Any Participant may request, and the Hearing Officer may call, a status hearing at any time subsequent to the initial prehearing conference to address issues that have arisen between the Participants or other matters relevant to the conduct of the hearing. Such issues may include, but are not limited to, discovery disputes and scheduling matters. A Participant requesting a status hearing to resolve a dispute shall include in its request a certification that it has made a good faith effort to resolve the dispute with the other Participant(s) before requesting the status hearing. The Hearing Officer shall direct the Clerk to issue a notice of status hearing that sets forth the date, time and place for the hearing, and identifies the matters to be addressed at the hearing.

1.5.5 Motions and Responses

(a) Unless otherwise provided in these Hearing Procedures or by the procedural schedule established by the Hearing Officer or Hearing Body, a Participant may file a motion at any time requesting any relief as may be appropriate. Unless ~~a~~the Hearing Officer allows a motion to be made orally on the record, motions shall be filed in writing. Motions based on facts that do not appear of record shall be supported by affidavit.

(b) Unless otherwise specified by the Hearing Officer or Hearing Body, responses to motions shall be filed within fourteen (14) days after service of the motion, and replies to responses shall be filed within seven (7) days after service of the responses~~;~~. ~~however, a~~A Hearing Officer or Hearing Body may deny dilatory, repetitive, or frivolous motions without awaiting a response. Unless otherwise ordered by a Hearing Officer or Hearing Body, the filing of a motion does not stay the proceeding or extend any scheduled dates in the proceeding.

1.5.6 Experts

(a) A Participant may employ an expert(s) to testify or consult in a proceeding. Any expert utilized in either capacity shall sign an agreement evidencing the expert's understanding and acknowledgement of the non-public nature of the proceeding and that unauthorized public disclosure of information obtained in connection with the expert's participation in the proceeding is prohibited.

(b) The Participant employing the expert shall propose the agreement for approval by~~via a~~ motion, and its approval shall be subject, in addition to consideration of any objections by other Participants, to ensuring that appropriate safeguards are maintained to protect the confidentiality of the proceeding and the information disclosed therein.

1.5.7 Inspection and Copying of Documents in Possession of Staff

(a) Documents to be Available for Inspection and Copying

(1) Within twenty-five (25) days after the date the ~~issuance of the notice of~~request for hearing is filed, Staff shall make available for inspection and copying by the ~~Respondent~~other Participants, all Documents prepared or obtained by Staff through or in connection with any compliance monitoring process~~(~~es~~)~~ that led to the institution of proceedings. Such Documents shall include but are not limited to:

(A) requests for information to the Respondent;

(B) every written request, including e-mail, directed to persons not employed by the Compliance Enforcement Authority to provide information or Documents or to be interviewed;

(C) the Documents provided in response to any such requests described in (A) and (B) above;

(D) all transcripts of testimony recorded during the Staff investigation and all exhibits to the transcript;

(E) all other Documents obtained from the Respondent; and

(F) all other Documents obtained from persons not employed by the Compliance Enforcement Authority.

The sole grounds on~~bases pursuant to~~ which Staff is ~~shall be~~ authorized to withhold Documents from inspection and copying are~~shall be~~ the bases set forth in subsection~~Paragraph 1.5.7~~(b); provided, however, that the Documents made available for inspection and copying need not include (i) exact copies of Documents the Respondent previously provided to Staff, and (ii) any Documents provided to the Respondent with or as part of the Notice of Alleged Violation, Notice of Penalty, assessment of proposed Mitigation Plan or Remedial Action Directive.

(2) Where there are Participants in a proceeding in addition to a single Respondent and Compliance Staff, the Hearing Officer~~ or [HEARING BODY]~~ shall oversee the Staff's designation of Documents to be produced to such other Participants and the development, execution and enforcement of any protective order deemed necessary.

(3) Staff shall promptly inform the Hearing Officer and each other ~~Respondent~~Participant if, after the issuance of a notice of hearing, requests for information are issued by Staff related to the same compliance monitoring process(es) that led to the institution of the proceeding. If Staff receives Documents pursuant to a request for information after Staff has made Documents ~~have been made~~ available ~~to a Respondent~~ for inspection and copying as set forth in ~~Subparagraph~~subsection (a)(1), the additional Documents shall be made available to the ~~Respondent~~Participants not later than fourteen (14) days after Staff receives such Documents. If a date for the ~~e~~Evidentiary ~~h~~Hearing has been scheduled, Staff shall make the additional Documents available to the ~~Respondent~~other Participants not less than ten (10) days before the Evidentiary ~~h~~Hearing. If Staff receives such Documents ten or fewer days before the Evidentiary ~~h~~Hearing is scheduled to begin or after the Evidentiary ~~h~~Hearing begins, Staff shall make the additional Documents available immediately to the ~~Respondent~~other Participants.

(4) Nothing in subsection~~paragraph~~ (a)(1) shall limit the discretion of the Compliance Enforcement Authority to make any other Document available to the ~~Respondent~~Participants or the authority of the Hearing Officer to order the production of any other Documents or information by any Participant.

(b) Documents That May Be Withheld by Staff

(1) Staff may withhold a Document from inspection and copying by ~~the Respondent~~a Participant if:

(A) the Document is privileged to the Compliance Enforcement Authority~~Staff~~ or constitutes attorney work product of ~~Staff's~~ counsel for the Compliance Enforcement Authority (in applying this provision, the attorney-client privilege shall be recognized as absolute and any demand for production of attorney work product shall be granted only after a showing of substantial need by the Respondent or other Participant);

(B) the Document is an examination or inspection report, an internal memorandum, or other note or writing prepared by a Staff member that ~~shall~~ will not be offered in evidence or otherwise relied on by Staff in the Hearing;

(C) the Document would disclose

(i) ~~(i)~~ an examination, investigatory or enforcement technique or guideline not otherwise made public of the Compliance Enforcement Authority, a federal, state, or foreign regulatory authority, or a self-regulatory organization;

(ii) the identity of a source, including a federal, state, or foreign regulatory authority or a self-regulatory organization, that furnished information or was furnished information on a confidential basis regarding an investigation, an examination, an enforcement proceeding, or any other type of civil or criminal enforcement action; or

(iii) an examination, an investigation, an enforcement proceeding, or any other type of civil or criminal enforcement action under consideration by, or initiated by, the Compliance Enforcement Authority, a federal, state, or foreign regulatory authority, or a self-regulatory organization; or

(D) the Hearing Officer grants leave to withhold a Document or category of Documents as not relevant to the subject matter of the proceeding, or for other good cause shown.

Provided, that where a Document contains information of the type listed in ~~Subparagraphs~~subsections (A), (B), (C) or (D) that is capable of being redacted, Staff shall make the document available for inspection and copying by the other Participants~~Respondent~~ in redacted form.

(2) Nothing in ~~Subparagraph~~subsections (b)(1)(B), (C) or (D) authorizes Staff to withhold a Document, or a part thereof, that contains exculpatory evidence.

Nothing in ~~Subparagraph~~subsection (b)(1) requires Staff to withhold a Document from disclosure.

(c) ___Withheld Document List

–At the time it is required to make Documents available for inspection and copying, Staff shall also provide to the Hearing Officer, the Respondent and any other Participant to which Documents are being made available, a list of Documents withheld by Staff pursuant to ~~Subparagraph~~subsection (b)(1), with a statement of the grounds that support withholding the Document. Upon review, for good cause shown, the Hearing Officer may order Staff to make any Document withheld, other than a Document that is subject to the attorney-client privilege, available to the ~~Respondent(s)~~other Participants for inspection and copying.

(d) ___Timing of Inspection and Copying

Except as set forth in this ~~Paragraph~~Section, the Hearing Officer shall determine the schedule of production of Documents for inspection and copying, provided that the Hearing Officer may modify any time period for production set forth in this Section~~Paragraph~~ as warranted by the circumstances.

(e) ___Place and Time of Inspection and Copying

Documents subject to inspection and copying pursuant to this ~~Paragraph~~Section shall be made available to the Respondent and other Participants for inspection and copying at the Compliance Enforcement Authority office where the Documents are ordinarily maintained, or at such other office as the Hearing Officer, in his or her discretion, shall designate, or as the Participants otherwise agree. A ~~Respondent~~Participant shall be given access to the Documents at the Compliance Enforcement Authority's offices during normal business hours. A ~~Respondent~~Participant shall not be given custody of the Documents or be permitted to remove the Documents from the Compliance Enforcement Authority's offices, other than copies of Documents made available by the Compliance Enforcement Authority for that purpose.

(f)____ Copying Costs

A ~~Respondent~~Participant may obtain a photocopy of all Documents made available for inspection. A ~~Respondent~~Participant shall be responsible for the cost of photocopying. Unless otherwise ordered by the Hearing Officer, charges for copies made at the request of a Participant~~Respondent~~ shall be at a rate to be established by the Compliance Enforcement Authority.

-(g) ___Failure to Make Documents Available — Harmless Error

In the event that a Document required to be made available to a Participant~~Respondent~~ pursuant to this Section~~Paragraph~~ is not made available by Staff, no rehearing or amended decision of a proceeding already heard or decided shall be required where the failure to make the Document available was harmless error. Should a dispute arise as to whether a rehearing or amended decision is required due to the failure of Staff to produce a Document, the burden shall be on

Staff to show that such failure was harmless error. The Hearing Officer, or, upon review, the ~~[HEARING BODY]~~Hearing Body shall determine whether the failure to make the Document available was harmless error.

1.5.8 Other Discovery Procedures

(a) In addition to the production of Documents by Staff for inspection and copying by Respondent and other Participants pursuant to ~~Paragraph~~Section 1.5.7, the Participants shall be entitled to utilize all other discovery methods provided for in Rules 402 through 409 of the FERC Rules of Practice and Procedure, 18 C.F.R. §385.402 through 385.409, including data requests, written interrogatories and requests for production of Documents or things, depositions by oral examination, requests for inspection of Documents and other property, requests for admissions, and requests for issuance of orders to one or more Registered Entities to produce Documents for inspection and copying or at the hearing or to provide testimony by an authorized representative in deposition or at the hearing.

(b) Unless otherwise directed by the Hearing Officer or ~~[HEARING BODY]~~Hearing Body upon motion by a Participant, or by the Hearing Officer, or by the ~~[HEARING BODY]~~Hearing Body on its own motion, such discovery, and the resolution of any disputes concerning such discovery, shall be conducted in accordance with the provisions of Rules 402 through 410 and 510(e) of the FERC Rules of Practice and Procedure, 18 C.F.R. §385.402 through 385.410 and 385.510(e), which are hereby incorporated by reference into these Hearing Procedures, subject to the following limitations and modifications to such Rules:

~~(a)~~(1) The provisions of ~~Subparagraphs~~subsections (d), (e) and (f) of ~~Paragraph~~Section 1.5.7 shall apply to any such discovery.

~~(b)~~(2) Rule 403(b)(2) (18 C.F.R. §385.403(b)(2)) and Rule 410(d)(2) (18 C.F.R. §385.410(~~b~~d)(2)) shall not be applicable.

~~(c)~~(3) The Hearing Officer and the ~~[HEARING BODY]~~Hearing Body have the authority to issue orders to compel the appearance by or production of Documents or information by, only a Person that (i) is a Participant or (ii) is a Registered Entity (including an authorized representative thereof) that is not a Participant. The Hearing Officer and the ~~[HEARING BODY]~~Hearing Body do not have authority to require a United States marshal or deputy marshal to serve an order to produce or provide Documents, information or testimony.

~~(d)~~(4) References to "subpoena" in Rules 404, 409, 410 and 510(e) shall be deemed to be to an order to a non-Participant Registered Entity to produce or provide Documents, information or testimony.

(~~e~~5) References to the "Commission" in Rules 402 through 410 and 510(e) shall be to FERC except as follows:

(i) the references in Rules 402(a), 404(b)(1) and 405(b), the second reference in Rule 410(d), and the references in Rule 510(e)(1) and (2) shall be deemed to be to the ~~[HEARING BODY]~~Hearing Body,

(ii) the reference in Rule 385.406(b)(4) to "Commission trial staff" shall be deemed to be to Compliance Staff, and

(iii) the reference in Rule 510(e)(3) shall be deemed to be to the Hearing Officer or ~~[HEARING BODY]~~Hearing Body.

(~~f~~6) Unless otherwise ordered by the Hearing Officer or ~~[HEARING BODY]~~Hearing Body, a data request, set of interrogatories, request for production of Documents or things, request for inspection of Documents or other property, request for admissions, or order to produce or provide Documents, information or testimony, shall not specify a due date or response date that is fewer than 21 days from the date of service of the request or date of the order.

~~(g)~~(7) A list of withheld Documents, if any, shall be provided by any Participant required to produce Documents, at the time the documents are required to be produced, to the Hearing Officer and to each Participant entitled to receive production of the Documents. Upon review, for good cause shown, the Hearing Officer may order the Participant to make any Document withheld available to any other Participant or Participants for inspection and copying.

~~(h)~~(8) In the event a Document or information required to be produced or provided by a Participant pursuant to discovery is not produced or provided by the Participant, no rehearing or amended decision of a proceeding already heard or decided shall be required where the failure to produce or provide the Document or information was harmless error. Should a dispute arise as to whether a rehearing or amended decision is required due to the failure of a Participant to produce or provide a Document or information, the burden shall be on the Participant that failed to produce or provide the Document or information to show that such failure was harmless error. The Hearing Officer or, upon review, the ~~[HEARING BODY]~~Hearing Body shall determine whether the failure to make the Document available was harmless error.

(~~i~~9) Unless otherwise ordered by the Hearing Officer or ~~[HEARING BODY]~~Hearing Body, all such discovery shall be requested, scheduled and conducted so as to be completed within six (6) months following the date ~~of~~ the request for hearing was filed~~initial prehearing conference held pursuant to Paragraphs 1.4.1 and 1.5.2~~.

(~~j~~10) Notwithstanding ~~(f)~~subsections (b)(6) and ~~(i)~~(b)(9), however, if the shortened hearing procedure in Section 1.3.4~~Paragraph 1.3.2~~ is used in a proceeding, the Hearing Officer, on his or her own motion or on motion of a Participant, shall establish a schedule for discovery, including response periods for responding to discovery requests, that are consistent with the expedited nature of the proceeding contemplated by the shortened hearing procedure.

(c) The Hearing Officer's ruling on all motions relating to disputes concerning such discovery shall consider the following objectives:

(~~i~~1) full disclosure of all relevant Documents and information;

(2~~ii~~) the exercise of due diligence in the conduct of discovery by a Participant; and

(~~iii~~3) disallowing use of discovery as a means to delay the proceeding or to harass or burden any other Participant.

1.5.9 Pre-Evidentiary Hearing Submission of Testimony and Evidence

(a) Unless the Hearing Officer orders otherwise and with the exception of (i) any adverse Participant examination pursuant to ~~Paragraph~~Section 1.6.16 and (ii) the testimony and Documents of a non-Participant provided pursuant to an order to produce or provide Documents, information or testimony, all witness direct testimony to be submitted in an Evidentiary ~~h~~Hearing must be prepared in written form, may have exhibits, schedules and attachments thereto, and shall be filed in advance of the ~~e~~Evidentiary ~~h~~Hearing pursuant to a schedule determined by the Hearing Officer, as it may be amended.

(b) Where a Participant intends to use a Document or other demonstrative evidence that has not been filed as part of written testimony in the conduct of cross-examination (other than Documents that are to be produced by a non-Participant at the hearing pursuant to an order to produce Documents), the Participant intending to use such Document or demonstrative evidence shall provide it to the other Participants and the Hearing Officer at least three (3) business days prior to the date at which the witness will be cross-examined at ~~the~~a ~~evidentiary~~Testimonial H~~h~~earing.

(c) Compliance Staff shall file the Documents it intends to offer into evidence as its direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, first. The Registered Entity shall file the Documents it intends to offer into evidence as its direct case, which also may be responsive to Staff's direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, second. Staff shall file as its rebuttal case the Documents it intends to offer into evidence in response to the Registered Entity's direct case, including the written testimony of its witnesses along with exhibits, schedules and attachments thereto, third.

(d) If appropriate due to the number and/or complexity of the issues, the Hearing Officer may allow for the Registered Entity to submit a rebuttal case that responds to Staff's rebuttal case, in which event the Hearing Officer shall also allow Staff to submit a surrebuttal case that responds to the Registered Entity's rebuttal case.

(e) Each round of evidence shall be limited in scope to responding to the preceding round of evidence, except that the Registered Entity's direct case may exceed the scope of Staff's direct case if necessary for the Registered Entity to set forth its direct case fully.

(f) The Participants shall file the Documents they intend to offer into evidence in accordance with the Hearing Officer's schedule, as it may be amended. Such filings of written testimony and other evidence in advance of the ~~e~~Evidentiary ~~h~~Hearing shall not entitle the Documents to be admitted into the evidentiary record. The Participants must offer their witnesses' testimony and other proposed evidence for admission into the evidentiary record during the ~~e~~Evidentiary ~~h~~Hearing.

(g) Any Participant who fails, without good cause shown, to comply with the Hearing Officer's schedule for the filing of written testimony and other evidence in advance of the ~~e~~Evidentiary ~~h~~Hearing may be limited in the presentation of its evidence during the ~~e~~Evidentiary ~~h~~Hearing or have its participation in the ~~e~~Evidentiary ~~h~~Hearing otherwise restricted by the Hearing Officer to avoid undue prejudice and delay.

1.5.10 Protective Orders

(a) All proceedings conducted pursuant to these Hearing Procedures, and any written testimony, exhibits, other evidence, transcripts, comments, briefs, rulings and other issuances, shall be non-public and shall be held in confidence by all Participants, except as the ERO (within the U.S., in accordance with the authorization previously granted by FERC to release information about a non-public proceeding) or FERC (in the case of U.S.-related information) or another Applicable Governmental Authority (in the case of non-U.S.-related information) authorizes or directs public disclosure of any portion of the record. In addition to this general proscription, at any time during a proceeding, the Hearing Officer, on his or her own motion or on the motion of any Participant or of any non-Participant ordered to produce Documents, information or testimony, may enter a protective order to designate as proprietary and protect the confidential, proprietary or trade secret nature of any data, information or studies, or any other information the public release of which may cause a security risk or harm to a Participant.

(b) The following types of information will be considered entitled to protection through a protective order:

(~~i~~1) confidential business and market information, including information that is proprietary, commercially valuable, or competitively sensitive;

(~~ii~~2) Critical Energy Infrastructure Information;

(~~iii~~3) information related to a Cybersecurity Incident;

(~~iv~~4) personnel information that identifies or could be used to identify a specific individual, or that reveals personnel, financial, medical or other personal information;

(~~v~~5) audit work papers;

(~~vi~~6) investigative files or Documents that would disclose investigative techniques of Staff, any Compliance Enforcement Authority, the ERO or any federal, state or foreign regulatory authority.

Nothing in this ~~Subparagraph~~subsection 1.5.10(b) shall require Staff to produce any Documents it is entitled to withhold under ~~Subparagraph~~subsection 1.5.7(b).

(c) A motion for a protective order shall specify the proposed expiration date for the proprietary status of the data, Documents or information, if any, and shall propose requirements or safeguards to be met for individuals participating in the proceeding to review the protected information while maintaining its proprietary status.

(d) A Document submitted and marked as proprietary, or a statement made at a hearing and identified as proprietary, shall be afforded proprietary treatment pending the timely submission of a motion to protect the confidential, proprietary or trade secret nature of that Document or statement and a ruling on such a motion by the Hearing Officer.

(e) The protective order shall identify the data, Documents or information that will be accorded proprietary treatment; the individuals participating in the proceeding, by category or otherwise, entitled to view the proprietary information; and the requirements, conditions or safeguards that must be met before an individual may view the information.

(f) A public redacted version of each Document and transcript that contains information that is protected pursuant to this ~~Paragraph~~Section must be filed with the proprietary version and must be served on each Participant for distribution to those individuals participating in the proceeding who are not entitled to view the proprietary information.

(g) Should it be necessary to address proprietary information during a hearing, the Hearing Officer shall, while the information is being addressed, close the hearing to all individuals other than those entitled to view or hear the proprietary information in accordance with the protective order.

1.5.11 Pre-Evidentiary Hearing Memorandum

(a) The Hearing Officer or the ~~[HEARING BODY]~~Hearing Body may request~~, as needed on a case by case basis due to the number or complexity of the issue(s),~~ the submission of memoranda prior to the ~~e~~Evidentiary ~~h~~Hearing that set forth ~~outline~~ each Participant's position on the issue(s) in dispute, the key facts and arguments, ~~and~~ the applicable Reliability Standard, rules, orders or other authority, and such other matters as may be directed by the Hearing Officer or the Hearing Body.

(b) The purpose of such memoranda will be to aid the Hearing Officer and ~~[HEARING BODY]~~Hearing Body in preparation for the ~~e~~Evidentiary ~~h~~Hearing. A Participant will not be deemed to have waived any issue, fact or argument that is not set forth in a pre-~~e~~Evidentiary ~~h~~Hearing memorandum.

(c) The Hearing Officer may establish ~~page~~word limitations on such submissions.

1.5.12 Certification of Questions to the NERC Board of Trustees

(a) Should a hearing present a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the proceeding in whole or in part, or as to which there are other extraordinary circumstances that make prompt consideration of the question by

the NERC Board of Trustees appropriate, the Hearing Officer, on his or her own motion or on motion of a Participant, may recommend to the Hearing Body that it certify, or the Hearing Body on its own motion may decide to certify, the question to the NERC Board of Trustees for determination pursuant to Section 412 of the NERC Rules of Procedure.

(b) If the Hearing Officer, on his or her own motion, or the Hearing Body, on its own motion, wishes to present a question to the Hearing Body for certification to the NERC Board of Trustees, the Hearing Officer shall first provide the Participants the opportunity to submit memoranda addressing whether the question should be certified and the precise terms of the question to be certified.

(c) If a Participant files a motion requesting, or the Hearing Officer determines on his or her own motion, that a question should be certified to the NERC Board of Trustees, the Hearing Officer shall submit a written recommendation on the matter to the Hearing Body. If the request for certification is based on the motion of a Participant, the Hearing Officer shall also submit to the Hearing Body the motion and any answers to the motion that were filed. If the request for certification is on the Hearing Officer's own motion, the Hearing Officer shall also submit to the Hearing Body the Participants' memoranda that were filed pursuant to subsection (b).

(d) Questions of fact presented by the particular matter in dispute in a hearing shall not be the subject of a certification to the NERC Board of Trustees.

(e) The Hearing Body shall determine, based on the criteria specified in subsection (a), whether the proposed question shall be certified to the NERC Board of Trustees for determination. If the Hearing Body determines that the proposed question should be certified to the NERC Board of Trustees, the Hearing Body shall also determine whether the hearing should be suspended, in whole or in part, while the question is pending before the NERC Board of Trustees for determination.

(f) As provided in NERC Rule of Procedure Section 412, the NERC Board of Trustees may decide to reject a proposed certification from a Hearing Body.

(f) If the NERC Board of Trustees accepts certification of a question and issues a determination on the question, the hearing shall proceed following the determination in accordance with the NERC Board of Trustees' decision.

1.6 Procedure at Evidentiary Hearing ~~Procedure~~

1.6.1 Purpose of Evidentiary Hearings~~s~~

The purpose of the E~~e~~videntiary H~~h~~earing shall be to admit the Participants' evidence into the record, and for each Participant to have the opportunity to cross-examine the other Participant's witnesses. A schedule for briefs, unless waived by the Participants, shall be set at the conclusion of the ~~e~~Evidentiary ~~h~~Hearing. ~~The evidentiary hearing also may be used to address any other issue pending between the Participants.~~

1.6.2 Order of Receiving Evidence

In all proceedings Compliance Staff shall open and close.

1.6.3 Opening and Closing Statements

Opening and closing statements will not be made during the ~~e~~Evidentiary ~~h~~Hearing as a matter of course except that such statements may be allowed when requested by a Participant, and shall be required when requested by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body. Any Participant's request for such statements, or a Hearing Officer or ~~[HEARING BODY]~~Hearing Body notice requiring such statements, shall be made at least ten (10) days in advance of the start of the ~~e~~Evidentiary ~~h~~Hearing.

1.6.4 Right of Participant to Present Evidence

Subject to compliance with the requirements of these Hearing Procedures concerning the timing of submission of written testimony and other evidence, a Participant has the right to present such evidence, to make such objections and arguments, and to conduct such cross-examination as may be necessary to assure the true and full disclosure of the facts.

1.6.5 Exhibits

(a) All material offered in evidence, except oral testimony allowed by the Hearing Officer or the testimony of a non-Participant pursuant to an order to produce or provide Documents, information or testimony, shall be offered in the form of an exhibit.

(b) Each exhibit must be marked for identification. A Participant must provide the court reporter with two (2) copies of every exhibit that the Participant offers into evidence, and will provide copies of any exhibit not served in advance of the ~~e~~Evidentiary ~~h~~Hearing to the Participants and the Hearing Officer.

1.6.6 Witness Attendance at Testimonial~~Evidentiary~~ Hearing

(a) Each witness shall attend the Testimonial~~evidentiary~~ ~~h~~Hearing in person unless a Participant has been informed in advance of the Testimonial~~evidentiary~~ ~~h~~Hearing that all other Participants waive cross-examination of the witness and neither the Hearing Officer nor the members of the ~~[HEARING BODY]~~Hearing Body have any questions for the witness, in which event the witness does need not be present at the ~~evidentiary~~Testimonial ~~h~~Hearing.

(b) A person compelled to appear, voluntarily testifying, or making a statement may be accompanied, represented and advised by an attorney.

(c) All testimony offered at ~~a~~the Testimonial~~evidentiary~~ ~~h~~Hearing is to be under oath or affirmation. If a witness is not required to attend ~~the evidentiary~~a Testimonial ~~h~~Hearing, then the Participant on whose behalf the witness prepared testimony shall submit an affidavit of the witness attesting to the veracity of the witness' testimony, and the Participant shall be allowed to introduce the witness' testimony, and the exhibits, schedules and attachments thereto, into the evidentiary record based on such affidavit.

1.6.7 Admission of Evidence

(a) Compliance Staff shall offer its exhibits into evidence first and the Registered Entity second, unless the Participants agree otherwise.

(b) Except for witnesses who are not required to attend the Testimonial~~evidentiary~~ ~~h~~Hearing, the Participants shall call each witness in turn. Following the witness' swearing in, the witness shall attest to the veracity of his or her written testimony. The witness may identify any language and/or figures in his or her written testimony or exhibits that the witness would like to change or correct. Subject to objection, such changes or corrections may be allowed at the Hearing Officer's discretion for the purpose of obtaining a full, accurate and complete record without imposing undue delay or prejudice on any Participant. The Participant whose witness has made changes or written corrections to written testimony and exhibits shall file corrected copies with the Clerk and provide corrected copies to the Hearing Officer and other Participant.

(c) Once a witness has attested to the veracity of his or her testimony, the Participant on whose behalf the witness is testifying shall move for admission of the witness' testimony, including all exhibits, schedules and attachments thereto, into evidence. Other Participants may object to the introduction of the witness' testimony, or any part thereof, as set forth in ~~Paragraph~~Section 1.6.11. Subject to the Hearing Officer's ruling on the objection, the witness' testimony shall be admitted into evidence.

(d) The witness shall then be turned over for cross-examination by other Participants, and for any questions by the Hearing Officer or any member of the ~~[HEARING BODY]~~Hearing Body, in accordance with Section~~Paragraph~~ 1.6.14, and then for redirect examination in accordance with Section~~Paragraph~~ 1.6.15. Witnesses shall be cross-examined on all previously-served testimony (direct, rebuttal or surrebuttal) when they first take the witness stand.

(e) Except (i) in exceptional cases and upon a showing of good cause, and (ii) witnesses testifying pursuant to an order to produce or provide Documents, information or testimony issued to a non-Participant, no witness shall be allowed to testify ~~during the evidentiary hearing~~ unless a Participant has served the witness' written testimony in advance of the ~~evidentiary~~Testimonial ~~h~~Hearing in accordance with the schedule established by the Hearing Officer. Due to the undue prejudice such surprise witness testimony would impose on other Participants, it is the Compliance Enforcement Authority's policy to discourage witness testimony at a~~n~~ ~~evidentiary~~Testimonial H~~h~~earing when a Participant has not served the witness' written testimony in advance of the Testimonial~~evidentiary~~ H~~h~~earing. If such testimony is allowed, sufficient procedural steps shall be taken by the Hearing Officer to provide the other Participants with a fair opportunity for response and cross-examination.

1.6.8 Evidence that is Part of a Book, Paper or Document

(a) When relevant and material matter offered in evidence is embraced in a book, paper or Document containing other matter that is not material or relevant, the Participant offering the same must plainly designate the matter offered as evidence, and segregate and exclude the material not offered to the extent practicable.

(b) If the material not offered is in such volume as would unnecessarily encumber the record, such book, papers or Document will not be received in evidence but may be marked for identification and, if properly authenticated, the relevant or material matter may be read into the

record, or, if the Hearing Officer so directs, a separate copy of such matter in proper form shall be offered as an exhibit.

(c) All other Participants shall be afforded an opportunity to examine the book, paper or Document and to offer in evidence in like manner other portions thereof if found to be material and relevant.

1.6.9 Stipulations

The Participants may stipulate to any relevant fact or the authenticity of any relevant Document. Stipulations may be made in writing or entered orally in the record. Notwithstanding stipulation, the Hearing Officer may require evidence of the facts stipulated in order to provide a complete evidentiary record on which to base the final order.

1.6.10 Official Notice

(a) Where relevant and material to the subject matter of the proceeding, the Hearing Officer may, upon request of a Participant, take official notice of any of the following:

(1) Rules, regulations, administrative rulings and orders, written policies of governmental bodies, and rulings and orders of other Compliance Enforcement Authorities.

(2) The orders, transcripts, exhibits, pleadings or any other matter contained in the record of other docketed proceedings of the Compliance Enforcement Authority.

(3) State, provincial and federal statutes and municipal and local ordinances.

(4) The decisions of state, provincial and federal courts.

(5) Generally recognized scientific or technical facts within the specialized knowledge of the Compliance Enforcement Authority.

(6) All other matters of which the courts of the United States may take judicial notice.

(b) All requests to take official notice shall be submitted in advance of the ~~e~~Evidentiary ~~h~~Hearing in accordance with a schedule established by the Hearing Officer. Before ruling on a request to take official notice, the Hearing Officer shall afford the other Participant opportunity to object or to show the contrary to the matter for which official notice is requested.

(c) An accurate copy of any item officially noticed shall be introduced into the record in the form of an exhibit presented by the Participant requesting official notice unless waived by the Participants and approved by the Hearing Officer. Any information officially noticed and not presented as an exhibit shall be set forth in a statement on the record.

1.6.11 Admissibility of Evidence

(a) Any evidence offered, including that included in a book, paper or Document pursuant to ~~Paragraph~~Section 1.6.8, shall be subject to appropriate and timely objections. Any Participant objecting to the admission or exclusion of evidence must state the grounds for objection.

(b) The admission of evidence shall not be limited by the generally recognized rules of evidence as applied in the courts of the United States or of the states, although the Hearing Officer may take such rules of evidence into consideration in ruling on the admissibility of evidence. The Hearing Officer will exercise discretion in the admission of evidence based upon arguments advanced by the Participants, and shall admit evidence if it is of a type commonly relied upon by reasonably prudent persons in the conduct of their affairs. The Hearing Officer may only exclude material from the record in response to a motion or objection by a Participant.

(c) Formal exception to a ruling on admissibility of evidence need not be taken to be preserved.

1.6.12 Offer of Proof

Any Participant who has had evidence excluded may make an offer of proof on the record. The offer of proof may consist of a statement made on the record of the substance of the evidence that the Participant claims would have been adduced, or any written or documentary exhibit that the Participant sought to introduce. Any such exhibit shall be retained as part of the record.

1.6.13 Reservation of Evidentiary Ruling

(a) The Hearing Officer shall rule upon any objection to the admissibility of evidence at the time the objection is made; provided that the Hearing Officer has discretion to reserve such a ruling or to require the Participants to file written arguments in relation thereto.

(b) If the Hearing Officer reserves the ruling, appropriate steps shall be taken during the ~~e~~Evidentiary ~~h~~Hearing to ensure a full, complete and accurate record in relation to the objected to evidence in the event the objection to the evidence's admissibility is overruled.

1.6.14 Cross-Examination

(a) Each witness shall be tendered for cross-examination subsequent to the admission of the witness' testimony into the evidentiary record. Each Participant shall have the right to cross-examine each witness of any other Participants. A Participant may waive cross-examination of any witness. Leading questions are permitted on cross-examination.

(b) The credibility of a witness may be attacked by any Participant, including the Participant calling the witness.

(c) The Hearing Officer and any member of the ~~[HEARING BODY]~~Hearing Body may ask the witness questions following the conclusion of the witness' cross-examination by the other Participant, and prior to the witness' redirect examination pursuant to Section~~Paragraph~~ 1.6.15. ~~If a member of the [HEARING BODY] seeks to ask a witness questions, the member shall do so by submitting the question in writing to the Hearing Officer, and the Hearing Officer shall ask the question of the witness.~~

1.6.15 Redirect Examination

A Participant shall be entitled to conduct redirect examination of each of the Participant's witnesses who are subject to cross-examination or questions of the Hearing Officer or a member of the ~~[HEARING BODY]~~Hearing Body. Any redirect examination shall be limited in scope to the witness' cross-examination and questions of the Hearing Officer and members of the ~~[HEARING BODY]~~Hearing Body. ~~If a member of the Hearing Body seeks to ask a witness questions, the member shall do so by submitting the question in written form to the Hearing Officer, and the Hearing Officer shall ask the question of the witness.~~

1.6.16 Examination of Adverse Participant

(a) Any Participant may call any adverse Participant, or any employee or agent thereof, during ~~the evidentiary~~a Testimonial ~~h~~Hearing to provide oral testimony on the Participant's behalf, and may conduct such oral examination as though the witness were under cross-examination.

(b) If a Participant intends to call an adverse Participant for examination, it shall give notice to the Hearing Officer and all other Participants setting forth the grounds for such examination at least fourteen (14) days in advance of the ~~evidentiary~~Testimonial ~~h~~Hearing, and the Participant who, or whose employee or agent, is sought to be called shall file any objection at least seven (7) days in advance of the ~~evidentiary~~Testimonial ~~h~~Hearing.

(c) Any Participant may conduct oral examination of a witness testifying pursuant to an order to produce or provide Documents, information or testimony issued to a non-Participant, as though the witness were under cross-examination.

1.6.17 Close of the Evidentiary Record

(a) The Hearing Officer shall designate the time at which the evidentiary record will be closed, which will typically be at the conclusion of the ~~e~~Evidentiary ~~h~~Hearing.

(b) Evidence may not be added to the evidentiary record after it is closed, provided that, prior to issuance of the Hearing Body's final order, the Hearing Officer may reopen the evidentiary record for good cause shown by any Participant. For the purpose of reopening the evidentiary record, newly discovered evidence that is material to the issues in dispute and could not, by due diligence, have been discovered prior to or during the Evidentiary Hearing, shall constitute good cause.

1.7 Post- Evidentiary Hearing Procedure

1.7.1 Briefs

(a) At the close of the ~~e~~Evidentiary ~~h~~Hearing, Participants may file initial and reply briefs.

(b) Briefs shall be concise, and, if in excess of twenty (20) pages, excluding appendices, shall contain a table of contents. Statements of fact should be supported by record citations.

(c) The Hearing Officer will prescribe the time for filing briefs, giving due regard to the nature of the proceeding, the extent of the record, the number and complexity of the issues, and the objective of expedition.

(d) Unless the Hearing Officer prescribes otherwise, all Participants shall file initial and reply briefs simultaneously.

(e) Participants' reply briefs shall be limited in scope to responding to arguments and issues raised in other Participants' initial briefs.

(f) The Hearing Officer may~~, with the agreement of the Participants,~~ allow oral closing statements to be made on the record in addition to or in lieu of briefs.

(g) The Hearing Officer may establish reasonable word~~page~~ limitations applicable to briefs.

1.7.2 Other Pleadings

Post-hearing pleadings other than briefs are permitted, but, absent good cause shown, such pleadings may not seek to introduce additional evidence into the record.

1.7.3 Draft Initial Opinions

The Hearing Officer may permit or require Participants to file draft initial opinions that set forth the Participants' proposed findings of fact and conclusions.

1.7.4 Hearing Officer's Initial Opinion

(a) ~~Except as otherwise ordered by the [HEARING BODY], a~~At the conclusion of the ~~e~~Evidentiary ~~h~~Hearing, and following the submission of initial and reply briefs and draft orders, if any, the Hearing Officer shall prepare an initial opinion for the ~~[HEARING BODY]~~Hearing Body's review and consideration.

(b) The initial opinion shall include a statement of each finding and conclusion, and the reasons or basis therefore, for all material issues~~ of fact, law or discretion~~ presented on the record. The initial opinion also shall contain the appropriate orders to dispose of the proceeding, including any Penalty, Mitigation Plan or Remedial Action Directive that the Hearing Officer proposes the ~~[HEARING BODY]~~Hearing Body require.~~ If the initial opinion proposes a Penalty, the initial opinion shall include a proposed Notice of Penalty.~~

(c) The initial opinion shall note if the subject of the proceeding has been deemed to involve a Cybersecurity Incident, if any information in the proceeding was deemed to be Critical Energy Infrastructure Information, or if any information in the proceeding is the subject of a protective order pursuant to ~~Paragraph~~Section 1.5.10.

1.7.5 Exceptions

(a) Within twenty-one (21) days after service of the initial opinion, or such other time as is fixed by the Hearing Officer, any Participant may file exceptions to the initial opinion in a brief designated "brief on exceptions" and, within fourteen (14) days after the time for filing briefs on

exceptions or such other time as is set by the Hearing Officer, any Participant may file as a reply, a "brief in reply to exceptions."

(b) Exceptions and replies thereto with respect to statements, findings of fact or conclusions in the initial opinion must be specific and must be stated and numbered separately in the brief. With regard to each exception, the Participant must specify each error asserted, and include a concise discussion of any policy considerations applicable and any other evidence and arguments in support of the Participant's position. Suggested replacement language for all statements to which exception is taken must be provided. Exceptions and arguments may be filed (1) together in one brief; or (2) in two separate documents, one designated as the brief containing arguments, and the other designated "Exceptions," containing the suggested replacement language.

(c) Arguments in briefs on exceptions and replies thereto shall be concise and, if in excess of twenty (20) pages, shall contain a table of contents.

(d) Participants shall not raise arguments in their briefs in reply to exceptions that are not responsive to any argument raised in any other Participant's brief on exceptions.

(e) Statements of fact should be supported by citation to the record.

(f) The Hearing Officer may establish reasonable ~~page~~word limitations applicable to arguments included in briefs on exception and briefs in reply to exceptions. Such ~~page~~word limitations shall not apply to a Participant's proposed replacement language.

(g) Unless good cause is shown, if a Participant does not file a brief on exceptions, or if a Participant filed a brief on exceptions that does not object to a part of the initial opinion, the Participant shall be deemed to have waived any objection to the initial opinion in its entirety, or to the part of the initial opinion to which the Participant did not object, whichever applies. This provision shall not prohibit the Participant, in its brief in reply to exceptions, from responding to another Participant's exceptions to such part of the initial opinion or from proposing alternative replacement language to the replacement language proposed by the other Participant for such part of the initial opinion.

1.7.6 Oral Argument

(a) The ~~[HEARING BODY]~~Hearing Body may elect to hear oral argument. If oral argument is held without briefs having been filed, Participants will be given the opportunity to present argument on all issues.

(b) If oral argument is held where briefs have been filed, argument may be limited to issues identified by the ~~[HEARING BODY]~~Hearing Body. The ~~[HEARING BODY]~~Hearing Body will direct the Clerk to issue a notice of oral argument that identifies the date, time, place and issues for the argument.

(c) The presentation of written materials or visual aids is permitted at oral argument. To the extent such materials or aids contain factual information, they shall be supported by the record, and ~~shall~~ contain accurate ~~record~~ citations to the record. Such materials or aids may not contain new calculations or quantitative analyses not presented in the record, unless they are based on

underlying data contained in the record. Copies of all written materials or visual aids to be presented at oral argument shall be served on all Participants not less than forty-eight (48) hours prior to the time and date of oral argument.

1.7.7 Additional Hearings

After the evidentiary record has been closed but before issuance of the Hearing Body's final order~~an initial opinion~~, the Hearing Officer may reopen the evidentiary record and hold additional hearings. Such action may be taken on the Hearing Officer's or the ~~[HEARING BODY]~~Hearing Body's own motion if there is reason to believe that reopening is warranted by any changes in conditions, or by the need to compile a complete evidentiary record on which to base the final order. Any Participant may file a motion to reopen the record, which shall contain the reasons for reopening, including material changes in conditions or the identification of additional evidence that should be included in the record, and a brief statement of proposed additional evidence and an explanation why such evidence was not previously adduced.

1.7.8 ~~[HEARING BODY]~~Hearing Body Final Order

(a) Following the receipt of the initial opinion, any exceptions and replies thereto, and oral argument, if any, the ~~[HEARING BODY]~~Hearing Body shall issue its final order.

(b) Issuance of a final order shall require (i) a quorum of the ~~[HEARING BODY]~~Hearing Body, which shall be (after any recusals, disqualifications and appointments of replacement members) at least fifty (50) percent of the number of members normally assigned to the ~~[HEARING BODY]~~Hearing Body, and (ii) majority vote of the members of the ~~[HEARING BODY]~~Hearing Body voting on the final order (which number of members voting shall not be less than a quorum).

(c) The ~~[HEARING BODY]~~Hearing Body shall strive, but shall not be required, to issue its final order within thirty (30) days following the last to occur of the initial opinion, exceptions or replies thereto, or oral argument. The final order may adopt, modify, amend or reject the initial opinion in its entirety or in part. The final order shall include a statement of each finding and conclusion, and the reasons or basis therefore, for all material issues ~~of fact, law or discretion~~ presented on the record.

(d) The ~~[HEARING BODY]~~ Hearing Body will base its determinations in the final order on the record. The final order also shall contain the appropriate orders to dispose of the proceeding, including any Penalty, ~~sanction,~~ Remedial Action Directive or Mitigation Plan required. ~~If the final order imposes a Penalty, it shall be entitled "Final Order and Notice of Penalty".~~

(e) The final order shall note if the subject of the proceeding has been deemed to involve a Cybersecurity Incident, if any information in the proceeding was deemed to be Critical Energy Infrastructure Information, or if any information in the proceeding is the subject of a protective order issued pursuant to ~~Paragraph~~Section 1.5.10.

(f) ~~The [HEARING BODY] shall direct the Clerk to serve the final order on the Participants.~~ The service of the final order shall include a notice informing the Participants of their appeal rights to the ERO or to FERC, as applicable.

1.7.9 The Record

The Clerk shall maintain the record for all dockets. The record shall include any of the following, including all attachments thereto and ~~d~~Documents filed therewith, that exist in any docket:

(1) Notice of Alleged Violation and Registered Entity's response thereto;

(2) Registered Entity's proposed Mitigation Plan and Staff's statement identifying its disagreement(s) therewith;

(3) Remedial Action Directives and the Registered Entity's notice contesting the Remedial Action Directive;

(4) Registered Entity's request for a hearing;

(5) Participant filings, motions, and responses;

(6) Notices, rulings, orders and other issuances of the Hearing Officer and ~~[HEARING BODY]~~Hearing Body;

(7) Transcripts;

(8) Evidence received;

(9) Written comments submitted in lieu of written testimony;

(10) Matters officially noticed;

(11) Offers of proof, objections and rulings thereon, and any written or documentary evidence excluded from the evidentiary record;

(12) ~~Briefs, p~~Pre-~~e~~Evidentiary ~~h~~Hearing memorandums, briefs, and draft opinions;

(13) Post-hearing pleadings other than briefs;

(14) The Hearing Officer's initial opinion;

(15) Exceptions to the Hearing Officer's initial opinion, and any replies thereto;

(16) The ~~[HEARING BODY]~~Hearing Body's final order~~, any Notice of Penalty issued therewith,~~ and the Clerk's notice transmitting the final order to the Participants;

(17) All notices of ex parte communications; and

(18) Any notifications of recusal and motions for disqualification of a member of the ~~[HEARING BODY]~~Hearing Body or Hearing Officer of Technical Advisor and any responses or replies thereto.

1.7.10 Appeal

A Participant, or a Regional Entity acting as the Compliance Enforcement Authority, may appeal a ~~F~~final ~~O~~order of the ~~[HEARING BODY]~~Hearing Body ~~may be appealed~~ to NERC in accordance with NERC's Rules of Procedure, Section 409. ~~The Clerk shall transmit to NERC the record of any docket that is the subject of an appealed final order.~~

1.8 Settlement

Settlements may be entered into at any time pursuant to Section 5.6 of the NERC Compliance Monitoring and Enforcement Program and the Compliance Enforcement Authority's settlement procedures, provided, that the Compliance Enforcement Authority (i) may decline to engage in or continue settlement negotiations after a Possible Violation or Alleged Violation becomes a Confirmed Violation, and (ii) may terminate settlement negotiations at any time.

1.9 Remedial Action Directives

1.9.1 Initiation of Remedial Action Directive Hearing

(a) Staff~~]~~ may issue a Remedial Action Directive to a Registered Entity at any time, including during any proceeding related to an Alleged Violation of a Reliability Standard. The Remedial Action Directive shall be delivered to the Registered Entity in accordance with Section 7.0 of the NERC Compliance Monitoring and Enforcement Program. The Compliance Enforcement Authority will notify NERC within two (2) business days after its Staff issues a Remedial Action Directive.

(b) The Registered Entity may contest the Remedial Action Directive by filing a written notice with the Clerk of the Compliance Enforcement Authority that states that the Registered Entity contests the Remedial Action Directive and that the Registered Entity requests a Remedial Action Directive hearing. The Registered Entity shall attach a copy of the Remedial Action Directive to its written notice. The Registered Entity must provide such notice within two (2) business days following the date of actual receipt (as defined in Section 7.0 of the NERC Compliance Monitoring and Enforcement Program) of the Remedial Action Directive. If the Registered Entity does not give written notice to the Compliance Enforcement Authority within the required time period, the Registered Entity shall be deemed to have waived its right to contest the Remedial Action Directive.

(c) The Clerk shall assign a docket number, and issue a notice of hearing that sets forth the date, time and place at which the hearing will convene ~~pursuant to Paragraph 1.4.1~~.

1.9.2 Remedial Action Directive Hearing Procedure

(a) Hearings to address Remedial Action Directives shall be conducted only under the expedited hearing process set forth in this Section~~Paragraph~~ 1.9.2. The ~~full~~general hearing procedures described in Sections 1.4 to 1.7 are applicable to the Remedial Action Directive hearing unless the context of a provision is inconsistent with or otherwise renders it inapplicable to the procedures set forth in this Section~~Paragraph~~.

(b) The Remedial Action Directive hearing ~~may~~shall be presided over by a Hearing Officer and will be conducted according to the following guidelines:

~~a)~~(1) The Hearing Officer ~~or the [HEARING BODY]~~ will hold a prehearing conference within two (2) business days after receipt of the Registered Entity's request for a hearing.

~~a)~~(2) A~~n evidentiary~~Testimonial ~~h~~Hearing will be conducted on the matter, in person or by teleconference, within seven (7) business days after the prehearing conference.

~~b)~~(3) At the ~~evidentiary~~Testimonial ~~h~~Hearing, Staff shall present oral witness testimony and evidence to show why the Remedial Action Directive should be complied with, and the Registered Entity shall present oral witness testimony and evidence to show why the Remedial Action Directive is not necessary or should be modified. All witness testimony shall be rendered under oath.

~~c)~~(4) At the ~~evidentiary~~Testimonial ~~h~~Hearing, the Participants shall have the opportunity to make opening statements. In addition, the Participants shall have the opportunity to make closing arguments, and Staff shall have the opportunity to make a rebuttal to the Registered Entity's closing argument.

~~d)~~(5) The Participants may file initial briefs and reply briefs, and/or draft opinions, on an expedited schedule set by the Hearing Officer ~~or the [HEARING BODY]~~. Oral argument shall not be held.

~~e)~~(c) The ~~[HEARING BODY]~~Hearing Body shall issue a summary written decision within ten (10) days following submission of the last brief~~the hearing~~, stating whether the Registered Entity shall or shall not be required to comply with the Remedial Action Directive and identifying any modifications to the Remedial Action Directive that ~~it~~the Hearing Body finds appropriate. Upon issuance of the summary written decision, the Registered Entity is required to comply with the Remedial Action Directive as specified in the summary written decision.

(d) Within thirty (30) days following issuance of its summary written decision, the ~~[HEARING BODY]~~Hearing Body shall issue a full written decision. The written decision shall state the conclusions of the ~~[HEARING BODY]~~Hearing Body with respect to the Remedial Action Directive, and shall explain the reasons for the ~~[HEARING BODY]~~Hearing Body's conclusions.

NERC

Section I — Executive Summary

Overview

The purpose of this document is twofold: (1) to define the process utilized in the Organization Registration Program by identifying which functional entities must register as owners, operators, and users of the bulk power system (BPS) for compliance with reliability standards; and (2) to define the process utilized in the Organization Certification Program for certifying the following entities: Reliability Coordinator (RC), Balancing Authority (BA), and Transmission Operator (TOP). The NERC Compliance and Certification Committee (CCC) is responsible for approving and forwarding these processes to the NERC Board of Trustees for its approval. Where a proposal for revisions to these processes comes to the Board of Trustees from sources other than the CCC, the Board of Trustees will seek the concurrence of the CCC before taking action on the proposal.

To Whom Does This Document Apply?

All industry participants responsible for or intending to be responsible for, the following functions must register with NERC through the Organization Registration Process. The entities are defined in the NERC Glossary of Terms used in reliability standards with responsibilities designated by the individual standards.

	Entities that Must Register	Entities that Need to be Certified
Reliability Coordinator (RC)	√	√
Transmission Operator (TOP)	√	√
Balancing Authority (BA)	√	√
Planning Coordinator (PC)	√	
Transmission Planner (TP)	√	
Transmission Service Provider (TSP)	√	
Transmission Owner (TO)	√	
Resource Planner (RP)	√	
Distribution Provider (DP)	√	
Generator Owner (GO)	√	
Generator Operator (GOP)	√	
Load-Serving Entity (LSE)	√	
Purchasing-Selling Entity (PSE)	√	
Interchange Authority (IA)	√	
Reserve Sharing Group (RSG)	√	

When did These Processes Begin?

The initial registration process began in January of 2006. Registration of new entities is an ongoing process. If a Registered Entity's information changes, these changes must be submitted to the applicable Regional Entity(s).

Certification is ongoing for new entities in accordance with Section IV of this manual.

Where to Access and Submit Form(s)?

Registration and certification forms are provided on each Regional Entity's ~~website~~website. Completed forms are to be sent electronically to the ~~compliance and certification manager~~website location and/or individual(s) responsible for registration and/or certification of the applicable Regional Entit~~y~~(ies). It is desirable that entities operate within a single Regional Entity ~~reliability~~ region; however, if an entity operates in more than one Region, separate registration applications must completed and submitted to each of the Regional Entities.

Roles and Responsibilities

The following is a high-level overview of the roles and responsibilities in the registration and certification processes:

NERC

1. Oversight of entity processes performed by the Regional Entities, including:
   a. Governance per the Regional Entity's delegation agreement with NERC.
   b. Coordination of process execution when an entity is registering and/or certifying with multiple Regional Entities.
2. Manage each entity's NERC Compliance Registry identification number (NERC ID) including:
   a. Sending a registration or certification letter that contains the NERC ID to the applicable Regional Entity(ies) for review and approval. If the Regional Entit~~y~~(ies) agrees with all the information provided, it will notify NERC to issue the NERC ID to the ~~r~~Registered ~~e~~Entity and will send a copy of the notification being provided to the Regional Entit~~y~~(ies).
   b. Ensuring each entity has only one NERC ID for all Regional Entit(ies) in which registered.
3. Make modeling changes based on registration information.
4. Maintain accurate registration and certification records including granting certification certificates for the entity(ies) responsible for compliance (including JRO/CFR).
5. Maintain published up-to-date list of ~~r~~Registered ~~e~~Entities (i.e. the NERC Compliance Registry) on the NERC website.

Regional Entity

Registration

1. Performs data collection and mapping of ~~Bulk Power System~~BPS facilities and those facilities that have a material impact on the BPS~~Bulk Power System~~ within its Regional Entity defined reliability region boundaries.
2. ~~Approves or disapproves~~Reviews entity registration applications.

~~1.Reviews entity certification applications for completeness.~~

~~1.~~3.Notifies NERC of entities that should be registered ~~with the Regional Entity~~.

~~4. Approves or denies Certification Team (CT) recommendations and notifies the entity and NERC of the decision.~~

~~4. Provides leadership to the CT throughout the certification process.~~Notifies NERC of functional changes to registered entities in the Regional Entity's boundaries.

Certification

1. Reviews entity certification applications for completeness.
2. Approves or denies Certification Team (CT) recommendations and notifies the entity and NERC of the decision.
3. Provides leadership to the CT throughout the certification process.

Entity Submitting the Application

1. Completes and submits registration and/or certification application.
2. Submits updates to registration and/or certification information as necessary and/or requested.
3. Responds to Regional Entity and/or NERC questions pertaining to registration and/or certification.
4. Provides documentation or other evidence requested or required to verify compliance with certification requirements.

Section II — Introduction to Organization Registration and Organization Certification Processes

The processes utilized to implement the Organization Registration and Organization Certification Programs are administered by each Regional Entity. Pursuant to its delegation agreement with NERC, each Regional Entity is responsible for (i) identifying entities that should be registered~~ing~~ and (ii) certifying industry participants, within its Regional Entity reliability region boundaries. Each Regional Entity must use the following NERC processes.

Organization Registration — Entities Required to Register

All industry participants responsible for one or more of the functions below must register for each function through the Organization Registration Program. These entities are defined in the NERC Glossary of Terms used in reliability standards with responsibilities designated by the individual standards and the NERC *Statement of Compliance Registry Criteria* document.

- Reliability Coordinator
- Transmission Operator
- Balancing Authority
- Planning Coordinator
- Transmission Planner
- Transmission Service Provider
- Transmission Owner
- Resource Planner
- Distribution Provider
- Generator Owner
- Generator Operator
- Load-Serving Entity
- Purchasing-Selling Entity
- Interchange Authority
- Reserve Sharing Group

The registration procedure is in Section III of this manual.

Organization Certification

All entities registered in the NERC Compliance Registry (NCR) for the RC, ~~TOP~~BA, and/or ~~BA~~TOP functions, and entities that perform some or all of the reliability functions for or with the RC, BA or TOP, shall be certified. Certification requires the entity to start operation within 12 months of being NERC certified. This certification process is described in Section IV of this manual.

Section III — Organization Registration Process

Purpose and Scope

The purpose and scope of this process is to provide guidance on how a user, owner, and/or operator of the BPS~~bulk power system~~ should be registered in the NCR.

Overview

Section 39.2 of the Commission's regulations, and Title 18 of the C.F.R. § 39.2, require~~s~~ each ~~owner, operator, and user~~user, owner and operator of the BPS~~bulk power system~~ to be registered with NERC and to comply with approved reliability standards.

~~Owners, operators, and users~~Users, owners and operators of the BPS~~bulk power system~~ will be registered by function(s) and are:

1. Responsible for compliance with all applicable requirements/sub-requirements within reliability standards approved by applicable government authorities, for the applicable functions for which the applicable entity is registered; and,
2. Subject to the compliance monitoring and enforcement requirements of Section 400 of the Rules of Procedure.

See Figure 1 *Organization Registration Process Overview.*

Organization Registration Process

1. Applicable entities shall begin the registration process by submitting a completed registration application~~-~~ to the Regional Entit~~y~~(ies) ~~of the reliability region(s)~~ where the entity intends to perform its function(s) (registration forms are provided on each Regional Entity's ~~website~~website).
    a. At any time an entity may recommend in writing, with supporting documentation, to the Regional Entit~~y~~(ies) that an entity be added to or removed from the compliance registry.
    b. The registration process for an entity may also be initiated by a Regional Entity, NERC, or applicable governmental authority.
2. NERC shall coordinate registration of entities that are required to register with multiple Regional Entities in order to ensure consistency of the registration process.
3. For entities that are required to be certified, the applicable Regional Entit~~y~~(ies) shall ensure that the registration information provided is accurate for updating the NCR per~~-~~ items 4 through 12 below and notifies the entity to initiate the certification process per Section IV of this manual.
4. Entities that have a NERC ID shall use it on the form**.**
    a. If an entity does not have a NERC ID, NERC shall assign one.
    b. An entity responsible for more than one function will use a single NERC ID.

5. Regional Entities shall evaluate the submitted information and determine if the information is complete and ~~/~~correct. If the information is not complete and ~~/~~correct, the entity will be notified to ~~complete/~~correct ~~or~~ or clarify the registration information.

6. A single entity must register for all functions that it performs itself. In addition, that entity may register as a Joint Registration Organization (JRO) on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for all requirements/sub-requirements of reliability standards applicable to that function or those functions including reporting requirements ~~.~~(Rules of Procedure Section 507).

7. Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more reliability standard(s) and/or for one or more requirements/sub-requirements within particular reliability standard(s) applicable to a specific function ~~.~~(Rules of Procedure Section 508).

8. In completing the regional entity responsibilities for the registration process, the following are key items the Regional Entity must verify:

   a. That Regional Entity registrations meet the geographical and electrical registration boundaries requirements of the Rules of Procedure Section 501(1.4).

   b. The registration submission includes all data requested by NERC that is necessary for accurately identifying and contacting the registered entity.

9. The Regional Entity shall forward all registration information to NERC:

   a. NERC forwards the proposed additions or changes to the NCR to the Regional Entity for review and comments.

   b. The Regional Entity has five (5) working days to respond to the proposed changes.

   c. If NERC does not receive any comments, the NCR will be revised.

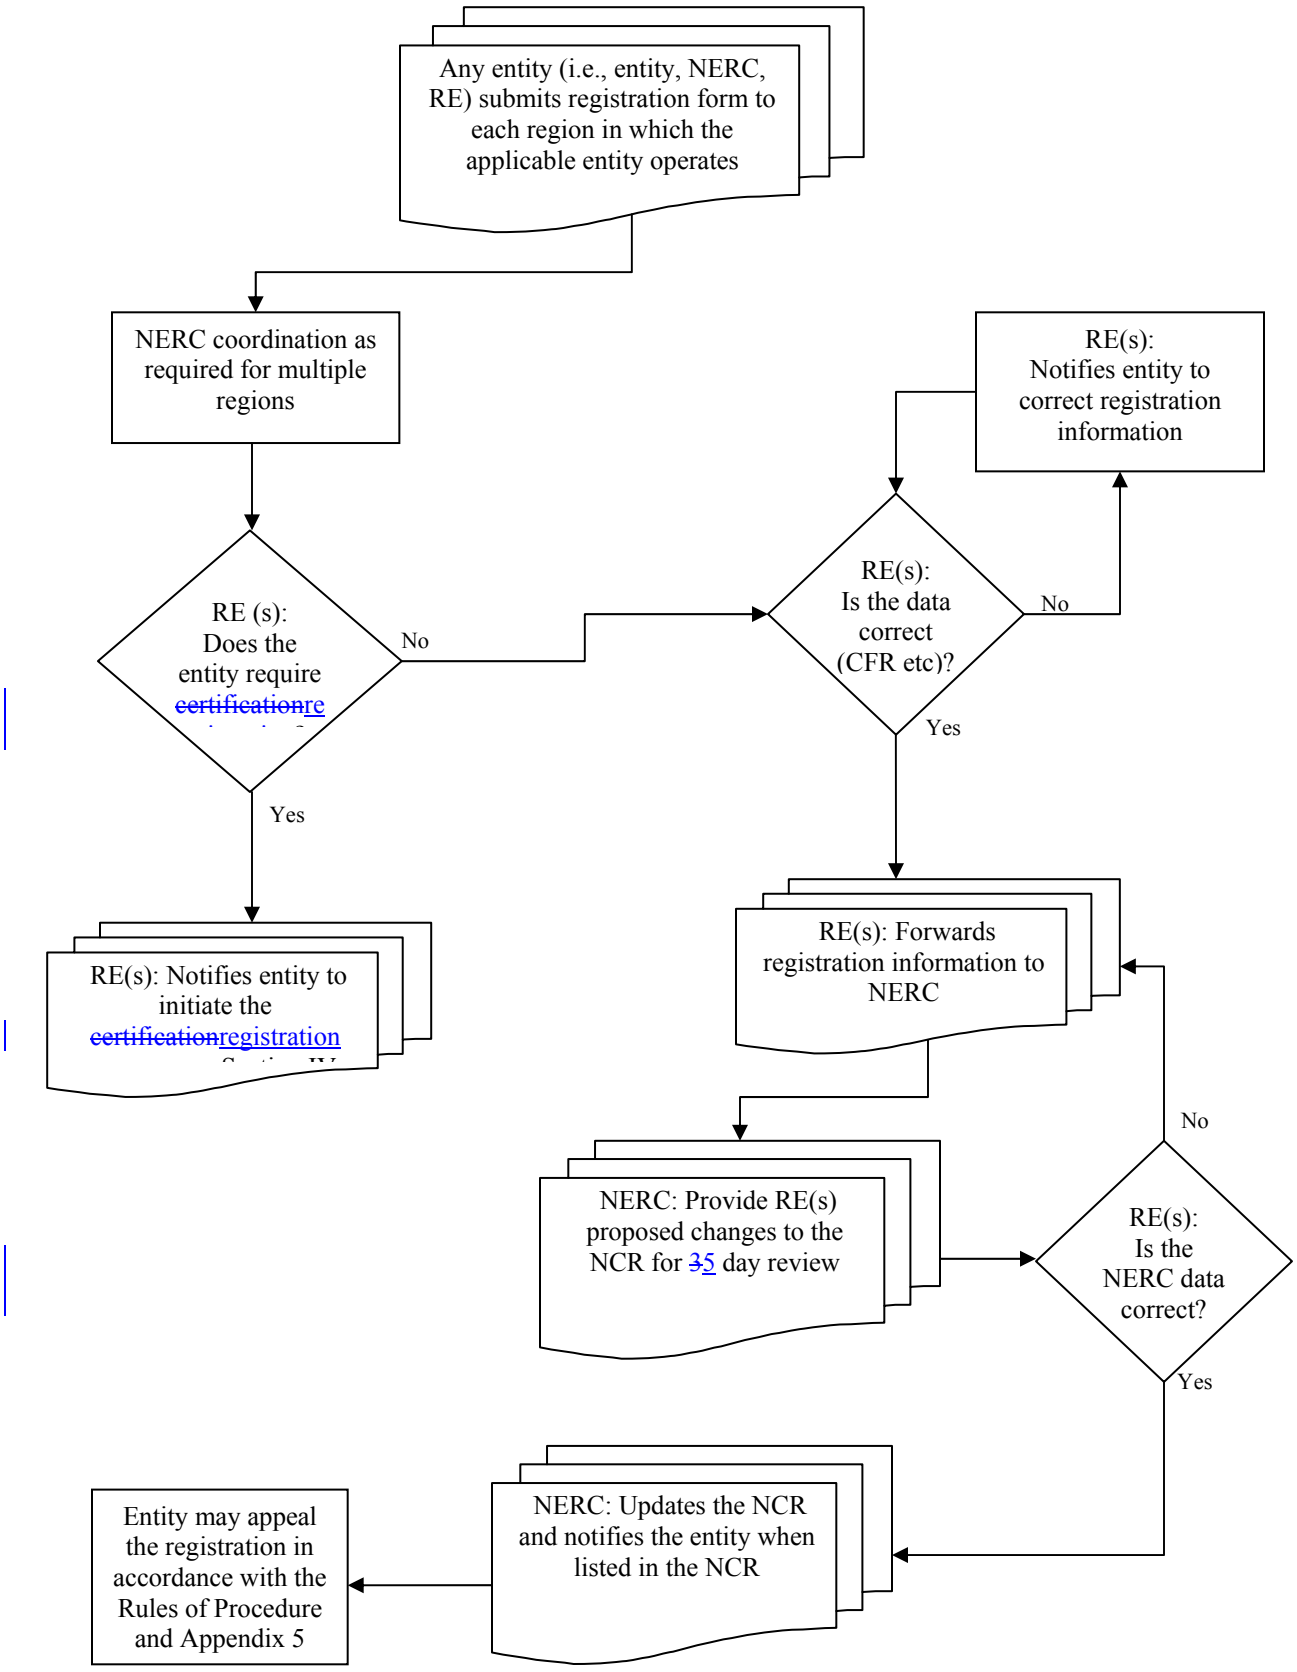
10. NERC updates the NCR and notifies the applicable entity(ies) within 5 days of the update.

11. The entity may appeal the registration in accordance with the Rules of Procedure Section 500 and Section V of Appendix 5A.

12. The NCR shall be dynamic and will be revised as necessary to take account of changing circumstances such as corrections, revisions, and or deletions. Per the Regional Entity's delegation agreement, the Regional Entity will take any recommendation received under Section 1.a, and other applicable information, under advisement as it determines whether an entity should be ~~on the NCR~~registered, and, if so, advises NERC.

    a. Each entity identified in the NCR shall notify its corresponding Regional Entity and/or NERC of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the entity's responsibilities with respect to the reliability standards. Failure to notify will not relieve the entity from any responsibility to comply with the reliability standards or shield it from any penalties or sanctions associated with failing to comply with the standards. (Rules of Procedure Section 400).

Figure 1: Organization Registration Process Overview



Section IV — Organization Certification Process

Purpose and Scope

The purpose and scope of this process is to provide guidance for completing the certification of a new entity that will become NERC certified and registered as an RC, ~~TOP, or BA~~BA or TOP or those entities that perform some or all of the reliability functions of an RC, BA or TOP.

Overview

See Figure 2 *Organization Certification Process Overview* for an overview of the certification process.

Organization Certification Process

1. Certification:
    a. An entity in a single ~~Regional Entity reliability~~ region shall initiate the certification process by completing a certification application (certification applications are provided on each Regional Entity's ~~website~~website) and sending it to the Regional Entity which will manage the certification process.
    b. An entity in multiple ~~Regional Entity reliability~~ regions shall initiate the certification process by completing a certification application (certification applications are provided on each Regional Entity's ~~website~~website) and sending it to the Regional Entities in those ~~reliability~~ regions. Each Regional Entity will inform NERC of the request. The Regional Entities will determine which Regional Entity will provide the leadership to manage the certification process.
    c. ~~Provisional Certification Process - All Reliability Coordinator Balancing Authorities, and/or Transmission Operators that were already registered and operating on June 18,2007 become "NERC Certified" upon completion of (1) a NERC Readiness Evaluation (on site activities completed by the evaluation team); and (2) a CMEP audit (on site activities completed by the audit team) after June 18, 2007. Recertification on a periodic basis of these entities will not be required. Demonstration of ongoing satisfactory performance of applicable RC, BA, and TOP functional requirements shall be accomplished by completion of a CMEP audit every three years per the requirements of the NERC Rules of Procedure~~.

~~2.~~

2. For an entity that is not required to be certified, the Regional Entit~~y~~(ies) shall reject the application and notify the entity that certification is not required.
3. If the application is not complete or accurate, the Regional Entity will notify the entity to revise the application as needed. When the application is deemed complete and accurate, it will be accepted. The entity, ~~and~~ the Regional Entity and NERC shall agree to a timeline including specific milestones for the certification process.
4. The decision to certify changes to an already operating and certified entity is a collaborative decision between NERC and the affected Regional Entit~~y~~(~~s~~ies) ~~and NERC~~. NERC has the

final authority regarding this decision. Items to consider for this decision include one or more of the following:

a. Changes to an entity's footprint or operational challenges (i.e., TLRs) due to the changes

b. Organizational restructuring that could impact the BPS reliability

c. Relocation of the control center(s)

d. Changes to entity ownership requiring major operating procedure changes

e. Significant changes to JRO / CFR assignments or agreements changes

f. Addition or removal of member JRO / CFR utilities or entities

g. Complete replacement of a SCADA/EMS system

5. The certification process shall be completed within nine months of the date of acceptance of the application unless agreed to by all parties involved in the process and approved by NERC.

6. The Regional Entit ~~y~~(ies) shall notify NERC that the certification process has begun to enable NERC to carry out its roles and responsibilities.

7. The Regional Entity will send a questionnaire with a submission deadline and a statement of expectations to all entities participating in the certification process. These questionnaires and other related documents are located on the ~~NERC Web site~~NERC website. The Regional Entity shall distribute questionnaires and other related documents to the following entities, as required:

   a. Entity seeking certification.

   b. Participating ~~BAs~~RCs, ~~RCs~~BAs, and TOPs in footprints in which the entity intends to operate or with which the entity intends to interconnect transmission facilities.

   c. Participating TOs, TSPs, PAs, GOs, IAs, GOPs, TPs, DPs, and/or other applicable entities.

8. The Regional Entity shall assemble a Certification Team (CT) that will be responsible for performing the activities included in the certification process.

   a. The CT members shall adhere to NERC's confidentiality agreements for any data or information made available to the CT member through the certification process. Team members shall not be employees of or have a direct financial interest in the entity or any of its affiliates.

   b. The Regional Entity, with concurrence of NERC, may increase or decrease the distribution of the questionnaires and other related documents based upon the complexity of the certification.

   c. If the entity objects to any member of the CT, the entity must make that known, in writing, to the ~~Regional Entity~~Certification Team Lead listing the reasons for the objection. The Regional Entity will either replace the team member or respond with written justification for keeping the member on the team.

   d. CT composition

      i. The BA CT shall consist of representatives from an existing BA, the entity's proposed RC, TOP, each affected Regional Entity, and NERC.

ii. The RC CT shall consist of representatives from an existing RC, a BA and a TOP in the proposed RC area, each affected Regional Entity, and NERC.

iii. The TOP CT shall consist of representatives from an existing TOP, the entity's proposed RC, each affected Regional Entity, and NERC.

iv. Additional CT members with expertise in the any of the NERC registry functional areas can be added as necessary.

v. Additional CT members from NERC or Regional Entity staff may be added as necessary.

vi. Entities such as government representatives or other stakeholders may be observers in the certification process.

e. CT composition – Existing certified entity seeking to expand footprint

i. Where an existing certified, operating entity seeks to expand the footprint in which it operates and seeks certification for the expanded footprint, the CT shall consist, at a minimum, of representatives from NERC and from the Regional Entity or Regional Entities in which the proposed expanded footprint area lies.

ii. The CT may also include one or more representatives of an existing BA, RC and/or TOP.

~~i.~~iii. NERC and the Regional Entity or Regional Entities will consult with the entity seeking certification for an expanded footprint and reach consensus on composition of the CT.

9. Each CT member must complete the NERC auditor training prior to participation.

10. The CT will review the entity's submitted documentation and address any issues prior to the site visit.

11. The CT shall inform the entity before the on-site visit of any documentation or clarification that is necessary to support the questionnaires.

12. The entity shall identify to the CT prior to the on-site visit all standards or requirements/sub-requirements which have been delegated to another entity.

a. The CT will review the entity~~(ies)~~'s ability to perform those delegated requirements/sub-requirements or standards.

13. The CT shall conduct at least one on-site visit to the entity's facilities (unless only a minor change in the footprint of an existing certified entity is under review, in which case the CT may determine that an on-site visit is not necessary). At a minimum, the team will:

a. Review with the entity the data collected through the questionnaires, and such data that is available only onsite;

b. Interview the operations and management personnel;

c. Inspect the facilities and equipment associated with the applicable reliability standards referenced in the questionnaire;

d. Request demonstration of all tools identified in the certification process;

e. Review documents and data including agreements, processes, and procedures identified in the certification process;

f. Verify operating personnel NERC certification documents and proposed work schedules; and,

g. Review any additional documentation resulting from inquiries arising during the site-visit.

14. The entity, in conjunction with the CT, shall attempt to resolve any deficiencies prior to issuance of the draft report.

15. The draft report is provided to the entity for review for fourteen (14) days and any resulting comments will be assessed by the CT for possible inclusion in the report.

16. The Regional Entit~~y~~(ies) may grant a time extension, not to exceed 180 days, to the entity to allow the entity to resolve any open certification issues.

17. The CT shall provide a certification recommendation and identification of audit deficiencies in the final written report. All members of the CT shall have an equal voice in the certification recommendation. This allows for a minority opinion if the review team cannot reach a consensus. The final written certification report is distributed to NERC, the entity, and the other affected Regional Entities, as applicable.

18. The following is the format for the final report:

- Title ~~page~~Page
- Table of Contents
- Introduction – A brief discussion on the Regional Entit~~y~~(ies) involved, the entity being certified, a description of the function the entity(ies) are being certified for, and a brief timeline of the certification project
- Certification Team (CT) – Provide the team makeup.
- Objective and Scope – Discussion on entity application (who, what, when, & how).
- Overall Conclusion – Recommendation being made by the CT.
- Certification Team Findings – Any item(s) needing to be closed prior to operation that do not hinder the certification team from making a recommendation.
- Positive Observations.
- Company History – Discussion on the applicant's company history.
- Company Details– Specific details regarding why the entity is being certified and its relationship with other entities (BAs, RCs, and TOPs etc).
- Documentation List – Provide a list of critical documentation reviewed by the CT used to make the CT's conclusion and the documentation retention requirements.
- Attachments – Describe those attachments that are for public viewing and those that are separated from the report due to confidentiality issues such as Critical Infrastructure documentation.

19. Certification recommendation and approval.

a. If the entity intends to operate in a single Regional Entity's reliability region, the CT shall make a certification recommendation to that Regional Entity. The Regional Entity shall approve or disapprove the recommendation. The Regional Entity shall notify the entity and NERC of the certification decision.

b. If the entity intends to operate in multiple Regional Entities, the CT shall make a certification recommendation to all applicable Regional Entities in a single report. Certification recommendation by the Regional Entities must be unanimous. The Regional Entities shall notify the entity and NERC of the certification decision.

c. NERC shall approve or disapprove all final certification recommendations and notify the entity of the decision.

20. The entity may appeal the decision in accordance with the NERC Rules of Procedure and Section VI of this manual.

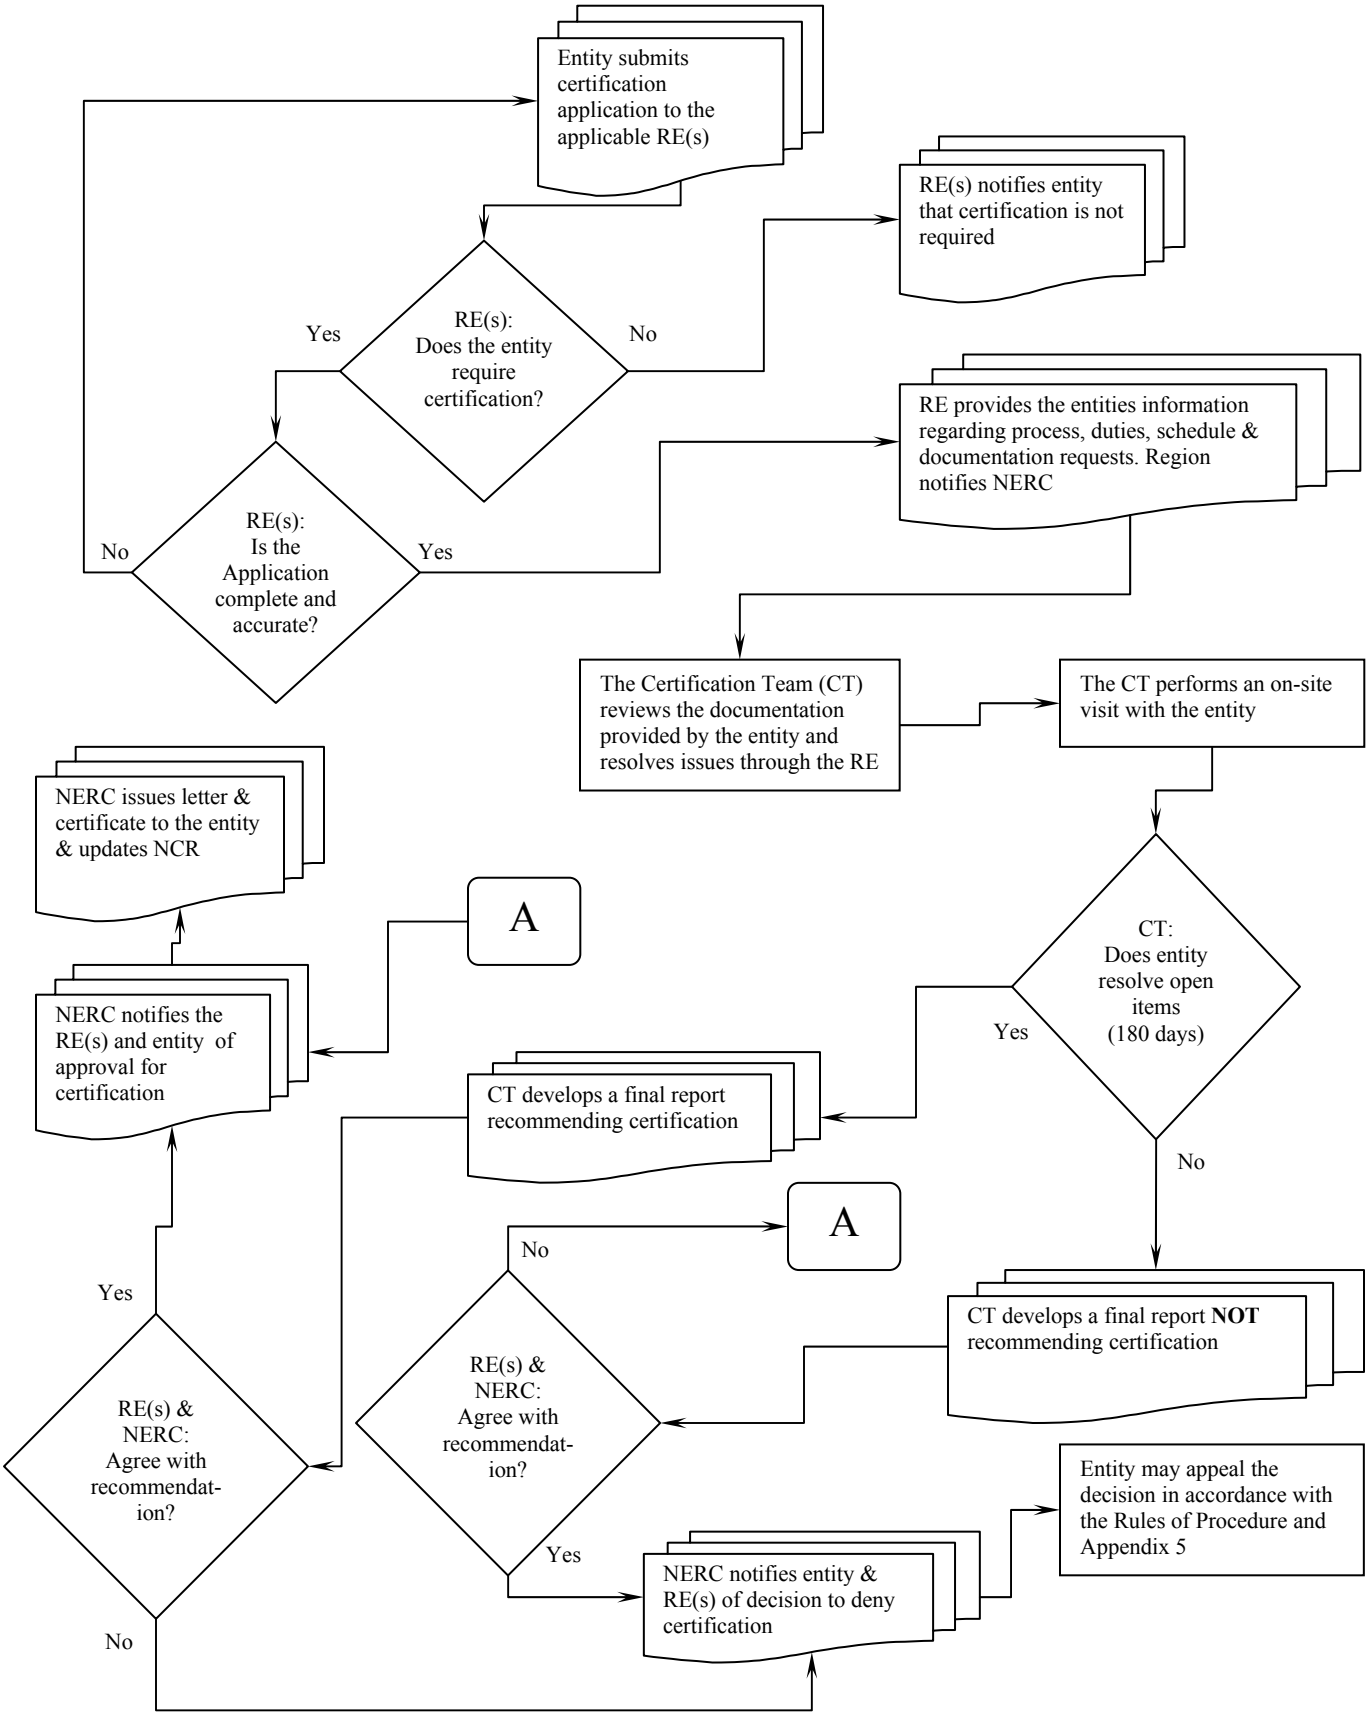
21. If the entity is approved for certification, NERC shall provide the entity a certification letter and a NERC certificate indicating that that entity is NERC certified as a BA, RC, and/or TOP as applicable.

    a. For those CFR entities that agree upon a division of compliance responsibilities for one or more reliability standards or requirements/sub-requirements, NERC shall provide all entities responsible for BA, RC and/or TOP requirements/sub-requirements and approved for certification as BA, RC and/or TOP a NERC certificate indicating that those entities are NERC certified as a BA, RC, and/or TOP.

    b. NERC shall update the registry ~~prior to the entity(s) going operational~~in accordance with the registration rules.

22. After the entity has been awarded certification, ~~the Regional Entity(ies)~~ NERC shall notify all applicable entities as to the date that the entity may begin its operation as a certified entity. The entity must commence operation within 12 months of certification. Failure to begin operation within the 12-month period shall require the entity to reapply for certification.

Figure 2: Organization Certification Process Overview



Section V — NERC Organization Registration Appeals Process

Purpose and Scope

This section describes the process that any organization may appeal its listing and functional assignment on the NCR.

Overview

NERC has established documented procedures to ensure a fair and impartial appeals process. No one with a direct interest in a dispute may participate in the appeals process except as a party or witness. See Figure 3, *Organization Registration Appeals Process Overview*.

Organization Registration Appeals Procedure

Any entity included on the NCR may challenge its listing and functional assignments with NERC.

1. All registration appeals must be filed in writing to NERC, via registered mail. Appeals are sent to:

   ~~Vice President and~~ Director of Compliance Operations
   North American Electric Reliability Corporation
   ~~116-390 Village Blvd.~~ 3353 Peachtree Rd NE
   Suite 600, North Tower
   ~~Princeton, New Jersey, 08540~~Atlanta, GA 30326

2. Each party in the appeals process shall pay its own expenses for each step in the process.

3. A stipulation of invoking the appeals process is that the Regional Entity or entity requesting the appeal agrees that NERC (its members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the appeals process, and any company employing a person assisting in the appeals process, shall not be liable for, and shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

4. Parties retain the right to seek further review of a decision in whatever regulatory agency or court that may have jurisdiction.

5. All appeals must be received within 21 days of receipt of the NERC letter informing the entity that it is listed on the NCR. The appeal must state why the entity believes it should not be registered based on the NERC Rules of Procedure and the *NERC Statement of Compliance Registry Criteria.*

6. After receipt of the appeal, the ~~r~~Registered ~~e~~Entity has a 30 day period to work with the Regional Entity to resolve the appeal, if possible. If the appeal is resolved, the Regional Entity will notify NERC with the details of the resolution and NERC will close the appeal.

7. At any time through this appeals process, an entity may agree with the decision and/or agree to close the appeal. NERC shall notify the involved parties and the NERC Board of Trustees Compliance Committee (BOTCC) that the appeal is resolved and update the NCR as applicable.

8. NERC will notify the entity and the applicable Regional Entit~~y~~(ies) regarding the appeal with the following expectations:

    a. The entity will provide NERC and the applicable Regional Entit~~y~~(ies) any additional data supporting its appeal within 10 days of the date of the NERC appeal notification.

    b. The applicable Regional Entit~~y~~(ies) will provide a copy of its assessment directly to the entity, as well as to NERC, within 20 days of the date of the NERC appeal notification.

    c. The entity may submit a response to the Regional Entit~~y~~(ies) assessment, with copies to the Regional Entit~~y~~(ies) and NERC, within 30 days of the date of the NERC appeal notification.

    d. To ensure there is no confusion with respect to the rights and responsibilities of the entity during the appeal process, the notification also confirms whether the entity will remain on the NERC Compliance Registry and will be responsible for compliance with approved reliability standards applicable to the function under appeal during the appeal.

9. Hearing and Ruling by the BOTCC

    a. The BOTCC will resolve registration disputes.

    b. The BOTCC may request additional data from NERC, the relevant Regional Entit~~y~~(ies) or the entity, and prescribe the timeframe for the submitting the requested data.

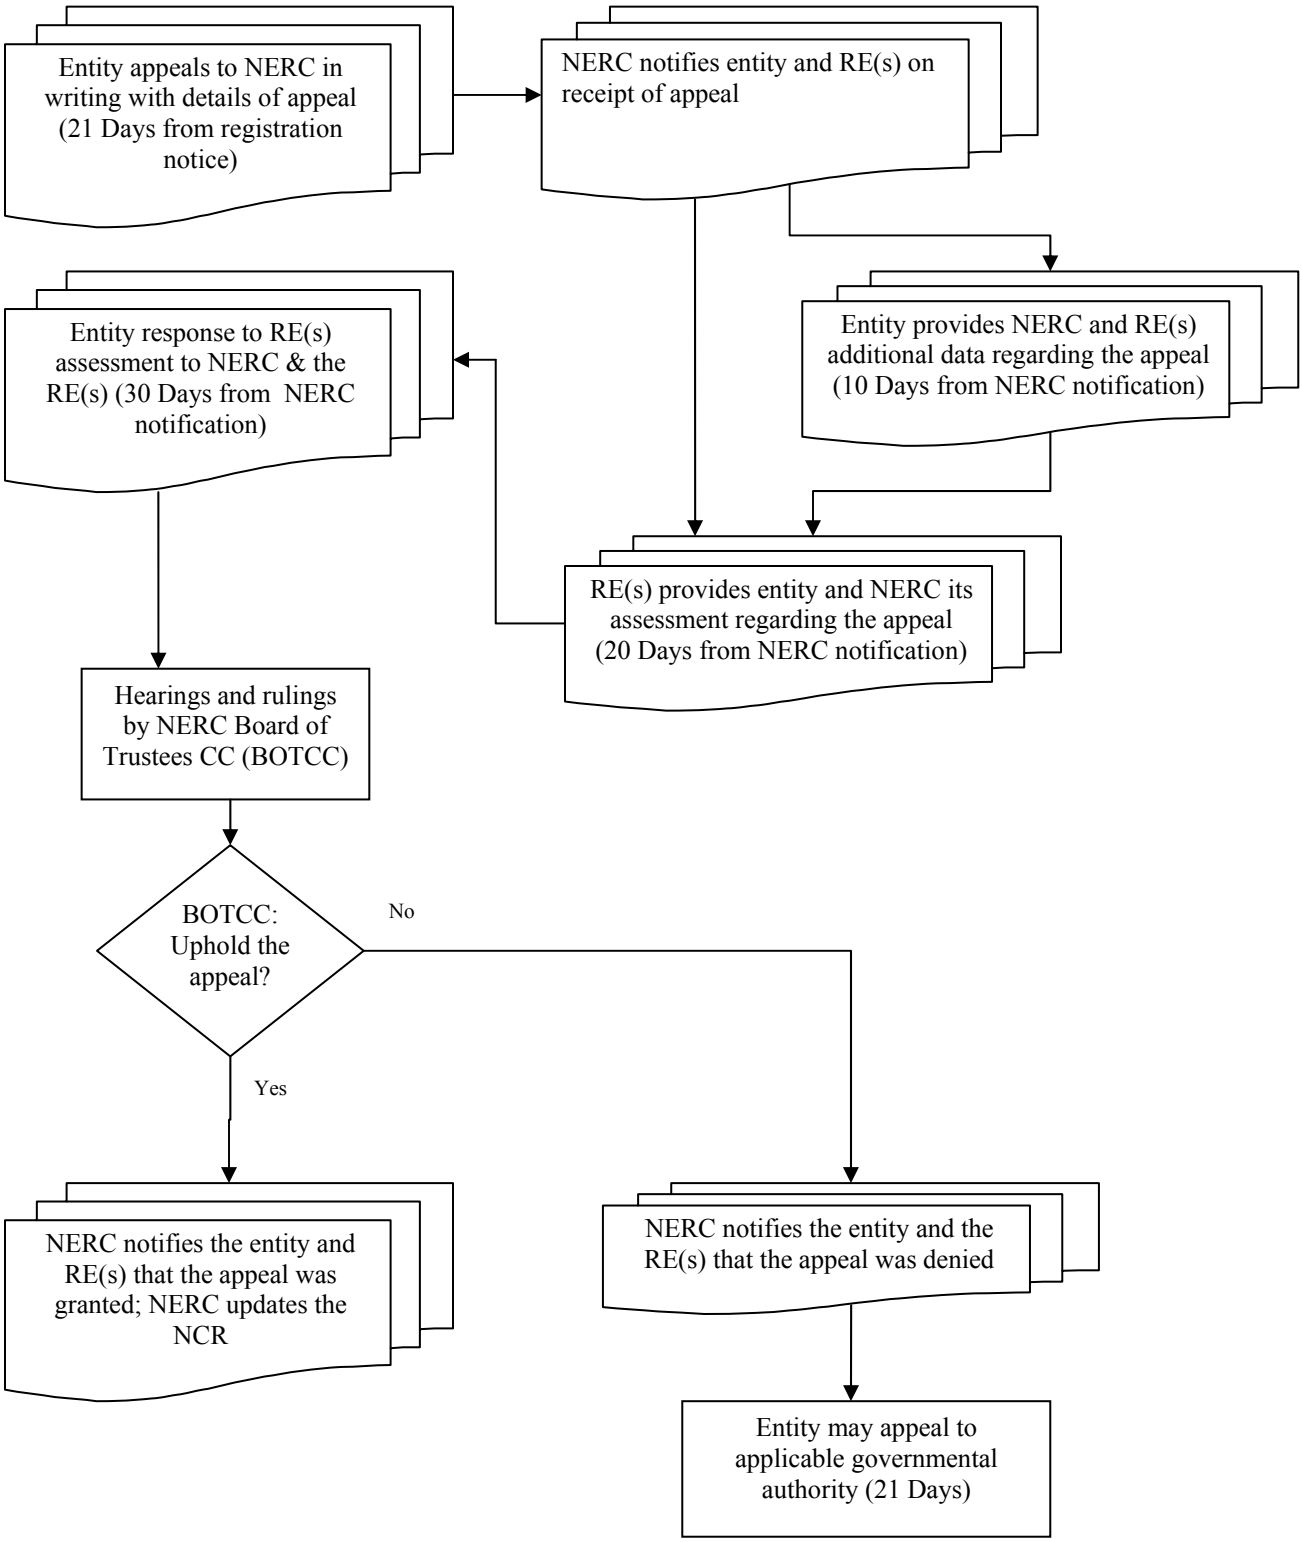
    c. The BOTCC will provide a written decision regarding any appeals, along with the basis for its decision.

    d. If the BOTCC upholds the appeal, NERC will:
        - Notify the entity and Regional Entit~~y~~(ies) that the appeal was granted.
        - Update the NCR.

    e. If the BOTCC does not uphold the appeal, NERC will:
        - Notify the entity and the Regional Entit~~y~~(ies) that the appeal was denied.
        - The entity may appeal to FERC or applicable Canadian Provincial regulator within 21 days of the notification of the decision.

f. A record of the appeals process shall be maintained by NERC. Confidentiality of the record of the appeal will be based on the NERC Rules of Procedure Section 1500.

Figure 3: Organization Registration Appeals Process Overview



Section VI — NERC Organization Certification Appeals Process

Purpose and Scope

This section describes the process for an organization to appeal the certification decision that was determined in the certification process.

Overview

The NERC Organization Certification Program provides a key means to fulfill NERC's mission. In conducting this program, NERC has established documented procedures to ensure a fair and impartial appeals process. No one with a direct interest in a dispute may participate in the appeals process except as a party or witness. See Figure 4 *Organization Certification Appeals Process Overview*.

Organization Certification Appeals Procedure

1. Appeal for an Organization Certification Finding.

   Any entity can appeal an organization certification decision issued as a result of the certification process.

2. Requirements and Conditions for Appeals.

   a. For all appeals under the NERC Organization Certification Program, the appeals process begins when an entity notifies the NERC ~~Vice President and~~ Director of Compliance Operations, in writing, that it wishes to use the NERC appeals process.

      - The ~~Vice President and~~ Director of Compliance Operations is the main contact for all parties in all steps of the appeals process.
      - If an appeal is not filed within twenty one (21) days ~~of~~following (i) the date that the certification report or finding is issued, or (ii) the date that a final ruling in a Regional Entity appeals process ~~ruling~~ is made, the finding shall be considered final and un-appealable.

   b. Each party in the appeals process shall pay its own expenses for each step in the process.

   c. A stipulation of invoking the appeals process is that the Regional Entity or entity requesting the appeal agrees that NERC (its members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the appeals process, and any company employing a person assisting in the appeals process, shall not be liable, and shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

   d. Parties retain the right to seek further review of a decision in whatever regulatory agency or court that may have jurisdiction.

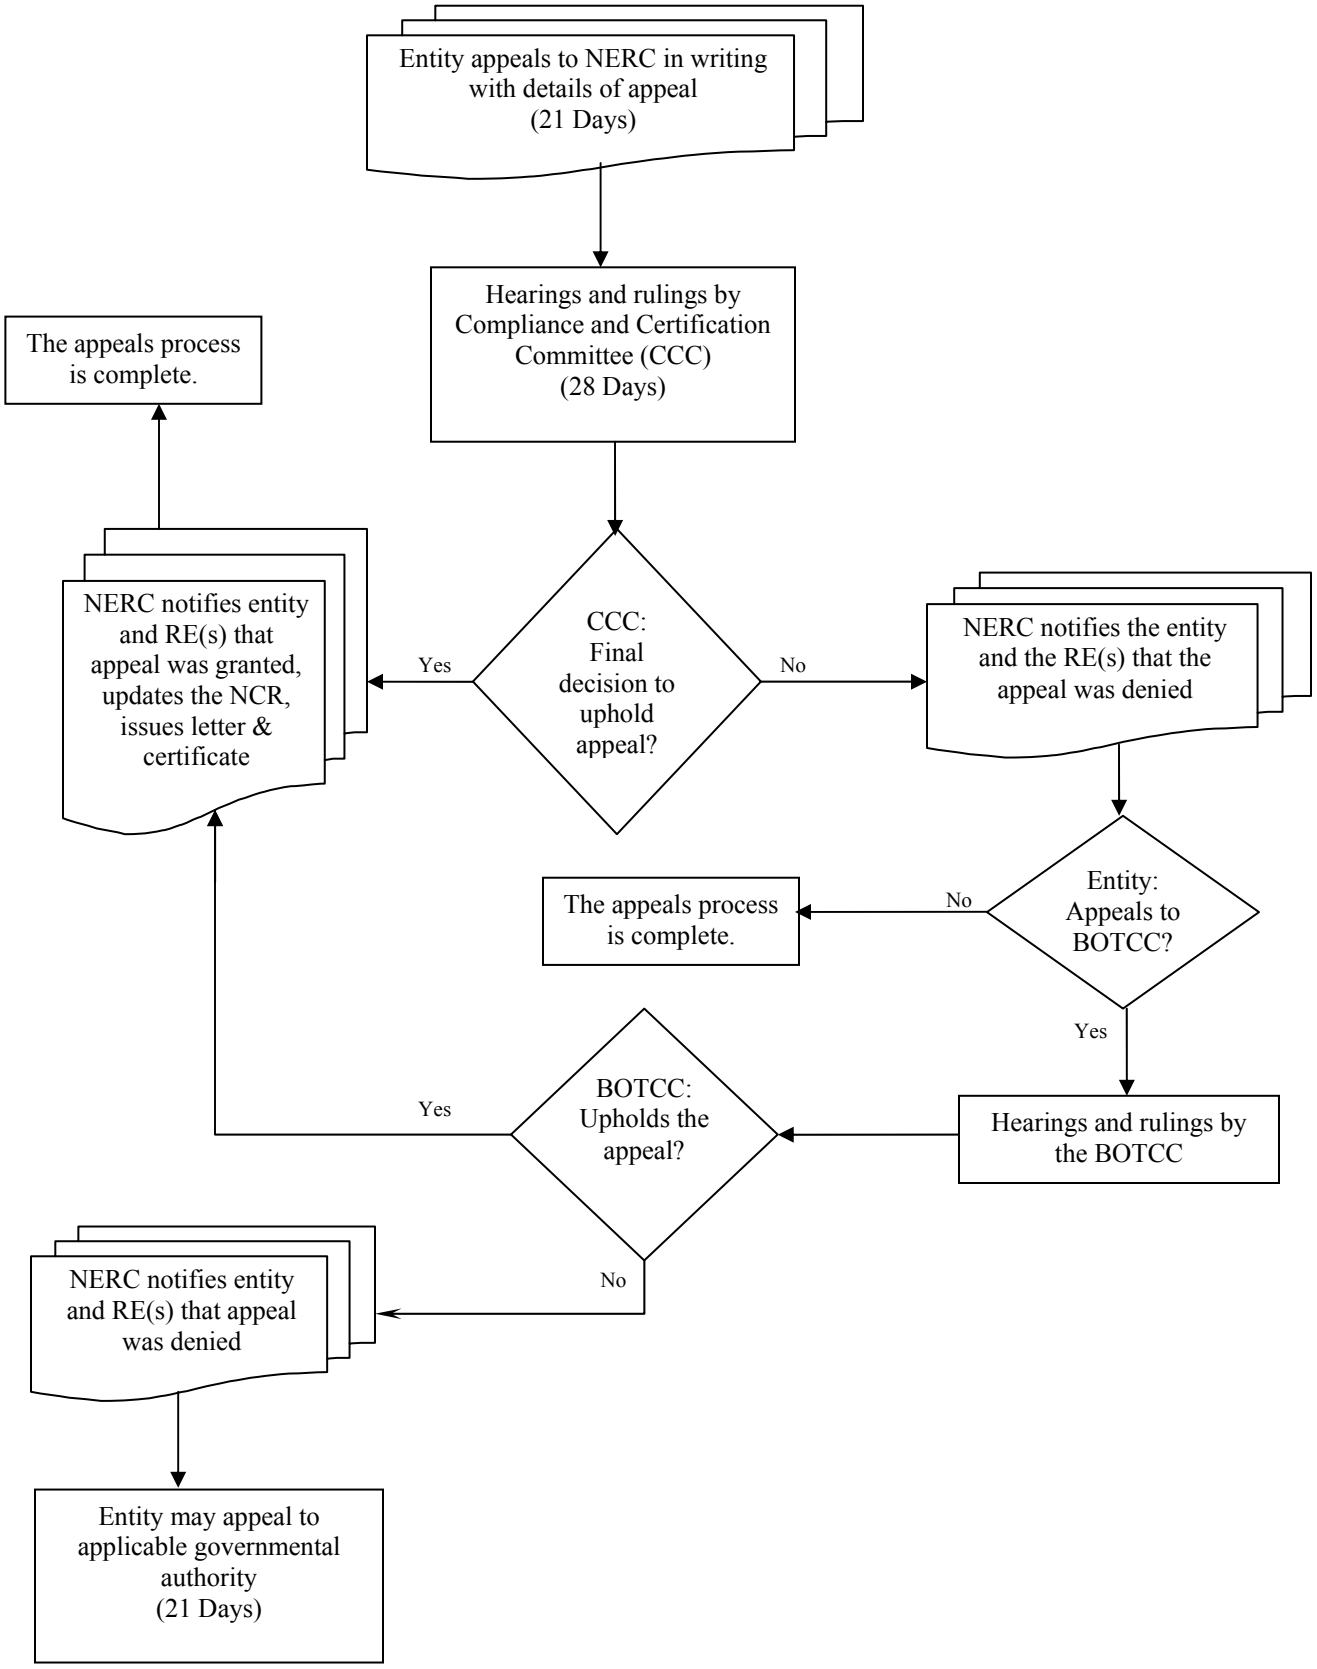
3. At any time through this appeals process, an entity may withdraw its appeal.
4. Hearing and Ruling by the Compliance and Certification Committee.
   a. Within twenty-eight (28) days of receiving notice from the NERC ~~Vice President and~~ Director of Compliance Operations, the CCC will conduct a hearing where all the parties or representatives of the disputing parties will present the issue in question, in accordance with CCC procedure CCCPP-005, *Hearing Procedures for Use in Appeals of Certification Matters*.
   b. If the appeal is upheld, NERC notifies the entity and RE(s), updates the NCR, and issues any appropriate letter and certificate to the entity.
   c. If the appeal is denied, NERC notifies the entity and RE(s).
5. Hearings and Ruling by the BOTCC.
   a. The BOTCC will be asked to resolve a dispute related to the NERC Organization Certification Program if any party to the appeal contests the CCC final order.
   b. The BOTCC may request additional data from NERC, RE(s) or the entity and prescribe the timeframe for the submitting the requested data.
   c. At the next regularly scheduled BOTCC meeting, or at a special meeting if the Board determines it is necessary, the Chairman of the CCC will present a summary of the dispute and the actions taken to the Board.
      - Each party will have an opportunity to state its case.
      - The BOTCC will then rule on the dispute.
   d. Based on~~If~~ the BOTCC's ruling on ~~upholds~~ the ~~appeal~~dispute, NERC will:
      - Notify the entity and the Regional Entit~~y~~(ies) as to the BOTCC's ruling and provide copies of the decision~~that the appeal was upheld~~.
      - Update the NCR as necessary based on the BOTCC's decision.
      - Issue a certification letter and a certificate to the entity ~~as~~if applicable based on the BOTCC's decision.

   ~~□~~eIf the BOTCC denies an~~does not uphold the~~ appeal by an entity, ~~NERC will notify the entity and the Regional Entity(ies) that the appeal was denied.~~

   ~~□~~ Tthe entity may appeal to the applicable governmental ~~authorities~~authority within 21 days ~~of~~following the issuance of the decision.

   f. A record of the appeals process shall be maintained by NERC and available upon request. Confidentiality of the record of the appeal will be based on the NERC Rules of Procedure Section 1500.

Figure 4: Organization Certification Appeals Process Overview



Definitions

NERC Organization Certification	The process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator.
Compliance and Certification Manager	The individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities applicable NERC Reliability Standards.
Days	Days as used in the registration and certification processes are defined as calendar days.
Footprint	The geographical or electric area served by an entity.
Functional Entity	An entity responsible for a function that is required to ensure the reliable operation of the electric grid as identified in the NERC Reliability Standards.
Mapping	The process of determining whether a Regional Entity's footprint is being served by Registered Entities.
NERC Identification Number (NERC ID)	A number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Note: corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.
Regional Entity	NERC works with eight Regional Entities to improve the reliability of the BPS~~bulk power system~~. The members of the Regional Entities come from all segments of the electric industry. These entities account for virtually all the electricity supplied in the United States, Canada, and a portion of Baja California Norte, Mexico. NERC delegates enforcement authority to these Regional Entities (FRCC, RFC, SPP, TRE, NPCC, MRO, SERC, & WECC).
Registration	Process undertaken by a Regional Entity to identify which entities are responsible for reliability functions within the Regional Entity's footprint.
Coordinated Functional Registration (CFR)	Where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more reliability standard(s) applicable to a particular function, and/or for one or more requirement(s)/sub-requirement(s) within particular reliability standard(s).

Appendix 8

Proposed Revisions 11-7-2011

NERC Event Response Procedures

Effective _____, 2012

North American Electric Reliability Corporation

NERC Event Response Procedures

Introduction

This Appendix provides a structured and detailed framework which defines the roles and responsibilities of NERC, the Regional Entities, and registered entities in conducting analyses of events that occur on the bulk power system (BPS).

The Electric Reliability Organization (ERO) enterprise-wide event analysis program is based on the recognition that BPS system events that occur, or have the potential to occur, have varying levels of significance. The manner in which registered entities, Regional Entities and NERC evaluate, respond and process these events is intended to reflect either the significance of the event or specific system conditions germane to the reliability of the BPS and the circumstances involved, or both.

When a BPS event occurs, the entities involved must first recognize it, then respond to it, and ultimately stabilize the system. Once the system has been stabilized, event analysis can begin.

Event analysis is the aggressive critical self analysis of BPS events that have occurred or have the potential to cascade. This analysis produces findings, lessons learned and best practices that provide experience-based insight in order to prevent repeat occurrences, provide informational material for entity training and industry learning, and institutionalize knowledge.

Event analysis begins with the registered entities that experienced the event, or circumstances surrounding a potential event, and depends upon collaboration between the registered entities, the Regional Entities, and NERC. The delineation between event categories is based on event significance and potential impact to the BPS. The significance and potential impact will drive the level of analysis for a particular event.

Critical components of an effective event analysis effort include the following:

- Prioritization of events affecting reliability of the BPS – detailed analysis for significant events and concise reviews for minor events
- Establishment of a clear timeline illustrating the sequence of events
- Specific identification of the causal factors of the event
- Identification and timely implementation of corrective actions
- Development and dissemination of alerts, quality lessons learned and best practices to the industry
- Emphasis on an aggressive critical self analysis by registered entities
- Emphasis on being a learning organization, including proactive improvement of BPS reliability
- Process transparency and predictability
- Proper confidentiality of data and information
- Identification of emerging trends discovered through event analysis

- Clarity and certainty about event analysis roles, responsibilities, and expectations for respective entities, including target timeframes for completing certain actions
- Appropriate Regional Entity and NERC review and oversight of registered entity event analysis results

Categorization of Events

Events are classified into one of five categories referred to as Category 1 (least significant) to Category 5 (most significant) based on the criteria specified in the "Event Category and Level of Analysis" Appendix to the NERC *ERO Event Analysis Process*. The categories of events and the criteria for determining the category into which an event should be classified may be revised by NERC based on experience and technical input. Any such revisions will be implemented in the *ERO Event Analysis Process*. However, an event may be assigned to a higher or lower Category based on the significance of the event. For these purposes, the following levels of significance will be considered: Significant, Conditionally Significant, Consequential and Noteworthy, Non-Consequential but Noteworthy, or Not Consequential:

Significant – The event caused or had the potential to cause an appreciable reduction in bulk power system reliability, excessive risk to generation and/or transmission facilities and serious harm to individuals. A Significant event results from the breakdown of multiple defenses and barriers and/or a non-adherence to one or more reliability standards. A Significant event will normally correspond to a Category 4 or 5 event. However, even if an event does not meet the criteria to be classified as a Category 4 or Category 5 event, it may be determined to be Significant based on the above-described cause(s) and impact(s) and one or more or the following considerations:

Significant by Act of Sabotage – The event involves a coordinated effort of sabotage or terrorism to the bulk power system.

Significant by Recurring – The event is similar to a previously-reported Significant event and should have been avoided by implementation of NERC Alerts or recommendations or lessons learned from previous event analysis.

Significant by Alert – The event is of a type that has been described in a previously-issued NERC Alert, usually in the format of a Recommendation or a Essential Action.

The NERC Director of Reliability Risk Management, with input from applicable Regional Entity management and applicable governmental authority staff and subject to approval by the NERC President and CEO, will determine if an event should be classified as Significant.

Conditionally Significant – An event is classified as Conditionally Significant based on the uniqueness of the event and other factors outside of common occurrences or reliability concerns. Among other factors, an event may be classified as Conditionally Significant (i) based on the event drawing substantial attention from federal or state governmental authorities and from the media, or (ii) due to the presence of unusual external conditions such as tornados, hurricanes, earthquakes, fires, floods or explosions

that create lengthy unplanned outages of generation or transmission elements or result in operation of the bulk power system at a significantly reduced capability.

The NERC Director of Event Analysis and Investigations, with input from applicable Regional Entity management and Applicable Governmental Authority staff and subject to approval by the NERC President and CEO, will determine if an event should be classified as Conditionally Significant.

Consequential and Noteworthy– The event caused an unexpected change in generation or other bulk power system conditions. The event should produce lessons learned and the possibility of a NERC Alert for dissemination. A Consequential and Noteworthy event will normally correspond to a Category 1, 2 or 3 Event.

Non-Consequential but Noteworthy – The event did not result in notable consequences but had the potential to be an event that would have more severe consequences under slightly different circumstances (e.g., a "near miss"). The event may produce lessons learned for bulk power system users, owners and operators.

Not Consequential – The event resulted in minimal or no consequences and there would be no value to analyzing it.

In this Appendix, the term "major event" is intended to refer to a Category 4 or 5, or a Significant or Conditionally Significant, event; and the term "other event" is intended to refer to a Category 1, 2 or 3, or a Consequential and Noteworthy, Non-Consequential but Noteworthy, or Not Consequential event. However, for purposes of determining and assigning responsibilities for the analysis of an event, an event may be determined to be "major" even though it does not meet the criteria or have the characteristics of a Category 1 or 2, or a Significant or Conditionally Significant event.

Responsibility for Event Analysis Based on Category or Significance of Event

NERC's role following an event affecting the bulk power system, including a major event such as a significant loss of load or generation, significant bulk power system disturbance, or other emergency on the bulk power system, is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the major event. Generally, NERC will take the lead role in the analysis of a major event, while the applicable Regional Entity or the registered entity will be responsible for the event analysis in the case of another event.

Response to and Analysis of Major Events

In the case of a major event, NERC, working closely with the Regional Entities and Reliability Coordinators, will coordinate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

When responding to any major event where physical or cyber security is suspected as a cause or contributing factor to the major event, NERC will immediately notify appropriate government agencies and coordinate its analysis with them.

Following the occurrence of a major event, a planning meeting involving the affected registered entities, applicable Regional Entities, NERC, and other applicable governmental authorities (AGA) is held to discuss the event and to determine how the event analysis should proceed. The analysis of major events will be conducted by an event analysis team led by the applicable Regional Entities or NERC.

As specified in the ERO Rules of Procedure, Section 807.f, the NERC President and CEO has the authority to determine whether any event warrants analysis at the NERC level. A Regional Entity may request that NERC elevate an analysis of a major event to the NERC level.

If the analysis is led by a Regional Entity, then NERC staff and other appropriate technical experts from the NERC community will participate, as needed, as members of the Regional Entity analysis team.

During the conduct of NERC-level analyses, assistance may be needed from government agencies. Collaborative analysis with certain government agencies may be appropriate in some cases; e.g., collaborating with the Nuclear Regulatory Commission technical staff when a major event involves a nuclear unit. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; analyses related to possible criminal or terrorist involvement in the major event; resources for initial data gathering immediately after the major event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies. If a federal or multi-national government analysis is called for, government agencies should work in primarily an oversight and support role, in close coordination with the NERC analysis.

If any Applicable Governmental Authority initiates a formal review process in conjunction with NERC, the decision on the composition of the event analysis team, the team lead, the information needed from affected registered entities, and the required scope of the analysis will be discussed and agreed upon by the Applicable Governmental Authority and NERC executive staff.

NERC may lead analyses of occurrences other than major events as needed based on specific facts and circumstances such as insufficient Regional Entity resources. In addition, a Regional Entity may request NERC to elevate an analysis of an occurrence other than a major event to the NERC level. In such cases, the leadership of the analysis team will shift to NERC, and the Regional Entity may continue to participate.

Responding to major events involves four phases:

1. situation assessment and communications;
2. situation tracking and communications;
3. data collection, investigation, analysis and reporting (event analysis); and
4. Publishing of recommendations (lessons learned, best practices, and Alerts, if applicable).

Phase 1 — Situation Assessment and Communications

When leading an event analysis, NERC's primary roles in Phase 1 are to:

- Lead or coordinate an initial situation assessment;
- issue a data retention hold notice;
- call for the collection of and analyze necessary initial data and information for the major event;
- assist the Regional Entity-led analysis with determining the need for supplemental technical expertise from the NERC community;
- issue initial findings, conclusions, and recommendations;
- maintain detailed data records (not subject to Freedom of Information Act);
- assist government agencies in criminal analyses when relevant;
- provide technical expertise for modeling and analyzing the major event; and
- follow up on recommendations (responsibility of both NERC and the Regional Entity).

While conducting its initial situation assessment, NERC will make an early determination as to whether the cause of the major event may be related to physical or cyber security, and communicate as appropriate with government agencies.

Notice of a major event is typically received by the NERC Bulk Power System Awareness person on duty and relayed to other appropriate NERC personnel.[1] NERC performs an initial situation assessment by contacting the appropriate party or parties, and makes a decision as to whether to activate its crisis communications plan. At the initial stage in gathering information about an incident, it is critical to minimize interference with bulk power system operators who are in the process of restoring the system. To minimize interference with their work, NERC, in its capacity as the Electricity Sector Information Sharing and Analysis Center (ES-ISAC), should serve as the primary communications link with government agencies.

The ES-ISAC Concept of Operations (ConOps) specifies the operations plan, communications procedures, and logistics NERC will follow during normal conditions, emergencies, and National Security Special Events. The ConOps includes the primary points of contact (24x7) for the Federal Energy Regulatory Commission, U.S. Department of Energy, U.S. Department of Homeland Security, U.S. Nuclear Regulatory Commission, and Public Safety and Emergency Preparedness Canada.

It is important that during these early hours that NERC Bulk Power System Awareness, in coordination with government agencies, determines whether the major event was caused by the actions of criminal or terrorist parties. The results of this criminal assessment are essential to operators because if there is a possibility that the "attack" is still ongoing, restoration and response actions would need to be tailored to these circumstances. If NERC and government agencies deem it necessary for further criminal analyses, NERC will issue a formal notice to affected systems to retain all relevant information gathered during this phase and subsequent phases of analysis.

NERC Reliability Standards set forth specific criteria and procedures for reporting the bulk power system disturbances and events. These criteria and procedures are intended to provide a common basis for consistent reporting of abnormal system conditions and events that occur in North America. All registered entities that are subject to the requirements of NERC Reliability

[1] NERC maintains 24x7 contact information for its key personnel to facilitate such contacts.

Standard EOP-004 must report the information required by that Reliability Standard within the time periods specified. Reliability coordinators will use the Reliability Coordinator Information System (RCIS) as their primary method of communications to NERC. The NERC Bulk Power Situational Awareness Group is responsible for monitoring the RCIS for such notifications.

Depending on the scope and magnitude of the major event, NERC will issue media advisories in accordance with its NERC Crisis Action Plan and the NERC Communications Protocol Document.

Phase 2 — Situation Tracking and Communications

Based on the nature and severity of the major event, in Phase 2 NERC will continue to track progress in restoring the bulk power system and service to customers, and keep industry, government agencies, and the public informed. The most important thing to recognize in this phase is that the primary focus of Reliability Coordinators and Transmission Operators is the prompt restoration of the bulk power system. NERC will coordinate requests by government agencies for information from Reliability Coordinators and Transmission Operators, and serve as a conduit and coordinator between industry and government for regular status reports on the restoration.

As the major event continues, NERC will determine whether a detailed analysis of the major event should be conducted, and start to identify manpower requirements, data collection and retention requirements, and at what level the analysis should be conducted. If the major event is localized within a region, NERC will participate in the analysis of the major event led by the Regional Entity.

Phase 3 — Data Collection, Investigation, Analysis, and Reporting

Based on the scope, magnitude, and impact of a major event, during Phase 3 NERC may:

1. perform an overview analysis of bulk power system and generator response;
2. rely on one of its Regional Entities to lead the analysis and monitor the analysis results;
3. work with a Regional Entity in its analysis; or
4. conduct a NERC-level analysis.

The NERC President and CEO will decide, based on the initial situation assessment and consultation with others, including the NERC technical committee officers[2], if the situation constitutes a major event and whether a NERC-level analysis is warranted. If a NERC-level analysis is to be conducted, the NERC President and CEO will appoint the analysis team leader.

NERC reserves the right to elevate or augment an analysis performed by a Regional Entity pending the results of the Regional Entity analysis. Additional requests for analyses or supporting data may be made by NERC at any time in the analysis process.

A NERC-level analysis will comprise (a) collecting pertinent data on the major event; (b) constructing a detailed sequence of events leading to and triggering the major event; (c)

[2] NERC will maintain a list of 24x7 contact information for its technical committee officers.

assembling bulk power system models and data and conducting detailed bulk power system analysis to simulate conditions before and after the major event; (d) conducting a root cause analysis to determine causal factors, necessary corrective actions and any needed reliability mitigation; and (e) issuing findings, conclusions, and recommendations. The details of these five phases of the analysis are:

a. Collecting Pertinent Data on the Major Event

- Collect all pertinent logs, disturbance recorders, operator transcripts, and other bulk power system data pertaining to the major event.

b. Detailed Sequence of Events Leading to and Triggering the Major Event

- Construct a detailed sequence of events leading to and triggering the major event. Reconcile logs, disturbance recorders, operator transcripts, and other bulk power system data to create an accurate sequence of events.
- Enter and preserve all data in a secure data warehouse.

c. Detailed Bulk Power System Analysis

- Assess the sequence of events to determine critical times for study.
- Assemble the necessary bulk power system models and data from Regional Entity and registered entities to accurately model (with power flow and dynamic simulations) the conditions prior to the major event. Determine conditions at critical times prior to initiation of the major event, including an assessment of reliability margins in the time period preceding the major event.
- Analyze data from phasor measurement units, high-speed data recorders, digital fault recorders, digital relays, and system relay targets.
- Analyze generator and load performance, including underfrequency and undervoltage relay actions.
- Use the model information and sequence of events to dynamically model the trigger occurrences and the outage sequence. Identify the bulk power system phenomena that propagated the failure. Provide graphical results showing the nature of the cascade. Conduct additional analyses as initial findings identify the need for further study.

d. Cause Analysis

Cause analysis methodology and the tools used guides the overall analysis process by providing a systematic approach to evaluating root causes, causal factors and contributing factors leading to the event. Cause analysis enables the analysis process to develop a factual record leading to logical and defensible conclusions in the final events analysis (EA) report regarding the causes of the event.

e. Findings, Conclusions, and Recommendations

- Identify and assess causal factors contributing to the major event, including possible instability conditions, system protection mis-operations, generator actions, etc.
- Either identify or rule out man-made/criminal cyber or physical attacks on the bulk power system.

- Determine if the bulk power system components were being operated within equipment and system design criteria at the time of the major event.
- Assess the qualifications, training, SCADA/EMS tools, and communications available to bulk power system operators and Reliability Coordinators, and how effective these were leading up to and during the major event.
- Assess the adequacy of communications system and communications among bulk power system operators.
- Identify any issues regarding maintenance or equipment conditions that may have contributed to the outage.
- Determine whether bulk power system restoration procedures were available and adequate. Identify any issues that caused unexpected delays in the restoration of generators and loads.
- Identify the root causes[3] and contributing factors of the major event.
- Recommend actions to prevent major events in the future and to improve bulk power system reliability.
- Determine whether the design of bulk power system components was a contributing factor to the event.
- All compliance issues will be referred to the NERC Director of Enforcement.

Phase 4 — Follow-up on Recommendations

For Phase 4 NERC and the Regional Entities will follow up on specific recommendations coming from all analyses, whether done at the Regional Entity or NERC level. In certain cases, where government agencies have taken a direct role in the analysis, reports will be made to those agencies on progress in addressing the recommendations.

Event Analysis of Other Events

For events (category 1 – 3) the registered entity should follow the methodology and steps outlined in the current version of the ERO event analysis process. The basic steps are outlined below.

1. The registered entity makes an initial assessment of an event, which includes determining the initial event category.
2. If the event is a "qualifying event" (*i.e.* Category 1-5), a planning meeting is held with all involved parties.
3. The registered entity submits a brief report.
4. If the qualifying event is a Category 3 or higher, the registered entity must also submit an event analysis report (EAR).
5. Lessons learned and best practices (if any) are developed and shared with industry.
6. The event is closed.

For lower tiered events, registered entities perform the event analysis. Coordination of the analysis becomes more complicated for events that involve a broader geographic area, involve multiple registered entities, or include a complex set of facts and circumstances.

A planning meeting should be held by the registered entity and the applicable Regional Entity as soon as possible following the occurrence of a qualifying event. During the meeting, agreement should be reached on the event category, the level of analysis, a timeline for completion of the report, and the need for a data retention hold and draft or preliminary reports. The event analysis should have a level of detail and target timeframe commensurate with the nature and scope of the event. Although the category of the event provides general guidance on the level of analysis needed, these guidelines may be adjusted based on the overall significance of the event and the potential for valuable lessons learned.

Registered entities that reside in two Regional Entity footprints should notify both Regional Entities of an event that spans both Regions. Following the notification, the two Regional Entities will determine which one will coordinate the remaining steps of the event analysis process. When multiple registered entities are involved in or affected by an event, they should collaborate with the Regional Entity to determine if it is appropriate for each entity to prepare a report or for the entities to work together to prepare a single report.

Weather-Related Occurrences - If a weather-related occurrence falls within any of the categories it should be reported. The affected registered entities should focus on restoration efforts. After restoration is complete, the affected entities, in coordination with Regional Entities, will determine if any additional information or event analysis steps are needed.

Development of Lessons Learned from Events

Lessons learned as a result of an event analysis should be shared with the industry as soon as practical. Proposed lessons learned should be drafted by a registered entity and should be submitted to the applicable Regional Entity. The lessons learned should be detailed enough to be of value to others and should not contain data or information that is deemed confidential. When possible, one-line diagrams, other diagrams and representations should be included to enhance the information provided in the lessons learned. Vendor-specific information should not be included unless it is discussed and coordinated with the vendor. If dissemination of vendor-specific information is beneficial, it may be pursued outside the event analysis process.

Lessons learned will be reviewed by selected technical groups and NERC staff for completeness and appropriateness prior to posting.

In normal operations, events may occur on the bulk power system that do not meet the reporting thresholds of the defined event categories but may yield lessons of value to the industry. These lessons learned can include the adoption of unique operating procedures, the identification of generic equipment problems, or the need for enhanced personnel training. In such cases, an event analysis report would not be required; however, registered entities are encouraged to share with their Regional Entities any potential lessons learned that could be useful to others in the industry, and to work with the Regional Entity and NERC to develop the lessons learned for dissemination.

Reporting and Analysis Requirements for Registered Entities in Connection with Events

Registered entities are required to report the occurrence of defined BPS disturbances and unusual occurrences to the applicable Regional Entity and NERC in accordance with various NERC and Regional reliability standards and other requirements. **It should be noted that following the event analysis process does not relieve the registered entity from mandatory reporting requirements dictated by regulatory authorities or NERC standards.**

In addition, a registered entity involved in an event will be required to submit one or more of the following reports, depending on the category of the event: a Brief Report; an Event Analysis Report; and proposed lessons learned. The following table shows the reports and timing requirements, by category of event:

Event Category	Brief Report	Event Analysis Report	Lessons Learned	Close Event Analysis
1	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Not required	Within 30 business days (if applicable)	10 business days following receipt of Brief Report
2	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	(If requested) Within 30 business days of the event	Within 30 business days	30 business days following receipt of EAR
3	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Within 60 business days of the event	Within 60 business days	30 business days following receipt of EAR
4	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Within 180 business days of the event	Within 180 business days	60 business days following receipt of EAR
5	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Within 180 business days of the event	Within 180 business days	60 business days following receipt of EAR

The final Event Analysis Report should address corrective actions and recommendations related to the event's causal factors and any identified lessons learned. Positive outcomes identified during an event should be documented as a best practice. These are key parts of a continuous learning and improvement program.

Event Analysis Interface with Compliance

To support a strong culture of compliance, registered entities are expected to perform a compliance analysis and to develop a compliance self-assessment report proportional to the significance of the event/risk to the BPS for categorized events in which there could be a gap between actual system or human performance and the requirements of NERC or regional reliability standards. Registered entities are encouraged to submit a compliance self-assessment report to the Regional Entity compliance liaison proportional to the significance of the event/risk to the BPS for categorized events. This report should encompass a sufficiency review, proportional to the event's significance, of applicable standards associated with the event.

Registered entities who make a good faith effort to self-identify and self-disclose possible violations stemming from their event analyses will be afforded consideration in any enforcement action in accordance with the NERC *Sanction Guidelines*, **Appendix B** to the Rules of Procedure. If further analysis by the Regional Entity or NERC reveals other possible violations, the registered entity's participation and cooperation will be noted and considered.

For this reason, it is recommended that registered entities establish a liaison between their internal event analysis and compliance functions. This will provide a clearer understanding and a more efficient transfer of information from both an operational and a compliance standpoint, and it will facilitate a thorough standards review by the registered entity.

Any possible violations of reliability standards that were identified in the registered entity's compliance self-assessment should be self-reported by the registered entity through the existing Compliance Monitoring and Enforcement Program procedures, with a notification that they were discovered as a result of participating in the ERO event analysis program and completing a compliance self-assessment of the event.

As provided in **Appendix 4B**, *Sanction Guidelines*, of the NERC Rules of Procedure, if the registered entity is fully cooperative in the event analysis process, conducts a self-analysis of the event and submits a timely compliance self-assessment report, and submits self-reports of any possible violations of reliability standards and implements corrective and mitigating actions, then in any subsequent enforcement actions pursuant to the Compliance Monitoring and Enforcement Program, the registered entity's actions will be considered as mitigating factors in the determination of any penalties or sanctions for violations of reliability standards in connection with the event.

Attachment A

NERC Major Event Analysis Objectives, Analysis Approach, Schedule, and Status

Analysis Objective	Analysis Approach	Schedule	Status
Pre-Major Event Conditions			
1. What was the precursor sequence of events leading to the major event?	• Assemble data/alarm logs and time-stamped sequence information. • Develop and maintain an expanding database of log and time-stamped sequence information. • Develop a precursor sequence of high-level, events relevant to, and leading to initiation of the major event. • Reconcile the precursor sequence of events with those emerging from Regional Entities, RTOs, and operating entities.		
2. What time frames are relevant for assessment of bulk power system conditions prior to the major event? What points in time should be used to establish a baseline set of study conditions when the bulk power system was last known to be stable and within normal operating criteria?	• Referencing precursor sequence of events, determine relevant times to develop base case conditions (stable and within normal operating criteria). • Verify relevant time horizons and availability of bulk power system data at those times with Regional Entities, RTOs, and operating entities.		
3. What models and data can best simulate bulk power system conditions prior to and during the major event? What is the relevant scope of the bulk power system for detailed study (what is considered the boundary of the bulk power system to be studied and what is considered neighboring or external bulk power systems?)	• Identify up-to-date bulk power system model(s) appropriate for powerflow and transient and dynamic simulations (determine if detailed eastern interconnection model is needed or multi-regional model(s) are needed. • Identify what models are available in Regional Entities, RTOs, and operating entities. • Identify who will actually perform power flow, transient and dynamic simulations; hire contractor(s) as needed. • Identify and assemble data required for these models. • Develop and maintain a bulk power system data repository.		

Analysis Objective	Analysis Approach	Schedule	Status
4. What bulk power system conditions existed in the precursor time horizon leading up to the major event (at the times identified in 1)?	• Obtain and manage data for powerflow: bulk power system configuration, planned and unplanned outages, unit commitment and dispatch, interchange schedules, congestion conditions, reserves, loads, state estimator snapshots, deratings and limitations, frequency, etc. Identify who will maintain and run powerflow simulations. • Work with Regional Entities, RTOs, and operating entities to develop powerflow cases defining the base conditions for each relevant time, ensuring the powerflows model each critical juncture leading up to the major event. • Identify and review results of additional studies completed by reliability coordinators, RTOs and operating entities. • Assess the powerflow results with respect to steady state operating criteria (was the bulk power system within all known limits at each precursor time)?		
5. Were there any prior-existing abnormalities, instabilities, reliability criteria violations, or reliability issues in the precursor sequence time horizon? Prior to initiation of the major event were there any latent instability conditions that would suggest the bulk power system was at risk? Were the precursor conditions ones that had been previously studied by the entities involved? Were there adequate reserves with effective distribution? Were planned outages effectively coordinated?	• Work with Regional Entities, RTOs, and operating entities to obtain and manage transient and dynamic models for simulations. • Identify who will conduct transient and dynamic simulations and if external contractor(s) are required. • Conduct transient and dynamic simulations at each of the precursor study times. • Assess the stability of the bulk power system at each of these times and identify any latent reliability issues prior to initiation of the major event. • Consider creating a visual map of bulk power system conditions. • Document the limitations and assumptions of simulations affecting the certainty of the simulation results.		
Sequence of Events			
6. What was the sequence of events leading to and directly triggering the major event?	• Evaluate data logs, fault recorder data disturbance recorder data, and synchro-phasor measurement to establish a detailed sequence of events that initiated the major event. • Identify the sequence of events that directly led to the major event. • Review and reconcile these trigger events with Regional Entities, RTO, and operating entity analyses.		

Analysis Objective	Analysis Approach	Schedule	Status
7. What was the sequence of events during the major event?	• Evaluate logs and disturbance recorder data to establish sequence during the major event . (The sequence of events may follow multiple tracks.) • Review and reconcile this sequence with those constructed by Regional Entities, RTOs, and operating entities. • Consider developing 3-D, time-lapse visualization of the major event (U. of Minnesota and/or U. of Wisconsin).		
8. What was the cause of the major event in terms of electrical conditions and other related occurrences? Generally describe any bulk power system breakups, islanding, etc. Were there conditions of voltage or frequency collapse, or unstable oscillations? Was the sequence strictly a sequential "domino" effect of facility trips? What were the bulk power system conditions (snapshots) at key points during the major event?	• Assess triggering sequence and major event sequence to establish the causes for the major event in terms of electrical conditions and occurrences. • Select key points in sequence for simulation that are relevant for study and that can be accurately modeled. (It may not be possible to reconcile data sufficiently to recreate bulk power system conditions during the major event.) • To the extent possible, conduct simulations and assess results at each point during the major event. • Review and reconcile results with Regional Entities, and operating entities.		
9. Why did the major event extend as far as it did? What arrested the major event from extending further into other areas of the bulk power system?	• Using advanced analysis techniques, assess where and why the major event was arrested.		
10. How did affected non-nuclear generators respond during the major event? Were trips as expected and required by procedures and standards? Did non-nuclear generators remain connected and support the bulk power system in the manner they should have? Did any generator action, generator control functions, or generator protection systems contribute to the major event?	• Prepare a table of affected generators and actions they made leading up to and during the major event, including time-stamped unit trips, relays initiating unit trips, MW and MVar outputs, voltages, and frequency, etc. • Analyze the automatic (including relay trips) and operator-initiated actions of non-nuclear generators to determine whether actions were correct under the conditions or not. • Reconcile non-nuclear generator data and analysis with that of the Regional Entities, RTOs, and operating entities.		
11. How did nuclear generators respond leading up to and during the major event? Were trips as expected and required by procedures and standards? Were there any nuclear safety issues identified?	• Work with NRC to develop a table of sequence of actions and issues regarding affected nuclear generators (both ones that tripped and those that did not). • Refer nuclear issues to NRC for analysis, assisting in their analyses where appropriate.		

Analysis Objective	Analysis Approach	Schedule	Status
12. What was the sequence and amount of load lost? What directly caused load loss (e.g. under-frequency load shed, loss of transmission source, voltage collapse, relay actions, under/over frequency protection or stalls, etc.)	• Work with Regional Entities, RTOs, and operating entities to develop a description of load lost/impacted, by area. • Analyze and report the cause for load loss in each area.		
13. How did system protection and automated controls operate during the major event? Did they operate correctly or not?	• Assess each automatic trip of a transmission or generator facility for proper or improper relay actions. • Assemble and review Regional Entity and operating entity reviews of logs, disturbance reports, and relay targets/logs and reconcile with NERC data.		
14. Was any equipment damaged during the major event?	• Request information from Regional Entities, and operating entities on equipment damage, as appropriate. • Assess any transmission or generation facilities sustaining damage during the major event, and extent of damage.		
15. Did SCADA/EMS and data communications systems operate correctly during the major event? What problems were noted?	• Request information from Regional Entities and operating entities. • Identify and analyze any problems with SCADA/EMS and data communications at regional and operating entity levels.		
Reliability Standards/Procedures			
16. What NERC reliability standards were applicable to the major event? What violations occurred? Were NERC standards and policies sufficient?	• Compliance staff review NERC standards relevant to the major event and perform a compliance review.		
17. What Regional Entity reliability standards were applicable to the major event? What violations occurred? Were Regional Entity standards and policies sufficient?	• Request Regional Entities to review applicable standards and report compliance with those standards during the major event.		
18. Were any special operating procedures or other operating guidelines in effect and being observed leading up to the major event? Were these procedures sufficient?	• Review and analyze loop flow procedures with Regional Entities and operating entities, and report analysis results.		
19. What other RTO, Transmission Owner, Balancing Authority procedures were applicable? What violations occurred? Were the procedures sufficient?	• Request RTOs, Transmission Owners, Balancing Authorities to review applicable standards and compliance with existing reliability procedures and standards during the major event, and report results.		
Maintenance			

Analysis Objective	Analysis Approach	Schedule	Status
20. Are there any indications that maintenance of transmission or generation facilities may have contributed to the major event?	• Assess whether equipment or maintenance issues (e.g. tree trimming) contributed to the major event and investigate specifics in areas of concern. • Review Regional Entity assessments of maintenance issues that may have contributed to the major event.		
Personnel, Procedures, and Communications			
21. What conditions were operators and reliability coordinators aware of leading up to and during the major event? What information did they have to warn them of unsafe bulk power system conditions? What problems or concerns did they have? What did they observe during the major event? Were human errors made that contributed to the major event? If there were, what were the causes of the errors?	• Develop an interview guide to address procedural and operational issues. • Conduct onsite interviews with operating personnel and reliability coordinators involved. • Analyze interview data to corroborate with technical data and report conclusions.		
22. Were lines of authority clearly understood and respected in the time leading up to and during the major event, as well as during the restoration period?	• Identify critical instructions given and evaluate results. • Review documentation and effectiveness of assignments of operating and reliability authorities.		
23. What communications occurred among operating entities?	• Review voice communications logs. • Evaluate logs relevant to the major event and identify key interactions. Report conclusions.		
24. What were the qualifications (including certification status) and training of all operating personnel involved in the major event and their supervisors?	• Request certification status of all operating personnel from involved operating entities. • Conduct onsite review of training materials and records. • Conduct onsite review of operating procedures and tools		
25. Was the role and performance of the reliability coordinators as expected?	• Review the adequacy of reliability plans for the affected Regional Entities. • Review the actions of the affected reliability coordinators to determine if they performed according to plans. • Assess whether inter-area communications were effective, both at the control area and reliability coordinator levels.		
System Restoration			
26. Were black start and restoration procedures available and adequate in each area? Were they followed and were they adequate to the restoration task? Were pre-defined authorities respected during the restoration?	• Onsite audit of blackstart and restoration procedures and plans. • Analyze whether the plans and procedures were used and whether they were sufficient for this major event.		

Analysis Objective	Analysis Approach	Schedule	Status
27. What issues were encountered in the restoration that created unexpected challenges or delays? What lessons were learned in the restoration (both things that went well and things that did not).	• Solicit information from operating entities and Regional Entities regarding unexpected challenges and delays in restoration, and lessons learned. • Analyze what worked well and what did not in the restoration.		
System Planning and Design			
28. Were the conditions leading up to the major event within the design and planning criteria for the transmission systems involved?	• Request transmission owners and Regional Entities involved to report any violations of design or planning criteria prior to or leading up to the major event.		
Conclusions and Recommendations			
29. From a technical perspective, what are the root causes of this major event? What additional technical factors contributed to making the major event possible?	• Conduct a root cause analysis on the findings and data. Categorize results as "root cause" or "contributing factor". Focus on technical aspects.		
30. What are the significant findings and lessons learned resulting from the analysis regarding technical failures leading to the major event? What actions are recommended to avoid similar future major events and improve bulk power system reliability? What issues may be inconclusive and require future analysis?	• Draft report of significant findings, lessons learned, and recommendations.		
31. Final Report	• Prepare and coordinate publication of final report.		

Appendix 8

Proposed Revisions 11-7-2011

NERC ~~Blackout and Disturbance~~Event Response Procedures

Effective ~~October 18, 2007~~ _____, 2012

North American Electric Reliability Corporation

NERC ~~Blackout and Disturbance~~Event Response Procedures

Introduction

~~NERC, through its professional staff and the regional entities and their members, provide the best source of technical and managerial expertise for responding to major events that affect the bulk power system.~~

This Appendix provides a structured and detailed framework which defines the roles and responsibilities of NERC, the Regional Entities, and registered entities in conducting analyses of events that occur on the bulk power system (BPS).

The Electric Reliability Organization (ERO) enterprise-wide event analysis program is based on the recognition that BPS system events that occur, or have the potential to occur, have varying levels of significance. The manner in which registered entities, Regional Entities and NERC evaluate, respond and process these events is intended to reflect either the significance of the event or specific system conditions germane to the reliability of the BPS and the circumstances involved, or both.

When a BPS event occurs, the entities involved must first recognize it, then respond to it, and ultimately stabilize the system. Once the system has been stabilized, event analysis can begin.

Event analysis is the aggressive critical self analysis of BPS events that have occurred or have the potential to cascade. This analysis produces findings, lessons learned and best practices that provide experience-based insight in order to prevent repeat occurrences, provide informational material for entity training and industry learning, and institutionalize knowledge.

Event analysis begins with the registered entities that experienced the event, or circumstances surrounding a potential event, and depends upon collaboration between the registered entities, the Regional Entities, and NERC. The delineation between event categories is based on event significance and potential impact to the BPS. The significance and potential impact will drive the level of analysis for a particular event.

Critical components of an effective event analysis effort include the following:

- Prioritization of events affecting reliability of the BPS – detailed analysis for significant events and concise reviews for minor events
- Establishment of a clear timeline illustrating the sequence of events
- Specific identification of the causal factors of the event
- Identification and timely implementation of corrective actions
- Development and dissemination of alerts, quality lessons learned and best practices to the industry
- Emphasis on an aggressive critical self analysis by registered entities
- Emphasis on being a learning organization, including proactive improvement of BPS reliability
- Process transparency and predictability

- Proper confidentiality of data and information
- Identification of emerging trends discovered through event analysis
- Clarity and certainty about event analysis roles, responsibilities, and expectations for respective entities, including target timeframes for completing certain actions
- Appropriate Regional Entity and NERC review and oversight of registered entity event analysis results

Categorization of Events

Events are classified into one of five categories referred to as Category 1 (least significant) to Category 5 (most significant) based on the criteria specified in the "Event Category and Level of Analysis" Appendix to the NERC *ERO Event Analysis Process*. The categories of events and the criteria for determining the category into which an event should be classified may be revised by NERC based on experience and technical input. Any such revisions will be implemented in the *ERO Event Analysis Process*. However, an event may be assigned to a higher or lower Category based on the significance of the event. For these purposes, the following levels of significance will be considered: Significant, Conditionally Significant, Consequential and Noteworthy, Non-Consequential but Noteworthy, or Not Consequential:

Significant – The event caused or had the potential to cause an appreciable reduction in bulk power system reliability, excessive risk to generation and/or transmission facilities and serious harm to individuals. A Significant event results from the breakdown of multiple defenses and barriers and/or a non-adherence to one or more reliability standards. A Significant event will normally correspond to a Category 4 or 5 event. However, even if an event does not meet the criteria to be classified as a Category 4 or Category 5 event, it may be determined to be Significant based on the above-described cause(s) and impact(s) and one or more or the following considerations:

Significant by Act of Sabotage – The event involves a coordinated effort of sabotage or terrorism to the bulk power system.

Significant by Recurring – The event is similar to a previously-reported Significant event and should have been avoided by implementation of NERC Alerts or recommendations or lessons learned from previous event analysis.

Significant by Alert – The event is of a type that has been described in a previously-issued NERC Alert, usually in the format of a Recommendation or a Essential Action.

The NERC Director of Reliability Risk Management, with input from applicable Regional Entity management and applicable governmental authority staff and subject to approval by the NERC President and CEO, will determine if an event should be classified as Significant.

Conditionally Significant – An event is classified as Conditionally Significant based on the uniqueness of the event and other factors outside of common occurrences or reliability concerns. Among other factors, an event may be classified as Conditionally Significant (i) based on the event drawing substantial attention from federal or state

governmental authorities and from the media, or (ii) due to the presence of unusual external conditions such as tornados, hurricanes, earthquakes, fires, floods or explosions that create lengthy unplanned outages of generation or transmission elements or result in operation of the bulk power system at a significantly reduced capability.

The NERC Director of Event Analysis and Investigations, with input from applicable Regional Entity management and Applicable Governmental Authority staff and subject to approval by the NERC President and CEO, will determine if an event should be classified as Conditionally Significant.

Consequential and Noteworthy– The event caused an unexpected change in generation or other bulk power system conditions. The event should produce lessons learned and the possibility of a NERC Alert for dissemination. A Consequential and Noteworthy event will normally correspond to a Category 1, 2 or 3 Event.

Non-Consequential but Noteworthy – The event did not result in notable consequences but had the potential to be an event that would have more severe consequences under slightly different circumstances (e.g., a "near miss"). The event may produce lessons learned for bulk power system users, owners and operators.

Not Consequential – The event resulted in minimal or no consequences and there would be no value to analyzing it.

In this Appendix, the term "major event" is intended to refer to a Category 4 or 5, or a Significant or Conditionally Significant, event; and the term "other event" is intended to refer to a Category 1, 2 or 3, or a Consequential and Noteworthy, Non-Consequential but Noteworthy, or Not Consequential event. However, for purposes of determining and assigning responsibilities for the analysis of an event, an event may be determined to be "major" even though it does not meet the criteria or have the characteristics of a Category 1 or 2, or a Significant or Conditionally Significant event.

Responsibility for Event Analysis Based on Category or Significance of Event

NERC's role following an event affecting the bulk power system, including a ~~blackout or other major bulk electric~~major event such as a significant loss of load or generation, significant bulk power system disturbance, or other emergency on the bulk power system, is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the ~~event. Working closely with the regional entities and reliability coordinators, NERC~~major event. Generally, NERC will take the lead role in the analysis of a major event, while the applicable Regional Entity or the registered entity will be responsible for the event analysis in the case of another event.

Response to and Analysis of Major Events

In the case of a major event, NERC, working closely with the Regional Entities and Reliability Coordinators, will coordinate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

When responding to any major event where physical or cyber security is suspected as a cause or contributing factor to ~~an~~the major event, NERC will immediately notify appropriate government agencies and coordinate its analysis with them.

Following the occurrence of a major event, a planning meeting involving the affected registered entities, applicable Regional Entities, NERC, and other applicable governmental authorities (AGA) is held to discuss the event and to determine how the event analysis should proceed. The analysis of major events will be conducted by an event analysis team led by the applicable Regional Entities or NERC.

As specified in the ERO Rules of Procedure, Section 807.f, the NERC President and CEO has the authority to determine whether any event warrants analysis at the NERC level. A Regional Entity may request that NERC elevate an analysis of a major event to the NERC level.

If the analysis is led by a Regional Entity, then NERC staff and other appropriate technical experts from the NERC community will participate, as needed, as members of the Regional Entity analysis team.

During the conduct of ~~some~~ NERC-level analyses, assistance may be needed from government agencies. Collaborative analysis with certain government agencies may be appropriate in some cases; e.g., collaborating with the Nuclear Regulatory Commission technical staff when a ~~system~~major event involves a nuclear unit. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; analyses related to possible criminal or terrorist involvement in the major event; resources for initial data gathering immediately after the major event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies. If a federal or multi-national government analysis is called for, government agencies should work in primarily an oversight and support role, in close coordination with the NERC analysis.

~~It is critical to establish, up front, a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the analysis and reporting of findings, conclusions, and recommendations related to major blackouts, disturbances, or other emergencies affecting the bulk power system.~~

~~Depending on the severity and of the event and the area impacted, the event analysis may be conducted either by NERC or by the impacted RE. If the analysis is conducted by the regional entity, NERC staff, at least one member of the NERC Event Analysis Working Group (in addition to the Event Analysis Working Group member from the impacted regional entity), and other appropriate technical experts from the NERC community will participate as members of the regional entity analysis team.~~

If any Applicable Governmental Authority initiates a formal review process in conjunction with NERC, the decision on the composition of the event analysis team, the team lead, the information needed from affected registered entities, and the required scope of the analysis will be discussed and agreed upon by the Applicable Governmental Authority and NERC executive staff.

~~A regional entity~~NERC may lead analyses of occurrences other than major events as needed based on specific facts and circumstances such as insufficient Regional Entity resources. In

addition, a Regional Entity may request NERC to elevate an analysis ~~to a NERC~~ of an occurrence other than a major event to the NERC level. In such cases, ~~all team responsibilities~~the leadership of the analysis team will shift to NERC, and the ~~regional entity~~Regional Entity may continue to participate ~~in the analysis on appropriate teams~~.

~~These procedures do not represent a "cookbook" to be followed blindly. They provide a framework to guide NERC's response to events that may have multiregional, national, or international implications. Experienced industry leadership would still be required to tailor the response to the specific circumstances of the event.~~

Responding to major ~~blackouts and other system disturbances can be divided into~~events involves four phases:

1. situation assessment and communications;
2. situation tracking and communications;
3. data collection, investigation, analysis and reporting (event analysis); and
4. ~~follow-up on~~Publishing of recommendations (lessons learned, best practices, and Alerts, if applicable).

Phase 1 — Situation Assessment and Communications

When leading an event analysis, NERC's primary roles in Phase 1 are to:

- ~~conduct~~Lead or coordinate an initial situation assessment;
- issue a data retention hold notice;
- call for the collection of and analyze necessary initial data and information for the major event;
- assist the ~~regional entity-lead~~Regional Entity-led analysis with determining the need for supplemental technical expertise from the NERC community;
- issue initial findings, conclusions, and recommendations;
- maintain detailed data records (not subject to Freedom of Information Act);
- assist government agencies in criminal analyses when relevant;
- provide technical expertise for modeling and analyzing the major event; and
- follow up on recommendations (responsibility of both NERC and the Regional Entity).

While conducting its initial situation assessment, NERC will make an early determination as to whether the cause of the major event may be related to physical or cyber security, and communicate as appropriate with government agencies.

Notice of a major event is typically received by the NERC ~~Electricity Sector Information Sharing and Analysis Center (ESISAC)~~Bulk Power System Awareness person on duty and relayed to other appropriate NERC personnel.[1] NERC performs an initial situation assessment by contacting the appropriate ~~reliability coordinator(s)~~party or parties, and makes a decision ~~on~~as to whether to activate its crisis communications plan. At the initial stage in gathering information about an incident, it is critical to minimize interference with bulk ~~electric~~power system operators who are in the process of restoring the system. To minimize interference with their work,

[1] NERC maintains 24x7 contact information for its key personnel to facilitate such contacts.

NERC, in its capacity as the ~~ESISAC~~Electricity Sector Information Sharing and Analysis Center (ES-ISAC), should serve as the primary communications link with government agencies.

The ~~ESISAC~~ES-ISAC Concept of Operations (ConOps) specifies the operations plan, communications procedures, and logistics NERC will follow during normal conditions, emergencies, and National Security Special Events. The ConOps includes the primary points of contact (24x7) for the Federal Energy Regulatory Commission, U.S. Department of Energy, U.S. Department of Homeland Security, U.S. Nuclear Regulatory Commission, and Public Safety and Emergency Preparedness Canada.

It is important that during these early hours ~~the ESISAC~~that NERC Bulk Power System Awareness, in coordination with government agencies, ~~determine~~determines whether ~~this~~the major event was caused by the actions of criminal or terrorist parties. The results of this criminal assessment are essential to operators because if there is a possibility that the "attack" is still ongoing, restoration and response actions would need to be tailored to these circumstances. If NERC and government agencies deem it necessary for further criminal analyses, NERC will issue a formal notice to affected systems to retain all relevant information gathered during this phase and subsequent phases of ~~an~~ analysis.

~~The~~NERC Reliability Standards set forth specific criteria and procedures for reporting the bulk power system disturbances and ~~other events are described in NERC Reliability Standard EOP-004-1.~~events. These criteria and procedures are intended to provide a common basis for consistent reporting of abnormal system conditions and events that occur in North America. All registered entities ~~responsible for the reliability of bulk power systems in North America must ensure that sufficient information is submitted to NERC~~that are subject to the requirements of NERC Reliability Standard EOP-004 must report the information required by that Reliability Standard within the time ~~frame required~~periods specified. Reliability coordinators will use the Reliability Coordinator Information System (RCIS) as ~~the~~their primary method of communications to NERC. The ~~ESISAC duty person~~NERC Bulk Power Situational Awareness Group is responsible for monitoring the RCIS for such notifications.

Depending on the scope and magnitude of the major event, NERC will issue media advisories ~~through its crisis communications plan.~~in accordance with its NERC Crisis Action Plan and the NERC Communications Protocol Document.

Phase 2 ~~—~~ Situation Tracking and Communications

Based on the nature and severity of the major event, in Phase 2 NERC will continue to track progress in restoring the bulk power system and service to customers, and keep industry, government agencies, and the public informed. The most important thing to recognize in this phase is that the primary focus of ~~reliability coordinators and transmission operators~~Reliability Coordinators and Transmission Operators is the prompt restoration of the bulk ~~electric~~power system. NERC will coordinate requests by government agencies for information from ~~reliability coordinators and transmission operators~~Reliability Coordinators and Transmission Operators, and serve as a conduit and coordinator between industry and government for regular status reports on the restoration.

As ~~events continue~~the major event continues, NERC will determine whether a detailed analysis of the major event should be conducted, and start to identify manpower requirements, data collection and retention requirements, and at what level the analysis should be conducted. If the major event is localized within a region, NERC will participate in the ~~event~~ analysis of the ~~regional entity~~major event led by the Regional Entity.

Phase 3 ~~—~~ Data Collection, Investigation, Analysis, and Reporting

Based on the scope, magnitude, and impact of ~~an~~a major event, during Phase 3 NERC may:

1. perform an overview analysis of bulk power system and generator response;
2. rely on one of its ~~regional entities~~Regional Entities to ~~conduct~~lead the analysis and monitor the analysis results;
3. work with a ~~regional entity~~Regional Entity in its analysis; or
4. conduct a NERC-level analysis.

The NERC President and CEO will decide, based on the initial situation assessment and consultation with others, including the NERC technical committee officers[2], if the situation constitutes a major event and whether a NERC-level analysis is warranted. If a NERC-level analysis is to be conducted, the NERC President and CEO will appoint the ~~Director of Events Analysis and Information Exchange to lead the analysis and assemble a high-level technical steering group to provide guidance and support throughout the analysis~~analysis team leader.

NERC reserves the right to elevate or augment an analysis performed by a ~~regional entity~~Regional Entity pending the results of the ~~regional entity~~Regional Entity analysis. Additional requests for analyses or supporting data may be made by NERC at any time in the ~~investigation~~analysis process.

~~A regional entity may request NERC to elevate an analysis to a NERC-level. In such cases, all team responsibilities will shift to NERC, and the regional entity may continue to participate in the analysis on appropriate teams.~~

~~If the analysis is to be lead by one of the regional entities, a member of the NERC staff, at least one member of the NERC Event Analysis Working Group (in addition to an Event Analysis Working Group member from the impacted regional entity), and other appropriate technical experts from the NERC community will participate as a triage team. The triage team will participate as members of the regional entity analysis team. The triage team will also will assist the regional entity with determining if additional technical expertise from the NERC community are needed for the analysis.~~

~~For NERC-level analyses, the first task of the Director of Events Analysis and Information Exchange would be to identify what technical and other resources and data would be needed from staff, the industry, and government, and to issue those requests immediately. This task will include identification of any special managerial, forensic, or engineering skills needed for the analysis. Secondly, the Director of Events Analysis and Information Exchange must issue~~

[2] NERC will maintain a list of 24x7 contact information for its technical committee officers.

~~requests for those resources and information. Third, the Director of Events Analysis and Information Exchange must organize the teams that will conduct and report on the analysis.~~

~~The teams needed for a particular analysis will vary with the nature and scope of the event. Attachment A describes the typical teams that would be required for a NERC-level analysis, and Attachment B provides suggested guidelines for the NERC-level analysis team scopes. Individuals that participate on these teams will be expected to sign an appropriate confidentiality agreement. NERC uses a standard (pro forma) confidentiality agreement (Attachment C) for participants in event analyses, which it will adapt for specific analyses.~~

~~The Blackout and Disturbance Analysis Objectives, Approach, Schedule, and Status (Attachment D) and Guidelines for NERC Reports on Blackouts and Disturbances (Attachment E) are used to guide and manage analysis and reporting on major blackouts and disturbances.A~~ NERC-level analysis will comprise (a) collecting pertinent ~~event~~ data on the major event; (b) constructing a detailed sequence of events leading to and triggering the ~~disturbance~~major event; (c) assembling bulk power system models and data and conducting detailed bulk power system analysis to simulate ~~pre- and post-event~~ conditions before and after the major event; ~~and~~ (d) conducting a root cause analysis to determine causal factors, necessary corrective actions and any needed reliability mitigation; and (e) issuing findings, conclusions, and recommendations. The details of these ~~four~~five phases of the analysis are:

a. Collecting Pertinent Data on the Major Event ~~Data~~

- Collect all pertinent ~~event~~ logs, disturbance recorders, operator transcripts, and other bulk power system data pertaining to the major event.

b. Detailed Sequence of Events Leading to and Triggering the Major Event

- Construct a detailed sequence of events leading to and triggering the major event. Reconcile ~~event~~ logs, disturbance recorders, operator transcripts, and other bulk power system data to create an accurate sequence of events.
- Enter and preserve all data in a secure data warehouse.

c. Detailed Bulk Power System Analysis

- Assess the sequence of events to determine critical times for study.
- Assemble the necessary bulk power system models and data from ~~regional entity~~Regional Entity and ~~operating~~registered entities to accurately model (with power flow and dynamic simulations) the ~~pre-event~~ conditions prior to the major event.[3] Determine ~~pre-event~~ conditions at critical times prior to ~~event~~ initiation of the major event, including an assessment of reliability margins in the ~~pre-event~~ time ~~frame~~period preceding the major event.
- Analyze data from phasor measurement units, high-speed data recorders, digital fault recorders, digital relays, and system relay targets.[4]

---

[3] ~~NERC is developing standards for data and model validation that will facilitate modeling activities in future blackout analyses.~~

[4] ~~NERC is developing standards for dynamic monitoring equipment and the deployment of such equipment at critical locations in the bulk electric system.~~

- Analyze generator and load performance, including underfrequency and undervoltage relay actions.
- Use the model information and sequence of events to dynamically model the trigger ~~events~~occurrences and the outage sequence. Identify the bulk power system phenomena that propagated the failure. Provide graphical results showing the nature of the cascade. Conduct additional analyses as initial findings identify the need for further study.

d. Cause Analysis

Cause analysis methodology and the tools used guides the overall analysis process by providing a systematic approach to evaluating root causes, causal factors and contributing factors leading to the event. Cause analysis enables the analysis process to develop a factual record leading to logical and defensible conclusions in the final events analysis (EA) report regarding the causes of the event.

e. Findings, Conclusions, and Recommendations

- Identify and assess ~~failures~~causal factors contributing to the major event, including possible instability conditions, system protection mis-operations, generator actions, etc.
- Either identify or rule out man-made/criminal cyber or physical attacks on the ~~electric~~bulk power system.
- Determine if the bulk power system ~~was~~components were being operated within equipment and system design criteria at the time of the ~~outage~~major event.
- Assess the qualifications, training, SCADA/EMS tools, and communications available to bulk power system operators and ~~reliability coordinators~~Reliability Coordinators, and how effective these were leading up to and during the major event.
- Assess the adequacy of communications system and communications among bulk power system operators.
- Identify any issues regarding maintenance or equipment conditions that may have contributed to the outage.
- Determine whether bulk power system restoration procedures were available and adequate. Identify any issues that caused unexpected delays in the restoration of generators and loads.
- Identify the root causes[~~5~~3] and contributing factors of the ~~cascading outage~~major event.
- Recommend actions to prevent ~~cascading outages~~major events in the future and to improve bulk power system reliability.
- Determine whether the ~~system is adequately designed~~design of bulk power system components was a contributing factor to the event.
- All compliance issues will be referred to the NERC Director of ~~Compliance~~Enforcement.

[~~5~~] ~~NERC will rely on root cause analysis experts, both from within the industry and outside consultants, to conduct these analyses.~~

Phase 4 — Follow-up on Recommendations

For Phase 4 NERC and the ~~regional entities~~Regional Entities will follow up on specific recommendations coming from all analyses, whether done at the ~~regional entity~~Regional Entity or NERC level. In certain cases, where government agencies have taken a direct role in the analysis, reports will be made to those agencies on progress in addressing the recommendations.

Event Analysis of Other Events

For events (category 1 – 3) the registered entity should follow the methodology and steps outlined in the current version of the ERO event analysis process. The basic steps are outlined below.

1. The registered entity makes an initial assessment of an event, which includes determining the initial event category.
2. If the event is a "qualifying event" (*i.e.* Category 1-5), a planning meeting is held with all involved parties.
3. The registered entity submits a brief report.
4. If the qualifying event is a Category 3 or higher, the registered entity must also submit an event analysis report (EAR).
5. Lessons learned and best practices (if any) are developed and shared with industry.
6. The event is closed.

For lower tiered events, registered entities perform the event analysis. Coordination of the analysis becomes more complicated for events that involve a broader geographic area, involve multiple registered entities, or include a complex set of facts and circumstances.

A planning meeting should be held by the registered entity and the applicable Regional Entity as soon as possible following the occurrence of a qualifying event. During the meeting, agreement should be reached on the event category, the level of analysis, a timeline for completion of the report, and the need for a data retention hold and draft or preliminary reports. The event analysis should have a level of detail and target timeframe commensurate with the nature and scope of the event. Although the category of the event provides general guidance on the level of analysis needed, these guidelines may be adjusted based on the overall significance of the event and the potential for valuable lessons learned.

Registered entities that reside in two Regional Entity footprints should notify both Regional Entities of an event that spans both Regions. Following the notification, the two Regional Entities will determine which one will coordinate the remaining steps of the event analysis process. When multiple registered entities are involved in or affected by an event, they should collaborate with the Regional Entity to determine if it is appropriate for each entity to prepare a report or for the entities to work together to prepare a single report.

Weather-Related Occurrences - If a weather-related occurrence falls within any of the categories it should be reported. The affected registered entities should focus on restoration efforts. After restoration is complete, the affected entities, in coordination with Regional Entities, will determine if any additional information or event analysis steps are needed.

Development of Lessons Learned from Events

Lessons learned as a result of an event analysis should be shared with the industry as soon as practical. Proposed lessons learned should be drafted by a registered entity and should be submitted to the applicable Regional Entity. The lessons learned should be detailed enough to be of value to others and should not contain data or information that is deemed confidential. When possible, one-line diagrams, other diagrams and representations should be included to enhance the information provided in the lessons learned. Vendor-specific information should not be included unless it is discussed and coordinated with the vendor. If dissemination of vendor-specific information is beneficial, it may be pursued outside the event analysis process.

Lessons learned will be reviewed by selected technical groups and NERC staff for completeness and appropriateness prior to posting.

In normal operations, events may occur on the bulk power system that do not meet the reporting thresholds of the defined event categories but may yield lessons of value to the industry. These lessons learned can include the adoption of unique operating procedures, the identification of generic equipment problems, or the need for enhanced personnel training. In such cases, an event analysis report would not be required; however, registered entities are encouraged to share with their Regional Entities any potential lessons learned that could be useful to others in the industry, and to work with the Regional Entity and NERC to develop the lessons learned for dissemination.

Reporting and Analysis Requirements for Registered Entities in Connection with Events

Registered entities are required to report the occurrence of defined BPS disturbances and unusual occurrences to the applicable Regional Entity and NERC in accordance with various NERC and Regional reliability standards and other requirements. **It should be noted that following the event analysis process does not relieve the registered entity from mandatory reporting requirements dictated by regulatory authorities or NERC standards.**

In addition, a registered entity involved in an event will be required to submit one or more of the following reports, depending on the category of the event: a Brief Report; an Event Analysis Report; and proposed lessons learned. The following table shows the reports and timing requirements, by category of event:

Event Category	Brief Report	Event Analysis Report	Lessons Learned	Close Event Analysis
1	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Not required	Within 30 business days (if applicable)	10 business days following receipt of Brief Report
2	Draft within five business days, sent to applicable Regional	(If requested) Within 30 business days of	Within 30 business days	30 business days following receipt of

	Entity for review. Final report within 10 days.	the event		EAR
3	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Within 60 business days of the event	Within 60 business days	30 business days following receipt of EAR
4	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Within 180 business days of the event	Within 180 business days	60 business days following receipt of EAR
5	Draft within five business days, sent to applicable Regional Entity for review. Final report within 10 days.	Within 180 business days of the event	Within 180 business days	60 business days following receipt of EAR

The final Event Analysis Report should address corrective actions and recommendations related to the event's causal factors and any identified lessons learned. Positive outcomes identified during an event should be documented as a best practice. These are key parts of a continuous learning and improvement program.

Event Analysis Interface with Compliance

To support a strong culture of compliance, registered entities are expected to perform a compliance analysis and to develop a compliance self-assessment report proportional to the significance of the event/risk to the BPS for categorized events in which there could be a gap between actual system or human performance and the requirements of NERC or regional reliability standards. Registered entities are encouraged to submit a compliance self-assessment report to the Regional Entity compliance liaison proportional to the significance of the event/risk to the BPS for categorized events. This report should encompass a sufficiency review, proportional to the event's significance, of applicable standards associated with the event.

Registered entities who make a good faith effort to self-identify and self-disclose possible violations stemming from their event analyses will be afforded consideration in any enforcement action in accordance with the NERC *Sanction Guidelines*, **Appendix B** to the Rules of Procedure. If further analysis by the Regional Entity or NERC reveals other possible violations, the registered entity's participation and cooperation will be noted and considered.

For this reason, it is recommended that registered entities establish a liaison between their internal event analysis and compliance functions. This will provide a clearer understanding and a more efficient transfer of information from both an operational and a compliance standpoint, and it will facilitate a thorough standards review by the registered entity.

Any possible violations of reliability standards that were identified in the registered entity's compliance self-assessment should be self-reported by the registered entity through the existing Compliance Monitoring and Enforcement Program procedures, with a notification that they were discovered as a result of participating in the ERO event analysis program and completing a compliance self-assessment of the event.

As provided in **Appendix 4B**, *Sanction Guidelines*, of the NERC Rules of Procedure, if the registered entity is fully cooperative in the event analysis process, conducts a self-analysis of the event and submits a timely compliance self-assessment report, and submits self-reports of any possible violations of reliability standards and implements corrective and mitigating actions, then in any subsequent enforcement actions pursuant to the Compliance Monitoring and Enforcement Program, the registered entity's actions will be considered as mitigating factors in the determination of any penalties or sanctions for violations of reliability standards in connection with the event.

Attachment A

Typical Team Assignments for Analysis of Blackouts or Disturbances[6]

Fact-Finding Teams

- Physical and/or cyber security (if needed)
- On-site interviews
- System data collection (frequency, voltages, generation and loads)[7]
- System protection and control information
- System restoration
- Coordination with regional entity teams

Assessment and Analysis Teams

- Performance of generation and transmission protection systems
- Frequency analysis
- Equipment maintenance
- SCADA/EMS/Tools
- Operator training
- Standards compliance
- System planning
- System operation
- System restoration
- Root cause analysis
- System simulation
- Interregional coordination
- Vegetation management
- Recommendations for future actions
- Security and law enforcement liaison

Data Management Teams

- Data requests
- Data collection
- Data warehouse – entry, logging, retention, and maintenance[8]
- Data release[9]

Report Writing Teams

- Text
- Graphics
- Presentations

---

[6] The analysis team leader will specify the tasks required of each team.

[7] Standard forms and procedures for the collection of data and information will be adapted for particular circumstances.

[8] Experience with data warehousing and access procedures gained during the investigation of the August 2003 blackout will be used in future investigations.

[9] Data release procedures will prevent inappropriate disclosure of information.

~~**Communications Teams**~~

- ~~Press releases~~
- ~~Interface with government agencies~~
- ~~Interviews~~

Attachment B

NERC Blackout and Disturbance Response Procedures
Guidelines for Analysis Team Scopes

Each blackout or disturbance is unique and will therefore demand a customized approach to its analysis. The following guidelines for analysis team scopes are suggestive rather than definitive. Not all the teams listed may be needed for a particular analysis.

Data Requests and Management — This team organizes large volumes of raw data and value-added information produced by analysts in support of the blackout analysis into a data warehouse. The team issues data requests from affected entities, catalogs and stores all data received, and provides secure and confidential access to teams and personnel supporting the analysis. The team serves as the single point for issuing data requests, receiving and storing data, and managing data queries by the analysts, and is responsible for assuring consistency, security, and confidentiality of the data and minimizing redundant data requests.

Sequence of Events — A precise, accurate sequence of events is a building block for all other aspects of the analysis, and is a starting point for the root cause analysis. It is the basis for developing computer models to simulate system conditions and evaluate steady state and stability conditions in the period leading to blackout. The sequence of events is the foundation of facts upon which all other aspects of the analysis can proceed.

System Modeling and Simulation Analysis — System modeling and simulation allows the investigators to replicate system conditions leading up to the blackout. While the sequence of events provides a precise description of discrete events, it does not describe the overall state of the electric system and how close it was to various steady state, voltage stability, and power angle stability limits. An accurate computer model of the system, benchmarked to actual conditions at selected critical times, allows analysts to conduct a series of sensitivity studies to determine if the system was stable and within limits at each point in time leading up to the blackout, and at what point the system became unstable. It also allows analysts to test different solutions to prevent cascading. Although it is not possible recreate the entire blackout sequence, simulation methods will reveal the mode(s) of failure initiating the blackout and propagating through the system.

Root Cause Analysis — Root cause analysis guides the overall analysis process by providing a systematic approach to evaluating root causes and contributing factors leading to the blackout or disturbance. This team works closely with the technical analysis teams and draws on other data sources as needed to record verified facts regarding conditions and actions (or inactions) that contributed to the blackout or disturbance. The root cause analysis guides the overall analysis by indicating areas requiring further inquiry and other areas that may be of interest regarding lessons learned, but are not causal to the blackout. Root cause analysis enables the analysis process develop a factual record leading to logical and defensible conclusions in the final report regarding the causes of the blackout.

Operations Tools, SCADA/EMS, Communications, and Operations Planning — This team will assess the observability of the electric system to operators and reliability coordinators, and the availability and effectiveness of operational (real-time and day-ahead)

reliability assessment tools, including redundancy of views and the ability to observe the "big picture" regarding bulk electric system conditions. The team also investigates the operating practices and effectiveness of those practices of operating entities and reliability coordinators in the affected area. This team investigates all aspects of the blackout related to operator and reliability coordinator knowledge of system conditions, action or inactions, and communications.

Frequency/ACE — This team will analyze potential frequency anomalies that may have occurred, as compared to typical interconnection operations, to determine if there were any unusual issues with control performance and frequency and any effects they may have had related to the blackout.

System Planning, Design, and Studies — This team will analyze the responsibilities, procedures, and design criteria used in setting system operating limits, and compare them to good utility practice. The team will review the actual limits in effect on day of the blackout and whether these limits were being observed. The team will review voltage schedules and guides, and reactive management practices in the affected areas, including use of static and dynamic reactive reserves. The team will analyze the tagged and scheduled transactions to determine if inter-regional transfer limits were understood and observed. The team will analyze system planning and design studies completed in the affected areas to determine if operating conditions were consistent with the assumptions of those studies and whether the planning and design studies were sufficient and effective.

Transmission System Performance, Protection, Control, Maintenance, and Damage — This team investigates the causes of all transmission facility automatic operations (trips and reclosures) leading up to the blackout on all facilities greater than 100 kV. This review includes relay protection and remedial action schemes, identifying the cause of each operation, and any misoperations that may have occurred. The team also assesses transmission facility maintenance practices in the affected area as compared to good utility practice and identifies any transmission equipment that was damaged in any way as a result of the blackout. The team will assess transmission line rating practices and the impact that ambient temperature and wind speeds had on the transmission line performance in terms of the design temperature of the transmission conductors. The team shall report any patterns and conclusions regarding what caused transmission facilities to trip; why the blackout extended as far as it did and not further into other systems; why the transmission separated where it did; any misoperations and the effect those misoperations had on the blackout; and any transmission equipment damage. The team will also report on the transmission facility maintenance practices of entities in the affected area compared to good utility practice. Vegetation management practices are excluded here and covered in a different team.

Generator Performance, Protection, Controls, Maintenance and Damage — This team will investigate the cause of generator trips for all generators with a 10 MW or greater nameplate rating leading to and through the end of the blackout. The review shall include the cause for the generator trips, relay targets, unit power runbacks, and voltage/reactive power excursions. The team shall report any generator equipment that was damaged as a result of the blackout. The team shall report on patterns and conclusions regarding what caused generation facilities to trip. The team shall identify any unexpected performance anomalies or unexplained events. The team shall assess generator maintenance practices in the affected area as compared to good utility practice. The team will analyze the coordination of generator under-frequency

settings with transmission settings, such as under-frequency load shedding. The team will gather and analyze data on affected nuclear units and work with the Nuclear Regulatory Commission to address nuclear unit issues.

Vegetation/ROW — This team investigates the practices of transmission facility owners in the affected areas for vegetation management and ROW maintenance. These practices will be compared with accepted utility practices in general, and with NERC Reliability Standards. The team will evaluate whether the affected parties were within their defined procedures at the time of the blackout and will investigate historical patterns in the area related to outages caused by contact with vegetation.

Analysis Process and Procedures Review — This team will review the process and procedures used in the analysis of the blackout, make recommendations for improvement, and develop recommendations for appropriate processes, procedures, forms, etc. to guide and expedite future analyses including coordination and cooperation between NERC, its regional entities, and government agencies.

Restoration Review — All entities operating portions of the bulk electric system in North America are required by NERC Reliability Standards to maintain System Restoration Plans and Black Start Plans, and Reliability Coordinators are required to coordinate the implementation of those plans. This team will review the appropriateness and effectiveness of the restoration plans implemented and the effectiveness of the coordination of these plans.

NERC and RE Standards/Procedures and Compliance — This team reviews the adequacy of NERC Reliability Standards, regional entity standards and procedures, and the compliance monitoring program to address issues leading to the blackout. The team also reviews the compliance of the affected operating entities with Reliability Standards. For less significant event analyses, this tea may not be needed. However, all compliance issues will be referred to the NERC Director of Compliance.

Attachment C

NERC CONFIDENTIALITY AGREEMENT
FOR
ANALYSIS OF BLACKOUTS AND DISTURBANCES

This Confidentiality Agreement ("Agreement"), dated _____, is between the North American Electric Reliability Corporation ("NERC"), and

_____, a member of the NERC Event Analysis Team ("Team Member")(collectively referred to as "Parties").

WHEREAS, NERC is conducting an analysis of the power event that occurred in _____ on _____ and related matters ("Event"); and

WHEREAS, NERC has established a team to carry out that analysis ("Event Analysis Team"); and

WHEREAS, in order for the Event Analysis Team to fulfill its objectives, it is necessary for the Event Analysis Team have access to confidential or business sensitive information from operating entities within the _____ and to be able to conduct open and unconstrained discussions among team members,

The Parties therefore agree as follows:

1. The term "Event Analysis Information" means all information related in any way to the Event that operating entities within the _____ or their representatives have furnished or are furnishing to NERC in connection with NERC's analysis of the Event, whether furnished before or after the date of this Agreement, whether tangible or intangible, and in whatever form or medium provided (including, without limitation, oral communications), as well as all information generated by the Event Analysis Team or its representatives that contains, reflects or is derived from the furnished Event Analysis Information; provided, however, the term "Event Analysis Information" shall not include information that (i) is or becomes generally available to the public other than as a result of acts by the undersigned Parties or anyone to whom the undersigned Parties supply the Information, or (ii) is known to or acquired by the Team Member separate from receiving the information from the Event Analysis Team.

2. The Team Member understands and agrees that the Event Analysis Information is being made available solely for purposes of the Event Analysis and that the Event Analysis Information shall not be used in any manner to further the commercial interests of any person or entity. The Team Member further understands and agrees that he or she will not disclose Event Analysis Information to any person who has not signed this Agreement except as such disclosure may be required by law or judicial or regulatory order.

3. If Team Member's employing organization has signed the NERC Confidentiality Agreement for Electric System Security Data ("NERC Security Data Agreement"), paragraph 2 shall not be deemed to prohibit Team Member from disclosing Event Analysis Information to

other employees of that organization, but only to the extent that "security data" as defined in the NERC Security Data Agreement is shared within the organization.

4. The Parties expressly agree that Event Analysis Information shall otherwise only be disclosed through official releases and reports as authorized by NERC.

5. It shall not be a violation of the NERC Confidentiality Agreement for Electric System Security Data for a Reliability Coordinator to furnish Event Analysis Information to an Event Analysis Team Member who has signed this Agreement.

6. This Agreement shall be for sole benefit of the parties hereto. This Agreement may be modified or waived only by a separate writing signed by the Parties. If any clause or provision of this Agreement is illegal, or unenforceable, then it is the intention of the Parties hereto that the remainder of this Agreement shall not be affected thereby, and it is also the intention of the Parties that in lieu of each clause or provision that is illegal, invalid or unenforceable, there be added as part of this Agreement a clause or provision as similar in terms to such illegal, invalid or unenforceable clause or provision as may be possible and be legal, valid and enforceable. This Agreement will be governed and construed in accordance with the laws of the State of New Jersey, except for any choice of law requirement that otherwise may apply the law from another jurisdiction.

7. This Agreement shall have a term of two (2) years from the date hereof, except that the obligations of paragraphs 2, 3, and 4 shall continue for five (5) years from the date hereof.

Pre-Major Event Conditions			
1. What was the precursor sequence of events leading to the major event?	• Assemble data/alarm logs and time-stamped sequence information. • Develop and maintain an expanding database of log and time-stamped sequence information. • Develop a precursor sequence of high-level, events relevant to, and leading to ~~event~~ initiation of the major event. • Reconcile the precursor sequence of events with those emerging from ~~REs~~Regional Entities, RTOs, and operating entities.		
2. What time frames are relevant for ~~pre-event~~ assessment of bulk power system conditions prior to the major event? What points in time should be used to establish a baseline set of study conditions when the bulk power system was last known to be stable and within normal operating criteria?	• Referencing precursor sequence of events, determine relevant times to develop base case conditions (stable and within normal operating criteria). • Verify relevant time horizons and availability of bulk power system data at those times with ~~REs organizations, RTOS~~Regional Entities, RTOs, and operating entities.		
3. What models and data can best simulate bulk power system conditions prior to and during the major event? What is the relevant scope of the bulk power system for detailed study (what is considered the boundary of the ~~study~~bulk power system to be studied and what is considered neighboring or external bulk power systems?)	• Identify up-to-date bulk power system model(s) appropriate for powerflow and transient and dynamic simulations (determine if detailed eastern interconnection model is needed or multi-regional model(s) are needed. • Identify what models are available in ~~REs~~Regional Entities, RTOs, and operating entities. • Identify who will actually perform power flow, transient and dynamic simulations; hire contractor(s) as needed. • Identify and assemble data required for these models. • Develop and maintain a bulk power system data repository.		
4. What bulk power system conditions existed in the precursor time horizon leading up to the major event (at the times identified in ~~1.~~1)?	• Obtain and manage data for powerflow: bulk power system configuration, planned and unplanned outages, unit commitment and dispatch, interchange schedules, congestion conditions, reserves, loads, state estimator snapshots, deratings and limitations, frequency, etc. Identify who will maintain and run powerflow simulations. • Work with ~~REs~~Regional Entities, RTOs, and operating entities to develop powerflow cases defining the base conditions for each relevant		

Analysis Objective	Analysis Approach	Schedule	Status
	time, ensuring the powerflows model each critical juncture leading up to the major event. • Identify and review results of additional studies completed by reliability coordinators, RTOs and operating entities. • Assess the powerflow results with respect to steady state operating criteria (was the bulk power system within all known limits at each precursor time)?		
5. Were there any prior-existing abnormalities, instabilities, reliability criteria violations, or reliability issues in the precursor sequence time horizon? Prior to ~~event~~ initiation of the major event were there any latent instability conditions that would suggest the bulk power system was at risk? Were the precursor conditions ones that had been previously studied by the entities involved? Were there adequate reserves with effective distribution? Were planned outages effectively coordinated?	• Work with ~~REs~~Regional Entities, RTOs, and operating entities to obtain and manage transient and dynamic models for simulations. • Identify who will conduct transient and dynamic simulations and if external contractor(s) are required. • Conduct transient and dynamic simulations at each of the precursor study times. • Assess the stability of the bulk power system at each of these times and identify any latent reliability issues prior to ~~blackout~~ initiation of the major event. • Consider creating a visual map of bulk power system conditions. • Document the limitations and assumptions of simulations affecting the certainty of the simulation results.		
~~Blackout~~ Sequence of Events			
6. What was the sequence of ~~system~~ events leading to and directly triggering the ~~blackout~~major event?	• Evaluate data logs, fault recorder data disturbance recorder data, and synchro-phasor measurement to establish a detailed sequence of events that initiated the major event. • Identify the sequence of events that directly led to the major event. • Review and reconcile these trigger events with ~~REs~~Regional Entities, RTO, and operating entity analyses.		
7. What was the sequence of events during the major event?	• Evaluate logs and disturbance recorder data to establish sequence during the ~~blackout~~major event. (The ~~event~~ sequence of events may follow multiple tracks.) • Review and reconcile this sequence with those constructed by ~~REs~~Regional Entities, RTOs, and operating entities. • Consider developing 3-D, time-lapse visualization of the ~~blackout~~major event (U. of Minnesota and/or U. of Wisconsin).		
8. What was the cause of the major event in terms of electrical conditions and other related ~~events~~occurrences? Generally describe any bulk power system breakups, islanding, etc. Were there conditions of voltage or	• Assess triggering sequence and ~~blackout~~major event sequence to establish the causes for the ~~blackout~~major event in terms of electrical conditions and ~~events~~occurrences. • Select key points in sequence for simulation that are relevant for study and that can be accurately modeled. (It may not be possible		

Analysis Objective	Analysis Approach	Schedule	Status
frequency collapse, or unstable oscillations? Was the sequence strictly a sequential "domino" effect of facility trips? What were the bulk power system conditions (snapshots) at key points during the major event?	to reconcile data sufficiently to recreate bulk power system conditions during the ~~blackout~~major event.) • To the extent possible, conduct simulations and assess results at each point during the ~~blackout~~major event. • Review and reconcile results with ~~REs~~Regional Entities, and operating entities.		
9. Why did the major event extend as far as it did? What arrested the major event from extending further into other ~~systems~~areas of the bulk power system?	• Using advanced analysis techniques, assess where and why the major event was arrested.		
10. How did affected non-nuclear generators respond during the major event? Were trips as expected and required by procedures and standards? Did non-nuclear generators remain connected and support the bulk power system in the manner they should have? Did any generator action, generator control functions, or generator protection systems contribute to the major event?	• Prepare a table of affected generators and actions they made leading up to and during the major event, including time-stamped unit trips, relays initiating unit trips, MW and MVar outputs, voltages, and frequency, etc. • Analyze the automatic (including relay trips) and operator-initiated actions of non-nuclear generators to determine whether actions were correct under the conditions or not. • Reconcile non-nuclear generator data and analysis with that of the ~~REs~~Regional Entities, RTOs, and operating entities.		
11. How did nuclear generators respond leading up to and during the ~~blackout~~major event? Were trips as expected and required by procedures and standards? Were there any nuclear safety issues identified?	• Work with NRC to develop a table of sequence of actions and issues regarding affected nuclear generators (both ones that tripped and those that did not). • Refer nuclear issues to NRC for analysis, assisting in their analyses where appropriate.		
12. What was the sequence and amount of load lost? What directly caused load loss (e.g. under-frequency load shed, loss of transmission source, voltage collapse, relay actions, under/over frequency protection or stalls, etc.)	• Work ~~REs~~with Regional Entities, RTOs, and operating entities to develop a description of load lost/impacted, by area. • Analyze and report the cause for load loss in each area.		
13. How did system protection and automated controls operate during the major event? Did they operate correctly or not?	• Assess each automatic trip of a transmission or generator facility for proper or improper relay actions. • Assemble and review ~~RE~~Regional Entity and operating entity reviews of logs, disturbance reports, and relay targets/logs and reconcile with NERC data.		
14. Was any equipment damaged during the major event?	• Request information from ~~REs~~Regional Entities, and ~~companies~~operating entities on equipment damage, as appropriate. • Assess any transmission or generation facilities sustaining damage during the major		

Analysis Objective	Analysis Approach	Schedule	Status
	event, and extent of damage.		
15. Did SCADA/EMS and data communications systems operate correctly during the major event? What problems were noted?	• Request information from ~~REs,~~Regional Entities and ~~companies~~operating entities. • Identify and analyze any problems with SCADA/EMS and data communications at regional and ~~company~~operating entity levels.		
Reliability Standards/Procedures			
16. What NERC reliability standards were applicable to the major event? What violations occurred? Were NERC standards and policies sufficient?	• Compliance staff review NERC standards relevant to the major event and perform a compliance review.		
17. What ~~RE~~Regional Entity reliability standards were applicable to the major event? What violations occurred? Were ~~RE~~Regional Entity standards and policies sufficient?	• Request ~~REs~~Regional Entities to review applicable standards and report compliance with those standards during the major event.		
18. Were any special operating procedures or other operating guidelines in effect and being observed leading up to the major event? Were these procedures sufficient?	• Review and analyze loop flow procedures with ~~involved REs and companies~~Regional Entities and operating entities, and report analysis results.		
19. What other RTO, ~~TO, CA~~Transmission Owner, Balancing Authority procedures were applicable? What violations occurred? Were the procedures sufficient?	• Request RTOs, ~~TOs, CAs~~Transmission Owners, Balancing Authorities to review applicable standards and compliance with existing reliability procedures and standards during the major event, and report results.		
Maintenance			
20. Are there any indications that maintenance of transmission or generation facilities may have contributed to the major event?	• Assess whether equipment or maintenance issues (e.g. tree trimming) contributed to the ~~blackout~~major event and investigate specifics in areas of concern. • Review ~~RE~~Regional Entity assessments of maintenance issues that may have contributed to the major event.		
Personnel, Procedures, and Communications			
21. What conditions were operators and reliability coordinators aware of leading up to and during the major event? What information did they have to warn them of unsafe bulk power system conditions? What problems or concerns did they have? What did they observe during the major event? Were human errors made that contributed to the major	• Develop an interview guide to address procedural and operational issues. • Conduct onsite interviews with operating personnel and reliability coordinators involved. • Analyze interview data to corroborate with technical data and report conclusions.		

