next largest loss of source for the Reliability Coordinator area."Such language addresses situations where a DC tie line may be the largest loss of source contingency for a region that is left as a gap in the existing definition, clarifies whether winter or summer generator capabilities are to be used, and used reliability related metrics instead of arbitrary targets. Similarly, the 1000 MW of 2.1 is arbitrary. A more appropriate metric would be the lowest expected value for a single contingency loss of source in the Reliability Coordinator area. For instance, assuming a 7% average forced outage rate for generators, using a metric of the second largest loss of source contingency in the Reliability Coordinator area for a supply-demand mismatch metric would give a greater than 99% confidence that the largest loss of source contingency at any given time is greater than that metric. Since the system is always operated to the worst case single

#	Organization	Yes or No	Question 7 Comment
			contingency at any moment, then, we would be quite confident in using the metric of the second largest loss of source contingency for Medium Impact. Hence, FMPA suggests that 2.1, 2.5 and 2.8 be combined using similar language to that which FMPA suggests for 1.1 using the second largest loss of source contingency in place of the reserve sharing obligation used in 1.1. that is:"Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple Facilities) or Control Centers that can cause a supply-demand mismatch exceeding the second largest loss of source contingency in the Reliability Coordinator Area." In 1.2, the 1000 MVARs is arbitrary. Additionally 1.2, 1.3, 1.7 and 1.10 ought to be combined using the same concept of exceeding IROLs. FMPA suggests:"Transmission Facilities, active compensation devices (such as synchronous condensers and SVCs), reliability must-run generation, or Special Protection Systems, that, if destroyed, degraded, misused, or otherwise rendered unavailable, results in exceeding an IROL and/or an Adverse Reliability Impact" Similarly, the 500 MVAR in 2.2 is arbitrary. FMPA suggests combining 2.2 with 2.3 and 2.5 in a similar fashion:"Transmission Facilities, active compensation devices (such as synchronous condensers and SVCs), reliability must-run generation, or Special Protection Systems, that, if destroyed, degraded, misused, or otherwise rendered unavailable, results in exceeding a SOL."Radial Facilities serving only load should not be included in 1.5 or 2.4. The term "Facilities" in these bullets is misused; a substation is NOT a Facility, but rather an interconnection point for multiple Facilities. Large auto-transformers and GSUs should not be excluded from the count. And, the distinction between the Interconnects is arbitrary and meaningless. FMPA suggests:"1.5 Transmission substations or switching stations with four or more Transmission Facilities operated at 300 kV or higher (for transformers, both primary or secondary winding > 300 kV, or a GSU of a registered generator)."By using the term Facilities, which by definition is a "... single BES Element", we also exclude radial serving only load Elements since those Elements are not Facilities. 2.4 would then be identical except using the 200 kV metric instead of 300 kV.In 2.6, the

#	Organization	Yes or No	Question 7 Comment
			distinction between the Interconnects is arbitrary and meaningless. The 300 kV metric should be used for all Interconnects. Black start and cranking paths should not be High Impact at all. High impact would be the system going black, a delay in restoring the system is a Medium Impact since the damage has already been done. Hence, 1.4 and 1.6 should be combined and made a Medium Impact. 1.14 is ambiguous. Is a tapped substation included in the count? Or a station on the end of a radial line? FMPA suggests associated the count of substations with 2.4, i.e.:"Transmission Operator functions performed by primary or backup Control Centers that remotely control two or more Transmission substations or switching stations identified in 2.4, or functionality that remotely controls a BES Cyber System with a High Impact Rating."
7.27	Southwest Power Pool Regional Entity	Yes	1.1: The criteria to include as High only the generation that exceeds the Contingency Reserve or reserve sharing obligation effectively removes nearly all generation resources from this impact category. 1.3: "Wide Area reliability impacts" as defined by the NERC Glossary of Terms (April 20, 2010) may be far too broad. If the unit is designated as RMR, it should be High impact regardless of the wide area consideration. 1.10: Please define the term "local area." 1.12 and 1.13: The Reliability Coordinator, and in the instance of a consolidated Balancing Authority, the Balancing Authority functions afforded a High impact categorization are fed real-time operational data from smaller, lower impact BES Cyber Systems owned and operated by other entities. Because of the criticality of the Reliability Coordinator and Consolidated Balancing Authority's near total reliance upon external real-time data sources, those sources need to also be afforded a High impact category. In particular, these BES Cyber Systems would include the EMS/SCADA and ICCP subsystems found in an entity's control center. 2.1: The 1000 MW criteria defining a Medium Impact generation asset will likely place