Analysis Objective	Analysis Approach	Schedule	Status
event? If there were, what were the causes of the errors?			
22. Were lines of authority clearly understood and respected in the time leading up to and during the major event, as well as during the restoration period?	• Identify critical instructions given and evaluate results. • Review documentation and effectiveness of assignments of operating and reliability authorities.		
23. What communications occurred among operating entities?	• Review voice communications logs. • Evaluate logs relevant to the major event and identify key interactions. Report conclusions.		
24. What were the qualifications (including certification status) and training of all operating personnel involved in the major event and their supervisors?	• Request certification status of all operating personnel from involved operating entities. • Conduct onsite review of training materials and records. • Conduct onsite review of operating procedures and tools		
25. Was the role and performance of the reliability coordinators as expected?	• Review the adequacy of reliability plans for the affected Regional Entities. • Review the actions of the affected reliability coordinators to determine if they performed according to plans. • Assess whether inter-area communications were effective, both at the control area and reliability coordinator levels.		
System Restoration			
26. Were black start and restoration procedures available and adequate in each area? Were they followed and were they adequate to the restoration task? Were pre-defined authorities respected during the restoration?	• Onsite audit of blackstart and restoration procedures and plans. • Analyze whether the plans and procedures were used and whether they were sufficient for this major event.		
27. What issues were encountered in the restoration that created unexpected challenges or delays? What lessons were learned in the restoration (both things that went well and things that did not).	• Solicit information from operating entities and Regional Entities regarding unexpected challenges and delays in restoration, and lessons learned. • Analyze what worked well and what did not in the restoration.		
System Planning and Design			
28. Were the conditions leading up to the major event within the design and planning criteria for the transmission systems involved?	• Request transmission owners and Regional Entities involved to report any violations of design or planning criteria prior to or leading up to the major event.		
Conclusions and Recommendations			
29. From a technical perspective, what are the root causes of this major event? What additional technical factors contributed to making the	• Conduct a root cause analysis on the findings and data. Categorize results as “root cause” or “contributing factor”. Focus on technical aspects.		

Analysis Objective	Analysis Approach	Schedule	Status
major event possible?			
30. What are the significant findings and lessons learned resulting from the analysis regarding technical failures leading to the major event? What actions are recommended to avoid similar future major events and improve bulk power system reliability? What issues may be inconclusive and require future analysis?	• Draft report of significant findings, lessons learned, and recommendations.		
31. Final Report	• Prepare and coordinate publication of final report.		

Personnel, Procedures, and Communications			
21. What conditions were operators and reliability coordinators aware of leading up to and during the event? What information did they have to warn them of unsafe system conditions? What problems or concerns did they have? What did they observe during the event? Were human errors made that contributed to the event? If there were, what were the causes of the errors?	• Develop an interview guide to address procedural and operational issues. • Conduct onsite interviews with operating personnel and reliability coordinators involved. • Analyze interview data to corroborate with technical data and report conclusions.		
22. Were lines of authority clearly understood and respected in the time leading up to and during the event, as well as during the restoration period?	• Identify critical instructions given and evaluate results. • Review documentation and effectiveness of assignments of operating and reliability authorities.		
23. What communications occurred among operating entities?	• Review voice communications logs. • Evaluate logs relevant to the blackout and identify key interactions. Report conclusions.		
24. What were the qualifications (including certification status) and training of all operating personnel involved in the event and their supervisors?	• Request certification status of all operating personnel from involved operating entities. • Conduct onsite review of training materials and records. • Conduct onsite review of operating procedures and tools		
25. Was the role and performance of the reliability coordinators as expected?	• Review the adequacy of reliability plans for the affected REs. • Review the actions of the affected reliability coordinators to determine if they performed according to plans. • Assess whether inter-area communications were effective, both at the control area and reliability coordinator levels.		
System Restoration			
26. Were black start and restoration procedures available and adequate in each area? Were they followed and were they adequate to the restoration task? Were pre-defined authorities respected during the restoration?	• Onsite audit of blackstart and restoration procedures and plans. • Analyze whether the plans and procedures were used and whether they were sufficient for this outage.		
27. What issues were encountered in the restoration that created unexpected challenges or delays? What lessons were learned in the restoration (both things that went well	• Solicit information from operating entities and REs regarding unexpected challenges and delays in restoration, and lessons learned. • Analyze what worked well and what did not in the restoration.		

~~and things that did not).~~			

System Planning and Design			
28. Were the conditions leading up to the event within the design and planning criteria for the transmission systems involved?	• Request transmission owners and REs involved to report any violations of design or planning criteria prior to or leading up to the blackout.		
Conclusions and Recommendations			
29. From a technical perspective, what are the root causes of this event? What additional technical factors contributed to making the event possible?	• Conduct a root cause analysis on the findings and data. Categorize results as "root cause" or "contributing factor". Focus on technical aspects.		
30. What are the significant findings and lessons learned resulting from the analysis regarding technical failures leading to the event? What actions are recommended to avoid similar future events and improve bulk electric system reliability? What issues may be inconclusive and require future analysis?	• Draft report of significant findings, lessons learned, and recommendations.		
31. Final Report	• Prepare and coordinate publication of final report.		

Attachment E

Guidelines for NERC Reports on Blackouts and Disturbances[10]

Introduction and Purpose

Executive Summary of Blackout or Disturbance

Conclusions & Recommendations

Actions to Minimize the Possibility of Future Blackouts and Disturbances

Detailed Analysis of Event

1. **Sequence of Events**
   - 1.1. Sequence of transmission and generation events
     - 1.1.1. Reasons for each trip
     - 1.1.2. Sequence of loss of load
     - 1.1.3. Description of cascading and islanding

[10] Each blackout or disturbance is unique and will therefore demand a customized approach to its investigation and reporting. These guidelines for NERC reports are suggestive rather than definitive. Not all investigations and reports will require covering all of these topics.

2. **System Modeling**
   2.1. Model and assumptions
      2.1.1. Equipment ratings and limits
      2.1.2. Steady state, system dynamics, and other analyses
      2.1.3. Degree of simulation success
      2.1.4. Simulation results
      2.1.5. Conclusions and lessons learned

   2.2. Pre-event Conditions
      2.2.1. Load levels
         2.2.1.1. Forecast vs. Actual
         2.2.1.2. Comparison with planning and operational models
      2.2.2. Generation dispatch
         2.2.2.1. Forecast vs. actual
         2.2.2.2. Comparison with day ahead studies
         2.2.2.3. Reporting of scheduled and forced outages
      2.2.3. Reserve capacity
         2.2.3.1. Location of MW reserves
         2.2.3.2. Planned vs. actual
      2.2.4. Transmission configurations
         2.2.4.1. Planned vs. actual
         2.2.4.2. Comparison with day ahead studies
         2.2.4.3. Reporting of scheduled and forced outages
      2.2.5. Interregional transactions
         2.2.5.1. Calculated transfer limits
         2.2.5.2. Basis for limits – thermal, voltage, and stability
         2.2.5.3. Seasonal assessments – Assumptions vs. actual
         2.2.5.4. Actual schedules vs. Tagged schedules
            2.2.5.4.1. AIE Survey
            2.2.5.4.2. Tag Survey
      2.2.6. System voltages (profile) and reactive supplies
         2.2.6.1. Coordination of reactive supplies and voltage schedules
         2.2.6.2. Reactive supply with power transfers

   2.3. Event Key Parameters
      2.3.1. System voltages (profile) and reactive supplies
      2.3.2. Power flows and equipment loadings
      2.3.3. System dynamic effects

3. **Transmission system performance**
   3.1. Equipment ratings
   3.2. Protective relay actions
   3.3. Equipment maintenance
   3.4. Equipment damage

4. **Generator performance**
   4.1. Generator control actions
   4.2. Generator protection

6.1.2.5. Operating qualifications and training
6.1.2.5.1. Qualification of operators
6.1.2.5.2. Training provided
6.1.2.5.3. Simulation of emergencies

7. **System Planning and Design**
7.1. Establishing operating limits
7.1.1. Responsibility for setting limits
7.1.2. ATC and TTC calculations
7.1.3. Planning studies
7.1.3.1. ·Wide-area simultaneous transfer limits
7.1.3.1.1. Determination of limits
7.1.3.1.2. Monitoring of limits
7.1.3.1.3. Basis for limits – thermal, voltage, and stability
7.1.3.1.4. RE assessments
7.1.3.1.5. Other system studies in affected areas
7.1.3.2. Reactive planning
7.1.3.2.1. Reactive reserve planning
7.1.3.2.2. Active vs. static resources
7.1.3.2.3. Voltage stability analysis
7.1.3.3. RE criteria and/or NERC standards used for planning
7.1.3.3.1. Compliance to these planning criteria and/or standards

8. **Reliability Standards and Compliance**
8.1. Audits
8.1.1. Reliability Coordinators
8.1.1.1. Previous audits and results
8.1.1.1.1. Compliance with NERC standards
8.1.1.2. Updated findings based on analysis
8.1.1.3. Post blackout audit results and findings
8.1.1.4. Recommendations for future audits
8.1.2. Balancing Authorities
8.1.2.1. RE audits
8.1.2.1.1. Compliance with NERC and RE standards
8.1.2.2. Updated findings based on analysis
8.1.2.3. Post blackout audit results and findings
8.1.2.4. Recommendations for future audits
8.2. RE criteria and/or NERC Reliability Standards used for operations
8.2.1. Compliance to these operating criteria and/or standards
8.3. Reliability Standards
8.3.1. Improvements needed
8.3.2. Potential new standards

9. **Actions to Minimize the Possibility of Future Widespread Events**
9.1. Reliability Standards and Compliance to Standards
9.2. Availability of Planned Facilities as Scheduled
9.3. Automatic Load Shedding Programs
9.4. Controlled Separation and Islanding

~~11.2.1.2. Data forms used~~
~~11.2.2. Data received~~
~~11.2.2.1. Quality and usefulness of data~~
~~11.2.3. Data warehousing~~
~~11.2.3.1. Data warehouse structure~~
~~11.2.3.2. Accessibility of data~~
~~11.2.4. Data forms and process for future analyses~~

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Proposed Revised Version – 11-7-2011

Rules of Procedure

Effective: ~~October 7, 2011~~ _____, 2012

TABLE OF CONTENTS

SECTION 100 — APPLICABILITY OF RULES OF PROCEDURE

NERC and NERC members shall comply with these rules of procedure. Each regional entity shall comply with these rules of procedure as applicable to functions delegated to the regional entity by NERC or as required by an appropriate governmental authority or as otherwise provided.

Each bulk power system owner, operator, and user shall comply with all rules of procedure of NERC that are made applicable to such entities by approval pursuant to applicable legislation or regulation, or pursuant to agreement.

Any entity that is unable to comply or that is not in compliance with a NERC rule of procedure shall immediately notify NERC in writing, stating the rule of concern and the reason for not being able to comply with the rule.

NERC shall evaluate each case and inform the entity of the results of the evaluation. If NERC determines that a rule has been violated, or cannot practically be complied with, NERC shall notify the applicable governmental authorities and take such other actions as NERC deems appropriate to address the situation.

NERC shall comply with each approved reliability standard that identifies NERC or the electric reliability organization as a responsible entity. Regional Entities shall comply with each approved reliability standard that identifies Regional Entities as responsible entities. A violation by NERC or a Regional Entity of such a reliability standard shall constitute a violation of these Rules of Procedure.

SECTION 200 — DEFINITIONS OF TERMS

201. General

For purposes of NERC rules of procedure, the terms defined in Section 202 shall have the meaning set forth therein. Other terms are defined within particular sections of the rules of procedure. Other terms used but not defined in the rules of procedure shall be defined in NERC's Bylaws, the NERC Glossary of Terms Used in Reliability Standards adopted in conjunction with NERC's Reliability Standards, or in accordance with their commonly understood and used technical meanings in the electric power industry, including applicable codes and standards.

202. Specific Definitions

"Board" means the Board of Trustees of NERC.

"Bulk power system" means facilities and control systems necessary for operating an interconnected electric energy supply and transmission network (or any portion thereof), and electric energy from generating facilities needed to maintain transmission system reliability. The term does not include facilities used in the local distribution of electric energy.

"Canadian" means one of the following: (a) a company or association incorporated or organized under the laws of Canada, or its designated representative(s) irrespective of nationality; (b) an agency of a federal, provincial, or local government in Canada, or its designated representative irrespective(s) of nationality; or (c) a self-representing individual who is a Canadian citizen residing in Canada.

"Certification" means an official recognition that indicates the recipient has passed a NERC exam or completed a specified number of continuing education hours.

"Compliance enforcement authority" means NERC or the regional entity in their respective roles of monitoring and enforcing compliance with the NERC reliability standards

"Confirmed violation" is an alleged violation~~one~~ for which (1) the registered~~an~~ entity has~~: 1)~~ accepted the notice of alleged violation and proposed penalty or sanction or other notification~~the finding~~ of the alleged violation ~~by a regional entity or NERC and will not seek an appeal~~, or (2) there has been the issuance of a final order finding a violation, penalty or sanction, ~~completed the hearing and appeals process within NERC~~, or (3) the period for requesting a hearing or~~allowed the time for submitting an~~ appeal has ~~to~~ expired and the registered entity has not contested the notice of alleged violation or penalty in any filing with the compliance enforcement authority, or (4) the registered entity has entered into~~admitted to the violation in~~ a settlement agreement, regardless of whether or not the registered entity has admitted or contested the alleged violation.

"Continuing education hour" or "CE hour" means based on sixty clock minutes, and includes at least fifty minutes of participation in a group, or self-study learning activity that meets the criteria of the NERC Continuing Education Program.

"Electric reliability organization" or "ERO" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and enforce Reliability Standards for the bulk power system in the United States. The organization may also have received recognition by applicable governmental authorities in Canada and Mexico to establish and enforce reliability standards for the bulk power systems of the respective countries.

~~"Entity variance" means an aspect of a reliability standard that applies only within a particular entity or a subset of entities within a limited portion of a regional entity, such as a variance that would apply to a regional transmission organization or particular market or to a subset of bulk power system owners, operators or users. An entity variance may not be inconsistent with or less stringent than the reliability standards as it would otherwise exist without the entity variance. An entity variance shall be approved only through the NERC standards development procedure and shall be made part of the NERC reliability standards.~~

"ERO governmental authority" is a government agency that has subject matter jurisdiction over the reliability of the bulk power system within its jurisdictional territory. In the United States, the ERO governmental authority is the Federal Energy Regulatory Commission. In Canada, the ERO governmental authority resides with applicable federal and provincial governments who may delegate duties and responsibilities to other entities. Use of the term is intended to be inclusive of all applicable authorities in the United States, Canada, and Mexico, and is not restricted to those listed here.

"Net Energy for Load" or "NEL" means net generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.

"Reliable operation" means operating the elements of the bulk power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cyber security incident, or unanticipated failure of system elements.

"Regional criteria" means reliability requirements developed by a regional entity that are necessary to implement, to augment, or to comply with reliability standards, but which are not reliability standards. Such regional criteria may be necessary to account for physical differences in the bulk power system but are not inconsistent with reliability standards nor do they result in lesser reliability. Such regional criteria are not enforceable pursuant to NERC-delegated authorities, but may be enforced through other available mechanisms. Regional criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents.

"Regional reliability standard" means a type of reliability standards that is applicable only within a particular regional entity or group of regional entities. A regional reliability standard may augment, add detail to, or implement another reliability standard or cover matters not addressed by other reliability standards. Regional reliability standards, upon adoption by NERC and approval by the applicable ERO governmental authority(ies), shall be reliability standards and shall be enforced within the applicable regional entity or regional entities pursuant to delegated authorities.

"Reliability standard" means a requirement to provide for reliable operation of the bulk power system, including without limiting the foregoing, requirements for the operation of existing bulk power system facilities, including cyber security protection, and including the design of planned additions or modifications to such facilities to the extent necessary for reliable operation of the bulk power system, but the term does not include any requirement to enlarge bulk power system facilities or to construct new transmission capacity or generation capacity. A reliability standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the applicable governmental authority.

"Remedial action directive" means an action (other than a penalty or sanction) required by a compliance enforcement authority that (1) is to bring a registered entity into compliance with a reliability standard or to avoid a reliability standard violation, and (2) is immediately necessary to protect the reliability of the bulk power system from an imminent or actual threat.

"Required date" means the date given a registered entity in a notice from NERC or a regional entity by which some action by the registered entity is required.

"Variance" means an approved alternative method of achieving the reliability intent of one or more requirements in~~aspect or element of~~ a reliability standard ~~that applies only within a particular regional entity or group of regional entities, or to a particular entity or class of entities. A variance allows an alternative approach to meeting the same reliability objective as the reliability standard, and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the ERO governmental authority, shall be enforced within the applicable regional entity or regional entities pursuant to delegated authority~~. No regional entity or bulk power system owner, operator, or user shall claim a variance from a NERC reliability standard without approval of such a variance through the relevant standard approval procedure for the variance. Each variance from a NERC reliability standard that is approved by NERC and applicable governmental authorities shall be made an enforceable part of the associated NERC reliability standard.

SECTION 300 — RELIABILITY STANDARDS DEVELOPMENT

301. General

NERC shall develop and maintain reliability standards that apply to bulk power system owners, operators, and users and that enable NERC and regional entities to measure the reliability performance of bulk power system owners, operators, and users; and to hold them accountable for reliable operation of the bulk power systems. The reliability standards shall be technically excellent, timely, just, reasonable, not unduly discriminatory or preferential, in the public interest, and consistent with other applicable standards of governmental authorities.

302. Essential Attributes for Technically Excellent Reliability Standards

1. **Applicability** — Each reliability standard shall clearly identify the functional classes of entities responsible for complying with the reliability standard, with any specific additions or exceptions noted. Such functional classes[1] include: reliability coordinators, balancing authorities, transmission operators, transmission owners, generator operators, generator owners, interchange authorities, transmission service providers, market operators, planning authorities, transmission planners, resource planners, load-serving entities, purchasing-selling entities, and distribution providers. Each reliability standard shall also identify the geographic applicability of the standard, such as the entire North American bulk power system, an interconnection, or within a regional entity area. A standard may also identify any limitations on the applicability of the standard based on electric facility characteristics.

2. **Reliability Objectives** — Each reliability standard shall have a clear statement of purpose that shall describe how the standard contributes to the reliability of the bulk power system. The following general objectives for the bulk power system provide a foundation for determining the specific objective(s) of each reliability standard:

    2.1 **Reliability Planning and Operating Performance**— Bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions.

    2.2 **Frequency and Voltage Performance**— The frequency and voltage of bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

[1] These functional classes of entities are derived from NERC's Reliability Functional Model. When a standard identifies a class of entities to which it applies, that class must be defined in the Glossary of Terms Used in Reliability Standards.

2.3 **Reliability Information** — Information necessary for the planning and operation of reliable bulk power systems shall be made available to those entities responsible for planning and operating bulk power systems.

2.4 **Emergency Preparation** — Plans for emergency operation and system restoration of bulk power systems shall be developed, coordinated, maintained, and implemented.

2.5 **Communications and Control** — Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of bulk power systems.

2.6 **Personnel** — Personnel responsible for planning and operating bulk power systems shall be trained and qualified, and shall have the responsibility and authority to implement actions.

2.7 **Wide-area View** — The reliability of the bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

2.8 **Security** —Bulk power systems shall be protected from malicious physical or cyber attacks.

3. **Performance Requirement or Outcome**— Each reliability standard shall state one or more performance requirements, which if achieved by the applicable entities, will provide for a reliable bulk power system, consistent with good utility practices and the public interest. Each requirement is not a "lowest common denominator" compromise, but instead achieves an objective that is the best approach for bulk power system reliability, taking account of the costs and benefits of implementing the proposal.

4. **Measurability** — Each performance requirement shall be stated so as to be objectively measurable by a third party with knowledge or expertise in the area addressed by that requirement. Each performance requirement shall have one or more associated measures used to objectively evaluate compliance with the requirement. If performance can be practically measured quantitatively, metrics shall be provided to determine satisfactory performance.

5. **Technical Basis in Engineering and Operations**— Each reliability standard shall be based upon sound engineering and operating judgment, analysis, or experience, as determined by expert practitioners in that particular field.

6. **Completeness** — Reliability standards shall be complete and self-contained. The standards shall not depend on external information to determine the required level of performance.

7. **Consequences for Noncompliance** — In combination with guidelines for penalties and sanctions, as well as other ERO and regional entity compliance documents, the consequences of violating a standard are clearly presented to the entities responsible for complying with the standards.

8. **Clear Language** — Each reliability standard shall be stated using clear and unambiguous language. Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance.

9. **Practicality** — Each reliability standard shall establish requirements that can be practically implemented by the assigned responsible entities within the specified effective date and thereafter.

10. **Consistent Terminology** — To the extent possible, reliability standards shall use a set of standard terms and definitions that are approved through the NERC reliability standards development process.

303. Relationship between Reliability Standards and Competition

To ensure reliability standards are developed with due consideration of impacts on competition, to ensure standards are not unduly discriminatory or preferential, and recognizing that reliability is an essential requirement of a robust North American economy, each reliability standard shall meet all of these market-related objectives:

1. **Competition** — A reliability standard shall not give any market participant an unfair competitive advantage.

2. **Market Structures** — A reliability standard shall neither mandate nor prohibit any specific market structure.

3. **Market Solutions** — A reliability standard shall not preclude market solutions to achieving compliance with that standard.

4. **Commercially Sensitive Information** — A reliability standard shall not require the public disclosure of commercially sensitive information or other confidential information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.

5. **Adequacy** — NERC shall not set standards defining an adequate amount of, or requiring expansion of, bulk power system resources or delivery capability.

304. Essential Principles for the Development of Reliability Standards

NERC shall develop reliability standards in accordance with the NERC *Standard Processes Manual*, which is incorporated into these rules as **Appendix 3A**. Appeals in connection with the development of a reliability standard shall also be conducted in accordance with the NERC *Standard Processes Manual*. Any amendments or revisions to the *Standard Processes Manual* shall be consistent with the following essential principles:

1. **Openness** — Participation shall be open to all persons and entities who are directly and materially affected by the reliability of the North American bulk power system. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in NERC or any other organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

2. **Transparency** — The process shall be transparent to the public.

3. **Consensus-building** —The process shall build and document consensus for each standard, both with regard to the need and justification for the standard and the content of the standard.

4. **Fair Balance of Interests** — The process shall fairly balance interests of all stakeholders and shall not be dominated by any two industry segments as defined in **Appendix** 3D, *Development of the Registered Ballot Body*, of these rules of procedure, and no single ~~interest category~~industry segment, individual or organization shall be able to defeat a matter.

5. **Due Process** — Development of standards shall provide reasonable notice and opportunity for any person with a direct and material interest to express views on a proposed standard and the basis for those views, and to have that position considered in the development of the standards.

6. **Timeliness** — Development of standards shall be timely and responsive to new and changing priorities for reliability of the bulk power system.

305. Registered Ballot Body

NERC reliability standards shall be approved by a registered ballot body prior to submittal to the board and then to ERO governmental authorities for their approval, where authorized by applicable legislation or agreement. This Section 305 sets forth the rules pertaining to the composition of, and eligibility to participate in, the registered ballot body.

1. **Eligibility to Vote on Standards** — Any person or entity may join the registered ballot body to vote on standards, whether or not such person or entity is a member of NERC.

2. **Inclusive Participation** — The segment qualification guidelines are inclusive; i.e., any entity with a legitimate interest in the reliability of the bulk power system that can meet any one of the eligibility criteria for a segment is entitled to belong to and vote in each segment for which it qualifies, subject to limitations defined in Sections 305.3 and 305.5.

3. **General Criteria for Registered Ballot Body Membership** — The general criteria for membership in the segments are:

   3.1 **Multiple Segments** — A corporation or other organization with integrated operations or with affiliates that qualifies to belong to more than one segment (e.g., transmission owners and load serving entities) may join once in each segment for which it qualifies, provided that each segment constitutes a separate membership and the organization is represented in each segment by a different representative. Affiliated entities are collectively limited to one membership in each segment for which they are qualified.

   3.2 **Withdrawing from a Segment or Changing Segments** — After its initial registration in a segment, each registered participant may elect to withdraw from a segment or apply to change segments at any time.

   3.3 **Review of Segment Criteria** — The board shall review the qualification guidelines and rules for joining segments at least every three years to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

4. **Proxies for Voting on Standards** — Any registered participant may designate an agent or proxy to vote on its behalf. There are no limits on how many proxies an agent may hold. However, for the proxy to be valid, NERC must have in its possession written documentation signed by the representative of the registered participant that the voting right by proxy has been transferred from the registered participant to the agent.

5. **Stakeholder Segments** — The specific criteria for membership in each registered ballot body segment are defined in the *~~Standard Processes Manual~~Development of the Registered Ballot Body* in **Appendix ~~3A~~3D.**

6. **Review of Stakeholder Segment Entries** — NERC shall review all applications for joining the registered ballot body, and shall make a determination of whether the applicant's self-selection of a segment satisfies at least one of the guidelines to belong to that segment. The entity shall then become eligible to participate as a

voting member of that segment. The Standards Committee shall resolve disputes regarding eligibility for membership in a segment, with the applicant having the right of appeal to the board.

306. Standards Committee

The Standards Committee shall provide oversight of the reliability standards development process to ensure stakeholder interests are fairly represented. The Standards Committee shall not under any circumstance change the substance of a draft or approved standard.

1. **Membership** — The Standards Committee is a representative committee comprising representatives of two members of each of the segments in the registered ballot body and two officers elected to represent the interests of the industry as a whole.

2. **Elections** — Standards Committee members are elected for staggered (one per segment per year) two-year terms by the respective stakeholder segments in accordance with the *Procedure for the Election of Members of the NERC Standards Committee*, which is incorporated into these rules as **Appendix ~~2~~3B**. Segments may use their own election procedure if such a procedure is ratified by two-thirds of the members of a segment and approved by the board.

3. **Canadian Representation**

   The Standards Committee will include Canadian representation as provided in **Appendix 3B**, *Procedure for the Election of Members of the NERC Standards Committee*.

   ~~3.1 **Provision for Sufficient Canadian Representation** — If any regular election of Standards Committee members does not result in at least two Canadian members on the Standards Committee, the Canadian nominees who were not elected but who received the next highest percentage of votes within their respective segment(s) will be designated as additional members of the Standards Committee, as needed to achieve a total of two Canadian members.~~

   ~~3.2 **Terms of Specially Designated Canadian Members** — Each specially designated Canadian member of the Standards Committee shall have a term ending with the next annual election.~~

   ~~3.3 **Segment Preference** — If any segment has an unfilled representative position on the Standards Committee following the annual election, the first preference is to assign each specially designated Canadian representative to a segment with an unfilled representative position for which his or her organization qualifies.~~

~~3.4~~3.1 **~~Rights of Specially Designated Canadian Members~~** — ~~Any specially designated Canadian members of the Standards Committee shall have the same rights and obligations as all other members of the Standards Committee.~~

4. **Open Meetings** — All meetings of the Standards Committee shall be open and publicly noticed on the NERC Web site.

307. Standards Process Management~~Manager~~

NERC shall assign a standards process manager to administer the development of continent-wide reliability standards and a regional standards manager to administer the development of regional reliability standards. The standards process manager shall be responsible for ensuring that the development and revision of standards are in accordance with the NERC *Standard Processes Manual*. The standards process manager and the regional standards manager shall work to achieve the highest degree of integrity and consistency of quality and completeness of the reliability standards. The regional standards ~~process~~ manager shall coordinate with any regional entities that develop regional reliability standards to ensure those standards are effectively integrated with the NERC reliability standards.

308. Steps in the Development of Reliability Standards

1. **Procedure** — NERC shall develop reliability standards through the process set forth in the NERC *Standard Processes Manual* (**Appendix 3A**). The ~~procedure~~*Standard Processes Manual* includes ~~a~~ provisions for developing~~approval of urgent action~~ reliability standards that can be completed using expedited processes, including a process to develop reliability standards to address national security situations that involve confidential isues~~within 60 days and emergency actions that may be further expedited~~.

2. **Board Adoption~~Approval~~** — Reliability standards or revisions to reliability standards approved by the ballot pool in accordance with the *Standard Processes Manual* shall be submitted for ~~approval~~adoption by the board. No reliability standard or revision to a reliability standard shall be effective unless ~~approved~~adopted by the board.

3. **Governmental Approval** — After ~~receiving~~ board adoption~~approval~~, a reliability standard or revision to a reliability standard shall be submitted to all applicable ERO governmental authorities in accordance with Section 309. No reliability standard or revision to a reliability standard shall be effective within a geographic area over which an ERO governmental authority has jurisdiction unless it is approved by such ERO governmental authority or is otherwise made effective pursuant to the laws applicable to such ERO governmental authority.

309. Filing of Reliability Standards for Approval by ERO Governmental Authorities

1. **Filing of Reliability Standards for Approval** — Where authorized by applicable legislation or agreement, NERC shall file with the applicable ERO governmental authorities each reliability standard, modification to a reliability standard, or withdrawal of a standard that is ~~approved~~adopted by the board. Each filing shall be in the format required by the ERO governmental authority and shall include: a concise statement of the basis and purpose of the standard; the text of the standard; the implementation plan for the reliability standard; a demonstration that the standard meets the essential attributes of reliability standards as stated in Section 302; the drafting team roster; the ballot pool and final ballot results; and a discussion of public comments received during the development of the reliability standard and the consideration of those comments.

2. **Remanded Reliability Standards and Directives to Develop Standards** — If an ERO governmental authority remands a reliability standard to NERC or directs NERC to develop a reliability standard, NERC shall within five (5) business days notify all other applicable ERO governmental authorities, and shall within thirty (30) calendar days report to all ERO governmental authorities a plan and timetable for modification or development of the reliability standard. Standards that are remanded or directed by an ERO governmental authority shall be modified or developed using the *Standard Processes Manual*. NERC shall, during the development of a modification for the remanded standard or directed standard, consult with other ERO governmental authorities to coordinate any impacts of the proposed standards in those other jurisdictions. The expedited standards development process~~action procedure~~ may be applied if necessary to meet a timetable for action required by the ERO governmental authorities, respecting to the extent possible the provisions in the standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interest in developing reliability standards. If the Board of Trustees determines that the standards process did not result in a standard that addresses a specific matter that is identified in a directive issued by an applicable ERO governmental authority, then Rule 321 of these Rules of Procedure shall apply.

3. **Directives to Develop Standards under Extraordinary Circumstances** — An ERO governmental authority may, on its own initiative, determine that extraordinary circumstances exist requiring expedited development of a reliability standard. In such a case, the applicable agency may direct the development of a standard within a certain deadline. NERC staff shall prepare the standard~~s~~ authorization request ~~and seek a stakeholder sponsor for the request. If NERC is unable to find a sponsor for the proposed standard, NERC will be designated as the requestor~~. The proposed standard will then proceed through the standards development process, using the expedited action process~~procedures~~ described in the *Standard Processes Manual* as necessary to meet the specified deadline. The timeline will be developed to respect, to the extent possible, the provisions in the

standards development process for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing reliability standards. If the Board of Trustees determines that the standards process did not result in a standard that addresses a specific matter that is identified in a directive issued by an applicable ERO governmental authority, then Rule 321 of these Rules of Procedure shall apply, with appropriate modification of the timeline.

~~3.1Consistent with all reliability standards developed under the expedited action process, each of the three possible follow-up actions as documented in the *Standard Processes Manual* are to be completed through the standards development process and are subject to approval by the ERO governmental authorities in the U.S. and Canada.~~

310. Reliability Standards Annual Work Plan

NERC shall develop and provide an annual work plan for development of reliability standards to the applicable ERO governmental authorities. NERC shall consider the comments and priorities of the ERO governmental authorities in developing and updating the work plan. Each annual work plan shall include a progress report comparing results achieved to the prior year's plan.

311. Regional Entity Standards Development Procedures

1. **NERC Approval of Regional Entity Reliability Standards Development Procedure** — To enable a regional entity to develop regional reliability standards that are to be recognized and made part of NERC reliability standards, a regional entity may request NERC to approve a regional entity reliability standards development procedure.

2. **Public Notice and Comment on Regional Reliability Standards Development Procedure** — Upon receipt of such a request, NERC shall publicly notice and request comment on the proposed regional standards development procedure, allowing a minimum of 45 days for comment. The regional entity shall have an opportunity to resolve any objections identified in the comments and may choose to withdraw the request, revise the procedure and request another posting for comment, or submit the procedure, along with its consideration of any objections received, for approval by NERC.

3. **Evaluation of Regional Reliability Standards Development Procedure** — NERC shall evaluate whether a regional reliability standards development procedure meets the criteria listed below and shall consider stakeholder comments, any unresolved stakeholder objections, and the consideration of comments provided by the regional entity, in making that determination. If NERC determines the regional reliability standards development procedure meets these requirements, the procedure shall be submitted to the board for approval. The

board shall consider the recommended action, stakeholder comments, any unresolved stakeholder comments, and the regional entity consideration of comments in determining whether to approve the regional reliability standards development procedure.

3.1 **Evaluation Criteria** — The regional reliability standards development procedure shall be:

3.1.1 **Open** — The regional reliability standards development procedure shall provide that any person or entity who is directly and materially affected by the reliability of the bulk power systems within the regional entity shall be able to participate in the development and approval of reliability standards. There shall be no undue financial barriers to participation. Participation shall not be conditional upon membership in the regional entity, a regional entity or any organization, and shall not be unreasonably restricted on the basis of technical qualifications or other such requirements.

3.1.2 **Inclusive** — The regional reliability standards development procedure shall provide that any person with a direct and material interest has a right to participate by expressing an opinion and its basis, having that position considered, and appealing through an established appeals process if adversely affected.

3.1.3 **Balanced** — The regional reliability standards development procedure shall have a balance of interests and shall not permit any two interest categories to ~~control the vote on~~dominate a matter or any single interest category to defeat a matter.

3.1.4 **Due Process** — The regional reliability standards development procedure shall provide for reasonable notice and opportunity for public comment. At a minimum, the procedure shall include public notice of the intent to develop a standard, a public comment period on the proposed standard, due consideration of those public comments, and a ballot of interested stakeholders.

3.1.5 **Transparent** — All actions material to the development of regional reliability standards shall be transparent. All standards development meetings shall be open and publicly noticed on the regional entity's Web site.

3.1.6 **Accreditation of Regional Standards Development Procedure** — A regional entity's reliability standards development procedure that is accredited by the American National Standards Institute ~~or the Standards Council of Canada~~ shall be deemed to meet the

criteria listed in this Section 311.3.1, although such accreditation is not a prerequisite for approval by NERC.

3.1.7 **Use of NERC Procedure** — A regional entity may adopt the NERC *Standard Processes Manual* as the regional reliability standards development procedure, in which case the regional entity's procedure shall be deemed to meet the criteria listed in this Section 311.3.1.

4. **Revisions of Regional Reliability Standards Development Procedures** — Any revision to a regional reliability standards development procedure shall be subject to the same approval requirements set forth in Sections 311.1 through 311.3.

5. **Duration of Regional Reliability Standards Development Procedures** — The regional reliability standards development procedure shall remain in effect until such time as it is replaced with a new version approved by NERC or it is withdrawn by the regional entity. The regional entity may, at its discretion, withdraw its regional reliability standards development procedure at any time.

312. Regional Reliability Standards

1. **Basis for Regional Reliability Standards** — Regional entities may propose regional reliability standards that set more stringent reliability requirements than the NERC reliability standard or cover matters not covered by an existing NERC reliability standard. Such regional reliability standards shall in all cases be submitted to~~approved by~~ NERC for adoption and, if adopted, made part of the NERC reliability standards and shall be enforceable in accordance with the delegation agreement between NERC and the regional entity or other instrument granting authority over enforcement to the regional entity. No entities other than NERC and the regional entity shall be permitted to develop regional reliability standards that are enforceable under statutory authority delegated to NERC and the regional entity.

2. **Regional Reliability Standards That are Directed by a NERC Reliability Standard** — Although it is the intent of NERC to promote uniform reliability standards across North America, in some cases it may not be feasible to achieve a reliability objective with a reliability standard that is uniformly applicable across North America. In such cases, NERC may direct regional entities to develop regional reliability standards necessary to implement a NERC reliability standard. Such regional reliability standards that are developed pursuant to a direction by NERC shall be made part of the NERC reliability standards.

3. **Procedure for Developing an Interconnection-wide Regional Standard** — A regional entity organized on an interconnection-wide basis may propose a regional reliability standard for approval as a NERC reliability standard to be

made mandatory for all applicable bulk power system owners, operators, and users within that interconnection.

3.1 **Presumption of Validity** — An interconnection-wide regional reliability standard that is determined by NERC to be just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities, shall be adopted as a NERC reliability standard. NERC shall rebuttably presume that a regional reliability standard developed, in accordance with a regional reliability standards development process approved by NERC, by a regional entity organized on an interconnection-wide basis, is just, reasonable, and not unduly discriminatory or preferential, and in the public interest, and consistent with such other applicable standards of governmental authorities.

3.2 **Notice and Comment Procedure for Interconnection-wide Regional Reliability Standard** — NERC shall publicly notice and request comment on the proposed interconnection-wide regional reliability standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed regional reliability standard concurrent with similar steps in the regional entity's reliability standards development process. The regional entity shall have an opportunity to resolve any objections identified in the comments and may choose to comment on or withdraw the request, revise the proposed regional reliability standard and request another posting for comment, or submit the proposed regional reliability standard along with its consideration of any objections received, for approval by NERC.

3.3 **Approval of Interconnection-wide Regional Reliability Standard by NERC** — NERC shall evaluate and recommend whether a proposed interconnection-wide regional reliability standard has been developed in accordance with all applicable procedural requirements and whether the regional entity has considered and resolved stakeholder objections that could serve as a basis for rebutting the presumption of validity of the regional reliability standard. The regional entity, having been notified of the results of the evaluation and recommendation concerning NERC proposed regional reliability standard, shall have the option of presenting the proposed regional reliability standard to the board for approval as a NERC reliability standard. The board shall consider the regional entity's request, NERC's recommendation for action on the regional reliability standard, any unresolved stakeholder comments, and the regional entity's consideration of comments, in determining whether to approve the regional reliability standard as a NERC reliability standard.

3.4 **ERO Governmental Authority Approval** — An interconnection-wide regional reliability standard that has been approved by the board shall be

filed with the applicable ERO governmental authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such ERO governmental authorities or on a date set by the ERO governmental authorities.

3.5 **Enforcement of Interconnection-wide Regional Reliability Standard** — An interconnection-wide regional reliability standard that has been approved by the board and by the applicable ERO governmental authorities or is otherwise made effective within Canada as mandatory within a particular region shall be applicable and enforced as a NERC reliability standard within the region.

4. **Procedure for Developing Non-Interconnection-Wide Regional Reliability Standards** — Regional entities that are not organized on an interconnection-wide basis may propose regional reliability standards to apply within their respective regions. Such standards may be developed through the NERC reliability standards development procedure, or alternatively, through a regional reliability standards development procedure that has been approved by NERC.

4.1 **No Presumption of Validity** — Regional reliability standards that are not proposed to be applied on an interconnection-wide basis are not presumed to be valid but may be demonstrated by the proponent to be valid.

4.2 **Notice and Comment Procedure for Non-Interconnection-wide Regional Reliability Standards** — NERC shall publicly notice and request comment on the proposed regional reliability standard, allowing a minimum of 45 days for comment. NERC may publicly notice and post for comment the proposed regional reliability standard concurrent with similar steps in the regional entity's reliability standards development process. The regional entity shall have an opportunity to comment on or resolve any objections identified in the comments and may choose to withdraw the request, revise the proposed regional reliability standard and request another posting for comment, or submit the proposed regional reliability standard along with its consideration of any objections received, for approval by NERC.

4.3 **NERC Approval of Non-Interconnection-wide Regional Reliability Standards** — NERC shall evaluate and recommend whether a proposed non-Interconnection-wide regional reliability standard has been developed in accordance with all applicable procedural requirements and whether the regional entity has considered and resolved stakeholder objections. The regional entity, having been notified of the results of the evaluation and recommendation concerning proposed regional reliability standard, shall have the option of presenting the proposed regional reliability standard to the board for approval as a NERC reliability standard. The board shall consider the regional entity's request, the recommendation for action on

the regional reliability standard, any unresolved stakeholder comments, and the regional entity's consideration of comments, in determining whether to approve the regional reliability standard as a NERC reliability standard.

4.4 **NERC Governmental Authority Approval** — A non-Interconnection-wide regional reliability standard that has been approved by the board shall be filed with the applicable ERO governmental authorities for approval, where authorized by applicable legislation or agreement, and shall become effective when approved by such ERO governmental authorities or on a date set by the ERO governmental authorities.

4.5 **Enforcement of Non-Interconnection-wide Regional Reliability Standards** — A non-Interconnection-wide regional reliability standard that has been approved by the board and by the applicable ERO governmental authorities or is otherwise made effective within Canada as mandatory within a particular region shall be applicable and enforced as a NERC reliability standard within the region.

5. **Appeals** — A Regional Entity shall have the right to appeal NERC's decision not to approve a proposed regional reliability standard or variance to the Commission or other applicable governmental authority.

313. Other Regional Criteria, Guides, Procedures, Agreements, Etc.

1. **Regional Criteria** — Regional entities may develop regional criteria that are necessary to implement, to augment, or to comply with NERC reliability standards, but which are not reliability standards. Regional criteria may also address issues not within the scope of reliability standards, such as resource adequacy. Regional criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents used to enhance the reliability of the regional bulk power system. These documents typically provide benefits by promoting more consistent implementation of the NERC reliability standards within the region. These documents are not NERC reliability standards, regional reliability standards, or regional variances, and therefore are not enforceable under authority delegated by NERC pursuant to delegation agreements and do not require NERC approval.

2. **Catalog of Regional Reliability Criteria** — NERC shall maintain a current catalog of regional reliability criteria. Regional entities shall provide a catalog listing of regional reliability criteria to NERC and shall notify NERC of changes to the listing. Regional entities shall provide any listed document to NERC upon written request.

314. Conflicts with Statutes, Regulations, and Orders

Notice of Potential Conflict — If a bulk power system owner, operator, or user determines that a NERC or regional reliability standard may conflict with a function, rule, order, tariff, rate schedule, legislative requirement or agreement that has been accepted, approved, or ordered by a governmental authority affecting that entity, the entity shall expeditiously notify the governmental authority, NERC, and the relevant regional entity of the conflict.

1. **Determination of Conflict —** NERC, upon request of the governmental authority, may advise the governmental authority regarding the conflict and propose a resolution of the conflict, including revision of the reliability standard if appropriate.

2. **Regulatory Precedence** — Unless otherwise ordered by a governmental authority, the affected bulk power system owner, operator, or user shall continue to follow the function, rule, order, tariff, rate schedule, legislative requirement, or agreement accepted, approved, or ordered by the governmental authority until the governmental authority finds that a conflict exists and orders a remedy and such remedy is affected.

315. Revisions to NERC ~~Reliability~~ Standard~~s~~ Processes Manual~~Development Procedure~~

Any person or entity may submit a written request to modify NERC *Standard Processes Manual*. Consideration of the request and development of the revision shall follow the process defined in the NERC *Standard Processes Manual*. Upon approval by the board, the revision shall be submitted to the ERO governmental authorities for approval. Changes shall become effective only upon approval by the ERO governmental authorities or on a date designated by the ERO governmental authorities or as otherwise applicable in a particular jurisdiction.

316. Accreditation

NERC shall seek and maintain~~continuing~~ accreditation of the NERC reliability standards development process by the American National Standards Institute ~~and the Standards Council of Canada~~.

317. Five-Year Review of Standards

NERC shall complete a review of each NERC reliability standard at least once every five years, or such longer period as is permitted by the American National Standards Institute, from the effective date of the standard or the latest revision to the standard, whichever is later. The review process shall be conducted in accordance with the NERC *Standard Processes Manual*. The standards process manager shall be responsible for administration of the five-year review of reliability standards. As a result of this review, the NERC

reliability standard shall be reaffirmed, revised, or withdrawn. If the review indicates a need to revise or withdraw the standard, a request for revision or withdrawal shall be prepared, submitted and addressed in accordance with the NERC *Standard Processes Manual*.

318. Coordination with the North American Energy Standards Board

NERC shall, through a memorandum of understanding, maintain a close working relationship with the North American Energy Standards Board ~~and ISO/RTO Council~~ to ensure effective coordination of wholesale electric business practice standards and market protocols with the NERC reliability standards.

319. Archived Standards Information

NERC shall maintain a historical record of reliability standards information that is no longer maintained on-line. For example, standards that have been retired~~expired or were replaced~~ may be removed from the on-line system. Archived information shall be retained indefinitely as practical, but in no case less than five years or one complete standards review cycle from the date on which the standard was no longer in effect. Archived records of reliability standards information shall be available electronically within 30 days following the receipt by the NERC standards information~~process~~ manager of a written request.

320. ~~Alternate Method~~Procedure for Developing and Approving~~Adopting~~ Violation Risk Factors and Violation Severity Levels

1. **Development of Violation Risk Factors and Violation Severity Levels** — NERC shall follow the process for developing violation risk factors (VRFs) and violation severity levels (VSLs) as set forth in the *Standard Processes Manual*, **Appendix 3A** to these rules of procedure.

2. **Remands or Directed Revision of VRFs and VSLs by ERO Governmental Authorities** — If an ERO governmental authority remands or directs a revision to a board-approved VRF or VSL assignment, the NERC director of standards, after consulting with the standard drafting team, Standards Committee, and the NERC director of compliance operations, will recommend to the board one of the following actions: (1) filing a request for clarification; (2) filing for rehearing or for review of the ERO governmental authority decision; or (3) approval of the directed revisions to the VRF or VSL. If and to the extent time is available prior to the deadline for the board's decision, an opportunity for interested parties to comment on the action to be taken will be provided.

3. **Alternative Procedure for Developing and Approving Violation Risk Factors and Violation Severity Levels** — In the event the standards development process fails to produce violation risk factors or violation severity levels for a particular

standard in a timely manner, the Board of Trustees may approve~~adopt~~ violation risk factors or violation severity levels for that standard after notice and opportunity for comment. In approving VRFs or VSLs, the board shall consider the inputs of the Member Representatives Committee and affected stakeholders ~~using the procedures set out in Section 1400 of these Rules of Procedure~~.

321. Special Rule to Address Certain Regulatory Directives

In circumstances where this Rule 321 applies, the Board of Trustees shall have the authority to take one or more of the actions set out below. The Board of Trustees shall have the authority to choose which one or more of the actions are appropriate to the circumstances and need not take these actions in sequential steps.

1. The Standards Committee shall have the responsibility to ensure that standards drafting teams address specific matters that are identified in directives issued by applicable ERO governmental authorities. If the Board of Trustees is presented with a proposed standard that fails to address such directives, the Board of Trustees has the authority to remand, with instructions (including establishing a timetable for action), the proposed reliability standard to the Standards Committee.

2. Upon a written finding by the Board of Trustees that a ballot pool has failed to approve a proposed reliability standard that contains a provision to address a specific matter identified in a directive issued by an ERO governmental authority, the Board of Trustees has the authority to remand the proposed reliability standard to the Standards Committee, with instructions to (i) convene a public technical conference to discuss the issues surrounding the regulatory directive, including whether or not the proposed standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified; (ii) working with NERC staff, prepare a memorandum discussing the issues, an analysis of the alternatives considered and other appropriate matters; and (iii) re-ballot the proposed reliability standard one additional time, with such adjustments in the schedule as are necessary to meet the deadline contained in paragraph 2.1 of this Rule.

   2.1 Such a re-ballot shall be completed within forty-five (45) days of the remand. The Standards Committee memorandum shall be included in the materials made available to the ballot pool in connection with the re-ballot.

   2.2 In any such re-ballot, negative votes without comments related to the proposal shall be counted for purposes of establishing a quorum, but only affirmative votes and negative votes with comments related to the proposal shall be counted for purposes of determining the number of votes cast and whether the proposed standard has been approved.

3. If the re-balloted proposed reliability standard achieves at least an affirmative two-thirds majority vote of the weighted segment votes cast, with a quorum established, then the proposed reliability standard shall be deemed approved by the ballot pool and shall be considered by the Board of Trustees for approval.

4. If the re-balloted proposed reliability standard fails to achieve at least an affirmative two-thirds majority vote of the weighted segment votes cast, but does achieve at least a sixty percent affirmative majority of the weighted segment votes cast, with a quorum established, then the Board of Trustees has the authority to consider the proposed reliability standard for approval under the following procedures:

   4.1 The Board of Trustees shall issue notice of its intent to consider the proposed reliability standard and shall solicit written public comment particularly focused on the technical aspects of the provisions of the proposed reliability standard that address the specific matter identified in the regulatory directive, including whether or not the proposed standard is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified.

   4.2 The Board of Trustees may, in its discretion, convene a public technical conference to receive additional input on the matter.

   4.3 After considering the developmental record, the comments received during balloting and the additional input received under paragraphs 4.1 and 4.2 of this Rule, the Board of Trustees has authority to act on the proposed reliability standard.

      4.3.1 If the Board of Trustees finds that the proposed reliability standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to approve the proposed reliability standard and direct that it be filed with applicable ERO governmental authorities with a request that it be made effective.

      4.3.2 If the Board of Trustees is unable to find that the proposed reliability standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is helpful to reliability, practical, technically sound, technically feasible, and cost-justified, then it has authority to treat the proposed reliability standard as a draft reliability standard and direct that the draft reliability standard and complete developmental record, including the additional input received under paragraphs 4.1 and 4.2 of this Rule, be filed with the applicable ERO governmental authorities as a compliance filing in

response to the order giving rise to the regulatory directive, along with a recommendation that the standard not be made effective and an explanation of the basis for the recommendation.

5. Upon a written finding by the Board of Trustees that standard drafting team has failed to develop, or a ballot pool has failed to approve, a proposed reliability standard that contains a provision to address a specific matter identified in a directive issued by an ERO governmental authority, the Board of Trustees has the authority to direct the Standards Committee (with the assistance of stakeholders and NERC staff) to prepare a draft reliability standard that addresses the regulatory directive, taking account of the entire developmental record pertaining to the matter. If the Standards Committee fails to prepare such draft reliability standard, the Board of Trustees may direct NERC management to prepare such draft reliability standard.

   5.1 The Board of Trustees may, in its discretion, convene a public technical conference to receive input on the matter. The draft reliability standard shall be posted for a 45-day public comment period.

   5.2 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees finds that the draft reliability standard, with such modifications as the Board of Trustees determines are appropriate in light of the comments received, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the bulk power system, then the Board of Trustees has the authority to approve the draft standard and direct that the proposed standard be filed with ERO governmental authorities with a request that the proposed standard be made effective.

   5.3 If, after considering the entire developmental record (including the comments received under paragraph 5.1 of this Rule), the Board of Trustees is unable to find that the draft reliability standard, even with modifications, is just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the bulk power system, then the Board of Trustees has the authority to direct that the draft standard and complete developmental record be filed as a compliance filing in response to the regulatory directive with the ERO governmental authority issuing the regulatory directive, with a recommendation that the draft standard not be made effective.

5.4 The filing of the reliability standard under either paragraph 5.2 or paragraph 5.3 of this Rule shall include an explanation of the basis for the decision by the Board of Trustees.

5.5 A reliability standard approved under paragraph 5 of this Rule shall not be eligible for submission as an American National Standard.

6. NERC shall on or before March 31st of each year file a report with applicable ERO governmental authorities on the status and timetable for addressing each outstanding directive to address a specific matter received from an applicable ERO governmental authority.

SECTION 400 — COMPLIANCE ENFORCEMENT

401. Scope of the NERC Compliance Enforcement Program

1. **Components of the NERC Compliance Enforcement Program** — NERC shall develop and implement a NERC Compliance Monitoring and Enforcement Program to promote the reliability of the bulk power system by enforcing compliance with approved reliability standards in those regions of North American in which NERC and/or a regional entity (pursuant to a delegation agreement with NERC that has been approved by the applicable ERO governmental authority) has been given enforcement authority. There are four distinct parts of the NERC Monitoring and Compliance Enforcement Program: (1) NERC's oversight of the regional entity compliance programs (Section 402), (2) the definition of the required regional entity compliance enforcement program attributes (Section 403), (3) NERC's monitoring of regional entity compliance with reliability standards (Section 404), and (4) the monitoring of compliance with reliability standards that are applicable to NERC (Sections 405–406).

2. **Who Must Comply** — Where required by applicable legislation, regulation, rule or agreement, all bulk power system owners, operators, and users, regional entities, and NERC, are required to comply with all approved NERC reliability standards at all times. Regional reliability standards and regional variances approved by NERC and the applicable ERO governmental authority shall be considered NERC reliability standards and shall apply to all bulk power system owners, operators, or users responsible for meeting those standards within the regional entity boundaries, whether or not the bulk power system owner, operator, or user is a member of the regional entity.

3. **Data Access** — All bulk power system owners, operators, and users shall provide to NERC and the applicable regional entity such information as is necessary to monitor compliance with the reliability standards. NERC and the applicable regional entity will define the data retention and reporting requirements in the reliability standards and compliance reporting procedures.

4. **Role of Regional Entities in the Compliance Enforcement Program** — Each regional entity that has been delegated authority through a delegation agreement or other legal instrument approved by the applicable ERO governmental authority shall, in accordance with the terms of the approved delegation agreement, administer a regional entity compliance enforcement program to meet the NERC Compliance Monitoring and Enforcement Program goals and the requirements in this Section 400.

5. **Program Continuity** — NERC will ensure continuity of compliance monitoring and enforcement within the geographic boundaries of a regional entity in the event that NERC does not have a delegation agreement, or the regional entity withdraws from the agreement or does not operate its compliance enforcement program in accordance with the delegation agreement or other applicable requirements.

5.1 Should NERC not have a delegation agreement with a regional entity covering a geographic area, or a regional entity withdraws from an existing delegation agreement or the delegation agreement is otherwise terminated, NERC will directly administer the Compliance Monitoring and Enforcement Program applicable to owners, operators and users of the bulk-power system within that geographic area.

1. This monitoring and enforcement will be accomplished by NERC and compliance staff from another approved regional entity.

2. If an existing delegation agreement with a regional entity is terminating, the regional entity shall promptly provide to NERC all relevant compliance information regarding registered entities, contacts, prior compliance information and actions, mitigation plans, and remedial actions for the period in which the regional entity was responsible for administering the Compliance Monitoring and Enforcement Program.

3. NERC will levy and collect all penalties directly and will utilize any penalty monies collected to offset the expenses of administering the compliance monitoring and enforcement program for the geographic area.

5.2 Should a regional entity seek to withdraw from its delegation agreement, NERC will seek agreement from another regional entity to amend its delegation agreement with NERC to extend that regional entity's boundaries for compliance monitoring and enforcement. In the event no regional entity is willing to accept this responsibility, NERC will administer the Compliance Monitoring and Enforcement Program within the geographical boundaries of the regional entity seeking to withdraw from the delegation agreement, in accordance with Section 401.5.1.

6. **Actively Monitored Requirements** — NERC, with input from the regional entities, stakeholders, and regulators, shall annually select a subset of the NERC reliability standards and requirements to be actively monitored and audited in the NERC annual compliance program. Compliance is required, and NERC and the regional entities have authority to monitor compliance, with all NERC reliability standards whether or not they are included in the subset of reliability standards and requirements designated to be actively monitored and audited in the NERC annual compliance program.

7. **Penalties, Sanctions, and Remedial Action Directives** — NERC and regional entities will apply penalties, sanctions, and remedial action directives that bear a reasonable relation to the seriousness of a violation and take into consideration timely remedial efforts as defined in the NERC *Sanction Guidelines*, which is incorporated into these rules as **Appendix 4B**.

8. **Multiple Enforcement Actions** – A registered entity shall not be subject to an enforcement action by NERC and a regional entity, or by more than one regional entity, for the same violation.

9. **Records** — NERC shall maintain a record of each compliance submission, including self-reported, possible, alleged, and confirmed violations of approved reliability standards; associated penalties, sanctions, remedial action directives and settlements; and the status of mitigation actions.

10. **Confidential Information** — NERC will treat all possible and alleged violations of reliability standards and matters related to a compliance monitoring and enforcement program process, including the status of any compliance investigation or other compliance monitoring and enforcement process, as confidential in accordance with Section 1500.

    The types of information that will be considered confidential and will not (subject to statutory and regulatory requirements) be disclosed in any public information reported by NERC are identified in Section 1500. Information that would jeopardize bulk power system reliability, including information relating to a Cyber Security Incident, will be identified and protected from public disclosure as critical energy infrastructure information in accordance with Section 1500.

    The regional entity and NERC shall give bulk power system owners, operators, and users a reasonable opportunity to demonstrate that information concerning a violation is confidential before such report is disclosed to the public.

11. **Public Posting** — When the affected bulk power system owner, operator, or user either agrees with a possible or alleged violation(s) of a reliability standard(s) or a report of a compliance audit or compliance investigation, or enters into a settlement agreement concerning a possible or alleged violation(s), or the time for submitting an appeal is passed, or all appeals processes are complete, NERC shall, subject to the confidentiality requirements of these rules, publicly post each confirmed violation, penalty or sanction, settlement agreement, and final compliance audit or compliance investigation report, on its Web site.

    11.1 Each bulk power system owner, operator, or user may provide NERC with a statement to accompany the violation or report to be posted publicly. The statement must be on company letterhead and include a signature, as well as the name and title of the person submitting the information.

    11.2 In accordance with Section 1500, information deemed by a bulk power system owner, operator, or user, regional entity, or NERC as critical energy infrastructure information (*NERC Security Guidelines for the Electricity Sector — Protecting Potentially Sensitive Information* may be used as a guide) or other confidential information shall be redacted in accordance with Section 1500 and not be released publicly.

    11.3 Subject to redaction of critical energy infrastructure information or other confidential information, for each confirmed violation or settlement relating to a possible violation or an alleged violation, the public posting shall include the name of any relevant entity, the nature, time period, and circumstances of such possible, alleged or confirmed violation, any

mitigation plan or other mitigating activities to be implemented by the entity in connection with the violation or settlement, and sufficient facts to assist owners, operators and users of the bulk power system to evaluate whether they have engaged in or are engaging in similar activities.

12. **Violation Information Review** — NERC compliance monitoring and enforcement program staff shall periodically review and analyze all reports of possible, alleged and confirmed violations to identify trends and other pertinent reliability issues.

402. NERC Oversight of the Regional Entity Compliance Enforcement Programs

1. **NERC Monitoring Program** — NERC shall have a program to monitor the compliance enforcement program of each regional entity that has been delegated authority. The objective of this monitoring program shall be to ensure that the regional entity carries out its compliance enforcement program in accordance with these rules and the terms of the delegation agreement, and to ensure consistency and fairness of the regional entity's compliance enforcement program. Oversight and monitoring by NERC shall be accomplished through an annual compliance enforcement program review, program audits, and regular evaluations of regional entity compliance enforcement program performance as described below.

   1.1 **NERC Review of Regional Compliance Enforcement Program Annual Plans** — NERC shall require each regional entity to submit for review and approval an annual compliance enforcement program implementation plan. NERC shall review each regional entity's compliance enforcement program annual implementation plan and shall accept the plan if it meets NERC requirements and the requirements of the delegation agreement.

   1.2 **Regional Entity Program Evaluation** — NERC shall annually evaluate the goals, tools, and procedures of each regional entity compliance enforcement program to determine the effectiveness of each regional entity program, using criteria developed by the NERC Compliance and Certification Committee.

   1.3 **Regional Entity Program Audit** — At least once every five years, NERC shall conduct an audit to evaluate how each regional entity compliance enforcement program implements the NERC Compliance Monitoring and Enforcement Program. The evaluation shall be based on these rules of procedures, including Appendix 4C, the delegation agreement, directives in effect pursuant to the delegation agreement, approved regional entity annual compliance enforcement program annual implementation plans, required program attributes, and the NERC compliance program procedures. These evaluations shall be provided to the appropriate ERO governmental authorities to demonstrate the effectiveness of each regional entity. In addition, audits of cross-border regional entities shall cover applicable requirements imposed on the regional entity by statute, regulation, or order of, or agreement with, provincial governmental and/or regulatory authorities for which NERC has auditing responsibilities over

the regional entity's compliance with such requirements within Canada or Mexico. Participation of a representative of an applicable ERO governmental authority shall be subject to the limitations of sections 3.1.6 and 8.0 of Appendix 4C of these rules of procedure regarding disclosures of non-public compliance information related to other jurisdictions. NERC shall maintain an audit procedure containing the requirements, steps, and timelines to conduct an audit of each regional entity compliance enforcement program. The current procedure is contained in the NERC Audit of Regional Entity Compliance Programs, which is incorporated into these rules as **Appendix 4A**.

1.4 ERO governmental authorities will be allowed to participate as an observer in any audit conducted by NERC of a regional entity's compliance monitoring and enforcement program. A representative of the regional entity being audited will be allowed to participate in the audit as an observer.

2. **Consistency Among Regional Compliance Enforcement Programs** — To provide for a consistent compliance enforcement program for all bulk power system owners, operators, and users required to comply with approved reliability standards, NERC shall maintain a single, uniform Compliance Monitoring and Enforcement Program, which is incorporated into these rules of procedure as **Appendix 4C**. Any differences in regional entity program methods, including determination of violations and penalty assessment, shall be justified on a case-by-case basis and fully documented in each regional entity delegation agreement.

2.1 NERC shall ensure that each of the regional entity compliance enforcement programs meets these Rules of Procedure, including **Appendix 4C**, and follows the terms of the delegation agreement and the approved regional entity compliance enforcement program annual plan.

2.2 NERC shall maintain a single, uniform compliance monitoring and enforcement program in **Appendix 4C** containing the procedures to ensure the consistency and fairness of the processes used to determine regional entity compliance enforcement program findings of compliance and noncompliance, and the application of penalties and sanctions.

2.3 NERC shall periodically conduct regional entity compliance manager forums. These forums shall use the results of regional entity compliance program audits and findings of NERC compliance staff to identify and refine regional entity compliance program differences into a set of best practices over time.

3. **Information Collection and Reporting** — NERC and the regional entities shall implement data management procedures that address data reporting requirements, data integrity, data retention, data security, and data confidentiality.

4. **Violation Disclosure** — NERC shall disclose all confirmed violations and maintain as confidential possible violations and alleged violations, according to the reporting and disclosure process in **Appendix 4C**.

5. **Authority to Determine Noncompliance, Levy Penalties and Sanctions, and Issue Remedial Action Directives** — NERC and regional entity compliance staff shall have the authority and responsibility to make initial determinations of compliance or noncompliance, and where authorized by the appropriate governmental authorities or where otherwise authorized, to determine penalties and sanctions for noncompliance with a reliability standard, and issue remedial action directives. Regional entity boards or a compliance panel reporting directly to the regional entity board will be vested with the authority for the overall regional entity compliance program and have the authority to impose penalties and sanctions on behalf of NERC, where authorized by applicable legislation or agreement. Remedial action directives may be issued by NERC or a regional entity that is aware of a bulk power system owner, operator, or user that is, or is about to engage in an act or practice that would result, in noncompliance with a reliability standard, where such directive is immediately necessary to protect the reliability of the bulk power system from an imminent or actual threat. If, after receiving such a directive, the bulk power system owner, operator, or user does not take appropriate action to avert a violation of a reliability standard, NERC may petition the applicable ERO governmental authority to issue a compliance order.

6. **Due Process** — NERC shall establish and maintain a fair, independent, and nondiscriminatory appeals process. The appeals process is set forth in Sections 408-410. The process shall allow bulk power system owners, operators, and users to appeal the regional entity's findings of noncompliance and to appeal penalties, sanctions, and remedial action directives that are levied by the regional entity. Appeals beyond the NERC process will be heard by the applicable ERO governmental authority.

   The appeals process will also allow for appeals to NERC of any findings of noncompliance issued by NERC to a regional entity for standards and requirements where the regional entity is monitored for compliance to a reliability standard. No monetary penalties will be levied in these matters; however sanctions, remedial actions, and directives to comply may be applied by NERC.

7. **Conflict Disclosure** — NERC shall disclose to the appropriate governmental authorities any potential conflicts between a market rule and the enforcement of a regional reliability standard.

8. **Confidentiality** — To maintain the integrity of the NERC Compliance Monitoring and Enforcement Program, NERC and regional entity staff, audit team members, and committee members shall maintain the confidentiality of information obtained and shared during compliance monitoring and enforcement

processes including investigations, audits, spot checks, drafting of reports, appeals, and closed meetings.

8.1 NERC and the regional entity shall have in place appropriate codes of conduct and confidentiality agreements for staff and other compliance enforcement program participants.

8.2 Individuals not bound by NERC or regional entity codes of conduct who serve on compliance-related committees or audit teams shall sign a NERC confidentiality agreement prior to participating on the committee or team.

8.3 Information deemed by a bulk power system owner, operator, or user, regional entity, or NERC as critical energy infrastructure information shall not be distributed outside of a committee or team, nor released publicly. Other information subject to confidentiality is identified in Section 1500.

8.4 In the event that a staff, committee, or audit team member violates any of the confidentiality rules set forth above, the staff, committee, or audit team member and any member organization with which the individual is associated may be subject to appropriate action by the regional entity or NERC, including prohibiting participation in future compliance enforcement activities.

9. **Auditor Training** — NERC shall develop and provide training in auditing skills to all people who participate in NERC and regional entity compliance enforcement audits. Training for NERC and regional entity personnel and others who serve as compliance audit team leaders shall be more comprehensive than training given to industry subject matter experts and regional entity members. Training for regional entity members may be delegated to the regional entity.

403. Required Attributes of Regional Entity Compliance Enforcement Programs

Each regional entity compliance enforcement program shall promote excellence in the enforcement of reliability standards. To accomplish this goal, each regional entity compliance enforcement program shall (i) conform to and comply with the NERC uniform Compliance Monitoring and Enforcement Program, **Appendix 4C** to these rules of procedure, except to the extent of any deviations that are stated in the regional entity's delegation agreement, and (ii) meet all of the attributes set forth in this Section 403.

Program Structure

1. **Independence** — Each regional entity's governance of its compliance enforcement program shall exhibit independence, meaning the compliance enforcement program shall be organized so that its compliance monitoring and enforcement activities are carried out separately from other activities of the regional entity. The program shall not be unduly influenced by the bulk power system owners, operators, and users being monitored or other regional entity activities that are required to meet the reliability standards. Regional entities must

include rules providing that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

2. **Exercising Authority** — Each regional entity compliance enforcement program shall exercise the responsibility and authority in carrying out the delegated functions of the NERC Compliance Monitoring and Enforcement Program in accordance with delegation agreements and **Appendix 4C**. These functions include but are not limited to: data gathering, data reporting, compliance investigations, compliance auditing activities, evaluating compliance and noncompliance, imposing penalties and sanctions, and approving and tracking mitigation actions.

3. **Delegation of Authority** — To maintain independence, fairness, and consistency in the NERC Compliance Monitoring and Enforcement Program, a regional entity shall not sub-delegate its compliance enforcement program duties to entities or persons other than the regional entity compliance enforcement program staff, unless (i) required by statute or regulation in the applicable jurisdiction, or (ii) by agreement with express approval of NERC and of FERC or other appropriate ERO governmental authority, to another regional entity.

4. **Hearings of Contested Findings or Sanctions —** The regional entity board or compliance panel reporting directly to the regional entity board (with appropriate recusal procedures) will be vested with the authority for conducting compliance hearings in which any bulk power system owner, operator, or user provided notice of an alleged violation may present facts and other information to contest a notice of alleged violation or any proposed penalty, sanction, any remedial action directive, or any mitigation plan component. Compliance hearings shall be conducted in accordance with the Hearing ~~Process~~Procedures set forth in Attachment 2 to **Appendix 4C**. If a stakeholder body serves as the hearing body, no two industry sectors may control any decision and no single segment may veto any matter related to compliance after recusals.

Program Resources

5. **Regional Entity Compliance Staff** — Each regional entity shall have sufficient resources to meet delegated compliance monitoring and enforcement responsibilities, including the necessary professional staff to manage and implement the regional entity compliance monitoring and enforcement program.

6. **Regional Entity Compliance Staff Independence** — The regional entity compliance monitoring and enforcement program staff shall be capable of and required to make all determinations of compliance and noncompliance and determine penalties, sanctions, mitigating activities and remedial action directives.

   6.1 Regional entity compliance enforcement program staff shall not have a conflict of interest, real or perceived, in the outcome of compliance monitoring and enforcement processes, reports, or sanctions. The regional entity shall have in effect a conflict of interest policy.

6.2 Regional entity compliance monitoring and enforcement program staff shall have the authority and responsibility to carry out compliance monitoring and enforcement processes (with the input of industry subject matter experts), make determinations of compliance or noncompliance, and levy penalties and sanctions without interference or undue influence from regional entity members and their representative or other industry entities.

6.3 Regional entity compliance monitoring and enforcement program staff may call upon independent technical subject matter experts who have no conflict of interest in the outcome of the compliance monitoring and enforcement process to provide technical advice or recommendations in the determination of compliance or noncompliance.

6.4 Regional entity compliance monitoring and enforcement program staff shall abide by the confidentiality requirements contained in Section 1500 and **Appendix 4C** of these Rules of Procedure, the NERC delegation agreement and other confidentiality agreements required by the NERC Compliance Monitoring and Enforcement Program.

6.5 Contracting with independent consultants or others working for the regional entity compliance enforcement program shall be permitted provided the individual has not received compensation from a bulk power system owner, operator, or user being monitored for a period of at least the preceding six months and owns no financial interest in any bulk power system owner, operator, or user being monitored for compliance to the reliability standard, regardless of where the bulk power system owner, operator, or user operates. Any such individuals for the purpose of these rules shall be considered as augmenting regional entity compliance staff.

7. Use of Industry Subject Matter Experts and Regional Entity Members — Industry experts and regional entity members may be called upon to provide their technical expertise in compliance monitoring and enforcement program activities.

7.1 The regional entity shall have procedures defining the allowable involvement of industry subject matter experts and regional entity members. The procedures shall address applicable antitrust laws and conflicts of interest.

7.2 Industry subject matter experts and regional entity members shall have no conflict of interest or financial interests in the outcome of their activities.

7.3 Regional entity members and industry subject matter experts, as part of teams or regional entity committees, may provide input to the regional entity compliance staff so long as the authority and responsibility for (i) evaluating and determining compliance or noncompliance and (ii) levying penalties, sanctions, or remedial action directives shall not be delegated to any person or entity other than the compliance staff of the regional entity. Industry subject matter experts, regional entity members, or regional entity

committees shall not make determinations of noncompliance or levy penalties, sanctions, or remedial action directives. Any committee involved shall be organized so that no two industry sectors may control any decision and no single segment may veto any matter related to compliance.

7.4 Industry subject matter experts and regional entity members shall sign a confidentiality agreement appropriate for the activity being performed.

7.5 All industry subject matter experts and regional entity members participating in compliance audits and compliance investigations shall successfully complete auditor training provided by NERC or the regional entity prior to performing these activities

Program Design

8. **Regional Entity Compliance Enforcement Program Content** — All approved reliability standards shall be included in the regional entity compliance monitoring and enforcement program for all bulk power system owners, operators, and users within the defined boundaries of the regional entity. Compliance to approved regional entity reliability standards is applicable only within the footprint of the regional entity that submitted those particular regional entity reliability standards for approval. NERC will identify the minimum set of reliability standards and requirements to be actively monitored by the regional entity in a given year.

9. **Antitrust Provisions** — Each regional entity's compliance monitoring and enforcement program shall be structured and administered to abide by U.S. antitrust law and Canadian competition law.

10. **Information Submittal** — All bulk power system owners, operators, and users within the regional entity responsible for complying with reliability standards shall submit timely and accurate information when requested by the regional entity or NERC. NERC and the regional entities shall preserve any mark of confidentiality on information submitted pursuant to Section 1502.1.

10.1 Each regional entity has the authority to collect the necessary information to determine compliance and shall develop processes for gathering data from the bulk power system owners, operators, and users the regional entity monitors.

10.2 The regional entity or NERC has the authority to request information from bulk power system owners, operators, and users pursuant to section 401.3 or this section 403.10 without invoking a specific compliance monitoring and enforcement process in **Appendix 4C**, for purposes of determining whether to pursue one such process in a particular case and/or validating in the enforcement phase of a matter the conclusions reached through the compliance monitoring and enforcement process(es).

10.3 When required or requested, the regional entities shall report information to NERC promptly and in accordance with **Appendix 4C** and other NERC procedures.

10.4 Regional entities shall notify NERC of all possible, alleged and confirmed violations of NERC reliability standards by entities over which the regional entity has compliance monitoring and enforcement authority , in accordance with **Appendix 4C**.

10.5 A bulk power system owner, operator, or user found in noncompliance with a reliability standard shall submit a mitigation plan with a timeline addressing how the noncompliance will be corrected. The regional entity compliance staff shall review and approve the mitigation plan in accordance with **Appendix 4C**.

10.6 An officer of a bulk power system owner, operator, or user shall certify as accurate all compliance data self-reported to the regional entity compliance monitoring and enforcement program.

10.7 Regional entities shall develop and implement procedures to verify the compliance information submitted by bulk power system owners, operators, and users.

11. **Compliance Audits of Bulk Power System Owners, Operators, and Users** — Each regional entity will maintain and implement a program of proactive compliance audits of bulk power system owners, operators, and users responsible for complying with reliability standards, in accordance with **Appendix 4C**. A compliance audit is a process in which a detailed review of the activities of a bulk power system owner, operator, or user is performed to determine if that bulk power system owner, operator, or user is complying with approved reliability standards.

11.1 For an entity registered as a balancing authority, reliability coordinator, or transmission operator, the compliance audit will be performed at least once every three years. For other bulk power system owners, operators, and users on the NERC Compliance Registry, compliance audits shall be performed on a schedule established by NERC.

11.2 Audits of balancing authorities, reliability coordinators, and transmission operators will include a component at the audited entity's site. For other bulk power system owners, operators, and users on the NERC Compliance Registry, the audit may be either an on-site audit or based on review of documents, as determined to be necessary and appropriate by NERC or regional entity compliance monitoring and enforcement program, staff.

11.3 Compliance audits must include a detailed review of the activities of the bulk power system owner, operator, or user to determine if the bulk power system owner, operator, or user is complying with all approved reliability

standards identified for audit by NERC. The compliance audit shall include a review of supporting documentation and evidence used by the bulk power system owner, operator or user to demonstrate compliance for an appropriate period prior to the compliance audit.

12. **Confidentiality of Compliance Monitoring and Enforcement Processes** — All compliance monitoring and enforcement processes, and information obtained from such processes, are to be non-public and treated as confidential in accordance with Section 1500 and **Appendix 4C** of these rules of procedure, unless NERC, the regional entity or FERC or another applicable governmental authority with jurisdiction determines a need to conduct a compliance monitoring and enforcement program process on a public basis, provided, that NERC and the regional entities shall publish (i) schedules of compliance audits scheduled in each year, (ii) a public report of each compliance audit, and (iii) notices of penalty and settlement agreements. Advance authorization from the applicable ERO governmental authority is required to make public any compliance monitoring and enforcement process or any information relating to a compliance monitoring and enforcement process, or to permit interventions when determining whether to impose a penalty. This prohibition on making public any compliance monitoring and enforcement process does not prohibit NERC or a regional entity from publicly disclosing (i) the initiation of or results from an analysis of a significant system event under Section 807 or of off-normal events or system performance under Section 808, or (ii) information of general applicability and usefulness to owners, operators, and users of the bulk power system concerning reliability and compliance matters, so long as specific allegations or conclusions regarding possible or alleged violations of reliability standards are not included in such disclosures.

13. **Critical Energy Infrastructure Information** — Information that would jeopardize bulk power system reliability, including information relating to a Cyber Security Incident will be identified and protected from public disclosure as critical energy infrastructure information. In accordance with Section 1500, information deemed by a bulk power system owner, operator, or user, regional entity, or NERC as critical energy infrastructure information shall be redacted according to NERC procedures and shall not be released publicly.

14. **Penalties, Sanctions, and Remedial Action Directives** — Each regional entity will apply all penalties, sanctions, and remedial action directives in accordance with the approved *Sanction Guidelines*, **Appendix 4B** to these rules of procedure. Any changes to the *Sanction Guidelines* to be used by any regional entity must be approved by NERC and submitted to the appropriate ERO governmental body for approval. All confirmed violations, penalties, and sanctions, including confirmed violations, penalties and sanctions specified in a regional entity hearing body final decision, will be provided to NERC for review and filing with applicable ERO governmental authorities as a notice of penalty, in accordance with **Appendix 4C**.

15. **Regional Hearing Process** — Each regional entity compliance enforcement program shall establish and maintain a fair, independent, and nondiscriminatory process for hearing contested violations and any penalties or sanctions levied, in conformance with Attachment 2 to **Appendix 4C** to these rules of procedure and any deviations therefrom that are set forth in the regional entity's delegation agreement.. The hearing process shall allow bulk power system owners, operators, and users to contest findings of compliance violations, any penalties and sanctions that are proposed to be levied, proposed remedial action directives, and components of proposed mitigation plans. The regional entity hearing process shall be conducted before the regional entity board or a balanced committee established by and reporting to the regional entity board as the final adjudicator, provided, that Canadian provincial regulators may act as the final adjudicator in their respective jurisdictions. The regional entity hearing process shall (i) include provisions for recusal of any members of the hearing body with a potential conflict of interest, real or perceived, from all compliance matters considered by the hearing body for which the potential conflict of interest exists and (ii) provide that no two industry sectors may control any decision and no single segment may veto any matter brought before the hearing body after recusals.

    Each regional entity will notify NERC of all hearings and NERC may observe any of the proceedings. Each regional entity will notify NERC of the outcome of all hearings.

    If a bulk power system owner, operator, or user or a regional entity has completed the regional entity hearing process and desires to appeal the outcome of the hearing, the bulk power system owner, operator, or user or the regional entity shall appeal to NERC in accordance with Section 409 of these rules of procedure, except that a determination of violation or penalty that has been directly adjudicated by an ERO governmental authority shall be appealed with that ERO governmental authority.

16. **Annual Regional Entity Compliance Enforcement Program Implementation Plan** — Each regional entity shall annually develop and submit to NERC for approval a regional entity compliance enforcement implementation plan in accordance with **Appendix 4C** that identifies the reliability standards and requirements to be actively monitored (both those required by NERC and any additional reliability standards the regional entity proposes to monitor), and how each NERC and regional entity identified standard will be monitored, evaluated, reported, sanctioned, and appealed. These implementation plans will be submitted to NERC on the schedule established by NERC, generally on or about ~~November~~October 1 of the preceding year. In conjunction with the annual implementation plan, each regional entity must report to NERC regarding how it carried out its delegated compliance monitoring and enforcement authority in the previous year, the effectiveness of the program, and changes expected to correct any deficiencies identified. Each regional entity will provide its annual report on

the schedule established by NERC, generally on or about February 15 of the following year.

404. NERC Monitoring of Compliance for Regional Entities or Bulk Power Owners, Operator, or Users

NERC shall monitor regional entity compliance with NERC reliability standards and, if no there is no delegation agreement in effect with a regional entity for the geographic area, shall monitor bulk power system owners, operators, and users for compliance with NERC reliability standards. Industry subject matter experts may be used as appropriate in compliance investigations, compliance audits, and other compliance activities, subject to confidentiality, antitrust, and conflict of interest provisions.

1. **NERC Obligations** — NERC compliance monitoring and enforcement staff shall monitor the compliance of the regional entity with the reliability standards for which the regional entities are responsible, in accordance with **Appendix 4C**. NERC shall actively monitor in its annual Compliance Enforcement and Monitoring Program selected reliability standards that apply to the regional entities. NERC shall evaluate compliance and noncompliance with all of the reliability standards that apply to the regional entities and shall impose sanctions, penalties, or remedial action directives when there is a finding of noncompliance. NERC shall post all violations of reliability standards that apply to the regional entities as described in the reporting and disclosure process in **Appendix 4C**.

   In addition, NERC will directly monitor bulk power system owners, operators, and users for compliance with NERC Reliability Standards in any geographic area for which there is not a delegation agreement in effect with a regional entity, in accordance with **Appendix 4C**. In such cases, NERC will serve as the Compliance Enforcement Authority described in **Appendix 4C**. Compliance matters contested by bulk power system owners, operators, and users in such an event will be heard by the NERC Compliance and Certification Committee.

2. **Compliance Audit of the Regional Entity** — NERC shall perform a compliance audit of each regional entity responsible for complying with reliability standards at least once every three years. NERC shall make an evaluation of compliance based on the information obtained through the audit. After due process is complete, the final audit report shall be made public in accordance with the reporting and disclosure process in **Appendix 4C**.

3. **Appeals Process** —Any regional entity or bulk-power system owner, operator or user found by NERC, as opposed to a regional entity, to be in noncompliance with a reliability standard may appeal the findings of noncompliance with reliability standards and any sanctions or remedial action directives that are issued by, or mitigation plan components imposed by, NERC, pursuant to the processes described in Sections 408 through 410.

405. Monitoring of Standards and Other Requirements Applicable to NERC

The NERC Compliance and Certification Committee shall establish and implement a process to monitor NERC's compliance with the reliability standards that apply to NERC. The process shall use independent monitors with no conflict of interest, real or perceived, in the outcomes of the process. All violations shall be made public according to the reporting and disclosure process in **Appendix 4C**. The Compliance and Certification Committee will also establish a procedure for monitoring NERC's compliance with its Rules of Procedure for the Standards Development, Compliance Enforcement, and Organization Registration and Certification Programs. Such procedures shall not be used to circumvent the appeals processes established for those programs.

406. Independent Audits of the NERC Compliance Monitoring and Enforcement Program

NERC shall provide for an independent audit of its compliance monitoring and enforcement program at least once every three years, or more frequently as determined by the board. The audit shall be conducted by independent expert auditors as selected by the board. The independent audit shall meet the following minimum requirements and any other requirements established by the NERC board.

1. **Effectiveness** — The audit shall evaluate the success and effectiveness of the NERC Compliance Monitoring and Enforcement Program in achieving its mission.

2. **Relationship** — The audit shall evaluate the relationship between NERC and the regional entity compliance enforcement programs and the effectiveness of the programs in ensuring reliability.

3. **Final Report Posting** — The final report shall be posted by NERC for public viewing in accordance with **Appendix 4C**.

4. **Response to Recommendations** — If the audit report includes recommendations to improve the NERC Compliance Monitoring and Enforcement Program, the administrators of the NERC Compliance Monitoring and Enforcement Program shall provide a written response and plan to the board within 30 days of the release of the final audit report.

407. Penalties, Sanctions, and Remedial Action Directives

1. **NERC Review of Regional Penalties and Sanctions —** NERC shall review all penalties, sanctions, and remedial action directives imposed by each regional entity for violations of reliability standards, including penalties, sanctions and remedial action directives that are specified by a regional entity hearing body final decision, to determine if the regional entity's determination is supported by a sufficient record compiled by the regional entity, is consistent with the *Sanction Guidelines* incorporated into these rules as **Appendix 4B** and with other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and is consistent with penalties, sanctions and remedial action directives imposed by the regional entity and by other regional entities for violations involving the same or similar facts and circumstances.

2. **Developing Penalties and Sanctions** — The regional entity compliance monitoring and enforcement program staff shall use the *Sanction Guidelines*, which are incorporated into these rules as **Appendix 4B**, to develop an appropriate penalty, sanction, or remedial action directive for a violation, and shall notify NERC of the penalty, ~~or~~ sanction or remedial action directive.

3. **Effective Date of Penalty** — Where authorized by applicable legislation or agreement, no penalty imposed for a violation of a reliability standard shall take effect until the thirty-first day after NERC files, with the applicable ERO governmental authority, a "notice of penalty" and the record of the proceedings in which the violation and penalty were determined, or such other date as ordered by the ERO applicable governmental authority.

408. Review of NERC Decisions

1. **Scope of Review** — A registered entity or a regional entity wishing to challenge a finding of noncompliance and the imposition of a penalty for a compliance measure directly administered by NERC, or a regional entity wishing to challenge a regional compliance program audit finding, may do so by filing a notice of the challenge with NERC's director of ~~compliance~~enforcement no later than 21 days after issuance of the notice of finding of violation or audit finding. Appeals by registered entities or regional entities of decisions of regional entity hearing bodies shall be pursuant to section 409 .

2. **Contents of Notice** — The notice of challenge shall include the full text of the decision that is being challenged, a concise statement of the error or errors contained in the decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief.

3. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of challenge, the NERC ~~D~~director of ~~Compliance~~enforcement may file with the hearing body a response to the issues raised in the notice, with a copy to the regional entity.

4. **Hearing by Compliance and Certification Committee** — The NERC Compliance and Certification Committee shall provide representatives of the regional entity or registered entity, and the NERC Compliance Monitoring and Enforcement Program an opportunity to be heard and shall decide the matter based upon the filings and presentations made, with a written explanation of its decision.

5. **Appeal** — The regional entity~~,~~ or registered entity may appeal the decision of the Compliance and Certification Committee by filing a notice of appeal with NERC's director of ~~compliance~~enforcement no later than 21 days after issuance of the written decision by the Compliance and Certification Committee. The notice of appeal shall include the full text of the written decision of the Compliance and Certification Committee that is being appealed, a concise statement of the error or errors contained in the decision, a clear statement of the

relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not presented to the Compliance and Certification Committee.

6. **Response by NERC Compliance Monitoring and Enforcement Program** — Within 21 days after receiving a copy of the notice of appeal, the NERC Compliance Monitoring and Enforcement Program staff may file its response to the issues raised in the notice of appeal, with a copy to the entity filing the notice.

7. **Reply** — The entity filing the appeal may file a reply within 7 days.

8. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record, the response, and any reply. At its discretion, the Compliance Committee may invite representatives of the regional entity or registered entity, and the NERC Compliance Monitoring and Enforcement Program to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the applicable ERO governmental authority.

9. **Impartiality** — No member of the Compliance and Certification Committee or the Board of Trustees Compliance Committee having an actual or perceived conflict of interest in the matter may participate in any aspect of the challenge or appeal except as a party or witness.

10. **Expenses** — Each party in the challenge and appeals processes shall pay its own expenses for each step in the process.

11. **Non-Public Proceedings —** All challenges and appeals shall be closed to the public to protect confidential information.

409. Appeals from Final Decisions of Regional Entities

1. **Time for Appeal** — A regional entity acting as the compliance enforcement authority, or an owner, operator or user of the bulk-power system, ~~wishing~~ shall be entitled to appeal ~~from~~ a final decision of a regional entity hearing body concerning ~~that finds~~ an alleged violation of a reliability standard, a proposed ~~or imposes a~~ penalty or sanction for violation of a reliability standard, a proposed mitigation plan, or a proposed remedial action directive, ~~shall file its~~by filing a notice of appeal with NERC's director of enforcement~~compliance~~, with ~~a copy~~copies to the regional entity and any other participants in the regional entity hearing body proceeding, no later than 21 days after issuance of the final decision of the regional entity hearing body. ~~The same appeal procedures will apply regardless of whether the matter first arose in a compliance investigation, compliance audit or self-report, other compliance monitoring and enforcement process, or in a reliability readiness evaluation.~~

2. **Contents** — The notice of appeal shall include the full text of the final decision of the regional entity hearing body that is being appealed, a concise statement of

the error or errors contained in the final decision, a clear statement of the relief being sought, and argument in sufficient detail to justify such relief. No factual material shall be presented in the appeal that was not first presented during the ~~compliance hearing~~proceeding before the regional entity hearing body.

3. **Response to Notice of Appeal~~by Regional Entity~~** — Within 21 days after the date~~receiving a copy of~~ the notice of appeal is filed, ~~(i)~~ the regional entity shall file the entire record of the ~~matter~~regional entity hearing body proceeding with NERC's director of ~~compliance~~enforcement, with a copy to the entity filing the notice of appeal~~,~~. ~~together with and (ii)~~Within 35 days after the date of the notice of appeal, all participants in the proceeding before the regional entity hearing body, other than the participant filing the notice of appeal, shall file their ~~its~~ responses to the issues raised in the notice of appeal.

4. **Reply** — The entity filing the appeal may file a reply to the responses~~regional entity~~ within 7 days.

5. **Decision** — The Compliance Committee of the NERC Board of Trustees shall decide the appeal, in writing, based upon the notice of appeal, the record of the ~~matter from~~ proceeding before the regional entity, the responses, and any replies~~y~~ filed with NERC. At its discretion, the Compliance Committee may invite representatives of the entity making the appeal and the other participants in the proceeding before the regional entity hearing body, to appear before the Committee. Decisions of the Compliance Committee shall be final, except for further appeal to the applicable ERO governmental authority.

6. **Expenses** — Each party in the appeals process shall pay its own expenses for each step in the process.

7. **Non-Public Proceedings** — All appeals shall be closed to the public to protect confidential information.

8. **Appeal of Hearing Body Decisions Granting or Denying Motions to Intervene** — This section is not applicable to an appeal of a decision of a regional entity hearing body granting or denying a motion to intervene in the regional entity hearing body proceeding. Appeals of decisions of regional entity hearing bodies granting or denying motions to intervene in regional entity hearing body proceedings shall be prosecuted and decided pursuant to Section 414.

410. Hold Harmless

A condition of invoking the challenge or appeals processes under Section 408 or 409 is that the entity requesting the challenge or appeal agrees that neither NERC (defined to include its members, Board of Trustees, committees, subcommittees, staff and industry subject matter experts), any person assisting in the challenge or appeals processes, nor any company employing a person assisting in the challenge or appeals processes, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach

agreement as a result of the challenge or appeals proceeding. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

411. Requests for Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Reliability Standards

A registered entity that is subject to a requirement of a NERC critical infrastructure protection reliability standard for which technical feasibility exceptions are permitted, may request a technical feasibility exception to the requirement, and the request will be reviewed, approved or disapproved, and if approved, implemented, in accordance with the NERC *Procedure for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standard*, Appendix 4D to these Rules of Procedure.

412. Certification of Questions from Regional Entity Hearing Bodies for Decision by the NERC Board of Trustees Compliance Committee

1. Certification from a Regional Entity Hearing Body

1.1 A regional entity hearing body that is conducting a hearing concerning a disputed compliance matter pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, may certify to the NERC Board of Trustees, for decision, a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the hearing in whole or in part, or as to which there are other extraordinary circumstances that make prompt consideration of the question by the Compliance Committee appropriate, in accordance with section 1.5.12 of the Hearing Procedures. All questions certified by a regional entity hearing body to the NERC Board of Trustees shall be considered and disposed of by the Compliance Committee of the Board of Trustees.

1.2. The Compliance Committee may accept or reject a certification of a question for decision. If the Compliance Committee rejects the certified question, it shall issue a written statement that the certification is rejected.

1.3 If the Compliance Committee accepts the certification of a question for decision, it shall establish a schedule by which the participants in the hearing before the regional entity hearing body may file memoranda and reply memoranda stating their positions as to how the question certified for decision should be decided by the Compliance Committee. The Compliance Committee may also request, or provide an opportunity for, the NERC Compliance Operations department, the NERC Compliance Enforcement department, and/or the NERC General Counsel to file memoranda stating their positions as to how the question certified for decision should be decided. After receiving such memoranda and reply memoranda as are filed in accordance with the schedule, the Compliance Committee shall issue a written decision on the certified question.

1.4. Upon receiving the Compliance Committee's written decision on the certified question, the regional entity hearing body shall proceed to complete the hearing in accordance with the Compliance Committee's decision.

2. Publication of Decisions of the Board of Trustees Compliance Committee on Certified Questions

NERC shall post on its web site the written decisions issued by the Compliance Committee on certified questions. Consistent with the non-public nature of hearings before regional entity hearing bodies, in the posted decision the names of the regional entity, registered entity or entities, and any other participants in the regional entity hearing body hearing, and such other information as is necessary to maintain the non-public nature of the hearing before the regional entity hearing body, shall be redacted. Decisions of the Compliance Committee to not accept a question proposed for certification by the regional entity hearing body shall not be posted.

413. Review and Processing of Regional Entity Hearing Body Final Decisions that Are Not Appealed

NERC shall review and process all final decisions of regional entity hearing bodies concerning an alleged violation, proposed penalty or sanction, or proposed mitigation plan that are not appealed pursuant to section 409, as though the determination had been made by the regional entity compliance program. NERC shall review and process such final decisions, and may require that they be modified by the regional entity, in accordance with, as applicable to the particular decision, sections 5.8, 5.9 and 6.5 of Appendix 4C

414. Appeals of Decisions of Regional Entity Hearing Bodies Granting or Denying Motions to Intervene in Regional Entity Hearing Body Proceedings

1. **Time to Appeal** — An entity may appeal a decision of a regional entity hearing body under section 1.4.4 of Attachment 2 of **Appendix C** denying the entity's motion to intervene in a regional entity hearing body proceeding, and the regional entity compliance staff or any other participant in the regional entity hearing body proceeding may appeal a decision of the regional entity hearing body under section 1.4.4 of Attachment 2 of **Appendix C** granting or denying a motion to intervene in the regional entity hearing body proceeding, in either case by filing a notice of appeal with the NERC director of enforcement, with copies to the regional entity clerk, the hearing body, the hearing officer, the regional entity compliance staff, and all other participants in the regional entity hearing body proceeding, no later than seven (7) days following the date of the regional entity hearing body decision granting or denying the motion to intervene.

2. **Contents of Notice of Appeal** — The notice of appeal shall set forth information and argument to demonstrate that the decision of the regional entity hearing body

granting or denying the motion to intervene was erroneous under the grounds for intervention specified in section 1.4.4 of Attachment 2 of **Appendix 4C** and that the entity requesting intervention should be granted or denied intervention, as applicable. Facts alleged in, and any offers of proof made in, the notice of appeal shall be supported by affidavit or verification. The notice of appeal shall include a copy of the original motion to intervene and a copy of the decision of the regional entity hearing body granting or denying the motion to intervene.

3. **Responses to Notice of Appeal** — Within ten (10) days following the date the notice of appeal is filed, the regional entity clerk shall transmit to the NERC director of compliance copies of all pleadings filed in the regional entity hearing body proceeding on the motion to intervene. Within fourteen (14) days following the date the notice of appeal is filed, the regional entity hearing body, the regional entity compliance staff, and any other participants in the regional entity hearing body proceeding, may each file a response to the notice of appeal with the NERC director of enforcement. Within seven (7) days following the last day for filing responses, the entity filing the notice of appeal, and any participant in the regional entity hearing body proceeding that supports the appeal, may file replies to the responses with the NERC director of compliance.

4. **Disposition of Appeal** — The appeal shall be considered and decided by the Compliance Committee of the NERC Board of Trustees. The NERC director of compliance shall provide copies of the notice of appeal and any responses and replies to the Compliance Committee. The Compliance Committee shall issue a written decision on the appeal; provided, that if the Compliance Committee does not issue a written decision on the appeal within forty-five (45) days following the date of filing the notice of appeal, the appeal shall be deemed denied and the decision of the regional entity hearing body granting or denying the motion to intervene shall stand. The NERC director of compliance shall transmit copies of the Compliance Committee's decision, or shall provide notice that the forty-five (45) day period has expired with no decision by the Compliance Committee, to the regional entity clerk, the regional entity hearing body, the entity filing the notice of appeal, the regional entity compliance staff, and any other participants in the regional entity hearing body proceeding that filed responses to the notice of appeal or replies to responses.

5. **Appeal of Compliance Committee Decision to FERC or Other ERO Governmental Authority** — Any entity aggrieved by the decision of the Compliance Committee of the NERC Board of Trustees on an appeal of a regional entity hearing body decision granting or denying a motion to intervene in a regional entity hearing body proceeding (including a denial of such appeal by the expiration of the forty-five (45) period as provided in section 414.4) may appeal or petition for review of the decision of the Compliance Committee to FERC or to another ERO governmental authority having jurisdiction over the matter, in accordance with the authorities, rules and procedures of FERC or such other ERO governmental authority. Any such appeal or petition for review shall be filed within the time period, if any, and in the form and manner, specified by

the applicable statutes, rules or regulations governing proceedings before FERC or the other ERO governmental authority.

SECTION 500 — ORGANIZATION REGISTRATION AND CERTIFICATION

501. Scope of the Organization Registration and Organization Certification Programs

The purpose of the Organization Registration Program is to clearly identify those entities that are responsible for compliance with the FERC approved reliability standards. Organizations that are registered are included on the NERC Compliance Registry (NCR) and are responsible for knowing the content of and for complying with all applicable reliability standards. Registered organizations are not and do not become members of NERC or a Regional Entity, by virtue of being listed on the NCR. Membership in NERC is governed by Article II of NERC's bylaws; membership in a Regional Entity or regional reliability organization is governed by that entity's bylaws or rules.

The purpose of the Organization Certification Program is to ensure that ~~the new entity (i.e., applicant to be an RC, BA, or TOP that is not already performing the function for which it is applying to be certified as) has~~entities performing certain functions have the tools, processes, training, and procedures to demonstrate their ability to meet the requirements/sub requirements of all of the reliability standards applicable to the function(s) they perform~~for which it is applying~~ thereby demonstrating the ability to become certified and then operational.

Organization Registration and Organization Certification may be delegated to Regional Entities in accordance with the procedures in this Section 500; the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into these rules as Appendix 5A; and, approved Regional Entity delegation agreements or other applicable agreements.

1. **NERC Compliance Registry** — NERC shall establish and maintain the NCR of the bulk power system owners, operators, and users that are subject to approved reliability standards.

   1.1 (a) The NCR shall set forth the identity and functions performed for each organization responsible for meeting requirements/sub-requirements of the reliability standards. Bulk power system owners, operators, and users (i) shall provide to NERC and the applicable Regional Entity information necessary to complete the registration, and (ii) shall provide NERC and the applicable Regional Entity with timely updates to information concerning the registered entity's ownership, operations, contact information, and other information that may affect the registered entity's registration status or other information recorded in the compliance registry.

   (b) A generation or transmission cooperative, a joint-action agency or another organization may register as a Joint Registration Organization (JRO), in lieu of each of the JRO's members or related entities being registered individually for one or more functions. Refer to Section 507.

(c) Multiple entities may each register using a Coordinated Functional Registration (CFR) for one or more reliability standard(s) and/or for one or more requirements/sub-requirements within particular reliability standard(s) applicable to a specific function pursuant to a written agreement for the division of compliance responsibility. Refer to Section 508.

1.2 In the development of the NCR, NERC and the Regional Entities shall determine which organizations should be placed on the NCR based on the criteria provided in the NERC *Statement of Compliance Registry Criteria* which is incorporated into these rules as Appendix 5B.

1.3 NERC and the Regional Entities shall use the following rules for establishing and maintaining the NCR based on the registration criteria as set forth in Appendix 5B *Statement of Compliance Registry Criteria*:

1.3.1 NERC shall notify each organization that it is on the NCR. NERC's notification shall state the effective date of the organization's registration. Where the organization is being registered for the first time and its bulk power system facilities were not previously owned by another registered entity, the effective date of the registration will be the date agreed to by the entity to be registered and the regional entity. Where the organization is being registered because it has acquired bulk power system facilities from a registered entity, or based on an internal restructuring or name change where the organization has been registered under a different entity name, the effective date of the registration will be the effective date of the transaction that results in the organization performing reliability functions that require it to be registered. The organization~~entity~~ is responsible for compliance with all the reliability standards applicable to the functions for which it is registered from the effective date of~~time it receives~~ the registration ~~notification from NERC~~.

1.3.2 Any organization receiving such a notice may challenge its placement on the NCR according to the process in Appendix 5A *Organization Registration and Organization Certification Manual*, Section V.

1.3.3 The Compliance Committee of the Board of Trustees shall promptly issue a written decision on the challenge, including the reasons for the decision.

1.3.4 The decision of the Compliance Committee of the Board of Trustees shall be final unless, within 21 days of the date of the Compliance Committee of the Board of Trustees decision, the

organization appeals the decision to the applicable governmental authority.

1.3.5 Each entity identified on the NCR shall notify its corresponding Regional Entity(s) of any corrections, revisions, deletions, changes in ownership, corporate structure, or similar matters that affect the entity's responsibilities with respect to the reliability standards. Failure to notify will not relieve the entity from any responsibility to comply with the reliability standards or shield it from any penalties or sanctions associated with failing to comply with the standards applicable to its associated registration.

1.4 For all geographical or electrical areas of the bulk power system, the registration process shall ensure that (1) no areas are lacking any entities to perform the duties and tasks identified in and required by the reliability standards to the fullest extent practical, and (2) there is no unnecessary duplication of such coverage or of required oversight of such coverage. In particular the process shall:

1.4.1 Ensure that all areas are under the oversight of one and only one Reliability Coordinator.

1.4.2 Ensure that all Balancing Authorities and Transmission Operator entities[2] are under the responsibility of one and only one Reliability Coordinator.

1.4.3 Ensure that all transmission facilities of the bulk power system are the responsibility and under the control of one and only one Transmission Planner, Planning Authority, and Transmission Operator.

1.4.4 Ensure that all loads and generators are under the responsibility and control of one and only one Balancing Authority.

1.5 NERC shall maintain the NCR of organizations responsible for meeting the requirements/sub-requirements of the reliability standards currently in effect on its Web site and shall update the NCR monthly.

2. **Entity Certification** — NERC shall provide for certification of all entities with primary reliability responsibilities requiring certification, including, but not limited to, Reliability Coordinators, Transmission Operators, Balancing Authorities, and those entities that perform some or all of the reliability functions

[2] Some organizations perform the listed functions (e.g., balancing authority, transmission operator) over areas that transcend the footprints of more than one reliability coordinator. Such organizations will have multiple registrations, with each such registration corresponding to that portion of the organization's overall area that is within the footprint of a particular reliability coordinator.

of Reliability Coordinators, Transmission Operators and Balancing Authorities. ~~This includes those entities that satisfy the criteria established in the NERC Provisional Certification Process. The NERC programs~~Certification of entities shall include, but is not limited to, the following:

2.1 Evaluate and certify the competency of entities performing or intending to perform the reliability functions of~~. The entities presently expected to be certified include~~ Reliability Coordinators, Transmission Operators, and Balancing Authorities.

2.2 Evaluate and certify each applicant's ability to meet the requirements for certification.

2.3 Maintain process documentation.

2.4 Maintain records of currently certified entities.

2.5 Issue a certification document to the applicant that successfully demonstrates its competency to perform the evaluated functions.

3. **Delegation and Oversight**

3.1 NERC may delegate responsibilities for Organization Registration and Organization Certification to Regional Entities in accordance with requirements established by NERC. Delegation will be via the delegation agreement between NERC and the Regional Entity or other applicable agreement. The Regional Entity shall administer Organization Registration and Organization Certification Programs in accordance with such delegations to meet NERC's programs goals and requirements subject to NERC oversight.

3.2 NERC shall develop and maintain a plan to ensure the continuity of Organization Registration and Organization Certification within the geographic or electrical boundaries of a Regional Entity in the event that no entity is functioning as a Regional Entity for that region, or the Regional Entity withdraws as a Regional Entity, or does not operate its Organization Registration and Organization Certification Programs in accordance with delegation agreements.

3.3 NERC shall develop and maintain a program to monitor and oversee the NERC Organization Registration and Organization Certification Programs activities that are delegated to each Regional Entity through a delegation agreement or other applicable agreement.

3.3.1 This program shall monitor whether the Regional Entity carries out those delegated activities in accordance with NERC requirements, and whether there is consistency, fairness of administration, and comparability.

3.3.2 Monitoring and oversight shall be accomplished through direct participation in the Organization Registration and Organization Certification Programs with periodic reviews of documents and records of both programs.

502. Organization Registration and Organization Certification Program Requirements

1. NERC shall maintain the Organization Registration and Organization Certification Programs.

   1.1 The roles and authority of Regional Entities in the programs are delegated from NERC pursuant to the Rules of Procedure through regional delegation agreements or other applicable agreements.

   1.2 Processes for the programs shall be administered by NERC and the Regional Entities. Materials that each Regional Entity uses are subject to review and approval by NERC.

   1.3 The appeals process for the Organization Registration and Organization Certification Programs are identified in Appendix 5A *Organization Registration and Organization Certification Manual*, Sections V and VI, respectively.

   1.4 The certification team membership is identified in Appendix 5A *Organization Registration and Organization Certification Manual*, Section IV.8.d.

2. To ensure consistency and fairness of the Organization Registration and Organization Certification Programs, NERC shall develop procedures to be used by all Regional Entities and NERC in accordance with the following criteria:

   2.1 NERC and the Regional Entities shall have data management processes and procedures that provide for confidentiality, integrity, and retention of data and information collected.

   2.2 Documentation used to substantiate the conclusions of the Regional Entity/ NERC related to registration and/or certification must be retained by the Regional Entity for (6) six years, unless a different retention period is otherwise identified, for the purposes of future audits of these programs.

   2.3 To maintain the integrity of the NERC Organization Registration and Organization Certification Programs, NERC, Regional Entities, certification team members, program audit team members (Section 506), and committee members shall maintain the confidentiality of information provided by an applicant or entities.

      2.2.1 NERC and the Regional Entities shall have appropriate codes of conduct and confidentiality agreements for staff, certification team,

certification related committees, and certification program audit team members.

2.2.2 NERC, Regional Entities, certification team members, program audit team members and committee members shall maintain the confidentiality of any registration or certification-related discussions or documents designated as confidential (see Section 1500 for types of confidential information).

2.2.3 NERC, Regional Entities, certification team members, program audit team members and committee members shall treat as confidential the individual comments expressed during evaluations, program audits and report-drafting sessions.

2.2.4 Copies of notes, draft reports, and other interim documents developed or used during an entity certification evaluation or program audit shall be destroyed after the public posting of a final, uncontested report.

2.2.5 Information deemed by an applicant, entity, a Regional Entity, or NERC as confidential, including critical energy infrastructure information, shall not be released publicly or distributed outside of a committee or team.

2.2.6 In the event that an individual violates any of the confidentiality rules set forth above, that individual and any member organization with which the individual is associated will be subject to immediate dismissal from the audit team and may be prohibited from future participation in compliance program activities by the Regional Entity or NERC.

2.2.7 NERC shall develop and provide training in auditing skills to all individuals prior to their participation in certification evaluations. Training for certification team leaders shall be more comprehensive than the training given to industry subject matter experts and Regional Entity members. Training for Regional Entity members may be delegated to the Regional Entity.

2.4 An applicant that is determined to be competent to perform a function after completing all certification requirements shall be deemed certified by NERC to perform that function for which it has demonstrated full competency.

2.4.1 All NERC certified entities shall be included on the NCR.

503. Regional Entity Implementation of Organization Registration and Organization Certification Program Requirements

1. **Delegation** — Recognizing the Regional Entity's knowledge of and experience with their members, NERC may delegate responsibility for Organization Registration and Organization Certification to the Regional Entity through a delegation agreement.

2. **Registration** — The following Organization Registration activities shall be managed by the Regional Entity per the NERC *Organization Registration and Organization Certification Manual*, which is incorporated into the Rules of Procedure as Appendix 5A *Organization Registration and Organization Certification Manual*:

    2.1 Regional entities shall verify that all Reliability Coordinators, Balancing Authorities, and Transmission Operators meet the registration requirements of Section 501(1.4).

3. **Certification —** The following Organization certification activities shall be managed by the Regional Entity in accordance with an approved delegation agreement or another applicable agreement:

    3.1 An entity seeking certification to perform one of the functions requiring certification shall contact the Regional Entity for the region(s) in which it plans to operate to apply for certification.

    3.2 An entity seeking certification and other affected entities shall provide all information and data requested by NERC or the Regional Entity to conduct the certification process.

    3.3 Regional Entities shall notify NERC of all certification applicants.

    3.4 NERC and/or the Regional Entity shall evaluate the competency of entities requiring certification to meet the NERC certification requirements.

    3.5 NERC or the Regional Entity shall establish certification procedures to include evaluation processes, schedules and deadlines, expectations of the applicants and all entities participating in the evaluation and certification processes, and requirements for certification team members.

        3.5.1 The NERC / Regional Entity certification procedures will include provisions for on-site visits to the applicant's facilities to review the data collected through questionnaires, interviewing the operations and management personnel, inspecting the facilities and equipment (including requesting a demonstration of all tools identified in the certification process), reviewing all necessary documents and data (including all agreements, processes, and procedures identified in the certification process), reviewing certification documents and projected system operator work schedules, and reviewing any additional documentation needed to

support the completed questionnaire or inquiries arising during the site visit.

3.5.2 The NERC/ Regional Entity certification procedures will provide for preparation of a written report by the certification team, detailing any deficiencies that must be resolved prior to granting certification, along with any other recommendations for consideration by the applicant, the Regional Entity, or NERC.

504. Appeals

1. NERC shall maintain an appeals process to resolve any disputes related to registration or certification activities per the *Organization Registration and Organization Certification Manual,* which is incorporated in these rules as Appendix 5A.

2. The Regional Entity certification appeals process shall culminate with the regional board or a committee established by and reporting to the regional board as the final adjudicator, provided that where applicable, Canadian provincial governmental authorities may act as the final adjudicator in their jurisdictions. NERC shall be notified of all appeals and may observe any proceedings **(**Appendix 5A *Organization Registration and Organization Certification Manual***)**.

505. Program Maintenance

NERC shall maintain its program materials, including such manuals or other documents as it deems necessary, of the governing policies and procedures of the Organization Registration and Organization Certification Programs.

506. Independent Audit of NERC Organization Registration and Organization Certification Program

1. NERC, through the Compliance and Certification Committee, shall provide for an independent audit of its Organization Registration and Organization Certification Programs at least once every three years, or more frequently, as determined by the Board. The audit shall be conducted by independent expert auditors as selected by the Board.

2. The audit shall evaluate the success, effectiveness and consistency of the NERC Organization Registration and Organization Certification Programs.

3. The final report shall be posted by NERC for public viewing.

4. If the audit report includes recommendations to improve the program, the administrators of the program shall provide a written response to the Board within 30 days of the final report, detailing the disposition of each and every

recommendation, including an explanation of the reasons for rejecting a recommendation and an implementation plan for the recommendations accepted.

507. Provisions Relating to Joint Registration Organizations (JRO)

1. In addition to registering as the entity responsible for all functions that it performs itself, an entity may register as a JRO on behalf of one or more of its members or related entities for one or more functions for which such members or related entities would otherwise be required to register and, thereby, accept on behalf of such members or related entities all compliance responsibility for that function or those functions including all reporting requirements. Any entity seeking to register as a JRO must submit a written agreement with its members or related entities for all requirements/sub-requirements for the function(s) for which the entity is registering for and takes responsibility for, which would otherwise be the responsibility of one or more of its members or related entities. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the JRO registration.

2. The JRO registration data must include the same registration information as a normal compliance registration entry. The JRO is responsible for providing all of the information and data, including submitting reports, as needed by the Regional Entity for performing assessments of compliance.

3. The Regional Entity shall notify NERC of each JRO that the Regional Entity accepts. The notification will identify the point of contact and the functions(s) being registered for on behalf of its members or related entities.

4. For purposes of compliance audits, the Regional Entity shall keep a list of all JROs. This document shall contain a list of each JRO's members or related entities and the function(s) for which the JRO is registered for that member(s) or related entity(s). It is the responsibility of the JRO to provide the Regional Entity with this information as well as the applicable JRO agreement(s).

5. The Regional Entity may request clarification of any list submitted to it that identifies the members of the JRO and may request such additional information as the Regional Entity deems appropriate.

6. The Regional Entity's acceptance of a JRO shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the JRO will meet the registration requirements of Section 501(1.4).

7. NERC shall maintain, and post on its Web site, a JRO registry listing all JRO registrations that have been reviewed and accepted by the Regional Entity. The posting shall identify the JRO entity taking compliance responsibilities for itself and its members.

8. The JRO shall inform the Regional Entity of any changes to an existing JRO. The Regional Entity shall promptly notify NERC of each such revision.

9. Nothing in Section 507 shall preclude a member of a JRO, a related entity, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting requirements for the reliability standards applicable to the function(s) for which the member or other entity is registering. A JRO member or related entity that registers as responsible for any reliability standard or requirement/sub-requirement of a reliability standard shall inform the JRO of its registration.

508. Provisions Relating to Coordinated Functional Registration (CFR) Entities

1. I n addition to registering as an entity responsible for all functions that it performs itself, multiple entities may each register using a CFR for one or more reliability standard(s) and/or for one or more requirements/sub-requirements within particular reliability standard(s) applicable to a specific function. The CFR submission must include a written agreement that governs itself and clearly specifies the entities' respective compliance responsibilities. The registration of the CFR is the complete registration for each entity. Additionally, each entity shall take full compliance responsibility for those standards and/or requirements/sub-requirements it has registered for in the CFR. Neither NERC nor the Regional Entity shall be parties to any such agreement, nor shall NERC or the Regional Entity have responsibility for reviewing or approving any such agreement, other than to verify that the agreement provides for an allocation or assignment of responsibilities consistent with the CFR.

2. Each CFR or each individual entity within a CFR must identify a point of contact that is responsible for providing information and data, including submitting reports as needed by the Regional Entity related to the CFR registration.

3. The Regional Entity shall notify NERC of each CFR that the Regional Entity accepts.

4. NERC or the Regional Entity may request clarification of any list submitted to it that identifies the compliance responsibilities of the CFR and may request such additional information as NERC or the Regional Entity deems appropriate.

5. The Regional Entity's acceptance of that CFR shall be a representation by the Regional Entity to NERC that the Regional Entity has concluded the CFR will meet the registration requirements of Section 501(1.4).

6. NERC shall maintain, and post on its Web site, a CFR registry listing all CFR registrations that have been accepted by NERC or by a Regional Entity. The posting shall clearly list all the reliability standards or requirements/sub-requirements thereof for which each entity of the CFR is responsible for under the CFR.

7. The point of contact shall inform the Regional Entity of any changes to an existing CFR. The Regional Entity shall promptly notify NERC of each such revision.

8. In the event of a violation of a reliability standard or of a requirement/sub requirement of a reliability standard for which an entity of a CFR is registered, that entity shall be identified in the notice of alleged violation and shall be assessed the sanction or penalty in accordance with the NERC Sanctions Guidelines. In the event a Regional Entity is not able to determine which entity(ies) is responsible for a particular reliability standard, or requirements/sub requirements thereof that has been violated, the Regional Entity shall investigate the noncompliance in accordance with the NERC Rules of Procedure Section 400, *Compliance Enforcement*, to determine the entity(ies) to which the Regional Entity shall to issue the sanction or penalty for the violation.

9. Nothing in Section 508 shall preclude an entity registered in a CFR, or any other entity from registering on its own behalf and undertaking full compliance responsibility including reporting requirements for the reliability standards applicable to the function(s) for which the entity is registering. An entity registered in a CFR that registers as responsible for any reliability standard or requirement/sub requirement of a reliability standard shall inform the point of contact of its registration.

SECTION 600 — PERSONNEL CERTIFICATION

601. Scope of Personnel Certification

Maintaining the reliability of the bulk electric system through implementation of the reliability standards requires skilled, trained and qualified system operators. The ~~System Operator~~Personnel Certification Program provides the mechanism to ensure system operators are provided the education and training necessary to obtain the essential knowledge and skills and are therefore qualified to operate the bulk electric system. The Personnel Certification Program awards system operator certification credentials to individuals who demonstrate they have attained essential knowledge relating to NERC reliability standards as well as principles of bulk power system operations. NERC, as the ERO, will ensure skilled, trained, and qualified system operators through the ~~System Operator~~Personnel Certification Program.

Except as necessary to obtain approval of the Rules of Procedure, the NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the policies, sets fees, and monitors the performance of the Personnel Certification Program for system operators.

~~NERC shall develop and maintain a personnel certification program to evaluate individuals and to issue credentials to individuals who demonstrate the required level of competence. A current version of such a program is the *System Operator Certification Program Manual*, which is incorporated into these rules as **Appendix 6**.~~

602. Structure of ERO Personnel Certification Program

1. The NERC personnel certification program shall be international in scope.

2. The personnel certification program shall have a governing body that (1) is able to independently exercise decision-making for all matters pertaining to certification, (2) includes individuals from the discipline being certified and whose composition addresses the needs of the users of the program (e.g., employers, regulators, etc.), and (3) has representation for each specialty or level within a discipline.

3. NERC shall maintain a nominating process for membership in the governing body. Nominations shall be open to all interested parties and self-nominations shall be accepted. The NERC Board of Trustees shall appoint members to the governing body from among those nominated. The members of the governing body shall serve at the pleasure of the board.

4. The personnel certification program governing body shall have control over the matters related to the personnel certification and recertification programs listed below, without being subject to approval by any other body.

    4.1 Policies and procedures, including eligibility requirements and application processing.

4.2 Requirements for personnel certification, maintaining certification, and recertification.

4.3 Examination content, development, and administration.

4.4 Examination cut score.

4.5 Grievance and disciplinary processes.

4.6 Governing body and subgroup(s)' meeting rules including agenda, frequency, and related procedures.

4.7 Subgroup(s) appointments and work assignments.

4.8 Publications about personnel certification and recertification.

4.9 Setting fees for application, and all other services provided as a part of the personnel certification and recertification activities.

4.10 Program funding, spending, and budget authority. Financial matters related to the operation of the program shall be segregated from other NERC activities.

5. The personnel certification program shall utilize written procedures for the selection of members of the governing body that prohibit the governing body from selecting a majority of its successors.

6. The personnel certification program shall be separate from the accreditation and education functions of NERC in related disciplines.

7. No member of the personnel certification program governing body or staff member working with the personnel certification program governing body shall have or exercise any authority or responsibility for compliance matters related to reliability standards concerning personnel certification.

603. Examinations and Maintenance of NERC System Operator Certification Credentials

1. System operators seeking to obtain a credential must pass an examination to earn the credential.

2. A certificate will be issued to successful candidates which is valid for three years.

3. A system operator must earn continuing education (CE) hours in NERC approved learning activities within the three-year period preceding the expiration date of his/her certificate as determined by the PCGC and posted in the NERC System Operator Program Manual. A system operator must request a renewal and submit the appropriate fee for certification renewal evaluation.

4. The credential of a certified system operator who does not accumulate the required number and balance of CE hours within the three-year period will be suspended. A system operator with a suspended certificate cannot perform any task that requires an operator to be NERC-certified. The system operator with a suspended credential will have up to twelve months to acquire the necessary CE hours.

   4.1 During the time of suspension, the original anniversary date will be maintained. Therefore, should the system operator accumulate the required number of CE hours within the twelve month suspension period, he/she will be issued a certificate that will be valid for three years from the previous expiration date.

   4.2 At the end of the twelve-month suspension period, if the system operator has not accumulated the required number of CE hours, the credential will be revoked and all CE hours earned will be forfeited. After a credential is revoked, the system operator will be required to pass an examination to become certified.

5. Hardship: Due to unforeseen events and extenuating circumstances, a certified system operator may be unable to accumulate the necessary CE hours in the time frame required by the Personnel Certification Program to maintain the credential. In such an event, the individual must submit a written request containing a thorough explanation of the circumstances and supporting information to the NERC Personnel Certification Manager. The PCGC retains the right to invoke this Hardship Clause as it deems appropriate to address such events or circumstances.

604. Dispute Resolution Process

1. Any dispute arising under the NERC agreement establishing the *NERC Personnel Certification Program* or from the establishment of any NERC rules, policies, or procedures dealing with any segment of the certification process shall be subject to the NERC System Operator Certification Dispute Resolution Process. The Dispute Resolution Process is for the use of persons who hold an operator certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the registration process.

2. Dispute Resolution Process consists of three steps.

   2.1. Notify NERC Personnel Certification Program Staff: This first step can usually resolve the issues without further actions. It is expected that most disputes will be resolved at this step. If the issue(s) is not resolved to the satisfaction of the parties involved in the first step, the issue can be brought to the Personnel Certification Governance Committee (PCGC) Dispute Resolution Task Force.

2.2. PCGC Dispute Resolution Task Force: If the NERC staff did not resolve the issue(s) to the satisfaction of the parties involved, a written request must be submitted to the chairman of the PCGC through NERC staff explaining the issue(s) and requesting further action. Upon receipt of the letter, the PCGC chairman will present the request to the PCGC Dispute Resolution Task Force for action. This task force consists of three current members of the PCGC. The PCGC Dispute Resolution Task Force will investigate and consider the issue(s) presented and make a decision. This decision will then be communicated to the submitting party, the PCGC chairman, and the NERC staff within 45 calendar days of receipt of the request.

3. Personnel Certification Governance Committee: If the PCGC Dispute Resolution Task Force's decision did not resolve the issue(s) to the satisfaction of the parties involved, the final step in the process is for the issue(s) to be brought before the PCGC. Within 45 days of the date of the Task Force's decision, the disputing party shall submit a written request to the PCGC chairman through NERC staff requesting that the issue(s) be brought before the PCGC for resolution. The chairman shall see that the necessary documents and related data are provided to the PCGC members as soon as practicable. The PCGC will then meet or conference to discuss the issue(s) and make their decision within 60 calendar days of the chairman's receipt of the request. The decision will be provided to the person bringing the issue(s) and the NERC staff. The PCGC is the governing body of the certification program and its decision is final.

4. Dispute Resolution Process Expenses: All individual expenses associated with the Dispute Resolution Process, including salaries, meetings, or consultant fees, shall be the responsibility of the individual parties incurring the expense.

5. Decision Process: Robert's Rules of Order shall be used as a standard of conduct for the Dispute Resolution Process. A majority vote of the members present will decide all issues. The vote will be taken in a closed session. No member of the PCGC may participate in the Dispute Resolution Process, other than as a party or witness, if he or she has an interest in the particular matter.

5.1 A stipulation of invoking the Dispute Resolution Process is that the entity invoking the Dispute Resolution Process agrees that neither NERC (its members, Board of Trustees, committees, subcommittees, and staff), any person assisting in the Dispute Resolution Process, nor any company employing a person assisting in the Dispute Resolution Process, shall be liable, and they shall be held harmless against the consequences of or any action or inaction or of any agreement reached in resolution of the dispute or any failure to reach agreement as a result of the Dispute Resolution Process. This "hold harmless" clause does not extend to matters constituting gross negligence, intentional misconduct, or a breach of confidentiality.

605. Disciplinary Action

1. Disciplinary action may be necessary to protect the integrity of the system operator credential. The PCGC may initiate disciplinary action should an individual act in a manner that is inconsistent with expectations, including but not limited to:

   1.1. Willful, gross, and/or repeated violation of the NERC reliability standards as determined by a NERC investigation.

   1.2. Willful, gross, and/or repeated negligence in performing the duties of a certified system operator as determined by a NERC investigation.

   1.3. Intentional misrepresentation of information provided on a NERC application for a system operator certification exam or to maintain a system operator credential using CE hours.

   1.4. Intentional misrepresentation of identification in the exam process, including a person identifying himself or herself as another person to obtain certification for the other person.

   1.5. Any form of cheating during a certification exam, including, but not limited to, bringing unauthorized reference material in the form of notes, crib sheets, or other methods of cheating into the testing center.

   1.6. A certified system operator's admission to or conviction of any felony or misdemeanor directly related to his/her duties as a system operator.

2. Hearing Process: Upon report to NERC of a candidate's or certified system operator's alleged misconduct, the NERC PCGC Credential Review Task Force will convene for the determination of facts. An individual, government agency, or other investigating authority can file a report. Unless the task force initially determines that the report of alleged misconduct is without merit, the candidate or certified system operator will be given the right to notice of the allegation. A hearing will be held and the charged candidate or certified system operator will be given an opportunity to be heard and present further relevant information. The task force may seek out information from other involved parties. The hearing will not be open to the public, but it will be open to the charged candidate or certified system operator and his or her representative. The task force will deliberate in a closed session, but the task force cannot receive any evidence during the closed session that was not developed during the course of the hearing.

3. Task force's decision: The task force's decision will be unanimous and will be in writing with inclusion of the facts and reasons for the decision. The task force's written decision will be delivered to the PCGC and by certified post to the charged candidate or certified system operator. In the event that the task force is

unable to reach a unanimous decision, the matter shall be brought to the full committee for a decision.

3.1. No Action: Allegation of misconduct was determined to be unsubstantiated or inconsequential to the credential.

3.2. Probation: A letter will be sent from NERC to the offender specifying:

3.2.1. The length of time of the probationary period (to be determined by the PCGC).

3.2.2. Credential will remain valid during the probationary period.

3.2.3. The probationary period does not affect the expiration date of the current certificate.

3.2.4. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

3.3. Revoke for Cause: A letter will be sent from NERC to the offender specifying:

3.3.1. The length of time of the probationary period (to be determined by the PCGC).

3.3.2. Credential is no longer valid.

3.3.3. Successfully passing an exam will be required to become recertified.

3.3.4. An exam will not be authorized until the revocation period expires

3.4. Termination of Credential: A letter will be sent from NERC to the offender specifying permanent removal of credential.

4. Credential Review Task Force: The Credential Review Task Force shall be comprised of three active members of the PCGC assigned by the Chairman of the PCGC on an ad hoc basis. No one on the credential review task force may have an interest in the particular matter. The task force will meet in a venue determined by the task force chairman.

5. Appeal Process: The decision of the task force may be appealed using the NERC System Operator Certification Dispute Resolution Process.

~~603.~~606 Candidate Testing Mechanisms

1. The personnel certification program shall utilize reliable testing mechanisms to evaluate individual competence in a manner that is objective, fair to all candidates, job-related, and based on the knowledge and skill needed to function in the discipline.

2. The personnel certification program shall implement a formal policy of periodic review of the testing mechanisms to ensure ongoing relevance of the mechanisms to knowledge and skill needed in the discipline.

3. The personnel certification program shall utilize policies and procedures to ensure that all test administration and development materials are secure and demonstrate that these policies and procedures are consistently implemented.

4. The personnel certification program shall establish pass/fail levels that protect the public with a method that is based on competence and generally accepted in the psychometric community as being fair and reasonable.

5. The personnel certification program shall conduct ongoing studies to substantiate the reliability and validity of the testing mechanisms.

6. The personnel certification program shall utilize policies and procedures that govern how long examination records are kept in their original format.

7. The personnel certification program shall demonstrate that different forms of the testing mechanisms assess equivalent content and that candidates are not penalized for taking forms of varying difficulty.

~~604.~~607. Public Information About the Personnel Certification Program

1. The personnel certification program shall ~~provide for publishing and availability of general descriptive material on~~maintain and publish publicly a System Operator Certification Program Manual describing the procedures used in examination construction and validation; all eligibility requirements and determination; fees; and examination administration documents, including: reporting of results, recertification requirements, and disciplinary and ~~grievance procedures~~dispute resolution.

2. The personnel certification program shall maintain and publish publicly ~~and make available~~ a comprehensive summary or outline of the information, knowledge, or functions covered by each~~the~~ examination.

3. The personnel certification program shall publish publicly and make available at least annually a summary of certification activities for the program, including at least the following information: number of examinations delivered, the number passed, the number failed, and the number certified.

~~605.~~608. Responsibilities to Applicants for Certification or Recertification

The personnel certification program:

1. Shall not discriminate among applicants as to age, gender, race, religion, national origin, disability, or marital status and shall include a statement of non-discrimination in announcements of the program.

2. Shall comply with all requirements of applicable federal and state/provincial laws with respect to all certification and recertification activities, and shall require compliance of all contractors and/or providers of services.

3. Shall make available to all applicants copies of formalized procedures for application for, and attainment of, personnel certification and recertification and shall uniformly follow and enforce such procedures for all applicants.

4. Shall implement a formal policy for the periodic review of eligibility criteria and application procedures to ensure that they are fair and equitable.

5. Shall provide competently proctored examination sites.

6. Shall uniformly report examination results to applicants in a timely manner.

7. Shall give applicants failing the examination information on general content areas of deficiency.

~~8.Shall implement policies and procedures providing due process for applicants questioning eligibility determination, examination results, and certification status, and shall publish this information. A current version of such a procedure is the NERC *System Operator Certification Dispute Resolution Process*, which is incorporated into these rules as part of **Appendix 6**.~~

~~9.Shall develop and maintain a program manual containing the processes and procedures for applicants for certification and recertification.~~

~~606.~~609 Responsibilities to the Public and to Employers of Certified Practitioners

The personnel certification program:

1. Shall demonstrate that the testing mechanisms adequately measure the knowledge and skill required for entry, maintenance, and/or advancement in the profession for each position to be certified.

2. Shall award certification and recertification only after the skill and knowledge of the individual have been evaluated and determined to be acceptable.

3. Shall ~~periodically publish or~~ maintain, in an electronic format, a current list of those persons certified in the programs and have polices and procedures that delineate what information about a credential holder may be made public and under what circumstances.

4. Shall have formal policies and procedures for discipline of a credential holder, including the revocation of the certificate, for conduct deemed harmful to the public or inappropriate to the discipline (e.g., incompetence, unethical behavior, physical or mental impairment affecting performance). These procedures shall incorporate due process. ~~The current procedure is the *NERC Certified System Operator Credential Disciplinary Action Procedure*, which is incorporated into these rules as part of **Appendix 6**.~~

5. Shall demonstrate that any title or credential awarded accurately reflects or applies to the practitioner's daily occupational or professional duties and is not confusing to employers, consumers, regulators, related professions, and/or other interested parties.

SECTION 700 — RELIABILITY READINESS EVALUATION AND IMPROVEMENT AND FORMATION OF SECTOR FORUMS

701. Confidentiality Requirements for Readiness Evaluations and Evaluation Team Members

1. All information made available or created during the course of any reliability readiness evaluation including, but not limited to, data, documents, observations and notes, shall be maintained as confidential by all evaluation team members, in accordance with the requirements of Section 1500.

2. Evaluation team members are obligated to destroy all confidential evaluation notes following the posting of the final report of the reliability readiness evaluation.

3. NERC will retain reliability readiness evaluation-related documentation, notes, and materials for a period of time as defined by NERC.

4. These confidentiality requirements shall survive the termination of the NERC Reliability Readiness Evaluation and Improvement Program.

702. Formation of Sector Forum

1. NERC will form a sector forum at the request of any five members of NERC that share a common interest in the safety and reliability of the bulk power system. The members of sector forum may invite such others of the members of NERC to join the sector forum as the sector forum deems appropriate.

2. The request to form a sector forum must include a proposed charter for the sector forum. The board must approve the charter.

3. NERC will provide notification of the formation of a sector forum to its membership roster. Notices and agendas of meetings shall be posted on NERC's Web site.

4. A sector forum may make recommendations to any of the NERC committees and may submit a standards authorization request to the NERC *Reliability Standards Development Procedure*.

SECTION 800 — RELIABILITY ASSESSMENT AND PERFORMANCE ANALYSIS

801. Objectives of the Reliability Assessment and Performance Analysis Program

The objectives of the NERC reliability assessment and performance analysis program are to: (1) conduct, and report the results of, an independent assessment of the overall reliability and adequacy of the interconnected North American bulk power systems, both as existing and as planned; (2) analyze off-normal events on the bulk power system; (3) identify the root causes of events that may be precursors of potentially more serious events; (4) assess past reliability performance for lessons learned; (5) disseminate findings and lessons learned to the electric industry to improve reliability performance; and (6) develop reliability performance benchmarks. The final reliability assessment reports shall be approved by the board for publication to the electric industry and the general public.

802. Scope of the Reliability Assessment Program

1. The scope of the reliability assessment program shall include:

   1.1 Review, assess, and report on the overall electric generation and transmission reliability (adequacy and operating reliability) of the interconnected bulk power systems, both existing and as planned.

   1.2 Assess and report on the key issues, risks, and uncertainties that affect or have the potential to affect the reliability of existing and future electric supply and transmission.

   1.3 Review, analyze, and report on regional self-assessments of electric supply and bulk power transmission reliability, including reliability issues of specific regional concern.

   1.4 Identify, analyze, and project trends in electric customer demand, supply, and transmission and their impacts on bulk power system reliability.

   1.5 Investigate, assess, and report on the potential impacts of new and evolving electricity market practices, new or proposed regulatory procedures, and new or proposed legislation (e.g. environmental requirements) on the adequacy and operating reliability of the bulk power systems.

2. The reliability assessment program shall be performed in a manner consistent with the reliability standards of NERC including but not limited to those that specify reliability assessment requirements.

803. Reliability Assessment Reports

The number and type of periodic assessments that are to be conducted shall be at the discretion of NERC. The results of the reliability assessments shall be documented in three reports: the long-term and the annual seasonal (summer) and the annual seasonal (winter) assessment reports. NERC shall also conduct special reliability assessments from time to time as circumstances warrant. The reliability assessment reports shall be reviewed and approved for publication by the board. The three regular reports are described below.

1. **Long-Term Reliability Assessment Report** — The annual long-term report shall cover a ten-year planning horizon. The planning horizon of the long-term reliability assessment report shall be subject to change at the discretion of NERC. Detailed generation and transmission adequacy assessments shall be conducted for the first five years of the review period. For the second five years of the review period, the assessment shall focus on the identification, analysis, and projection of trends in peak demand, electric supply, and transmission adequacy, as well as other industry trends and developments that may impact future electric system reliability. Reliability issues of concern and their potential impacts shall be presented along with any mitigation plans or alternatives. The long-term reliability assessment reports will generally be published in the fall (September) of each year. NERC will also publish electricity supply and demand data associated with the long-term reliability assessment report.

2. **Summer Assessment Report** — The annual summer seasonal assessment report typically shall cover the four-month (June–September) summer period. It shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected summer peak demands. It shall also identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may include possible mitigation alternatives. The report will generally be published in mid-May for the upcoming summer period.

3. **Winter Assessment Report** — The annual winter seasonal assessment report shall cover the three-month (December–February) winter period. The report shall provide an overall perspective on the adequacy of the generation resources and the transmission systems necessary to meet projected winter peak demands. Similar to the summer assessment, the winter assessment shall identify reliability issues of interest and regional and subregional areas of concern in meeting projected customer demands and may also include possible mitigation alternatives. The winter assessment report will generally be published in mid-November for the upcoming winter period.

4. **Special Reliability Assessment Reports** — In addition to the long-term and seasonal reliability assessment reports, NERC shall also conduct special reliability assessments on a regional, interregional, and interconnection basis as conditions warrant, or as requested by the board or applicable governmental authorities. The teams of reliability and technical experts also may initiate special assessments of

key reliability issues and their impacts on the reliability of a regions, subregions, or interconnection (or a portion thereof). Such special reliability assessments may include, among other things, operational reliability assessments, evaluations of emergency response preparedness, adequacy of fuel supply, hydro conditions, reliability impacts of new or proposed environmental rules and regulations, and reliability impacts of new or proposed legislation that affects or has the potential to affect the reliability of the interconnected bulk power systems in North America.

804. Reliability Assessment Data and Information Requirements

To carry out the reviews and assessments of the overall reliability of the interconnected bulk power systems, the regional entities and other entities shall provide sufficient data and other information requested by NERC in support of the annual long-term and seasonal assessments and any special reliability assessments.

Some of the data provided for these reviews and assessment may be considered confidential from a competitive marketing perspective, a critical energy infrastructure information perspective, or for other purposes. Such data shall be treated in accordance with the provisions of Section 1500 – Confidential Information.

While the major sources of data and information for this program are the regional entities, a team of reliability and technical experts is responsible for developing and formulating its own independent conclusions about the near-term and long-term reliability of the bulk power systems.

In connection with the reliability assessment reports, requests shall be submitted to each of the regional entities for required reliability assessment data and other information, and for each region's self-assessment report. The timing of the requests will be governed by the schedule for the preparation of the assessment reports.

The regional self-assessments are to be conducted in compliance with NERC standards and the respective regional planning criteria. The team(s) of reliability and technical experts shall also conduct interviews with the regional entities as needed. The summary of the regional self-assessments that are to be included in the assessment reports shall follow the general outline identified in NERC's request. This outline may change from time to time as key reliability issues change.

In general, the regional reliability self-assessments shall address, among other areas, the following topics: demand and net energy for load; assessment of projected resource adequacy; any transmission constraints that may impact bulk transmission adequacy and plans to alleviate those constraints; any unusual operating conditions that could impact reliability for the assessment period; fuel supply adequacy; the deliverability of generation (both internal and external) to load; and any other reliability issues in the region and their potential impacts on the reliability of the bulk power systems.

805. Reliability Assessment Process

Based on their expertise, the review of the collected data, the review of the regional self-assessment reports, and interviews with the regional entities, as appropriate, the teams of reliability and technical experts shall perform an independent review and assessment of the generation and transmission adequacy of each region's existing and planned bulk power system. The results of the review teams shall form the basis of NERC's long-term and seasonal reliability assessment reports. The review and assessment process is briefly summarized below.

1. **Resource Adequacy Assessment** — The teams shall evaluate the regional demand and resource capacity data for completeness in the context of the overall resource capacity needs of the region. The team shall independently evaluate the ability of the regional entity members to serve their obligations given the demand growth projections, the amount of existing and planned capacity, including committed and uncommitted capacity, contracted capacity, or capacity outside of the region. If the region relies on capacity from outside of the region to meet its resource objectives, the ability to deliver that capacity shall be factored into the assessment. The demand and resource capacity information shall be compared to the resource adequacy requirements of the regional entity for the year(s) or season(s) being assessed. The assessment shall determine if the resource information submitted represents a reasonable and attainable plan for the regional entity and its members. For cases of inadequate capacity or reserve margin, the regional entity will be requested to analyze and explain any resource capacity inadequacies and its plans to mitigate the reliability impact of the potential inadequacies. The analysis may be expanded to include surrounding areas. If the expanded analysis indicates further inadequacies, then an interregional problem may exist and will be explored with the applicable regions. The results of these analyses shall be described in the assessment report.

2. **Transmission Adequacy and Operating Reliability Assessment** — The teams shall evaluate transmission system information that relates to the adequacy and operating reliability of the regional transmission system. That information shall include: regional planning study reports, interregional planning study reports, and/or regional operational study reports. If additional information is required, another data request shall be sent to the regional entity. The assessment shall provide a judgment on the ability of the regional transmission system to operate reliably under the expected range of operating conditions over the assessment period as required by NERC reliability standards. If sub-areas of the regional system are especially critical to the reliable operation of the regional bulk transmission system, these facilities or sub-areas shall be reviewed and addressed in the assessment. Any areas of concern related to the adequacy or operating reliability of the system shall be identified and reported in the assessment.

3. **Seasonal Operating Reliability Assessment** — The team(s) shall evaluate the overall operating reliability of the regional bulk transmission systems. In areas with potential resource adequacy or system operating reliability problems, operational readiness of the affected regional entities for the upcoming season

shall be reviewed and analyzed. The assessment may consider unusual but possible operating scenarios and how the system is expected to perform. Operating reliability shall take into account a wide range of activities, all of which should reinforce the regional entity's ability to deal with the situations that might occur during the upcoming season. Typical activities in the assessment may include: facility modifications and additions, new or modified operating procedures, emergency procedures enhancement, and planning and operating studies. The teams shall report the overall seasonal operating reliability of the regional transmission systems in the annual summer and winter assessment reports.

4. **Reporting of Reliability Assessment Results** — The teams of reliability and technical experts shall provide an independent assessment of the reliability of the regional entities and the North American interconnected bulk power system for the period of the assessment. While the regional entities are relied upon to provide the information to perform such assessments, the review team is not required to accept the conclusions provided by the regional entities. Instead, the review team is expected, based on their expertise, to reach their own independent conclusions about the status of the adequacy of the generation and bulk power transmission systems of North America.

   The review team also shall strive to achieve consensus in their assessments. The assessments that are made are based on the best information available at the time. However, since judgment is applied to this information, legitimate differences of opinion can develop. Despite these differences, the review team shall work to achieve consensus on their findings.

   In addition to providing long-term and seasonal assessments in connection with the reliability assessment program, the review team of experts shall also be responsible for recommending new and revised reliability standards related to the reliability assessments and the reliability of the bulk power systems. These proposals for new or revised standards shall be entered into NERC's Standards Development Process.

   Upon completion of the assessment, the team shall share the results with the regional entities. The regional entities shall be given the opportunity to review and comment on the conclusions in the assessment and to provide additional information as appropriate. The reliability assessments and their conclusions are the responsibility of NERC's technical review team and NERC.

   The preparation and approval of NERC's reliability assessment reports shall follow a prescribed schedule including review, comment, and possible approval by appropriate NERC committees. The long-term and seasonal (summer and winter) reliability assessment reports shall be further reviewed for approval by the board for publication to the electric industry.

806. Scope of the Reliability Performance and Analysis Program

The components of the program will include analysis of large-scale outages, disturbances, and near misses to determine root causes and lessons learned; identification and continuous monitoring of performance indices to detect emerging trends and signs of a decline in reliability performance; and communications of performance results, trends, recommendations, and initiatives to those responsible to take actions; followed with confirmation of actions to correct any deficiencies identified. Within NERC, the reliability performance program will provide performance results to the standards development and compliance enforcement programs to make the necessary adjustments to preserve reliability based on a risk-based approach.

807. Analysis of Major Events

Responding to major events affecting the bulk power system such as significant losses of load or generation, ~~blackouts and others~~significant bulk power system disturbances, or other emergencies on the bulk power system, can be divided into four phases: situation~~al~~ assessment and communications; situation tracking and communications; data collection, investigation, analysis, and reporting; and follow-up on recommendations.

a. NERC's role following a major event~~blackout or other major bulk power system disturbance or emergency~~ is to provide leadership, coordination, technical expertise, and assistance to the industry in responding to the major event. Working closely with the regional entities and reliability coordinators, and other appropriate registered entities, NERC will coordinate and facilitate efforts among industry participants, and with state, federal, and provincial governments in the United States and Canada to support the industry's response.

b. When responding to any major event where physical or cyber security is suspected as a cause or contributing factor to ~~an~~the major event, NERC will immediately notify appropriate government agencies and coordinate its activities with them.

c. NERC Reliability Standard EOP-004 sets forth specific criteria and procedures for reporting the bulk power system disturbances and events described in that reliability standard. All registered entities that are subject to the requirements of NERC Reliability Standard EOP-004 must report the information required by that reliability standard within the time periods specified. Each user, owner, and operator of the bulk power system shall also provide NERC and the applicable regional entities with such additional information requested by NERC or the applicable regional entity as is necessary to enable NERC and the applicable regional entities to carry out their responsibilities under this section.

d. During the conduct of ~~some~~ NERC analyses, assistance may be needed from government agencies. This assistance could include: authority to require data reporting from affected or involved parties; communications with other agencies of government; investigations related to possible criminal or terrorist involvement in the major event; resources for initial data gathering immediately after the major

event; authority to call meetings of affected or involved parties; and technical and analytical resources for studies.

e. NERC shall work with all other participants to establish a clear delineation of roles, responsibilities, and coordination requirements among industry and government for the investigation and reporting of findings, conclusions, and recommendations related to major events ~~blackouts~~, ~~disturbances, or other emergencies affecting the bulk power system~~ with the objective of avoiding, to the extent possible, multiple investigations of the same major event. If the major event is confined to a single regional entity, NERC representatives will participate as members of the regional entity analysis team. NERC will establish, maintain, and revise from time to time as appropriate based on experience, a manual setting forth procedures and protocols for communications and sharing and exchange of information between and among NERC, the affected regional entity or entities. and relevant governmental authorities, industry organizations and bulk power system users, owners, and operators concerning the investigation and analysis of major events.

f. NERC and applicable entity(s) ~~shall~~will apply, as appropriate to the circumstances of the major event, the NERC ~~*Blackout and Disturbance*~~ *Event Response Procedures*, which are incorporated into these rules as **Appendix 8**. These procedures provide a framework to guide NERC's response to major events that may have multiregional, national, or international implications. Experienced industry leadership shall be applied to tailor the response to the specific circumstances of the major event. In accordance with ~~that~~those procedures, the NERC president will determine whether the major event warrants analysis at the ~~NERC level~~NERC level. A regional entity may request that NERC elevate any analysis of a major event to ~~a~~the NERC level.

g. NERC will screen and analyze the findings and recommendations from the analysis, and those with generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with section 810.

808. Analysis of Off-Normal Occurrences~~Events~~, ~~Potential~~Bulk Power System Performance~~Vulnerabilities~~, and Bulk Power System ~~Performance~~Vulnerabilities

1. NERC and regional entities ~~shall~~will analyze bulk power system and equipment performance occurrences~~events~~ that do not rise to the level of a major event~~blackout, disturbance, or system emergency~~, as described in section 807. NERC and regional entities ~~shall~~will also analyze potential vulnerabilities in the bulk power system that they discover or that are brought to their attention by other sources including government agencies. The purpose of these analyses is to identify the root causes of ~~events~~occurrences or conditions that may be precursors of major events or other potentially more serious ~~events~~occurrences, or that have the potential to cause major events or other more serious occurrences~~events~~, to

assess past reliability performance for lessons learned, and to develop reliability performance benchmarks and trends.

2. NERC and regional entities will screen and analyze off-normal occurrences, bulk power system performance, ~~events~~ and potential bulk power system vulnerabilities for significance, and information from those indicated as having ~~with~~ generic applicability will be disseminated to the industry through various means appropriate to the circumstances, including in accordance with section 810.

3. NERC Reliability Standard EOP-004 sets forth specific criteria and procedures for reporting the bulk power system disturbances and events described in that reliability standard. All registered entities that are subject to the requirements of NERC Reliability Standard EOP-004 must report the information required by that reliability standard within the time periods specified. Each user, owner, and operator, of the bulk power system shall provide NERC and the applicable regional entities with such additional information requested by NERC or the applicable regional entities as is necessary to enable NERC and the applicable regional entities to carry out their responsibilities under this section.

809. Reliability Benchmarking

NERC shall identify and track key reliability indicators as a means of benchmarking reliability performance and measuring reliability improvements. This program will include assessing available metrics, developing guidelines for acceptable metrics, maintaining a performance metrics "dashboard" on the NERC Web site, and developing appropriate reliability performance benchmarks.

810. Information Exchange and Issuance of NERC Advisories, Recommendations and Essential Actions

1 Members of NERC and bulk power system owners, operators, and users shall provide NERC with detailed and timely operating experience information and data.

2. In the normal course of operations, NERC disseminates the results of its events analysis findings, lessons learned and other analysis and information gathering to the industry. These findings, lessons learned and other information will be used to guide the reliability assessment program.

3. When NERC determines it is necessary to place the industry or segments of the industry on formal notice of its findings, analyses, and recommendations, NERC will provide such notification in the form of specific operations or equipment Advisories, Recommendations or Essential Actions:

3.1 Level 1 (Advisories) – purely informational, intended to advise certain segments of the owners, operators and users of the bulk power system of findings and lessons learned;

3.2 Level 2 (Recommendations) – specific actions that NERC is recommending be considered on a particular topic by certain segments of owners, operators, and users of the bulk power system according to each entity's facts and circumstances;

3.3 Level 3 (Essential Actions) – specific actions that NERC has determined are essential for certain segments of owners, operators, or users of the bulk power system to take to ensure the reliability of the bulk power system. Such Essential Actions require NERC board approval before issuance.

4. The bulk power system owners, operators, and users to which Level 2 (Recommendations) and Level 3 (Essential Actions) notifications apply are to evaluate and take appropriate action on such issuances by NERC. Such bulk power system owners, operators, and users shall also provide reports of actions taken and timely updates on progress towards resolving the issues raised in the Recommendations and Essential Actions in accordance with the reporting date(s) specified by NERC.

5. NERC will advise the Commission and other applicable governmental authorities of its intent to issue all Level 1 Advisories, Level 2 Recommendations, and Level 3 Essential Actions at least five (5) business days prior to issuance, unless extraordinary circumstances exist that warrant issuance less than five (5) business days after such advice. NERC will file a report with the Commission and other applicable governmental authorities no later than thirty (30) days following the date by which NERC has requested the bulk power system owners, operators, and users to which a Level 2 Recommendation or Level 3 Essential Action issuance applies to provide reports of actions taken in response to the notification. NERC's report to the Commission and other applicable governmental authorities will describe the actions taken by the relevant owners, operators, and users of the bulk power system and the success of such actions taken in correcting any vulnerability or deficiency that was the subject of the notification, with appropriate protection for confidential or critical infrastructure information.

811. Equipment Performance Data

Through its Generating Availability Data System (GADS), NERC shall collect operating information about the performance of electric generating equipment; provide assistance to those researching information on power plant outages stored in its database; and support equipment reliability as well as availability analyses and other decision-making processes developed by GADS subscribers. GADS data is also used in conducting assessments of generation resource adequacy.

SECTION 900 — TRAINING AND EDUCATION

901. Scope of the Training and Education Program

Maintaining the reliability of the bulk electric system through implementation of the Reliability Standards requires informed and trained personnel. The training and education program will provide the education and training necessary for bulk power system personnel and regulators to obtain the essential knowledge necessary to understand and operate the bulk electric system.

NERC shall develop and maintain training and education programs for the purpose of establishing training requirements, developing materials, and developing training activities. The target audience of the training and education programs shall be bulk power system operating personnel including system operations personnel, operations support personnel (engineering and information technology), supervisors and managers, training personnel, and other personnel directly responsible for complying with NERC reliability standards who, through their actions or inactions, may impact the real-time, or day-ahead reliability of the bulk power system.

NERC shall also develop and provide appropriate training and education for industry participants and regulators affected by new or changed reliability standards or compliance requirements.

To accomplish those objectives:

1. NERC shall periodically conduct job task analyses for targeted bulk power system personnel to ensure that the training program content is properly aligned to the job tasks performed by those personnel.

2. NERC shall develop and maintain personnel training program curriculum requirements based on valid job-task analysis.

3. NERC shall periodically conduct performance surveys to determine the effectiveness of the training program and identify areas for further training development and improvement.

4. NERC shall develop training and education materials and activities to assist bulk power system entities implementing new or revised reliability standard requirements or other NERC-related changes.

5. NERC shall develop and provide training to people who participate in NERC and regional entity evaluations, audits, and investigations for the compliance enforcement program, organization certification program, and the continuing education program.

902. Continuing Education Program

NERC shall develop and maintain a continuing education program to foster the improvement of training and to promote quality in the training programs used by and

implemented by bulk power system entities. The program shall approve or accredit those activities and entities meeting NERC continuing education requirements.

1. NERC shall develop and implement continuing education program requirements that promote excellence in training programs and advance improved performance for bulk system personnel identified in Section 901.

2. NERC shall develop and maintain a process to approve or accredit continuing education providers and activities seeking approval or accreditation and meeting NERC-approved continuing education requirements.

3. NERC shall perform periodic audits on continuing educaiton providers and training activities to ensure that the approved or accredited providers and training activities satisfy NERC continuing education requirements.

4. NERC shall develop and maintain an appeals process for disputed application reviews, interpretations of guidelines and standards, probation or suspension of NERC-approved provider status, or continuing education hour disputes.

SECTION 1000 — SITUATION AWARENESS AND INFRASTRUCTURE SECURITY

1001. Situation Awareness

NERC shall through the use of reliability coordinators and available tools, monitor present conditions on the bulk power system and provide leadership coordination, technical expertise, and assistance to the industry in responding to events as necessary. To accomplish these goals, NERC will:

1. Maintain real-time situation awareness of conditions on the bulk power system;

2. Notify the industry of significant bulk power system events that have occurred in one area, and which have the potential to impact reliability in other areas;

3. Maintain and strengthen high-level communication, coordination, and cooperation with governments and government agencies regarding real-time conditions; and

4. Enable the reliable operation of interconnected bulk power systems by facilitating information exchange and coordination among reliability service organizations.

1002. Reliability Support Services

NERC ~~will provide~~may assist in the development of tools and other support services for the benefit of reliability coordinators and other system operators to enhance reliability, operations and planning. NERC will work with the industry to identify new tools, collaboratively develop requirements, support development, provide an incubation period, and at the end of that period, transition the tool or service to another group or owner for long term operation of the tool or provision of the service~~, including the Area Control Error (ACE) and Frequency Monitoring System, NERC Hotline, Real-time Flows, System Data Exchange (SDX), Reliability Coordinator Information System (RCIS), Transmission Services Information Network (TSIN), Interchange Distribution Calculator (IDC), Interregional Security Network (ISN), and Central Repository for Security Events (CRC)~~. To accomplish this goal, NERC will:

1. ~~Maintain~~Collaborate with industry to determine the ~~reliability and effectiveness~~necessity of ~~all mission-critical operating reliability support systems and~~new tools or services to enhance reliability;

2. For those tools that the collaborative process determines should proceed to a development phase, provide a start-up mechanism and development system~~Continue to support maintenance of a transmission provider curtailment report on the CRC site in response to Federal Energy Regulatory Commission Order 605~~;

3. Implement the tool either on its own or through an appropriate group or organization~~Investigate and analyze the use of high-speed real-time system measurements, including phasors, in predicting the behavior and performance of the Eastern Interconnection~~; and

4. Where NERC conducts the implementation phase of a new tool or service, develop a transition plan to turn maintenance and provision of the tool or service over to an organization identified in the development stage~~Facilitate real-time voice and data exchange services among reliability coordinators (e.g., Hotline, Interregional Security Network, NERCnet, System Data Exchange, etc.)~~.

In addition to tools developed as a result of a collaborative process with industry, NERC may develop reliability tools on its own, but will consult with industry concerning the need for the tool prior to proceeding to development.

Tools and services being maintained by NERC as of January 1, 2012, will be reviewed and, as warranted, transitioned to an appropriate industry group or organization. NERC will develop and maintain a strategic reliability tools plan that will list the tools and services being maintained by NERC, and, where applicable, the plans for transition to an appropriate industry group or organization.

1003. Infrastructure Security Program

NERC shall coordinate electric industry activities to promote critical infrastructure protection of the bulk power system in North America by taking a leadership role in critical infrastructure protection of the electricity sector so as to reduce vulnerability and improve mitigation and protection of the electricity sector's critical infrastructure. To accomplish these goals, NERC shall perform the following functions.

1. Electric Sector Information Sharing and Analysis Center (ESISAC)

   1.1 NERC shall serve as the electricity sector's Sector Coordinator and operate its Information Sharing and Analysis Center to gather information and communicate security-related threats and incidents within the sector, with United States and Canadian government agencies, and with other critical infrastructure sectors.

   1.2 NERC shall improve the capability of the ESISAC to analyze security threats and incident information and provide situational assessments for the electricity sector and governments.

   1.3 NERC shall work closely with the United States Department of Homeland Security, Department of Energy, Natural Resources Canada, and Public Safety and Emergency Preparedness Canada.

   1.4 NERC shall strengthen and expand these functions and working relationships with the electricity sector, other critical infrastructure industries, governments, and government agencies throughout North America to ensure the protection of the infrastructure of the bulk power system.

   1.5 NERC shall fill the role of the Electricity Sector Coordinating Council and coordinate with the Government Coordinating Council.

1.6 NERC shall coordinate with other critical infrastructure sectors through active participation with the other Sector Coordinating Councils, the other ISACs, and the National Infrastructure Advisory Committee.

1.7 NERC shall encourage and participate in coordinated critical infrastructure protection exercises, including interdependencies with other critical infrastructure sectors.

2. Security Planning

2.1 NERC shall take a risk management approach to critical infrastructure protection, considering probability and severity, and recognizing that mitigation and recovery can be practical alternatives to prevention.

2.2 NERC shall keep abreast of the changing threat environment through collaboration with government agencies.

2.3 NERC shall develop criteria to identify critical physical and cyber assets, assess security threats, identify risk assessment methodologies, and assess effectiveness of physical and cyber protection measures.

2.4 NERC shall enhance and maintain the bulk power system critical spare transformer program, encourage increased participation by asset owners, and continue to assess the need to expand this program to include other critical bulk power system equipment.

2.5 NERC shall support implementation of the Cyber Security Standards through education and outreach.

2.6 NERC shall review and improve existing Security Guidelines, develop new Security Guidelines to meet the needs of the electricity sector, and consider whether any guidelines should be developed into standards.

2.7 NERC shall conduct education and outreach initiatives to increase awareness and respond to the needs of the electricity sector.

2.8 NERC shall strengthen relationships with federal, state, and provincial government agencies on critical infrastructure protection matters.

2.9 NERC shall maintain and improve mechanisms for the sharing of sensitive or classified information with federal, state, and provincial government agencies on critical infrastructure protection matters; work with DOE and DHS to implement the National Infrastructure Protection Plan, as applicable to the electricity sector; and coordinate this work with PSEPC.

2.10 NERC shall improve methods to better assess the impact of a possible physical attack on the bulk power system and means to deter, mitigate, and respond following an attack.

2.11 NERC shall assess the results of vulnerability assessments and enhance the security of System Control and Data Acquisition (SCADA) and process control systems by developing methods to detect an emerging cyber attack and the means to mitigate impacts on the bulk power systems.

2.12 NERC shall work with the National SCADA Test Bed and the Process Control Systems Forum to accelerate the development of technology that will enhance the security, safety, and reliability of process control and SCADA systems.

SECTION 1100 — ANNUAL NERC BUSINESS PLANS AND BUDGETS

1101. Scope of Business Plans and Budgets

The board shall determine the content of the budgets to be submitted to the applicable ERO governmental authorities with consultation from the members of the Members Representatives Committee, regional entities, and others in accordance with the bylaws. The board shall identify any activities outside the scope of NERC's statutory reliability functions, if any, and the appropriate funding mechanisms for those activities.

1102. NERC Funding and Cost Allocation

1. In order that NERC's costs shall be fairly allocated among interconnections and among regional entities, the NERC funding mechanism for all statutory functions shall be based on net energy for load (NEL).

2. NERC's costs shall be allocated so that all load (or, in the case of costs for an interconnection or regional entity, all load within that interconnection or regional entity) bears an equitable share of such costs based on NEL.

3. Costs shall be equitably allocated between countries or regional entities thereof for which NERC has been designated or recognized as the electric reliability authority.

4. Costs incurred to accomplish the statutory functions for one interconnection, regional entity, or group of entities will be directly assigned to that interconnection, regional entity, or group of entities provided that such costs are allocated equitably to end-users based on net energy for load.

1103. NERC Budget Development

1. The NERC annual budget process shall be scheduled and conducted for each calendar year so as to allow a sufficient amount of time for NERC to receive member inputs, develop the budget, and receive board and, where authorized by applicable legislation or agreement, ERO governmental authority approval of the NERC budget for the following fiscal year, including timely submission of the proposed budget to FERC for approval in accordance with FERC regulations.

2. The NERC budget submittal to ERO governmental authorities shall include provisions for all ERO functions, all regional entity delegated functions as specified in delegation agreements and reasonable reserves and contingencies.

3. The NERC annual budget submittal to ERO governmental authorities shall include description and explanation of NERC's proposed ERO program activities for the year; budget component justification based on statutory or other authorities; explanation of how each budgeted activity lends itself to the accomplishment of the statutory or other authorities; sufficiency of resources

provided for in the budget to carry out the ERO program responsibilities; explanation of the calculations and budget estimates; identification and explanation of changes in budget components from the previous year's budget; information on staffing and organization charts; and such other information as is required by FERC and other ERO governmental authorities having authority to approve the proposed budget.

4. NERC shall develop, in consultation with the regional entities, a reasonable and consistent system of accounts, to allow a meaningful comparison of actual results at the NERC and regional entity level by the applicable ERO governmental authorities.

1104. Submittal of Regional Entity Budgets to NERC

1. Each regional entity shall submit its proposed annual budget for carrying out its delegated authority functions as well as all other activities and funding to NERC in accordance with a schedule developed by NERC and the regional entities, which shall provide for the regional entity to submit its final budget that has been approved by its board of directors or other governing body no later than July 1 of the prior year, in order to provide sufficient time for NERC's review and comment on the proposed budget and approval of the regional entity budget by the NERC Board of Trustees in time for the NERC and regional budgets to be submitted to FERC and other ERO governmental authorities for approval in accordance with their regulations. The regional entity's budget shall include supporting materials in accordance with the budget and reporting format developed by NERC and the regional entities, including the regional entity's complete business plan and organization chart, explaining the proposed collection of all dues, fees, and charges and the proposed expenditure of funds collected in sufficient detail to justify the requested funding collection and budget expenditures.

2. NERC shall review and approve each regional entity's budget for meeting the requirements of its delegated authority. Concurrent with approving the NERC budget, NERC shall review and approve, or reject, each regional entity budget for filing.

3. NERC shall also have the right to review from time to time, in reasonable intervals but no less frequently than every three years, the financial books and records of each regional entity having delegated authority in order to ensure that the documentation fairly represents in all material respects appropriate funding or delegated functions.

1105. Submittal of NERC and Regional Entity Budgets to Governmental Authorities for Approval

1. NERC shall file for approval by the applicable ERO governmental authorities at least 130 days in advance of the start of each fiscal year. The filing shall include: (1) the complete NERC and regional entity budgets including the business plans and organizational charts approved by the board, (2) NERC's annual funding requirement (including regional entity costs for delegated functions), and (3) the

mechanism for assessing charges to recover that annual funding requirement, together with supporting materials in sufficient detail to support the requested funding requirement.

2. NERC shall seek approval from each governmental authority requiring such approval for the funding requirements necessary to perform ERO activities within their jurisdictions.

1106. NERC and Regional Entity Billing and Collections

1. NERC shall request the regional entities to identify all load-serving entities[3] within each regional entity and the NEL assigned to each load-serving entity, and the regional entities shall supply the requested information. The assignment of a funding requirement to an entity shall not be the basis for determining that the entity must be registered in the compliance registry.

2. NERC shall accumulate the NEL by load-serving entities for each ERO governmental authority and submit the proportional share of NERC funding requirements to each ERO governmental authority for approval together with supporting materials in sufficient detail to support the requested funding requirement.

3. NEL reported by balancing authorities within a region shall be used to rationalize and validate amounts allocated for collection through regional entity processes.

4. The billing and collection processes shall provide:

   4.1 A clear validation of billing and application of payments.

   4.2 A minimum of data requests to those being billed.

   4.3 Adequate controls to ensure integrity in the billing determinants including identification of entities responsible for funding NERC's activities.

   4.4 Consistent billing and collection terms.

5. NERC will bill and collect all budget requirements approved by applicable ERO governmental authorities (including the funds required to support those functions assigned to the regional entities through the delegation agreements) directly from the load-serving entities or their designees or as directed by particular ERO governmental authorities, except where the regional entity is required to collect the budget requirements for NERC, in which case the regional entity will collect directly from the load-serving entities or as otherwise provided by agreement and

[3] A regional entity may allocate funding obligations using an alternative method approved by NERC and by FERC and other appropriate ERO governmental authorities, as provided for in the regional delegation agreement.

submit funds to NERC. Alternatively, a load-serving entity may pay its allocated ERO costs through a regional entity managed collection mechanism.

6. NERC shall set a minimum threshold limit on the billing of small LSEs to minimize the administrative burden of collection.

7. NERC shall pursue any non-payments and shall request assistance from applicable governmental authorities as necessary to secure collection.

8. In the case where a Regional Entity performs the collection for ERO, the Regional Entity will not be responsible for non-payment in the event that a user, owner or operator of the Bulk Power System does not pay its share of dues, fees and charges in a timely manner, provided that such a Regional Entity shall use reasonably diligent efforts to collect dues, fees, and other charges from all entities obligated to pay them. However, any revenues not paid shall be recovered from others within the same region to avoid cross-subsidization between regions.

9. Both NERC and the regional entities also may bill members or others for functions and services not within statutory requirements or otherwise authorized by the appropriate governmental authorities. Costs and revenues associated with these functions and services shall be separately identified and not commingled with billings associated with the funding of NERC or of the regional entities for delegated activities.

1107. Penalty Applications

1. Where NERC or a regional entity initiates a compliance monitoring and enforcement process that leads to imposition of a penalty, the entity that initiated the process shall receive any penalty monies imposed and collected as a result of that process, unless a different disposition of the penalty monies is provided for in the delegation agreement, or in a contract or a disposition of the violation that is approved by NERC and FERC.

2. All funds from financial penalties assessed in the United States received by the entity initiating the compliance monitoring and enforcement process shall be applied as a general offset to the entity's budget requirements for the subsequent fiscal year, if received by July 1, or for the second subsequent fiscal year, if received on or after July 1. Funds from financial penalties shall not be directly applied to any program maintained by the entity conducting the compliance monitoring and enforcement process. Funds from financial penalties assessed against a Canadian entity shall be applied as specified by legislation or agreement.

3. In the event that a compliance monitoring and enforcement process is conducted jointly by NERC and a regional entity, the regional entity shall receive the penalty monies and offset the entity's budget requirements for the subsequent fiscal year.

4. Exceptions or alternatives to the foregoing provisions will be allowed if approved by NERC and by FERC any other applicable ERO governmental authority.

1108. Special Assessments

On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next funding cycle, NERC shall file with the applicable ERO governmental authorities, where authorized by applicable legislation or agreement, for authorization for an amended or supplemental budget for NERC or a regional entity and, if necessary under the amended or supplemental budget, to collect a special or additional assessment for statutory functions of NERC or the regional entity. Such filing shall include supporting materials to justify the requested funding, including any departure from the approved funding formula or method.

SECTION 1200 — REGIONAL DELEGATION AGREEMENTS

1201. Pro Forma Regional Delegation Agreement

NERC shall develop and maintain a pro forma regional entity delegation agreement, which shall serve as the basis for negotiation of consistent agreements for the delegation of ERO functions to regional entities.

1202. Regional Entity Essential Requirements

NERC shall establish the essential requirements for an entity to become qualified and maintain good standing as a regional entity.

1203. Negotiation of Regional Delegation Agreements

NERC shall, for all areas of North America that have provided NERC with the appropriate authority, negotiate regional delegation agreements for the purpose of ensuring all areas of the North American bulk power systems are within a regional entity area. In the event NERC is unable to reach agreement with regional entities for all areas, NERC shall provide alternative means and resources for implementing NERC functions within those areas. No delegation agreement shall take effect until it has been approved by the appropriate ERO governmental authority.

1204. Conformance to Rules and Terms of Regional Delegation Agreements

NERC and each regional entity shall comply with all applicable ERO rules of procedure and the obligations stated in the regional delegation agreement.

1205. Sub-delegation

The regional entity shall not sub-delegate any responsibilities and authorities delegated to it by its regional delegation agreement with NERC except with the approval of NERC and FERC and other appropriate ERO governmental authorities. Responsibilities and authorities may only be sub-delegated to another regional entity. Regional entities may share resources with one another so long as such arrangements do not result in cross-subsidization or in any sub-delegation of authorities.

1206. Nonconformance to Rules or Terms of Regional Delegation Agreement

If a regional entity is unable to comply or is not in compliance with an ERO rule of procedure or the terms of the regional delegation agreement, the regional entity shall immediately notify NERC in writing, describing the area of nonconformance and the reason for not being able to conform to the rule. NERC shall evaluate each case and inform the affected regional entity of the results of the evaluation. If NERC determines that a rule or term of the regional delegation agreement has been violated by an entity or cannot practically be implemented by an entity, NERC shall notify the applicable ERO governmental authorities and take any actions necessary to address the situation.

1207. Regional Entity Audits

Approximately every five years and more frequently if necessary for cause, NERC shall audit each regional entity to verify that the regional entity continues to comply with NERC rules of procedure and the obligations of NERC delegation agreement. Audits of regional entities shall be conducted, to the extent practical, based on professional auditing standards recognized in the U.S., including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, and if applicable to the coverage of the audit, may be based on Canadian or other international standards. The audits required by this section 1207 shall not duplicate the audits of regional entity compliance monitoring and enforcement programs provided for in **Appendix 4A**, Audit of Regional Compliance Programs, to these rules of procedure.

1208. Process for Considering Registered Entity Requests to Transfer to Another Regional Entity ~~Audits~~

1. A registered entity that is registered in the region of one regional entity and believes its registration should be transferred to a different regional entity may submit a written request to both regional entities requesting that they process the proposed transfer in accordance with this section. The registered entity's written request shall set forth the reasons the registered entity believes justify the proposed transfer and shall describe any impacts of the proposed transfer on other bulk power system owners, operators, and users.

2. After receiving the registered entity's written request, the two regional entities shall consult with each other as to whether they agree or disagree that the requested transfer is appropriate. The regional entities may also consult with affected reliability coordinators, balancing authorities and transmission operators as appropriate. Each regional entity shall post the request on its web site for public comment period of 21 days. In evaluating the proposed transfer, the regional entities shall consider the location of the registered entity's bulk power system facilities in relation to the geographic and electrical boundaries of the respective regions; the impacts of the proposed transfer on other bulk power system owners, operators; and users, the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments to other load-serving entities of each regional entity, including the sufficiency of the proposed transferee regional entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the registered entity; the registered entity's compliance history with its current regional entity; and the manner in which pending compliance monitoring and enforcement matters concerning the registered entity would be transitioned from the current regional entity to the transferee regional entity; along with any other reasons for the proposed transfer stated by the registered entity and any other reasons either regional entity considers relevant. The regional entities may request that the registered entity provide additional data and information concerning the proposed transfer for the regional entities' use in their evaluation. The registered entity's

current regional entity shall notify the registered entity in writing as to whether (i) the two regional entities agree that the requested transfer is appropriate, (ii) the two regional entities agree that the requested transfer is not appropriate and should not be processed further, or (iii) the two regional entities disagree as to whether the proposed transfer is appropriate.

3. If the two regional entities agree that the requested transfer is appropriate, they shall submit a joint written request to NERC requesting that the proposed transfer be approved and that the delegation agreement between NERC and each of the regional entities be amended accordingly. The regional entities' joint written submission to NERC shall describe the reasons for the proposed transfer; the location of the registered entity's bulk power system facilities in relation to the geographic and electrical boundaries of the respective regions; the impacts of the proposed transfer on other bulk power system owners, operators, and users; the impacts of the proposed transfer on the current and future staffing, resources, budgets and assessments of each regional entity, including the sufficiency of the proposed transferee regional entity's staffing and resources to perform compliance monitoring and enforcement activities with respect to the registered entity; the registered entity's compliance history with its current registered entity; and the manner in which pending compliance monitoring and enforcement matters concerning the registered entity will be transitioned from the current regional entity to the transferee regional entity. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the regional entities and any other information the board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC board may request that the regional entities provide additional information, or obtain additional information from the registered entity, for the use of the NERC board in making its decision. If the NERC board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

4. If the two regional entities do not agree with each other that the proposed transfer is appropriate, the regional entity supporting the proposed transfer shall, if requested by the registered entity, submit a written request to NERC to approve the transfer and the related delegation agreement amendments. The regional entity's written request shall include the information specified in section 1208.3. The regional entity that does not believe the proposed transfer is appropriate will be allowed to submit a written statement to NERC explaining why the regional entity believes the transfer is not appropriate and should not be approved. The NERC Board of Trustees shall consider the proposed transfer based on the submissions of the regional entities and any other information the board considers relevant, and shall approve or disapprove the proposed transfer and the related delegation agreement amendments. The NERC board may request that the regional entities provide additional information, or obtain additional information from the registered entity, for the use of the NERC board in making its decision.

If the NERC board approves the proposed transfer, NERC shall file the related delegation agreements with FERC for approval.

5. Prior to action by the NERC Board of Trustees on a proposed transfer of registration under Section 1208.3 or 1208.4, NERC shall post information concerning the proposed transfer, including the submissions from the regional entities, on its Web site for at least twenty-one (21) days for the purpose of receiving public comment.

6. If the NERC Board of Trustees disapproves a proposed transfer presented to it pursuant to either section 1208.3 or 1208.4, the regional entity or entities that believe the transfer is appropriate may, if requested to do so by the registered entity, file a petition with FERC pursuant to 18 C.F.R. section 39.8(f) and (g) requesting that FERC order amendments to the delegation agreements of the two regional entities to effectuate the proposed transfer.

7. No transfer of a registered entity from one regional entity to another regional entity shall be effective (i) unless approved by FERC, and (ii) any earlier than the first day of January of the second calendar year following approval by FERC, unless an earlier effective date is agreed to by both regional entities and NERC and approved by FERC.

SECTION 1300 — COMMITTEES

1301. Establishing Standing Committees

The board may from time to time create standing committees. In doing so, the board shall approve the charter of each committee and assign specific authority to each committee necessary to conduct business within that charter. Each standing committee shall work within its board-approved charter and shall be accountable to the board for performance of its board-assigned responsibilities. A NERC standing committee may not delegate its assigned work to a member forum, but, in its deliberations, may request the opinions of and consider the recommendations of a member forum.

1302. Committee Membership

Each committee shall have a defined membership composition that is explained in its charter. Committee membership may be unique to each committee, and can provide for balanced decision-making by providing for representatives from each sector or, where sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area, by bringing together a wide diversity of opinions from industry experts with outstanding technical knowledge and experience in a particular subject area. Committee membership shall also provide the opportunity for an equitable number of members from the United States and Canada, based approximately on proportionate net energy for load. All committees and other subgroups (except for those organized on other than a sector basis because sector representation will not bring together the necessary diversity of opinions, technical knowledge and experience in a particular subject area) must ensure that no two stakeholder sectors are able to control the vote on any matter, and no single sector is able to defeat a matter. With regard to committees and subgroups pertaining to development of, interpretation of, or compliance with standards, NERC shall provide a reasonable opportunity for membership from sectors desiring to participate. Committees and subgroups organized on other than a sector basis shall be reported to the NERC board and the Member Representatives Committee, along with the reasons for constituting the committee or subgroup in the manner chosen. In such cases and subject to reasonable restrictions necessary to accomplish the mission of such committee or subgroup, NERC shall provide a reasonable opportunity for additional participation, as members or official observers, for sectors not represented on the committee or subgroup.

1303. Procedures for Appointing Committee Members

Committee members shall be nominated and selected in a manner that is open, inclusive, and fair. Unless otherwise stated in these rules or approved by the board, all committee member appointments shall be approved by the board, and committee officers shall be appointed by the Chairman of the Board.

1304. Procedures for Conduct of Committee Business

1. Notice to the public of the dates, places, and times of meetings of all committees, and all nonconfidential material provided to committee members, shall be posted

on the Corporation's Web site at approximately the same time that notice is given to committee members. Meetings of all standing committees shall be open to the public, subject to reasonable limitations due to the availability and size of meeting facilities; provided that the meeting may be held in or adjourn to closed session to discuss matters of a confidential nature, including but not limited to personnel matters, compliance enforcement matters, litigation, or commercially sensitive or critical infrastructure information of any entity.

2. NERC shall maintain a set of procedures, approved by the board, to guide the conduct of business by standing committees.

1305. Committee Subgroups

Standing committees may appoint subgroups using the same principles as in Section 1302.

SECTION 1400 — AMENDMENTS TO THE NERC RULES OF PROCEDURE

1401. Proposals for Amendment or Repeal of Rules of Procedure

In accordance with the bylaws of NERC, requests to amend or repeal the rules of procedure may be submitted by (1) any ~~ten~~fifty members of NERC, which number shall include members from at least three membership sectors~~segments~~, (2) the Member Representatives Committee, (3) a ~~standing~~ committee of NERC to whose function and purpose the rule pertains, or (4) an officer of ~~the ERO~~NERC.

1402. Approval of Amendment or Repeal of Rules of Procedure

Amendment to or repeal of rules of procedure shall be approved by the board after public notice and opportunity for comment in accordance with the bylaws of NERC. In approving changes to the rules of procedure, the board shall consider the inputs of the Member Representatives Committee, other ERO committees affected by the particular changes to the rules, and other stakeholders as appropriate. After board approval, the amendment or repeal shall be submitted to the ERO governmental authorities for approval, where authorized by legislation or agreement. No amendment to or repeal of the rules of procedure shall be effective until it has been approved by the applicable ERO governmental authorities.

~~**1403.Alternative Procedure for Violation Risk Factors**~~

~~In the event the standards development process fails to produce violation risk factors for a particular standard in a timely manner, the Board of Trustees may adopt violation risk factors for that standard after notice and opportunity for comment. In adopting violation risk factors, the board shall consider the inputs of the Member Representatives Committee and affected stakeholders.~~

SECTION 1500 — CONFIDENTIAL INFORMATION

1501. Definitions

1. **Confidential information** means (i) confidential business and market information; (ii) critical energy infrastructure information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) cybersecurity incident information; provided, that public information developed or acquired by an entity shall be excluded from this definition.

2. **Confidential business and market information** means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

3. **Critical energy infrastructure information** means specific engineering, vulnerability, or detailed design information about proposed or existing critical infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on critical infrastructure; and (iii) does not simply give the location of the critical infrastructure.

4. **Critical infrastructure** means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

5. **Cybersecurity incident information** means any information related to, describing, or which could be used to plan or cause a cybersecurity incident as defined in 18 C.F.R. § 39.1.

1502. Protection of Confidential Information

1. **Identification of Confidential Information** — An owner, operator, or user of the bulk power system and any other party (the "submitting entity") shall mark as confidential any information that it submits to NERC or a regional entity (the "receiving entity") that it reasonably believes contains confidential information as defined by these rules, indicating the category or categories ~~defied~~defined in Section 1501 in which the information falls. If the information is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the submitting entity shall so indicate and provide supporting references and details.

2. **Confidentiality** — Except as provided herein, a receiving entity shall keep in confidence and not copy, disclose, or distribute any confidential information or any part thereof without the permission of the submitting entity, except as otherwise legally required.

3. **Information no longer Confidential –** If a submitting entity concludes that information for which it had sought confidential treatment no longer qualifies for that treatment, the submitting entity shall promptly so notify NERC or the relevant regional entity.

1503. Requests for Information

1. **Limitation** — A receiving entity shall make information available only to one with a demonstrated need for access to the information from the receiving entity.

2. **Form of Request** — A person with such a need may request access to information by using the following procedure:

   2.1 The request must be in writing and clearly marked "Request for Information."

   2.2 The request must identify the individual or entity that will use the information, explain the requester's need for access to the information, explain how the requester will use the information in furtherance of that need, and state whether the information is publicly available or available from another source or through another means. If the requester seeks access to information that is subject to a prohibition on public disclosure in the Commission-approved rules of a regional transmission organization or independent system operator or a similar prohibition in applicable federal, state, or provincial laws, the requester shall describe how it qualifies to receive such information.

   2.3 The request must stipulate that, if the requester does not seek public disclosure, the requester will maintain as confidential any information received for which a submitting party has made a claim of confidentiality in accordance with NERC's rules. As a condition to gaining access to such information, a requester shall execute a non-disclosure agreement in a form approved by NERC's board of trustees.

3. **Notice and Opportunity for Comment** — Prior to any decision to disclose information marked as confidential, the receiving entity shall provide written notice to the submitting entity and an opportunity for the submitting entity to either waive objection to disclosure or provide comments as to why the confidential information should not be disclosed. Failure to provide such comments or otherwise respond is not deemed waiver of the claim of confidentiality.

4. **Determination by ERO or Regional Entity** — Based on the information provided by the requester under Rule 1503.2, any comments provided by the submitting entity, and any other relevant available information, the chief executive officer or his or her designee of the receiving entity shall determine whether to disclose such information.

5. **Appeal** — A person whose request for information is denied in whole or part may appeal that determination to the President of NERC (or the President's designee) within 30 days of the determination. Appeals filed pursuant to this Rule must be in writing, addressed to the President of NERC (or the President's designee), and clearly marked "Appeal of Information Request Denial."

   NERC will provide written notice of such appeal to the submitting entity and an opportunity for the submitting entity to either waive objection to disclosure or provide comments as to why the confidential information should not be disclosed; provided that any such comments must be received within 30 days of the notice and any failure to provide such comments or otherwise respond is not deemed a waiver of the claim of confidentiality.

   The President of NERC (or the President's designee) will make a determination with respect to any appeal within 30 days. In unusual circumstances, this time limit may be extended by the President of NERC (or the President's designee), who will send written notice to the requester setting forth the reasons for the extension and the date on which a determination on the appeal is expected.

6. **Disclosure of Information** — In the event the receiving entity, after following the procedures herein, determines to disclose information designated as confidential information, it shall provide the submitting entity no fewer than 21 days' written notice prior to releasing the information in order to enable such submitting entity to (a) seek an appropriate protective order or other remedy, (b) consult with the receiving entity with respect to taking steps to resist or narrow the scope of such request or legal process, or (c) waive compliance, in whole or in part, with the terms of this Rule. Should a receiving entity be required to disclose confidential information, or should the submitting entity waive objection to disclosure, the receiving entity shall furnish only that portion of the confidential information which the receiving entity's counsel advises is legally required.

7. **Posting of Determinations on Requests for Disclosure of Confidential Information** — Upon making its determination on a request for disclosure of confidential information, NERC or the regional entity, as applicable, shall (i) notify the requester that the request for disclosure is granted or denied, (ii) publicly post any determination to deny the request to disclose confidential information, including in such posting an explanation of the reasons for the denial (but without in such explanation disclosing the confidential information), and (iii) publicly post any determination that information claimed by the submitting entity to be confidential information is not confidential information (but without in such

posting disclosing any information that has been determined to be confidential information).

1504. Employees, Contractors and Agents

A receiving entity shall ensure that its officers, trustees, directors, employees, subcontractors and subcontractors' employees, and agents to whom confidential information is exposed are under obligations of confidentiality that are at least as restrictive as those contained herein.

1505. Provision of Information to FERC and Other Governmental Authorities

1. **Request** — A request from FERC for reliability information with respect to owners, operators, and users of the bulk power system within the United States is authorized by Section 215 of the Federal Power Act. Other applicable ERO governmental authorities may have similar authorizing legislation that grants a right of access to such information. Unless otherwise directed by FERC or its staff or the other ERO governmental authority requesting the information, upon receiving such a request, a receiving entity shall provide contemporaneous notice to the applicable submitting entity. In its response to such a request, a receiving entity shall preserve any mark of confidentiality and shall notify FERC or other appropriate governmental authorities that the submitting entity has marked the information as confidential.

2. **Continued Confidentiality** — Each receiving entity shall continue to treat as confidential all confidential information that it has submitted to NERC or to FERC or another appropriate ERO governmental authority, until such time as FERC or the other appropriate ERO governmental authority authorizes disclosure of such information.

1506. Permitted Disclosures

1. **Confirmed Violations** — Nothing in this Section 1500 shall prohibit the disclosure of a violation at the point when the matter is filed with an appropriate governmental authority as a notice of penalty, the "violator" admits to the violation, or the alleged violator and NERC or the regional entity reach a settlement regarding the violation.

2. **Compliance Information** — NERC and the regional entities are authorized to exchange confidential information related to evaluations, audits, and investigations in furtherance of the compliance and enforcement program, on condition they continue to maintain the confidentiality of such information.

1507. Remedies for Improper Disclosure

Any person engaged in NERC or regional entity activity under section 215 of the Federal Power Act or the equivalent laws of other appropriate governmental authorities who improperly discloses information determined to be confidential may lose access to confidential information on a temporary or permanent basis and may be subject to

adverse personnel action, including suspension or termination. Nothing in Section 1500 precludes an entity whose information was improperly disclosed from seeking a remedy in an appropriate court.

SECTION 1600 — REQUESTS FOR DATA OR INFORMATION

1601. Scope of a NERC or Regional Entity Request for Data or Information

Within the United States, NERC and regional entities may request data or information that is necessary to meet their obligations under Section 215 of the Federal Power Act, as authorized by Section 39.2(d) of the Commission's regulations, 18 C.F.R. § 39.2(d). In other jurisdictions NERC and regional entities may request comparable data or information, using such authority as may exist pursuant to these rules and as may be granted by ERO governmental authorities in those other jurisdictions. The provisions of Section 1600 shall not apply to requirements contained in any Reliability Standard to provide data or information; the requirements in the Reliability Standards govern. The provisions of Section 1600 shall also not apply to data or information requested in connection with a compliance or enforcement action under Section 215 of the Federal Power Act, Section 400 of these Rules of Procedure, or any procedures adopted pursuant to those authorities, in which case the Rules of Procedure applicable to the production of data or information for compliance and enforcement actions shall apply.

1602. Procedure for Authorizing a NERC Request for Data or Information

1. NERC shall provide a proposed request for data or information or a proposed modification to a previously-authorized request, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability at least twenty-one (21) days prior to initially posting the request or modification for public comment. Submission of the proposed request or modification to the Office of Electric Reliability is for the information of the Commission. NERC is not required to receive any approval from the Commission prior to posting the proposed request or modification for public comment in accordance with paragraph 1602.2 or issuing the request or modification to reporting entities following approval by the Board of Trustees.

2. NERC shall post a proposed request for data or information or a proposed modification to a previously authorized request for data or information for a forty-five (45) day public comment period.

    2.1. A proposed request for data or information shall contain, at a minimum, the following information: (i) a description of the data or information to be requested, how the data or information will be used, and how the availability of the data or information is necessary for NERC to meet its obligations under applicable laws and agreements; (ii) a description of how the data or information will be collected and validated; (iii) a description of the entities (by functional class and jurisdiction) that will be required to provide the data or information ("reporting entities"); (iv) the schedule or due date for the data or information; (v) a description of any restrictions on disseminating the data or information (e.g., "confidential," "critical energy infrastructure information," "aggregating"

or "identity masking"); and (vi) an estimate of the relative burden imposed on the reporting entities to accommodate the data or information request.

2.2. A proposed modification to a previously authorized request for data or information shall explain (i) the nature of the modifications; (ii) an estimate of the burden imposed on the reporting entities to accommodate the modified data or information request, and (iii) any other items from paragraph 1.1 that require updating as a result of the modifications.

3. After the close of the comment period, NERC shall make such revisions to the proposed request for data or information as are appropriate in light of the comments. NERC shall submit the proposed request for data or information, as revised, along with the comments received, NERC's evaluation of the comments and recommendations, to the Board of Trustees.

4. In acting on the proposed request for data or information, the Board of Trustees may authorize NERC to issue it, modify it, or remand it for further consideration.

5. NERC may make minor changes to an authorized request for data or information without board approval. However, if a reporting entity objects to NERC in writing to such changes within 21 days of issuance of the modified request, such changes shall require board approval before they are implemented.

6. Authorization of a request for data or information shall be final unless, within thirty (30) days of the decision by the Board of Trustees, an affected party appeals the authorization under this Section 1600 to the ERO governmental authority.

1603. Owners, Operators, and Users to Comply

Owners, operators, and users of the bulk power system registered on the NERC Compliance Registry shall comply with authorized requests for data and information. In the event a reporting entity within the United States fails to comply with an authorized request for data or information under Section 1600, NERC may request the Commission to exercise its enforcement authority to require the reporting entity to comply with the request for data or information and for other appropriate enforcement action by the Commission. NERC will make any request for the Commission to enforce a request for data or information through a non-public submission to the Commission's enforcement staff.

1604. Requests by Regional Entity for Data or Information

1. A regional entity may request that NERC seek authorization for a request for data or information to be applicable within the footprint of the regional entity, either as a freestanding request or as part of a proposed NERC request for data or information. Any such request must be consistent with this Section 1600.

2. A regional entity may also develop its own procedures for requesting data or information, but any such procedures must include at least the same procedural

elements as are included in this Section 1600. Any such regional entity procedures or changes to such procedures shall be submitted to NERC for approval. Upon approving such procedures or changes thereto, NERC shall file the proposed procedures or proposed changes for approval by the Commission and any other ERO governmental authorities applicable to the regional entity. The regional entity procedures or changes to such procedures shall not be effective in a jurisdiction until approved by, and in accordance with any revisions directed by, the Commission or other ERO governmental authority.

1605. Confidentiality

If the approved data or information request includes a statement under Section 1602.1.1(v) that the requested data or information will be held confidential or treated as critical energy infrastructure information, then the applicable provisions of Section 1500 will apply without further action by a submitting entity. A submitting entity may designate any other data or information as confidential pursuant to the provisions of Section 1500, and NERC or the regional entity shall treat that data or information in accordance with Section 1500. NERC or a regional entity may utilize additional protective procedures for handling particular requests for data or information as may be necessary under the circumstances.

1606. Expedited Procedures for Requesting Time-Sensitive Data or Information

1. In the event NERC or a regional entity must obtain data or information by a date or within a time period that does not permit adherence to the time periods specified in Section 1602, the procedures specified in Section 1606 may be used to obtain the data or information. Without limiting the circumstances in which the procedures in Section 1606 may be used, such circumstances include situations in which it is necessary to obtain the data or information (in order to evaluate a threat to the reliability or security of the bulk-power system, or to comply with a directive in an order issued by the Commission or by another ERO governmental authority) within a shorter time period than possible under Section 1602. The procedures specified in Section 1606 may only be used if authorized by the NERC Board of Trustees prior to activation of such procedures.

2. Prior to posting a proposed request for data or information, or a modification to a previously-authorized request, for public comment under Section 1606, NERC shall provide the proposed request or modification, including the information specified in paragraph 1602.2.1 or 1602.2.2 as applicable, to the Commission's Office of Electric Reliability. The submission to the Commission's Office of Electric Reliability shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information. The submission shall be made to the Commission's Office of Electric Reliability as far in advance, up to twenty-one (21) days, of the posting of the proposed request or modification for public comments as is reasonably possible under the circumstances, but in no event less than two (2) days in advance of the public posting of the proposed request or modification.

3. NERC shall post the proposed request for data or information or proposed modification to a previously-authorized request for data or information for a public comment period that is reasonable in duration given the circumstances, but in no event shorter than five (5) days. The proposed request for data or information or proposed modification to a previously-authorized request for data or information shall include the information specified in paragraph 1602.2.1 or 1602.2.2, as applicable, and shall also include an explanation of why it is necessary to use the expedited procedures of Section 1606 to obtain the data or information.

4. The provisions of paragraphs 1602.3, 1602.4, 1602.5 and 1602.6 shall be applicable to a request for data or information or modification to a previously-authorized request for data or information developed and issued pursuant to Section 1606, except that (a) if NERC makes minor changes to an authorized request for data or information without board approval, such changes shall require board approval if a reporting entity objects to NERC in writing to such changes within five (5) days of issuance of the modified request; and (b) authorization of the request for data or information shall be final unless an affected party appeals the authorization of the request by the Board of Trustees to the ERO governmental authority within five (5) days following the decision of the Board of Trustees authorizing the request, which decision shall be promptly posted on NERC's web site.

Proposed Changes to the NERC Rules of Procedure and Associated Appendices

Announcement: Comment Period Opens for Proposed Changes to NERC Rules of Procedure and Associated Appendices

November 7, 2011

Click Here for access to the proposed changes: (NERC Rules of Procedure webpage)

The North American Electric Reliability Corporation (NERC) is proposing changes to its Rules of Procedure (ROP), Sections 100-1600, and associated Appendices 4B, 4C, 5A and 8, and deletion of Appendices 3C and 6. NERC is soliciting comments on these proposed amendments. Redlined versions of ROP Sections 100-1600 and Appendices 4B, 4C, 5A and 8, showing the proposed additions, deletions and revisions, are now available at: http://www.nerc.com/page.php?cid=1|8|169. In addition, the posting includes a separate document that provides a detailed summary and discussion of the proposed revisions and the reasons they are being proposed.

Proposed revisions to ROP Sections 100-1600 and Appendices 4B and 4C were previously posted for stakeholder comment from July 1 – August 15, 2011. Based on consideration of the comments submitted on that posting and further discussions among NERC, the Regional Entities and stakeholders, numerous further revisions have been made to ROP Sections 100-1600 and Appendices 4B and 4C (including deletion or significant modifications of previously-proposed revisions). These deletions and additional modifications are incorporated into the versions of ROP Sections 100-1600 and Appendices 4B and 4C on which comments are now being solicited. The proposed revisions to Appendices 5A and 8 and the proposed deletion of Appendices 3C and 6 are being posted for stakeholder comment for the first time.

Comments are due December 22, 2011, and must be submitted electronically to ROPcomments@nerc.net**.** NERC presently intends to submit the proposed changes to the ROP and Appendices (as revised based on consideration of the comments received on this posting) to the NERC Board of Trustees for approval at its February 9, 2012 meeting. If approved by the Board, the proposed amendments would then be filed with applicable governmental authorities.

For further information, please contact Rebecca Michael at rebecca.michael@nerc.net.

Summary of Proposed Changes to the NERC Rules of Procedure and Associated Appendices

November 7, 2011

The North American Electric Reliability Corporation (NERC) is proposing changes to its Rules of Procedure (ROP), Sections 100-1600, and associated Appendices 4B, 4C, 5A and 8, and deletion of Appendices 3C and 6. NERC is soliciting comments on these proposed amendments. Redlined versions of ROP Sections 100-1600 and Appendices 4B, 4C, 5A and 8, showing the proposed additions, deletions and revisions, are now available at http://www.nerc.com/page.php?cid=1|8|169.[1] In addition, the posting includes a separate document that provides a detailed summary and discussion of the proposed revisions and the reasons they are being proposed.

Proposed revisions to ROP Sections 100-1600 and Appendices 4B and 4C were previously posted for stakeholder comment from July 1 – August 15, 2011. Based on consideration of the comments submitted on that posting and further discussions among NERC, the Regional Entities and stakeholders, numerous further revisions have been made to ROP Sections 100-1600 and Appendices 4B and 4C (including deletion or significant modifications of previously-proposed revisions). These deletions and additional modifications are incorporated into the versions of ROP Sections 100-1600 and Appendices 4B and 4C on which comments are now being solicited. The proposed revisions to Appendices 5A and 8 and the proposed deletion of Appendices 3C and 6 are being posted for stakeholder comment for the first time.[2]

Comments are due December 22, 2011, and must be submitted electronically to ROPcomments@nerc.net. NERC presently intends to submit the proposed changes to the ROP and Appendices (as revised based on consideration of the comments received on this posting) to the NERC Board of Trustees for approval at its February 9, 2012 meeting. If approved by the Board, the proposed amendments would then be filed with applicable governmental authorities.

Overview of Reasons for the Proposed Amendments

[1] Because extensive changes are proposed to the current Appendix 8, a "clean" version of proposed revised Appendix 8 is also included in this posting, for the convenience of readers.

[2] As described in the summary document included with this posting, in addition to the proposed deletion of Appendix 6 — System Operator Certification Program Manual, NERC is proposing to move to ROP Section 600 many provisions that are currently in Appendix 6.

The proposed revisions to the ROP and Appendices are the result of the continuation of a process that began with the preparation of NERC's *Three-Year ERO Performance Assessment Report* that was filed with the Commission on July 20, 2009 in accordance with 18 C.F.R. §39.3(c). The *Three-Year ERO Performance Assessment Report* identified a number of changes to be made in the ERO's operations and processes, some of which required amendments to the NERC ROP. Following submission of the *Three-Year ERO Performance Assessment Report*, NERC and the Regional Entities engaged in a process to identify, draft, and submit for approval (1) necessary changes to NERC's delegation agreements with the Regional Entities, and (2) associated amendments to the ROP. This process resulted in development of a new version of the delegation agreements as well as proposed revisions to ROP Sections 100-1600 and Appendices 4A, 4B and 4C and a new Appendix 5B.[3] These documents were filed with the Commission for approval on June 9, 2010, were conditionally approved by the Commission in an Order issued October 21, 2010, and became effective on January 1, 2011. Additional revisions resulting from the October 21, 2010 Commission Order were submitted in compliance filings on February 18, 2011 and November 7, 2011.

Although the proposed ROP amendments filed with the Commission on June 9, 2010, largely addressed revisions associated with, or identified in the development of, the revised delegation agreements, several NERC-Regional Entity working groups continued to work identify additional revisions to the ROP and Appendices that were necessary or appropriate, based on issues identified in the *Three-Year ERO Performance Assessment Report* as well as on the experience of NERC and the Regional Entities in implementing the existing ROP, and carrying out the duties and responsibilities of the ERO, over the period since NERC was certified as the ERO, the delegation agreements with the Regional Entities were initially approved by the Commission, and the Commission-approved reliability standards became mandatory and enforceable.[4] As of today, this period represents more than four years of operating experience. The working groups engaged in studying the need for, identifying and developing further revisions to the ROP and Appendices included a working group comprised of representatives of compliance program staffs of NERC and the Regional Entities, a working group comprised of representatives of the legal staffs of NERC and the Regional Entities, and an Event Analysis Working Group comprised of NERC and Regional Entity representatives. The experience brought to bear on these reviews of the ROP and Appendices has included the more than four years of experience of the NERC and Regional Entity staffs in administering and implementing the compliance monitoring and enforcement processes, determining penalties for violations of reliability standards pursuant to the NERC Sanction Guidelines, conducting or participating in hearings before Regional Entity Hearing Bodies on compliance enforcement matters, and responding to and conducting analyses of events on

[3] New Appendix 5B is the NERC Statement of Compliance Registry Criteria, which was not previously included in the ROP.

[4] NERC was certified as the ERO by the Commission in an Order issued July 20, 2006. The delegation agreements between NERC and the Regional Entities were originally approved by the Commission in an Order issued April 19, 2007. The initial set of reliability standards approved by the Commission became effective on June 18, 2007.

the bulk power system. In a number of instances, the working groups recognized, with the benefit of experience in implementing and applying particular ROP provisions, that the clarity of an ROP provision could be improved through rewriting it, or that two ROP provisions were inconsistent. In other instances, it was recognized, again based on experience, that the ROP did not address certain situations that had arisen in the development of reliability standards, implementation of the compliance monitoring and enforcement program, determination and assessment of penalties, conduct of hearings on compliance enforcement matters, registration and certification of entities, and other ERO activities, that should be addressed in the ROP. In addition, legal review of the ROP and Appendices was undertaken to identify provisions that are obsolete, unclear, constitute undue detail, or describe administrative or process details that do not rise the level of "ERO Rules" that need to be in the ROP and Appendices, but rather can be moved to lower-tiered documents or eliminated entirely.[5]

For example, the proposed revisions to the ROP that are being posted for comment include revisions that were identified from these diverse sources:

- Various provisions in ROP Section 300, Reliability Standards Development, were identified as inconsistent with revisions to Appendix 3A — Standard Processes Manual that were approved by the Commission in 2010 and 2011.

- It was recognized that Appendix 3C — Procedure for Coordinating Reliability Standards Approvals, Remands, and Directives, can be deleted as no longer necessary. Appendix 3C was originally developed in response to directives in P 286 of the Commission's July 2006 ERO Certification Order, concerning coordination among the applicable North American regulatory bodies with authority over development and approval of reliability standards for the bulk power system, specifying that NERC should identify the relevant regulatory bodies and their respective standards approval and remand processes that will be implicated in any remand of a proposed reliability standards, and specify the actual steps to coordinate all of these processing requirements, including those that may be necessary for an expedited deadline to return a remanded proposed reliability standards. As NERC has continued, subsequent to 2006, in its efforts to gain recognition as the ERO and adoption of mandatory reliability standards in the Canadian provinces and Mexico, the requirements and processes applicable to adoption and revision of reliability standards in the non-U.S. jurisdictions have been established by legislation or regulation with those jurisdictions or by memoranda of understanding between NERC and the applicable governmental authorities. As the concerns underlying the directives in P 286 of the ERO Certification Order are now addressed through legislation, regulation, or memoranda of understanding in or with the non-U.S. applicable governmental authorities, Appendix 3C can be deleted.

[5] Elimination from the ROP of administrative and other provisions that do not rise to the level of ERO Rules provides greater flexibility in revising those provisions in the future as needed, since the future changes can be effectuated without the need to post them for comments, submit them to the NERC Board for approval, and then file them with FERC for approval, before the revised provisions can become effective.

- A number of provisions were identified in Appendix 4B — Sanction Guidelines, that are not directly related to determining penalties and sanctions for violations of reliability standards and should be removed from Appendix 4B (some of these provisions are covered in other ROP sections or Appendices where they are more appropriately placed). Other provisions were identified in Appendix 4B that are internally redundant. This review resulted in proposed revisions that significantly simplify and streamline the text of Appendix 4B.

- It was recognized that the processes described in Appendix 4C — Compliance Monitoring and Enforcement Program, should be more clearly separated into "compliance processes" (Section 3.0 of Appendix 4C) and "enforcement" processes (Section 5.0).

- In the conduct of Regional Entity hearings to date, a number of procedural situations had arisen, in the experience of Regional Entities, that were not addressed in the current Hearing Procedures (Attachment 2 to Appendix 4C), or as to which the current Hearing Procedures did not provide sufficient guidance to the Hearing Officer, Hearing Body and the parties as to their roles, responsibilities and authorities in addressing these situations. The proposed amendments to the Hearing Procedures that are being presented for comment are intended to provide guidance and greater clarity with respect to these situations. The recognition of the need for these revisions to the Hearing Procedures was the result of the collective experience of the Regional Entities in conducting a number of hearings on compliance matters.

- It was determined that a number of changes need to made to Appendix 5A — Organization Registration and Certification Manual, to correctly reflect the respective responsibilities of NERC and the Regional Entities in the registration process based on the revised delegation agreements that became effective on January 1, 2011.

- The need was identified, based on experience, to provide a more streamlined process in Appendix 5A for certification of entities to perform the functions of Reliability Coordinator, Transmission Operator and Balancing Authority where an entity is already certified for a reliability function and seeks only to expand the footprint in which it will perform the reliability function.

- It was determined that Appendix 6 — System Operator Certification Manual, contains a very considerable amount of administrative details (such as procedures for registering for certification examinations, procedures and conduct at the testing center, and various fees) which do not rise to level of ERO Rules and do not need to be in the ROP. When these administrative provisions were removed, it was recognized that the remaining, substantive material in Appendix 6 could readily be moved to Section 600 of the ROP, and the separate Appendix 6 could be eliminated.

- As the result of concerns and comments about the event analysis process raised during the three-year ERO assessment process and directives in orders issued by the Commission in connection with

the three-year assessment and the subsequent revisions to the delegation agreements and associated revisions to the ROP,[6] it has been recognized that significant review and revision of the process was warranted. Among other things, it was determined that operational and administrative details of the event response and event analysis processes should be placed into a separate Event Analysis Process document that will not be part of the ROP; placement of such details in a separate document will facilitate revisions to these process details as warranted based on experience without the necessity of following the lengthy ROP revision process. An Event Analysis Working Group has developed an ERO Event Analysis Process which has been undergoing field testing since October 2010. As part of this effort, it was also recognized that requirements imposed on registered entities should remain in the ROP, as Commission-approved ERO Rules; and that the current ROP Appendix (Appendix 8) on responding to and analyzing events on the bulk power system, needed to be significantly revised to reflect the revised roles and responsibilities of NERC, the Regional Entities and registered entities in responding to and analyzing bulk power system events. The result is the proposed revised Appendix 8 — NERC Event Response Procedures, on which comments are being solicited in this posting.

The Summary of Proposed Rules of Procedure Revisions that is included as part of this posting provides a detailed summary and discussion, on a section-by-section basis, of the proposed amendments to ROP Sections 100-1600, as well as of the proposed revisions to Appendices 4B, 4C, 5A and 8 and the proposed deletions of Appendices 3C and 6. The discussion in the Summary includes explanation of the reasoning behind proposed substantive changes.

[6] *North American Electric Reliability Corp., Order on the Electric Reliability Organization's Three-Year Performance Assessment*, 132 FERC ¶ 61,217 (2010); *North American Electric Reliability Corp., Order Conditionally Approving Revised Pro Forma Delegation Agreement, Revised Delegation Agreements with Regional Entities, Amendments to Rules of Procedure and Certain Regional Entity Bylaws*, 133 FERC ¶ 61,061 (2010).

Summary of Proposed Rules of Procedure Revisions

I. Rules of Procedure Sections 100-1600[1]

A. Section 200 – Definitions of Terms

Certification – added definition relating to system operator certification which is currently provided in Appendix 6 which is being deleted; definition has also been revised from current Appendix 6 at the direction of the Personnel Certification Governance Committee

Compliance enforcement authority – added definition (same definition as in Appendix 4C, CMEP).

Confirmed violation – revised definition to be consistent with revised definition in Appendix 4C, Compliance Monitoring and Enforcement Program.

Continuing education hour or CE hour – added definition relating to system operator certification currently provided in Appendix 6, which is being deleted.

Entity variance – deleted definition – this term is not used.

Remedial action directive – added definition here (same definition as in Appendix 4C, CMEP).

Variance – revised definition to be consistent with definition in Appendix 3A, Standard Processes Manual.

B. Section 300 – Reliability Standards Development

Section 304.1 – Added "and entities" for clarity and completeness.

Section 304.4 – Revised for consistency with Appendix 3A, Standard Processes Manual.

Section 305.5 – Corrected Appendix reference from Appendix 3A to Appendix 3D.

Section 306.1 – Added text to reflect that the Standards Committee will include "two officers elected to represent the interests of the industry as a whole."

Section 306.2 – Corrected reference from Appendix 2 to Appendix 3B.

[1] Sections that do not have proposed revisions are not listed in this Summary.

Section 306.3 – Deleted specific provisions on Canadian representation and replaced them with: "The Standards Committee will include Canadian representation as provided in **Appendix 3B**, *Procedure for the Election of Members of the NERC Standards Committee*." This topic is covered substantively in Appendix 3B.

Section 307 – Changed title to "Standards Process Management"; revised text to describe functions of the NERC regional standards manager as well as the NERC standards process manager.

Sections 308.1 – Revised text to refer to expedited processes for developing reliability standards, including developing reliability standards to address national security situations that involve confidential issues (replacing reference to "urgent action" reliability standards). "Urgent action" is no longer used in Appendix 3A.

Section 308.2 & 308.3 – Revised text to reflect that reliability standards are "adopted," not "approved," by the NERC Board of Trustees (in accordance with ANSI requirements).

Section 309.1 -- Revised text to reflect that reliability standards are "adopted," not "approved," by the NERC Board of Trustees (in accordance with ANSI requirements).

Section 309.2 – Changed reference from "expedited action procedure" to "expedited standards development process".

Section 309.3 – Deleted provision that where an ERO governmental authority directs development of a standard by a deadline, NERC staff must, after preparing a SAR, attempt to find a stakeholder sponsor for the SAR. Also changed reference from "expedited action procedures" to "expedited action process" for consistency with Appendix 3A.

Section 309.3.1 – Deleted this section as no longer necessary based on the current version of Appendix 3A.

Section 311.3.1.3 – Changed text from "control the vote on a matter" to "dominate a matter" to be consistent with terminology in §304.4 and in Appendix 3A.

Section 311.3.1.6 – Deleted reference to accreditation of a Regional Standards Development Procedure by the Standards Council of Canada as sufficient to establish compliance with the evaluation criteria in §311.3.1. The Standards Council of Canada has advised NERC that accreditation by that body is not available to entities based in the U.S.

Section 312.1 – Revised text to make clear that Regional Reliability Standards must be submitted to NERC for adoption, and, if adopted, become part of the NERC reliability standards.

Section 313.1 – Added "NERC" before "reliability standards" for clarity.

Section 315 – Changed title of section to refer to the NERC Standard Processes Manual, which is the current title of Appendix 3A.

Section 316 – Deleted reference to seeking "continuing" accreditation since ANSI does not grant "continuing" accreditation, and replaced it with a statement that NERC will "seek and maintain" accreditation. Also, deleted reference to seeking accreditation from the Standards Council of Canada; the Standards Council of Canada has advised that accreditation is not available to NERC since it is not based in Canada.

Section 317 – Revised text as follows: "NERC shall complete a review of each NERC reliability standard at least once every five years, or such longer period as is permitted by the American National Standards Institute, from the effective date of the standard or the latest revision to the standard, whichever is later." It may be possible to obtain relief from ANSI from the requirement that each standard be reviewed at least every five years.

Section 318 – Deleted reference to ISO/RTO Council. Although NERC strives to maintain close working relationships with the ISO/RTO Council and with industry associations and other, similar organizations, based on experience NERC has not found it necessary to work specifically with the ISO/RTO Council to coordinate wholesale electric business standards and market protocols with NERC reliability standards.

Section 319 – Changed reference to "standards that expired or were replaced" to "standards that have been retired," which is consistent with the terminology NERC uses elsewhere to describe standards no longer in effect. Also, changed reference to "NERC standards manager" to "NERC standards information manager" – the position of standards information process manager will be responsible for receiving and responding to requests for archived standards information.

Section 320 – The section has been revised to describe generally the process for developing and approving VRFs and VSLs, rather than just the alternate method for adopting VRFs. New §320.1 states that NERC will follow the process for developing VRFs and VSLs set forth in the Standard Processes Manual. New §320.2 states that if an ERO governmental authority remands or directs a revision to a Board-approved VRF or VSL, the NERC director of standards (based on consultation with the standard drafting team), the Standards Committee, and the NERC director of compliance options, will recommend one of three actions to the Board: (1) file a request for clarification, (2) file a request for rehearing, or (3) approve the directed revision. Section 320.3, which now contains the "alternative procedure," has been amended to apply to VSLs and well as to VRFs. Section 320.3 (which includes content being moved from ROP §1403, as it is more appropriately located in §300), has also been amended to specify that there will be notice and opportunity for comment before the Board approves a VRF or VSL, and that the Board will consider the inputs of the MRC and affected stakeholders.

C. Section 400 – Compliance Enforcement

Section 401.6 – For clarity of this point, the second sentence is amended as follows: "Compliance is required, and NERC and the regional entities have authority to monitor compliance, with all NERC reliability standards whether or not they are included in the subset of reliability standards and requirements designated to be actively monitored and audited in the NERC annual compliance program." Registered entities are subject to monitoring for compliance with all standards applicable to their registered functions, not just the standards on the actively monitored list.

Section 401.7 – Changed reference to "remedial actions" to "remedial action directives," which is a defined term. (This change has been made in a number of places throughout the ROP.)

Section 401.8 – Amended section to specify that a registered entity shall not be subject to an enforcement action by more than one Regional Entity for the same violation.

Section 401.9 – Changed reference to "remedial actions" to "remedial action directives."
Section 401.11 – Added reference to "or other mitigating activities" after "mitigation plan." This revision, which is made in a number of places throughout the ROP, reflects the fact that actions taken by a registered entity to correct and prevent recurrence of a non-compliance, while they are accepted by the CEA, are not always memorialized in a formal mitigation plan.

Section 402.5 – The revisions are intended to make the text more consistent with the definition of remedial action directive.

Section 402.6 – Changed reference to "remedial actions" to "remedial action directives."

Section 403.4 – Changed reference to "Hearing Process" to "Hearing Procedures" (Attachment 2 to Appendix 4C).

Section 403.6 – Added reference to "mitigating activities" and changed reference to "remedial actions" to "remedial action directives."

Section 403.7.3 – Changed reference to "remedial actions" to "remedial action directives."

Section 403.14 – In the title of this section, changed reference to "remedial actions" to "remedial action directives." Also, this section is amended to make clear that confirmed violations, penalties and sanctions specified in a Regional Entity hearing body final decision (as well as confirmed violations, penalties and sanctions developed by the Regional Entity through the enforcement process without a hearing) will be provided to NERC for review and filing with the applicable ERO governmental authorities as a notice of penalty.

Section 403.15 – The last paragraph of this section is amended to provide that a regional entity (as well as a bulk power system owner, operator or user) may appeal a Regional Entity hearing body decision to NERC in accordance with §409.

Section 403.16 – Amended to advance the date by which annual Regional Entity compliance enforcement program implementation plans are to be submitted to NERC, from November 1 to October 1 of the preceding year.

Section 407.1 – Changed references to "remedial actions" to "remedial action directives" to reflect the context. In addition, the section is amended to provide that NERC will review penalties, sanctions and remedial action directives specified by a Regional Entity hearing body final decision, to determine if the determination is supported by a sufficient record, consistent with the *Sanction Guidelines* and other directives, guidance and directions issued by NERC pursuant to the delegation agreement, and consistent with penalties, sanctions and remedial action directives imposed by the Regional Entity and by other Regional Entities for violations involving the same or similar facts and circumstances. In order to perform its function of ensuring consistency in penalty determinations for similar violations and among Regional Entities, it is necessary for NERC to review penalties determined by Regional Entity hearing bodies just as it determines penalties determined by Regional Entity compliance enforcement staff.

Section 408 – Several references to the NERC director of compliance are changed to the NERC director of enforcement. Additionally, §408.1 is revised to add reference to Regional Entities appealing decisions of Regional Entity hearing bodies pursuant to ROP §409.

Section 409.1 – The section is amended to reflect that a Regional Entity acting as the compliance enforcement authority, as well as a bulk power system owner, operator or user, may appeal a final decision of a Regional Entity hearing body. Additional amendments are made to use defined terms. Another amendment specifies that the entity appealing must submit its notice of appeal to the NERC director of enforcement (formerly director of compliance) and provide copies to the Regional Entity and any other participants in the Regional Entity hearing body proceeding. The last sentence of the section is deleted as unnecessary.

Section 409.2 – Changed "compliance hearing" to "proceeding."

Section 409.3 & 409.4 – Changed to reflect that the Regional Entity may file an appeal of a Regional Entity hearing body decision, to specify that the Regional Entity shall file the entire record of the Regional Entity hearing body with the NERC director of enforcement, to specify that participants in the hearing body proceeding other than the appellant shall file their responses to the issues raised in the notice of appeal 35 days after the date of appeal (which will allow for at least a 14-day period after the record of the hearing body proceedings is filed with the NERC director of enforcement), and to provide that the appellant may file a reply to the responses within 7 days.

Section 409.5 – Changed to specify that in considering an appeal from a Regional Entity hearing body decision, the BOTCC may allow other participants to the Regional Entity (in addition to the party appealing), to appear before the BOTCC.

Section 409.8 – New section is added to specify that Section 409 is not applicable to an appeal taken from a decision of the Regional Entity hearing body granting or denying a motion to intervene in the Regional Entity hearing, and that such appeals shall be conducted in accordance with ROP §414.

Section 412 – This new section sets forth the procedures by which the NERC BOTCC will accept or reject a question certified to the BOTCC by a Regional Entity hearing body (pursuant to §1.5.12 of the Hearing Procedures in Appendix 4C), and if the BOTCC decides to accept the certified question, the procedure for receiving argument from the participants on, and deciding, the question. Section 412.2 specifies that written decisions of the BOTCC on certified questions will be posted on the NERC web site, with redaction of the names of the participants and of any other information that is necessary to maintain the non-public nature of the Regional Entity hearing body proceeding.

Section 413 – This new section specifies that NERC shall review and process final decisions of Regional Entity hearing bodies concerning alleged violations, proposed penalties or sanctions, or proposed mitigation plans, that are not appealed to the BOTCC, as though the determination was made by the Regional Entity compliance program, and may require that the decision be modified by the Regional Entity, in accordance with sections 5.8, 5.9 and 6.5 of Appendix 4C. In order to perform its function of ensuring consistency in violation, penalty and mitigation plan determinations for similar facts and circumstances and among Regional Entities, it is necessary for NERC to review penalties determined by Regional Entity hearing bodies just as it reviews violations, penalties and mitigation plans determined or approved by Regional Entity compliance enforcement staffs.

Section 414 – This new section establishes procedures for review and decision by the NERC BOTCC of appeals of decisions of a Regional Entity hearing body to grant or deny a request for intervention in the Regional Entity hearing body proceeding. Addition of these procedures is needed due to the proposed amendment to §1.4.4 of the Hearing Procedures to allow the Regional Entity hearing body to grant requests to intervene in limited circumstances. New §414.5 recognizes that the BOTCC's decision on the appeal may thereafter be appealed to FERC or to another ERO governmental authority having jurisdiction over the matter, in accordance with the authorities, rules and procedures of the ERO governmental authority.

D. Section 500 – Organization Registration and Certification

Section 501 – The first paragraph is revised for clarification to refer to certification of entities performing certain specified functions, rather than entities applying to be a RC, BA or TOP.

Section 501.1.3.1 – This section is revised to provide greater specificity with respect to the effective date of an entity's registration, particularly in the case of registrations resulting from sales or transfers of BPS assets or from corporate reorganizations that result in a new legal entity owning BPS assets formerly owned by another registered entity. The effective date will be stated in NERC's notification of registration. Where the organization is being registered for the first time and its BPS facilities were not previously owned by another registered entity, the effective date of the registration will be the date agreed to by the entity to be registered and the applicable Regional Entity. Where the organization is being registered because it has acquired BPS facilities from a registered entity, or based on an internal restructuring or name change where the organization has been registered under a different entity name, the effective date of the registration will be the effective date of the transaction that results in the organization performing the reliability functions that require it to be registered.

Section 501.2 – This section is amended to refer to the need for certification of RCs, TOPs and BAs and entities that perform some or all of the reliability functions of RCs, TOPs and BAs. Additionally, reference to the NERC Provisional Certification Process is deleted, as that process is no longer needed and is being eliminated.

Section 501.2.1 – Amended to refer to entities intending to perform (as well as entities performing) the functions of RC, TOPs and BAs, since the certification process applies to entities seeking to perform these functions as well as entities already performing the functions.

E. Section 600 – Personnel Certification

Section 600 has been substantially revised and expanded. Appendix 6, System Operator Certification Program Manual, is being deleted in its entity and its substantive provisions are being moved into Section 600.

Section 601 – Scope of Personnel Certification – This section is amended to state (1) that the Personnel Certification Program awards system operator certification credentials to individuals who demonstrate that they have attained essential knowledge relating to NERC reliability standards as well as principles of BPS operations, and (2) that except as necessary to obtain approval of the ROP, the NERC Personnel Certification Governance Committee (PCGC) is the governing body that establishes the polices, sets fees, and monitors the performance of the Personnel Certification Program for system operators.

Section 602 – Structure of ERO Personnel Certification Program – This section contains existing provisions describing the structure of the Personnel Certification Program.

Section 603 – Examination and Maintenance of NERC System Operator Certification Credentials – Section 603 is a new section encompassing material being moved from Appendix 6. It describes the basic requirements for obtaining a system operator certification (*i.e.*, passing an examination) and maintaining the certification (*i.e.*, earning the necessary number of Continuing Education (CE) hours

during the ensuing three-year period). It also states what occurs should the certified operator fail to obtain the necessary amount of CE hours during the three-year period, including the procedure for requested a hardship clause exception.

Section 604 – Dispute Resolution Process – Section 604 is a new section encompassing material being moved from Appendix 6. It describes the NERC System Operator Certification Dispute Resolution Process for resolving disputes that arise under the System Operator Certification Program concerning any aspect of the certification process. The Dispute Resolution Process is for the use of persons who hold an operator certification or persons wishing to be certified to dispute the validity of the examination, the content of the test, the content outlines, or the registration process.

Section 605 – Disciplinary Action – Section 605 is a new section encompassing material being moved from Appendix 6. It describes the grounds and procedures for disciplinary action against a system operator, including the hearing process and the possible decisions that may be rendered against the system operator. It also describes the Credential Review Task Force, which will make factual determinations and ultimate determinations as to disciplinary action.

Section 606 – Candidate Testing Mechanisms – This section is currently Section 603 of the ROP. The text has not been revised.

Section 607 – Public Information About the Personnel Certification Program – This section is currently Section 604 of the ROP. It has been revised to state that the Personnel Certification Program shall maintain and publish publicly a System Operator Certification Program Manual, covering listed topics; and shall maintain and publish publicly a comprehensive summary or outline of the of the information, knowledge, or functions covered by each system operator certification examination and a summary of certification activities for the program.

Section 608 – Responsibilities to Applicants for Certification or Recertification – This section is currently Section 605 of the ROP. Items 8 and 9 in the list of duties and responsibilities of the Personnel Certification Program (implement and publish policies and procedures providing due process for applicants questioning eligibility determination, examination results and certification status, and develop and maintain a program manual containing the processes and procedures for applicants for certification and recertification) have been deleted since these topics are covered in Sections 604 and 607.

Section 609 – Responsibilities to the Public and to Employers of Certified Practitioners – This section is currently Section 606 of the ROP. It has been revised (1) to delete the provision that the Personnel Certification Program shall periodically publish a current list of those persons who are certified, and (2) to delete a reference to the disciplinary action program being contained in Appendix 6, as it will be included in Section 605.

F. Section 800 – Reliability Assessment and Performance Analysis

Sections 807 and 808 have been revised to provide for a more consistent use of terms in these sections including "major event" and "occurrences." Similar revisions have been made in Appendix 8.

Section 807a is revised to state that in responding to a major event, NERC will work with registered entities as well as with Regional Entities and Reliability Coordinators.

Sections 807c and 808.3 are amended to refer to NERC Reliability Standard EOP-004 which sets forth specific criteria and procedures for reporting BPS disturbances and events described in that standard, with which registered entities subject to EOP-004 must comply. These sections further states that BPS users, owners and operators shall also provide NERC and Regional Entities with such additional information they request as is necessary to enable them to carry out their responsibilities under these sections.

Section 807e is amended to provide that NERC will establish, maintain, and revise from time to time based on experience a manual setting forth procedures and protocols for communications and sharing and exchange of information between and among NERC, Regional Entities, governmental authorities, industry organizations, and BPS users, owners and operators, concerning the investigation and analysis of major events.

Section 807f is amended to reflect the revised title of Appendix 8.

Section 807g is amended to state that NERC will disseminate to the industry findings and recommendations of general applicability from event analyses, "through various means appropriate to the circumstances," including in accordance with ROP §810. This revision will give NERC greater flexibility in determining and using the most effective means to disseminate information gained from event analyses to the industry.

Section 808.2 has a similar amendment to §807g as described immediately above.

G. Section 1000 – Situation Awareness and Infrastructure Security

Section 1002 has been amended to state NERC's new policy regarding maintenance and financial support of existing and potential new reliability tools and support services. NERC will work with industry to identify new tools, collaboratively develop requirements, support development, provide an incubation period, and at the end of that period transition the tool or service to another group or owner for long term operation of the tool or provision of the service. NERC may also develop reliability tools on its own, but will consult with industry concerning the need for the tool prior to development. Tools and services being maintained by NERC as of January 1, 2012 will be reviewed and, as warranted, transitioned to an appropriate industry group or organization.

H. Section 1200 – Regional Delegation Agreements

Section 1208 – The title is revised to delete the word "Audits," thereby correcting a previous scrivener's error.

I. Section 1400 – Amendments to the NERC Rules of Procedure

Section 1401 is revised to provide that requests to amend or repeal the ROP may be submitted by (among other sources) (i) fifty (rather than ten) members of NERC, which must include members from at least three membership sectors (rather than "segments"), (ii) a committee (rather than "standing committee") of NERC, or (iii) an officer of NERC (rather than of "the ERO"). These revisions are necessary to correct inconsistencies with Article XI, section 2 of the NERC Bylaws.

Section 1403 is deleted and its subject matter, which is more appropriately placed in ROP §300, is moved to §320.3.

J. Section 1500 – Confidential Information

Section 1502.1 is revised to correct an existing typographical error.

II. Appendix 3C – Procedure for Coordinating Reliability Standards Approvals, Remands, and Directives

NERC is proposing to delete Appendix 3C as no longer necessary. Appendix 3C was originally developed in response to directives in P 286 of the Commission's July 2006 ERO Certification Order, concerning coordination among the applicable North American regulatory bodies with authority over development and approval of reliability standards for the bulk power system, specifying that NERC should identify the relevant regulatory bodies and their respective standards approval and remand processes that will be implicated in any remand of a proposed reliability standards, and specify the actual steps to coordinate all of these processing requirements, including those that may be necessary for an expedited deadline to return a remanded proposed reliability standards. As NERC has continued, subsequent to 2006, in its efforts to gain recognition as the ERO and adoption of mandatory reliability standards in the Canadian provinces and Mexico, the requirements and processes applicable to adoption and revision of reliability standards in the non-U.S. jurisdictions have been established by legislation or regulation with those jurisdictions or by memoranda of understanding between NERC and the applicable governmental authorities. As the concerns underlying the directives in P 286 of the ERO Certification Order are now addressed through legislation, regulation, or memoranda of understanding in or with the non-U.S. applicable governmental authorities, Appendix 3C can be deleted.

III. Appendix 4B – Sanction Guidelines

A principal objective of the proposed amendments to Appendix 4B is to eliminate text that does not relate to the purpose of the Sanction Guidelines, namely, how penalties and sanctions for violations of reliability standards are determined, and to eliminate internally duplicative or repetitive text. The following portions of Appendix 4B are being completely or substantially deleted consistent with this objective: (1) current section 2, Document Scope and Exclusions; (2) current §3.1, Necessary Elements of NERC Compliance Program; (3) current §3.2, Settlement of Compliance Violations, as well as the current sections captioned "Settlement Request" and "Settlement Effect on Continuation of Determination of Penalties, Sanctions, or Remedial Actions;" (4) current §3.7, "No Influence of Penalty, Sanction or Remedial Action Upon Violation Confirmation Process;" and (5) current §6, "Remedial Action" (remedial action directives are covered in §7.0 of Appendix 4C); as well as portions of the texts of other sections.

Text paraphrasing or referring to various statutory provisions and Commission regulations and orders has also been deleted, as these authorities speak for themselves; however, a statement has been added in §1 that "NERC and the regional entities will apply the provisions of this document in accordance with applicable statutory provisions and with the regulations, orders, and statements of policy of FERC and other ERO governmental authorities that are applicable to the determination and imposition of penalties and sanctions for violations of reliability standards in the respective jurisdictions."

Revisions have been made throughout Appendix 4B for more consistent use of terms within the document and as used elsewhere in the ROP, such as remedial action directive, possible violation, alleged violation, and registered entity.

In current §3.2/renumbered §2.1, text is retained specifying that provisions in a settlement agreement regarding penalties or sanctions can supersede any corresponding penalties or sanctions that would otherwise be determined pursuant to the Sanction Guidelines.

In renumbered §2.5, "Multiple Violations," text has been added to state that where penalties or sanctions for several unrelated violations by an entity are being determined at the same time, NERC or the regional entity may determine and issue a single aggregate penalty or sanction bearing a reasonable relationship to the aggregate of the violations. This is consistent with long-standing practice.

In renumbered §3.2.2, which discusses how the fact that a violation is a registered entity's first violation will be considered in determining (reducing or excusing) the Base Penalty Amount, text has been added to provide that this relief generally will not be afforded if NERC or the regional entity determines the violator has a poor internal compliance program or culture of compliance (as well as a poor compliance record, as stated in the existing text). This is consistent with longstanding practice,

and also consistent with the increased emphasis NERC is placing in compliance monitoring and enforcement activities on the registered entity's internal compliance program and culture of compliance.

In renumbered §3.3, which lists adjustment factors that will be considered in determining the penalty after the Base Penalty Amount is established, subpart c lists as an adjustment factor disclosure of the violation by the violator through self-reporting, or as the result of a compliance self-analysis following a bulk power system event, and voluntary mitigating activities (which is a broader term than the current "corrective action") by the violator. Subpart d, which refers to the degree and quality of cooperation by the violator in the investigation, has been amended to include reference to the violator's cooperation in an event analysis concerning, and the performance of a compliance self-analysis by the violator following, a BPS event in which the violation occurred or to which it related. The references to cooperation in the analysis of, and performance of a compliance self-analysis following, a system event, is consistent with proposed amendments to Appendix 8 to reflect expectations that registered entities will conduct self-analyses of system events in which they are involved. In subpart f, "settlement" has been added as an explicit adjustment factor.

In renumbered §3.3.1, which discusses repetitive violations and the violator's compliance history as an adjustment factor, text has been added to state that in evaluating the violator's compliance history, NERC or the regional entity will take into account previous violations by affiliates of the violator, particularly violations of the same or similar reliability standard requirements, and will evaluate whether any such prior violations reflect recurring conduct by affiliates that are operated by the same corporate entity or whose compliance activities are conducted by the same corporate entity. This addition is consistent with a 2010 guidance order from FERC, and should also promote the sharing of compliance information and lessons learned between registered entities that are corporate affiliates.

Also, in renumbered §3.3.1, the term "violation reset time period" has been changed to "reset period or reset time frame," as these are the terms used in several reliability standards.

Renumbered §3.3.3, retitled "Disclosure of the Violation Through Self-reporting and Voluntary Mitigating Activities by the Violator," has been revised consistent with subpart c of §3.3.3 as described above. In addition, the following text has been added: "If a self-report or a self-certification submitted by the violator accurately identifies a violation of a Reliability Standard, an identification of the same violation in a subsequent compliance audit or spot check will not subject the violator to an escalated penalty as a result of the compliance audit process unless the severity of the violation is found to be greater than reported by the violator in the self-report or self-certification." A similar statement is currently contained in §3.0 of Appendix 4C, but it is being moved to Appendix 4B as it more appropriately relates to penalty determinations than to compliance monitoring processes.

Renumbered §3.3.4, retitled "Degree and Quality of Cooperation," has been revised consistent with subpart d of §3.3 as described above.

Renumbered §3.3.5, retitled "Presence and Quality of the Violator's Internal Compliance Program," has been revised to add reference to "other indicators of the violator's culture of compliance" as an adjustment factor.

Section 3.3.6, "Settlement," has been added consistent with the addition of subpart f in §3.3 as described above.

Renumbered §3.3.7, retitled "Violation Concealment and Responsiveness," has been revised to state that NERC or the regional entity shall consider an increase to the penalty if NERC or the regional entity determines, based on its review of the facts, that the violator resisted or impeded the discovery and review of a violation.

In numerous other areas of Appendix 4B, revisions have been made for the purpose of simplifying the text. The text of current Appendix 4B is extremely elaborate and the simplification of the text will make the document easier to use for all participants. As part of this effort, in numerous places text has been revised to state that "NERC and the regional entity will do X," rather than the current text structure of "X will occur" or "X will be taken into account."

IV. Appendix 4C – Compliance Monitoring and Enforcement Program

Throughout Appendix 4C, "Regional Entity" has been revised to "Compliance Enforcement Authority" (CEA in this summary) in numerous places. In addition, since sections have been added and deleted and, as a result, other sections have been renumbered in this Appendix, there are revisions throughout the Appendix to change cross-references.

A. Section 1.0 -- Introduction

Section 1.1 – Definitions – A cross-reference has been added to incorporate definitions in Section 1500 of the ROP.

Section 1.1.2 – Annual Audit Plan – reference to including "Compliance Audit Participant Requirements" in the Annual Audit Plan has been deleted.

Section 1.1.9 – Confirmed Violation – the definition has been expanded to more comprehensively capture the circumstances that constitute a "Confirmed Violation," based on experience, and will include entry into a settlement agreement.

Section 1.12 – ISO/RTO – added new definition that is used in new §5.11 (described below).

Section 1.1.13 (renumbered) – Mitigation Plan – Text not necessary to define the term is being deleted.

Section 1.1.16 (renumbered) – The defined term "Notice of Alleged Violation" is changed to "Notice of Alleged Violation and Proposed Penalty or Sanction," which is the term more commonly used; Notices of Alleged Violation typically include a proposed penalty or sanction.

Section 1.1.18 (renumbered) – Notice of Confirmed Violation – text is deleted that is not necessary to define "Notice of Confirmed Violation." The subject matter of the deleted text is covered (more appropriately) in the definition of "Confirmed Violation."

Section 1.19 (renumbered) – Notice of Penalty – added the phrase Notice "or other notification" of Confirmed Violation to reflect that Regional Entities may sometimes provide notice of a Confirmed Violation through a means of notification other than a Notice of Confirmed Violation.

Section 1.1.22 (renumbered) – Possible Violation – text is deleted that is not necessary to define the term, and potentially inaccurate (a Possible Violation could be identified by a means other than one of the compliance monitoring and enforcement processes enumerated in Section 3.0).

Section 1.1.24 (renumbered) – Preliminary Screen – an additional component is added to the determinations to be made in the Preliminary Screen: "if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation which is currently being processed."

Section 1.1.24 (renumbered) – Public Notification List – Added new definition that is used in new §5.11 (described below).

Section 1.1.25 (renumbered) – Regional Implementation Plan – revised to reflect that the Regional plans are now to be submitted to NERC by October 1 (rather than November 1) of the preceding year.

Section 1.1.27 (renumbered) – Remedial Action Directive – revised to state that a Remedial Action Directive is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat.

Section 1.1.29 (renumbered) – Self-Certification – Definition is expanded to reflect that additional possible responses to a self-certification request will be allowed, *i.e.*, that the Registered Entity does not own facilities that are subject to the Reliability Standard requirement, or that the Reliability Standard requirement is not applicable to the Registered Entity.

Section 1.1.30 (renumbered) – Self-Report – (1) The defined term is changed from Self-Reporting to Self-Report (this revision is made throughout the document). (2) Definition is revised to provide that the Self-Report may state that the Registered Entity believes it has, or may have, violated a Reliability Standard. This will enable a Registered Entity to submit a Self-Report without having to conclude that it has violated a Reliability Standard. (3) The provision that the Self-Report should state the actions

that have been taken or will be taken to resolve the violation is deleted; this requirement could delay submission of a Self-Report while the Registered Entity determines what actions are to be taken.

Section 1.1.31 (renumbered) – Spot Check – (1) The defined term is changed from Spot Checking to Spot Check (this revision is made throughout the document). (2) In the third basis stated in the definition on which a Spot Check may be initiated, reference to "events, as described in the Reliability Standard" is deleted and "risk-based assessments" is added. The addition is consistent with NERC's developing risk-based assessment approach to determining the frequency with which to conduct compliance monitoring activities.

B. Section 2.0 – Identification of Organizations Responsible for Complying with Reliability Standards

Section 2.0 is revised to specify that a Registered Entity must inform NERC or the applicable Regional Entity promptly of changes to the Registered Entity's compliance information "including planned or completed changes in ownership of Bulk Power System facilities, registration status, address or other contact information, and name of designated compliance contact." Experience has indicated that NERC and the Regional Entities are not receiving timely notification of such information, which may affect registration status, identification of the correct/current Registered Entity, or the ability to contact the Registered Entity.

Detailed text concerning disclosure of confidential compliance information to FERC and other Applicable Governmental Authorities has been deleted here (and in other sections where it was repeated), and replaced with: "Any such provision of information to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8,0, Reporting and Disclosure." The complete text of this provision will now appear in one section (Section 8.0).

C. Section 3.0 – Compliance Monitoring Processes

In the title of Section 3.0, reference to "Enforcement" is deleted; and in the first sentence of the section, "assess and enforce" is deleted. Section 3.0 encompasses only compliance monitoring processes, while Section 5.0 encompasses enforcement.

Throughout Section 3.0, footnotes stating that a particular compliance process normally completes within a specified time period have been deleted; the time required to complete individual compliance processes has varied widely based on particular facts and circumstances.

Text has been added in the first paragraph of the section stating that scheduled compliance monitoring processes will be conducted in accordance with NERC and Regional Annual Implementation Plans and individual entity audit plans; and that compliance monitoring processes can also be initiated on an unscheduled basis as needed, based on factors such as those enumerated in the text, such as the

compliance history of the Registered Entity and the quality of its internal reliability compliance program. This text is consistent with NERC's developing risk-based assessment approach to compliance monitoring.
Text has been added to state that if a potential noncompliance is identified through one of the compliance monitoring processes described in Section 3.0 or through another means, the Compliance Enforcement Authority (CEA) will conduct a Preliminary Screen of the information in accordance with Section 3.8; if the Preliminary Screen results in an affirmative determination with respect to the Preliminary Screen criteria, a Possible Violation exists and the CEA will proceed in accordance with Section 5.0, Enforcement Actions.

Text describing the enforcement actions that may be taken by the CEA is deleted, as this topic is covered in Section 5.0, not in this section.

Text is added to state that the CEA has authority to collect documents, data and information in the manner it deems most appropriate, including removing copies of documents, data and information from the Registered Entity's location in accordance with appropriate security procedures conforming to ROP Section 1500 and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost if the information were placed into the public domain.

This section is revised to state that a Registered Entity that believes a request for documents, data or information is unreasonable may request a determination from the NERC General Counsel (changed from the NERC "compliance program officer").

Section 3.1 – Compliance Audits – Revised to state that Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors, are examples of professional auditing standards on which Compliance Audit processes for Compliance Audits in the U.S. should be based.

Section 3.1.1 – Compliance Audit Process Steps – (1) The first step is revised to state that the Annual Audit Plan will be posted, rather than distributed to all Compliance Audit Participants. (2) The second step is revised to provide that the CEA will notify the Registered Entity of the Compliance Audit and the Reliability Standards to be evaluated, 90 days (rather then 2 months) prior to commencement of a regularly scheduled Compliance Audit. (3) The fourth step is revised to delete the statement that the audit team will review the Registered Entity's submitted information "prior to performing the Compliance Audit" – the submitted information may be reviewed before or during the on-site audit activities. Text stating that the audit team "follows NERC audit guidance in the implementation of the Compliance Audit" is also deleted here, as this statement is applicable to all the process steps. (4) The fifth step is revised to state that the audit reported will be completed in accordance with Section 3.1.6,

which addresses the form and contents of the audit report. (5) A step has been added that if the audit team identifies evidence of a potential noncompliance, the CEA will conduct a Preliminary Screen in accordance with Section 3.0. Other process steps describing enforcement actions are deleted here, since enforcement processes are covered in Section 5.0.

Section 3.1.2 – Compliance Enforcement Authority Annual Audit Plan and Schedule – (1) Revised to state that Registered Entities scheduled for Compliance Audits in a year will be notified by October 1 of the preceding year (rather than by January 1 of the year in which the audit is to be conducted). (2) Text is changed to state that the CEA will give due consideration to schedule changes requested by a Registered Entity "for reasonable cause" (rather than "to avoid unnecessary burden") which will allow a broader basis for justification of schedule change requests.

Section 3.1.3 – Frequency of Compliance Audits – The last sentence is deleted because the subject of objections to the composition of the audit team is covered in Section 3.1.5.4.
Section 3.1.4.1 – Reliability Standards – Revised to clarify that a Compliance Audit may include other standards applicable to the Registered Entity, that are not identified in the NERC Implementation Plan, whether or not the other standards are identified in the Regional Entity's Implementation Plan.

Section 3.1.4.2 – Period Covered – (1) Revised to emphasize that the Registered Entity's data and information must show compliance with the standards being audited for the entire period covered by the Compliance Audit. (2) Text is added to state that the CEA will indicate the beginning and End Date of the audit period in its notice of the Compliance Audit. (3) Revised to state that the start of the audit period will be the End Date of the previous Compliance Audit (which may be a different date than the last day of the previous Compliance Audit). (4) The existing second sentence of this section, concerning modification of the audit period, is deleted and replaced with a more straightforward sentence ("The Compliance Enforcement Authority may modify the beginning date of the audit period for any given Reliability Standard requirement based on an intervening compliance monitoring process."). (5) Text is revised to state that the End Date may be a predetermined specific date or may be stated generally as the last day of the Compliance Audit.

Section 3.1.4.3 – Review of Mitigating Activities – The term "Mitigation Plan" is replaced with "mitigating activities." "Mitigating activities" is a broader term, reflecting that actions taken by a registered entity to correct and prevent recurrence of a noncompliance, while they are accepted by the CEA, are not always memorialized in a formal Mitigation Plan.

Section 3.1.5.1 – Composition of Compliance Audit Teams – (1) Revised to state that the audit team will be comprised of members who the CEA has determined to have the requisite knowledge, training, and skills to conduct the Compliance Audit. (2) Revised to clarify who may be included on Compliance Audit teams, in addition to staff of the Regional Entity: (i) contractors and industry subject matter experts, (ii) NERC staff members (which may include contractors to NERC), (iii) compliance staff

members of other Regional Entities, and (iv) representatives of FERC and of other Applicable Governmental Entities that have reliability jurisdiction with respect to the Registered Entity.

Section 3.1.5.2 – Requirements for Compliance Audit Team Members – (1) First bullet is revised to state that audit team members must be free of conflicts of interest "in accordance with Compliance Enforcement Authority policies." (2) Fourth bullet is revised to eliminate the requirement that the CEA provide to the Registered Entity copies of the confidentiality agreements or acknowledgements executed by the audit team members; instead, the CEA will provide confirmation to the Registered Entity that all audit team members have executed confidentiality agreements or acknowledgements.

Section 3.1.5.3 – Compliance Audit Observers and Other Attendees – Revised to clarify the distinctions between audit team members (§3.1.5.1), observes, and attendees. The first paragraph is amended to specify that the following may participate as observers: NERC staff; other members of the Regional Entity's compliance staff; with the Regional Entity's permission, compliance staff members of other Regional Entities; and representatives of FERC and of other Applicable Governmental Entities that have reliability jurisdiction with respect to the Registered Entity. The second paragraph, which is not being revised (and was approved by the Commission in its October 7, 2011 Order) states who may be attendees at the audit. A new third paragraph has been added to state that "Compliance Audit observers and attendees are not audit team members and do not participate in conducting the Compliance Audit or in making audit findings and determinations."

Section 3.1.5.4 – Registered Entity Objections to Compliance Audit Team – (1) Revised to delete "other than a member of NERC or FERC staff" in the sentence "A Registered Entity subject to a Compliance Audit may object to any member of the audit team [deletion] on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties." NERC (and numerous stakeholders who commented on this provision) believe that while a Registered Entity should not be able to object to participation by NERC staff or FERC staff on a Compliance Audit team (as FERC has indicated in prior orders), a Registered Entity should be allowed to object to the inclusion of a <u>particular individual</u> NERC staff or FERC staff member on the audit team based on conflict of interest, bias or similar specific grounds (*e.g.*, the NERC staff member of FERC staff member is a former employee of the Registered Entity).

Section 3.1.6 – Compliance Audit Reports – (1) In the second line, "evidence of possible noncompliance" is changed to "evidence of potential noncompliance" to avoid confusion with the defined term "Possible Violation." (2) In the first paragraph, the phrase "other mitigating activities" is added to "Mitigation Plan," as not all actions taken by Registered Entities to correct a noncompliance and prevent recurrence are memorialized in formal Mitigation Plans. (3) The first paragraph is also revised to state that the audit report may also state areas of concern and recommendations identified by the audit team (rather than specifying that any recommendations of the audit team be provided in a separate document). (4) In the second paragraph, the first sentence is revised to specify that the CEA will provide the final audit report to the Registered Entity on or before the date the report is provided

to NERC. (5) Text concerning the provision of non-public compliance information to FERC or to another Applicable Governmental Entity is deleted and replaced with a reference to §8.0, where the full text on this topic is provided.

Section 3.2 – Self-Certification – The second paragraph of this section is deleted because its substance has been moved to Appendix 4B, *Sanction Guidelines*, where it is more appropriately placed.

Section 3.2.1 – Self-Certification Process Steps – (1) The first step is revised to specify that the posted reporting schedule should include the applicable reporting periods. (2) The first step is also revised to specify that NERC, along with the CEA, will be responsible to ensure that the appropriate standards, compliance procedures and submittal forms are maintained and available (which may be through a means other than electronic). (3) Consistent with the revised definition of Self-Certification (§1.1.29), the third step is revised to list the four possible responses in a Self-Certification. (4) The fourth step is revised to state that, at a minimum, the CEA will review Self-Certifications of non-compliance and Self-Certifications stating that the Registered Entity does not own facilities that are subject to the Reliability Standard requirement or that the requirement is not applicable to the Registered Entity. (5) The fifth step is revised to state that if the CEA identifies a potential noncompliance, the CEA conducts a Preliminary Screen. (6) A paragraph is added stating that receipt of a Self-Certification by the CEA shall not be construed as a finding by the CEA that the Registered Entity is compliant with, not compliant with, or not subject to, the Reliability Standard requirement. This additional text is intended to negate the assumption that if a CEA makes no further response to a Registered Entity concerning a Self-Certification, the CEA has determined that the Registered Entity is compliant with the Reliability Standard requirement.

Section 3.3 – Spot Check – (1) Revised to state that a Spot Check may be initiated at the discretion of the CEA or as directed by NERC, including on a random schedule. The list of potential reasons is revised to include risk-based assessments based on the Registered Entity's BPS facilities and operations and their significance to the reliability of the BPS and the Registered Entity's compliance history and internal compliance program or other indicators of its culture of compliance. This addition is consistent with NERC's developing program of using risk-based assessments to determine when additional compliance monitoring processes should be initiated, and the scope of the compliance monitoring processes conducted, with respect to a Registered Entity.

Section 3.3.1 – Spot Check Process Steps – (1) The first step is revised to state that a "notification letter" will be issued by the CEA to the Registered Entity, which will include the scope of the Spot Check including the Reliability Standard requirements that will be covered. (2) The second step is revised to state that the notification package will include the names and employment histories of the persons who will perform the Spot Check. It is also revised to state that the CEA shall provide confirmation to the Registered Entity that the Spot Check team members have executed confidentiality agreements or acknowledgements. The second step is also revised to state that the Registered Entity may object to inclusion of any individual on the Spot Check team on the grounds specified in §3.1.5.4,

but that nothing in §3.1 shall be read to limit the participation of NERC staff on a Spot Check team or to limit the participation of FERC staff in a Spot Check of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction. (3) The third step is revised to specify that the Registered Entity must provide the required information to the CEA by the date specified in the request. (4) The fifth step is revised to state that if the Spot Check team's review of the information submitted indicates a potential noncompliance, the CEA will conduct a Preliminary Screen. (5) The sixth step is revised to state that the Spot Check team will prepare a draft Spot Check report and the Registered Entity will be given ten business days to comment on it. (6) The sixth step is revised to provide that the Spot Check team will consider any corrections based on the Registered Entity's comments, finalize the Spot Check report and provide it to the Registered Entity and to NERC. (7) The step stating that the CEA will send the Registered Entity a Notice of Possible Violation is deleted, as that step will now be covered in Section 5.0, Enforcement Actions.

Section 3.4 – Compliance Investigations – In two places, "possible violation" is replaced with "potential noncompliance" to avoid confusion with the defined term "Possible Violation."

Section 3.4.1 – Compliance Investigation Process Steps – (1) The first step is revised to provide that the CEA will take certain actions within three (rather than within two) business days of the decision to initiate a Compliance Investigation. (2) The second step is revised to provide that within three (rather than two) business days after receiving notice of the decision to initiate a Compliance Investigation, NERC will notify FERC and other Applicable Governmental Authorities. In addition, text concerning the provision of non-public compliance information to FERC or to another Applicable Governmental Entity is deleted and replaced with a reference to Section 8.0, where the full text is provided. (4) The fourth step is revised to provide that the Registered Entity must provide any required information to the CEA by the Required Date as specified in the request. (5) The eighth step is revised to provide that the CEA may review any mitigating activities (in addition to Mitigation Plans), since not all actions taken by a Registered Entity to correct a noncompliance and prevent recurrence are memorialized in a formal Mitigation Plan. (6) The ninth step is revised to provide that if the CEA identifies a potential noncompliance, it will conduct a Preliminary Screen. (7) In the tenth step, text concerning the provision of non-public compliance information to FERC or to another Applicable Governmental Entity is deleted and replaced with a reference to Section 8.0, where the full text is provided.

Section 3.5 – Self-Reports – A sentence is added stating that if possible, and without delaying the Self-Report, a Self-Report may include the actions that have been taken or will be taken to resolve the violation. This addition is consistent with the change to the definition of Self Report (§1.1.30).

Section 3.5.1 – Self-Report Process Steps – (1) The first step is revised to delete reference to the CEA's Web site; the CEA may make the Self-Report submittal forms available through other means. (2) The fourth step is revised to provide that the CEA will conduct a Preliminary Screen of the Self-Report information.

Section 3.6.1 – Periodic Data Submittals Process Steps – (1) The first step is revised to delete reference to the CEA's Web site; the CEA may make the submittal forms available through other means. (2) The third step is revised to provide that the Registered Entity must provide any required information to the CEA by the Required Date as specified in the request. (3) The fifth step is revised to provide that if the CEA's review of the data submittal indicates a potential noncompliance, the CEA will perform a Preliminary Screen. (4) A paragraph is added at the end of this section stating that receipt of a Periodic Data Submittal by the CEA shall not be construed as a finding by the CEA that the Registered Entity is compliant with, not compliant with, or not subject to, the Reliability Standard requirement. This additional text is intended to negate the assumption that if a CEA makes no further response to a Registered Entity concerning a Periodic Data Submittal, the CEA has determined that the Registered Entity is compliant with the Reliability Standard requirement.
Section 3.7 – Exception Reporting – This section is deleted and Exception Reporting will no longer be considered one of the compliance monitoring processes, as exception reports are triggered by requirements of particular Reliability Standard, and not on the initiative of the CEA. However, an exception report containing evidence of a potential noncompliance may still result in performance of a Preliminary Screen and initiation of an enforcement action (see revised Section 2.0).

Section 3.7 (as renumbered) – Complaints – In the first paragraph, text stating that NERC will review any Complaint "that is related to a Regional Entity or its affiliates, divisions, committees or subordinate structures" is deleted. Regional Entities as such are not subject to Reliability Standards; and for those Regional Entities that perform registered functions (FRCC, SPP and WECC), there are in place (or pending before the Commission for approval) agreements by which other Regional Entities, not NERC, perform the CEA responsibilities with respect to the registered functions.

Section 3.8 – Preliminary Screen – (1) The provisions relating to performance of Preliminary Screen are relocated to Section 3.8 from Section 5.1, as the Preliminary Screen is considered a step in the compliance monitoring process (Section 3.0), rather than in the compliance enforcement process (Section 5.0). (2) Section 3.8 states that the Preliminary Screen will be conducted within five business days after the CEA identifies the potential noncompliance, except that (i) if the CEA identifies the potential noncompliance during a Compliance Audit, the Preliminary Screen will be conducted immediately following the exit briefing of the Registered Entity, and (ii) if the CEA identifies the potential noncompliance during a Compliance Investigation, the Preliminary Screen shall be conducted immediately after the Registered Entity is first notified of the potential noncompliance identified by the Compliance Investigation. The two exceptions are necessary so that the Registered Entity does not receive a Notice of Possible Violation before being notified that the Compliance Audit or Compliance Investigation has found a potential noncompliance. (3) Consistent with the change in definition (§1.1.23), the Preliminary Screen will now include a determination of whether, if known, the potential noncompliance is not a duplication of a Possible Violation or Alleged Violation that is currently being processed. (4) The revised section provides that if the Preliminary Screen results in an affirmative determination with respect to the three criteria, a Possible Violation exists and the CEA shall proceed in accordance with Section 5.0.

D. Section 4.0 – Annual Implementation Plans

Section 4.1 – NERC Compliance Monitoring and Enforcement Program Implementation Plans – (1) Revised to provide that the NERC Implementation Plan will be provided to the Regions by on or about September 1 (rather than October 1) of the prior year. (2) Revised to state that NERC may update and revise its Implementation Plan during the course of the year. (3) Revised to state that Regional Entities have discretion to make modifications to the NERC Implementation Plan with respect to individual Registered Entities, based on a determination concerning the Registered Entity's past and current compliance performance.

Section 4.2 – Regional Entity Implementation Plan – (1) Consistent with the revised schedule in §4.1, revised to provide that the Regional Implementation Plans will be submitted on or about October 1 (rather than November 1) of the previous year. (2) Revised to state that a Regional Entity may update and revise its Implementation Plan during the year as necessary, with NERC approval or as directed by NERC. (3) Revised to state that Regional Entities have discretion to make modifications to their Implementation Plans with respect to individual Registered Entities, based on a determination concerning the Registered Entity's past and current compliance performance.

E. Section 5.0 – Enforcement Actions

In the first paragraph of §5.0, "remedial actions" is replaced with "mitigating activities," to avoid possible confusion with the defined term Remedial Action Directive.

A statement is added that imposition and acceptance of penalties and sanctions shall not be considered an acceptable alternative to a Registered Entity's continuing obligations to comply with Reliability Standards.

Text is added to state that the CEA has authority to collect documents, data and information in the manner it deems most appropriate, including removing copies of documents, data and information from the Registered Entity's location in accordance with appropriate security procedures conforming to ROP Section 1500 and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost if the information were placed into the public domain.

This section is revised to state that a Registered Entity that believes a request for documents, data or information is unreasonable may request a determination from the NERC General Counsel (changed from the NERC "compliance program officer").

A statement is added that under the circumstances presented by some Possible Violations, Alleged Violations or Confirmed Violations, absolute adherence to the enforcement process in §5.0, to the exclusion of other approaches, may not be the most appropriate, efficient or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the CEA and the Registered Entity; in such circumstances, other approaches may be considered and employed. A similar statement is found in current Appendix 4B, but is being deleted there, as it is more appropriately placed in Appendix 4C.

Section 5.1 – Preliminary Screen – This section is deleted and the topic is now covered in Section 3.8 (as discussed above).

Section 5.1 – Notice of Possible Violation – (1) Revised to state that the Notice of Possible Violation will state the dates involved in the Possible Violation "if known." (2) Revised to state that the CEA will report the Possible Violation to NERC (rather than entering it into the compliance reporting and tracking system – it is not necessary to specify the particular reporting mechanism to be used). (3) Revised to state that NERC will report the Possible Violation to other Applicable Governmental Authorities, as applicable (in addition to FERC), in accordance with §8.0, Reporting and Disclosure.

Section 5.3 – Notification to Registered Entity of Alleged Violation – (1) Revised to provide that the CEA will notify the Registered Entity of the determination of an Alleged Violation, even if the CEA and the Registered Entity have entered into settlement negotiations. (2) Revised to state that the CEA will issue a Notice of Alleged Violation and Proposed Penalty or Sanction "or similar notification," to recognize that some Registered Entities' processes may involve providing notification through a different means than a Notice of Alleged Violation and Proposed Penalty or Sanction. Similar revisions are made in other sections. (3) Revised to state that the notification of Alleged Violation will be issued by e-mail and will be effective as of the date of the electronic mail message; this will promote consistency in the methods of delivering notification. Also, the requirements that the notification be signed by an officer or designee of the CEA, and be sent to the CEO of the Registered Entity, are deleted; the notification will be sent to the Registered Entity's compliance contact. (4) Revised to state that the CEA will report the Alleged Violation to NERC (rather than entering it into the compliance reporting and tracking system – it is not necessary to specify the particular reporting mechanism to be used). (5) In item (v) of the list of contents of a notification of Alleged Violation, "or other mitigating activities" is added after "implement a Mitigation Plan," to reflect that some actions taken by Registered Entities to correct and prevent recurrence of a noncompliance, although they are approved by the CEA, are not memorialized in a formal Mitigation Plan. (6) In item (vii) of the list of contents of a notification of alleged violation, "full hearing procedure" is changed to "general hearing procedure" consistent with a revision in the Hearing Procedures. (7) Text concerning the provision of non-public compliance information to FERC or another Applicable Governmental Entity is deleted and replaced with a reference to §8.0, where the full text is provided. (8) The last paragraph of this section is deleted, as completion of the enforcement action and issuance of a Notice of Confirmed Violation is covered in later sections.

Section 5.4 – Registered Entity Response -- (1) Revised to add agreement by the Registered Entity with the notification of Alleged Violation as establishing acceptance of the CEA's determination of violation and penalty or sanction. (2) Revised to provide that the 30 day period runs from the date of notification of Alleged Violation by electronic mail (consistent with a revision to §5.3, above). (3) Revised to state that the CEA will issue a Notice of Confirmed Violation "or similar notification," to recognize that some Registered Entities' processes may involve providing notification through a different means than a Notice of Confirmed Violation. Similar revisions are made in other sections. (4) Revised to state that the CEA will report the Confirmed Violation to NERC (rather than entering it into the compliance reporting and tracking system – it is not necessary to specify the particular reporting mechanism to be used). (5) Revised to state that the Registered Entity will be allowed to provide a written explanatory statement to accompany the filing with FERC and public posting of the Confirmed Violation. (6) Revised to state that if the Registered Entity contests the Alleged Violation or proposed penalty or sanction, it must submit a response within 30 days following the date of notification of the Alleged Violation. (7) Reference to issuing a Notice of Confirmed Violation by the CEA is deleted, as this topic is covered in a subsequent section.

Section 5.6 – Settlement Process -- (1) Revised to provide that the Registered Entity or the CEA may terminate settlement negotiations at any time. Either party should have discretion to terminate settlement negotiations if they are not progressing in a productive manner. (2) Revised to provide that the time for the Registered Entity to respond to the notification of Alleged Violation pursuant to §5.4 is suspended during settlement negotiations. (3) Revised to state that the CEA and the Registered Entity will execute a settlement agreement (rather than that the CEA will issue a letter) setting forth the final settlement terms. (4) Revised to state that within five business days after NERC advises the CEA of NERC's approval, rejection or proposed revisions to a settlement agreement, the CEA will notify the Registered Entity. Notification to the Registered Entity should come from the CEA, not from NERC which has not been in negotiation or other contact with the Registered Entity. (5) Text concerning the provision of non-public compliance information to FERC or another Applicable Governmental Entity is deleted and replaced with a reference to §8.0, where the full text is provided. (6) Text is added to clarify that in the public posting of the settlement agreement or of the terms of the settlement, any Critical Energy Infrastructure Information or Confidential Information will be redacted.

Section 5.7 – NERC Appeal Process – Revised to provide that the CEA, as well as the Regional Entity, may appeal the decision of the Regional Entity hearing body, in accordance with amended Section 409 of the ROP.

Section 5.9 – Notice of Penalty – (1) Revised to provide that the Registered Entity shall be informed that the Notice of Penalty is pending public filing at least five business days prior to the public filing and posting. (2) Text concerning the provision of non-public compliance information to FERC or another Applicable Governmental Entity is deleted and replaced with a reference to §8.0, where the full text is provided.

Section 5.10 – Completion of Enforcement Action – The title of this section is revised from "Closure of Enforcement Action."

Section 5.11 -- Special Procedures for an Enforcement Action Against an ISO/RTO Where the Monetary Penalty May be Allocated by the ISO/RTO to Other Entities – This is a new section to establish procedures pursuant to which (1) an ISO/RTO can request the CEA to make a determination, during the enforcement process for a Notice of Possible Violation issued to the ISO/RTO, that one or more specified other entities were responsible, in whole or on part, for actions or omissions that caused or contributed to the violation (if approved), and (2) the specified other entity(ies) can request and be allowed to participate in the enforcement process.

Section 5.11.1 specifies that NERC will maintain on its website, based on information to be provided by the ISO/RTO, a Public Notification List of Entities that an ISO/RTO contends it has authority to allocate to, pursuant to a proceeding under §205 of the Federal Power Act, some or all of a monetary penalty imposed on the ISO/RTO for a violation of a Reliability Standard. Pursuant to §5.11.3, the ISO/RTO will not be allowed to invoke the procedures of §5.11, and the CEA will not make the requested determination, with respect to another Entity that was not listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation to the ISO/RTO, unless the ISO/RTO demonstrates and the CEA concludes that there are extraordinary circumstances that warrant the CEA making the requested determination with respect to the specified other Entity(ies).

Section 5.11.2 specifies that in order to request the CEA to make a determination in an enforcement action that a specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation (if confirmed) of a Reliability Standard for which the ISO/RTO has received a Notice of Possible Violation, the ISO/RTO shall, no later than five business days after receiving the Notice of Possible Violation (i) submit a written request to the CEA and (ii) issue a notice to the specified other Regional Entity(ies). Section 5.11.2 contains the content and delivery requirements for the ISO/RTO's request and notice. Pursuant to §5.11.3, upon verifying that the specified other entity(ies) were on the Public Notification List as of the date of issuance of the Notice of Possible Violation, that the ISO/RTO has authority to allocate all or a portion of any monetary penalty to the other entity(ies), and that the other entity(ies) received a timely notice from the ISO/RTO in accordance with §5.11.2, the CEA will contact the other entity(ies) to provide further information concerning their right to participate in the enforcement process for the Notice of Possible Violation. In order to participate in the enforcement process, the other entity(ies) will be required to submit a written request to participate and to execute a nondisclosure agreement. The specified other entity(ies) must request to participate in the enforcement process prior to, as applicable (i) the date of execution of a settlement agreement between the CEA and the ISO/RTO, and (ii) the date that the CEA issues a Notice of Confirmed Violation to the ISO/RTO. Pursuant to §5.11.5, upon receiving notice from the CEA that it is allowed to participate in the enforcement action, the specified other entity may

participate in the same manner as the ISO/RTO and shall be subject to all applicable requirements and deadlines specified in the Compliance Program.

Section 5.11.6 provides that, assuming all the precedent conditions described above have been met, and if the enforcement action is not resolved by a settlement agreement stating whether or not the specified other entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, the CEA shall make, and include in its proposed Notice of Penalty, its determination of whether or not the specified other entity(ies) were responsible, in whole or in part, for actions or omissions that caused or contributed to the violation.

Section 5.11.7 provides that if an ISO/RTO's tariffs, agreement or other relevant governance documents establish procedures, that have been approved by FERC, that allow members of the ISO/RTO to directly assign to the ISO/RTO monetary penalties imposed on the ISO/RTO member(s) for violations of Reliability Standards, then the ISO/RTO members may follow the same requirements of §5.11.2, 511.3 and 511.5 as are applicable to an ISO/RTO under those sections, and the ISO/RTO shall be afforded the same rights to participate in the enforcement action as a specified other entity under §5.11.2, 5.11.3, 5.11.5 and 5.11.6, subject to the same requirements and conditions specified in those sections.

Section 5.11.8 specifies that the ISO/RTO shall be obligated and responsible to pay any monetary penalty imposed by the CEA on the ISO/RTO for violation of a Reliability Standard, in accordance with §5.10 of Appendix 4C, (i) regardless of whether the CEA has made a determination that a specified other entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, (ii) without regard to the timing of any separate proceeding(s) in which the ISO/RTO seeks to allocate some or all of the monetary penalty to a specified other entity(ies), and (iii) without regard to whether or when the ISO/RTO receives payment from the specified other entity(ies). This provision obligates the ISO/RTO to pay any penalty imposed on it for violation of a Reliability Standard within the time period specified in §5.10, without regard to whether or when the ISO/RTO has received payment from any other entity to which the ISO/RTO is seeking to allocate all or a portion of the penalty.

F. Section 6.0 – Mitigation of Violations of Reliability Standards

Text is added to state that the CEA has authority to collect documents, data and information in the manner it deems most appropriate, including removing copies of documents, data and information from the Registered Entity's location in accordance with appropriate security procedures conforming to ROP Section 1500 and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost if the

information were placed into the public domain.

This section is revised to state that a Registered Entity that believes a request for documents, data or information is unreasonable may request a determination from the NERC General Counsel (changed from the NERC "compliance program officer").

Section 6.2 – Contents of Mitigation Plans – Revised to eliminate the requirement that the representative of the Registered Entity who signs the Mitigation Plan shall be (if applicable) the person that signed the Self-Certification or Self-Report submittal. The Mitigation Plan must be signed by an officer, employee, attorney or other authorized representative of the Registered Entity.

Section 6.3 – Timetable for Completion of Mitigation Plans – (1) Detailed text concerning the timing by which a Mitigation Plan should be completed is deleted and replaced with "shall be completed in accordance with its terms." (2) Examples of grounds on which the completion deadline may be extended are revised to include specific operational issues such as the ability to schedule an outage to complete mitigating activities and construction requirements that require longer to complete than originally anticipated.

Section 6.4 – Submission of Mitigation Plans – Revised to provide that a Mitigation Plan may be reflected in a settlement agreement or Notice of Penalty (in addition to the option of being submitted as a separate document). This is consistent with longstanding practice, *e.g.*, that the terms of the Mitigation Plan are often included in the settlement agreement rather than in a separate "Mitigation Plan" document.

Section 6.6 – Completion/Confirmation of Implementation of Mitigation Plans – (1) Revised to delete reference to the CEA verifying that the Registered Entity is in compliance with the requirements of the Reliability Standard a noncompliance with which led to the Mitigation Plan. The CEA will only be required to verify that all required actions in the Mitigation Plan have been completed. (2) Revised to state that the Regional Entity will provide to NERC the quarterly status reports from Registered Entities on progress in completing Mitigation Plans, "upon request by NERC" (rather than as a matter of course).

G. Section 7.0 – Remedial Action Directives

Consistent with the revision to the definition of Remedial Action Directive (§1.1.27), this section is revised to state that a Remedial Action Directive is issued when the action is immediately necessary to protect the reliability of the BPS from an imminent or actual threat.

The third paragraph is revised to remove the text that the CEA shall consult the Reliability Coordinator for the Registered Entity "to ensure that the Remedial Action Directive is not in conflict with directives issued by the Reliability Coordinator," *i.e.*, the consultation will not be limited to this topic.

The fourth paragraph is revised to expand the information to be included in a notice of Remedial Action Directive, including the requirement the CEA is imposing to remove the threat to reliability of the BPS; a schedule for specific periodic updates to the CEA on progress to achieving compliance; and a statement that the Registered Entity is in a state of noncompliance with the Reliability Standard until the requirements of the Remedial Action Directive are completed and certified complete by an officer of the Registered Entity.

The fifth paragraph is revised to provide that the notice of the Remedial Action Directive that is delivered by electronic mail shall be sent to both the Registered Entity's CEO and its designated contact person for reliability matters; and that the notice will be deemed received on the earlier of the actual date of receipt of the electronic submission or receipt of the express courier delivery of the notice as specified by the courier service's verification of delivery.

The sixth paragraph is revised to specify that the CEA will copy NERC on all correspondence sent to the Registered Entity.

H. Section 8.0 – Reporting and Disclosure

This section is revised to contain two subsections, as described below.

Section 8.1 – Information to be Reported -- This section lists the information to be provided by Regional Entities to NERC via electronic reports. A sentence is added that NERC will work with Regional Entities to specify form, content, timing and method of submitting reports and notices. The revised list of information to be reported includes the status of the review and assessment of all Possible Violations, Alleged Violations and Confirmed Violation; the potential impact of any Alleged Violation of Confirmed Violation on the reliability of the BPS; and the name of a Regional Entity staff person knowledgeable about the information to serve as a point of contact, as well as other information specific in current §8.0.

Section 8.2 – Reporting to Applicable Governmental Authorities and Public Disclosure -- Text concerning procedures for the disclosure of non-public U.S. compliance information to Applicable Governmental Authorities other than FERC, and disclosure of non-public non-U.S. compliance information to FERC, which is currently found in several sections of Appendix 4C, has been placed into §8.2 and deleted from all other sections. As described above with respect to the revisions to other sections in which this text is being deleted, it is replaced with a reference to §8.0. This section is also revised to state that NERC will publicly post on its web site each Notice of Penalty, with any Critical Energy Infrastructure Information or Confidential Information redacted, when NERC files the Notice of Penalty with FERC pursuant to §5.9.

I. Section 9.0 – Data Retention and Confidentiality

There are no changes to Section 9.0 other than changes in capitalization of terms and changes in certain terms to be consistent with the changes to those terms elsewhere in Appendix 4C.

V. Attachment 1 to Appendix 4C – Process for Non-Submittal of Requested Data

In Attachment 1 to Appendix 4C, the process steps that the CEA will follow for non-submittal of requested or required data have been revised. The revised text more clearly sets forth the three steps that will be followed, including the two additional notifications that will be issued and to whom they will be issued, if the Registered Entity fails to provide data, information or reports requested in a compliance monitoring or enforcement process by the Required Date.

VI. Attachment 2 to Appendix 4C – Hearing Procedures

Throughout Appendix 2, (1) references to "[HEARING BODY]" (which were originally intended to allow each Regional Entity to insert the name of its Hearing Body) have been replaced with "Hearing Body;" and (2) references to provisions within Attachment 2 have been changed from "Paragraph" to "Section." Additionally, in numerous sections, the text has been divided into lettered subsections ((a), (b), (c), etc.).

A. Section 1.1 -- Applicability, Definitions and Interpretation

Section 1.1.1 – Procedure Governed – (1) Subsection (b) is revised to provide that where the Hearing Body is comprised, in whole or in part, of industry stakeholders, the composition of the hearing body shall be such that no two industry segments may control, and no single industry segment may veto, any decision by the Hearing Body; and where the Hearing Body is comprised solely of independent members and an independent Hearing Officer, decisions shall require a majority vote. This revision is intended to accommodate NPCC's new Hearing Body composition which was recently approved by the Commission. (2) A new subsection (d) has been added providing that if a final order has been entered by the Hearing Body, or the Hearing Body has issued a ruling determining that there are no issues to be decided regarding the Alleged Violation, proposed Penalty amount, proposed Mitigation Plan or proposed Remedial Action Directive, or the Registered Entity and the CEA have entered into a settlement agreement resolving the matters that are the subject of the hearing, the hearing shall be terminated by the Hearing Body and no further proceedings shall be conducted.

Section 1.1.2 – Deviation -- A reference to the Hearing Officer "as defined in Paragraph [now Section] 1.1.5 has been deleted as unnecessary.

Section 1.1.4 – Interpretation – A new subsection (b) is added to provide that "Any ruling, order or decision of the Hearing Officer referenced in these Hearing Procedures shall be made by the Hearing Body where the composition of the Hearing Body consists of independent members and an

independent Hearing Officer." This additional text is intended to accommodate NPCC's new Hearing Body composition which the Commission has recently approved; it avoids a situation in which the Hearing Officer, as a member of the Hearing Body, would be required to review his or her own decisions.

Section 1.1.5 – Definitions – (1) The definition of "Clerk" is expanded to identify his/her duties ("perform administrative tasks relating to the conduct of hearings as described in these Hearing Procedures"). (2) The definition of "Director of Compliance" is expanded to include an individual designated by the CEA (regardless of title) who is responsible for management and direction of the Compliance Staff. (3) Two new definitions are added, "Evidentiary Hearing" and "Testimonial Hearing." An Evidentiary Hearing is a hearing at which one or more Participants submit evidence for the record, while a Testimonial Hearing is an Evidentiary Hearing at which one or more witnesses appear in person to present testimony and be subject to cross-examination. (Corresponding revisions are made throughout the Hearing Procedures as necessary to identify references to hearings as "Evidentiary" or "Testimonial".) (4) A definition of "Hearing Body" is added, consistent with the revision of this term from "[HEARING BODY]" as described above. (5) The definition of "Participant" is revised consistent with the revisions to Section 1.2.12 (described below) that provide for the Hearing Body to be able to grant intervention into the hearing in specific, limited circumstances.

B. Section 1.2 – General Provisions including Filing, Service, Transcription and Participation

Section 1.2.1 – Contents of Filing – In subsection (d) a reference to "documents" is changed to the broader term "evidence."

Section 1.2.3 – Submission of Documents – (1) In subsection (a), the placeholder for insertion of the CEA's regular business hour is deleted and replaced with "during the Compliance Enforcement Authority's regular business hours." (2) In subsection (b), the placeholder for insertion of the CEA's time of close of business is deleted and replaced with "5:00 P.M." (3) In subsection (e), the statement "The signature on a filing constitutes a certificate that the signer has read the filing and knows its contents, and that the contents are true to the best of the signer's knowledge and belief" is deleted, since this topic is now covered in new §1.2.15.

Section 1.2.4 – Service – (1) In subsection (a), the statement that the Registered Entity's "designated agent for service" shall automatically be included on the service list is changed to "compliance contact." (2) In subsection (b), a proviso "subject to the provisions of Section 1.5.10" is added. Section 1.5.10 is the section of the Hearing Procedures on Protective Orders. (3) Subsection (c) is revised to state that the Clerk shall transmit a copy of the record to the ERO at the time the CEA transmits (rather than "serves") to the ERO a Notice of Penalty or a Hearing Body final order that includes a Notice of Penalty.

Section 1.2.8 – Transcripts – (1) The text in subsection (a) is amended to provide that the court reporter shall file a copy of each transcript with the Clerk, and that upon receipt of a transcript from the court reporter, the Clerk shall send notice to the Participants stating that a transcript has been filed by the court reporter, the date or dates of the hearing that the transcript records, and the date the transcript was filed with the Clerk. This filing and notice initiate the time period within which the Participants may file transcript corrections. (2) In subsection (b), the time within which a Participant may file suggested transcript corrections is changed to within 14 days from the date of the Clerk's notice that the transcript has been filed with the Clerk. In addition, this subsection is revised to provide that the Hearing Officer shall only allow changes that conform the transcript to "the statements being transcribed" (rather than suggesting that the testimony given could be revisited).

Section 1.2.11 – Participant Participation – the statement that witnesses shall personally appear at the evidentiary hearing if required by Paragraph 1.6.6 is deleted and replaced with "except as required by Section 1.6.6" (§1.6.6 addresses the requirements for witness attendance at Testimonial Hearings).

Section 1.2.12 – Interventions – (1) The title of this section is changed from "Interventions Are Not Permitted," as the revised section will authorize the Hearing Body to allow intervention under limited, specific circumstances. (2) The section is revised as necessary throughout to reflect that the Hearing Body (as well as FERC) will be allowed to permit interventions. (3) New subsection (b) provides that the Hearing Body may allow a Person to intervene only if the Hearing Body determines that the Person seeking intervention has a direct and substantial interest in the outcome of the Alleged Violation, proposed penalty or sanction, Mitigation Plan, or Remedial Action Directive that is the subject of the proceeding. Two examples of a "direct and substantial interest in the outcome" are provided in the text. Two examples of situations that will not constitute "a direct and substantial interest in the outcome" and will not be grounds on which intervention may be allowed, are also provided in the text (including "seek[ing] to intervene to advocate an interpretation of the Reliability Standard requirement(s) or provision(s) of the *Sanction Guidelines* that are at issue"). (3) Subsections (c), (d) and (e) set forth the procedures and timing requirements for submission of a motion to intervene (including the required contents), responses by other Participants, issuance of a recommendation by the Hearing Officer, and the Hearing Body's decision on the motion to intervene. (4) Subsection (f) authorizes the Hearing Officer or the Hearing Body to stay or suspend the proceedings while a request to intervene filed with the Hearing Body or with FERC, or any appeal of the ruling on the request to intervene, is being resolved. (5) Subsection (g) provides that a Person allowed to intervene shall be deemed to be aligned with the Respondent(s), unless the Hearing Body specifies that the Person intervening shall be aligned with another Participant. (6) Subsection (h) provides that a Person allowed to intervene must take the record and procedural status of the proceeding as it stands on the date the motion to intervene is granted by the Hearing Body. (7) Subsection (i) provides that appeals of decisions of the Hearing Body granting or denying requests to intervene may be appealed to NERC in accordance with ROP §414, and that the notice of appeal must be filed with the NERC director of enforcement no later than seven days following the date of the decision of the Hearing Body granting or denying the intervention.

Section 1.2.14 – Docketing System – Revised to state that a docketed proceeding shall be created upon the filing of a request for hearing (rather than upon issuance of a Notice of Alleged Violation). Docketed hearing proceedings need to be created by the Regional Entity Hearing Body only when a request for a hearing on a matter is filed.

Section 1.2.15 – Representation Deemed to be Made in All Pleadings – This is a new section. It provides that a Participant presenting any pleading to the Hearing Officer or Hearing Body shall be deemed to certify to the best of the Participant's knowledge, information and belief, formed after and based on an inquiry that is reasonable under the circumstances, certain specified matters as to the factual allegations in the pleading, the denials in the pleading of factual allegations made by another Participant, the claims, defenses and other contentions set forth in the pleading, and that the pleading is not being presented for any improper purpose such as to harass, cause unnecessary delay, or needlessly increase the cost incurred by any Participant.

C. Section 1.3 – Initiation of the Hearing Process

Section 1.3.1 – Registered Entity's Option to Request a Hearing – (1) This section has been divided into subsections. (2) In subsection (d), concerning notification in a Notice of Alleged Violation of hearing options, a reference to Section 5.3 of the Compliance Monitoring and Enforcement Program is added. (3) Subsection (e) sets forth the required contents of a Registered Entity's request for hearing, and provides that the Registered Entity may state two or more alternative grounds for its position. (4) Subsection (f) contains the provisions for determining if the general hearing procedure (referred to in the current Hearing Procedures as the "full" hearing procedures) or the shortened hearing procedure will be used, based on the Registered Entity's request and the response by the Compliance Staff and any other Participants (there are no substantive changes to this provision).

Section 1.3.2 – Compliance Staff's Response to Request for Hearing – This section specifies that the Compliance Staff must file a response to the request for hearing (i) if the request for hearing requests use of the shortened hearing procedure or (ii) the request for hearing requests that the Registered Entity's proposed revised Mitigation Plan be approved. In all other situations, the Compliance Staff may, but is not required to, file a response to the request for hearing. Any response by the Compliance Staff must be filed within 15 days after the date the request for hearing was filed, unless the Hearing Officer or Hearing Body allows a longer time.

Section 1.3.3 – Notice of Hearing – This new section provides that the Clerk shall issue a notice of hearing not less than 16 days nor more than 21 days after the request for hearing is filed, stating whether the shortened hearing procedure or the general hearing procedure will be used; and identifying the Hearing Officer and the date, time and place for the initial prehearing conference (which shall be set for seven days following the date of the notice if the shortened hearing procedure is to be used, and 14 days following the date of the notice if the general hearing procedure is to be used).

Section 1.3.4 – Shortened Hearing Procedure – There are a number of revisions to this section to conform to terminology changes elsewhere in the revised Hearing Procedures; however, the following two revisions are substantive: (1) Compliance Staff is to make Documents available to the Registered Entity for inspection and copying pursuant to §1.5.7 within ten days (rather than five days) after the issuance of the notice of hearing; and (2) it shall be the objective of the Hearing Body to issue its final order within 120 days (rather than 90 days) after the notice of hearing. Completing the hearing process within 90 days was viewed as unrealistic in light of the various intermediate time periods for activities specified in the Hearing Procedures.

D. General Hearing Procedure

Section 1.4.1 – [Currently] Notice of Hearing – The text of this section, which in the current Hearing Procedures covers issuance of the initial notice of hearing, is deleted (this topic will be covered in new §1.3.3), and the section is intentionally left blank to avoid the need to renumber all the following subsections in §1.4.

Section 1.4.2 – Hearing Officer – (1) In subsection (a), text is revised to provide that the CEA shall (rather than may) utilize a Hearing Officer to preside over the hearing. (2) Correspondingly, subsection (b) is revised to provide that the Hearing Officer is responsible (rather than may be delegated authority) for the conduct of the hearing. (3) In subsection (b), the list of the Hearing Officer's responsibilities is modified to include to "hear argument on all objections, motions and other requests."

Section 1.4.3 – Hearing Body – (1) New subsection (a) provides that the composition of the Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision of the Hearing Body. (2) The text in subsection (b) is revised to specify that upon receiving a filing by a Participant, the Clerk shall promptly send a notice to the members of the Hearing Body identifying the date of the filing and the Participant making the filing and briefly describing the nature of the filing, and that any member of the Hearing Body may request from the Clerk a copy of any filing made by a Participant. (3) Subsection (b) is also revised to specify that the Clerk shall send all issuances of the Hearing Officer to the Hearing Body members. (4) Text is added to subsection (b) to specify that at any prehearing conference or hearing attended by a member of the Hearing Body, the Hearing Body member may ask questions directly of any Participant or witness.

Section 1.4.4 – Interlocutory Review – Revised to provide that a petition for interlocutory review shall be supported by either references to the record or by affidavit if based on facts that do not appear in the record.

Section 1.4.5 – Disqualification – Revised to provide that where a replacement Hearing Officer is appointed after the hearing has commenced, the replacement Hearing Officer may recall any witness or may take other steps necessary to ensure familiarity with the record.

Section 1.4.7 – No Ex Parte Communications – (1) Text is added to specify that the proscription against ex parte communications does not prohibit (i) communications between the Hearing Officer or members of the Hearing Body to the Clerk for the purpose of transmitting documents, giving instructions to the Clerk, or discussing scheduling or other procedural matters, or (ii) communications between or among the Clerk, the Hearing Body and representatives of the CEA for purposes of establishing the hearing forum. (2) In subsection (c), text is revised to require that a report of a prohibited communication be made by any member of the Hearing Body, the Hearing Officer or a Technical Advisor who receives or makes or knowingly allows (currently "knowingly causes to be made") a prohibited communication.

Section 1.4.8 – Appearances – Text is added to specify that all representatives appearing before the Hearing Body or Hearing Officer shall conform to the standards of ethical conduct required of practitioners before the courts of the United States.

Section 1.4.10 – Consolidation of Proceedings – (1) Revised to provide that consolidation may be considered on motion of a Participant (in addition to by the Hearing Body on its own motion). (2) References to "transaction" are changed to "occurrence," as more descriptive of the types of events that might result in an Alleged Violation, proposed penalty or proposed Mitigation Plan and ultimately result in a hearing before a Regional Entity Hearing Body.

E. Section 1.5 – Prehearing Procedure

Section 1.5.2 – Prehearing Conferences – (1) Revised to require the Hearing Officer to hold at least one prehearing conference. (2) Topics are added to the topics to be discussed at the initial prehearing conference. (3) Text is added to specify that the scheduled date for the Evidentiary Hearing shall be within 90 days of the initial prehearing conference, unless a different date is specified by the Hearing Officer or the Hearing Body with the consent of all Participants or for good cause shown. (4) Text is added to require the Hearing Officer to hold a final prehearing conference prior to the Evidentiary Hearing, to discuss specified topics and other topics suggested by the Participants.

Section 1.5.3 – Summary Disposition – (1) The basis for granting summary disposition is revised to state that there are no issues of material fact and a Participant is entitled to issuance of a final order in its favor. (2) More detailed requirements are added for the contents of a motion requesting summary disposition and the responses in opposition.

Section 1.5.4 – Status Hearing – (1) Text is added to expand the reasons for a status hearing to include "other matters relevant to the conduct of the hearing." (2) Text is added to require that a Participant

requesting a status hearing to resolve a dispute shall include in its request a certification that it has made a good faith effort to resolve the dispute with the other Participant(s) before requesting the status hearing.

Section 1.5.7 – Inspection and Copying of Documents in Possession of Staff – (1) Revised to specify that Staff is to make Documents available for inspection and copying by other Participants (rather than by just the Respondent) within 25 days after the request for hearing is filed (rather than within 5 days after the notice of hearing is issued). Corresponding revisions of "Respondent" to "Participants" are made throughout this section. (2) The requirements for production of later-received Documents are tied to the scheduled date of the Evidentiary Hearing (rather than "the hearing"). (3) The provision concerning privileged and work product Documents that may be withheld by Compliance Staff is revised to Documents that are privileged to, or work product of counsel to, the CEA (rather than the Compliance Staff). (4) Text is revised to provide that inspection reports, internal memoranda or other notes or writings prepared by Compliance Staff may be withheld if they will not be offered in evidence "or otherwise relied on by Staff in the hearing." (5) The provision concerning Documents that may be withheld by Compliance Staff because they would disclose an examination, investigatory or enforcement technique or guideline is revised to specify that the protected information must not otherwise be made public. (6) Subsection (c) is revised to require that the Compliance Staff's withheld Documents list must include a statement of the grounds that support withholding the Documents. (7) Subsection (c) is also revised to specify that the Hearing Officer, for good cause shown, may order Compliance Staff to make available any withheld Document other than a Document that is subject to attorney-client privilege. (8) Subsection (e) is revised to make it clear that a Participant may remove from the CEA's offices copies of the Documents made available by the CEA.

Section 1.5.8 – Other Discovery Procedures – (1) Text is revised to provide that the Hearing Officer, for good cause shown, may order a Participant to make a withheld Document available to other Participants, for inspection or copying. (2) The time period during which discovery should be completed is revised to 6 months following the date the request for hearing was filed (changed from 6 months from the date of the initial prehearing conference).

Section 1.5.9 – Pre-Evidentiary Hearing Submission of Testimony and Evidence – Revised to clarify that all Participant witness direct testimony to be submitted in an Evidentiary Hearing must be prepared in written form.

Section 1.5.11 – Pre-Evidentiary Hearing Memorandum – (1) Revised to eliminate the need for the Hearing Officer or Hearing Body to have grounds for requesting submission of pre-Evidentiary Hearing memoranda. (2) Revised to provide that the topics directed to be included in the pre-Evidentiary Hearing Memoranda may include "such other matters as may be directed by the Hearing Officer or the Hearing Body."

Section 1.5.12 – Certification of Questions to the NERC Board of Trustees – This new section provides for certification by the Hearing Body to the NERC Board of Trustees, for decision, a significant question of law, policy or procedure the resolution of which may be determinative of the issues in the proceeding in whole or in part, or as to which there are other extraordinary circumstances that make prompt consideration of the question by the Board of Trustees appropriate, pursuant to ROP §412. The section specifies that questions of fact presented by the particular matter in dispute in a hearing shall not be the subject of a certification. The section provides the procedures for requesting certification of a question or considering whether a question should be certified. The Hearing Body shall determine whether any proposed question shall be certified to the NERC Board for decision. The Hearing Body shall also determine whether or not the hearing should be stayed or suspended while a certified question is pending before the NERC Board.

F. Section 1.6 – Procedure at Evidentiary Hearing

Section 1.6.1 – Purpose of Evidentiary Hearing – Revised to delete the provision that the evidentiary hearing also may be used to address any other issue pending between the Participants.

Section 1.6.6 – Witness Attendance at Testimonial Hearing – A provision is added to specify that a person compelled to appear, voluntarily testifying, or making a statement may be accompanied, represented and advised by an attorney.

Section 1.6.14 – Cross-Examination – (1) Revised to provide that leading questions are permitted on cross-examination. (2) Text is added to state that the credibility of a witness may be attacked by any Participant, including the Participant calling the witness. (3) Revised to delete the requirement that if a member of the Hearing Body seeks to ask a witness questions, the Hearing Body member shall do so by submitting the questions in writing to the Hearing Officer to ask the witness (in other words, Hearing Body members can question witnesses directly).

Section 1.6.15 – Redirect Examination – Revised to delete the requirement that if a member of the Hearing Body seeks to ask a witness questions, the Hearing Body member shall do so by submitting the questions in writing to the Hearing Officer to ask the witness.

Section 1.6.17 – Close of the Evidentiary Record – (1) Revised to state that the Hearing Officer may reopen the evidentiary record for good cause shown prior to issuance of the Hearing Body's final order. (2) A statement is added that for purposes of reopening the evidentiary record, newly discovered evidence that is material to the issues in dispute and could not, by due diligence, have been discovered prior to or during the Evidentiary Hearing, shall constitute good cause.

G. Section 1.7 – Post-Evidentiary Hearing Procedure

Section 1.7.1 – Briefs – (1) Revised to allow the Hearing Officer to allow oral closing statements in addition to (not just in lieu of) briefs, and to delete the requirement that there must be agreement of the Participants in order for the Hearing Officer allow oral closing statements in addition to or in lieu of briefs (thereby leaving it to the Hearing Officer's discretion as to whether or not to allow or request closing statements). (2) Revised to allow the Hearing Officer to impose reasonable word limits (rather than page limits) on briefs. The use of word limits is consistent with current practice in many courts and agencies.

Section 1.7.4 – Hearing Officer's Initial Opinion – Revised to eliminate the provision that if the initial opinion proposes a Penalty, the initial opinion shall include a proposed Notice of Penalty. Notices of Penalty are prepared by NERC. Corresponding revisions are made in other sections of the Hearing Procedures to delete references to Notices of Penalty prepared by the Hearing Officer or the Hearing Body.

Section 1.7.5 – Exceptions – Revised to allow the Hearing Officer to impose reasonable word limits (rather than page limits) on briefs.

Section 1.7.7 – Additional Hearings – Revised to state that the Hearing Officer may reopen the record and hold additional hearings before issuance of the Hearing Body's final order (rather than before issuance of the Hearing Officer's initial decision).

Section 1.7.10 – Appeal – (1) Revised to state that a Participant or a Regional Entity acting as the CEA may appeal a final order of the Hearing Body to NERC in accordance with NERC ROP §409. (2) The statement that the Clerk shall transmit the record to NERC for any proceeding that appealed is deleted, as the procedures governing appeals are set forth in ROP §409.

H. Section 1.8 -- Settlement

Consistent with revisions in Section 5.6 of the Compliance Monitoring and Enforcement Program, this section is revised to provide that the CEA may terminate settlement negotiations at any time.

I. Section 1.9 – Remedial Action Directives

Section 1.9.1 – Initiation of Remedial Action Directive Hearing – Revised to specify that the CEA will notify NERC within two business days after issuance of a Remedial Action Directive.

Section 1.9.2 – Remedial Action Directive Hearing Procedure – (1) Revised to state that the hearing shall (rather than may) be presided over by a Hearing Officer. (2) Revised to state that the Hearing Body shall issue its summary written decision within 10 days following submission of the last brief (rather than within 10 days following the hearing). (3) Text is added to clarify that "upon issuance of the summary written decision, the Registered Entity is required to comply with the Remedial Action

Directive as specified in the summary written decision;" that is, the obligation to comply is not postponed until the Hearing Body issues its full written decision.

VII. Appendix 5A – Organization Registration and Certification Manual

A. Section I – Executive Summary

A number of revisions have been made throughout Appendix 4A for more consistent use of terms and acronyms, such as "BPS," "RC," "TOP" and BA," and "user, owner or operator" (of the BPS).

The section captioned "Where to Access and Submit Form(s)?" is revised to specify that completed registration and certification forms should be sent to the website location and/or individual(s) responsible for registration and/or certification at the Regional Entity.

In the section captioned "Roles and Responsibilities," the descriptions of the roles and responsibilities of NERC and the Regional Entities in the registration and certification processes have been revised in accordance with current practice.

B. Section II – Introduction to Organization Registration and Organization Certification Processes

In the section captioned "Organization Certification," text has been revised to specify that all entities registered in the NERC Compliance Registry for the RC, TOP and BA functions, and entities that perform some or all of the reliability functions for or with the RC, TOP or BA, shall be certified.

C. Section III – Organization Registration Process

The section captioned "Organization Registration Process," including Figure 1, Organization Registration Process Overview, has been revised consistent with current practice as to the respective responsibilities of NERC and the Regional Entities in the organization registration process.

D. Section IV – Organization Certification Process

In the section captioned "Purpose and Scope," the reference to certification of a new entity that will become NERC certified and registered as a BA, TOP or RC has been expanded to include those entities that perform some or all of the reliability functions of an RC, BA or TOP.

In the section captioned "Organization Certification Process," the text describing the Provisional Certification Process has been deleted, since the Provisional Certification Process is no longer needed. In subsection 8c of that section, the reference to the Regional Entity as the entity to which an entity

undergoing certification may express its objections to a member of the Certification Team (CT), has been changed to the Certification Team Lead. A new subsection 8e has been added to describe the composition of the CT where an existing certified entity is seeking to expand its footprint. In subsection 13, an exception has been added to the requirement that the CT shall conduct at least one on-site visit to the entity's facilities, specifically, where only a minor change in the existing footprint of an existing certified entity is under review, in which case the CT may determine that an on-site visit is not necessary. In Section 21, the provision that NERC shall update the Compliance Registry (for a new certification) "prior to the entity going operational" is changed to "in accordance with the registration rules."

E. Section V – NERC Organization Registration Appeals Process

The title and address of the NERC employee with whom registration appeals must be filed is revised. Registration appeals should now be submitted to the NERC Director of Compliance Operations.

F. Section VI – NERC Organization Certification Appeals Process

In the section captioned "Organization Certification Appeals Procedure," the title of the NERC employee with whom registration appeals must be filed is revised. Registration appeals should now be submitted to the NERC Director of Compliance Operations. Subsection 5d has been revised to more clearly describe the actions to be taken by NERC based on the Board of Trustees Compliance Committee's decision on the registration dispute.

VIII. Appendix 6 – System Operator Program Certification Manual

Appendix 6 is being deleted from the ROP, and, as described above in the summary of the revisions to ROP Section 600, the substantive provisions of Appendix 6 are being moved into Section 600. It was determined that Appendix 6 contained a significant amount of administrative detail about the System Operator Certification Program that does not need to be in the ROP.

IX. Appendix 8 – NERC Event Response Procedures

Appendix 8 is being comprehensively revised. The title of this Appendix is changed to "NERC Event Response Procedures." Consistent with the proposed revisions to ROP Sections 807 and 808 (described above), Appendix 8 has been revised to provide for a more consistent use of terms including "major event" and "occurrences."

Some material has been deleted from Appendix 8 because it will be covered in NERC's Event Analysis Process document, or is otherwise administrative detail concerning event analysis that does not need to be included in the ROP. For example, current Attachments A (Typical Team Assignments for Analysis of Blackouts or Disturbances), B (Guidelines for Analysis Team Scopes), C (NERC Confidentiality

Agreement for Analysis of Blackouts and Disturbances), and E (Guidelines for NERC Reports on Blackouts and Disturbances) are deleted. Current Attachment D (retitled "NERC Major Event Analysis Objectives, Analysis Approach, Schedule, and Status") is retained, but with sections added for Personnel, Procedures and Communications; System Restoration; System Planning and Design; and Conclusions and Recommendations.

The "Introduction" section of revised Appendix 8 provides an overview of the event response and analysis procedures, including the critical components of an effective event analysis effort.

The section "Categorization of Events" provides a description of the categorization of events, both as Category 1 (least significant) to Category 5 (most significant) events, and by level of significance: "Significant," "Conditionally Significant," "Consequential and Noteworthy," "Non-Consequential but Noteworthy," and "Not Consequential." Descriptions of the levels of significance are provided. As used in revised Appendix 8, the term "major event" is generally intended to refer to a Category 4 or 5, or a Significant or Conditionally Significant, event; and the term "other event" is generally intended to refer to a Category 1, 2 or 3, or a Consequential and Noteworthy, Non-Consequential but Noteworthy, or Not Consequential, event.

The section "Responsibility for Event Analysis Based on Category or Significance of Event" describes NERC's role in event analysis in the case of a major event and in the case of another event (*i.e.*, an event that is not a major event)..

The section "Response to and Analysis of Major Events" describes the activities that will occur or be performed by the involved participants in the case of a major event. This section describes the four phases of responding to a major event: (1) Situation Assessment and Communications, (2) Situation Tracking and Communications, (3) Data Collection, Investigation, Analysis, and Reporting (which is the event analysis phase), and (4) Publishing of Recommendations (lessons learned, best practices, and alerts, if applicable). In the Data Collection, Investigation, Analysis, and Reporting phase (*i.e.*, event analysis), based on the scope, magnitude and impact of a major event, NERC may (1) perform an overview analysis of BPS and generator response, (2) rely on a Regional Entity to conduct the analysis and monitor the analysis results, (3) work with a Regional Entity in its analysis, or (4) conduct a NERC-level analysis. Appendix 8 describes the following steps for the Data Collection, Investigation, Analysis, and Reporting phase: (a) collecting pertinent data on the major event, (b) detailed sequence of events leading to and triggering the major event, (c) detailed BPS analysis, (d) cause analysis, and (e) findings, conclusions and recommendations.

The section "Event Analysis of Other Events" describes the process steps for an event analysis of another event (*i.e.*, a non-major event).

A table is included in the revised Appendix 8 listing, by Category of event, the reports that Registered Entities involved in the event are expected to prepare and submit and the timing requirements for each report.

The section "Development of Lessons Learned from Events" describes the process for developing lessons learned from an event, to be disseminated to the industry.

The section "Reporting and Analysis Requirements for Registered Entities in Connection with Events" specifies that Registered Entities are required to report the occurrence of defined BPS disturbances and unusual occurrences to the applicable Regional Entity and to NERC in accordance with NERC and Regional Reliability Standards and other requirements.

The section "Event Analysis Interface with Compliance" states that to support a strong culture of compliance, Registered Entities are expected to conduct a rigorous self-analysis of events to determine if there have been Possible Violation(s) of a NERC Reliability Standard(s). Registered Entities are also strongly encouraged to submit a compliance self-assessment report to the applicable Regional Entity compliance liaison. This section states that, as provided in Appendix 4B, *Sanction Guidelines*, if the Registered Entity is fully cooperative in the event analysis process, conducts a self-analysis of the event and submits a timely compliance self-assessment report, and submits Self-Reports of any Possible Violations of Reliability Standards and implements corrective and mitigating actions, then in any subsequent enforcement actions, the Registered Entities' actions will be considered as mitigating factors in the determination of any penalties or sanctions for violations of Reliability Standards in connection with the event.

Subject: NERC: Standards Announcement - Project 2011-INT-01 Interpretation of MOD-028-1 for FPL | Ballot Pool, Initial Ballot and Comment Period Information
Date: Monday, October 03, 2011 2:55:06 PM

Standards Announcement

Project 2011-INT-01 Interpretation of MOD-028-1 for FPL
Ballot Pool Window Open: October 4 – November 2, 2011
Formal Comment Period Open: October 4 – November 16, 2011
Initial Ballot Window: November 7 – November 16, 2011

2011-INT-01 Project Page

In May 2011, Florida Power & Light Company (FPL) requested an interpretation of MOD-028-1 – Area Interchange Methodology, Requirement R3.1. The request asks for clarification of the timing and frequency of Total Transfer Capability (TTC) calculations needed for Available Transfer Capability (ATC) calculations. At its July 2011 meeting the Standards Committee approved (with FPL's approval) addressing FPL's request for interpretation through a rapid revision to the MOD-028-1 standard. As envisioned, making a permanent revision to the standard makes more efficient use of industry resources than providing clarity first through an interpretation and then later through a revision to the standard.

A drafting team appointed by the Standards Committee has posted FPL's request for interpretation, a SAR identifying the revisions necessary to address the requested clarification, a draft MOD-028-2 (clean and redline showing changes to the last approved version of the standard), and an associated implementation plan, for a formal 45-day comment period through 8 p.m. Eastern on Wednesday, November 16, 2011. Because the revisions are narrowly focused on addressing the clarification requested by FPL, the Standards Committee approved waiving the initial 30-day formal comment period. A ballot pool is open through **8 a.m. Eastern on Wednesday, November 2**.

Ballot Pool Open through 8 a.m. Eastern on Wednesday, November 2

A ballot pool is being formed for balloting the revisions to MOD-028-2. The Standards Committee has authorized posting the standard and implementation plan for a 45-day formal comment period with an initial ballot conducted during the last 10 days of that comment period. (The Standards Committee authorized waiving the initial 30-day formal comment period because the revisions to MOD-028 are narrowly focused on addressing the clarification requested in FPL's request for interpretation.)

The ballot pool is open through 8 a.m. Eastern on November 2, 2011, and the ballot window will be open from 8 a.m. Eastern on Monday, November 7 through 8 p.m. Eastern on Wednesday, November 16, 2011.

Instructions for Joining the Ballot Pool for Project 2011-INT-01

Registered Ballot Body members may join the ballot pool to be eligible to vote in the upcoming ballot at the following page: Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list server for this ballot pool is: bp-2011-INT-01_in@nerc.com

Instructions for Commenting

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An initial ballot of MOD-028-2 and its associated implementation plan will begin on Monday, November 7, 2011 and end at 8 p.m. Eastern on Wednesday, November 16, 2011.

For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Subject: NERC: Standards Announcement - Project 2009-22 COM-002-2 Interpretation for IRC | Ballot Window Now Open Through 8 p.m. Eastern on Friday, November 18, 2011
Date: Tuesday, November 08, 2011 11:23:09 AM

Standards Announcement

Project 2009-22 COM-002-2 Interpretation for IRC

Ballot Window Now Open Through 8 p.m. Eastern on Friday, November 18, 2011

Now Available

An initial ballot of an interpretation of COM-002-2 – Communications and Coordination, Requirement R2 is open through 8 p.m. Eastern on Friday, November 18, 2011.

Instructions for Balloting the Interpretation of COM-002-2 for IRC
Members of the ballot pool associated with this project may log in and submit their vote for the interpretation from the following page: https://standards.nerc.net/CurrentBallots.aspx

Instructions for Commenting
A formal comment period is open through **8 p.m. Eastern on Friday, November 18, 2011**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Special Instructions for Submitting Comments with a Ballot
Please note that comments submitted during the formal comment period and the ballot for the interpretation both use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Next Steps
The drafting team will consider all comments submitted to determine whether to make additional revisions to the interpretation.

Background
On October 1, 2009, clarification was requested by ISO-RTO Council on Requirement R2, specifically on whether “directives” are limited to actual and anticipated emergency operating conditions, or whether routine operating instructions are also considered “directives.” The effort was delayed following discussion with the requester based on the anticipation that more clarity regarding the term, “directives” would be identified through standard development work in Project 2007-02.

When it became clear that the work in Project 2007-02 would require considerable industry debate, a drafting team was formed and prepared a draft interpretation, which was posted for a 30-day formal comment period that ended December 18, 2010. Reprioritization of the total

standards workload in accordance with guidance from the NERC Board of Trustees issued in November 2009 and a delay as the Standards Committee developed more formal processes for addressing interpretations resulted in a delay in further processing; the Standards Committee directed that work resume on the Interpretation in April 2011.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development and interpretation processes. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Subject: NERC: Standards Announcement - Project 2010-07 Generator Requirements at the Transmission Interface
Date: Wednesday, November 09, 2011 11:33:00 AM

Standards Announcement

Project 2010-07 Generator Requirements at the Transmission Interface

Four Ballot Windows Now Open Through 8 p.m. Eastern on Friday, November 18, 2011

Now Available

An initial ballot of each of the following standards is open through 8 p.m. Eastern on Friday, November 18, 2011. Note that the ballots are limited to the few modifications made to these standards to ensure that there is a functional entity responsible for requirements associated with the transmission line connecting the generator step up transformer to the transmission system (generator interconnection Facility).

- FAC-001-1 – Facility Connection Requirements
- Two versions of FAC-003 – Transmission Vegetation Management (FAC-003-3 and FAC-003-X). Note that FAC-003-X shows changes to FAC-003-1, while FAC-003-3 shows changes to FAC-003-2 developed by the Project 2007-07 drafting team. FAC-003-2 was adopted by the NERC Board on November 3, and a revised version of FAC-003-3 showing the Project 2010-07 drafting team's changes against the Board's version has now been posted.
- PRC-004-2.1 – Analysis and Mitigation of Transmission and Generation Protection System Misoperations

IMPORTANT: Updates on Posted Standards
Last week, while the Project 2010-07 standards were posted for comment, NERC's Board of Trustees adopted FAC-003-2 – Transmission Vegetation Management (developed under Project 2007-07 Vegetation Management). Based on this approval, NERC staff will file FAC-003-2 with the applicable regulatory authorities. The Project 2010-07 SDT will move forward with ballots for both FAC-003-3 (proposed changes to the BOT-adopted FAC-003-2) and FAC-003-X (proposed changes to the FERC-approved FAC-003-1) with the intention of eventually only filing FAC-003-3. The SDT has elected to carry FAC-003-X through to ballot because if FAC-003-2 and FAC-003-3 are not approved by FERC, the SDT wants to be ready to file FAC-003-X to ensure that there is a functional entity responsible for managing vegetation on the piece of line commonly known as the generator interconnection Facility.

Additionally, when the NERC Board of Trustees adopted FAC-003-2 –Transmission Vegetation Management last week, it approved the standard with NERC staff-proposed VSLs rather than the Project 2007-07 SDT-developed VSLs that were originally posted with both FAC-003-2 and

FAC-003-3. The posted versions of Project 2010-07's FAC-003-3 now include the FAC-003-2 VSLs proposed by NERC staff, since they are the set that was approved by the NERC Board of Trustees. Note that the Project 2010-07 SDT made no substantive changes to any version of the FAC-003-2 VSLs; the SDT simply changed "Transmission Owner" to "responsible entity." A text box has also been added to the VSL section of FAC-003-3 for further clarity.

Instructions for Balloting
Members of the ballot pools associated with this project may log in and submit their votes for the standards from the following page: https://standards.nerc.net/CurrentBallots.aspx

Instructions for Commenting
A formal comment period is open through **8 p.m. Eastern on Friday, November 18, 2011**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Special Instructions for Submitting Comments with a Ballot
Please note that comments submitted during the formal comment period and the ballots for the standards all use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Next Steps
The drafting team will consider all comments submitted during the formal comment period and ballots to determine whether to make additional revisions to the standards.

Background
The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Facilities, commonly known as generator interconnection Facilities, that are considered by some entities to be transmission, these are most often radial Facilities that are not part of the integrated grid. As such, they should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.
As part of the BES, generators do affect the overall reliability of the BES. But registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. This can be accomplished by properly applying FAC-001, FAC-003, and PRC-004 to Generator Owners as proposed in the redline standards posted for comment.

Before reviewing the standards, the drafting team encourages all stakeholders to read the technical justification resource document it has provided to describe its rationale and its work thus far.

Additional information is available on the project page.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Congratulations to all and thanks for your hard work in getting this phase to a successful completion. I know it wasn't easy and I pushed you at times but we did it! Now comes the fun part – phase 2! I'll be talking to Pete & Barry next week (they are on vacation this week) as to how they want to proceed and we will need to coordinate the posting of the SAR with NERC staff but we should be on our way shortly.

Happy Thanksgiving and thanks again,

Edd

Standards Announcement

Project 2010-17 Definition of Bulk Electric System

Recirculation Ballot Results

Now Available

Two recirculation ballots, for the definition of Bulk Electric System (BES) and for the application form titled 'Detailed Information to Support a Request for a BES Exception,' closed on November 21, 2011. Both recirculation ballots achieved stakeholder approval.

Voting statistics for each ballot are listed below, and the Ballot Results Web page provides a link to the detailed results.

BES Definition	Detailed Information to Support a Request for BES Exception
Quorum: 95.92%	Quorum: 93.02%
Approval: 81.32%	Approval: 81.48%

Next Steps

The definition of Bulk Electric System, its associated implementation plan and the supporting application form titled 'Detailed Information to Support a BES Exception Request' will be presented to the NERC Board of Trustees for adoption and subsequently filed with regulatory authorities. A set of proposed changes to the Rules of Procedure to provide a process for determining exceptions to the definition of BES is near completion and will be presented to the NERC Board of trustees for approval at the same time as the BES definition. The regulatory deadline in FERC Orders 743 and 743A requires that the revised definition of BES and process for handling exceptions be filed by January 25, 2012.

Additional information about the project, including a Fact Sheet and additional informational documents, has been posted on the project page.

Background

On November 18, 2010 FERC issued Order 743 (amended by Order 743A) and directed NERC to revise the definition of Bulk Electric System so that the definition encompasses all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. Additional specificity will reduce ambiguity and establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

In addition, NERC was directed to develop a process for identifying any Elements or Facilities that should be excluded from the BES. NERC addressed these directives with two activities – the definition of Bulk Electric System was revised through the standard development process and a BES Definition Exception Process has been developed as proposed modifications to the Rules of Procedure. The work of the BES Definition Exception Process has been publicly

posted at: http://www.nerc.com/filez/standards/Rules_of_Procedure-RF.html.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Subject:	NERC Ballot, Project 2008-10 — Interpretation of CIP-006-1 R1.1 for Progress Energy
Date:	Monday, November 14, 2011 11:30:48 AM

NPCC Members of the NERC Registered Ballot Body,

The Regional Standards Committee, receiving input from the Task Force on Infrastructure Security and Technology, "TFIST" has reviewed the subject interpretation currently posted for ballot on the NERC website through 8 pm, November 21, 2011. The interpretation was not viewed as expanding the standard's requirement and the RSC recommends an "Affirmative" vote to accept the interpretation.

If you have any questions please contact me.

From Bullet 2 on page 3 of 5:

2. During the time a NERC Software Tool is not available and a NERC Reliability Standard:
   a. does not require the use of a NERC Software Tool, but
   b. a NERC Software Tool is the only way to accomplish the requirement

In this situation, a CEA is not to verify whether a registered entity has an alternate method or back-up tool. However, a CEA is to verify evidence that the registered entity took necessary actions to act in the best interest of the interconnection at all times and accomplished the requirements of the standard at issue.

This Bullet suggests that the availability objective of the standard, but not the requirement.

Draft Directive #2011 CAG-001 Regarding Generator Transmission Leads

Comments

The industry would be better served by allocating resources to the Project 2010-07 Standard Drafting Team for Generator Requirements at the Transmission Interface as opposed to implementing the draft Compliance Directive.

The SDT's proposal of altering the appropriate TO/TOP standards to address any identified reliability gaps and to increase their applicability to Generator Owners and/or Generator Operators is preferable to the Directive's approach of registering most Generator Owners and/or Generator Operators as Transmission Owners/Transmission Operators whose compliance obligations will vary based on Regional discretion. This unnecessary interim step will carry high administrative costs, circumvent the NERC Standards Development Process, and divert resources from NERC's own Standard Drafting Team that has been charged with solving this issue.

Specific Issues

- The Directive has the potential to circumvent FERC's authority since it seeks to modify approved NERC Reliability Standards by increasing their applicability without prior Commission approval.
- While the Directive appears to limit its applicability to Generator Owners/Operators with certain characteristics, those characteristics appear to encompass a large number of generators. Furthermore, it is evident that any perceived increase in reliability is purely subjective given that the Standards Process has not been followed – the Standards Process allows companies to assess the benefits and burdens associated with applying new or modified Standard requirements.
- Providing Regional Entities with the discretion to negotiate with Registered Entities in determining which standards will apply will create an uneven application both within a given Region and across Regional boundaries and thereby undermine the Directive's stated goal of achieving consistency.
- The suggested applicable TO/TOP requirements are broader than the proposals of the SDT and the GO/TO team before it. Since those teams have involved broad industry representation and have been considering this issue for years, their proposals should be reflected (and not expanded) in any interim Directive.
- The assumption is being made that a Generator Owner/Operator with a generator lead meets the Registry Criteria for registering as a TO/TOP in that the entity is presumed to own and/or operate an integrated transmission facility. This assumption has not been resolved by the Commission. (*See* FERC's Cedar Point Wind, LLC Order, Oct. 11, 2011, at P 15).

November 15, 2011

NPCC Comments to Draft NERC Compliance Process Directive #2011-CAG-001

Directive Regarding Generator Transmission Leads

- Before the interim bulletin or interim directive is implemented the Region should identify the transmission assets of each of the registered GO/GOP in its Region, to assess if there exists reliability gaps that would necessitate the registration of a GO/GOP as a TO/TOP. This assessment would identify any applicable facilities that are not currently "covered" by NERC Reliability Standards.
- If ultimately issued, the document should be classified as a "Bulletin" rather than as a "Directive" as the need to register a GO/GOP as TO/TOP should be evaluated on a case by case basis by the applicable Regional Entity. A directive seems to indicate that the GO/GOP should be registered as a TO/ TOP. The use of the word bulletin would provide guidance and alert the Regional Entities and registered entities as to the issue and make it clear that an assessment has to be done by the Regional Entity first before any registration activities take place.
- If implemented, the document needs to emphasize, in its title and throughout, that this is an interim document to be considered during the time that the appropriate existing NERC Reliability Standards are being reviewed and revised to incorporate, among other things, the identification of all applicable registered entities (including existing GO/GOP) for the appropriate Reliability Standards. The revision of the standards is a recommendation from the *Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface* completed November 16, 2009.
- Once there have been any gaps identified then the appropriate registration could take place as needed.
- The need to register a GO/GOP as a TOP is not warranted.

- As the registration of GO/GOP could be impacted by a new BES definition, this initiative should not implemented until after the FERC has issued its final rule related to the definition of the BES.
- The Termination provision in the MOU needs to be addressed. The Termination provision allows either party, on notice to the other, to unilaterally terminate the MOU. From the Region's perspective, the right to terminate should not be a unilateral option of the Entity. And from the Entity's perspective, there is probably concern that the Region having that ability could potentially expose the Entity to having to comply with the full set of TO/TOP Reliability Standards if the MOU, with its select list of TO/TOP requirements, is terminated by the Region. As NERC's proposal is an interim measure that will apply until there are changes to GO/GOP Reliability Standards to incorporate protections for generator leads. Perhaps a more appropriate Termination clause would include a trigger whereby the MOU terminates upon FERC approval of those new GO/GOP standards.
- An MOU that would be proposed, between a Regional Entity and a GO/GOP, to describe and identify the specific requirements that the GO/GOP may need to meet as a TO or TOP should not include a requirement for an annual review of registration status for the GO/GOP. This would create a burden on both the Regional Entity and the GO/GOP and would not yield significant changes on an annual basis. Reviews should occur periodically, over a longer time frame (e.g. five years) or after new facilities have been introduced.

If yes, explain what change and why:

Compliance Application

Are you suggesting a change to the compliance application section of the CAN? Yes / No

If yes, explain what change and why: The ACE equation used in the CAN is not correct. Bias Setting is actually B and not beta.

In the examples of how the Bias Setting accommodates the provision of frequency response, the contingent BA also provides some frequency response. If it provided response exactly equal to bias, its change in ACE would reflect the size of the contingency.

In the example:

> *When determining a fixed Frequency Bias Setting as described in R2.1, the first step for a BA is to analyze its Frequency Response to a number of disturbances. A list of on-peak events that can be analyzed for the determination of a fixed-bias setting is provided annually by the NERC Resources Subcommittee at the end of each year. Other tools that sample frequency change and analyze the change in Tie Line deviation throughout the year during on-peak periods may also be used in this analysis.*

The CAN is correct that other sets of events can be used. Also, the number of annual samples could be relatively small once a BA is aware that their frequency response is well below 1% of peak. Only a few samples would be needed to confirm response is still below 1%.

Bias setting is an obligation of a Balancing Authority. Frequency Response is provided by generators and frequency responsive load (such as motors).

Based on a response to the March 18, 2010 FERC Order on this standard, NERC is obliged to file a new BAL-003 by May of 2012. It's not clear why the CAN is needed as the standard may take a different approach.

Comment Period Opens
Proposed Amendments to NERC Rules of Procedure Section 509, Section 1703 and Appendix 5C

Comment Period Ends October 27, 2011

The North American Electric Reliability Corporation (NERC) is proposing changes to its Rules of Procedure (ROP) and associated Appendices.

NERC is requesting comments on a proposed revision to the NERC Rules of Procedure to add new sections 509 and 1703, as well as, Appendix 5C: *Procedure For Requesting and Receiving An Exception From The Application Of The NERC Definition of Bulk Electric System.* The comment period begins September 13, 2011 and ends October 27, 2011.

The proposed revisions are in response to FERC Orders 743 and 743A where NERC was directed to revise the definition of the Bulk Electric System (BES) and to develop a proposed exemption process. The proposed amendments would effectuate the exemption process directive by creating a new ERO rule implementing an exceptions process.

Under this process entities would be allowed to pursue either including within the BES an Element or Elements that would otherwise be excluded by application of the BES Definition or excluding from the BES an Element or Elements that would otherwise be included by application of the BES Definition. This exception process was developed with the participation of interested stakeholders who believe it to be practical in application and less burdensome than the NOPR proposal where a Regional Entity would have sought ERO and Commission approval before exempting each facility rated at 100kV or above from compliance with the Reliability Standards.

Materials Included in this Request for Comments

- Proposed new Section 509: Exceptions to the Definition of the Bulk Electric System
- Proposed new Section 1703: Challenges to NERC Determinations of BES Exception Requests under ROP Section 509
- Proposed new Appendix 5C: *Procedure for Requesting and Receiving An Exception From the Application of The NERC Definition of Bulk Electric System* (clean and redline showing changes from the May 2011 posting)

Additional Materials Included for information

- Consideration of comments from May 2011 posting
- BES Exception Request flowchart and timelines
- Exception Request Form template

Submission of Comments
Comments are due **October 27, 2011,** and must be submitted electronically using the form provided.

1. The ROP team believes the proposed amendments represent a process that balances the need for effective and efficient reliability administration with due process and clarity of expectations. Do you agree? **Please comment why or why not…If not please offer your proposed revision.**

   ☐ ***Yes***

   ☒ **No**

   ☒ **Comments:** The process needs simplification in order to be efficient. The whole process may take over 22 months to be completed as shown in the flowcharts.

   NERC has failed to address the specific requirements of a key FERC directive contained in Orders No. 743 and 743-A. These Rules of Procedure amendments potentially violate the jurisdictional boundary set between Transmission and local distribution in Federal Power Act (FPA), Section 215, 824(o) and in those Orders.

   The Regions and NERC must first screen all Elements and facilities presented for exception for the presence of "facilities used in the distribution of electric energy." In our view, and that of FERC, these local distribution facilities must be excluded from the Bulk Electric System (BES) as is specifically required in FPA, Section 215, 824(o), and through reference to the FPA by FERC in Order Nos. 743 and 743-A. This local distribution exclusion from the BES should be automatic upon presentation of appropriate proofs. Only then may NERC apply its various administrative procedures and technical criteria for exempting jurisdictional Transmission Elements and Facilities from the BES, where they may be found ***not*** "necessary for operating an interconnected electric energy transmission network."

   NERC should adopt, in the proposed amendments to the RoP as a potential "first screen", the FERC Seven Factor test, and use it for identifying and excluding any and all "facilities used in the distribution of electric energy." Filing Entities presenting such appropriate proofs should not need to present further evidence to demonstrate that such Elements and facilities are eligible for exclusion from the BES.

   The presentation of a local distribution determination by a jurisdictional Federal, State or Provincial body, that such Elements or facilities are "facilities used in the distribution of electric energy," represents appropriate proof and is sufficient for said Elements and facilities to be excluded from the BES.

   Supporting Discussion:

   Federal Power Act (FPA), Section 215, 824(o), Definitions differentiates between jurisdictional Transmission and non-jurisdictional local distribution as follows:

   (a) Definitions- For purposes of this section:
   (1) The term `bulk-power system' means--
   (A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and
   (B) electric energy from generation facilities needed to maintain transmission system reliability.
   The term does not include facilities used in the local distribution of electric energy.

In FERC Order 743-A the Commission stated

> 69. We agree … that the Seven Factor Test could be relevant and possibly is a logical starting point for determining which facilities are local distribution for reliability purposes"

By adopting this FERC Seven Factor test, the BES SDT will have fulfilled its obligation to respond to these FERC mandates relating to "local distribution" as stated in FERC Order 743:

> "Determining where the line between 'transmission' and 'local distribution' lies," (¶37),
>
> "To the extent that any individual line would be considered to be local distribution, that line would not be considered part of the bulk electric system" (¶39), to establish
>
> "[A] means to track and review facilities that are classified as local distribution to ensure accuracy and consistent application of the definition" (¶119).

Supporting References:

FERC Order 743 observed some believe that "the Commission's [and by extension NERC's] proposal exceeds its jurisdiction by encompassing local distribution facilities that are not necessary for operating the interconnected transmission network." [FERC Order 743, ¶27.]

In this regard FERC Order 743 states:

> At ¶37, Congress specifically exempted "facilities used in the local distribution of electric energy" from the definition. … Determining where the line between "transmission" and "local distribution" lies, which includes an inquiry into which lower voltage "transmission" facilities are necessary to operate the interconnected transmission system, should be part of the exemption process the ERO develops.
>
> And at ¶39, To the extent that any individual line would be considered to be local distribution, that line would not be considered part of the bulk electric system.
>
> And at ¶119, … [W]e believe that it would be beneficial for the ERO in maintaining a list of exempted facilities, to consider including a means to track and review facilities that are classified as local distribution to ensure accuracy and consistent application of the definition. Similarly, the ERO could track exemptions for radial facilities. [Emphasis added]

Note that in ¶119 the Commission clearly distinguishes between "radial facilities" and "local distribution" just as it differentiates between jurisdictional radials and non-jurisdictional local distribution facilities in footnote 82:

> [82] As discussed further below, the Commission uses the term "exclusion" herein when discussing facilities expressly excluded by the statute (*i.e.*, local distribution) and the term "exemption" when referring to the exemption process NERC will develop for use with facilities other than local distribution that may be exempted from compliance with the mandatory Reliability Standards for other reasons.

2. The ROP team believes the proposed amendments represent a process that is consistent, repeatable, and verifiable. Do you agree? **Please comment why or why not…If not, please offer your proposed revision.**

☐ ***Yes***

☒ **No**

☒ **Comments: Refer to the response to Question #1.**

There is a very noticeable gap and lack of transparency on how the exception application will be evaluated and processed. Suggest the ROP team develop a reference/guidance document in order to assist Registered Entities, Regional Entities, and the ERO on how and on what basis an exception application would or should be processed.

While the proposed process is repeatable, it is difficult to evaluate if the process will be verifiable because it will depend, for example, how the RE conducts its review of an Exception request.

In addition, there is a significant need to provide Applicants greater clarity and improved transparency with regard to how their exception applications will be evaluated by Regional Entities and NERC. Absent some guidance we are concerned that Regional variances will arise during application of the Exception Process within the eight NERC regions.

The RoP Drafting Team and/or the BES Standard Drafting Team develop an Applicant's and Evaluator's Guidance document to assist Applicants, Regional Entities, and NERC in preparing and evaluating exception applications. For example, the Federal Power Act provides Congress' vision for a reliable transmission system. Federal Power Act (FPA), Section 215, 824(o), Definitions states,

> (4) The term **`reliable operation**' means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.

NERC and the Regions should specifically adopt this Congressional guidance, defining 'reliable operation,' as their overriding Technical Principle when evaluating Exception Process applications concerning jurisdictional Transmission Elements and facilities.

3. The ROP team believes the proposed amendments represent a process that supports consistent treatment of transmission lines that cross international borders. Do you agree? **Please comment Please comment why or why not…If not, please offer your proposed revision.**

☒ ***Yes***

☐ **No**

☒ **Comments:** The Procedure for requesting and receiving an exception from the application of the NERC definition of BES may not be applicable because of the obligation to make submissions to the applicable Governmental Authorities in Canada. NERC will have to take into consideration that procedures exist under Canadian jurisdictions which may be quite different from the one proposed.

Also, footnote 2 in section 1.2 presumes automatic adherence of Canadian Authorities or the need for its procedure to be submitted to NERC. Instead, it will be necessary that NERC and Canadian Authorities, with the Canadian Entities involved, to come to a common understanding of differences to arrive at an agreement. Those exchanges should aim to ensure reliability across the border while respecting proper jurisdictions. It could be done by

addressing reliability in bulk power transfer within (intra) or between (inter) two Balancing Authority Areas, and monitored facilities included in an Interconnection Reliability Operating Limit (IROL). Other criteria must be left to the discretion of the applicable jurisdiction.

4. The ROP team believes the proposed amendments represent a process that helps alleviate concerns about a "one-size fits all" approach. Do you agree? **Please comment why or why not…If not, please offer your proposed revision.**

   ☐ ***Yes***

   ☒ **No**

   ☒ **Comments:** As stated previously, the Procedure needs to be made more efficient, recognize that applicable Governmental Authorities in Canada may adopt different approaches or methodologies for addressing exceptions to the NERC BES definition.

   Also refer to the response to Question #1.

5. The ROP team believes the proposed amendments represent a process that allowed commenters to raise and address a number of their substantive concerns. Do you agree? **Please comment Please comment why or why not…If not, please offer your proposed revision.**

   ☐ ***Yes***

   ☒ **No**

   ☒ **Comments:** Refer to the response to Question #2.

6. Do you have any other comments not covered above?

   ☐ **Comments:** Sections 4.5.3 and 4.6 discuss the disclosure of confidential information mandated by or under the rules, laws, or acts within the United States. Suggest that alternate language be used for clarity, or adequate provisions be provided to include other jurisdictions, such as Canada.

   As stated in previous responses, the Procedure in the document in general, and specifically in the document's Section 1.3 footnote needs to be made more efficient, and that it needs to be recognized that applicable Governmental Authorities in Canada may adopt different approaches or methodologies for addressing exceptions to the NERC BES definition. In addition, before implementing this process, NERC will have to ensure that they fit all applicable Governmental Authorities frameworks as addressed in the proposed Section 1703 - Challenges to NERC Determinations of BES Exception Requests under ROP Section 509.

   Section 5.3 should be made to read:

"Each Regional Entity shall establish provisions for a Technical Review Panel consisting of not less than five (5), three (3) individuals as appointed by the Board of the Regional Entity. Panel members shall comply with Subsection 7 of Section 403 of the NERC Rules of Procedure, shall not have participated in the review of the Exception Request, and shall have the required technical background to evaluate Exception Requests."

Unofficial Comment Form (Standard)

Project 2011-INT-01 – Interpretation of MOD-028 R3.1 for FPL

Instructions

Please **DO NOT** use this form for official commenting. Please use the electronic form to submit comments on the SAR and draft MOD-028-2 standard (Area Interchange Methodology). The electronic comment form must be completed **November 16, 2011.**

If you have questions please contact Monica Benson at monica.benson@nerc.net or by telephone at 404-446-2573.

http://www.nerc.com/filez/standards/2011-INT-01_Interpretation_MOD-028-1_FPL.html

Background Information

MOD-028-1 Area Interchange Methodology is one of the three methodologies included in the ATC-Related MOD standards. Sub-requirement R3.1 of MOD-028-1 states the following:

R3.1 For on-peak and off-peak intra-day and next-day TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

NERC received a request to interpret this sub-requirement. The requester stated:

> *By using the words "on-peak", "off-peak", and "intra-day" this requirement implies there would have to be separate TTC numbers for different portions of the current day. However, R5 of MOD-28 establishes the calculation frequencies and only requires an update to TTC once within the 7 days prior to the specified period where they are used in an ATC calculation. The clarification needed is on the ATC Drafting Team's intent with respect to the quantity and timing of individual TTC calculations needed for use in the ATC calculations. Adherence to the implied intra day calculation requirement of R3.1 is resulting in additional work and creating coordination issues with other parties which are not calculating intra day TTC values.*

NERC assembled an Interpretation team made up of some of the members of the original ATC-TTC-CBM-TRM Drafting Team. While that Interpretation team was preparing its Interpretation, the Standards Committee requested the Interpretation Team use a "rapid revision" approach to clarify the requirement in question directly. (The Standards Committee confirmed that revising the standard rather than developing an interpretation was acceptable to the requester.) The Interpretation team discussed this approach, and developed a revision to the standard that is intended to eliminate the ambiguity present in the current version of the standard. Other minor corrections and errata were addressed as well.

Questions

1. Do you agree with the use of this "Rapid" approach to clarify the standard, rather than clarifying the standard through an Interpretation? If No, please explain your concerns.

☒ Yes

☐ No

Comments:

2. Does the language in the SAR adequately represent the issue raised in the interpretation request? If No, please provide your suggestions to modify the SAR.

☒ Yes

☐ No

Comments:

3. Does the proposed revision resolve the issue raised in the interpretation request? If No, please provide your suggestions to modify the standard.

☒ Yes

☐ No

Comments:

4. If you have any other comments on the SAR or on the proposed Standard that you have not provided above, please provide them here.

Comments:

Unofficial Comment Form

Interpretation of COM-002-2 – Communications and Coordination R2 for the ISO/RTO Council (Project 2009-22)

Please **DO NOT** use this form to submit comments. Please use the electronic comment form to submit comments on the Interpretation of COM-002-2 — Communications and Coordination R2 for the ISO/RTO Council (Project 2009-22). Comments must be completed by **November 17, 2011.**

2009-22 Project Page

If you have questions please contact Joseph Krisiak by email at Joseph.Krisiak@nerc.net or by telephone at 609-651-0903.

Background Information

On October 1, 2009, clarification was requested by ISO-RTO Council on requirement R2, specifically on whether "directives" are limited to actual and anticipated emergency operating conditions, or whether routine operating instructions are also considered "directives."

A drafting team was formed and prepared a draft interpretation, which was posted for a 30-day informal comment period that ended December 18, 2010. However, the effort was delayed following discussion with the requester based on the anticipation that more clarity regarding the term, "directives" would be identified through standard development work in Project 2007-02. Reprioritization of the total standards workload (with interpretations given a lower priority than standards development in accordance with guidance from the NERC Board of Trustees issued November 2009) resulted in further delay. Additional delay was created as Standards Committee developed more formal processes for addressing interpretations were developed. The Standards Committee directed that work resume on the Interpretation in April 2011. The OPCPSDT, which was previously working on this Interpretation, re-commenced work in June 2011 and reached consensus in September 2011.

The drafting team primarily based its interpretation on the purpose statement of the standard, which reads:

> To ensure Balancing Authorities, Transmission Operators, and Generator Operators have adequate communications and that these communications capabilities are staffed and available for addressing a real-time emergency condition. To ensure communications by operating personnel are effective.

The drafting team has interpreted this to mean that the standard should only apply during emergencies, and that routine operating instructions during normal operations would not require the communications protocols for repeat backs as specified in R2.

To the extent entities are seeking to modify the definition of the word "directive," such changes cannot be made though the interpretation process. However, that definition is within the scope of other drafting teams that are currently working on revisions to this and related standards, and comments should be provided to those teams directly.

Regarding modifications made to the interpretation since its last posting, the SDT eliminated the statement "routine operating instructions can be directives," as commenters felt it added

confusion. Additionally, some commenters suggested a sentence regarding electronic communications should be removed. The SDT agreed that the sentence went beyond the question asked, and removed the sentence. With these changes, the SDT believe it has addressed the majority of the concerns raised with the original interpretation.

Please use this form to record comments for the drafting team.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

Please review the request for an interpretation, the associated standard, and the draft interpretation and then answer the following questions.

1. The NERC Board of Trustees indicated that the interpretation process **should not** be used to address requests for a decision on **"how"** a reliability standard applies to a registered entity's particular facts and circumstances. Do you believe this request for an interpretation is asking for clarity on the meaning of a requirement or clarity on the application of a requirement?

   ☒ The request is asking for clarity on the **meaning** of a requirement.

   ☐ The request is asking for clarity on the **application** of a requirement.

   Comments:

2. The NERC Board of Trustees indicated that in deciding whether or not to approve a proposed interpretation, it will use a standard of strict construction and not seek to expand the reach of the standard to correct a perceived gap or deficiency in the standard. Do you believe this interpretation expands the reach of the standard?

   ☐ The interpretation expands the reach of the standard.

   ☒ The interpretation does not expand the reach of the standard.

   Comments:

3. Do you agree with this interpretation? If not, why not.

   ☒ Yes

   ☐ No

   Comments:

4. If you have any other comments that you have not already provided in response to the prior questions, please provide them here.

   Comments:

Unofficial Comment Form

Generator Requirements at the Transmission Interface (Project 2010-07)

Please **DO NOT** use this form to submit comments. Please use the electronic comment form to submit comments on the first formal posting for Project 2010-07—Generator Requirements at the Transmission Interface. The electronic comment form must be completed by **November 18, 2011.**

2010-07 Project Page

If you have questions please contact Mallory Huggins at mallory.huggins@nerc.net or 202-383-2629.

Background

With the exception of the errata change to PRC-004-2.1, which is being posted for the first time, this is the second formal comment period and first ballot period for the standards included in Project 2010-07. The standards will be posted for formal comment for 45-days, with a ballot during the final 10 days of the comment period. Ballot pool formation will take place during the first 30 days of the comment period, and the SDT is hosting an interactive webinar on October 6.

A 30-day formal comment period took place earlier this year, from June 17-July 17, 2011. The SDT thanks all those who provided feedback during that comment period. The SDT has reviewed and considered all comments submitted, and has incorporated many of them into its latest proposed standards, as explained in the Consideration of Comments form posted at the Project 2010-07 project page.

The purpose of Project 2010-07 is to ensure that all generator-owned Facilities are appropriately covered under NERC's Reliability Standards. While many Generator Owners and Generator Operators operate Elements and Facilities that are considered by some entities to be Transmission, these are most often radial Facilities that are not part of the integrated grid, and as such should not be subject to the same standards applicable to Transmission Owners and Transmission Operators who own and operate Transmission Elements and Facilities that are part of the integrated grid.

As part of the BES, generators affect the overall reliability of the BES. However, registering a Generator Owner or Generator Operator as a Transmission Owner or Transmission Operator, as has been the solution in some cases in the past, may decrease reliability by diverting the Generator Owner's or Generator Operator's resources from the operation of the equipment that actually produces electricity – the generation equipment itself.

The drafting team's goal is to ensure that an adequate level of reliability is maintained in the BES by clearly describing which standards need to be applied to generator interconnection Facilities that are not already applicable to Generator Owners or Generator Operators. The SDT believes this can be accomplished by properly applying FAC-001, FAC-003, and PRC-004-2.1 to Generator Owners as proposed in the redline standards posted for comment.

NOTE: The Project 2007-07 Vegetation Management team will likely be posting a sixth draft of FAC-003-2 for recirculation ballot during the Project 2010-07's comment period. Both teams acknowledge this overlap, and have been in contact to discuss best strategies moving forward. The

changes proposed by the Project 2010-07 SDT in FAC-003-3 are minimal, and serve only to apply the standard and its requirements to qualifying Generator Owners. The SDT recognizes that a number of scenarios may occur with respect to the filing and approval of Versions 2 and 3 of FAC-003 and has attempted to account for those in the FAC-003-3 implementation plan.

You do not have to answer all questions. Enter all comments in Simple Text Format.

1. Based on stakeholder comment, the SDT clarified the applicability language of FAC-001-1 and removed the Generator Owner from R4. Do you support the proposed redline changes to FAC-001-1? (Please refer to the posted FAC-001-1 technical justification document for more information about the SDT's rationale for its changes.)

   ☐ Yes

   ☒ No

Comments: The intent of the draft language in FAC-001-1 is to provide guidance for addressing the alleged reliability gap that exists between GO/GOPs that own/ operate transmission facilities but are not registered as TO/TOPs.

The impact of the revised language will depend on the characterization of the generator lead after the "third party " connects to the existing generator lead.

IF the generator lead is owned by the TO utility after the third party connection :

The proposed DRAFT FAC-001 language suggests that within 45 days of a 3rd party having an executed Agreement to evaluate the reliability impact of interconnecting, the existing generator needs to document and publish facility connection requirements. The proposed language suggests that a third party can commandeer existing generators leads and interconnect. A reclassification would be required because "third party" power would flow through the downstream portions of the existing leads. This introduces **significant challenges** for defining ownership / transfer of installed assets as well as real property, easements, operational jurisdiction, O&M cost responsibility, etc.

The FERC approved pro-forma Attachment X Interconnection Agreement clearly states that the project Developer must meet all **Applicable Reliability Standards** which means that all requirements and guidelines of the Applicable Reliability Councils, and the Transmission District to which the Developer's Large Generating Facility is directly interconnected. As an example, to accommodate this NERC proposal, the FERC approved NYISO pro-forma tariff would need to be revised to allow this "third party" use. The pro-forma interconnection tariff also states that the Developer must provide updated project information prior to the Facilities Study. The Facilities Study might not be made until several years after the Interconnection Request /Feasibility Study is made ("executed Agreement to evaluate the reliability impact of interconnecting" in this proposed draft is akin to the Interconnection Request/Feasibility Study).

Placing the requirement to have the existing Generator Owner publish reliability requirements for a potential "third party user", without the generator having any knowledge of the potential reliability outcomes or asset transfer / ownership issues is not a reasonable expectation.

The interconnection of a third party to an existing generator lead would force existing generators to revise their Interconnection Agreements with FERC.

The "third party", would at a minimum, need to comply with the existing Generators reliability obligations as specified in the Interconnection Agreement.

IF the third party connects to the GO owned generator lead, the GO will be considered a TO:
A TO would not be involved, other than review of the SRIS and Facilities reports.
The difficult thing for an existing GO would be to prepare, within 45 days of having an executed Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility, a document listing the requirements.

To allow for the above possibilities, the language for applicability of FAC-001 to GO's or GOP's, should be :

> "Each applicable Generator Owner shall, at least 60 days prior to execution of a Facilities / Class Year Study Agreement to evaluate the reliability impact of interconnecting a third party Facility to the Generator Owner's existing Facility that is used to interconnect to the Transmission System, document and publish its Facility connection requirements to ensure compliance with NERC Reliability Standards and applicable Regional Entity, sub regional, Power Pool, and individual Transmission Owner planning criteria and Facility connection requirements."

2. Do you support the one year compliance timeframe for Generator Owners as proposed in the Implementation Plan for FAC-001-1?

   ☒ Yes

   ☐ No

   Comments:

3. With respect to FAC-003, many commenters focused on the half-mile qualifier in FAC-003. Some commenters found the half-mile length too short, others found it too long, and still others found the choice among the starting points of the switchyard, generating station, or generating substation to be confusing. The drafting team attempted to address all of these concerns with its latest proposed standard changes. The qualifier now reads: "…that extends greater than one mile beyond the fenced area of the generating station switchyard…" We believe that the one mile length is a reasonable approximation of line of sight, and that using a fixed starting point (at the fenced area of the generation station switchyard) eliminates confusion and any discretion on the part of a Generator Owner or an auditor. Finally, we maintain that it is appropriate to include this qualifier for Generator Owners because there is a very low risk from vegetation within the line of sight, and thus the formal steps in this standard are not necessary to ensure reliability of these lines.

   Taking into consideration that only one of the versions of FAC-003 will actually be implemented, a decision that will be made as Project 2007-07—Vegetation Management moves forward, do you support the proposed redline changes to FAC-003-X and FAC-003-3?

☐ Yes

☒ No

Comments: Suggest in FAC-003-X; 4.3.1. that Regional Entity be changed to RE as listed in 4.2.1 for consistency. Also Regional Entity is used throughout the rest of the document, suggest using RE for consistency.

In FAC-003-3; 4.3.1. add station to the following: " Overhead transmission lines that extend greater than one mile or 1.609 kilometers beyond the fenced area of the generation station switchyard and are" to show consistency as it is written in FAC-003-X 4.3.1.

The technical justification characterized the exclusion (i.e., one mile or 1.609 kilometers beyond the fenced area of the generating station switchyard) as "approximate line of sight [sic] from a fixed point" and noted that this line of sight may be limited by local terrain. Where line of sight of the radial corridor is limited on a clear day due to terrain, the one mile exemption must be limited in distance to no more than the line of sight on a clear day beyond the fenced area.

4. Do you support compliance timeframe for Generator Owners as included and explained in the Implementation Plans for FAC-003-X?

   ☒ Yes

   ☐ No

   Comments:

5. In the FAC-003-3 implementation plan, the SDT has attempted to account for a number of different scenarios that could play out with respect to the filing and approvals of FAC-003-2 and FAC-003-3. Do you support this approach? If there are other scenarios that the SDT needs to account for, please suggest them here.

   ☒ Yes

   ☐ No

   Comments:

6. In its technical justification document, the SDT reviews all standards that had been proposed for substantive modification in the Ad Hoc Group's original support and explains why, with the exception of FAC-003, modifying them would not provide any reliability benefit. Do you support these justifications? If you believe the SDT needs to add more information to its rationale for any of these decisions, please include suggested language here.

   ☒ Yes

   ☐ No

   Comments:

7. The SDT is attempting to modify a set of standards so that radial generator interconnection Facilities are appropriately accounted for in NERC's Reliability Standards, both to close reliability

gaps and to prevent the unnecessary registration of GOs and GOPs at TOs and TOPs. Does the set of standards currently posted achieve this goal?

☒ Yes

☐ No

Comments:

8. If you answered “yes” to Question 7, are the modifications the SDT has made in this posting the appropriate ones?

☒ Yes

☐ No

Comments:

9. If you answered “no” to Question 7, what standards need to be added or removed to achieve the SDT’s goal? Please provide technical justification for your answer.

☐ Yes

☐ No

Comments:

10. Do you have any other comments that you have not yet addressed? If yes, please explain.

☐ Yes

☒ No

Issue

Are you suggesting a change to the issue statement of the CAN? Yes
If yes, explain what change and why: By attempting to clarify the requirement around maintenance outages in the planning horizon, the CAN is adding to the requirement as well as introducing new concepts that will require further clarification. It would be more effective to address this issue through the standard interpretation process. Referring to Requirement R1.3.12 from TPL-002:

"R1.3.12. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed."

Because of the timeframe in which planning studies are conducted, it is at the discretion of the party doing the studies what maintenance outages should be included in the studies.

From the CAN, a CEA is to use the following to determine whether the outage is "planned" in the TPL planning horizon as required by the standard:

1. if it is included on an approved, applicable TOP or BA outage schedule; and
2. if the outage was included on the approved, applicable TOP or BA outage schedule more than 12 months out from the time the TPL assessment was conducted.

A transmission planner may not have the above processes (which in fact may need further clarification), nor is it reasonable to expect that finally approved is in the same timeframe as originally scheduled, thus making those planning studies obsolete. It is more reasonable if there is a planned outage that extends for a significant duration of the planning horizon which is being studied. It may be more appropriate to include those maintenance outages for which the duration spans several seasonal study conditions.

There is frequent mention of Protection System outages. It should be made clear that a Protection System, or one of the elements that comprises a Protection System may be taken out of service for maintenance without the need for studies or assessments as long as the primary protection on the facility is not compromised. The facility must have adequate protection in service while the element or elements are out of service.

Unofficial Comment Form for Interpretation of CIP-006-x for Progress Energy (Project 2008-10)

Please **DO NOT** use this form to submit comments. Please use the electronic comment form to submit comments on the interpretation of CIP-006-x for Progress Energy (Project 2008-10). The electronic comment form must be completed by **November 21, 2011.**

Project Page

If you have questions please contact Steven Noess at steven.noess@nerc.net or by telephone at 404-446-9691.

Background Information

The last successive ballot to this interpretation closed on October 12, 2009. Since that date, a project team from the CIP Interpretation Drafting Team reviewed and responded to the comments received from the last successive ballot and made revisions to the interpretation. The project team revised the interpretation pursuant to NERC Guidelines for Interpretation Drafting Teams (available here).

The interpretation drafting team determined that the interpretation must limit itself to the question asked: whether CIP-006-1, Requirement R1.1, applies to the aspects of wiring that comprises the ESP. The interpretation drafting team revised the interpretation from the last successive ballot accordingly.

The definition of "Cyber Asset" in the *NERC Glossary of Terms Used in Reliability Standards* includes "communication networks," but the interpretation drafting team determined that it does not explicitly include wiring or communication mediums in general. Since wiring is not included in the definition of "Cyber Asset," the interpretation drafting team interpreted that Requirement R1.1 of CIP-006-1 does not apply to wiring.

The team furthermore acknowledges and notes in its revised interpretation that a different interpretation, appended to CIP-006-3c as appendix 3, applies to the "alternative measures" question "where a completely enclosed ('six-wall') border cannot be established" for "Cyber Assets within an Electronic Security Perimeter." The interpretation drafting team has determined that such analysis is beyond the scope of this interpretation. CIP-006-1 R1.1 applies to "Cyber Assets" and this interpretation is limited to whether wiring is a "Cyber Asset." A secondary analysis of "acceptable alternative measures where a completely enclosed ('six-wall') border cannot be established" does not apply.

You do not have to answer all questions. Enter All Comments in Simple Text Format.

Insert a "check" mark in the appropriate boxes by double-clicking the gray areas.

Please review the request for an interpretation, the associated standard, and the draft interpretation and then answer the following questions.

1. The NERC Board of Trustees indicated that the interpretation process **should not** be used to address requests for a decision on **"how"** a reliability standard applies to a registered entity's particular facts and circumstances. Do you believe this request for an interpretation is asking for clarity on the meaning of a requirement or clarity on the application of a requirement?

   ☒ The request is asking for clarity on the **meaning** of a requirement.

☐ The request is asking for clarity on the **application** of a requirement.

Comments:

2. The NERC Board of Trustees indicated that in deciding whether or not to approve a proposed interpretation, it will use a standard of strict construction and not seek to expand the reach of the standard to correct a perceived gap or deficiency in the standard. Do you believe this interpretation expands the reach of the standard?

   ☐ The interpretation **expands** the reach of the standard.

   ☒ The interpretation **does not expand** the reach of the standard.

   Comments:

3. Do you agree with this interpretation? If not, why not.

   ☒ Yes

   ☐ No

   Comments:

4. Are there any other comments you would like to add that haven't been covered in the previous questions, please add them here.

   Comments: No comments.

Re: Policy Input to NERC Board of Trustees

Dear Bill:

The agenda for the November 2, 2011 Member Representatives Committee (MRC) meeting is chock full of substantive items, several of which will warrant high interest by members of the Board of Trustees (board). The board always is interested in policy input from the committee members on any issue, but would especially like to hear members' views on the following:

Compliance Enforcement Initiative (BOTCC-2 and MRC-9) — NERC filed late last week with FERC its decision to shift how it deals with Possible Violations that pose lesser risks to the bulk power system (BPS). As the filing explains, NERC and the Regional Entities are employing a more comprehensive and integrated risk control strategy that differentiates and addresses compliance issues according to their significance to the reliability of the BPS. In addition, NERC and the Regional Entities are increasing the utilization of their inherent enforcement discretion in the implementation of compliance and enforcement activities. The board will be very interested in the reaction of committee members to this filing and NERC's continuing efforts to improve the efficiency and effectiveness of its compliance enforcement process.

Compliance Application Notices – Status (MRC 10) — NERC continues to work to improve both the process and content of Compliance Application Notices. The board welcomes comments on whether the changes to date are addressing effectively the issues raised at the August meeting.

Status of CIP Standards Version 4 and 5 Implementation Plans (MRC-11) — I understand that a number of concerns have been voiced by the industry regarding the draft implementation plans for Versions 4 and 5 of the CIP Standards regarding duplication of effort and backwards looking compliance requirements. While we do not have formal input from stakeholders until the posting of draft proposals, the board would still like to hear discussion by the MRC on the concerns they have with the staging of these proposed implementation plans. I understand that this discussion will begin in the Standards Oversight and Technology meeting and continue during the MRC meeting.

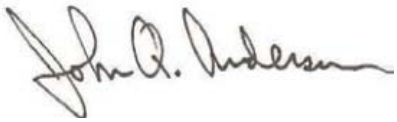
3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404-446-2560 | www.nerc.com

Bulk Electric System (BES) Definition and Rules of Procedure – Status (MRC-12) — The board is very interested in how the BES Definition project is progressing since the August meeting. I understand that the drafting team took very seriously the board's views and is proposing to address the FERC directive in one phase and the remaining industry issues in a subsequent phase. The board wants to stay actively involved as this effort progresses, and to that end asks the MRC to continue its review and discussion at the November meeting.

Rules of Procedure Changes (MRC-15) — At the August MRC meeting some issues were raised regarding some of the Rules of Procedure changes that were being proposed, namely the provision to impose penalties in the event registered entities failed to respond to NERC data requests. While the proposed changes are still being discussed by NERC and the Regional Entities, and will not be posted for industry comment until after the November meetings, the board would like to hear of any concerns the committee has with the general direction of the proposed changes.

Thank you in advance for providing written comments to Dave Nevius, MRC secretary (dave.nevius@nerc.net) **by October 24, 2011** so they can be packaged and sent to the board members in advance of the meeting.

Thank you,



John Q. Anderson
NERC Board of Trustees Chair

cc: NERC Board of Trustees
Member Representatives Committee

EDISON ELECTRIC INSTITUTE

Policy Input to the NERC Board of Trustees

Atlanta

Provided by the Edison Electric Institute

November 3, 2011

On behalf of our member companies, the Edison Electric Institute (EEI) appreciates the opportunity to provide the following policy input to the NERC Board of Trustees. EEI is the trade association representing the investor-owned segment of the electric industry in this country. Our views on NERC-related matters are informed by the CEO Task Force on Reliability, CEO Task Force on Business Continuity, and the Reliability Executive Advisory Committee.

In addition to responding to the request for policy input dated October 6, our comments reflect other current strategic issues that may be discussed at the upcoming meetings in Atlanta.

NERC As A Learning Organization

We are strongly convinced that the most important form of learning can be derived from:

- Understanding those events on the system involving various configurations of equipment and network conditions that unexpectedly cause special problems or challenges
- how personnel make decisions and perform under a broad range of conditions, and
- integration of newer technologies on the system, where there may be very little experience available to reasonably judge potential reliability issues.

In addition to its requirements under Section 215 to develop mandatory reliability standards, conduct the enforcement of those standards, and perform reliability assessments, EEI appreciates that NERC aspires to organize itself to support the electric industry's performance in providing bulk power system reliability. NERC in the past year has begun to deliver "lessons learned" on various issues, and conduct various webinars and technical workshops on a broad range of issues.

EEI understands that these activities may have some modest value for "learning." This value could be increased at least in part by providing the "lessons learned" in context by NERC making public the event analysis reports that lead to the "lessons learned."

For almost two years, EEI has focused the Board of Trustees on the Events Analysis program and the need for reform. We understand that changes to the Rules of Procedure regarding Events Analysis are likely to be previewed at the upcoming meetings and look forward to engaging the discussion. Reviewing previous EEI comments, it is imperative that the program a) find a constructive way forward that allows for timely reporting and disclosure of important findings, b) defines a relationship with enforcement that requires transparency and due process, and c) restricts enforcement activities from becoming endless time-consuming 'fishing expeditions' for violations. On this last point, EEI understands that some analyses of minor events can extend for years, and while there may be "learning" to be extracted from such endeavors, at some point a reasoned decision needs to be made to either "fish or cut bait," to either declare a violation or close the case and move on.

NERC is arriving at a critical threshold challenge in its pursuit of the goal of becoming a learning organization. Reconciling the inherent tensions of the competing goals, prudent compliance risk management and the open discussion of company experiences, needs to be plainly addressed, and soon. EEI believes that now is the time for NERC to begin consideration for various alternatives that could relieve some of these tensions. The North American Transmission Forum (NATF) continues to expand its scope of activities and plans a significant expansion in the next three years. Similarly, the North American Generator Forum (NAGF) has begun to develop its structure and processes. Information sharing, learning from system events, discussing new technologies and system configurations and their potential reliability impacts, and developing best practices, all of these can and should be considered as capable of being handled by NAGF and NATF.

Allowing NAGF and NATF to cover these issues could help NERC to sharpen its focus on its core program requirements, managing the development of mandatory standards, and compliance and enforcement. As described in the following comments, there are many matters in NERC's core program areas that offer opportunities for continuous improvement.

Lessons Learned From The Facilities Ratings Alert

One year ago, NERC issued an Alert on facilities ratings, saying that a vegetation contact by a Transmission Owner suggested that widespread actual field conditions varied significantly from design assumptions – to the point where some facility ratings were considered inaccurate. The Alert recommended that companies carefully examine and reconcile their facilities ratings to actual field conditions.

Companies have broadly supported this initiative and with the benefit of experiences gathered in the year, EEI believes that transparent communications and corrective actions are underway. Summary statistics distributed by NERC show that companies are mitigating discrepancies by physically adjusting structures, revising ratings, or removing clearance or other "underbuild" issues. EEI believes that none of the discrepancies discovered to date in any way suggest a reduction or imminent systemic threat to reliability. Experience further suggests that the existing FERC-approved standards continue to suitably address facilities ratings issues. In addition, EEI encourages NERC in the future to more explicitly consider potential costs and benefits when considering whether or how to communicate these technical issues, and to more carefully consider the appropriate use of Alerts to help ensure that Alerts do not inadvertently impose *de facto* requirements.

Standards Development

Recent changes to the standards development process manual have provided some marginal improvements in the process. EEI supported these changes. Further work is needed, more improvements should be made.

There are many potentially legitimate drivers to explain the length of time needed to achieve consensus in standards development. The issues may be technically difficult to understand and analyze, and there may be multiple issues being addressed that require the coordination with other standards. There may be strong divergent viewpoints within a ballot body on proposals being made. The matter may be defined as a lower priority issue. In addition, drafting teams may have engaged issues with no explicit deadlines. With enforceable standards, drafting teams must now go beyond the technical aspects of a standard and must now consider potential compliance issues that may result from the use of certain

wording or phrases, or the lack of specificity or ambiguity in requirements or measures.

For whatever combinations of explanations, EEI continues to emphasize that the NERC processes need to focus much more aggressively on resource efficiency in management and execution. Companies' subject matter experts own the majority portion of the responsibility with regard to standards development and need to square up to the challenge. However, companies' resources are severely resource constrained, and much stronger process management disciplines are badly needed. The promulgation of regional standards also has become a resource issue. NERC, as the ERO, should ensure that there is an enterprise-wide priority evaluation as many of the same resources are needed to develop regional standards.

Root cause analyses for standards development may provide some benefit here, but such analyses should not be required as a condition for developing a strategic action plan to identify changes that will improve the efficiency of standards development. EEI supports an approach, where stakeholders and NERC management assemble a small team of officer-level personnel to discuss options and deliver to NERC management and the Board of Trustees an action plan early next year. To the extent possible, the team could explore short-term process changes that would not require FERC approval, and those that would require such approval, and that the implementation of such recommendations could be reflected in proposed NERC 2013 budget development.

FAC-003

EEI strongly supports FAC-003 and recommends that the Board of Trustees approve the standard, which will apply to several hundred thousand miles of transmission lines in this country. We believe that the changes offer a substantial improvement over the current version for several reasons. Proposed FAC-003 responds to the directives in Order No. 693 issued in March 2007. It is an initial example of a results-based design that aims first at identifying the reliability objective and then allows companies to establish programs to accomplish that objective in a manner that adapts to localized conditions, topographies, and climates, thus avoiding a micro-managed assembly of one-size-fits-all 'how to' requirements to manage vegetation. It also attempts to differentiate through the proposed VRFs and VSLs those violations that likely would pose greater risks of cascading outages. We believe that the revised proposed standard will improve

companies' abilities to allow for coordinated right of way and line inspections, and adapt their vegetation management plans to cover widely varying conditions, thus improving resource management efficiency while maintaining bulk power system reliability.

Compliance and Enforcement

EEI supports NERC moving ahead with the "find fix track report" (FFTR) enforcement discretion tool with its recent proposal filed at FERC. Joint trade association comments filed on October 21 offered a strong endorsement, which is attached to this policy input document. Properly implemented and carefully monitored for actual results, we believe that FFTR will help companies, NERC, and the regional entities, to improve resource allocation in alignment with reliability priorities. This is a good start and yet we also believe that much more needs to be done. We encourage NERC not only to resist any efforts to add more process to FFTR, but to also strive to reduce process over time. Further, EEI looks forward to reviewing program results with the Board in six months to ensure benefits are realized and that resources are able to devote more time to reliability operations rather than to administrative compliance activities.

Compliance Operations

EEI appreciates the broad range of initiatives that have been undertaken on the goal of delivering compliance guidance to companies. EEI counts approximately five different kinds of compliance guidance that have been developed recently, including RSAWs, CANs, CARS, lessons learned, and case notes. While in general we continue to strongly support such tools and practices on a conceptual level, we comment on some challenges and report to the Board of Trustees some likely next steps that stakeholders will take.

First, we have several times commented on Compliance Application Notices (CANs), engaged NERC staff in various meetings, commented on proposed CANs, and most recently commented on proposed revised CANs and a process document. We were encouraged by NERC's announcement at the Board of Trustees meeting in Vancouver that NERC would restate the guidelines for CANs and would review those CANs already in place. While we have seen some improvements, there are still concerns that remain. For example, NERC has just released a final revised CAN-0016 (Sabotage Reporting procedures under CIP-001) and a final revised process document. EEI with other trade associations are likely

to use the new appeal process to address CAN-0016 and three or four other CANs, where we expect unsatisfactory outcomes. In the final CAN-0016, we continue to strongly believe that NERC has altered the boundaries of the standard.

Regarding the CANs process document, we are deeply troubled by a process where NERC solicits comments on a proposed CAN and completely discards those comments. In the case of CAN-0016, we understand over 70 parties commented that NERC reached beyond the scope of the standard. Yet, NERC rejected those comments without explanation. CAN development must adhere to reasonable due process and CAN-0016 clearly raises basic concerns about the viability of the current CAN implementation process.

Second, a recently proposed Compliance Process Directive (CPD) seeks to address a perceived reliability gap pertaining to transmission facilities that connect generation plants to the larger network. These issues were addressed in a series of recent FERC orders that covered registration appeals, and are reflected by a high-priority standard under development. The proposed CPD lists criteria that would govern decisions for registering entities for the TO/TOP function.

EEI will provide comments timely on the CPD by November 15, however, our first impression is that the document ignores current FERC-approved entity registration criteria and provides no other analysis of the declared "reliability gap" that the CPD would address other than to suggest that all of these generator connection facilities must be covered. Instead, we see a one-size-fits-all mandate.

EEI asks that the Board of Trustees Compliance Committee seek a more detailed understanding of the reliability gap that would be covered by the proposed CPD and determine to its own satisfaction whether such a gap actually exists. If the need for the CPD is more clearly established, we also ask that any final CPD avoid violating or materially changing the FERC-approved NERC registration criteria.