#	Organization	Yes or No	Question 7 Comment
			most generation into a Low Impact category.
7.28	Oncor Electric Delivery LLC	Yes	1.10 needs to better define “local area” (eg. 3 busses) Need criteria for “Low” such that “None” is the lowest level of protection required. Also, there is a need to have categories for systems with no IP communication or dial-up only communications.
7.29	LCEC	Yes	2.4 Replace transmission facilities with “Substations and/or switching stations and two or more non-radial transmission lines”. or”Transmission Facilities with four or more non-radial transmission lines operated at 200 kV or above in the Eastern and Western Interconnections, or 100 kV or above in the Texas and Quebec Interconnections, not included in Section 1.” 2.7 change to "non-radial" Transmission substations or switching stations or”Primary or Backup Control Centers that remotely control two or more Transmission substations or switching stations, each with four or more non-radial transmission lines, operated at 200 kV or above in the Eastern and Western Interconnections and 100kV or above in the Texas and Quebec Interconnections, or functionality that remotely controls a BES Cyber System with a Medium Impact Rating, not included in Section 1.”
7.30	Turlock Irrigation District	Yes	Attachement II criterion #1.4 states that BES Cyber Systems that can affect operations for Blackstart Resources in the Transmission Operator's restoration plan shall be categorized as High Impact. This should be changed to include only the Blackstart Resources in a region's Blackstart Capability Plan because Transmission Operator's restoration plans typically include Blackstart Resources that are not material to the restoration of the BES. Blackstart Resources that are material to the restoration of the BES are designated by each Regional Entity in accordance with NERC Standard EOP-007-0 titled "Establish, Maintain, and Document a Regional Blackstart Capability Plan". We suggest that the wording of criterion #1.4 be changed to "Generation Facilities designated as Blackstart Resources in the Regional Blackstart Capability Plan". Making this change would maintain consistency between the Standards and would also be consistent with the Purpose section of CIP-010-1 which states that the categorization of

#	Organization	Yes or No	Question 7 Comment
			BES Cyber Systems should be "commensurate with the adverse impact... on the reliability of the BES. Attachment II criterion #1.6 uses the term "primary Cranking Path". What is the meaning of the word "primary" as used in this context? We suggest that the wording be changed to "Facilities required to support Cranking Path(s) that are material to the restoration of the BES as used in a Transmission Operator's restoration plan per EOP-005".
7.31	Garland Power and Light	Yes	Attachment II 1.4 Should state that it is the Primary Black Start Unit and does not include the Next Start Unit.1.5 Multiple circuits between two substations should count as a single transmission line. General Comment Need to add “scoping filter” as described on slide 31 of the NERC Workshop (May 19-20) Presentation on CIP 10 as presented by Jackie Collett. There already has been a Regional Entity Auditor make a presentation that he intended to audit beyond the scope of what is in the current standard - he (the auditor) may apply the same approach to the new standard if the filter is not stated with the definition - not adding the clarification (scoping filter) just adds the potential for alleged violations and all the baggage that goes with that until one can hopefully get resolved - If you add the filter which states “typically excludes business, market function systems, and non real-time systems”, then it is a good scope and we would agree
7.32	Powersouth Energy Cooperative	Yes	CIP-010 Attachment II 1.1 As drafted, if reserve requirements have not been established for an entity, generation facilities are considered High Impact if singularly or in combination exceed 2,000 MW. It seems to be reasonable to apply the 2,000 MW limit to reserves as well with reserve requirements only greater than 2,000 MW being considered as High Impact. 1.4 Additional consideration should be given to categorizing blackstart units in all cases as High Impact. Some units, while identified in a TO’s restoration plan, are not part of