Entity Risk Assessments

Last year at the Board of Trustees meeting in Phoenix, stakeholders uniformly embraced a broad recognition that NERC should move toward more risk-based approaches to executing its core program missions for standards development,

and compliance and enforcement. This reflected the dual themes of "everything cannot be priority" and "everything does not share the same reliability risks."

We appreciate that translating these broad goals into actionable decisions is another matter. We applaud compliance operations in seeking to explore various tools and practices to apply to this policy target.

However, we need to raise a growing concern with NERC's plans to develop "entity risk assessments". Exactly how these assessments will be conducted, the kinds of materials that will be gathered, the criteria for making or changing determinations, the application of these criteria, and the need for making these assessments in light of the existing audit and spot check tools, all are unknown. EEI asks that the Board of Trustees Compliance Committee engage a more detailed discussion on the need for this particular activity, how it will be managed and practiced, due process issues, the extent of oversight by the Board of Trustees, the resources needed to conduct this work, and its ultimate strategic value in compliance operations.

EEI believes that this proposal needs much more careful consideration. In the nuclear generation industry, for example, we understand that there are five clearly defined risk categories, and companies understand the criteria and actions needed to move up or down. We ask that consideration of such risk assessments developed by NERC to include the costs and benefits for the activity, its importance for the overall missions of compliance and enforcement, process clarity and transparency, and stakeholder involvement. The activity in the nuclear industry involved owners and operators. Similarly, stakeholders should be allowed to participate in the development of the NERC process.

CIP Standards / Version 4 / Version 5

EEI generally supports the proposal by FERC in Docket No. RM11-11 to approve "version 4" of the CIP standards and for FERC to adopt the CIP drafting team work plan by setting a reasonable deadline for filing "version 5" of the standards. We believe that NERC needs to move forward proactively to respond to the full range of directives in Order No. 706. Comments in the docket are due at FERC on November 21, and we expect that the issues could also arise at the November 29-30 FERC technical conference addressing the status of various NERC priorities.

We also recognize that "version 5" is an enormous and complex undertaking. Order No. 706 contains over one hundred directives addressing a broad range of

issues. Many directives are subject to widely varying understandings by technical experts. There could be significant implementation costs, timing concerns, and compliance complexities if there were close proximity of version 4 and version 5 effective dates, which must be carefully considered. The current drafting team plan offers no specific "plan B" for bifurcating divisive issues, thus creating a type of "all or nothing" approach to "version 5."

For these reasons, EEI believes that it would be extremely useful for stakeholders to work with NERC management and the drafting team to develop a strategic plan and to map a workable pathway to finishing the current project, including consideration of potential alternatives to the current work plan. To this end, we strongly urge NERC to convene an industry group to focus on this issue in advance of November 21.

Bulk Electric System Project

EEI understands the BES project to be on schedule for a timely compliance filing at FERC in early 2012. The initial ballots are concluding and while both the BES definition and related exceptions process did not receive the needed levels of support, EEI expects that both recirculation ballots will succeed. We also understand that various issues raised over the past several months in the project may be combined into a second phase.

Rules of Procedure Changes

The proposed changes to the Rules of Procedure included in the meeting package raise two areas of concern. First, it is difficult to determine exactly what the changes are that are being proposed. While the summary information leads one to believe the proposed changes are minor in nature, a closer inspection indicates the changes are more extensive. EEI requests that NERC provide a clearer red-line version of the proposed changes.

Second, it appears one of the proposed changes involves a proposal to impose monetary penalties for failures to comply with the Rules of Procedure. Stakeholders offered comments two months ago on a first batch of proposed changes to the Rules of Procedure, including this issue. Since Section 215 provides that the Electric Reliability Organization may impose monetary sanctions only for violations of FERC-approved reliability standards, numerous comments raised questions on the legality of such action and also asked for clearer explanations of the drivers for these changes. Based on the MRC agenda item, it

appears that the proposal to impose penalties is still in proposed Rules of Procedure and that the Board of Trustee will be asked to approve them at their February 2012 meeting. Should the Board of Trustees ultimately approve the changes, we expect to challenge their legality in comments in any FERC proceeding where decisions on them are made. We also urge NERC to have greater transparency in making clear the reasons for proposed changes, how stakeholder comments are addressed, and the proposed changes.

EEI asks that NERC provide a practical explanation for its proposal. Then, EEI can offer alternative constructive solutions and avoid challenging NERC at FERC on the law.

Spare Equipment Database

EEI supports the work of the NERC Spare Equipment Database Task Force (SEDTF) and the recommendations made in the Task Force Report regarding implementation and voluntary participation in a database for the purposes of facilitating communication and potential exchange of spare equipment between Transmission and Generation Owners in the case of a High Impact Low Frequency event. As currently proposed, the NERC SEDTF will provide value without being overly burdensome on participants and will adequately protect sensitive information. We encourage NERC to continue to ensure that the database purpose and use remains limited to that which is outlined in the Report and that the confidentiality of the information contained in the database be maintained at the highest possible level.

We appreciate the opportunity to provide these comments and look forward to actively discussing the issues next week in Atlanta.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	)	Docket No. RC11-6-000

MOTION TO INTERVENE AND COMMENTS OF THE EDISON ELECTRIC INSTITUTE, THE AMERICAN PUBLIC POWER ASSOCIATION, ELECTRICITY CONSUMERS RESOURCE COUNCIL, THE NATIONAL RURAL ELECTRIC COOPERATIVE ASSOCIATION, THE TRANSMISSION ACCESS POLICY STUDY GROUP, THE ELECTRIC POWER SUPPLY ASSOCIATION AND THE LARGE PUBLIC POWER COUNCIL

The Edison Electric Institute ("EEI"), the American Public Power Association ("APPA"), the National Rural Electric Cooperative Association ("NRECA"), the Transmission Access Policy Study Group ("TAPS"), the Electricity Consumers Resource Council ("ELCON"), the Electric Power Supply Association ("EPSA") and the Large Public Power Council ("LPPC") (collectively referred to as the "Trade Associations") submit this joint and several motion to intervene and comments in support of the Petition filed by the North American Electric Reliability Corporation ("NERC") on September 30, 2011, in this docket asking the Federal Energy Regulatory Commission ("FERC" or "Commission") for approval of NERC's proposed new enforcement mechanism known as Find, Fix Track and Report ("FFTR").[1]

JOINT AND SEVERAL MOTION TO INTERVENE

Pursuant to Rules 212 and 214 of the Commission's Rules of Procedure, the Trade Associations move to intervene in this proceeding.

EEI is the association of the nation's shareholder-owned electric utilities, international affiliates, and industry associates world-wide.

[1] Petition Requesting Approval of New Enforcement Mechanisms and Submittal of Initial Informational Filing Regarding NERC's Efforts to Refocus Implementation of its Compliance Monitoring and Enforcement Program, Docket No. RC11-6-000 ("the Petition").

APPA is the national service organization representing the interests of more than 2,000 not-for-profit, publicly owned electric utilities throughout the United States.

NRECA is the not-for-profit national service organization representing approximately 930 not-for-profit, member-owned rural electric cooperatives, including 66 generation and transmission cooperatives that supply wholesale power to their distribution cooperative owner-members.

TAPS is an association of transmission-dependent utilities in more than 30 states, promoting open and non-discriminatory transmission access.

ELCON is the national association representing large industrial users of electricity.

EPSA is the national trade association representing competitive power suppliers, including generators and marketers. These suppliers account for 40 percent of the installed capacity in the United States.

The Large Public Power Council represents 25 of the largest state-owned and municipal utilities in the nation, reflecting the views of the larger, asset owning members of the public power community.

The Trade Associations meet the requirements of Rule 214(b) for intervention. Many of the Trade Associations' members are users, owners, and operators of the bulk-power system and are subject to the Reliability Standards established by NERC, acting as the Commission-certified Electric Reliability Organization ("ERO"), and will be subject to the enforcement mechanisms that are the subject of the Petition. Therefore, the Trade Associations are interested parties with respect to this docket. The Trade Associations' respective members will be directly impacted by the outcome of this proceeding and cannot be adequately represented by another party to the proceedings. The intervention of the Trade Associations is in the public interest. Accordingly,

the Trade Associations respectfully request that the Commission grant their joint and several motion to intervene.

COMMENTS

Executive Summary

The Trade Associations strongly support NERC's decision to revamp how it deals with Possible Violations of reliability standards that pose a lesser risk to the bulk power system ("BPS"). NERC's Petition for approval of new compliance enforcement mechanisms outlines a promising new strategy to differentiate among and address compliance issues according to their significance to the reliability of the BPS. While all Possible Violations will continue to be found, fixed, tracked and reported to Regional Entities, NERC and the Commission, lesser risk issues that have been corrected (*i.e.*, already mitigated/fixed-in-the-field by the registered entity) will be presented as Remediated Issues in a Find, Fix, Track and Report ("FFTR") spreadsheet that will be submitted to the Commission in a monthly informational filing.

The Trade Associations strongly support NERC's proposal to exercise discretion in dealing with lesser risk enforcement matters and urge the Commission to accept NERC's petition as a well-designed first step in recognizing a significant and growing problem of resource misallocation in the ERO compliance and enforcement program. Minor administrative, documentation-related, and other violations that pose a lesser risk to reliability need to be addressed quickly and simply, so that NERC, the Commission and the industry can refocus their attention on actual and potential reliability issues, including but not limited to significant violations of reliability standards, that pose a significant risk to reliable operation of the BPS.

The Trade Associations support NERC's analysis that its FFTR proposal is consistent with the Commission's regulations and prior orders, NERC's Rules of Procedure and Commission policies on enforcement discretion. For example, all possible violations will be timely reported to the Commission, as required by 18 CFR Part 39.7(b). All Possible Violations will be identified and mitigated and will become part of the registered entity's compliance history.

NERC's proposal to submit six-month and twelve-month reports on its progress implementing the FFT proposal will provide evidence on the tangible experience of registered entities, NERC and Regional Entities. The initial NERC informational filing in mid-2012 will provide specific information on the status of FFTR and feedback on whether FFTR has begun to shift NERC, Regional Entity and industry resources by increasing the efficiency and effectiveness of documenting compliance and handling minor enforcement matters. The Commission should also consider convening a policy-level technical conference to address the broader goals, priorities, cost impacts, and practical challenges for NERC compliance and enforcement.

The Commission Should Approve the FFTR as a Promising New Approach

The Trade Associations believe that the FFTR approach provides an effective means to handle the preponderance of NERC violations that have little or no impact on the reliability of the BPS. Registered entities are now overwhelmed by the demands of the compliance and enforcement "administrivia" associated with demonstrating compliance with many of the NERC standards. Such minor violations should be resolved quickly and simply so that personnel may devote the substantial resources now dedicated to handling these issues to matters that have a greater impact on BPS reliability. The Trade Associations believe that the FFTR proposal can serve as one remedy for this serious and growing problem and provide a means to re-focus resources on issues more important to BPS reliability.

On a consolidated basis, NERC and the regions propose to spend in 2012 approximately $92 million on compliance and enforcement activities, almost 45% of the consolidated ERO budget. The current enforcement backlog of over 3,000 pending violations is growing. The average processing time for a NERC violation is not known with precision; however, the Trade Associations understand that it is not unusual for many minor enforcement matters to require two years to reach the Commission as filed Notices of Penalty.

The registered entity resources required to satisfy the broad range of compliance documentation and enforcement-related paperwork and other administrative demands are without doubt several multiples of the consolidated NERC spending. These expenditures include preparation for and participation in compliance audits and spot checks, self-reporting and mitigation plan development and management, violations settlement discussions and negotiations, and a broad range of other compliance monitoring, reporting and data submittals, and the attendant paperwork flow management and coordination within registered entities. The

work requires the involvement of field operations and maintenance personnel, technical subject matter experts, compliance program management, attorneys, outside consultants, and in some cases, senior management. This rough estimate does not include capital expenditures, or operating and maintenance expenses, required to plan and operate the bulk power system, but only the registered entity managerial and administrative overhead expense that supports NERC compliance and enforcement processes. FFTR is an important first step to ensure that the substantial resources devoted to compliance demonstration and enforcement are targeted on those matters that pose the greatest risk to the reliability of the BPS. This approach will better ensure the more effective deployment of NERC's compliance and enforcement resources.

Trade Associations also strongly support NERC's proposal to submit informational reports in six months and twelve months. Those reports will provide specific information on the status of FFTR implementation, and should be structured to enable the Commission and stakeholders to assess the effectiveness of the FFTR tool, its impact on NERC and industry costs, and whether the FFTR tool is yielding a reduction to the compliance violation backlog. The informational filings should also provide information to allow the Commission and stakeholders to understand how the Regional Entities are implementing FFTR. The informational reports will also provide a timely opportunity to identify any mid-course changes to NERC's plans needed to ensure that FFTR achieves its objectives.

Finally, in its filing in this docket, NERC also proposes additional work phases to address other issues in compliance and enforcement. The Trade Associations strongly agree that a broad range of work is needed, and recommend that the Commission convene a technical conference next year to address policy level issues. We outline our concerns and objectives below – but submit that these technical and policy issues are beyond the scope of the actual proposal and any

approvals that may be before the Commission in the instant filing. These long term improvements to NERC's compliance and enforcement program are more properly the subject of a new Commission proceeding, noticed as an AD docket, in which NERC, industry stakeholders, and the Commission can engage in an open dialogue on the direction of the NERC compliance and enforcement program.

Throughout 2009, stakeholders engaged both the Commission and NERC to discuss the problem in standards development that "everything is a priority." Significant efforts have been underway since that time to better define priorities for standards development, and the Commission has expressed general support that such efforts are both needed and timely. Now, NERC rightly has begun to address a similar prioritization issue from the perspective of compliance and enforcement. The present approach of more or less equal treatment of all violations, and the full enforcement of each and every violation under the process that has been developed and practiced to date, in effect creates an inefficient, unsustainable, costly, and unnecessary policy for compliance with the Commission-approved standards.

A Commission technical conference should address the range of policy issues and help focus the scope and content of subsequent NERC work plans and proposals for this core NERC program. We believe that such a technical conference should focus on how compliance and enforcement programs can be designed to create incentives for improved performance, avoid creating distractions for personnel and resources to cover matters largely irrelevant to reliability, address potentially unsustainable compliance-related costs, and ensure efficient program administration. Given the nature of the problem, the attention provided to standards development prioritization last year, and the costs involved, we believe that there is significant merit for using a technical conference process to address compliance and enforcement policy

issues. We envision that such a conference would include the involvement and participation of senior executive officers.

The Trade Associations Support Opportunities for Open Discussion of the FFTR Proposal

Given that the FFTR proposal impacts all users, owners, and operators of the bulk-power system and could result in a shift in the overall approach to NERC enforcement, the free exchange of ideas and concerns by industry participants with the Commission and its staff is essential. Indeed, the proposed FFTR procedure will be a significant topic of discussion at the NERC Board of Trustees (BOT) meetings, including many attended by Commissioners and Staff. The application of the *ex parte* rules to the FFTR proposal would prevent the free flow of information necessary for the Commission to adequately consider the FFTR proposal. The Trade Associations understand that the Commission will issue appropriate notice of the NERC BOT meetings so that Commissioners may participate without excusing themselves from discussion of the FFTR proposal. The Trade Associations appreciate this recognition of the importance of open discussion of the proposal. The Trade Associations also support the Commission considering other opportunities for discussion of FFTR. This may include the upcoming technical conference scheduled for November 29 and 30. By making this suggestion, the Trade Associations do not intend in any way to delay the Commission's consideration and hoped-for approval of the FFTR proposal.

CONCLUSION

For these reasons, the Trade Associations request that the Commission grant the Petition, recognizing the FFTR process as an important new approach to improve the compliance process

to redirect resources to the most important risks to reliability and hold a technical conference next year to discuss progress in achieving that goal.

Respectfully submitted,

/s/ *Signed*

Policy Input to the NERC BOT and MRC – October 24, 2011

The Electricity Consumers Resource Council (ELCON) is pleased to offer the following policy input to the NERC Member Representatives Committee and the Board of Trustees.

In addition to the specific replies to issues listed by NERC Chairman John Q. Anderson, ELCON raises two high-level concerns:

1. Large industrial electricity consumers need a reliable supply of electricity, but it must be at competitive prices. Increasingly, compliance with the growing numbers of NERC standards requires tremendous quantities of resources. NERC must find a way to balance compliance to necessary standards with consumer costs.

2. While entities required to be in compliance with NERC standards want clear and concise standards, increasingly they are concerned that NERC staff, rather than industry stakeholders, are making determinations that in essence become mandatory actions. The approved ANSI-approved standards development process should be followed to the greatest degree possible.

Responses to specific issues raised in Chairman Anderson's letter:

- **Compliance Enforcement Initiative (BOTCC-2 and MRC-9)** – ELCON joined with other trade associations in a FERC filing strongly urging FERC approval of NERC's decision to revamp how it deals with Possible Violations of reliability standards that pose a lesser risk to the bulk power system. Registered entities are now overwhelmed by the demands of the compliance and enforcement "administrivia" associated with demonstrating compliance with many of the NERC standards. ELCON agrees with the other trade associations that the "Find, Fix, Track and Report" (FFTR) proposal can serve as one remedy for this serious and growing problem and provide a means to re-focus resources on issues more important to BPS reliability.

- **Compliance Application Notices – Status (MRC 10)** – Initially, ELCON was a strong advocate and supporter of the CANs process. However, we have become very disappointed with the results. We hoped that positive fixes were on the way, but have not yet seen them. There is very broad industry concerns with the CANs process. ELCON is working with other industry stakeholders to develop a procedure that will provide necessary guidance, respond to industry concerns, and minimize costs.

- **Status of CIP Standards Version 4 and 5 Implementation Plans (MRC-11): --** The implementation of the CIP standards has become very complex including duplication of effort and backwards looking compliance requirements – thus raising serious resource and cost issues. There is very broad industry concern with how the standards are being implemented. ELCON is working with other industry stakeholders to develop an

implementation plan that will minimize costs while providing guidance and minimizing costs..

- **Bulk Electric System (BES) Definition and Rules of Procedure (MRC 12)** – ELCON is generally pleased with the outcome of what is now called Phase I of the BES Definition project (NERC Project 2010-17), and we urge the Board to endorse the drafting team's product without qualification. We continue to feel strongly that technical criteria, assumptions or metrics used in definitions or standards be based on sound technical analysis that has been thoroughly vetted by the industry. For example, the continued use of the 20/75-MVA generation thresholds in the BES definition and Statement of Compliance Registry Criteria remains problematic. We urge the Board to reaffirm its unqualified support for Phase II and for the Phase II drafting team to complete its work expeditiously.

Electric Power Supply Association
Advocating the power of competition

NERC Board of Trustees
Atlanta, Georgia
November 3, 2011
Policy Input of the Electric Power Supply Association

On behalf of its member companies, the Electric Power Supply Association ("EPSA")[1] appreciates the opportunity to provide policy input in advance of next week's NERC Member Representatives Committee ("MRC") and Board of Trustees ("BOT") meetings in Atlanta Georgia. EPSA commends the MRC leadership, the BOT and NERC management for recognizing the value of stakeholders' policy input in advance of the MRC and BOT meetings and how that input can play an important role in NERC's successful evolution as the Electric Reliability Organization ("ERO").

MRC Chair Bill Gallagher provided in his October 6 letter to BOT Chair John Q. Anderson five policy issues for which the BOT seeks comment. Herein, EPSA responds to the policy issues highlighted by the BOT Chair Anderson. Generally the theme of the EPSA comments remain similar to what was communicated to the BOT in preparation for the Vancouver meeting. NERC as an organization should be focused on material programs and processes that increase the ERO's efficiency and effectiveness, as attested to by material evidence that supports these programs and processes. The new compliance and enforcement initiative is such a program. However, EPSA is concerned that the multitude of new compliance "guidance" initiatives create duplicative processes and confusion that may in fact undermine efficiency and limit the ERO's effectiveness.

Compliance Enforcement Improvement Initiative

The ERO petitioned the Federal Energy Regulatory Commission ("FERC") regarding new initiatives that will increase the efficiency of compliance enforcement. EPSA along with the other industry trade associations supported the NERC petition in October 21 comments to FERC. As was highlighted in the October 6, BOT policy input letter the thrust of this initiative is to reduce the violation caseload in light of heightened concerns from both industry and regulators

[1] EPSA is the national trade association representing competitive power suppliers, including generators and marketers. Competitive suppliers, which, collectively, account for 40 percent of the installed generating capacity in the United States, provide reliable and competitively priced electricity from environmentally responsible facilities serving power markets. Each EPSA member typically operates in four or more NERC regions, and members represent over 700 registered entities in the NERC registry. EPSA seeks to bring the benefits of competition to all power customers. The comments contained in this filing represent the position of EPSA as an organization, but not necessarily the views of any particular member with respect to any issue.

over the growth in the backlog for minor administrative violations. In the FERC pleading EPSA and the other trade associations supported the need for increased efficiency for compliance demonstration. Moreover, the trades expressed their joint support for the ERO addressing this issue and submitting the petition to the Commission. In addition, the associations sought clarity regarding ex-parte concerns and a technical conference to discuss the progress of the initiative publicly.

EPSA has urged the Commission to act favorably on the petition so that the Find, Fix, Track and Report ("FFTR") process can advance, furthering the efficiency of the compliance process. The new mechanism should serve as an impetus to improve the compliance and enforcement process and allow for more focus on issues that have the greatest impact on reliability. The pursuit of such improvements to the compliance and enforcement program is appropriate and should continue to be stressed. Managing compliance and enforcement is necessary for the ERO to meet its core mission and is further strengthened and defined by such changes.

Compliance Action Notices (CANs)

The Vancouver meeting highlighted a need to revisit the Compliance Application Notice ("CAN") process to both rewrite CANs Process Document and the CANs issued thus far. EPSA appreciates this commitment to improve CANs and the CANs process. Much as has been documented already to date, industry continues to support the need for compliance guidance within the bounds of existing Standards. Unfortunately, since the inception of the CANs, EPSA members have found that the process and a small number of certain CANs go beyond the bounds of existing Standards.

The CANs process has the potential to appropriately provide guidance to assist company compliance efforts. However, because the process is new and still evolving, there are steps that need to be taken to strengthen the CANs process so that a CAN does not become final unless the CAN provides guidance that is within the bounds of Standards. To assist in that evolution EPSA provides the following recommendations:

(1) As an initial matter and as previously pointed out by EPSA, CANs function as supporting documents under NERC's Rules of Procedure ("ROP"), but are not currently recognized as such. Recognizing them as supporting documents would align CANs with the existing ROP and increase clarity regarding how CANs fit with Standards. EPSA has recently submitted a letter to the NERC General Counsel about this issue (attached).

(2) CANs that have been reviewed and raise no concerns that they go beyond the bounds of existing Standards should be deemed as final and used as guidance. CANS that require a greater level of review should either be held in abeyance until

that review is completed or slated for the Standard rapid repair process. This would ensure that the majority of draft CANs are made final in a timely manner. These CANs would become quickly available to Compliance and Enforcement Authorities ("CEAs"). In addition, this process would provide sufficient due process while also identifying and providing for needed standard revision.

Status of CIP Standards Version 4 and 5 Implementation

EPSA members recognize the importance of Critical Infrastructure Protection ("CIP") Standards because the Standards not only address reliability but security issues. The importance of CIP Standards highlights the need to quickly update and improve them. However, the quick pace of CIP Standard drafting has led to two different but concurrent versions that will need to be implemented almost simultaneously. The implementation of different versions over a short period of time creates significant challenges and confusion for industry.

In the spirit of the new compliance and enforcement initiative, there needs to be attention given to how these two versions can be implemented efficiently and reasonably. Given the open-ended questions about CIP 4 and 5 implementation, EPSA members encourage further dialogue among the ERO, Regions and Industry without delay to ensure successful CIP version 4 and 5 implementation.

Proposed New Rules of Procedure

As EPSA stated in its August policy input, the current taxonomy for determining changes for programs, processes and rules should raise and address material problems without undermining ERO efficiency. To ensure efficiency the BOT should be provided with material evidence for any changes considered prior to approving them. ROP changes should all be evaluated based on their material support and ability to increase ERO efficiency. One benchmark for determining adequate support is stakeholder comments. The BOT should ensure that comments are appropriately addressed before approving ROP changes.

The following is from the EPSA August policy input and remains relevant to the questions posed in BOT Chair Anderson in his October letter:

> *NERC has posted draft ROP revisions for sections 400, 1002 and 1502 that propose to simplify documents, make for more consistent use of defined terms, move provisions to different sections or consolidate sections, provide greater consistency among different documents that address the same topic and create conforming cross references. Additionally, the proposed changes create new authorities to fine entities for not responding to data requests and increase penalties for violations if the entity engages in "frivolous or dilatory action" during a hearing.*

EPSA supports efforts to clean up the ROP by making the language more efficient and concise. However, EPSA is concerned about resources being expended on new ROP proposals that address infrequent and immaterial issues.

The new ROP proposals have been characterized during their rollout as rules that will be used infrequently because data requests generally are responded to and hearings occur without delay. Therefore EPSA is concerned that precedent-setting proposed ROPs address items that rarely happen and are not significant. In light of recent ERO priority and resource discussions, making immaterial ROP changes for infrequent events justifies EPSA's concern. New rules should be considered only if there is sufficient justification for the changes. Moreover, the ERO should be focused on material priorities.

Sincerely,
/s/
Jack Cashin

October 25, 2011

David N. Cook
Senior Vice President & General Counsel
North American Electric Reliability Corporation (NERC)
1120 G St. NW, Suite 990
Washington, DC 20005

Dear David,

The Vancouver Board meeting highlighted the Compliance Action Notice (CAN) program and the need to revisit the program and associated processes. As NERC is in the process of revising the CANs program to increase its effectiveness while increasing Standard guidance and information in accordance with Commission Order No. 693, EPSA has comments for your consideration.

EPSA has found while examining the CANs process that there are potential implications for the NERC Rules of Procedure (ROP). These implications often prompt issues that go beyond specific CANs and the CANs process, suggesting the need for potentially revisiting and changing the NERC ROP. Specifically, it appears that the current NERC ROP views CANs as supporting documents for Standards. We would appreciate your views and any clarification you can offer on this interpretation.

From the NERC ROP, (Appendix 3A - of the Standards Process Manual, page 39 (attached)) the definition of "supporting documents" appears to apply to CANs for the following reasons:

1. The NERC Web page for CANS states: "CANs have two purposes: to provide transparency to industry on how an ERO auditor will apply compliance criteria to a NERC Reliability Standard and to establish consistency in the application of compliance criteria across all regions." See http://www.nerc.com/page.php?cid=3|22|354.

2. The July 8, 2011 Compliance Application Notice Update states - that "A CAN is not a Reliability Standard or an Interpretation of a Reliability Standard. Further, a CAN cannot modify or change an Interpretation or Reliability Standard." (p. 5) See http://www.nerc.com/files/CAN_Process_Update_20110708.pdf.

3. Appendix 3A (p, 39.) describes supporting documents: "These documents may explain or facilitate implementation of standards but do not themselves contain mandatory requirements subject to compliance review. Any requirements that are mandatory shall be incorporated into the Standard in the Standard development process." This description matches the purpose of CANs. Furthermore, CANs align with the definitions for two of the examples of supporting documents found in the table on p. 39 of the Standards Process Manual:

- Guideline: Recommended process that identifies a method of meeting a requirement under specific conditions.

- Reference: Descriptive, technical information or analysis or explanatory information to support the understanding and interpretation of a reliability standard. A standard reference may support the implementation of a reliability standard or satisfy another purpose consistent with the reliability and market interface principles.

Properly, these two types of supporting documents are consistent with the Commission's assertion that "(NERC) needs to provide more information and guidance to registered entities concerning compliance and enforcement process" (FERC Order on NERC Three-Year Assessment). As CANs fulfill each of these functions, they should be interpreted to be supporting documents.

Much of the Vancouver discussion on this issue addressed the lack of clarity regarding CANs and their relationship with both Standards and Standard Interpretations. If CANs are recognized specifically as Standard supporting documents, how CANs relate to Standards becomes better defined regarding how they should be used by Compliance Enforcement Authorities (CEAs). Moreover, using CANs as supporting documents would alleviate due process concerns that have been expressed in CANs discussions.

As CANs are on the Atlanta Board of Trustees (BOT) agenda, EPSA believes further clarity is necessary on this issue. Consequently, your thoughts on the questions and issues raised in the letter are appreciated.

Please call if you have any questions.

Sincerely,

_____

Jack Cashin, Director of Regulatory Policy

Herb Schrayshuen, Senior Vice President & General Counsel of NERC
Mike Moon, Compliance Operations of NERC

NERC Sector 4 – Federal or Provincial Utility
Policy Input to NERC Board of Trustee Request of October, 2011
October 24, 2011

The North American Electric Reliability Corporation (NERC) Sector 4 members appreciate the opportunity to provide written input to the NERC Board of Trustees. Sector 4 held a conference call among its members to discuss the request for policy input and shared several emails to coordinate this input.

1. **Compliance Enforcement Improvement Initiatives**

   Sector 4 members support a goal of improving compliance enforcement and look forward to engaging with NERC and industry to develop and implement improvements. Sector 4 supports the recent FERC filing outlining NERC's approach to Possible Violations that pose lesser risk to the bulk power system. In particular, the improvements should reduce administrative activities that are unrelated to the reliability of the BES. The reductions and improvements should be for both NERC and industry workload, and ultimately focus efforts on critical high priority issues.

2. **Compliance Application Notices in the Context of Standards and Interpretations Development**

   Sector 4 appreciates the effort and priority that NERC staff is placing on developing CANs in an effort to provide more consistency and transparency. As we stated in our previous comments, we view the development of CANs as only a stopgap measure that has the potential to provide considerable risk to industry and NERC, especially if the CAN conflicts with current industry approach and understanding of standard requirements. Also, because the CAN is not an official interpretation, any compliance violations that may result from the use of a CAN may not be recognized in some jurisdictions. Sector 4 appreciates NERC's recognition of industry's concerns, and the discussion at the August MRC and Board meetings. In fact, recent CAN changes now properly assign applicability to the Compliance Enforcement Authority. We also look forward to additional improvements that would result in CANs being used as guidance rather than rigid requirements and interpretations. We would also recommend that NERC provide written feedback to industry on why some industry comments are not acted upon.

3. **Status of CIP Standards Version 4 and 5 Implementation Plans**

   Staging and timing of Version 4 and 5 implementation is critical, and efforts should be taken to reduce duplication of effort and unnecessary investment that could result from premature implementation of Version 4.

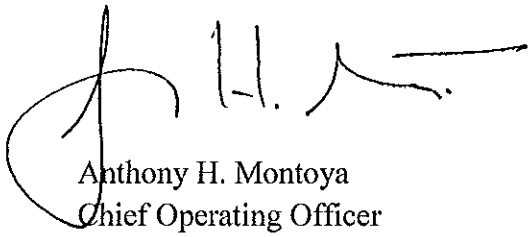
4. **MRC BES/ALR Policy Issues Task Force Report to the Board**

   Sector 4 members support the efforts of the Bulk Electric System (BES) Standard Drafting Team (SDT) activities related to BES/ALR and their efforts to continue work to resolve this.

5. **NERC Rules of Procedure Changes**

   Sector 4 is concerned that ROP's could be used to create mandatory requirements that are outside of the standard development and enforcement process. Specifically, Sector 4 is concerned with Section 414, "Imposition of Fines for Failure to Provide Information Requested Pursuant to the Rules of Procedure", whereby fines unrelated to Electric Reliability Standard enforcement are being contemplated. The establishment of requirements and fines, outside of the Standard development and enforcement process could create serious jurisdictional problems for Sector 4 members. Sector 4 Canadian Provincial Utility representatives encourage the NERC Board to consider comments being provided by the Canadian Electricity Association for additional input on this policy issue.

On behalf of the NERC Sector 4 Members -
Sincerely,



Anthony H. Montoya
Chief Operating Officer
Western Area Power Administration

ISO/RTO Council's (IRC) Policy Input to Board of Trustees

(Ref. MRC Agenda Items 9, 10, 11 and 15)

MRC Agenda Item 9 – Compliance Enforcement Initiative

The ISO/RTO Council (IRC[1]) supports NERC's request that FERC approve the Find, Fix, Track and Report (FFTR) initiative in its Compliance Monitoring and Enforcement Program (CMEP) as outlined by NERC. The IRC supports NERC's objective of streamlining the processing of possible violations that pose lesser risks to the bulk power system, and supports the use of the FFTR mechanism as a means to achieve that objective.

The IRC agrees with NERC that the FFTR initiative represents "a more flexible approach to enforcing compliance in a manner that truly fosters enhanced reliability rather than draining resources on minutia" while providing "for systematic NERC tracking of region- and industry-wide trends in possible violations/issues to ensure continued reliable operations and compliance with standards...."

The IRC have proposed recommendations in two areas:

1. FERC require NERC to use the NERC stakeholder process in its preparation of the six-month and one-year reports on the initiative, providing an opportunity for public review of those reports once filed.

2. FERC remand the proposed entity risk assessment initiative to NERC, and direct NERC to fully develop that initiative's components and process with industry input.

The IRC finds the entity risk assessment components presented by NERC in its petition to be both vague and subjective, and the manner in which the components are evaluated to be non-transparent. This creates a significant possibility that a Registered Entity may be unfairly saddled with a "risky" reputation without a means to even understand, much less challenge, the manner in which that degree of risk was determined.

[1] The IRC is comprised of the Alberta Electric System Operator ("AESO"), Electric Reliability Council of Texas ("ERCOT"), the Independent Electricity System Operator of Ontario, Inc. ("IESO"), ISO New England, Inc. ("ISO-NE"), Midwest Independent Transmission System Operator, Inc. ("Midwest ISO"), New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), Southwest Power Pool, Inc. ("SPP") and New Brunswick System Operator ("NBSO").

Further development of the entity risk assessment components and process, with industry input, is therefore needed to ensure that objective and transparent criteria are in place that will permit conduct of the assessments in a fair, objective, and reviewable manner. Given the potential impact to Registered Entities' compliance posture and liability exposure, the rights and obligations and impact must be fully understood and the process must be completely transparent before it is put into effect. Moreover, FERC should require the addition of a process that will afford Registered Entities an opportunity to challenge their assigned risk levels.

MRC Agenda Item 10 – Compliance Application Notices – Status

The IRC previously commented on its concern that the Compliance Application Notices were imposing new requirements as part of their guidelines to Compliance Enforcement Agents. NERC President Gerry Cauley at the August 3, 2011 Board of Trustees meeting agreed with the concern and indicated that he would initiate revisions to selected CANs to remove requirement language such that CANs contain guideline language and provide examples for evidence only.

These comments are directed towards the revised CANs posted subsequent to Mr. Cauley's statement.

IRC's Comments

The IRC recognizes significant improvement in a number of revised CANs since Mr. Cauley's declaration and thanks Mr. Cauley for his support in this area. The IRC however still finds that some CANs contain or imply requirements not stipulated in standards, and therefore require additional revision to remove such language.

The IRC reiterates its support of a CAN Process that is implemented consistent with the limited intent and scope that recognizes that:

1. The CAN Process is not meant to address "gaps and ambiguities" in the approved standards, and that CANs shall not introduce any new standard, requirement or measure not explicitly mandated by a given standard
    a. CANS must not be used to implement rights and obligations, policies, best practices or NERC's subjective belief of what is required by a standard where any of the foregoing exceed the scope of the standards;
    b. CANS must not be used to close perceived "gaps" in standards;

c. CANS are intended to achieve consistency among auditors with respect to compliance assessments; and should be limited to identifying non-exclusive guiding principles for determining "safe-harbour" evidence that is acceptable to demonstrate compliance (i.e. not defining the one and only measurement of piece of evidence, just guidelines for evidence that if met will demonstrate compliance)
d. CANs are temporary CMEP administration aids to facilitate consistent CMEP results that will expire if and when the underlying issue is addressed by an interpretation and/or standard revision implemented through the FERC approved standards development process.

2. The CAN Process is a NERC-staff initiative and not part of the Standards Development Process and therefore not enforceable.
3. A CAN must not impose data retention or measures that begin BEFORE the effective dates given in the FERC and Canadian authorities' approvals.
4. A CAN must not contain language indicating a "possible compliance violation"; a "non-compliance" finding; or a "compliance" finding based on the contents of the CAN. Such language should be removed before any CAN is considered final.

MRC Agenda Item 11 – Status of CIP Standards Version 4 and 5 Implementation Plans

Version 3 of the CIP standards is in effect and the implementation of those standards is well underway. Many entities are already fully responsible for compliance with these standards, while others may still be in implementation. The new Version 4 standard changed the identification requirements for Critical Asset identification from the Risk-Based Assessment Methodology of the Version 3 to a newly established set of "Bright Line" criteria in CIP-002-4. Changes within CIP-003 to CIP-009 V4 are only "conformance changes" to coordinate with the changes in CIP-002-4. FERC has issued a NOPR for comment on their proposal to approve Version 4. A primary concern with the NOPR proposals is that FERC proposes to direct NERC to make the implementation plan for Version 4 a firm "deadline" for implementation. This may be problematic in that entities must remain fully compliant with Version 3 until Version 4 is fully "mandatory and enforceable". There may be significant differences between the Critical Assets (and, thus, the Critical Cyber Assets) identified in Versions 3 and 4. The entities must carefully bookend compliance for all Critical Assets and Critical Cyber Assets with both versions under the new CIP standards.

These concerns become even more complex when the proposed timeline for CIP Version 5 is considered. The present Version 5 development timeline calls for posting for a concurrent 60 day comment and ballot period beginning in early November 2011. Successive and recirculation ballots are planned for the first half of 2012 as needed, with an anticipated filing of Version 5 with FERC in the third quarter of 2012.

There are significant concerns with the overlap of implementation plans. The implementation of the presently mandatory Version 3 standards, the Version 4 Implementation plan, depending upon the FERC approval (NOPR has been issued), with a resultant Version 4 mandatory status possibly effective even before the completion of all implementation of Version 3, and a possible Version 5 Implementation plan beginning even before Version 4 is fully mandatory and implemented and Version 5 mandatory status beginning even before the completion of the mandatory implementation of Version 4. All of these overlap with the required Audit/Compliance Period for the present cycles and on into the "Next" Audit Cycle.

Unnecessary complexity exists in such a moving implementation. Great care and attention will be required as Registered Entities transition from Version3 to Version 4, and then subsequently move from Version 4 to Version 5; with overlapping requirements of each.

It is not difficult to postulate the possibility that some Critical Assets may be identified under the bright line criteria of Version 4 that were not identified under the risk-based assessment methodology of Version 3; or even vice versa. Version 5 modifies the bright line criteria by adding different tiers of Critical Assets. Thus, this presents a very complicated and complex set of tasks and demonstration of compliance for differing standards' requirements.

FERC should be encouraged not to make the Implementation Plan of Version 4 a mandatory deadline, given the uncertainties of the development of Version 5 of the CIP standards. The Implementation Plan should be established with flexibilities to coordinate with requirements of Version 5. Perhaps, given the overlapping of the various Implementation Plans, it would be much better and result in less possibility of gaps, if the Implementation of Version 4 were not required, given the very near future of Version 5 requirements.

MRC Agenda Item 15 – Rules of Procedure Changes

For this and future Rules of Procedure (RoP) changes, it would be helpful if NERC would communicate the reasons for the proposed change prior to posting them for comment.

Based on our extensive experience with filing Tariff/Market Rule changes with regulators, NERC should vet concepts regarding RoP changes because:

a. NERC could use its resources more efficiently. If NERC personnel would first present for discussion RoP concepts and take time to understand areas of agreement/disagreement, and tailor accordingly, then less time needs to be spent drafting RoP changes that are later deemed unnecessary or unwise, but only after having received comment.

b. Stakeholders could use their resources more efficiently. When Stakeholders are not first briefed on the concepts of the proposal, and the problems the proposal is aiming to solve, it is very difficult to know how to effectively review and comment. This problem is exacerbated when NERC publishes for comment documents several hundred pages long.

c. Any disagreements will be identified clearly & early. To the extent there is disagreement, it is clearly understood and not the result of misunderstanding. This will facilitate and expedite Regulators' review of the proposed changes.

The EPAct mandated commenting periods for changes to the ERO's rules. We believe the reason for this was to ensure industry input was considered. Understanding the problem to be solved before asking Stakeholders to critique a proposed solution would enable targeted, informed comments and more efficient use of resources.

MEMORANDUM

To: **John Q. Anderson**

From: **Bill Gaines, Director of Utilities and CEO, Tacoma Utilities, on Behalf of the Large Public Power Council**

Subject: **October 6, 2011 Letter Requesting Input**

Please be advised that on behalf of the Large Public Power Council ("LPPC"),[1] I have reviewed and concur in the response submitted today by the State and Municipal Utility Sector to your October 6, 2011 letter requesting input in advance of the upcoming Members Representative Committee and NERC Board meetings.

[1] LPPC represents 25 of the largest state and municipal utilities in the nation, with members that own approximately 90% of the transmission assets owned by non-federal public power utilities. The council's members are listed below.

Austin Energy (TX) • Chelan County PUD (WA) • CPS Energy (TX) • Clark Public Utilities (WA) • Colorado Springs Utilities (CO)
IID (CA) • JEA (FL) • Long Island Power Authority (NY) • Los Angeles Department of Water and Power (CA) • Lower Colorado River Authority (TX)
MEAG Power (GA) • Nebraska Public Power District (NE) • New York Power Authority (NY) • Omaha Public Power District (NE) • OUC (FL)
Platte River Power Authority (CO) • Puerto Rico Electric Power Authority (PR) • Sacramento Municipal Utility District (CA) • Salt River Project (AZ)
Santee Cooper (SC) • Seattle City Light (WA) • Snohomish County PUD (WA) • Tacoma Public Utilities (WA)

POLICY INPUT TO NERC BOARD OF TRUSTEES

NOVEMBER 3, 2011

Pursuant to the NERC Board of Trustee's request for policy input from the NERC Member Representative Committee for the upcoming November 3, 2011 meeting, the Midwest Reliability Organization ("MRO") Board of Directors respectfully submits the following for consideration by the NERC Board of Trustees.

Compliance Enforcement Improvement Initiatives (BOTCC-2 and MRC-9)

MRO supports this effort. Possible violations from the MRO region comprised nearly 21% of the initial submitted filing. MRO believes that tailoring the compliance and enforcement process to significance and risk is an important step in shifting from a compliance and enforcement-centric ERO model to an engagement-centric ERO model that emphasizes performance. Compliance must be considered in the context of performance. For example, a Registered Entity which has strong internal assurance programs to find and self report problems before they escalate, combined with solid, swift corrective action plans, should be encouraged and not punished through a labyrinth of enforcement administration. The Compliance and Enforcement program must be designed around risk and provide the encouragement and tools necessary for the industry to assure risks are being addressed, which will ultimately improve performance.

Compliance Application Notices – Status (MRC 10)

MRO commends NERC's acknowledgement of the need to improve existing CANs and encourages NERC to consider how it can effectively leverage the expertise of the industry in the development of CANs without compromising the ERO's enforcement function. Additionally, MRO is concerned that CANs are designed for use by Region and NERC staff. If the intent of CANs is to set expectations for compliance, then these expectations should be transparent to those who are subject to them, the Registered Entities.

MRO is also concerned that the Regions will be "hamstrung" as NERC is providing a binding directive on the Regions via the CANs without the same obligation on the industry. Instead, Region staff and those we oversee, the Registered Entities, should share the same expectations related to the application of the standards.

MRO supports a two step approach to bring about more uniform application of the standards in the compliance area which can replace the current CANs:

1. NERC should establish and train to a uniform process for generally applying the standards across the Regions and NERC. In addition, MRO suggests that NERC should

continue to use the quarterly NERC and Region audit staff workshops to address the uniform application of standards.

2. Phase 2 of the NERC compliance enforcement initiative should include the development of application guides and model controls and procedures to meet requirements. MRO is facilitating these efforts in the MRO Region using stakeholder expertise to develop standards application guides to better clarify the application of requirements, the type of evidence needed to demonstrate compliance, and the controls and procedures necessary to "wrap around" the requirements.

Bulk Electric System (BES) Definition and Rules of Procedure – Status (MRC-12)

MRO supports NERC's efforts to address the regulatory directive. Any other changes regarding the BES definition and related Rules of Procedure can be accomplished later as a separate filing to the regulator.

Rules of Procedure Changes (MRC-15)

MRO supports the non-substantive Rules of Procedure changes and other changes that are required to comply with a regulatory directive. MRO is not supportive of other proposed substantive changes to the Rules of Procedures at this time. Currently, NERC and the industry are facing numerous challenges, including the adoption of a new compliance enforcement initiative. MRO recommends that NERC defer the other Rules of Procedure changes for later in 2012 and, perhaps, include them as part of Phase 2 of the compliance enforcement initiative.

Regional Reliability Standards

MRO notes that two regional standards within the Eastern Interconnection will be presented to the NERC Trustees for approval on November 3, 2011. MRO is again concerned that a proliferation of regional standards will be spread across the Eastern Interconnection – complicating the operations of the bulk electric system by creating un-necessary coordination seams between systems and adding both costs and risk across the interconnection.

Additionally, both proposed regional standards are being addressed through the standards process:

- PRC-006. The continent-wide Under Frequency Load Shedding standard (PRC-006-1) was approved by the Trustees on November 4, 2010 and is pending regulatory approval.

- MOD-025. NERC has a project to merge two standards (MOD-024 and MOD-025) into a single standard (MOD-025-2, Project 2007-09 ("Generation Verification")).

First, MRO suggests that the Trustees direct NERC staff to coordinate the current standards setting process among the six Regional Entities in the Eastern Interconnection to assure as much uniformity as possible across the interconnection.

Second, MRO suggests that the Trustees direct NERC staff to establish a standards setting process for the Eastern Interconnection. While the Rules permit regional standards, they do not have an explicit requirement for coordination among the Regional Entities within the Eastern Interconnection or an explicit method to permit the Eastern Interconnection to propose and ballot standards through a single process. Further, deference for interconnection-wide standards should apply equally to the Eastern Interconnection as they do to Regional Entities organized within an interconnection (Texas and the West interconnections). Where possible, reliability will benefit from greater standardization across the Eastern Interconnection.

NPCC, Inc.
NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE OF THE AMERICAS, NEW YORK, NY 10018 TELEPHONE (212) 840-1070 FAX (212) 302-2782

NPCC Board of Directors Policy Input to the

November 2, 2011 NERC Member Representatives Committee

and November 3, 2011 NERC Board of Trustees Meetings

1. **Compliance Enforcement Initiative**
   a. NPCC supports the Find, Fix, Track and Report (FFT) procedure as a forward advancement in NERC's continuing efforts to improve the efficiency and effectiveness of the ERO's compliance processes for Possible Violations that pose lesser risks to the bulk power system
   b. NPCC recommends that NERC continue to emphasize that FFT candidates are strictly identified by the Regional Entities and that there are no formulaic criteria for FFT designation
   c. NPCC suggests that the filing of FFTs for approval, in order to obtain closure with regard to Possible Violations, would be an appropriate and effective enhancement to the FFT process

2. **Compliance Application Notices (CAN) - Status**
   a. NPCC supports the suggestions made by the industry for improvement to the process during the posting periods and is actively engaging its Regional Standards Committee in the review of draft CANs
   b. NPCC continues to be concerned that the clarification provided by CANs, which are temporary in nature, can have the unintended impact of expanding a standard and adding to its requirements. Any such changes should be expeditiously captured within a revised standard.

3. **Status of CIP Standards Version 4 and 5 Implementation Plans**
   a. NPCC supports a phased approach to the implementation of CIP standards, with Version 5 using the Bright line approach to the identification of critical cyber assets that was introduced in Version 4
   b. NPCC suggests that Version 5 of the CIP standards should not result in excess or unneeded expenditures, as it is a furtherance of CIP Version 4 and addresses the remaining FERC Directives found in Order 706

4. **Bulk Electric System (BES) Definition and Rules of Procedure - Status**
   a. NPCC members have separately submitted their individual comments with regard to the BES Definition
   b. NPCC acknowledges the proposed NERC BES Definition as being responsive to the FERC Order and reiterates its view that cost effectiveness should be a consideration in the implementation, including in the exception process
   c. NPCC, consistent with its commitment to enhanced reliability, will continue to utilize a risk-based analysis to define facilities for which its more stringent Regional criteria apply

5. **Rules of Procedure Changes**
   a. NPCC does not support the imposition of financial penalties for administrative infractions by registered entities
   b. NPCC strongly recommends that Rules of Procedure changes not preclude NPCC's FERC approved structure for its Hearing Body

Approved by the NPCC Board of Directors at its October 26, 2011 Meeting

National Rural Electric Cooperative Association (NRECA)
Policy Input to the NERC Board of Trustees (BOT)
October 24, 2011

NRECA appreciates the opportunity to provide policy input to the NERC BOT regarding several issues that will be discussed at the November 2/3 MRC and BOT meetings.

Compliance Enforcement Improvement Initiatives (BOTCC-2 and MRC 9)

- NRECA, along with APPA, EEI, ELCON, EPSA, LPPC and TAPS, filed joint comments with FERC supporting the NERC FFTR proposal. EEI is including these joint comments with their policy input submittal and NRECA strongly supports the issues addressed in the joint comments.
- Specifically from the joint comments, NRECA supports the need for a six and twelve month report from NERC on the effectiveness of the FFTR process. These reports must provide details describing the extent of the efficiencies gained by industry, NERC and the REs due to the implementation of the FFTR process.
- NRECA also supports the need for a high level policy focused FERC Commissioner-led technical conference in 2012 to further examine the efficiency results of implementing the FFTR process and to more fully review the NERC compliance and enforcement program. This technical conference should review the many elements of the NERC compliance and enforcement program. There is industry concern that there are unnecessary, conflicting and confusing processes/elements in the NERC compliance and enforcement program that are causing industry to not clearly understand where they should focus their attention.
- From an overall compliance and enforcement program view, NRECA is hearing increasing concerns from its members that the costs associated with demonstrating compliance are continuing to increase at excessive rates. Without continued attention on making the NERC compliance and enforcement program much more efficient and effective, associated industry costs will soon become unsustainable. The entire process for how industry is required to document its compliance efforts must be reexamined to ensure that the focus is actually on operating a reliable BES.
- NERC, the REs and industry need to enter into a dialogue to review the long-term viability for NERC to become the lessons-learned organization it aspires to be. Because the NERC governing documents do not provide a way for NERC to be involved in an examination of an event/incident without also focusing on compliance and enforcement matters, NERC may not be in the best position to gather information from industry and produce timely and comprehensive lessons learned for industry. Other options need to be explored for determining the best way to provide industry with needed lessons learned analysis and information.

- NRECA is beginning to hear of concerns with NERC's risk profiling program that is being implemented to determine the extent of an entity's compliance program. The results of this profiling goes toward determining the level of audit an entity will be subject to. The concerns include NERC/RE staff seeking to review sensitive and confidential internal documents, which if not provided, will cause that entity's audit to be more extensive. We believe these early concerns with the program point to a need to take an immediate and careful review of the program before these and other problems become a more significant issue.
- NRECA strongly encourages NERC to continue to explore steps to reduce burdens on stakeholders, RE and NERC staff, while focusing on the issues that are most critical to BES reliability.

Compliance Application Notices (MRC-10)

- NRECA is very dissatisfied with the level of progress that has been made regarding the correction of problems with several CANs and the CAN Process since August BOT meeting. The vast majority of industry comments on the CAN Process and CAN-0016 were not responded to in a satisfactorily manner. As an example, approximately 70 respondents commented that the draft revised CAN-0016 (on CIP-001) exceeded the scope of the standard language. In response, NERC apparently disagreed and issued a revised final CAN that interpreted CIP-001 and developed audit schemes that are not represented in the standard language.
- NRECA and other trade associations are likely to submit several CANs for a higher level review as permitted in the revised CAN process. However, since the CEO of NERC is part of the approval process of CANs, it is unclear what evidence – above and beyond comments already submitted on the CAN during the development stage - would convince the CEO to take a different position than he previously took. NRECA and other trade associations will utilize the existing process to see if it is fair and effective for providing an appeal of a CAN. It is possible that further changes may be needed to the CAN Process after we see how the current process works.
- NRECA is concerned that NERC is more focused with making minor adjustments to all the existing final and draft CANs rather than more properly focusing the majority of its attention on the CANs that industry identified as improperly changing and interpreting standards outside of the standards development process. NERC has overwhelmed the industry with requesting comments on twenty-plus draft CANs since the end of August. With industry attention and focus on numerous other NERC standard and compliance activities, issuing this many CANs for industry comment in such a short timeframe is stretching industry resources to the limit. In some cases, it is likely that industry did not have the ability to properly review draft CANs due to other commitments. Industry did not ask for all CANs to be revised. We did ask for the process and the few

problematic CANs we identified to be revised between the August and November BOT meetings. NERC's unnecessary rush to revise all CANs is not indicative of NERC addressing industry's concerns, and NRECA is very disappointed with NERC's direction on these issues.

- Several draft CANs and the revised final CAN-0016 continue to exceed providing compliance audit guidance and have actually interpreted or changed the original meaning of the existing reliability standard outside of the standards development process. This is unacceptable and these missteps must be corrected.
- There needs to be a priority placed on developing a permanent solution to address the vague and unclear language that exists in standards – CANs are not that solution. The appropriate solution is to fix such language in the formal standards development process or through formal interpretations.
- It continues to be unacceptable for an entity to be found in violation of a standard based on a CAN that expands the meaning or requirements of a standard because that CAN did not go through the standards development process, nor did it gain approval from the Registered Ballot Body (RBB), the BOT or FERC.
- The basis for any violation and resulting penalty must be from a standard or interpretation that has received approval from the RBB, the BOT and FERC.

Status of CIP Standards Version 4 and 5 Implementation Plans (MRC-11)

- NRECA is concerned with a number of issues regarding the forthcoming implementation of Version 4 and 5 of the CIP standards. With the issuance of FERC's NOPR on Version 4 of the CIP standards, and the potential approval of these standards, the timeframe for when entities will have to implement these standards may not be far off. While FERC is currently evaluating Version 4, the industry is moving forward with the development of Version 5. The primary need for Version 5 is the need to address the many outstanding FERC directives that were not addressed in Version 4. Version 4 only addressed the FERC directive related to developing bright-line criteria for identifying Critical Assets. With the potential for Version 5 to be approved by industry and the BOT in the third quarter of 2012 and shortly thereafter submitted to FERC for approval, this sets up a situation over the next few years that could require entities to go from Version 3 of the CIP standards to implementing Version 4 and then Version 5 in quick succession.
- NRECA believes the potential for the Version 4 and 5 implementation plans to overlap one another could create a number of problems. The most significant problems could be confusion over what an entity is required to comply with and a lack of clarity for auditors knowing what version of a standard to audit an entity against. In addition, with the constant changing of the CIP standards over the next few years, entities may be faced with unnecessary increases in compliance demonstration

and program costs. It is critical for industry, NERC and the REs to have a detailed plan developed to address the concerns identified above. We ask NERC and the REs to immediately reach out to industry – possibly through the trade associations – to begin developing solutions to these potential problems.

- NRECA requests that NERC meet with the trade association immediately after the November 3 BOT meeting to discuss the development of NERC's and industry's comments to FERC on the Version 4 NOPR.
- NERC must understand that industry cannot continue to be faced with constantly changing CIP standards. There must be an effort to quickly bring these standards to a final and stable state so industry can focus on developing and finalizing their compliance plans and programs related to the CIP standards.

Bulk Electric System (BES) Definition and Rules of Procedure (MRC-12)

- With the affirmative result of the initial ballot of the BES definition, NRECA is hopeful that the likely forthcoming recirculation ballot will maintain that affirmative result. This would provide the BOT with a revised definition that satisfactorily responds to FERC's Order Nos. 743 and 743-A within the timeframe provided by FERC.
- Upon the BES definition drafting team's completion of this first phase of work on the BES definition, NERC needs to continue providing the needed support and priority for the drafting team's efforts on phase 2 of project which is scheduled to begin immediately upon completion of the first phase.

Rules of Procedure (ROP) Changes (MRC-15)

- NRECA remains strongly opposed to NERC assessing penalties for non-standard/compliance related actions. NERC has not provided any evidence or basis for such significant potential changes to its ROP. In addition to opposing these changes, NRECA believes that Section 215 of the Federal Power Act does not provide NERC with such authority. Making such changes to the ROP may make it necessary for industry to consider other steps, including legal options, to prevent these changes from being implemented.
- NRECA also remains strongly opposed to the NERC proposal to increase from 10 to 50 the number of NERC members required to request an ROP modification. Again, NERC has provided no evidence or basis for demonstrating the need for such changes. There appears to be no other purpose for these changes other than to make it more difficult for members to request modifications to the ROP. To date NERC members have never formally requested ROP changes which makes it all the more confusing why NERC has proposed this unnecessary change to the ROP.
- For all future ROP changes proposed by NERC, there must be detailed evidence and support provided for the proposed changes prior to the 45-day comment period. Recent proposed changes to the NERC ROP have

not been accompanied by any evidence/basis. This makes it challenging for industry to understand why changes were proposed and it does not help industry to provide constructive and targeted comments on such changes.

- NRECA appreciates what appears to be an effort to provide industry with an advance opportunity to review and provide feedback to NERC on forthcoming ROP modifications. We hope this will be an ongoing effort.

MEMORANDUM

From: John DiStasio
Tim J. Arlt

To: Dave Nevius, Secretary
NERC Member Representatives Committee

Subject: Response to Request for Policy Input

Date: October 24, 2011

This response is submitted on behalf of the MRC's State and Municipal and Sector Utilities ("SMUs") to the letter dated October 6, 2011 from NERC Board Chairman John Q. Anderson to Mr. Bill Gallagher, acting in his capacity as Chairman of the NERC Member Representatives Committee (MRC), requesting policy input on topics to be discussed by the NERC MRC and the NERC Board of Trustees at meetings to be held November 2 and 3, 2011.

This response addresses the following five topics raised in Mr. Anderson's October 6th letter, and provides additional thoughts related to general direction and priorities.

- NERC's Compliance Enforcement Initiative to address Possible Violations that pose lesser risks to the Bulk Power System (BPS), and to facilitate increased enforcement discretion (BOTCC-2; MRC-9);
- NERC's effort to revise the process and content of Compliance Application Notices (CANs) (MRC-10);
- NERC's proposed implementation plans for Versions 4 and 5 of the Critical Infrastructure Protection (CIP) Standards (MRC-11);
- NERC's efforts to develop a new Bulk Electric System (BES) definition and Rules of Procedure (ROP) changes responsive to FERC Order Nos. 743 and 743-A (MRC-12); and
- NERC's proposed ROP changes, including a provision to impose penalties in the event a registered entity does not respond to a NERC data request (MRC-15).

The November Board meeting provides a timely opportunity for NERC to assess its strategic direction and priorities for 2012 and beyond, to ensure that we are making effective use of resources to ensure reliable operation of the BPS, now and in the future. SMUs believe that the ERO Enterprise, which encompasses NERC, its Regional Entities and the registered entities and stakeholders that participate in NERC's activities, are at a new crossroad. It is no longer sufficient that we work *harder* on the various standards, compliance, cyber-security and events analysis initiatives we now have under way. Instead we need to create and implement process initiatives that allow us to get things done with less time and fewer resources, to free up

NERC and industry bandwidth to work on more important initiatives. We also need to be cautious about launching new initiatives, to make sure that new projects do not ultimately duplicate the work of other organizations or create multiple processes within NERC.

As discussed below, we applaud NERC for its develop and implementation of the Compliance Enforcement Initiative, but remain concerned that the Compliance Application Notice process is duplicative of the standards process and other NERC compliance tools such as compliance reports, bulletins, directives, and Reliability Standard Audit Worksheets.

The NERC Standards Process is worthy of additional high-level attention. We are interested in exploring process improvements, with respect given to due process, that would allow the industry to reach consensus in support of technically sound standards more expeditiously than today, with less time, effort and expense. It is increasingly common for drafting teams to second-guess their own efforts to write requirements that accomplish reliability objectives based on perception that the enforcement process is focused on compliance, not on reliable operation.

NERC also faces a continuing tension between its goal of becoming a learning organization and its role as an enforcement entity. Event analysis is a fundamental obligation of both NERC and the industry, if we are to learn from our mistakes, to prevent the next wide area BES event from occurring. However, the perception of industry stakeholders is that event analysis and public distribution of lessons learned take a second chair behind preservation of enforcement issues. Finally, SMUs recognize that the electric industry faces a daunting set of emerging issues, some of which are squarely within NERC's statutory mandate and others which are more peripheral to NERC's scope and mission. We need to develop a better strategy and process for policy issue identification and scoping, to ensure that NERC develops timely information for policy makers on emerging issues, without jeopardizing the ERO's ability to accomplish its core mission.

Our input on the specific questions raised in the October 6 letter is this:

1. Compliance Enforcement Initiative (BOTCC-2; MRC-9)

SMUs support NERC's September 30, 2011 filing with the Federal Energy Regulatory Commission (FERC) in Docket No. RC11-6 ("the September 30 Filing") introducing a new enforcement process that permits regional entities to exercise the discretion to treat possible violations that pose lesser risk through "Find, Fix and Track" reports, in place of a formal Notice of Penalty. SMUs believe that the proposed approach holds much potential for reforming the enforcement process to reflect a "risk-based" approach to establishing priorities for compliance and enforcement activities. This will allow the industry to refocus its efforts on achieving reliability excellence through attention to matters that pose the greatest risk to the BES. The new approach also promises to improve caseload processing to reduce the enforcement backlog that is now pending before NERC.

To facilitate implementation of this new process and to provide needed certainty to registered entities as to the mechanics of the proposed compliance enforcement initiative, SMUs urge NERC to establish clear guidelines in order to give regional entities and registered entities reasonably objective direction as to eligibility for "find, fix and track" (FFT) treatment. Such

clearly-defined procedures will guide regions in their implementation of the compliance initiative and ensure some degree of uniformity across regions as to how the process is carried out. SMUs recognize that these guidelines should invest the regional entities with a meaningful discretion in determining which potential violations will be afforded FFT treatment.

As part of the September 30 Filing, NERC introduces what it envisions to be an ongoing initiative to develop an "entity risk assessment" enabling registered entities to enjoy "lesser compliance monitoring," based on a determination that the entities meet certain criteria for organizations that can be relied upon to manage reliability matters in a demonstrably expert fashion. While SMUs express tentative support this concept, they are very concerned about fairness in implementation. SMUs stress the need for uniformity and objectivity in how qualification for this "lesser compliance monitoring" treatment is determined across the program and between regions. In particular, NERC should develop objective metrics to provided a basis for how such determinations are to be made, how a registered entities' qualification for "lesser compliance monitoring" treatment will be determined and by whom. SMUs submit that in order for this concept to be administered fairly and effectively, all registered entities must start with a clean slate as of the date this program is implemented, regardless of past compliance history. This will ensure that the new process will be administered without prejudice and will properly account for registered entities' actions under the newly-developed compliance enforcement initiative.

SMUs look forward to working with NERC and other stakeholders to further refine the mechanics of the proposed approach to enforcement discretion.

2. Compliance Application Notices Content and Process (MRC-10)

SMUs generally support the use of CANs as a helpful tool to resolve uncertainty surrounding certain reliability standards. However, SMUs emphasize that CANs should not be read to identify exclusive means for compliance with reliability standards, where the CANs are designed not simply to interpret the standards but offer compliance techniques. Compliance ultimately is governed by the language of the standard itself and compliance often may be achieved through multiple means. SMUs recognize that the disclaimer associated with each CAN specifies that the CAN does not substitute for standards or establish a definitive interpretation, and that the revisions to the disclaimer included in the recently posted CAN Template Form make further clear that the CANs are not intended to deine exclusive methods for compliance. SMUs strongly support this reworded disclaimer, but emphasize that its impact must be impressed upon regional entities' auditors. The pre-existing disclaimer already included the note that the CANs are not intended to establish conclusive interpretations of standards. Nonetheless, the SMUs' experience has been that the disclaimer was given limited credence in the field, where registered entity practices that do not follow the example for compliance measures outlined in the CANs are often conclusively presumed to be violations of the applicable standards

SMUs continue to believe that CANs should not supplant the formal standards interpretation process, or be used to forestall needed reform for ambiguous standards. Both the interpretation process and the standards development process used to secure formal revision to the standards employ the full ANSI process, and benefit from formal consideration of

stakeholder comments, unlike the CANs. SMUs do not view a CAN as more than a stopgap measure when formal clarification of, or revision to, a standard is needed.

SMUs appreciate NERC's commitment to improve the CANs process. The CAN stakeholder process has improved opportunity for input, but there remains a good deal of concern among the SMUs as to how receptive NERC ultimately will be to stakeholder comments. SMUs urge NERC to be mindful of the input it receives through the CAN stakeholder process and to take care to address these issues and to modify draft CANs in such a way as to satisfy the concerns voiced by stakeholders. As well, SMUs urge NERC to post stakeholder comments on the CANs at links available when accessing the CANs themselves, enabling registered entities to weigh others' input in developing their views of the meaning of a standard.

3. Implementation Plans for CIP Versions 4 and 5 (MRC-11)

SMUs urge NERC to convene an open discussion with stakeholder groups in order to develop a rational approach to implementation of CIP Versions 4 and 5. There is strong sentiment for doing what is practically feasible in implementing Version 4, while continuing to work on Version 5. The practical consequences of a phased approach, the issue posed by delays in implementation, and the cost and difficulty of approaching implementation in phases should be fully vetted.

4. Bulk Electric System Definition and Rules of Procedure Changes (MRC-12)

SMUs express their strong support for the efforts of the BES drafting team and Rules of Procedure Team to reach industry consensus in support of a technically robust BES definition and workable technical exception criteria. We are optimistic that the draft standard will reach industry approval to allow timely filing of the revised definition, exception criteria and rules of procedure in January 2012. We are equally committed to Phase 2 of this project, to address a number of significant technical issues and concerns that could not be timely addressed by the SDT and industry stakeholders while meeting the regulatory deadlines established by the Commission in Order No.743.

5. Proposed Rules of Procedure Changes (MRC-15)

It is the SMUs' understanding that NERC has proposed to revise its ROP to impose penalties on registered entities that do not respond to NERC data requests. It is not clear to SMUs that failure to respond to NERC data requests is a problem that occurs with sufficient regularity to require a routine process for penalization. Nor is it clear that NERC has the legal authority to impose a financial penalty in such circumstances. SM-TDU's would appreciate more input on this topic. SMUs note that they have been and will continue to be diligent in their response to NERC data requests.

Thank you for the opportunity to provide this input.

Transmission Access Policy Study Group

www.tapsgroup.org

An association of transmission-dependent utilities and other supporters of equal, non-discriminatory transmission access and vigorously competitive wholesale electric markets. TAPS members are located in 35 states, including:
Alabama, Arizona, California, Colorado, Connecticut, Delaware, Florida, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Nebraska, New Hampshire, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Carolina, South Dakota, Vermont, Virginia, West Virginia, Wisconsin, Wyoming

Re: Response to Letter from John Q. Anderson Requesting Policy Input to NERC Board of Trustees

Dear John:

This responds to your letter of October 6, 2011 soliciting policy input from the Member Representatives Committee on various issues in advance of the November 2-3, 2011 meetings of the MRC and Board of Trustees.

You solicit input with respect to topics including the status of Compliance Application Notices (CANS), the proposed changes to the NERC Rules of Procedure that were discussed at the August MRC meeting, the proposed BES definition, and the Compliance Enforcement Initiative.

CANS

We appreciate NERC's commitment, expressed at the August MRC and Board meetings, to improve CANs. Some improvements have been made since then; for example, the draft revision to CAN-0010 no longer improperly restricts the definition of "annual." Much work remains to be done, however, because a significant number of revised CANS continue to overreach, creating additional or more stringent requirements. For example, the draft revision to CAN-0031 posted on September 23, like the prior version, defines a "physical access point" as any opening over 96 square inches, despite the fact that there is no such definition in the standard. We urge NERC management and staff to continue their efforts to bring existing and new CANS into line with the reliability standards.

Rules of Procedure

While we do not know the status of the changes to the Rules of Procedure that were proposed in June 2011 and discussed at the August MRC meeting, we are concerned by the new Rule 414 proposed in the June posting, under which NERC would assess fines for failure to provide information. As stakeholders have stated in comments to NERC and at the August MRC meeting, the proposal is flawed and should not be implemented. Nothing in the Federal Power Act gives NERC the authority to assess fines for violations of its rules.

This legally dubious measure is likely not needed for entities of any size. Our understanding is that most NERC requests for information get a high

response rate without the threat of penalties. To the extent the proposal is aimed at obtaining data for planning purposes from small, unregistered entities, it is similarly unnecessary because good planning does not require 100% data.

We suggest that NERC demonstrate a currently unmet need for information that has a clear link to preserving or enhancing the integrity of the Bulk Electric System, before instituting this controversial proposal.

Bulk Electric System definition

We believe that, although minor improvements before the end of the year are possible, the BES definition that recently succeeded in an initial ballot will comply with FERC Order 743, and we support the planned second phase of the BES definition project, which is to address issues such as the technical justification for the threshold for BES generators. The related "Detailed Information to Support BES Exception Requests" failed to win a supermajority in the last ballot. We are hopeful that the Detailed Information will be approved through the standard drafting process in time to be filed at FERC by the January 25, 2012 deadline, and urge NERC to allow that process to continue. If it does not succeed, however, we do not believe that NERC will be required to resort to the "Rule 321" process; instead, NERC should approve the Detailed Information through its Rules of Procedure revision process, as permitted by FERC in Order 743 P 90.

Compliance Enforcement Initiative

We strongly support NERC's "Find, Fix, Track, and Report" initiative. We expect that the FFTR process will allow NERC, the Regional Entities, and the industry to better focus resources on violations that pose a significant risk to reliability. We look forward to working with NERC to ensure that FFTR is implemented consistently and effectively.

Thank you for considering these concerns. We look forward to discussing these issues in Atlanta next week.

Sincerely,

Terry Huval, P.E
Director, Lafayette Utilities System

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Reliability Standards

Standards Oversight and Technology Committee
November 2, 2011
Herb Schrayshuen, Vice President Standards and Training

RELIABILITY | ACCOUNTABILITY

Policy and Guidance

- Update on proposals to revise Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) criteria
- Significant minority opinions on proposed NERC Reliability Standards
- ANSI – Forward looking obligations
- Five-year assessment and Rule of Procedure 317
- Industry request to change our position on CIP Version 4
- Policy discussion on Reliability Standard Development Plan (RSDP) long-term adjustments

Proposal to Revise VRF/VSL Criteria

- VRFs
  - The goal of this effort is to standardize a method to determine VRF assignments for individual requirements
    - As a part of this effort, the team is proposing to create definitions for five VRFs, rather than the current three VRFs
  - Definitions and a tool to help assist in determining the VRF were presented to stakeholders for comment in mid-2010
    - An updated set of definitions, as well as an updated tool for use in analyzing VRFs, is being prepared for a second round of industry comment

Highlights of the Proposal

- VSLs
  - The goal of this effort is to develop a generalized approach for creating VSLs to be used in lieu of the current approach of performing an exhaustive analysis of possible violations for inclusion in the VSLs. The team is updating the proposal for informal review and feedback prior to posting for industry comment

Minority Opinions

- How should the BOT proceed on proposed standards on which there are significant minority opinions; e.g., FAC-003-2?
- Does the Board of Trustees or Standards Oversight and Technology Committee want an early alert and more thorough technical presentation (technical conference) when a given proposed standard has significant minority opinions before it comes to the Board of Trustees for approval?

ANSI – Forward Looking Obligations

- NERC received notice that effective September 9, 2011 NERC's standard development process has been re-approved as an ANSI-accredited standard development process. The following statement was included in the approval letter:
  - NERC is expected to continue to make progress towards its stated goal of submitting documents to ANSI for consideration as proposed American National Standards (ANS)

ANSI

- Options
  - Reaccredit every five years as we have been
  - Move to a continual accreditation process by submitting one or more standards to ANSI for approval

Next Steps

- Initiate a dialogue with Canadian stakeholders to address issues associated with submitting one or more NERC standards to ANSI for approval
  - In the past the Canadian stakeholders have objected to a review by a United States accrediting organization

5-Year Assessment and ROP 317

- Discuss options for exercising discretion on review of standards every five years
  - Under ROP 317, NERC is required to review each standard within five years of its effective date
    - ANSI accreditation requirement
  - Five-year review obligation is incorporated in the prioritization process

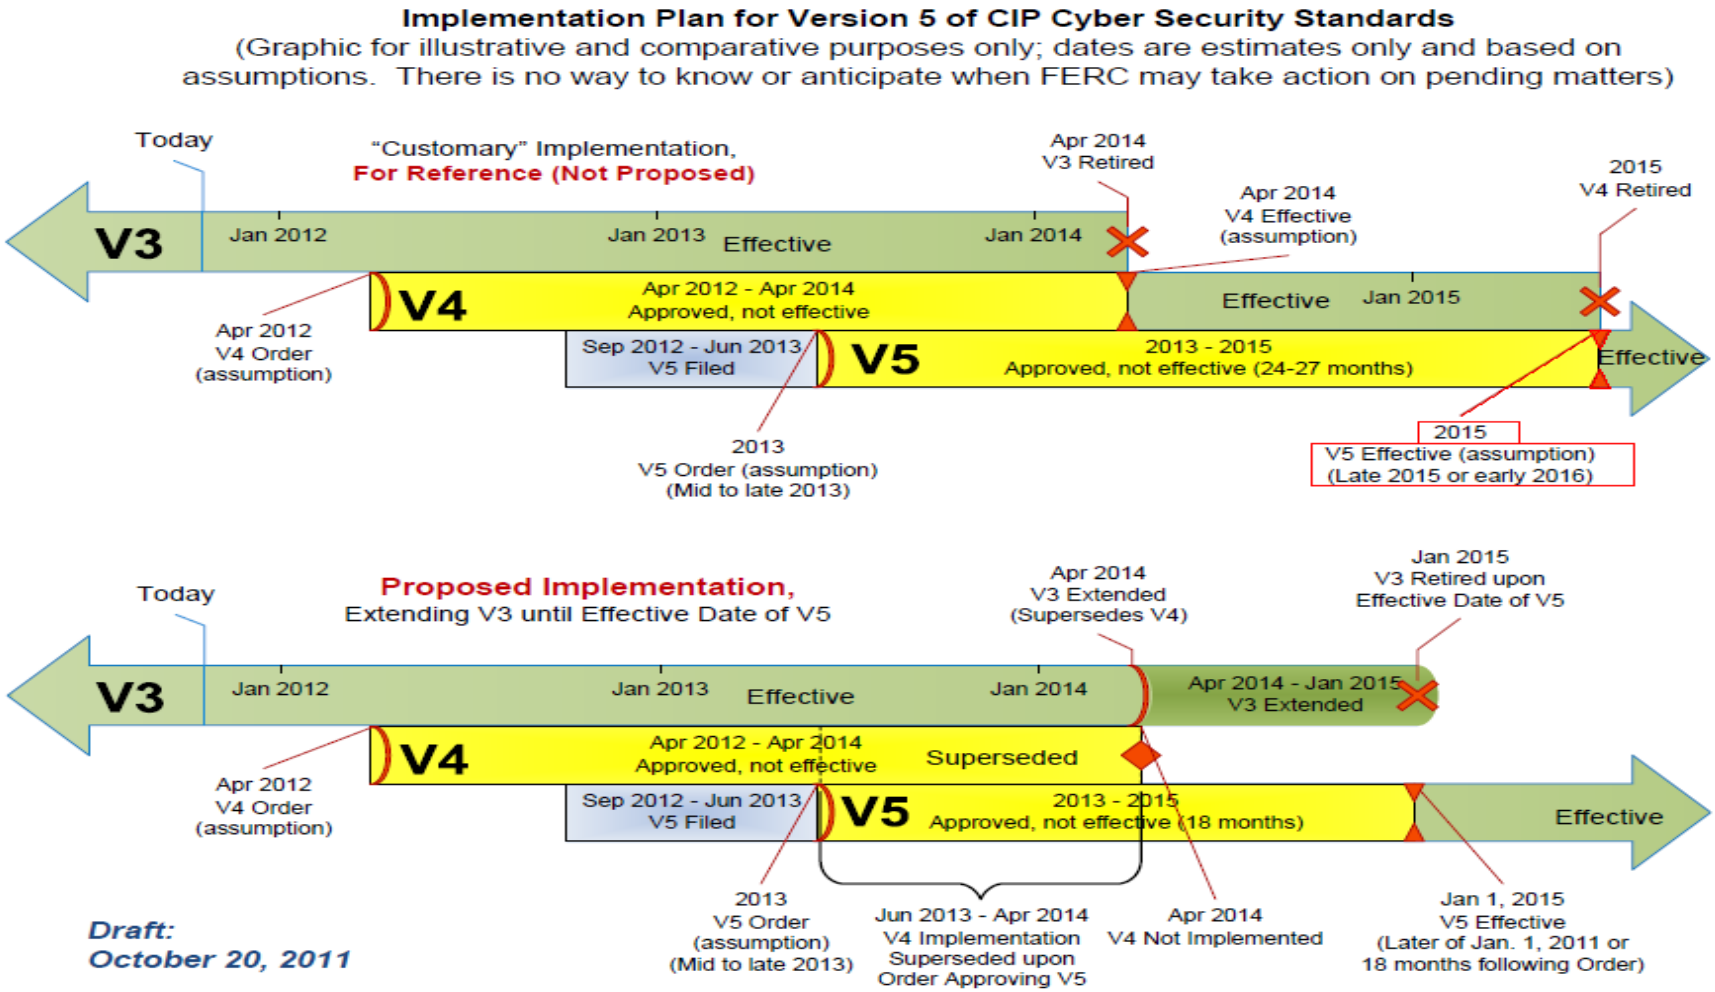
Policy Question

- What is the nature and extent of the “review” that NERC needs to conduct to comply with this ANSI and Rules of Procedure requirement?

Industry Request to Change Our Position on CIP v4

- Certain stakeholder groups are advocating that NERC consider withdrawing CIP-002 Version 4 (v4) and that the industry await the development and delivery of CIP Version 5 (v5)
- The Standard Drafting Team proposed an option that would allow a registered entity to go to CIP v5 early
- Under consideration now is an option that extends v3 slightly, makes v5 effective January 1, 2015 and supersedes implementation of v4
- Given that NERC has filed CIP-002 Version 4 for approval, what are the possible courses of action?

Current Transition Plan



Policy Discussion on RSDP Long Term Adjustments

- This year, the process for developing the RSDP considered areas not explicitly accounted for in the past
- The Standards Committee considered:
  - The NERC President's Top Priority Issues for Bulk Power System Reliability and used them to help prioritize work and allocate resources to work on projects related to reliability, time-sensitivity, and practicality

Issues

- The plan should include the most current changes to the long-term strategic direction of the ERO
  - Cold-weather issues related to the Texas event
  - Risk to Reliability Performance report
- To incorporate new projects, the Standards Committee may need to defer some of the projects slated for initiation in 2012 to address these strategic priority areas when they become more defined

Options

- More specific process modifications such as:
  - Coordination during the development of the RSDP with the PC/RAPA emerging issues process
  - Beginning the planning process earlier, to ensure all aspects are considered in the planning cycle
  - Building the plan to recognize the dynamic nature of our priorities
    - And ensuring the plan can easily accommodate change
    - The plan treats such change as an expectation, rather than an exception
  - Formally integrate the emerging issues process from the Reliability Assessment and Performance Analysis activities under the Planning Committee with the standards development process

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Compliance Enforcement Initiative

Filing and Status Update

November 2, 2011

Rebecca Michael

RELIABILITY | ACCOUNTABILITY

Status of the Filings

- NERC filed several components of the Compliance Enforcement Initiative on September 30, 2011
  - Docket No. RC11-6: Petition for Approval of New Enforcement Mechanisms; Initial Informational Filing of FFTs
    - First group of FFT Remediated Issues
      - 117 total: 62 Operations/Planning Standards/55 CIP Standards
    - No action requested on individual FFT remediated issues
    - Report back to the Commission and industry stakeholders at six months and one year following initial filing

Status of the Filings

- Docket No. NP11-270: First Spreadsheet NOP
  - 75 total: 44 Operations/Planning Standards/31 CIP Standards
  - Subject to FERC's 30-day review period for NOPs
  - Requesting action on the Spreadsheet NOP format or individual NOP violations to be taken in this docket
- Docket No. NP11-267 – NP11-269: 3 Full NOPs

- Second group of FFT Remediated Issues and second Spreadsheet NOP violations were filed October 31, 2011
  - Docket No. RC12-_: 82 FFT Remediated Issues
  - Docket No. NP12-1: 31 in Full CIP NOP
  - Docket No. NP12-2: 46 in Spreadsheet NOP

Next Steps

What Industry Can Do

- Public comments were filed on October 21, 2011
- Continue to develop internal compliance programs
  - Ongoing self-monitoring to find, fix, and self-report possible violations in advance of audits and self-certifications
- Utilize ERO resources to aid compliance and improve self-reporting
  - Webinars, workshops, and documents on NERC website
  - Guidance for self-reports posted on NERC website at http://www.nerc.com/files/Guidance%20on%20Self-Reports.pdf
  - Other CEI forms are available on NERC website under Compliance, then Resources at http://www.nerc.com/files/Notice%20of%20FFT%20Treatment.pdf

http://www.nerc.com/files/FFT%20Spreadsheet%20Template.pdf

http://www.nerc.com/files/NOP%20Spreadsheet%20Template.pdf

Conclusion

- Ongoing work
- Public outreach
- Training

The ERO's commitment to promoting reliability excellence is unchanged.

Compliance Operations Update

November 2, 2011

Mike Moon
Director, Compliance Operations

RELIABILITY | ACCOUNTABILITY

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Topics for Discussion

- Risk-based Reliability Compliance and Entity Assessment
- Regional Entity ork on Entity Assessment
  - Culture of Compliance NPCC
  - Internal Controls MRO
- Compliance Operations update

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Risk-based Reliability Compliance and Entity Assessment

Purpose of Entity Assessment

- In the 2012 Plan
- To make an overall, comprehensive assessment of an entity to appropriately scope where an entity is doing well and where an entity is not
  - An entity doing well
    - May get extended time between compliance monitoring activities
  - An entity not doing well may get extra compliance monitoring activities
    - More self-certifications

Entity Assessment

- Five aspects
  - Technical and risk profile
  - Reliability metrics
  - Internal compliance program
  - Enforcement metrics and status
  - Regional Entity evaluations
- Entity assessment does not place an entity into a tier as described in the 2012 ERO CMEP Implementation Plan
  - Only Reliability Standard requirements are placed into tiers

Current Status and Next Steps

- NERC and the Regional Entities have been exploring different options
- Regions are conducting preliminary entity assessments
- In the process of developing a draft template
- Working with select registered entities to gain industry perspective and input
- A draft template will be provided for broader industry input

Current Status and Next Steps

Regional Entity work on Entity Assessment

- NPCC Internal Compliance Program
- MRO Internal Controls

NERC

Compliance Operations Update

Compliance Analysis Reports

Recently Completed and Posted

- TOP-002 Normal Operations Planning
  - Applicable to over 63% of registered entities
  - 139 Violations, 74% self identified
    - Documentation is an area that needs improvement
- Compliance Registry and Registration Appeals
  - 94 appeals; 69% settled at region, 88% were in 2007
  - Process works
- NERC Organization Certifications
  - Process works; estimate 10 per year

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

NERC Compliance Process Directive #2011-CAG-001

Directive Regarding Generator Transmission Leads

Purpose

- Interim guidance to address reliability gap that exists with GO/GOPs that own transmission facilities (meeting the NERC Statement of Compliance Registry Criteria) but not registered as TO/TOP
- Ensure consistency across the Regions for GO/GOPs that meet the Compliance Registry Criteria to be registered as TO/TOPs

- NOTE: **This Directive does not prejudge outcome of Standards Development process**

Background

- ERO recognized a gap in reliability as it relates to particular types of transmission facilities that connect generators directly to the bulk power system (BPS)
- NERC formed the Ad Hoc Group for Generator Requirements at the Transmission Interface (GOTO Ad Hoc Team); *Final Report from the Ad Hoc Group for Generator Requirements at the Transmission Interface Nov 2009*
- Currently, the Standard Drafting Team has proposed application of three Reliability Standards and 11 requirements of the FAC-001, FAC-003 and PER-003 standards
- The ultimate goal is to propose revisions to all standards that are applicable

Next Steps

- Industry comment period
  - Comments due November 15 through NERC stakeholder committees, trade associations, and forums
- Discussed at the Oct 17-18 North American Generator Forum Annual meeting and received feedback and comments
- Review comments
- Publish a final directive by end of year

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Questions?

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Entity Assessment Backup

Technical and Risk Profile

- Organization and structure
- Registered functions
- System size
- Neighboring entities
- High voltage transmission
  - Circuit miles
- Number of interconnections
- Generation portfolio
- Peak demand

Technical and Risk Profile

- An Independent System Operator with multiple functions and a large geographical foot print would obviously have a higher profile than a small entity with limited functions and connections to other entities
- A high risk profile based on a large complex entity does not necessarily equate to that entity being a bad actor

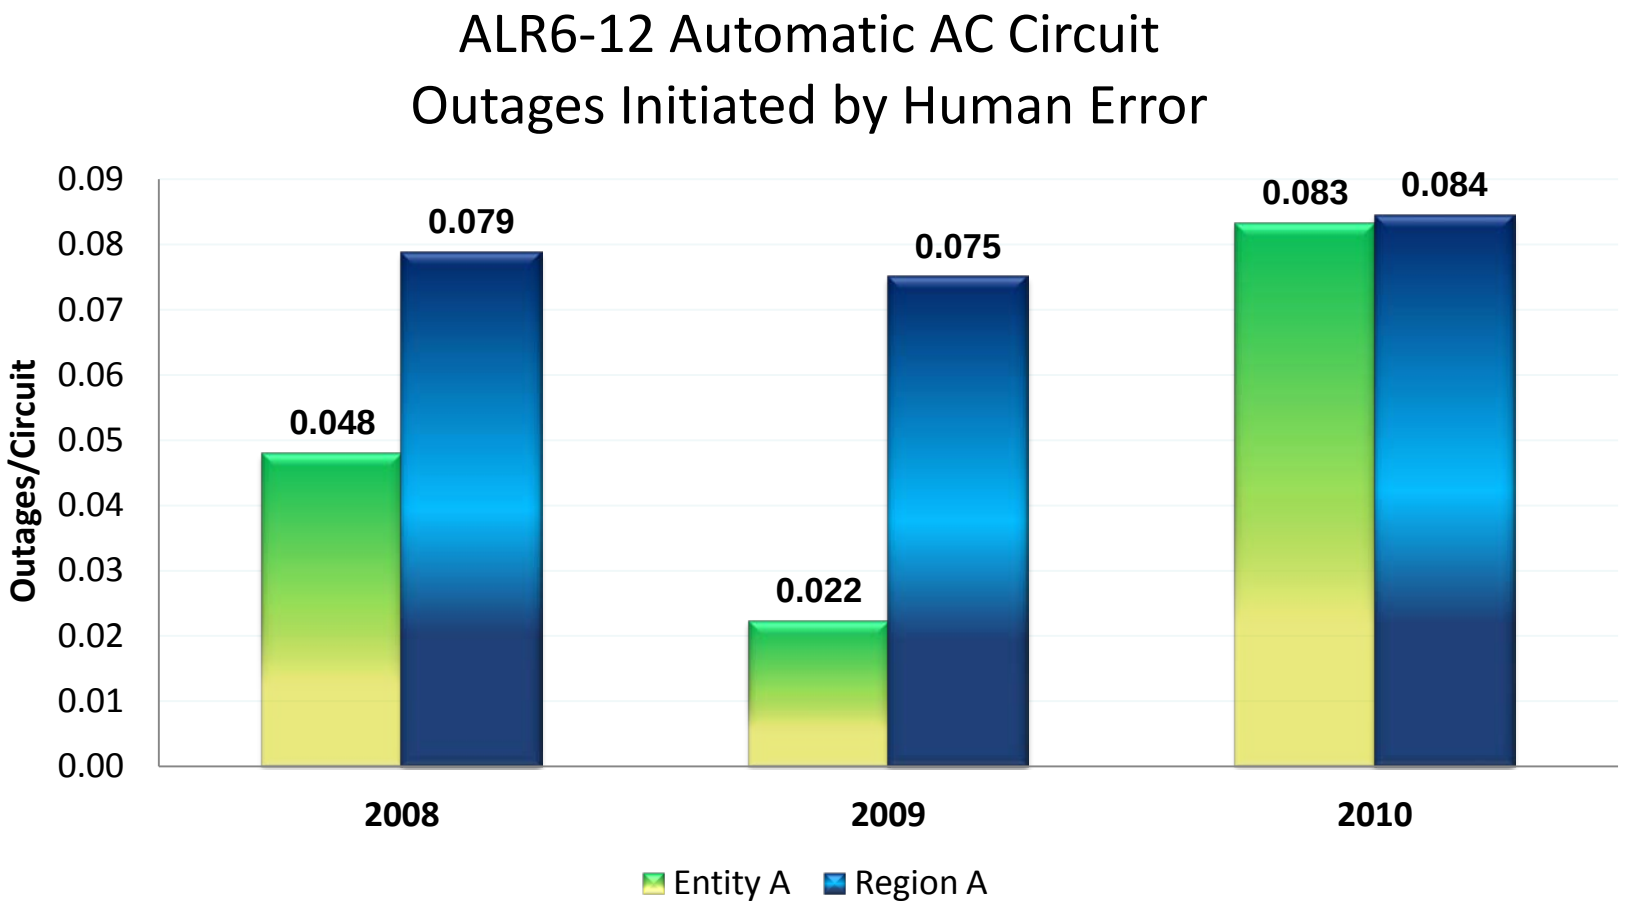
Reliability Metrics

- Unique metrics based on functional registration to measure performance
- How do we incorporate the Integrated Risk Index (IRI) into the entity assessment?

Reliability Metrics

- ALR6-11: Automatic Outages Initiated by Failed Protection System Equipment
  - This reliability metric shows automatic outages due to failed protection system equipment
- ALR6-12: Automatic Outages Initiated by Human Error
  - This reliability metric shows the automatic outages due to human error
- ALR6-15: Element Availability Percentage (APC)
  - This reliability metrics provides the overall percent of time the aggregate of transmission elements are available and in service
- Performance relative to the regional average

Reliability Metrics



Internal Compliance Program

- This assessment will allow a Regional Entity to identify generic strengths and weaknesses of a registered entities' culture of compliance
  - Examples of excellence and best practices
- It is envisioned that these identified examples of excellence and best practices can be shared with registered entities
  - Sharing will be on a group or individual basis
  - The sole purpose is to encourage the development and maintenance of a sound culture of compliance throughout the Regional Entity and the ERO

Internal Compliance Program

Key ICP Attributes	Reference Document
Officers/Personnel	Docket No. PL08-3-000: *FERC Policy Statement on Enforcement, Page 10, ¶ 22*
Independence	Docket No. PL06-1-000: *FERC Policy Statement on Enforcement, Page 10, ¶ 22*

Breakdown of Violations at NERC for Processing

Violations “at NERC” as of October 19, 2011

- 152 are BOTCC-approved
  - 40 from pre-September—33 scheduled for filing on October 31, 2011, with balance awaiting mitigation-related activities (MRA)
  - 52 from September—awaiting execution or MRA
  - 60 from October
- 130 are scheduled for BOTCC action in November and December

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda Item 5
MRC Presentation
November 2, 2011

September 8, 2011 Southwestern Outage

Member Representatives Meeting
November 2, 2011
Dave Nevius, Senior Vice President

RELIABILITY | ACCOUNTABILITY

Event Particulars

- Extended over Southern CA, parts of AZ, and Northern Baja California Mexico
- Over two million customers affected
- Loss of ~7,800 MW of customer load and ~5,000 MW of generation
- FERC and NERC conducting joint inquiry into event

Inquiry Status

- Interviews conducted with four entities to date:
  - Arizona Public Service
  - California Independent System Operator
  - Imperial Irrigation District
  - WECC Reliability Coordinator
- Data/information gathering from impacted entities
  - SCADA/EMS
  - PMU/DFR
  - Voice recordings
  - Logs
  - Interview results
  - Etc.

FERC/NERC Inquiry Teams

- Sequence of events
- System simulation/modeling
- Root cause and human performance analysis
- Operations tools, SCADA/EMS, communications, operations planning
- System planning, design, and studies
- Frequency/ACE analysis
- Transmission and generation performance, system protection and control, maintenance, damage
- System restoration
- Lessons learned and recommendations

Inquiry Timetable

- Our experience with events of this magnitude is that it takes a number of months to complete the analysis and prepare appropriate recommendations
- Timing of this inquiry will depend on what we learn as we get deeper into the analysis.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Agenda Item 6
MRC Presentation
November 2, 2011

February 2011 Cold Snap Report and Recommendations

Member Representatives Meeting
November 2, 2011
Earl Shockley, Director of Reliability Risk Management

RELIABILITY | ACCOUNTABILITY

Recommendations - Electric

- There were a total of 26 electric recommendations issued:
  - Planning and reserves (5)
  - Coordination with generator owners/operators (5)
  - Winterization (10)
  - Communications (4)
  - Load Shedding (2)
- There were also six gas recommendations

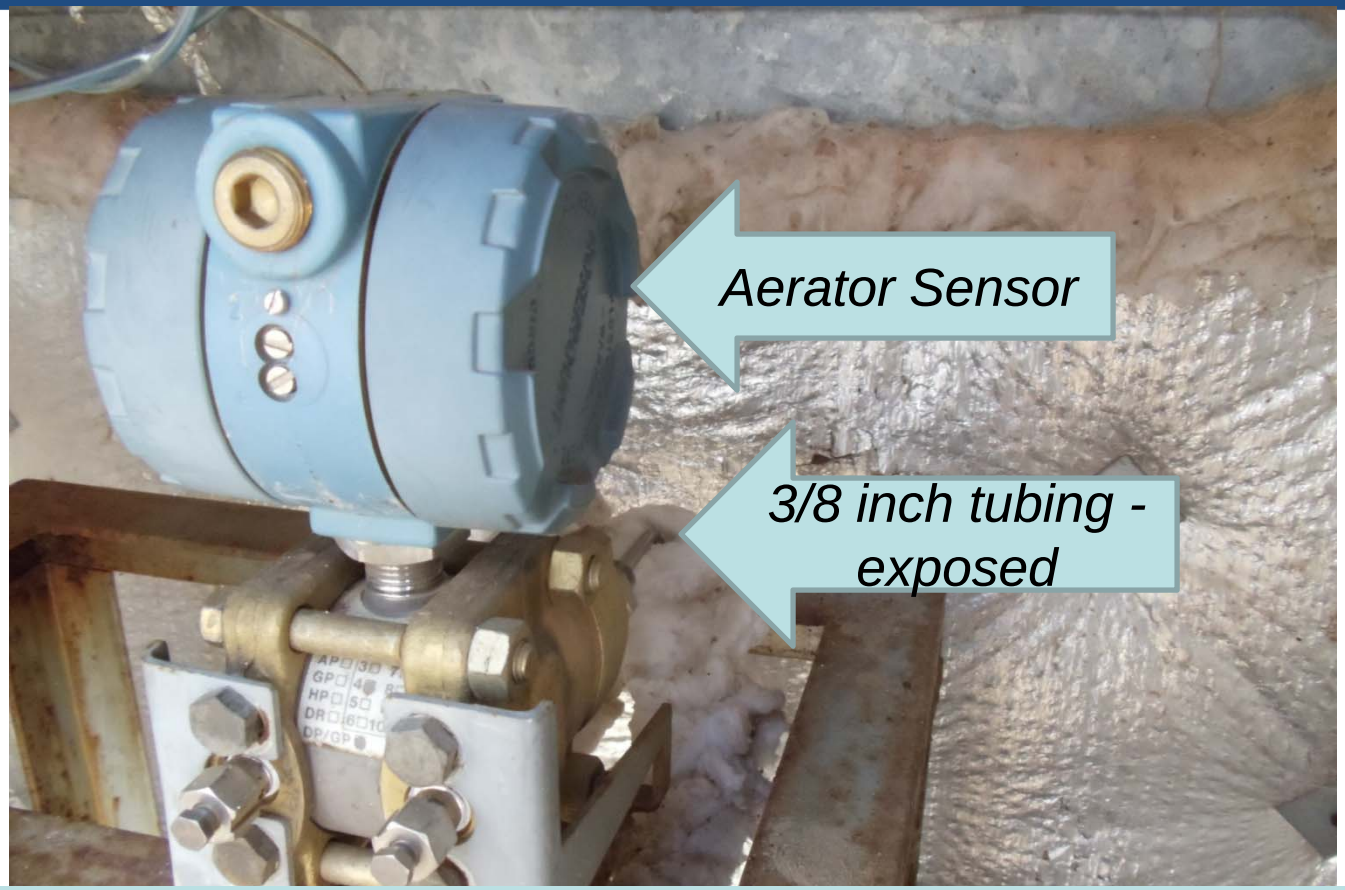
3 Key Findings - Summary

- Many generators failed to adequately apply and institutionalize knowledge and recommendations from previous severe winter weather events
- Generators failed to adequately prepare the plants for winter and were generally reactive as opposed to proactive
- Balancing Authorities, Reliability Coordinators and generators often lacked adequate knowledge of plant temperature design limits and the equipment most effected by freezing

Supporting Recommendations

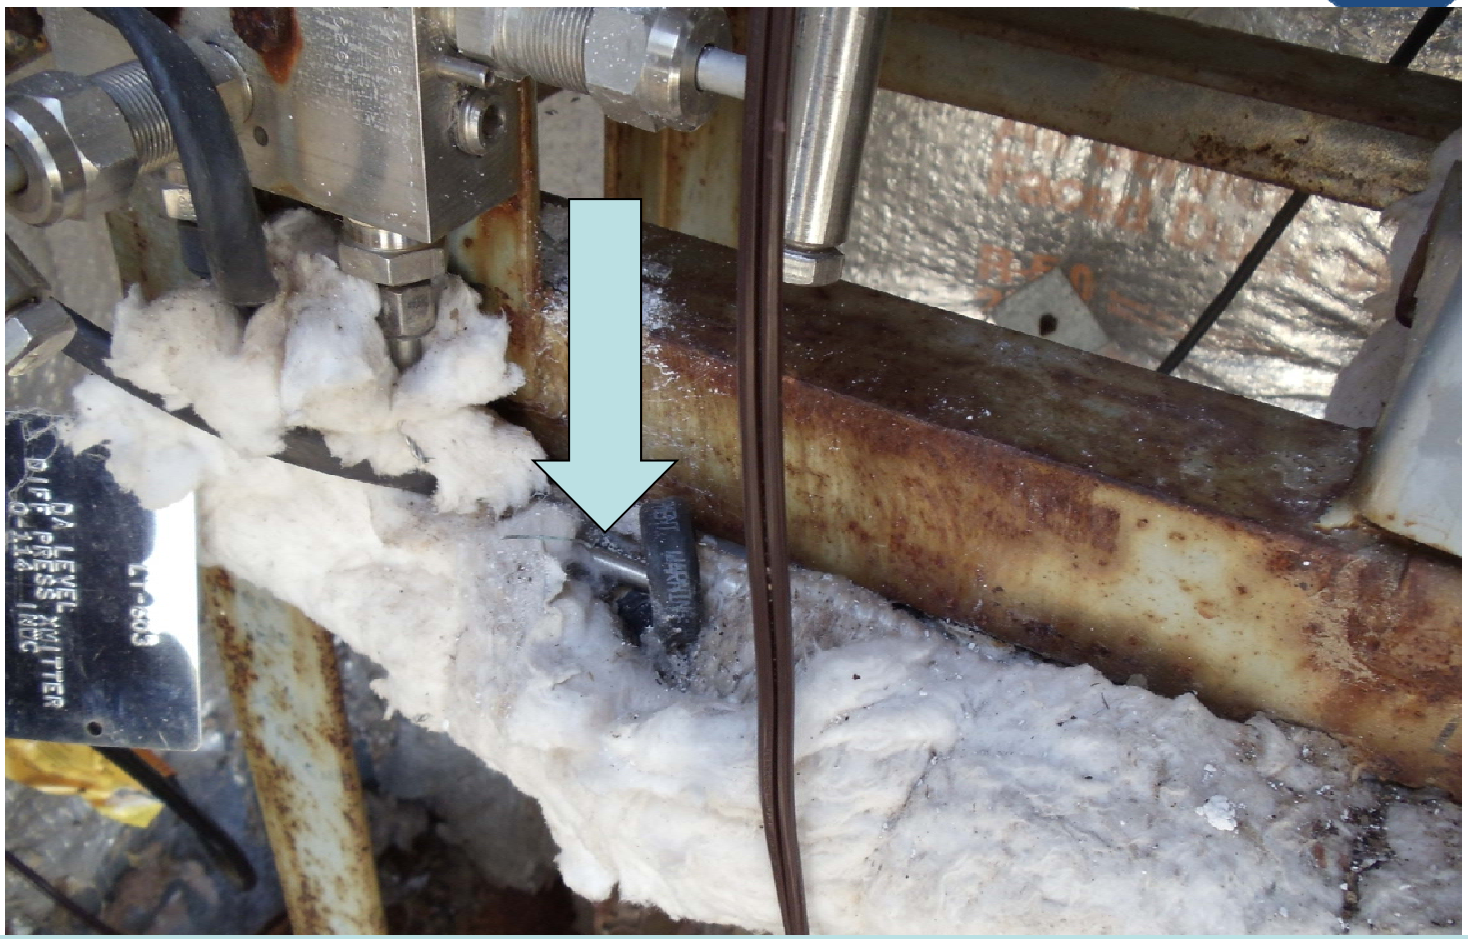
- R1 - BAs, RCs, and GO/GOPs – Consider winter peak season preparations as critical as summer peak season preparations
- R6 - TOs, BAs, and GO/GOPs – Verify that units that have fuel switching capabilities can periodically demonstrate those capabilities
- R8 - BAs, RCs and TOPs – Require GO/GOPs to provide accurate ambient temperature design specifications and keep current

Frozen Sensor



R 14 - GO/GOPs – Ensure that adequate maintenance and inspection of freeze protection elements is conducted on a timely and repetitive basis.

Inadequate Insulation

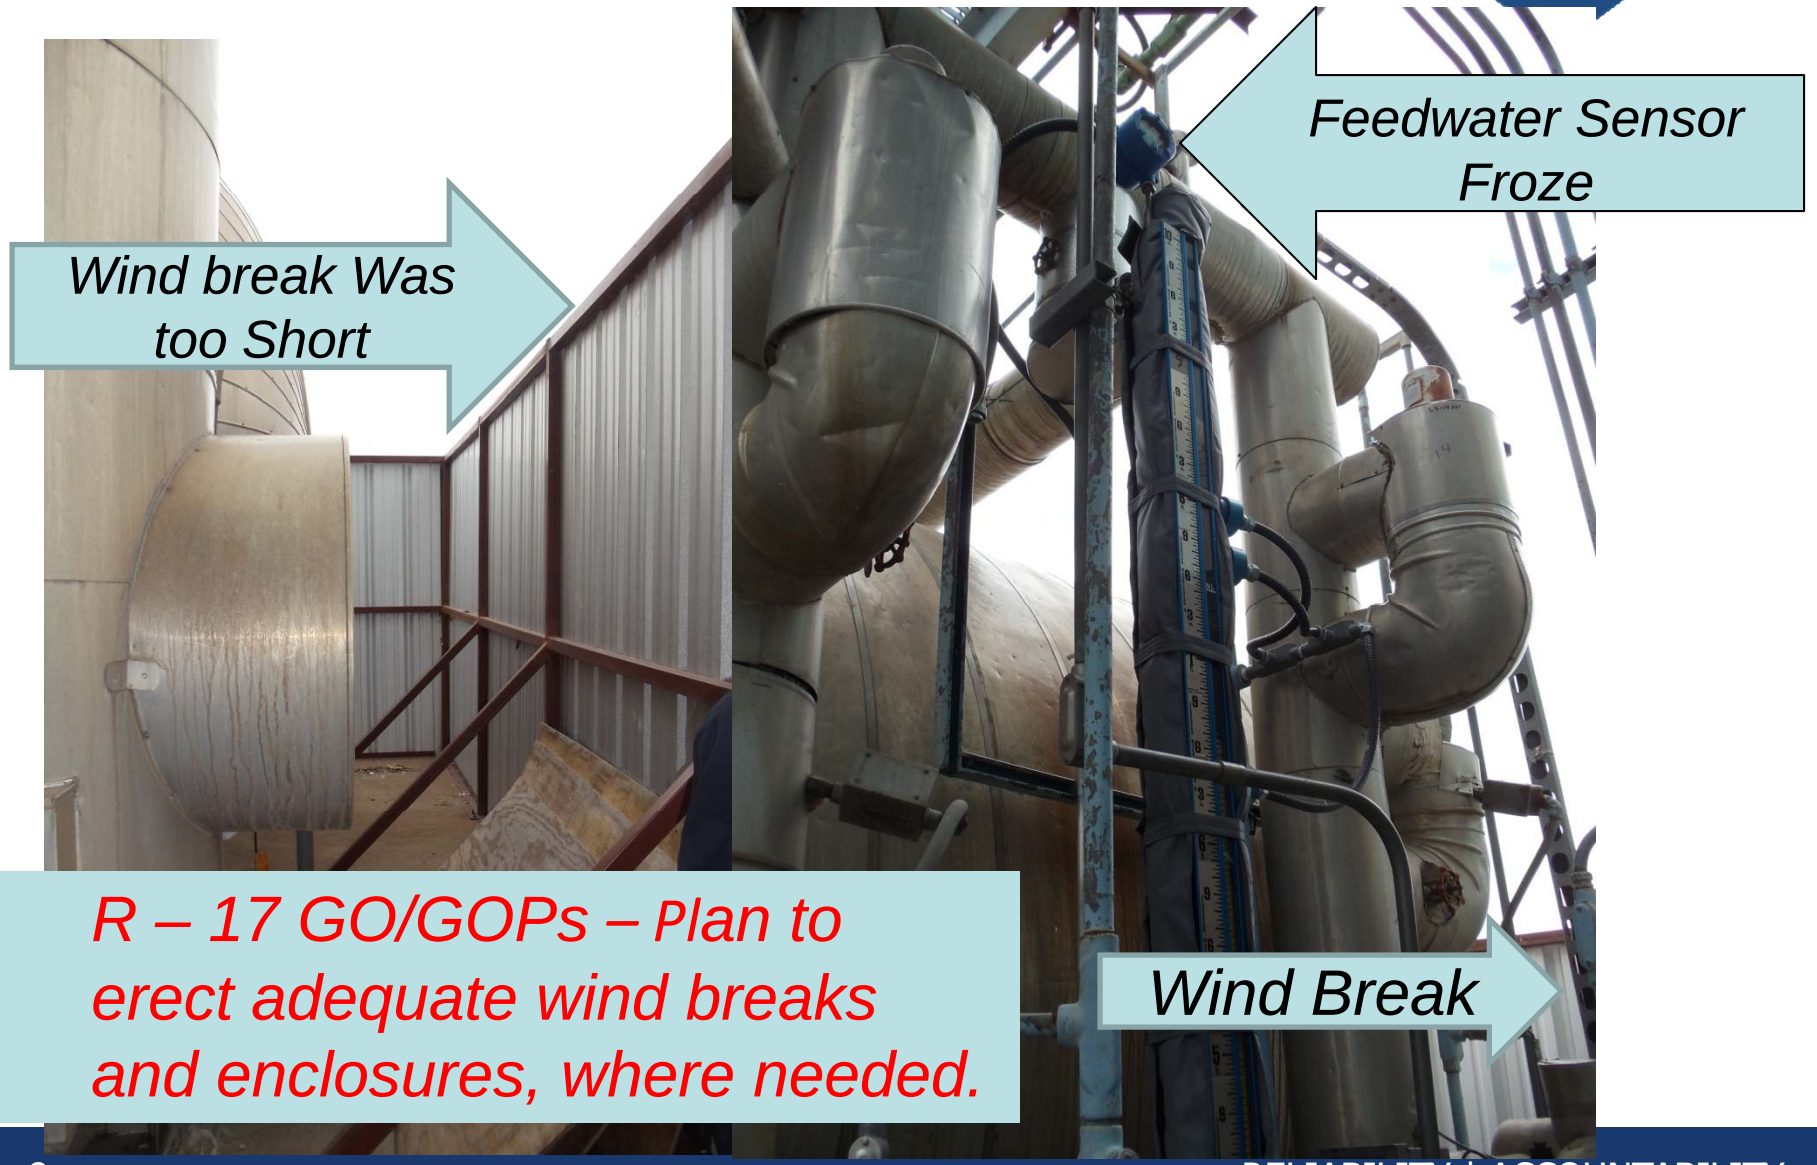


R – 16 GO/GOPs – Inspect and maintain thermal insulation on all units.

Lack of Insulation

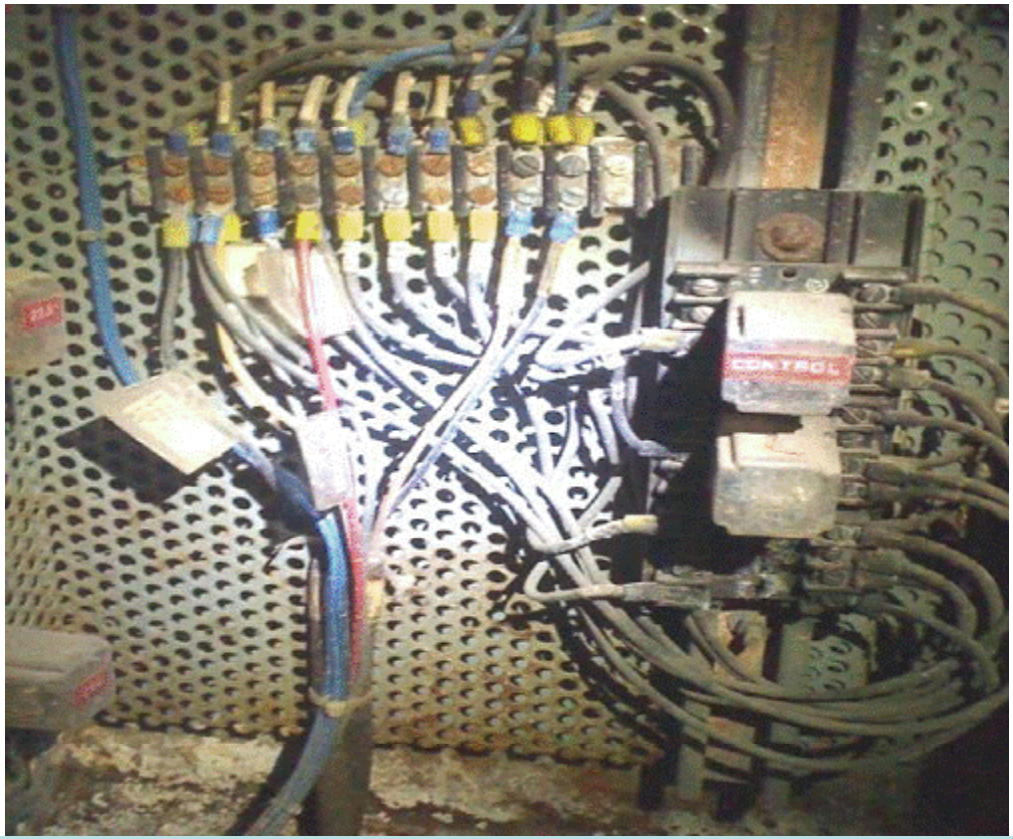
R – 18 GO/GOPs – Develop and annually conduct winter-specific and plant-specific operator awareness and maintenance training.

Wind Break Design



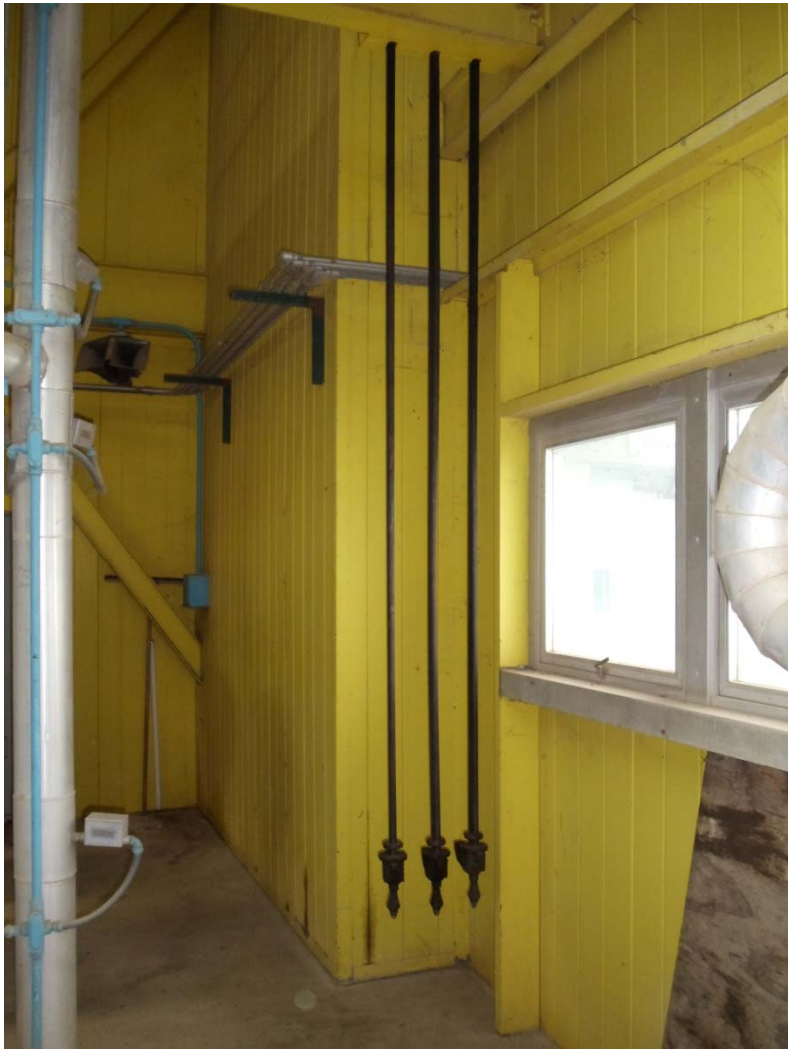
R – 17 GO/GOPs – Plan to erect adequate wind breaks and enclosures, where needed.

Corroded Freeze Protection Panel



R – 15 GO/GOPs – Inspect and maintain heat tracing equipment on all generating units.

Oil Burning Wands



R – 6 TOs, BAs, and GO/GOPs – Verify that units that have fuel switching capabilities can periodically demonstrate those capabilities

Fuel Transfer Valves

Agenda Item 10
MRC Presentation
November 2, 2011

Compliance Application Notice (CAN) Update to MRC

Member Representatives Meeting
November 2, 2011
Michael Moon, Director Compliance Operations

RELIABILITY | ACCOUNTABILITY

Agenda

- BOT guidance
- CAN Process
- CAN-0016 Sabotage Reporting Procedure
- Status of revisions to the remaining CANs currently posted as final

Board of Trustees Guidance

- Address CANs to Compliance Enforcement Authorities (auditors, investigators, enforcement staff, compliance enforcement authority staff)
- CANs are not to expand upon the standard or add requirements
- Avoid words such as “must”
- Provide a higher level of review for industry to access to contest a CAN
- Repost for industry comment

Industry Feedback on Process

- Provide more detail on the CAN development process to include vetting
- Post all industry comments for transparency
- Provide the feedback mechanism to Standards for issues not dealt with in the CAN
- Provide detail for the higher level review process, format and timelines
- Provide detail regarding the higher level reviewer(s) options

Industry Feedback on Process

- Create a systematic method for prioritizing CANs
  - Will solicit input from the Standards Committee and the Compliance and Certification Committee
- Track and provide requestor segment/source
- Provide more detail in responses to comment groups
- Provide appendix templates for industry use:
  - Appendix 1 – Can Template (currently provided on the NERC web site)
  - Appendix 2 – Industry Prioritization Recommendation Form
  - Appendix 3 – CAN Comments Template
  - Appendix 4 – Standards Issues Database Submittal Form
  - Appendix 5 – Higher Level of Review Submittal Form

Industry Feedback on Process

- Ballot Compliance Application Notices
  - Comments are sought and will be considered in the drafting phase
- Respond to every CAN comment individually
  - Comments will be grouped and answered in more detail
- Webinars prior to CAN development
  - Prioritization Form, Appendix 2, provides for input prior to drafting
  - Solicit input on prioritization and issues refinement from the Standards and Compliance and Certification Committees

Process

Revised CAN Process and appendices were approved by the BOTCC and reposted as final on October 14

- CAN Process (Clean)
- CAN Process (Redline)
- CAN Process Appendix 1 - CAN Template
- CAN Process Appendix 2 - Industry Prioritization Form
- CAN Process Appendix 3 - CAN Comment Form
- CAN Process Appendix 4 - Standards Suggestion Form
- CAN Process Appendix 5 - CAN High-Level Review Request Form

Industry Feedback CAN-0016

- Fundamental difference – documentation versus implementation of procedure
- Whether all employees must be aware of the entity's sabotage reporting procedure or only the operating personnel must be aware of the procedure
- Implementation would create an evidentiary burden
  - Documentation of events
  - Training
- Revised CAN did not answer the original question

CAN-0016

- Implementation is required
- All employees must be aware of the entity's sabotage reporting procedure
- Implementation would create an evidentiary burden
  - Documentation of events – not looking for documentation of every potential sabotage event but examples of where/how the process was utilized
  - Training – changed to awareness
- Revised CAN did not answer the original question
  - A CEA is to verify that facilities that may affect the bulk power system are not excluded

Status of Revisions to Final CANs

- Completed Industry Review and are in Analysis
  - CAN-0005 CIP-002-3 R3 Critical Cyber Asset Designation for System Operator Laptops
  - CAN-0006 EOP-005-1 R7 Verification of Restoration
  - CAN-0007 CIP-004-2 R4.2 & CIP-004-3 R4.2 Revocation of Access to CCAs
  - CAN-0008 PRC-005-1 R2 Basis for First Maintenance and Testing Date
  - CAN-0018 FAC-008 R1.2.1 Terminal Equipment
  - CAN-0009 FAC-008 and FAC-009
  - CAN-0010 Definition of Annual
  - CAN-0011 PRC-005-1 R2 New Equipment
  - CAN-0012 Completion of Periodic Activity Requirements Prior to a Registered Entity's Effective Date for a Standard
  - CAN-0013 PRC-023-1 R1 and R2 Effective Dates for Switch-On-To-Fault Schemes
  - CAN-0015 Unavailability of NERC Software Tools
  - CAN-0022 VAR-002-1.1b R1 and R3 Generator Operation in Manual Mode
  - CAN-0026 TOP-006 R3 Protection Relays
  - CAN-0028 TOP-006 R1.2 Reporting

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Fundamental Issues

- Where compliance monitoring is not explicitly addressed by a standard:
  - Whether a range of acceptable compliance actions may be defined or
  - Whether compliance is to be monitored according to each entity's interpretation of the standard?
- What is the appropriate level of industry involvement in the determination of a range of acceptable compliance actions?
- Where a standard requires a procedure or process but does not specify implementation is implementation implied?

Summary

CANs with changes suggested by industry under consideration:

- CAN-0006 EOP-005-1 R7 Verification of Restoration
- CAN-0012 Completion of Periodic Activity Requirements Prior to a Registered Entity's Effective Date for a Standard
- CAN-0013 PRC-023 Switch on to Fault Schemes
- CAN-0016 CIP-001 R1 Sabotage Reporting Procedure
- CAN-0018 FAC-008 R1.2.1 Terminal Equipment
- CAN-0022 VAR-002-1.1b R1 and R3 Generator Operation in Manual Mode
- CAN-0024 CIP-002-1 R3.1 Routable Protocols and Data Diode Devices
- CAN-0030 Attestations
- CAN-0031 CIP-005, -006 Acceptable Opening Dimensions

Summary

- Have revised the Process per BOT guidance and Industry feedback
- Reposted CAN-0016 as final per BOT guidance and with consideration of industry feedback
- Anticipate reposting by the end of the year:
  - all CANs previously posted as final plus
  - 11 additional CANS currently in process
- Will implement posting all industry comments with CANs under development that were not previously posted as final
- Will implement all new process steps with new CANs

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Questions?

Revisions to Final CANs

Posted on September 1, 2011 with comments due September 21, 2011. Industry comments are currently being analyzed.

- CAN-0005 CIP-002 R3: Critical Cyber Asset Designation for System Operator Laptops
- CAN-0006 EOP-005: Verification of Restoration
- CAN-0007 CIP-004 R4: Revocation of Access to CCAs
- CAN-0008 PRC-005 R2: Pre-June 18, 2007 Evidence
- CAN-0018 FAC-008: Terminal Equipment

Revisions to Final CANs

Posted on September 23, 2011 with comments due October 14, 2011.

- CAN-0009 FAC-008 and FAC-009: Facility Ratings and Design Specifications
- CAN-0017 CIP-007 R5: Technical and Procedural System Access and Password Controls
- CAN-0029 PRC-004 R1, R2 and Re: Protection System Misoperations
- CAN-0031 CIP-006 R1: Acceptable Opening Dimensions
- CAN-0039 EOP-004 Filing DOE Form OE-417 Event Reports

Revisions to Final CANs

Approved by CAN Executive Approval Team

- CAN-0010 Multiple Standards: Definition of “Annual”
- CAN-0011 PRC-005-1 R2: New Equipment
- CAN-0012 CIP-002 through CIP-009: Completion of Periodic Activity by Effective Date
- CAN-0013 PRC-023 R1 and R2: Switch on to Fault Schemes
- CAN-0015 Multiple Standards: NERC Software Tools
- CAN-0022 VAR-002 R1: Generator Operation in Manual Mode
- CAN-0026 TOP-006 R3: Protection Relays
- CAN-0028 TOP-006 R1.2: Reporting

Project 2010-17 Definition of Bulk Electric System

Member Representatives Meeting
November 2, 2011
Peter Heidrich, FRCC – BES Definition Drafting Team Chair
Carter Edge, SERC – ROP Drafting Team Chair

RELIABILITY | ACCOUNTABILITY

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Topics

- Expanded project plan
- Bulk Electric System (BES) Definition
  - Initial ballot results
  - Clarifications
- Rules of Procedure exception process (Appendix 5C)
- Exception application form
  - Initial ballot results
  - Industry concerns
- Implementation plan
- Near-term project milestones

Project Plan - Phased Approach

- Phase 1 - Addresses directives from Orders No. 743 and 743-A
- Phase 2 - Addresses concerns identified through the Standards Development Process

(DRAFT Standard Authorization Request and the *Bulk Electric System Definition Project - Fact Sheet* has been posted for informational purposes.)

Project Plan - Phased Approach

- NERC Standards Committee
  - Approved the multi-phased approach
  - Committed to keeping this project on its “High Priority” project list
  - Committed to continuing development work with the current SDT through completion of Phase 2
  - Committed to supplying resources to complete technical research

Initial Ballot Results

- BES definition ballot results
  - Quorum: 92.97%
  - Approval: 71.68%
- Comments from 255 different people from 156 companies representing 10 of the 10 industry segments

BES Definition – Clarifying Revisions

- Transformer designations
- Generation threshold values
- Reactive resources
- Behind the meter generation
- Local networks

BES Designation Criteria Inclusions

I1 - Transformers with the primary terminal and at least one secondary terminal operated at 100 kV or higher unless excluded under Exclusion E1 or E3.

BES Designation Criteria Inclusions

I2 - Generating resource(s) with gross individual nameplate rating greater than 20 MVA or gross plant/facility aggregate nameplate rating greater than 75 MVA including the generator terminals through the high-side of the step-up transformer(s) connected at a voltage of 100 kV or above.

BES Designation Criteria Inclusions

I5 –Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I1.

BES Designation Criteria Exclusions

E2 - A generating unit or multiple generating units on the customer's side of the retail meter that serve all or part of the retail Load with electric energy if: (i) the net capacity provided to the BES does not exceed 75 MVA, and (ii) standby, back-up, and maintenance power services are provided to the generating unit or multiple generating units or to the retail Load by a Balancing Authority, or provided pursuant to a binding obligation with a Generator Owner or Generator Operator, or under terms approved by the applicable regulatory authority.

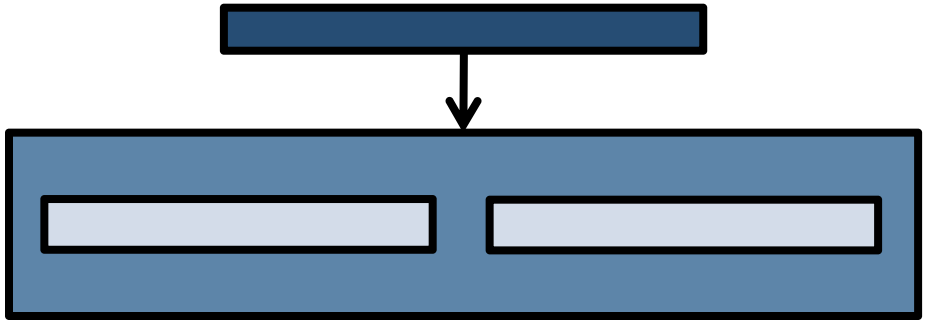
BES Designation Criteria Exclusions

E3 – Local networks (LN):

The LN is characterized by all of the following:

a) Limits on connected generation
b) Power flows only into the LN and the LN does not transfer energy originating outside the LN for delivery through the LN
c) Not part of a Flowgate or transfer path

Bulk Electric System Definition



Note - Elements may be included or excluded on a case-by-case basis through the Rules of Procedure exception process.

Rules of Procedure Exception Process

- What's Posted (Through October 27, 2011)
  - For Comment
    - New Rule 509
    - New Rule 1703
    - New Appendix 5C
  - For information
    - Process flow diagrams
    - Exception Request Form (Sample)

Rules of Procedure Exception Process

- New Rule 509 - Exceptions to the Definition of the Bulk Electric System

  "Appendix 5C sets forth the procedures by which (i) an entity may request a determination that an Element that falls within the definition of the Bulk Electric System should be exempted from being considered a part of the Bulk Electric System, or (ii) an entity may request that an Element that falls outside of the definition of the Bulk Electric System should be considered a part of the Bulk Electric System."

Rules of Procedure Exception Process

- New Rule 1703 - Challenges to NERC Determinations of BES Exception Requests under ROP
  - Leverages existing (proposed) appeals process
  - NERC's decision to Approve, Disapprove, or Terminate
  - 30 days to appeal
  - 90 days for review panel to decide
  - May request BOTCC review panel decision

Rules of Procedure Exception Process

- New Appendix 5C
  - Entity determination of status is a prerequisite for requesting an exception
  - Section 4: Who's and What's
    - Who can submit and who to submit a request to
    - What to submit
    - Who "approves"
    - What happens if I disagree
  - Section 5: What to expect

Rules of Procedure Exception Process

- Initial screening
  - Region “accepts or rejects” the request for substantive review
    - Eligible submitter?
    - Request for exception?
    - Required information provided?

Rules of Procedure Exception Process

- Substantive review
  - Region recommends “approval or disapproval” of request to NERC based on:
    - “necessary for the reliable operation of the interconnected bulk power transmission system as evidenced by required information provided”.

Rules of Procedure Exception Process

- NERC decision
  - NERC receives the request record with a recommendation from the Regional Entity
    - States the basis for the recommendation
    - Includes information considered by the Regional Entity in arriving at its recommendation
  - Submitting Entity or Owner has opportunity to comment in support or opposition to the recommendation
  - NERC decision final if not appealed

Rules of Procedure Exception Process

- Implementation plans for requests
  - Status “as is” when going through the process
  - Some implementation may be necessary for:
    - New inclusion exceptions
    - Denials of exception requests for exclusion
      - Newly-constructed or installed element
      - Was not included in the bulk electric system under the bulk electric system definition in effect

Exception Process Technical Principles

- Comments from first formal posting
- Reliability benefits of an element cannot be determined by a single study or analysis of a single parameter
- Not feasible to establish continent-wide values and/or limits

Exception Process Technical Principles

- The Standard Drafting Team has adopted a new approach:
  - "Detailed Information to Support an Exception Request" application form
  - Targeted questions for transmission and generation addressing the facility characteristics with guidance on the type of supporting evidence to accompany request
  - No hard numbers to guide the evaluation
  - Engineering judgment will be utilized to perform the evaluation of the evidence in a consistent, repeatable, and verifiable process

Initial Ballot Results

- Detailed information to support an Exception Request application form ballot results:
  - Quorum: 89.53%
  - Approval: 64.03%
- Comments from 137 different people from 83 companies representing 10 of the 10 industry segments

Exception Process Technical Principles

- Industry concerns:
  - Desire “hard” and “fast” guidance
  - Limited role in process
  - Impact of “yes” or “no” response to questions
  - What is the benchmark for evaluation?
  - Will phase 2 examine process results?

Exception Process Technical Principles

- Standard Drafting Team response:
  - Individual variables, extenuating circumstances
  - Open and transparent exception process
  - Professional experience
  - No single answer will determine outcome
  - Necessary for the reliable operation of the grid
  - Phase 2 will examine process results

Implementation Plan

- Effective dates:
  - This definition shall become effective on the first day of the second calendar quarter after applicable regulatory approval or Board of Trustees adoption as applicable
- Compliance obligations:
  - For elements included by the definition – 24 months after the applicable effective date of the definition
  - Standard Drafting Team believes that the timeframe is needed to:
    - Effectively produce reasonable transition plans
    - Submit any necessary registration changes
    - File for exceptions
    - Provide training

Near-term Project Milestones

- Recirculation Ballot (November 14, 2011)
  - Revised bulk electric system definition with designations (inclusions and exclusions)
  - Implementation plan
  - “Detailed Information to Support an Exception Request” application form
- Post Phase 2 SAR (December 2011)
- File with the Commission (FERC) by January 25, 2012

Agenda Item 13
MRC Presentation
November 2, 2011

Adequate Level of Reliability

MRC BES/ALR Policy Group

Member Representatives Committee
November 2011

RELIABILITY | ACCOUNTABILITY

MRC BES / ALR Policy Group

- Three policy questions addressed
- Ad hoc subgroup developed responses
- Followed specific format:
  - Issue Statement
  - Recommendations
  - Background
  - Options and analysis *(advantages and disadvantages)*

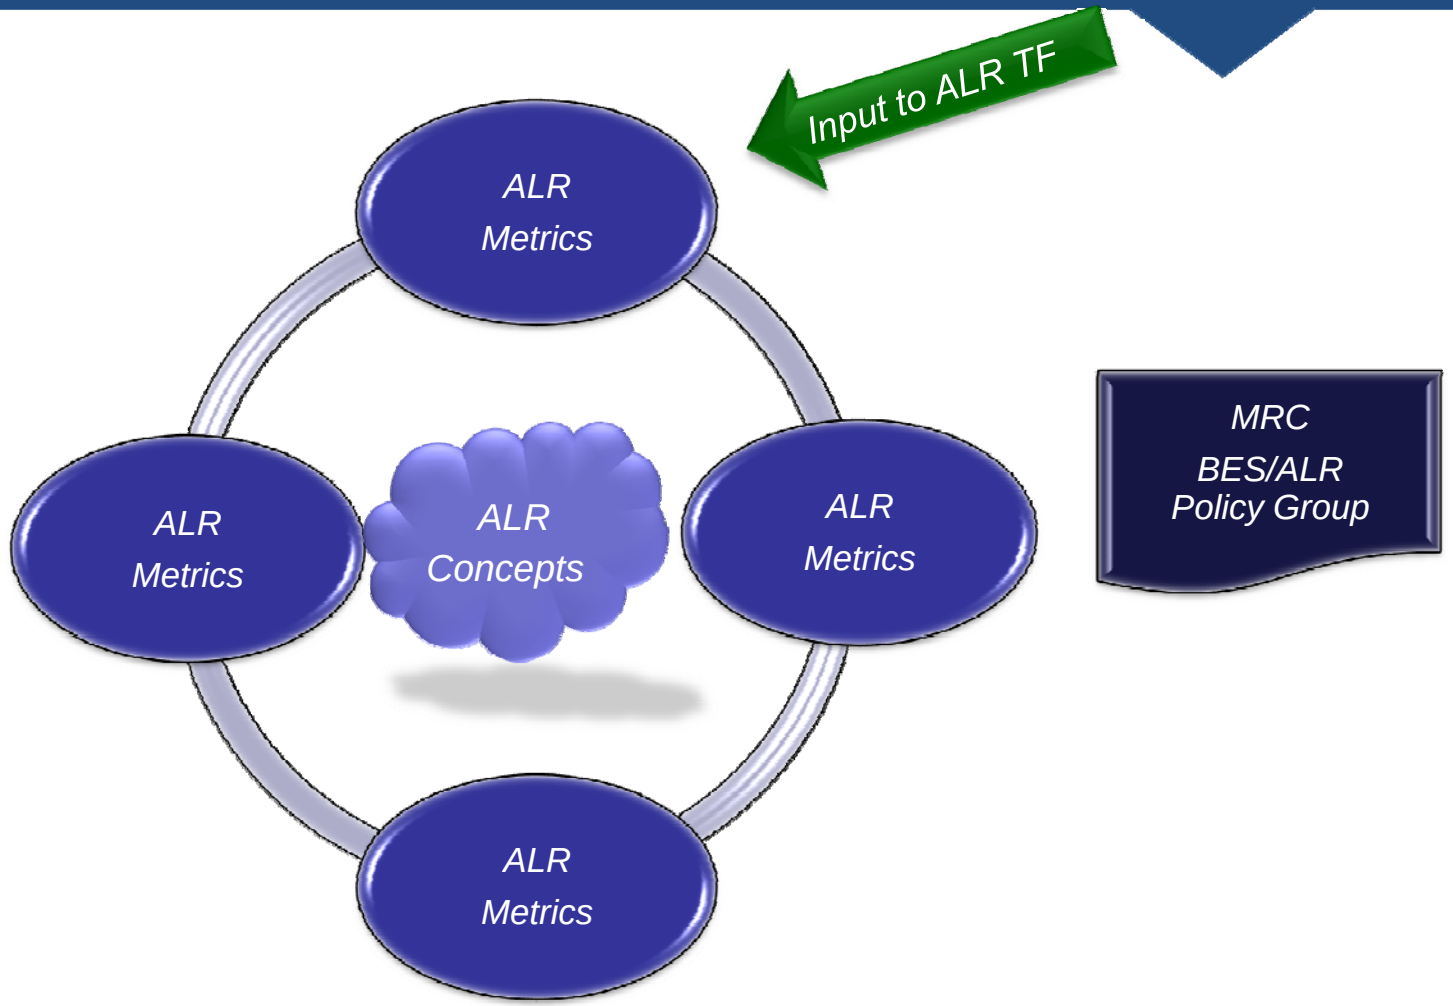
Recommendations

- How should cost/benefit be factored into ALR? How and by whom should those decisions be made? [jurisdictional issues]*:*
  - **Recommendation:** *Assess the reliability objectives of ALR criteria and provide an explicit recognition of high-level macro cost-effectiveness of requirements within a reliability standard to meet the reliability objectives.*
- How should "cascading" be defined?
  - **Recommendation:** *No change to the definition of Cascading.*

Recommendations

- Is the impact of all load loss equal? For example, is the impact of *"X"* MWs of load loss in a major metropolitan area the same as *"X"* MWs in a rural area?
  - **Recommendation:** *Revise ALR defining criteria to differentiate among the different characteristics of loss of supply, transmission and load loss as a function of planning design, operator preparations and ability to control outcomes from events; and refine the incorporation of resilience and recovery in the ALR elements.*

Policy Input from MRC on ALR



ALR Task Force Status

- ALR Task Force has met monthly since June 2011
- ALTF began with fundamental BES reliability objectives and target outcomes to achieve “ALR”
  - Occam’s Razor
  - Only now comparing ALRTF working definition with current ALR definition
- ALR Definition must be:
  - Concise, yet self-contained
  - Self-explanatory to BES planners and operators
  - Meaningful to policy-makers – placing a premium on translation in the ALRTF Report

ALR Task Force Status

- Discussions include:
  - System characteristics (performance objectives and target outcomes)
    - Prevent BES instability, uncontrolled separation, cascading, and voltage collapse when subjected to predefined initiating events
    - Maintain system frequency and voltage within parameters
    - Positive damping and stability after initiating events
    - Sufficient transfer capability and resources to serve load
    - Minimize scope and duration of disturbances and ensure rapid restoration (resiliency)

ALR Task Force Status

- Measurement of characteristics
  - Capability and resources to meet load obligations
  - Common mode failure - caused by related events
  - TADS: non-automatic/automatic outages
  - Uncontrolled versus unnecessary tripping

Rules of Procedure Revisions

Member Representatives Committee Meeting
November 2, 2011
Rebecca Michael, Associate General Counsel

RELIABILITY | ACCOUNTABILITY

Non-Substantive Revisions

- Capitalization and definition revisions to the Rules and Appendices
  - The proposed revisions are in the NERC Rules of Procedure and all existing Appendices to the Rules of Procedure (3A, 3B, 3C, 4A, 4B, 4C, 4D, 4E, 5A, 5B, 6 and 8), as well as proposed new Appendix 2, Definitions of Terms Used in the Rules of Procedure.
  - These revisions are being made in response to the RDA Order at PP 92-93
  - These are intended to be non-substantive revisions and the objectives are:
    - To place all definitions of defined terms used anywhere in the Rules of Procedure in a single, readily-accessible location (proposed Appendix 2)
    - To capitalize defined terms throughout the Rules of Procedure where they are intended to be used in their defined meanings (as well as proper nouns and similar terms normally capitalized)
    - To lower-case other terms that are currently capitalized in the Rules of Procedure but are not defined terms
    - Definitions from the NERC *Glossary of Terms* were used where appropriate

Non-Substantive Revisions

- The revisions were posted for public comment on September 2, 2011
- Public comments were submitted to NERC on October 17, 2011
- Further revisions have been made based on the comments
- These will be presented to the Board of Trustees for approval on November 3, 2011
- They will be filed with Applicable Governmental Authorities for approval thereafter

Substantive Revisions

- Timeline for Board of Trustees approval
  - There are two sets of substantive revisions
    - On June 30, 2011, proposed revisions to Sections 100-1600 and Appendices 4B and 4C were posted for public comment
      - Comments were submitted on August 15, 2011
    - In November 2011, additional revisions will be posted
      - In addition to changes in response to comments, these will include, among other things, new revisions to Sections 1002, new Section 1800 on administrative fines (originally posted as Section 414), Sections 807/808 and Appendix 8 regarding Events Analysis, Appendix 6 deleted and material moved to Section 600 – a summary of all revisions is included in agenda materials

Substantive Revisions

- Following the November Board meeting, a revised, consolidated set of proposed revisions will be posted for a 45-day comment period
- They will be submitted for Board of Trustees approval at the February 2012 meeting

Revisions to June 30

- A new administrative fine provision, Section 1800, will apply only to failure to provide information in response to Level 2 (Recommendations) and Level 3 (Essential Actions) notifications
- Two proposed hearing provisions have been eliminated
  - One would have allowed NERC to reach down to take a case
  - The other would have allowed the Hearing Body to increase a penalty due to frivolous filings, dilatory tactics, *etc*.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

New Provisions

- Section 300, Reliability Standards Development
- Personnel Certification, Appendix 6 deleted, materials moved to Section 600
- Event Analysis, Section 800 and Appendix 8
- Procedure for Coordinating Reliability Standards Approvals, Remands, and Directives, Appendix 3C
- Compliance Monitoring and Enforcement Program, Appendix 4C, at new Section 5.11, Participation by RTO/ISO members in enforcement action
- Organization Registration and Certification, Section 500 and Appendix 5A

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Reliability Standards

Board of Trustees Meeting
November 3, 2011
Herb Schrayshuen, Vice President Standards and Training

RELIABILITY | ACCOUNTABILITY

Standards Actions

- Continent-wide Standards Program
  - Project 2007-07 – Vegetation Management – FAC-003-2
  - Reliability Standard Development Plan 2012-2014
- Regional Standards Programs
  - MOD-025-RFC-1: Reactive Power Capability
  - IRO-006-TRE-1: IROL and SOL Mitigation in the ERCOT Interconnection
  - PRC-006-SERC-1: Automatic Underfrequency Load Shedding (UFLS) Requirements
- CIP Implementation Plan Resolution

Vegetation Management - FAC-003-2

- FAC-003-2 – Transmission Vegetation Management
- Foundational standard for vegetation management
- Requirements include several significant improvements relative to existing standard
- Revised definitions for:
  - Right-of-Way (ROW)
  - Vegetation inspection
- Includes a new definition for:
  - Minimum Vegetation Clearance Distance (MVCD)
- Approval 86.25% - Quorum 87.17%

Highlights of New Standard

- Results-based additions:
  - Provides background, rationale, and guidelines to support implementation within standard
- Requirement improvements:
  - Expanded vegetation management to include all lands without regard to ownership
  - Subdivided requirement for inspections and communications of imminent threats for improved clarity
  - Retained obligation to report vegetation-related outages but moved out of requirements into compliance reporting
  - Added objective method for calculating vegetation clearances
  - Added time-bound vegetation inspection intervals

Highlights of New Standard

- Includes explicit requirements to manage vegetation:
  - Requires prevention of all vegetation encroachments inside the MVCD
- Uses Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) to focus work on lines posing greatest risk to reliability

Minority Issues

- Uses objective method to define the MVCD which identifies the minimum flash-over distances but does not provide any margin
  - New standard obliges entities to maintain vegetation appropriately without using a one-size-fits-all approach
- Focuses on managing vegetation on ROWs that could lead to cascading outages, but not other outcomes of vegetation related outages beyond those that cause cascading, uncontrolled separation, and instability
  - SDT feels that the ERO's responsibility is limited to developing standards that prevent cascading, uncontrolled separation, and instability only

Minority Issues

- Requirement for each Transmission Owner to complete 100 % of its annual vegetation work plan is not enforceable as written and also provides entities with reasons for not completing 100% of their work plan
  - New standard ensures that Transmission Owners are not penalized for a failure to complete their annual plan as long as the changes do not lead to any vegetation-related encroachments into the MVCD
- Requirement for vegetation management plan replaced with less detailed requirements and no obligation for document maintenance
  - New standard focuses on actual performance

Minority Issues

- Moderate and High (rather than Severe) VSLs for sustained outages from fall-ins and blow-ins from within ROW "lower" expectations for prevention of these types of vegetation outages even on critical lines
  - VSLs linked to failure to comply with different aspects of management program – not all aspects of program are equal
- Continues to exclude all vegetation fall-ins and blow-ins from outside the ROW, the most significant contributor to vegetation caused sustained outages
  - Couldn't write requirement applicable to all Transmission Owners when utilities have limited rights to manage vegetation outside ROW

Minority Issues

- Exemptions in footnotes call into question enforcement discretion
  - Provisions prevent Transmission Owners from having to develop burdensome self-reports of violations for conditions that were outside their control. Explicitly noting these concerns should not have any impact on enforcement discretion.

Reliability Standards and Development Plan (RSDP)

- Update Milestones:
  - July 2011 – solicited suggestions for additional projects
  - August 2011 – Standards Committee reviewed and prioritized projects
  - September 2011 – posted draft plan for stakeholder comment
    - Received 15 sets of comments representing views from 63 people, 38 companies, and all 10 of the 10 industry segments.
  - October 2011 – Standards Committee approved the 2012-2014 RSDP

Highlights of RSDP

- Standards Committee considered three separate aspects for prioritization (reliability, time sensitivity, and practicality), and tested a fourth (cost considerations).
  - This allowed the Standards Committee to consider each of the key drivers separately, as well as in aggregate, to determine how best to allocate resources.

Highlights of RSDP

- Standards Committee allocated the throughput capability to three areas:
  - Reliability – 8 projects
  - Time-sensitive projects – 3 projects
  - Practicality projects – 2 projects

Highlights of RSDP

- Projects continuing/starting in 2012 address:
  - Protection systems and associated misoperations
  - Communications
  - Cyber security
  - Real-time operations
  - Frequency response
  - Definition of Bulk Electric System (BES)
- Process will continue to evaluate emerging issues: cold weather, GMD, ROW clearances, etc.
  - Plan is expected to be dynamic, and the Standards Committee may implement differently if needed to respond to emerging issues

Reactive Power Capability MOD-025-RFC-1

- MOD-025-RFC-1 - Verification and Data Reporting of Gen Gross and Net Reactive Power Capability
  - Provides planning entities with accurate generator gross and net reactive power capability modeling data
  - Requires Generator Owner to verify operating range of reactive power capability every five years
  - Requires Generator Owner to provide verification data to its Transmission Planner, Transmission Operator, Reliability Coordinator or Planning Coordinator
  - Developed to supplement MOD-025-1 continent-wide standard (under development)

Minority Issues

- No need for regional standard since continent-wide MOD-025-1 under development
  - Reliability*First* fulfilling its obligation under MOD-025-1 (approved by board, not by FERC)
  - When continent-wide MOD-025 approved, Reliability*First* standard will be reviewed for duplicative requirements
  - Replacement of legacy documents required in Reliability*First*'s Bylaws
  - New standard addresses ambiguities, inconsistencies and deficiencies in legacy documents

Minority Issues

- Attachment 1 Section 2.1 is too rigid; will hinder ability to obtain reactive power test results when plant conditions do not allow the real power to be at the level reported in MOD-024-RFC-01.
  - Reported capability equal to unit's continuous, sustainable output 24/7 without encountering equipment limits (may be different from unit's maximum capacity)

IROL and SOL Mitigation in ERCOT – IRO-006-TRE-1

- IRO-006-TRE-1 - IROL and SOL Mitigation in the ERCOT Interconnection
  - Provides enforceable requirements associated with existing ERCOT congestion management procedures
  - Requires Reliability Coordinator to have and implement procedures for identification and mitigation of exceedances of identified IROLs and SOLs unresolved by automatic actions of ERCOT Nodal market operations system
  - Addresses directive in FERC Order 693 paragraph 964:

    "…Modify … ERCOT procedures to ensure consistency with the standard form of the Reliability Standards including Requirements, Measures and Levels of Non-Compliance."

Automatic Underfrequency Load Shedding (UFLS) Requirements – PRC-006-SERC-1

PRC-006-SERC-1 - Automatic Underfrequency Load Shedding Requirements

- Identifies Planning Coordinator as entity responsible for developing UFLS schemes
- Adds requirements for Planning Coordinators not contained in continent-wide standard PRC-006-1:
  - Include SERC subregion as identified island required by PRC-006-1
  - Select/develop automatic UFLS scheme meeting specified criteria
  - Conduct simulations of UFLS schemes for load and generation imbalances of 13%, 22%, and 25%

Highlights of New Standard

- Transmission Owners and distribution providers required to implement the UFLS schemes developed by Planning Coordinator and changes to those schemes within 18 months of notice
- Planning Coordinators required to provide specified information to SERC
- Generator Owners required to provide specified information to SERC to facilitate post-event analysis of frequency disturbances

Highlights of New Standard

- Clearly defines roles and responsibilities of responsible entities
  - Planning Coordinator responsible for developing UFLS schemes within its Planning Coordinator area
- Requires more granular studies of frequency response than continent-wide PRC-006-1 (three specified load/generation imbalance levels)
- Requires reporting to SERC to aid in post-event analysis

Minority Issues

- Question correlation between Continent-wide and SERC standards and how the two standards work together
  - SERC standard provides regional detail for some of the NERC requirements
  - SERC standard is not stand-alone; works in conjunction with continent-wide UFLS standard

Minority Issues

- No need for a regional standard – continent-wide standard sufficient
  - Regional requirements provide regional consistency and coordination
  - Regional standard more stringent than continent-wide standard

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Special Report: Spare Equipment Database System

Board of Trustees
November 3, 2011
Dale Burmester, SEDTF Chair
American Transmission Company

RELIABILITY | ACCOUNTABILITY

Spare Equipment Database (SED) Overview

- Catalogs spare transformers
  - Voluntary system
- Catalogs long-lead time (6 months+)
  - Spare transmission transformers:
  - Spare Generator Step-Up (GSU) Transformers
- 24x7 Web-based operations
- Keeps entity information confidential

Spare Transformer Reliability Risk

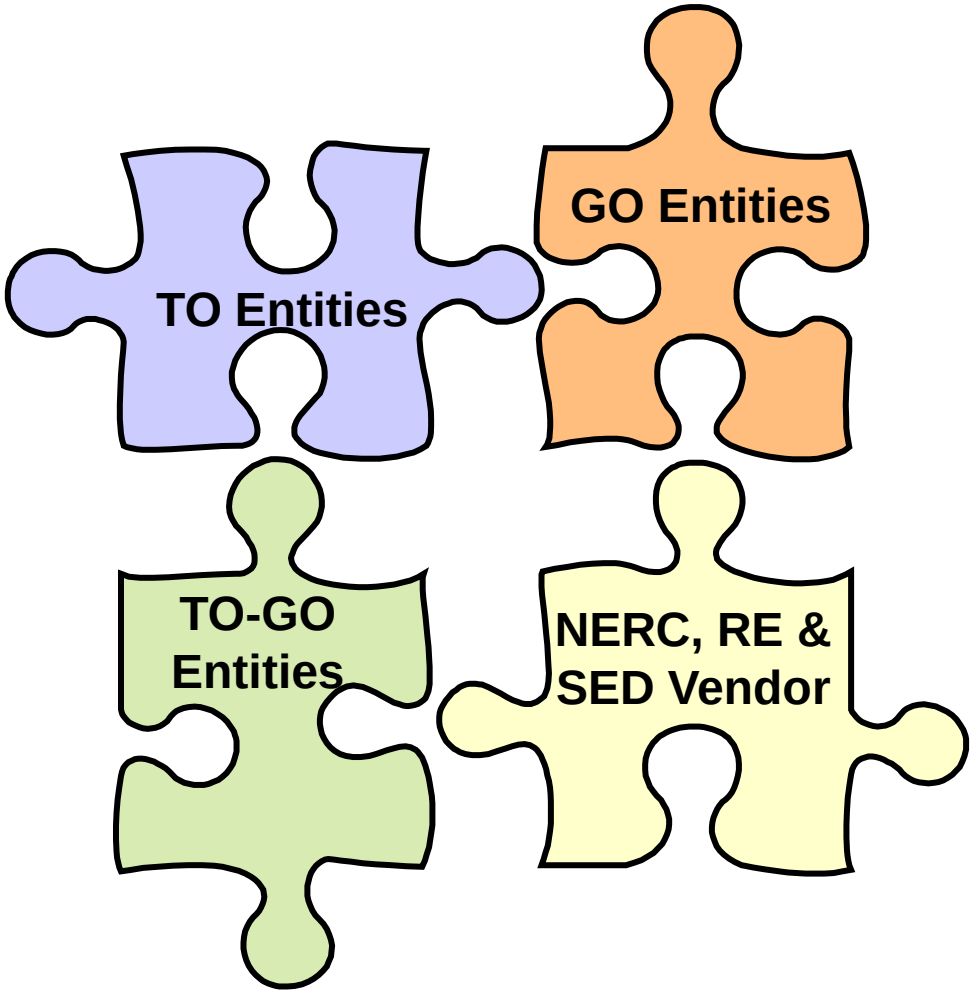
- Small event
  - Entity may need spare transformers
- High impact, Low frequency event (HILF)
  - Many entities may need spare transformers
- Could entity(ies) buy new transformers after event?
  - Yes, but manufacture time is six months+
  - Large events could extend time to one year+

SED Risk Mitigation

- Allows entities to confidentially seek spares
  - Quicker to use someone else's than manufacturer
  - Faster restoration after event
- Provides for faster entity cooperation
  - Entities contact SED instead of everyone
- Balances risk mitigation and freedom
  - Voluntary participation
  - Double-blind requests
  - Entities not forced to commit spares

Participants

- Voluntary participation by up to:
  - ≈165 TO Entities
  - ≈670 GO Entities
  - ≈175 TO-GO Entities
- Minimal RE coordination
- Very low expected industry effort



Timeline

December 2011

- Vendor Begins Design

1st Quarter 2012

- SED Production Rollout

1st Quarter 2013

- SED Performance Assessment

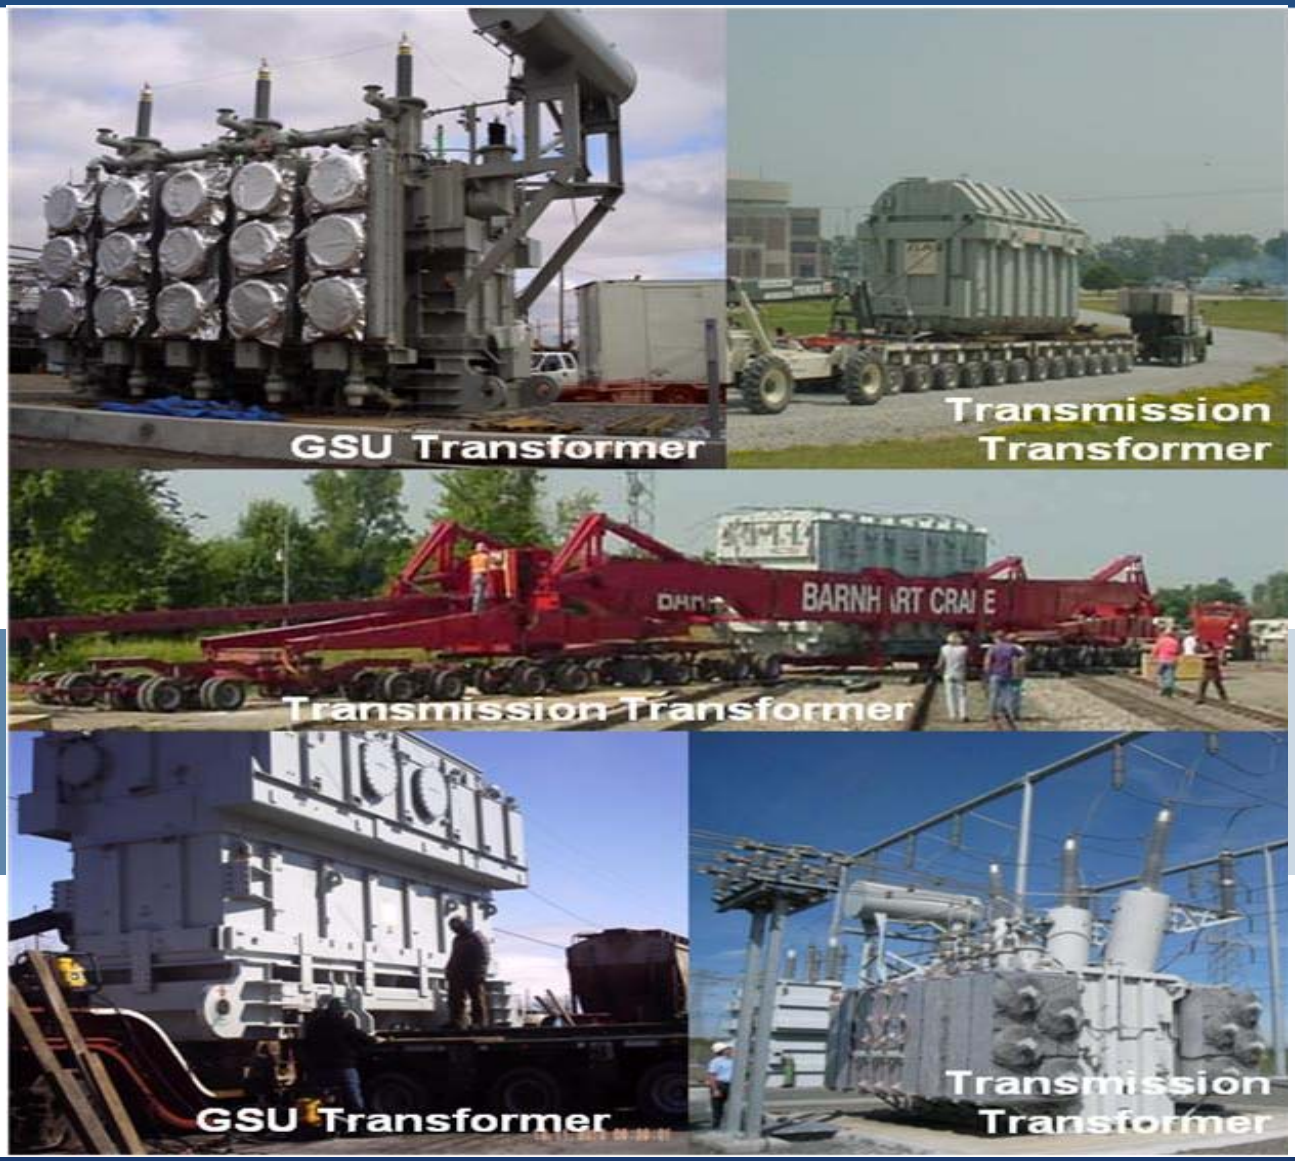
Questions and Answers



Background Information

Development Background

- Spare Equipment Database Task Force (SEDTF)
  - Planning Committee (PC) Initiated (2010)
- BPS spare equipment uniform approach
- Not intended to replace:
  - Existing utility spare programs
  - Spare pooling agreements
- September 14, 2011
  - Report approved by PC
  - Report endorsed by Operating Committee (OC) and Critical Infrastructure Protection Committee (CIPC)

SED Information

Contact Information to include:

- Name of TO or GO Functional Entity †
- Primary Contact Information †
- Secondary Contact Information
- SED Data Manager

Note: SED reporting is voluntary; however, if a spare is reported the information marked with an † symbol is deemed mandatory.

SED Asset Information to include:

- Transformer Identifier †
- Transformer Type †
- Spare's Physical Location
- Number of Phases †
- Rated Voltage – High Voltage (HV) †
- Rated Voltage – Low Voltage (LV) †
- Maximum MVA rating †
- Percent Impedance & MVA base
- Tertiary Winding – Voltage and MVA
- Connection Type
- Spare Status Category
- Joint Ownership and Sharing Restrictions
- Open Comment Field
- Transformer Voltage Class

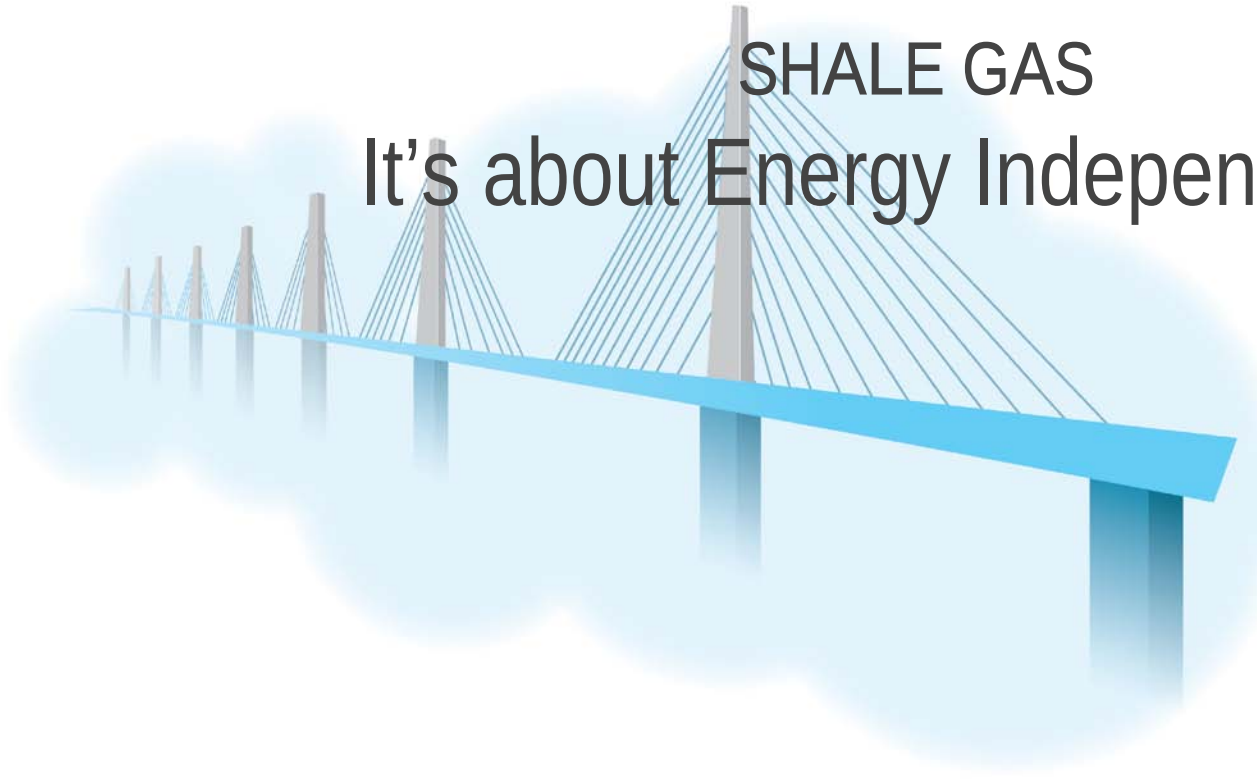
Field Information

- All fields confidential
  - Five contact information fields
    - Primary/secondary contact information
  - Fourteen asset information fields
    - Transformer configuration and rating information

Public Summary Reports

- SED Mutual Confidentiality Agreement limits to:
  - Number of participating:
    - Entities by Regional Entity
    - Transmission power transformer owners
    - GSU transformer owners
    - Transformers by high-side voltage
    - Total MVA amount MVA by high-side voltage
  - Number of eligible:
    - Entities in the aggregate
    - Entities by Regional Entity

SHALE GAS
It's about Energy Independence



Terry Boston

President & CEO
PJM Interconnection

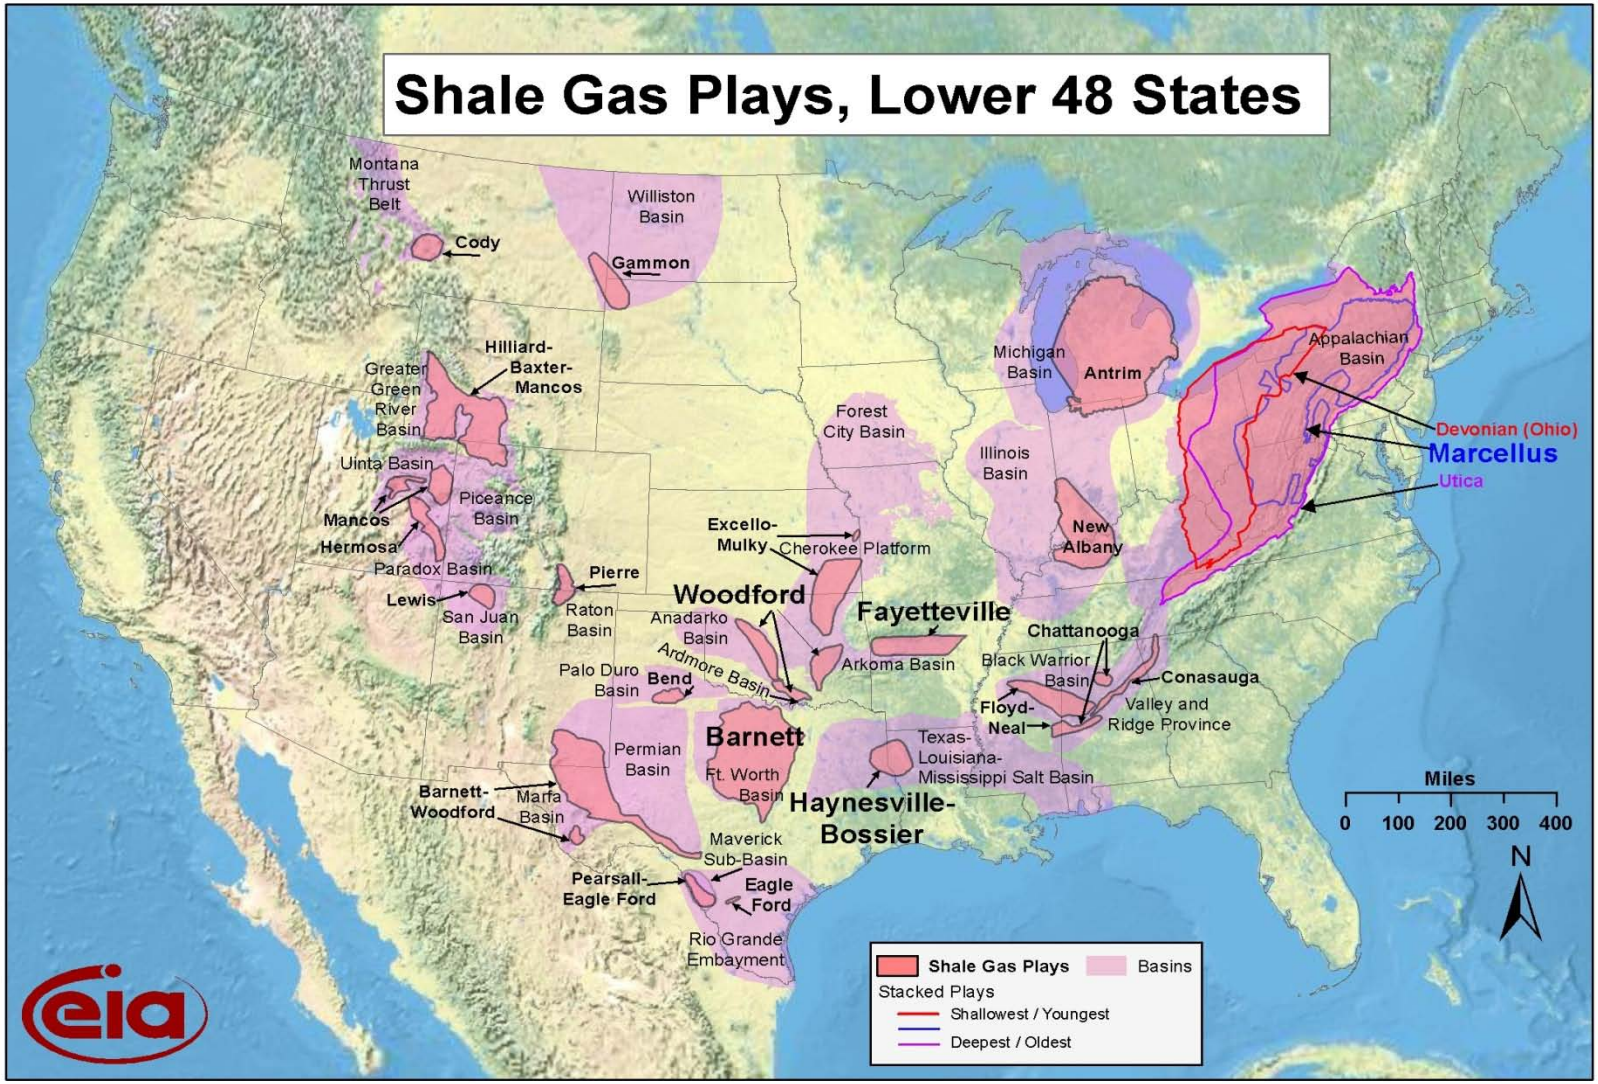
CERTS

October 4, 2011

What is the Marcellus Shale?

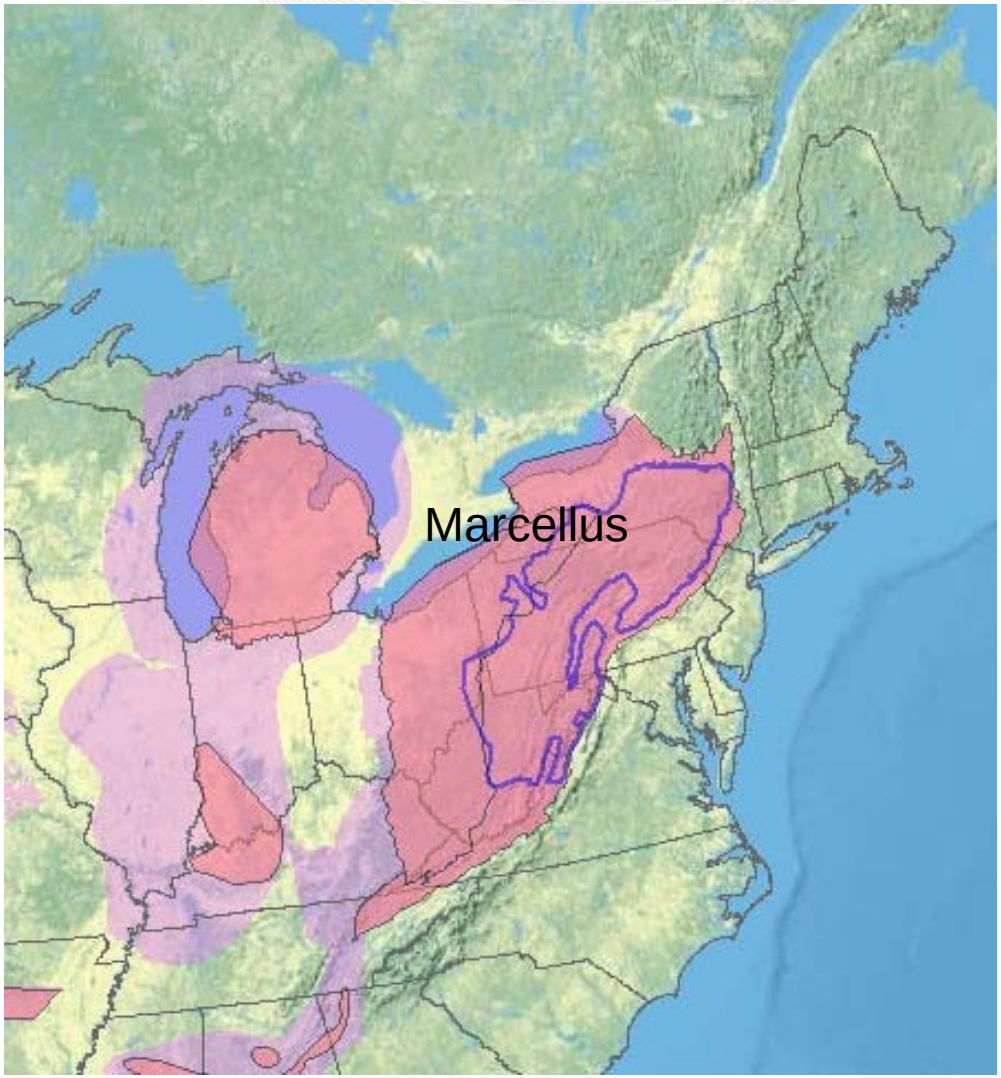
- Large, natural gas rich, shale formation spanning tens of million of acres
- Natural gas and hydrocarbons are trapped inside the solid shale

Source: Range Resources



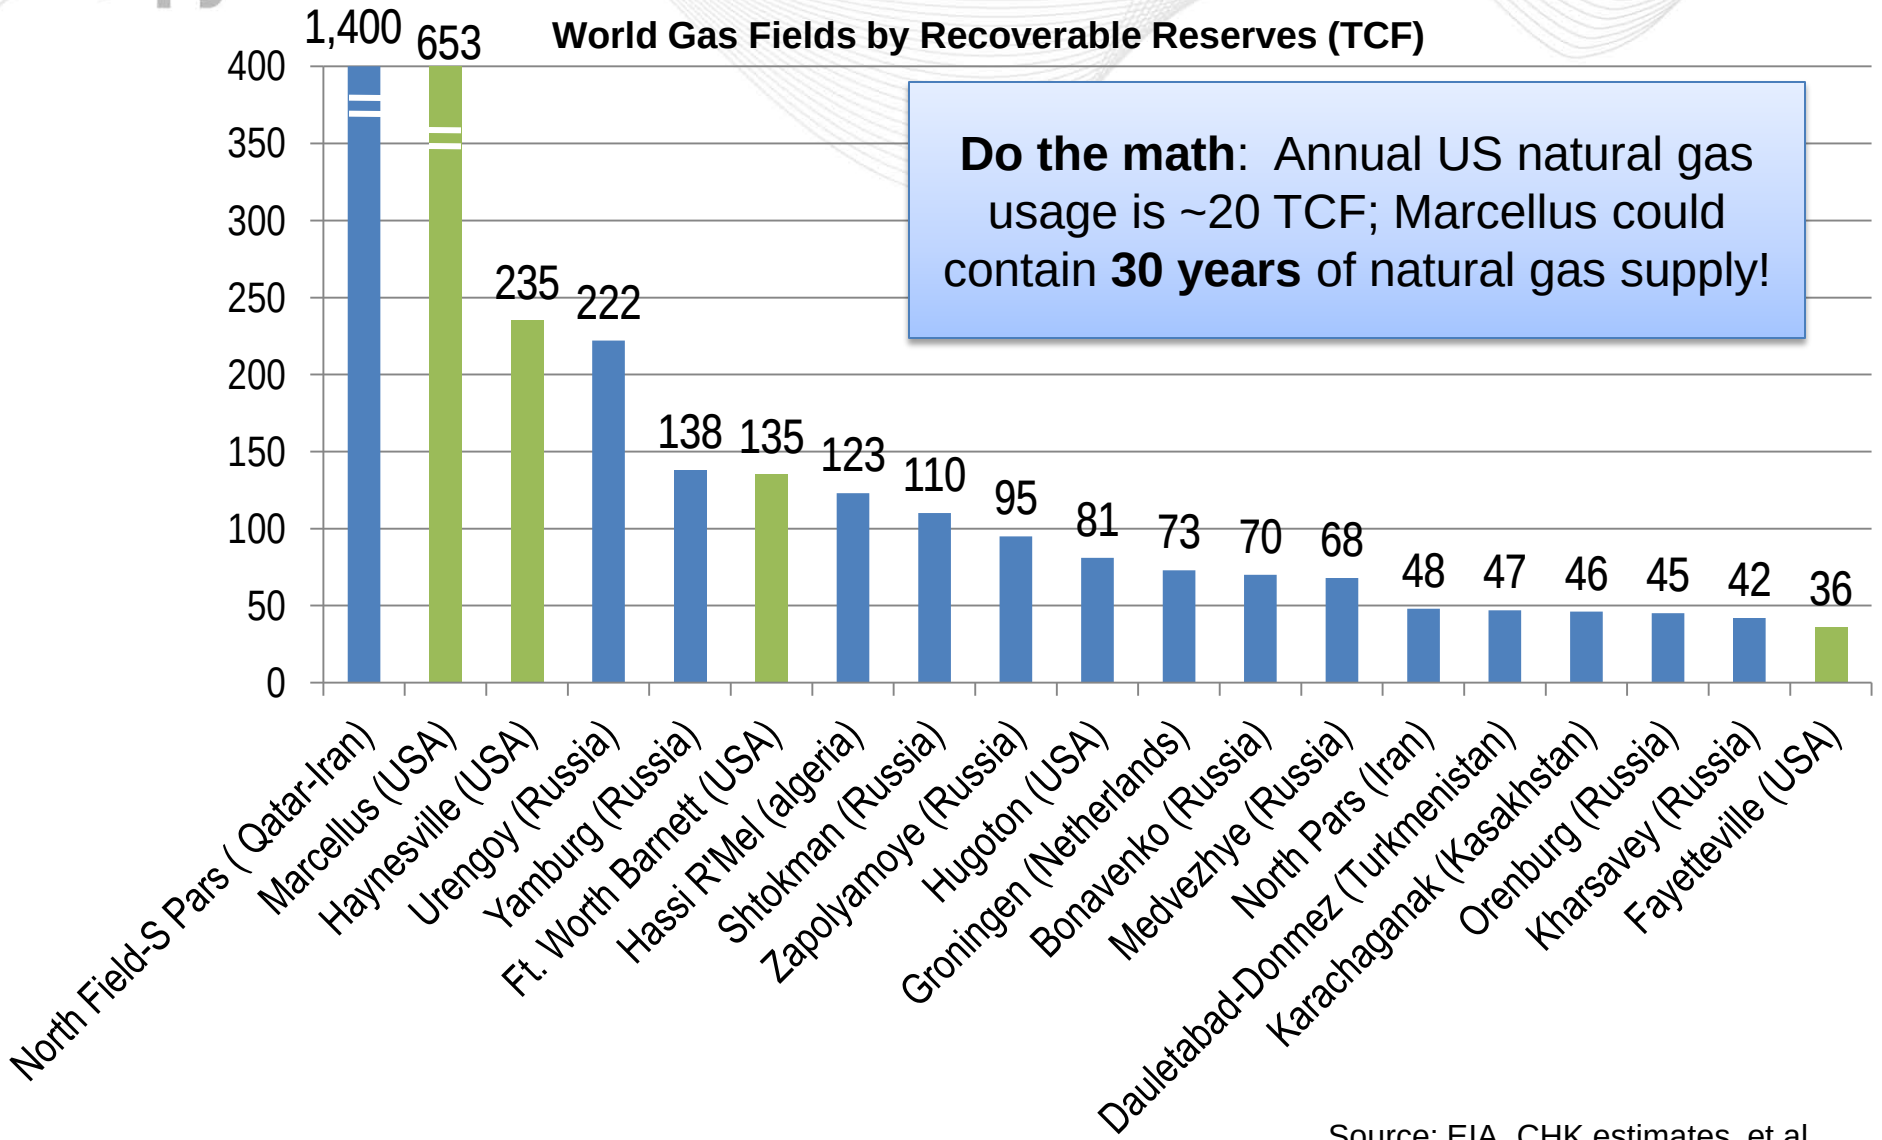
Source: Energy Information Administration based on data from various published studies.
Updated: March 10, 2010

PJM and NYISO are Sitting Atop the Largest Shale Gas Discovery



Source: Energy Information Administration based on data from various published studies.
Updated: March 10, 2010

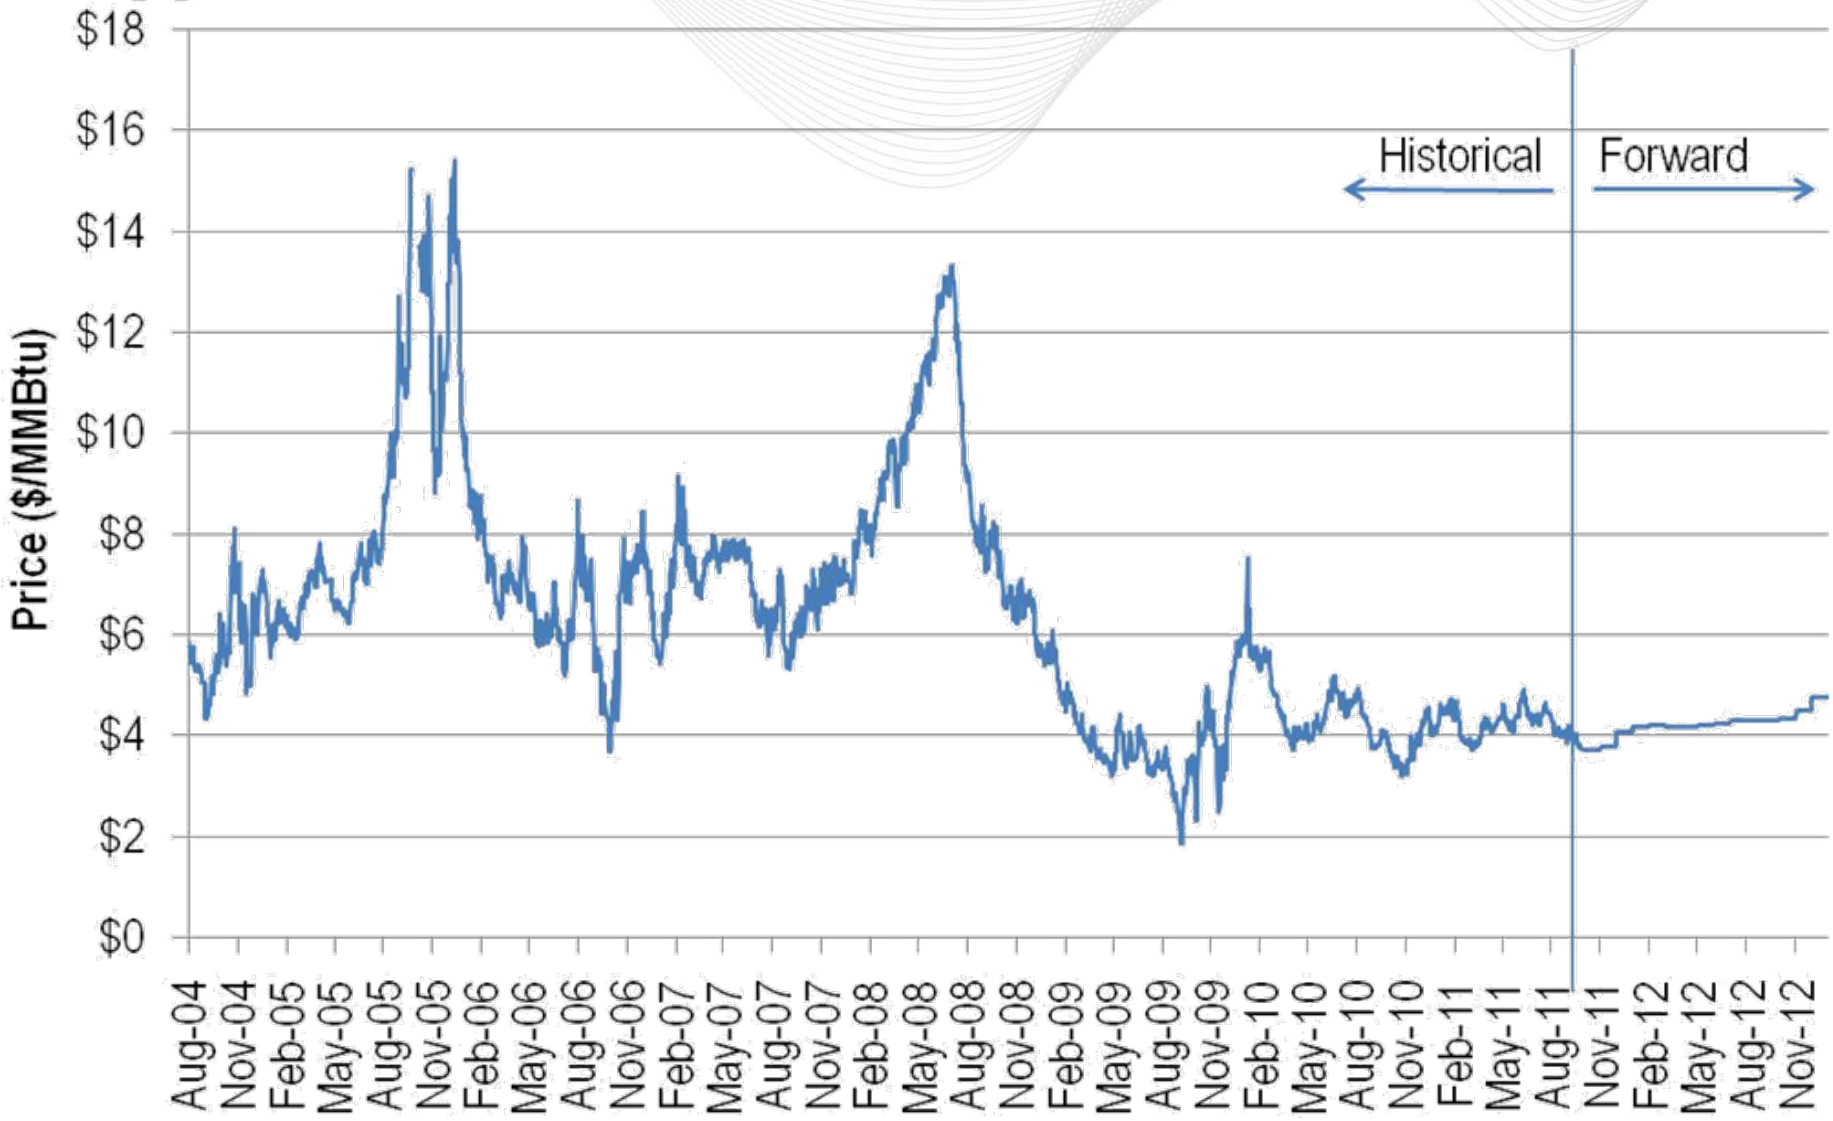
Marcellus Shale Gas Is A Game Changer



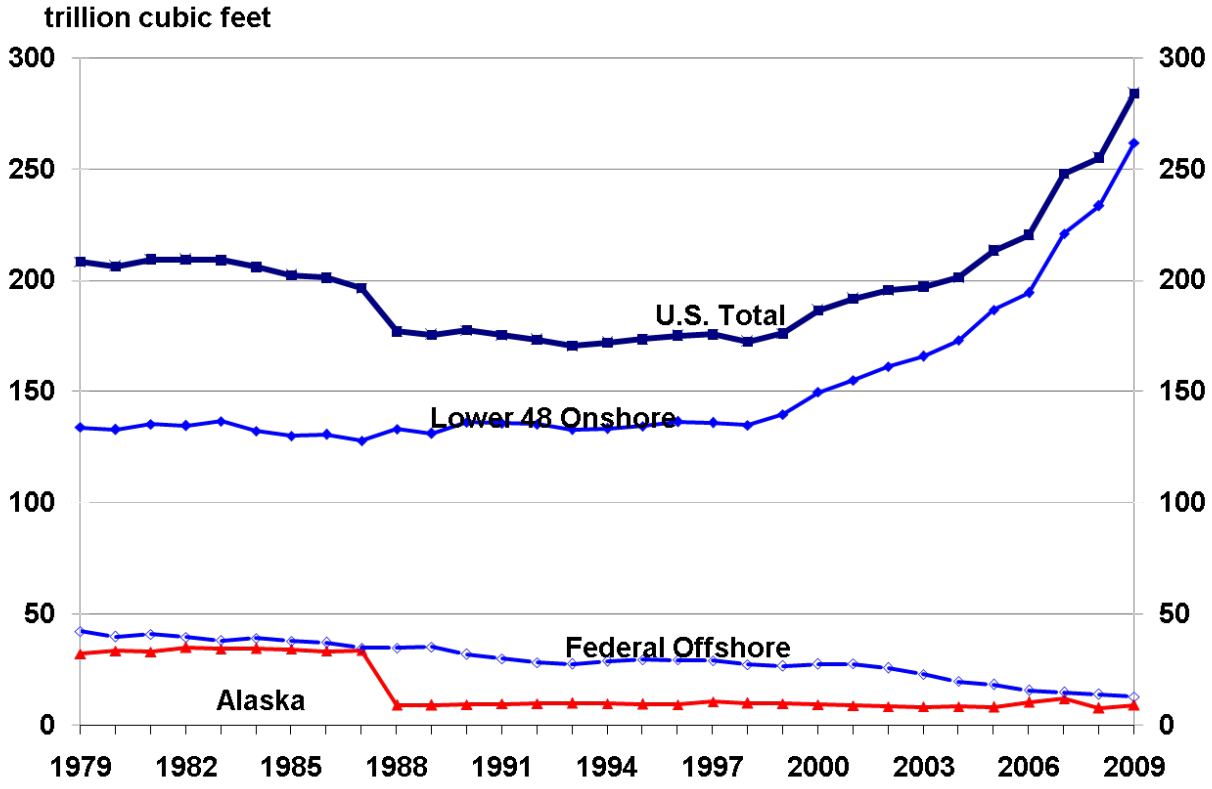
Do the math: Annual US natural gas usage is ~20 TCF; Marcellus could contain **30 years** of natural gas supply!

Source: EIA, CHK estimates, et al

Natural Gas Prices (Henry Hub)



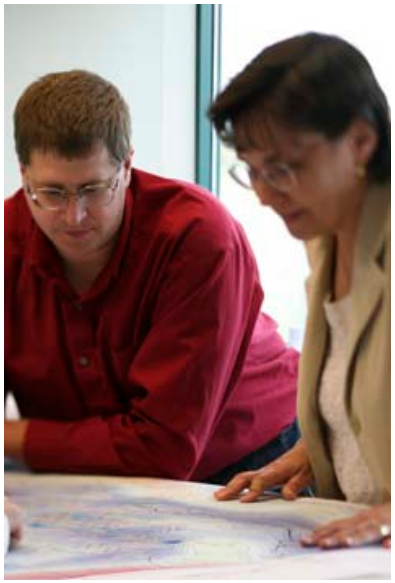
U.S. proved reserves of natural gas at the end of 2009 were at their highest level since 1971



Source: Energy Information Administration

Marcellus Shale Development

State-of-the-Art Technology - Proven Approach - Industry Expertise



Preparation → **Drilling** → **Completion & Production** → **Reclamation**

Source: Range Resources

How Do You "Drill Horizontal"

- Small bend in drilling motor assembly
- roughly 1-2°
- drills the curve over the course of 900'
- at a rate of 10° per 100' to achieve a 90° turn horizontally

It's not abrupt, rather a gradual sweeping motion.

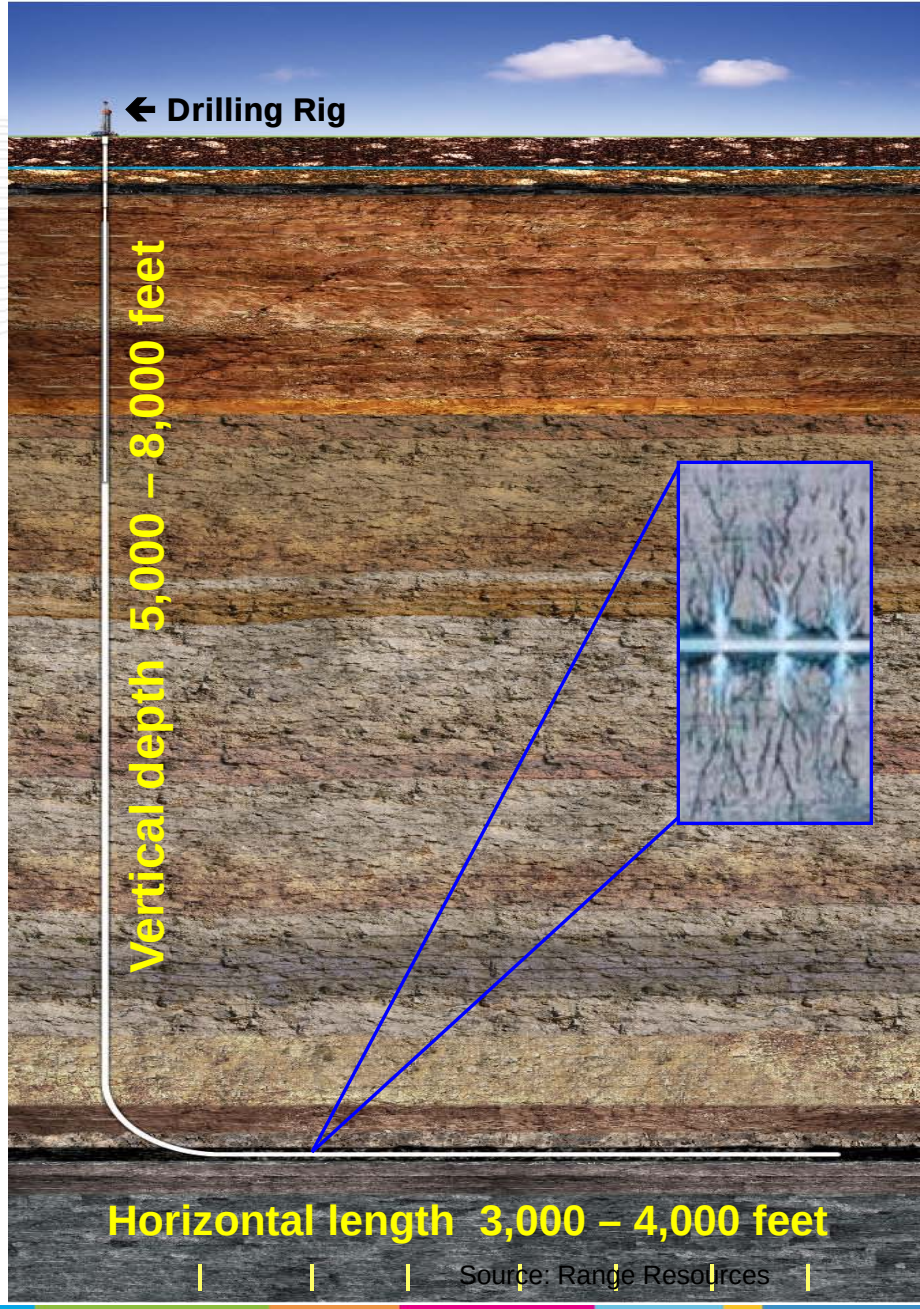
Weatherford drilling technology

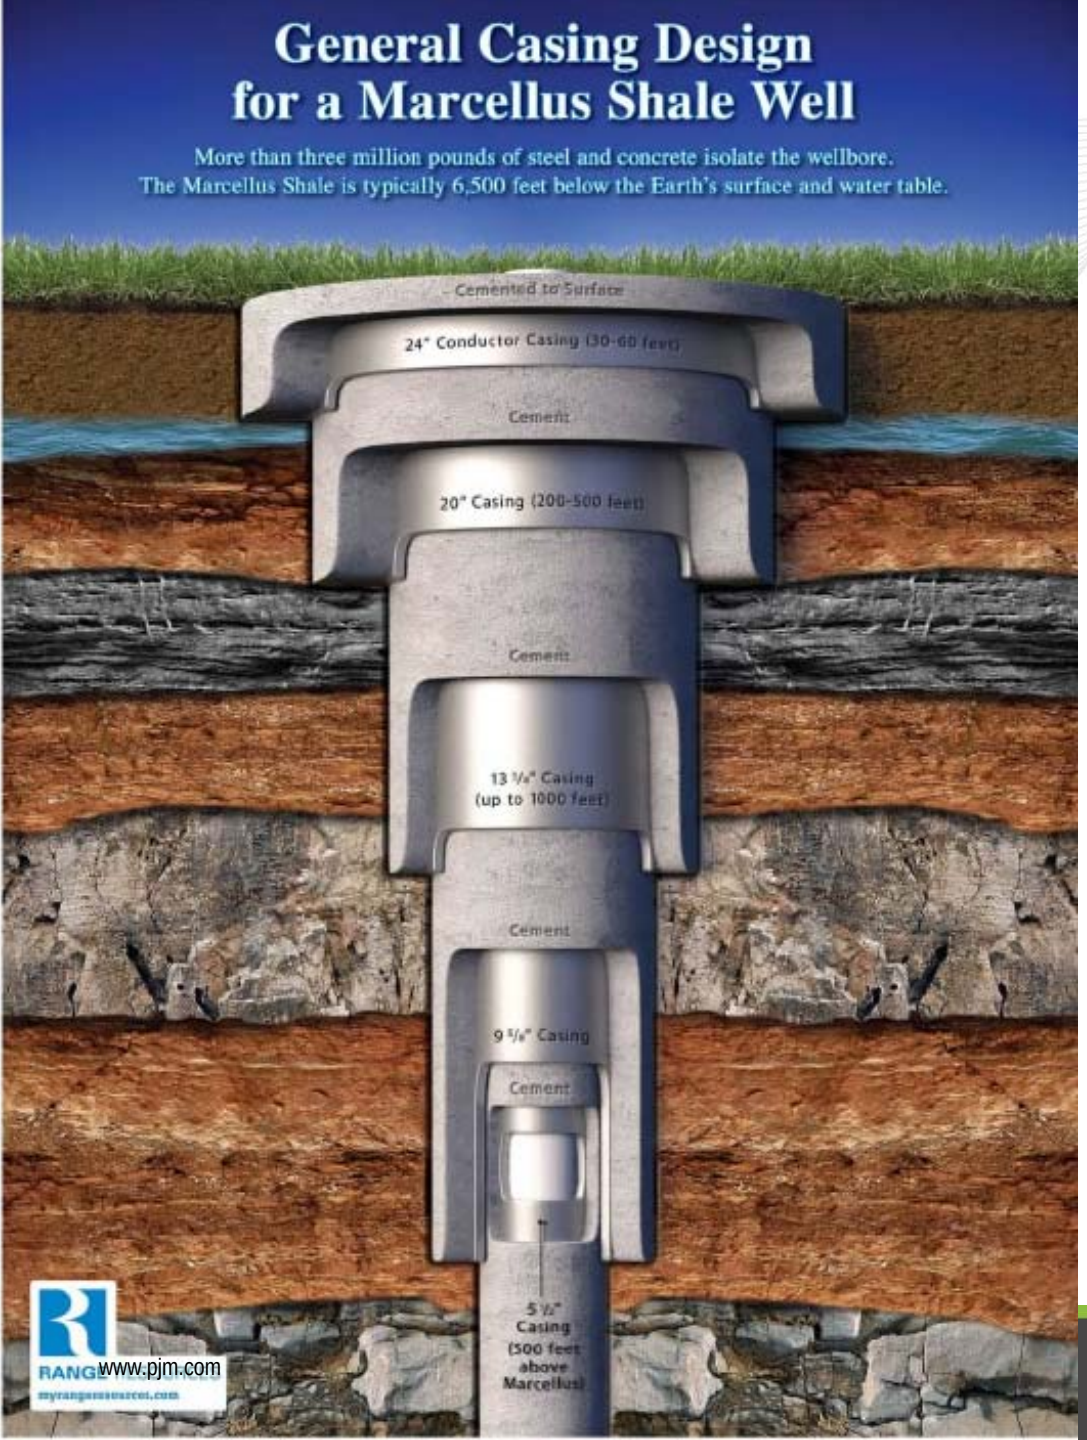
Source: Range Resources

Fresh water aquifers - generally less than 500 foot depth ➔

The same several thousand of feet of impermeable rock that have kept oil and gas in deeper rocks for hundreds of millions of years – also prevent fracturing fluids from contacting fresh ground water aquifers

Marcellus Shale ➔
(100 – 300 feet thick)





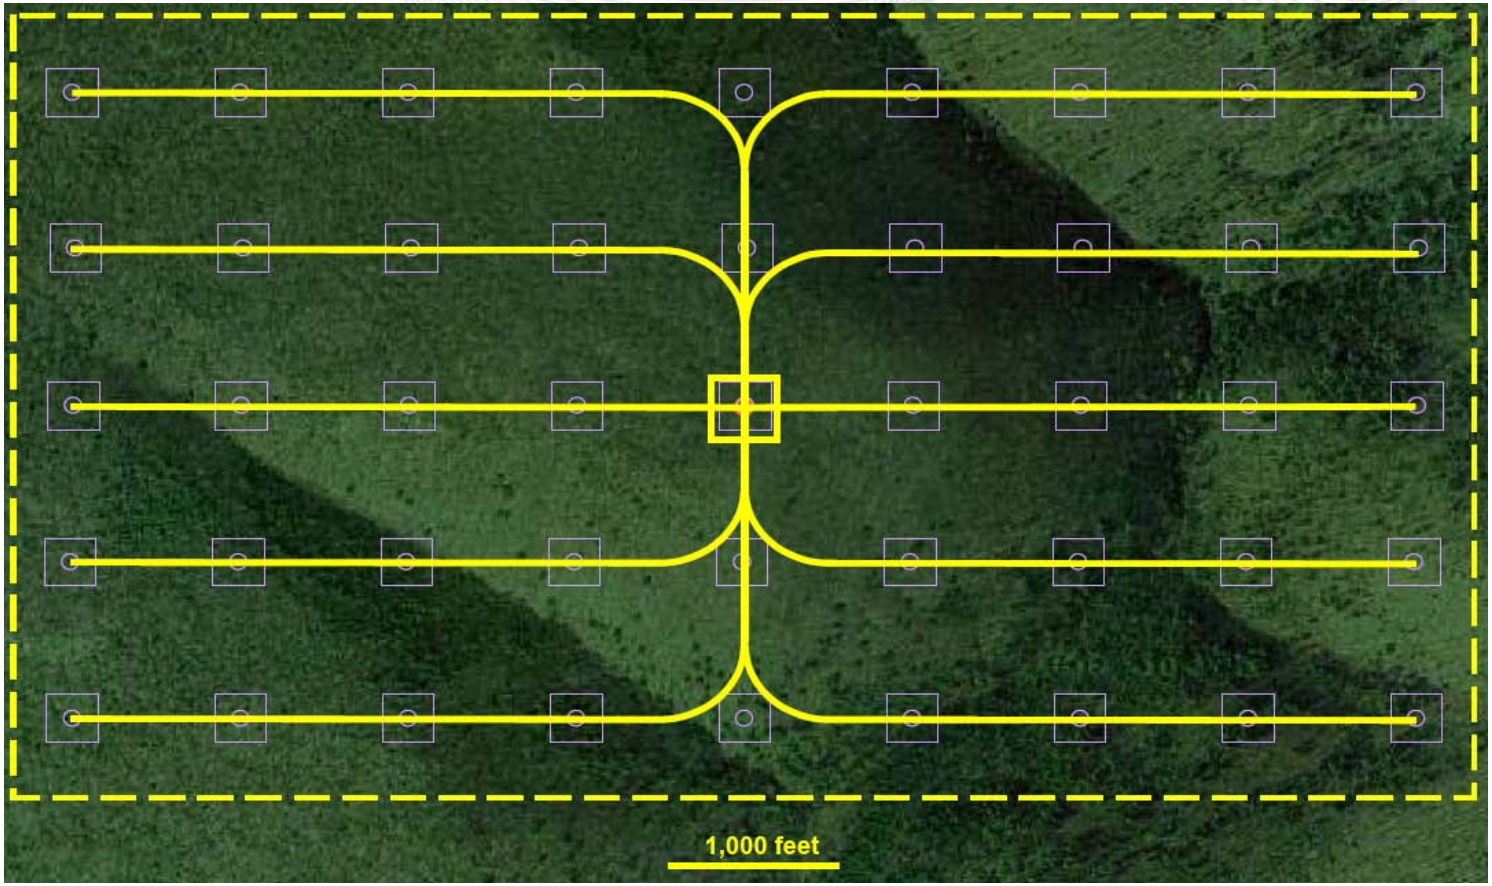
Water Protection

"The simple reality is that stimulation using this technique does not impact ground-water bearing zones."

– **Robert W. Watson** PhD PE is Emeritus Associate Professor of Petroleum and Natural Gas Engineering and Environmental Systems Engineering at The Pennsylvania State University

Source: Range Resources

Horizontal Drilling



Total surface disturbance during drilling, including access road, drilling pad and required pipeline infrastructure:

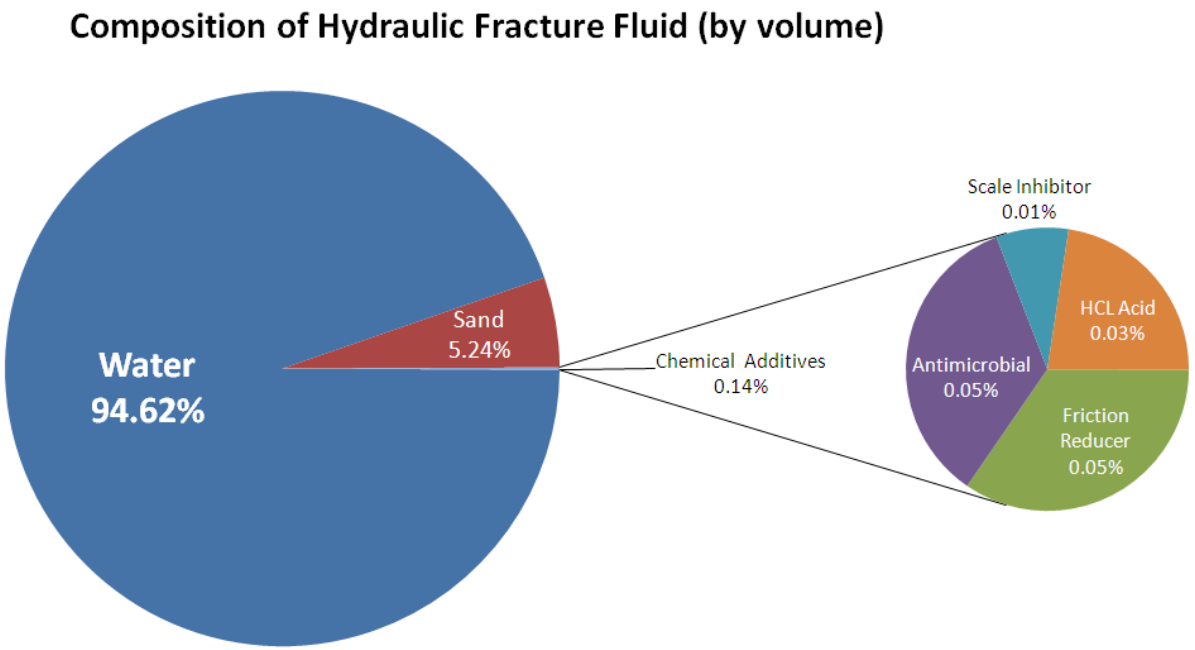
- Horizontal (yellow) develop 1,000 acres per pad with 1% surface disturbance
- Vertical (purple) on 1,000-foot spacing develop 23 acres per well with 19% total surface disturbance

Source: Range Resources

Environmental Issues with Marcellus Shale Development in PA

- Natural gas infiltration in Dimock, PA – 19 homes with contaminated water wells
- GasLand – presented natural gas drilling as a danger to water and human health
- NY Times Article on Feb. 27, 2011
- EPA letter of Mar. 7, 2011 to PA DEP requesting immediate testing of drinking water for radium
- Since 1941 over 1.2 million wells drilled using hydraulic fracturing with only two known failures

Frac Mixture - What goes into the well?



Primarily fresh water, with some sand, and a very small proportion of common chemicals, representing 0.14% of the mix. The chemicals are in very small quantities, low concentrations, used in highly supervised environments, and injected through multiple layers of cemented steel casings

Source: Range Resources

Marcellus Shale Conclusions

1. Environmental risks exist to shale gas drilling, but appear manageable
2. Everything is pointing to more gas-fired electric generation
3. Marcellus Shale gas will impact PJM and electricity markets in the years to come

Electric Reliability Issues from the Dash to Gas

- No N-1 criteria for pipeline network (ISO-New England 2004 had 7,000+ MW loss)
- Almost all generators are on non-firm NG contracts
- February 2 & 3, southwest rotating outages – some NG compressor stations were not on critical electric service list
- Some gas compressing stations are on interruptible electricity contracts
- Gas line pressure can be an issue when starting several generators (TVA lost 2,600 MW 2003 Δ Pressure > 100 PSI)
- Following PG&E explosion some pipelines have lowered maximum pressure by > 10%

Electric Reliability Issues from the Dash to Gas

- Local Distribution residential heating has first priority for gas (winter interruptions are more likely)
- Intrastate gathering pipelines (laterals) do not have the federal right of eminent domain
- Gas production and pipeline network is changing so fast that direction of flow is not known (Rockies Express 1323 Miles $4.5 billion)
- Gas market day does not align with the electricity market day
- Some of the gas pipeline and NG market control centers are not staffed 24x7
- Gas storage is relatively small in geologic formations that are often far from load centers (East Coast and West Coast)
- DOE (CERTs) and FERC action needed on joint infrastructure planning and Gas/Electric market coordination

Re: **NERC Meetings of the Member Representatives Committee and Board of Trustees – November 2nd and 3rd**

Ladies and Gentlemen:

A review of the above referenced meetings is provided below for your information.

Member Representatives Committee – November 2nd

Remarks by Gerry Cauley, NERC President and CEO

1. NERC needs to start by focusing on the four pillars: Reliability, Accountability, Risk-based, and Learning Organization.
    a. Reliability has real impacts and real consequences.
    b. Risk-based – there is a need to focus on the effective controls and mechanisms that can have positive impacts on the risks to reliability of the system.
    c. Accountability – We are all accountable to the public and need to address and be responsive to the events that occur (e.g. Southwest cold snap, Southern California event).
    d. Learning Organization – we need to analyze the events, provide event reports and develop lessons learned.
2. NERC filed the Find, Fix and Track Compliance Enforcement Initiative and is thankful for the support.
3. Budget – expects efficiency to be obtained going forward and thus a flattening of the budget. Mike Walker has started the planning cycle.
4. Standards
    a. BES definition is back on track
    b. Priorities and projects for the Standards Committee
        i. How do we include emerging issues?
        ii. Where are we in the process and how effective are the standards?
        iii. NERC would like to get together with the senior leadership of the industry (CEO level discussion) to discuss enhancements to the standards process, recognizing that the MRC should be involved as well.

5. Compliance Application Notices – at meeting in August NERC had a challenge to improve the CAN's development process. NERC committed to go back and check to confirm that CAN's did not expand on the requirements of standards and provided an appeal process to Gerry and the BOTCC. However, the application of the standard is a prerogative of the ERO and can not be seeded to the industry. NERC needs to call balls and strikes. The improvement since August is a more transparent process and provides a right to an appeal, but ultimately NERC will call the balls and strikes.
6. CIP- 4 and 5 – He suggested that NERC might ask for a delay in the effective date of CIP 4 to see if we can get 5 done and go directly from 3 to 5.
7. Rules of Procedure
    a. NERC can do better in getting information out for comments
    b. The penalties for violation of the Rules of Procedure are necessary to close a gap. That is, if NERC puts out an alert and it's an emergency to take action, NERC needs to be able to enforce.

Presentations

1. September 8th Southwestern Outage
2. Cold Snap Report
3. Compliance Application Notice Update
4. BES definition
5. Adequate Level of Reliability
6. Culture of Reliability (LG&E/KU)
7. Rules of Procedure

Comments

Most of the comments from observers were about the CAN's and CIP 4 and 5 issues. These comments were:

1. CAN's
    a. There was a discussion of the proposed directive requiring the registration of generators that own transmission as TOPs. The directive as written would hold generators who are classified as TOPs to a set of standards that are not appropriately geared to their risk to the BES. Suggestions were made to have the standards limited to a smaller set of requirements.
    b. Comments on posted CAN's seem to be ignored, since NERC doesn't explicitly respond. Mike Moon explained that when comments come in NERC will post and consider them, but does not reply to all of them. A possible way forward was suggested that NERC should explain why it chose the path it did with out explicitly responding to all comments.
    c. CAN-0016 Sabotage reporting- Gerry Cauley explained that we should get to the nub of the issue and compliance enforcement should apply the plain language, working with a registered entity's procedures and not relying on the entity's knowledgeable personnel. With that as the approach auditors should be able to determine compliance.
    d. There is a need for the standards to stand on their own feet and not rely on CAN's. The plain language of the standard should be all that is needed. If standard is not clear, it should be clarified.

2. CIP 4 and 5
    a. The alternatives are to go forward with CIP 4 and implement on current schedule or ask FERC in response to the NOPR to delay the effective date of CIP-4 to see if CIP-5 can be completed and supersede CIP-4. The issues are how much will it cost to implement CIP 4 over and above what would be needed for CIP-5, how long will it take to finish CIP-5, and is there a CIP-6 that is likely to follow?

Board of Trustees Meeting – November 3rd

1. Remarks by FERC Commissioners
    a. Commissioner LeFleur- There is a reliability cycle of setting standards, auditing registered entities and compliance enforcement. Discussion of ALR is worthwhile, since at their core reliability issues are about making choices and costs and reliability risks are part of the input to making those choices. She also discussed the upcoming Technical conference in November.
    b. Commissioner Norris- ALR implicates reliability and costs and is something that we should have an open discussion about. He thinks that empowering people to make their own choices about reliability is appropriate as long as they don't affect the reliability of others. He also commented that the current backlog is unsustainable and that some process like the FFT and/or other types of process improvements are needed.
2. Presidents Report -Comments by Gerry Cauley- he repeated many of his comments from the MRC meeting and added a few additional comments as follows:
    a. He would like to see the FERC Technical Conference on November 29th and 30th as a regular part of business on an annual cycle like the FERC State of the Markets Report.
    b. Standards are a mixed story. We are making the transition to clear reliability focused standards, but we need to be able to solve problems and react expeditiously to emerging issues. Plans to work with MRC and other industry representatives.
    c. Right of Way Alert- One year out industry is meeting expectations, but the issue going forward is how do maintain focus so that we manage the risk.
    d. CAN's are a necessary part of ERO. We need to work at getting a better understanding. However, CAN's can not be a popular vote.
    e. Reliability Assessments – NERC's role is to be an independent assessor of reliability. NERC will take criticism from all sides in order to meet its responsibility.
3. Reliability Standards
    a. Project 2007-07 Vegetation Management - **Approved Unanimously**
        i. Gerry – this is an important standard and this risk-based approach is an opportunity to make it better. However, there are a number of minority views including some concerns from FERC Staff
        ii. Joe McCleland is concerned with removal of clearance 1 margin. The planned distances using the MCVD criteria represent the minimum distance for flashover so he is concerned about how far the standard requires the distance to be from the vegetation.

iii. Gerry- is concerned about removing margin, but the standard is a performance standard, which is based on the failure to perform not on enforcing compliance with the margin.
iv. Paul Barber – need vegetation plans that work in different regions
v. Dave Goulding- concerned with fall-ins and blow-ins from outside the right of way.
vi. Gerry – the standard will not prevent all contact, but is designed to prevent systemic failure.

b. Standard Development Plan 2012 -14 – **Approved Unanimously**
c. MOD 25 – **Approved Unanimously**
d. TRE – IRO-006-TRE-1 - **Approved Unanimously**
e. PRC-006-SERC-1 – **Approved Unanimously**

4. Discussion of asking for a later effective date for CIP-4 in hope that CIP-5 will finish in time. The discussion generally evidenced little to no support for asking for a later effective date so board did not instruct NERC staff to ask for a later effective date.
5. Rules of Procedure
    a. Non-substantive Rules changes – **Approved Unanimously**
    b. Overhaul of rules, which would include a penalty mechanism for the failure to comply with a rule. Discussion evidenced that Board had concerns with a penalty mechanism.
6. Reinstatement of NERC Rules of Procedure Section 402.1.3.2 – NERC will deal with the issue on a regional basis as they carry forward there review of each region. – **Approved Unanimously.**
7. WECC By-Laws – **Approved Unanimously**
8. Reports and Presentations
    a. Spare Equipment Data Base Report – **Accepted**
    b. Three year ERO Performance Assessment Report
    c. Shale Gas Presentation
    d. Standing Committee Reports including Compliance and Certification Committee; Critical Infrastructure Committee; Member Representatives Committee; Operating Committee; Personnel Certification and Governance Committee; Planning Committee; Standards Committee; Electric Sub-Sector Coordinating committee
    e. Forum and Group Reports including NAESB; Regional Entity Management Group; North American Transmission forum; North American Generator Forum
    f. Board Committee Reports
        i. Corporate governance and Human Resources
        ii. Establish 457 (b) Plan – **Approved**
        iii. Compliance
        iv. Enforcement
        v. Nominating
        vi. Finance and Audit
        vii. Review Statement of Activities: Year End Projection – **Accepted**
        viii. Risk Management Framework – **Approved**
        ix. Standards Oversight and Technology

Wednesday, November 2, 2011
NERC MRC Meeting

1. Minutes*
a. October 5, 2011 Conference Call
b. August 3, 2011 Meeting

2. Future Meetings*
Regular Agenda

3. Welcome to Atlanta

- Encouraged by Headquarter move to Atlanta
- Congratulations to NERC personnel moving to other positions (Tom Galloway, Mark Weatherford); welcome to new NERC management team members (Marvin IT VP), Matt Lasar, new CSO

4. Remarks By Gerry Cauley, NERC President and CEO

- Why does NERC do what it does? Four pillars:
  1. Reliability – not theoretical concept; these are real demands w/real impacts
  2. Risk-based – can't do everything; what can we do?
  3. Accountability
  4. Learning organization

- Since Vancouver meeting, filed FFTR proposal w/FERC; is an effective tool; preference is to keep the tool simple
- 2012 budget has been approved in a clean FERC Order; new efficiencies will be reflected in next budget cycle
- BES definition – results of first ballot exceeded my expectations
- Standards – interested to hear and develop better sense of where we are on improving process, clarifying objectives, developing quality standards, etc.; I would like to see senior industry leadership across sectors convene and discuss what works well and what doesn't
- Compliance operations – we had a challenge raised last meeting through CANs; our revised procedure ensures greater checks and balances, w/two avenues for appeal; apologize for inundation of CANs and revised CANs; we're striving for consistency; we cannot cede to the industry by popular vote to determine what standard means; we won't ever get rid of tension between registered entities and ERO; CANs actually pre-date my arrival at NERC, they just weren't transparent
- CIP V4/V5 – we would ask FERC to approve V4 and bright-line criteria; but can we move effective date of V4 back a few months to determine likely development of V5; that will be NERC's request to FERC
- ROP Changes – NERC can still improve in being transparently clear regarding problem ROP changes are intended to solve; intention of penalties is meant to be targeted at essential action; ERO has no backstop to issue an Essential Action in the event of an imminent threat (e.g. cyber); this closes a strategic gap regarding need for U.S. legislation; ensures an entity cannot blow off the Alert

5. September 8, 2011 Southwestern Outage*

- Remains under review through joint NERC/FERC proceeding *(see presentation slides)*
- Timing of inquiry will depend on what is learned as analysis deepens
- NERC & FERC appeared before joint committees of CA state legislature

6. February 2011 Cold Snap Report and Recommendations*

- Three (3) key findings:
  1. Many generators failed to adequately apply and institutionalize knowledge and recommendations from previous severe winter weather events (recommendations from 2009 are very similar to those from this report)
  2. Generators failed to adequately prepare the plants for winter and were generally reactive as opposed to proactive
  3. Balancing Authorities, Reliability Coordinators and generators often lacked adequate knowledge of plant temperature design limits and the equipment most effected by freezing

- Three (3) key recommendations:
  1. R1 - BAs, RCs, and GO/GOPs – Consider winter peak season preparations as critical as summer peak season preparations
  2. R6 - TOs, BAs, and GO/GOPs – Verify that units that have fuel switching capabilities can periodically demonstrate those capabilities
  3. R8 - BAs, RCs and TOPs – Require GO/GOPs to provide accurate ambient temperature design specifications and keep current

I. Predict
II. Plan
III. Preparation

- Generators were reactive, not proactive
- Overall challenge is to not let these events slide into the rear-mirror; we can predict, plan for and prepare for cold weather
- PJM: keep in mind that operators performed well

7. Election of Committee Officers for 2012*

- Motion to elect Scott Helyer & Carol Chinn approved by voice vote

8. Status of MRC Sector Nominations*

- Nominations close Nov. 11
- Election period opens Dec. 12

9. NERC Compliance Enforcement Initiative* – Status

- Report to BOTCC repeated
- Chair echoes support for initiative

10. Compliance Application Notices – Status*

<u>GO/GOP Directive</u>

- As opposed to registering GO/GOPs for full suite of TO/TOP requirements, looking to refine subset of applicable requirements that these entities must fulfill

- Directive adds 22 standards to those contemplated under Project 2010-07
- Stakeholder comments:
    - How is it that a GO/GOP registered as a TO/TOP is not required to comply with full suite of TO/TOP requirements?
        - A: yes, that's true; but many have acknowledged, including FERC, that this is not appropriate in this context; interim solution is to work thru MOU to avoid full registration, in order to only focus on appropriate/applicable requirements
    - Why wasn't directive provided to all stakeholders? It may have been thought that there was broad dissemination, but it didn't go to everyone
        - A: it was felt that it would be more appropriate to go through trade associations and NAGF
    - Where is there evidence of reliability gap? Not reflected in any recent event analyses; view this as 2nd/3rd order reliability concern; are we setting up debates between GOPs and TOPs regarding management of potential impacts? Blackstart resources are also de-listing; this undermines TOPs' ability to prepare for system restoration
        - A: I don't think we want to deal w/an event to address this issue
    - Will NERC ignore stakeholder comments?
        - We will post all comments received and redline any proposed changes
- Gerry Cauley: trying to understand the timing; what's the sense of urgency? Can we wait for the standard to be approved? There are potential reliability risks; question is what the urgency and priority levels are; is there a reliability issue the other way? A line is owned, but someone else has operational control over the line
    - ELCON: gap needs to be defined more clearly; also need to ensure that solution doesn't simply sweep in other entities; for large industrials, costs are increasing
- Mike Moon: it is not the directive's intent to induce sweeping registration of GOs/GOPs
- Bill Gallagher: again, proof will be in the execution

<u>CANs</u>

- BOT guidance
    - Looking to improve tone, wording, etc.
- CAN Process
    - Pledge to improve feedback loop w/industry on comments submitted
- CAN-0016 Sabotage Reporting Procedure
    - Concedes that NERC did not do a good job initially; NERC believes implementation is required
- Status of revisions to the remaining CANs currently posted as final
    - Would like industry to provide specific examples of alternative compliance route
    - Aiming to have CAN revisions concluded by end of 2011
    - Will keep BOTCC and open forum with trade associations apprised of developments around CANs
- NRECA disappointed by progress since August; CAN-0016 <u>does</u> go beyond language in the standard; when comments are filed and ignored, we question the value of submitting comments; we can expect entities and perhaps joint trade association appeals going forward
- Paul Murphy: commend NERC on response since August; there remain CANs that go beyond scope of standard and we'll continue to provide comments; likely worth reflecting on engagement with stakeholders on CANs to date as part of NERC's learning organization mandate

- Sector 7 – repeat that we need justification from NERC for why certain CANs are prepared the way they are
- FRCC – applauds NERC for progress on CANs and transparency in process
- Tom Berry – my hope is that CANs ultimately sunset; eventually standard should be able to speak for itself and need for CAN is obviated
- Fred Gorbet – optimistic about progress that has been made
- Tim Gallagher – we've moved debate out of the field and into the MRC forum; that's a good thing; NERC should treat CAN as FERC treats a NOPR; may not agree w/comment, but should at least consider and address it
- Ed Tymofichuk – need to think long-term about standards; standards should be able to stand on their own w/o need for CANs, interpretation, etc.
- Allen Mosher – should development of CAN be held to a development approach similar to standard or interpretation?
- Bill Gallagher: interpretations are time consuming! Re-writing standard is preferable; most CANs are good, let's remember
- Gerry Cauley: let's work more on resolving CAN-0016 and associated issues; let's focus on better negotiation and hopefully not have to resolve this through the appeals process

11. Status of CIP Standards Version 4 and 5 and Implementation Plans*

- CIP SDT to post its implementation plan next week (Nov. 8)
- Gerry Cauley: the only thing NERC is requesting deferral on is effective date of V4, to see if we can get to a better place through V5; question for the BOT is permitting
- Discussion around need for stability in CIP standards; investments are a concern, as some required to comply w/V4 may not be necessary for V5
- NRECA: NERC and industry need to meet to discuss in advance of Nov. 21 deadline
- Paul Murphy: we will have fewer assets identified as critical under V4 than we will under V3; number of assets therefore not the best measure for assessing standard; the notion of not implementing V4 creates a bit of a credibility problem for industry; my expectation is that we'll be asking eventually for delay in implementation of V5
- Gerry Cauley: we need input from industry on perceived investment requirements, and carrying forward investments over the course of standards adoption; question is not driven by NERC, but more by industry decisions; I'm not sure we have industry top-line of sight on what's involved for moving towards V5; this is a big deal; need to be focused here; we should have senior industry leadership meet to discuss end-point for CIP standards; need a conference on strategy (Q1 2012?)
- SDT confirmed that Sep. 2012 filing date for V5 to FERC remains the target
- Bill Gallagher: bear in mind that this issue is near & dear to folks on Capitol Hill and at FERC; it's also important for our pocketbooks to get this right

12. BES Definition and Rules of Procedure – Status*

- Phase II to address concerns identified over the course of process; draft SAR has been posted for informational purposes; clarifying revisions include
    - Transformer designations
    - Generation threshold values
    - Reactive resources
    - Behind the meter generation
    - Local networks

- SC has committed to maintaining BES project as "high priority" project
- Despite super-majority approval of first ballot, we're still in a tentative spot; success of this project will reflect on whole ERO

- 73 comments received on ROP Exception Process; those comments to be evaluated by Project Team
- Concerns remain around confidentiality of data that is submitted in conjunction with an exception request
- Technical Principles for Exception Process has been a contentious matter; trying to ascertain the impact of an element on the system
- Principles fell just short of a super-majority; comments weren't seeking substantive modifications; more about the use of information that will be submitted; once application is submitted, it falls into black box where there's no signal about prospects for acceptance or rejection; fear that if submitter answers "yes" to one of many questions, this will result in automatic inclusion under BES definition
- Compliance obligations for new elements – 24 months after applicable effective date
- *See presentation slides for near-term milestones*
- Hoping to go to NERC Board for approval b/w Jan. 11-Jan. 18 2012

13. ALR Task Force Status Report*
See presentation slides

14. Culture of Reliability Excellence – LG&E/KU*
See presentation slides

15. Rules of Procedure Changes
- Some changes in non-substantive revisions will be considered alongside February 2011 filing
- **Nov. 7** scheduled date for posting of revised substantive revisions; will be submitted to Board for approval for Feb. 2011 meetings
- New provisions planned for event analysis (Sec. 800); represents substantial portion of changes; will likely draw many comments

Q&A
- Not expected that Sec. 1800 would be universally or frequently exercised; looking to address issue of recalcitrant entity
- Janice Case: I have concerns that we're putting this out for comment and we haven't discussed this at the Board (reminder that this is on the Board agenda for tomorrow)
- Carol Chinn: we need more transparency; summary is 40 pages long and difficult to follow; problematic that stakeholder comment regarding questions around NERC authority to do this has not been considered
- NRECA: has there been a dramatic failure to respond to Level 2 & Level 3 Alerts? My understanding is that reports back are high; what is basis for changing 10-50 the number of
- NERC members to request a ROP amendment?
    - A: Responses have not been 100%; also, according to S. 100 of ROP, members must comply with NERC ROP; we believe that fines is a reasonable addition to the ROP; 50 requestors is meant to conform w/by-laws
- Common theme is questions around NERC's authority to do this

16. Looking Ahead to February 8, 2012 Meeting – Key Agenda Items

- ANSI accreditation issue ripe for discussion

17. Comments by Outgoing Chairman

- Remember, this ERO regime is an experiment; many on Capitol Hill think it should be done a different way
- Thanks Gerry Cauley, Dave Nevius and NERC staff for his support

18. Comments by Chairman Elect

- Thanks Bill Gallagher for service as Chair

Information Only – No Discussion

19. Update on Regulatory Matters*

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Announcement

NERC Board Approves Vegetation Management Standard; Focuses on Four Pillars of Success

November 7, 2011

ATLANTA – The North American Electric Reliability Corporation (NERC) had its quarterly Board of Trustees meeting on November 3 in Atlanta. NERC President and Chief Executive Officer Gerry Cauley welcomed NERC board members; Federal Energy Regulatory Commissioners John Norris and Cheryl LaFleur; and industry stakeholders.

In its fifth year as the electric reliability organization, NERC strives to build upon four pillars for continued success. Those foundations are:

- **Reliability** – addressing real problems to improve the reliability of the grid.
- **Accountability** – being accountable to customers, the industry and government for the performance of the grid.
- **Learning** – enabling the industry to learn from experience to improve future reliability performance.
- **Risk-based model** – focusing actions and programs on issues most important to grid reliability.

"There must be a clear and compelling understanding about what we are trying to accomplish as the electric reliability organization," Cauley said. "By focusing on these four pillars, our role is reliability and our objectives are clear."

During this meeting, the board approved the Project 2007-07 Vegetation Management (FAC-003-2), which is a results-based, foundational standard that provides a defense in-depth approach to vegetation inspections and minimum clearance distances.

The board also approved the Reliability Standards Development Plan for 2012-2014, which addresses different aspects of standards prioritization; and two Rules of Procedure changes – *Rules of Procedure Non-substantive Capitalization and*

Definition changes and *Reinstatement of Section 402.1.3.2*.

Three regional standards – Reactive Power Capability (MOD-025-RFC-1), Mitigation in the ERCOT Interconnection (IRO-006-TRE-1) and Automatic Underfrequency Load Shedding (PRC-006-SERC-1) – received approval as well.

In the Member Representative Committee meeting November 2, the committee elected its officers for 2012: Scott Helyer of Tenaska Corporation as chair and Carol Chinn of American Transmission Company as vice-chair.

NERC's next board meeting is February 9 in Phoenix.

###

The North American Electric Reliability Corporation's mission is to ensure the reliability of the North American bulk power system. NERC is the electric reliability organization (ERO) certified by the Federal Energy Regulatory Commission in the United States to establish and enforce reliability standards for the bulk-power system. NERC has equivalent relationships with provincial and federal authorities in Canada. NERC develops and enforces reliability standards; assesses adequacy annually via a 10-year forecast, and summer and winter forecasts; monitors the bulk power system; and educates, trains and certifies industry personnel. NERC Antitrust Compliance Guidelines

Agenda

1. **2011 Long-Term Reliability Assessment — Approve**
2. **2011/2012 Winter Reliability Assessment — Approve**
3. **Technical and Conforming Amendments to Rules of Procedure — Approve**

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Antitrust Compliance Guidelines

I. General

It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition.

It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.

Antitrust laws are complex and subject to court interpretation that can vary over time and from one court to another. The purpose of these guidelines is to alert NERC participants and employees to potential antitrust problems and to set forth policies to be followed with respect to activities that may involve antitrust considerations. In some instances, the NERC policy contained in these guidelines is stricter than the applicable antitrust laws. Any NERC participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NERC's antitrust compliance policy is implicated in any situation should consult NERC's General Counsel immediately.

II. Prohibited Activities

Participants in NERC activities (including those of its committees and subgroups) should refrain from the following when acting in their capacity as participants in NERC activities (e.g., at NERC meetings, conference calls and in informal discussions):

- Discussions involving pricing information, especially margin (profit) and internal cost information and participants' expectations as to their future prices or internal costs.
- Discussions of a participant's marketing strategies.
- Discussions regarding how customers and geographical areas are to be divided among competitors.
- Discussions concerning the exclusion of competitors from markets.
- Discussions concerning boycotting or group refusals to deal with competitors, vendors or suppliers.

- Any other matters that do not clearly fall within these guidelines should be reviewed with NERC's General Counsel before being discussed.

III. Activities That Are Permitted

From time to time decisions or actions of NERC (including those of its committees and subgroups) may have a negative impact on particular entities and thus in that sense adversely impact competition. Decisions and actions by NERC (including its committees and subgroups) should only be undertaken for the purpose of promoting and maintaining the reliability and adequacy of the bulk power system. If you do not have a legitimate purpose consistent with this objective for discussing a matter, please refrain from discussing the matter during NERC meetings and in other NERC-related communications.

You should also ensure that NERC procedures, including those set forth in NERC's Certificate of Incorporation, Bylaws, and Rules of Procedure are followed in conducting NERC business.

In addition, all discussions in NERC meetings and other NERC-related communications should be within the scope of the mandate for or assignment to the particular NERC committee or subgroup, as well as within the scope of the published agenda for the meeting.

No decisions should be made nor any actions taken in NERC activities for the purpose of giving an industry participant or group of participants a competitive advantage over other participants. In particular, decisions with respect to setting, revising, or assessing compliance with NERC reliability standards should not be influenced by anti-competitive motivations.

Subject to the foregoing restrictions, participants in NERC activities may discuss:

- Reliability matters relating to the bulk power system, including operation and planning matters such as establishing or revising reliability standards, special operating procedures, operating transfer capabilities, and plans for new facilities.
- Matters relating to the impact of reliability standards for the bulk power system on electricity markets, and the impact of electricity market operations on the reliability of the bulk power system.
- Proposed filings or other communications with state or federal regulatory authorities or other governmental entities.

Matters relating to the internal governance, management and operation of NERC, such as nominations for vacant committee positions, budgeting and assessments, and employment matters; and procedural matters such as planning and scheduling meetings.

Agenda Item 3
Board of Trustees Conference Call
November 22, 2011

Technical and Conforming Amendments to Rules of Procedure

Action

Approve proposed amendments to Rules of Procedure as shown in attached redline.

Background

At its November 3, 2011 meeting, the Board of Trustees (Board) approved non-substantive proposed amendments to NERC's Rules of Procedure that standardized the capitalization of defined terms and located all definitions used in the Rules in a new Appendix 2 (the "capitalization/definitions amendments"). On November 17, 2011, the Federal Energy Regulatory Commission (FERC) approved NERC's request to approve unrelated amendments to Appendices 3B and 3D to the Rules of Procedure. The capitalization/definitions amendments the Board approved on November 3 did not include the latest version of Appendices 3B and 3D.

Now that FERC has approved NERC's proposed amendments to Appendices 3B and 3D, it is appropriate to make technical and conforming changes to those documents and to Appendix 2, in order to maintain the capitalization and definitions structure that the Board approved on November 3. It is important to note that the board has already approved the substance of what is contained in Appendices 3B and 3D. The change to Appendix 2 is to add another definition to the list of definitions.

Attached to this item are the redlined changes to Appendices 2, 3B, and 3D needed to conform the capitalization and definitions to the approach the Board approved on November 3. Following Board approval, the changes will be incorporated in the overall package of rule changes that we file with FERC.

10-20-2011

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

DEFINITIONS USED IN THE RULES OF PROCEDURE

APPENDIX 2 TO THE RULES OF PROCEDURE

Effective: [DATE], 2012

General

For purposes of the NERC Rules of Procedure, including all Appendices, the terms defined in this Appendix shall have the meanings set forth herein. For convenience of reference to the user, definitions of terms that are used in a particular Appendix may be repeated in that Appendix.

Where used in the Rules of Procedure, a defined term will be capitalized. Where a term defined in this Appendix appears in the Rules of Procedure but is not capitalized, the term is there being used in its ordinary and commonly understood meaning and not as defined in this Appendix (if different). Other terms that are not defined terms, such as the names of entities, organizations, committees, or programs; position titles; titles of documents or forms; section headings; geographic locations; and other terms commonly presented as proper nouns, may also be capitalized in the Rules of Procedure without being defined in this Appendix.

Definitions of terms in this Appendix that are marked with asterisks (**) are taken from the NERC *Glossary of Terms Used in Reliability Standards*. Definitions of terms in this Appendix that are marked with "pluses" (++) are taken from Section 215 of the Federal Power Act or the Commission's regulations at 18 C.F.R. Part 39 or Part 388.

Other terms used in the Rules of Procedure but not defined in this Appendix that have commonly understood and used technical meanings in the electric power industry, including applicable codes and standards, shall be construed in accordance with such commonly understood and used technical meanings.

Specific Definitions

"Adjacent Balancing Authority" means a Balancing Authority Area that is interconnected to another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.**

"Adjusted Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as determined based on application of the adjustment factors identified in Section 4.3 of the *Sanction Guidelines* to the Base Penalty Amount.

"Advisories" or "Level 1 (Advisories)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Alleged Violation" means a Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.

"Annual Audit Plan" means a plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited, the schedule of Compliance Audits, and Compliance Audit Participant requirements for the calendar year.

"Annual Report" means the annual report to be filed by NERC with FERC and other Applicable Governmental Authorities in accordance with Section 13.0 of Appendix 4D.

"Applicable Governmental Authority" means the FERC within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.

"Applicable Requirement" means a Requirement of a CIP Standard that (i) expressly provides either (A) that compliance with the terms of the Requirement is required where or as technically feasible, or (B) that technical limitations may preclude compliance with the terms of the Requirement; or (ii) is subject to Appendix 4D by FERC directive.

"Balancing Authority" means the responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.**

"Balancing Authority Area" means the collection of generation, transmission, and loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains load-resource balance within this area.**

"Base Penalty Amount" means the proposed Penalty for a violation of a Reliability Standard as initially determined pursuant to Sections 4.1 and 4.2 of the NERC *Sanction Guidelines*, before application of any adjustment factors.

"Blackstart Resource" means a generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan.**

"Board" or "Board of Trustees" means the Board of Trustees of NERC.

"Board of Trustees Compliance Committee," "BOTCC" or "Compliance Committee" means the Compliance Committee of the NERC Board of Trustees.

"Bulk Electric System" means, as defined by the Regional Entity, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.**

"Bulk Power System" means, depending on the context: (i) Facilities and control systems necessary for operating an interconnected electric energy supply and transmission network (or any portion thereof), and electric energy from generating facilities needed to maintain

transmission system reliability. The term does not include facilities used in the local distribution of electric energy [++]. (ii) Solely for purposes of Appendix 4E, Bulk Electric System.

"Canadian" means one of the following: (a) a company or association incorporated or organized under the laws of Canada, or its designated representative(s) irrespective of nationality; (b) an agency of a federal, provincial, or local government in Canada, or its designated representative(s) irrespective of nationality; or (c) a self-representing individual who is a Canadian citizen residing in Canada.

"Canadian Entity" means a Responsible Entity that is organized under Canadian federal or provincial law.

"Cascading" means the uncontrolled successive loss of System Elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.**

"CCC" means the NERC Compliance and Certification Committee.

"Certification" means, depending on the context, (i) the process undertaken by NERC and a Regional Entity to verify that an entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator and/or Reliability Coordinator; such Certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure; or (ii) for purposes of Appendix 6, an official recognition that indicates the recipient has passed a NERC exam or completed a specified number of Continuing Education Hours.

"Certification Staff" means individuals employed or contracted by NERC who have the authority to make initial determinations of Certification of entities performing reliability functions.

"Certification Team" means a team assembled by a Regional Entity that will be responsible for performing the activities included in the Certification process for an entity pursuant to Appendix 5A.

"Classified National Security Information" means Required Information that has been determined to be protected from unauthorized disclosure pursuant to Executive Order No. 12958, as amended, and/or the regulations of the NRC at 10 C.F.R. §95.35; or pursuant to any comparable provision of Canadian federal or provincial law.

"Clerk" means an individual as assigned by the Compliance Enforcement Authority to perform duties described in Attachment 2, Hearing Procedures, to Appendix 4C.

"Commission" means the Federal Energy Regulatory Commission or FERC.

"Complaint" means an allegation that a Registered Entity violated a Reliability Standard.

"Compliance and Certification Manager" means individual/individuals within the Regional Entity that is/are responsible for monitoring compliance of entities with applicable NERC Reliability Standards.

"Compliance Audit" means a systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the Requirements of applicable Reliability Standards.

"Compliance Audit Participants" means Registered Entities scheduled to be audited and the audit team members.

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

"Compliance Enforcement Authority's Area of Responsibility" means the Compliance Enforcement Authority's Region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's Area of Responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Compliance Investigation" means a comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.

"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC *Uniform Compliance Monitoring and Enforcement Program* (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

"Compliant Date" means the date by which a Responsible Entity is required to be in compliance with an Applicable Requirement of a CIP Standard.

"Confidential Business and Market Information" means any information that pertains to the interests of any entity, that was developed or acquired by that entity, and that is proprietary or competitively sensitive.

"Confidential Information" means (i) Confidential Business and Market Information; (ii) Critical Energy Infrastructure Information; (iii) personnel information that identifies or could be used to identify a specific individual, or reveals personnel, financial, medical, or other personal information; (iv) work papers, including any records produced for or created in the course of an evaluation or audit; (v) investigative files, including any records produced for or created in the course of an investigation; or (vi) Cyber Security Incident Information; provided, that public information developed or acquired by an entity shall be excluded from this definition; or (vii) for purposes of Appendix 4D, any other information that is designated as Confidential Information in Section 11.0 of Appendix 4D.

"Confirmed Violation" means an Alleged Violation for which an entity has: (1) accepted the finding of the violation by a Regional Entity or NERC and will not seek an appeal, or (2) completed the hearing and appeals process within NERC, or (3) allowed the time for requesting a hearing or submitting an appeal to expire, or (4) admitted to the violation in a settlement agreement.

"Continuing Education Hour" or "CE Hour" means sixty minutes of participation in a group, independent study, or self-study learning activity as approved by the NERC Continuing Education Program.

"Continuing Education Program Provider" or "Provider" means the individual or organization offering a learning activity to participants and maintaining documentation required by Appendix 6.

"Coordinated Functional Registration" means where two or more entities (parties) agree in writing upon a division of compliance responsibility among the parties for one or more Reliability Standard(s) applicable to a particular function, and/or for one or more Requirement(s)/sub-Requirement(s) within particular Reliability Standard(s).

"Covered Asset" means a Cyber Asset or Critical Cyber Asset that is subject to an Applicable Requirement.

"Credential" means a NERC designation that indicates the level of qualification achieved (i.e., reliability operator; balancing, interchange, and transmission operator; balancing and interchange operator; and transmission operator).

"Credential Maintenance" means to meet NERC CE Hours' requirements to maintain a valid NERC-issued system operator Credential.

"Critical Assets" means Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.**

"Critical Cyber Assets" means Cyber Assets critical to the reliable operation of Critical Assets.**

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing Critical Infrastructure that (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on Critical Infrastructure; and (iii) does not simply give the location of the Critical Infrastructure.++

"Critical Infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.++

"Critical Infrastructure Protection Standard" or "CIP Standard" means any of NERC Reliability Standards CIP-002 through CIP-009.

"Cross-Border Regional Entity" means a Regional Entity that encompasses a part of the United States and a part of Canada or Mexico.++

"Cyber Assets" means programmable electronic devices and communication networks including hardware, software, and data.**

"Cyber Security Incident" means any malicious or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk Power System.++

"Cyber Security Incident Information" means any information related to, describing, or which could be used to plan or cause a Cyber Security Incident.

"Days", as used in Appendix 5A with respect to the Registration and Certification processes, means calendar days.

"Delegate" means a person to whom the Senior Manager of a Responsible Entity has delegated authority pursuant to Requirement R2.3 of CIP Standard CIP-003-1 (or any successor provision).

"Director of Compliance" means the Director of Compliance of NERC or of the Compliance Enforcement Authority, as applicable, who is responsible for the management and supervision of Compliance Staff, or his or her designee.

"Distribution Provider" means the entity that provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"Effective Date" means the date, as specified in a notice rejecting or disapproving a TFE Request or terminating an approved TFE, on which the rejection, disapproval or termination becomes effective.

"Electric Reliability Organization" or "ERO" means the organization that is certified by the Commission under Section 39.3 of its regulations, the purpose of which is to establish and

enforce Reliability Standards for the Bulk Power System in the United States, subject to Commission review. The organization may also have received recognition by Applicable Governmental Authorities in Canada and Mexico to establish and enforce Reliability Standards for the Bulk Power Systems of the respective countries.

"Element" means any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An Element may be comprised of one or more components.**

"Eligible Reviewer" means a person who has the required security clearances or other qualifications, or who otherwise meets the applicable criteria, to have access to Confidential Information, Classified National Security Information, NRC Safeguards Information or Protected FOIA Information, as applicable to the particular information to be reviewed.

"End Date" means the last date of the period to be covered in a Compliance Audit.

"Essential Actions" or "Level 3 (Essential Actions)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Exception Reporting" means information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a System Operating Limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.

"Expiration Date" means the date on which an approved TFE expires.

"Facility" means a set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)**

"FERC" means the United States Federal Energy Regulatory Commission.

"Final Penalty Amount" means the final, proposed penalty for violation of a Reliability Standard, determined in accordance with the *Sanction Guidelines*.

"FOIA" means the U.S. Freedom of Information Act, 5 U.S.C. §552.

"Footprint" means the geographical or electric area served by an entity.

"Functional Entity" means an entity responsible for a function that is required to ensure the Reliable Operation of the electric grid as identified in the NERC Reliability Standards.

"Generator Operator" means the entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.**

"Generator Owner" means an entity that owns and maintains generating units.**

"Hearing Body" or "Regional Entity Hearing Body" means the body established by a Regional Entity to conduct hearings pursuant to the Hearing Procedures.

"Hearing Officer" means, depending on the context, (i) an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to Attachment 2, Hearing Procedures, of Appendix 4C, or (ii) solely for hearings conducted pursuant to Appendix 4E, (A) a CCC member or (B) an individual employed or contracted by NERC, as designated and approved by the CCC to preside over hearings conducted pursuant to the Hearing Procedures in Appendix E; the Hearing Officer shall not be a member of the Hearing Panel.

"Hearing Panel" means the five person hearing body established as set forth in the CCC Charter on a case by case basis and that is responsible for adjudicating a matter as set forth in Appendix 4E.

"Hearing Procedures" means, depending on the context, (i) Attachment 2 to the NERC or a Regional Entity CMEP, as applicable, or (ii) the hearing procedures of the NERC Compliance and Certification Committee in Appendix 4E.

"Interchange" means energy transfers that cross Balancing Authority boundaries.**

"Interchange Authority" means the responsible entity that authorizes the implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communications of Interchange information for reliability assessment purposes.**

"Interchange Schedule" means an agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.**

"Interchange Transaction" means an agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.**

"Interconnected Operations Service" means a service (exclusive of basic energy and Transmission Services) that is required to support the Reliable Operation of interconnected Bulk Electric Systems.**

"Interconnection" means a geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control.++

"Interconnection Reliability Operating Limit" means a System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.**

"Interpretation" means an addendum to a Reliability Standard, developed in accordance with the NERC *Standard Processes Manual* and approved by the Applicable Governmental Authority(ies), that provides additional clarity about one or more Requirements in the Reliability Standard.

"Joint Registration Organization" means an entity that registers in the Compliance Registry to perform reliability functions for itself and on behalf of one or more of its members or related entities for which such members or related entities would otherwise be required to register.

"Lead Mediator" means a member of a mediation team formed pursuant to Appendix 4E who is selected by the members to coordinate the mediation process and serve as the mediation team's primary contact with the Parties.

"Load-Serving Entity" means an entity that secures energy and Transmission Service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.**

"Mapping" means the process of determining whether a Regional Entity's Footprint is being served by Registered Entities.

"Mediation Settlement Agreement" means a written agreement entered into by the Parties to a mediation pursuant to Appendix 4E that resolves the dispute.

"Member" means a member of NERC pursuant to Article II of its Bylaws.

"Member Representatives Committee" or "MRC" means the body established pursuant to Article VIII of the NERC Bylaws.

"Mitigation Plan" means an action plan, required when a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, settlement agreement, or otherwise, that is developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.

"NERC-Approved Learning Activity" means training that maintains or improves professional competence and has been approved by NERC for use in its Continuing Education Program.

"NERC Compliance Monitoring and Enforcement Program Implementation Plan" or "NERC Implementation Plan" means the annual NERC Compliance Monitoring and Enforcement Program Implementation Plan that specifies the Reliability Standards that are subject to reporting by Registered Entities to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard.

"NERC Compliance Registry," "Compliance Registry" or "NCR" means a list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power

System, and the entities registered as their designees, that perform one or more functions in support of reliability of the Bulk Power System and are required to comply with one or more Requirements of Reliability Standards.

"NERC Identification Number" or "NERC ID" means a number given to NERC Registered Entities that will be used to identify the entity for certain NERC activities. Corporate entities may have multiple NERC IDs to show different corporate involvement in NERC activities.

"NERC Organization Certification" or "Organization Certification" means the process undertaken by NERC and a Regional Entity to verify that a new entity is capable of responsibilities for tasks associated with a particular function such as a Balancing Authority, Transmission Operator, and/or Reliability Coordinator; such certification activities are further described in Section 500 and Appendix 5A of the NERC Rules of Procedure.

"Net Energy for Load" or "NEL" means net generation of an electric system plus energy received from others less energy delivered to others through interchange. It includes system losses but excludes energy required for the storage of energy at energy storage facilities.

"Notice of Alleged Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3 of Appendix 4C.

"Notice of Completion of Enforcement Action" means a notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10 of Appendix 4C, stating than an enforcement action is closed.

"Notice of Confirmed Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards, as a result of (1) the Registered Entity accepting a Notice of Alleged Violation and the proposed Penalty or sanction, or (2) the finding of a violation through a hearing and appeal, or (3) the expiration of the period for requesting a hearing or an appeal, or (4) the Registered Entity admitting the violation as part of an executed settlement agreement.

"Notice of Penalty" means a notice prepared by NERC and filed with FERC, following approval by NERC of a Notice of Confirmed Violation or a settlement agreement, stating the Penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.

"Notice of Possible Violation" means a notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard Requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

"NRC" means the United States Nuclear Regulatory Commission.

"NRC Safeguards Information" means Required Information that is subject to restrictions on disclosure pursuant to 42 U.S.C. §2167 and the regulations of the NRC at 10 C.F.R. §73.21-73.23; or pursuant to comparable provisions of Canadian federal or provincial law.

"Open Access Transmission Tariff" means an electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.**

"Part A Required Information" means Required Information that is to be provided in Part A of a Responsible Entity's TFE Request.

"Part B Required Information" means Required Information that is to be provided in Part B of a Responsible Entity's TFE Request.

"Participant" means a Respondent and any other Person who is allowed or required by FERC to participate as an intervenor in a proceeding conducted pursuant to the Hearing Procedures, and as used in the Hearing Procedures shall include, depending on the context, the members of the Compliance Staff that participate in a proceeding or the members of the Certification Staff that participate in a proceeding pursuant to Appendix 4E.

"Party" or "Parties" means a Person or the Persons participating in a mediation pursuant to Appendix 4E.

"Penalty" means and includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity or Respondent to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's or Respondent's violation and take into consideration any timely efforts made by the Registered Entity or Respondent to remedy the violation.

"Periodic Data Submittals" means modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.

"Planning Authority" means the responsible entity that coordinates and integrates transmission Facilities and service plans, resource plans, and Protection Systems.**

"Point of Delivery" means a location that a Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.**

"Point of Receipt" means a location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a generator delivers its output.

"Possible Violation" means the identification, by the Compliance Enforcement Authority, using one of the compliance monitoring and enforcement processes in Section 3.0 of Appendix 4C, of a possible failure by a Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.

"Preliminary Screen" means an initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, and (2) the Reliability Standard Requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered.

"Probation" means a step in the disciplinary process pursuant to Appendix 6 during which the certificate is still valid. During the probationary period, a subsequent offense of misconduct, as determined through the same process as described above, may be cause for more serious consequences.

"Protected FOIA Information" means Required Information, held by a governmental entity, that is subject to an exemption from disclosure under FOIA (5 U.S.C. §552(e)), under any similar state or local statutory provision, or under any comparable provision of Canadian federal or provincial law, which would be lost were the Required Information to be placed into the public domain.

"Protection System" means protective relays which respond to electrical quantities, communications systems necessary for correct operation of protective functions, voltage and current sensing devices providing inputs to protective relays, station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.**

"Purchasing-Selling Entity" means the entity that purchases, or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.**

"Receiving Entity" means NERC or a Regional Entity receiving Confidential Information from an owner, operator, or user of the Bulk Power System or from any other party.

"Recommendations" or "Level 2 (Recommendations)" is a notification issued by NERC in accordance with Section 810.3.1 of the Rules of Procedure.

"Region" means the geographic area, as specified in a Regional Entity's delegation agreement with NERC, within which the Regional Entity is responsible for performing delegated functions.

"Regional Criteria" means reliability requirements developed by a Regional Entity that are necessary to implement, to augment, or to comply with Reliability Standards, but which are not Reliability Standards. Such Regional Criteria may be necessary to account for physical differences in the Bulk Power System but are not inconsistent with Reliability Standards nor do they result in lesser reliability. Such Regional Criteria are not enforceable pursuant to NERC-delegated authorities, but may be enforced through other available mechanisms. Regional Criteria may include specific acceptable operating or planning parameters, guides, agreements, protocols or other documents.

"Regional Entity" means an entity having enforcement authority pursuant to 18 C.F.R. § 39.8.++

"Regional Entity Compliance Monitoring and Enforcement Program Implementation Plan" or "Regional Implementation Plan" means an annual plan, submitted by November 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC Compliance Monitoring and Enforcement Program Implementation Plan, identifies (1) all Reliability Standards identified by NERC to be actively monitored during each year, (2) other Reliability Standards proposed for active monitoring by the Regional Entity, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria with each Reliability Standard, and (4) the Regional Entity's Annual Audit Plan.

"Regional Reliability Standard" means a type of Reliability Standard that is applicable only within a particular Regional Entity or group of Regional Entities. A Regional Reliability Standard may augment, add detail to, or implement another Reliability Standard or cover matters not addressed by other Reliability Standards. Regional Reliability Standards, upon adoption by NERC and approval by the Applicable Governmental Authority(ies), shall be Reliability Standards and shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Registered Ballot Body" means that aggregation of all entities or individuals that qualify for one of the Segments approved by the Board of Trustees, and are registered with NERC as potential ballot participants in the voting on proposed Reliability Standards.

"Registered Entity" means an owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.

"Registration" or "Organization Registration" means the processes undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region.

"Reliability Coordinator" means the entity that is the highest level of authority who is responsible for the Reliable Operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.**

"Reliability Coordinator Area" means the collection of generation, transmission and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.**

"Reliability Standard" means a requirement to provide for Reliable Operation of the Bulk Power System, including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation capacity. A Reliability Standard shall not be effective in the United States until approved by the Federal Energy Regulatory Commission and shall not be effective in other jurisdictions until made or allowed to become effective by the Applicable Governmental Authority.

"Reliability Standards Development Plan" means the forward-looking plan developed by NERC on an annual basis setting forth the Reliability Standards development projects that are scheduled to be worked on during the ensuing three-year period, as specified in Section 310 of the Rules of Procedure.

"Reliable Operation" means operating the Elements of the Bulk Power System within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or Cascading failures of such system will not occur as a result of a sudden disturbance, including a Cyber Security Incident, or unanticipated failure of system Elements.++

"Remedial Action Directive" means an action (other than a Penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent threat.

"Reporting Entity" means an entity required to provide data or information requested by NERC or a Regional Entity in a request for data or information pursuant to Section 1600 of the Rules of Procedure.

"Requirement" means an explicit statement in a Reliability Standard that identifies the functional entity responsible, the action or outcome that must be achieved, any conditions achieving the action or outcome, and the reliability-related benefit of the action or outcome. Each Requirement shall be a statement with which compliance is mandatory.

"Required Date" means the date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.

"Required Information" means the information required to be provided in a TFE Request, as specified in Section 4.0 of Appendix 4D.

"Reserve Sharing Group" means a group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g. ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes), then, for the purposes of disturbance control performance, the areas become a Reserve Sharing Group.**

"Resource Planner" means the entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority area.**

"Respondent" means, depending on the context, the Registered Entity, who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable, or the Registered Entity that is the subject of the Certification decision that is the basis for a proceeding under Appendix 4E.

"Responsible Entity" means an entity that is registered for a reliability function in the NERC Compliance Registry and is responsible for complying with an Applicable Requirement, as specified in the "Applicability" section of the CIP Standard.

"Revoked" means a NERC certificate that has been suspended for more than twelve months. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified. The certificate holder will be required to pass an exam to be certified again. Any CE Hours accumulated prior to or during the revocation period will not be counted towards Credential Maintenance.

"Revoke for Cause" means a step in the disciplinary process pursuant to Appendix 6 during which the certificate is no longer valid and requiring successfully passing an exam to become certified. However, an exam will not be authorized until the revocation period expires. CE Hours earned before or during this revocation period will not be counted for maintaining a Credential.

"Sector" means a group of Members of NERC that are Bulk Power System owners, operators, or users or other persons and entities with substantially similar interests, including governmental entities, as pertinent to the purposes and operations of NERC and the operation of the Bulk Power System, as defined in Article II, Section 4 of the NERC Bylaws. Each Sector shall constitute a class of Members for purposes of the New Jersey Nonprofit Corporation Act.

"Segment" means one of the subsets of the Registered Ballot Body whose members meet the qualification criteria for the subset.

"Self-Certification" means attestation by a Registered Entity of compliance or non-compliance with a Reliability Standard for which Self-Certification is required by the Compliance Enforcement Authority and that is included for monitoring in the Regional Implementation Plan.

"Self-Reporting" means a report by a Registered Entity stating (1) that the Registered Entity believes it has violated a Reliability Standard, and (2) the actions that have been taken or will be taken to resolve the violation.

"Senior Manager" means the person assigned by the Responsible Entity, in accordance with CIP Standard CIP-003-1 Requirement R2 (or subsequent versions), to have overall responsibility for leading and managing the Responsible Entity's implementation of, and adherence to, the CIP Standards.

"Sink Balancing Authority" means the Balancing Authority in which the load (sink) is located for an Interchange Transaction.**

"Source Balancing Authority" means the Balancing Authority in which the generation (source) is located for an Interchange Transaction.**

"Special Protection System" means an automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. A Special Protection System does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated, or (c) out-of-step relaying (not designed as an integral part of a Special Protection System).**

"Spot Checking" means a process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Reporting, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to events, as described in the Reliability Standards or based on operating problems or system events.

"Staff" or "Compliance Staff" means individuals employed or contracted by NERC or the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Strict Compliance" means compliance with the terms of an Applicable Requirement without reliance on a Technical Feasibility Exception.

"Submitting Entity" means an owner, operator, or user of the Bulk Power System or any other party that submits information to NERC or a Regional Entity that it reasonably believes contains Confidential Information.

"Suspended" means certificate status due to an insufficient number of CE Hours being submitted prior to the expiration of a certificate. While in this state, a certificate holder can not perform any task that requires an operator to be NERC-certified.

"System" means a combination of generation, transmission and distribution components.**

"System Operating Limit" means the value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria.**

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies NERC's or the Compliance Enforcement Authority's (as applicable) conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the Hearing Body or Hearing Panel.

"Technical Feasibility Exception" or "TFE" means an exception from Strict Compliance with the terms of an Applicable Requirement on grounds of technical feasibility or technical limitations in accordance with one or more of the criteria in section 3.0 of Appendix 4D.

"Termination of Credential" means a step in the disciplinary process pursuant to Appendix 6 whereby a Credential is permanently Revoked.

"TFE Request" means a request submitted by a Responsible Entity in accordance with Appendix 4D for an exception from Strict Compliance with an Applicable Requirement.

"Transmission Customer" means 1. any eligible customer (or its designated agent) that can or does execute a Transmission Service agreement or can and does receive Transmission Service. 2. Any of the following responsible entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.**

"Transmission Operator" means the entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission Facilities.**

"Transmission Owner" means the entity that owns and maintains transmission Facilities.**

"Transmission Planner" means the entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority area.**

"Transmission Service" means services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.**

"Transmission Service Provider" means the entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable Transmission Service agreements.**

"Type of CE Hours" means NERC-Approved Learning Activity covering topics from Appendix A to Appendix 6, NERC Reliability Standards and/or simulations for which there is a minimum requirement for Credential Maintenance.

"Variance" means an aspect or element of a Reliability Standard that applies only within a particular Regional Entity or group of Regional Entities, or to a particular entity or class of entities. A Variance allows an alternative approach to meeting the same reliability objective as the Reliability Standard, and is typically necessitated by a physical difference. A Variance is embodied within a Reliability Standard and as such, if adopted by NERC and approved by the Applicable Governmental Authority(ies), shall be enforced within the applicable Regional Entity or Regional Entities pursuant to delegated authorities or to procedures prescribed by the Applicable Governmental Authority.

"Violation Risk Factor" or "VRF" means a factor (lower, medium or high) assigned to each Requirement of a Reliability Standard to identify the potential reliability significance of noncompliance with the Requirement.

"Violation Severity Level" or "VSL" means a measure (lower, moderate, high or severe) of the degree to which compliance with a Requirement was not achieved.

"Wide Area" means the entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.**

Procedures for Election of Members of the Standards Committee

Effective: November 17, 2011

116-390 Village Boulevard, Princeton, New Jersey 08540-5721
Phone: 609.452.8060 ▪ Fax: 609.452.9550 ▪ www.nerc.com

Table of Contents

Purpose

This procedure is provided for use by the NERC Sstandards Registered Ballot Body to facilitate the election of industry stakeholder sSegment (Segment)[1] representatives to the NERC Standards Committee. This procedure is a default process that is available, on a voluntary basis, for the benefit of all Segments of the Registered Ballot Body. The use of alternative procedures is described in a later section.

Responsibilities for This Procedure

The NERC Board of Trustees provides oversight of the election of Standards Committee members. The Board provides the authority for approval of this procedure and any revisions thereto, and monitors any Segment-specific procedures that may be developed to ensure they are consistent with established principles.

The Standards Committee shall be responsible for advising the Board regarding the use of this procedure or any revisions to the procedure.

Each Registered Ballot Body entity shall be responsible for actively participating in the nomination and election of Standards Committee representatives for each Segment in which the entity is a member.

The Sstandards Pprocess Mmanager (SPM) shall administer the implementation and maintenance of this procedure.

Guiding Principles

This procedure supports a Reliability sStandards development process that is open, inclusive, balanced, and fair. This procedure shall be interpreted in a manner that is consistent with NERC's mission of promoting the reliability of the North American bBulk eElectric sSystems, NERC Standard Processes Manual, NERC's Rreliability and Mmarket Iinterface Pprinciples, and maintaining good standing as a standards developer accredited by the American National Standards Institute.

Standards Committee Membership

Each valid[2] Segment shall be eligible to elect two voting members to represent the Segment on the Standards Committee. A rRegistered Eentity may provide only one Standards Committee member, irrespective of the number of sSegments in which the entity is registered. Each representative that is elected by a Segment to fill one of those positions shall serve on behalf of the Registered Ballot Body entities in that Segment. An eligible position on the Standards eCommittee that is not filled by a Segment shall be shown as vacant and shall not be counted in the determination of a quorum. Each elected member of the Standards Committee (except for the officers who do not vote) shall carry one vote.

[1] Industry stakeholder Segment criteria and a list of entities in the NERC sStandards Registered Ballot Body are provided on the NERC web site. In this procedure, the term "Segment" shall mean one of the currently defined industry stakeholder Segments.

[2] Validity is determined by established Segment criteria, including the minimum number of entities in a Segment.

Standards Committee Membership Term

The Standards Committee reports to the NERC Board of Trustees and is responsible for managing the NERC Standard Processes Manual and other duties as assigned by the Board.

The Standards Committee also serves for the benefit of the members of the Registered Ballot Body and is accountable to them through election by the Segment representatives. Standards Committee membership shall be for a term of two years, with members' terms staggered such that half of the member positions (one per Segment) are refilled each year by Segment election. Prior to the end of each term, nominations will be received and an election held in accordance with this procedure, or a qualified Segment procedure, to elect Standards Committee representatives for the next term. There is no limit on the number of two-year terms that a member of the Standards Committee may serve, although the setting of limits in the future is not precluded.

Standards Committee Officers

Approximately 90 days prior to the end of each term, the Standards Committee shall elect a chairman and vice chairman (from among its members by majority vote of the members of the Standards Committee) to serve as officers and preside over the business of the Standards ~~c~~Committee for the following two years. The officers shall serve a term of two years, starting in January of the following year, without limit on the number of terms an officer may serve, although the setting of limits in the future is not precluded. The chairman and vice chairman shall serve as non-voting members of the Standards Committee. The SPM serves as a non-voting member and secretary of the Standards Committee.

The vacancies in the ~~Industry~~ Segments and/or Canadian representation created by the selection of the chair and vice chair shall be filled at the annual election of representatives to the Standards Committee that is next held following the election of the chairman and vice chairman. When a representative is elected to serve as the chairman or vice chairman during the second year of a two year term, the representative elected to fill the vacancy shall serve a one year term.

Standards Committee Scope and Conduct of Business

The Standards Committee conducts its business in accordance with a separate scope document, the Standard Processes Manual, other applicable NERC procedures, and procedures that the Standards ~~c~~Committee itself may develop. This procedure addresses the nomination and election of members of the Standards ~~c~~Committee and is not intended to otherwise establish or limit the scope, authorities, or procedures of the Standards ~~c~~Committee.

Segment Representative Nominations

Approximately 90 days prior to the start of each term and after the election of officers, the SPM shall request nominations to fill Standards Committee positions that will become open with the expiration of the current term.

Notice of the nominations process shall be announced to the Registered Ballot Body and to others that may be interested in standards for the reliability of North American ~~b~~Bulk ~~e~~Electric ~~s~~Systems. The SPM shall post the announcement on the NERC web page and distribute the

announcement to applicable NERC e-mail lists. The announcement shall include a brief description of the responsibilities of the Standards Committee and estimates of the work effort and travel expected of Standards Committee members.

Any person or entity may submit a nomination. Self-nominations are encouraged.

To be eligible for nomination, a nominee shall be an employee or agent of an entity registered in the applicable Segment. To allow verification of affiliation, a nominee shall be a registered ~~U~~user in the NERC Registered Ballot Body. It is not required that the nominee be the same person as the entity's Registered Ballot Body representative for that Segment.

The SPM shall provide a method for the submittal of nominations, preferably an on-line nominations form using ~~I~~internet protocols. The nomination form shall request the following information and other information that the SPM deems necessary to completing the election process:

Nomination Information

1. Segment for which the nomination is made.
2. Nominee name (selected from list of registrants).
3. Nominee job title. [3]
4. Nominee organization (must be an entity registered in the designated Segment). [3]
5. Nominee contact information: telephone, fax, e-mail, and mailing address.[3]
6. Nominee brief summary of qualifications related to serving on the Standards Committee (limited to a 3,000-character text box — approximately 500 words or one-page, single-spaced).
7. Indication (check box) that the nominee has been contacted and is willing to serve on the Standards Committee for a two-year term.
8. Person or entity making the nomination.
9. Contact information for person or entity making nomination: contact name, organization, telephone, fax, e-mail, and mailing address.

The SPM shall verify that each nomination received is complete and valid. The SPM may follow up with nominees to collect additional information.

In the event that multiple nominations are received for persons from a single entity within a Segment, that entity's representative shall determine which person will be the nominee from that entity.

The SPM shall post each nomination that is complete and valid. Each nomination shall be posted as soon as practical after it has been verified.

[3] Information items 3–5 are provided automatically from the nominee during registration.

The nomination period shall remain open for 21 calendar days from the announced opening of the nominations, at which time the nominations shall be closed.

Segment Representative Elections

The SPM shall prepare a slate of nominees for each Segment. The Segment slate shall consist of all valid nominations received for that Segment, without prejudice in the method of listing the slate.

The SPM shall provide an electronic ballot form for each Segment, listing the slate of nominees. Each Registered Ballot Body entity in a Segment may cast one vote per Standards Committee member position being filled (i.e. one vote if one position is being filled and two votes if two positions are being filled). In the case that an entity casts two votes within a Segment, each vote must be for a different candidate in that Segment (i.e. an entity cannot vote twice for a nominee within a Segment).

This ballot procedure is repeated for each Segment in which an entity is a member of the Registered Ballot Body. The ballot for each Segment is conducted independently from the ballots of other Segments. Only the entities in the Registered Ballot Body for a Segment may vote in that Segment.

The ballot period shall be announced to the Registered Ballot Body and to others that may be interested in standards for the reliability of North American ~~b~~Bulk ~~e~~Electric ~~s~~Systems. The SPM shall post the announcement on the NERC web page and distribute the announcement to applicable NERC e-mail lists.

The ballot period shall remain open for ten calendar days from the announced opening of the ballot period, at which time the ballot period shall be closed.

Votes may be cast by the Registered Ballot Body Representative for each entity, or a proxy designated by the representative. An entity may vote in each Segment in which it is registered.

Ballot results shall remain confidential during the ballot period. As soon as practical after the close of the ballot period, the SPM shall publicly post the election results for each Segment~~,~~ (i.e. the names of elected members and slates for any run-off elections that may be required).

Election Formula

The elected Standards Committee member for each Segment shall be the nominee receiving the highest total number of votes, with the condition that the nominee must receive a vote from a simple majority of the entities casting a vote in that Segment. If the election is being held for two positions in a Segment, the nominees receiving the highest and second highest number of votes shall be elected, with the condition that each nominee must receive a vote from a simple

majority of the entities casting a vote in that Segment[4]. In this case, if only one of the two nominees meets these criteria, then that nominee shall be deemed elected.

In the event that the election is incomplete in a Segment's first ballot (no candidate or only one candidate meets the criteria), then a second ballot will be conducted in that Segment, using a process similar to that previously described. If two positions are remaining to be filled in the second ballot, the slate of candidates shall consist of the four candidates receiving the highest number of votes in the first ballot. If one position is remaining to be filled in the second ballot, the slate shall consist of the two candidates receiving the highest number of votes. A candidate who was elected in the first ballot is considered elected and is excluded from the second ballot. In the event of a tie that precludes choosing the top four (or two) candidates, the slate will be expanded to include those candidates that are tied.

After the second ballot in the Segment, the candidate(s) receiving the highest number of votes shall be elected to fill the remaining position(s) in that Segment.

In the event of a tie between two or more candidates after a second ballot, a run-off ballot may be used to break the tie. The position shall remain vacant until the tie is broken by the Segment.

Representation from Canada

To achieve balance of representation between the United States and Canada on the basis of ~~n~~Net ~~e~~Energy for ~~l~~Load (NEL), the following special procedure shall apply:

1. If any regular election of Standards Committee members does not result in at least two Canadian members being elected, the Canadian nominees receiving the next highest percentage of votes within their respective Segment(s) will be designated as members, as needed to achieve a total of two Canadian members;
2. Each such specially designated Canadian member of the Standards Committee shall have a one year term, as the Standards Committee holds elections each year and special designation of members should not interfere with the regular election process;
3. If any ~~s~~Segment~~, as defined in Rule of Procedure Appendix 3D,~~ has an unfilled position following the annual Standards Committee election, the first preference is to assign each specially designated Canadian representative to an unfilled ~~s~~Segment for which he or she qualifies;
4. Any such specially designated members of the Standards Committee shall have the same rights and obligations as all other members of the Standards Committee;
5. For the purpose of the Standards Committee election process, Canadian representation shall be defined as: any company or association incorporated in Canada, any agency of a federal, provincial, or local government in Canada, or any person with Canadian citizenship who is residing in Canada.

[4] Each entity in the Segment is allowed to cast two votes. This criterion means that more than fifty percent (>50%) of the entities cast one of their votes for that nominee.

Special Elections

The Standards Committee's officers shall determine the need for a special election to fill a vacant Standards Committee position between regular elections considering, among other things, the timing of the last and the next regular election. If a need is determined, the Standards Committee officers shall communicate a request to the dDirector of Sstandards, who shall initiate a process to conduct the election. The SPM shall post a request for nominations on the NERC web page and distribute the announcement to applicable NERC e-mail lists, e.g., the Registered bBallot bBody of the Segment(s) involved. The election will be held 30 days after the announcement and shall use the same election process and formula employed in regular elections. The Board of Trustees shall be notified of the election results.

Alternative Procedures

This procedure is provided as the default method for Segments to elect representatives to the Standards Committee. Alternative procedures may be used by a Segment, or jointly by several Segments. Such a procedure shall be consistent with the principles noted in this document. Such a procedure shall be ratified by at least two-thirds of the rRegistered eEntities in each Segment in which it will be applied, and is subject to review by the NERC Board.

Registered Ballot Body Criteria

Effective: November 17, 2011

116 -390 Village Boulevard, Princeton, New Jersey 08540-5721

Phone: 609.452.8030 · Fax: 609.452.9550 · www.nerc.com

Appendix 3D — Development of the Registered Ballot Body[1]

Registration Procedures

The Registered Ballot Body comprises all organizations, entities, and individuals that:

1. Qualify for one of the Ssegments, and
2. Are registered with NERC as potential ballot participants in the voting on Reliability Sstandards, and
3. Are current with any designated fees.

Each participant, when initially registering to join the Registered Ballot Body, and annually thereafter, shall self-select to belong to one of the Ssegments described below.

NERC general counsel will review all applications for joining the Registered Ballot Body, and make a determination of whether the self-selection satisfies at least one of the guidelines to belong to that sSegment. The entity or individual will then be "credentialed" to participate as a voting member of that sSegment. The Standards Committee will decide disputes, with an appeal to the Board of Trustees.

All registrations will be done electronically.

Segment Qualification Guidelines

1. Except as set forth below, the sSegment qualification guidelines are inclusive; i.e., any entity or individual with a legitimate interest in the reliability of the bBulk pPower sSystem that can meet any one of the guidelines for a sSegment is entitled to belong to and vote in that Ssegment.

2. Corporations or organizations with integrated operations or with affiliates that qualify to belong to more than one Ssegment (e.g., transmission owners and Lload Sserving Eentities) may belong to each of the Ssegments in which they qualify, provided that each sSegment constitutes a separate membership and is represented by a different representative. Individuals or entities that elect to participate in Segment 8 are not eligible to participate in multiple sSegments.

3. At any given time, affiliated entities may collectively be registered only once within a sSegment.

4. Any individual or entity, such as a consultant or vendor, providing products or services related to bBulk pPower sSystem reliability within the previous 12 months to another entity eligible to join Segments 1 through 7 shall be qualified to join any one Ssegment for which one of the entities receiving those products or services is qualified to join.

5. Corporations, organizations, entities, and individuals may participate freely in all subgroups.

6. After their initial selection, registered participants may apply to change Ssegments annually, on a schedule determined by the Standards Committee.

[1] The sSegment qualification guidelines were proposed in the final report of the NERC Standing Committees Representation Task Force on February 7, 2002. The Board of Trustees endorsed the industry sSegments and weighted Ssegment voting model on February 20, 2002 and may change the model from time to time.

7. The qualification guidelines and rules for joining Ssegments will be reviewed periodically to ensure that the process continues to be fair, open, balanced, and inclusive. Public input will be solicited in the review of these guidelines.

8. Since all balloting of Reliability sStandards will be done electronically, any registered participant may designate a proxy to vote on its behalf. There are no limits on how many proxies a person may hold. However, NERC must have in its possession, either in writing or by email, documentation that the voting right by proxy has been transferred.

Segments

Segment 1. Transmission Owners

a. Any entity that owns or controls at least 200 circuit miles of integrated transmission facilities, or has an Open Access Transmission Tariff or equivalent on file with a regulatory authority.

b. Transmission owners that have placed their transmission under the operational control of an RTO or ISO.

c. Independent transmission companies or organizations, merchant transmission developers, and transcos that are not RTOs or ISOs.

d. Excludes RTOs and ISOs that are eligible to join to Segment 2.

Segment 2. Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs)

a. Any entity authorized by appropriate governmental authority to operate as an RTO or ISO.

Segment 3. Load-Serving Entities (LSEs)

a. Entities serving end-use customers under a regulated tariff, a contract governed by a regulatory tariff, or other legal obligation to serve.

b. A member of a generation and transmission (G&T) cooperative or a joint-action agency is permitted to designate the G&T or joint-action agency to represent it in this sSegment; such designation does not preclude the G&T or joint-action agency from participation and voting in another Ssegment representing its direct interests.

c. Agents or associations can represent groups of LSEs

Segment 4. Transmission Dependent Utilities (TDUs)

a. Entities with a regulatory, contractual, or other legal obligation to serve wholesale aggregators or customers or end-use customers and that depend primarily on the transmission systems of third parties to provide this service.

b. Agents or associations can represent groups of TDUs.

Segment 5. Electric Generators

a. Affiliated and independent generators, including variable and other renewable resources.

b. A corporation that sets up separate corporate entities for each one or more generating plants in which it is involved may only have one vote in this sSegment regardless of how many single-plant or multiple-plant corporations the parent corporation has established or is involved in.

c. Agents or associations can represent groups of electrical generators.

Segment 6. Electricity Brokers, Aggregators, and Marketers

a. Entities serving end-use customers under a power marketing agreement or other authorization not classified as a regulated tariff.

b. An entity that buys, sells, or brokers energy and related services for resale in wholesale or retail markets, whether a non-jurisdictional entity operating within its charter or an entity licensed by a jurisdictional regulator.

c. G&T cooperatives and joint-action agencies that perform an electricity broker, aggregator, or marketer function are permitted to belong to this ~~s~~Segment.

d. Agents or associations can represent groups of electricity brokers, aggregators, or marketers.

e. This S~~s~~egment also includes demand-side management providers.

Segment 7. Large Electricity End Users

a. At least one service delivery taken at 50 kV (radial supply or facilities dedicated to serve customers) that is not purchased for resale.

b. A single customer with an average aggregated service load (not purchased for resale) of at least 50,000 MWh annually, excluding cogeneration or other back feed to the serving utility.

c. Agents or associations can represent groups of large end users.

Segment 8. Small Electricity Users

a. Service taken at below 50 kV.

b. A single customer with an average aggregated service load (not purchased for resale) of less than 50,000 MWh annually, excluding cogeneration or other back feed to the serving utility.

c. Agents, state consumer advocates, or other advocate groups can represent groups of small customers.

d. Any entity or individual currently employed by an entity that is eligible to join one or more of the other nine S~~s~~egments, shall not be qualified to join Segment 8.

e. Any individual or entity, such as a consultant, employee or vendor, providing products or services related to ~~b~~Bulk ~~p~~Power ~~s~~System reliability within the previous 12 months to another entity eligible to join Segments 1 through 7, including trade associations representing such Segments, shall be qualified to join any one ~~s~~Segment for which one of the entities receiving those products or services is qualified to join and shall not be eligible to join ~~s~~Segment 8.

Segment 9. Federal, State, and Provincial Regulatory or other Government Entities

a. Does not include federal power management agencies or the Tennessee Valley Authority.

b. May include public utility commissions.

Segment 10. Regional Entities

a. Any entity that is a Rregional eEntity~~, as defined in NERC's Bylaws~~. It is recognized that there may be instances in which an entity is both an RTO or ISO and a Rregional eEntity. In such a case, the two functions must be sufficiently independent to meet NERC's Rules of Procedure and applicable regulatory requirements, as evidenced by the approval of a Rregional eEntity delegation agreement. Without such an approval, the entity shall be limited to choosing to enter one Ssegment or the other, but not both.

Standards Committee

Preliminary Election Results
Initial Election November 8-18, 2011

The Standards Committee nomination period for the January 2012 through December 2013 two-year term has closed. Twenty-two nominations were received, including at least one for each of the ten Industry Segments.

Each of the ten Industry Segments must elect one representative. The following individuals were the only individuals nominated to represent their Industry Segment, and are elected to the Standards Committee as they were unopposed:

- Segment 2 – Ben Li
- Segment 4 – Allen Mosher
- Segment 7 – Frank McElvain
- Segment 9 – Klaus Lambeck

The following individual was elected through an alternative process ratified by members of that Industry Segment as allowed under the Election Procedure for Members of NERC Standards Committee:

- Segment 10 – Linda Campbell

In accordance with the Election Procedure for Members of NERC Standards Committee, an election will be held for Segments 1, 3, 5, and 8. For each of these segments, we received more than one nominee. The slate of nominees for each of these segments is shown below and detailed information on each of these candidates is posted on the Standards Committee's Nominations and Elections web page:

Segment 1:

- David Kiguel
- Carol Sedewitz

Segment 3:

- Wayne Amondson
- John Babik
- John Bussman
- John Hagen
- Michael DeLoach

- Linn Oelker
- Keith Porterfield

Segment 5:

- Randy Crissman
- Amir Y Hammad
- Scott Miller
- Don Mzyk
- John Seelke

Segment 6:

- Andrew Gallo
- Alice Ireland

Segment 8:

- Frederick R. Plett
- James Stanton

The election will begin on Tuesday, November 8, 2011 and remain open for ten calendar days. Each individual that is a member of the Registered Ballot Body in one of the Industry Segments identified above will vote for a Standards Committee member to represent that Industry Segment. Proxies are allowed.

Next Steps

To be elected during the initial ballot, a nominee must meet both of the following:

- Receive the highest total number of votes in that Segment, and
- Receive a simple majority of the votes cast in that Segment.

If no candidate meets both criteria through the initial ballot, a second ballot will be conducted in that Segment. For the second ballot, the slate consists of the two candidates who received the highest number of votes in the initial ballot.

The candidate receiving the highest number of votes in the second ballot is elected to represent that Segment.

Date:	Tuesday, November 15, 2011 4:20:27 AM

Kathleen, thanks.

The SC met with a number of SDT chairs/vice-chairs at the October face to face meeting and got feedback that in general, the QR process added value to standards development. The extended delays caused by the QR process were not mentioned at that meeting.

That said, I am not ruling out that there have been delays that could result in project slippages. I will raise this with the SC at the next meeting.

Ben

Agenda
Standards Committee Meeting

November 10, 2011 | 1-5 p.m. Eastern
Phone Number: 1-866-740-1260
Meeting Code: 4685998
Security Code: 224466

Introductions and Chair's Remarks
NERC Antitrust Compliance Guidelines and Public Announcement*
Agenda

1. **Review of Agenda (Approve)**
   Quorum obtained.
   Approved.
2. **Waiver of 5-day Rule (Approve)**
   Approved
3. **Consent Agenda (Approve)**
   a. October 3, 2011 Standards Committee QRAWG Meeting Minutes* (Ratify) b.

   October 10, 2011 Standards Committee QRAWG Meeting Minutes* (Ratify) c.

   October 12, 2011 Standards Committee Meeting Minutes*

   d. October 20, 2011 Standards Committee QRAWG Meeting Minutes* **(Ratify)**
   e. October 24, 2011 Standards Committee Executive Committee Meeting Minutes***(Ratify)**
   f. November 2, 2011 Standards Committee QRAWG Meeting Minutes* **(Ratify)**
   g. Project 2010-07 — Generator Requirements at the Transmission Interface Standard Drafting Team * **(Appoint) Confidential (To be sent separately)**

   Approved for3a hrough 3f. Item 3g moved out.
   3gi: Two candidates proposed.
   Approved.
4. **High Priority Projects, Activities, and Action Items (Review)**
   a. Status of Projects Identified as High Priority* (A. Rodriquez)

One Project Completed:

- *Project 2006-02 Assess Transmission Future Needs. Note this project may be impacted by future actions regarding the TPL Footnote B project, currently proposed for Remand by the FERC.*

Six Projects on Schedule (+/- Two Weeks):

- *NEW Project 2007-06 System Protection Coordination*
- *Project 2007-12 Frequency Response*
- *Project 2007-17 Protection System Maintenance and Testing*
- *Project 2008-06 Cyber Security Order 706*

- *Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves. This projects schedule is being redeveloped based on feedback from the last Standards Committee meeting.*
- *Project 2010-17 Definition of BES*

One Project Ahead of Schedule:

- *NEW Project 2010-07 Generator Requirements at the Transmission Interface*

Seven Projects Behind Schedule:

Analysis of timelines and delays are based on schedules adjusted and presented at the July SC meeting.

- *NEW Project 2006-06 Reliability Coordination. This project is approximately 3 months behind schedule. Recently, its schedule has slipped due to more time being required to respond to comments received during Quality Review than expected. Originally expected to take 2 weeks, it actually has taken the team 14 weeks so far.**
- *Project 2007-02 Operating Personnel Communication Protocols. This project is approximately 4 months behind schedule. Recently, its schedule has slipped due to the team focusing on completing the related interpretation. Quality issues have also been identified that are being addressed. Their original target was to complete the draft of the standard over four weeks, but it actually has taken the team 17 weeks so far.**
- *Project 2007-03: Real-time Operations - The work done in response to the most recent Quality Review took longer than anticipated – approximately 4 weeks longer than planned. QRAWG review and subsequent modification has taken an additional 3 weeks.*
- *Project 2007-07 Vegetation Management. This project has completed its recirculation ballot, and is being presented to the Board of Trustees on November 3. An update on its status will be provided verbally. Its delay was caused first by its coordinator leaving NERC, then primarily by moving to informal development, both periods during which the SDT worked independently. This resulted in modifying the standard in response to comment staking a significant amount of time longer than planned (slightly more than one year in total from the Initial ballot to the submission for Recirculation)*
- *NEW Project 2007-09 Generator Verification. This project is approximately 1.5 months behind schedule. Recently, its schedule has slipped due to more time being required to respond to industry comments than expected. Originally expected to take 5 weeks, it actually has taken the team 12 weeks so far.**
- *NEW Project 2009-01 Disturbance and Sabotage Reporting. This project is approximately 2.5 months behind schedule. Recently, its schedule has slipped due to resource conflicts, resulting in delays related to submitting documents to QR and responding to QR's feedback. Originally expected to take 2 weeks, it actually took the team 10 weeks.**
- *NEW Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project is approximately 7.5 months behind the desired schedule due to confusion regarding the projects goals. The team is reevaluating its project schedule to accelerate the project.*

b. Status of Outstanding Interpretations *(L. Hussey and A. Rodriquez)

No new interpretations received since last SC meeting.

Project	*Status*

Project 2008-10 — Interpretation of CIP-006-1 for Progress Energy	*Posted for parallel comment and successive ballot through November 21, 2011.*
Project 2009-22 — Interpretation of COM-002-2 for the IRC	*Posted for parallel comment period and initial ballot through November 17, 2011.*
Project 2009-26 — Interpretation of CIP-004-1 for WECC	
Project 2010-INT-05 CIP-002-1 for Duke Energy	*In progress*
2010-INT-01 TOP-006-2 for FMPP	*Awaiting outcome of CAN discussion at November 2011 BOT meeting.*
2010-INT-02 TOP-003-1 for FMPP	*Awaiting outcome of CAN discussion at November 2011 BOT meeting.*
Project 2010-INT-03 TOP-002-2a for FMPP	*Awaiting outcome of CAN discussion at November 2011 BOT meeting.*
RFI received on 11/4/2010 from TECO on CIP-007	*Requester has indicated that he would like to move forward with the request, pending the outcome of revisions to CAN.*
RFI received in 12/9/2010 from Bridgeport Energy on FAC-008-1	*CAN-0018 on this issue was posted as final 6-17-11. Requester has been contacted to see if the CAN satisfies their need for clarification. Awaiting response. Note: due to the BOT's request that all CANs be rewritten, requester will need to be contacted when CAN-0018 is revised.*
RFI received on 12/28/2010 from ITC on CIP-007	*Assigned to CIP IDT, to be processed when earlier requests have been moved through the process.*
RFI received on 1/28/2011 from Constellation Power Gen on VAR-002-1b	*Accepted for processing.*
RFI received on 2/24/2011 from OGE on CIP-002-3 R1.2.5	*Assigned to CIP IDT, to be processed when earlier requests have been moved through the process.*
RFI received on 5/13/11 from FPL on MOD-028-1	*Revision to the standard is posted for parallel comment and initial ballot through November 16, 2011.*
RFI received on 6/9/2011 from Consumers Energy on CIP-003-3	*Assigned to CIP IDT, to be processed when earlier requests have been moved through the process.*
RFI received on 7/22/11 from EEI and NRECA on CIP-001-1	*In August the SC voted to move forward with this interpretation. Drafting team appointment on hold pending finalization of CAN-0016 to see if the revision of the CAN provides clarification. In September, the SC reaffirmed this decision. In October, EEI indicated their intent (in policy input to the Board of Trustees) to pursue an appeal of CAN-0016.*

5. **Standard Actions**

   a. Project 2007-17 - Protection System Maintenance & Testing - PRC-005* (A. Rodriquez) **(Appoint)**

Confidential (To be sent separately)

Removing 2 inactive members and adding 8 new members.

No NPCC reps in initial slate. Carol proposed to add one. Long discussion. Final motion without the NPCC rep.
Approved.
Additional NPCC person will be sought in a couple of month if the SDT Chair concurs.

6. **Reports**
   a. Report from Board of Trustees and Standards Oversight and Board of Trustees Meetings (A. Mosher and H. Schrayshuen)

   BoT approved the VM standard and the reliability standards development plan (RSDP).

b. Report from Order 754 Tech Conference (H. Schrayshuen) *Moved to 4ai*

c. Report on Throughput Issues (H. Schrayshuen)

7. **Coordination (Review)**
   a. Coordination with Regulatory and Governmental Authorities (H. Hawkins)
   b. Coordination with Regional Managers (H. Schrayshuen)
   c. Update on Proposal for Coordination with Regional Standards Development* (M. Long)
8. **Discussion Items**
   a. Report from October 13 Strategic Planning Session* (M. Gildea)
   Send comments to Allen by the 17th.

b. Project 2010-07 – Generator Requirements at the Transmission Interface – Impact of Compliance Process Directive #2011-CAG-001* (P. Brown)
Concerns that directive circumvents the established standards development process.
Appears to be expanding the requirements.

9. **Informational Items (Review)**
   a. Drafting Team Vacancies*
   b. Standards Committee Roster*
10. **Executive Committee Actions (Pre-authorize)**
   a. Project 2010-05.1 Phase 1 of Protection Systems: Misoperations – Project schedule* **(Endorse)**
   This project involves two phases, with the initial phase focused solely on standard related to misoperations. This project is a "pilot" for the "rapid development" process and, when started, had a target project duration (from SAR posting to completion of the recirculation ballot) of 12 months. The team submitted a project schedule that proposed a project duration of 18 months. When reviewed during the October 2011 Standards Committee meeting, the committee expressed concern that the schedule did not reflect the goals associated with piloting the rapid development process. The committee directed the team to develop a schedule that supports the rapid development goals.
   This project team has not met to review changes to the schedule, but has virtual meetings scheduled in November and is expected to produce a revised schedule for Standards Committee review and endorsement before the December Standards Committee meeting.

Agreed to give SC Executive Committee authority to decide.

b. Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves – Project schedule* **(Endorse)**

This project involves two phases, with several standards in each of the phases. Some of the standards involved in Phase 1 have been posted for stakeholder comment and some have not.
The team submitted a single project schedule that proposed posting all standards in this phase of the project for an initial and a recirculation ballot and seemed to assume that the standards already vetted as well as the new standards that haven't been posted for any stakeholder review, would all receive sufficient stakeholder support to move forward with an initial and a recirculation ballot. When reviewed during the October 2011 Standards Committee meeting, the committee expressed concern that the schedule, for those standards that haven't already been posted for at least one formal comment period, is not realistic. The committee endorsed the proposed schedule for those standards that have already been posted for stakeholder comment and directed the drafting team to develop a more realistic schedule for its proposed standards that have not been posted.
An updated schedule based on the Standards Committee's guidance has been drafted and is being reviewed internally prior to moving forward before the December Standards Committee meeting.

11. **Adjourn**

Re: Request for Clarification on Compliance Application Notice 0006: EOP-005-1, Requirement 7, "Verification of Restoration"

Dear Mr. Moon:

The NPCC Restoration Working Group is charged to facilitate effective and coordinated power system restoration among the NPCC Reliability Coordinator areas and with adjacent jurisdictions. As part of its efforts, the Working Group annually reviews the restoration plans of the NPCC Reliability Coordinator areas, and it develops and leads an annual wide area restoration simulation with the Reliability Coordinators of NPCC and their neighboring Reliability Coordinators. Recognizing these responsibilities, the Restoration Working Group is seeking further clarification of Compliance Application Notice 0006: EOP-005-1, Requirement 7, "Verification of Restoration," regarding concerns raised previously.

The CAN broadly addresses restoration simulations as follows:

> "Regarding simulation: Simulation is an option that the TOP or BA can use to verify its restoration procedure. Simulation can include electronic simulation, which is a simulation of what is expected to actually occur during system restoration. Simulations may be conducted at a control center using the system operator's workstation or other facilities. Simulation can also include a walk-through simulation of a restoration procedure that has been tested using previous electronic simulation methods. In both cases, a CEA is to verify that the restoration scope and the results of the simulation are close enough to what would actually occur that decisions made during the simulation would be effective in actual restoration."

This describes the restoration exercises which are typically conducted throughout North America and certainly reflects the understanding of NPCC in applying Requirement 7. However, the CAN goes on to state:

> A ***simulated restoration exercise that takes place without actual equipment***[4] (whether by electronic or walk-through simulation) would not normally be considered verification "by actual testing or simulation," as required by the standard. However, under certain circumstances, a registered entity may fulfill the requirement by conducting a simulation restoration exercise(s) that takes place without actual equipment. For

a walk-through simulation conducted without actual equipment, the CEA is instructed to verify that the registered entity has a letter from either its BA or a TOP whose restoration procedure includes the registered entity, stating that:

1. the registered entity does not have a technical component to its restoration plan and

2. the registered entity's restoration is included in the BA's or TOP's restoration plan.

This statement does not provide any clarity to Requirement 7, which is already applicable to the BA and TOP. It is not clear what is meant by "…letter from either its BA or a TOP…" when the responsible entity is already a BA or TOP. It is the belief of the NPCC Restoration Working Group that this section of the CAN should be deleted since it has no relevance to the TOP or BA compliance requirements.

In addition, there is some doubt regarding how to demonstrate compliance as summarized in the CAN, revisions are suggested:

"Providing Evidence of Compliance

CEAs may use any of the following to obtain reasonable assurance of the entity's compliance:

- engineering analytical methods and practices;
- power flows to verify steady state conditions;
- transient stability analysis to verify the dynamic performance;
- electromagnetic transient analysis to verify switching operations.

CEAs are to verify that all of the evidence replicates actual events."

The language of the CAN infers that information in ALL of the bullets is necessary to achieve compliance. However, it is the belief of the NPCC Restoration Working Group that not all of the study work enumerated above is necessary to demonstrate evidence of compliance, and the CAN should be clearer on the point. Specific compliance measurements are being added outside of the Standard.

The CAN is introducing a limited definition for simulation that has not been vetted through the Standards Development Process. The term simulation is an undefined term and should be left with the registered entity to determine the appropriate level of simulation to meet the requirement. Lack of any or all of the four proposed means of simulation should not be a cause to find non-compliance. It may be appropriate to report to the area that this should be considered an area for improvement. If the industry or NERC believes it is necessary to define simulation for purposes of EOP-005, a SAR should be introduced to ensure the industry expert have an opportunity to develop the definition to improve the standard.

Your assistance in this important effort is appreciated.

Very truly yours,

David Dolan

Re: Request for Clarification on Compliance Application Notice 0006: EOP-005-1, Requirement 7, "Verification of Restoration"

Dear Mr. Moon:

The NPCC Restoration Working Group is charged to facilitate effective and coordinated power system restoration among the NPCC Reliability Coordinator areas and with adjacent jurisdictions. As part of its efforts, the Working Group annually reviews the restoration plans of the NPCC Reliability Coordinator areas, and it develops and leads an annual wide area restoration simulation with the Reliability Coordinators of NPCC and their neighboring Reliability Coordinators. Recognizing these responsibilities, the Restoration Working Group is seeking further clarification of Compliance Application Notice 0006: EOP-005-1, Requirement 7, "Verification of Restoration," regarding concerns raised previously.

The CAN broadly addresses restoration simulations as follows:

> "Regarding simulation: Simulation is an option that the TOP or BA can use to verify its restoration procedure. Simulation can include electronic simulation, which is a simulation of what is expected to actually occur during system restoration. Simulations may be conducted at a control center using the system operator's workstation or other facilities. Simulation can also include a walk-through simulation of a restoration procedure that has been tested using previous electronic simulation methods. In both cases, a CEA is to verify that the restoration scope and the results of the simulation are close enough to what would actually occur that decisions made during the simulation would be effective in actual restoration."

This describes the restoration exercises which are typically conducted throughout North America and certainly reflects the understanding of NPCC in applying Requirement 7. However, the CAN goes on to state:

> A ***simulated restoration exercise that takes place without actual equipment***[4] (whether by electronic or walk-through simulation) would not normally be considered verification "by actual testing or simulation," as required by the standard. However, under certain circumstances, a registered entity may fulfill the requirement by conducting a simulation restoration exercise(s) that takes place without actual equipment. For a walk-through simulation conducted without actual equipment, the CEA is instructed to verify that the registered entity has a letter from either its BA or a TOP whose restoration procedure includes the registered entity, stating that:
> 1. the registered entity does not have a technical component to its restoration plan and
>
> 2. the registered entity's restoration is included in the BA's or TOP's restoration plan.

This statement does not provide any clarity to Requirement 7, which is already applicable to the BA and TOP. It is not clear what is meant by "…letter from either its BA or a TOP…" when the responsible entity is already a BA or TOP. It is the belief of the NPCC Restoration Working Group that this section of the CAN should be deleted since it has no relevance to the TOP or BA compliance requirements.

In addition, there is some doubt regarding how to demonstrate compliance as summarized in the CAN, revisions are suggested:

> **"Providing Evidence of Compliance**
>
> CEAs may use any of the following to obtain reasonable assurance of the entity's compliance:
>
> - engineering analytical methods and practices;
> - power flows to verify steady state conditions;
> - transient stability analysis to verify the dynamic performance;
> - electromagnetic transient analysis to verify switching operations.

CEAs are to verify that all of the evidence replicates actual events."

The language of the CAN infers that information in ALL of the bullets is necessary to achieve compliance. However, it is the belief of the NPCC Restoration Working Group that not all of the study work enumerated above is necessary to demonstrate evidence of compliance, and the CAN should be clearer on the point. Specific compliance measurements are being added outside of the Standard.

The CAN is introducing a limited definition for simulation that has not been vetted through the Standards Development Process. The term simulation is an undefined term and should be left with the registered entity to determine the appropriate level of simulation to meet the requirement. Lack of any or all of the four proposed means of simulation should not be a cause to find non-compliance. It may be appropriate to report to the area that this should be considered an area for improvement. If the industry or NERC believes it is necessary to define simulation for purposes of EOP-005, a SAR should be introduced to ensure the industry expert have an opportunity to develop the definition to improve the standard.

Your assistance in this important effort is appreciated.

Very truly yours,

David Dolan

CAN Number (If a CAN has been numbered, it is under development)	CAN Requestor	Status	Standard	Project Subject	Item Description/Driver for Request (NERC has tried to identify these issues without identifying regions or registered entities; the description is a summary at the time of quarterly prioritization. It may not include all the related information currently identified with each possible CAN; NERC will document other information related to each within that CANs development history. Items listed here may require more than one CAN per standard or a group of similar issues into one CAN, depending on efficiencies, other NERC-wide efforts, etc.)	last updated: 11/16/11
5		Industry Comments/ Industry Redline	CIP-002-3 R3	Laptops remotely controlling BES assets are designated CCA	Registered entities and Regional Entities requested clarity regarding whether system operator laptops with the capability and purpose of controlling Bulk Electric System assets remotely (whether in normal operations or in emergencies) should be designated as Critical Cyber Assets (CCAs).	
6		Final	EOP-005-1 R7	Verification of Restoration Procedure by Actual Testing or by Simulation	This CAN provides instruction for assessing whether: 1) an entity has verified its restoration procedure "by actual testing or by simulation," as required by EOP-005-1 R7, and 2) the use of a third-party vendor impacts a registered entity's obligation under the standard	
7		Industry Comments/ Industry Redline	CIP-004-2 R4.2 CIP-004-3 R4.2	Revocation of Access (physical and electronic) to Critical Cyber Assets	Registered Entities and Regional Entities requested clarity about the extent and timing of revocation of access to Critical Cyber Assets (CCAs) required in CIP-004 R4.2. Specifically, clarity was sought on what constitutes revocation, access (physical and electronic), and what constitutes revocation of access to CCAs under different entity-specific scenarios.	
8		Final	PRC-005-1 R2	Pre-June 18 evidence	NERC Compliance received a request for clarification on PRC-005-1 R2 regarding the monitored timeframes for gathering evidence pre-June 2007 when determining compliance with an entity's maintenance and testing program. What is the validity of a regional auditor to ask for evidence pre June 2007 even though there was no obligation to retain records until at least June 17, 2007?	
9		Final	FAC-008 R1 FAC-009 R1, R2	Facilities not Matching Design Specifications	This CAN provides instruction for assessing compliance with FAC-008 R1 and FAC-009 R1 when an entity's constructed Facilities do not match its design specifications.	
10		Final	Definition of "Annual"	Definition of "Annual"	The definition of "annual" and implementation of annual requirements	
11		Final	PRC-005-1 R2	New Equipment	NERC Compliance received a request for clarification on PRC-005-1 R2 regarding gathering evidence of initial testing for new equipment	
12		Final	Requirement of periodic action by Effective Date	Requirement of periodic action by Effective Date	Registered entities and Regional Entities have requested that NERC provide clarification on whether a registered entity must provide evidence that it completed a periodic action or event required by a NERC Reliability Standard (Standard) prior to the registered entity's Effective Date for the Standard.	
13		Final	PRC-023	R1 and R2	This CAN clarifies the Effective Dates for SOTF schemes included on 1) transmission lines operated at 200 kV and above, and 2) transformers with low voltage terminals connected at 200 kV and above, under PRC-023 Requirement (R) 1 and R2.	
15		Industry Comments/ Industry Redline	EOP-002-2 Attachment 1; EOP-005-1 R11.3; IRO-002-2 R4, R5, R6; IRO-003-2 R1, R2; IRO-005-3 R1; and IRO-006-4.1 R1.4.1	NERC Tools	NERC Compliance received a request for clarification on a suite of reliability standards that require the use of a NERC tool. What is a registered entity's performance obligation to a standard's requirements when a NERC Tool is unavailable? EOP-005-1 R11.3: NERC Compliance received a request for clarification regarding "working with" and the applicability.	
16		Final	CIP-001 R1	Non-BES Facilities	Is a registered entity required to include non-BES facilities in its Sabotage Reporting Procedure?	

17		Final	CIP-007-3 R5	Password controls	Is a CEA is to verify that technical controls, procedural controls, or both are implemented in assessing compliance with CIP-007 Requirement (R) 5?	
18		Final	FAC-008 R1.2.1	1.2.1	This CAN provides instruction for assessing what equipment should be considered "terminal equipment" under FAC-008.	
19		In Development	CIP-007-3 R3	Security Patches	Is a registered entity required to have a technical control for password configuration or would a manual solution meet the requirement? How would a manual solution be audited? NERC Compliance received a request for clarification for when and under what conditions a TFE is required.	
20		Industry Comments/ Industry Redline	TPL-002a R6 & R11 TPL-002.0b R1.3.12 TPL-003a R1.3.12 TPL-004 R	Eval of Maintenance Outages	NERC received a request for clarification of whether maintenance outages, including Protection Systems, must be included in operational planning studies under TOP-002 or in transmission planning assessments under TPL-002, TPL-003, and TPL-004.	
21		In Development	COM-002	Definition of a Directive	NERC received a request for clarification of the definition of a "directive," whether it applies to both non-emergency and emergency situations, and the required use of three-part communications.	
22		Industry Comments/ Industry Redline	VAR-002-1.1b R1	Startup in Manual Mode	NERC received requests for clarification regarding whether a generator may be operated in manual mode during start-up.	
23		In Development	CIP-005 R3 CIP-006 R6 CIP-007 R6	Logging System Failures	NERC received a request for clarification of whether any exception exists for an entity that cannot log access 100% of the time, 24 hours per day, seven days per week, and if not, whether the entity needs to file a self-report of non-compliance any time the access logging system fails.	
24		Industry Comments/ Industry Redline	CIP-002-1 R3.1	Data Diodes	NERC received a request for clarification of whether the communication characteristics of data diode devices can be used to exclude non-critical Cyber Assets (CA) from consideration as Critical Cyber Assets (CCA) when a routable protocol is implemented, thereby making them inapplicable to CIP Standards.	
25		In Development	EOP-001-1 R2.4	BA Restoration Plans	NERC received the following question: When a BA is not a registered TOP, how does it comply with EOP-001-0 R3.4 (U.S.) or EOP-001-1 R2.4 (Canada), which require BAs to have a set of plans for system restoration?	
26		Industry Comments/ Industry Redline	TOP-006-1 R3	Protective Relays	NERC received a request for clarification of whether a RC, TOP and BA, under TOP-006 Requirement (R) 3, needs to provide appropriate technical information to its operating staff for all protective relays in its area whether or not it has the responsibility or ownership of the protective relays.	
27		Industry Comments/ Industry Redline	TOP-003-1 R2	Generator Outages	NERC received a request to clarify whether TOP-003 R2 requires the BA to plan and coordinate scheduled outages of generators within the BA's area.	
28		Final	TOP-006-1 R1.2	BA v. TOP Reporting	This CAN provides instruction for assessing whether a BA or TOP has fulfilled the requirements for reporting transmission or generation resources available for use to RCs and other affected BAs and TOPs under TOP-006 R1.2.	
29		Industry Comments/ Industry Redline	PRC-004-1 R2 R3	Misoperations	NERC received a request for clarification regarding whether entities must develop and implement Corrective Action Plans (CAPs) for, and maintain a record of, all Misoperations or only those that must be reported to NERC/RAPA.	
30		Industry Comments/ Industry Redline	Attestations	Attestations	NERC received a request for clarification regarding the appropriate situations and uses of attestations as evidence of compliance with a reliability standard.	
31		Industry Comments/ Industry Redline	CIP-005 CIP-006 CIP-006 R1.1	Physical Security Access Points	NERC received a request to define the entry point metric definition of the access points on the perimeter. NERC also received a request for clarification for an acceptable entry point into a Physical Security Perimeter (PSP) of Critical Cyber Assets (CCA), as well as acceptable opening dimensions.	
32		In Development	EOP-008	Above and Beyond Security Measures	NERC received a request for clarification regarding whether an entity will be considered non-compliant if the measures it has implemented to comply with the requirement(s) of a Standard 1. meet the intent of the Standard and 2. exceed or are superior to the requirement of the Standard, 3. but do not meet the actual requirements of a given Standard.	

33		In Development	PRC-023 R1.8; • R1.9 • (R1.1; R1.6; R1.7)	Load questions	NERC Compliance received a request for clarity on: -"load remote to system" - "generation remote to load" - if there is a 4-hour load rating or can a seasonal facility rating be used for R1.1 -in a Directional Comparison Blocking (DCB) Scheme, does the reverse looking zone need to comply with PRC-23 loadability requirements? -R2 of the PRC-023-1 standard has an effective date of July 1, 2010 and if an entity chooses to apply R1.6, R1.7, R1.8, R1.9, R1.12, or R1.13, how can this be a valid choice until they have the appropriate agreement from it PC, TOP and RC? -what is the process that requires every entity that falls under this standard to be included with unknown PA/PC in their respective regions? Some registered entities do not know who, if anybody, is their PA/PC., and upon contacting some TOPs, BAs, etc. in their area that are registered as a PA/PC to ask if they would serve as their PA/PC and were rebuffed. -the use of PC for PA and IC or IA in NERC Reliability Standards until a FERC Filing/Order is in effect.	
34		In Development	EOP-002-2.1 R1 IRO-001-1.1 R3 TOP-001-1 R1	Authority Letters	NERC received a request to clarify what criteria auditors consider when reviewing an authority letter.	
35		In Development	Periodic Data Submittals	Periodic Data Submittals	NERC received a request for clarification of whether violations would be mitigated if they were included in periodic data submittals.	
36		In Development	PRC-023	Applicability	This is in regards to PRC-023 and its applicability to Generator Owners that are not also transmission owners and/or distribution providers as stated in FERC Order 733.	
37		In Development	Roll-up Violations	Roll-up Violations	NERC received a request for clarification regarding whether the finding of non-compliance of one requirement would be applied across other Standards to which that requirement applies	
38		In Development	PER-002 R4	Training Hours	NERC received a request for clarification of how many training hours equals the required five days of training per PER-002 R4.	
39		Industry Comments/Industry Redline	DOE 417	DOE Form OE-417	The Department of Energy's (DOE) new online process for submitting the OE-417 disturbance reporting form does not automatically issue a copy to NERC or the Regions.	
40		Industry Comments/Industry Redline	BAL-003 R2	Frequency Bias Value	NERC received a request for clarification on the proper approach to determine Frequency Bias Setting.	
41		In Development	IRO-004 R1	Complete Dynamic Modeling	NERC received a request for clarification on whether complete dynamic modeling is required for next-day assessments.	
42		In Development	PRC-001 R1 PRC-001 R2 PRC-001 R4	Purpose Limits of Protection System Schemes	R1: Clarity on the use of the term "Generator Operator" (Not GOP's responsibility in company to know protection system)	
43		Industry Comments/Industry Redline	PRC-005 R2	Maintenance and Testing Procedure & Consistency Issues fm Key Reliability Standard Spot Check	NERC received several requests for clarification on what types of evidence are typically used to demonstrate compliance with Protection Systems[1] maintenance and testing in certain compliance areas	
44		In Development	TOP-001 R1 TOP-001 R2 TOP-001 R5 TOP-001-1 R8	System Emergency and Emergency Conditions	NERC received a request for clarification on the definition of system emergency.	
45		In Development	TPL-002 R1.3.10 TPL-003 R1.3.10 TPL-004 R1.3.7	Power Flow Models and Protection Systems Include Relay Devices as N-1	NERC received a request for clarification on whether the inclusion of redundant and backup protective system failures are required in power flow models.	

46		In Development	PER-002 and PER-003	Local v. Remote Operators	Remote (or local) control center operators are not certified; NERC position is that the main control center needs to be and that remote operators do not need to be.	
47		In Development	PRC-004	Relay in Abnormal Condition	Does operation of a relay during an abnormal condition constitute a misoperation?	
48		In Development	COM-001 R1.1-R1.4	Telecommuncation Redundancy	A single point of failure is not an automatic failure to comply with R1.1 - 1.3. If a facility is not sufficiently redundant, an entity is not automatically out of compliance with all R1 sub requirements but only R1.4.	
49		In Development	TOP-002 R14	Intentional Delays Notifying BA and RC	Define "Intentional Time Delay"	
50		In Development	BAL-002-0 R3, R1.1, R3.1, R4, R4.2	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	We need to compare standards VRF with AML for consistency.	
51		In Development	CIP-004-2 R3 TOP-002-2a R2, R6, R8, R10, R19 TOP-002-2 R11	Background Checks System Conditions	Clarification of CIP-004-2 for Army Corps of Engineers; 7-yr Criminal Background Check? Asks for clarity on acceptable sources of ID verification, periodicity of ID verifications and 7-yr criminal checks; use gov't I-9; R6: Clarification of whether it is the responsibility of the BA to plan to meet CPS and DCS under unscheduled changes in the system configuration and generation dispatch. R2, R8, and R19: Clarity on BA obligations; the request for clarity seems to try to change the standard; "What do I have to do to comply?" R6 and R10: BA and TOP applicability.	
52		In Development	BAL-001-1 R1, BAL-002	Error Control	Clarification of whether the WECC Automatic Time Error Control Procedure (WATEC) violates Requirement 1 of BAL-001-0. Also see Standard's list for clarification "which disturbances are excluded from compiance evaluation".	
53		In Development		New Generation Facility	Whether an entity must be registered before connection and any testing	
54		In Development	PRC-008-1	UFLS Equipment	NERC should consider officially defining UFLS equipment as a Protection System or explicitly list what is included as part of UFLS equipment in order to remove confusion concerning this terminology. Adapt compliance applications for PRC-005 to the standard	
55		In Development	PRC-017-0 R1.1	define protection system	Include control circuitry as part of an SPS or formally regard an SPS to fall under the definition of a Protection System	
56		In Development	CIP-003 R1	Enforcing Subrequirements in Standards	If an entity may have one or more policies for any standard to demonstrate / define how it meets the requirements and sub-requirements how within the policy or policies the entity must clearly address each of the components laid out in the requirement and sub-requirements.	
57		In Development	PRC-011	UVLS	Adapt compliance applications for PRC-005 to the standard	
58		In Development	PRC-017	SPS	Adapt compliance applications for PRC-005 to the standard	
		RED= HIGH PRIORITY				
		In Queue	EOP-003-1 R3 & R5	Applicability	NERC Compliance received a request for clarity regarding the BA and TOP applicability with regard to compliance with the standard. Also - does this just apply to automatic load shedding or does it also apply to manual load shedding? (see interpretation list) it is fixed in the standard - as of 4/28 it has been approved by the BOT and is pending FERC filing	
		In Queue	IRO-002-1 R3	Applicability	Clarity requested from a region on the RC, BA, and TOP applicability	

		YELLOW= MEDIUM PRIORITY				
		In Queue	EOPs	Evidence Consistency	NERC Compliance received a request for clarification regarding communication capability, access, and verification using, RCIS, WECCnet, and FRCC	
		In Queue	TPL-003	Application	Application of Table 1 in TPL-003 and proper modeling of contingency events (ie: Category C vs. D)	
		In Queue	PRC-005-2	Define	Definition of a Calendar Year (CAN-0010)	
		In Queue	various	RRO requirements	Clarity on the RRO requirements and references in the currently approved NERC standards - ERCOT	
		In Queue	PRC-001		Internal Direction/Potential CAN discussion -Oceanview CI PRC-001	
		In Queue	IRO-006-4.1 R3	Applicability	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	
		In Queue	MOD-018	Applicability	Definition of a "non-member."	
		In Queue	Definition of BPS	Intrepretation of BPS definition	Application of current BPS definition in regard to attributing “one transmission source” to “load”	
		In Queue	RRO stnds	Clarity, Consistency	NERC Compliance received a request for clarity regarding the proper use of RRO.	
		PURPLE= NOT YET PRIORITIZED				
	Xcel Energy	not yet prioritized	CIP-004 R3.1	criminal background checks	Clarification regarding the use of criminal history checks conducted by the FBI in support of the Access Authorization process mandated by the US Nuclear Regulatory Commission. Many companies rely on this process to support their CIP PRAs conducted under the CIP-004 Standard. We think a CAN addressing the acceptability of this practice would help provide clarity to the process.	
	APX Power Markets	not yet prioritized		Management Console for Virtual Machine (VM) technology	With the Management Console having the capabilities for impacting the CCA VM Client, the Management Console should be considered a CCA. With the expanded usage of Virtual Machine technology it is in the best interest of the industry to have this clearly outlined to make sure the overall reliability of the BES is maintained.	
	Xcel Energy	not yet prioritized	FAC-003-1, R1.2.2. (and subrequirements R1.2.2.1 & R1.2.2.2)	IEEE Standard conflicting with NERC standard	According to R1.2.2., “Transmission Owner-specific minimum clearance distances shall be no less than those set forth in the Institute of Electrical and Electronics Engineers (IEEE) Standard 516-2003”… A newer version of this IEEE standard was published in 2009 which contains clearances that are less restrictive than the 2003 version. Would a Transmission Owner be found non-compliant if they adopt the 2009 version, even though the requirement specifically refers to the 2003 version?	
	Quanta Technology	not yet prioritized	IRO-005-3a R10	derived limits	The confusion with IRO-005-3a R10 is that it is not clear what the auditors would deem to be “derived limits” and what their approach would be to a small generator “…operating the Bulk Electric System.” What is also not clear is how auditors would approach independent entities even becoming aware of derived limits.	
	SPP	not yet prioritized	CIP-002-4	Critical Asset losing its designation	If a Critical Asset loses its designation, as can be expected when the Bright Line criteria of CIP-002-4 changes the identification criteria for Critical Assets, when you lose the Critical Asset, you automatically lose the Critical Cyber Assets and the applicability of the CIP standards to any Cyber Assets previously protected at that no-longer critical asset. In this instance, do you have to conform to CIP-007/R7?	
	NERC (dealing with PJM)	not yet prioritized	PRC-001	FERC OER’s position on PRC-001 R1	Do system operators need a relay book [on the desk] with detailed engineering information on all the relay schemes in their area to be compliant with PRC-001 R1?	
	WECC	not yet prioritized	multiple	Entities that have smaller generator units within the larger facility	Discuss whether the addition of a task force does would add anything.	
	WECC/FEUS	not yet prioritized		definition of Radial Transmission	Source documents from multiple regions and from NERC demonstrate the inconsistent application of 'radial'.	

	First Energy	not yet prioritized	any CAN that contains definition of calendar year	definiinition of Calendar Year	If a standard requires the performance of an activity every 4 calendar years, and an entity performed the activity on January 1, 2008, would the entity meet the standard if the entity performed the activity anytime during 2012? Or would the completion be required on December 31, 2011?	
	Reliability First Corp	not yet prioritized	multiple CIP standards	hashing requirement	Possible Regional CAN: clarify hashing requirements	
	NERC dealing with WECC	not yet prioritized	TPL-003	application of Table 1	Confusion about what is an extreme event and misunderstanding of categorizing simulations (found in Table 1 of the TPL standards) on the final outcome after the fault was cleared instead on the initiating event/fault as required.	
	Reliability First Corp	not yet prioritized	CIP-003 R.1.1	address all requirments and subrequirements	Possible CAN: Within the policies the entity clearly address each of the components laid out in the requirement and sub-requirements. CAN will cover all standards.	
	NERC	not yet prioritized	PER-002-0	Operating Personnel Training	Possible CAN: Clarification may be necessary to ensure that Registered Entities understand what is expected and auditors have a consitent approach for determining compliance.	
	NERC	not yet prioritized	CFR	Commissioning Testing	Possible CAN: When will an entity be subject to compliance? Clarify that an entity must be registered before connection and any testing.	
	NERC	not yet prioritized	PRC-017-0	SPS Identificiation	Possible CAN: It would clarify things greatly if PRC-017-0 R1.1 specifically included control circuitry as part of an SPS or formally regarded an SPS to fall under the definition of a Protection System	
	NERC	not yet prioritized	PRC-008-0 R1	TO and DP with a UFLS Program	Possible CAN: Consider defining UFLS equipment as a Protection System or explicitly list what is included as part of UFLS equipment in order to remove confusion concerning this terminology.	
	Reliability Performance Group	not yet prioritized	PRC-004-1	Consistent Reporting of Protection System Misoperations	Possible CAN: Clarify the audit perimeter forMisoperations and CAPs to be reviewed. Also clarify if non-reportable Misoperations are subject to a compliance.	
		GREEN= LOWER PRIORITY				
		In Queue	FAC-003-1 R1	TVMP Changes	NERC received multiple requests for clarification on FAC-003-1 R1 regarding the allowable timeframe for implementation when an entity changes one TVMP plan based on normal trend to another TVMP plan based on clear cut. Once changed is the entity bound to implement immediately? Does the stnd provide for entities to have a transition period while changing TVMP plan? When they change a program, see below for TOP-002 and combine for one CAN	
		In Queue	TOP-002	Evidence	NERC Compliance received a request for clarification regarding different approaches to compliance when either the standard is less stringent than the registered entity's procedure or the auditing approach goes above what the standard requires. When a standard requires a registered entity to develop and implement its own plan, the auditor will audit to the registered entity's plan, even if it is superior to the requirements in the standard.	
Reasoning		**ISSUES THAT HAVE BEEN ADDRESSED/Retired CANs**				
AML Corrected		Adressed	BAL-005-0.1b R1	Applicability	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	
Issue too Broad		Adressed	CIP-002	CCAs	NERC Compliance received a request for clarification regarding different approaches to compliance and the scope of obligations on entities.	

Covered by CAN-0012 and CAN-0010		Adressed	CIP-005 R4	Cyber Vulnerability Assessment	NERC Compliance received a request for clarification on whether or not it is it appropriate to enforce this standard as requiring the entity to have performed a CVA prior to their Compliance Date.	
AML Corrected		Adressed	COM-001-1.1 R6	Applicability	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	
AML Corrected		Adressed	EOP-002-2.1 R7.2, R9	Applicability	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	
Submitted to Standards Issue Database		Adressed	FAC-003	Embedded References	NERC Compliance received a request for clarification about using IEEE standard by references in an enforceable standard when that IEEE standard has such stringent copyrights that can't be included in standard for auditors to audit to.	
CAN not appropriate vehicle but will hold for future		Adressed	FAC-008	Submitted Example of Excellence	NERC Compliance received a request for a best practice example of how to approach facility ratings.	
AML Corrected		Adressed	FAC-014-2 R2 and R4	Applicability	Inadvertent errors between stnds and compliance data sheets and database.	
AML Corrected		Adressed	TOP-001-1 R7.1	Applicability	Inadvertent errors between stnds and compliance data sheets and database.	
AML Corrected		Adressed	TOP-003-0 R1.2	Applicability	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	
AML Corrected		Adressed	TOP-005-1.1 R2 and R3	Applicability	Inadvertent errors between stnds VRF matrix and compliance Actively Monitored List - need review and verification.	
Discussed in Bulletin 2011-002 Audit Notifications		Adressed	PRC-008 R2	Evidence	NERC Compliance received a request for clarification on audit notifications and "data requests" for this standard.	
1 - Material covered in subsequent order		Adressed	INT-004-2 R1	Correction to VRF Matrix	This document provides notice of a correction in the Violation Risk Factor Matrix regarding compliance applicability of INT-004-2 R1.	
2- Material covered in subsequent order		Retired	TOP-003-0 R1.3	Correction to VRF Matrix	This document provides notice of a correction in the Violation Risk Factor Matrix and the 2010 Actively Monitored Standards spreadsheet regarding compliance applicability of TOP-003-0 R1.3.	
3- Material covered in subsequent order		Retired	IRO-006-4.1 R2	Correction to 2010 Actively Monitored Standards spreadsheet	This document provides notice of a correction in the 2010 Actively Monitored Standards spreadsheet regarding compliance applicability of IRO-006-4.1 R2.	
4- Material covered in subsequent order		Retired	IRO-004-1 R3	Correction to VRF Matrix and Actively Monitored spreadsheet	This document provides notice of a correction in the Violation Risk Factor Matrix and the 2010 Actively Monitored Standards spreadsheet regarding compliance applicability of IRO-004-1 R3.	
14 - Material covered in subsequent order		Addressed	IA & IC	IA & IC	Version 5 of the functional model refers to both IA and IC s interchangeably. Until all docs are fixed, they will be treated as the same.	

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0028 Comment Analysis Summary

TOP-006 R3 Reporting Responsibilities

CAN-0028 was originally posted as final on July 19, 2011. The original CAN provided instruction for assessing whether a Balancing Authority (BA) or Transmission Operator (TOP) fulfilled the requirements for reporting transmission or generation resources available for use to the applicable Reliability Coordinator (RC) and other affected BAs and TOPs under TOP-006 R1.2. The CAN has been revised to incorporate the direction provided by the NERC Board of Trustees in August of 2011 and was reposted as final on November 16, 2011.

The revised draft CAN was posted for industry comment on the NERC web site on October 10, 2011 and the comment period expired on October 31, 2011. During the comment period, NERC received positive comments from industry members stating that CAN-0028 accurately describes the reporting requirements for BAs and TOPs, the CAN accurately describes the evidence required to verify that the resource availability information was provided to the appropriate registered entities, and that CAN-0028 does not expand the applicability or requirements of the existing standard as drafted.

NERC received approximately eight comments from registered entities and three comments from trade associations, which are identified below. The main themes of the comments consisted of the following three categories: scope, effective date and evidence of compliance.

Scope

There were several recommended substantive changes to the CAN in regard to scope. Some commenters stated that CAN-0028 is unnecessary because the language of TOP-006 R1.2 clearly defines the reporting responsibilities of the applicable registered entities. The commenters further stated that the CAN should be withdrawn because the standard provides sufficient guidance.

In response to the comments, CAN-0028 was drafted to provide clarity with regard to reporting responsibilities. As currently written, TOP-006 R1.2 does not clearly decipher which function is responsible for reporting with regard to generation and transmission resources. The purpose of this CAN is to clarify and to instruct CEA staff to verify the proper evidence for the applicable function.

Other comments discussed the terminology of Bulk Power System (BPS) instead of Bulk Electric System (BES). The comments recommended that the CANs should be further improved, such that they all consistently use the NERC defined term BES and remove all references to the BPS. The rationale for the requested change is because the NERC Reliability Standards apply to the BES unless otherwise noted in the Applicability Section of a Standard. Moreover, there is no definition of BPS in the NERC Glossary of

Terms. The use of BPS in the CANs unnecessarily complicates and confuses the purported guidance therein.

In response to the comment, NERC has authority as the Electric Reliability Organization (ERO) to ensure the reliability of the Bulk Power System (BPS), as stated in section 215 of the Federal Power Act (FPA). The CANs reference BPS for this reason. Although BES is a defined term in the NERC Glossary, the BES is a subset of the greater BPS. Therefore, Compliance Application Notices will continue to use the terminology of BPS unless the standard specifies that it is applicable to the BES.

Another comment received was that the NERC Functional Model does not establish any responsibility for the TOP regarding generation resources, and BAs are not responsible for reporting transmission resources. For consistency, industry recommended that a similar statement be added for TOPs stating they are not responsible for reporting generation resources.

In response to the comments, the following language was added to the CAN for clarity:
"1. When auditing the BA, a CEA is to verify that the BA communicated generation resources, and 2. When auditing the TOP, a CEA is to verify that the TOP communicated transmission resources." This change explains the reporting responsibility for each registered entity, by function.

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final and provides in that posting an implementation and effective date, which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

To clarify the effective date in CAN-0028, which is July 19, 2011, the effective date remains the same date as the original posting. Because the change to the CAN did not materially revise the compliance application in the previously posted version, it is a continuation of the original compliance application, and therefore this CAN was dated the same date as the earlier version.

Evidence of Compliance

Several commenters requested that the bullets be reworded to provide clarity in the Evidence of Compliance section, which was incorporated into the CAN. When a CEA audits a BA, they are to verify that the BA communicated generation resources. When a CEA audits a TOP, they are to verify that the TOP communicated transmission resources. This instruction provides guidance for consistent application to CEAs in the field.

Conclusion

The analysis spreadsheet for CAN-0028 has been posted on the NERC website. NERC received feedback that the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments. In order to provide increased transparency to the comment analysis phase of the CAN process, this document was created to supplement the information contained in the spreadsheet.

NERC staff thanks industry members for the time and effort put into providing the comments and feedback for CAN-0028. If you would like further discussion on CAN-0028, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice — 0028

~~Compliance Application:~~ TOP-006[1] R1.2 Reporting Responsibilities

Posted July ~~18~~19, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[2]
NERC
Regional ~~Entities~~ Entity (RE)
Transmission Operator~~s~~ (TOP)
Balancing ~~Authorities~~ Authority (BA)
~~Generator Operators (GOP)~~
Reliability Coordinator~~s~~ (RC)

Issue: What are resource reporting responsibilities for the ~~Balancing Authorities (~~BA~~)~~ s and ~~Transmission Operators (~~TOP~~s)~~ under TOP-006 R1.2?
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether a BA or TOP has fulfilled the requirements for reporting transmission or generation resources available for use~~NERC received a request for clarification of whether a BA is responsible for reporting generation or transmission resources available for use~~ to RCs and other affected BAs and TOPs under TOP-006 Requirement ~~(R)~~R 1.2.

~~NERC also received a request for clarification of whether a TOP is responsible for reporting transmission or generation resources available for use to RCs and other affected BAs and TOPs under TOP-006 R1.2.~~

~~**Reliability Objective**~~
~~The Reliability Objective is to have current resource information available to ensure critical reliability parameters are monitored in real-time.~~

[1] ~~Version 1 of the standard is effective in the United States. Version 2 of the standard was approved by the NERC Board of Trustees on October 17, 2008 and went into effect for the Canadian Provinces pursuant to Canadian Memorandum of Understandings on April 1, 2009. Version 2 will become effective in the United States on the first day of the first calendar quarter, three months after FERC approval.~~
[2] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard and requirements.

609.452.8060 | www.nerc.com~~

Background

CEAs are to verify that ~~TOP-006 requires~~ BAs and TOPs ~~to~~ have reported the availability of generation or transmission resources under TOP-006. CEAs are to be aware that ~~; however,~~ BAs are not responsible for reporting transmission resources and that TOPs are not responsible for reporting generation resources..

Compliance Application

TOP-006 ~~-1 and TOP-006-2~~ provides, in pertinent part:

> ***R1.*** *Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.*
>
> …
>
> *R1.2. Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.*

CEAs are to assess compliance for the responsible entity ~~W~~within the context of TOP-006 R1.2 as follows:

1. ~~the~~ A BA is the responsible entity for the reporting of generation resources available for use to the appropriate RC and the other affected BAs and TOPs; and
2. ~~the~~ A TOP is the responsible entity for the reporting of transmission resources available for use to the appropriate RC and the other affected BAs and TOPs.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from July 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[3] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

~~This CAN covers Versions 1 and 2 of the standard, is effective upon posting on the NERC Web site and will remain in effect until such time that a future version of the standard or interpretation addresses this specific issue and is enforceable.~~

~~Providing~~ Evidence of Compliance

A CEA is to look for evidence that: ~~BA and TOP must be able to provide an auditor or Compliance Enforcement Authority:~~

1. When auditing the BA, verify that the BA communicated generation resources, and~~Evidence of its communications to its RC and other affected BAs and TOPs of the applicable generation or~~

[3] "Initiated" means that a registered entity has received notification of the upcoming audit.

Compliance Application Notice – 0028

TOP-006 R1.2 Reporting Responsibilities

Posted: July 19, 2011
Revised: November 16, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Transmission Operator (TOP)
Balancing Authority (BA)
Reliability Coordinator (RC)

Issue: What are resource reporting responsibilities for BAs and TOPs under TOP-006 R1.2?
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether a BA or TOP has fulfilled the requirements for reporting transmission or generation resources available for use to RCs and other affected BAs and TOPs under TOP-006 R1.2.

Background
CEAs are to verify that BAs and TOPs have reported the availability of generation or transmission resources under TOP-006. CEAs are to be aware that BAs are not responsible for reporting transmission resources and that TOPs are not responsible for reporting generation resources.

Compliance Application
TOP-006 provides, in pertinent part:

> ***R1.*** *Each Transmission Operator and Balancing Authority shall know the status of all generation and transmission resources available for use.*
> …
>
> > ***R1.2.*** *Each Transmission Operator and Balancing Authority shall inform the Reliability Coordinator and other affected Balancing Authorities and Transmission Operators of all generation and transmission resources available for use.*

CEAs are to assess compliance for the responsible entity within the context of TOP-006 R1.2 as follows:

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard and requirements.

1. A BA is the responsible entity for the reporting of generation resources available for use to the appropriate RC and the other affected BAs and TOPs; and
2. A TOP is the responsible entity for the reporting of transmission resources available for use to the appropriate RC and the other affected BAs and TOPs.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from July 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[2] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

1. When auditing the BA, a CEA is to verify that the BA communicated generation resources, and
2. When auditing the TOP, a CEA is to verify that the TOP communicated transmission resources.

This evidence could include, but is not limited to: operator logs, voice recordings and electronic communications. A CEA is to verify the 90 days of historical data retained by the BA and TOP pursuant to the standard (*see* section D. Compliance, subsection 1.3 Data Retention of TOP-006). To verify compliance for the remainder of the audit period, a CEA may review processes, procedures, or other evidence to demonstrate compliance.

Industry Comments for CAN-0028

Comment Topics	Main Points	Industry Suggestions
Supports CAN	The CAN is accurate as written	No suggestions
Scope	The NERC Reliability Standards apply to the BES unless otherwise noted in the Applicability Section of a Standard. Moreover, there is no definition of BPS in the NERC Glossary of Terms. The use of BPS in the CANs unnecessarily complicates and confuses the purported guidance therein.	Revised CANs should be further improved such that they all consistently use the NERC defined term BES and remove all references to the BPS.
Effective Date	The Effective Period of this CAN should not start before the date it is posted for industry's review.	Suggest implementation period for CAN
Evidence of Compliance	The CAN correctly states that BAs are not responsible for reporting transmission resources. This is consistent with the NERC Functional Model. Likewise, the NERC Functional Model does not establish any responsibility for the TOP regarding generation resources.	For consistency, we recommend a similar statement is written for TOPs stating they are not responsible for reporting generation resources.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0006 Comment Analysis Summary

EOP-005 R7 Verification of Restoration Procedure

CAN-0006 was originally posted as a final CAN on October 28, 2010. The original CAN provided descriptions regarding what constitutes "actual testing," "simulation" and stated that "tabletop testing" did not fulfill the requirements of EOP-005 R7. NERC received a request to review this CAN regarding the compliance application in regards to tabletop testing by registered entities that do not have a technical component to their restoration plan, a situation that was occurring in one region of the United States.

The revised CAN has been reposted as final on November 11, 2011, and incorporates the results of the review conducted for tabletop testing as well as the direction provided by the NERC Board of Trustees in August of 2011.

The draft of the revised CAN was posted for industry comment on the NERC web site on September 1, 2011 and the comment period expired on September 21, 2011. NERC received approximately 20 comments from various industry stakeholders and trade associations, which are identified below. The main themes of the comments consisted of the following five categories: errata changes, the scope of the CAN, the effective date language and the types of evidence the Compliance Enforcement Authorities (CEA) are to verify.

Errata

The recommended errata changes were revised in order to provide correct spelling in a footnote and clarity in the title of the CAN.

Scope

There were several recommended substantive changes to the CAN in regard to the scope of the compliance guidance. The commenters stated that CAN-0006 appears to expand the requirement and many of the draft CAN details are outside the context of what is intended by the initial issue. The suggestion was received for revising the CAN to only provide what is an acceptable test or simulation to verify the restoration procedure.

There were several suggestions from industry that were incorporated. The CAN was revised in response to the comments that "tabletop testing", or simulated restoration exercises which take place without actual equipment, would be sufficient to comply with the requirement under specific circumstances; these circumstances are described in the CAN. Further, based on commenter's suggestions, the ambiguous terms "adequacy of the verification" and "close enough" were removed from the CAN. Some commenter's disagreed with the use of the term "electronic simulation", stating

it is not required by the standard. The original CAN had incorporated this term to inform industry what type of simulation would fulfill the requirement; the revised CAN continues use of the term to distinguish it from "tabletop testing" and to instruct CEAs when each type of simulation should be deemed to fulfill the requirement. There were other comments stating that the types of evidence a CEA would require took the CAN out of scope – these are discussed below in the "Evidence of Compliance" section.

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final and provides an effective date which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

To clarify the effective date in CAN-0006, which is October 25, 2010, the effective date remains the same date as the original posting. Because the change to the CAN did not materially revise the compliance application in the previously posted version, it is a continuation of the original compliance application, and therefore this CAN was dated the same date of the earlier version. This CAN provides greater flexibility for how a registered entity demonstrates compliance with the standard by including tabletop testing, under specific circumstances, for verification of restoration procedures.

Evidence

Commenters had questions regarding the Evidence of Compliance section. Particularly, several industry members stated that there were other equally effective means that illustrate the registered entity fulfills the intent of the requirement. NERC staff took this suggestion and added the language, "such evidence may include," to notify the CEAs that they should take into account that the evidence listed was not an exhaustive list. The final sentence in the CAN also provides other types of evidence that a CEA may verify to obtain reasonable assurance of the entity's compliance.

In the circumstance that a registered entity does not have a technical role in restoring the system, a letter from the TOP whose restoration procedure includes the registered entity is evidence that a CEA will require to verify that a registered entity does not have to do actual or electronic simulation testing. The letter provides the CEA with reasonable assurance that the registered entity does not have a technical component to its restoration procedure and that there is an entity (the TOP) covering the technical restoration issues so no reliability gap exists.

Conclusion

The analysis spreadsheet for CAN-0006 is also posted on the NERC website. While the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments, it is hoped that this document will supplement that

information. Feedback from all sources is key and NERC staff thanks industry for the time and effort put into providing that feedback. If you would like further discussion on CAN-0006, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice – 0006

EOP-005 R7 Verification of Restoration Procedure

Posted: October 25, 2011
Reposted: November 11, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Balancing Authority (BA)
Transmission Operator (TOP)

Issue: In regard to evidentiary requirements regarding actual testing or by simulation, what constitutes an actual test and what constitutes a simulation?
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether:

1) an entity has verified its restoration procedure "by actual testing or by simulation," as required by EOP-005-1 R7, and

2) the use of a third-party vendor impacts a registered entity's obligation under the standard.

Compliance Application
EOP-005-1 R7 provides, in pertinent part:

> ***R7****. Each Transmission Operator and Balancing Authority shall verify the restoration procedure by actual testing or by simulation.*

CEAs are instructed to obtain evidence that a registered entity verified its restoration procedure by actual testing or by simulation.

A CEA is not to assess the circumstances under which actual testing or simulation has occurred. Rather, a CEA is to focus solely on the registered entity's testing or simulation that verifies whether the entity's restoration procedure restores its electric system in a stable and orderly manner in the event of a partial or total shutdown of its system.[2]

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards or requirements.
[2] As specified in EOP-005-1 R1

The size of an entity **does not** determine whether actual testing or simulation is required; therefore, CEAs are to assess whether registered entities have verified their procedures by actual testing, simulation, or some combination of the two, by the instructions provided below.

Regarding actual testing: Actual testing is an option that a TOP or BA may use to verify steps of the restoration procedure to demonstrate the TOP's or BA's ability to establish a Cranking Path with clearly identified Loads and then starting a generating unit using that Cranking Path. The intent is to demonstrate that the Cranking Path can be successfully established.

Actual testing may also include use of the restoration procedure to restore a portion of the system where the responsible entity uses logs, Historian[3] data, and other documentation to verify that the step(s) of the restoration procedure[4] worked, based on actual operations (including things such as verification of fuel sources). While the actual testing may be different from what is expected to occur in an actual restoration, a CEA is to assess whether the attributes necessary to verify the adequacy of the system restoration procedure are included.

Regarding simulation: Simulation is an option that the TOP or BA may use to verify its restoration procedure. Simulation may include electronic simulation, which is a simulation of what is expected to actually occur during system restoration. Simulations may be conducted at a control center using the system operator's workstation or other facilities. Simulation may also include a walk-through simulation of a restoration procedure that has been tested using previous electronic simulation methods. In both cases, a CEA is to verify that the restoration scope and the results of the simulation replicate what would actually occur, including that decisions made during the simulation would be effective in actual restoration.

An ***electronic simulation***[5] may include an engineering analysis, which uses engineering analytical methods and practices that provide results that are consistent with actual measurements to verify the restoration procedure. The analysis is performed in a simulation environment, and the restoration procedure is verified by showing that the steps in the restoration procedure do not place load and generation out of balance. The level of simulation required depends on the actual restoration procedure, the facilities being simulated, and the contingencies considered. This may require the use of power flows[6] to verify steady state conditions; transient stability analysis to verify the dynamic performance; electromagnetic transient analysis to verify switching operations; and an overall analysis to tie the results of these studies into a coherent determination of whether the proposed restoration actually achieves its desired goal.

[3] Historian Software provides high-speed data capture

[4] Restoration procedures are a guide to use during a restoration event and not a sequence of tasks to be performed in a numerical order. System conditions and other activities in other areas of the system will affect the restoration process.

[5] Training or development systems should be visibly and distinctly different from the live EMS control screens. See NERC Lesson Learned, EMS/SCADA Systems – Training System versus Live EMS Screen.

[6] "Power flows" refers to power flow studies which, for the purpose of the CAN, are interchangeable with load flow studies.

A ***walk-through simulation of the actual equipment*** using the restoration procedure without actually performing the actions may include, but is not limited to, the use of equipment such as control room consoles, control panel illustrations, one line diagrams, or other diagrams that identify system components. The walk-through simulation can verify some attributes of the procedure by simulating procedure steps, such as staff pointing to physical breakers, one line drawings or light indicators and stating expected results when actions are taken. This type of simulation relies on the results of engineering studies performed using the same system conditions as proposed in the restoration procedure to verify expected steady state, transient stability and electromagnetic transient results. Regardless of the type of simulation, the desired outcome is to verify that the restoration procedure is viable in the event of a partial or total shutdown of the bulk power system (BPS).

A ***simulated restoration exercise that takes place without actual equipment***[7] (whether by electronic or walk-through simulation) would not normally be considered verification "by actual testing or simulation," as required by the standard. As described below, a registered entity may fulfill the requirement by conducting a simulation restoration exercise(s) that takes place without actual equipment. For a walk-through simulation conducted without actual equipment, the CEA is instructed to verify that the registered entity has a letter from either its BA or a TOP whose restoration procedure includes the registered entity, stating that:

1. the registered entity does not have a technical component to its restoration plan and
2. the registered entity's restoration is included in the BA's or TOP's restoration plan.

Regarding outsourcing of reliability requirements and coordination: A BA or TOP may use a third party to conduct a simulation of its restoration procedure. The third party may be a contractor or another registered entity, such as a TOP. In such cases, a CEA is to verify that the registered entity has a copy of the restoration procedure applicable to its facilities, documentation to show that the restoration procedure was verified by simulation, and the simulation results.

Additional information on compliance responsibility and accountability regarding the delegations of performance of reliability-related tasks is contained in the "NERC Compliance Public Bulletin #2010-004 Guidance for Entities that Delegate Reliability Tasks to a Third Party Entity."[8]

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from October 25, 2010, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

[7] Simulated restoration exercises conducted without actual equipment may be considered "tabletop exercises."
[8] http://www.nerc.com/files/2010-004%20v1%200.pdf

For any enforcement action in process and for audits that have been initiated,[9] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

CEAs are to assess evidence to obtain reasonable assurance of the entity's compliance. Such evidence may include:

- engineering analytical methods and practices
- power flows to verify steady state conditions
- transient stability analysis to verify the dynamic performance
- electromagnetic transient analysis to verify switching operations

CEAs are to verify that all of the evidence replicates actual events. Additionally, CEAs may accept actual responses to system disturbances, long-term dynamics, or other modeling tools or techniques not listed in this notice to obtain a reasonable assurance that a registered entity is compliant with this requirement.

~~Compliance Application:~~ EOP-005-1 R7 Verification of Restoration Procedure

Posted October 25, 2010
Reposted: November 10, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Balancing Authority (BA)
Transmission ~~Operators~~Operator (TOP)

Issue: In regard to evidentiary requirements regarding actual testing or by simulation, what constitutes an actual test and what constitutes a simulation? ~~Evidentiary Requirements regarding Actual Testing or by Simulation~~
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether: ~~Registered entities and Regional Entities request that NERC provide informal guidance on the following issues:~~

1) an entity has verified its restoration procedure "by actual testing or by simulation," as required by EOP-005-1 R7, and ~~What constitutes a test?~~

2) the use of a third-party vendor impacts a registered entity's obligation under the standard. ~~What constitutes a simulation?~~

~~How does the use of a third-party vendor impact the registered entity's obligation to coordinate its restoration plan, as required by EOP-005-1 R4?~~

~~What types of evidence may demonstrate that a registered entity has verified its restoration procedure "by actual testing or by simulation," as required by EOP-005-1 R7?~~

~~Also, registered entities and Regional Entities request informal guidance on whether the size of an entity determines its use of actual testing or simulation when verifying its restoration procedure.~~

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards or requirements.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

~~**Reliability Objective**~~

~~The reliability objective of EOP-005-1 R7 is to ensure that registered entities verify, by actual testing or by simulation, that procedures are in place and will work to restore the system in the event of a partial or total shut-down of their respective area of the bulk power system.~~

Compliance Application

EOP-005-1 R7 provides, in pertinent part:

> ***R7***. *Each Transmission Operator and Balancing Authority shall verify the restoration procedure by actual testing or by simulation.*

CEAs are instructed to obtain evidence that a registered entity verified its restoration procedure by actual testing or by simulation. A CEA is not to assess the circumstance under which actual testing or simulation has occurred. Rather, a CEA is to focus solely on the registered entity's testing or simulation that verifies whether the entity's restoration procedure restores its electric system in a stable and orderly manner in the event of a partial or total shutdown of its system.[2]

The size of an entity does not determine whether actual testing or simulation is required; therefore, CEAs are to assess whether registered entities have verified their procedures by actual testing, simulation, or some combination of the two, by the instructions provided below.

~~Registered entities must provide evidence to demonstrate to the Compliance Enforcement Authority that they have verified their restoration procedures by actual testing or by simulation.~~

~~The standard does not provide the circumstances under which actual testing or simulation must occur as long as the testing or simulation results in verifying the adequacy of the system restoration. The size of an entity also does not determine whether actual testing or simulation is required. Registered entities may verify their procedures by actual testing, simulation, or some combination of the two.~~

Regarding actual testing: Actual testing is an option that a ~~Transmission Operator~~TOP or ~~Balancing Authority~~BA ~~can~~ may use to verify steps of the restoration ~~elements of a~~ procedure to determine the TOP's or BA's ability to establish a Cranking Path with clearly identified Loads and then starting a generating unit using that Cranking Path. The intent is to demonstrate that the Cranking Path can be successfully established.

[2] As specified in EOP-005-1 R1

Actual testing may also include use of the restoration procedure to restore a portion of the system where the responsible entity uses logs, Historian dad, and other documentation to verify that the step(s) of the restoration procedure[3] worked, based on actual operations (including things such as verification of fuel sources). While the actual testing may be different from what is expected to occur in an actual restoration, a CEA is to assess whether the attributes necessary to verify the adequacy of the system restoration procedure are included.

~~s, but is not limited to, a physical test of the procedure, such as operating Bulk Electric System Elements in order to demonstrate the ability to 1) establish a Cranking Path with clearly identified loads that are part of the underfrequency load shedding or undervoltage load shedding and 2) start a generating unit using that Cranking Path. The intent is to simulate and verify that the cranking path can be successfully and efficiently established within anacceptable voltage and frequency range. Actual testing may also include using a procedure to restore the system (*i.e.*, relay trip), and retaining logs and data (historian data), and other documentation to verify that the element(s) of the procedure worked based on actual operations (including verification of fuel sources), in the case of a system event. While the actual testing may be different from what is expected to occur in an actual restoration, the aspects necessary to verify the adequacy of the system restoration procedures must be included.~~

Regarding simulation: Simulation is an option that the ~~Transmission Operator~~TOP or ~~Balancing Authority~~BA ~~can~~ may use to verify its restoration procedure. Simulation ~~can~~ may include electronic simulation, which is a simulation of what is expected to actually occur during ~~real-time~~ system restoration. Simulations ~~are~~ may be conducted at a control room center using the system operator's workstation or other facilities. ~~on the Transmission Operators' or Balancing Authorities' workstations.~~ Simulation ~~can~~ may also include a walk-through simulation of a ~~on~~ restoration procedure that has been tested using previous electric simulation methods. ~~plans that have been tested using previous electronic simulation methods.~~ In both cases, a CEA is to verify that the restoration scope and the results of the simulation replicate ~~must be close enough to~~ what would actually occur, including that decisions made during the simulation would be effective in actual restoration. ~~so that decisions and restoration procedures made with the results would be effective in real-time restoration.~~

[3] Restoration procedures are a guide to use during a restoration event and not a sequence of tasks to be performed in a numerical order. System conditions and other activities in other areas of the system will affect the restoration process.

An ***electronic simulation***[4] ~~can~~ may include ~~the use of~~an engineering analysis, which uses ~~using~~ engineering analytical methods and practices that provide results that are consistent with actual measurements to verify the restoration procedure. The analysis is performed in a simulation environment, and the restoration procedure is verified by showing that the steps in the restoration procedure do not place load and generation out of balance. ~~programmed into a real-time simulation in the control room or its workstations, and the restoration procedure is verified by showing that the simulating procedure steps do not result in any steady state or transient stability criteria violations when compared to the output of the programmed analysis into the simulator.~~ The level of simulation required depends on the actual restoration procedure, ~~nature of the restoration procedure,~~ the facilities being simulated, and the contingencies being considered. This may require the use of power flows[5] ~~load flows~~ to verify steady state conditions; transient stability analysis to verify the dynamic performance; electromagnetic transient analysis to verify switching operations; and an overall analysis to tie the results of these studies into a coherent determination of whether ~~if~~ the proposed restoration actually achieves its desired goal.

A ***walk-through simulation on the actual equipment*** using the restoration procedure without actually performing the actions ~~can~~ may include, but is not limited to, the use of things such as control room consoles, control panel illustrations, one line diagrams, or other diagrams that identify system components. The walk-through simulation can verify some ~~aspects~~ attributes of the procedure by simulating procedure steps, such as staff pointing to physical breakers, one line drawings, light indicators and stating expected results when actions are taken. This type of simulation relies on the results of engineering studies performed using the same system conditions as proposed in the restoration procedure to verify expected steady state, transient stability and electromagnetic transient results. Regardless of the type of simulation, ~~its~~ the desired outcome is to verify that the restoration procedure is viable~~s to restore the system are viable~~ in the event of a partial or total shut down of the ~~bulk~~ Bulk P~~p~~ower S~~s~~ystem (BPS).

A ***simulated restoration exercise that takes place without actual equipment***[6] (whether by electronic or walk-through simulation) would not normally be considered verification "by actual testing or simulation," as required by the standard. As described below, a registered entity may fulfill the requirement by conducting a simulation restoration exercise(s) that takes place without actual equipment. For a walk-through simulation conducted without actual equipment, the CEA is instructed to verify that the registered entity has a letter from either its BA or a TOP whose restoration procedure includes the registered entity, stating that:

[4] Training or development systems should be visibly and distinctly different from the live EMS control screens. See NERC Lesson Learned, EMS/SCADA Systems – Training System versus Live EMS Screen.
[5] "Power flows" refers to power flow studies which, for the purpose of the CAN, are interchangeable with load flow studies.
[6] Simulated restoration exercises conducted without actual equipment may be considered "tabletop exercises."

1. the registered entity does not have a technical component to its restoration plan and
2. the registered entity's restoration is included in the BA's or TOP's restoration plan.

~~Regarding table tops: A table top exercise that takes place without actual equipment (whether by electronic or walk-through simulation) would not be considered "by actual testing or simulation," as required by the standard. However, table top exercises may provide training value with respect to the coordination of tasks and communication between operating personnel.~~

Regarding outsourcing of reliability requirements and coordination: A BA or TOP may use a third party to conduct a simulation of its restoration procedure. The third party may be a contractor or another registered entity, such as a TOP. In such cases, a CEA is to verify that the registered entity has a copy of the restoration procedure applicable to its facilities, documentation to show that the restoration procedure was verified by simulation, and the simulation results.

Additional information on compliance responsibility and accountability regarding the delegations of performance of reliability-related tasks is contained in the "NERC Compliance Public Bulletin #2010-004 Guidance for Entities that Delegate Reliability Tasks to a Third Party Entity."[7]

~~Requirement 4 addresses coordination with regard to the restoration plan. If a registered entity's restoration procedure includes coordination with a third party because that registered entity outsourced the initiation, or partial or full implementation, of R7 to another registered entity or non-registered third party contractor or consultant, the verification of the procedure should demonstrate that the procedures to coordinate are in place and the restoration procedure to restore the system is viable in the event of a partial or total shut down of the bulk power system. In such cases, the registered entity must have and be able to produce a copy of the restoration procedure applicable to its facilities as well as the backup documentation to support the conclusion. For example, Transmission Owner A is being audited and it partially owns blackstart facilities with Transmission Owner B. The restoration procedures for the blackstart facilities are developed by Transmission Owner B and are contained in Transmission Owner B's procedures, Transmission Owner A must have and produce a copy in the audit as well as the backup documentation to support the conclusion and must demonstrate that the system restoration procedure was verified by "actual testing or by simulation."~~

[7] http://www.nerc.com/files/2010-004%20v1%200.pdf

~~Additional information on compliance responsibility and accountability regarding the delegations of performance of reliability-related tasks is contained in the "NERC Compliance Public Bulletin #2010-004 Guidance for Entities that Delegate Reliability Tasks to a Third Party Entity."[8]~~

~~**Non-exclusive list of Evidence**~~**Effective Period for CAN**

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from October 25, 2010, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[9] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

The following is a non-exclusive list of evidence that has been used to meet R7:

- engineering analytical methods and practices;
- load flows to verify steady state conditions;
- transient stability analysis to verify the dynamic performance; and
- electromagnetic transient analysis to verify switching operations.

All of the evidence relied on must be shown to duplicate actual events. Additionally, registered entities may use actual responses to system disturbances, long-term dynamics, one lines, or other modeling tools or techniques not listed in this notice to demonstrate compliance with this requirement.

Evidence of Compliance

CEAs are to assess evidence to obtain reasonable assurance of the entity's compliance. Such evidence may include:

- engineering analytical methods and practices
- power flows to verify steady state conditions
- transient stability analysis to verify the dynamic performance
- electromagnetic transient analysis to verify switching operations

~~[8] http://www.nerc.com/files/2010-004%20v1%200.pdf~~

[9] "Initiated" means that a registered entity has received notification of the upcoming audit.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CEAs are to verify that all of the evidence replicates actual events. Additionally, CEAs may accept actual responses to system disturbances, long-term dynamics, or other modeling tools or techniques not listed in this notice to obtain a reasonable assurance that a registered entity is compliant with this requirement.

Industry Comments for CAN-0006

Comment Topics	Main Points	Industry Suggestions
Errata Changes	Spelling and grammatical changes	Change title, check spelling
Scope	CAN appears to expand the requirement by requiring entities to provide transient stability and electromagnetic transient studies, which may not be necessary to ensure an entity's restoration plan can achieve its desired goal. This effort and coordination will likely be halted if NERC provides guidance to CEAs that "table top" exercises would not suffice in an audit. Many of the draft CAN details are outside the context of what is intended by the initial issue. Suggest revising this CAN to only providing what is an acceptable test or simulation to verify the restoration procedure. CAN-0006 goes beyond simple guidance by implying an interpretation of "simulations" to include steady state, dynamic and EMTP studies. Interpretations of standards should go through the formal interpretation process. The CAN over-reaches and changes the standard in at least three ways: 1. By adding a requirement to verify adequacy 2. By requiring "electronic simulation" 3. By adding a requirement for a letter of approval in order to use a valid interpretation of "simulation"	CAN 0006 should state that a TOP and BA need to "verify the(ir) restoration procedure" by actual testing (of the restoration procedure, ie: by training on the restoration procedure, by review of the restoration procedure to assure accuracy, etc.) or by simulation (of the restoration procedure, ie: by table top exercise, by practicing the implementation of the procedure, etc.).
Effective Date	Any version of a CAN should become effective only after it is public posted by NERC as final and provides in that posting an implementation and effective date which cannot be earlier than the posted date.	The effective date of this revised CAN should be the date it is posted as final, not the previous date of October 25, 2010.
Evidence	Other equally effective means that illustrate the registered entity fulfills the intent of the requirement.	One could interpret this section to mean that an entity must have all four types of studies for its system.
Applicability	The CAN should make it clear that the only role of the BA is to support the TOP in the restoration. This requirement was never intended to apply to the BA.	TOP-002-2b includes an interpretation of R10 that clarifies the BA can have no role in meeting SOLs and IROLs outside of following the orders of the TOP. FERC has proposed to improve the interpretation.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0009 Comment Analysis Summary

FAC-008 and FAC-009 Facility Rating and Design Specifications

CAN-0009 was originally posted on January 7, 2011 following the October 7, 2011 *Recommendation to Industry: Consideration of Actual Field Conditions in Determination of Facility Ratings* to provide guidance whether registered entities should self-report a violation of either FAC-008-1 R1 or FAC-009-1 R1 when constructed Facilities do not match a registered entity's design specifications. This CAN has been redrafted to implement the NERC Board of Trustees (BOT) guidance for CANs that was provided at the August 3, Member Representative Committee (MRC)/BOT meeting.

The draft revised CAN was posted for industry comment on the NERC web site on September 23, 2011 and the comment period expired on October 14, 2011.

NERC received approximately 20 comments from various industry stakeholders and trade associations, which are identified by name below. The main themes of the comments consisted of the following five categories: errata changes, scope, effective date, evidence of compliance and the CAN process.

Errata

The recommended errata change was to list the entire Requirement R1.3 to avoid confusion. For clarity, the CAN now has the entire requirement listed. NERC staff thanks the commenters for pointing out this recommended change in the CAN.

Scope

There were several recommended substantive changes to the CAN in regard to scope. The commenters stated that CAN-0009 goes beyond FAC-008 AND FAC-009 and Compliance Enforcement Authority (CEA) staff should not be instructed to verify evidence that field conditions match the design of the facilities.

In response to the comments, CAN-0009 addresses operational Facilities with discrepancies between design specifications used for the development of ratings and actual field conditions that are outside the entity's design tolerances. While the importance of correcting these discrepancies within the above dates cannot be overstated, any such discrepancy is not necessarily a violation of the NERC Reliability Standards. CAN-0009 reinforces the premise that the recommendation was based on improving reliability, not creating compliance enforcement actions. It also provides for these Possible Violations to be held in abeyance for determination after the registered entity's assessment is complete, with strong considerations for a zero-dollar penalty or resolution through the Find, Fix and Track (FFT) recording mechanism.

Effective Date

Several commenters believe that NERC should to incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final and provides in that posting an implementation and effective date which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

To clarify the effective date in CAN-0009, which is April 19, 2011, the effective date remains the same date as the original posting. Because the changes to the CAN did not add any changes to the compliance application from the previously posted version, this CAN was dated to remain in effect as if it were posted at the time of the earlier version.

Evidence of Compliance

Several commenters believe that there is no recommended evidence for either the CEAs or registered entities to properly evaluate compliance with the standard. This section is more focused on enforcement action and penalty assessment and should not be part of this CAN. This entire section should be revised to provide recommended evidence and not focus on enforcement actions or penalty assessments.

In response to the comments, the CAN was revised to instruct CEAs to review each registered entity's Facility Rating Methodology (FRM). Due to the unique nature of each FRM, the CEAs are to review these methods to determine whether the entity's FRM included addressed the actual physical application of the design criteria in the field for individual Facilities and/or actual clearances for individual Facilities.

Further, CEAs are to strongly consider a registered entity's concerns for reliability, and they are to consider several factors and exercise discretion before making a determination of a possible violation. Also, the CAN points out that any discrepancy may result in a zero-dollar penalty or FFT resolution.

CAN Process

Several commenters stated that NERC was working at an unreasonable pace for revising and reposting all of the final CANs. The comments pointed out that due to such volume, NERC may not receive the constructive input from stakeholders that they could have under a more measured approach. There was an acknowledgement of understanding, in that the current volume is a unique task resulting from the NERC Board of Trustees direction, but it results in a strain on industry resources to review and comment on all postings. The suggestion was a request for more reasonable review opportunities going forward.

In response to the comments, NERC staff is aware that the volume of CANs being posted for comment has been cumbersome. The revision process has given industry another opportunity to comment on

previously posted final CANs, and NERC staff has spent many hours in preparing the drafts and reviewing the comments received from industry. The revised CANs should be complete by the end of 2011, and going forward, the industry comment periods will be handled in a much more manageable pace. If any industry members need more time to submit CAN comments, they are welcome to request an extension by sending an email to cancomments@nerc.net. We understand the situation and are trying our best to accommodate all requests.

Conclusion

NERC staff thanks industry for providing invaluable feedback to the CAN process and to CAN-0009. If you would like to discuss CAN-0009, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice – 0009

FAC-008 and FAC-009 Facility Ratings and Design Specifications

Posted: January 7, 2011
Revised: November 11, 2011

Primary Interest Groups

Compliance Enforcement Authority (CEA)[1]
Transmission Owner (TO)
Generation Owner (GO)
Regional Entity
NERC

Issue: Should CEAs find a violation of FAC-008 R1 or FAC-009 when it is determined that constructed Facilities do not match design specifications?

For the purpose of aiding CEAs, this CAN provides instruction for assessing compliance with FAC-008 R1 and FAC-009 R1 when an entity's constructed Facilities do not match its design specifications.

Summary

Due to the Recommendation to Industry (discussed below), possible non-compliances may be discovered for registered entities that had developed the most robust Facility Rating Methodologies (FRMs). This CAN reinforces the premise that the recommendation was based on improving reliability, not creating compliance enforcement actions. It also provides for these Possible Violations to be held in abeyance for determination after the registered entity's assessment is complete, with strong considerations for a zero-dollar penalty or resolution through the Find, Fix and Track (FFT) recording mechanism.