#	Organization	Yes or No	Question 7 Comment
			the Regional Entities Restoration Plan. Some generation that may be used in a restoration effort may be removed from the TO's restoration plan to avoid implementation of High Impact security requirements. Some "middle ground" should be found so that more units can remain available in a restoration plan without being subject to costly security requirements and subsequently an increase in exposure for a utility to be non-compliant. It is recognized that there must be a sufficient number of blackstart critical units that remain protected by High Impact status to ensure restoration following an event. 1.10 Is "local area" meant to be the Balancing area or can the entity define local area. 2.1 As drafted, if reserve requirements have not been established for an entity, generation facilities are considered Medium Impact if singularly or in combination exceed 1,000 MW. It seems to be reasonable to apply the 1,000 MW limit to reserves as well with reserve requirements only greater than 1,000 MW being considered as Medium Impact. 3. Some consideration should be given to providing exclusions to exempt assets that in reality have no material impact.
7.33	City Utilities of Springfield, Missouri	Yes	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
7.34	MidAmerican Energy Company	Yes	Clarification is needed for the term "primary Cranking Path" (CIP-010-1 Attachment II item 1.6). Cranking Path is a NERC defined term; however, "primary Cranking Path" is not defined. Item 1.4 includes all generating facilities designated as Blackstart Resources in the Transmission Operator's restoration plan. Larger entities submit multiple plans with many blackstart units and cranking paths. Protecting all blackstart units will divert valuable renounces from (better) protecting more valuable facilities. Draft definition of "primary Cranking Path": "Cranking Path and facilities included in the Transmission Operator's restoration plan as the preferred path and facilities for restoring the BES system to a stable condition with sufficient generation capacity synchronized to complete the full restoration of native load". Subsequently, CIP-010-1 Attachment II item 1.4 should be updated to only designate

#	Organization	Yes or No	Question 7 Comment
			Generation Facilities associated with the “Primary Cranking Path”. ALSO Mr. Scott Mix indicated in the May workshop that there should not be any CIP-002 critical asset systems that map to the CIP-010 low category. Current MW ratings in Attachment II Items 1.1 and 2.1 are set too high and will cause critical generating plants to move to the low impact category. Four critical units at MEC would move to low. Simultaneous loss of the four MEC units would impact the reliability of the BES. Set the MW level in Attachment II Item 1.1 to 500MW and Item 2.1 to 300MW.
7.35	PacifiCorp	Yes	Comments: Clarification is needed for the term “primary Cranking Path” (CIP-010-1 Attachment II item 1.6). Cranking Path is a NERC defined term; however, “primary Cranking Path” is not defined. Item 1.4 includes all generating facilities designated as Blackstart Resources in the Transmission Operator's restoration plan. Larger entities submit multiple plans with many blackstart units and cranking paths. Protecting all blackstart units will divert valuable renounces from (better) protecting more valuable facilities. Draft definition of “primary Cranking Path”: "Cranking Path and facilities included in the Transmission Operator’s restoration plan as the preferred path and facilities for restoring the BES system to a stable condition with sufficient generation capacity synchronized to complete the full restoration of native load”. ALSO "Wide Area" impacts need to be clarified in Item 1.3 for "Must Run" units. ALSO Mr. Scott Mix indicated in the May workshop that there should not be any CIP-002 critical assets that map to the CIP-010 low category. Current MW ratings in Attachment II Items 1.1 and 2.1 are set too high and will cause critical generating plants to move to the low impact category. Set the MW level in Attachment II Item 1.1 to 500MW and Item 2.1 to 300MW.