Background

NERC's *Recommendation to Industry: Consideration of Actual Field Conditions in Determination of Facility Ratings*[2] (Recommendation) identified a reliability concern due to Facilities in the field not matching a registered entity's design specifications. This Recommendation contained a call to action for industry with key dates, which were revised on November 29, 2010, as follows:

- October 20, 2010 – Acknowledge receipt of Recommendation
- October 28, 2010 – Attend Webinar (optional)
- November 29, 2010 – Attend second Webinar (optional)

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.
[2] Issued on October 7, 2010

- January 18, 2011– Assess impact of the alert and provide an action plan, as required, to NERC, including any extension requests for completing assessments (originally December 15, 2010)
- May 12, 2011 – Attend Webinar (optional)
- Complete assessments - Identify all discrepancies between the design and actual field conditions that are outside the registered entity's design tolerances and report those discrepancies to NERC, applicable Reliability Coordinators (RCs), Transmission Operators (TOPs), and Regional Entities by:[3]
    1. ***December 31, 2011 for High Priority Facilities***
    2. ***December 31, 2012 for Medium Priority Facilities***
    3. ***December 31, 2013 for Lowest Priority Facilities***
- Remediation to correct all issues identified during the assessment should occur as quickly as practical but within one year of identification; otherwise, entities are to obtain an approval from their respective Regional Entity to extend the deadline.

In addressing this important reliability Recommendation, registered entities may discover operational Facilities with discrepancies between design specifications used for the development of ratings and actual field conditions that are outside the entity's design tolerances. While the importance of correcting these discrepancies within the above dates cannot be overstated, any such discrepancy is not necessarily a violation of the NERC Reliability Standards.

Nevertheless, such a discrepancy may contribute to a possible violation of one or more of the following requirements: FAC-008-1 R1 or FAC-009-1 R1 or R2, based on the facts and circumstances specific to each instance, as described below. NERC encourages each registered entity to closely examine its Facility Ratings methodology (FRM) required by FAC-008-1 R1 and the application of its FRM as required by FAC-009 R1 and R2 to determine if it is in compliance.

Compliance Application

FAC-008

FAC-008-1 requires a registered entity to have a documented FRM for developing Facility Ratings of its solely and jointly owned Facilities.

FAC-008 provides, in pertinent part:

> ***R1.*** *The Transmission Owner and Generator Owner shall each document its current methodology used for developing Facility Ratings (Facility Ratings Methodology) of its solely and jointly owned Facilities. The methodology shall include all of the following:*

[3] All assessments were originally due on April 7, 2011.

> ***R1.1.*** *A statement that a Facility Rating shall equal the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.*
>
> ***R1.2.*** *The method by which the Rating (of major BES equipment that comprises a Facility) is determined.*
>
> > ***R1.2.1.*** *The scope of equipment addressed shall include, but not be limited to, generators, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.*
> >
> > ***R1.2.2.*** *The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.*
>
> ***R1.3.*** *Consideration of the following:*
>
> > ***R1.3.1.*** *Ratings provided by equipment manufacturers.*
> >
> > ***R1.3.2.*** *Design criteria (e.g., including applicable references to industry Rating practices such as manufacturer's warranty, IEEE, ANSI or other standards).*
> >
> > ***R1.3.3.*** *Ambient conditions.*
> >
> > ***R1.3.4.*** *Operating limitations.*
> >
> > ***R1.3.5.*** *Other assumptions.*

CEAs are to verify whether a registered entity's FRM included consideration of the equipment manufacturer's provided ratings (R1.3.1), design criteria (R1.3.2), ambient conditions (R1.3.3), operating limitations (R1.3.4) and other assumptions (R1.3.5) in its FRM.

FAC-009 R1

FAC-009-1 R1 requires TOs and GOs to establish Facility Ratings for their solely and jointly owned Facilities that are consistent with the associated FRM, which is required under FAC-008 R1.

FAC-009 provides, in pertinent part:

> ***R1.*** *The Transmission Owner and Generator Owner shall each establish Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings Methodology.*

Therefore, in order for a CEA to determine whether a registered entity's Facility Ratings were established pursuant to the entity's FRM, the CEA is to first verify whether the entity's FRM addresses design criteria for Transmission Facilities, including clearances, and if so, whether the design criteria and clearances that are included are:

1) the actual physical application of the design criteria in the field for individual Facilities and/or actual clearances for individual Facilities; ***or***

2) did not include the actual physical application of the design criteria in the field for individual Facilities and/or actual clearances for individual Facilities. In this case, the entity may have stated design criteria broadly as general policy requirements.

If the CEA determines that Option 1 applies, i.e. where an entity's FRM requires the inclusion of the actual clearances or the physical applications of design criteria in the field for individual Facilities in the calculation of the Facility Rating:

- If the entity's calculated Facility Ratings do not reflect the FRM requirement, then the CEA is to find a non-compliance with FAC-009 R1. *See below for a discussion regarding compliance actions.*
- Additionally, where an entity's Facility Ratings include the FRM requirement, the Facilities are to be constructed to the actual clearances and/or design criteria specified in the entity's FRM. If the Facilities in the field are not constructed to design specifications and/or within acceptable tolerances for clearances, the CEA is to find a non-compliance with FAC-009 R1.

If the CEA determines that Option 2 applies, i.e. where clearances or design criteria are stated broadly as general policy requirements:

- A CEA is not to consider actual field construction in assessing compliance.

FAC-009 R2

FAC-009-1 R2 requires TOs and GOs to provide Facility Ratings for solely and jointly owned existing Facilities and new Facilities, as well as any modifications to existing Facilities or re-ratings of existing Facilities to their associated RCs, Planning Authorities (PA), Transmission Planners (TP), and TOPs as scheduled by such requesting entities.

FAC-009 provides, in pertinent part:

> ***R2.*** *The Transmission Owner and Generator Owner shall each provide Facility Ratings for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities to its associated Reliability Coordinator(s), Planning Authority(ies), Transmission Planner(s), and Transmission Operator(s) as scheduled by such requesting entities.*

In assessing compliance with FAC-009-1 R2, a CEA is to verify that an entity provided its current Facility Ratings as scheduled by the requesting entities. As R2 includes "new Facilities, modifications to existing

Facilities and re-ratings of existing Facilities," a CEA is also to verify that TOs updated their ratings to address changing field conditions.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[4] a CEA is to apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

It is of prime importance that registered entities operate reliably within the requirements and assumptions that are contained in the registered entity's FRM. The Recommendation cited above addresses only the issue of whether Facilities were constructed pursuant to a registered entity's design specifications and required clearances.

During any finding of possible non-compliance, CEAs are to strongly consider a registered entity's concerns for reliability, such as when the entity included the actual physical application of their design criteria in the field for individual Facilities and/or actual clearances for individual Facilities in their FRMs. In the event a CEA determined that there are discrepancies between the design and actual field conditions that are outside the registered entity's design tolerances, the following will be strong considerations in the determination of a zero-dollar penalty or FFT resolution:

- the registered entity's continuation of its robust FRM;
- timely and thorough evaluations by the registered entity of its system using accurate measurement methods and technologies;
- timely self-disclosure of any compliance gaps; and
- prompt corrective actions and consistent completion of its Mitigation Plan milestones.

Further, CEAs are to exercise discretion to hold the processing of all possible violations reported as a result of the assessments until the entity's assessments are complete, as long as the registered entity reporting such possible violations is proceeding in good faith to complete the assessments.

[4] "Initiated" means that a registered entity has received notification of the upcoming audit.

Please note that in the unlikely circumstance that an actual event occurs in which a CEA determines a discrepancy between actual conditions and facility ratings was a cause or contributing factor, the CEA is to proceed to investigate that case directly and not wait. Similarly, any possible violations of FAC-003 should continue to be reported immediately and may be processed separately and immediately by the CEA.

This document is designed to convey compliance monitoring instruction to achieve a measure of consistency among auditors and Compliance Enforcement Authorities. It is not intended to establish new requirements under NERC's Reliability Standards or to modify the requirements in any existing NERC Reliability Standard. Compliance will continue to be assessed based on language in the currently enforceable NERC Reliability Standards. This document is not intended to define the exclusive method an entity must use to comply with a particular standard or requirement, or foreclose a registered entity's demonstration by alternative means that it has complied with the language and intent of the standard or requirement, taking into account the facts and circumstances of a particular registered entity. Implementation of information in this document is not a substitute for compliance with requirements in NERC's Reliability Standards.

Compliance Application Notice

~~Compliance Application:~~ FAC-008 and FAC-009 Facility Ratings and Design Specifications

Posted: January 7, 2011
Revised: November 11, 2011

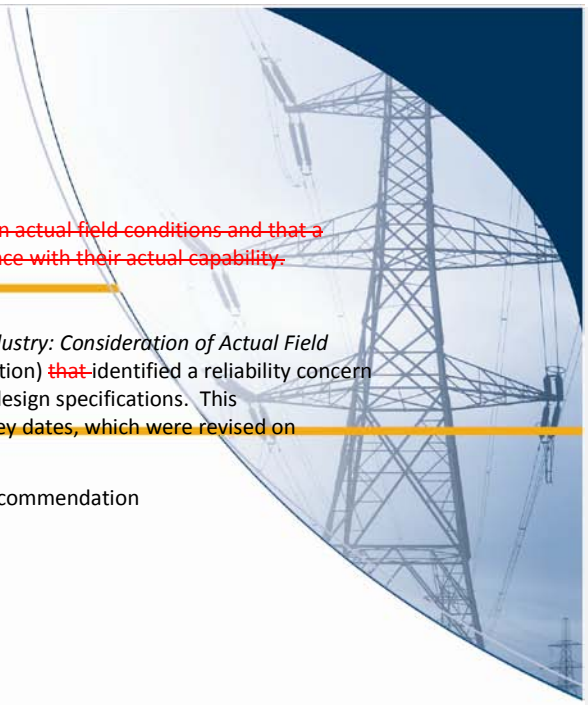
Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
Transmission Owner (TO)
Generation Owner (GO)
Regional Entity
NERC
~~Transmission Owners~~
~~Generation Owners~~

Issue: Should CEAs find a violation of FAC-008 R1 or FAC-009 when it is determined that constructed Facilities do not match design specifications?
For the purpose of aiding CEAs, this CAN provides instruction for assessing compliance with FAC-008 R1 and FAC-009 R1 when an entity's constructed Facilities do not match its design specifications.
~~**Constructed facilities not matching a registered entity's design specifications**~~
~~NERC Compliance received a request for clarification regarding whether registered entities should self-report a violation of either FAC-008-1 R1 or FAC-009-1 R1 when constructed Facilities do not match a registered entity's design specifications.~~

Summary
Due to the Recommendation to Industry (discussed below), possible non-compliances may be discovered for registered entities that had developed the most robust Facility Rating Methodologies (FRMs). This CAN reinforces the premise that the recommendation was based on improving reliability, not creating compliance enforcement actions. It also provides for these Possible Violations to be held in abeyance for determination after the registered entity's assessment is complete, with strong considerations for a zero-dollar penalty or resolution through the Find, Fix and Track (FFT) recording mechanism.
~~**Reliability Objective**~~

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com



~~To ensure that a registered entity's Facility Ratings are based on actual field conditions and that a registered entity's Facilities are therefore operated in accordance with their actual capability.~~

Background

~~On October 7, 2010,~~ NERC's ~~issued the~~ *Recommendation to Industry: Consideration of Actual Field Conditions in Determination of Facility Ratings*[2] (Recommendation) ~~that~~ identified a reliability concern due to Facilities in the field not matching a registered entity's design specifications. This Recommendation contained a call to action for industry with key dates, which were revised on November 29 as follows:

- October 20, 2010 – Acknowledge receipt of Recommendation
- October 28, 2010 – Attend Webinar (optional)
- November 29, 2010 – Attend second Webinar (optional)
- January 18, 2011– Assess impact of the alert and provide an action plan, as required, to NERC, including any extension requests for completing assessments (originally December 15, 2010)
- May 12, 2011 – Attend Webinar (optional)
- Complete assessments - Identify all discrepancies between the design and actual field conditions that are outside the registered entity's design tolerances and report those discrepancies to NERC, applicable Reliability Coordinators (RCs), Transmission Operators (TOPs), and Regional Entities by:[3]

~~• October 28, 2010 – attend Webinar (optional)~~

~~• November 29, 2010 – attend second Webinar (optional)~~

~~• January 18, 2011– assess impact of the alert and provide an action plan, as required, to NERC, including any extension requests for completing assessments (originally December 15, 2010)~~

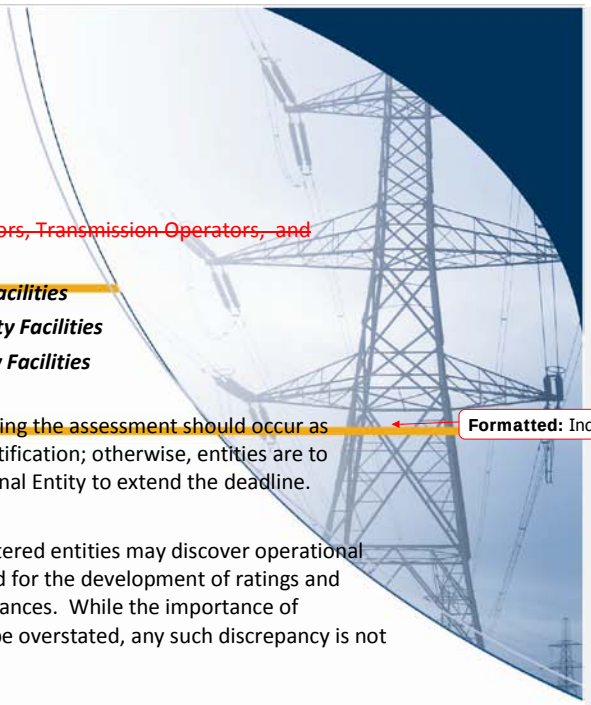
~~• Complete assessments - Identify all discrepancies between the design and actual field conditions that are outside the registered entity's design tolerances and report those~~

Formatted: Indent: Left: -0", Hanging: 0"

[2] Issued on October 7, 2010

[3] All assessments were originally due on April 7, 2011.

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com



discrepancies to NERC, applicable Reliability Coordinators, Transmission Operators, and Regional Entities by (originally April 7, 2011):

1. ***December 31, 2011 for High Priority Facilities***
2. ***December 31, 2012 for Medium Priority Facilities***
3. ***December 31, 2013 for Lowest Priority Facilities***

- Remediation to correct all issues identified during the assessment should occur as quickly as practical but within one year of identification; otherwise, entities are to obtain an approval from their respective Regional Entity to extend the deadline.

Formatted: Indent: Left: 0.25"

In addressing this important reliability Recommendation, registered entities may discover operational Facilities with discrepancies between design specifications used for the development of ratings and actual field conditions that are outside the entity's design tolerances. While the importance of correcting these discrepancies within the above dates cannot be overstated, any such discrepancy is not necessarily a violation of the NERC Reliability Standards.

Nevertheless, such a discrepancy may contribute to a possible violation of one or more of the following requirements: FAC-008-1 R1 or FAC-009-1 R1 or R2, based on the facts and circumstances specific to each instance, as described below. NERC encourages each registered entity to closely examine its Facility Ratings methodology (FRM) required by FAC-008-1 R1 and the application of its FRM as required by FAC-009 R1 and R2 to determine if it is in compliance. Where the registered entity makes a determination that it is not compliant, the entity should self report to the appropriate Regional Entity.

Compliance Application: FAC-008 and FAC-009

- Remediation to correct all issues identified during the assessment should occur as quickly as practical but within one year of identification OR obtain approval from NERC to extend deadline

In addressing this important reliability Recommendation, registered entities may discover operational Facilities with discrepancies between design specifications used for the development of ratings and actual field conditions that are outside the entity's design tolerances. While the importance of correcting these discrepancies within the above dates cannot be overstated, any such discrepancy is not necessarily a violation of the Reliability Standards.

Nevertheless, such a discrepancy may contribute to a possible violation of FAC-008-1 R1 or FAC-009-1 R1 or R2 based on the facts and circumstances specific to each instance, as described below. NERC

Where the registered entity makes a determination that it is not compliant, the entity should self report to the appropriate Regional Entity.~~

~~**Compliance Application**~~

FAC-008

FAC-008-1 requires a registered entity to have a documented FRM for developing Facility Ratings of its solely and jointly owned Facilities.

FAC-008 provides, in pertinent part:

> ***R1.*** *The Transmission Owner and Generator Owner shall each document its current methodology used for developing Facility Ratings (Facility Ratings Methodology) of its solely and jointly owned Facilities. The methodology shall include all of the following:*
>
> > ***R1.1.*** *A statement that a Facility Rating shall equal the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.*
> >
> > ***R1.2.*** *The method by which the Rating (of major BES equipment that comprises a Facility) is determined.*
> >
> > > ***R1.2.1.*** *The scope of equipment addressed shall include, but not be limited to, generators, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.*
> > >
> > > ***R1.2.2.*** *The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.*
> >
> > ***R1.3.*** *Consideration of the following:*
> >
> > > ***R1.3.1.*** *Ratings provided by equipment manufacturers.*
> > >
> > > ***R1.3.2.*** *Design criteria (e.g., including applicable references to industry Rating practices such as manufacturer's warranty, IEEE, ANSI or other standards).*
> > >
> > > ***R1.3.3.*** *Ambient conditions.*
> > >
> > > ***R1.3.4.*** *Operating limitations.*
> > >
> > > ***R1.3.5.*** *Other assumptions.*

CEAs are to verify ~~thatwhether~~that a registered entity's FRM included consideration of the equipment manufacturer's provided ratings (R1.3.1), design criteria (R1.3.2), ambient conditions (R1.3.3), operating limitations (R1.3.4) and other assumptions (R1.3.5) in its FRM.

~~The methodology is to include consideration of the following:~~

~~R1.3.1. Ratings provided by equipment manufacturers.~~

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

~~R1.3.2. Design criteria (e.g., including applicable references to industry Rating practices such as manufacturer's warranty, IEEE, ANSI or other standards).~~

~~R1.3.3. Ambient conditions.~~

~~R1.3.4. Operating limitations.~~

~~R1.3.5. Other assumptions.~~

Compliance Application: FAC-008 and FAC-009

Where an entity's FRM considered equipment manufacturer's provided ratings (R1.3.1), design criteria (R1.3.2), ambient conditions (R1.3.3), operating limitations (R1.3.4) and other assumptions (R1.3.5), the registered entity would be in compliance with FAC-008-1 R1.

FAC-009 R1

FAC-009-1 R1 requires TOs and GOs to establish Facility Ratings for their solely and jointly owned Facilities that are consistent with the associated FRM, which is required under FAC-008 R1.

FAC-009 provides, in pertinent part:

> ***R1.*** *The Transmission Owner and Generator Owner shall each establish Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings Methodology.*

~~FAC-009 R1~~

~~FAC-009-1 R1 requires each Transmission Owner and Generator Owner to establish Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated FRM.~~

Therefore, in order for a CEA to determine whether a registered entity's Facility Ratings were established pursuant to the entity's FRM, the CEA is to first verify whether the entity's FRM addresses design criteria for Transmission Facilities, including clearances, and if so, whether the design criteria and clearances that are included are:

~~In order to be compliant with FAC-009-1 R1, a registered entity's Facility Ratings must be established pursuant to its FRM required by FAC-008-1 R1.~~

~~In order to determine whether a registered entity's Facility Ratings were established pursuant to its FRM, a registered entity should first evaluate whether its FRM addresses design criteria for Transmission~~

Comment [A1]: Industry Comment:

There is no wording in FAC-008 or FAC-009 that identifies a violation if design information and field construction do not match. These words are not present in either standard or any of the requirements. NERC has incorrectly, through this CAN process created a new requirement which is explicitly forbidden by NERC's own Rules of Procedure and the CAN process.

Further the NERC Alert by definition is not law and cannot be the sole basis for an enforcement action.

Comment [A2]: See points one and two

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

~~Facilities, including clearances and, if so, whether the design criteria and clearances that are included are:~~

1) the actual physical application of the design criteria in the field for individual Facilities and/or actual clearances for individual Facilities; ***or***

2) did not include the actual physical application of the design criteria in the field for individual Facilities and/or actual clearances for individual Facilities. In this case, the entity may have stated design criteria broadly as general policy requirements.~~stated broadly as general policy requirements.~~

If the CEA determines that Option 1 applies, i.e. where an entity's FRM requires the inclusion of the actual clearances or the physical applications of design criteria in the field for individual Facilities in the calculation of the Facility Rating:

~~***Where an entity's FRM requires the inclusion of the actual clearances or the physical applications of design criteria in the field for individual Facilities in the calculation of the Facility's Rating (#1):***~~

- If the entity's calculated Facility Ratings do not reflect the FRM requirement, then the CEA is to find a non-compliance with FAC-009 R1. *See below for a discussion regarding compliance actions.*

- ~~If the entity's calculated Facility Ratings do not reflect the FRM requirement, then the registered entity would possibly be non-compliant with FAC-009 R1.~~

  - ~~Additionally, where an entity's Facility Ratings include the FRM requirement, the Facilities must be constructed to the actual clearances and/or design criteria specified in the entity's FRM. If the Facilities in the field are not constructed to design specifications and/or within acceptable tolerances for clearances, or the registered entity would possibly be non-compliant with FAC-009 R1.~~

- Additionally, where an entity's Facility Ratings include the FRM requirement, the Facilities are to be constructed to the actual clearances and/or design criteria specified in the entity's FRM. If the Facilities in the field are not constructed to design specifications and/or within acceptable tolerances for clearances, the CEA is to find a non-compliance with FAC-009 R1.

If the CEA determines that Option 2 applies, i.e. where clearances or design criteria are stated broadly

Comment [A3]: Industry Comment (EEI):

Penalizing entities that fall under Option 1, as indicated in the CAN, would incorrectly penalize entities who have included appropriate reliability measures in favor of those who were less specific. Furthermore, the simple identification of clearances as criterion in their FRM or even the validation of those clearances at the time of the original installation would not constitute a violation of the requirements of either standard or the entity's FRM unless the entity's FRM criteria also specifically required periodic inspections to validate those clearances over time and even in those situations, not all changes can be reasonably controlled over time.

Moreover, the situation is being addressed by NERC through two NERC Alerts, "Recommendations to the Industry" dated October 7, 2010 and updated on November 20, 2010. Therefore, we see no benefit to reliability through a punitive process that we believe is unenforceable. We also note that NERC, through the above mentioned Alerts, has already set a schedule for assessing facility conditions by priority. Those schedules through urgent Industry attention are being effectively addressed while issues, as they are uncovered, are being resolved. Consequently, EEI respectfully submit that this CAN should be rescinded or dismissed in its entirety.

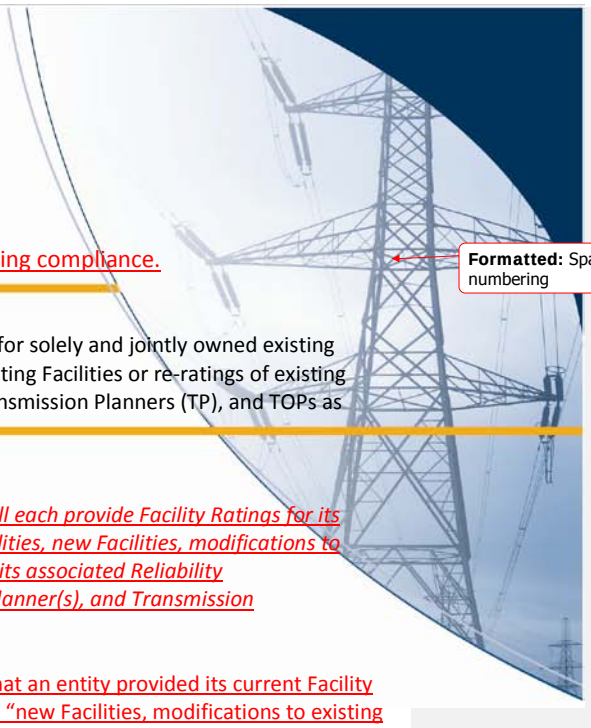
609.452.8060 | www.nerc.com



as general policy requirements.

A CEA is not to consider actual field construction in assessing compliance.

Formatted: Space Before: 0 pt, No bullets or numbering

FAC-009 R2

FAC-009-1 R2 requires TOs and GOs to provide Facility Ratings for solely and jointly owned existing Facilities and new Facilities, as well as any modifications to existing Facilities or re-ratings of existing Facilities to their associated RCs, Planning Authorities (PA), Transmission Planners (TP), and TOPs as scheduled by such requesting entities.

FAC-009 provides, in pertinent part:

> ***R2.*** *The Transmission Owner and Generator Owner shall each provide Facility Ratings for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities to its associated Reliability Coordinator(s), Planning Authority(ies), Transmission Planner(s), and Transmission Operator(s) as scheduled by such requesting entities.*

In assessing compliance with FAC-009-1 R2, a CEA is to verify that an entity provided its current Facility Ratings as scheduled by the requesting entities. As R2 includes "new Facilities, modifications to existing Facilities and re-ratings of existing Facilities," a CEA is also to verify that TOs updated their ratings to address changing field conditions.

Evidence of Compliance

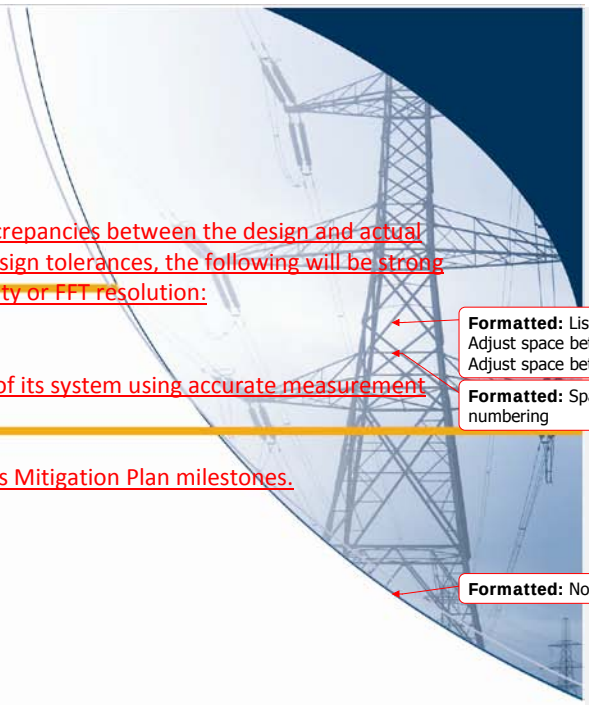
It is of prime importance that registered entities operate reliably within the requirements and or assumptions that are contained in the registered entity's FRM. The Recommendation cited above addresses only the issue of whether Facilities were constructed pursuant to a registered entity's design specifications and required clearances.

Formatted: Normal, No bullets or numbering

During any finding of possible non-compliance, CEAs are to strongly consider a registered entity's concerns for reliability, such as when the entity included the actual physical application of their design criteria in the field for individual Facilities and/or actual clearances for individual Facilities in their

Formatted: Indent: Left: 0"

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com



FRMs. In the event a CEA determined that there are discrepancies between the design and actual field conditions that are outside the registered entity's design tolerances, the following will be strong considerations in the determination of a zero-dollar penalty or FFT resolution:

the registered entity's continuation of its robust FRM;
timely and thorough evaluations by the registered entity of its system using accurate measurement methods and technologies;
timely self-disclosure of any compliance gaps; and
prompt corrective actions and consistent completion of its Mitigation Plan milestones.

~~the registered entity's continuation of its robust FRM;~~

~~timely and thorough evaluations by the registered entity of its system using accurate measurement methods and technologies;~~
~~timely self-disclosure of any compliance gaps; and~~
~~prompt corrective actions and consistent completion of its Mitigation Plan milestones.~~

Further, CEAs are to exercise discretion to hold the processing of all possible violations reported as a result of the assessments until the entity's assessments are complete, as long as the registered entity reporting such possible violations is proceeding in good faith to complete the assessments.

Please note that in the unlikely circumstance that an actual event occurs in which a CEA determines a discrepancy between actual conditions and facility ratings was a cause or contributing factor, the CEA is to proceed to investigate that case directly and not wait. Similarly, any possible violations of FAC-003 should continue to be reported immediately and may be processed separately and immediately by the CEA.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from January 7, 2011. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

Formatted: Font: (Default) Calibri, 11 pt

Formatted: Space Before: 0 pt, No bullets or numbering

Formatted: Font: (Default) Calibri, 11 pt

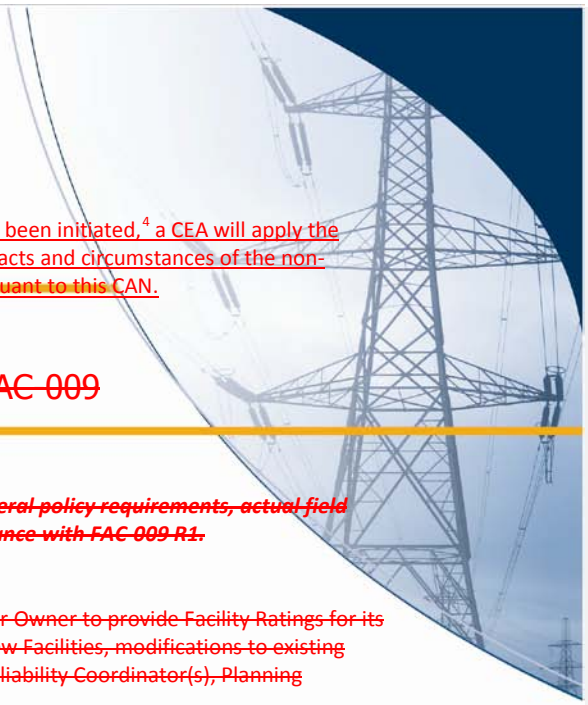
Comment [A6]: Industry comment (EEI):

EEI believes that NERC needs to incorporate a reasonable implementation period for all CANs. Generally, we have observed that CANs routinely apply either retroactive enforcement or enforcement from the point of "Final Posting".
In both cases, entities are not afforded any ability to adjust their programs, policies, systems or hardware to conform to these newly defined or clarified requirements. This approach, if left unchanged, will ensure that many, if not most, registered entities will be continually self reporting their potential noncompliance as a result of CANs. This situation is concerning and troubling particularly at a time when NERC is pursuing Find, Fix and Track.

Comment [A7]: Industry Comment:

This language is troubling given that the effective date authority is expressly provided for in the Reliability Standards. The proposed effective period in the CANs should not usurp this authority in any way. Once a future version of the Standard in question is approved and effective, judgment on whether the future version addresses the specific issue in the CAN is irrelevant in light of new Standard language and questions must be considered in the context of the newly applicable Standard language.

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com



For any enforcement action in process and for audits that have been initiated,[4] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Compliance Application: FAC-008 and FAC-009

Where clearances or design criteria are stated broadly as general policy requirements, actual field construction would not considered in determining noncompliance with FAC-009 R1.

FAC-009 R2
FAC-009-1 R2 requires each Transmission Owner and Generator Owner to provide Facility Ratings for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities to its associated Reliability Coordinator(s), Planning Authority(ies), Transmission Planner(s), and Transmission Operator(s) as scheduled by such requesting entities.

For compliance with FAC-009-1 R2, an entity that provides its current Facility Ratings as scheduled by the requesting entities would be in compliance with the requirement. As R2 includes "new Facilities, modifications to existing Facilities and re-ratings of existing Facilities," the standard contemplates that transmission owners update their ratings to address changing field conditions and would thus be positioned for compliance with the standard.

Possible Compliance Actions
The first order of business under FAC-009 is for registered entities to operate reliably within the requirements and or assumptions contained in the registered entity's FRM.

In contrast, the Recommendation addresses whether Facilities were constructed pursuant to a registered entity's design specifications and required clearances.

Registered entities that included the actual physical application of its design criteria in the field for individual Facilities and/or actual clearances for individual Facilities in its FRM have exhibited an attention to detail and a concern for reliability. In the event a registered entity discovers a noncompliance as a result of this Recommendation, the a registered entity's continuation of its robust FRM; timely and thorough evaluations of its system using accurate measurement methods and technologies; timely self-disclosure of any compliance gaps; prompt corrective actions and consistent completion of its Mitigation Plan milestones will be strong considerations in the determination of a zero-dollar penalty.

[4] "Initiated" means that a registered entity has received notification of the upcoming audit.

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

~~Compliance Application: FAC-008 and FAC-009~~

~~Further, NERC and Regional Entity staff will exercise enforcement discretion to hold the processing of all possible violations reported as a result of the assessments until the entity's assessments are complete, as long as the registered entity reporting such possible violations is proceeding in good faith to complete the assessments.~~

~~Please note that in the unlikely circumstance that an actual event occurs in which NERC or the Regional Entity determines a discrepancy between actual conditions and facility ratings was a cause or contributing factor, then NERC or the Regional Entity would proceed to investigate that case directly and not wait. Similarly, any possible violations of FAC-003 should continue to be reported immediately and may be processed separately and immediately by the Regional Entity or NERC.~~

Industry Comments for CAN-0009		
Comment Topics	**Main Points**	**Industry Suggestions**
Errata Changes	Need to list R1.3 in entirety	Spell out full standard
Scope	The CAN incorrectly implies that the requirement is to have the field conditions match the design.	There is no such requirement. The requirements are to have a FRM and apply that FRM to establish ratings.
Effective Date	This language is troubling given that the effective date authority is expressly provided for in the Reliability Standards. The proposed effective period in the CANs should not usurp this authority in any way.	The CAN Process language may need to address how final CANs are to be treated when further revised. When a once final CAN is selected for revision, it makes sense that it would be rescinded and replaced by the updated final CAN thus removing any standing of the former final CAN.
Evidence	The first paragraph should be struck. The statements are irrelevant, their purpose is not clear and the paragraph does not support evidence of compliance.	There is no recommended evidence for either the CEAs or registered entities to properly evaluate application or compliance with the standard. This section is more focused on enforcement action and penalty assessment and should not be part of this CAN. This entire section be revised to provide recommended evidence and not focus on enforcement actions or penalty assessments.
Process	Unreasonable pace that revising and reposting "all" CANs in 12 weeks presents. Previous requests were made for more time to review CANs posted for input, and while the time allowed increased from two weeks to three, increasing the number of CANs posted for review defeats the time added.	Due to such volume, NERC may not receive the constructive input from stakeholders that they could have under a more measured approach. Understanding that the current volume is a unique task resulting from Board direction, we are doing our best to review and comment on postings, and again we appeal for a more reasonable review opportunity going forward.

Compliance Application Notice – 0017

CIP-007 R5 Technical and Procedural System Access and Password Controls

Posted: November 11, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Registered Entities subject to CIP Reliability Standards

Issue: Is a CEA to verify that technical controls, procedural controls, or both are implemented in assessing compliance with CIP-007[2] Requirement (R)5?

For the purpose of aiding a CEA, this CAN provides instruction for assessing whether a technical solution, a procedural solution or both are required for system access and password controls for a registered entity's Cyber Assets and Critical Cyber Assets to fulfill the requirements of CIP-007 R5.

- System Access Controls – R5, R5.1 and R5.2
  First, this CAN provides instruction regarding when a CEA is to verify technical or procedural controls under R5.1 and R5.2, which state that a registered entity will establish, implement, and document technical *and* procedural controls, noting that both are not applicable to each of the actions contained in the sub-requirements of R5.1 and R5.2.

- Administrator, Shared, or Other Generic Account Passwords – R5.2.1
  Second, this CAN clarifies that the passwords specified in R5.2.1 must comply with the password construction and change requirements contained in R5.3.

- Password Controls – R5.3
  Third, this CAN provides instruction regarding when a CEA is to verify that a registered entity has a fully compliant technical solution.[3]

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.

[2] The FERC order approving the Version 2 CIP Reliability Standards, CIP-002-2 through CIP-009-2, was issued in September 2009. See North American Electric Reliability Corp., 128 FERC ¶ 61,291 (September 2009 Order), order denying rehearing and granting clarification, 129 FERC ¶ 61,236 (2009). The FERC Order on Version 3 CIP Reliability Standards was issued on March 31, 2010. See North American Electric Reliability Corp., 130 FERC ¶ 61,271 (2010) (March 31 Order).

[3] Registered entities' software, hardware and equipment have varying degrees of capability to provide a technical solution to fulfill the password control requirements of R5.3. Consequently, registered entities, under currently owned equipment, software, and security password schemes, may not have the ability to ensure compliance with the standard via a fully compliant technical solution.

- Technical Feasibility Exception (TFE)
  Finally, this CAN provides instruction on when a CEA is to verify the entity has submitted a request for a TFE and whether the TFE request has been approved.

Summary of Compliance Application Notice

A CEA is to verify that a registered entity has implemented technical and procedural controls as required in the standards. In regard to R5.3, when an entity's Cyber Asset or Critical Cyber Asset is not capable of structuring passwords as required by the standard, then the CEA is instructed to verify whether the asset is covered under a TFE or the safe harbor of a TFE submission. In the case of a TFE submission, the CEA is instructed to verify whether the TFE-based compensating measures are in place. If a registered entity has submitted a TFE request, the entity will be subject to a safe harbor pending approval of the TFE, pursuant to section 5.3 of appendix 4D of the NERC Rules of Procedure.

Background

CIP-007 provides, in pertinent part:

R5. *Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.*

R5.1. *The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.*

R5.1.1. *The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-3 Requirement R5.*

R5.1.2. *The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.*

R5.1.3. *The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.*

R5.2. *The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.*

R5.2.1. *The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.*

R5.2.2. *The Responsible Entity shall identify those individuals with access to shared accounts.*

R5.2.3. *Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).*

R5.3. *At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:*

R5.3.1. *Each password shall be a minimum of six characters.*

R5.3.2. *Each password shall consist of a combination of alpha, numeric, and "special" characters.*

R5.3.3. *Each password shall be changed at least annually, or more frequently based on risk. [Emphasis added]*

Compliance Application

System Access Controls – R5, R5.1 and R5.2

NERC and the Regional Entities have determined that the "and" in R5 indicates that both technical and procedural controls are required throughout the sub-requirements R5.1 and R5.2, but both are not required for each of the actions required by R5.1 and R5.2. Therefore, a CEA is to verify that a registered entity has implemented the appropriate control(s) – either 1) both technical and procedural controls, or 2) only a procedural control – as required for each action. To clarify the first point, whenever a registered entity has a technical control, the technical control has been programmed to perform pursuant to a procedure, which is the procedural control. Therefore, whenever there is a technical control there is also an associated procedural control.

Examples:

R5.1.2 provides an example of a requirement where both procedural and technical controls are required. R5.2.1 requires an entity to establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails. Here, the methods, processes and procedures that generate the logs, to the extent they are electronic, would be a technical control. However, the entity also has a procedure that was programmed into the electronic solution that provides the procedural basis for the technical control and thus becomes the procedural control. A CEA is to verify the registered entity's technical control is performing as intended.

R5.1.3 provides an example of a requirement where only a procedural control is required. R5.1.3 requires an annual review of user accounts to verify access privileges. Here, the annual review to verify access privileges may be a manual process, and, if so, would be conducted pursuant to a procedural control. Because the standard only addresses the review, there would be no technical control required by R5.1.3. Note that the procedural control is associated with

a technical database or software program (an employee is reviewing the electronically generated audit trails).

Administrator, Shared, or Other Generic Account Passwords – R5.2.1

A CEA is to verify that passwords that were changed prior to putting the system into service (as required by R5.2.1) meet the password construction and maintenance controls of R5.3, specifically password length (R5.3.1), password complexity (R5.3.2), and periodic password change (R5.3.2). The CEA should review the initial password controls as it does any other password controls per R5.3, as discussed below. If any of these password controls cannot technically be met (either initially or when changed), the CEA is to verify whether the registered entity has requested or obtained a TFE.

Password Controls – R5.3

A CEA is to verify that a registered entity requires and uses passwords, subject to the sub-requirements of CIP-007 R5.3. Where a registered entity owns equipment that has the capability – to whatever degree – to provide a technical solution, the CEA is to verify that the registered entity has the technical solution enabled, regardless if the technical solution has the ability to meet all of the requirements of the standard, as outlined below:

1. **A technical solution is available:**
   If the software's technical solution fully meets the requirements of the standard, the CEA is to determine that the registered entity fulfills the requirement, and no further action is required.

   Example:

   A device supports at least six alphanumeric passwords (letters and numbers) and allows inclusion of special characters. If the device can be configured to require at least six characters in the password and can be configured to require letters, numbers and special characters, then there is a technical control and a procedural control, which would allow the registered entity to fulfill the requirements. For a CEA to find that the registered entity has met the requirements of R5.3.2 in this example, the CEA is to verify the registered entity implemented the technical control as specified in the procedural control.

2. **A technical control is available but does not fulfill the requirements of the standard:**
   If a registered entity has equipment for which a technical control only partially meets the requirements of the standard, but the equipment has the capability to fulfill all requirements of the standard by also implementing a procedural control for the remaining requirements, the CEA is to verify that the registered entity has implemented a procedural control for any requirements that the technical solution cannot fulfill, and has obtained, or is in the process of obtaining, a TFE.

Example:

The server or workstation at issue runs a software application that 1) can configure a minimum password length, 2) can require complex passwords, and 3) will accept a fully compliant password. However, while the minimum password length of six characters can be enforced, setting the complex password option does not prevent a complex password from *not* including either a numeric digit or a special character. In other words, the requirements of R5.3.1 can be met, but the requirements of R5.3.2 cannot. For a CEA to find that the registered entity has met the requirements of both R5.3.1 and R5.3.2 in this example, the CEA is to verify that the registered entity had enabled the technical solution (set the minimum password length to at least six and enabled the complex password option), had further augmented the technical controls with a procedural control by implementing an internal policy and training program that requires numeric and special characters for passwords, and had submitted a TFE for the technical component.

Whether a procedural control is adequate is determined through the evaluation and approval of a TFE; however, a sufficient procedural control could include a procedural policy statement, personnel training, and other compensating measures, such as requiring longer passwords, restricting electronic access, and having a more frequent password change cycle.[4]

3. **Neither a technical control nor a procedural control can be implemented on the targeted Cyber Asset or Critical Cyber Asset device that will fulfill the requirements of the standard:** If a registered entity has a device that is incapable of fulfilling the password requirements of the standard through a technical solution, a procedural solution or a combination of both, the CEA is to verify that the registered entity has requested or obtained a TFE.

   This situation may exist due to equipment restrictions for password lengths, equipment restricting the ability to change passwords, or password character sets not allowing the required diversity, among other reasons. The CEA is to verify that compensating technical or procedural controls are described in the TFE.

   Example:

   A piece of equipment can only support four numeric digits for a password. In this case, the device is not capable of configuring a compliant password at all. The registered entity can only rely upon procedural controls to require a four-digit password complexity; a six-character complex password is not possible. The CEA is not to find that the entity has met R5.3.2 in this example, and therefore is to verify that a TFE has been submitted.

[4] CIP-007 R5.3.3 requires each password to be changed at least annually or more frequently based on risk.

Effective Period for CAN

This CAN is effective for CIP-007 upon posting as final on the NERC Web site, and is to be used by CEAs to assess compliance from the posting date forward, regardless of the start date of any non-compliance or Possible Violation. It supersedes all prior communications and will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[5] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

System Access Controls – R5, R5.1 and R5.2

A CEA is to verify that a registered entity implemented either 1) both a technical and a procedural control, or 2) only a procedural control, for each action required by R5.1 and R5.2 by reviewing:

1. documentation of the control(s) the registered entity has implemented for each required action; and
2. evidence that the control(s) fulfill the requirement of the specific action.

Administrator, Shared, or Other Generic Account Passwords – R5.2.1

A CEA is to verify evidence of the password change as described in the discussion of R3.

Password Controls – R5.3

1. **A technical solution is available:**
   If the software's technical solution fully meets the requirements of the standard, a CEA is to review the registered entity's evidence demonstrating how its technical solution fulfills the requirements of R5.3.

2. **A technical control is available but does not fulfill the requirements of the standard:**
   Where a registered entity's technical solution does not have the ability to fully meet the requirements of R5.3, a CEA is to verify that the registered entity 1) provided a procedural solution for any requirements that its technical solution cannot fulfill and 2) has obtained, or is in the process of obtaining, an approved TFE.[6] Additionally, the CEA is instructed to review:
   a. the entity's approved TFE or submitted TFE request;
   b. evidence of the extent to which the entity's technical solution fulfills the requirement(s);
   c. documentation of the registered entity's procedural solution to meet the remaining requirements of R5.3;

[5] "Initiated" means that a registered entity has received notification of the upcoming audit.

[6] If a registered entity has submitted a TFE request, the entity will be subject to a safe harbor pending approval of the TFE, pursuant to section 5.3 of appendix 4D of the NERC Rules of Procedure.

d. documentation of the registered entity's training program to educate its affected personnel on its procedural solution as required by CIP-004; and
e. attestations from persons with overall responsibility for the procedural control (or alternative language: "attestations from persons responsible for implementing and/or overseeing compliance with the procedural solution").

3. **Neither a technical solution nor a procedural solution can be implemented on the targeted Cyber Asset or Critical Cyber Asset device:**
   If the registered entity cannot implement a technical solution or a procedural solution on the Cyber Asset or Critical Cyber Asset, a CEA is to verify that the registered entity has obtained, or is in the process of obtaining, a TFE.[7] Additionally, the CEA is instructed to review:
   a. the entity's approved TFE or submitted TFE request, and
   b. evidence of its implementation of the compensating measures (which may be on a different device) provided in its TFE.

This document is designed to convey compliance monitoring instruction to achieve a measure of consistency among auditors and Compliance Enforcement Authorities. It is not intended to establish new requirements under NERC's Reliability Standards or to modify the requirements in any existing NERC Reliability Standard. Compliance will continue to be assessed based on language in the currently enforceable NERC Reliability Standards. This document is not intended to define the exclusive method an entity must use to comply with a particular standard or requirement, or foreclose a registered entity's demonstration by alternative means that it has complied with the language and intent of the standard or requirement, taking into account the facts and circumstances of a particular registered entity. Implementation of information in this document is not a substitute for compliance with requirements in NERC's Reliability Standards.

CAN-0017 Comment Analysis Summary

CIP-007 R5 Technical and Procedural System Access and Password Controls

CAN-0017 provides instruction for assessing whether a technical solution, a procedural solution or both are required for system access and password controls for a registered entity's Cyber Assets and Critical Cyber Assets to fulfill the requirements of CIP-007 R5. The draft CAN was posted for industry comment on the NERC web site on September 23, 2011 and the comment period expired on October 14, 2011.

NERC received approximately 23 comments from various industry stakeholders and trade associations, which are identified below. The main themes of the comments consisted of the following four categories: errata changes, scope, effective date and evidence of compliance.

Errata

Errata changes were made in order to correct a few typos and to change the number of a footnote.

Scope

There two industry groups that recommended substantive changes to the CAN in regard to scope. There were several comments that stated a procedural control is permitted by the standards and a TFE should not be required. It is understood that the compliance application may generate additional TFE's when the TFE is process is already overburdened, however, after legal review, it was determined that the compliance application stated in the CAN is required by FERC Orders. [1]

R5 specifies the need for technical and procedural controls. R5.1 does not use the words "where technically feasible"[2] and thus a TFE is not required where a procedural solution is the appropriate solution. R5.2 also does not use the words "where technically feasible" so again, a TFE is not required nor available. In the case of R5.2.1, the CAN provides for the availability of a TFE as the passwords must be changed in accordance with R5.3. R5.3 requires and provides for the availability of a TFE.

Additionally, a comment was made in regards to the CEA verifying the adequacy of the controls submitted in the TFE, specifically that this is not the role of the CEA. The CAN was modified to remove the instruction that CEAs are to verify the adequacy of compensating measures.

[1] *See* 133 FERC ¶61,008, Order on Compliance Filing Docket No. RR10-1-001 (October 1, 2020) and NERC Rules of Procedure Appendix 4D.
[2] *Id.*

Effective Date

Several commenters believe that NERC should to incorporate a reasonable implementation period for CAN-0017 to allow for time to file a Technical Feasibility Exception (TFE) with the applicable Regional Entity.

In response, CAN-0017 is effective for CIP-007 R5 upon posting as final on the NERC Web site. Registered entities should be aware that auditors will be using the guidance in CAN-0017 for assessing compliance from the posted date going forward, however a submitted TFE will provide a safe harbor until the TFE is approved. Additionally, CEAs will use discretion in whether the CAN is to be applied to any entity who has received notification of an upcoming audit.

Evidence

Commenters had questions regarding the Evidence of Compliance section. Particularly, several industry members stated that the standard did not reference training and there is not an obligation to provide training under CIP-007 R5.

In response, the evidence listed in the CAN includes several options that CEA staff can look for to verify compliance with the standard. One of the key concerns was CEAs verifying evidence of training. Although CEAs are not to verify adequacy of compensating measures as compensating measures are to be evaluated through the TFE process, a CEA does need to verify that the compensating measures have been implemented. Training is one way to ensure that an entity's staff is aware of the procedural control. Training may be conducted in a variety of methods and evidence of such training may include interviews with the applicable personnel. Additionally, the Evidence of Compliance section states, "may include but is not limited to," to account for the fact that entities may or may not have a specific type of evidence.

Conclusion

The analysis spreadsheet for CAN-0017 is also posted on the NERC website. While the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments, it is hoped that this document will supplement that information. Feedback from all sources is key and NERC staff thanks industry for the time and effort put into providing that feedback. If you would like further discussion on CAN-0017, please feel free to contact us at cancomments@nerc.net.

CIP-007 R5 Technical and Procedural System Access and Password Controls

Posted [DATE]

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entities
Registered Entities subject to CIP Reliability Standards

Issue: Is a CEA is to verify that technical controls, procedural controls, or both are implemented in assessing compliance with CIP-007[2] Requirement (R)-5?
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether a technical solution, a procedural solution or both are required for system access and password controls for a registered entity's Cyber Assets and Critical Cyber Assets to fulfill the requirements of CIP-007 R5.

- System Access Controls – R5, R5.1 and R5.2
  First, this CAN provides instruction regarding when a CEA is to verify technical or procedural controls under R5.1 and R5.2, which state~~s~~ that a registered entity will establish, implement, and document technical *and* procedural controls, noting that both are not applicable to each of the actions contained in the sub-requirements of R5.1 and R5.2.

- Administrator, Shared, or Other Generic Account Passwords – R5.2.1
  Second, this CAN clarifies that the passwords specified in R5.2.1 must comply with the password construction and change requirements contained in R5.3.

- Password Controls – R5.3
  Third, this CAN provides instruction regarding when a CEA is to verify that a registered entity has a fully compliant technical solution.[3]

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards and requirements.
[2] The FERC order approving the Version 2 CIP Reliability Standards, CIP-002-2 through CIP-009-2, was issued in September 2009. *See North American Electric Reliability Corp.*, 128 FERC ¶ 61,291 (September 2009 Order), *order denying rehearing and granting clarification*, 129 FERC ¶ 61,236 (2009). The FERC Order on Version 3 CIP Reliability Standards was issued on March 31, 2010. *See North American Electric Reliability Corp.*, 130 FERC ¶ 61,271 (2010) (March 31 Order).
[3] Registered entities' software, hardware and equipment have varying degrees of capability to provide a technical solution to fulfill the password control requirements of R5.3. Consequently, registered entities, under currently owned equipment,

- Technical Feasibility Exception (TFE)
  Finally, this CAN provides instruction on when a CEA is to verify the entity has submitted a request for a TFE and whether the TFE request has been approved.

~~CAN~~ Summary of Compliance Application Notice

Formatted: Font: Bold

A CEA is to verify that a registered entity has implemented technical and procedural controls as required in the standards. In regard to R5.3, when an ~~entities'~~ entity's Cyber Asset or Critical Cyber Asset is not capable of structuring passwords as required by the standard, then the CEA is instructed to verify whether the asset is covered under a TFE or the safe harbor of a TFE submission. In the case of a TFE submission, the CEA is instructed to verify whether the TFE-based compensating measures are in place. ~~there are adequate compensating measures in place.~~ If a registered entity has submitted a TFE request, the entity will be subject to a safe harbor pending approval of the TFE, pursuant to section 5.3 of appendix 4D of the NERC Rules of Procedure.

Background

CIP-007 provides, in pertinent part:

> ***R5.*** *Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.*
>
> ***R5.1.*** *The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.*
> ***R5.1.1.*** *The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-3 Requirement R5.*
> ***R5.1.2.*** *The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.*
> ***R5.1.3.*** *The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.*
>
> ***R5.2.*** *The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.*
> ***R5.2.1.*** *The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.*
> ***R5.2.~~1~~2.*** *The Responsible Entity shall identify those individuals with access to shared accounts.*

software, and security password schemes, may not have the ability to ensure compliance with the standard via a fully compliant technical solution.

Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

R5.2.~~1~~3. *Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).*

R5.3. *At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:*

R5.3.1. *Each password shall be a minimum of six characters.*

R5.3.2. *Each password shall consist of a combination of alpha, numeric, and "special" characters.*

R5.3.3. *Each password shall be changed at least annually, or more frequently based on risk. [Emphasis added]*

Compliance Application

System Access Controls – R5, R5.1 and R5.2

NERC and the Regional Entities have determined that the "and" in R5 indicates that both technical and procedural controls are required throughout the sub-requirements R5.1 and R5.2, but both are not required for each of the actions required by R5.1 and R5.2. Therefore, a CEA is to verify that a registered entity has implemented the appropriate control(s) – either 1) both technical and procedural controls, or 2) only a procedural control – as required for each action. To clarify the first point, whenever a registered entity has a technical control, the technical control has been programmed to perform pursuant to a procedure, which is the procedural control. Therefore, whenever there is a technical control there is also an associated procedural control.

Examples

R5.1.2 provides an example of a requirement where both procedural and technical controls are required. R5.2.1 requires an entity to establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails. Here, the methods, processes and procedures that generate the logs, to the extent they are electronic, would be a technical control. However, the entity also has a procedure that was programmed into the electronic solution that provides the procedural basis for the technical control and thus becomes the procedural control. A CEA is to verify the registered entity's technical control is performing as intended. ~~Additionally, the registered entity will also have a procedure to input data and generate reports, which is another procedural control.~~

R5.~~3~~1.3.~~1~~ provides an example of a requirement where only a procedural control is required. R5.~~3.1~~1.3 requires an annual review of user accounts to verify access privileges. Here, the annual review to verify access privileges may be a manual process, and, if so, would be conducted pursuant to a procedural control. Because the standard only addresses the review, there would be no technical control required by R5.3.1. Note that the procedural control is associated with a technical database or software program (an employee is reviewing the electronically generated audit trails).

Administrator, Shared, or Other Generic Account Passwords – R5.2.1

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

A CEA is to verify that passwords that were changed prior to putting the system into service (as required by R5.2.1) meet the password construction and maintenance controls of R5.3, specifically password length (R5.3.1), password complexity (R5.3.2), and periodic password change (R5.3.2). The CEA should review the initial password controls as it does any other password controls per R5.3, as discussed below. If any of these password controls cannot technically be met (either initially or when changed), the CEA is to verify whether the registered entity has requested or obtained a TFE.

Password Controls – R5.3

A CEA is to verify that a registered entity requires and uses passwords, subject to the sub-requirements of CIP-007 R5.3. Where a registered entity owns equipment that has the capability – to whatever degree – to provide a technical solution, the CEA is to verify that the registered entity has the technical solution enabled, regardless if the technical solution has the ability to meet all of the requirements of the standard, as outlined below:

1. **A technical solution is available:**
   If the software's technical solution fully meets the requirements of the standard, the CEA is to determine that the registered entity fulfills the requirement, and no further action is required.
   Example:
   A. ~~**Fully Compliant Procedural and Technical Solution:** -~~ A device supports at least six alphanumeric passwords (letters and numbers) and allows inclusion of special characters. If the device can be configured to require at least six characters in the password and can be configured to require letters, numbers and special characters, then there is a technical control and a procedural control, which would allow the registered entity to fulfill the requirements. For a CEA to find that the registered entity has met the requirements of R5.3.2 in this example, the CEA is to verify the registered entity implemented the technical control as specified in the procedural control.

2. **A technical control is available but does not fulfill the requirements of the standard:** ~~–~~
   If a registered entity has equipment for which a technical control only partially meets the requirements of the standard, but the equipment has the capability to fulfill all requirements of the standard by also implementing a procedural control for the remaining requirements, the CEA is to verify that the registered entity has implemented a procedural control for any requirements that the technical solution cannot fulfill, and has obtained, or is in the process of obtaining, a TFE.
   Example:

   ~~***Examples***~~
   ~~1.~~A. ~~**Fully Compliant Procedural and Technical Solution:** - A device supports at least six alphanumeric passwords (letters and numbers) and allows inclusion of special characters. If the device can be configured to require at least six characters in the password and can be configured to require letters, numbers and special characters, then there is a technical control and a procedural control, which would allow the registered entity to fulfill the requirements. For a CEA to find that the registered entity has met the requirements of R5.3.2 in this~~

Formatted: Indent: Left: 0.5"
Formatted: Font: 11 pt

3353 Peachtree Road NE

Atlanta, GA 30326
404.446.2560 | www.nerc.com

~~example, the CEA is to verify the registered entity implemented the technical control as specified in the procedural control.~~

~~The server or workstation at issue runs a software application that 1) can configure a minimum password length, 2) can require complex passwords and 3) will accept a fully compliant password. However, while the minimum password length of six characters can be enforced, setting the complex password option does not prevent a complex password from not including either a numeric digit or a special character. In other words, the requirements of R5.3.1 can be met, but the requirements of R5.3.2 cannot. For a CEA to find that the registered entity has met the requirements of both R5.3.1 and R5.3.2 in this example, the CEA is to verify that the registered entity had enabled the technical solution (set the minimum password length to at least 6 six and enabled the complex password option), had further augmented the technical controls with a procedural control by implementing an internal policy and training program that requires numeric and special characters for passwords, and had submitted a TFE.~~

~~2.B.~~ **~~Fully Compliant Procedural cSolution:~~** ~~—~~The server or workstation at issue runs a software application that 1) can configure a minimum password length, 2) can require complex passwords and 3) will accept a fully compliant password. However, while the minimum password length of six characters can be enforced, setting the complex password option does not prevent a complex password from *not* including either a numeric digit or a special character. In other words, the requirements of R5.3.1 can be met, but the requirements of R5.3.2 cannot. For a CEA to find that the registered entity has met the requirements of both R5.3.1 and R5.3.2 in this example, the CEA is to verify that the registered entity had enabled the technical solution (set the minimum password length to at least six and enabled the complex password option), had further augmented the technical controls with a procedural control by implementing an internal policy and training program that requires numeric and special characters for passwords, and had submitted a TFE for the technical component.

Formatted: Font: Italic

~~A device supports at least six alphanumeric passwords (letters and numbers) and allows inclusion of special characters but does not mandate the use of special characters. If the device can be configured to require at least six characters in the password and can be configured to require both letters and numbers, then there is a partial technical control, but a procedural control to include special characters, would require a procedural control to include special characters, which would allow the registered entity to fulfill the requirements. For a CEA to find that the registered entity has met the requirements of R5.3.2 in this example, the CEA is to verify the registered entity implemented the partial technical control, and submitted a TFE explaining additional (perhaps on a different device[4]) technical and procedural controls used.~~

~~C. —~~ **~~Non-Compliant Solution:~~** ~~—~~A server or workstation runs a software application that 1) can configure minimum password length, but the password cannot contain any

Formatted: Font: 11 pt

~~[4] In this case, additional technical and procedural controls might involve a "front-end processor" device which can be inserted into the communication path to technically enforce the password requirements, and a procedural control that requires use of the front-end device. Additional controls may be required for physical access.~~

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

~~special characters. The CEA cannot find that the entity has met R5.3.2 in this example, and therefore verify that a TFE has been submitted.~~

Whether a procedural control is adequate is determined through the evaluation and approval of a TFE; however, a sufficient procedural control could include a procedural ~~CEA is to look for a sufficient procedural control to include a compliant~~ policy statement, personnel training, and other compensating measures, such as requiring longer passwords, restricting electronic access, and a more frequent password change cycle.[5]

3. **Neither a technical control nor a procedural control can be implemented on the targeted Cyber Asset or Critical Cyber Asset device that will fulfill the requirements of the standard:** If a registered entity has a device that is incapable of fulfilling the password requirements of the standard through a technical solution, a procedural solution or a combination of both, the CEA is to verify that the registered entity has requested or obtained a TFE.

   This situation may exist due to equipment restrictions for password lengths, equipment restricting the ability to change passwords, or password character sets not allowing the required diversity, among other reasons. The CEA is to verify that compensating technical or procedural controls are described in the TFE.

   Example:
   A piece of equipment can only support four numeric digits for a password. In this case, the device is not capable of configuring a compliant password at all. The registered entity can only rely upon procedural controls to require a four-digit password complexity; a six-character complex password is not possible. The CEA is not to find that the entity has met R5.3.2 in this example, and therefore is to verify that a TFE has been submitted.

Effective Period for CAN
This CAN is effective for CIP-007 upon posting as final on the NERC Web site, and is to be used by CEAs to assess compliance from the posting date forward, regardless of the start date of any non-compliance or Possible Violation. It supersedes all prior communications and will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[6] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

~~Providing~~ Evidence of Compliance
System Access Controls – R5, R5.1 and R5.2
A CEA is to verify that a registered entity implemented either 1) both a technical and a procedural control, or 2) only a procedural control, for each action required by R5.1 and R5.2 by reviewing:

[5] CIP-007 R5.3.3 requires each password to be changed at least annually or more frequently based on risk.
[6] "Initiated" means that a registered entity has received notification of the upcoming audit.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

1. documentation of the control(s) the registered entity has implemented for each required action; and
2. evidence that the control(s) ~~are~~ fulfill~~ing~~ the requirement of the specific action.

Administrator, Shared, or Other Generic Account Passwords – R5.2.1
A CEA is to verify evidence of the password change as described in the discussion of R3.

Password Controls – R5.3

1. **A technical solution is available:**
   If the software's technical solution fully meets the requirements of the standard, a CEA is to review the registered entity's evidence demonstrating how its technical solution fulfills the requirements of R5.3.

2. **A technical control is available but does not fulfill the requirements of the standard:**
   Where a registered entity's technical solution does not have the ability to fully meet the requirements of R5.3, a CEA is to verify that the registered entity 1) provided a procedural solution for any requirements that its technical solution cannot fulfill and 2) has obtained, or is in the process of obtaining, an approved TFE.[7] Additionally, the CEA is instructed to review:
   a. the entity's approved TFE or submitted TFE request;
   b. evidence of the extent to which the entity's technical solution fulfills the requirement(s);
   c. documentation of the registered entity's procedural solution to meet the remaining requirements of R5.3;
   d. documentation of the registered entity's training program to educate its affected personnel on its procedural solution as required by CIP-004; and
   e. attestations from persons with overall responsibility ~~responsible~~ for the procedural control (or alternative language: "attestations from persons responsible for implementing and/or overseeing compliance~~ying~~ with the procedural solution").

3. **Neither a technical solution nor a procedural solution can be implemented on the targeted Cyber Asset or Critical Cyber Asset device:**
   If the registered entity cannot implement a technical solution or a procedural solution on the Cyber Asset or Critical Cyber Asset, a CEA is to verify that the registered entity has obtained, or is in the process of obtaining a TFE.[8] ~~.~~ Additionally, the CEA is instructed to review:
   a. the entity's approved TFE or submitted TFE request, and
   b. evidence of its implementation of the compensating measures (which may be on a different device) provided in its TFE.

Industry Comments for CAN-0017

Comment Topics	Main Points	Industry Suggestions
Errata Changes	Typos and incorrect references to subrequirements	Fix the typos and incorrect numbering in the standard.
Scope	Exceeds the scope or adds new requirements to the standards.	CAN-0017 requires the CEA and the Responsible Entity to take actions above and beyond the requirement of Standard CIP-005 R5.3.
Effective Date	NERC implement a reasonable implementation period where Entities are afforded the ability to adjust their programs, policies, systems, or hardware to conform to newly defined or clarified requirements.	NERC needs to incorporate a reasonable implementation period for all CANs.
Evidence	Instruction that CEAs are to review “attestations from persons responsible for implementing and/or complying with the procedural solution” is not in line with the plain language of the approved standard.	The plain language of the standards and associated requirements as identified above simply do not specify training. Hence, training of the type and as identified is not required and should be stricken from the CAN.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0018 Comment Analysis Summary

FAC-008 Terminal Equipment

CAN-0018 provides instruction for assessing what equipment should be considered "terminal equipment" under FAC-008 R1.2.1. The CAN was posted for industry comment on the NERC web site on September 1, 2011 and the comment period expired on September 21, 2011.

NERC received approximately 20 comments from various industry stakeholders and trade associations, which are identified by name below. The main themes of the comments consisted of the following four categories: errata changes, the scope of the CAN and the effective date language.

Errata

The recommended errata changes were revised in order to provide clarity in the CAN.

Scope

There were several recommended substantive changes to the CAN in regard to the scope of the compliance guidance. The commenters stated that CAN-0018 expands the requirement by listing additional equipment that is not listed in the standard. Industry suggestions were that registered entities should be allowed to define what terminal equipment means in their Facility Rating methodology (FRM) and should not be limited to the direction of the CAN. While NERC understands the need for flexibility, in order to ensure that Compliance Enforcement Authority (CEA) staff applies FAC-008 consistently across the ERO, instruction for CEAs was needed. In response to some concerns that the equipment listed became too broad, the CAN was revised to state "the focus is on series-connected equipment that could have the most limiting applicable Equipment Rating".

In response to other comments, a footnote was added to clarify that Current Transformers (CTs) may be assessed as a Protection System element under relay protective devices, terminal equipment, or both categories listed in Requirement R1.2.1 depending upon the entity's FRM. (*See* footnote 2 in the CAN)

Effective Date

There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version. Several commenters believe that NERC should to incorporate a reasonable implementation period for CAN-0018. Other commenters suggested that a CAN should become effective only after it is posted as final and effective date cannot be earlier than the posted date.

To clarify the effective date in CAN-0018, which is June 17, 2011, the effective date remains the same date as the original posting. Because the change to the CAN materially revised the compliance application in the previously posted version by changing potential transformers to current transformers, the CEAS should apply the compliance application beginning on June 17, 2011 so there is no confusion regarding any potential application of the original CAN.

Conclusion

The analysis spreadsheet for CAN-0018 is also posted on the NERC website. While the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments, it is hoped that this document will supplement that information. Feedback from all sources is key and NERC staff thanks industry for the time and effort put into providing that feedback. If you would like further discussion on CAN-0018, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice – 0018

FAC-008 R1.2.1 Terminal Equipment

Posted: June 17, 2011
Reposted: November 11, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Transmission Owner (TO)
Generator Owner (GO)

Issue: What equipment is included under the term "terminal equipment" in the NERC Reliability Standard FAC-008?
For the purpose of aiding a CEA, this CAN provides instruction for assessing what equipment should be considered "terminal equipment" under FAC-008.

Background

Standard FAC-008 does not outline what equipment is classified as "terminal equipment" under R1.2.1.

The original CAN-0018 included all equipment that is generally deemed to be "terminal equipment." However, equipment such as potential devices that are not connected in series and, therefore, cannot limit a Facility Rating are not applicable to this requirement. CAN-0018 has been revised from the original posting of the final CAN to reflect only series connected terminal equipment that is applicable to FAC-008.

Compliance Application

FAC-008 provides, in pertinent part:

> ***R1.2.1.*** *The scope of equipment addressed shall include, but not be limited to, generators, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.*

For the purpose of documenting the methodology used for developing Facility Ratings under FAC-008, the focus is on series-connected equipment that could have the most limiting applicable Equipment Rating.

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards or requirements.

CEAs are instructed to verify that a registered entity has included the following equipment as "terminal equipment" under FAC-008 R1.2.1:

- Wave traps
- Current transformers[2]
- Disconnect switches
- Breakers
- Primary fuses
- Any piece of series-connected equipment that comprises a Facility and that could have the most limiting applicable Equipment Rating

In the event an entity does not include a rating methodology for one or more of the above listed equipment types, a CEA is to verify that the entity does not own such equipment.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications, and instructs CEAs not to verify inclusion of potential devices in a registered entity's FRM as required by the original CAN-0018. CEAs are to use this CAN to assess compliance from June 17, 2011, regardless of the start date of the violation. This CAN will remain in effect until such time that a future version of the standard or interpretation addresses this specific issue and is enforceable.

CEAs are instructed to assess compliance by:

1. CEAs are instructed to look at the entity's current FRM[3] to verify the elements of terminal equipment. CEAs are not to look further back in time to determine non-compliance or a Possible Violation because prior versions of an entity's FRM did not include, at a minimum, all of the terminal equipment identified in this CAN.
2. CEAs are to review the entity's current and prior FRMs to determine whether the entity's current FRM identifies a new most limiting Equipment Rating. If the entity listed a new most limiting Equipment Rating that should have been previously identified, the CEA is instructed to find non-compliance or a Possible Violation.

[2] A CEA may consider a current transformer that is part of a Protection System as an element to be accounted for under relay protective devices, terminal equipment, or both categories depending upon the entity's rating methodology. However, an entity's rating methodology must address all current transformers that could limit the Equipment Rating.

[3] "Current" means the Facility Ratings methodology in effect at the time of the audit. This is consistent with compliance monitoring guidance provided in the 2012 CMEP Implementation Plan and AML.

For any enforcement action in process and for audits that have been initiated,[4] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

CEAs are to look for evidence that the registered entity's current FRM addresses the equipment specified by R1.2.1, including terminal equipment as defined above.

For the purpose of documenting the methodology used for developing Facility Ratings under FAC-008, the focus is on series-connected equipment that could have the most limiting applicable Equipment Rating.

CEAs are instructed to verify that a registered entity has included the following equipment as "terminal equipment" under FAC-008 R1.2.1:

~~The term "terminal equipment" includes:~~

- Wave traps
- Current transformers[2]
- ~~Potential devices~~
- Disconnect switches
- Breakers
- Primary Fuses
- Any piece of series-connected equipment that compromises a Facility ~~is in series with the circuit~~ and that could have the most ~~become a~~ limiting ~~element~~applicable Equipment Rating~~.~~

In the event an entity does not include a rating methodology for one or more of the above listed equipment types, a CEA is to verify that the entity does not own such equipment.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications, and instructs CEAs not to verify inclusion of potential devices in a registered entity's FRM as required by the original CAN-0018. CEAs are to use this CAN to assess compliance from June 17, 2011, regardless of the start date of the violation. This CAN will remain in effect until such time that a future version of the standard or interpretation addresses this specific issue and is enforceable.

~~is effective for FAC-008 upon posting on the NERC Web site. It supersedes all prior communications and will remain in effect until a future CAN supersedes it or until such time that a future version of the standard or interpretation addresses this specific issue and is enforceable, or until it is superseded by a future CAN that addresses this particular Standard and Requirement.~~

CEAs are instructed to assess compliance by:

1. CEAs are instructed to look at the entity's current FRM[3] to verify the elements of terminal equipment. CEAs are not to look further back in time to determine non-compliance or a Possible Violation because prior versions of an entity's FRM did not include, at a minimum, all of the terminal equipment identified in this CAN.
2. CEAs are to review the entity's current and prior FRMs to determine whether the entity's current FRM identifies a new most limiting Equipment Rating. If the entity listed

[2] A CEA may consider a current transformer that is part of a Protection System as an element to be accounted for under relay protective devices, terminal equipment, or both categories depending upon the entity's rating methodology. However, an entity's rating methodology must address all current transformers that could limit the Equipment Rating.

[3] "Current" means the Facility Ratings methodology in effect at the time of the audit. This is consistent with compliance monitoring guidance provided in the 2012 CMEP Implementation Plan and AML.

Industry Comments for CAN-0018

Comment Topics	Main Points	Industry Suggestions
Bullets 1 and 3 in the Effective Period for a CAN section contradict one another	Bullet 1 states that CEAs should not allege a Possible Violation because prior versions of an entity's Facility Ratings Methodology (FRM) did not include all terminal equipment. No conditions are placed on bullet 1. Bullet 3 indicates that a Possible Violation should be allegedif the terminal equipment is the limit with the updated FRM and the prior FRM did not include the terminal equipment.	Reform bullets
CAN inappropriately expands the scope	This CAN continues to have language that expands the scope of the Standard. Simply providing a list that was not included in the approved standard introduces additional requirements that were not developed or approved through the standards development process	Revise CAN and reevaluate the bullets
Can should be modified for defining the term "terminal equipment".	The language "not limited to" does not allow the CAN to develop a list of additional equipment to be considered under FAC-008. By the ROP, this is a modification to the standard and legally must be balloted to be effective.	Standard FAC-008 clearly provides a list to define the scope of equipment to include, this list of terminal equipment, if appropriate, needs to be included in the standard if agreed to by the industry. It should not be put forth in a CAN, as a compliance point, without full industry review and agreement through the standards development process.
Effective Period for CAN section issue	The first and second paragraph under the effective Period for Can section should be deleted	The first and second paragraph under the effective Period for Can section should be deleted

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0008 Comment Analysis Summary

PRC-005 R2 Basis for First Maintenance and Testing Date

CAN-0008 was originally posted as a final CAN on April 19, 2011. The original CAN provided instruction for assessing whether an entity was following its Protection System maintenance and testing program as of the mandatory date of June 18, 2007. The CAN has been revised to incorporate the direction provided by the NERC Board of Trustees in August of 2011 and has been reposted as final on November 16, 2011.

The revised CAN was posted for industry comment on the NERC web site on September 1, 2011, and the comment period expired on September 21, 2011. NERC received 24 comments from various industry stakeholders and trade associations, which are identified by name below. The main themes of the comments consisted of the following four categories: errata changes, the scope and legal basis, and the effective date of the CAN. As discussed below, the main area of concern with the revised CAN was that CEAs are instructed to verify the last date equipment was maintained and tested, regardless if that date was prior to the mandatory and effective date.

Errata

The recommended errata changes were implemented in order to correct the second bullet of the first example in the CAN. For clarity, the CAN now reads “on or after November 2003.” NERC staff thanks the commenters for pointing out this recommended change in the CAN.

Scope and Legal Basis

There were several recommended substantive changes to the CAN in regard to scope and the validity of the practice of verifying evidence prior to June 18, 2007. The commenters further stated that NERC has no legal basis for requiring entities to produce documents related to any maintenance or testing performed prior to June 18, 2007. The suggestion from industry was to have June 18, 2007 be considered as the start time for any interval associated with PRC-005.

As explained in a number of different forums, when CEAs request evidence of an entity’s last maintenance and testing date that occurred prior to the mandatory effective date of June 18, 2007, this evidence is used to demonstrate compliance with both PRC-005 R2.1 and R2.2 beginning on June 18, 2007. There is no inquiry regarding compliance prior to June 18, 2007. In addition, CEAs are instructed to accept evidence other than maintenance and testing records because NERC understands that those may not have been kept with the same consistency prior to June 18, 2007. As examples, some registered entities kept records of substation inspections that did not specify all of the maintenance and testing conducted during each visit but coupled with other documents, including

company procedures and attestations, demonstrated that the company in fact maintained and tested devices in connection with such inspections.

In regard to R2.1, the entity's last maintenance and testing date provides evidence of a starting point for the entity's interval to ensure that maintenance and testing is currently being performed within the schedule established in the registered entity's own program. PRC-005 R2.1 provides that an entity's documentation of its program's implementation shall include:

Evidence Protection System devices were maintained and tested within the defined intervals.

A CEA is thus required to verify that a registered entity, as of June 18, 2007, was maintaining and testing its Protection System devices according to the intervals the entity determined. Without knowing the last test date, it would be impossible for a CEA to determine if a registered entity was within its interval for maintenance and testing. It would also be impossible for a CEA to be able to determine the basis for the entity's first maintenance and testing date after June 18, 2007.

Further, PRC-005 R2.2 provides that an entity's documentation of its program's implementation shall include:

Date each Protection System device was last tested/maintained.

This requirement is explicit and was provided without regard to whether that date was before or after June 18, 2007. Further, the plain language of PRC-005 Requirement 2 does not foreclose the option to verify evidence prior to June 18, 2007. There is no language in the standard that defines or establishes timelines.

However, as indicated, different types of evidence can be used to identify testing and maintenance dates that occurred prior to June 18, 2007.
The legal basis to request evidence to demonstrate compliance with the requirements is provided in the NERC Rules of Procedure, Appendix 4C, Sections 3.1.1 and specifically 3.1.4.2, which was clarified in the version effective January 1, 2011. In relation to this issue, this section provides that a registered entity should be able to demonstrate compliance from June 18, 2007 through the audit period. The specific language of Section 3.1.4.2 states:

> The Registered Entity's data and information should show compliance with the Reliability Standards that are the subject of the Compliance Audit for the period beginning with the day after the prior audit by the Compliance Enforcement Authority ended (or the later of June 18, 2007 or the Registered Entity's date of registration if the Registered Entity has not previously been subject to a Compliance Audit), and ending with the End Date for the Compliance Audit.

Section 3.1.1, Compliance Audit Process Steps, states:

> The Registered Entity provides to the Compliance Enforcement Authority the required information in the format specified in the request.

Therefore, the CAN maintains the instruction for CEAs to verify evidence that establishes a registered entity's last Protection System maintenance and testing date and intervals, regardless if the evidence required to demonstrate compliance is dated prior to June 18, 2007. These requirements were known to industry from April 1, 2005, the effective date of the standard, over 2 years prior to the mandatory and effective date of June 18, 2007, and were visible as registered entities were developing their Protection System Maintenance and Testing programs.

The CAN has attempted to clarify that there is some flexibility in regards to what evidence may be acceptable, including an attestation along with other corroborating evidence. NERC understands the concerns of industry and wants to emphasize that the rationale for this CAN is to ensure consistency of application throughout the ERO and to assist industry in understanding the expectations of the CEAs s

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final and provides in that posting an implementation and effective date which cannot be earlier than the posted date. There has been confusion, according to industry, about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

The effective date of CAN-0008 is April 19, 2011, which is the effective date of the original CAN posting. Because the revisions to this CAN did not materially alter the compliance application contained in the previously posted version, there is no need to establish a new effective date.

Conclusion

The analysis spreadsheet for CAN-0008 is posted on the NERC website. Because the spreadsheet format may not provide sufficient visibility into the effort that NERC puts into reviewing all of the comments received with respect to this CAN, this document is intended to supplement that information. Feedback from all sources is key and NERC staff thanks industry for the time and effort put into providing that feedback. If you would like further discussion on CAN-0008, please contact us at cancomments@nerc.net.

Industry Comments for CAN-0008

Comment Topics	Main Points	Industry Suggestions
Scope	Prior to June 18, 2007, entities had no mandatory testing/maintenance requirements and were not required to preserve evidence of testing/maintenance completed. NERC has no legal basis for requiring entities to produce documents related to any maintenance or testing performed prior to June 18, 2007. That date should be considered the start time for any periodic cycle associated with PRC-005. Not only is there no demonstrable reliability benefit from requiring this data, reliability problems may arise as a consequence of this requirement. The use of regional and NERC resources on this matter will mean less available resources for enhancing reliability in other, more pressing areas.	Prohibit the CAN from requiring evidence prior to June 18, 2007.
Errata	There is a minor error in Example 1 bullet 2 should be November 2003 or later.	Make changes for clarity.
Effective Dates	The effective date of this CAN should be date it is posted as final, not the posted date (April 19, 2011) of the previous final version of CAN-0008	Change effective date of CAN to time CAN is posted as final
Evidence	CAN-0008 requires evidence retention from a period of time when evidence was not required and may not exist. Nowhere in the standard do the requirements stipulate that the testing had to be completed prior to June 18, 2007.	The revised draft CAN-0008 should be further modified to clarify the amount and type of evidence required to demonstrate compliance with PRC-005-1 R2.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Compliance Application Notice – 0008

PRC-005-1 R2 Basis for First Maintenance and Testing Date
Posted: April 19, 2011
Revised: November 11, 2011

Primary Interest Groups

Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Transmission Owner (TO)
Generation Owner (GO)
Distribution Provider (DP) that owns a transmission Protection System

Issue: Under what circumstances are CEAs required to consider evidence dated before June 18, 2007 in connection with their review of issues related to PRC-005-1 R2?

For the purpose of aiding a CEA, this CAN provides instruction for assessing whether an entity was following its Protection System[2] maintenance and testing program starting from June 18, 2007.

Compliance Application

CEAs are to obtain the last date a registered entity tested and maintained its Protection System devices in order to verify compliance with PRC-005-1 R2. Compliance with PRC-005-1 R2 is to be verified starting from June 18, 2007.

PRC-005-1 R2 provides, in pertinent part:

> ***R2.*** *Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Reliability Organization[3] on request (within 30 calendar days). The documentation of the program implementation shall include:*
>
> > ***R2.1.*** *Evidence Protection System devices were maintained and tested within the defined intervals.*
> >
> > ***R2.2.*** *Date each Protection System device was last tested/maintained.*

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards and requirements.
[2] The *NERC Glossary of Terms Used in Reliability Standards* defines Protection System as "Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry."
[3] For this standard, the Regional Reliability Organization refers to the Regional Entity.

The last maintenance or test date is necessary for a CEA to determine whether a registered entity is conducting maintenance and testing within the intervals defined by its own Protection System maintenance and testing program, including in circumstances when the interval began prior to June 18, 2007, the mandatory and enforceable date of the standard.

A CEA is to verify that the registered entity included the date each Protection System device was last tested and maintained in its documentation of the registered entity's program implementation, and a CEA is to validate these documented dates.

To the extent that prior maintenance/test dates for specific devices occurred prior to June 18, 2007, the CEA is instructed to request evidence of such maintenance/testing because:

1) the evidence documents the last date the registered entity performed maintenance and testing if that occurred prior to June 18, 2007,
2) the evidence demonstrates that the registered entity was following its program starting from June 18, 2007, and
3) the evidence provides the basis for the registered entity's first post-June 18, 2007 maintenance and testing date.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[4] a CEA is to apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

A CEA is to obtain corroborating evidence regarding the pre-June 18, 2007 maintenance and testing date from the registered entity including, but not limited to:

- invoices
- maintenance reports
- emails
- orders for parts

[4] "Initiated" means that a registered entity has received notification of the upcoming audit.

- hand-written notes
- an attestation with corroborating evidence

Additionally, CEAs are to verify evidence of when the last conducted maintenance and testing was performed on a registered entity's equipment over the entire audit period. Some examples are as follows:

Example 1
In this example, the registered entity has its first audit on April 10, 2010; it has a documented maintenance and testing interval of six years, and it conducted maintenance and testing on its equipment in November 2009. CEAs are to verify:

1) evidence of the registered entity's maintenance and testing activities in November 2009 (demonstrating compliance beginning in November 2009), and
2) evidence or records sufficient to demonstrate that the registered entity's prior maintenance and testing activity occurred in or after November 2003 (to show compliance between June 18, 2007 and November 2009).

Example 2
In this example, the registered entity has its first audit on April 10, 2010. It has a documented maintenance and testing interval of six years, it is due to conduct maintenance and testing in November 2012, and it has not conducted maintenance and testing on its equipment since the June 18, 2007 mandatory and enforceable date for the standard.

1) The CEA is to obtain evidence of the registered entity's maintenance and testing activities in November 2006 (demonstrating compliance beginning on June 18, 2007).
2) In this situation the CEA would not require evidence of the registered entity's November 2000 maintenance and testing.
3) During the next audit, the CEA would require evidence of the registered entity's November 2012 maintenance and testing.

Compliance Application Notice — 0008

~~Compliance Application:~~ PRC-005~~-1~~ R2 ~~Pre June 18, 2007 Evidence~~Basis for First Maintenance and Testing Date

Posted: April 19, 2011
Revised: Month XX, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity~~ies~~
Transmission Owner~~s~~ (TO)
Generation Owner~~s~~ (GO)
Distribution Provider~~s~~ (DP) that owns a transmission Protection System

Issue: Under what circumstances are CEAs required to consider evidence dated before June 18, 2007 in connection with their review of issues related to PRC-005-1 R2?
~~Requirement for Registered Entities to maintain pre-June 2007 evidence~~
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether an entity was following its Protection System[2] ~~NERC Compliance received a request for clarification on PRC-005-1 R2 regarding the requirement for pre-June 18, 2007 evidence to determine compliance with an entity's~~ maintenance and testing program starting from June 18, 2007.
~~Specifically, what is the validity of a Regional Auditor to ask for evidence pre-June 2007 even though there was no obligation to retain records until at least June 18, 2007?~~

~~**Reliability Objective**~~
~~To ensure that maintenance and testing of Protection Systems are being conducted within defined intervals.~~

Compliance Application
~~Registered entities must be able to provide evidence to the Compliance Enforcement Authority~~CEAs are to obtain the last date a registered entity tested and maintained ~~to substantiate the last date it tested and~~

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards and requirements.
[2] The *NERC Glossary of Terms Used in Reliability Standards* defines Protection System as "Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry."

~~maintained~~ its Protection System[3] devices in order to verify~~demonstrate its~~ compliance with PRC-005-1 R2. Compliance with PRC-005-1 R2 is to be verified starting from June 18, 2007.

PRC-005-1 R2 provides, in pertinent part:

> ***R2.*** *Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Reliability Organization[4] on request (within 30 calendar days). The documentation of the program implementation shall include:*
>
> > ***R2.1.*** *Evidence Protection System devices were maintained and tested within the defined intervals.*
> >
> > ***R2.2.*** *Date each Protection System device was last tested/maintained.*

~~*implementation of that program to its Regional Reliability Organization[5] on request (within 30 calendar days). The documentation of the program implementation shall include:*~~

~~***R2.1.*** *Evidence Protection System devices were maintained and tested within the defined intervals.*~~

~~***R2.2.*** *Date each Protection System device was last tested/maintained.*~~

The last maintenance or test date is necessary for a CEA ~~In order~~ to determine whether a registered entity is conducting maintenance and testing within the intervals defined by its own Protection System maintenance and testing program, including in circumstances when ~~regardless if~~ the interval began prior to June 18, 2007, ~~bridged~~ the mandatory and enforceable date of the standard. ~~the compliance enforcement authority must have a substantiated last maintenance or test date.~~

~~Therefore~~A CEA is to verify that the registered entity included the date each Protection System device was last tested and maintained in its documentation of the registered entity's program implementation; ~~The registered entity's last date for maintenance and testing must be included in the documentation of its program's implementation as required by the Standard,~~ and a CEA is to validate these documented dates.

To the extent that prior maintenance/test dates for specific devices occurred prior to June 18, 2007, the CEA is instructed to request evidence of such maintenance/testing because: ~~Any required pre-June 18, 2007 evidence serves three purposes:~~

1) ~~it~~the evidence documents the last date the registered entity performed maintenance and testing if that occurred prior to June 18, 2007,
2) the evidence ~~it~~ demonstrates that the registered entity was following its program starting from June 18, 2007, and

---

[3] ~~The *NERC Glossary of Terms Used in Reliability Standards* defines Protection System as "Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry."~~

[4] For this standard, the Regional Reliability Organization refers to the Regional Entity.

[5] ~~For this standard, the Regional Reliability Organization refers to the Regional Entity.~~

3) the evidence it provides the basis for the registered entity's first post-June 18, 2007 determination of its next maintenance and testing date.

The auditor must be able to validate these documented dates. It is acceptable for the documented dates to be evidenced by whatever records the registered entity has in regards to the maintenance and testing – including, but not limited to: invoices, maintenance reports, confirming emails, orders for parts, hand-written notes, and/or an employee's signed attestation of the testing supported by corroborating evidence.

Any required pre-June 18, 2007 evidence serves two purposes: it documents the last date the registered entity performed maintenance and testing, if that occurred prior to June 18, 2007, and it also provides the basis for the registered entity's post-June 18, 2007 determination of its next maintenance and testing date.

Compliance GuidanceEvidence of Compliance

A CEA is to obtain corroborating evidence regarding the pre-June 18, 2007 maintenance and testing date from the registered entity including, but not limited to:

- invoices
- maintenance reports
- emails
- orders for parts
- hand-written notes
- an attestation with corroborating evidence

Additionally, The registered entity will be required to provideCEAs are to verify evidence of when it the last conducted maintenance and testing was performed on its a registered entity's equipment over the entire audit period. Some examples are as follows:

Example #1

In this example, the registered entity has its first audit on April 10, 2010; it has a documented maintenance and testing interval of 6six years,; and it conducted maintenance and testing on its equipment in November 2009. The auditor or Compliance Enforcement AuthorityCEAs are to verify would require:

1) evidenceevidence of the registered entity'ies maintenance and testing activities in November 2009 (demonstrating compliance beginning in November 2009), and
2) some evidence or records sufficient to demonstrateing that of the registered entity's prior maintenance and testing activity occurred in or after November 2003 or sooner (to show compliance from between June 18, 2007 through and November 2009).

Example #2

In this example, the registered entity has its first audit on April 10, 2010;. Iit has a documented maintenance and testing interval of 6 six years;, it is due to conduct maintenance and testing in November 2012, and it has not conducted maintenance and testing on its equipment since the June 18,

2007 mandatory and enforceable date for the standard. ~~The auditor~~ CEA ~~or Compliance Enforcement Authority would require:~~

1) The CEA is to obtain evidence of the registered ~~entities~~ entity's maintenance and testing activities in November 2006 (demonstrating compliance beginning on June 18, 2007).
2) In this situation the ~~auditor or Compliance Enforcement Authority~~CEA would not require evidence of the registered entity's November 2000 maintenance and testing.
3) During the next audit, the ~~auditor or Compliance Enforcement Authority~~CEA would require evidence of the registered entity's November 2012 maintenance and testing.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[6] a CEA is to apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

~~**Prior Communications**~~

~~*RSAW January 13, 2010 – Transmission & Generation Protection System Maintenance and Testing~~
~~*NERC Relay Maintenance Technical Reference *Protection System Maintenance – A Technical Reference* Section 8.2, dated September 13, 2007~~

CAN-0010 Comment Analysis Summary

Implementation of Annual in Reliability Standards Requirements

CAN-0010 was originally posted as a final CAN on April 19, 2011. The original CAN provided instruction for assessing whether an entity was performing tasks within a calendar year when "annual" was listed in a standard without a clear instruction for the applicable timeframe. The CAN has been revised to incorporate the direction provided by the NERC Board of Trustees in August of 2011 and was reposted as final on November 16, 2011.

The revised draft CAN was posted for industry comment on the NERC web site on October 10, 2011, and the comment period expired on October 31, 2011. NERC received comments from 13 registered entities and 5 trade associations, which are identified below. The main themes of the comments consisted of the following four categories: background section, scope, effective date and evidence of compliance.

Background

Industry members stated that there has been no analysis performed that would indicate that different implementations for annual activities has had an impact on reliability, and that the Background section may provide some information that is incorrect and misleading.

In response to the comments, registered entities were using their own implementation of annual and were not always performing the required task "annually." There were instances where registered entities provided "grace periods" for conducting their annual requirements and, due to the grace periods, were not conducting annual activities at least once every calendar year.

There are two possible definitions for "Calendar Year": 1) once every rolling 12 months or 2) once every defined calendar year. In order to maintain consistency across the ERO, meet the requirement of the standard and at the same time provide flexibility to registered entities, this CAN was drafted to instruct Compliance Enforcement Authority (CEA) staff to verify that, when not otherwise specified in the standard, annual activities were conducted at least once every calendar year.

Scope

There were several recommended substantive changes to the CAN in regard to scope. The commenters stated that CAN-0010 goes beyond the requirements in the standards and that Compliance Enforcement Authority (CEA) staff should not be instructed to verify evidence of annual implementation when a standard is silent to the matter.

In response to the comments, CAN-0010 was drafted to provide flexibility but to also ensure that activities were performed at least once per calendar year. Many commenters were in favor of the third bullet in the Compliance Application section of the CAN, as it provides flexibility for registered entities' internal compliance program; others stated this was confusing and just a restatement of the first bullet. It was determined to keep the third bullet in favor of providing suggestions for flexibility.

There were also several comments from industry stakeholders and trade associations that recommended the language referencing an entity's culture of compliance should be stricken from the CAN as this was unnecessary for the compliance application. In response, the "culture of compliance" language was removed.

Another sentence recommended to be removed was in regard to the "best practice" of performing the activity with no more than 15 months between the events required by the standard. This "best practice" had been added to provide a framework of what would be considered good practices; certainly a true "best practice" for an annual requirement would be to perform the activity once every rolling 12 months. The term "best practice" was used to indicate this was not an enforceable suggestion. This language remained in the CAN as a suggestion for industry to conduct annual activities no more than 15 months apart.

To recap, the compliance application states that a CEA will verify that a registered entity conducted required annual activities at least once in a calendar year (Jan 1 - Dec 31), unless otherwise provided in the standard or requirement. Several commenters stated that this practice could reward an entity that waited 23 months between activities, while an entity that performs the same task within 13 months but not in a calendar year would be found in noncompliance. This was a concern for reliability that an entity may wait 23 months between activities. However, if the entity did perform a task within 23 months after the last activity (January in year one and December of following year), the entity would be forced to complete their activity within 12 months of the third year (December of year three) to remain within the bounds of "once every calendar year." While this is not a best practice, the "once every calendar year" compliance application and practical operation would not permit this practice to prevail over time, and it is anticipated that entities with strong cultures of compliance would not allow this to happen at all, absent unusual circumstances.

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final and provides in that posting an implementation and effective date, which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

To clarify the effective date in CAN-0010, which is April 19, 2011, the effective date remains the same date as the original posting. Because the change to the CAN did not materially revise the compliance application in the previously posted version, it is a continuation of the original compliance application, and therefore this CAN was dated the same date of the earlier version.

Evidence of Compliance

Several commenters stated that the CAN requires evidence beyond the intent of the standards as written. There is concern that this standard is in fact imposing more stringent criteria on entities beyond the intent of the standard as written. This allows a CEA to enforce more stringent criteria on individuals who may have proposed a best practice approach, resulting in an increased exposure to noncompliance.

Other commenters stated that parts of the Evidence of Compliance section seem to be in conflict. Paragraph A guides CEAs not to take compliance actions if an entity has a best practice of performing something annually not to exceed 15 months, but in fact may perform the function between 15 months and 24 months, or annually. While if an entity has implemented a rolling 12-month process, it could be exposed if the 12 months are exceeded for any reason.

The CAN was drafted to encourage registered entities to take a more stringent approach to conducting annual activities and instructs CEAs not to determine non-compliance or a Possible Violation as long as the registered entity has conducted the annual activity at least once in every Calendar Year, even if the registered entity did not meet its own requirement for the implementation of annual activities.

Conclusion

The analysis spreadsheet for CAN-0010 is posted on the NERC website. NERC received feedback that the spreadsheet format did not provide industry visibility into the effort that is put into reviewing all of the comments. In order to provide increased transparency to the comment analysis phase of the CAN process, this document has been created to supplement the information contained in the spreadsheet. NERC staff thanks industry members for the time and effort put into providing the comments and feedback for CAN-0010. If you would like further discussion on CAN-0010, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice – 0010

Implementation of "Annual" in Reliability Standards Requirements

Posted: April 19, 2011
Revised: November 16, 2011

Primary Interest Groups

Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Registered Entities subject to reliability standards containing a requirement to repeat some performance on an annual basis (annual requirement)

Issue: How is a CEA to assess whether a registered entity met the "annual" requirement of a reliability standard?

This CAN provides instruction to CEAs on how to assess compliance when a standard requires an "annual" activity.

Background

The reliability standards contain numerous requirements for registered entities to perform an action "annually." Without clear guidance, registered entities determined their own implementation of the term "annual," which is contained in a multitude of standards, without certainty that the implementation of the requirements established compliance with the applicable reliability standards. The intent of most annual requirements is to ensure that entities perform a particular task on a regular basis, with an established maximum interval between the occasions when the task is performed. Intervals that are too long affect the ability of the activity to protect reliability.

Compliance Application

NERC has established clarity for the implementation of annual requirements as well as parameters for CEAs to assess compliance regarding the registered entity's implementation of an annual requirement. The registered entity's implementation of annual requirements may apply to standards that require an annual action or event, unless a standard contains a definition of annual. In cases where the standard contains a definition of the term "annual" or "annually," that definition remains and is applicable to that standard. In cases where the standard specifies how annual requirements are implemented, that language remains and is applicable to that standard. This CAN does not supersede or change any language contained in a standard.

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.

In all standards where the term "annual" is not defined, CEAs are to determine if the registered entity established its own implementation of annual requirements within the parameters provided below. CEAs are instructed to look for a registered entity's documented implementation of annual requirements as the basis for determining compliance. CEAs are to verify whether a registered entity documented either one implementation of annual across all standards that do not specify how an annual requirement is implemented, or an implementation for each individual standard.

CEAs are to verify that a registered entity implemented annual requirements pursuant to the guidelines below:

a) Within a Calendar Year, beginning on January 1 and ending on December 31 (Calendar Year):

   In this option, CEAs are to verify that the activity or event is conducted at least once every Calendar Year. A best practice is that the activities or events should not be too far apart. For example, a registered entity's documentation may state that there should be no more than 15 months between the events required by the standard.

   Or:

b) Rolling 12 months: The activity or event is conducted at least once within the last 12-month period.

   Or:

c) CEAs are to verify whether registered entities have documented another implementation of annual[2] requirements along with procedures that define that implementation. However, CEAs are to verify that any alternative documented method demonstrates that the required activity was conducted at least once every Calendar Year.

   Regardless of the registered entity's documented implementation of annual, that implementation will not supersede any requirement stated in the standard.

This implementation of annual will be in effect throughout the ERO, will supersede any prior guidance, and is in effect until the term "annual" is defined in each standard.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain

[2] For example, a registered entity may define "annual" as "at least once within the last 12-month period" and may include a grace period of two months. In this situation, the activity or event is still to be conducted at least once every Calendar Year.

in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[3] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

CEAs are to assess compliance based on an entity's implementation of one of the below situations:

- A CEA is instructed not to find noncompliance or a possible violation if a registered entity is following its own documented implementation of annual[4] and its own documented implementation plan for annual requirements.
- A CEA is instructed to look for evidence that a registered entity has and adheres to its own documented implementation of annual and its own documented implementation plan for annual requirements. If an entity does not adhere to its implementation, a CEA is instructed to find noncompliance or a possible violation, *unless* the entity conducts the annual activity at least once every Calendar Year.
- If a registered entity does not have a documented implementation of annual and its own documented implementation plan for annual requirements, a CEA is to assess the entity's compliance based upon Option A contained above: that the activity or event is conducted at least once each Calendar Year.

A CEA is instructed not to find noncompliance or a possible violation if the activity or event is conducted at least once: (1) within each Calendar Year OR (2) within a documented rolling 12-month period.

Compliance Application Notice — 0010

~~Compliance Application: Definition of "Annual" and~~ Implementation of Annual Requirements

Posted: April 19, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional ~~Entities~~Entity
Registered Entities subject to Reliability Standards containing a requirement to repeat some performance on an annual basis (annual requirement)

Issue: How is a CEA to assess whether a registered entity met the ~~The definition of~~ "annual" requirement of a reliability standard? ~~and implementation of annual requirements~~
This CAN provides instruction to CEAs on how to assess compliance when a standard requires an "annual activity. ~~NERC received a request for clarification of the definition of the term "annual" and guidance regarding the implementation of annual requirements.~~

~~**Reliability Objective**~~
~~To maintain reliability through the consistent application of the annual requirements contained in NERC Reliability Standards. The intent of most annual requirements is to ensure that entities perform a particular task on a regular basis, with an established maximum interval between the occasions when the task is performed. Intervals that are too long degrade the value of the activity in protecting reliability.~~

Background
The reliability standards contain numerous requirements that Registered Entities perform an action "annually." Without clear guidance, registered entities determined their own ~~definition~~ implementation of the term "annual," which is contained in a multitude of standards, without certainty that the ~~its definition or~~ implementation of the requirements established compliance with the applicable Reliability Standards. The intent of most annual requirements is to ensure that entities perform a particular task on a regular basis, with an established maximum interval

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.

Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com~~116-390 Village Blvd.~~
~~Princeton, NJ 08540~~
~~609.452.8060 | www.nerc.com~~

between the occasions when the task is performed. Intervals that are too long affect the ability of the activity to protect reliability.

Compliance Application

NERC has established clarity for the implementation of annual requirements ~~term "annual,"~~ as well as parameters for CEAs to assess compliance regarding the ~~implementation of a~~ registered entity's ~~definition~~ implementation of an annual requirement. The registered entity's implementation of annual requirements may ~~that will~~ apply to standards that require an annual action or event, unless a standard contains a definition of "annual." In cases where the standard contains a definition of the term "annual" or "annually," that definition remains and is applicable to that standard. In cases where the standard specifies how annual requirements are implemented, that language remains and is applicable to that standard. This CAN does not supersede or change any language contained in a standard.

In all standards where the term "annual" is not defined, CEAs are to determine if the registered entity ~~may determine~~ established its own implementation of ~~its definition of~~ annual requirements within the parameters provided below. CEAs are instructed to look for a~~, but must document its definition in order to provide that definition as the basis for its compliance. A~~ registered ~~entity~~ entity's ~~may~~ documented ~~one definition~~implementation of annual requirements as the basis for determining compliance. CEAs are to verify whether a registered entity documented either one implementation of annual across all standards that do not specify how an annual requirement is implemented, or documented an implementation ~~across all standards that do not specify how an annual requirement is implemented, or a registered entity may document a definition~~ for each individual standard.

CEAs are to verify that a ~~A~~ registered ~~entity may define "~~implemented annual~~" as:~~ requirements pursuant to the guidelines below:

a) ~~Annual – within~~Within a ~~calendar~~ Calendar ~~year~~Year, with the calendar year beginning on January 1 and ending on December 31 (Calendar Year).

   In this option, CEAs are to verify that the activity or event ~~must~~ is ~~be~~ conducted at least once ~~in~~ every Calendar Year. A best practice is that the activities or events should not be too far apart. For example, a registered entity's documentation may state that there should be no more than 15 months between the events required by the standard. ~~While including these parameters is not required, it is a best practice that demonstrates a concern for reliability.~~

b) Rolling 12 months – the activity or event ~~must have been~~is conducted at least once within the last 12-month period.

c) CEAs are to verify whether ~~R~~registered entities have ~~may have~~ documented another ~~definition~~ implementation of ~~"~~annual~~"~~[2] requirements along with ~~and~~

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt, Not Superscript/ Subscript

[2] For example, a registered entity may define "annual" as "at least once within the last 12-month period" and may include a grace period of two months. In this situation, the activity or event must still be conducted at least once in every Calendar Year.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com~~116-390 Village Blvd.~~
~~Princeton, NJ 08540~~
~~609.452.8060 | www.nerc.com~~

procedures that define ~~its~~ their implementation of annual requirements. However, CEAs are to verify that ~~that differ from the options contained in this CAN;~~ any alternative documented method ~~must~~ demonstrates that the required activity was conducted at least once in every Calendar Year.

Regardless of the registered entity's documented ~~definition~~ implementation of annual, ~~it will not~~that implementation will not supersede any requirement stated in the standard.

This ~~definition~~ implementation of annual will be in effect throughout the ERO, will supersede any prior ~~definition~~ guidance, and is in effect until the term "annual" is defined in each standard.

Formatted: Font: 12 pt

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[3] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

CEAs are to assess compliance based on an entity's implementation of one of the below situations:

- A CEA is instructed not to find noncompliance or a possible violation if a registered entity is following its own documented implementation of annual[4] and its own documented implementation plan for annual requirements.
- A CEA is instructed to look for evidence that a registered entity has and adheres to its own documented implementation of annual and its own documented implementation plan for annual requirements. If an entity does not adhere to its implementation, a CEA is instructed to find noncompliance or a possible violation, *unless* the entity conducts the annual activity at least once every Calendar Year.

[3] "Initiated" means that a registered entity has received notification of the upcoming audit.
[4] Provided that, as indicated above, the registered entity's definition of annual causes the activity or event to occur at least once every Calendar Year.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326

Princeton, NJ 08540
609.452.8060 | www.nerc.com~~

- If a registered entity does not have a documented implementation of annual and its own documented implementation plan for annual requirements, a CEA is to assess the entity's compliance based upon Option A contained above: that the activity or event is conducted at least once each Calendar Year.

A CEA is instructed not to find noncompliance or a possible violation if the activity or event is conducted at least once: (1) within each Calendar Year OR (2) within a documented rolling 12 month period.

~~**Compliance Guidance**~~

- ~~If a registered entity is following its own documented definition of annual[5] and its own documented implementation plan for annual requirements, a registered entity will be determined to be compliant in regard to the annual requirement of a standard.~~
- ~~If a registered entity has its own documented definition of annual and its own documented implementation plan for annual requirements but is not adhering to either, the registered entity will be found non-compliant with the annual requirement of the standard at issue, unless the entity is conducting the required activity or event at least once in every Calendar Year.~~
- ~~If a registered entity does not have a documented definition of annual and its own documented implementation plan for annual requirements, the entity's compliance will be determined based upon option (a) contained herein, which is that the activity or event must have been conducted at least once within each Calendar Year.~~

Industry Comments for CAN-0010

Comment Topics	Main Points	Industry Suggestions
Background Section	The Background provides some information that is incorrect and misleading.	There has been no analysis performed that would indicate that the use of annual has had an impact on reliability.
Scope	The “best practice” language should be removed. This allows a CEA to enforce a more stringent criteria on individuals who may have proposed a best practice approach, resulting in an increase exposure to non compliance.	Industry is suggesting to strike the best practice and culture of compliance language.
Effective Date	The effective period of the CAN should not be sooner than the final approval and final publishing of the CAN.	We recommend an implementation period of 12 months after approval.
Evidence of Compliance	CAN is requiring evidence beyond the intent of the standards as written. The Compliance Application section centers around the idea that an entity must have a definition of annual consistent with the CAN while the third bullet in the Evidence of Complianc	Remove third bullet in the Evidence of Compliance section.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0011 Comment Analysis Summary

PRC-005 R2 Interval Start Date for New Equipment

CAN-0011 was originally posted as a final CAN on April 19, 2011. The original CAN provided instruction for assessing the interval start dates and determining whether new Protection System equipment had been maintained and tested within the intervals defined in a registered entity's program. The CAN has been revised to incorporate the direction provided by the NERC Board of Trustees in August of 2011 and was reposted as final on November 16, 2011.

The revised draft CAN was posted for industry comment on the NERC web site on October 10, 2011, and the comment period expired on October 31, 2011. NERC received approximately 21 comments from registered entities and 3 comments from trade associations, which are identified below. The main themes of the comments consisted of the following four categories: errata changes, scope, effective date and evidence of compliance.

NERC received positive feedback from industry during the comment period, with commenters highlighting that CAN-0011 addresses a valid weakness in the language in PRC-005 R2. The industry feedback stated that it is not clear from the requirement when the first start date of a maintenance interval for newly deployed Protection System equipment should begin.

Errata

Several commenters recommended changing the issue statement. After reviewing all of the proposed language, the issue statement was reworded and has been clarified to better address the CAN topic of interval dates for new equipment.

There was a comment about the version of the standard not being listed (PRC-005-1 now reads PRC-005), which may cause confusion if a future standard is approved and becomes effective. This change was intentionally done for efficiency; the CAN would remain intact in the event that a new standard or interpretation was issued that did not address the issue in the CAN. As mentioned in the effective date section, if a revised standard or interpretation addresses the issue in a CAN, the CAN will be superseded and retired.

Scope

There were several recommended substantive changes to the CAN in regard to scope. Some of the comments claimed that CAN-0011 goes beyond the requirements in the standards and that Compliance Enforcement Authority (CEA) staff should not be instructed to verify evidence that may go beyond PRC-005 R2. Other comments stated that the CAN should be subject to NERC's formal standards development or interpretation process. Several commenters stated that the issue of pre-operational

testing is already being addressed through Standards Drafting Team (SDT) Project 2012-04 Protection System Commissioning Testing. Further, the SDT has issued a FAQ on the topic, and the CAN is in direct conflict with the guidance provided by the SDT, which states that the in-service date should be considered the start date for the entity's interval.

Several entities, including EEI, commented that new equipment testing is often conducted well in advance of placing the equipment in service. Although the pre-operational testing differs from maintenance and testing, completion of the pre-operational testing is the point at which a registered entity makes a determination of the condition of the equipment; additional tests are not conducted at the in-service date, which could be significant time after the pre-operational testing is done.

In response to the comments regarding the SDT, CAN-0011 was drafted to address the issues with compliance monitoring for the current effective standard, which does not have clear direction regarding interval start times for new equipment. Although there is a SDT working on the new version of PRC-005, that version has not been approved and is not in effect. While the FAQ document may provide rationale for the direction of the new version in the standard, it is not an enforceable document—only the current requirements of the in-force standard. NERC understands that this CAN may be superseded in the future with the issuance of the new standard, but CEA staff needs to consistently monitor compliance with the currently enforceable standards.

Another comment was in regard to whether CANs are considered the sole method for attaining compliance. It was pointed out that there are often multiple ways for an entity to comply with a standard, and in many cases requirements do not specifically define relevant terms or processes, thereby allowing a broad range of solutions, that an entity might achieve an equal level of compliance.

In response, the purpose of CANs is to create consistency, and therefore CEAs are expected to use the CAN to assess compliance. While there will be unique facts and circumstance that affect compliance assessment, that is to be the exception rather than the norm. The expectation is that the CAN should provide the range of activities that fulfill the requirement of the standard. If there is an equally effective means of achieving compliance, industry is welcome to present the information to NERC at cancomments@nerc.net.

Another scope concern received from industry was that CAN-0011 requires evidence of pre-operational testing to demonstrate compliance outside of a period in which the standards and/or this compliance application were effective. The comment stated that the CAN requires evidence before entities were aware that they even needed to collect or obtain such evidence for any compliance purpose. The commenter felt that CAN-0011 was an interpretation of the standard and should be vetted through the established stakeholder process.

In response to the comments, new Protection System devices are subject to a registered entity's current Protection System Maintenance and Testing Program. CAN-0011 instructs CEAs to verify that maintenance and testing are being conducted according to the intervals defined in the registered entity's program, which requires a start date for the interval.

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final, and provides in that posting an implementation and effective date, which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

To clarify the effective date in CAN-0011, which is April 19, 2011, the effective date remains the same date as the original posting. Because the change to the CAN did not materially revise the compliance application in the previously posted version, it is a continuation of the original compliance application, and therefore this CAN was dated the same date of the earlier version.

Evidence of Compliance

Several commenters stated that there may be adequate forms of evidence other than pre-operation test reports. They went on to state that CANs are to verify compliance and show examples of at least one method to be compliant. CANs are not to specify the only way to be compliant.

In response, NERC has solicited industry to propose other methods of achieving compliance. Commenters stated that either 1) the in-service date should be the beginning of the interval or 2) there should not be an interval until the first maintenance and testing has been completed. The in-service date was determined to not be the appropriate date for the reasons discussed above. Delaying compliance monitoring until the first maintenance and testing date is not an option that supports reliability, and further, does not provide a basis for establishing the first maintenance and testing date.

Conclusion

The analysis spreadsheet for CAN-0011 has been posted on the NERC website. NERC received feedback that the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments. In order to provide increased transparency to the comment analysis phase of the CAN process, this document was created to supplement the information contained in the spreadsheet. NERC staff thanks industry members for the time and effort put into providing the comments and feedback for CAN-0011. If you would like further discussion on CAN-0011, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice – 0011

PRC-005 R2 Interval Start Date for New Equipment

Posted: April 19, 2011
Revised: November 16, 2011

Primary Interest Groups

Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Transmission Owner (TO)
Generator Owner (GO)
Distribution Provider (DP) that owns a transmission Protection System

Issue: May pre-operational test[2] records be used as evidence to show that maintenance and testing was performed within the registered entity's defined maintenance and testing interval for new equipment?
For the purpose of aiding a CEA, this CAN provides instruction for assessing the interval start date for **new** Protection System equipment that affects the reliability of the Bulk Electric System (BES), for the purpose of determining whether new Protection System equipment had been maintained and tested within the intervals defined in a registered entity's program.

Compliance Application

In order to determine compliance with PRC-005 R2, CEAs are instructed to look for evidence that substantiates the last date a registered entity tested and maintained its Protection System[3] devices.

PRC-005 R2 provides, in pertinent part:

> ***R2.*** *Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Reliability Organization[4] on request (within 30 calendar days). The documentation of the program implementation shall include:*

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.
[2] Pre-operational testing may also be referred to as "commissioning tests." The "pre-operational test" means the last testing a registered entity conducts on the Protection System device before the device is put into service.
[3] The *NERC Glossary of Terms Used in Reliability Standards* defines Protection System as "Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry."
[4] For this standard, the Regional Reliability Organization refers to the Regional Entity.

R2.1. *Evidence Protection System devices were maintained and tested within the defined intervals.*

R2.2. *Date each Protection System device was last tested/maintained.*

Without evidence demonstrating that new equipment was tested and was in appropriate condition to enter into service (the start date), a CEA cannot assess when the registered entity's maintenance or testing must occur.

As soon as the entity conducts its pre-operational testing, the interval begins for its maintenance and testing program.[5] The completion of the pre-operational testing, not the initiation of the pre-operational testing, is the point in time that the registered entity is aware of the operating condition of the equipment. Thus the completion date of the pre-operational testing is the date that should be used as the start date for the equipment's maintenance and testing interval. As pre-operational testing may occur over a period of time, the CEA is to verify the date that the pre-operational testing was completed for the equipment at issue.

The next maintenance and testing date to be verified by the CEA would be at some specific period of time after the start date, as defined by the interval defined in the registered entity's maintenance and testing program.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[6] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

To determine evidence of the start date for a registered entity's equipment's maintenance and testing interval, a CEA is instructed to look for the date the registered entity completed its equipment's pre-

[5] The registered entity's Protection System maintenance and testing program is only applicable for Protection System devices in service; however the date the equipment was placed in-service is not the date that should be used for the starting point of the maintenance and testing interval, unless the equipment was placed into service on the same date the pre-operational testing was completed.

[6] "Initiated" means that a registered entity has received notification of the upcoming audit.

operational testing that demonstrated that the equipment was deemed operational and ready to be placed into service.

In the event that a registered entity has equipment that changes status, such that it becomes subject to the standard (such as a radial line becoming a non-radial line), a CEA is instructed to look for either:

1. the date existing Protection System devices were last maintained or tested, or
2. the date the registered entity completed its equipment's pre-operational testing that demonstrated that the equipment was deemed operational and ready to be placed into service

as the start date for determining the equipment's maintenance and testing interval under the registered entity's maintenance and testing program.

Distribution Provider (DP)~~s~~ that own a transmission Protection System

Issue: May pre-operational test[2] records be used as evidence to show that ~~Evidentiary requirements for initial~~ maintenance and testing was performed within the registered entity's defined maintenance and testing interval for new equipment? ~~of new equipment in a Protection System~~
For the purpose of aiding a CEA, this CAN provides instruction for assessing the interval start date for **new** Protection System equipment affecting the reliability of the Bulk Electric System (BES) for the purpose of determining ~~Registered entities have requested that NERC provide clarification on~~ whether new Protection System equipment had been maintained and tested within the intervals defined in the ~~NERC Reliability Standard PRC-005 requires evidence of the pre-operational testing[3] of~~ a registered entity's ~~protective system equipment~~program.

~~**Reliability Objective**~~
~~The reliability objective of PRC-005-1 R2 is to ensure all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested with the intervals defined in the registered entity's program.~~

Compliance Application
In order to determine compliance with PRC-005 R2, CEAs are instructed to look for evidence that substantiates the ~~Registered entities must be able to provide evidence to the Compliance Enforcement~~

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.
[2] Pre-operational testing may also be referred to as "commissioning tests." The "pre-operational test" means the last testing a registered entity conducts on the Protection System device before the device is put into service.
[3] ~~The "pre-operational test" means the last testing a registered entity conducts on the Protection System device before the device is put into service.~~

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.com

~~Authority (CEA) to substantiate the~~ last date ~~it a registered entity~~ tested and maintained its Protection System[4] devices. ~~in order to demonstrate its compliance with PRC-005-1 R2.~~

PRC-005-1 R2 ~~requires~~provides, in pertinent part:

> ***R2.*** *Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Reliability Organization[5] on request (within 30 calendar days). The documentation of the program implementation shall include:*
>
> ***R2.1.*** *Evidence Protection System devices were maintained and tested within the defined intervals.*
> ***R2.2.*** *Date each Protection System device was last tested/maintained.*

~~In order to determine whether a registered entity is conducting maintenance and testing within the intervals defined by its own Protection System maintenance and testing program, the CEA must have a substantiated last maintenance or test date.~~

Without evidence ~~to~~ demonstrat~~e~~ing that new equipment ~~had been~~was tested and was in appropriate condition to enter into service (the start date), a CEA cannot assess when the registered entity's ~~cannot provide the date it used as a starting point to determine when its first~~ maintenance or testing must occur. ~~according to the intervals defined by its Protection System maintenance and testing program.~~

As soon as the entity conducts its pre-operational testing[6], the interval begins for its ~~and puts the protective scheme into service,[7] the interval has begun for its~~ maintenance and testing program.[8] The completion of the pre-operational testing, not the initiation of the pre-operational testing, is the point in time that the registered entity is aware of the operating condition of the equipment. ~~and t~~Thus the completion date ~~is the~~ of the pre-operational testing is the date that should be used as the start~~ing point~~ date for the equipment's maintenance and testing interval. As pre-operational testing may occur over a period of time, the CEA is to verify the date that the pre-operational ~~registered entity should use the date that the pre-operational~~ testing was completed for the equipment at issue.

---

[4] The *NERC Glossary of Terms Used in Reliability Standards* defines Protection System as "Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry."
[5] For this standard, the Regional Reliability Organization refers to the Regional Entity.
[6] ~~Pre-operational testing may also be referred to as "commissioning tests".~~
[7] ~~The registered entity's Protection System maintenance and testing program is only applicable for Protection System devices in service; however the date the equipment was placed in-service is not the date that should be used for the starting point of the maintenance and testing interval, unless the equipment was placed into service on the same date the pre-operational testing was completed.~~
[8] The registered entity's Protection System maintenance and testing program is only applicable for Protection System devices in service; however the date the equipment was placed in-service is not the date that should be used for the starting point of the maintenance and testing interval, unless the equipment was placed into service on the same date the pre-operational testing was completed.

116-390 Village Blvd.
Princeton, NJ 08540
609.452.8060 | www.nerc.

The next maintenance and testing date to be verified by the CEA would be at some specific period of time after the start date, ~~in the future from that start date,~~ as defined by the interval defined in the registered entity's maintenance and testing program.

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from April 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[9] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance ~~Guidance~~

~~As~~ To determine evidence of the start~~ing point~~ date for ~~its~~ a registered entity's equipment's maintenance and testing interval, a CEA is instructed to look for the date the registered entity completed its equipment's pre-operational testing that demonstrated that the equipment was deemed operational and ready to be placed into service. ~~must be able to provide an auditor or CEA with:~~

~~the date it completed its pre-operational testing, and~~

~~evidence that the equipment was deemed operational and cleared for entry into service.~~

In the event that a registered entity has equipment that ~~changed~~ changes status such that it becomes subject to the standard (such as a radial line becoming a non-radial line), a CEA is instructed to look for either:

1. the date existing Protection System devices were last maintained or tested, or
   the date the registered entity completed its equipment's pre-operational testing that demonstrated that the equipment was deemed operational and ready to be placed into service
   ~~new Protection System devices completed pre-operational testing,~~

~~will be~~as the start date for determining the equipment's maintenance and testing interval under the registered entity's maintenance and testing program. ~~A registered entity must be prepared to provide evidence of this date to the auditor or CEA.~~

Industry Comments for CAN-0011

Comment Topics	Main Points	Industry Suggestions
Errata Changes	Make changes to CAN for clarity	Review various footnotes and sentences
Supports CAN	Supports CAN as written	CAN provides additional clarity
Scope	The CAN should be subject to NERC's formal standards development or interpretation process.	This issue is already being addressed through SDT Project 2012-04 Protection System Commissioning Testing.
Evidence of Compliance	The plain language of the Standard should be used to assess compliance.	The Registered Entity's intervals and basis have been defined in the Protection System maintenance and testing program, however, that program applies to new equipment when such equipment becomes operational or placed in service. This is not dependent on the pre-operational test date.
Effective Date	A reasonable implementation plan should be considered.	Longer timeframe to implement

Industry Comments for CAN-0012

Comment Topics	Main Points	Industry Suggestions
Supports CAN	Supports CAN as written	CAN provides additional clarity
Scope	An entity should only be required to perform periodic activities after the "compliant" date of a standard.	This CAN should be revised. A registered entity should not have to comply with a standard until the date on which the standard became effective for that entity.
Effective Date	Entities should be provided adequate time to adjust their programs, systems or hardware to conform to the instruction outlined in a CAN.	We request that NERC incoroporates a reasonable implementation period for all CANs.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0012 Comment Analysis Summary

Completion of Periodic Activity Requirements During Implementation Plan

CAN-0012 was originally posted as final on July 18, 2011. The original CAN provided instruction for assessing whether registered entities completed a periodic action in accordance with the implementation plan for a standard. The CAN has been revised to incorporate the direction provided by the NERC Board of Trustees in August of 2011 and was reposted as final on November 16, 2011.

The revised draft CAN was posted for industry comment on the NERC web site on October 10, 2011 and the comment period expired on October 31, 2011. NERC received some positive feedback from industry during the comment period, stating that CAN-0012 addresses a valid concern in the assessment of implementation plans.

NERC received approximately 19 comments from registered entities and three comments from trade associations, which are identified below. The main themes of the comments consisted of the following two categories: scope and effective date.

Scope

There were several recommended substantive changes to the CAN in regard to scope. The commenters stated that CAN-0012 goes beyond the requirements in the standards, and Compliance Enforcement Authority (CEA) staff should not be instructed to verify evidence prior to the "compliant" date. The rationale was that a registered entity should not have to comply with a standard until the date on which the standard became effective for that entity.

In response to the comments, CAN-0012 was drafted to provide direction to CEAs on how to assess compliance in regard to periodic activities required by the standard. The implementation plan for a standard provides time for a registered entity to become compliant with the standard. As of the effective date of that standard for the registered entity, a CEA is to verify that the registered entity is compliant with requirements of a standard, which includes compliance with the requirement to conduct periodic activities.

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted by NERC as final and provides in that posting an implementation and effective date, which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

CEAs assess compliance according to the CAN upon posting of the CAN as final on the NERC web site. This specific CAN had been posted as final on July 18, 2011; as the compliance application in the redrafted CAN did not impose any additional evidentiary burden on registered entities, the use of the compliance application continues from the original posting date. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

Conclusion

The analysis spreadsheet for CAN-0012 has been posted on the NERC website. NERC received feedback that the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments. In order to provide increased transparency to the comment analysis phase of the CAN process, this document has been created to supplement the information contained in the spreadsheet. NERC staff thanks industry members for the time and effort put into providing the comments and feedback for CAN-0012. If you would like further discussion on CAN-0012, please feel free to contact us at cancomments@nerc.net.

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Registered Entity

Issue: Under what circumstances should a CEA verify completion of a periodic action or event during the implementation plan of a new or revised standard?
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether registered entities performed a periodic action in accordance with the implementation plan for a standard.

Compliance Application
In the event that a standard that is subject to an implementation plan, such as the CIP-002 through CIP-009 standards, contains a requirement of a periodic action or event, CEAs are to verify that the first occurrence of the periodic action or event was completed on or before the "compliant" date that applies to the particular registered entity, unless otherwise specified in the standard. For the CIP standards, "compliant" means that a registered entity meets the full intent of the requirements and is beginning to maintain required "data," "documents," "documentation," "logs," and "records." The CEA is to review the required data, documents, documentation, logs and records to verify compliance with the requirement for the recurring periodic actions or events.

Example 1
A standard indicated a "compliant" date of August 1, 2011 for a particular registered entity and required an annual activity.[2] In the event that, on January 1, 2012, a registered entity completed a self-certification for this standard, the CEA is to have looked at the date that it completed the activity.

1. If the registered entity had not performed the activity at least once on or before the "compliant" date of August 1, 2011, the CEA is to find a Possible Violation of the standard from

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards and requirements.
[2] In cases where the standard contains a definition of the term "annual" or "annually," that definition remains and is applicable to that standard. In all standards where the term "annual" is not defined, CEAs are to assess compliance by determining the entity's definition of annual within the parameters provided in CAN-0010 Definition of Annual, provided the action or activity was performed prior to the registered entity's Effective Date for the Standard.

August 1, 2011 until the date the registered entity completed the activity. Even if the registered entity had performed the annual activity after the ”compliant” date of the standard, the entity would be considered non-compliant.

2. If the registered entity performed the activity on or before August 1, 2011, the CEA is to determine that the entity did not have a non-compliance with the standard. Because the requirement was for an annual activity, if the entity had performed the activity between January 1, 2011, and August 1, 2011, the registered entity would have had until December 31, 2012 to complete the recurring activity. However, as stated in CAN-0010 Definition of Annual, it is a best practice not to have more than 15 months pass between events that must occur on an annual basis.

Example 2

A standard indicated a “compliant” date of August 1, 2011 for a particular registered entity, and required an activity to be completed every three months. In the event that, on January 1, 2012, a registered entity completed a self-certification for this standard, a CEA is to have looked at the date that it completed the activity.

1. If the registered entity completed the required periodic activity after the “compliant” date of August 1, 2011, the CEA is to find a Possible Violation of the standard.
2. If the registered entity performed the periodic activity on August 1, 2011, and again on December 1, 2011 (four months between activities instead of the three-month requirement), the CEA is to find a Possible Violation from November 1, 2011 (the date that the next activity should have been completed) through December 1, 2011 (the date the activity was completed).

   The time between activities is important. The clock for the three-month interval begins once the last activity has been completed. In this example, the entity performed the activity on December 1, 2011, and would have until March 1, 2012 before the next activity needed to be performed.

   The violation would be due to the gap in compliance from November 1, 2011 through December 1, 2011.
3. If the registered entity performed the activity on June 1, 2011, September 1, 2011 and December 1, 2011, the entity would be in compliance with the standard, because it had performed the activity prior to the “compliant” date and every subsequent three-month period.
4. If the registered entity performed the activity on June 1, 2011 and November 1, 2011 and was scheduled to conduct the next activity on February 1, 2012, the entity would be non-compliant with the standard from September 1, 2011 through November 1, 2011 because the effective date (August 1, 2011) did not restart the clock for the three-month period. To be the compliant,

the entity would have to have been tested on June 1, 2011, September 1, 2011 and December 1, 2011 (as in example #3).

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from July 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[3] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the situation, in determining whether to assess compliance pursuant to this CAN.

Compliance Application Notice — 0012

Completion of Periodic Activity Requirements ~~Prior to a Registered Entity's Effective Date for a Standard~~During Implementation Plan

Posted: July 18, 2011

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entities
Registered Entities

Issue: Under what circumstances should a CEA verify completion of ~~Requirement for~~ a periodic action or event during the implementation plan of a new or revised ~~to be completed prior to a Registered Entity's effective date for a~~ Standard?

NERC received a request for clarification on whether a registered entity must provide evidence that it completed a periodic action or event required by a NERC Reliability Standard (Standard) prior to the registered entity's effective date[2] for the Standard.

~~**Reliability Objective**~~

~~The reliability objective is to ensure periodic actions or events required by a Standard have been completed during the registered entity's implementation period to demonstrate that the registered entity is compliant[3] upon its effective date for a Standard.~~

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standards and requirements.

[2] A registered entity's effective date is dependent upon the effective date of the Standard, the entity's registration date, and the Standard's implementation plan, as applicable. For example, in the NERC Critical Infrastructure Protection (CIP) Reliability Standards CIP-002 through CIP-009 versions 1, 2 and 3, a registered entity's effective date is the compliant date that is applicable to the registered entity in either the original Implementation Plan for CIP version 1 Standards or the *Newly Identified Critical Cyber Asset Implementation Plan* for version 2 and 3 Standards.

[3] ~~For the CIP standards, "compliant" is defined in 1) *The (Revised) Implementation Plan for Cyber Security Standards CIP-002-1 through CIP-009-1* and 2) *The Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities for Cyber Security Standards CIP-002-2 through CIP-009-2 and CIP-002-3 through CIP-009-3*, to mean the registered entity meets~~

Compliance Application

In the event that a standard that is subject to an implementation plan, such as the CIP-002 – CIP-009 standards, contains a requirement of a periodic action or event, CEAs are to verify that the first ~~Where a Standard's requirements include a requirement for a periodic action or event, the first~~ occurrence of the ~~recurring~~ periodic action or event was completed on or before the "compliant" date that applies to the particular registered entity, unless otherwise specified in the standard. For the CIP standards, "compliant" means that a registered entity meets the full intent of the requirements and is beginning to maintain required "data," "documents," "documentation," "logs," and "records." The CEA is to review the required data, documents, documentation, logs and records to verify compliance with the requirement for the recurring periodic actions or events.~~requirement must be completed by the registered entity prior to the effective date of the standard.~~

Example 1

A standard indicated a "compliant" date of August 1, 2011 for a particular registered entity and required an annual activity.[4] In the event that, on January 1, 2012, a registered entity was completing a self-certification for this standard, the CEA is to look at the date that it completed the activity.

~~1) A registered entity must have conducted the required periodic action or event prior to the standard's effective date unless otherwise specified in a Standard; and~~

1. If the registered entity had not performed the activity at least once on or before the "compliant" date of August 1, 2011, the CEA is to find a Possible Violation of the standard from August 1, 2011 until the date the registered entity completed the activity. Even if the registered entity had performed the annual activity after the "compliant" date of the standard, the entity would be considered non-compliant.
2. If the registered entity performed the activity on or before August 1, 2011, the CEA is to determine that the entity did not have a non-compliance with the standard. Because the requirement was for an annual activity, if the entity had performed the activity between January 1, 2011, and August 1, 2011, the registered entity would have had

~~the full intent of the requirements and is beginning to maintain required "data," "documents," "documentation," "logs," and "records."~~

[4] In cases where the standard contains a definition of the term "annual" or "annually," that definition remains and is applicable to that standard. In all standards where the term "annual" is not defined, CEAs are to assess compliance by determining the entity's definition of annual within the parameters provided in CAN-0010 Definition of Annual, provided the action or activity was performed prior to the registered entity's Effective Date for the Standard.

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

until December 31, 2012 to complete the recurring activity. However, as stated in CAN-0010 Definition of Annual, it is a best practice not to have more than 15 months pass between events that must occur on an annual basis.

~~2) A Responsible Entity must have sufficient evidence for an auditor to validate that the action or event was completed.~~

Example 2

A standard indicated a "compliant" date of August 1, 2011 for a particular registered entity, and required an activity to be completed every three months. In the event that, on January 1, 2012, a registered entity was completing a self-certification for this standard, a CEA is to look at the date that it completed the activity.

~~Following its effective date, the registered entity is required to collect and maintain required "data," "documents," "documentation," "logs," and "records" to demonstrate compliance with the requirement for the recurring periodic actions or events.~~

1. If the registered entity completed the required periodic activity after the "compliant" date of August 1, 2011, the CEA is to find a Possible Violation of the standard.
2. If the registered entity performed the periodic activity on August 1, 2011, and again on December 1, 2011 (four months between activities instead of the three-month requirement) the CEA is to find a Possible Violation from November 1, 2011 (the date that the next activity should have been completed) through December 1, 2011 (the date the activity was completed).

   The importance is the time between activities. The clock for the three-month interval begins once the last activity has been completed. In this example, the entity performed the activity on December 1, 2011, and would have until March 1, 2012 before the next activity needed to be performed.

   The violation would be due to the gap in compliance from November 1, 2011 through December 1, 2011.
3. If the registered entity performed the activity on June 1, 2011, September 1, 2011 and December 1, 2011 the entity would be in compliance with the standard, because it had performed the activity prior to the "compliant" date and every subsequent three-month period.
4. If the registered entity performed the activity on June 1, 2011 and November 1, 2011 and was scheduled to conduct the next activity on February 1, 2012, the entity would be non-compliant with the standard from September 1, 2011 through November 1, 2011 because the effective date (August 1, 2011) did not restart the clock for the three-

3353 Peachtree Road NE
Suite 600, North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

month period. To be the compliant, the entity would have to have tested on June 1, 2011, September 1, 2011 and December 1, 2011 (as in example #3).

~~**Examples:**~~

1. ~~A Standard became effective July 1, 2010, and required an annual activity.[5] In the event that, on January 1, 2011 a registered entity was completing a self-certification for this Standard, it would look at the date that it completed the activity.~~

    a. ~~If the registered entity had not performed the activity at least once prior to the effective date of July 1, 2010, it would be in violation of the Standard from the effective date until the date the registered entity completed the activity. Even if the registered entity had performed the annual activity once in the calendar year, if it was performed after the effective date of the Standard, the entity would be considered non-compliant.~~

    b. ~~If the registered entity performed the activity between January 1, 2010 and July 1, 2010, the entity would be in compliance with the Standard. Because the requirement was for an annual activity, the registered entity had until the next December 31, 2011 to complete the recurring activity. However, as stated in CAN-0010 Definition of Annual it is a best practice to not have more than 15 months between events; therefore, it would be prudent for the registered entity to complete the activity by June 15, 2011.~~

2. ~~A Standard became effective on July 1, 2010 and required an activity to be completed every three months. In the event that, on January 1, 2011 a registered entity was completing a self-certification for this standard covering the prior year, it would look at the date that it completed the activity.~~

    a. ~~If the registered entity completed the required periodic activity after the effective date of July 1, 2010, it would be in violation of the Standard.~~

    b. ~~If the registered entity performed the periodic activity on June 15, 2010 and again on October 15, 2010 the entity would be in violation from September 15, 2010 (the date that the next activity should have been completed) through October 15, 2010 (the date the activity was completed). The entity would have until January 15, 2010 before the next activity needed to be performed. This violation would be due to the gap in compliance from September 15, 2010 through October 15, 2010. The effective date does not restart the clock for the three-month period.~~

Formatted: Font: 12 pt

[5] ~~In cases where the standard contains a definition of the term "annual" or "annually," that definition remains and is applicable to that standard. In all standards where the term "annual" is not defined, the registered entity may determine its definition of annual within the parameters provided in CAN-0010 Definition of Annual, provided the action or activity was performed prior to the registered entity's Effective Date for the Standard.~~

~~c. If the registered entity performed the activity on June 15, 2010, September 15, 2010 and December 15, 2010 the entity would be in compliance with the Standard because it had performed the activity prior to the effective date and every subsequent three-month period.~~

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from July 19, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[6] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the situation, in determining whether to assess compliance pursuant to this CAN~~This CAN is effective upon posting on the NERC Web site and will remain in effect until such time that a future version of the standard or interpretation addresses this specific issue and is enforceable. CAN-0012 could be superseded by a future CAN that addresses this particular Standard and Requirement~~.

Industry Comments for CAN-0013

Comment Topics	Main Points	Industry Suggestions
Supports CAN	Supports CAN as written	No changes
Errata Changes	Leave the version of the standard instead of removing it, in the title.	Suggests leaving the version of the standard (in this case PRC-023-1, as opposed to PRC-023) as it specifically identifies the version of the standard to which it applies and it also conforms to most other CANS that have been previously issued.
Effective Date	When does the PC need to establish this initial list?	According to PRC-023 R3 the Planning Coordinator needs to make a list of facilities 100kV to 200kV that are critical to the reliability of the BES. R3.3 states that the PC needs to deliver this list to the RCs, TOs, GOs, and DPs within 30 days of the establishment of the initial list.
Evidence of Compliance	CAN-0013 is changing the clear language of the Standard and hence changing the requirements of the Standard which should be prohibited based on Rules of Procedure. PRC-023-2 has been written in more detail and addresses this concern.	Until PRC-023-2 is approved PRC-023-1 should stand as approved.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0013 Comment Analysis Summary

PRC-023 R1 and R2 Effective Dates for Switch-On-To-Fault Schemes

CAN-0013 was originally posted as final on June 17, 2011. The original CAN clarified the effective dates for switch-on-to-fault (SOTF) schemes under PRC-023 R1 and R2. The CAN has been revised to incorporate the direction provided by the NERC Board of Trustees in August of 2011 and was reposted as final on November 16, 2011.

The revised draft CAN was posted for industry comment on the NERC web site on October 10, 2011, and the comment period expired on October 31, 2011. NERC received a few positive comments from industry members, stating that the clarifications provided in CAN-0013 were acceptable as written.

NERC received approximately nine comments from registered entities and three comments from trade associations, which are identified below. The main themes of the comments consisted of the following four categories: errata changes, issue statement, effective date and evidence of compliance.

Errata

There was a comment about the version of the standard not being listed, which may cause confusion if a future standard is approved and becomes effective.

We acknowledge that the version has been removed from the standard (PRC-023-1 now reads PRC-023), and this change was intentional for efficiency and to avoid any potential gaps in compliance monitoring. The change was made to ensure that the message of the CAN remained intact in the event that a revised standard or interpretation became enforceable that did not address the issue in the CAN. As mentioned in the effective date section, if an enforceable revised standard or interpretation addresses the issue in a CAN, the CAN will be superseded by the standard.

Scope

Several commenters made recommendations to change the effective date section of CAN-0013. They stated that although the CAN was developed to specifically address the effective dates relevant to "switch-on-to-fault schemes," they suggest for clarity that NERC include the effective date for requirements included in 5.1.3. This CAN was not expanded to include the effective dates for R5.1.3, but NERC staff will investigate whether this information can be included on the Standards Mandatory and Effective Dates page on the NERC website.

Effective Date

Several commenters said that NERC should incorporate a reasonable implementation period for all CANs. Other commenters suggested that a CAN should become effective only after it is publicly posted

by NERC as final and provides in that posting an implementation and effective date, which cannot be earlier than the posted date. There has been confusion from the industry about the date stated in the Effective Period of CAN section, as it refers to the date of the previously posted version.

The effective date for CAN-0013 remains June 17, 2011, the same date as the original posting. This is because the change to the CAN did not materially revise the compliance application in the previously posted version, and therefore the compliance application is a continuation of the original compliance application. Both dates of final posting are included on the final CAN.

Evidence of Compliance

Other commenters stated that CAN-0013 changes the clear language of the standard requirements, which should be prohibited based on the Rules of Procedure. PRC-023-2 has been written in more detail and addresses this concern, and until PRC-023-2 is approved, PRC-023-1 should stand as approved.

It is understood that another version of PRC-023 is currently being drafted, but the ERO has an obligation to monitor compliance to the current, enforceable standards. CAN-0013 provides additional clarity and promotes consistency with CEA staff for compliance monitoring activities. When PRC-023-2 becomes mandatory and enforceable, if it resolves the issue, CAN-0013 will be superseded and retired.

Conclusion

The analysis spreadsheet for CAN-0013 has been posted on the NERC website. NERC received feedback that the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments. In order to provide increased transparency to the comment analysis phase of the CAN process, this document was created to supplement the information contained in the spreadsheet. NERC staff thanks industry members for the time and effort put into providing the comments and feedback for CAN-0013. If you would like further discussion on CAN-0013, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice – 0013

PRC-023 R1 and R2 Effective Dates for Switch-On-To-Fault Schemes

Posted: June 17, 2011
Revised: November 16, 2011

Primary Interest Groups

Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Transmission Owners (TO), Generation Owners (GO), Distribution Providers (DP) and Planning Coordinators (PC) with load-responsive phase protection systems subject to NERC Reliability Standard PRC-023

Issue: What are the Effective Dates for switch-on-to-fault (SOTF) schemes?

For the purpose of aiding a CEA, this CAN clarifies the Effective Dates for SOTF schemes included on 1) transmission lines operated at 200 kV and above, and 2) transformers with low voltage terminals connected at 200 kV and above, under PRC-023 Requirement (R) 1 and R2.

Background

Points 5.1.1 and 5.1.2 of the introduction to the standard set forth the effective dates for equipment applicable to R1 and R2. The language reads:

> ***5.1.1*** *For circuits described in 4.1.1[2] and 4.1.3[3] above (except for switch-on-to-fault schemes) — the beginning of the first calendar quarter following applicable regulatory approvals.*
>
> ***5.1.2*** *For circuits described in 4.1.2[4] and 4.1.4[5] above (including switch-on-to-fault schemes) — at the beginning of the first calendar quarter 39 months following applicable regulatory approvals.*

The Standard Drafting Team included a parenthetical in PRC-023 R5.1.2 to address comments from industry participants that "[t]he schedule for switch-on-to-fault (SOTF) protections applied on elements 200 kV and above is the same as the Beyond Zone 3 schedule for the phase protections referenced in

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.
[2] Transmission lines operated at 200 kV and above.
[3] Transformers with low voltage terminals connected at 200 kV and above.
[4] Transmission lines operated at 100 kV to 200 kV as designated by the PC as critical to the reliability of the Bulk Power System (BPS).
[5] Transformers with low voltage terminals connected at 100 kV to 200 kV as designated by the PC as critical to the reliability of the BPS.

section A.4.1.2 and A.4.1.4 applied on elements 100 kV to 200 kV. The Effective Date for the standard should be modified to include all SOTF protections in the Effective Date in Section A.5.1.2."

Compliance Application

The Effective Date for SOTF schemes included on 1) transmission lines operated at 200 kV and above, and 2) transformers with low voltage terminals connected at 200 kV and above, is the beginning of the first calendar quarter 39 months following applicable regulatory approvals. CEAs are to assess compliance as of the applicable Effective Date.

To summarize, the Effective Dates corresponding to the applicable equipment under points 5.1.1 and 5.1.2 of the introduction to PRC-023 are as follows:

Equipment	Effective Date	US Effective Date
Transmission lines operated at 200 kV and above (except SOTF schemes)	the beginning of the first calendar quarter following applicable regulatory approvals	July 1, 2010
Transformers with low voltage terminals connected at 200 kV and above (except SOTF schemes)		
Transmission lines operated at 100 kV to 200 kV as designated by the Planning Coordinator as critical to the reliability of the Bulk Electric System.	the beginning of the first calendar quarter 39 months following applicable regulatory approvals	October 1, 2013
Transformers with low voltage terminals connected at 100 kV to 200 kV as designated by the Planning Coordinator as critical to the reliability of the Bulk Electric System		
SOTF schemes on all applicable facilities specified in the applicability sections A.4.1.1 – A.4.1.4		

Effective Period for CAN

This revised CAN supersedes the original CAN, as well as all prior communications. CEAs are to use this CAN to assess compliance from June 17, 2011, regardless of the start date of the violation. It will remain in effect until such time that a future version of a FERC or other applicable government authority approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[6] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

This document is designed to convey compliance monitoring instruction to achieve a measure of consistency among auditors and Compliance Enforcement Authorities. It is not intended to establish new requirements under NERC's Reliability Standards or to modify the requirements in any existing NERC Reliability Standard. Compliance will continue to be assessed based on language in the currently enforceable NERC Reliability Standards. This document is not intended to define the exclusive method an entity must use to comply with a particular standard or requirement, or foreclose a registered entity's demonstration by alternative means that it has complied with the language and intent of the standard or requirement, taking into account the facts and circumstances of a particular registered entity. Implementation of information in this document is not a substitute for compliance with requirements in NERC's Reliability Standards.

Revision History

Posted Date	Action	Revision
June 17, 2011	Posted Final CAN	
November 16, 2011	Posted Revised CAN	Revised target audience to CEA

~~*This document is designed to convey compliance guidance from NERC's various activities. It is not intended to establish new requirements under NERC's Reliability Standards or to modify the requirements in any existing NERC Reliability Standards. Compliance will continue to be determined based on language in the NERC Reliability Standards as they may be amended from time to time.*~~

[7] "Initiated" means that a registered entity has received notification of the upcoming audit.

Comment [A1]: MRO NSRF: NERC continues to ignore industry and EEI comments that CANs cannot and should not use retroactive compliance dates. Because any clarification changes, at a minimum how NERC standards are applied, entities must be allowed time to review and change their practices if needed. It is wrong to used retroactive dates.

Comment [A2]: ERCOT: As written, the CAN is imposing an effective date prior to the posting date. The effective date should be the posting date of the final CAN. Any reference prior to that is not meaningful since the evidence guideline provided in the final CAN should be applicable going forward, not backward.

Comment [A3]: NRECA: Although the CAN was developed to specifically address the effective dates relevant to "switch-on-to-fault schemes", NRECA suggests for clarity that that NERC include the effective date for requirements included in 5.1.3.

Formatted: Font: 12 pt, Not Superscript/ Subscript

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Comment [A4]: KCP&L: KCP&L does not agree with the CAN-013 regarding the potential intention of the applicability and effective dates established by Standard PRC-023-1. Standard PRC-023 may be in error, but the CAN-0013 is changing the clear language of the Standard and hence changing the requirements of the Standard which should be prohibited based on Rules of Procedure. PRC-023-2 has been written in more detail and addresses this concern. Until PRC-023-2 is approved PRC-023-1 should stand as approved.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt, Not Superscript/ Subscript

Comment [A5]: ERCOT: by using phrases such as "are to use this CAN to assess compliance" and "apply appropriate discretion," the "Effective Period" section implies that the guidance provided in the CAN is mandatory, despite the fact that the CAN is not developed through the Standards Development Process, not balloted and not approved by government authorities. The SRC recommends not using the terms "compliance," "non-compliance," or "assess," or "assessment."

Comment [A6]: ACES: The CAN does not fully satisfy the effective date issue because the CAN does not address A.5.1.3 in the Effectiv ...

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Compliance Application Notice — 0029

PRC-004 R1, R2 and R3 Protection System Misoperations

Posted [DATE]

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Transmission Owner (TO)
Generator Owner (GO)
Distribution Providers that own a Transmission Protection System (DP)

Issue: Does development of the common reporting template implemented by Electric Reliability Organization (ERO) - Reliability Assessment and Performance Analysis (RAPA) in 2011 modify the way in which compliance with PRC-004 will be measured?
For the purpose of aiding a CEA, this CAN provides instruction for assessing whether entities reported Protection System Misoperations as required by PRC-004.

Compliance Application
PRC-004 Requirements 1 - 3 provides:

> ***R1.*** *The Transmission Owner and any Distribution Provider that owns a transmission Protection System shall each analyze its transmission Protection System Misoperations and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's[2] procedures developed for Reliability Standard PRC-003 Requirement 1.*
>
> ***R2.*** *The Generator Owner shall analyze its generator Protection System Misoperations, and shall develop and implement a Corrective Action Plan to avoid future Misoperations of a similar nature according to the Regional Reliability Organization's procedures developed for PRC-003 R1.*

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard and requirements.
[2] Consistent with applicable FERC precedent, the term 'Regional Reliability Organization' in this context refers to the applicable Regional Entity.

3353 Peachtree Road NE
Suite 600 North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

R3. *The Transmission Owner, any Distribution Provider that owns a transmission Protection System, and the Generator Owner shall each provide to its Regional Reliability Organization, documentation of its Misoperations analyses and Corrective Action Plans according to the Regional Reliability Organization's procedures developed for PRC-003 R1.*

The Electric Reliability Organization (ERO)-Reliability Assessment and Performance Analysis (RAPA) common reporting template on misoperation reporting guidelines can be found at: http://www.nerc.com/docs/pc/rmwg/Protection_System_Misoperation_Reporting_Template_Final.xlsx

The revised Misoperation reporting guidelines, implemented by ERO-RAPA in 2011, do not modify or negate the requirements under PRC-004. However, if a Regional Reliability Organization (RRO) has adopted the ERO-RAPA guidelines as the RRO's procedures used to meet compliance with PRC-003 Requirement R1, then the guidelines developed by ERO-RAPA should be treated as the RRO procedure that responsible entities must follow to comply with PRC-004 Requirements R1 through R3.

Whether an RRO has adopted the ERO-RAPA reporting guidelines to meet compliance with PRC-003-1 Requirement R1 or not, CEAs are to look for evidence that entities required to comply with PRC-004-1 Requirement R1 and R2 1) analyzed all Protection System Misoperations in accordance with their RRO's latest procedures and 2) developed and implemented a Corrective Action Plan (CAP) for each Misoperation in accordance with their RRO's latest procedures. In addition, CEAs are to look for evidence that entities provided documentation of their Protection System Misoperations, analyses and CAPs according to the applicable RRO procedures in accordance with PRC-004-1 Requirement R3.

Effective Period for CAN

This CAN is effective upon posting as final on the NERC Web site, and is to be used by CEAs to assess compliance from the posting date forward, regardless of the start date of any non-compliance or Possible Violation. It supersedes all prior communications and will remain in effect until such time that a future version of a FERC-approved or other applicable government authority-approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[3] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

A CEA is to assess the following to obtain reasonable assurance of the entity's compliance:

- the entity's record of all Protection System Misoperations analyses, and
- evidence the entity implemented a CAP in response to each Misoperation, and
- evidence that entities provided documentation of their Protection System Misoperations, analyses and Corrective Action Plans according to the applicable RRO procedures.

[3] "Initiated" means that a registered entity has received notification of the upcoming audit.

This document is designed to convey compliance monitoring instruction to achieve a measure of consistency among auditors and Compliance Enforcement Authorities. It is not intended to establish new requirements under NERC's Reliability Standards or to modify the requirements in any existing NERC Reliability Standard. Compliance will continue to be assessed based on language in the currently enforceable NERC Reliability Standards. This document is not intended to define the exclusive method an entity must use to comply with a particular standard or requirement, or foreclose a registered entity's demonstration by alternative means that it has complied with the language and intent of the standard or requirement, taking into account the facts and circumstances of a particular registered entity. Implementation of information in this document is not a substitute for compliance with requirements in NERC's Reliability Standards.

CAN-0029 Comment Analysis Summary

PRC-004 R1, R2 and R3 Protection System Misoperations

CAN-0029 provides instruction for assessing whether entities reported Protection System Misoperations as required by PRC-004. This CAN was posted for industry comment on September 23, 2011 through October 14, 2011. NERC received ten comments from registered entities and one comment from a trade organization as listed below.

Six of the 11 commenters, including the trade organization, supported the CAN. The remaining comments concerned the scope and the compliance application contained in the CAN, and was addressed as follows:

Scope

There was one comment submitted that requested the version of the standard be included in the CAN, and this was not changed as the version number was intentionally not included for efficiency. A CAN is superseded by a revised standard or interpretation that addresses the issue in the CAN and will be retired. If the issue is not addressed in the revised standard or interpretation, the CAN remains the compliance application to be used by Compliance Enforcement Authorities (CEAs), which would not be the case if the CAN was limited to a specific version. The same is true if the issue is mapped to another requirement or standard; if the issue is addressed the CAN is superseded and will be retired.

Compliance Application

There were four comments submitted for the Compliance Application section. Two addressed the RRO procedure, stating that it CAN should clearly state that the ERO-RAPA reporting process is not the defacto RRO procedure referenced in PRC-003. The CAN does not specifically state that the ERO-RAPA procedure is not the defacto RRO procedure, but states:

> The revised Misoperation reporting guidelines, implemented by ERO-RAPA in 2011, do not modify or negate the requirements under PRC-004. However, if a Regional Reliability Organization (RRO) has adopted the ERO-RAPA guidelines as the RRO's procedures used to meet compliance with PRC-003 Requirement R1, then the guidelines developed by ERO-RAPA should be treated as the RRO procedure that responsible entities must follow to comply with PRC-004 Requirements R1 through R3.

It was determined that this language conveys the message requested by the commenters.

The other two comments requested the sentence "developed and implemented a Corrective Action Plan (CAP) for each Misoperation in accordance with their RRO's **latest procedures**" be clarified to state

instead "developed and implemented a Corrective Action Plan (CAP) for each Misoperation in accordance with their RRO's **procedures that are valid at that time**." The intent of the CAN was not to require an entity to develop and implement a CAP for misoperations that occurred in the past for every change in RRO reporting procedures and the language was modified in the CAN.

Conclusion

The analysis spreadsheet for CAN-0029 is also posted on the NERC website. While the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments, it is hoped that this document will supplement that information. Feedback from all sources is key and NERC staff thanks industry for the time and effort put into providing that feedback. If you would like further discussion on CAN-0029, please feel free to contact us at cancomments@nerc.net.

Compliance Application Notice — 0039

EOP-004-1 Filing DOE Form OE-417 Event Reports

Posted [DATE]

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Reliability Coordinator (RC)
Balancing Authority (BA)
Transmission Operator (TOP)
Generator Operator (GOP)
Load Serving Entity (LSE)
Regional Reliability Organization

Issue: Does the Department of Energy's (DOE) new online process affect the EOP-004 requirement for a registered entity to submit the OE-417 disturbance report to NERC?
The Department of Energy's (DOE) new online process for submitting the OE-417 disturbance reporting form does not automatically issue a copy to NERC or the Regional Entities.

Background
The DOE's Electric Emergency Incident and Disturbance Report (Form OE-417) collects information on electric incidents and emergencies. The DOE uses the information to fulfill its overall national security and energy emergency management responsibilities, as well as for analytical purposes. Beginning January 2011, the DOE initiated a new process by which entities are to submit OE-417 reports for qualifying events. Entities may now go to the DOE web site and fill out an online form for submission. The DOE online process tool does not distribute a copy of the report, either simultaneously or at a later time, to NERC. Therefore, NERC and the Regional Entities have no record of the event. **Compliance Application**
EOP-004-1, Table 1-EOP-004-0 states, in pertinent part:

> *All entities required to file a DOE OE-417 report (Schedule 1 & 2) shall send a copy of these reports to NERC simultaneously, but no later than 24 hours after the start of the incident or disturbance.*

[1]Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.

3353 Peachtree Road NE
Suite 600 North Tower
Atlanta, GA 30328
404.446.2560 | www.nerc.com

EOP-004-1 R3 provides, in pertinent part:

> ***R3.*** *A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity experiencing a reportable incident shall provide a preliminary written report to its Regional Reliability Organization and NERC.*
>
> > ***R3.1.*** *The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall submit within 24 hours of the disturbance or unusual occurrence either a copy of the report submitted to DOE, or, if no DOE report is required, a copy of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report form. Events that are not identified until some time after they occur shall be reported within 24 hours of being recognized.*
> >
> > ***R3.2.*** *Applicable reporting forms are provided in Attachments 1-EOP-004 and 2-EOP-004.*
> >
> > ***R3.3.*** *Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by a disturbance and issue a written Interconnection Reliability Operating Limit and Preliminary Disturbance Report within 24 hours. In such cases, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall promptly notify its Regional Reliability Organization(s) and NERC, and verbally provide as much information as is available at that time. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall then provide timely, periodic verbal updates until adequate information is available to issue a written Preliminary Disturbance Report.*

DOE's institution of a new process does not provide an exemption to EOP-004. Regardless of how registered entities fulfill their DOE requirement (through the online submission tool or in another manner), CEAs are to look for evidence that entities submitted either

1) a copy of the on-line OE-417 report or

2) an off-line form pursuant to R3.2

to NERC at ESISAC@nerc.com and to the entity's Regional Entity within 24 hours of the disturbance or unusual occurrence, or as otherwise required by the standard, to fulfill the requirements of EOP-004-1. In the event that the CEA finds a registered entity did not submit a report to NERC, a CEA is to find a Possible Violation of EOP-004-1.

In the event registered entities submitted an OE-417 report online between January 2011 and posting of this CAN as final on the NERC web site, and did not provide NERC with a copy, registered entities are encouraged to submit the information from these reports to NERC at ESISAC@nerc.com.

Effective Period for CAN

This CAN is effective for EOP-004-1 upon posting as final on the NERC Web site, and is to be used by CEAs to assess compliance from the posting date forward, regardless of the start date of any non-compliance or Possible Violation. It supersedes all prior communications and will remain in effect until such time that a future version of a FERC-approved or other applicable government authority-approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

3353 Peachtree Road NE
Suite 600 North Tower
Atlanta, GA 30328
404.446.2560 | www.nerc.com

For any enforcement action in process and for audits that have been initiated,[2] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Providing Evidence of Compliance
CEAs are to look for evidence that entities provided a report to the appropriate Regional Entity and NERC within 24 hours of the disturbance or unusual occurrence, or as otherwise required by EOP-004.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0039 Comment Analysis Summary

EOP-004 R3 Filing DOE Form OE-417 Event Reports

CAN-0039 provides clarification that the online process for submitting Department of Energy's (DOE) OE-417 disturbance reporting form does not allow for multiple parties to receive the report automatically. The CAN was posted for industry comment on the NERC web site on September 23, 2011 and the comment period expired on October 14, 2011.

NERC received approximately 15 comments from various industry stakeholders and trade associations, which are identified by name below. The main themes of the comments consisted of the following three categories: errata changes, scope of CAN and a suggestion for NERC to coordinate the reporting process with the DOE. There were also a few comments in support of the position in CAN-0039.

Errata

The recommended errata change was to add 'reporting requirements' to the end of the following statement, "DOE's institution of a new process does not provide an exemption to EOP-004." This change was made to the CAN as requested.

Scope

There two industry groups that recommended substantive changes to the CAN in regard to scope. The commenters stated that CAN-0039 goes beyond the language of EOP-004 and Compliance Enforcement Authority (CEA) staff should not be instructed to verify evidence that Form OE-417 was submitted to NERC because the DOE reporting procedure is not part of the requirement.

This CAN is to ensure that disturbances are being sent to NERC and the Regional Entities as required by EOP-004. Although the Requirement does not state the DOE form explicitly, it was brought to NERC's attention that some entities were under the impression that, by submitting the online DOE submittal process that a copy of that report would be sent to NERC and the Regional Entity. The CAN was issued to make CEA staff aware that the form is not automatically sent to NERC and the Regional Entities and additional steps must be taken to ensure proper delivery.

NERC to Coordinate with DOE

Several commenters suggested that NERC work with the DOE to streamline the process and make the online submittal of OE-417 as seamless as possible to reduce the administrative burden of saving a copy and sending it to NERC and the Regional Entities. NERC is currently working with DOE to allow for multiple parties to receive the report. While that process has not been implemented, it is thought that, when it is implemented, it will not occur automatically, but will required a registered entity to check a box to have the reports sent to other parties (including the Regional Entity and NERC). In the interim,

registered entities should be submitting OE-417 Forms to DOE, NERC and the applicable Regional Entity.

Conclusion

The analysis spreadsheet for CAN-0039 is also posted on the NERC website. While the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments, it is hoped that this document will supplement that information. Feedback from all sources is key and NERC staff thanks industry for the time and effort put into providing that feedback. If you would like further discussion on CAN-0039, please feel free to contact us at cancomments@nerc.net.

Edison Electric Institute (EEI)
National Rural Electric Cooperative Association (NRECA)

Industry Comments for CAN-0039		
Comment Topics	**Main Points**	**Industry Suggestions**
Errata Changes	Add language for clarity	Suggest adding 'reporting requirements' to the end of the following statement; " DOE's institution of a new process does not provide an exemption to EOP-004."
Scope	The DOE reporting procedure is not part of the requirement.	The DOE online reporting process allows only one opportunity to save the report before submission and the submitted report cannot be retrieved, it only makes sense to allow the registered entity to submit a separate NERC report if necessary to comply. A registered entity should not be put in a position that a potential violation of a standard could occur because of the creation of the DOE on-line submission tool.
Supports CAN	This CAN is appropriate and acceptable.	CAN-0039 appropriate and acceptable as written as well as consistent with the original intent of the Standard. EEI also commends NERC in their efforts to make this CAN technically accurate, informationally sound and in line with the vision of CANs.
NERC to coordinate with DOE	Encourage NERC to work with DOE to gain direct access to the reports which would eliminate this whole issue and the need for the registered entity to report information twice.	Suggest that the DOE modify the form to include a drop down list that would allow reporting parties to select the region that they are in and this selection would automatically send the form to DOE, NERC, and the Regional Entity.

Industry Comments for CAN-0031		
Comment Topics	**Main Points**	**Industry Suggestions**
Errata Changes	Minor changes to CAN	Suggest changing language for consistency and fixing typos.
Scope	The Standards themselves do not dictate the type of material(s) that must be used to meet compliance, and various materials can be used to effectively meet the intent of the standard.	Any direction provided outside of Appendix 3a of the Rules of Procedure (i.e., the Standards Process Manual, including the Process for Developing a Term and/or the Process for Developing an Interpretation), would be arbitrary and unsupported by anything directly written or reasonably implied in the Standard.
Effective Date	NERC needs to incorporate a reasonable implementation period for all CANs.	There must be adequate time to allow them to prepare and submit the TFEs, and for the Regional Entities to evaluate them.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Compliance Application Notice — 0031

CIP-006 R1 Acceptable Opening Dimensions

Posted [DATE]

Primary Interest Groups
Compliance Enforcement Authority (CEA)[1]
NERC
Regional Entity
Registered Entities subject to CIP-005 and CIP-006
Responsible Entities[2]

Issue: What is the acceptable unprotected opening dimension in the Physical Security Perimeter (PSP)?
For the purpose of aiding a CEA, this CAN provides instruction to assess whether an opening in the PSP must have additional protective measures in place.

Background
CIP-006 R1.1 is intended to ensure protection of assets within an ESP via a "six-wall" border or documented alternative measures. To date there are a variety of ways in which entities have endeavored to create a completely enclosed (six-wall) border.

Compliance Application
CIP-006 states, in pertinent part:

> ***R1.*** *Physical Security Plan – The Responsible Entity shall document, implement, and maintain a physical security plan, approved by the senior manager or delegate(s) that shall address, at a minimum, the following:*
>
> > ***R1.1.*** *All Cyber Assets within an Electronic Security Perimeter shall reside within an identified Physical Security Perimeter. Where a completely enclosed ("six-wall") border*

[1] Compliance Enforcement Authorities include ERO auditors, investigators, enforcement personnel or any person authorized to assess issues of concern, potential non-compliance, and possible, alleged or confirmed violations of NERC Reliability Standard requirements.
[2] Within the text of Standard CIP-006, "Responsible Entity" shall mean: Reliability Coordinator; Balancing Authority; Interchange Authority; Transmission Service Provider; Transmission Owner; Transmission Operator; Generator Owner; Generator Operator; Load Serving Entity; NERC; and Regional Entity

3353 Peachtree Road NE
Suite 600 North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

cannot be established, the Responsible Entity shall deploy and document alternative measures to control physical access to such Cyber Assets.

R.1.2. *Identification of all physical access points through each Physical Security Perimeter and measures to control entry at those access points.*

R.1.3. *Processes, tools, and procedures to monitor physical access to the perimeter(s).*

CEAs are to consider 96 square inches as the measurement for each maximum acceptable opening without physical protective measures in place. This is consistent with other agencies that use similar measurement practices in other industries.

- Director of Central Intelligence Directive (DCID) 6/9 is the Manual of Physical Security Standards for Sensitive Compartmented Information Facilities (SCIF) adopted by the Department of Defense (DOD). Section 3.3.4 of this document references the 96-square-inch metric in regard to physical protection of vents, ducts and pipes. http://www.fas.org/irp/offdocs/dcid6-9.pdf

- Department of Homeland Security Management Directives System MD# 11030.1 is the Manual of Physical Protection of Facilities and Real Property adopted by the Department of Homeland Security (DHS). Section VI.A.2 of this document references a 100-square-inch metric in regard to areas of single openings for perimeter walls. http://www.dhs.gov/xlibrary/assets/foia/mgmt_directive_110301_physical_protection_of_facilities_and_real_property.pdf

- DOD Directive 5210.63 is the directive for Security of Nuclear Reactors and Special Nuclear Materials. In Enclosure 2 of this directive, definition E2.1.16.2 references 96 square inches as the maximum allowable opening without protective measures for Special Nuclear Material Vaults. http://biotech.law.lsu.edu/blaw/dodd/corres/pdf2/D521063p.pdf

Additionally, for any opening greater than 96 square inches with one side greater than 6 inches in length, CEAs are to look for evidence that the opening is protected against entry by the use of bars, wire mesh or other permanently installed metal barrier that leaves no opening greater than 6 inches on its shortest side.

Several application examples include:

- An opening of 8 inches by 8 inches would not require any additional protection since the opening is less than 96 square inches.
- An opening of 2 inches by 100 inches would not require any additional protection, because even though the opening is greater than 96 square inches, the smaller dimension is less than 6 inches.
- An opening of 8 inches by 15 inches would require metal bars or mesh since the opening is greater than 96 square inches, and the smaller dimension is greater than 6 inches.
- An opening of 8 inches by 100 inches that cannot be closed in by bars or mesh due to safety/regulatory requirements but upon which entities utilized “alternative measures”

3353 Peachtree Road NE
Suite 600 North Tower
Atlanta, GA 30326
404.446.2560 | www.nerc.com

(e.g., electronic sensors) would require a TFE to be filed with the appropriate Regional Entity.

Effective Period for CAN

This CAN is effective upon posting as final on the NERC Web site, and is to be used by CEAs to assess compliance from the posting date forward, regardless of the start date of any non-compliance or Possible Violation. It supersedes all prior communications and will remain in effect until such time that a future version of a FERC-approved or other applicable government authority-approved standard or interpretation becomes effective and addresses the specific issue contained in this CAN.

For any enforcement action in process and for audits that have been initiated,[3] a CEA will apply the appropriate discretion, including consideration of the specific facts and circumstances of the non-compliance, in determining whether to assess compliance pursuant to this CAN.

Evidence of Compliance

A CEA is to assess the following to obtain reasonable assurance of the entity's compliance:

- That any opening that does not have physical protective measures in place is less than 96 square inches.

- That any opening greater than 96 square inches, with its shortest side greater than 6 inches in length, is protected against entry by the use of bars, wire mesh or other permanently installed metal barrier that leaves no opening greater than 6 inches on its shortest side.

  In addition, a CEA is to verify that a responsible entity submitted a TFE for CIP-006 R1.1 that outlines the basis and alternate and/or compensating measures for any opening over 96 square inches without physical protective measures. For example, a motion detector is a non-physical protective measure.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CAN-0031 Comment Analysis Summary

CIP-006 R1 Acceptable Opening Dimensions

CAN-0031 provides instruction for a CEA to assess whether an opening in the Physical Security Perimeter (PSP) must have additional protective measures in place. The CAN incorporates the direction provided by the NERC Board of Trustees in August of 2011.

The draft CAN was posted for industry comment on the NERC web site on September 23, 2011, and the comment period expired on October 14, 2011. NERC received approximately 17 comments from registered entities and three comments from trade associations, which are identified below. The main themes of the comments consisted of the following three categories: errata changes, scope and effective date of the CAN.

Errata

The recommended errata change was to remove references to CIP-005 in the applicability section of the CAN, which was done. There was a change made with regard to the length of "any side greater than 6 inches" to now read "its shortest side greater than 6 inches." Also, in the evidence of compliance section, the word "preventative" was added with a footnote to clarify that physical preventative measures are needed, not physical detection controls (also discussed below).

Scope

There were several recommended substantive changes to the CAN in regard to scope. The commenters stated that CAN-0031 goes beyond the requirements in the standards, and Compliance Enforcement Authority (CEA) staff should not be instructed to verify evidence of 96 inches, because the standard does not articulate an exact measurement.

In response to the comments, CAN-0031 was drafted to ensure consistency among the ERO. Because the language of the standard does not state a number as an acceptable opening, the standard could be applied inconsistently. In order for Compliance Enforcement Authority (CEA) staff to assess compliance in a consistent manner, 96 square inches was determined to be appropriate, because it is consistent with other agencies, including the Department of Defense and the Department of Homeland Security.

Some commenters suggested that the CAN be further expanded to include other examples of different shapes, such as a circle or a polygon. In response, the shape of the opening is not the subject of the discussion, and calculations may need to be made in order to determine if an opening is greater than 96 square inches.

Other comments discussed the material used to enclose those openings and suggested to include other materials beside metal. In response, the language was changed from metal to "other permanently installed barrier," and a footnote was added to clarify that true physical prevention control, rather than physical detection control (such as motion sensors), is the goal of installing these barriers.

Effective Date

Several commenters believe that NERC should incorporate a reasonable implementation period with adequate time to allow registered entities to prepare and submit the Technical Feasibility Exceptions (TFEs), and for the Regional Entities to evaluate them. CEAs will apply discretion in applying the compliance application for registered entities that have had an audit initiated. Entities are encouraged to assess their facilities and to submit TFEs to their applicable Regional Entity if necessary.

Conclusion

The analysis spreadsheet for CAN-0031 and the industry comments that were received have been posted on the NERC website in addition to this Comment Analysis Summary. NERC received feedback that the spreadsheet format did not provide sufficient information to provide industry with visibility into the effort that is put into reviewing all of the comments. In order to provide increased transparency to the comment analysis phase of the CAN process, the industry comments are being posted, and this document has been created to supplement the information contained in the spreadsheet.

NERC staff thanks industry members for the time and effort put into providing the comments and feedback for CAN-0031. If you would like further discussion on CAN-0031, please feel free to contact us at cancomments@nerc.net.

The following DRAFT NERC CANs have been analyzed, and the Industry Comment Analysis Spreadsheet and Comment Analysis Summary are posted on the NERC website:

1. **DRAFT CAN-0029**: PRC-004 R1, R2 and R3 Protection System Misoperations
   - Industry Comment Analysis Spreadsheet
   - Comment Analysis Summary
2. **DRAFT CAN-0039**: EOP-004-1 Filing DOE Form OE-417 Event Reports
   - Industry Comment Analysis Spreadsheet
   - Comment Analysis Summary

The updated NERC CAN Status spreadsheet has been posted as final under Complete List of CANs and Status section on the NERC website:

1. The CAN Status spreadsheet has been updated to reflect the recent changes to Compliance Application Notices. This spreadsheet indicates the status of each CAN currently in the development process. This list includes new potential CANs that have not been issued a priority.

The following additional category has been added to the NERC CAN website:

1. Category: "Post Comment Period" contains CANs that were posted for industry comment, the comment period has closed, and the comments are currently being reviewed by NERC staff. NERC received requests from industry to keep all CANs posted on the NERC website, so this tab was added to keep track of CANs after the comment period has closed.

The following new document type has been added to the NERC CAN website:

1. Document Type: "Comment Analysis Summary" is an overview of the industry comments received. This summary identifies the registered entities that submitted comments and provides rationale for why the CAN either changed or did not change based on the most prevalent comments. This document is intended to be supplemental information to provide further transparency into the CAN process.

Please email comments using the CAN Comment Form to cancomments@nerc.net.

For more information regarding Compliance Application Notices, please contact Valerie Agnew at (404) 446-2566, Ben Engelby at (404) 446-2578 or Caroline Clouse at (404) 446-2588.

Subject: NERC: Standards Announcement - "NEW" Weekly Standards Bulletin | November 7-13, 2011
Date: Monday, November 07, 2011 3:47:00 PM

Standards Bulletin: November 7-13, 2011

This weekly bulletin compiles a list of current and upcoming standards, interpretations, and CANs posted for comment, industry review, or balloting, along with a list of upcoming standards-related postings and events. The bulletin is being piloted for the next few weeks, so any feedback on its effectiveness, content, and format is welcome. Please email Monica Benson with questions about standards commenting and balloting, Caroline Clouse with questions about CANs, and Mallory Huggins with feedback on this bulletin.

Now available on the Standards Under Development Page.

Proposed Standards and Interpretations Posted for Comment (comment periods close at 8 p.m. Eastern)

- Interpretation 2011-INT-01: Revision of MOD-028 to address RPL Request for Interpretation – Posted October 4 - November 16, 2011 (Comment Form)
- Project 2009-22: Interpretation of COM-002-2 R2 for IRC – Posted October 4 - November 17, 2011 (Comment Form)
- Regional Reliability Standard SERC RRSD Procedures – Posted October 4 - November 18, 2011 (Comment Form)
- Project 2010-07: Generator Requirements at the Transmission Interface (FAC-001-1, FAC-003-X, FAC-003-3, PRC-004-2) – Posted October 5 - November 18, 2011 (Comment Form)
- Project 2008-10: Revision of CIP-006-1 R1.1 to address Progress Energy Request for Interpretation – Posted October 12 - November 21, 2011 (Comment Form)
- Regional Reliability Standard VAR-001-2 WECC Variance – Posted October 20 - December 5, 2011 (Comment Form)

- Project 2007-12: Frequency Response (BAL-003-1) – Posted October 25 - December 8, 2011 (Comment Form)

- Project 2009-01: Disturbance and Sabotage Reporting (EOP-004-2) – Posted October 28 - December 12, 2011 (Comment Form)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Posted November 7, 2011 - January 6, 2012 (Comment Form)

Current Ballots for Proposed Standards or Interpretations (ballot periods close at 8 p.m. Eastern)

- Interpretation 2011-INT-01: Revision of MOD-028 to address FPL Request for Interpretation – Open November 7-16, 2011 (Initial Ballot)

- Project 2009-22: Interpretation of COM-002-2 R2 for IRC – Open November 8-17, 2011 (Initial Ballot)

- Project 2010-07: Generator Requirements at the Transmission Interface (FAC-001-1, FAC-003-X, FAC-003-3, PRC-004-2) – Open November 9-18, 2011 (Initial Ballot)

- Project 2008-10: Interpretation of CIP-006-1 R1.1 for Progress Energy – Open November 11-21, 2011 (Successive Ballot)

Join Ballot Pools (ballot pool windows close at 8 a.m. Eastern)

- Project 2008-10: Interpretation of CIP-006-1 R1.1 for Progress Energy – Open October 12 - November 10, 2011 (Join Ballot Pool)

- Project 2007-12: Frequency Response (BAL-003-1) – Open October 25 - November 23, 2011 (Join Ballot Pools – Initial Ballot and Non-Binding Poll)

- Project 2009-01: Disturbance and Sabotage Reporting (EOP-004-2) – Open October 28 - November 28, 2011 (Join Ballot Pools – Initial Ballot and Non-Binding Poll)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Open November 7, 2011 - December 15, 2011 (Join Ballot Pool)

Pending Ballots for Proposed Standards or Interpretations (ballot periods close at 8

p.m. Eastern)

- Project 2007-12: Frequency Response (BAL-003-1) – Open November 30 - December 8, 2011 (Initial Ballot and Non-Binding Poll)

- Project 2009-01: Disturbance and Sabotage Reporting (EOP-004-2) – Open December 2-12, 2011 (Initial Ballot and Non-Binding Poll)

- Project 2008-06: Cyber Security Order 706 (Version 5 CIP Standards) – Open December 16, 2011 - January 6, 2012 (Initial Ballots)

Compliance Application Notices (CANs) Posted for Industry Review

- Comments due by November 9, 2011 to cancomments@nerc.net using the CAN Comment Form:

  - CAN-0020 TPL-002, TPL-003, TPL-004 and TOP-002 Equipment Maintenance Outages (Redline and Clean)

  - CAN-0030 Attestations (Redline and Clean)

- Comments due by November 23, 2011 to cancomments@nerc.net using the CAN Comment Form:

  - CAN-0040 BAL-004 Frequency Response Calculation (Clean Draft)

  - CAN-0043 PRC-005 Protection System Maintenance and Testing Evidence (Clean Draft)

Standard Drafting Team Vacancies

- Any industry stakeholder meeting the indicated qualifications for one of the following vacant appointments may submit a self-nomination form to sarcomm@nerc.com. Further instructions can be found on the Drafting Team Vacancies page on NERC's website.

  - Project 2007-06 System Protection Coordination: Seeking an individual from a Canadian entity with experience in coordination of protection systems (new installations and revisions).

  - Project 2007-12 Frequency Response: Seeking an individual representing Transmission Dependent Utilities with experience in analyzing or modeling frequency response.

- Project 2010-07 Generator Requirements at the Transmission Interface: Seeking an individual, preferably from a Regional Entity, with a compliance role or background. Candidate should have experience working with generation, transmission, or both. The candidate should also be familiar with the history of the GOTO Ad Hoc Group, recent registration activity, and the work of the Project 2010-07 SDT.

Upcoming Events

- Standards Committee Conference Call – November 10, 2011, 1-5 p.m. Eastern (Agenda)
- Compliance Workshop, Atlanta, GA – December 6, 2011, all day (Register)

For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

Importance:	High

RSC Members et al,

Attached please find our first NPCC Cost Effective Analysis Procedure "CEAP" Report for the NPCC UFLS Regional Standard. This report, as previously indicated, is developed by staff and based on the responses we received during the CEAP posting. We had a very good level of responses and also support for the standard. We will be posting this report, along with the standard and implementation plan during the ballot period.

In addition, Lee and I will be posting all the documents and procedures and processes we approved at the RSC meeting last week on the NPCC website. I want to thank you all for a very productive meeting last week.

I also will be sending out a list of the tentative RSC meeting dates we agreed to in Boston along with their venue soon. Please review the meeting dates for any potential conflicts with other meetings you may be attending and propose alternatives.

Thanks,

Guy V. Zito

Cost Effectiveness Analysis Procedure "CEAP"

For

NPCC Regional Reliability Standard
Underfrequency Load Shedding
PRC-006-NPCC-01

The NPCC Regional Standards Committee
11/4/2011

I. EXECUTIVE SUMMARY

During a 2010 FERC technical conference, the Commission recognized that "reliability does not come without cost" and significant industry interest was expressed in the development of a process to identify costs for draft Reliability Standards including the ability of the proposed Standard to achieve their reliability objective(s) in an efficient and cost effective manner. Additionally, the NPCC Board of Directors (BOD) during its consideration of the Disturbance Monitoring Regional Standard, requested the development of a formal procedure to assess the implementation costs and the relevant incremental reliability improvement (benefits) that a Regional Standard would provide.

Accordingly, NPCC Staff has developed a Cost Effectiveness Analysis Procedure (CEAP) and applied it to the PRC-006-NPCC-01 draft UFLS Regional Standard to address these concerns. Since the effort to draft an UFLS Regional Standard and revise the performance attributes of the program was underway prior to the development of the CEAP, in some cases this report relies on prior estimates to demonstrate adherence to the principles set forth in the CEAP.

The CEAP introduces two assessments of the estimated implementation costs of the requirements in a proposed draft Standard which include a Cost Benefit Analysis "CBA" and the Cost Effectiveness Analysis "CEA". These assessments are being incorporated into the Standard's development process. The purpose of the CEAP , conducted in parallel with the drafting process, is designed to provide supporting information and background for NPCC stakeholders, ballot body and the NPCC Board of Directors without delaying the development of the Standard. The CEAP also provides a "snapshot" of the cost of a proposed Standard, while soliciting input from a wide range of industry viewpoints, including NPCC's technical groups in order to determine if there is an adverse impact to reliability or affects potential adherence to other NPCC Regional or Continent wide Standards or Criteria should the draft Standard be approved.

This CEAP for PRC-006-NPCC-1 was developed by compiling the responses to questions posted for industry comment and some prior cost assessments during the development of NPCC Directory #12.

The results of the CEAP have determined that in the view of most stakeholders, the standard satisfactorily achieves an adequate level of reliability, is cost effective in achieving the reliability objective, has no adverse impact on reliability and is not cost prohibitive. Therefore, the NPCC Regional Standards Committee (RSC) recommends stakeholder and BOD adoption of this Standard.

II. COST BENEFIT ANALYSIS (PHASE 1)

NPCC performed a *Cost Benefit Analysis (CBA)* that was based on a number of factors and was used in determining whether a Regional Standard should proceed to development. Prior to the development of PRC-006-NPCC, the NPCC region had a regional UFLS program in place along with criteria that its Members were required to adhere to. In 2006 the NPCC technical groups assessed the adequacy of the regional UFLS program to determine if reliability objectives continued to be met and published the results in the "*2006 Assessment of Under frequency Load Shedding Adequacy Part III – Assessment of Program Modifications and 2008 Assessment of Under frequency Load Shedding Adequacy – Québec Area*". This study was approved by the Reliability Coordinating Committee "RCC" on November 19, 2008 along with a set of recommendations and an implementation schedule to initiate and complete the required changes. The decision to change the performance characteristics of the UFLS program was based on the critical importance of UFLS to maintain system stability, reliability prevent cascading outages.

The attributes of the new UFLS program were subsequently incorporated into NPCC Directory #12 and approved by the NPCC Full Members on June 26, 2009. Directory #12 is the foundation document for the NPCC UFLS Regional Standard and the cost information available to RCC and NPCC Full Members at that time was contained in a survey analysis performed by the Task Force on System Protection (TFSP). The estimated total cost of the UFLS program change and implementation was estimated to be approximately **$ 8M** for the region. This estimate represented only the cost of those who responded and did not reflect the potential total cost of compliance to the criteria within the region.

The decision to develop the NPCC UFLS Standard was based on the significant reliability benefit and the relatively low cost of development. The standard fills a reliability related need and achieves an adequate level of reliability by arresting frequency decay and maintaining stable islands after potential breakup while mitigating the probability of a cascading widespread outage. In addition the standard was fully coordinated with the NERC UFLS Continent-Wide Standard and developed to "augment" and implement that standard.

Additionally, the Standard closes a significant reliability gap since it requires all applicable regional entities to adhere to the programs requirements, regardless of their membership status with NPCC and a Members obligation to adhere to the criteria. Mandatory requirements subject to enforcement through legislation will demonstrate the importance of UFLS.

Finally, the CEAP revealed that many of the entities required to make changes associated with the new UFLS program have cost recovery mechanisms in place.

III. COST EFFECTIVENESS (PHASE 2)

The *Cost Effectiveness Analysis (CEA)* was performed to provide information about the effectiveness and relative cost of the Standard's requirements to achieve the objective or reliability goal for which the Standard was written. This involved a set of questions soliciting industry feedback on the technical feasibility of achieving the reliability objective of the Standard via its requirements and to solicit information on implementation costs, cost recovery, procurement of any resources needed to demonstrate compliance with the draft Standard.

These questions were focused on the individual requirements of the standard and all cost information submitted by entities was reviewed and compiled by NPCC Staff prior to being made public and presented to the RSC.

Market issues of individual stakeholders could exist or be revealed through the responses to the CEAP questions, therefore the necessary confidentialities have been maintained and no market sensitive information is revealed.

As part of determining cost effectiveness, the following questions were posted for a 30 day comment period and industry response;

1) **On a requirement by requirement basis, are the Requirements effective in achieving the reliability objective of the Standard and if not, why?**

2) **Are there alternative ways to achieve the draft Standard's reliability objective? If so, what alternatives are there and which requirements would they replace? This must be supported by studies done or be demonstrable.**

3) **On a requirement by requirement basis, do the draft requirements in the Standard achieve or contribute to a level of reliability that is "adequate", i.e. acceptable? If so, how? If not, why not?**

4) **Is there any adverse impact to reliability or any other existing standard, NPCC Regional Criteria, or in-process project draft Standard(s), of which your organization is aware?**

5) **Describe the size of your organization in broad general terms, e.g. GO-Total installed MWs, TOs circuit miles by kV and total load served, etc.**

6) **What are the gross anticipated one-time and ongoing costs of implementing the Standard as presently drafted (labor and materials)? Is there a cost recovery mechanism in place for your organization, i.e. markets or tariffs?**

NPCC received responses from market participants consisting of large and small Transmission Owners, Reliability Coordinators, Generator Owners and a Consultant. The entities who responded, in a strong majority, indicated their support of the Standard and that its requirements are effective in achieving its reliability objectives.

One of the respondents had some specific suggestions regarding alternate requirements and revising the requirements. These same comments were also submitted during the Standards development when comments were solicited and were reviewed by the Standard Drafting Team (SDT) which provided respective responses to the comments at that time and additionally revised the standard's requirements to address the issue.

The majority of respondents indicated that the standard achieves an adequate level of reliability. Those who did not were mainly representatives of Generators Owners (GO) who remain opposed to securing compensatory load shedding when they are unable to comply with the Standard's thresholds for underfrequency trip protection on their generators. The SDT had also revised the language of two of the standard's requirements to address this issue however the responding GOs either did not review the revisions or still have an issue.

No existing or anticipated adverse reliability impact as a result of the Standard's implementation has been identified. There was concern expressed by one of the respondents that NERC Project 2007-09-Generator Performance is currently underway and that there may be some interaction with this standard. NPCC is aware of this concern and an NPCC representative is currently a member of the Project 2007-09 SDT and is actively coordinating within the SDT to make certain that no adverse impact with the NPCC Regional Standard exists. Furthermore a change to the performance curve in that continent wide standard is being proposed to coordinate with the Hydro Quebec UFLS program which will largely mitigate this issue.

All those who responded indicated implementation costs were minimal with the exception of the Generator Owners who were uncertain about costs and indicated that no direct recovery mechanism was available to them. Respondents that did submit cost estimates recognized that implementation of Directory #12 which outlines the same requirements as the Standard is already underway and those costs have already been agreed upon by NPCC's Full Members.

IV. CEAP RECOMMENDATION

This CEAP recommendation to accept the standard is based on the following:

- The CBA completed prior to the development of this Standard by the Task Force on System Protection (TFSP), estimated a relatively minimal cost of approximately $8 M for the NPCC Region. The CEA cost of implementing the Underfrequency load shedding improvements, was estimated to be $9.5 M and is an effective investment to maintain the continuity and reliability of the electric power system. The respondents expressed their opinions that there were no viable alternatives to the methods proposed in the Standard to achieve the desired reliability objectives.

- The NPCC Reliability Coordinating Committee approved technical studies performed by SS-38 for this UFLS program.

- CEA industry responses indicating a majority of respondents showing support for the standard including : no adverse reliability impacts, reasonable costs, achievement of an adequate reliability. The majority of respondents indicated the standard contained effective requirements to achieve the reliability objective.

- RCC approved implementation of Directory#12 *UFLS Program Requirements* which has identical program requirements and an implementation plan which is already underway,

- NPCC RSC and SDT recommendations in support of the Standard and its requirements which they have endorsed as efficiently and are critical in effectively achieving the reliability objective of the standard.

Importance:	High

Reliablity Coordinating Committee Members and Alternates,

The NPCC Regional Regional Reliability Standard for UFLS, PRC-006-NPCC-01 is currently posted for ballot through **11:59 pm, November 18, 2011**. Posted materials for your review include the standard(developed from the existing RCC approved Directory #12 UFLS), Implementation Plan(which was developed from the RCC implementation plan for Directory #12)), and a Cost Effectiveness Analysis Procedure report (developed from a previous TFSP report with additional information from a recent open posting). The proposed standard will have minimal impact to the region in regard to additional work or resources required to implement.

Please have your organization review the standards and posted materials at:

https://www.npcc.org/Standards/SitePages/DevStandardDetail.aspx?DevDocumentId=4

Please ensure your organization's representive reviews the materials and casts their vote accordingly. If you have any questions please contact me.

Thank-you,

Guy V. Zito

November 7th, 2011

NPCC Full and General Members;

In accordance with the NPCC Regional Standard Development Procedure a notification of ballot has been posted for *NPCC Regional Standard PRC-006-1 Automatic Underfrequency Load Shedding* and its associated Implementation Plan.

The Task Force on System Studies (TFSS) and the Reliability Coordinating Committee (RCC) have each endorsed the draft of this standard and on September 30th, 2011 the NPCC Regional Standards Committee (RSC) authorized a 30 day pre-ballot review and subsequent 10 day ballot period.

Additionally, in response to a request from the NPCC BOD, NPCC has developed a Cost Effectiveness Analysis Procedure (CEAP) designed to assess the implementation costs and reliability benefit of this proposed standard. The results of that analysis have been summarized and included with the ballot materials.

Ballots may be cast effective immediately until the close of the ballot period at 2359 EST on November 18th, 2011.

The draft Standard, its Implementation Plan and the results of the Cost Effectiveness Analysis Procedure (CEAP) are posted on the NPCC Website and can be viewed at:

https://www.npcc.org/Standards/SitePages/DevStandardDetail.aspx?DevDocumentId=4

Please contact me with any questions regarding posted ballot materials, the NPCC Regional Standard Development Procedure or the Cost Effectiveness Analysis Procedure.

Respectfully,

Gerry Dunbar

November 21st, 2011

NPCC Full and General Members;

In accordance with the NPCC Regional Standard Development Procedure the ballot period for NPCC Regional Standard *PRC -006-NPCC -01 Automatic Underfrequency Load Shedding* and its Implementation Plan closed at 2359 on November 18th, 2011.

The results of the ballot were as follows:

Quorum: 100% of Sectors participated.

Approval: 83.5%

A recommendation for final Regional approval will be sent to the NPCC Board of Directors for their consideration at their meeting on November 30th, 2011.

Contingent upon the approval of the NPCC BOD the Standard will be submitted to NERC for approval by the Board of Trustees with subsequent filings with the FERC and applicable provincial authorities thereafter.

Voting was conducted electronically and the full development record for the standard may be viewed at:

https://www.npcc.org/Standards/SitePages/DevStandardDetail.aspx?DevDocumentId=4

Thank you for your participation.

November 7th, 2011

NPCC Full and General Members;

In accordance with the NPCC Regional Standard Development Procedure a notification of ballot has been posted for NPCC Regional Standard PRC-006-1 *Automatic Underfrequency Load Shedding* and its associated Implementation Plan.

The Task Force on System Studies (TFSS) and the Reliability Coordinating Committee (RCC) have each endorsed the draft of this standard and on September 30th, 2011 the NPCC Regional Standards Committee (RSC) authorized a 30 day pre-ballot review and subsequent 10 day ballot period.

Additionally, in response to a request from the NPCC BOD, NPCC has developed a Cost Effectiveness Analysis Procedure (CEAP), designed to assess the implementation costs and reliability benefit of this proposed standard. The results of that analysis have been summarized and included with the ballot materials.

Ballots may be cast effective immediately until the close of the ballot period at 2359 EST on November 18th, 2011.

The draft Standard, its Implementation Plan, and the results of the Cost Effectiveness Analysis Procedure (CEAP) are posted on the NPCC Website and can be viewed at:

https://www.npcc.org/Standards/SitePages/DevStandardDetail.aspx?DevDocumentId=4

Please contact me with any questions regarding posted ballot materials, the NPCC Regional Standard Development Procedure or the Cost Effectiveness Analysis Procedure.

Respectfully,

Gerry Dunbar

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. NPCC Regional Standards Committee (RSC) authorized posting UFLS RSAR development on August 20, 2008.
2. UFLS RSAR posted on NPCC website on August 25, 2008.
3. NPCC Reliability Coordinating Committee (RCC) approved the Task Force on System Studies (TFSS) as the lead task force to initiate drafting a UFLS Regional Standards on September 4, 2008.
4. NPCC UFLS Regional Standard Drafting Team initial meeting on January 27, 2009.
5. First draft posted on the NPCC Website July 13, 2009 for a 45 day comment period.
6. Second draft posted on the NPCC Website May 26, 2010 for a 45 day comment period.
7. Third draft posted on the NPCC Website May 6, 2011 for a 45 day comment period.

Description of Current Draft:

This is the third draft of the proposed standard.

Future Development Plan:

Anticipated Action	Anticipated Date
1. Post the initial draft of the standard for 45 day comment period.	July 13, 2009 to August 27, 2009
2. Respond to comments on the first posting and post revised standard and implementation plan for a 45 day comment period.	September 2009 to May 2010 May 26, 2010 to July 9th, 2010
3. Respond to comments on the 2nd posting.	July 2010 to October 2010
4. Obtain RSC approval to move the standard forward to balloting.	November 2010
5. Post the standard and implementation plan for a 30 day pre ballot review.	December 2010

6. Conduct a ten day ballot.	December 2010
7. Respond to ballot comments and post revised standard and implementation plan for a 45 day comment period.	May, 2011.
8. Respond to comments on the 3rd posting.	July 2011
9. Obtain RSC approval to move the standard forward to balloting.	August 2011
10. Post the standard and implementation plan for a 30 day pre ballot review.	August 2011
11. Conduct a ten day ballot.	September 2011
12. Membership Approval.	September 2011.

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the NERC Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the NPCC Glossary.

In the standards, defined terms are indicated with its first letter capitalized.

A. Introduction

1. Title: **Automatic Underfrequency Load Shedding**

2. Number: PRC-006-NPCC-1

3. Purpose: To provide a regional reliability standard that ensures the development of an effective automatic underfrequency load shedding (UFLS) program in order to preserve the security and integrity of the bulk power system during declining system frequency events in coordination with the NERC UFLS reliability standard characteristics.

4. Applicability:

4.1. Generator Owner

4.2. Planning Coordinator

4.3. Distribution Provider

4.4. Transmission Owner

5. (Proposed) Effective Date: To be established.

B. Requirements

R1 Each Planning Coordinator shall establish requirements for entities aggregating their UFLS programs for each anticipated island and requirements for compensatory load shedding based on islanding criteria (required by the NERC PRC Standard on UFLS). [Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]

R2 Each Planning Coordinator shall, within 30 days of completion of its system studies required by the NERC PRC Standard on UFLS, identify to the Regional Entity the generation facilities within its Planning Coordinator Area necessary to support the UFLS program performance characteristics. [Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]

R3 Each Planning Coordinator shall provide to the Transmission Owner, Distribution Provider, and Generator Owner within 30 days upon written request the requirements for entities aggregating the UFLS programs and requirements for compensatory load shedding program derived from each Planning Coordinator's system studies as determined by Requirement R1. [Violation Risk Factor: Low] [Time Horizon: Long Term Planning]

R4 Each Distribution Provider and Transmission Owner in the Eastern Interconnection portion of NPCC shall implement an automatic UFLS program reflecting normal operating conditions excluding outages for its Facilities based on frequency thresholds, total nominal operating time and amounts specified in Attachment C, Tables 1 through 3, or shall collectively implement by mutual agreement with one or more Distribution Providers and Transmission Owners within the same island identified in Requirement R1 and acting as a single entity, provide an aggregated automatic UFLS program that sheds their coincident peak aggregated net Load, based on frequency thresholds, total nominal operating time and amounts specified in Attachment C, Tables 1 through 3. [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R5 Each Distribution Provider or Transmission Owner that must arm its load to trip on underfrequency in order to meet its requirements as specified and by doing so exceeds the tolerances and/or deviates from the number of stages and frequency set points of the UFLS program as specified in the tables contained in Requirement R4 above, as applicable depending on its total peak net Load shall: [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

5.1 Inform its Planning Coordinator of the need to exceed the stated tolerances or the number of stages as shown in UFLS Attachment C, Table 1 if applicable and

5.2 Provide its Planning Coordinator with a technical study that demonstrates that the Distribution Providers or Transmission Owners specific deviations from the requirements of UFLS Attachment C, Table 1 will not have a significant adverse impact on the bulk power system.

5.3 Inform its Planning Coordinator of the need to exceed the stated tolerances of UFLS Attachment C, Table 2 or Table 3, and in the case of Attachment C, Table 2 only, the need to deviate from providing two stages of UFLS, if applicable, and

5.4 Provide its Planning Coordinator with an analysis demonstrating that no alternative load shedding solution is available that would allow the Distribution Provider or Transmission Owner to comply with UFLS Attachment C Table 2 or Attachment C Table 3.

R6 Each Distribution Provider and Transmission Owner in the Québec Interconnection portion of NPCC shall implement an automatic UFLS program for its Facilities based on the frequency thresholds, slopes, total nominal operating time and amounts specified in Attachment C, Table 4 or shall collectively implement by mutual agreement with one or more Distribution Providers and Transmission Owners within the same island, identified in Requirement R1, an aggregated automatic UFLS program that sheds Load based on the frequency thresholds, slopes, total nominal operating time and amounts specified in Attachment C, Table 4. [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R7 Each Distribution Provider and Transmission Owner shall set each underfrequency relay that is part of its region's UFLS program with the following minimum time delay:

7.1 Eastern Interconnection – 100 ms

7.2 Québec Interconnection – 200 ms

[Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R8 Each Planning Coordinator shall develop and review once per calendar year settings for inhibit thresholds (such as but not limited to voltage, current and time) to be utilized within its region's UFLS program. [Violation Risk Factor: Medium] [Time Horizon: Long Term Planning]

R9 Each Planning Coordinator shall provide each Transmission Owner and Distribution Provider within its Planning Coordinator area the applicable inhibit thresholds within 30 days of the initial determination of those inhibit thresholds and within 30 days of any changes to those thresholds. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R10 Each Distribution Provider and Transmission Owner shall implement the inhibit threshold settings based on the notification provided by the Planning Coordinator in accordance with Requirement R9. [Violation Risk Factor: High] [Time Horizon: Operations Planning]

R11 Each Distribution Provider and Transmission Owner shall develop and submit an implementation plan within 90 days of the request from the Planning Coordinator for approval by the Planning Coordinator in accordance with R9. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R12 Each Transmission Owner and Distribution Provider shall annually provide documentation, with no more than 15 months between updates, to its Planning Coordinator of the actual net Load that would have been shed by the UFLS relays at each UFLS stage coincident with their integrated hourly peak net Load during the previous year, as determined by measuring actual metered Load through the switches that would be opened by the UFLS relays. [Violation Risk Factor: Lower] [Time Horizon: Long Term Planning]

R13 Each Generator Owner shall set each generator underfrequency trip relay, if so equipped, below the appropriate generator underfrequency trip protection settings threshold curve in Figure 1, except as otherwise exempted in Requirements R16 and R19. [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R14 Each Generator Owner shall transmit the generator underfrequency trip setting and time delay to its Planning Coordinator within 45 days of the Planning Coordinator's request. [Violation Risk Factor: High] [Time Horizon: Operations Planning]

R15 Each Generator Owner with a new generating unit, scheduled to be in service on or after the effective date of this Standard, or an existing generator increasing its net capability by greater than 10% shall: [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

15.1 Design measures to prevent the generating unit from tripping directly or indirectly for underfrequency conditions above the appropriate generator tripping threshold curve in Figure 1.

15.2 Design auxiliary system(s) or devices used for the control and protection of auxiliary system(s), necessary for the generating unit operation such that they will not trip the generating unit during underfrequency conditions above the appropriate generator underfrequency trip protection settings threshold curve in Figure 1.

R16 Each Generator Owner of existing non-nuclear units in service prior to the effective date of this standard that have underfrequency protections set to trip above the appropriate curve in Figure 1 shall: [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

16.1 Set the underfrequency protection to operate at the lowest frequency allowed by the plant design and licensing limitations.

16.2 Transmit the existing underfrequency settings and any changes to the underfrequency settings along with the technical basis for the settings to the Planning Coordinator.

16.3 Have compensatory load shedding, as provided by a Distribution Provider or Transmission Owner that is adequate to compensate for the loss of their generator due to early tripping.

R17 Each Planning Coordinator in Ontario, Quebec and the Maritime provinces shall apply the criteria described in Attachment A to determine the compensatory load shedding that is required in Requirement R16.3 for generating units in its respective NPCC area. [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R18 Each Generator Owner, Distribution Provider or Transmission Owner within the Planning Coordinator area of ISO-NE or the New York ISO shall apply the criteria described in Attachment B to determine the compensatory load shedding that is required in Requirement R16.3 for generating units in its respective NPCC area. [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R19 Each Generator Owner of existing nuclear generating plants with units that have underfrequency relay threshold settings above the Eastern Interconnection generator tripping curve in Figure 1, based on their licensing design basis, shall: [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

19.1 Set the underfrequency protection to operate at as low a frequency as possible in accordance with the plant design and licensing limitations but not greater than 57.8Hz.

19.2 Set the frequency trip setting upper tolerance to no greater than + 0.1 Hz.

19.3 Transmit the initial frequency trip setting and any changes to the setting and the technical basis for the settings to the Planning Coordinator.

R20 The Planning Coordinator shall update its UFLS program database as specified by the NERC PRC Standard on UFLS. This database shall include the following information: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

20.1 For each UFLS relay, including those used for compensatory load shedding, the amount and location of load shed at peak, the corresponding frequency threshold and time delay settings.

20.2 The buses at which the Load is modeled in the NPCC library power flow case.

20.3 A list of all generating units that may be tripped for underfrequency conditions above the appropriate generator underfrequency trip protection settings threshold curve in Figure 1, including the frequency trip threshold and time delay for each protection system.

20.4 The location and amount of additional elements to be switched for voltage control that are coordinated with UFLS program tripping.

20.5 A list of all UFLS relay inhibit functions along with the corresponding settings and locations of these relays.

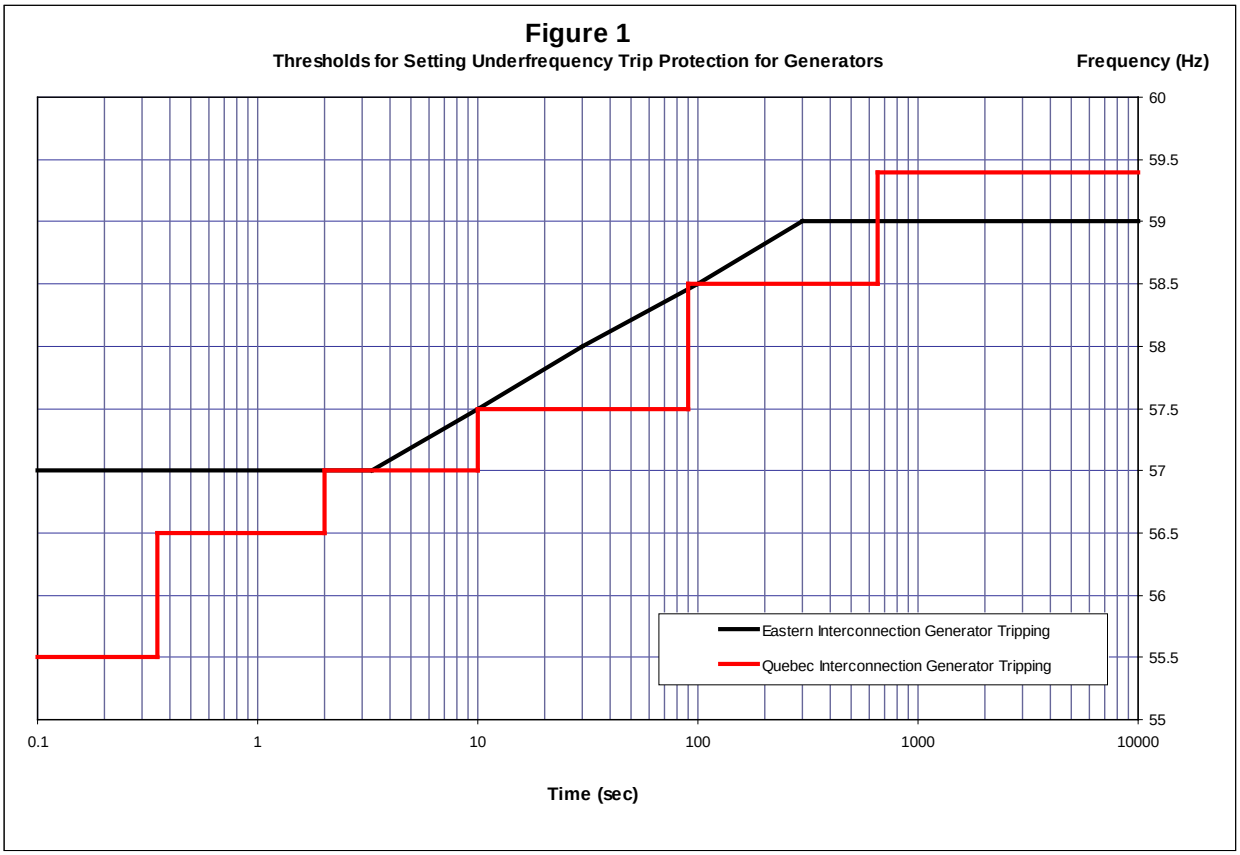
R21 Each Planning Coordinator shall notify each Distribution Provider, Transmission Owner, and Generator Owner within its Planning Coordinator area of changes to load distribution needed to satisfy UFLS program performance characteristics as specified by the NERC PRC Standard on UFLS.[Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R22 Each Distribution Provider, Transmission Owner and Generator Owner shall implement the load distribution changes based on the notification provided by the Planning Coordinator in accordance with Requirement R21. [Violation Risk Factor: High] [Time Horizon: Long Term Planning]

R23 Each Distribution Provider, Transmission Owner and Generator Owner shall develop and submit an implementation plan within 90 days of the request from the Planning Coordinator for approval by the Planning Coordinator in accordance with Requirement R21. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

Figure 1

Thresholds for Setting Underfrequency Trip Protection for Generators



C. Measures

M1 Each Planning Coordinator shall have evidence such as reports, system studies and/or real time power flow data captured from actual system events and other dated documentation that demonstrates it meets Requirement R1.

M2. Each Planning Coordinator shall have evidence such as dated documentation that demonstrates that it meets requirement R2.

M3 Each Planning Coordinator shall have evidence such as dated documentation that demonstrates that it meets Requirement R3.

M4 Each Distribution Provider and Transmission Owner in the Eastern Interconnection portion of NPCC shall have evidence such as documentation or reports containing the location and amount of load to be tripped, and the corresponding frequency thresholds, on those circuits included in its UFLS program to achieve the individual and cumulative percentages identified in Requirement R4. (Attachment C Tables 1-3).

M5 Each Distribution Provider or Transmission Owner shall have evidence such as reports, analysis, system studies and dated documentation that demonstrates that it meets Requirement R5.

M6 Each Distribution Provider and Transmission Owner in the Québec Interconnection shall have evidence such as documentation or reports containing the location and amount of load to be tripped and the corresponding frequency thresholds on those circuits included in its UFLS program to achieve the load values identified in Table 4 of Requirement R6. (Attachment C Table 4).

M7 Each Distribution Provider and Transmission Owner shall have evidence such as documentation or reports that their underfrequency relays have been set with the minimum time delay, in accordance with Requirement R7.

M8 Each Planning Coordinator shall have evidence such as reports, system studies or analysis that demonstrates that it meets Requirement R8.

M9 Each Planning Coordinator shall provide evidence such as letters, emails, or other dated documentation that demonstrates that it meets Requirement R9.

M10 Each Distribution Provider and Transmission Owner shall provide evidence such as test reports, data sheets or other documentation that demonstrates that it meets Requirement R10.

M11 Each Distribution Provider and Transmission Owner shall provide evidence such as letters, emails or other dated documentation that demonstrates that it meets Requirement R11.

M12 Each Distribution Provider and Transmission Owner shall provide evidence such as reports, spreadsheets or other dated documentation submitted to its Planning Coordinator that indicates the frequency set point, the net amount of load shed and the percentage of its peak load at each stage of its UFLS program coincident with the integrated hourly peak of the previous year that demonstrates that it meets Requirement R12.

M13 Each Generator Owner shall provide evidence such as reports, data sheets, spreadsheets or other documentation that demonstrates that it meets Requirement R13.

M14 Each Generator Owner shall provide evidence such as emails, letters or other dated documentation that demonstrates that it meets Requirement R14.

M15 Each Generator Owner shall provide evidence such as reports, data sheets, specifications, memorandum or other documentation that demonstrates that it meets Requirement R15.

M16 Each Generator Owner with existing non-nuclear units in service prior to the effective date of this Standard which have underfrequency tripping that is not compliant with Requirement R13 shall provide evidence such as reports, spreadsheets, memorandum or dated documentation demonstrating that it meets Requirement R16.

M17 Each Planning Coordinator in Ontario, Quebec and the Maritime provinces shall provide evidence such as emails, memorandum or other documentation that demonstrates that it followed the methodology described in Attachment A and meets Requirement R17.

M18 Each Generator Owner, Distribution Provider or Transmission Owner within the Planning Coordinator area of ISO-NE or the New York ISO shall provide evidence such as emails, memorandum, or other documentation that demonstrates that it followed the methodology described in Attachment B and meets Requirement R18.

M19 Each Generator Owner of nuclear units that have been specifically identified by NPCC as having generator trip settings above the generator trip curve in Figure 1 shall provide evidence such as letters, reports and dated documentation that demonstrates that it meets Requirement R19.

M20 Each Planning Coordinator shall provide evidence such as spreadsheets, system studies, or other documentation that demonstrates that it meets the requirements of Requirement R20.

M21 Each Planning Coordinator shall provide evidence such as emails, memorandum or other dated documentation that it meets Requirement R21.

M22 Each Distribution Provider, Transmission Owner and Generator Owner shall provide evidence such as reports, spreadsheets or other documentation that demonstrates that it meets Requirement R22.

M23 Each Distribution Provider, Transmission Owner and Generator Owner shall provide evidence such as letters, emails or other dated documentation that demonstrates it meets Requirement 23.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

NPCC Compliance Committee

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Data Retention

The Distribution Provider and Transmission Owner shall keep evidences for three calendar years for Measures 4, 5, 6,7,10, 11, and 12.

The Planning Coordinator shall keep evidence for three calendar years for Measures 1, 2, 3, 8, 9, 20, and 21.

The Planning Coordinator in Ontario, Quebec, and the Maritime Provinces shall keep evidence for three calendar years for Measure 17.

The Distribution Provider, Transmission Owner, and Generator Owner shall keep evidences for three calendar years for Measures 18, 22, and 23.

The Generator Owner shall keep evidence for three calendar years for Measures 13, 14, 15, 16, and 19.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	**N/A**	Planning Coordinator did not establish requirements for entities aggregating their UFLS programs. or Did not establish requirements for compensatory load shedding.	Planning Coordinator did not establish requirements for entities aggregating their UFLS programs and did not establish requirements for compensatory load shedding.
R2	The Planning Coordinator identified the generation facilities within its Planning Coordinator Area necessary to support the UFLS program, but did so more than 30 days but less than 41 days after completion of the system studies.	The Planning Coordinator identified the generation facilities within its Planning Coordinator Area necessary to support the UFLS program, but did so more than 40 days but less than 51 days after completion of the system studies.	The Planning Coordinator identified the generation facilities within its Planning Coordinator Area necessary to support the UFLS program, but did so more than 50 days but less than 61 days after completion of the system studies.	The Planning Coordinator identified the generation facilities within its Planning Coordinator Area necessary to support the UFLS program, but did so more than 60 days after completion of the system studies. or The Planning Coordinator did not identify the generation facilities within its Planning Coordinator Area necessary to support the UFLS program.
R3	The Planning Coordinator provided the requested information, but did so more than 30 days but less than 41 days to the requesting entity.	The Planning Coordinator provided the requested information, but did so more than 40 days but less than 51 days to the requesting entity.	The Planning Coordinator provided the requested information, but did so more than 50 days but less than 61 days to the requesting entity.	The Planning Coordinator provided the requested information, but did so more than 60 days after the request. or The Planning Coordinator failed to provide the requested information.

R4	N/A	N/A	N/A	The Distribution Provider or Transmission Owner failed to implement an automatic UFLS program reflecting normal operating conditions excluding outages, for its Facilities or collectively implemented by mutual agreement with one or more Distribution Providers and Transmission Owners within the same island identified in Requirement R1, an aggregated automatic UFLS program that sheds Load based on frequency thresholds, total nominal operating time, and amounts specified in the appropriate included tables.
R5	N/A	The Distribution Provider or Transmission Owner armed its load to trip on underfrequency in order to meet its minimum obligations and by doing so exceeded the tolerances and/or deviated from the number of stages and frequency set points of the UFLS program as specified in the tables contained in Attachment C, as applicable depending on their total peak net Load, but did not inform the Planning Coordinator of the need to exceed the stated tolerances of UFLS Table 2 or Table 3, and in the case of Table	The Distribution Provider or Transmission Owner armed its load to trip on underfrequency in order to meet its minimum obligations and by doing so exceeded the tolerances and/or deviated from the number of stages and frequency set points of the UFLS program as specified in the tables contained in Attachment C, as applicable depending on their total peak net Load, but did not provide the Planning Coordinator with an analysis demonstrating that no alternative load shedding solution is available that would allow the Distribution Provider or	The Distribution Provider or Transmission Owner did not arm its load to trip on underfrequency in order to meet its minimum obligations and in doing so exceeded the tolerances and/or deviated from the number of stages and frequency set points of the UFLS program as specified in the tables contained in Attachment C, as applicable depending on their total peak net Load.

		2 only, the need to deviate from providing two stages of UFLS.	Transmission Owner to comply with the appropriate table.	
R6	N/A	N/A	T	The Distribution Provider or Transmission Owner in the Québec Interconnection portion of NPCC did not implement an automatic UFLS program for its Facilities based on the frequency thresholds, slopes, total nominal operating time and amounts specified in Attachment C, Table 4 or did not collectively implement by mutual agreement with one or more Distribution Providers and Transmission Owners within the same island, identified in Requirement R1, an aggregated automatic UFLS program that sheds Load based on the frequency thresholds, slopes, total nominal operating time and amounts specified in Attachment C, Table 4.
R7	N/A	N/A	N/A	The Distribution Provider or Transmission Owner failed to set

				an underfrequency relay that is part of its region's UFLS program as specified in Requirement R7.
R8		N/A	The Planning Coordinator developed inhibit thresholds as specified in Requirement R8 but did not perform the review once per calendar year.	The Planning Coordinator did not develop inhibit thresholds as specified in Requirement R8.
R9	The Planning Coordinator provided to a Transmission Owner or Distribution Provider within its Planning Coordinator area the applicable inhibit thresholds more than 30 days but less than 41 days of the initial determination or any subsequent change to the inhibit thresholds.	The Planning Coordinator provided to a Transmission Owner or Distribution Provider within its Planning Coordinator area the applicable inhibit thresholds more than 40 days but less than 51 days of the initial determination or any subsequent change to the inhibit thresholds.	The Planning Coordinator provided to a Transmission Owner or Distribution Provider within its Planning Coordinator area the applicable inhibit thresholds more than 50 days but less than 61 days of the initial determination or any subsequent change to the inhibit thresholds.	The Planning Coordinator provided to a Transmission Owner or Distribution Provider within its Planning Coordinator area the applicable inhibit thresholds more than 60 days after the initial determination or any subsequent change to the inhibit thresholds. or The Planning Coordinator did not provide to a Transmission Owner or Distribution Provider within its Planning Coordinator area the applicable inhibit thresholds.
R10	N/A	N/A	N/A	The Distribution Provider or Transmission Owner did not implement the inhibit threshold based on the notification provided by the Planning Coordinator in accordance with Requirement R9.

R11	The Distribution Provider or Transmission Owner developed and submitted its implementation plan more than 90 days but less than 101 days after the request from the Planning Coordinator.	The Distribution Provider or Transmission Owner developed and submitted its implementation plan more than 100 days but less than 111 days after the request from the Planning Coordinator.	The Distribution Provider or Transmission Owner developed and submitted its implementation plan more than 110 days but less than 121 days after the request from the Planning Coordinator.	The Distribution Provider or Transmission Owner developed and submitted its implementation plan more than 120 days after the request from the Planning Coordinator. or The Distribution Provider or Transmission Owner did not develop its implementation plan.
R12				The Transmission Owner or Distribution Provider did not provide documentation to its Planning Coordinator of actual net load data or updates to the data that would be shed by the UFLS relays, as determined by measuring actual metered load through the switches that would be opened by the UFLS relays, that were armed to shed at each UFLS stage coincident with their integrated hourly peak during the previous year.
R13	N/A	N/A	N/A	The Generator Owner did not set each generator underfrequency trip relay, if so equipped, below the appropriate generator underfrequency trip protection settings threshold curve in Figure 1, except as otherwise exempted.

R14	The Generator Owner transmitted the generator underfrequency trip setting and time delay to its Planning Coordinator more than 45 days and less than 56 days of the Planning Coordinator's request.	The Generator Owner transmitted the generator underfrequency trip setting and time delay to its Planning Coordinator more than 55 days and less than 66 days of the Planning Coordinator's request.	The Generator Owner transmitted the generator underfrequency trip setting and time delay to its Planning Coordinator more than 65 days and less than 76 days of the Planning Coordinator's request.	The Generator Owner transmitted the generator underfrequency trip setting and time delay to its Planning Coordinator more than 75days after the Planning Coordinator's request. or The Generator Owner did not transmit the generator underfrequency trip setting and time delay to its Planning Coordinator.
R15	N/A	N/A	The Generator Owner did not fulfill the obligation of Requirement R15; Part 15.1 OR did not fulfill the obligation of Requirement R15, Part 15.2.	The Generator Owner did not fulfill the obligation of Requirement R15, Part 15.1 and did not fulfill the obligation of Requirement R15, Part 15.2.
R16	N/A	The Generator Owner did not fulfill the obligation of Requirement R16, Part 16.2.	The Generator Owner did not fulfill the obligation of Requirement R16; Part 16.1 OR did not fulfill the obligation of Requirement R16, Part 16.3.	The Generator Owner did not fulfill the obligation of Requirement R16, Part 16.1 and did not fulfill the obligation of Requirement R16, Part 16.3.

R17	N/A	N/A	N/A	The Planning Coordinator did not apply the methodology described in Attachment A to determine the compensatory load shedding that is required.
R18	N/A	N/A	N/A	The Generator Owner, Distribution Provider, or Transmission Owner did not apply the methodology described in Attachment B to determine the compensatory load shedding that is required.
R19	N/A	The Generator Owner did not fulfill the obligation of Requirement R19, Part 19.3.	The Generator Owner did not fulfill the obligation of Requirement R19; Part 19.1 OR did not fulfill the obligation of Requirement R19, Part 19.2.	The Generator Owner did not fulfill the obligation of Requirement R19, Part 19.1 and did not fulfill the obligation of Requirement R19, Part 19.2.
R20	The Planning Coordinator did not have data in its database for one of the parameters listed in Requirement 20, Parts 20.1 through 20.5.	The Planning Coordinator did not have data in its database for two of the parameters listed in Requirement 20, Parts 20.1 through 20.5.	The Planning Coordinator did not have data in its database for three of the parameters listed in Requirement 20, Parts 20.1 through 20.5.	The Planning Coordinator did not have data in its database for four or more of the parameters listed in Requirement 20, Parts 20.1 through 20.5.

R21	N/A	N/A	N/A	The Planning Coordinator did not notify a Distribution Provider, Transmission Owner, or Generator Owner within its Planning Coordinator area of changes to load distribution needed to satisfy UFLS program requirements.
R22	N/A	N/A	N/A	The Distribution Provider, Transmission Owner, or Generator Owner did not implement the load distribution changes based on the notification provided by the Planning Coordinator.
R23	The Distribution Provider. Transmission Owner or Generator Owner developed and submitted its implementation plan more than 90 days but less than 101 days after the request from the Planning Coordinator.	The Distribution Provider. Transmission Owner or Generator Owner developed and submitted its implementation plan more than 100 days but less than 111 days after the request from the Planning Coordinator.	The Distribution Provider. Transmission Owner or Generator Owner developed and submitted its implementation plan more than 110 days but less than 121 days after the request from the Planning Coordinator.	The Distribution Provider. Transmission Owner or Generator Owner developed and submitted its implementation plan more than 120 days after the request from the Planning Coordinator. or The Distribution Provider. Transmission Owner or Generator Owner did not develop its implementation plan.

PRC-006-NPCC-1 Attachment A

Compensatory Load Shedding Criteria for Ontario, Quebec, and the Maritime Provinces:

The Planning Coordinator in Ontario, Quebec and the Maritime provinces is responsible for establishing the compensatory load shedding requirements for all existing non-nuclear units in its NPCC area with underfrequency protections set to trip above the appropriate curve in Figure 1. In addition, it is the Planning Coordinator's responsibility to communicate these requirements to the appropriate Distribution Provider or Transmission Owner and to ensure that adequate compensatory load shedding is provided in all islands identified in Requirement R1 in which the unit may operate.

The methodology below provides a set of criteria for the Planning Coordinator to follow for determining compensatory load shedding requirements:

1. The Planning Coordinator shall identify, compile and maintain an updated list of all existing non-nuclear generating units in service prior to the effective date of this standard that have underfrequency protections set to trip above the appropriate curve in Figure 1. The list shall include the following information for each unit:

    1.1 Generator name and generating capacity
    1.2 Underfrequency protection trip settings, including frequency trip set points and time delays
    1.3 Physical and electrical location of the unit
    1.4 All islands within which the unit may operate, as identified in Requirement R1

2. For each generating unit identified in (1) above, the Planning Coordinator shall establish the requirements for compensatory load shedding based on criteria outlined below:

    2.1 Arrange for a Distribution Provider or Transmission Owner that owns UFLS relays within the island(s) identified by the Planning Coordinator in Requirement R1 within which the generator may operate to provide compensatory load shedding.

    2.2 The compensatory load shedding that is provided by the Distribution Provider or Transmission Owner shall be in addition to the amount that the Distribution Provider or Transmission Owner is required to shed as specified in Requirement R4..

    2.3 The compensatory load shedding shall be provided at the UFLS program stage (or threshold stage for Quebec) with a frequency threshold setting that corresponds to the highest frequency at which the subject generator will trip above the appropriate curve in Figure 1 during an underfrequency event. If the highest

frequency at which the subject generator will trip above the appropriate curve in Figure 1 does not correspond to a specific UFLS program stage threshold setting, the compensatory load shedding shall be provided at the UFLS program stage with a frequency threshold setting that is higher than the highest frequency at which the subject generator will trip above the appropriate curve in Figure 1.

2.4 The amount of compensatory load shedding shall be equivalent (±5%) to the average net generator megawatt output for the prior two calendar years, as specified by the Planning Coordinator, plus expected station loads to be transferred to the system upon loss of the facility. The net generation output should only include those hours when the unit was a net generator to the electric system.

In the specific instance of a generating unit that has been interconnected to the electric system for less than two calendar years, the amount of compensatory load shedding shall be equivalent (±5%) to the maximum claimed seasonal capability of the generator over two calendar years, plus expected station loads to be transferred to the system upon loss of the facility.

PRC-006-NPCC-1 Attachment B

Compensatory Load Shedding Criteria for ISO-NE and NYISO:

The Generator Owner in the New England states or New York State are responsible for establishing a compensatory load shedding program for all existing non-nuclear units with underfrequency protection set to trip above the appropriate curve in Figure 1 of this standard. The Generator Owner shall follow the methodology below to determine compensatory load shedding requirements:

1. The Generator Owner shall identify and compile a list of all existing non-nuclear generating units in service prior to the effective date of this standard that has underfrequency protection set to trip above the appropriate curve in Figure 1. The list shall include the following information associated with each unit:

    1.1 Generator name and generating capacity
    1.2 Underfrequency protection trip settings, including frequency trip set points and time delays
    1.3 Physical and electrical location of the unit
    1.4 Smallest island within which the unit may operate as identified by the Planning Coordinator in Requirement R1 of this Standard.

2. For each generating unit identified in (1) above, the Generator Owner shall establish the requirements for compensatory load shedding based on criteria outlined below:

    2.1 In cases where a Distribution Provider or Transmission Owner has coordinated protection settings with the Generator Owner to cause the generator to trip above the appropriate curve in Figure 1, the Distribution Provider or Transmission Owner is responsible to provide the appropriate amount of compensatory load to be shed within the smallest island identified by the Planning Coordinator in Requirement R1 of this standard.

    2.2 In cases where a Generator Owner has a generator that cannot physically meet the set points defined by the appropriate curve in Figure 1, the Generator Owner shall arrange for a Distribution Provider or Transmission Owner to provide the appropriate amount of compensatory load to be shed within the smallest island identified by the Planning Coordinator in Requirement R1 of this standard.

    2.3 The compensatory load shedding that is provided by the Distribution Provider or Transmission Owner shall be in addition to the amount that the Distribution Provider or Transmission Owner is required to shed as specified in Requirement R4.

2.4 The compensatory load shedding shall be provided at the UFLS program stage with the frequency threshold setting at or closest to but above the frequency at which the subject generator will trip.

2.5 The amount of compensatory load shedding shall be equivalent (±5%) to the average net generator megawatt output for the prior two calendar years, as specified by the Planning Coordinator, plus expected station loads to be transferred to the system upon loss of the facility. The net generation output should only include those hours when the unit was a net generator to the electric system.

In the specific instance of a generating unit that has been interconnected to the electric system for less than two calendar years, the amount of compensatory load shedding shall be equivalent (±5%) to the maximum claimed seasonal capability of the generator over two calendar years, plus expected station loads to be transferred to the system upon loss of the facility.

PRC-006-NPCC-1 Attachment C

UFLS Table 1: Eastern Interconnection

Distribution Providers and Transmission Owners with 100 MW or more of peak net Load shall implement a UFLS program with the following attributes:

Frequency Threshold (Hz)	Total Nominal Operating Time (s)[1]	Load Shed at Stage as % of TO or DP Load	Cumulative Load Shed as % of TO or DP Load
59.5	0.30	6.5 – 7.5	6.5 – 7.5
59.3	0.30	6.5 – 7.5	13.5 – 14.5
59.1	0.30	6.5 – 7.5	20.5 – 21.5
58.9	0.30	6.5 – 7.5	27.5 – 28.5
59.5	10.0	2 – 3	29.5 – 31.5

UFLS Table 2: Eastern Interconnection

Distribution Providers and Transmission Owners with 50 MW or more and less than 100 MW of peak net Load shall implement a UFLS program with the following attributes:

UFLS Stage	Frequency Threshold (Hz)	Total Nominal Operating Time(s)[1]	Load Shed at Stage as % of TO or DP Load	Cumulative Load Shed as % of TO or DP Load
1	59.5	0.30	14-25	14-25
2	59.1	0.30	14-25	28-50

1. The total nominal operating time includes the underfrequency relay operating time plus any interposing auxiliary relay operating times, communication times, and the rated breaker interrupting time. The underfrequency relay operating time is measured from the time when frequency passes through the frequency threshold setpoint, using a test rate of frequency decay of 0.2 Hz per second. If the relay operating time is dependent on the rate of frequency decay, the underfrequency relay operating time and any subsequent testing of the UFLS relays shall utilize a test rate of linear frequency decay of 0.2 Hz per second.

UFLS Table 3: Eastern Interconnection

Distribution Providers and Transmission Owners with 25 MW or more and less than 50 MW of peak net Load shall implement a UFLS program with the following attributes:

UFLS Stage	Frequency Threshold (Hz)	Total Nominal Operating Time (s)[1]	Load Shed at Stage as % of TO or DP Load	Cumulative Load Shed as % of TO or DP Load
1	59.5	0.30	28-50	28-50

1. The total nominal operating time includes the underfrequency relay operating time plus any interposing auxiliary relay operating times, communication times, and the rated breaker interrupting time. The underfrequency relay operating time is measured from the time when frequency passes through the frequency threshold setpoint, using a test rate of frequency decay of 0.2 Hz per second. If the relay operating time is dependent on the rate of frequency decay, the underfrequency relay operating time and any subsequent testing of the UFLS relays shall utilize a test rate of linear frequency decay of 0.2 Hz per second.

UFLS Table 4: Quebec Interconnection

	Rate	Frequency (Hz)	MW at peak (*Load must be fixed at all times.)	Mvar at peak	Total Nominal Operating Time (s) [2]
Threshold Stage 1	——	58.5	1000*	1000	0.30
Threshold Stage 2	——	58.0	800*	800	0.30
Threshold Stage 3	——	57.5	800	800	0.30
Threshold Stage 4	——	57.0	800	800	0.30
Threshold Stage 5 (anti-stall)	——	59.0	500	500	20.0
Slope Stage 1	-0.3 Hz/s	58.5	400	400	0.30
Slope Stage 2	-0.4 Hz/s	59.8	800*	800	0.30
Slope Stage 3	-0.6 Hz/s	59.8	800*	800	0.30
Slope Stage 4	-0.9 Hz/s	59.8	800	800	0.30

2. The total nominal operating time includes the underfrequency relay operating time plus any interposing auxiliary relay operating times, communications time, and the rated breaker interrupting time. The underfrequency relay operating time shall be measured from the time when the frequency passes through the frequency threshold set point.

PRC-006-NPCC-1 Automatic Underfrequency Load Shedding

Implementation Plan

Background:

The purpose of this draft Regional Standard is to ensure the development and maintenance of an effective and coordinated Automatic Underfrequency Load Shedding program in order to preserve the reliability and integrity of the bulk power system during declining system frequency events.

In the developing the Implementation Plan for PRC-006-NPCC-01 the Standard Drafting Team considered the following:

1. The requirements listed in this Regional Standard are intended to cover all aspects of the UFLS program. The Regional Standard Drafting Team (RSDT) coordinated its development with the draft NERC UFLS Standard PRC-006. The intent of this Regional Standard is to be more stringent than the continent wide standard while incorporating specific program characteristics into the requirements.
2. The Implementation Plan for this standard is based, in part, on the timelines reflected in the existing and ongoing Implementation Plan for NPCC Directory #12 absent the annual milestones required by Directory #12.

Effective Dates:

Eastern Interconnection & Québec Interconnection Portions of NPCC Excluding the Independent Electricity System Operator (IESO) Planning Coordinator Area of NPCC in Ontario, Canada.

1. The effective date for requirements R1, R2, R3, R4, R5, R6, and R7 is the first day of the first calendar quarter following applicable regulatory approval but no earlier than Jan 1, 2016 to allow for the existing implementation plan to be completed.

2. The effective date for requirements R8 through R23 is the first day of the first calendar quarter two years following applicable governmental and regulatory approval.

Independent Electricity System Operator (IESO) Planning Coordinator's Area of NPCC in Ontario, Canada

1. Effective the first day of the first calendar quarter following applicable governmental and regulatory approval but no earlier than April 1, 2017.

Cost Effectiveness Analysis Procedure "CEAP"

For

NPCC Regional Reliability Standard
Underfrequency Load Shedding
PRC-006-NPCC-01

The NPCC Regional Standards Committee
11/4/2011

I. EXECUTIVE SUMMARY

During a 2010 FERC technical conference, the Commission recognized that "reliability does not come without cost" and significant industry interest was expressed in the development of a process to identify costs for draft Reliability Standards including the ability of the proposed Standard to achieve their reliability objective(s) in an efficient and cost effective manner. Additionally, the NPCC Board of Directors (BOD) during its consideration of the Disturbance Monitoring Regional Standard, requested the development of a formal procedure to assess the implementation costs and the relevant incremental reliability improvement (benefits) that a Regional Standard would provide.

Accordingly, NPCC Staff has developed a Cost Effectiveness Analysis Procedure (CEAP) and applied it to the PRC-006-NPCC-01 draft UFLS Regional Standard to address these concerns. Since the effort to draft an UFLS Regional Standard and revise the performance attributes of the program was underway prior to the development of the CEAP, in some cases this report relies on prior estimates to demonstrate adherence to the principles set forth in the CEAP.

The CEAP introduces two assessments of the estimated implementation costs of the requirements in a proposed draft Standard which include a Cost Benefit Analysis "CBA" and the Cost Effectiveness Analysis "CEA". These assessments are being incorporated into the Standard's development process. The purpose of the CEAP, conducted in parallel with the drafting process, is designed to provide supporting information and background for NPCC stakeholders, ballot body and the NPCC Board of Directors without delaying the development of the Standard. The CEAP also provides a "snapshot" of the cost of a proposed Standard, while soliciting input from a wide range of industry viewpoints, including NPCC's technical groups in order to determine if there is an adverse impact to reliability or affects potential adherence to other NPCC Regional or Continent wide Standards or Criteria should the draft Standard be approved.

This CEAP for PRC-006-NPCC-1 was developed by compiling the responses to questions posted for industry comment and some prior cost assessments during the development of NPCC Directory #12.

The results of the CEAP have determined that in the view of most stakeholders, the standard satisfactorily achieves an adequate level of reliability, is cost effective in achieving the reliability objective, has no adverse impact on reliability and is not cost prohibitive. Therefore, the NPCC Regional Standards Committee (RSC) recommends stakeholder and BOD adoption of this Standard.

II. COST BENEFIT ANALYSIS (PHASE 1)

NPCC performed a *Cost Benefit Analysis (CBA)* that was based on a number of factors and was used in determining whether a Regional Standard should proceed to development. Prior to the development of PRC-006-NPCC, the NPCC region had a regional UFLS program in place along with criteria that its Members were required to adhere to. In 2006 the NPCC technical groups assessed the adequacy of the regional UFLS program to determine if reliability objectives continued to be met and published the results in the "*2006 Assessment of Under frequency Load Shedding Adequacy Part III – Assessment of Program Modifications and 2008 Assessment of Under frequency Load Shedding Adequacy – Québec Area*". This study was approved by the Reliability Coordinating Committee "RCC" on November 19, 2008 along with a set of recommendations and an implementation schedule to initiate and complete the required changes. The decision to change the performance characteristics of the UFLS program was based on the critical importance of UFLS to maintain system stability, reliability prevent cascading outages.

The attributes of the new UFLS program were subsequently incorporated into NPCC Directory #12 and approved by the NPCC Full Members on June 26, 2009. Directory #12 is the foundation document for the NPCC UFLS Regional Standard and the cost information available to RCC and NPCC Full Members at that time was contained in a survey analysis performed by the Task Force on System Protection (TFSP). The estimated total cost of the UFLS program change and implementation was estimated to be approximately **$ 8M** for the region. This estimate represented only the cost of those who responded and did not reflect the potential total cost of compliance to the criteria within the region.

The decision to develop the NPCC UFLS Standard was based on the significant reliability benefit and the relatively low cost of development. The standard fills a reliability related need and achieves an adequate level of reliability by arresting frequency decay and maintaining stable islands after potential breakup while mitigating the probability of a cascading widespread outage. In addition the standard was fully coordinated with the NERC UFLS Continent-Wide Standard and developed to "augment" and implement that standard.

Additionally, the Standard closes a significant reliability gap since it requires all applicable regional entities to adhere to the programs requirements, regardless of their membership status with NPCC and a Members obligation to adhere to the criteria. Mandatory requirements subject to enforcement through legislation will demonstrate the importance of UFLS.

Finally, the CEAP revealed that many of the entities required to make changes associated with the new UFLS program have cost recovery mechanisms in place.

III. COST EFFECTIVENESS (PHASE 2)

The *Cost Effectiveness Analysis (CEA)* was performed to provide information about the effectiveness and relative cost of the Standard's requirements to achieve the objective or reliability goal for which the Standard was written. This involved a set of questions soliciting industry feedback on the technical feasibility of achieving the reliability objective of the Standard via its requirements and to solicit information on implementation costs, cost recovery, procurement of any resources needed to demonstrate compliance with the draft Standard.

These questions were focused on the individual requirements of the standard and all cost information submitted by entities was reviewed and compiled by NPCC Staff prior to being made public and presented to the RSC.

Market issues of individuals takeholders could exist or be revealed through the responses to the CEAP questions, therefore the necessary confidentialities have been maintained and no market sensitive information is revealed.

As part of determining cost effectiveness, the following questions were posted for a 30 day comment period and industry response;

1) **On a requirement by requirement basis, are the Requirements effective in achieving the reliability objective of the Standard and if not, why?**

2) **Are there alternative ways to achieve the draft Standard's reliability objective? If so, what alternatives are there and which requirements would they replace? This must be supported by studies done or be demonstrable.**

3) **On a requirement by requirement basis, do the draft requirements in the Standard achieve or contribute to a level of reliability that is "adequate", i.e. acceptable? If so, how? If not, why not?**

4) **Is there any adverse impact to reliability or any other existing standard, NPCC Regional Criteria, or in-process project draft Standard(s), of which your organization is aware?**

5) **Describe the size of your organization in broad general terms, e.g. GO-Total installed MWs, TOs circuit miles by kV and total load served, etc.**

6) **What are the gross anticipated one-time and ongoing costs of implementing the Standard as presently drafted (labor and materials)? Is there a cost recovery mechanism in place for your organization, i.e. markets or tariffs?**

NPCC received responses from market participants consisting of large and small Transmission Owners, Reliability Coordinators, Generator Owners and a Consultant. The entities who responded, in a strong majority, indicated their support of the Standard and that its requirements are effective in achieving its reliability objectives.

One of the respondents had some specific suggestions regarding alternate requirements and revising the requirements. These same comments were also submitted during the Standards development when comments were solicited and were reviewed by the Standard Drafting Team (SDT) which provided respective responses to the comments at that time and additionally revised the standard's requirements to address the issue.

The majority of respondents indicated that the standard achieves an adequate level of reliability. Those who did not were mainly representatives of Generators Owners (GO) who remain opposed to securing compensatory load shedding when they are unable to comply with the Standard's thresholds for underfrequency trip protection on their generators. The SDT had also revised the language of two of the standard's requirements to address this issue however the responding GOs either did not review the revisions or still have an issue.

No existing or anticipated adverse reliability impact as a result of the Standard's implementation has been identified. There was concern expressed by one of the respondents that NERC Project 2007-09-Generator Performance is currently underway and that there may be some interaction with this standard. NPCC is aware of this concern and an NPCC representative is currently a member of the Project 2007-09 SDT and is actively coordinating within the SDT to make certain that no adverse impact with the NPCC Regional Standard exists. Furthermore a change to the performance curve in that continent wide standard is being proposed to coordinate with the Hydro Quebec UFLS program which will largely mitigate this issue.

All those who responded indicated implementation costs were minimal with the exception of the Generator Owners who were uncertain about costs and indicated that no direct recovery mechanism was available to them. Respondents that did submit cost estimates recognized that implementation of Directory #12 which outlines the same requirements as the Standard is already underway and those costs have already been agreed upon by NPCC's Full Members.

IV. CEAP RECOMMENDATION

This CEAP recommendation to accept the standard is based on the following:

- The CBA completed prior to the development of this Standard by the Task Force on System Protection (TFSP), estimated a relatively minimal cost of approximately $8 M for the NPCC Region. The CEA cost of implementing the Underfrequency load shedding improvements, was estimated to be $9.5 M and is an effective investment to maintain the continuity and reliability of the electric power system. The respondents expressed their opinions that there were no viable alternatives to the methods proposed in the Standard to achieve the desired reliability objectives.

- The NPCC Reliability Coordinating Committee approved technical studies performed by SS-38 for this UFLS program.

- CEA industry responses indicating a majority of respondents showing support for the standard including: no adverse reliability impacts, reasonable costs, achievement of an adequate reliability. The majority of respondents indicated the standard contained effective requirements to achieve the reliability objective.

- RCC approved implementation of Directory#12 *UFLS Program Requirements* which has identical program requirements and an implementation plan which is already underway,

- NPCC RSC and SDT recommendations in support of the Standard and its requirements which they have endorsed as efficiently and are critical in effectively achieving the reliability objective of the standard.

CONTENTS

Monthly NERC, NAESB, Regional Entity Update

Creating a Culture of Compliance

BACKGROUND

Outlined below is recent standards and compliance activity at NERC, NAESB and the Regional Entities. If you have comments for MISO consideration send them to standards&compliance@misoenergy.org

To facilitate communication regarding particular issues, two exploder lists have been created. The lists are titled, NERC_NAESB Monthly Update (join this list to receive this monthly report on NERC, NAESB, and Regional Activities), and Standards Collaboration (join this list to participate in meetings and receive communications on collaborating on comments to new and revised standards).

To join, please go to https://extranet.midwestiso.org. If you do not have an existing account, you will need to create one. Once you have created an account, click on "update account information," and check the box for the exploder/s you would like to join.

DEADLINES

Ballot Results

See more information on the NERC Ballot Results web page

Initial Ballot Results

- Project 2007-17: Protection System Maintenance and Testing

Voting statistics are listed below

Quorum: 84.86%

Approval: 61.10%

Non-Binding Poll Results for VRFs and VSLs

Quorum: 83.13%

Approval: 68.68%

The drafting team will consider all comments received, and decide whether to make additional revisions to the standards.

- Project 2010-17: Definition of Bulk Electric System

Voting statistics are listed below

BES Definition

Quorum: 92.97%

Approval: 71.68%

Technical Criteria to Support a BES Exception Request

Quorum: 89.53%

Approval: 764.03%

The drafting team will consider all comments received, and decide whether to make additional revisions to the definition of Bulk Electric System, the associated implementation plan, and the application form titled Detailed Information to Support an Exception Request referenced in the Rules of Procedure Exception Process. The drafting team is working to meet the regulatory deadline established in FERC Orders 743 and 743A (filing by January 25, 2012).

Recirculation Ballot Results

- Project 2007-07: Transmission Vegetation Management

Voting statistics are listed below

Quorum: 87.17%

Approval: 86.25%

The standard will be presented to the NERC Board of Trustees for adoption

Successive Ballot Results

- None

NERC General Counsel Announces Plans to Step Down from Duties in March; Search for Replacement Begins

David Cook, senior vice president and general counsel at the North American Electric Reliability Corporation, announced plans to step down from those duties on March 31.

Cook joined NERC in 1999, where he led NERC's efforts to secure passage of reliability legislation as part of the Energy Policy Act of 2005. Following passage of the legislation, Cook worked with industry stakeholders to gain certification of NERC as the "electric reliability organization" under the new section 215 of the Federal Power Act. As general counsel, he forged the rules and procedures for developing and enforcing mandatory reliability standards that are the core of this organization.

Prior to joining NERC, Cook spent 20 years with the Federal Energy Regulatory Commission, the last ten as deputy general counsel, where he was heavily involved in FERC's restructuring efforts for the natural gas and electric industries.

"David's contributions to NERC are numerous and have shaped the electric industry for many years, first at FERC and more recently at NERC. He has guided NERC's growth and development as the electric reliability organization with an unyielding commitment to an open, transparent stakeholder process," said Gerry Cauley, president and chief executive officer at NERC. "David's keen intellect, absolute integrity and careful legal scholarship have been a tremendous asset to NERC and the entire industry."

Cook will assist with the transition to a new general counsel, and stay on at NERC in a part-time capacity.
"It has been my deep privilege to work with the men and women of the electricity industry these many years," Cook said. "We are all better off because of their strong commitment to the reliability of the bulk power system of North America."

NERC has begun a search for Cook's replacement in coordination with Russell Reynolds Associates, who will work closely with NERC leadership and Human Resources throughout the selection process. Cauley expects to bring his recommendation to the NERC Board of Trustees in February 2012.

NERC stakeholders who want to recommend candidates for the position should submit names and appropriate contact information to Lawrence Klock, managing director at Russell Reynolds Associates (larry.klock@russellreynolds.com) or Thomas Linquist, executive director (thomas.linquist@russellreynolds.com), no later than November 4. A full position description and qualification requirements can be received by emailing Klock or Linquist.

Chief Security Officer Accepts Appointment to Department of Homeland Security

Mark Weatherford, vice president and chief security officer at the North American Electric Reliability Corporation (NERC), has been appointed to the position of Deputy Under Secretary for Cybersecurity for the National Protection and Programs Directorate at the Department of Homeland Security. The appointment was announced by DHS Secretary Janet Napolitano, and is effective mid-November.

"Mark's appointment is a great honor and a testament to his expertise in the field of cybersecurity," said Gerry Cauley, president and chief executive officer at NERC. "During his time at NERC, he has forged industry and government partnerships that will continue long after his departure."

Weatherford joined NERC in July 2010 after serving as chief information security officer for the State of California under former Governor Arnold Schwarzenegger. He was awarded SC Magazine's "CSO of the Year" award in 2010. Weatherford began his career as a cryptologic officer in the U.S. Navy.

"It has been an honor to work at NERC and with the dedicated professionals in the electric industry in both the United States and Canada. NERC has one of the most challenging cybersecurity missions of any critical infrastructure in the country, and the Nation can be assured that they take that mission seriously," Weatherford said. "We have made tremendous progress during my tenure at NERC, but much remains to be done and I'm confident in the commitment to carry that progress forward."

Cauley has named Matthew Blizard, currently the manager of Policy and Coordination for Critical Infrastructure at NERC, to replace Weatherford. Blizard has 30 years of experience in the U.S. Coast Guard managing security, mission support and Coast Guard operations.

Compliance

Update on Compliance Application Notice Progress

As part of its ongoing effort to rewrite existing Compliance Application Notices to reflect direction from the NERC Board of Trustees and input from the industry, there has been much activity on the CANs website. The industry's responses have been received and are appreciated.

Currently, NERC is in the process of analyzing industry's comments on CANs -0005, -0006, -0007, -0008 and -0018. These CANs are the expected revisions to be posted as final on the NERC Compliance site.

The comment period for the remaining CANs (CANs -0009, -0011, -0012, -0013, -0015, -0022, -0026 and -0028), and now ends October 31. NERC will begin analysis at that time. Other CANs that were posted for comment and are now closed are -0017, -0024, -0029, -0031 and -0039. CANs -0020 and -0030 comment periods are open through November 9.

Also, Bulletin #2011-006, CIP Table Three Entities, has been posted on the NERC website (See *Public Bulletins* on the Compliance web page).

Workshop News

Compliance and Standards joined forces October 26-28 for the Standards and Compliance Workshop in Atlanta. With the themes of maintaining a risk-based focus, prioritizing standards and the Compliance Enforcement Initiative, both groups presented in conjunction, reinforcing the concept of feedback loops among NERC's internal groups, as laid out by President and CEO Gerry Cauley.

Make plans to attend the next Compliance workshop on December 6 in Atlanta. Agenda topics include an About NERC session; JRO/CFR Concurrent Registration; CANs Update; CIP Auditing Issues; Entities' panel discussion on successful audits; Enforcement Direction; and the 2012 CMEP Implementation Plan. Click here for workshop registration and here for hotel registration.

2012 Audit Worksheets Posted

Reliability Standard Audit Worksheets (RSAW) required for the Tier 1 requirements identified in the 2012 Actively Monitored List have been posted to the NERC website, under the RSAW tab.

The RSAWs can be downloaded as a set or individually by Reliability Standard number. Regional Entities and registered entities are reminded to check the NERC website regularly to ensure the latest versions are being used. The RSAWs are updated on an as-needed basis and notifications are only provided for major postings. If you have any questions or comments regarding the RSAWs contact Craig Struck.

Critical Infrastructure

NERC Opened First Grid Security Conference in New Orleans

The North American Electric Reliability Corporation opened its first grid security conference October 19 in New Orleans with more than 260 security professionals in attendance.

Gerry Cauley, NERC president and chief executive officer, delivered the welcoming address and opening keynote.

"The battle to secure the grid is ongoing and will continue into the future. The ability to continue taking advantage of advances in technology, while ensuring effective levels of security, is critical to our ability to operate," Cauley said. "The 2011 Grid Security Conference is one of the vehicles NERC is using to advance information sharing between NERC, the government and the electricity industry."

GridSecCon brings together industry and government security to deliver a comprehensive education and networking event. More than 20 education sessions are scheduled on topics ranging from *Advanced Persistent Threat*, *Industry Best Practices in Grid Security*, and *Electric Facility Threats and Violence.*
"NERC's goal at this conference is to provide security professionals with real tools and information that they can take back to their companies and improve their security posture," said Mark Weatherford, chief security officer at NERC. "The wide representation from organizations across the United States and Canada indicates the need for an event dedicated to electricity sector cybersecurity."

Other speakers include Department of Homeland Security Acting Deputy Under Secretary for Cybersecurity Greg Schaffer; Lofty Perch President and Chief Security Scientist Mark Fabro; and Tiago Alves de Jesus, from the Royal Canadian Mounted Police.

NERC plans to sponsor GridSecCon annually for industry security professionals. For more information on NERC's cybersecurity program, please visit the website. Public presentations will be posted there after the conference.

Reliability Assessment and Performance Analysis

NERC Launches Demand Response Availability Data System Website

The North American Electric Reliability Corporation (NERC) launched a system that collects information to measure demand response contributions to the reliability of the bulk power system.

The Demand Response Availability Data System (DADS) will provide a basis for projecting the impacts of both dispatchable and non-dispatchable demand response on capacity planning and operational reliability. Demand response enrollment and event information will be collected and assessed on a semi-annual basis with summer and winter reporting periods.

"Demand response is a relatively new resource, and both NERC and the industry need to measure its performance in order to gauge its benefits and impacts on reliability," said Mark Lauby, vice president and director of Reliability Assessment and Performance Analysis at NERC. "Comprehensive performance measures will help develop more confidence in demand response use."

Demand response is one of many resources needed to satisfy the increasing demand for electricity in North America. Capacity and ancillary services provided by demand response help ensure resource adequacy, while providing operators with additional flexibility in maintaining operating reliability.

DADS will allow NERC to receive, manage, assess and share data on demand response programs, products and services administered by retail and wholesale entities throughout North America. This data collection system will provide a basis for counting and validating demand response resources as part of meeting operational and resource reliability requirements.

Visit the DADS website by clicking here.

Reliability Risk Management

Reliability Risk Management Group Formed

On September 26, NERC President and CEO Gerry Cauley announced the consolidation of the Event Analysis and Investigations and Situation Awareness

groups. The new human performance initiative also was consolidated into this new group.

This organizational change to consolidate group resources and to leverage the diverse experience and expertise strategically improves NERC's commitment to reliability excellence and risk management. This new group, Reliability Risk Management (RRM), will allow for more efficient analysis of events on the bulk power system, as they manage the information from "cradle to grave."

"This group will ensure reliability of the bulk power system by being the creditable source of information for grid system health, while conducting technically sound event analysis and investigations of events and disturbances," said Earl Shockley, director of RRM. "We also will continue providing timely lessons learned and needed reliability industry alerts to industry stakeholders."

The primary functions of the newly formed group are:

- Capture and report creditable system awareness information for bulk power system events and system conditions.
- Conduct robust event analysis using cause analysis and risk-based methods.
- Facilitate and ensure lessons learned and any necessary reliability communications are issued to industry stakeholders in a timely manner.
- Retain a strong enforcement authority through any necessary investigations that are independent, objective and at a level consistent with the expectations of the industry and government.

SAFNR V2 Project Updates Previous System

NERC is updating the project that provides real-time system operational information to the 12 Reliability Coordinators basis for FERC, NERC and the eight Regional Entities. Situation Awareness for FERC, NERC and the Regional Entities Version 2 (SAFNR V2) will replace the current SAFNR V1 displays, currently provided by individual Regional Coordinators, with a centralized system that presents for NERC staff with a common look among the Regional Coordinators; with overview information at an interconnection level with the ability to drill into the Regional Coordinators' transmission systems for greater detail; and with extended data retention for trending purposes.

The project currently is in the development and implementation stage. The project has an aggressive schedule to complete the software applications, the visual displays, and to have all subscriber agreements in place during the first quarter of 2012. Six of the Regional Coordinators have successfully mapped their SAFNR V2 operational data to the project consultant. The remaining Regional Coordinators will begin mapping their data in the next few weeks. The SAFNR V2 applications have met the SAFNR V2 project team's design concepts, and the end users should be pleased with the final product.

Standards

Nomination Time for Standards Committee

NERC is accepting nominations for stakeholders to serve on NERC's Standards Committee. There are 10 seats available and nominations are open through November 1.

Any interested stakeholder is eligible and may self-nominate or be nominated by a third party using the 2012-2013 term nomination form. These forms are posted on the Standard Committee's Nominations and Elections page as they are received.

The Standards Committee reports to NERC's Board of Trustees, and provides executive and strategic oversight on NERC's standards activities. The Committee depends on the stakeholder community to identify volunteers to fill vacant seats and to elect strong representation for their segments.

The Standards Committee is composed of two representatives elected from each of the 10 industry segments that make up the Registered Ballot Body. If the industry does not elect at least two Canadian members, the Canadian nominees receiving the next

highest percentage of votes within their respective segment(s) will be designated as members, as needed, to achieve a total of two Canadian members. While other Standards Committee members are elected for two-year terms, Canadian members elected in this manner serve for one-year.

The balanced representation on the Committee is designed to ensure that NERC's standards development activities are fair and balanced, and effectively meet industry reliability needs. To ensure continuity on the Committee, the two-year terms in each segment are staggered, with an annual election held each fall. This means individuals elected from the current slate of nominees will serve from January 1, 2012 through December 31, 2013.
After the nomination period ends on November 1, an election will be conducted for any segment in which there are multiple nominees. To be elected, a nominee must capture a simple majority of the votes from the segment, and if no nominee captures a simple majority, then the two candidates receiving the most votes will compete for the seat in a runoff election.

Standards Committee members are expected to participate in formal monthly Committee meetings (generally eight half-day conference calls, plus two-day quarterly meetings in person), as well as subcommittees and working groups. Committee members also are encouraged to keep members of their segments informed about and engaged in NERC standards development activities.

Appendix 4B of the NERC Rules of Procedure provides more detail about the Standards Committee election process. The Committee's charter and other relevant documents are available on the Standards Committee's Related Files page.

Addressing FERC Order 754

A technical discussion concerning the Federal Energy Regulatory Commission's Order 754 (Single Point of Failure) took place October 24-25 at FERC. Attendees representing FERC, NERC and industry experts on system protection and planning focused on the Order's concern with protection system failures. Discussions included voluntary standards from 1997, standards currently in effect, stakeholder practices, and some regional criteria. The June 14, 2004 Westwing Outage, in particular, was discussed at length and is one of three significant events referenced in a NERC advisory to industry (issued March 30, 2009) that concerns protection system single point of failure. To date, NERC has identified five events which involved single point of failure.

The technical discussion fulfilled the initial directives from Order 754 and concluded with consensus among participants that there is a reliability concern involving single point of failure that requires additional study. Ultimately, the issue may involve transmission planning standards TPL-001-004, which specify bulk electric system performance for certain system protection failures. It was clear from the discussion and subsequent consensus that system performance requirements are achieved jointly through collaboration between planning and protection engineers.

Before concluding, the group formulated a problem statement with several action items for additional development in a joint meeting of the NERC System Protection and Control Subcommittee and the Transmission Issues Subcommittee scheduled for December 6-8 in Fort Worth, Texas. Additionally, a NERC standards project page (Order 754) and distribution list has been created to the keep industry abreast of activities relevant to this issue. With insight from the technical discussion informing Order 754-related initiatives underway, a successful outcome should be achieved that will complement standards currently filed for approval and ultimately enhance reliability.

The most significant next step is the preparation of a data request to the industry in accordance with the NERC Rules of Procedure, Section 1600. For inclusion on email notices regarding activity on Order 754, contact Scott Barfield or call 404-446-9689.

Update: 2012-2014 Reliability Standards Development Plan

In October, the Standards Committee was asked to approve the 2012-2014 Reliability Standards Development Plan. The Plan, developed over the past several months with input from a number of stakeholders, was approved with modifications. Major modifications include the addition of an update on regional standards, a regional standards development work plan, and descriptions of the various regional projects currently in or planned for development. Other modifications deal primarily with structure and formatting changes, as well as additional editorial suggestions.

The next step is to present the Plan to the Board of Trustees for approval at the November 3 meeting in Atlanta. Following board approval, NERC will file the Plan with applicable Electric Reliability Organization governmental authorities.

Standard Drafting Team Vacancies

Any industry stakeholder meeting the indicated qualifications for one of the following three vacant appointments may submit a self-nomination form to sarcomm@nerc.com. Further instructions can be found on the Drafting Team Vacancies page on NERC's website.

Project 2007-06 System Protection Coordination
Seeking an individual from a Canadian entity with experience in coordination of protection systems (new installations and revisions).

Project 2007-12 Frequency Response
Seeking an individual representing Transmission Dependent Utilities with experience in analyzing or modeling frequency response.

Project 2010-07 Generator Requirements at the Transmission Interface
Seeking an individual, preferably from a Regional Entity, with a compliance role or background. Candidate should have experience working with generation, transmission, or both. The candidate should also be familiar with the history of the GOTO Ad Hoc Group, recent registration activity, and the work of the Project 2010-07 SDT.

In addition to these vacancies, the **Project 2007-17 Protection System Maintenance and Testing** drafting team is seeking individuals with experience in developing, managing, or supporting a maintenance program or testing a program for one or more of the following: generator protection systems, transmission protection systems, under-frequency load shedding equipment, under-voltage load shedding equipment, and/or special protection systems. The specific focus of this solicitation is to add members representing smaller entities. If you are interested in serving on this drafting team, please complete this project-specific nomination form by September 23, 2011. More details are included on the Project 2007-17 project page. Please contact Andy Rodriquez with questions regarding the vacancies.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

October 31, 2011

VIA ELECTRONIC FILING

Ms. Kimberly D. Bose
Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, D.C. 20426

Re: NERC Analysis of NERC Standard Process Results Third Quarter 2011 in Docket Nos. RR06-1-000, RR09-7-000

Dear Ms. Bose:

The North American Electric Reliability Corporation ("NERC") submits its Analysis of NERC Standards Process Results for the Third Quarter 2011 ("Ballot Results Filing"). This filing is submitted in response to the Federal Energy Regulatory Commission's ("FERC") January 18, 2007 Order[1] requiring NERC to closely monitor and report to FERC the voting results for NERC Reliability Standards each quarter for three years. In a subsequent order issued on September 16, 2010, the Commission renewed and expanded on its directive for an additional three years.[2]

The Ballot Results Filing is included as **Attachment A** to this filing. The Ballot Results Filing addresses ballot results during the July 1, 2011 to September 30, 2011 time frame and includes NERC's analysis of the voting results, including trends and patterns of stakeholder approval of NERC Reliability Standards. NERC requests that FERC accept this filing as compliant with the renewed directive in the September 16, 2010 Order to submit quarterly reports for an additional three years from the date of the order.

Respectfully submitted,

/s/ Willie L. Phillips
Willie L. Phillips
Attorney for North American Electric Reliability Corporation

Introduction

Background: NERC's Revised Processes for Developing Standards

NERC develops Reliability Standards in accordance with Section 300 of its Rules of Procedure and the NERC *Standard Processes Manual*, which is included as Appendix 3A to the NERC Rules of Procedure.[1] The current *Standard Processes Manual* was approved by the Federal Energy Regulatory Commission ("FERC" or the "Commission") in September 2010,[2] amended August 2011,[3] and incorporates a number of process revisions intended to maintain the openness and inclusiveness of the standards development process, while improving efficiency and the quality of standards and interpretations. A summary of these revisions is included for convenience as Appendix A to this report.

To date, no project initiated under the revised *Standard Processes Manual* has been completed. All projects discussed in this report, and for which ballots were completed in the third quarter 2011, were initiated under the *Reliability Standards Development Procedure Version 7,* but will be completed under the new processes.

This Report

There are two purposes for producing this report. First, this report and future versions will provide NERC, its Board of Trustees, committees, and industry stakeholders information to support future decisions concerning improvements to the standards development process. Second, this report is responsive to directives from FERC directing NERC to monitor, analyze, and report on the results of its standards development processes.[4]

At the end of each calendar quarter, NERC will update this report by incorporating results from the most recent calendar quarter to monitor and report progress on improvements to various aspects of the standards development process. The first section of this report provides an overview and analysis of ballots conducted during the third quarter of 2011. The second section compares timelines for the projects balloted in the third quarter 2011 against baselines provided in the report filed on January 31, 2011, on the time to complete each phase of standards development. The comparison to the historical baselines is responsive to the

[1] NERC's Rules of Procedure are available at: http://www.nerc.com/page.php?cid=1|8|169.

[2] *Order Approving Petition and Directing Compliance Filing*, 132 FERC ¶ FERC 61,200 (September 3, 2010).

[3] *Letter Order Approving Standard Processes Compliance Filing* (August 25, 2011)

[4] *See Order on Compliance Filing,* 118 FERC ¶ 61,030 (January 18, 2007). *See also, Order on the Electric Reliability Organization's Three-Year Performance Assessment,* 132 FERC ¶ 61,217 at P 85 (September 16, 2010) ("Three-Year Assessment Order"). Specifically, the Three-Year Assessment Order directed NERC to analyze:

(i) the time required to complete projects (excluding urgent action projects);
(ii) the time required to complete projects initiated in response to NERC's urgent action progress (including whether or not a permanent fix was implemented within the sunset period); and
(iii) the time required to complete projects in response to Commission directives. The analysis should include data on the time required for each stage of the process. For example, the analysis should document the time required to move a proposed Reliability Standard from a Standards Authorization Request to the NERC Board, and then to the Commission.

Commission's directive to analyze the time required to complete each phase of the standards development process. NERC staff and the Standards Committee will use this analysis to monitor successes and to identify opportunities for improvements.

Analysis of Q3 2011 Standards Ballot Results

From July 1, 2011, through September 30, 2011, NERC conducted ballots for four separate Reliability Standards projects. Table 1 summarizes these ballot events. A complete record for each project is available on NERC's website on the Ballot Results webpage.[5]

Table 1

Project Type[6]	Project Number & Name	Q3 Ballot Events	Status
Revision	2006-02 - Assess Transmission Future Needs and Develop Transmission Plans	Recirculation Ballot of one Standard	Adopted by NERC BOT 8/2011
Revision	2006-06 - Reliability Coordination	Recirculation Ballots of three Standards and conforming changes to another Standard	Four standards adopted by NERC BOT 8/2011. (Work on three additional standards that were not balloted in Q3 2011 is ongoing.)
New	2007-09 - Generator Verification	Initial Ballot of two Standards	Ongoing
Revision	2007-17 - Protection System Maintenance and Testing	Initial Ballot of one Standard	Ongoing

During the third quarter 2011, two projects had balloted standards that were approved by their ballot pools and adopted by the NERC Board of Trustees on August 4, 2011. The first of these projects was Project 2006-02 - Assess Transmission Future Needs and Develop Transmission Plans. Although the ballot was for a single standard, the project involved the consolidation of requirements from six standards into a single standard. The recirculation ballot achieved a very high quorum of almost 95 percent, and a weighted segment approval of just over 75 percent. The NERC Board of Trustees adopted the standard and a petition for regulatory approval was submitted on October 19, 2011.

The second project was Project 2006-06 - Reliability Coordination. For Project 2006-06, three standards were approved by the ballot pool and adopted by the NERC Board of Trustees on

[5] The Ballot Results webpage is available at: https://standards.nerc.net/Ballots.aspx.

[6] Appendix A to this report provides a brief description of each type of standards project.

August 4, 2011. The project involves six standards, including three that were balloted in the third quarter. The standards drafting team ultimately determined that a recirculation ballot of these three standards was appropriate, based upon the consensus achieved in a previous ballot that was concluded in the second quarter 2011. These three standards were balloted individually, and each achieved high quorum and weighted ballot pool approvals of between 75 and 78 percent.

The NERC Board adopted the three standards, along with conforming changes to a fourth standard on August 4, 2011, and a petition for regulatory approval of the four standards is being prepared for filing in the fourth quarter 2011. The drafting team is continuing work on three other standards that are part of this project (this includes additional modifications to the standard being filed with a conforming change).

Two other projects that were balloted during the third quarter require additional work and are ongoing: Project 2007-09 - Generator Verification, and Project 2007-17 - Protection System Maintenance and Testing.

Project 2007-09 involves development of five standards, and, like Project 2006-06, the standards are at different points in development. Two of the standards in Project 2007-09 underwent separate initial ballots during the third quarter.[7] Both ballots achieved a very high quorum, but low weighted segment approvals of 46.53 percent and 18.23 percent. The other three standards were posted for comment concurrent with the two ballots, and the drafting team is considering comments received on all five standards to determine what revisions to the standards are needed.

Project 2007-17 is a project to merge four standards into a single standard. At the end of the second quarter, a recirculation ballot was conducted that narrowly failed to achieve the required two-thirds weighted segment approval. The drafting team for this project reevaluated the comments from the successive ballot and made additional revisions to clarify certain requirements, along with revisions to supporting technical references. In accordance with the *Standard Processes Manual*, the standard development process was reinitiated with the posting of a Standards Authorization Request ("SAR") and revised standard. Because the standard was not new to stakeholders, the Standards Committee waived the initial comment period and an initial ballot was conducted. The initial ballot achieved a quorum, but the standard again failed to achieve the required weighted segment approval by a few percentage points. Development will continue.

[7] Stakeholders have requested that individual standards be balloted separately for projects that involve multiple standards, and during the third quarter 2011 NERC began adopting this approach when possible.

Q3 2011 Ballots and Comparison to Baseline Data

In the version of this report filed on January 31, 2011, NERC provided baselines for each phase of development for standards projects. These baselines were established by grouping all NERC standards projects from 2006 through 2010 into four categories (new standards, revisions to existing standards, expedited projects, and interpretations) and then averaging the times for each phase of development within each group.

In this section of this and future reports, NERC will compare the projects balloted each quarter against these baselines. These comparisons may highlight anomalies initially, but over time the comparison will help to identify trends in the time required for various phases of standards development.

During the third quarter of 2011, ballots were conducted for four standards projects. Three of the standards projects balloted in the third quarter are categorized as "revisions to existing standards" for the purposes of comparing to baselines. The remaining project is categorized as a project to develop "new standards" for this purpose. Chart 1 compares the development phases for each of the four revision projects in this quarter to the baseline. Chart 2 compares the development phases of the project to develop new standards to the baseline.

A discussion of the development phases for these projects is included below.

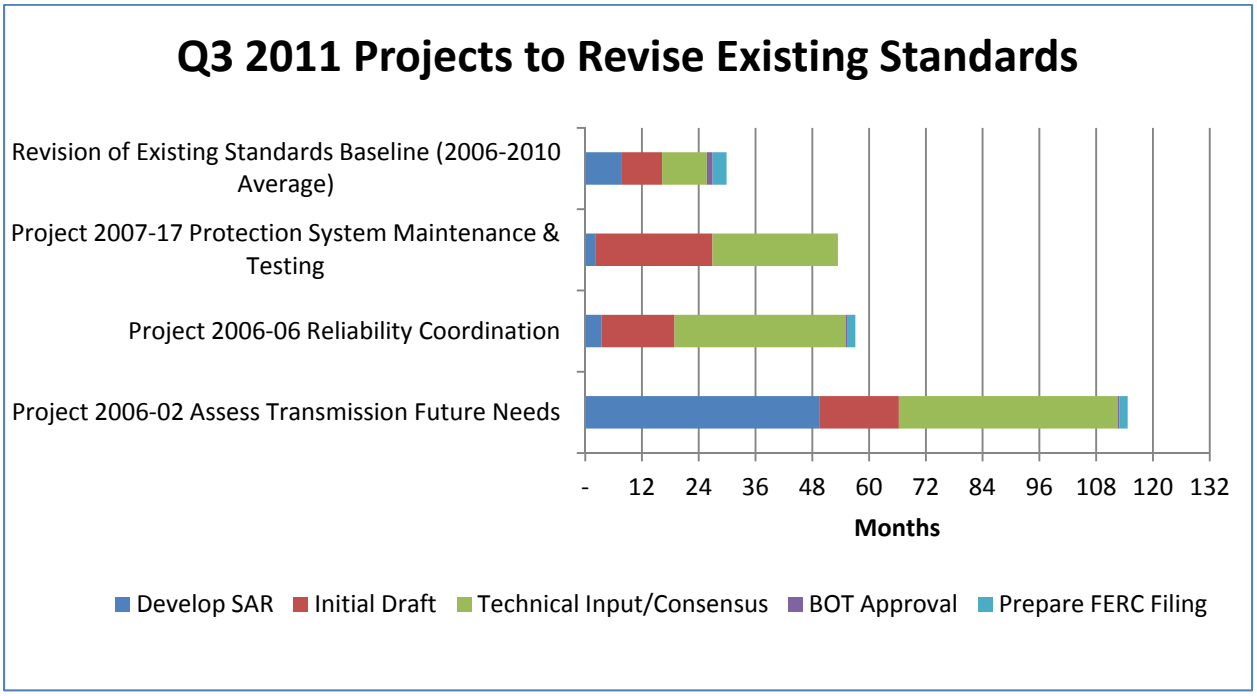

Chart 1

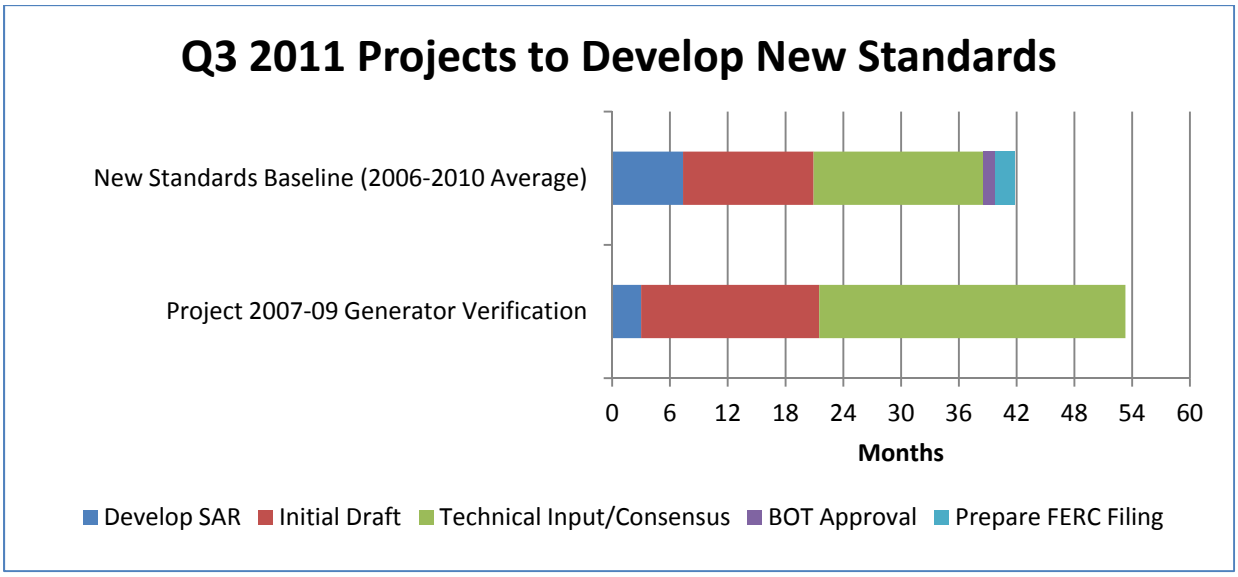

Chart 2

No ballots of "interpretations" or "expedited projects" were conducted during the third quarter 2011.

SAR Development Phase. For all projects balloted in the third quarter of 2011 with the exception of Project 2006-02,[8] the SAR was finalized quickly after being posted for industry review. One project, 2007-17, required that the SAR be posted a second time when the project was reinitiated after a recirculation ballot failed to achieve industry approval. No additional time was included in the SAR development phase for the purpose of this analysis because the drafting team did not make any substantive revisions to the original SAR. From 2006 to 2010, SAR development times averaged eight months for a project to revise one or more existing standards. The SAR development period for projects balloted during the third quarter of 2011 averaged less than three months.

Initial Draft Phase. All three projects balloted in the third quarter 2011 required a longer period of time than the baseline for the comparable type of project, with the initial draft phases of the three projects requiring between 15 and 24 months to complete. For comparison, the 2006-2010 average duration of this phase of standard development was between eight and nine months for projects to revise standards, and almost 14 months for projects to develop new standards. One factor that may account for the difference between the projects being balloted in the third quarter and the 2006-2010 baseline is that many of the projects included in the baseline included a single standard, whereas all of the projects balloted in Q3 2011 include multiple standards. In addition, Project 2006-06 involves a number of issues that require coordination with other drafting teams to ensure a cohesive approach to requirements involving real-time operations and communications.

[8] As discussed in the *Analysis of NERC Standard Process Results Second Quarter 2011,* filed July 29, 2011, the SAR development period for Project 2006-02 was more than 49 months, in part because SAR development for Project 2006-02 was placed on 'hold' for almost two years before the SAR was finalized while waiting for completion of Version 0 standards.

Technical Input Phase. Technical input from the industry is received through the formal and informal posting periods. Between each posting, the drafting team reviews the feedback received from stakeholders and makes revisions to the standard or standards. For a formal posting, drafting teams are also required to respond to each stakeholder comment. Thus the technical input phase includes periods of time when standards and associated documents are posted for industry review – typically either for 30 or 45 days – alternating with periods of time during which the drafting team is reviewing the input provided, revising the standards and associated documents, and preparing responses to the comments received. The technical input phase is essentially a highly-organized dialogue between the drafting team and other industry stakeholders.

For the three revision projects balloted during the third quarter of 2011, this phase has taken, on average, 36 months and is ongoing for two of the three projects. For Project 2007-09, in which the two standards balloted are new standards, the technical input phase has taken 32 months to date, and is ongoing. For all projects revising existing standards from 2006 to 2010, the average duration of the technical input phase was nine and a half months, and for projects to develop new standards the average duration of this phase was approximately 18 months. As with the initial draft phase, conclusions about the comparison between this quarter's projects and the baseline must consider that the baseline averages developed for 2006 to 2011 involved many projects to develop a single standard while all three of the projects this quarter are complex projects involving multiple standards and coordination with other projects.[9]

Board of Trustee Adoption. The period of time between ballot pool approval of a standard and Board of Trustee adoption of the standard varies depending on the number of other items that require action by the board. (The board has a fixed schedule of face-to-face meetings, and supplements its face-to-face meetings, as needed, to ensure prompt action when necessary to meet ERO obligations.) In the third quarter of 2011, five standards from two projects (one from Project 2006-02 Assess Transmission Future Needs and Develop Transmission Plans, and four from Project 2006-06 Reliability Coordination) were presented to the Board of Trustees for adoption. All of the standards were presented to the Board for adoption within two weeks of ballot pool approval.

Filing with Regulatory Authorities. During the third quarter of 2011, NERC filed a petition for approval of two interpretations of the same standard, EOP-004. These interpretations were approved by the Board of Trustees in November 2010. Once the Board of Trustees approves a standards project, NERC staff routinely prepares a draft filing, which is then circulated internally for comment. If substantive edits are required in response to comments received, then additional drafts may be circulated. After a consensus is reached on the draft, NERC finalizes the filing and compiles supporting exhibits for submittal to FERC.[10]

[9] NERC has recognized this constraint and when the baselines are updated with 2011 data will provide additional analysis to account for the differences between projects.

[10] NERC also files each new or revised standard with each applicable Canadian governmental authority.

Conclusion

NERC and the Standards Committee continue to look for opportunities to improve the efficiency and effectiveness of the standards process. One possible improvement that was tested during the third quarter 2011 was the practice of balloting each standard in a project individually. Some drafting teams have expressed concerns that this may result in a less efficient process if standards approved by the ballot pool must ultimately be changed after approval in order to conform to changes made to other standards that are part of the same project. It will be important to monitor each project to determine when separate balloting may provide additional information to assist the drafting team in developing a technically sound standard and reaching consensus more quickly. NERC continues to recognize challenges in communicating changes made by drafting teams between a recirculation ballot and the previous ballot, and has undertaken steps to improve active stakeholder participation in recirculation ballots by improving communications to stakeholders to identify changes made in response to stakeholder input before standards are posted for recirculation ballots.

Appendix A

Summary of Process Revisions in NERC Standards Processes Manual

NERC's *Standards Processes Manual* was developed to replace *Reliability Standards Development Procedure Version 7 (RSDP7)* as Appendix 3A of the NERC Rules of Procedure. The *Standard Processes Manual* was approved by FERC in September 2010.[11]

One of the significant modifications in the new *Standard Processes Manual* is the method used to achieve consensus – through parallel comment and ballot periods, which are conducted early in the process and continue until consensus is achieved. This change appears to be increasing the quality and quantity of feedback that the standards drafting teams are receiving on proposed standards. Because drafting teams are encouraged to make significant changes to the standards between successive ballots without a pre-ballot review period, this modification gives drafting teams the flexibility to revise the standards to take account of the comments received and immediately re-ballot without the separate, successive formal comment and pre-ballot review periods that were required in the *RSDP7*.

This added efficiency means drafting teams begin ballot periods earlier in the development process. While initial ballot results may receive lower approval ratings in the initial stages, as approval increases, the successive ballot process provides a clear indication of the move toward industry consensus.

Just as in the *RSDP7*, an entity or individual that desires to vote on proposed reliability standards must be a member of the registered ballot body. The registered ballot body includes all entities or individuals that qualify for one of ten stakeholder segments and have registered with NERC as potential voting participants. Each member of the registered ballot body is eligible to participate in the voting process and ballot pool for each standard action. The ten stakeholder segments are:

- Transmission Owners
- Regional Transmission Organizations and Independent System Operators
- Load-Serving Entities
- Transmission Dependent Utilities
- Electric Generators
- Electricity Brokers, Aggregators, and Marketers
- Large Electricity End Users
- Small Electricity Users
- Federal, State, and Provincial Regulatory or other Government Entities
- Regional Reliability Organizations and Regional Entities

[11] *Order Approving Petition and Directing Compliance Filing*, 132 FERC ¶ FERC 61,200 (September 3, 2010).

Each standard ballot action has its own ballot pool, populated by interested members of the registered ballot body, including those with specific technical expertise of the subject matter. The individuals that join a ballot pool respond to a pre-ballot e-mail announcement associated with each reliability standard ballot action. The ballot pool size varies, and is based on the standard and the topic. The ballot pool votes to approve or reject each standard action. Specifically, the ballot pool votes determine: (1) the need for and technical merits of a proposed standard action; and (2) that appropriate consideration was given to views and objections received during the development process.

The reliability standards development process may include three types of ballots: an initial ballot, a successive ballot, and a recirculation ballot. An initial ballot is conducted during the last 10 days of a 45-day comment period; successive ballots are conducted during the last 10 days of a 30-day comment period. Following an initial or successive ballot, the drafting team is obligated to respond to each stakeholder comment. The drafting team must consider the issues raised in stakeholder comments to determine whether revisions to the standard and its associated implementation plan should be made.

If the comments submitted during the initial comment period and ballot indicate a need for significant changes, then the drafting team will produce a new draft standard, even if the weighted segment approval is 66.66% or greater. When a drafting team makes significant revisions to the standard, the next ballot held is a successive ballot conducted during the last 10 days of a parallel 30-day comment period. Votes cast by the ballot pool in the initial ballot are not counted in a successive ballot. Each ballot pool member must cast a new vote.

If needed, the *Standard Processes Manual* allows for multiple, successive ballots to obtain the two-thirds majority on a proposed standard. Once the comments from a successive ballot are addressed by the drafting team and there is no need for significant changes to the standard, the standard proceeds to a recirculation ballot.

A recirculation ballot does not have a comment period, and votes cast in the most recent successive ballot are carried forward. If a member of the ballot pool chooses to vote in the recirculation ballot, the vote cast by that member in the successive ballot is updated.

Approval of a standard action requires that both:

- A quorum is established. This requirement is met when at least 75% of the members of the ballot pool for the standard action submit a response with an affirmative vote, a negative vote, or an abstention; and
- A two-thirds majority of the weighted segment votes cast are affirmative. The number of votes cast is the sum of affirmative and negative votes, excluding abstentions and non-responses.

The following process is used to determine whether there are sufficient affirmative votes.

- The number of affirmative votes cast in each segment is divided by the sum of affirmative and negative votes cast to determine the fractional affirmative vote for

each segment. Abstentions and non-responses are not counted for the purposes of determining the fractional affirmative vote for a segment.

- If there are less than ten entities that vote in a segment, the vote weight of that segment is proportionally reduced. Each voter within that segment voting affirmative or negative receives a weight of 10% of the segment vote. For segments with ten or more voters, the regular voting procedures are followed.
- The sum of the fractional affirmative votes from all segments divided by the number of segments voting is used to determine if a two-thirds majority affirmative vote has been achieved. (A segment is considered as "voting" if any member of the segment in the ballot pool casts either an affirmative or a negative vote.) [12]
- A standard is approved if the sum of fractional affirmative votes from all segments divided by the number of voting segments is equal to or greater than two thirds.

On March 17, 2011[13] the Commission approved a modification to NERC's Rules of Procedure, Rule 321, that was developed to respond to FERC's March 18, 2010 Order directing NERC to propose modifications to NERC's Rules of Procedure was approved by the Commission.[14] Rule 321 lays out specific processes to be used if stakeholders are unable to achieve consensus through the processes in the Standards Processes Manual to present the NERC Board of Trustees with a standard that is responsive to a specific Commission directive.

[12] When less than ten entities vote in a segment, the total weight for that segment is determined as one tenth per entity voting.

Appendix B

Types of Standards Projects

For the purpose of analyzing results of its standards processes, NERC has identified four broad categories of standards projects.

The first category of projects is **Revisions to Existing Standards**. Revisions to existing standards are a significant and an ongoing part of NERC's standards development work, as NERC and industry work to address regulatory directives from FERC, modify standards to address changing technologies and operating conditions, and review standards in compliance with the five-year interval required to maintain ANSI accreditation. Between 2006 and 2010, the average time to complete revisions to existing standards was 30 months.

The second category is **New Standards**. There have been, and will continue to be, occasions where an entirely new standard or group of standards may be needed to address bulk power system reliability. The data collected from 2006 through 2010 show that these projects take longer, on average, than projects to revise existing standards. Between 2006 and 2010, the average time to complete projects to draft new standards was 42 months.

The third category is **Urgent Action/Expedited Projects**.[15] Urgent Action or Expedited Projects are shortened by reducing the time for certain process steps, or by allowing steps that would normally proceed serially to be conducted in parallel. By definition, these projects are expected to have a shorter development time, on average, than most standards projects. On average, the development time for Urgent Action and Expedited Projects from 2006 through 2010 was a little more than 7 months.

The final category is **Interpretations**. Entities that must comply with a reliability standard have the right to request a formal interpretation of a requirement included in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2010, NERC received a number of requests for interpretation that were absorbed into other projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard. For those interpretation requests that were processed, the average time to complete interpretations and file them with regulatory authorities was about 10 months.

[15] Prior to September 2010, the NERC *Reliability Standards Development Procedure* incorporated a process used for developing a standard more quickly than the normal standard development process, which was referred to as the Urgent Action Process. FERC's approval of the *Standard Processes Manual* in September 2010 replaced the Urgent Action process with the Expedited Standards Development Process.

Appendix C

Phases in Standard Projects

NERC has identified five phases in the development of a Reliability Standard. Table 2 identifies those phases.

Table 2

Phases in NERC Reliability Standards Development Projects	
Phase	**Description**
1. SAR Development	from initial draft SAR to SC acceptance of a SAR for posting, including industry ballot of SAR if required
2. Initial Draft Development	from acceptance of SAR to posting of initial draft
3. Industry Technical Input/Consensus Building	from posting of initial draft(s) through ballot pool approval of a recirculation ballot
4. Board of Trustee (BOT) Approval	from ballot pool approval to BOT approval
5. Filing with Regulatory Authorities	from BOT approval to filing

Agenda
Standards and Compliance Workshop

October 26-28, 2011

JW Marriott Atlanta-Buckhead
3300 Lenox Road
Atlanta, GA 30326
(404) 262-3344

Wednesday, October 26	Presentation	Presenter
10:00 a.m.- 12:00 p.m.	NERC Standards 101	**Maureen Long**, Director of Standards Process, and **Mallory Huggins**, Standards Specialist
12:00-1:00 p.m.	Lunch for NERC 101 participants	--
1:00-1:40 p.m.	President's Remarks	**Gerry Cauley**, President and CEO
1:40-2:30 p.m.	Standards Development Updates (Reliability Standards Development Plan; Prioritization; Version 0; Active Projects)	**Andy Rodriquez**, Director of Standards Development
2:30 – 3:15 p.m.	Cliff Notes for Standards Participation	**Maureen Long**, Director of Standards Process, and **Laura Hussey**, Standards Process Manager
3:15-3:30 p.m.	Break	--
3:30-4:30 p.m.	Feedback Loops: Events Analysis, Compliance, and Standards	**Roman Carter**, Manager of Situation Awareness, **Val Agnew**, Manager of Compliance Standards Interface and Outreach, and **Herb Schrayshuen**, VP of Standards and Training
4:30-5:00 p.m.	General Q&A Session	**Val Agnew**, Manager of Compliance Standards Interface and Outreach, and **Herb Schrayshuen**, VP of Standards and Training

Thursday, October 27	Presentation	Presenter
8:00-9:00 a.m.	FERC Commissioner Remarks	**Commissioner Cheryl LaFleur**
9:00-9:30 a.m.	Rapid Development Project: Project 2010-05.1—Phase 1 of Protection Systems: Misoperations	**Maureen Long**, Director of Standards Process
9:30-10:00 a.m.	Interpretations	**Laura Hussey**, Standards Process Manager
10:00-10:15 a.m.	Break	--
10:15 a.m.-12:00 p.m.	Compliance and Enforcement Initiative and the Future Impact on Standards Development	**Rebecca Michael**, Associate General Counsel and Acting Director of Enforcement, and **Val Agnew**, Manager of Compliance Standards Interface and Outreach
12:00-1:00 p.m.	Lunch	--
1:00-3:00 p.m.	Project 2010-017— Definition of Bulk Electric System	**Pete Heidrich**, Chair of Project 2010-17—Definition of BES, Standard Drafting Team, and **Carter Edge**, Chair of Project 2010-17—Definition of BES, Rules of Procedure
3:00-3:15 p.m.	Break	--
3:15-4:00 p.m.	ERO 2012 Implementation Plan and Actively Monitored List	**Kyle Howells,** Compliance Auditor
4:00-5:00 p.m.	Compliance Application Notices (CANs)	**Ben Engelby,** Senior Compliance Specialist, and **Caroline Clouse,** Compliance Specialist

Friday, October 28	Presentation	Presenter
8-8:30 a.m.	Auditors and Compliance Enforcement Authority Training	**Peter Knoetgen**, Director of Training and Accreditation
8:30-9:30 a.m.	Website Update and Available NERC Resources	**Kristin Iwanechko**, Manager of Standards Information, and **Caroline Clouse**, Compliance Specialist
9:30-10:15 a.m.	Critical Infrastructure Protection (CIP) Initiatives at NERC	**Brian Harrell**, Manager of CIP Standards, Training, and Awareness
10:15-10:30 a.m.	Break	--
10:30-11:30 a.m.	CIP Version 5	**Steve Noess**, Standards Development Advisor
11:30 a.m.-12:00 p.m.	General Q&A Session	**Val Agnew**, Manager of Compliance Standards Interface and Outreach, and **Herb Schrayshuen**, VP of Standards and Training

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards and Compliance Workshop Errata

A few items from the workshop require clarification, correction, or follow-up, and we've addressed them below. If you have additional questions or concerns, please contact mallory.huggins@nerc.net.

Correction: In discussing EOP-008-1—Loss of Control Center Functionality, a presenter identified that the standard requires the Reliability Coordinator, Balancing Authority, and Transmission Operator to have a backup facility, but it is only the Reliability Coordinator that is required to have a backup control center facility. All three entities do have to have backup functionality, but only the Reliability Coordinator has to have a backup control center facility (per Requirement R3).

Clarification: As reported during the workshop, the Compliance Application Notice (CAN) process has been revised based on stakeholder input. The October 14, 2011 version of the CAN process is available on NERC's website. The revised CAN process includes a step to use input from the Compliance and Certification Committee, the Standards Committee, stakeholders, and factors surrounding the CAN request to prioritize development of CANs. Involving the Standards Committee in this prioritization is new and hasn't been implemented yet, as the work done since the CAN process was revised (on October 14, 2011) has focused on modifying specific CANs based on Board of Trustees feedback.

Follow-up: Several attendees asked for a reference for writing procedures. Maureen Long recommends *Procedure Writing: Principles and Practices*, by Douglas Wieringa, Christopher Moore, and Valerie Barnes. This paperback was originally written for the Department of Energy to guide the writing of procedures for nuclear power plant operating personnel. It was later revised to appeal to a broader population of procedure writers.

Water rate pact bodes well for earnings of Calif. electric utilities, analysts say

by Jeff Stanfield

A settlement between four California water utilities and the California Public Utilities Commission's Division of Ratepayer Advocates, filed Nov. 2, is a positive sign for the state's largest investor-owned utilities, whose returns on equities for 2012-2015 will be reset in 2012, analysts with Macquarie Capital (USA) Inc. said in a Nov. 3 report.

The settlement calls for only a very small reduction in ROE requests for the four water utilities: California Water Service Co., San Jose Water Co., California-American Water Co. and Golden State Water Co., Macquarie said in the report.

ROE decisions in water and electric rate cases traditionally have been similar, and since both types of utilities are under the PUC's jurisdiction, the presiding commissioner in the water case is likely to be the same for the electric cases, Macquarie analyst Angie Storozynski, one of the report's authors, said in a Nov. 3 interview. Also, the ratepayer advocates weigh in on electric and water rate cases, so "we think this is a good positive for the electrics," she said.

The water utilities have agreed to lower their 2012-2014 ROEs by 20 to 30 basis points as the parties settled for a 9.99% allowed ROE and equity ratios of 51.35% to 55%, the Macquarie report said.

If approved by the PUC, the settlement would result in a reduction of 20 to 30 basis

Edwardsport woes aside, Duke charges ahead on $7B power plant construction portfolio

by Jason Lehmann

Duke Energy Corp. is nearing the end of a roughly $7 billion, 2,700-MW fleet modernization program, with new plants expected to be in service later this year and in 2012 in Indiana and the Carolinas.

Duke Energy Carolinas LLC's planned 620-MW combined-cycle Buck plant in Rowan County, N.C., is 96% complete, with the company having spent $625 million on the estimated $700 million project through the third quarter, according to the company's third-quarter earnings slide presentation. The plant is expected to be online later this year.

The 825-MW Cliffside clean coal plant is 93% finished and expected to come online in fall 2012. Duke said through the third quarter it has spent about $1.93 billion on the Rutherford County, N.C., project, with another $475 million of investment planned.

The planned 620-MW combined-cycle Dan River facility in Rockingham County, N.C., is 61% completed and expected to come online by the end of 2012. Like Cliffside and

House Republicans vote to subpoena White House Solyndra documents

by Kathleen Hart

Over the strong objections of committee Democrats, Republicans on a House Energy and Commerce Committee panel voted 14-9 to authorize a subpoena for White House communications on the $535 million U.S. Department of Energy loan guarantee to now-bankrupt Solyndra Inc.

"I feel compelled to offer this resolution. … We have exercised restraint … and the administration has resisted our efforts every step of the way," Rep. Cliff Stearns, R-Fla., chairman of the committee's Oversight and Investigations Subcommittee, said at a Nov. 3 meeting called to consider whether to subpoena internal White House communications on the loan guarantee to solar panel manufacturer Solyndra. "We have an obligation to the American people to find out what went wrong with this loan guarantee program."

Rep. Henry Waxman, D-Calif., ranking Democrat on the full committee, argued that the resolution would give Rep. Fred Upton, R-Mich., chairman of the committee, a "blank

check to subpoena the White House when there is no need for this extraordinary step." Arguing that the investigation into Solyndra should be bipartisan, Waxman called the resolution authorizing a White House subpoena "an unprecedented departure" from the practices of the committee.

"We are entitled to obtain information from the White House to advance our legitimate oversight needs, not for a fishing expedition by the Republicans," Waxman charged, adding that "it's sad to see what's going on today."

"Half a billion dollars of taxpayers' money appears to be lost. This is not a fishing expedition," Stearns responded. "We want answers. … It is unfortunate it has come to this."

Stearns laid out the steps in the committee's investigation of Solyndra leading up to the Nov. 3 vote to subpoena internal White House communications. Earlier this year, he said, the Office of Management and Budget "repeatedly failed to cooperate with our investigation, and we agreed to put off a vote on that subpoena because we were assured that engaging in a dialogue with the administration and the minority would resolve all of the problems without the need to resort to a subpoena."

However, that assurance was little more than a "stalling tactic," Stearns argued. "Unfortunately, the same continued uncooperative conduct by the administration has necessitated today's vote," he said.

On Sept. 1, Stearns noted, the committee asked the White House for all documents containing communications relating to Solyndra between the White House and Solyndra, and between the White House and Solyndra's investors. Select communications produced by the White House revealed that senior advisers in the West Wing were monitoring and discussing Solyndra. "Based on these documents, we sent a second request to the White House Counsel on October 5 for all internal communications relating to Solyndra," he said.

Stearns insisted the committee sought to engage in a dialogue about how best to manage production of documents. However, he said, the White House counsel's office responded in an Oct. 14 letter saying that in the opinion of the White House, the committee did not need to see such documents.

"On October 18, the committee staff informed the counsel's office that it needed to invoke a valid privilege or produce the responsive documents," Stearns said. "When asked again to contact committee staff in order to start a dialogue on this issue, the White House counsel's office refused to engage in any discussion. One week later, on October 25, the White House counsel sent another non-responsive letter to the committee, again refusing to produce the documents, because, in the administration's opinion, the committee did not need to see such documents."

Only after "repeated failed attempts to engage the White House did the committee notify the White House and the administration that it intended to notice a business meeting to discuss the possible issuance of subpoenas to obtain the requested information," Stearns said. "This finally got the attention of the White House counsel and we met with her yesterday."

However, according to Stearns, the White House was unable or unwilling to answer basic questions, including: "Do you have any responsive documents? Are you going to be asserting executive privilege? What quantity of documents do you have? Have you conducted an internal investigation to inform us as to what types of documents you have? Without the answers to these questions, it is nearly impossible to narrow or limit the scope of our requests," the subcommittee chairman said.

Republicans also pointed to recent findings about problems with the loan guarantee program brought to light by DOE Inspector General Gregory Friedman, who testified before the House Oversight and Government Reform Committee's Regulatory Affairs, Stimulus Oversight, and Government Spending Subcommittee on Nov. 2. Friedman said the DOE Loan Guarantee Program office "could not 'readily demonstrate how it resolved or mitigated relevant risks prior to granting loan guarantees,'" Stearns said, adding, "This is extremely troubling."

Amid Solyndra controversy, DOE's Chu rallies for federal support of clean energy

by Jonathan Crawford

Even as the controversy surrounding a federal loan guarantee to the now-bankrupt solar panel maker Solyndra Inc. continues, Energy Secretary Steven Chu, speaking Nov. 3 at a conference on energy policy, rallied behind government support of the clean energy sector, saying that now is not the time to throw in the towel.

"The global competition is fierce, and support for innovative technologies comes with inherent risk. Not every company or every product will succeed, but that is no reason to sit on the sidelines and concede leadership in clean energy," Chu said at a Washington Post Live forum held in Washington, D.C.

Chu, who is slated to testify Nov. 17 before Congress as part of an ongoing investigation into the U.S. Department of Energy's $535 million loan guarantee to Solyndra, cited a number of examples in defending his backing for government support of the clean energy sector. From the domestic aviation and information technology sectors to U.S. auto manufacturing, which was recently on the verge of collapse, government can be critical in promoting and developing industries, he said.

"The lesson from these examples is clear: the U.S. government recognized an economic opportunity, made a choice to compete, and took the necessary actions to promote these industries," he maintained.

Chu said that while solar cells, wind turbines and lithium ion batteries were all invented in the U.S., the nation is no longer a leading manufacturer of any of them. The country has ceded the lead to countries like China, which last year, he said, offered roughly $30 billion in government financing to its solar companies, including $7 billion to Suntech Power Holdings Co. Ltd. Other countries are adopting renewable electricity standards and public financing for clean energy projects, he said.

The U.S., on the other hand, lacks a comprehensive national energy policy and is still debating the economic benefits of the clean energy sector, Chu stated.

Chu said the stakes are large. The global clean energy market is already worth an estimated $240 billion and is growing rapidly, with solar photovoltaic systems alone representing a global market worth more than $80 billion this year.

Responding to questions about the Solyndra controversy, Chu conceded that there is room for improvement for the government program.

"Congress and the administration can design a better loan program. We think we can design a program so that it is self-paid," he said, without elaborating on details.

Chu maintained that such risk-taking is an important part of the nation's narrative, and that the U.S. finds itself at a crossroads of sorts.

"America faces a choice today: Are we going to recognize the opportunity and compete in the clean energy race, or will we wave the white flag and watch all of these jobs go to China, Korea, Germany and other countries?" he said.

NH senators see nation's electric reliability declining, seek FERC review

by Kathleen Hart

In the wake of the late October snowstorm that left more than 2 million New Englanders without power, Sens. Jeanne Shaheen, D-N.H., and Kelly Ayotte, R-N.H., wrote to FERC Chairman Jon Wellinghoff on Nov. 3, warning of a decline in reliability and calling for a federal review of reliability standards for America's electric power grid.

"Given your responsibility to protect the bulk electric system and ensure reliability for the millions of consumers and business who rely on electric power, we are requesting your prompt review of the adequacy of our nation's reliability standards," Shaheen and Ayotte wrote in the letter, which was sent to Wellinghoff and North American Electric Reliability Corp. President and CEO Gerry Cauley.

"New Hampshire residents have had to deal with repeated widespread power outages during the past year due to weather-related events, most recently during last weekend's October snowstorm," Ayotte said in a Nov. 3 news release. "With this early record-breaking winter storm serving as a reminder, we must work to ensure proper oversight is in place to guarantee reliability standards."

"While all of us in New Hampshire understand the challenges our weather brings, electric outages seem to be getting worse, not better. We need an electric system we can rely on, one that contributes to our public safety instead of detracting from it," Shaheen said in the news release.

"We are writing regarding the recent snowstorm which has left 315,000 New Hampshire and more than 2 million New England utility customers without power. In New Hampshire alone, the storm caused the loss of ninety-one main circuits, or back bone power lines, for [Public Service Co. of New Hampshire], the largest number in the company's history," the senators wrote. "Three other utilities, [National Grid USA], [Unitil Corp.] and the [New Hampshire Electric Cooperative Inc.] were also heavily affected by the storm."

PSNH is a subsidiary of Northeast Utilities.

Shaheen and Ayotte contended in the letter that electric reliability seems to be declining.

"Perhaps most troubling to us is the seeming downward trend in electric reliability for New Hampshire's utilities. In the case of PSNH, New Hampshire's largest electric utility, during the last two years alone the utility experienced three severe weather incidents which affected hundreds of thousands of electric customers," the letter said. "In addition to last month's snowstorm, which ranks as the third largest power outage in our state's history, 160,000 customers lost power in August of this year from Hurricane Irene and 360,000 customers lost power in February of 2010 from a wind storm. These outages are in addition to three smaller weather-related outages this year which also affected tens of thousands of their customers."

The senators pointed to a study by the Lawrence Berkeley National Laboratory estimating that the national cost of power interruptions is about $80 billion a year.

"The health and welfare of the American people and the needs of our economy demand a reliable electric power system," the senators added. "Given the most recent events, we think it is incumbent upon the Federal Energy Regulatory Commission and the North American Electric Reliability Corporation to undertake a review of reliability standards."

NRG's Crane: Falling cost of solar could revolutionize hub-and-spoke industry model

by Andrew Engblom

The falling price of solar panels could soon revolutionize the traditional hub-and-spoke model of the electric utility industry, eliminating many long high-voltage transmission lines, NRG Energy Inc. President and CEO David Crane said Nov. 3 during an earnings conference call.

"We will be in a situation where within two years the price of delivered power from solar installations will be able to undercut the retail price of grid power in roughly 20 states," Crane said. "Many of these high-price retail states are in our core regions. This low-cost solar power, installed in ever-increasing volumes on a distributed and semi-distributed basis in a way that obviates the need for a lot of very long high-voltage transmission lines, has a potential to revolutionize the hub-and-spoke power system which currently makes up the American power industry."

The delivered cost of solar energy has been cut in half in the past 24 months, Crane said, and he expects that trend to continue.

"Call it, if you will, Crane's Solar Corollary to Moore's law," he said. Other sources of electrical power increase their output by "brute force," but solar energy is essentially a nanotechnology. This makes it more like the semiconductor industry, which has famously doubled the density of transistors, and thus, processor speed, every two years.

"We are convinced that the cost of solar installations is going to continue to drop precipitously, both in absolute terms and relative to other forms of power generation," Crane said. "We believe the delivered cost of energy from solar PV, which has been cut in half in the last 24 months, will be cut again in the next 24 months."

The ramifications of this, Crane said, are that while the solar energy industry historically has largely been a "creature of government financial largess," that this is about to change.

"It's only true if you're looking backwards," Crane said. "If we look forward, we see a solar industry that's going to trend strongly towards distributed and residential installations."

He added that the government should continue to support these sectors, but that the distributed solar market "is a free-market construct."

Strategy to capture this involves distributed projects, retail business

To take advantage of this trend, Crane pointed to NRG's deal with industrial real estate developer ProLogis, which provides NRG with the right of first offer to install solar on rooftops of ProLogis properties in as many as 28 states. Those rooftops could support approximately 733 MW of distributed solar generation opportunities, according to the companies' announcement.

Other plays, Crane said, involve NRG's three retail electricity providers. The company has also made and will continue to make major investments in utility-scale solar projects, Crane said, adding that over time he expects distributed solar to dominate.

"I think that, over time, the distributed residential is going to end up sort of swamping the big-scale projects," Crane said in response to an analyst's question. "We will stay in the utility-side space, but I just wanted to [say] that we're positioning ourselves hard to take advantage of the opportunity we see on the distributing — the residential side."

For the near-term, though, utility-scale projects are the company's biggest solar energy bets, with more than 881 MW of utility-scale solar now under construction or in the final stages of advanced development.

NRG Executive Vice President and COO Mauricio Gutierrez said the 290-MW Agua Caliente solar project is now 40% complete; the 250-MW Colorado Valley Solar Ranch is "up to a good start"; and the first 63-MW unit of Ivanpah is "well under way," with the erection of the first solar receiver tower progressing as planned. Work has also begun on the foundation of the 65-MW unit 2 at the site. Work on the 26-MW Borrego, the 33-MW Alpine and the 25-MW Avra Valley projects is scheduled to begin in the first quarter of 2012. All of these projects are in California except for Avra Valley, which is in Arizona.

The scale of those largest three projects, however, will be difficult to duplicate, Crane said, explaining that they could only be financed due to the federal loan guarantee program that has now expired.

"I am sure there will come a day when we will see another wave of 300-plus megawatt large solar projects, but these projects are more than $1 billion projects, and without federal loan guarantees there is not that much Wall Street money to provide debt on that," Crane said.

As a result, he said he expects utility-scale solar projects to drop back to 20-MW to 100-MW sized deals, which he said NRG will "pursue aggressively."

First Solar expects 'correction' in oversupplied solar panel market

by Andrew Engblom

First Solar Inc. plans to shift its focus toward developing new markets outside of Europe, while slowing its manufacturing expansion as part of a revised strategy following the sudden exit of former CEO Rob Gillette on Oct. 25.

SNL Center for Financial Education

Principles of Valuation in the Power Sector

Hands-on training in the techniques necessary to successfully navigate valuation in the U.S. power sector, whether single assets or whole companies.

December 12–14, Houston, TX

Website: www.snlcenter.com/powerval

Class size is limited – Don't delay.

EASY REGISTRATION

- Online: www.snlcenter.com/powerval
- Phone: (434) 951-7786

PROGRAM FEE

$2,395

WHO BENEFITS

- Finance, investor relations or corporate strategy/corporate development professionals at power or gas companies
- Professionals in investment banking, project finance, asset management, hedge funds, or equity/fixed income research
- Consultants, accountants and lawyers who advise power and gas clients
- Industry regulators
- Current or potential suppliers or professionals looking for an understanding of how Wall Street analyzes the power and gas sector and the fundamentals that bear on their analyses

Program covers

- Identifying the valuation methodologies specific to the U.S. power sector, including DCF, comparables, multiples and real options
- Understanding value drivers, capital structure
- Techniques for acquiring the data used for modeling assumptions
- Valuing single plants, T&D assets, regulated generation assets and whole companies
- Incorporating revenue drivers, including forward and spot pricing, implied heat rates
- Assessing M&A synergies and regulatory considerations
- Understanding the role of power purchase agreements, tolling agreements, steam contracts and other financial arrangements
- Case studies, hands-on modeling and take-away templates

To see the complete agenda, go to www.snlcenter.com/powerval.

Instructor: James W. Bowen

As a veteran consultant in the energy industry, Jim Bowen has successfully valued hundreds of power plants and utilities. Prior to founding his own advisory firm, Momentum Development Corporation, Jim was a consultant with McKinsey & Co. and, previous to that, an attorney with Akin Gump. He holds a J.D., cum laude, from the Harvard Law School, an M.Sc. in Financial Management from the University of London, and a B.S. in Economics from the U.S. Military Academy.

Continuing education credits

This program qualifies for 17 hours professional development credit as granted by CFA Institute and 20.5 hours of CPE credit through the National Association of State Boards of Accountancy. Full details available on the Continuing Education page of the program website.

Register at www.snlcenter.com/powerval

Presented by

SNL Center FOR FINANCIAL EDUCATION

During the company's third-quarter earnings presentation on Nov. 3, First Solar Chairman, founder and interim CEO Mike Ahearn said a new direction was needed given the excess supply of solar panels and declining subsidies in Europe.

"The board felt the leadership change was necessary in order for the company to navigate through the current market conditions," Ahearn said. He also shot down speculation about fraud or major operational actions being related to Gillette's resignation, saying that it was "simply a question of fit."

To move forward, Ahearn said the company must find new customers for its panels and move beyond dependence on the European subsidies. It will also take a bottoms-up approach to rethink how its product is sold and deployed. "We all believe it is economically not feasible to think that this condition can last forever," he said. "There will be a correction is our bet. We need to be very vigilant about how to ride through and build these new markets."

While he declined to lay out a complete new strategy, telling analysts that a review was under way and that more information would be provided next month, he said Europe is not likely to be able to provide substantial new demand in the near future.

"The fact is that today we operate in subsidized markets where the short-term prospects are not as attractive," Ahearn said. "The European countries that subsidized demand that allowed the solar industry to scale to its current levels have been reducing their subsidies. In the U.S., there have been no significant state-level programs in several years, and the solar industry is feeding mostly off of legacy subsidies in California."

Some growth, in the form of utility-scale projects in the U.S., is expected, Ahearn said, but the company will also look to China, India, Australia and Africa for new markets. "We must … go where we can solve pressing problems," he said.

Ahearn said moving beyond the traditional subsidized markets means that the company must overcome the inertia of depending on legacy markets and move off the "short-term fixation" on earnings per share. "These actions will cost money. They will take time," he said. "Our decision-making needs to be guided by creating long-term value."

Vietnam plant postponed

As part of its presentation, Ahearn said the company has postponed plans to bring a new plant online in Vietnam, but that it will go ahead with plans to open a factory in Mesa, Ariz., in order to supply PV modules to its 2.7-GW project pipeline in North America.

Simultaneously, the company announced that it has inaugurated its second manufacturing plant in Frankfurt, Germany. The 50,000-square-meter facility, which reached full production in October, will manufacture 250 MW a year of solar modules. The expansion doubles the company's production capacity in Germany to 500 MW.

Sale of Topaz expected within months

In the U.S., the company closed on the sale of a number of major utility-scale solar projects during the quarter ahead of the sunsetting of the Department of Energy's loan guarantee program. One project, the 550-MW Topaz plant, did not receive a loan guarantee, but First Solar CFO Mark Widmar said the company "is in advanced negotiations with a buyer" and that the sale should be completed "over the next few months."

In other project news, the company said it would build, operate and maintain the 66-MW Alpine solar project in Lancaster, Calif., for NRG Energy Inc.

The company said its average conversion efficiency reached 12.4% for its best manufacturing lines during the third quarter. Its overall average conversion efficiency was 11.8%.

Progress still targeting year-end closure of merger with Duke

by Amy Poszywak

Progress Energy Inc. Chairman, President and CEO William Johnson said Nov. 3 that the company is still targeting closure of its merger with Duke Energy Corp. by the end of the year, though he acknowledged that the actual closing date will be determined by the timing of regulatory approval at FERC and the state commissions in North and South Carolina.

FERC on Sept. 30 conditioned its approval of the merger on the companies adding more market power mitigation measures. In an Oct. 17 response, Duke and Progress agreed to engage in virtual divestiture, selling the rights to various generating plants' output, and made several additional commitments, such as agreeing to have a market monitor oversee the virtual divestiture process.

FERC has set a 30-day comment period on the companies' response that will run out in mid-November, after which the commission will issue a final decision, Johnson said during the call.

Duke and Progress, despite having already submitted their mitigation plan to FERC, have also asked the agency, in a request for rehearing, why it departed from its precedent when analyzing those competitive impacts.

The South Carolina Public Service Commission, which needs to approve the joint dispatch agreement between Duke and Progress related to the merger, has postponed a hearing on the matter until the week of Dec. 12 in light of the outstanding FERC decision, Johnson said. The North Carolina Utilities Commission is reportedly awaiting FERC's response before making its decision.

Duke reveals NC rate case recommendation; future case likely as new plants come online

by Jason Lehmann

Duke Energy Corp. told Wall Street analysts Nov. 3 during a quarterly earnings conference call that North Carolina Utilities Commission staff filed testimony earlier this week on Duke Energy Carolinas LLC's proposed base rate increase, recommending a rate increase well below the company's initial request.

Duke Energy Carolinas in July asked North Carolina regulators to approve a $646 million electric rate increase based on an 11.5% ROE and 53% equity component, effective February 2012. Duke Chairman, President and CEO Jim Rogers said NCUC staff returned with a recommended overall rate increase of $211 million, "reflecting a number of adjustments to cost of service," an ROE of 9.25% and a 50% equity component.

Duke Energy Carolinas also has a base rate increase request pending in South Carolina with the state Public Service Commission, asking for a $216 million rate increase, also based upon an 11.5% ROE and 53% equity component.

Hearings are scheduled to begin Nov. 28 in North Carolina and Dec. 7 in South Carolina on the respective rate increase requests.

"We recognize that rate increases are challenging in these tough economic times," Rogers said. "However, it is very important to remember that these increases are principally the result of investments we have made to modernize our infrastructure and implement federal environmental mandates."

Rogers said Duke "will continue to explore opportunities for settlements in the weeks ahead."

Asked by an analyst if the company is exploring rate impact mitigation measures with North and South Carolina regulators, Rogers acknowledged that Duke "has worked hard in every state" to invest in energy efficiency and to "put control of the use of electricity in the hands of our customers."

That electricity prices are rising due to generating fleet and electric grid investments should come as no surprise, Rogers said.

"Clearly everyone today understands — probably more than they did when we first introduced our energy efficiency measures — the importance of having those in place and giving control to our consumers during this rising price environment," Rogers said.

Duke Group Executive and CFO Lynn Good hinted that as Duke Energy Carolinas' planned 825-MW, coal-fired Cliffside and 620-MW Dan River combined-cycle plants in North Carolina come online in 2012, the company will need an additional rate increase to recover its investment in those facilities.

"We have not estimated an increase at this point," Good said. "I think it will be dependent on the success of this case as well as what we see in terms of our cost structure, so more to come on that."

Progress Energy still addressing challenges at Crystal River 3 nuke

by Amy Poszywak

Progress Energy Inc. Chairman, President and CEO William Johnson on Nov. 3 reaffirmed the company's plans and estimated cost for repairs at its Crystal River 3 nuclear unit in Florida, an issue that has been lingering over the company's share price for quite some time.

"We continue to believe repairing the plant is better for our Florida customers than retiring and replacing it," Johnson said during Progress' third-quarter earnings call. "But as I said in June, we are approaching this situation in a very disciplined structured way and continue to assess cost and feasibility at every step."

The unit has been offline since September 2009 when damage to concrete in the periphery of its containment building was discovered during an attempt to replace steam generators. This "delamination" was followed by the discovery of a second delamination, or separation damage, in March.

In a June 28 conference call, Johnson said the company will spend $900 million to $1.3 billion to repair the Crystal River plant, adding that the cost is well within the plant's $2.25 billion insurance coverage limits. The CEO reiterated that statement during the Nov. 3 call.

In August, the Florida Public Service Commission established a plan to review the prudence and cost related to the Crystal River 3 outage, including replacement power costs, which they then divided into three phases, Johnson said.

"The first phase will focus on the events and decisions leading up to the delamination event on Oct. 2, 2009," Johnson said. "A hearing is scheduled for June 2012 and we filed initial supporting testimony last month. The second phase will review the decision whether to repair rather than decommission the unit. And the third phase will include review of the decisions and events subsequent to the October 2009 event and leading up to the March 2011 delamination and ultimate repair of the containment building."

Johnson said the company has been working closely with Nuclear Electric Insurance Ltd., the insurance company that covers the company against the incremental cost of replacement power resulting from prolonged accidental outages, as it conducts its review of the claim. Crystal River 3 is not expected to be up and running until 2014.

On July 5, Moody's said it expected the delays in the repair plan to have a negative effect on the utility's credit quality and business risk profile but will not immediately lead to a change in the company's credit ratings or rating outlook.

Elster Electricity's Q3 gas gains offset weak North America, Mideast markets

by Dan Testa

German smart metering company Elster Group SE on Nov. 3 reported third-quarter 2011 revenues of $464.4 million, a 2.9% increase over the third quarter of 2010.

Describing it as a "solid quarter," Elster CEO Simon Beresford-Wylie ascribed the gains to a strong gas segment and growing markets in Europe and Latin America overcoming weakness in the water and electricity segments, particularly in North America and the Middle East.

"The strength of Elster's gas business and our geographic diversity have driven our steady performance in the face of the challenging macro environment, especially in North America," Beresford-Wylie said in a news release. "I am very encouraged by our strong forward order book and the momentum coming from Europe and Latin America for their near and mid-term smart grid deployments. I am also especially pleased by the very strong results turned in by our gas business."

Elster's third-quarter 2011 revenue represented a $13.1 million increase over the third quarter in 2011 but a 2.6% decrease on a constant currency basis. Adjusted EBITDA for Elster came in at $67.6 million for the third quarter of 2011, down 10.7% from a year earlier.

GAAP net income from continuing operations attributable to Elster came in at $23.3 million, or 21 cents per American depositary share. Non-GAAP net income was $30.5 million for the third quarter of 2011, down from $43.3 million in the third quarter of 2010.

Elster's gross margin was 31.5% in the third quarter of 2011, compared to 31.2% a year earlier, with the company attributing the solid performance to the gas segment offsetting weaker results in the water segment and North America. Total operating expenses increased by $19 million, or 23.2%, to $100.9 million in the third quarter of 2011, an increase from $81.9 million in the third quarter of 2010.

Elster's gas segment was far and away its strongest performer, with revenues of $276.4 million in the third quarter of 2011, reflecting a 16.7% increase over the prior-year quarter. Profit for the gas segment was $64.1 million for the quarter, an 8.3% increase over the third quarter of 2010. For the first nine months of 2011, gas revenues were $807.2 million, up 18.9% compared to 2010.

Electricity revenues, on the other hand, declined 10.7% from the previous year, to $105.1 million in the third quarter of 2011. Elster's electricity profit of $8.3 million in the third quarter of 2011 marked a 50.9% decrease from the third quarter of 2010.

Elster's water segment fared about the same, with revenues of $91.2 million in the third quarter of 2011, a 10.2% decrease from the year-prior quarter. Water segment profit of $3.5 million amounted to a decline of 62% compared to the third quarter of 2010. Profit margin for Elster's water segment declined to 3.8% from 9.1% in 2010.

In the cases of water and electricity, Elster attributed the declines to sluggish markets in the Middle East and North America.

"In the United States in particular, many customers and prospective customers continue to live in a world of exceptionally tight budgets. The consequences of this, as we have seen throughout the year, are delayed and postponed projects," Beresford-Wylie said on the conference call. "Indeed, the latest third-party industry data points to a contraction in the overall North American region market."

In a report issued later that day, analysts for Macquarie (USA) Equities Research seemed to appreciate the candor of Elster executives in acknowledging a slowdown in metering activity, primarily in North America, the Middle East and Europe. But Macquarie also found Elster "impressively treading water" in the difficult conditions, and it reaffirmed an "outperform" rating for what it described as "the most attractive publicly traded smart metering company."

"Much of our bullish thesis on [Elster] is predicated on its exposure toward the high growth, high margin gas business (including utilization), which limits exposure to the slowdown in US electric metering in particular," Macquarie analyst Andrew Weisel wrote. "Moreover, unlike other metering companies, [Elster]'s customer concentration is extremely low."

Macquarie did, however, lower Elster's target price to $18.50 from $19 and revised non-GAAP EPS estimates for 2012 and 2013 to $1.26 and $1.45, respectively, from $1.28 and $1.49 for the same periods.

Elster's guidance for 2011 was that revenues will grow 5% to 9% for the year, compared to 2010, and the company estimates 2011 GAAP earnings per ADS in the range of 90 cents to $1.

For the first nine months of 2011, Elster reported revenues of $1.4 billion, up $112.4 million, or 8.8%, over the first three quarters of 2010, and up 3.7% on a constant currency basis.

Elster's adjusted EBITDA for the first three quarters of 2011 was $199.7 million, a 3.3% decrease from the $206.6 million recorded in the first nine months of 2010. GAAP net income from continuing operations attributable to Elster over the first three quarters of 2011 was $61.6 million, or 55 cents per ADS. Non-GAAP net income for the first nine months of 2011 was $91.1 million, up 28.1% from $71.1 million in the first three quarters of 2010.

Elster's total operating expenses for the first nine months of the year increased $44.3 million, or 16.1%, to $318.7 million, up from $274.4 million in the same period in 2010. Elster attributed the increased expenses to its transition to a public company, which occurred in the fourth quarter of 2010. The company also incurred a charge of $10.3 million, or 9 cents per ADS, to write off unamortized debt issuance in the second quarter of 2011 from an old credit facility.

EPA rules, market factors forcing quick decisions by power plant owners

by Wayne Barber

New clean air rules, renewable standards and the cheap — for now, at least — price of natural gas are forcing power generators to make long-term portfolio decisions in a hurry, speakers said Nov. 3 at the Infocast Power Generation Summit in Washington, D.C.

Tight deadlines in the U.S. Environmental Protection Agency's Cross-State Air Pollution Rule were cited by many speakers, including American Electric Power Co. Inc. Executive Vice President of Generation Mark McCullough.

"Let's take a little moment here," McCullough said. "We are not out to gut the Clean Air Act." But big generators such as AEP want enough time to do environmental retrofits on coal plants while replacing the weakest coal units by building natural gas-fired plants, he said.

AEP is looking to retire 6,000 MW of older coal units by 2015. That is a concern because these units are still used a lot during heat waves, McCullough said. Given the time that it takes to build either

a new gas plant or an SO2 scrubber, the current CSAPR time frames are not feasible, he said.

When asked why AEP had not been retrofitting more coal units before the cross-state rule was published, McCullough said AEP has spent millions of dollars studying how to comply with previous EPA rules only to see them thrown out by the courts a couple of years ago.

The timing of the EPA deadlines "limits your options," said Kimberly Malm Adelberg, a climate strategy manager with a Southern Co. subsidiary.

Various speakers also predicted that the cross-state rule, coupled with other EPA proposals on everything from regional haze to cooling water, could shrink reserve margins in many regions of the country.

"We don't know if we will have adequate generation" if the cross-state rule goes into effect in January 2012, said Donna Nelson, who chairs the Public Utility Commission of Texas. Generators in Texas have sued the EPA over a decision to include Texas in the cross-state rule, and Nelson admitted that Texas has not yet formulated much of a "Plan B."

Some speakers noted that generators in regulated states can at least pass on the cost of complying with EPA rules to ratepayers. But Pennsylvania Public Utility Commission Chairman Robert Powelson predicted that such requests will yield "regulatory fatigue" at state commissions that must deal with ratepayers.

Consultant takes contrary view on natural gas

Most power generators — both regulated utilities and independent power producers — have turned to new natural gas plants as their default source of generation. But Stuart Pearman, a partner with ScottMadden Inc., cautioned that the electricity sector has seen such "silver bullets" in the past and they often misfire.

"Gas is the silver bullet right now. Everybody knows that except for me," Pearman said. He likened it to an imbalanced stock portfolio. "What we like to do in this industry is just buy one stock," he said.

The power industry has seen a dash to gas in the past, and it resulted in an overbuild of natural gas-fired plants, Pearman said. The shale gas revolution could turn out to be more complicated than many expect, he cautioned. A company that develops natural gas reserves assuming the price will be $5.10 per Mcf will be hurting if the market price turns out to be much less, he said.

As for other options, Pearman said the Fukushima Dai-ichi nuclear disaster in Japan has eliminated the chances for any "grand bargain" on Capitol Hill to provide incentives for both nuclear power and renewable energy.

CPS Energy President and CEO Doyle Beneby said that the San Antonio municipal utility has to be more "defensive" than many of its investor-owned counterparts. This means hedging its bets between traditional power plants and more renewable energy, he said.

With multitiered strategy, Edison keeps eye on EMG prize

by Jason Lehmann

Though Edison International plans no new equity investments in its competitive generation subsidiary, Edison Mission Group Inc., it has outlined several "potential scenarios that can produce real value at EMG," according to Chairman, President and CEO Ted Craver.

"The size of that potential value seems large enough to us to warrant pursuing," Craver said Nov. 2 during a quarterly earnings conference call with Wall Street analysts. "However, we also recognize that there is not unlimited time to work the many scenarios. We are approaching the time when scenarios will give way to decisions and we believe many of these will be made over the next six to 12 months."

Craver said the U.S. Environmental Protection Agency's final Mercury and Air Toxics Standards Rule scheduled to be finalized in December will allow EMG subsidiary Midwest Generation EME LLC to crystallize its emissions compliance strategy and to begin making decisions on individual plant retrofits, though other EPA proposals surrounding greenhouse gases and water will also play into those decisions.

At Midwest Generation, Craver said, EMG will only make emissions retrofits "where it can see sustainable value for making those investments," and is fine-tuning its construction timeline to meet its emissions reduction obligations while simultaneously minimizing major capital spending into 2012 and complying with construction permits for its coal-fired Waukegan and Powerton generating plants in Illinois.

Second, Craver said that because Edison will not commit equity financing, EME Homer City Generation LP must gauge its ability to secure third-party financing for its planned installation of flue gas desulfurization scrubbers on Homer City units 1 and 2. EMG will consider project sales as an option to meet its liquidity needs, but Craver said realized prices in the PJM Interconnection LLC capacity auction for the 2015-2016 capacity auction will be "a critical indicator of future value for our fleet."

"One would think that the shut down decisions by other generators since the last auction should lead to a further improvement in capacity prices but this needs to be confirmed," he said.

EMG is also evaluating Homer City's compliance with the EPA's phase one Cross-State Air Pollution rules in 2012-2013 "taking into account PJM rules, existing capacity sales and allowance price and availability."

EMG also needs to establish "a more sustainable capital structure," which Craver said will require winding down about $1 billion of the merchant's $3.7 billion of outstanding unsecured debt.

Generation beyond coal

Of EMG's 2,000-MW wind portfolio under construction and in development, the company is seeking financing for 1,042 MW of wind development, including nonrecourse debt financings for its contracted projects.

"As many of you are aware, the project finance market has tightened with the ongoing European banking situation and we are exploring the private placement market as an alternative to the project finance market," Edison CFO, Treasurer and Executive Vice President W. James Scilacci said, later adding that "our job here is to look to see if we can finance the maximum extent possible or find PPAs for those emerging projects and then flip them into potential project financings."

According to the company's CapEx forecast, renewable capital and construction spending will total $274 million in 2011 and $108 million in 2012.

Black & Veatch: Utilities face tough coal retirement decisions

by Matthew Bandyk

While the U.S. Environmental Protection Agency's proposed emissions standards for coal and oil-fired power plants may get delayed again, numerous utilities are feeling pressure to make decisions as soon as possible to either retire or retrofit aging coal plants, according to Black & Veatch Corp. Management Consulting Managing Director Robert Patrylak.

Several of the utility clients that Patrylak works with as part of Black & Veatch's strategic resource planning service line have expressed concern that in the next few months they will have to begin the actions needed to comply with the EPA regulations, he said in a Nov. 1 interview. Even immediate action could be too late. "They are concerned that even if they make the decision now, they're not going to have time to meet the regulations," he said.

Because of the short timeframe, for some plant owners, future delays of the regulations may be rendered moot because they will have already taken action by the time a delay is implemented. "If they've already made the decision to go forward, then you would have already gone down the road of spending that money," Patrylak said.

Black & Veatch periodically publishes forecasts for the U.S. power generation sector. In its most recent analysis, released last spring, the firm found that 64 GW of coal-fired capacity will be retired by 2020, and the main drivers of these retirements will be the EPA's Cross-State Air Pollution Rule, the Mercury and Air Toxics Standards Rule and federal regional haze regulations.

The analysis attempts to model on a unit-by-unit level, based on the costs of regulations and the capacity revenue in regional markets, at what point it will be economic for a utility to retire a plant rather than retrofit it with controls to comply with regulations.

The results, outlined in a presentation that Patrylak gave Nov. 2 at the Infocast Power Generation Summit in Washington, D.C., found that 46% of the retirements are in the Midwest region, with 31% in the Southeast, 16% in the West, and 7% in the Northeast.

Texas, which the analysis counted as its own region, saw no retirements. "Gas is typically on the margin," Patrylak said. In Texas, "there's more profit margin between the costs of the coal, so we're not seeing much of an impact" in the Electric Reliability Council of Texas Inc. market, he said.

Black & Veatch is working on an update of this analysis to be released the first week of December. Patrylak said that based on his preliminary review of the numbers, he expects the new analysis will have similar findings for Texas as the spring analysis.

The potential impact of greenhouse gas regulation was also included in the firm's forecasts. The spring analysis assumed that the federal government would impose a cap-and-trade program starting in 2035. This program was found to have the most powerful retirement effect on plants that are between baseload and peaking status.

"Introducing greenhouse gas [regulation] can actually change the whole perspective for a lot of mid-merit assets," Patrylak said at the conference. "That increased cost eats right into the margin and causes the plant to operate less as the coal cost gets more parity with the natural gas asset."

All told, the Black & Veatch analysis found that conventional coal-fired generation would fall from 31% of the nation's electric generation capacity mix today to 15% in 2035. Combined-cycle gas-fired generation, meanwhile, will increase from 21% to 30% of the capacity and renewables will grow from 6% to 16%, according to the analysis.

Ormat eyes future geothermal development

by Matthew Bandyk

Ormat Technologies Inc. has 160 to 165 MW of new geothermal projects or expansions under construction, company executives said Nov. 3.

One of the largest is the 30-MW first phase of the McGinness Hills project in Lander County, Nev. According to a presentation that accompanied the company's third-quarter earnings call, field development and construction of the project is in progress, and the Ormat Industries Ltd. subsidiary expects it to be completed in 2012.

McGinness Hills, as well as two other Ormat projects, recently received a loan guarantee for up to $350 million from the U.S. Department of Energy.

"The nominal interest on the part of the loan that was funded earlier this week is an exceptionally low 4.687%, and this will reduce our interest rate over the long term," Ormat Technologies CEO Dita Bronicki said during the call.

The 160 to 165 MW of projects under construction include a 36-MW plant in Kenya. Of the seven U.S. projects, Ormat expects all but one to qualify for the Section 1603 investment tax credit cash grant program. However, the investment tax credit status of the company's proposed 20-MW Carson Lake plant is uncertain. "We are developing a new project schedule to determine if the project can still meet the ITC deadline," President and COO Yoram Bronicki said during the call.

The company also has 123 MW of projects in early development. Of those, the two U.S. projects are the 15-MW Crump Geyser project in Oregon, with commercial operation expected in 2013, and the 30-MW Wister Phase I in California, which does not have an announced operation date.

The company also is exploring 31 sites in Oregon, Idaho, Nevada, Utah, California, Alaska and Hawaii for potential development of new facilities.

On Nov. 2, Ormat reported third-quarter adjusted EBITDA of $46.7 million, compared to $78.8 million in the third quarter of 2010.

For the quarter, revenues from the company's electricity segment were up to $86.8 million from $83.4 million a year earlier. The presentation attributed the increase mostly to higher electricity rates for plants such as the 31-MW Puna Geothermal Venture I project in Hawaii. Ormat is planning an 8-MW expansion of the plant.

"Puna enhancement has been completed and we are ready to deliver power to the grid as soon as the [power purchase agreement] is approved" by the Hawaii Public Utilities Commission, Yoram Bronicki said.

Enbridge to acquire 50% stake in 300-MW Quebec wind project

by Wijdan Khaliq

Enbridge Inc. and EDF EN Canada Inc. signed an agreement under which Enbridge will invest C$330 million to acquire a 50% interest in the 300-MW Lac Alfred Wind Project in Quebec.

The wind project will consist of 150 turbines supplied by REpower systems AG. Construction of the project is slated to take place in two phases. Phase one began in June and is expected to be finished in December 2012, while phase two is expected to be completed in December 2013, according to a Nov. 3 news release.

EDF EN Canada will continue to lead and manage the construction phase under a fixed-price, turnkey engineering, procurement and construction agreement. The company's operation and maintenance affiliate, enXco Service Canada, will provide long-term operations and maintenance services.

The project will sell its power under a 20-year power purchase agreement to Hydro-Québec, which will also construct a 30-kilometer transmission line to connect the project to the grid under an interconnection agreement.

The transaction is subject to customary conditions precedent, including the consent and approval of Hydro-Québec Distribution and Hydro-Québec TransEnergie, according to the release.

EDF EN Canada is a subsidiary of EdF Energies Nouvelles, which is in turn a subsidiary of EDF Group.

FERC allows PJM to shorten waiting period for board members

by Glen Boshart

FERC on Nov. 1 approved a PJM Interconnection LLC proposal to shorten the period of time that a former director, officer or employee of a PJM member or a member's affiliate must be removed from that position before being elected to PJM's board.

In asking FERC to reduce the waiting period to two years, PJM explained that the existing five-year waiting period has been hampering its ability to find qualified board members, i.e., those with experience dealing with industry issues specific to the region.

"It is beneficial and crucial to PJM's continued success that the board attract members from the PJM region who are familiar with the current practices and operations of PJM," the RTO told FERC. "By electing members to the board from the PJM footprint, PJM will be able to maximize local input, rather than expend time and resources seeking and training candidates who lack the PJM-specific expertise that adds significant value to the PJM board."

PJM said its ability to find qualified candidates residing in its footprint has become increasingly difficult as its membership ranks have exploded to 727 members. Expecting that growth to continue, PJM said the five-year waiting period has made recruiting even more difficult. The proposed two-year waiting period would reduce at least this hurdle, PJM explained.

As for any independence concerns, PJM insisted that requiring nominated candidates to be two years removed from any position they may have had with PJM members or affiliates will still ensure the RTO's independence, while allowing PJM to access people with current, region specific expertise.

The RTO also told FERC that its proposed waiting period is "already common practice in the industry," noting that three other ISOs require no waiting period while the rest mandate a two-year waiting period. Moreover, citing a 2004 federal appeals court ruling in a case involving the California ISO, PJM reminded FERC that court precedent holds that the agency must give deference to RTOs and ISOs regarding governance decisions.

PJM asked that the proposed changes to its operating agreement become effective Nov. 22.

Noting that no party opposed PJM's proposal, FERC approved it without comment through a designated letter order. (ER11-4630)

Edwardsport *continued*

Buck, the roughly $700 million project is on budget. Duke said it has spent $375 million on the plant through Sept. 30.

Duke's most controversial project, the 618-MW integrated gasification combined-cycle Edwardsport facility in Knox County, Ind., is 96% complete, with about $2.93 billion invested in the plant, which Duke now estimates will run about $3.3 billion. The proposed cost cap to customers remains at $2.72 billion for construction costs.

Duke still expects that the plant will be in service in fall 2012, but the company is awaiting an Indiana Utility Regulatory Commission decision on whether Duke can recoup the $2.72 billion proposed cost cap from customers and whether intervenor allegations that Duke fraudulently concealed or grossly mismanaged the project are true.

"Our case is supported by independent auditor testimony demonstrating the costs of the Edwardsport plant were both reasonable and necessary and that we prudently managed the project," Duke Chairman, President and CEO Jim Rogers said during a Nov. 3 earnings conference call. "Our testimony in … early September demonstrates that the intervenors' allegations are unfounded."

Rogers said extensive startup testing is under way at Edwardsport, and mechanical and electrical systems will be turned over to startup crews later this year.

"The plant, which will use Indiana coal, will provide cleaner, more efficient energy to our customers in the state," he said. "Due to its efficiency and low cost of energy, Edwardsport will be the first plant to be dispatched on our Indiana system and remains the best solution for our customers' needs, helping to ensure the energy future of this region."

Completion of the projects will allow Duke to continue retiring older, inefficient generation the company has deemed too costly or unpractical to fit with emissions controls.

"When our modernization program is complete, nearly 100% of our coal generation capacity will have scrubbers in operation. This positions us well as the EPA continues to finalize more stringent environmental regulations," Rogers said. "At this time our current plans for compliance assume we have already retired or will retire almost 3,800 MW of coal generation, or about 20%, of our existing coal fleet system wide by 2015."

Renewable build-out also on track

Duke also expects to wrap about 800 MW of wind projects in 2012, bringing Duke's wind portfolio to about 1,800 MW when completed. "Consistent with our strategy, each of these projects is backed by long-term power purchase agreements," Rogers said.

Plants slated for completion in 2012 include the Los Vientos phase 1 and 2 facilitates in Willacy County, Texas, totaling 402 MW; the 168-MW Ironwood project in Ford County, Texas; the 131-MW Cimarron Wind plant in Gray County, Kan.; and the 69-MW Laurel Hill facility in Lycoming County, Pa.

Calif. electric utilities *continued*

points from currently allowed water ROEs. "When you move from 10.2% to 10% ROE, it has an almost meaningless impact," Storozynski said. "That is why I think it is positive."

PG&E Corp. subsidiary Pacific Gas and Electric Co. and Edison International subsidiary Southern California Edison Co. are expected to begin their cost-of-capital reviews sometime in 2012, the report said.

"Over the last couple of decades, and especially since the electric deregulation in the state, electric utility ROEs in California have been much higher than those for water and gas utilities due to higher levels of capital spending and high debt imputed from power purchase agreements for California electrics," the report said. "We believe the ROE premium for electrics over water should continue especially as [PG&E Corp.] and [Edison International] have signed numerous new conventional and renewable [power purchase agreements] since their ROEs were last set, further increasing their debt levels imputed by credit agencies."

The 2013 earnings-per-share estimates for both electric companies could rise from current levels. The current levels reflect a 100-basis-point reduction in allowed ROEs, so there is room for ROE increases, the report said.

"The companies should see an above average EPS growth driven by [capital expenditures] and regulatory recovery, and yet [they] three trade at a significant [price-to-earnings ratio] discount to their peers," the report concluded.

DRA: Cost of capital decreasing

Division of Ratepayer Advocates Director Joe Como said in an interview that the assumption should not be made that his division will settle for higher ROEs for the electric companies. He said the investor-owned electric utilities are already earning ROEs that are higher than they should be.

"Return on equity should follow the cost of capital, and the cost of capital has been decreasing, not increasing," Como said. "We have always argued the return on equity has been too high, higher than it needs to be. They should get a fair return on their equity but not higher than reasonable. The value of that equity has come down, and their ability to get capital is cheaper, so they should pass some of that cost savings on to ratepayers."

ROEs should not be higher than absolutely necessary, he said, because the state has spent so much on renewable energy resources to achieve its environmental objectives, and renewables are much more expensive than traditional resources and thus impact ratepayers.

"We cannot expect the customers to be saddled with any unnecessary cost, and it is unnecessary to pay too much on return on equity," he said. "I believe the energy utilities need to reduce their return on equity as well."

The utilities are making more money because of the high price of renewables and the state's renewable standard goals, and they are doing so comfortably as natural monopolies, Como concluded.

In California, the ROE levels are set in the midcycle of general rate cases, Como said. He said he expects that the utilities will make their ROE filings around March 2012, and the proceedings would continue through the rest of the year, so any changes in the cost of capital for the electric utilities would not take effect until 2013 at the earliest.

PG&E, SoCalEd assess earnings

Edison International and PG&E released their third-quarter earnings Nov. 2 and 3, respectively. PG&E Corp. Chairman, President and

CEO Anthony Earley Jr. said in a Nov. 3 earnings call that the company has determined that it needs to spend more on its gas and electric systems. The company will spend about $200 million more than it previously planned in 2012 and about the same amount again in 2013 to improve safety and reliability of operations across the utility, but mostly on the gas side.

The company's response to the San Bruno, Calif., gas pipeline explosion in September 2010 will have a negative impact on the company's earnings in 2012, which will continue into 2013, Earley said. "It is our objective, however, to earn our authorized return in 2014. Some of this additional spending will be acceleration of work we'd previously planned to complete over a longer period," he said.

Meanwhile, in a Nov. 2 earnings call, Edison International CFO, Treasurer and Executive Vice President W. James Scilacci Jr. said the company's ongoing message is that rate-based growth will increase regulated subsidiary SoCalEd's earnings, while lower gross margins for the merchant coal fleet have and will adversely impact subsidiary Edison Mission Energy's earnings.

During the call, an analyst noted that the midpoint earnings estimate of $3.15 for SoCalEd "on its face appears to be an ROE modestly in excess of the 11.5," though he said this probably includes construction work in progress and takes into consideration how corporate allocations "move around."

Scilacci replied that his company has benefited from tax benefits and "a lot of cash" that has deferred the need to finance as much as originally forecast, resulting in lower interest expense. SoCalEd CFO and Senior Vice President Linda Sullivan also said the timing of the company's capital spending program was a factor.

Later, Scilacci declined to speculate on a question about whether the ROE for FERC-jurisdictional transmission operations would be more or less than 11.1% beyond 2012. "It's going to be in the general ballpark and it has a small impact … because when you look at the total rate base, FERC is 15% of our total rate base so it's going to be small impacts if it's changing 5 or 10 basis points," he said.

SoCalEd's 2012 general rate case is moving into its final stages, Edison International Chairman, President and CEO Theodore Craver Jr. said. The last major procedural filings were made in October and the record is now basically complete, he said, adding that the assigned administrative law judge must now draft a proposed decision, and the PUC is scheduled to decide the case by the end of the year. If the final decision is delayed, the commission has already ruled that the new rates will be retroactive to Jan. 1, 2012, Craver said.

Market Story

Next-day power prices end mixed, caught between generally weaker demand, rising gas

by Amanda Luhavalja

Spot power markets saw choppy action Thursday, Nov. 3, with generally lower demand outlooks ahead of the approaching weekend running counter to rising gas prices and ongoing unit outages across the country. Next-day power markets advanced in Texas and parts of the Northeast and Midwest, with spot values ending flat to down across much of the West as traders worked a partial weekend product.

Looking at natural gas, following a 3.2-cent loss Nov. 2, the December gas futures contract rebounded to the upside Thursday, settling the day at $3.778/MMBtu, up 2.9 cents even after the U.S. Energy Information Administration reported at midmorning a larger-than-expected 78-Bcf injection into storage for the week ended Oct. 28.

With the rebound in futures, physical gas prices were swept higher, suggesting rising fueling costs for U.S. power generators. According to data from IIR Energy, almost 100,000 MW is offline across the U.S., up almost 18,000 MW on the day with almost half of the outages located along the East Coast.

IIR data shows a large portion of the downed units, more than 42,500 MW, is coal-fired, up about 6,500 MW on the day. In terms of nuclear supply, SNL Energy data shows total U.S. nuclear supply remains below 85% capacity.

Texas prices move higher with expected ramp in demand, rise in spot gas

Spot power prices in Texas ratcheted higher Thursday, as rising spot gas prices and an expected bump higher in demand come Friday supported gains.

At the spot markets, ERCOT North, South and Houston power parcels were exchanged in the low $30s, gaining $2 to $3 on average on the session.

The ERCOT grid operator sees demand peaking at 40,184 MW on Friday, up about 8,000 MW from Thursday.

Northeast power markets see choppy moves

With milder temperatures in the 60s and 70s in areas across the region expected to keep a lid on demand ahead of the weekend, running counter to stronger physical gas markets, spot power prices in the Northeast chopped around Thursday.

In New England, at the NEPOOL-Mass hub, spot on-peak power was transacted in the low $40s, up 50 cents on the day, with the off-peak market pegged in the mid-$30s. In New York, at the Zone G hub in the east, next-day parcels were reported done in the low $40s, down about 75 cents. To the south, in the mid-Atlantic, next-day deals at the PJM West hub were inked in the low $40s, down almost $5 on the session.

Demand in the PJM Mid-Atlantic region is seen cresting near 32,243 MW on Friday, decreasing about 1,400 MW from Thursday, while in the PJM Western region, load is expected to peak near 44,781 MW on Friday, down about 900 MW from Thursday.

In the north, New England demand is seen peaking near 16,130 MW on Friday, down more than 500 MW from Thursday, while New York load is expected to reach a high of 18,963 MW on Friday, dropping more than 1,000 MW from Thursday.

Midwest power prices run mixed amid lower demand outlooks, rising gas

Next-day power markets in the central U.S. saw a mixed session Thursday as higher spot gas prices were offset by weaker demand projections for Friday.

In Ohio, at the Cinergy hub, spot on-peak power parcels traded in the mid-$30s, easing about $1 on the day, and off-peak deals were done in the mid-$20s. Spot peak power at the PJM AEP Dayton hub was transacted in the high $30s, down $2.50 in value.

Demand in the AEP region in Ohio is seen cresting near 15,890 MW on Friday, down about 800 MW from Thursday, while load in ComEd is expected to peak near 11,761 MW on Friday, easing about 850 MW from Thursday.

Most West Coast markets firm to lower with partial weekend inclusion

West Coast power prices were generally flat to lower Thursday, as traders worked a revised lower-load Friday-Saturday product ahead of the upcoming weekend, which deflated values.

Load in California is projected to peak near 29,100 MW on Friday, down about 300 MW from Thursday before falling even further Nov. 5.

In California, spot heavy-load power at North Path-15 was exchanged in the low $40s, flat on the session. Heavy-load parcels at South Path-15 ran in the upper $30s, down more than $2 on the session.

In the Northwest, heavy-load deals at Mid-Columbia were dealt in the mid-$30s to low $40s, flat on the day, with heavy-load packages at COB done in the upper $30s to low $40s, up nearly $2.

In forward trading at Mid-C, trading was thin. "We saw a few term trades today," according to a trading source. December delivery deals were pegged near $36.75, with January 2012 parcels assessed at $33.25 and third-quarter 2012 business done at $37.

Spot heavy-load power at Palo Verde and Mead in the Southwest was transacted in the mid-$20s, easing more than $3 on the day at the two markets. Light-load power packages at Palo Verde and Mead ran in the mid-$20s.

The Dominion Energy Index, maintained by The Dominion Energy Services Corp., measures actual and forecast demand for heating and cooling energy. It is designed to be more precise than the current heating degree days and cooling degree days indexes. The first reading in each regional list is the actual energy demand measured the day the forecast is made. The forecast energy demand for the following week for a given region follows the actual reading in the table. "Normals" for each region for each day have been calculated using 30-year weather averages.

Re: TFCO Review of the of the Proposed Modification to the Maxcys-Bucksport Special Protection System

Sir / Madam:

Sections 2.3 and 2.3.3 of Appendix B, "Procedure for Review of Special Protection Systems," of NPCC Regional Reliability Reference Directory 7, "Special Protection Systems," charge the NPCC Task Force on Coordination of Operation to review the operability of a newly proposed Type I special protection system or a modification of an existing Special Protection System:

> **2.3 "If the proposing entity expects the Special Protection System to have inter-Area or inter-Regional consequences, or if the TFSS or TFCP review concludes this to be the case, TFCP will request the Task Force on Coordination of Operation (TFCO), the Task Force on System Protection (TFSP) and TFSS to review it. Each of the Task Forces may require a presentation from the proposing entity."**
>
> **2.3.3 "TFCO will review the operability of the Special Protection System and forward a summary of their findings to TFCP, TFSS and TFSP. This summary will include a statement as to whether the Task Force has any objections to its modification or installation."**

At its meeting of October 6 and 7, 2011, the NPCC Task Force on Coordination of Operation reviewed the proposed modification to the Maxcys-Bucksport Special Protection System.

The Maine Power Reliability Program (MPRP), which will strengthen the transmission system in northern Maine, will eliminate the need for the Maxcys-Bucksport SPS by the spring of 2014. During the ongoing construction, modifications to the Maxcys-Bucksport special protection system will be required. The energization of one portion of a new transmission path, 345 kV Section 3023 between the Albion Road and Orrington Substations, together with the Albion Road 345-115 kV autotransformer, will necessitate a modification of the Maxcys-

Bucksport SPS. These revisions will include setpoints for triggering the transfer trip and generation rejection signals associated with the SPS. The Maxcys-Bucksport SPS forces a controlled separation of Bangor Hydro and the Maritimes by opening transmission facilities for contingencies on Section 388 between the Orrington and Maxcys substations and Section 392 between the Maxcys and Maine Yankee substations. The energization of Section 3023 and the Albion Road autotransformer provides an additional transmission path south of Orrington that must also be tripped following contingencies on Sections 388 or 392 in order to maintain the controlled separation of Bangor Hydro and the Maritimes. It is currently expected that the modified SPS will be required from the autumn of 2012 until the spring of 2014, at which time the Maxcys-Bucksport special protection system is scheduled to be removed.

Following its review of the proposed revisions to the Maxcys-Bucksport special protection system, the NPCC Task Force on Coordination of Operation concluded that these proposed changes will not impact the operability of the system and recommends its approval as an NPCC Type I special protection system.

Thank you for your attention to this important issue.

Very truly yours,

Dave Daley

Industry Webinar

Project 2007-12 Frequency Response and Frequency Bias Setting

November 14, 2011 | 1:00–5:00 p.m. ET

Click here for: Webinar Registration

Teleconference: 800.704.5185 | **Access Code:** 8816510 | **Broadcast Audio Code:** 838373

Background: Frequency Response is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. In FERC Order 693 the Commission directed the ERO to:

1. Determine the appropriate periodicity of Frequency Response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and

2. Define the necessary amount of Frequency Response needed for reliable operation for each Balancing Authority with methods of obtaining and measuring that the Frequency Response is achieved. The proposed standard sets a minimum Frequency

Response obligation for each Balancing Authority, provides a uniform calculation of Frequency Response and Frequency Bias Settings that transition to values closer to natural Frequency Response, and encourages coordinated AGC operation.

For more information or assistance, please contact Darrel Richardson (via email) or at (609) 613-1848 or Wendy Sandberg (via email) or at (404) 446-9735.

NERC Reliability | Accountability

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

NERC Standards 101

RELIABILITY | ACCOUNTABILITY

Presentation Agenda

- NERC Overview
- Standards Process

NERC

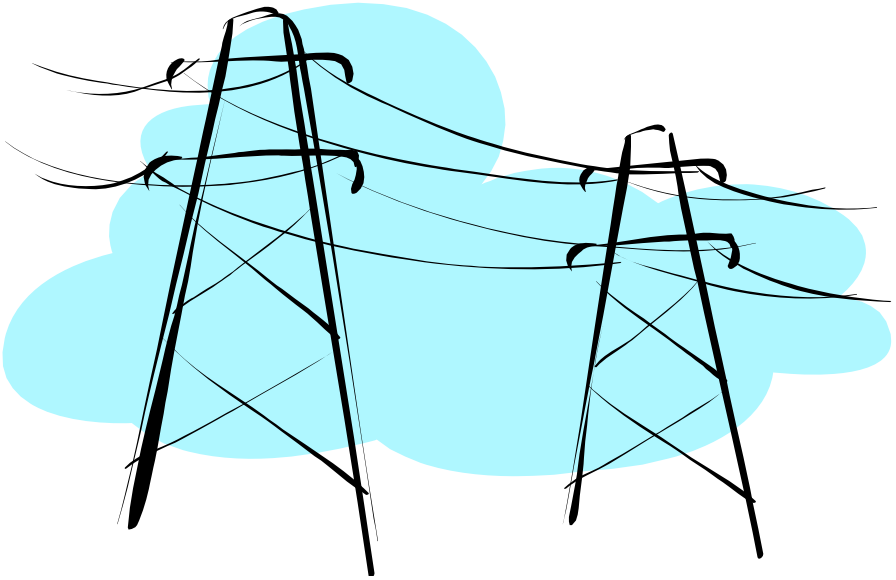
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

NERC Overview

RELIABILITY | ACCOUNTABILITY

What is NERC's role in the industry?

- Mission: Ensure the reliability of the North American bulk power system by…
  - Holding entities accountable for compliance with mandatory reliability standards
  - Acting as a catalyst for positive change within the industry

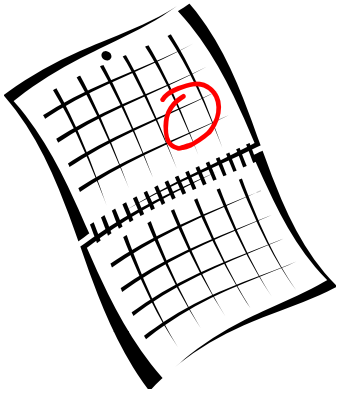


Defining Reliability

- NERC defines a **reliable** bulk power system as one that is able to meet the electricity needs of end-use customers even when unexpected equipment failures reduce the amount of available electricity.
- This means:
  1. Adequacy – sufficient resources
  2. Security – ability of system to withstand sudden and unexpected disturbances

Reliability History: Key Dates

November 9, 1965 – Northeast Blackout



1968: National Electric Reliability Council (NERC) established by the electric industry

2002: NERC operating policy and planning standards became mandatory and enforceable in Ontario, Canada

August 14, 2003 Blackout

2005: U.S. Energy Policy Act of 2005 creates the Electric Reliability Organization (ERO)

2006: Federal Energy Regulatory Commission (FERC) certified NERC as the ERO; Memorandum of Understanding (MOUs) with some Canadian Provinces

2007: North American Electric Reliability Council (NERC) became the North American Electric Reliability Corporation (NERC); FERC issued Order 693 approving 83 of 107 proposed Reliability Standards; became mandatory and enforceable

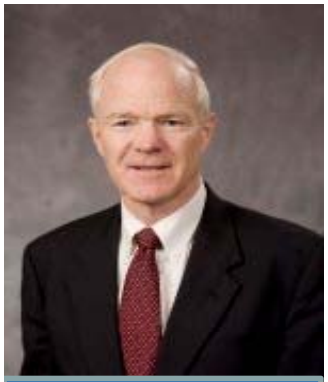
What does it mean to be the ERO?

- Only one ERO, overseen by U.S. and Canadian regulatory authorities (FERC and the provinces)
  - Responsible for developing/enforcing reliability standards
  - Independent of owners, operators, users
  - Adhere to rules governing standards development, compliance enforcement, budgeting

What does NERC do?

- Develops and enforces reliability standards
- Monitors the bulk power system
- Assesses adequacy
- Audits owners, operators, and users for preparedness
- Educates and trains industry personnel

NERC's Board of Trustees



J. Anderson

T. Berry

G. Cauley

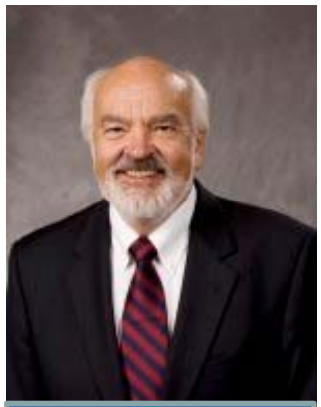
V. Bailey

P. Barber

J. Case

F. Gorbet

D. Goulding



K. Peterson

B. Scherr

J. Schori

R. Thilly

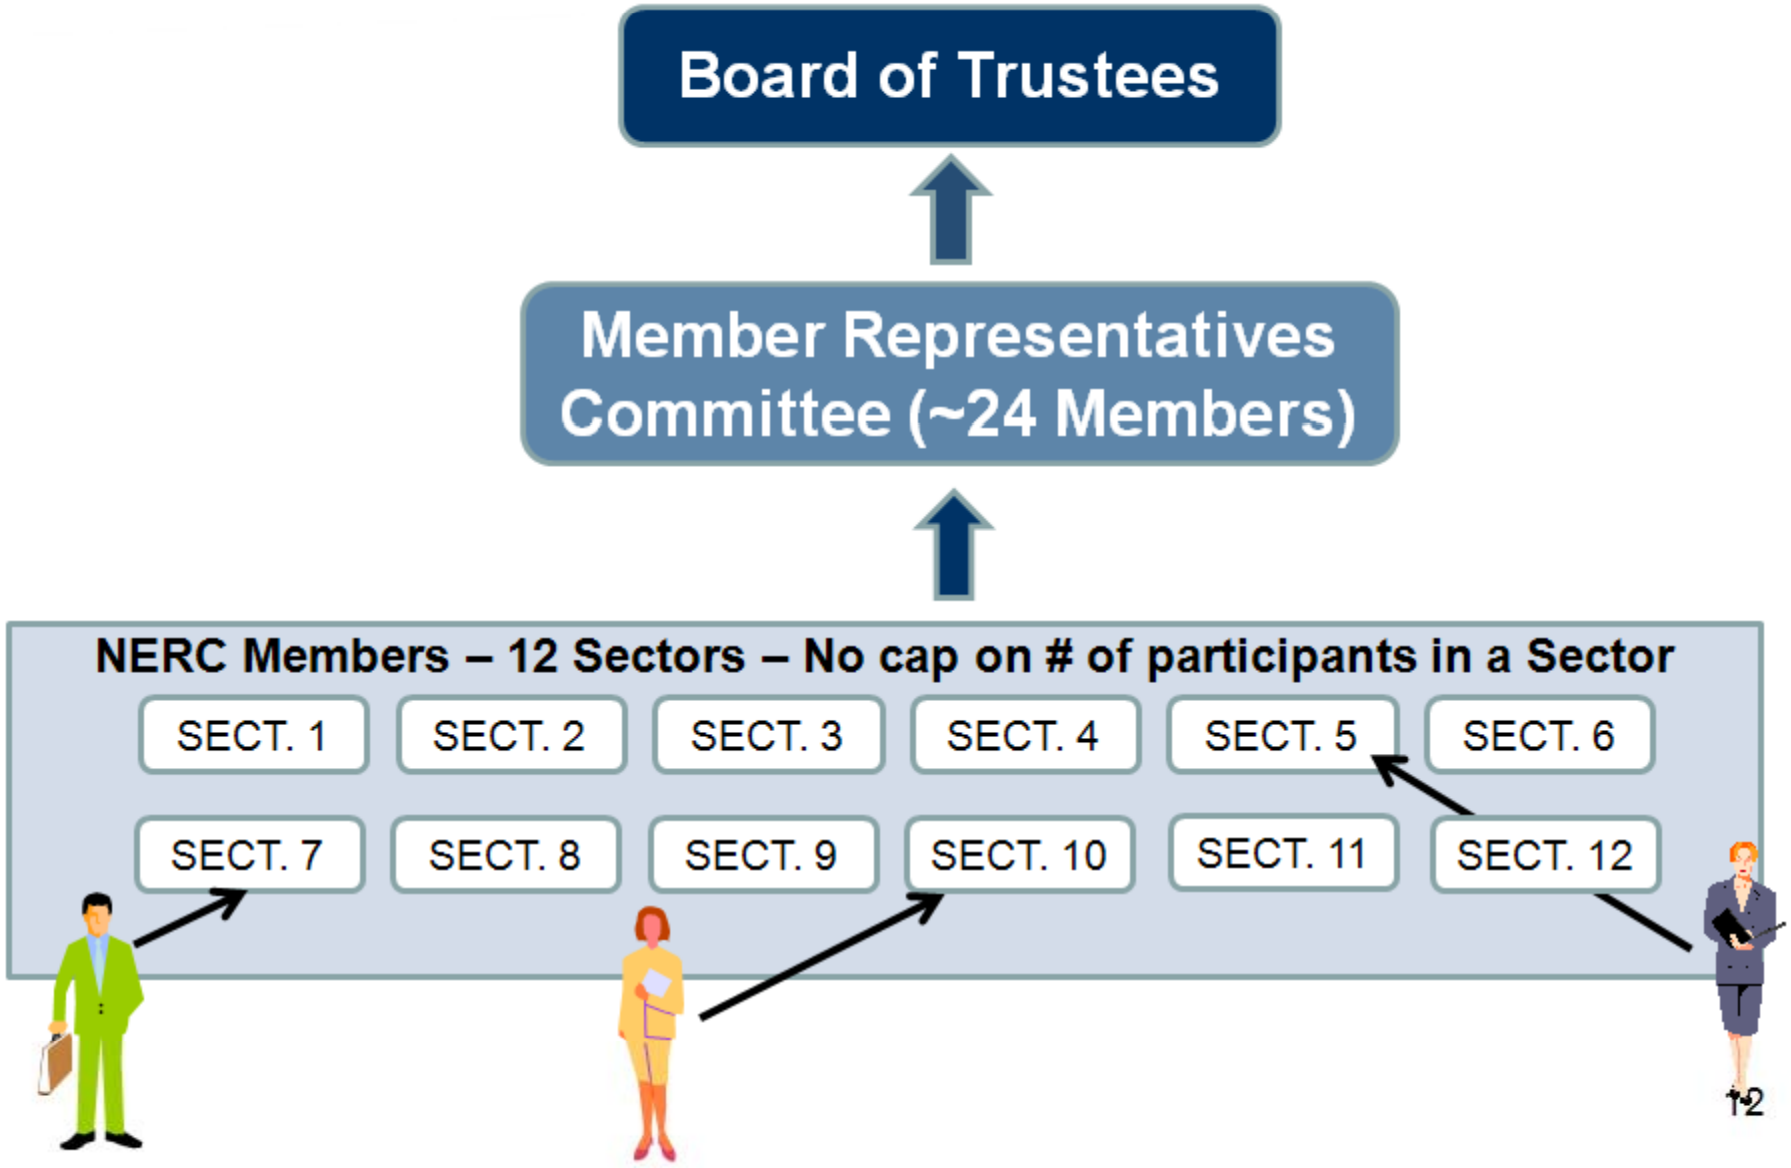
NERC Membership

- Open to all entities interested in the bulk power system
- Twelve membership categories:
  - Investor-owned utility
  - State or municipal utility
  - Cooperative utility
  - Federal or provincial utility/power marketing administrator
  - Transmission dependent utility

NERC Membership, cont.

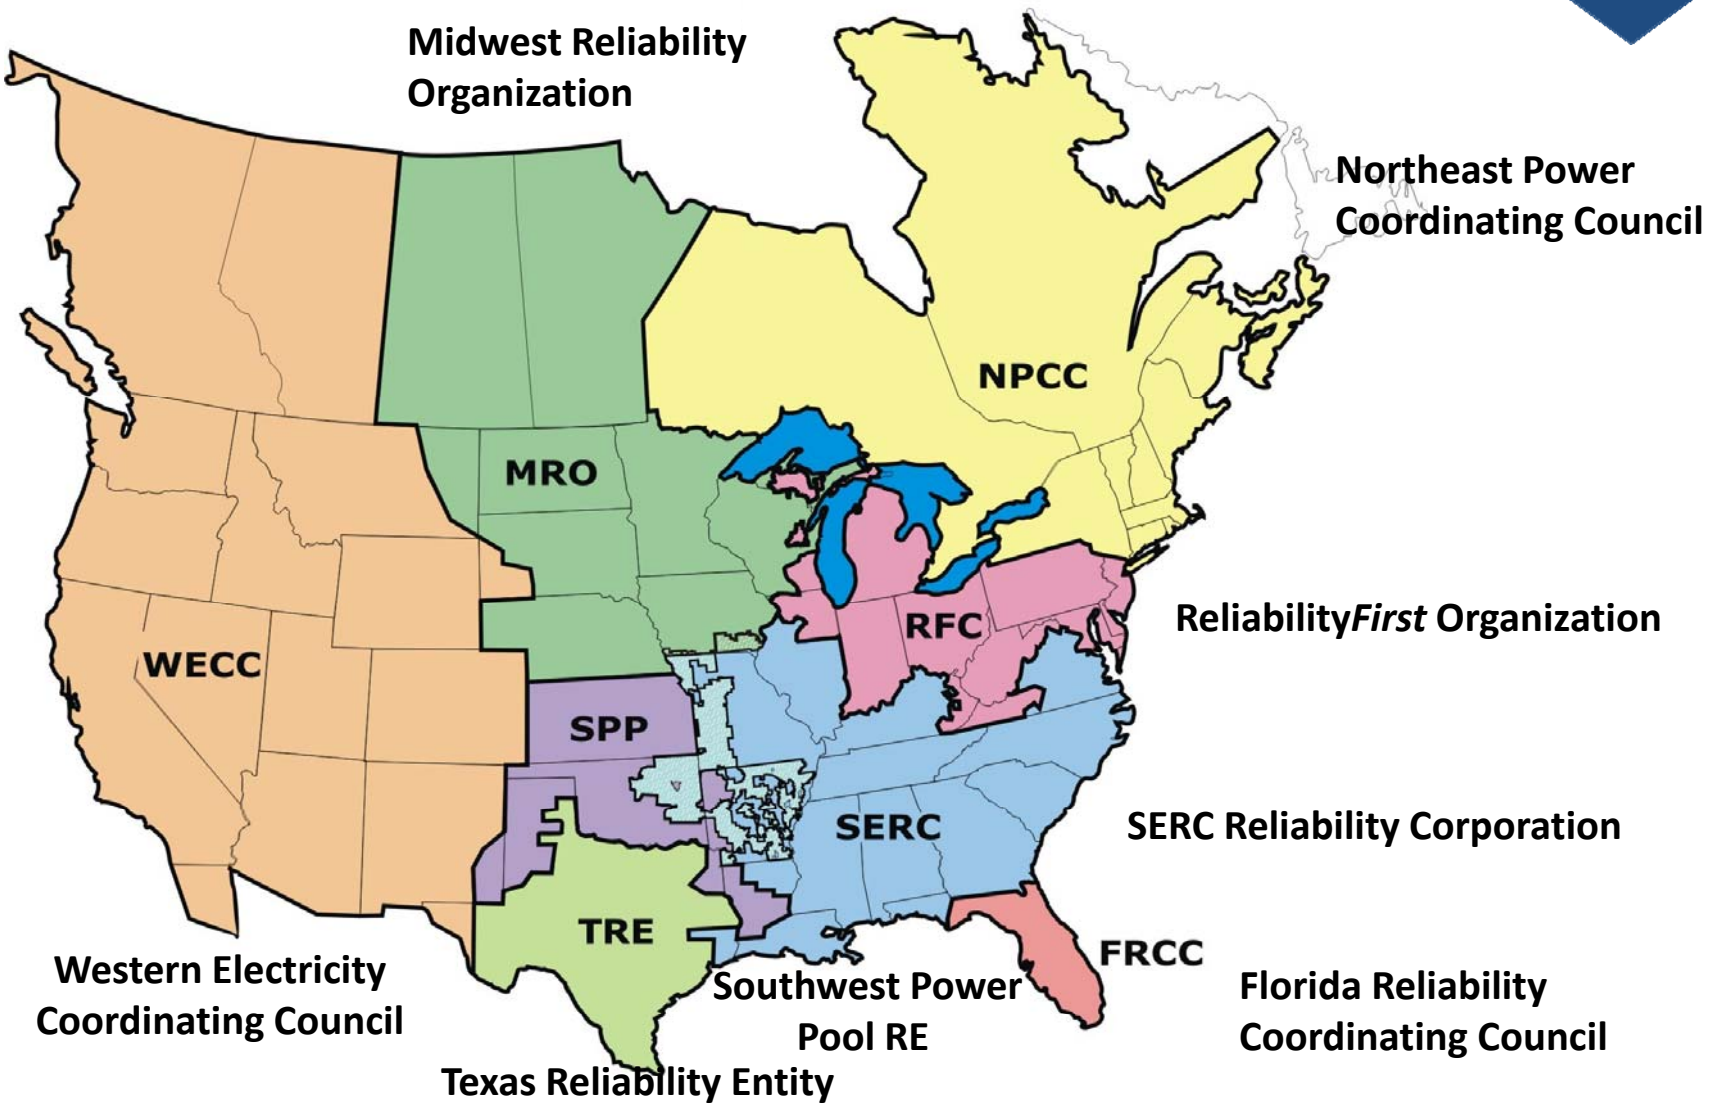
- More membership categories:
  - Merchant electricity generator
  - Electricity marketer
  - Large end-use electricity customer
  - Small end-use electricity customer
  - Independent system operator/regional transmission organization
  - Regional Entity
  - Government Representative

Hierarchy Showing Relationship of NERC Members to Board of Trustees



NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

NERC Regions



Eight NERC Regions

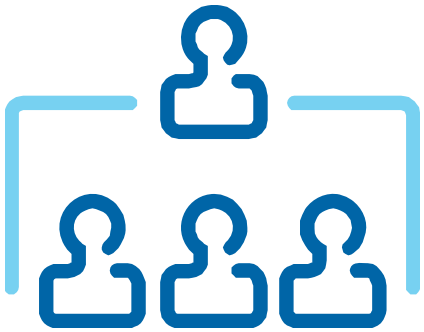
- Perform delegated functions:
  - Compliance
  - Regional standards
  - Organization registration
  - Reliability assessments
- Regional consistency key for transparency, predictability, and uniform outcomes

NERC Funding

- NERC and Regional Entities allocate operating costs to load-serving entities (LSEs):
  - LSEs are owners, operators, and users of the bulk power system responsible for delivering electricity to retail customers

NERC Departments

- Compliance Enforcement
- Compliance Operations
- Critical Infrastructure Protection (CIP)
- Investigations
- Operations, Planning, and Delivery
- Reliability Assessment and Performance Analysis (RAPA)
- Reliability Initiatives and System Analysis
- Situational Awareness
- Standards
- Governmental Relations
- Legal and Regulatory
- Training



NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

NERC's Standards Process

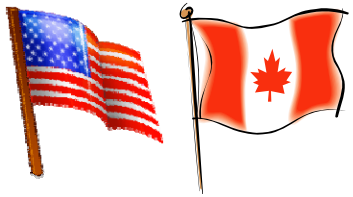
RELIABILITY | ACCOUNTABILITY

NERC's Standards Process

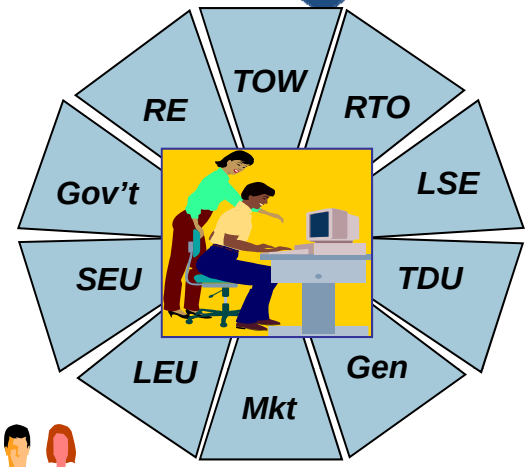
- In 2010, a new process was developed with input from Standards Committee, Results-Based Process Ad Hoc Team, stakeholders, and regulators
- FERC approved the Standard Processes Manual on September 3, 2010
- Goals:
  - Improve efficiency
  - Improve quality
  - Preserve American National Standards Institute (ANSI) accreditation

Roles and Responsibilities

Board of Trustees



Regulators



Ballot Body

Standards Committee

Drafting Teams

Stakeholders

Standards Staff

Ballot Pools

Standards Committee

- Prioritizing standards development activities
- Reviews actions to ensure the standards development process is followed
- Reviews and authorizes Standard Authorization Requests (SARs)
- Manages progress of SARs and standards development efforts
- Reviews and authorizes drafting new or revised standards and their supporting documents
- Makes appointments to drafting teams

Regulatory Agencies Approve

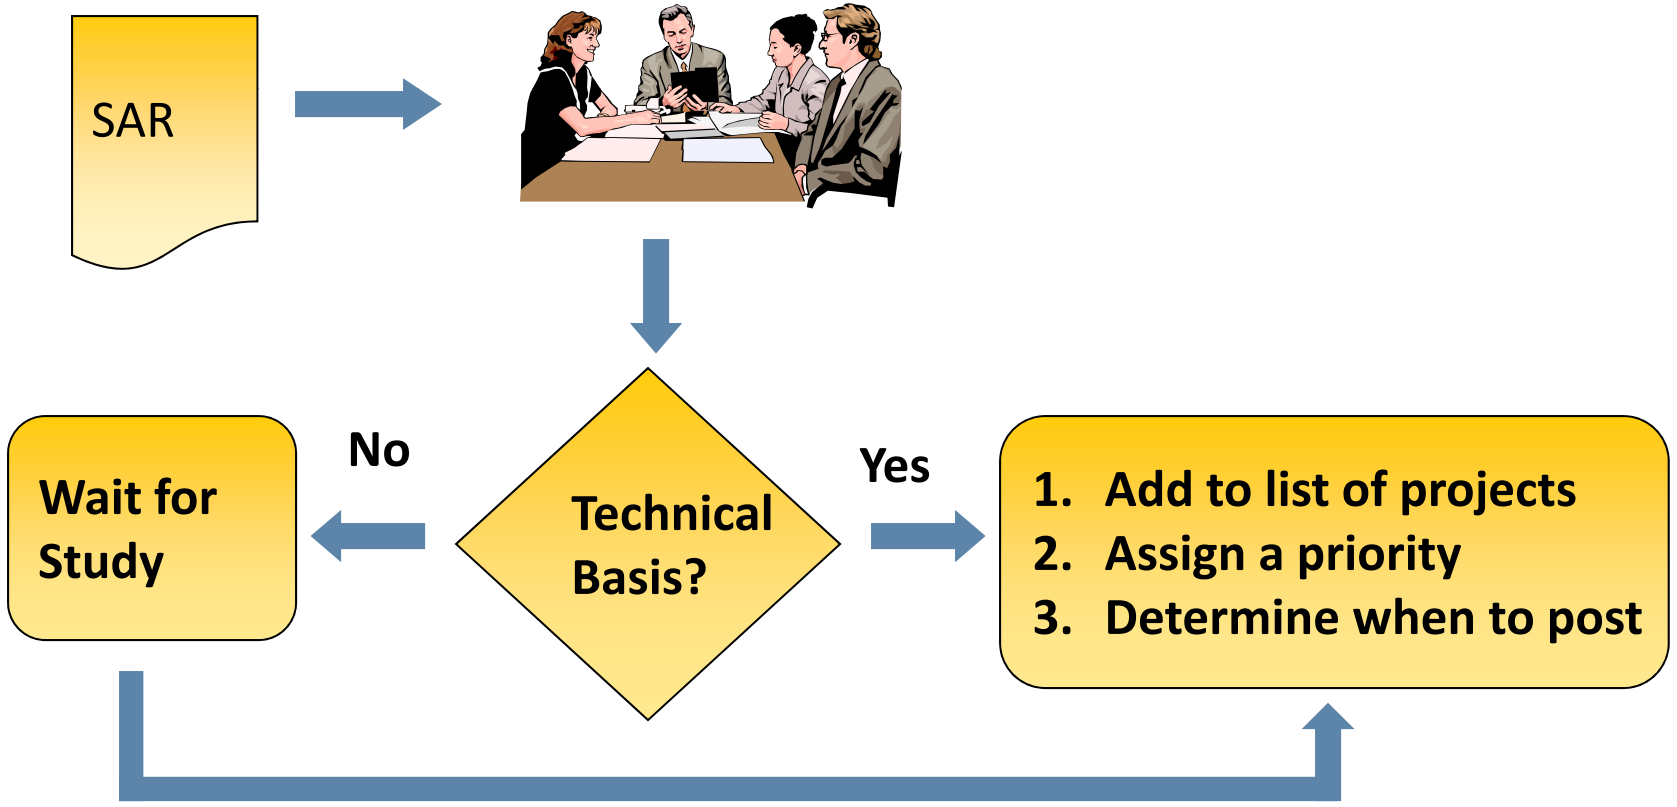
Board Adopts

Post for Recirculation Ballot

Standard Authorization Requests

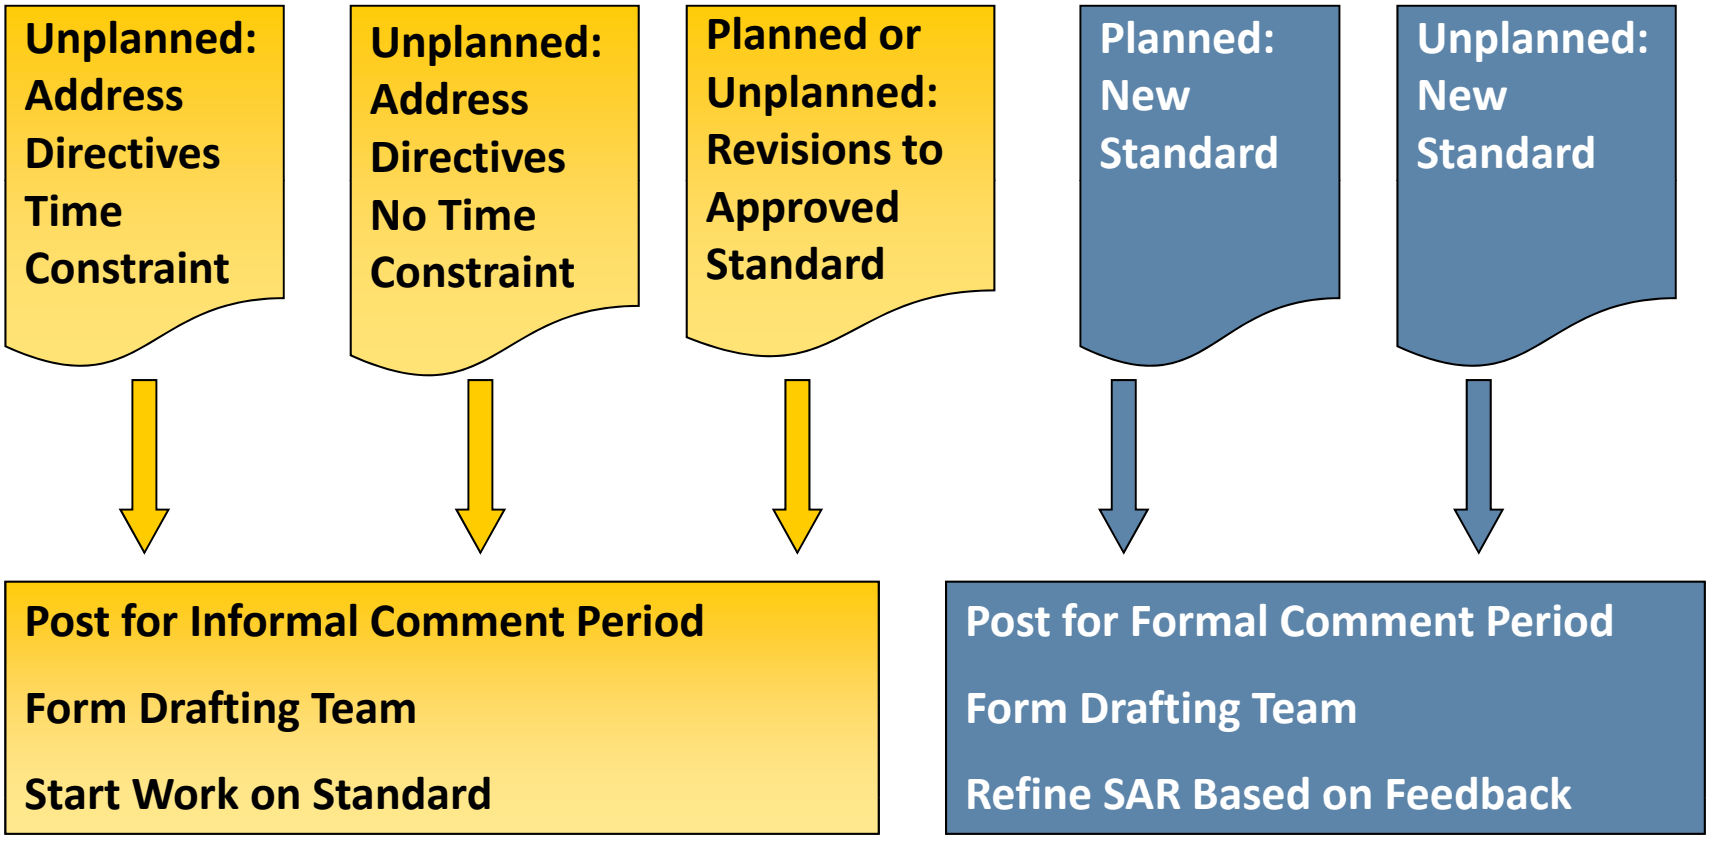
Every valid SAR is accepted.

SARs need a technical basis and are posted based on priority.



Processing of SARs

Post proposals for "new" standards for formal comment period; collect informal comments for others.



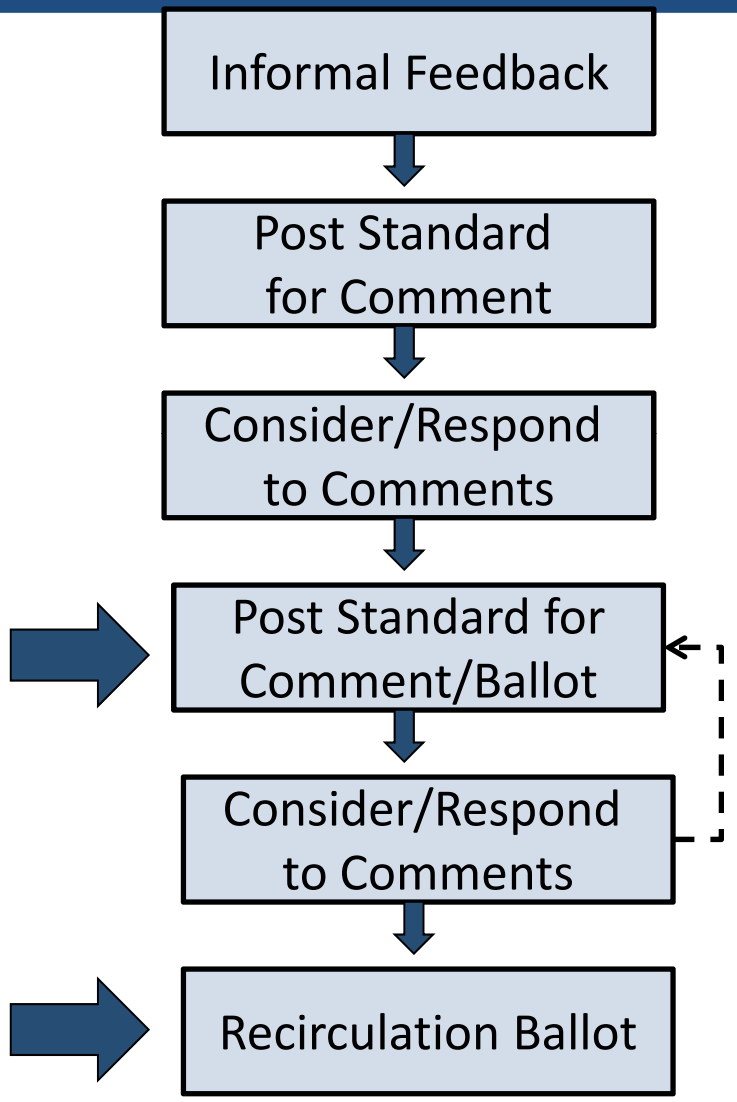
Roles and Responsibilities of Drafting Teams

- Develop an excellent, technically correct standard that helps provide an adequate level of bulk power system reliability and achieves stakeholder consensus
  - Stay within the scope of the SAR
  - Address regulatory directives and stakeholder issues
  - Ensure standard meets criteria for approval
- Develop initial set of Violation Risk Factors (VRFs)and Violation Severity Levels (VSLs) and associated reasoning
- Produce a realistic implementation plan
- Develop supporting documents (optional)

Drafting Team Formation and Support

- If a team is formed to address the SAR, the same team develops the standard
- Includes a technical writer, if needed
- Technical experts provide content for requirements
- Technical writer drafts language for technical experts
- Technical experts have “power of veto”

Stakeholder Consensus Process



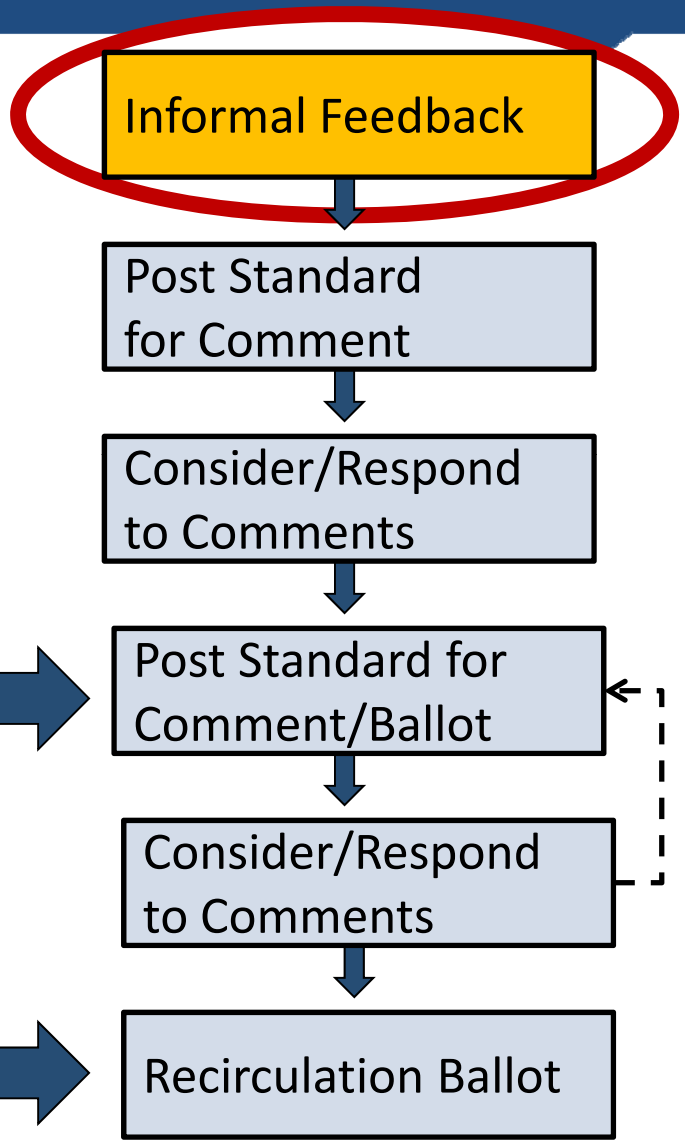
New/Successive Ballot:

At this step, the standard is either "new" or significantly changed from the last version posted for comment/ ballot. The ballot record starts with no votes and no comments.

Recirculation Ballot:

At this step, there have been no significant changes to the standard from the last ballot. The ballot record starts with all votes and comments from the previous ballot.

Stakeholder Consensus Process



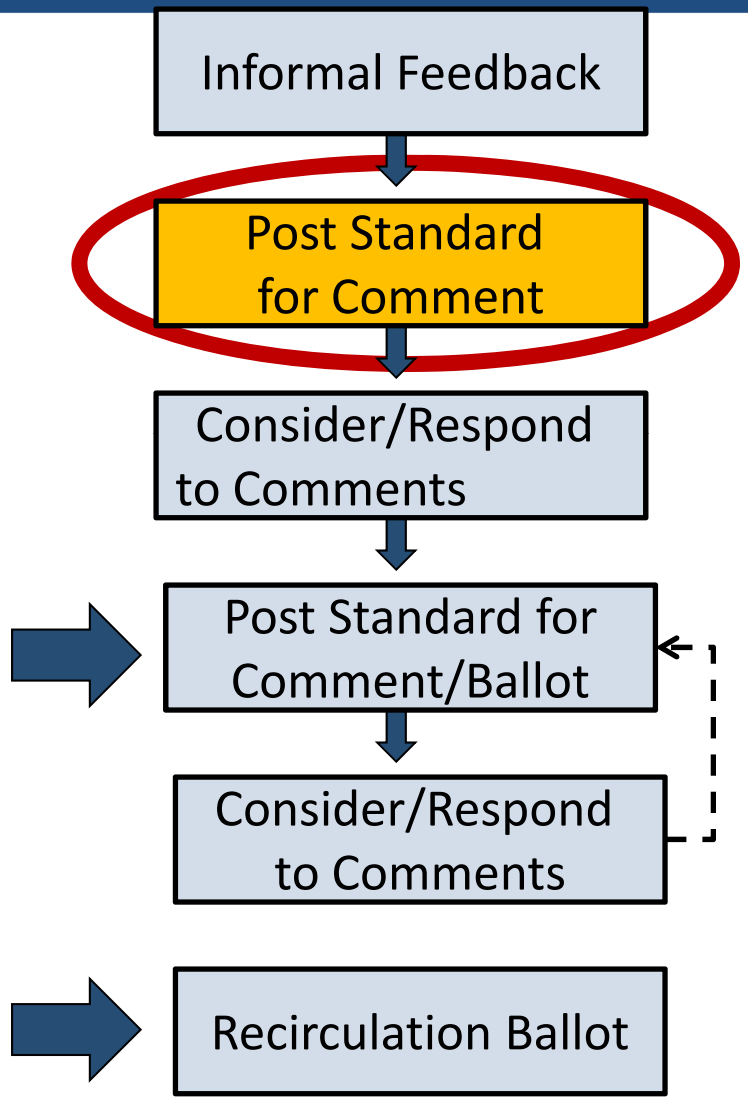
New/Successive Ballot:
At this step, the standard is either "new" or significantly changed from the last version posted for comment/ ballot. The ballot record starts with no votes and no comments.

Recirculation Ballot:
At this step, there have been no significant changes to the standard from the last ballot. The ballot record starts with all votes and comments from the previous ballot.

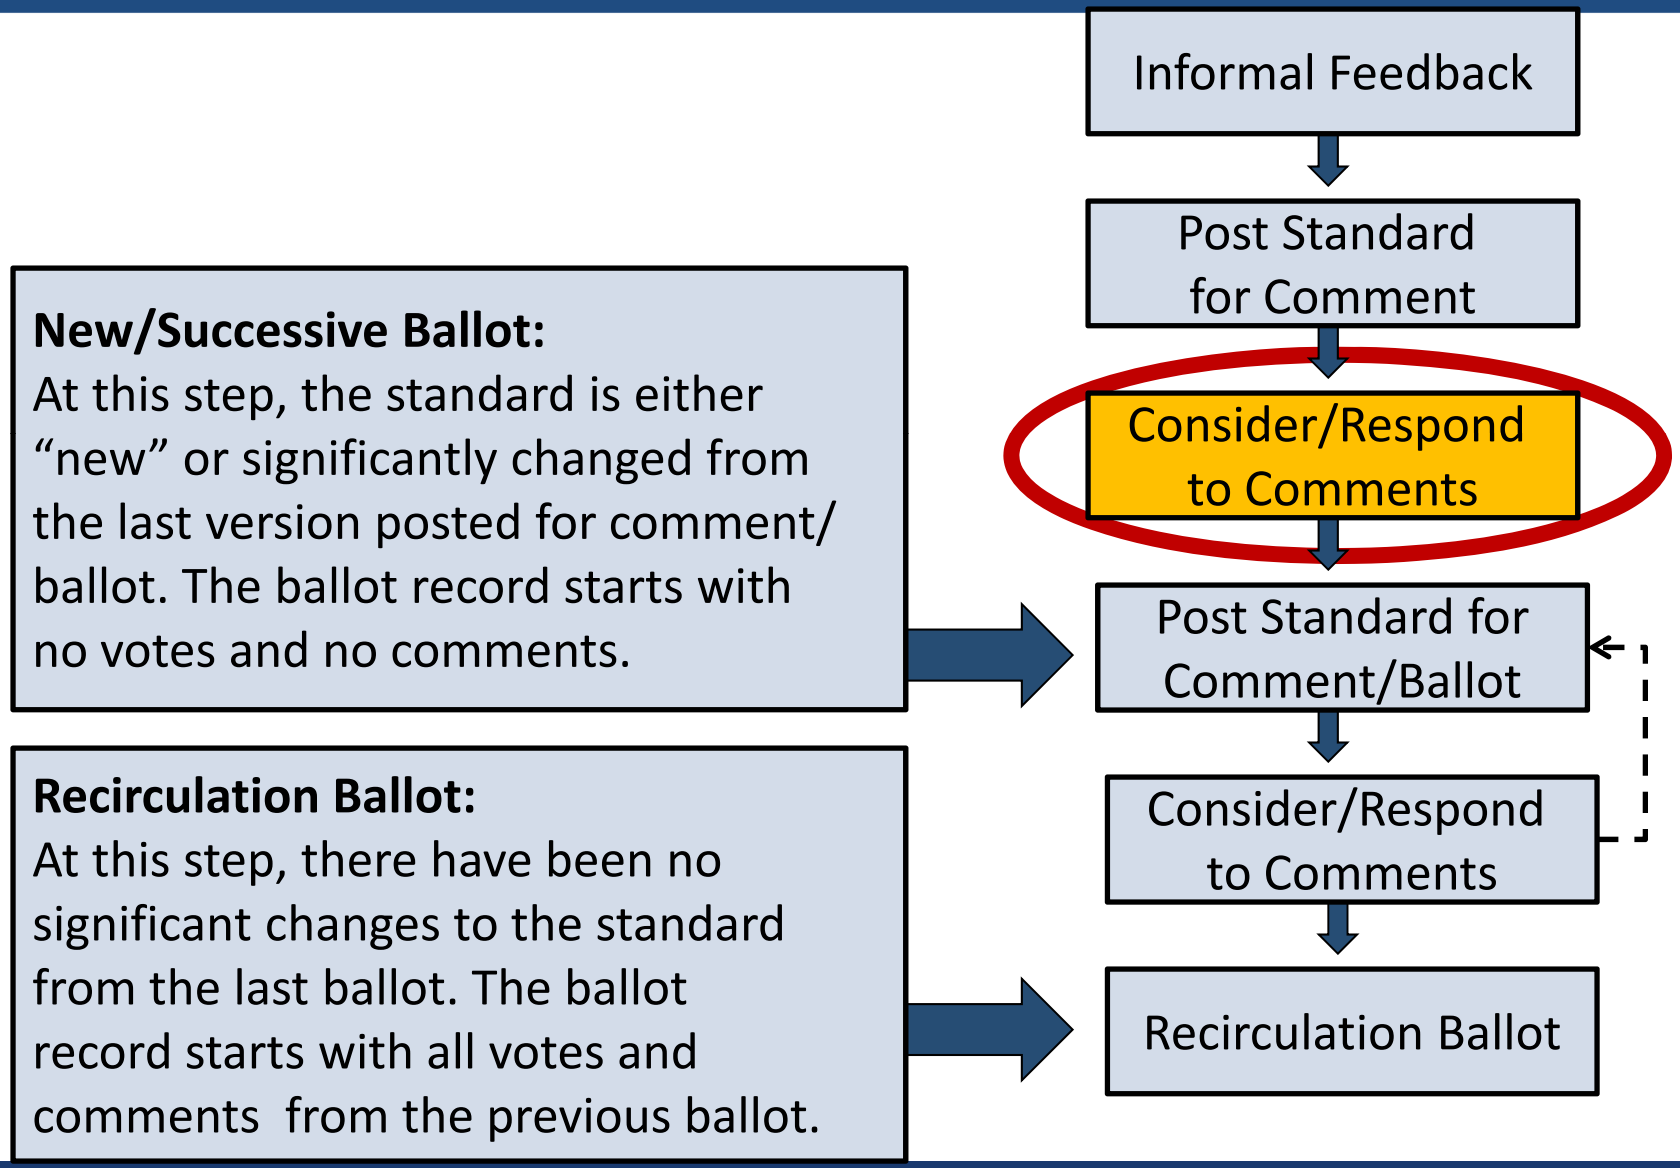
Stakeholder Consensus Process

New/Successive Ballot:
At this step, the standard is either "new" or significantly changed from the last version posted for comment/ ballot. The ballot record starts with no votes and no comments.

Recirculation Ballot:
At this step, there have been no significant changes to the standard from the last ballot. The ballot record starts with all votes and comments from the previous ballot.



Stakeholder Consensus Process



Building Consensus with Comments

- Stakeholder feedback is essential
- The best comments offer suggested replacement language first and then support that suggested language with rationale
- If a stakeholder cannot suggest alternate language, he or she should still make sure to support his or her claim with sound technical rationale

Sample Comments

- In attachments 1, 2, and 3 the six month requirement for notice is too short in many cases. We suggest nine months to one year. Six months is not enough time for budgeting and construction scheduling.
- The Generator Owner appears to be the logical choice. GO has the access to the equipment records, GOP may not.

Sample Comments

- Disagree with R2 as written.
- Disagree with assigning requirement to the GO.
- Definition is a little loose.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

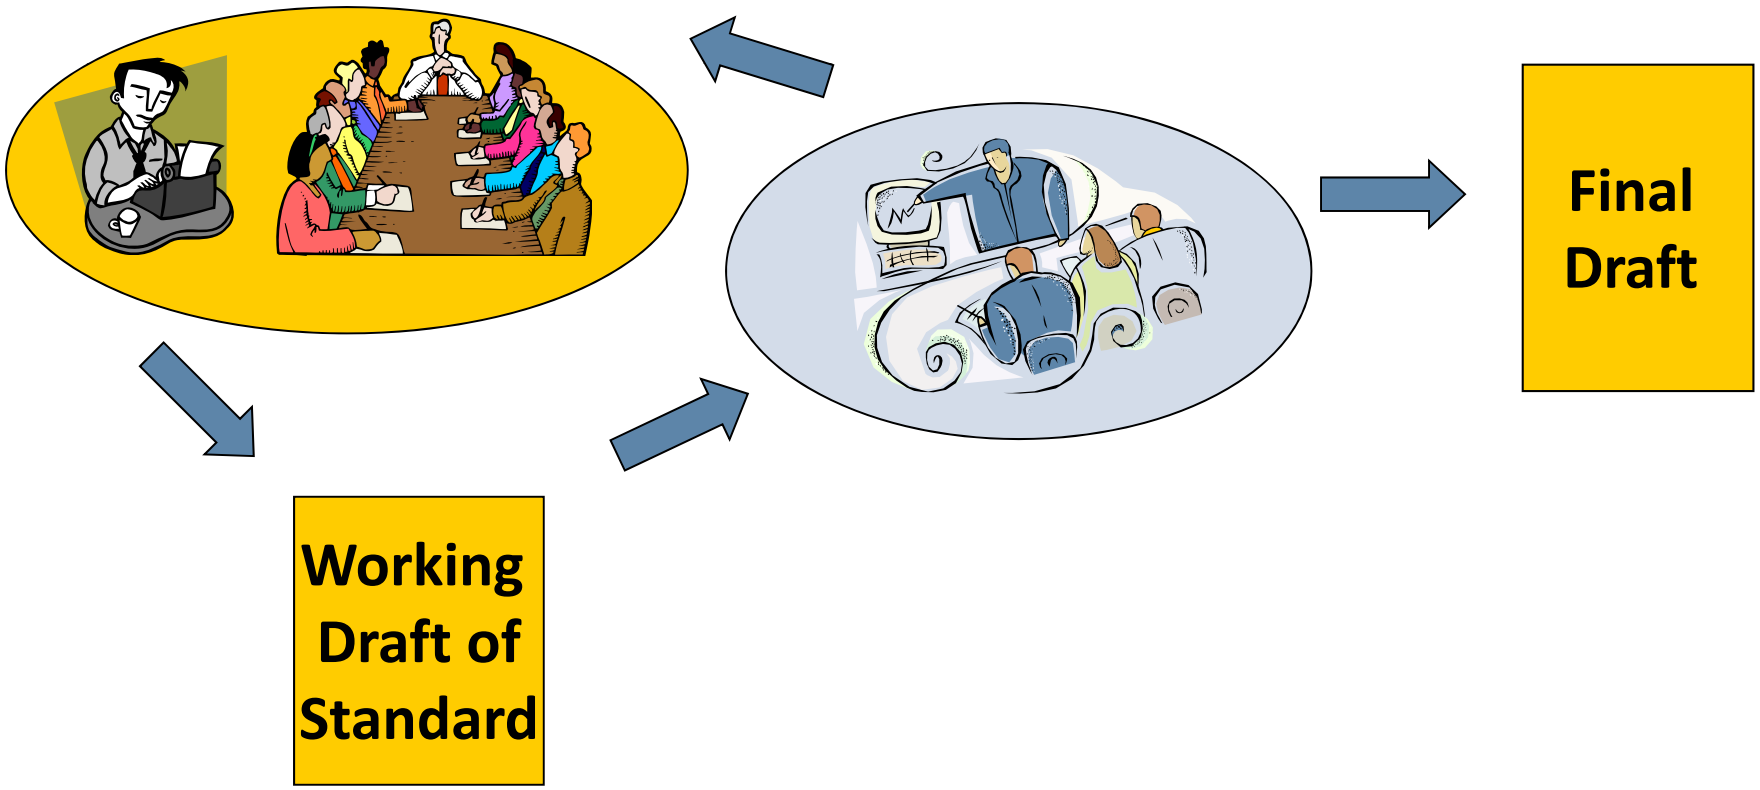
Drafting Team Responses to Comments

If Comment:	Then:	And:
Unrelated	Note that comment is unrelated	No action needed
Proposes change beyond scope	Note that comment is proposing an expansion	Add "issues database"
Proposes modification based on new technical issue	Provide team's analysis of the proposal	If accepted, modify standard
Proposed modification based on already vetted technical issue	Provide summary of vetting and resolution	No action needed
Proposes modification to provide greater clarity	Provide team's view as to whether the proposed modification improves clarity	If accepted, modify the standard

Emphasis on Quality Before Posting Final Drafts

Quality review required before "final" draft posted.

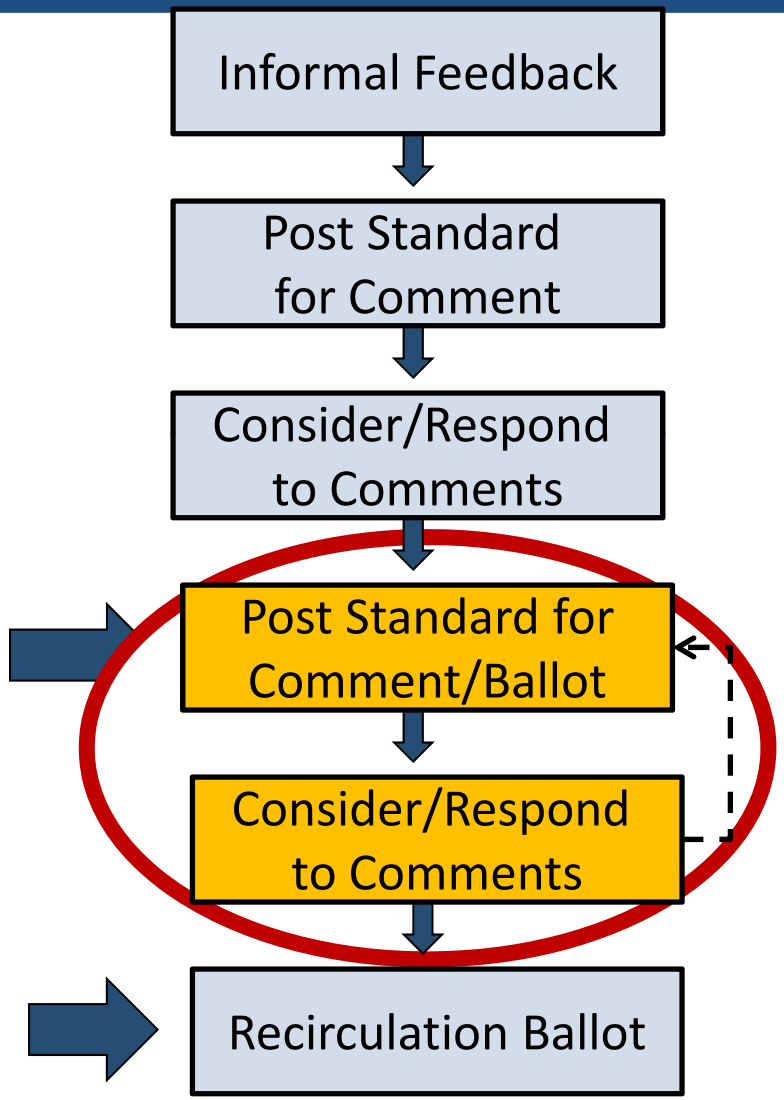
Results of review sent to Standards Committee and drafting team.



Stakeholder Consensus Process

New/Successive Ballot:
At this step, the standard is either "new" or significantly changed from the last version posted for comment/ ballot. The ballot record starts with no votes and no comments.

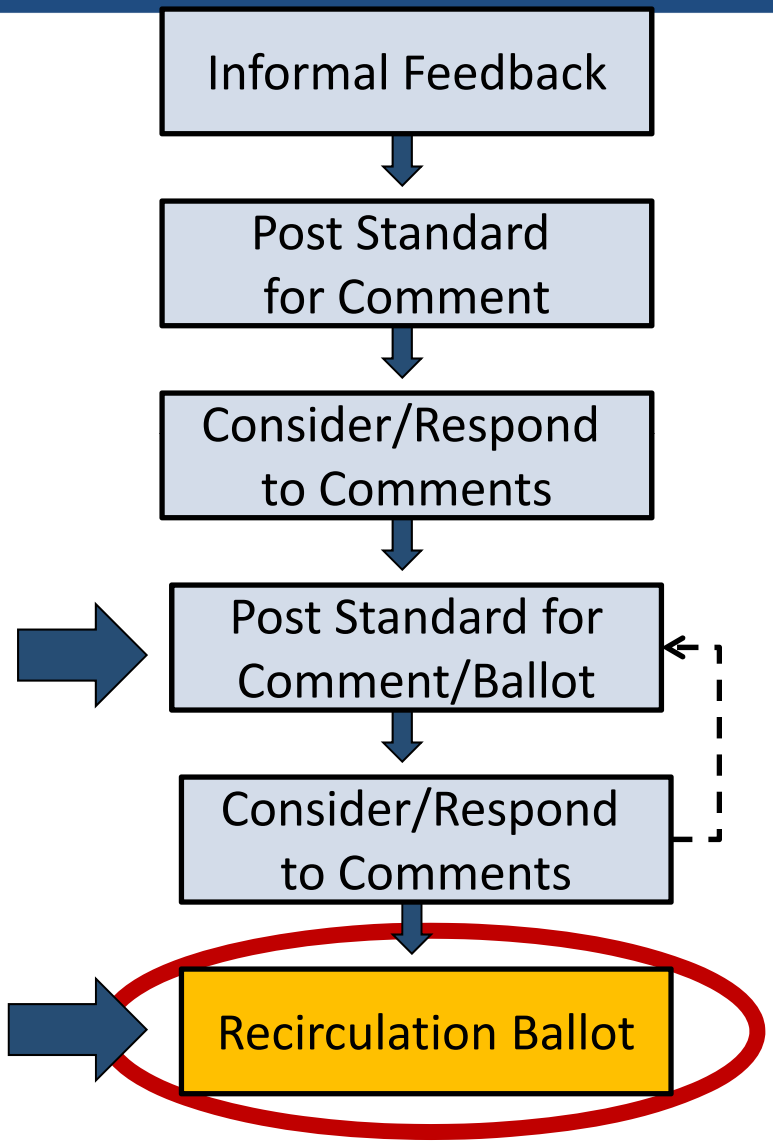
Recirculation Ballot:
At this step, there have been no significant changes to the standard from the last ballot. The ballot record starts with all votes and comments from the previous ballot.



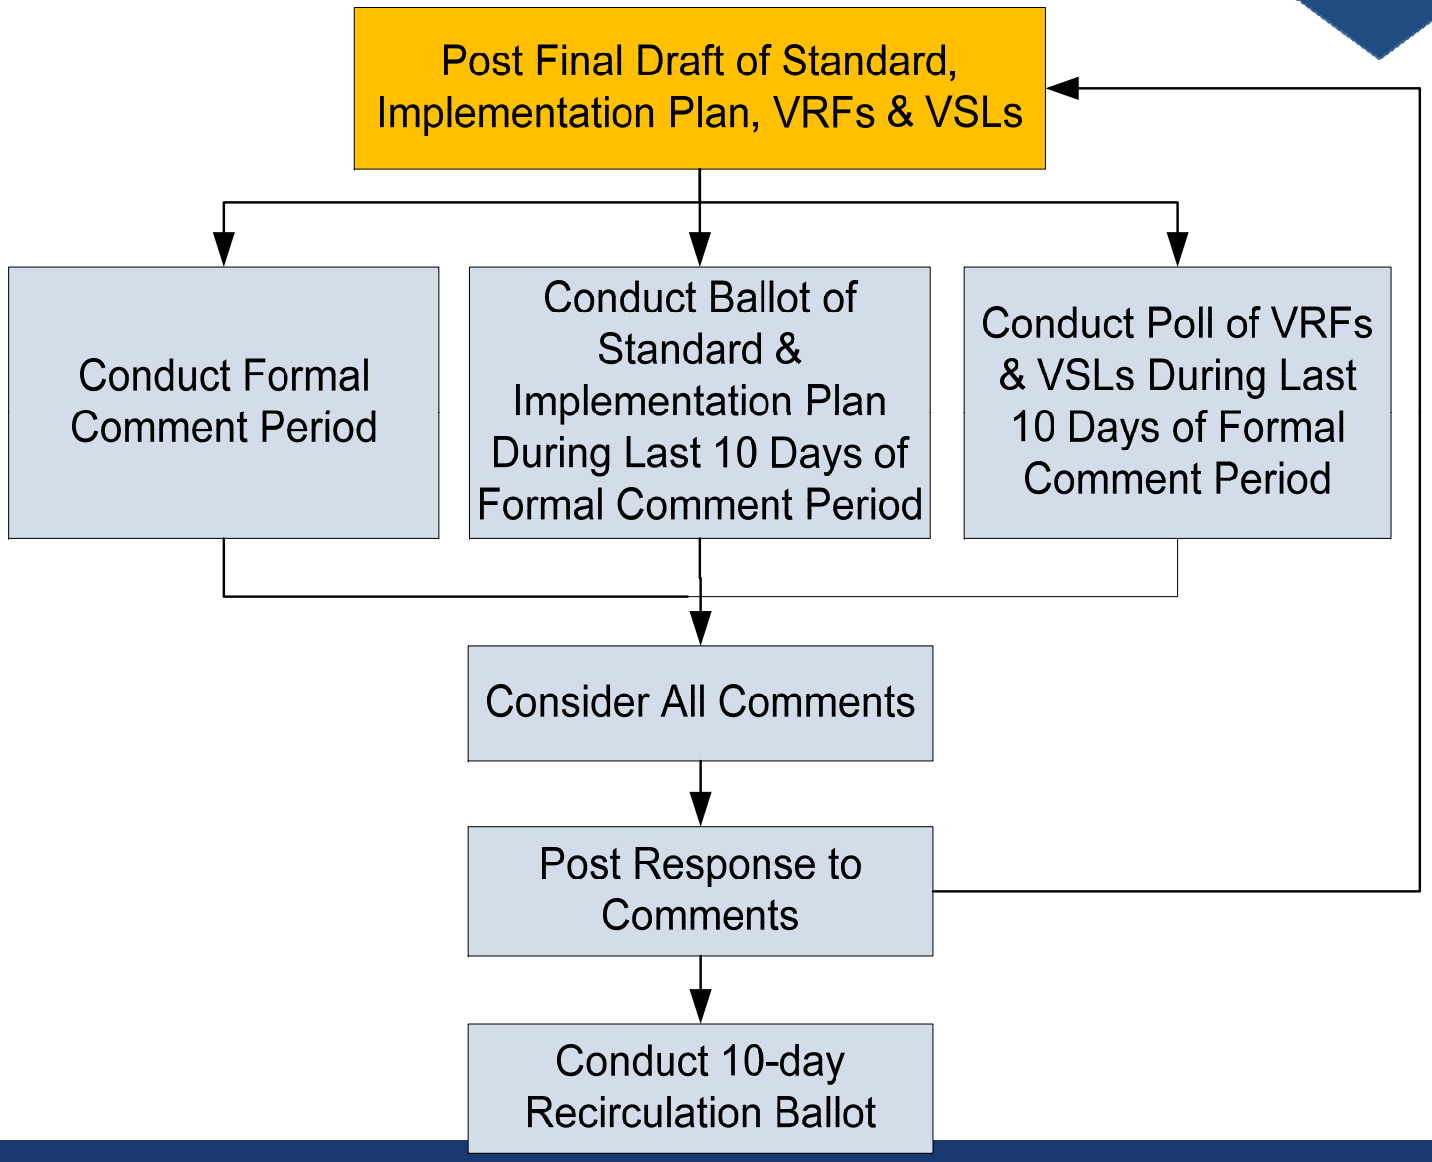
Stakeholder Consensus Process

New/Successive Ballot:
At this step, the standard is either "new" or significantly changed from the last version posted for comment/ ballot. The ballot record starts with no votes and no comments.

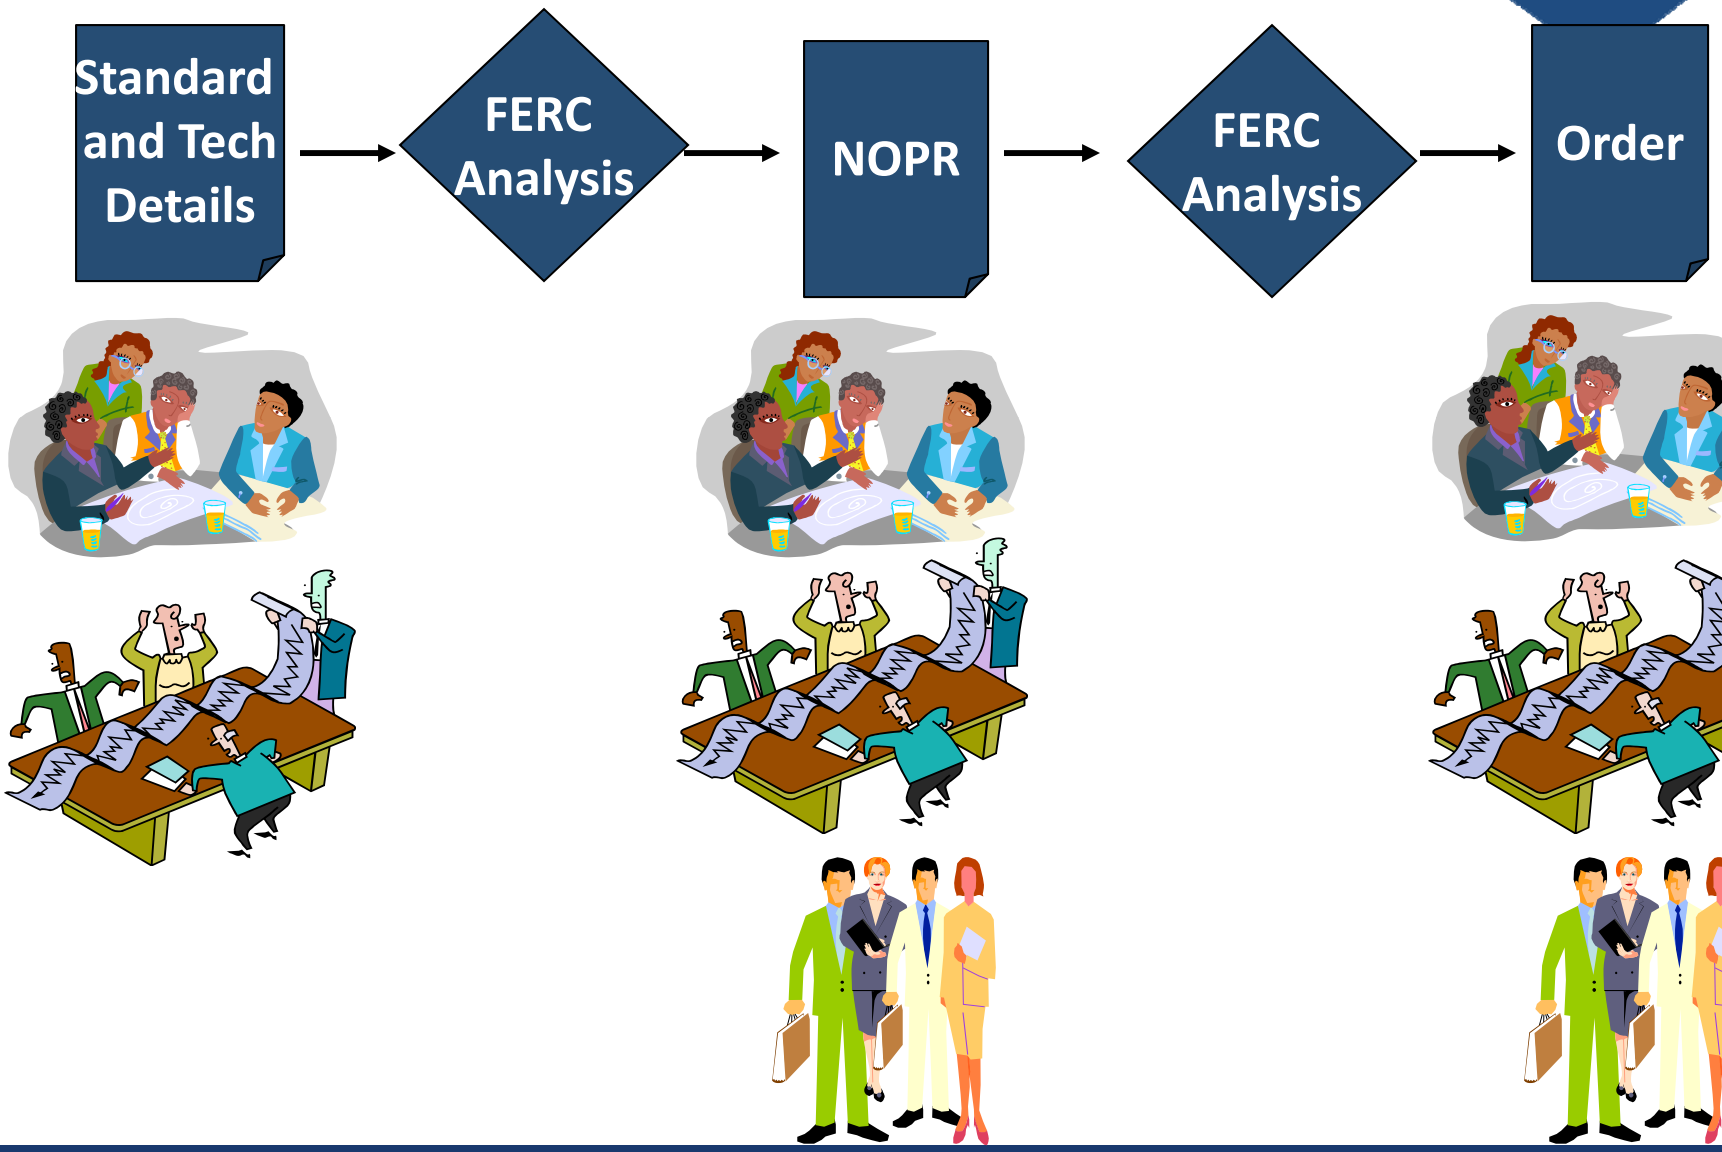
Recirculation Ballot:
At this step, there have been no significant changes to the standard from the last ballot. The ballot record starts with all votes and comments from the previous ballot.



Concurrent Commenting and Balloting



FERC's Approval Process for Standards



Interpretations

- A valid interpretation request seeks additional clarity about one or more requirements in approved NERC Reliability Standards
- An entity or individual may submit a Request for Interpretation using the form on NERC's website
- The interpretation development process is similar to the standard development process
- An interpretation response provides clarity on the requirement(s) but does not expand on the requirement(s) or explain how to comply

Getting Involved

- Add yourself to mailing list for standards by emailing eleanor.crouch@nerc.net
- Respond to requests for comments on draft standards; review comments from others
- Participate in webinars and workshops
- Have your company join the Registered Ballot Body and Ballot Pools
- Vote on standards
- Volunteer for drafting teams
- Volunteer for the Standards Committee

NERC Staff Contacts

- Feedback on the standards process: **Maureen Long** at maureen.long@nerc.net or **Laura Hussey** at laura.hussey@nerc.net or fill out a Suggestions and Comments form.
- Help joining a Registered Ballot Body or participating in comment periods: **Monica Benson** at monica.benson@nerc.net
- To be added to (one or more of) NERC's email lists: **Eleanor Crouch** at eleanor.crouch@nerc.net
- Suggestions for website improvements: **Kristin Iwanechko** at kristin.iwanechko@nerc.net
- Suggestions for improved communication: **Mallory Huggins** at mallory.huggins@nerc.net
- If you ever feel there was an error or omission during the consideration of comments process: **Herb Schrayshuen** at herb.schrayshuen@nerc.net.

BOARD OF DIRECTORS
Wednesday, November 30, 2011

7:30 a.m. – 10:30 a.m.
Toronto Marriott Bloor Yorkville
90 Bloor Street East
Toronto, Ontario

Dial-In Available: 877-260-3999 **Code: 6945#**

AGENDA

1. Introductions/Quorum/Antitrust Compliance Statement 7:30 a.m.

2. President's Report 7:35 a.m.

3. Consideration of draft NPCC Board of Directors Minutes of October 26, 2011 Meeting 7:45 a.m. *[Action Required]*

4. Membership Sector Designations 7:50 a.m. *[Action Required]*

5. NPCC Committees 8:00 a.m.
   a) Approval of 2012 Corporate Governance and Nominating, Finance and Audit, Management Development and Compensation, and Pension Committee Members *[Action Required]*
   b) Approval of 2012 RSC, CC, RCC, PIC Members *[Action Required]*
   c) Committee Reports – to be presented at 11/30/11 Members Meeting

6. Designation of 2012 Officers for NPCC 8:10 a.m. *[Action Required]*

7. Approval of 2012 NPCC Independent Chairman 8:45 a.m. *[Action Required]*

8. Organizational Matters 9:10 a.m.
   a) MDCC Recommendations
      (Committee Resolutions to be distributed at meeting) *[Action Required]*
   b) Topics for January 31, 2012 Board Strategy Session
      e.g.: Developmental Process for Board Policy Positions, etc.

9. Administrative Matters 9:55 a.m.
   a) Review of 2011 Board Self-Assessment

10. Other Matters 10:10 a.m.
    a) FERC Approval of NPCC as WECC CEA

AGENDA (continued)

11. 2012 Board of Director Meeting Dates 10:25 a.m.
    - Monday, January 31, 2012 – NPCC Board Strategy Session (1 p.m.) and Dinner (6 p.m.)
    - Tuesday, February 1, 2012 – NPCC Offices (8:30 a.m. – 1 p.m.)
    - Tuesday, March 13, 2012 –Tentative BES Teleconference (10 a.m. – 11 a.m.)
    - Tuesday, May 1, 2012 – Teleconference (10 a.m. – 1 p.m.)
    - Thursday, June 26, 2012 – NPCC Offices (10 a.m. – 3 p.m.)
    - Tuesday, August 7, 2012 – Teleconference (10 a.m. – 1 p.m.)
    - Wednesday, September 19, 2012 – NPCC Offices (10 a.m. – 3 p.m.)
    - Tuesday, October 30, 2012 – Teleconference (10 a.m. – 1 p.m.)
    - Wednesday, November 30, 2012 – Montreal, Quebec (7:30 a.m. – 10 a.m.)

Antitrust Compliance Guidelines

It is NPCC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment.

Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.

Any NPCC meeting participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Secretary, Andrianne S. Payson at 212-259-8218.

President's Report

November 30, 2011

Board of Directors Meeting

NPCC, Inc.

Report Items:

- Bulk Electric System Definition
- 2011 Board Actions
- ERO Efficiency Efforts

Northeast Power Coordinating Council, Inc. Board of Directors Meeting Draft Minutes for Approval

October 26, 2011 | 10:00 a.m.
(via teleconference)

The Chairman called to order a duly noticed meeting of the Board of Directors ("*Board*") of Northeast Power Coordinating Council, Inc. ("*NPCC*") held on October 26, 2011, at 10:00 a.m. A quorum was declared present during the meeting by the President and CEO, Edward Schwerdt. Andrianne Payson acted as Recording Secretary. The meeting announcement, agenda and list of attendees are attached as **Exhibits A, B, and C**, respectively.

NPCC Antitrust Compliance Guidelines
The Chairman recommended a waiver of the reading of the *NPCC Antitrust Compliance Guidelines* that was distributed via email with the Board agenda package and reviewed by Directors upon commencement of the meeting. A motion to waive the reading of the *NPCC Antitrust Compliance Guidelines* was duly made, seconded and unanimously approved.

Minutes
The President and CEO presented for approval a draft of the minutes of the Board meeting held on September 20, 2011. He noted that a few revisions had been incorporated into the minutes to clarify comments made during the last meeting. A motion to approve the minutes, as modified, of the NPCC Board of Directors meeting held on September 20, 2011 was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

President's Report
The President and CEO presented his report to the Board, which discussed the following three items:

- The President reported that on September 30, 2011, NERC had filed a Petition Requesting Approval of New Enforcement Mechanisms, and Submittal of an Initial Find, Fix and Track ("*FFT*") Informational Finding. He explained that the petition provided for the compliance and enforcement process to be tailored to fit the significance and risk of possible violations, which was an important step toward improving reliability and security of the Bulk Power System. He further explained that NERC and the Regional Entities planned to assist the industry in focusing its energies on developing and maintaining effective internal reliability assurance programs to improve performance. He noted that NPCC had joined with all of the other Regional Entities to file a Motion to Intervene and Comment on October 21st in support of the NERC filing. He explained that the significance of this filing is the recommendation that FERC consider the possible violations that have been resolved through the FFT process as "remediated issues" and should consider these matters closed to further regulatory review.

- The President next provided an update on the extensive efforts being made to develop a workable Bulk Electric System ("*BES*") Definition that is responsive to FERC Orders and supports reliability in the Northeastern United States. He explained that after a 45-day comment period, the recently posted second draft BES Definition had been approved by approximately 72% of the industry, which was more than the 2/3 vote needed to approve the BES definition. He noted that the associated "exceptions" process documentation had been approved by 64% of the industry. He informed the Board that responses to industry comments on both the draft BES Definition and the

"exceptions" process documentation were being developed by the BES drafting teams and that both items would be re-balloted shortly. He added that NPCC was proactive in developing an initial draft template for the industry's BES transition plans and had distributed the draft both within NPCC and NERC for comments.

- The President concluded his report with an update stating that NERC would be announcing a number of substantive changes to the NERC Rules of Procedure in order to simplify and provide more consistency with the application of this document. He noted that the proposed changes are scheduled to be posted for comments next week and that they impact the standards development, compliance enforcement and reliability assessment and performance analysis program areas. He explained that earlier draft versions of the proposed changes codify the new Events Analysis process, seek to impose penalties on the industry for administrative infractions, and potentially revise the role of the enforcement hearing officer in a manner that could inadvertently be inconsistent with NPCC's recently approved "hearing body" structure. He noted that NPCC's policy input to the NERC Member Representatives Committee and NERC Board of Trustees is intended to be directive with respect to these proposed changes, and that the Board policy input on enforcement and reliability assessment and performance analysis program areas would be discussed later in the meeting.

Report by the Treasurer

FAC Charter - The Treasurer presented his report to the Board. He informed the Board that the Finance and Audit Committee (FAC) had recently reviewed the FAC charter and was recommending certain ~~changes~~minor changes. ~~that were~~The Charter is consistent with American Institute of Certified Public Accountants (AICPA) recommendations~~requirements~~. A motion to approve the revised FAC charter was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Third Quarter 2011 Regional Entity (RE) Division Activities - NPCC's Senior Financial Analyst, Ms. Jessica Hala, presented the Statement of Activities (RE Division) for the period ended September 30, 2011 and provided a brief summary of NPCC's financial performance through the end of the third quarter. She explained that funding from assessments, workshops and membership dues were in line with budget year-to-date and that they were projected to remain on budget through year end 2011. She also noted that quarterly remittances from NERC had been received in a timely manner. Ms. Hala informed the Board that total expenses were approximately $2.1 million under-budget year-to-date, but that based on expected fourth quarter activity, total expenses were estimated to remain in line with or somewhat under budget at year end 2011. As examples, she explained that although personnel expenses were under-budget by $1.2 million through the end of third quarter 2011, the accrual for at-risk compensation in the fourth quarter would bring personnel expenses closer to the figure budgeted for calendar year 2011 and that staff vacancies would ultimately bring personnel expenses under the budget by approximately $200,000 at year end, absent any fourth quarter staffing changes. Ms. Hala further explained that contracts and consulting expenses were $582,000 under budget through September 30, 2011, but were projected to be in line with the amount budgeted for this line item for calendar year 2011 due to planned work flow in the Compliance program area in fourth quarter 2011. There were no questions from the Board following this presentation.

Organizational Matters

Corporate Governance and Nominating Committee (CGNC) Independent Director Nominees – The Board Chair presented the CGNC's two independent director nominees for 2012-2014, Mr. Donald L. Correll and Ms. Jan L. Newton, whose biographies had been circulated to the Board prior to the meeting. Following questions from the Board, the Board Chair explained that there was a good selection of candidates and that it was difficult to select two nominees from the top candidates. The President and CEO added that the CGNC had provided Russell Reynolds Associates (RRA) with the criteria that should be used to select candidates and that RRA had developed an extensive listing of candidates meeting the criteria for a North American-wide search. In response to questions from the Board, the Board Chair explained that all other candidates had been notified by RRA regarding the CGNC's decision on their candidacy. One Director

noted that a candidate he had recommended to the CGNC for consideration had not been notified by RRA and asked for follow-up by the CGNC. The President and CEO expressed surprise that RRA had not contacted this candidate and indicated that the Vice President and COO would follow-up immediately with RRA regarding this matter. In response to additional questions from the Board, the President and CEO explained that both Independent Directors would serve the same two-year term from 2012 to 2014, but that subsequent terms could be staggered. He also explained that the compensation for both directors was reviewed for comparability with Independent Director compensation studies discussed within the CGNC, fees paid by NERC and other Regional Entities, the Board Chair's compensation paid by NPCC, and feedback from RRA regarding Independent Director compensation in the sector generally. The President and CEO added that per diem payments would only be required if there was a compliance hearing and the Independent Directors were to serve on the hearing body for a proceeding. A motion to approve the two Independent Director nominees recommended by the CGNC, Mr. Donald L. Correll and Ms. Jan L. Newton, was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Draft Independent Director Agreement - The Board Chair generally explained the form of agreement that had been reviewed by the CGNC and asked for questions. There were no questions from the Board. A motion to approve the draft form of Independent Director Agreement as recommended by the CGNC was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Membership, Board and Committee Changes
Stakeholder Director Nominees - The President and CEO presented the following CGNC recommended Stakeholder Director nominees for 2012:

Sector 1 - Transmission Owners

André Boulanger (1 year term)
Hydro-Quebec TransEnergie

William Longhi (2 year term)
Orange and Rockland Utilities

Sector 2 - Reliability Coordinators

Peter Brandien (1 year term)
ISO-New England, Inc.

Bruce Campbell (2 year term)
Independent Electricity System Operator

Sector 3 - TDUs, Dist., and LSEs

David Boguslawski (1 year term)
Northeast Utilities

Mike Penstone (2 year term)
Hydro One, Inc.

Sector 4 - Generator Owners

Andrew Barrett (1 year term)
Ontario Power Generation, Inc.

Brad Van Auken (2 year term)
New York Power Authority

Sector 5 - Marketers, Brokers, Aggregators

Glen McCartney (1 year term)
Constellation Energy Commodities Group, Inc.

Daniel Whyte (2 year term)
Brookfield Power Generation

Sector 6 - Regulators

Hans Mertens (1 year term)
Vermont Dept. of Public Service

Tammy Mitchell (2 year term)
New York State Dept of Public Service

Sector 7 – Subregional, Customers, Other Regional Entities

Michael Forte (1 year term)
New York State Reliability Council, LLC

Jeffrey Fenn (2 year term)
SGC Engineering

The President and CEO explained that since the NPCC Bylaws provide for staggered terms for Stakeholder Directors, the first Stakeholder Director nominee in each Sector would serve a one-year term and the second Stakeholder Director nominee in the Sector would serve a two-year term. He noted that the CGNC's recommendation for addressing representation in Sector 3, where there were three existing Board members who had expressed interest in serving, was that nominee Peter Brandien would serve a one-year term while another Reliability Coordinator representative, such as Mr. Rick Gonzales, could serve a subsequent one-year term. There were no additional questions from the Board. A motion to endorse the slate of stakeholder director nominees to be presented to Members for approval was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Committee Changes – The President and CEO informed the Board that there were several proposed changes to NPCC's Regional Standards Committee (RSC) and Reliability Coordinating Committee (RCC), and that two previously proposed changes by NYPA had been withdrawn. The Board noted the following committee changes:

- RSC - Sector 2 (*Reliability Coordinators*): Ms. Tina Teng to serve as the Independent Electricity System Operator member, replacing Mr. Kurtis B. Chong.
- RSC - Sector 2 (*Reliability Coordinators*): Mr. Scott Berry to serve as the Independent Electricity System Operator alternate #1.
- RSC - Sector 2 (*Reliability Coordinators*): Ms. Esther Kim to serve as the Independent Electricity System Operator alternate #2.
- RCC - Sector 2 (*Reliability Coordinators*): Mr. Len Kula to serve as the Independent Electricity System Operator alternate, replacing Mr. Mark Wilson.

- RCC - Sector 2 (*Reliability Coordinators*): Mr. Paul Renaud to serve as the Vermont Transco member, replacing Mr. Frank Ettori.
- RSC – Sector 3 (*TDUs, Dist., LSEs*): Mr. Anthony LaRusso to serve as the National Grid alternate.

A motion to approve these committee changes was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

NERC Matters

MRC and BOT November 2-3, 2011 Agendas – The President and CEO informed the Board that the NERC Board Chair was soliciting input for the upcoming NERC Member Representatives Committee meeting and the NERC Board of Trustees meeting on November 2 and 3, 2011. He presented the draft NPCC Board Policy Input for these meetings and requested comments from the Board on five areas: (1) Compliance Enforcement Initiative; (2) Compliance Application Notices (CAN) – Status; (3) Status of CIP Standards Version 4 and 5 Implementation Plans; (4) Bulk Electric System (BES) Definition and Rules of Procedure – Status; and (5) Rules of Procedure Changes. Several Board members provided comments on the draft Board Policy Input relating to (i) the "no formulaic criteria for FFT designation"; (ii) the authority of FERC to approve FFTs in the United States; (iii) the addition of a "cost effectiveness" comment to item 4 (BES Definition); (iv) the "negative" vote by a majority of NPCC Members against the proposed BES Definition; and (v) the "affirmative vote by the NPCC Board in support of the proposed BES Definition. Following a lengthy discussion, the Board agreed to revise item 4 (BES Definition) of the NPCC Board Policy Input so that it reads as follows:

a. NPCC members have separately submitted their individual comments with regard to the BES Definition
b. NPCC acknowledges the proposed NERC BES Definition as being responsive to the FERC Order and reiterates its view that cost effectiveness should be a consideration in the implementation, including in the exception process
c. NPCC, consistent with its commitment to enhanced reliability, will continue to utilize a risk-based analysis to define facilities for which its more stringent Regional criteria apply

A motion to approve the draft NPCC Board Policy Input, as modified by the Directors, was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Following the discussion on the draft NPCC Board Policy Input, several Board members expressed concern that NPCC Members could vote one way on a particular issue while the NPCC Board voted another way on that same issue. One Director noted that the Board did not always have to share the same position as NPCC Members on a particular issue and that NPCC management was not required to "line up the organization's views with those of the Members all of the time." Directors also noted that NPCC, as an organization, could be effective if it solicits feedback from its Members but is able to make an independent decision. In response to additional questions from the Board, the Board Chair suggested that the question of who the Board represents and whether the Board can act independently, pursuant to the NPCC Bylaws, should be placed on the agenda for the 2012 Board Strategy Meeting. The President and CEO agreed to add this item to the 2012 Board Strategy Meeting agenda.

Administrative Matters

Board Charter – The Secretary presented the draft Board of Directors Charter and Governance Guidelines and explained that most of the changes reflected the proposed changes to NPCC's Amended and Restated Bylaws for NPCC's new governance structure. In response to a Director question on the procedure to "retire regionally-specific standard" as the NERC continent-wide standards develop, the President and CEO explained that NPCC Members could vote to eliminate NPCC's regionally-specific standards pursuant to

the NPCC Bylaws. A motion to approve the revised Board of Directors Charter and Governance Guidelines was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

CGNC Charter – The President and CEO then presented the draft CGNC charter which was revised to reflect the addition of independent directors to the NPCC Board and to clarify the process for selecting independent directors and an independent Board Chair. A motion to approve the revised CGNC charter was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Management Development and Compensation Committee (MDCC) Charter – The Board Chair then presented a draft of the MCC charter which had been revised for consistency with NPCC's bylaws, and to incorporate references to the succession plan reviewed by the committee. A motion to approve the revised MDCC charter was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Pension Committee Charter – The President and CEO then presented the draft Pension Committee charter which had been revised to recognize the authority of the Pension Committee to retain advisors that report to the Pension Committee. One Director questioned the authority of the committee to appoint advisors in its sole discretion. Following discussion, it was agreed that the Pension Committee could appoint advisors, but "within the approved budget." A motion to approve the Pension Committee charter, as revised by the Board, was duly made, seconded and unanimously approved.

Proposed 2012 Board of Director Meeting Dates – The President and CEO presented the schedule of proposed Board meeting dates in 2012. At the request of one Director, the Board agreed to change the date of the September meeting in NPCC offices from Tuesday, September 18, 2012 to Wednesday, September 19, 2012. A motion to approve the schedule of Board meeting dates in 2012, as revised, was duly made, seconded and unanimously approved by the Directors in each active Sector of the Board.

Development of 2011 Board of Directors Self-Assessment – The Board Chair questioned whether there were any comments on the CGNC recommended 2011 Board Effectiveness Self-Assessment Questionnaire that was included in the Board agenda package. Since there were no comments during the meeting, he asked the Directors to send their completed questionnaires to the NPCC Secretary. The President and CEO indicated that he would circulate a clean version of the questionnaire to the Board following the meeting since the version circulated to the Board incorporated a few updates in a marked version of the document.

Regulatory Matters

The President and CEO informed the Board that on October 17, 2011 FERC had approved NPCC's Amended & Restated Bylaws which, among other things, established a hybrid board of directors with both stakeholder directors and independent directors. He also informed the Board that a FERC Order had been issued on October 20, 2011 approving NPCC's Protection and Control regional Reliability Standard PRC-002-NPCC-01. The Board recognized the efforts of NPCC's RSC and its chair, Mr. Guy Zito, for this accomplishment that reflected NPCC's first FERC-approved Regional Reliability Standard. One Board member further commended NPCC and the RSC since FERC had also not placed any conditions on this Reliability Standard. The President and CEO concluded his updates on Regulatory Matters by announcing an upcoming FERC technical conference from November 29-30 on reliability.

Future Meetings in 2011

The President and CEO presented the schedule of Board meetings for the remainder of calendar year 2011, which was distributed with the Board agenda package. He reminded the Board that the next Board meeting was scheduled for November 30, 2011 from 7:30 a.m. to 10:30 a.m., in Toronto, Ontario.

The President and CEO also reminded the Board that NPCC's 2011 Annual General Meeting was scheduled for Wednesday, November 30, 2011 from 1:00 pm to 5:00 pm, in Toronto, Ontario.

Adjournment
There being no further business, the Board Chair adjourned the meeting of the NPCC Board of Directors at 11:50 a.m.

Approved by Board action on _____, 2011.

WASHINGTON, D.C. 20426
OFFICE OF ELECTRIC RELIABILITY

North American Electric Reliability Corporation
Docket No. RR11-2-000

November 15, 2011

Schiff Hardin LLP
1666 K Street, N.W., Suite 300
Washington, D.C. 20036-4390

Attention: Owen E. MacBride
Attorney for North American Electric Reliability Corporation

Reference: Petition for Approval of Compliance Monitoring and Enforcement Agreement Between Northeast Power Coordinating Council, Inc. and Western Electricity Coordinating Council and Related Amendments to Delegation Agreements

Dear Mr. MacBride:

1. On May 25, 2011, the North American Electric Reliability Corporation (NERC) submitted a petition requesting approval of: (1) an agreement between Northeast Power Coordinating Council, Inc. (NPCC) and Western Electricity Coordinating Council (WECC) concerning compliance monitoring and enforcement of WECC registered functions; (2) an agreement between NERC and WECC regarding termination of the existing agreement concerning compliance monitoring and enforcement of WECC registered functions; and (3) related amendments to delegation agreements between NERC and NPCC, and NERC and WECC. NERC requests an effective date of January 1, 2012.

2. NERC states that the purpose of its petition is to provide for NPCC to assume responsibility for performing Regional Entity compliance monitoring and enforcement program functions with respect to those reliability functions for which WECC is the registered entity within the United States portion of the WECC region. Currently, NERC acts as the Compliance Enforcement Authority for WECC registered functions in the United States portion of the WECC region, pursuant to an agreement between NERC and WECC.

3. Notice of this filing was issued on May 25, 2011, with comments, protests or motions to intervene due on or before June 15, 2011. No protests or adverse comments were filed.

4. NERC's uncontested filing is accepted pursuant to the authority delegated to the Director, Office of Electric Reliability, under 18 C.F.R. § 375.303, effective January 1, 2012.

5. This action shall not be construed as accepting any other contingency plan pursuant to 18 C.F.R. § 375.303(a)(1)(i) or any other data or report pursuant to C.F.R. § 375.303(b)(3)(iv). This action shall not be construed as approving any other application including Electric Reliability Organization or Regional Entity Rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such acceptance or approval shall not be deemed as recognition of any claimed right or obligation associated therewith; and such acceptance or approval is without prejudice to any findings or orders which have been or which may hereafter be made by the Commission in any proceeding now or pending or hereafter instituted by or against NERC.

6. This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order, pursuant to 18 C.F.R. § 385.713.

Sincerely,

Joseph H. McClelland, Director
Office of Electric Reliability

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Media Release

NERC Completes First Grid Security Exercise

November 17, 2011

WASHINGTON, DC – More than 75 industry and government partners participated in the North American Electric Reliability Corporation's (NERC) first cybersecurity readiness exercise, GridEx 2011, this week.

Ending today, the two-day exercise is part of NERC's ongoing security readiness program to assess NERC and the industry's crisis response plans and validate current readiness in response to a cyber incident. GridEx, which NERC plans to sponsor bi-annually, also allowed enhanced collaboration between NERC, the industry and government stakeholders.

"GridEx 2011 is an opportunity for NERC, industry stakeholders and government partners to work together and identify gaps in the overall security posture of the grid," said Mark Weatherford, vice president and chief security officer at NERC. "Most importantly, it will provide data to help the electricity sector focus resources to better address cybersecurity issues."

GridEx, modeled after the Department of Homeland Security's CyberStorm exercise series, allowed participants to respond to scenario events as they would in the case of a real-time incident. This will enable participants and leadership to assess, test and validate existing crisis response plans; and to adjust plans as needed in an exercise setting.

Participants included NERC and Regional Entities, electric sector utilities, Department of Energy, Department of Homeland Security and Department of Defense, as well those from the Federal Energy Regulatory Commission and Canadian agencies. For more information on NERC's cybersecurity program, click here or visit NERC's website at www.nerc.com.

Chapter 1 – Executive Summary

This document provides an update on the status of Standards Development work at NERC, as well as a forecast of work being planned for 2012-2014. The document has several sections:

- Chapter 1 contains this Executive Summary
- Chapter 2 contains introductory remarks from the Chair of the Standards Committee and NERC's Vice-President and Director of Standards
- Chapter 3 provides a general update on Standards Activities in 2011
- Chapter 4 provides a summary of the development of this document and the implementation of projects in general
- Chapter 5 provides a summary of the Work Plan
- Appendix 1 shows the prioritization scores used in the development of the Work Plan
- Appendix 2 shows the Work Plan in Gantt chart form
- Appendix 3 shows the Regional Work Plan in Gantt chart form
- Appendix 4 provides brief summaries of all the projects proposed within the Work Plan

Chapter 2 – A Joint Letter from the Chair of the Standards Committee and NERC's Vice-President of Standards and Training

To: NERC's Board of Trustees, Stakeholders, Regulatory Authorities, and other interested parties

NERC is committed to the development of clear, technically excellent standards for the reliable planning and operation of the North American bulk power system. NERC's industry-based standard development process strives to leverage the knowledge and experience of subject-matter experts to develop stakeholder consensus in support of standards that achieve reliability objectives and are responsive to regulatory directives, balanced against the burdens and costs of compliance imposed upon the more than 1,900 entities that are now subject to these standards. No single standard can ensure this outcome. Rather, NERC strives to develop and enhance a portfolio of performance, risk-mitigation, and competency-based reliability standards that achieve a consistent defense in depth against credible events that may lead to cascading, uncontrolled separation, or instability and ensure prompt system restoration when extreme events occur.

Achieving this balance is intrinsically difficult. Just as the management of the reliability "bar" through enforceable standards is an ongoing and evolving process, the process for developing standards needs to evolve as well, in response to the learning that has occurred in the period since passage of the Energy Policy Act of 2005 and the initial enforcement of NERC standards in June 2007. We would like to use this message to highlight current achievements in the standards arena and our plans for 2012-2014, as well as certain emerging factors and concerns.

NERC's Reliability Standards Development Plan delivered the following results in 2011:

- As of November 1, 2011, 20 new or revised standards have been approved by the Board of Trustees, and are either filed or in the process of being filed with the FERC.
- Results Based Standard development principles were used for all new standards projects.
- The Standards Committee worked with NERC staff to prioritize standards development resources on twelve high priority projects. There has been no specific redirection of this effort relative to the selected priorities by regulatory authorities.
- Stakeholder-driven Quality Review has been integrated into the standards development process to assure the best quality standards from a compliance and implementation perspective.
- NERC undertook a first effort to develop a standard on a Rapid Development basis utilizing the new Standard Processes Manual.

- To balance the resources committed to the development of new standards versus the interpretation of existing standards, the Standards Committee has limited the number of interpretations under active development to three projects at any one time, while pursuing new procedural options such as "rapid revision" to correct deficiencies in the underlying standard.

The 2012-14 Reliability Standards Development Plan described in this report builds on recent experience by proposing an achievable yet ambitious plan of standards development. The 2012-14 Plan provides for:

- Continuation of ongoing standards projects with sufficient resources to ensure timely completion.
- Project priorities were established using a more comprehensive model with scores and explanatory inputs from the Standards Committee, NERC staff and industry stakeholders.
- Projects have been ranked for development priority along three tracks, based on consideration of Reliability Benefits, Time Sensitivity, and Practicality.
- As ongoing projects are completed, we are scheduling follow-on projects based on the availability of subject-matter experts and the completion of technical input, research, and industry outreach conducted by NERC's standing committees and subcommittees.
- Finally, the 2012-14 Plan incorporates a more comprehensive integration of the regional standards effort into this process. For the first time a complete project management process is being applied to regional standards development.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, a wide variety of electric system events and emerging risks to bulk power system reliability may necessitate deviations from this plan. In order to respond to such threats and initiate development of new or revised standards, the actual deployment of resources to staff this plan may shift. Additionally, the estimated times listed for project completion may change as more is learned about a given project.

NERC currently is investigating the following "emerging issues," each of which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Not every issue is addressable or best addressed through development of a new industry standard; the issues outlined above illustrate that truism. But where a standards related response is indicated, we will be ready to reprioritize and adjust.

The Standards Committee and NERC staff also recognize that major standards process efficiencies are still necessary if we are to make efficient use of NERC and industry resources, while meeting external expectations for the timely development and approval of technically excellent reliability standards. In 2012, we need to ask ourselves once again, "is there a better way to develop reliability standards?"

We achieve the past results and plan for the future results only with your support, and greatly appreciate that the industry has accepted the evolving prioritization process. Our efforts to effectively manage and balance the many conflicting demands placed upon both the industry and NERC staff resources has provided this next plan, which we hope you will endorse.

Each of us, day in and day out, is driven to do the "right" thing, and your ERO's reputation will be enhanced through your active support for completion of NERC's 2012-14 Reliability Standards Development Plan.

Sincerely,

Allen Mosher
Senior Director of Policy Analysis and Reliability, American Public Power Association
Chair, NERC Standards Committee

Herb Schrayshuen
Vice President of Standards and Training, NERC

Chapter 3 - General

This is the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The Plan provides several items of interest to its readers:

- Information regarding the state of Standards at NERC, changes in Standards, and challenges facing Standards in the years to come;
- Status updates regarding standards and related projects currently in development;
- A forecast of Standards Development work scheduled for the next three years; and
- An overview of the process used to prioritize work and assign resources to Standards development projects.

NERC Standards staff endeavors to maintain a complete, updated set of Standards information on the NERC website, which can be found at www.nerc.com.

The Standards Program continues to manage its ongoing load of work in order to move toward the target work load levels initially identified in early 2011. Progress is being made in this area; however, some projects expected to be completed in 2011 are still in active development. This is largely due to unforeseen complications regarding achieving consensus and managing overall product quality.

This Plan is intended to be a forecast of the standards work expected to be developed in the coming years. However, other priorities may necessitate deviations from this plan. As new technologies are discovered or new threats to reliability identified, the actual deployment of resources to staff this plan may shift. Similarly, the estimated times listed for project completion may change as more is learned about a given project.

NERC is currently investigating the following "emerging issues," which may result in the identification of additional standards development work:

- Cold weather preparedness and winterization
- Geomagnetic disturbances
- Right-of-way clearances and maintenance
- System design and planning
- High Impact/Low Frequency events and disaster preparedness

Status Updates

2011 Reorganization and Hiring

In early 2011, NERC performed a minor reorganization of the Standards staff in order to ensure appropriate focus on key areas. A new position, Director of Regulatory Initiatives, was established to ensure overall coordination between NERC and its various regulators. NERC also established a Manager of Standards Information, with the primary focus of ensuring that information posted on the NERC website accurately reflects the current body of Standards and associated compliance information. Additional staff was hired into the Standards Process, Standards Development, and Regional Standards teams to better support the volume of work ongoing within the Standards Program.

Completed Standards Development Projects

In 2011, NERC completed development of the following projects.

- 2006-02 Assess Transmission and Future Needs (BOT approved, awaiting filing)
- 2007-04 Certifying System Operators (filed with regulators)
- 2008-06 Cyber Security Order 706 Version 4 (filed with regulators)
- 2009-06 Facility Ratings (filed with regulators)
- 2010-10 FAC 729 (filed with regulators)
- 2010-11 TPL Table 1 Footnote B (filed with regulators)
- 2010-13 Relay Loadability Order Phase 1 (filed with regulators)

Progress on Version Zero Standards

The set of Version 0 standards included 110 standards. Of the 110 standards, NERC withdrew three, and the Federal Energy Regulatory Commission (FERC) ruled on the remaining 107 as follows:

- 27 were approved without any directives to modify the associated standard
- 56 were approved with directives to modify the associated standard
- 24 were not approved, pending provision of additional information

Of the 56 that were approved with directives, progress in revising those standards includes:

- 7 have been approved by FERC
- 9 have been submitted and are pending FERC approval
- 18 are associated with projects under active development

- 22 are associated with projects that are either inactive or not started

Of the 24 that were not approved pending submittal of additional information, progress in revising those standards includes:

- 8 have been approved by FERC
- 4 have been submitted and are pending FERC approval
- 2 are associated with projects under active development
- 10 are associated with projects that are either inactive or not started

As of September 1, 2011, there are 103 continent-wide Reliability Standards with 1220 requirements that are mandatory and enforceable in the United States.[1]

Interpretations of Reliability Standards

Entities required to comply with a reliability standard have the right to request a formal interpretation of a requirement in a standard. Interpretation projects generally are narrower in scope than other standards projects, but like standards, interpretations are drafted by a drafting team and posted for industry review and ballot. From 2006 to 2011, NERC processed 43 interpretation requests. In addition, NERC received a number of requests for interpretation that were absorbed into standards development projects because drafting teams could not prepare the interpretations without expanding the requirements of the approved standard.

Progress on Regulatory Directives

Since NERC became the Electric Reliability organization (ERO), FERC has issued 44 Orders containing approximately 655 directives related to NERC Reliability Standards. Of the approximately 655 directives issued since 2007, NERC has completed projects associated with approximately 44% of these directives and continues to make substantial progress in addressing the remaining directives focusing first on those that have the greatest impact on reliability.

A significant number of the directives ordered by FERC for implementation by NERC (as the FERC-approved ERO) specify that NERC submit or modify a Reliability Standard that addresses a specific matter, as permitted under Section 215(d)(5) of the Federal Power Act. Other directives order NERC to make changes in its procedural rules. Still other directives order NERC to consider the views of various commenters when NERC next revises a particular Reliability Standard.

[1] The data included in this paragraph does not include Regional Reliability Standards.

NERC processes these various types of directives consistent with its Rules of Procedure (including Appendices 3A- Standard Processes Manual and 3C Procedure for Coordinating Reliability Standards). Specifically, when a regulatory order or rule is issued, that order is reviewed and any directives within the order related to standards development are added to the NERC Standards Issues Database and categorized. NERC then seeks to associate each directive with a specific standard. Projects and the associated Standards, along with the associated regulatory directives, are then prioritized for revision using the prioritization process described elsewhere in this document.

In 2011, NERC developed and filed the first NERC Standards Report, Status and Timetable for Addressing Regulatory Directives. This report is to be filed annually with FERC on or before March 31 of each year in accordance with Section 321.6 of the NERC Rules of Procedure ("Rule 321") that was approved by the FERC on March 17, 2011. The progress against the directives issued is outlined in the aforementioned report.

Regional Standards Development

Regional standards work within NERC and the Regions has seen a great deal of development and implementation of new initiatives since the beginning of 2011. First, the Regional Reliability Standards Working Group (RRSWG) transitioned into the Regional Standards Group (RSG). Comprised of the NERC Vice President of Standards and Training and the Standards Managers from each of the eight Regional Entities, the RSG reports to the ERO Executive Management Group (EMG). Its purpose is to provide process and policy recommendations in the execution of the Regional Entity delegation agreements and the NERC Rules of Procedure. An overarching objective is to coordinate the development of Regional and continent-wide standards to support and continually enhance reliability across North America for the benefit of all bulk electric system users, owners and operators.

In support of this purpose and this objective, a primary initiative of the RSG is to create and sustain viable standards development coordination processes to obtain consistency and uniformity, where appropriate, across the ERO enterprise – NERC and the Regional Entities – while ensuring efficient and effective use of resources in executing the statutory responsibilities of the ERO as the reliability standards development authority. To that end, the RSG developed a combined list of all regional standards and variances in the development process in order to prioritize these projects continent-wide. This will allow NERC to coordinate the necessary resources through the development and ultimate filing of these standards and variances with applicable regulatory authorities. Project information for each of those regional standards and variances in the development process is provided in this Plan, along with a high-level overview of the project timeline.

Rapid Development and Rapid Revision Projects

NERC's Standards Committee (SC) tentatively has identified two ways to accelerate project development while staying within the boundaries established in the Standard Processes Manual. Both approaches are consistent with the original vision of standards development when the ERO was being developed.

The first, called "Rapid Development," utilizes a small team of professionals to draft a standard over a short, but intensive period of time. The standard is then submitted with its associated SAR and the project moves directly into the first formal comment phase. Under this model, it may be possible to develop and ballot a standard within a period less than a year. The SC is evaluating the approach as part of Project 2010-05.1 Phase 1 of Protection Systems: Misoperations. Initial results have provided useful lessons learned, including the need to carefully select members of the small team to ensure not just subject matter expertise, but balance of interests as well.

The second approach, called "Rapid Revision," takes a similar approach, but is focused on dealing with concerns identified during the Interpretation process. If an interpretation drafting team identifies simple modifications to a standard that can address an interpretation request more effectively than an interpretation can alone, the team may propose to the requester that the team instead make such changes and submit them with an associated SAR. If agreed to by the requester, and following SC review, the changes may move directly to comment and ballot. This approach is being tested with project 2011-INT-01 Interpretation of MOD-028-1 R3.1 for Florida Power and Light.

Challenges facing Standards

Five-Year Review Obligation

As part of its Rules of Procedure, NERC has committed to review each of its standards for modification once every five years. 2012 marks the fifth year since NERC's first set of standards became mandatory and enforceable in the United States; many of those standards are now due for that five-year review. While not giving the appearance of being onerous, this obligation has proved challenging to meet. The work load of the ERO remains high, and maintaining focus on those projects that are most beneficial to reliability has resulted in a delay of the work required for these five-year reviews (except when already associated with a project of significant reliability value). Using current assumptions, the five-year review obligation will not be met for a number of standards. NERC and the SC are working together with the NERC Board of Trustees to evaluate options for addressing this issue.

Product Quality

As NERC's and the industry's experience with standards has evolved, it has become increasingly clear that minor problems with the quality of standards can have significant repercussions when it comes to clarity and compliance. NERC has undertaken efforts to improve the quality of its work products, and will continue to do so in 2012. Steps being taken include creating technical writer positions, enhanced training for staff, and developing additional internal quality assurance processes.

Standards Program Throughput

One continuing challenge is the ability to not only produce quality products, but to do so consistently and efficiently. While in some cases limited by necessity due to the scarcity of industry resources available in the workforce, the Standards Program continues to look for ways to improve the efficiency of its processes and its ability to demonstrate tangible progress

in standards development on a regular basis. In 2012, Standards staff will be implementing enhanced document management capabilities, as well as portfolio-level project controls to ensure optimal use of resources and overall consistency of throughput. This more global "portfolio view" was used to in part to develop this Plan, but additional improvements are expected in 2012 as well. As such, it should be noted that this, in addition to the normal variables associated with consensus-based product development, may lead to changes in the schedules used to develop the forecasts within this document

Conclusion

The Standards Program continues to make changes to improve its overall effectiveness, and looks forward to additional improvements in 2012. The SC's work on this Plan has appropriately focused the industry on standards development to ensure the best progress in improving reliability, addressing concerns in a timely manner, and assisting with implementation complexity. Additionally, the plan was developed with the use of a subjective review of the implications of cost. NERC believes this approach correctly balances the needs of the industry with the public interest, and will continue to work with the industry to ensure the continued protection of reliability in North America.

Chapter 4 – Project Development Overview

Project Prioritization and Plan Development

This year, NERC continued use of the Prioritization Tool (the Tool) developed by the Standards Committee (SC) in late 2010 and early 2011 to help determine how best to assign resources and perform work. Following the finalization of the 2011-2013 Plan, the Standards Committee's Process Subcommittee (SCPS) began to work on improving the Tool for use in the development of the 2012-2014 Plan.

Similar to last year, the Tool utilizes a simple scoring mechanism to identify key considerations for use in determining project priority. Revisions were made to the tool in response to comments received during the development of the 2011-2013 Plan. Changes included the elimination and consolidation of scores that seemed to overlap or be redundant, removal of the "Project Percent Complete" evaluations (as there is currently no intention of moving projects into Informal Development, as was considered during the development of the 2011-2013 Plan), the addition of a score to account for projects related to the NERC President's Top Priority Issues for Bulk Power System Reliability, and trial testing of a new metric that accounts for "cost considerations." In addition, the Tool was modified to allow a more sophisticated analysis of each of the key drivers in project prioritization. This allowed the SC to consider each of those factors separately, as well as in aggregate, to determine how best to allocate resources.

During the month of July 2011, NERC solicited the industry at-large for additional projects for consideration in the 2012-2014 Plan. NERC received nine submissions, resulting in the creation of six new projects. NERC created one project to account for the remaining Order 729 directives yet to be resolved, and one project to account for issues with the MOD-029-01 standard that will need to be addressed at some point in the future. NERC created four additional projects to account for projects to modify standards based on NERC's five-year review obligation, as identified in its Rules of Procedure.

In August, the SC began reviewing each of these projects, assigning them various scores based on input from constituents within their respective segments. NERC staff assembled the results in September, and an initial Prioritization and Work Plan was approved for posting at the September meeting of the SC. This Work Plan assumed an overall throughput capacity of thirteen projects in development concurrently, and divided that capability into three areas:

- Reliability Projects – those projects expected to be the most beneficial to Reliability. Capacity for eight concurrent projects was assigned to this area.
- Time-Sensitive Projects – those projects with time sensitivity, such as those responsive to FERC orders with specified deadlines, as well as those projects needed to meet the ERO's five-year review obligation. Capacity for three concurrent projects was assigned to this area.

- Practicality Projects – those projects that improve the overall effectiveness of NERC's Reliability Standards, including addressing failed interpretations, improving the clarity of often violated standards, and other such general improvements. Capacity for two concurrent projects was assigned to this area.

The Work Plan identified each project and the amount of work associated with it, then allocated projects in their respective areas in order or priority as resources came available. Some projects were identified that needed additional research and were scheduled for initiation with sufficient time to allow such work to be completed. Additionally, some projects require specific expertise. To the extent such needs were identified, that expertise was managed to ensure the volume of work did not exceed the resource capacity. For example, projects related to protection systems generally were not started until another project related to protection systems was completed.

This Work Plan, along with the prioritization itself and this document in draft form, were posted for industry comment in September. Comments were received and considered at the October 2011 SCPS meeting; the final prioritization and Plan was approved by the SC at its October meeting. The Plan was presented to NERC' Board of Trustees and was approved at the Board's November meeting.

Project Implementation

Standards development projects at NERC proceed through a specific set of steps, identified in NERC's Standard Processes Manual. In general, the process can be summarized as follows:

- Initiation – projects are identified, and simple problem statements are developed. These problem statements are used to assist in the overall project prioritization effort described above.
- Planning – projects are further developed to determine their scope and merits. The drafting of a formal Standards Authorization Request (SAR) occurs in this step, as well as the development of communication plans if deemed to be necessary. In some cases, this step may occur concurrently with the initial steps of Execution and Control.
- Execution and Control – once the SC has approved a project for moving into this phase, standards or other work products are produced and the project begins moving forward in earnest. A detailed project schedule is developed, and standards are drafted, posted for comment, and balloted, culminating in review by NERC's Board of Trustees for adoption.
- Regulatory Submission - Following adoption by NERC's Board of Trustees, the standards are submitted to regulatory authorities.

- Closing – Following action by NERC's Board of Trustees, the project is reviewed and analyzed for "lessons learned." Public information is updated as necessary, and any necessary supplemental regulatory filings are made.

For more information on the specific details of each step in the implementation of projects to develop NERC Reliability Standards, readers are directed to various resources posted at the NERC Standards Resources page:

http://www.nerc.com/commondocs.php?cd=2

Chapter 5 – Project Work Plan Summary

This chapter summarizes the Reliability Standards Development Plan (the "Plan") for years 2012-2014. The following is based on the Standards Committee's Prioritization of Projects (included as Appendix 1) and the associated staff-developed Work Plan (included as Appendix 2). The Regional Work Plan is included as Appendix 3. A detailed summary of projects, including regional projects, is included as Appendix 4.

Projects for 2012-2014

NERC intends to continue development of the following projects in 2012. These are Active Projects, and are expected to continue until completion. Although there are other projects that ranked higher this year than some of these projects, the Standards Committee believes that the industry has committed to completing these projects, and given that the workload is reaching a manageable size, moving any of these projects into informal development would be counterproductive.

The projects below have been color coded, to indicate their focus area (Reliability, Time Sensitivity, or Practicality). While most projects impact all three of these areas in some way, this is intended to illustrate the primary consideration driving each project's development priority.

Existing Active Projects:

- 2006-06 Reliability Coordination.
- 2007-02 Operating Personnel Communication Protocols.
- 2007-03 Real-time Transmission Operations.
- 2007-06 Protection System Coordination.
- 2007-07 Vegetation Management. This project is expected to be completed in early 2012, but at the time of this document's finalization, it has not yet been formally completed.
- 2007-09 Generator Verification.
- 2007-12 Frequency Response.
- 2007-17 Protection System Maintenance and Testing.
- 2008-06 Cyber Security – Order 706.
- 2009-01 Disturbance and Sabotage Reporting.
- 2010-05.1 Phase 1 of Protection Systems: Misoperations.
- 2010-07 Generator Requirements at the Transmission Interface.
- 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves.
- 2010-17 Definition of Bulk Electric System.

NERC intends to initiate development of the following additional projects in 2012. These projects have been assigned based on priority, but constrained by the need to have a limited

number of projects under active development at any given time. Project 2010-05.2 is not schedule to start until later in 2012 due to the need for subject matter expertise in misoperations, which is already committed to Phase 1 of the project. 2012-04 is not starting until later in 2012 due to the need for subject matter expertise in protection system testing, which is already committed to Project 2007-17.

While this Plan is a reasonable approach to Standards development, it cannot account for unforeseen events. The Plan is subject to modification in response to factors such as delays in the completion of current projects, the need to complete background research prior to initiation of standards development work, unforeseen regulatory directives, and factors such as new or emerging reliability risks to the Bulk Electric System. Changes to the Plan during its execution are not only possible, but likely, and should be expected.

Additional Projects in 2012:

- 2008-02 Undervoltage Load Shedding.
- 2009-02 Real-time Monitoring and Analysis Capabilities. This project is currently in informal development.
- 2009-03 Emergency Operations. This project is currently in informal development.
- 2010-01 Support Personnel Training. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-05.2 Phase 2 of Protection Systems: SPS and RAS. This project is expected to be started upon the completion of the first phase of the project, 2010-05.1 Phase 1 of Protection Systems: Misoperations. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.
- 2010-13.2 Phase 2 of Relay Loadability: Generation. This project is currently in informal development. This project has been identified as having a higher priority, as it has a FERC deadline. While this was accounted for in the Prioritization, the SC agreed that this should take precedence over the 5-year review projects considered in the Prioritization.
- 2012-04 Protection System Commissioning Testing. This project is expected to be started upon the completion of 2007-17 Protection System Maintenance and Testing. This project requires research prior to initiation, which is expected to be completed in the earlier part of 2012.

NERC intends to initiate development of the following projects in 2013. As noted above, these projects generally have been assigned based on priority and constrained by the need to have a limited number of projects under active development at any given time. 2012-06 is not starting until 2013 due to the need for subject matter expertise in reserves and in generator characteristics, which are already committed to projects 2010-14.1 and 2007-09, respectively. 2009-07 is not starting until 2013 due to the need for subject matter expertise in protection systems, which is already committed to project 2007-06.

Additional Projects in 2013:

- 2007-11 Disturbance Monitoring. This project is currently in informal development.
- 2008-01 Voltage and Reactive Planning and Control. This project is currently in informal development.
- 2008-12 Coordinate Interchange Standards. This project is currently in informal development.
- 2009-07 Reliability of Protection Systems. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until after the completion of 2007-06 Protection System Coordination.
- 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent. This project is currently in informal development.
- 2012-01 Equipment Monitoring and Diagnostic Devices. This project requires research prior to initiation, which is expected to be completed in the latter part of 2012.
- 2012-06 Generator Capabilities. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is not expected to start until completion of both 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves and 2007-09 Generator Verification.

NERC intends to initiate development of the following projects in 2014. These projects have been identified as having a lower priority, although some are associated with the 5-year review obligation. In general, these projects are not projected to be initiated until 2014 due to the need to limit the number of projects active at any given time. 2010-13.3 is not projected to start until 2014 due to the need for subject matter expertise in relay loadability, which is already committed to Phase 2 of the project.

Additional Projects in 2014:

- 2009-04 Phasor Measurements. This project requires research prior to initiation, which is expected to be completed in 2013.
- 2009-05 Resource Adequacy Assessments.
- 2010-03 Modeling Data. This project requires research prior to initiation, which is expected to be completed in the latter part of 2013.
- 2010-04 Demand Data. This project requires research prior to initiation, which is expected to be completed in 2014.
- 2010-08 Functional Glossary Model Revisions.

- 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings. Based on the limited number of experts in this subject matter area, and the need for research prior to beginning work, this project is expected to not start until completion of the previous phase of this project, 2010-13.2 Phase 2 of Relay Loadability: Generation.
- 2010-16 Definition of System Operator.
- 2012-05 ATC Revisions - Order 729.

Projects for 2015 and Beyond

NERC intends to develop the following projects in 2015 or later, which is beyond the scope of this Plan. These projects have been identified as having a lower priority. There also is some question as to whether or not they will provide sufficient value to be cost justified at this time. They have been included for completeness and to ensure that they are recognized as necessary projects.

It should be noted that several of these projects are related to NERC's ongoing obligation to review its standard every five years, as required in the Rules of Procedure. This is discussed in more detail in the General chapter.

- 2010-02 Connecting New Facilities to the Grid
- 2012-02 Physical Protection
- 2012-03 PRC-004 VSLs
- 2012-07 Obsolescence Review
- 2012-08 Glossary Updates
- 2012-09 IRO Review
- 2012-11 FAC Review
- 2012-12 PER Review
- 2012-13 NUC Review
- 2012-14 Risk Analysis

The following two projects were identified as potential projects for consideration, but not included in the prioritization. If necessary, they will be evaluated mid-year on an ad-hoc basis; otherwise, they will be considered in the prioritization process for the 2013-2015 Reliability Standards Development Plan.

- 2006-06.2 Phase 2 of Reliability Coordination
- 2012-15 Flow Limited Paths

Appendix 1 - Prioritization

The following pages show the project rankings in each of the three primary categories: Reliability, Time Sensitivity and Practicality. The assignment of scores was based on the mean of individual scores provide by members of the Standards Committee. Scores highlighted in red indicate areas where the members of the SC were divided regarding how to assign a particular score.

Following the identification of potential projects, this prioritization is the next step in the creation of the Reliability Standards Development Plan, and provides a starting point for further discussion. The prioritization is used to create the Work Plan that follows as Appendix 2.

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization

RELIABILITY SORT

Project Number and Name	Short Description	(E) **Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	(F) **Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	(G) **Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	(H) **Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(I) **Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	(J) **Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	(K) **Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	(L) **Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	(M) **Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	(N) **Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	7	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	6	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	2	29
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	3	7
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	14	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	11	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	12	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	9	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	19	32

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	37	41
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	4	3
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	16	12
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	15	25
Project 2010-13.2 Phase 2 of Relay Loadability: Generation (INFORMAL)	29 - Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010. Related to System Protection Initiative.	50	29.2	50	62.5	50	12	0	0			129.2	42	82	0	21	26	24	34
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	8	4
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	20	15
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	22	20
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	41	43
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	10	30
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001- through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	17	5
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	RELIABILITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	40	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	42	44
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	13	31
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	38	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	39	24
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	21	33
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-11 FAC Review	44 - 5-Year Review of FAC-010, -011, -014	0	0	0	50	50	27	0	0			0	0	57	0	40	40	26	35
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2012-13 NUC Review	46 - 5-Year Review of NUC-001.	0	0	0	25	25	39	0	0			0	0	37	0	43	43	28	36
Project 2012-12 PER Review	45 - 5-Year Review of PER-003, -004 and -005.	0	0	0	50	50	49	0	0			0	0	20	0	44	44	30	37
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	32
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative. BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12

Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	TIME SENSITIVITY SORT							
Project Number and Name	Short Description	Addresses an ERO Strategic Priority (to be completed by NERC Staff) 50 = Yes 0 = No	Addresses a reliability risk not covered by an existing standard 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	Improves one or more existing standards: 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	Cost of Implementation The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Cost of Administration The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	Time Sensitivity (to be competed by NERC Staff) Number of months until due date, if any	Addresses compliance issues from NERC Staff or Stakeholders 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	Other Practicality Concern (Explanation for the rating must be indicated in the column to the right) (0 to 50)	Explanation	Reliability Score (0 - 250)	Cost Consideration Score (0 - 100)	Time Sensitivity Score (0 - 100)	Practicality Score (0 - 150)	Reliability Ranking	Cost Consideration Ranking	Time Sensitivity Ranking	Practicality Ranking
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2012-06 Generator Capabilities	40 - For all synchronous generators, specify minimum droop settings and frequency response performance. Require proven voltage support and reactive response to a specific level. Related to Frequency Response Initiative. Related to BAL-003 and the Continent Wide Reserve Policy. New standard(s).	50	50	91.7	62.5	37.5	0	0	0			191.7	60	0	0	6	8	34	38
Project 2012-04 Protection System Commissionning Testing	38 - Establish minimum level of required commissioning testing prior to putting protection systems into service. Related to System Protection Initiative. New standard(s).	50	48.3	67.7	41.7	50	0	0	0			166	56	0	0	9	10	35	39
Project 2010-01 Support Personnel Training	21 - Require the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system. New standard(s).	50	45.8	50	85	41.7	0	0	0			145.8	42	0	0	15	25	36	41
Project 2012-01 Equipment Monitoring and Diagnostic Devices	35 - Consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures. New standard(s).	0	25	70.8	87.5	62.5	0	0	0			95.8	36	0	0	26	34	37	43
Project 2009-04 Phasor Measurements	18 - Supports a blackout recommendation. Several industry studies were issued that need to be analyzed to determine appropriate requirements for a NERC standard. Related to North-American Synchro-Phasor Initiative. New standard(s).	0	66.7	0	50	33.3	0	0	0			66.7	46	0	0	30	23	38	40
Project 2009-05 Resource Adequacy Assessments	19 - Implements recommendations from the Resource and Transmission Adequacy Task Force (RTATF) Report and the Gas/Electricity Interdependency Task Force Report, approved by the NERC Board on June 15, 2004, related to resource adequacy. New standard(s).	50	8.3	0	33.3	25	0	0	0			58.3	38	0	0	31	33	39	42
Project 2012-02 Physical Protection	36 - Consider the development of reliability standards for the safety and protection of essential equipment, buildings and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system. New standard(s).	0	45.8	8.3	91.7	83.3	0	0	0			54.1	20	0	0	32	37	40	44
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2012-14 Risk Analysis	47 - Require entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist should include things like GMD, voltage collapse, and other extreme events. New standard(s).	0	25	0	100	50	0	0	0			25	19	0	0	37	38	43	45
Project 2012-07 Obsolescence Review	41 - Require all TOs and GOs to periodically review their electronic, electric, mechanical, and other control systems, as well as protection systems, to replace obsolete equipment. New standard(s).	0	25	0	100	75	0	0	0			25	13	0	0	38	39	44	46
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2006-06.2 Phase 2 of Reliability Coordination	NA - Address specific directives from FERC Order 693 related to reliability standard IRO-003-2 - Reliability Coordination - Wide-Area View											0	0	0	0	47	47	47	47
Project 2012-15 Flow Limited Paths	NA - Address concerns identified with MOD-029 and its treatment of flow-limited paths.											0	0	0	0	48	48	48	48

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	Short Description	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities (INFORMAL)	16 - The project will establish requirements for the functionality, performance, and management of Real-time tools for Reliability Coordinators, Transmission Operators, and Balancing Authorities for use by their System Operators in support of reliable System operations. New standard(s).	0	66.7	58.3	90	85	27	37.5	10	50	Getting industry buy in to the deveopment of the tool required.	125	38	57	97.5	22	32	25	1
Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Control: Reserves (ACTIVE)	31 - The project includes of modifications to BAL-001 and BAL-002 to support Frequency Response project. Includes Continent-wide Reserve Policy. 5 Year review of BAL-001. Related to Frequency Response Initiative.	0	50	87.5	81.3	31.3	1	8.3	45.8	40	There is a significant disagreement between FERC Staff, NERC Staff and the industry as to what is required under BAL-002. There could also be signifcant cost savings to the industry if the revisions to BAL-001 were to be realized.	137.5	56	100	94.1	17	12	1	2
Project 2008-01 Voltage and Reactive Planning and Control (INFORMAL)	11 - This project supports a blackout recommendation. Industry debate is needed on whether there should be a North American standard that requires a specific amount of reserves, or whether requirements for specific reserves should continue to be addressed at the regional level. The requirements in the existing standards need to be upgraded to be more specific in defining voltage and reactive power schedules. Consideration should be given to adding a requirement for the Reliability Coordinator to monitor and take action if reactive power falls outside identified limits. VAR-001 and -002.	0	66.7	78.3	54.2	30	5	35.2	8.3	50	Addressing Reactive Requirements key to reliability of system. Lenght of Time since the reliability need was identified -- Project was identified to address a Blackout Recommendation (elapsed time = 7 years) and FERC Order 693 directives (elapsed time = 4-1/2 years). Subsequently, NERC Transmission Issues Subcommitte.	145	65	94	93.5	16	4	12	3
Project 2009-03 Emergency Operations (INFORMAL)	17 - This set of EOP standards may be merged into a single standard. There are some requirements in IRO-001 that may be improved and merged into the new EOP standard. EOP-001, -002, -003, IRO-001.	0	45.8	72.7	45	45	5	12.5	29.2	50	Getting the industry to agree to combining the standards into one or two instead of four.	118.5	57	94	91.7	23	9	15	4
Project 2007-03 Real-time Transmission Operations (ACTIVE)	4 - Requires upgrading and expanding existing requirements that address transmission operator responsibilities to ensure the real-time operating reliability of the transmission assets within the transmission operator's area. PER-001, TOP-001-through TOP-008	0	4.2	66.7	33.3	50	5	50	41.7			70.9	47	94	91.7	28	21	19	5
Project 2008-06 Cyber Security - Order 706 (ACTIVE)	13 - The project requires modifications to CIP-002 thru CIP-009 to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.	50	70.8	100	87.5	75	48	45.8	45.8			220.8	52	22	91.6	2	17	29	6
Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)	15 - This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards. EOP-004, CIP-001 and CIP-008.	50	66.7	56.1	16.7	16.7	5	50	27.8			172.8	72	94	77.8	8	2	6	7
Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)	25 - Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not include SPS and RAS. Related to System Protection Initiative.	50	62.5	62.5	33.3	37.5	5	50	25			175	64	94	75	7	5	5	8
Project 2007-17 Protection System Maintenance & Testing (ACTIVE)	10 - Intended to consolidate several standards into a single maintenance and testing standard: PRC-005 (Transmission and Generation Protection System Maintenance and Testing), PRC-008-0 (Underfrequency Load Shedding Equipment Maintenance Programs), PRC-011-0 (UVLS System Maintenance and Testing), and PRC-017-0 (Special Protection System Maintenance and Testing). Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn. Related to System Protection Initiative.	50	50	100	60	50	5	45.8	25			200	60	94	70.8	3	7	2	9
Project 2010-17 Definition of BES (ACTIVE)	34 - Define the BES as per FERC Order 743.	0	87.5	75	81.3	75	5	37.5	29.2	1.7	From Stakeholder Comments, foundation of standards.	162.5	52	94	68.4	10	18	7	10
Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings	30 - Address concerns with Stable Power Swings as identified in the FERC Order on Relay Loadability. Related to System Protection Initiative. New standard(s).	50	41.7	41.7	81.3	68.8	36	5	12.5	50	Relay performance during "stable" swings is complex. Restraint from tripping during stable swings must be balanced with the necessity of separation during unstable swings. The FERC order ignores this.	133.4	33	42	67.5	18	35	27	11
Project 2007-12 Frequency Response (ACTIVE)	9 - Requires entities to provide data needed to model each interconnection's frequency response, as well as establishes Frequency Response Obligation. Related to Frequency Response Initiative, BAL-003.	0	50	79.2	50	75	5	16.7	10	36.7	Frequency response has declined over the years. This issue is a high priority for FERC.	129.2	51	94	63.4	19	20	13	12
Project 2010-07 Generator Requirements at the Transmission Interface (ACTIVE)	27 - This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. Multiple standards.	0	75	75	66.7	66.7	5	50	8.3			150	54	94	58.3	12	15	9	13

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2007-06 System Protection Coordination (ACTIVE)	5 - Requires upgrading and expanding the existing requirements from PRC-001 to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system. PRC-027. Related to System Protection Initiative.	50	62.5	83.3	55	45	5	12.5	41.7			195.8	61	94	54.2	4	6	3	14
Project 2007-07 Vegetation Management (ACTIVE)	6 - Project 2007-07 Vegetation Management Requires upgrading the existing requirements for entities to implement a vegetation management program to prevent transmission outages that adversely impact the reliability of the bulk electric system. FAC-003.	50	4.2	58.3	58.3	45	5	0	0	50	Results-Based Proof-of-Concept	112.5	40	94	50	24	29	16	15
Project 2010-05.2 Phase 2 of Protections Systems: SPS and RAS	26 - Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional updates to PRC-004 as well. Related to System Protection Initiative.	50	42.7	60	40	45	5	33.3	12.5			152.7	54	94	45.8	11	14	8	16
Project 2009-07 Reliability of Protection Systems	20 - Requires facility owners to have protection system equipment installed such that, if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards. Related to System Protection Initiative. New standard(s).	50	83.3	88.3	66.7	41.7	0	12.5	25			221.6	66	0	37.5	1	3	33	17
Project 2006-06 Reliability Coordination (ACTIVE)	2 - Requires upgrading and expanding existing requirements that address reliability coordinator actions to prevent instability, uncontrolled separation or cascading outages. COM-001, COM-002, IRO-001, IRO-002, IRO-005, IRO-014, IRO-015, IRO-016, and IRO-003.	50	33.3	66.7	37.5	37.5	5	4.2	25			150	56	94	29.2	13	11	10	18
Project 2007-11 Disturbance Monitoring (INFORMAL)	8 - Requires upgrading and expanding existing requirements for entities to install disturbance monitoring equipment and report disturbance data to ensure information is available to analyze bulk power system disturbances. PRC-002, PRC-018.	0	25	72	75	66.7	5	0	0	26.7	High Regional Priority	97	39	94	26.7	25	31	17	19
Project 2008-12 Coordinate Interchange Standards (INFORMAL)	14 - Revise the set of Coordinate Interchange standards to 1) ensure that each requirement is assigned to an owner, operator or user of the bulk power system, and not to a tool used to coordinate interchange, 2) to address the Interchange Subcommittee's concerns related to the Dynamic Transfers and Pseudo-ties, and 3) to address previously identified stakeholder comments and applicable directives from Order 693. INT-001 through -010.	0	45.8	25	41.7	41.7	5	25	1.7			70.8	47	94	26.7	29	22	20	20
Project 2010-14.1 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent (INFORMAL)	32 - The project includes elimination of Time Error Corrections, 5-year review of BAL-005, miscellaneous clean up and modification to BAL-006.	0	4.2	0	50	50	5	0	25			4.2	26	94	25	39	36	23	21
Project 2012-05 ATC-Revisions - Order 729	39 - Respond to directives in Order 729 related to ATC Standards. Perform 5-year review of MOD-001, -004, -008, -029, and -030. Also includes MOD-028.	0	0	0	50	50	51	0	25			0	0	17	25	41	41	31	22
Project 2012-09 IRO Review	43 - 5-Year review of IRO-006, -008, -009, and -010.	0	0	0	50	50	54	16.7	8.3			0	0	12	25	42	42	32	23
Project 2010-08 Functional Model Glossary Revisions	28 - The Functional Model Working Group (FMWG) has received many comments and questions from stakeholders concerning the differences in definitions between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards. This project is designed to address these comments and make the definitions of functional entities consistent between the Functional Model and the NERC Glossary of Terms Used in Reliability Standards.	0	0	29.2	33.3	33.3	0	0	0	12	Foundational piece of ERO	29.2	41	0	12	35	28	42	24
Project 2007-09 Generator Verification (ACTIVE)	7 - Requires upgrading existing requirements for generators to verify their capabilities to ensure that accurate data is used in model to assess the bulk electric system. MOD-025, -026, 027; PRC-019 and -024.	0	66.7	62.5	75	45.8	5	10	0			129.2	52	94	10	20	19	14	25
Project 2012-03 PRC-004 VSLs	37 - Update VSLs to address the situation where Corrective Action Plans were developed or documented, but not fully implemented. PRC-004.	0	0	0	25	50	0	8.3	0			0	0	0	8.3	45	45	45	26
Project 2010-16 Definition of System Operator	33 - Refine definition of "System Operator" to exclude the Generator Operator, as all other "System Operators" have a more wide-area view.	0	8.3	25	33.3	37.5	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	33.3	41	0	7.5	34	27	41	27
Project 2012-08 Glossary Updates	42 - Per FERC Order 693, define Bulk Power System, Reliability Standard, and Reliable Operation. Modify definition of Generator Operator and Transmission Operator.	0	0	0	75	75	0	4.2	0	3.3	From Stakeholder Comments, foundation of standards.	0	0	0	7.5	46	46	46	28
Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)	3 - Requires developing new requirements in support of blackout recommendation #26 to ensure that real-time system operators use standard communication protocols during normal and emergency operations. COM-003.	50	75	70.8	25	25	5	4.2	0			195.8	74	94	4.2	5	1	4	29

NERC Standards Committee
Project Prioritization Worksheet

STANDARDS COMMITTEE Reliability Standard Project Prioritization		(E)	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	PRACTICALITY SORT							
Project Number and Name	**Short Description**	**Addresses an ERO Strategic Priority** (to be completed by NERC Staff) 50 = Yes 0 = No	**Addresses a reliability risk not covered by an existing standard** 100 = Severe risk 75 = High risk 50 = Moderate risk 25 = Low risk 0 = N/A	**Improves one or more existing standards:** 100 = Significantly 75 = Moderately 50 = Incrementally 25 = Minimally 0 = N/A	**Cost of Implementation** The cost of complying with the standard is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Cost of Administration** The cost to demonstrate and verify compliance is expected to be: 100 = Very high 75 = High 50 = Average 25 = Low 0 = Very Low	**Time Sensitivity** (to be competed by NERC Staff) Number of months until due date, if any	**Addresses compliance issues from NERC Staff or Stakeholders** 50 =Significant issues 25 = Moderate issues 10 = Minimal issues 0 = N/A	**Addresses a failed interpretation or SDT inability to develop an interpretation related to a lack of clarity that is** 50 = Significant 25 = Moderate 10 = Minimal 0 = N/A	**Other Practicality Concern** (Explanation for the rating must be indicated in the column to the right) (0 to 50)	**Explanation**	**Reliability Score (0 - 250)**	**Cost Consideration Score (0 - 100)**	**Time Sensitivity Score (0 - 100)**	**Practicality Score (0 - 150)**	**Reliability Ranking**	**Cost Consideration Ranking**	**Time Sensitivity Ranking**	**Practicality Ranking**
Project 2008-02 Undervoltage Load Shedding	12 - Consider consolidating PRC-010-0 (Assessment of the Design and Effectiveness of UVLS Program) and (PRC-022-1 — Under-Voltage Load Shedding Program Performance). Currently missing are any criteria for identifying where UVLS should be installed. The team will utilize the FIDVR (Fault-Induced Delayed Voltage Recovery) Technical Reference Paper in the development of requirements. Related to System Protection Initiative.	50	29.2	70.8	83.3	50	5	0	0			150	42	94	0	14	24	11	30
Project 2010-03 Modeling Data	23 - Requires merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. Related to Blackout recommendation and Modeling Initiative. MOD-010 thru -015.	0	41.7	47.7	33.3	33.3	5	0	0			89.4	56	94	0	27	13	18	31
Project 2010-04 Demand Data	24 - As envisioned, this project will result in two standards — with MOD-016 through MOD-020 being merged into a single standard, and MOD-021 remaining as a separate standard. The requirements need to be more specific to clearly identify the format, etc., for providing data.	0	0	51.7	18.8	18.8	5	0	0			51.7	54	94	0	33	16	21	32
Project 2010-02 Connecting New Facilities to the Grid	22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.	0	0	25	33.3	33.3	5	0	0			25	40	94	0	36	30	22	33

Table of Contents

Objective

This document presents a Standards Committee process for identifying, prioritizing, and monitoring NERC standards development projects, taking into account the various drivers for project initiation and the industry's resource constraints. The process provides the flexibility to accommodate new projects and to adjust project priority and completion schedule in response to changing conditions.

Changes in this Revision

When first used in developing the 2011-2013 Reliability Standard Development Plan (RSDP), the Standards Committee solicited feedback on the use of this tool. Stakeholders submitted several comments and suggestions that the Standards Committee deferred until the development of this revision. In response to those comments and suggestions, as well as other feedback received during the development of this revision, the Standards Committee made the following changes:

- Elimination of the perceived duplication between the process of assigning a score based on the number and type of regulatory directives assigned (previously column G) and the process of assigning scores for "Reliability Gap" (previously column H) and "Reliability Improvement" (previously column I). Some concern has been expressed that ranking the priority of directives assigned to a project based on their reliability impact and then additionally rating a project on its reliability impact was "double counting."
- Addition of a score to account for projects that address ERO Strategic Priorities
- Consolidation of all deadlines (regulatory directive based (previously column F), 5-year review based (column K), or otherwise) into one single new "Time Sensitivity" score. While previously, the Standards Committee felt that time limits derived from directives should be given special consideration, further discussion has led to the questioning of that assertion. Instead, all time limits will be considered, and the Standards Committee may elect to use its judgment to make additional modifications to project prioritization results based on specific knowledge or situations.
- Elimination of the "Project Percent Complete" (previously column N) evaluation
- Addition of two preliminary "cost" considerations
- Modification of the scoring mechanism, such that the "total" score is now the sum of the four subject area scores. In two cases, subject matter scores are no longer simple summations, but instead are determined based on slightly more complex equations.
- The ability to rank projects based on different factors (Reliability, Cost Considerations, Time Sensitivity, Practicality, or all factors combined)

Background

Since the startup of the ERO, the number of standards development projects has been significant. Coupled with the increasing number of requests for interpretations and directives issued by regulatory authorities, the industry has experienced a rapid and sustained increase in standards development related workload. The standards development process allows for any individual to propose a new project or request an interpretation. While the Standards Committee can exercise its discretion to delay the start of any project to cope with increased workload and to better manage standard projects to achieve timely completion, additional flexibility beyond just withholding the start of a project is needed.

At its April 2010 meeting, the NERC Standards Committee endorsed a proposal to develop a structured process to assist in managing standards development projects from the project planning stage through submission of a completed standard to the NERC Board of Trustees. The process outlined in this document takes into account industry resource constraints and changing conditions as new projects emerge and as issues are encountered during the course of standard development. It is expected that this process will occur on an annual basis. Projects that are requested mid-cycle will be scored and evaluated as described in Section 7.

1. **Identifying the List of Standards Projects**

   In general, standard projects may be initiated for a variety of reasons, including:

   a. **To meet a deadline.** These deadlines may include the five-year standard revision cycle requirement, regulatory-imposed deadlines, or other time-based commitments.

   b. **To address a Reliability Need** — Industry participants, regulators, NERC staff or the Board of Trustees identify the need for a new standard or revision to an existing standard to meet a reliability need or fill a reliability gap

   c. **To address practical implementation issues.**— Industry participants, NERC and Regional Entity staff identify quality and clarity gaps in NERC's existing reliability standards that need to be remedied to ensure consistent industry compliance. These may be indentified through compliance, through the need for interpretations, or through other means (for example, Regional Entities and stakeholders may propose continent-wide NERC standards that will avoid the need to develop regional standards which will be phased out when the NERC standards are put in place).

   The list of standards projects will include all current projects, all projects in informal development, and all new projects that have yet to be initiated.

   Although any stakeholder can submit a Standards Authorization Request at any time, NERC will generally solicit project candidates for a fixed period of time prior to beginning its annual prioritization. Requests received outside that window of time will be considered for prioritization either at the next annual prioritization or on a case by case basis.

2. **Identifying NERC Project Capacity**

NERC is only able to manage a finite number of projects at a given point in time, due to the limitations of both staff and industry resources. In general, NERC can accommodate 10-12 projects on an ongoing basis. Because some projects are more complex than others, NERC's Standards Committee will work with NERC staff to determine the total capacity for NERC Standards Development. NERC staff will remain responsible for the actual assignment of staff resources to projects.

3. **Identifying the Project Portfolio Mix**

Because there are many legitimate reasons for initiating projects, a simple ranking based on priorities is not sufficient. Although focusing on those projects with the greatest reliability need is important, it does not recognize the practical considerations or the time sensitivity of each project. For example, a project with a low reliability impact may nonetheless be associated with a regulatory imposed deadline; or a project may not directly improve reliability, but make a standard much easier to comprehend and implement successfully.

To address this, the Standards Committee allocates Project Capacity to three programs within the Standards Development portfolio: Time Sensitive projects, Practicality projects, and Reliability projects. This allocation is determined by the Standards Committee each year as the Reliability Standards Development Plan is being drafted. For example, assuming that the SC will pursue a total of 12 projects in 2012, this could result in capacity being allocated for three Time-sensitive projects, three Practicality projects, and six Reliability projects.

4. **Evaluating Each Project**

Each project identified will be evaluated in several areas. Members of the Standards Committee will provide the majority of the evaluation data, while NERC staff will only provide information regarding Time-Sensitivity and alignment with ERO Strategic Priorities (columns E and J in Attachment A).

Each representative on the Standards Committee will provide their recommendations for the values assigned to specific areas of each project. NERC will then aggregate and analyze this information and present it to the Standards Committee for review. In general, the arithmetic mean of all Standards Committee input will be used to set the "score" to be used in the prioritization. So if three members selected 50, 75, and 100 out of a possible total 100, the arithmetic mean would be 75.

However, in those cases where significant disagreement is noted between Standards Committee members, further discussion will occur among the Standards Committee to determine if additional changes should be considered. "Significant" disagreement shall be defined as more than 50% of the Standards Committee members participating having scores that are different from the mean by more than 30% of the maximum value for that particular score. So for example, if three members selected 0, 50, and 100, the mean would be 50. However, 66% (two) of the members would have chosen values that were different from the mean by more than 30% (50 points), so further discussion would be required to reconcile the difference.

5. **Determining Cost Considerations**

   As a first step, all projects will be evaluated for cost considerations. This is accomplished by comparing the "reliability" value to the "cost" value. The calculation of this value is explained in Attachment A's explanation of Column P.

   Cost is measured in two areas – the cost to the industry to comply with the standard, and the cost to the industry to demonstrate compliance with the standard. The first area should be focused on the incremental upgrades and investments needed to meet the standard (e.g., equipment purchases, software upgrades, training), while the second area should consider the cost of retaining data and documents, auditing and audit preparation, and reporting.

   Projects with a score of less than 50 will generally having a lower benefit relative to cost. When contemplating projects for the Reliability Program area, those with a lower benefit should be carefully considered prior to being initiated. However, a lower benefit should generally not by itself preclude a project from consideration.

6. **Determining Projects for Each Program**

   For each of the three portfolio program areas (Time Sensitive, Reliability, or Practicality), the Standards Committee will prioritize the list of projects and assign the top priority projects to the programs until program capacity is eliminated.

   Following this, the Standards Committee will review any projects that are in progress but are not currently assigned to one of the three portfolio programs. In general, the Standards Committee will displace lower priority projects within the program with projects currently in progress – effectively "filling" the programs with active work before adding new work. However, the Standards Committee may, if it so chooses, halt an existing project in order to move a project that it deems more critical forward.

   Next, the Standards Committee will review project interdependencies. If a high-priority project is expected to move forward, and relies on a lower-priority project for completion, then that lower-priority project should displace a higher-priority project to ensure the dependency is honored.

   Finally, the Standards Committee will eliminate any duplicate projects that appear in more than one program. The Standards Committee shall make the determination regarding in which program a project should reside. As these duplicate projects are eliminated, other projects may return or be added to the program.

   Additionally, the Prioritization will develop a list of potential projects for further research and planning. This list of potential projects will be brought to the Standing Committees for their assistance such that they may be considered in the following year for initiation.

7. **Adding New Projects Intra-year and Adjusting Project Priority**

When a new project emerges and is evaluated outside the annual prioritization, the resulting point scores may indicate that the new project should have priorities higher than other projects currently under active development. It is generally assumed that ongoing projects should have highest priority and should continue development work regardless of other projects' emergence. However, both emerging reliability issues and regulatory directives may lead the Standards Committee to direct that one or more projects that are currently assigned to a program be put on hold until resources become available and development work can be restarted.

The Standards Committee will decide if any of the ongoing projects should be stopped or deferred and advise the respective Standard Drafting Teams (SDTs) accordingly, or develop other remedial actions to launch the new projects and continue with all ongoing projects. If it determines that none of the ongoing projects should be stopped and the new projects should be launched, but no resource relief can be provided, the Standards Committee will bring the situation, along with options and recommendations, to the Board of Trustees for its attention and direction.

8. **Developing Projects Schedules**

The time required to complete a standard development project varies from one project to another depending on the scope of work and the complexity of the issues to be addressed. While the SAR proponents generally have a good grasp of the time required to complete a standard project from the formation of the SDT to balloting, the SDT itself may have more intimate knowledge of the technical issues involved and hence a better feel of the time needed to complete its assigned project. Further, since SDT members are industry volunteers that are committed to their projects, it is desirable and appropriate that the SDTs provide inputs into their project schedules and milestone events.

In general, NERC staff together with the Standards Committee will develop an initial project schedule based on past experience, complexity of the standards and other considerations such as available expertise, compliance deadlines, etc. Then, the SDT will be given the opportunity to review and adjust the project schedule at its initial meetings, and present a revised schedule, if necessary, to the Standards Committee for consideration. Once approved by the Standards Committee, the SDT will take ownership of the project and its schedule, and monitor and report project progress to the Standards Committee on an as-needed basis.

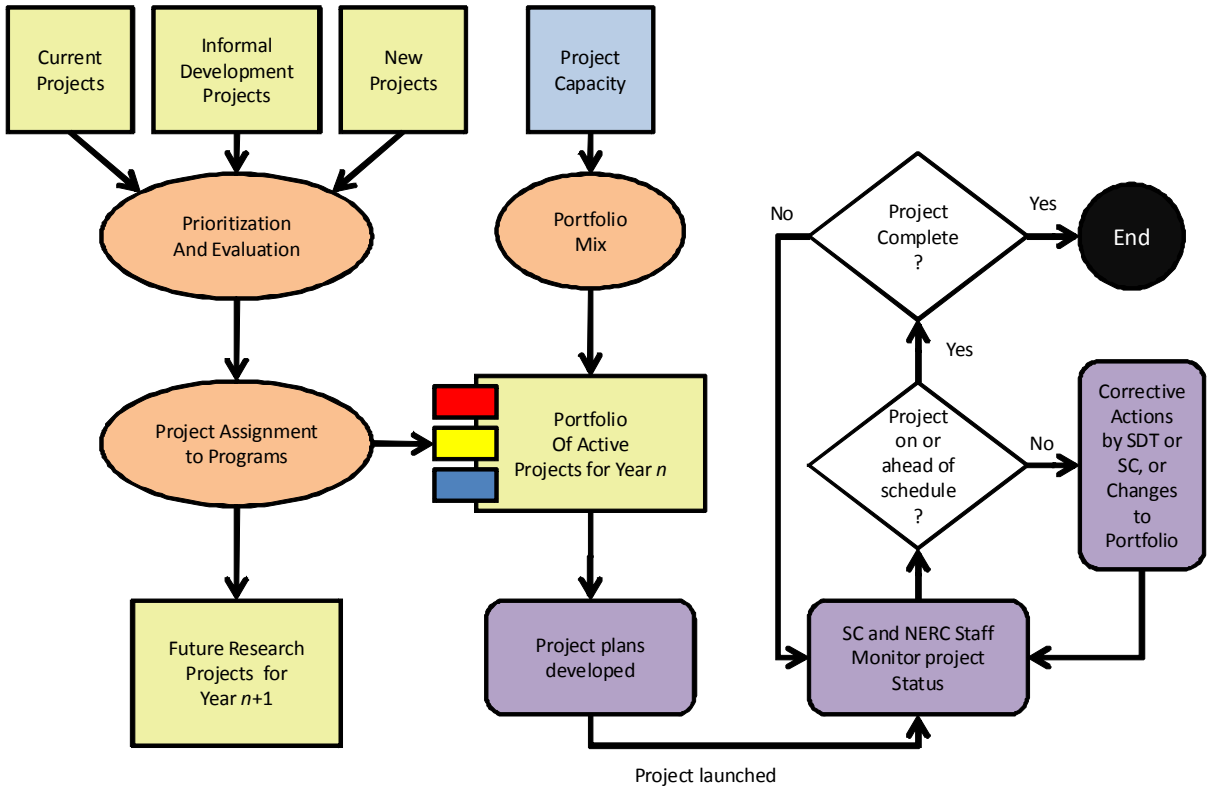
9. **Monitoring Projects**

The SDTs are responsible for monitoring all milestone events and completion schedules for their assigned projects. If at any time the milestone dates for a project are expected to be missed, the responsible SDT should report to the Standards Committee, and present options to put the project back on schedule or request accepting delays with supporting rationale. Where necessary, the SDT may seek the Standards Committee's endorsement or advice for other remedial actions including additional resource support, resolution of contentious issues, accepting an extension of the project schedule, or other actions deemed appropriate.

Such reporting should be made at least two months prior to a milestone date in danger of being missed, and at least four months prior to the scheduled completion date (end of re-circulation balloting) that is in danger of being missed. The Standards Committee will act upon receiving a report from the SDT of potential slippage. In its deliberation, it will assess impacts of implementing any remedial actions on the status of other ongoing or pending projects.

From time to time, the Standards Committee may request the Chair or a representative of an SDT to report on the progress of a project even though there is no indication of a potential slippage.

10. **Project Identification, Prioritization and Management Flow Diagram**
    A flow diagram showing the process described in 1 to 9 is shown below.



Attachment A – Project Prioritization Tool Details

Below is a detailed description of the values and calculations used in the Project Prioritization Tool.

Rows

Row 1 Contains general information and macro buttons.

The ***"Sort"*** macro buttons simply sorts rows 3 through 250 in descending order of the associated column and re-establishes the rankings listed in columns B, T, U, V, W, and X as appropriate.

The ***Click Here to Insert a Row*** macro button shifts all existing data down one row to insert a blank row in row 3. Data will then need to be entered into the new row.

Row 2 Contains the column headers.

Columns

Column A Blank.

Column B ***Priority Number:*** The relative ranking or each project as a result of the most recent "Total" Sort performed.

Column C ***Project Number and Name***

Column D ***Short Description*** (of the Project)

Column E ***Addresses an ERO Strategic Priority***. If the project is expected to aid in meeting one of the ERO's identified strategic priorities, then 50 points are added to the project reliability score. This value is assigned by NERC staff, and is used to calculate the **Reliability Score.**

Column F ***Addresses a reliability risk not covered by an existing standard.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture "gaps" in the reliability standards, and should consider factors such as how the project relates to instability, separation, or a cascading sequence of failures; how it relates to an adequate level of reliability; and how wide the impact of the project is. A "*Fill-in-the-blank"* standard would be one possible example of a "gap." This value is used to calculate the **Reliability Score.** It is also used with Columns G, H, and I in the calculation used to determine the **Cost Consideration Score.**

100 = Severe risk

75 = High risk

50 = Moderate risk

25 = Low risk

0 = N/A

Column G ***Improves one or more existing standards.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. In general, this value is intended to capture ways of improving the effectiveness of existing standards to provide improved reliability, such as raising the minimum level of compliance or adding additional requirements. This value is used to calculate the **Reliability Score.** It is also used with Columns F, H, and I in the calculation used to determine the **Cost Consideration Score.** The project is expected to improve reliability:

100 = Significantly

75 = Moderately

50 = Incrementally

25 = Minimally

0 = N/A

Column H ***Cost of Implementation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and I in the calculation of the **Cost Consideration Score,** and should consider such items as equipment purchases or upgrades, training, and similar costs. In other words, what would it cost the industry to become compliant with the standard? When considered in aggregate, the cost of complying with the standard is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column I ***Cost of Administration.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used with Columns F, G, and H in the calculation of the **Cost Consideration Score,** and should consider things such as the cost to retain data, the cost to document, and the cost of compliance staff evaluating data. In other words, what would it cost the industry (including applicable entities, regions, and NERC) to prove that the standard is being complied with? When considered in aggregate, the cost to demonstrate and verify compliance is expected to be:

100 = Very high

75 = High

50 = Average

25 = Low

0 = Very Low

Column J ***Time Sensitivity.*** Number of months until due date, if any, from the time the prioritization is effective. For example, in 2012, this should be the number of months from January 2012 to the due date. This value is assigned by NERC staff, and is used to calculate the **Time Sensitivity Score.** 0 indicates no deadline exists within the subsequent 60 months.

Column K ***Addresses compliance issues from NERC Staff or Stakeholders.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. For example, if Compliance had idenfied a frequently violated standard, or standards for which one or more CAN's had been developed, or standard which has been identified by stakeholders as being difficult to comprehend. This value is used to calculate the **Practicality Score.**

50 =Significant issues

25 = Moderate issues

10 = Minimal issues

0 = N/A

Column L ***Addresses a failed interpretation or SDT inability to develop an interpretation.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. This value is used to calculate the **Practicality Score.** The interpretation is needed to address a lack of clarity that is:

50 = Significant

25 = Moderate

10 = Minimal

0 = N/A

Column M ***Other Practicality Concern.*** This value is subjective in nature, and will be determined based on the consensus of the Standards Committee. An example of a project that would have points assigned here is the Vegetation Management project because of it being used at the prototype results based standard. Additional considerations would be the breadth of impact to registered entities, projects with active field trials, the length of time project has been in the queue, and projects that clarify a standard or delete redundant requirements. Addressing "*Fill-in-the-blank"* standard would be another area where practicality might drive a need to develop a standard by eliminating the potential for duplicate work among the regions. Between 0 and 50. This value is used to calculate the **Practicality Score**, and must be accompanied by an explanation of the relative value provided in Column N.

Column N ***Explanation:*** the explanation of the value set in column M.

Column O ***Reliability Score.*** The sum of columns E, F, and G. Between 0 and 250.

Column P ***Cost Consideration Score.*** Calculated based on the sum of columns F and G less the sum of the columns H and I, then scaled to produce a value between 0 and 100. Projects with no reliability benefit are automatically scored as 0.

Column Q ***Time Sensitivity Score.*** Calculated by dividing the number of months in column J by sixty, subtracting that value from one, and then multiplying by 100 and rounding. If the number of months is zero or greater than 60, then the score is set at 0. This results in projects with a closer deadline having a higher priority.

Column R ***Practicality Score.*** The sum of columns K, L, and M. Between 0 and 150.

Column S ***Total Score.*** The sum of the **Reliability Score, Cost Consideration Score, Time Sensitivity Score,** and **Practicality Score.** Based on total scores, results in a weighted score with approximately the following distribution of weights:

Reliability 41.6%
Cost Consideration 16.7%
Time Sensitivity 16.7%
Practicality 25%

Columns T-X ***Rankings.*** The numbers show the rankings for each area, and color codes the cells based on the following:

- The top *n* projects, where *n* is the number at the top of the column for columns U, W, and X
- All projects with a Cost Consideration Score greater than or equal to *n*, where *n* is the number at the top of column V.

Attachment B: Prioritization Tool

STANDARDS COMMITTEE Reliability Standard Project Prioritization			(E) Click Here to Insert a Row	(F)	(G)	(H)	(I)	(J)	(K)	(L)	(M)	(N)	SUMMARY						7	25	3	3

1	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	Draft new standard PRC-025-1 Generator Relay Loadability in compliance with the FERC Order 733 issued March 18, 2010											0	0	0	0	0	1	1	1	1	1
2	Project 2010-13-3 Phase 3 of Relay Loadability: Stable Power Swings												0	0	0	0	0	2	2	2	2	2
3	Project 2010.05.2 Phase 2 of Protections Systems: SPS and RAS	Modify current PRC-012, -014, and -016 standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. May include additional udpates to PRC-004 as well.											0	0	0	0	0	3	3	3	3	3
4	Project 2010-16 Definition of System Operator												0	0	0	0	0	4	4	4	4	4
5	Project 2007-17 Protection System Maintenance & Testing	Transmission and Generation Protection System Maintenance and Testing, to consolidate PRC-005-1, PRC-008-0 — Underfrequency Load Shedding Equipment Maintenance Programs; PRC-011-0 — UVLS System Maintenance and Testing; and PRC-017-0 — Special Protection System Maintenance and Testing into a single maintenance and testing standard. Standards PRC-008-0, PRC-011-0, and PRC-017-0 would then be withdrawn.											0	0	0	0	0	5	5	5	5	5
6	Project 2007-06 System Protection Coordination	Requires upgrading and expanding the existing requirements to identify criteria for determining where to install protection system devices and for requiring the installation of those devices to protect the reliability of the bulk electric system.											0	0	0	0	0	6	6	6	6	6
7	Project 2007-12 Frequency Response	Requires entities to provide data needed to model each interconnection's frequency response.											0	0	0	0	0	7	7	7	7	7
8	Project 2010-05.1 Phase 1 of Protection Systems: Misoperations	Modify current PRC-003 and -004 standards and definitions related to Protection System Misoperations to support a good metric for measurement of Protection System performance and ensure the reliability of the bulk power system. Does not incude SPS and RAS.											0	0	0	0	0	8	8	8	8	8
9	Project 2008-06 Cyber Security - Order 706	This is the second phase (Phase 2) of Project 2008-06 Cyber Security Order 706. The project requires modifications to CIP-002 thru CIP-009 not included in Phase 1 of the project to bring the standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706.											0	0	0	0	0	9	9	9	9	9
10	Project 2010-07 Transmission Requirements at the Generator Interface	This project proposes changes to the requirements and the addition of new requirements to add significant clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid.											0	0	0	0	0	10	10	10	10	10
11	Project 2009-01 Disturbance and Sabotage Reporting	This project will entail revision to existing standards CIP-001 and EOP-004. The standards may be merged to eliminate redundancy and provide clarity on sabotage events. EOP-004 has some 'fill-in-the-blank' components to eliminate. The development may include other improvements to the standards deemed appropriate by the drafting team, with the consensus of stakeholders, consistent with establishing high quality, enforceable and technically sufficient bulk power system reliability standards.											0	0	0	0	0	11	11	11	11	11

Appendix 2 – Work Plan

The following page shows the schedule of work in Gantt chart format. Projects for which the Standing Committees will be asked to provide research are identified with blue Gantt chart bars, and have been tentatively allocated a year duration for research (pending feedback from the Standing Committees).

Following the Prioritization, the Work Plan is the next step in the creation of the Reliability Standards Development Plan. It is used primarily to identify project predecessors and ensure resource allocations are consistent and manageable. Once complete, it identifies the estimated start and completion of all projects over the three-year period.

ID	Task Name
1	**Reliability Projects: 8 Slots**
2	**Project 2008-06 Cyber Security - Order 706 (ACTIVE)**
3	**Project 2007-17 Protection System Maintenance & Testing (ACTIVE)**
4	**Project 2007-02 Operating Personnel Communications Protocols (ACTIVE)**
5	**Project 2007-06 System Protection Coordination (ACTIVE)**
6	**Project 2009-01 Disturbance and Sabotage Reporting (ACTIVE)**
7	**Project 2010-05.1 Phase 1 of Protection Systems: Misoperations (ACTIVE)**
8	**Project 2006-06 Reliability Coordination (ACTIVE)**
9	**Project 2007-09 Generator Verification (ACTIVE)**
10	***Project 2012-04 Protection System Commissioning Testing***

Appendix 3 – Regional Work Plan

The following page shows the schedule of regional work in Gantt chart format. Projects that are actively being pursued are identified with black Gantt chart bars, with blue bars representing various stages of development. Projects that are "on hold" are represented by a black diamond.

ID	Task Name
1	**PRC-002-FRCC-1 (on hold)**
2	**PRC-003-FRCC-1 (on hold)**
3	**PRC-006-FRCC-1 (on hold)**
4	**PRC-024-FRCC-1 (on hold)**
5	**PRC-006-NPCC-1**
6	Regional standard development
7	Posting of Documents for process evaluation at NERC
8	Prepare BOT Material
9	Develop Initial Draft of Regulatory Filings
10	**PRC-012-NPCC-1 (on hold)**
11	**MOD-024-RFC-01**
12	Regional standard development
13	Prepare BOT Material
14	Develop Initial Draft of Regulatory Filings
15	**MOD-025-RFC-01**
16	Regional standard development
17	Prepare BOT Material
18	Develop Initial Draft of Regulatory Filings
19	**PRC-002-RFC-01**
20	Regional standard development
21	Prepare BOT Material
22	Develop Initial Draft of Regulatory Filings
23	**PRC-006-RFC-1**
24	Regional standard development
25	Posting of Documents for process evaluation at NERC
26	Prepare BOT Material
27	Develop Initial Draft of Regulatory Filings
28	**PRC-012-RFC-1**
29	Regional standard development
30	Posting of Documents for process evaluation at NERC
31	Prepare BOT Material
32	Develop Initial Draft of Regulatory Filings
33	**PRC-006-SERC-01**
34	Regional standard development
35	Prepare BOT Material
36	Develop Initial Draft of Regulatory Filings
37	**PRC-006-SPP-01**
38	Regional standard development
39	Posting of Documents for process evaluation at NERC
40	Prepare BOT Material
41	Develop Initial Draft of Regulatory Filings
42	**IRO-006-TRE-1**
43	Regional standard development
44	Prepare BOT Material
45	Develop Initial Draft of Regulatory Filings
46	**BAL-001-TRE-1**
47	Regional standard development
48	Posting of Documents for process evaluation at NERC
49	Prepare BOT Material
50	Develop Initial Draft of Regulatory Filings
51	**BAL-002-WECC-1**
52	Regional standard development
53	Posting of Documents for process evaluation at NERC
54	Prepare BOT Material
55	Develop Initial Draft of Regulatory Filings
56	**BAL-004-WECC-1**
57	Regional standard development
58	Posting of Documents for process evaluation at NERC
59	Prepare BOT Material
60	Develop Initial Draft of Regulatory Filings
61	**VAR-001-WECC-1**
62	Regional standard development
63	Posting of Documents for process evaluation at NERC
64	Prepare BOT Material
65	Develop Initial Draft of Regulatory Filings

Appendix 4 – Project Summaries

The following are detailed summaries of the projects discussed earlier within this plan.

DEVELOPMENT 2012

Project 2006-06 Reliability Coordination

Summary:

This project ensures that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, and enforceable, and that this set of requirements is sufficient to maintain reliability of the Bulk Electric System. Most of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process. There have been suggestions for improving these requirements, and the drafting team is considering comments submitted by stakeholders, drafting teams and FERC in determining what changes should be proposed. The drafting team is reviewing all of the requirements in this set of standards and making a determination whether to:

- Modify the requirement to improve clarity and measurability while removing ambiguity;
- Move the requirement (into another project or Standard, or to the certification process); or
- Eliminate the requirement (because it is redundant or does not support BPS reliability).

This project ranked #13 in Reliability Priority.

Standards affected:

COM-001, COM-002, IRO-001- IRO-002, IRO-005, IRO-014, IRO-015, IRO-016

Status:

This project's SAR was finalized on May 2, 2007. The draft standards have been posted several times. The NERC Board of Trustees adopted IRO-002-3, IRO-005-4 and IRO-014-2, along with a conforming change to IRO-001-1.1 associated with IRO-014-2 (creating IRO-001-2) on August 4, 2011. The Board also approved the retirement of IRO-015-1 and IRO-016-1. The drafting team is continuing development on COM-001-2, COM-002-3, and additional revisions to IRO-001, which will become IRO-001-3. It is estimated this project will complete in Q2 2012.

FUTURE CONSIDERATION

Project 2006.06.2 Phase 2 of Reliability Coordination: IRO-003

Summary:

This project will address directives from Order 693 related to the inclusion of measures in IRO-003 and the determination of "critical facilities."

Standards affected:

IRO-003

Status:

A SAR was developed and was finalized on July 14, 2010. However, no additional work has occurred for this project at this time. No estimate for starting the project has been identified.

DEVELOPMENT 2012

Project 2007-02 Operating Personnel Communication Protocols

Summary:

This project is reviewing COM-003 to ensure the standard is complete, appropriately scoped, and enforceable. The project is also considering other general improvements and stakeholder comments received during the initial development of the standards, as well as other comments received from Electric Reliability Organization (ERO) regulatory authorities. This also satisfies the NERC requirement for five-year review of the standard.

This standard will require the use of specific communication protocols, especially for communications during alerts and emergencies. The standard will be applicable to transmission operators, balancing authorities, reliability coordinators, generator operators and distribution providers. Requirements will include protocols for communicating changes to real-time operating states and protocols for issuing and responding to operating directives.

This project ranked #5 in Reliability Priority.

Standards affected:

COM-003

Status:

This project's SAR was finalized on June 8, 2007. A draft standard was posted November 20, 2009 through January 15, 2010. Due to focusing on other priorities, this team was temporarily put on hold. The project was restarted in 2011, and the team is reviewing comments and preparing to post a new version of the standard. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-03 Real-time Transmission Operations

Summary:

This project is clarifying requirements for real-time operations of the Bulk Electric System in several standards, as well as providing other general improvements. It will consider stakeholder comments received during the initial development of the standards, as well as other comments received from ERO regulatory authorities. This also satisfies the NERC requirement for five-year review of the standards.

This project ranked #5 in Practicality Priority.

Standards affected:

PER-001, TOP-001, TOP-002, TOP-003, TOP-004, TOP-004, TOP-005¸ TOP-006, TOP-007, TOP-008

Status:

This project's SAR was finalized November 1, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from May 31, 2011 through June 9, 2011. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-06 System Protection Coordination

Summary:

This project is reviewing PRC-001-1 to assure that Protection System application and performance issues are coordinated among all related entities. It will ensure the applicable entities within the standard correctly reflect the functional responsibilities, as described in the NERC Functional Model. The project will also incorporate other general improvements, address directives received from ERO regulatory authorities, and consider the observations and recommendations developed by the NERC SPCTF. As necessary, the project will coordinate the transfer of monitoring-related requirements to other standards as appropriate through coordination with project 2006-06 Reliability Coordination.

This project ranked #4 in Reliability Priority.

Standards affected:

PRC-001, PRC-027 (New)

Status:

This project's SAR was finalized on July 27, 2007. A draft standard was posted from September 9, 2009 through October 26, 2009. Several interim drafts have been developed since that time. A new results-based version of the standard is in development. It is estimated this project will complete in Q1 2013.

DEVELOPMENT 2012

Project 2007-07 Vegetation Management

Summary:

This project will address some 'fill-in-the-blank' components of the existing standard, which were created in 2006 (prior to mandatory and enforceable standards). The project also will investigate applicability to lower voltage transmission lines, address the issue of clearances for lines on both federal and non-federal lands, consider revising the definition of right of way to encompass required clearance areas, and review the suitability of the IEEE 516-2003 standard for minimum vegetation clearance. This also satisfies the NERC requirement for five-year review of the standard.

Standards affected:

FAC-003

Status:

This project's SAR was finalized June 27, 2007. The standards have been posted several times for public comment. The standards were most recently posted for Successive Ballot from February 18, 2011 through February 28, 2011. The team has drafted a revised standard and has requested it be posted for Recirculation Ballot. It is estimated this project will complete in Q1 2012.

DEVELOPMENT 2012

Project 2007-09 Generator Verification

Summary:

This project will create or modify standards to ensure that generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator protective relays and generator voltage regulator controls and limit functions. It also will ensure that generator models accurately reflect the generator's capabilities and operating characteristics.

Standards affected:

MOD-024, MOD-025, MOD-026, MOD-027, PRC-019, PRC-024

Status:

This project's SAR was finalized June 14, 2007. The standards have been posted several times for public comment. Two of the standards were posted most recently for Initial Ballot from July 22, 2011 through August 1, 2011. Three other standards were posted for comment June 12, 2011 through July 15, 2011. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2007-11 Disturbance Monitoring

Summary:

Purpose
This project establishes and clarifies requirements for the installation of Disturbance Monitoring Equipment (DME) and reporting of disturbance data to facilitate analyses of events and verify system models. The project will review PRC-002 and each of the current regional programs developed in accordance with that standard, including any other associated programs and/or requirements related to or contained within the disturbance monitoring program documentation. The project will then determine which requirements should be continent-wide requirements and which requirements should be included in regional standards.

Standards affected:

PRC-002, PRC-018

Status:

This project's SAR was finalized May 21, 2007. An initial draft standard was posted from February 2, 2009, to March 18, 2009. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

DEVELOPMENT 2012

Project 2007-12 Frequency Response

Summary:

Purpose:
This project will modify the BAL-003 Standard to require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds. It also will ensure the standard provides consistent methods for measuring Frequency Response and determining the Frequency Bias Setting.

This project is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

BAL-003

Status:

This project's SAR was finalized June 30, 2007. The standard has been posted once for public comment, and is expected to be posted for comment in Q4 of 2011. The project is expected to complete in Q2, 2012.

DEVELOPMENT 2012

Project 2007-17 Protection System Maintenance and Testing

Summary:

This project will modify the standards related to ensuring all transmission and generation Protection Systems affecting the reliability of the Bulk Electric System (BES) are maintained and tested. The project will respond to various FERC directives contained in Order 693, as well as make general improvements to the standard.

This project ranked #3 in Reliability Priority.

Standards affected:

PRC-005, PRC-008, PRC-011, PRC-017

Status:

This project's SAR was finalized May 7, 2007. The standards have been posted several times for public comment. The standards were posted most recently for Initial Ballot from September 19, 2011 through September 28, 2011. It is estimated this project will complete in Q2 2012.

PENDING 2013

Project 2008-01 Voltage and Reactive Planning and Control

Summary:

This project will revise the VAR Standards to require that appropriate functional entities develop and coordinate voltage and reactive planning and operating criteria to ensure that there are sufficient reactive resources, and voltage and reactive margins, to manage the risk of voltage instability. The project will also address the FERC directives in Order 693 associated with these standards. Review and modifications to the existing VAR standards will also consider the Transmission Issues Subcommittee's "Reactive Support & Control Whitepaper" dated 05/18/2009.

This project ranked #3 in practicality.

Standards affected:

VAR-001, VAR-002

Status:

This project's SAR was finalized April of 2011. This project was moved into informal development in 2011, prior to posting any daft of the standard. It is estimated this project will begin in Q1 2013 and complete in Q2 2014.

PENDING 2012

Project 2008-02 Undervoltage Load Shedding

Summary:

This project will improve the existing standards on Under Voltage Load Shedding (UVLS) to ensure that load is shed when needed to prevent voltage collapse and voltage instability in the Bulk Electric System. The existing standards will be consolidated, and specific criteria for UVLS programs and assessments of those UVLS programs should be added. 'Fill-in-the-blank' elements should be eliminated, and concerns related to Fault-Induced Delayed Voltage Recovery will be reviewed and addressed.

This project ranked #14 in Reliability Priority.

Standards affected:

PRC-010, PRC-022

Status:

This standard has a proposed SAR that was posted for comment from January 20, 2010, through February 19, 2010. It is estimated this project will start in Q3 2012 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2008-06 Cyber Security – Order 706

Summary:

This project establishes standards to protect the critical cyber assets (including hardware, software, data, and communications networks) essential to the reliable operations of the bulk power system. Currently the project is focused on Version 5 of the standards, which is focused on addressing the remaining directives in Order 706.

This project ranked #2 in Reliability Priority.

Standards affected:

CIP-002, CIP-003, CIP-004, CIP-005, CIP-006, CIP-007, CIP-008, CIP-009, CIP-010 (New), CIP-011 (New)

Status:

This project's SAR was finalized June 9, 2008. Older versions of the standard have been posted, balloted, and approved several times. Version 5 of the standards has not yet been posted for comment. It is estimated this project will complete in Q3 2012.

PENDING 2013

Project 2008-12 Coordinate Interchange Standards

Summary:

This project will revise the set of Coordinate Interchange standards to ensure that each requirement is assigned to an owner, operator, or user of the bulk power system, and not to a tool used to coordinate interchange; to address the Interchange Subcommittee concerns related to the Dynamic Transfers and Pseudo-ties; and to address previously identified stakeholder comments. The project also will consider adding requirements to have backup capability for use when the interchange transaction tool fails.

Standards affected:

INT-001, INT-003, INT-004, INT-005, INT-006, INT-007, INT-008, INT-009, INT-010

Status:

This project's SAR was finalized December 1, 2008. An initial draft set of standards was developed and posted for comment from November 10, 2009 through December 9, 2009. However, the project was moved into informal development in 2011. It is estimated this project will start in Q2 2013 and complete in Q2 2014.

DEVELOPMENT 2012

Project 2009-01 Disturbance and Sabotage Reporting

Summary:

Purpose:

This project entails revisions to existing standards CIP-001-1 – Sabotage Reporting and EOP-004-1 – Disturbance Reporting. The project will eliminate redundancy and provide clarity on sabotage events. Additionally, EOP-004 will be reviewed to eliminate any 'fill-in-the-blank' components.

This project ranked #8 in Reliability Priority.

Standards affected:

CIP-001, EOP-004

Status:

This project's SAR was finalized August 13, 2009. The standard has been posted for comment twice, and is being prepared for Initial Ballot. It is estimated this project will complete in Q3 2012.

PENDING 2012

Project 2009-02 Real-time Reliability Monitoring and Analysis Capabilities

Summary:

This project will create new or revised standards to establish requirements for the monitoring and analysis capabilities provided to System Operators to support Real-time System Operations. The project will address availability parameters, performance metrics, and procedures for failure notification, maintenance coordination, and change management.

This project ranked #1 in Practicality Priority.

Standards affected:

New

Status:

This project's SAR was finalized March 31, 2010. The project team posted a White Paper created to illustrate the concepts it intends to pursue as the project unfolds. This posting solicited comments from February 16, 2011, through April 4, 2011. This project was moved to informal development in 2011. It is estimated this project will start in Q2 2012 and complete in Q1 2013.

PENDING 2012

Project 2009-03 Emergency Operations

Summary:

This project will review the EOP-001, EOP-002, and EOP-003 standards and associated interpretations to ensure the requirements are clear and unambiguous. Many of the requirements in this set of standards were translated from Operating Policies as part of the Version 0 process; suggestions for improvement have been submitted by stakeholders, other drafting teams, and FERC staff.

This project ranked #4 in Practicality Priority.

Standards affected:

EOP-001, EOP-002, EOP-003

Status:

This project's SAR was finalized November 5, 2010. Prior to the development of an initial draft standard, this project was moved to informal development. It is estimated this project will start in Q3 2012 and complete in Q4 2013.

2014 PENDING RESEARCH

Project 2009-04 Phasor Measurements

Summary:

This project will review several industry studies to determine if there should be phasor requirements developed for a NERC standard. This project is related to the North-American Synchro-Phasor Initiative, and supports a blackout recommendation.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2014 and complete in Q4 2015.

PENDING 2014

Project 2009-05 Resource Adequacy Assessments

Summary:

This project will implement certain recommendations related to resource adequacy from the *Resource and Transmission Adequacy Task Force (RTATF) Report* and the *Gas/Electricity Interdependency Task Force Report,* approved by the NERC Board on June 15, 2004. The project will create a standard with requirements to perform resource adequacy assessments, using metrics that take into account various factors (including, but not limited to, fuel deliverability). The standard would also make the results of the assessments available to the industry, NERC, and appropriate regulatory agencies.

Standards affected:

New

Status:

This project's SAR was finalized August 17. 2007. Prior to the development of an initial draft standard, this project was moved to informal development in 2011. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2013 PENDING RESEARCH

Project 2009-07 Reliability of Protection Systems

Summary:

This project will ensure Protection Systems are designed and installed with redundancy where appropriate, such that if there were a failure to a specified component of that protection system, the failure would not prevent meeting the BES performance identified in the TPL standards.

This project ranked #1 in Reliability Priority.

Standards affected:

New

Status:

This project has an initial draft of a SAR that was posted for comment January 20, 2009, through February 18, 2009. Comment responses have not been prepared, and the SAR has not been finalized. It is estimated this project will start in Q1 2013 and complete in Q1 2015.

2012 PENDING RESEARCH

Project 2010-01 Support Personnel Training

Summary:

This project will develop a standard that requires the use of a systematic approach to determining training needs of generator operators and operations planning and support staff with a direct impact on the reliable operations of the bulk power system.

This project ranked #15 in Reliability Priority.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2012 and complete in Q3 2014.

FUTURE CONSIDERATION, PENDING RESEARCH

Project 2010-02 Connecting New Facilities to the Grid

Summary:

22 - Ensure that all of the elements that should be addressed when a new facility is connected to the grid are included in the revised standard. FAC-001 and -002.

Standards affected:

FAC-001, FAC-002

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2015 and complete in Q1 2017.

2014 PENDING RESEARCH

Project 2010-03 Modeling Data

Summary:

This project will consider merging, upgrading and expanding existing requirements for entities to provide data used to model the bulk electric system. This project is related the Modeling Initiative, and supports a blackout recommendation.

Standards affected:

MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, PRC-013, PRC-015

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q2 2016.

2014 PENDING RESEARCH

Project 2010-04 Demand Data

Summary:

This project will consolidate MOD-016 through MOD-020 into a single standard, with MOD-021 remaining as a separate standard. Requirements will be made be more specific to clearly identify the format for providing data, and modifications will made in support if previously received industry comments and regulatory directives.

Standards affected:

MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, MOD-021

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q3 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-05.1 Phase 1 of Protection Systems: Misoperations

Summary:

This project addresses a key element for Bulk Electric System (BES) reliability: the correct performance of Protection Systems. Monitoring BES Protection System events to identify and correct the root causes of Misoperations will improve overall Protection System performance. The project will revise the definition of Misoperation and redraft the standard to be more clear and unambiguous.

This project ranked #7 in Reliability Priority.

Standards affected:

PRC-003, PRC-004

Status:

This project's SAR was finalized June 9, 2011. An initial draft of the standard was posted for comment from June 10, 2011 through July 11, 2011. A second draft is being prepared for posting and initial ballot. It is estimated this project will complete in Q3 2012.

2012 PENDING RESEARCH

Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS

Summary:

This project will moodily the current standards and definitions related to SPS/RAS Misoperations to support a good metric for measurement of Protection System performance and to ensure the reliability of the bulk power system. This project is related to the System Protection Initiative.

This project ranked #11 in Reliability Priority.

Standards affected:

PRC-012, PRC-014, PRC-016.

Status:

This project has a draft SAR, but it has not yet been posted for comment. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

DEVELOPMENT 2012

Project 2010-07 Generator Requirements at the Transmission Interface

Summary:

This project will develop any needed changes to the Reliability Standards to provide clarity to Generator Owners and Generator Operators regarding their reliability standard obligations at the interface with the interconnected grid. The project will review standard for applicability, propose changes as necessary, and ensure that requirements that should apply to all generators, regardless of interconnection configuration, are implemented effectively.

This project ranked #12 in Reliability Priority, #13 in Practicality Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

FAC-001, FAC-003, PRC-004, others as needed

Status:

This project's SAR was finalized November 30, 2010. A draft set of standards was developed and posted from June 17, 2011 through July 17, 2011. Discussion and coordination between NERC, FERC , and the members of the project team are ongoing to ensure adequate coverage of all reliability needs. It is estimated this project will complete in Q1 2013.

FUTURE CONSIDERATION

Project 2010-08 Functional Glossary Model Revisions

Summary:

This project will ensure the definitions of various functional entities between the Functional Model, the NERC Glossary of Terms, and the NERC Statement of Compliance Registration Criteria are consistent.

Standards affected:

TBD

Status:

The Functional Model Working Group (FMWG) is responding to comments received from the first posting of the SAR. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

PENDING 2012

Project 2010-13.2 Phase 2 of Relay Loadability: Generation

Summary:

This project is being created in response to directives included in FERC Order 733. The project will draft a new standard to address generator relay loadability.

Standards affected:

New

Status:

This project's SAR was finalized November 1, 2010. Prior to the development of an initial draft, this project was moved to informal development in 2011. It is estimated this project will start in Q4 2012 and complete in Q3 2014.

2014 PENDING RESEARCH

Project 2010-13.3 Phase 3 of Relay Loadability: Stable Power Swings

Summary:

This project is being created in response to directives includes in FERC Order 733. The project will draft a new standard to address protective relay operations due to power swings.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q4 2014 and complete in Q3 2016.

DEVELOPMENT 2012

Project 2010-14.1 Phase 1 of Balancing Authority Reliability-based Controls: Reserves

Summary:

This project will review the standard related to Control Performance and Disturbance control, and propose modifications or new standards as necessary. This project includes the testing and analysis of the new Balancing Authority ACE Limit (BAAL) metric, as well as the development of a continent-wide reserve policy to support BAL-01, BAL-002, and BAL-003.

This project ranked #1 in Time Sensitivity Priority, and #2 in Practicality Priority.

Standards affected:

BAL-001, BAL-002, New

Status:

This project was created by merging two existing teams. As such, there are two SARs associated with the project – one that was finalized on November 7, 2007, and one that was finalized on December 3, 2007. The combined effort was moved into informal development in 2011, but restarted to coordinate with project 2007-12 Frequency Response. It is estimated this project will complete in Q4 2012.

PENDING 2013

Project 2010-14.2 Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Control: Time Error, AGC, and Inadvertent

Summary:

This project will consider the Time Error Correction standard, AGC, standard, and Inadvertent Accounting standard to determine what changes, if any, are necessary to ensure the standards are clear and unambiguous. In some cases, the standard may no longer be necessary.

Standards affected:

BAL-004, BAL-005, BAL-006

Status:

This project is currently in informal development. Based on its priority, it has been identified in the 2012-2014 Work Plan to begin in Q2 2013 and complete in Q1 2015.

PENDING 2014

Project 2010-16 Definition of System Operator

Summary:

This project will remove the 'Generator Operator' from the current definition of System Operator. This will more accurately establish the responsibilities and expectations of the Generator Operator consistent with the current manner in which the bulk electric system is operated.

Standards affected:

TBD

Status:

A proposed SAR and revision to the definition of System Operator was posted for a 30-day formal comment period from November 3, 2010 through December 3, 2010. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

DEVELOPMENT 2012

Project 2010-17 Definition of Bulk Electric System

Summary:

This project will revise the definition of Bulk Electric System (BES) to address various Federal Energy Regulatory Commissions (FERC) concerns the definition must be modified to encompass all Elements and Facilities necessary for the reliable operation and planning of the interconnected bulk power system. These concerns have been identified in FERC Order 693 issued on March 16, 2007 and in Order 743 issued on November 18, 2010 (Order 743). The project will also consider additional modifications (beyond those established in the regulatory directives) to improve clarity, to reduce ambiguity and to establish consistency across all Regions in distinguishing between BES and non-BES Elements and Facilities.

This project ranked #10 in Reliability Priority, and is one of several that share the #2 score for Time Sensitivity Priority.

Standards affected:

Multiple

Status:

This project's SAR was finalized March 25, 2011. The draft definition has been posted twice, with the most recent posting done concurrently with an initial ballot from September 30, 2011, to October 02 2011. The first part of this project is expected to complete in Q1 of 2012. The remainder of this project is estimated to complete in Q2 2013.

2013 PENDING RESEARCH

Project 2012-01 Equipment Monitoring and Diagnostic Devices

Summary:

This project will consider the development of reliability standards for the application of major equipment monitoring and diagnostic devices and procedures, with the intent of identifying potential equipment failures prior to their occurrence. This will provide more time to address failing systems and avoid or minimize long lead times.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2013 and complete in Q1 2015.

FUTURE CONSIDERATION

Project 2012-02 Physical Protection

Summary:

This project will develop standards for the safety and protection of essential equipment, buildings, and people located in power generation, transmission, or distribution system locations in order to mitigate the associated reliability risks to the bulk power system.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-03 PRC-004 VSLs

Summary:

This project will address a problem identified in the VSLs of PRC-004. Currently, the VSLs do not address the case where a Corrective Acton Plan was developed or documented, but not fully implemented.

Standards affected:

PRC-004

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

2012 PENDING RESEARCH

Project 2012-04 Protection System Commissioning Testing

Summary:

This project will address a gap in reliability related to protection systems by creating a standard that requires commissioning testing. Improper or inadequate commissioning testing practices are a common cause of protection system Misoperation. However, the current set of approved NERC reliability standards does not address the testing of protection system equipment *before* that equipment is placed into initial service. Creating a commissioning standard would also enhance the effectiveness of the mandatory auditing program.

This project ranked #9 in Reliability Priority,

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q2 2012 and complete in Q2 2014.

PENDING 2014

Project 2012-05 ATC Revisions - Order 729

Summary:

This project will respond to the remaining directives in Order 729.

Standards affected:

MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, MOD-030

Status:

This is a new project, which will require SAR development. It is estimated this project will start in Q3 2014 and complete in Q1 2016.

2013 PENDING RESEARCH

Project 2012-06 Generator Capabilities

Summary:

This project will develop standards to ensure generator performance. The project should consider requirements that specify governor droop, frequency response, and reactive response.

This project ranked #6 in Reliability Priority

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. It is estimated this project will start in Q1 2013 and complete in Q4 2014.

FUTURE CONSIDERATION

Project 2012-07 Obsolescence Review

Summary:

This project will create a standard that requires Generator and Transmission Owners periodically review their control and protection systems to identity and electronic, electrical, or mechanical devices that have become obsolete.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-08 Glossary Updates

Summary:

This project will respond to FERC directives to either create or modify the following definitions: Transmission Operator, Generator Operator, Bulk Power System, Reliable Operation, and Reliability Standard.

Standards affected:

TBD

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-09 IRO Review

Summary:

This project will perform the five-year review of several IRO standards, pursuant to NERC's Rules of Procedure.

Standards affected:

IRO-006, IRO-006-EAST, IRO-008, IRO-009, and IRO-010

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-11 FAC Review

Summary:

This project will perform the five-year review of several FAC standards, pursuant to NERC's Rules of Procedure.

Standards affected:

FAC-010, FAC-011, FAC-014

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-12 PER Review

Summary:

This project will perform the five-year review of several PER standards, pursuant to NERC's Rules of Procedure.

Standards affected:

PER-003, PER-004, PER-005

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-13 NUC Review

Summary:

This project will perform the five-year review of the NUC standard, pursuant to NERC's Rules of Procedure.

Standards affected:

NUC-001

Status:

This is a new project, which will require SAR development. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-14 Risk Analysis

Summary:

This project will develop a standard that requires entities to have and maintain a checklist of potential threats to the power system that must be addressed by each TOP/BA. The checklist would include things like GMD, voltage collapse, and other extreme events.

Standards affected:

New

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE CONSIDERATION

Project 2012-15 Flow Limited Paths

Summary:

The MOD-029 standard includes a provision that, if left uncorrected, could in certain scenarios result in significantly over-conservative ATC values being calculated. This project will address this problem.

Standards affected:

MOD-029

Status:

This is a new project, which will require SAR development and research. At this time, no estimate for starting the project has been identified.

FUTURE DEVELOPMENT

PRC-002-FRCC-1 — FRCC Regional Disturbance Monitoring and Reporting Requirements

Summary:

FRCC plans to convert the existing handbook document, "FRCC Requirements for Disturbance Monitoring Equipment" (revision dated June, 2006) into a new Regional Reliability Standard that complies with the requirements of NERC Reliability Standard, PRC-002-1 — Define Regional Disturbance Monitoring and Reporting Requirements.

Standards affected:

PRC-002-1

Status:

This Regional project is currently on "hold." Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-11 Disturbance Monitoring being classified as a "Project in Informal Development," FRCC staff will be re-evaluating the current status of the regional project to determine whether to proceed with the Regional Reliability Standard development or to revise the current FRCC Regional Criteria document "FRCC Requirements for Disturbance Monitoring Equipment."

FUTURE DEVELOPMENT

PRC-003-FRCC-1 — FRCC Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems

Summary:

FRCC plans to convert the existing handbook document "FRCC Requirements for Analysis of Protection Misoperations & Corrective Actions Reporting" (revision dated October, 2003) into a new Regional Reliability Standard, that complies with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

Standards affected:

PRC-003-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2010-05.1 Protection Systems: Phase 1 (Misoperations) being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC has revised Regional Criteria documents ("FRCC Requirements for Analysis of Protection Misoperations and Corrective Actions Reporting," revision dateed December 2, 2010) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-003-1 — Regional Procedure for Analysis of Misoperations of Transmission and Generation Protection Systems.

FUTURE DEVELOPMENT

PRC-006-FRCC-1 — FRCC Automatic Underfrequency Load Shedding Program

Summary:

FRCC is developing a Regional Reliability Standard to provide last resort system preservation measures by implementing an Underfrequency Load Shedding (UFLS) program. Additional requirements may be needed due to FRCC peninsular geography and limited ties to the north. Operating experience and decades of studies by the FRCC and its predecessor reliability organizations have resulted in a well-developed UFLS program that is very resilient to frequency excursion resulting from severe and extreme contingencies. The standard development project will effectively use the proven high performance characteristics of the existing FRCC UFLS program and refine its requirements and coordination procedures to comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

Standards affected:

PRC-006-1

Status:

PRC-006-FRCC-1 FRCC Automatic Underfrequency Load Shedding Program has been approved by the FRCC Registered Ballot Body and the FRCC Board of Directors. Based on concerns identified by NERC standards staff and the pending Commission (FERC) approval of the NERC Continent-Wide Reliability Standard PRC-006-1 Automatic Underfrequency Load Shedding and associated Regional variances, the Regional project has been placed on “hold.” The FRCC has since revised Regional Criteria documents (FRCC Automatic Underfrequency Load Shedding Program, revision date: April 7, 2011) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-006-1 — Automatic Underfrequency Load Shedding.

FUTURE DEVELOPMENT

PRC-024-FRCC-1 — FRCC Regional Generator Performance During Frequency and Voltage Excursions

Summary:

FRCC is developing a standard to establish "ride through" requirements for generators in the FRCC Region with respect to temporary grid voltage or frequency deviations from their normal range. The Standard should address time duration limits for operation of generator protection for

1) frequencies outside of the 59.5 - 60.5 hertz range,
2) voltages outside of the 95% - 105% range, and
3) generator stator current overloads.

The Standard should address exemption criteria and mitigation measures available for resolving apparent conflicts between generator capabilities and the coordination requirements. Considerable knowledge of grid frequency and voltage excursions and the time limited capabilities of generators to sustain these conditions has been gained through operating experience and previous reliability studies. This standards development project should effectively use this knowledge to define coordination requirements and procedures that comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Standards affected:

PRC-024-1

Status:

Based on the NERC Standards Committee reprioritization of NERC Reliability Standard Development Projects resulting in Project 2007-09 Generator Verification being classified as a "high priority" project in active development, the Regional project is currently on "hold." The FRCC is actively revising Regional Criteria documents (FRCC Generator Coordination Requirements) to ensure the procedures comply with the requirements of NERC Reliability Standard, PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

2012 DEVELOPMENT

PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Program

Summary:

The purpose of this Standard is to establish the requirements for NPCC and its members to operate and maintain a coordinated Regional Underfrequency load shedding (UFLS) program. The NPCC's UFLS program will meet the requirements contained in NERC standards, and provide those entities to which it is applicable the guidance necessary to implement it. This standard will also mandate that coordination with neighboring Regional Underfrequency load shedding programs be developed when necessary. The unique character, dispersion, sensitivity and density of the NPCC regional loads emphasize the need for this Standard.

The NPCC regional UFLS standard shall apply to all applicable entities within the Region and sub-regional areas that are both synchronous and asynchronous to the Eastern Interconnection. Quebec UFLS has different parameters, and these are included in the standard and fully coordinated within the Region.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. NPCC expects to complete the drafting of this standard in 2011 and conduct a ballot of stakeholders in the first quarter of 2012. Submission to the NERC Board of Trustees and subsequent filing with FERC is expected to occur in 2012.

FUTURE DEVELOPMENT

PRC-012-NPCC-1 — Special Protection Systems

Summary:

To support and enhance bulk power system reliability, this Standard will establish the criteria for the minimum design objectives and practices for special protection systems (the purpose of which are to detect abnormal system conditions, and take corrective actions other than the isolation of faulted elements to maintain the stability and security of the bulk power system). This Standard will also establish the requirements for close coordination between system planning, design, operating, maintenance and protection functions to ensure that the impacts of special protection system operations do not result in a significant adverse impact.

The proposed Standard will describe the requirements for the design and approval of Special Protection Systems and the technical criteria required to support its implementation. The Standard will also identify the need for close coordination among various parties to ensure that the Special Protection Systems are implemented correctly, and triggers and resulting actions are made known and communicated in an on-line database.

Standards affected:

PRC-012-0

Status:

This Regional project is currently on “hold” pending the completion of the NERC Reliability Standard Development Project 2010-05.2 Phase 2 of Protection Systems: SPS and RAS, and the outcome of the work by the NERC SPCS on the definition of SPS.

2011 DEVELOPMENT

MOD-024-RFC-1 — Verification and Data Reporting of Generator Gross and Net Real Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Real Power capability to support NERC Reliability Standard MOD-024. The objective of the regional standard is to ensure accurate information on generator gross and net Real (MWs) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-024-1

Status:

This Regional standard has been approved by the Reliability*First* Board. Currently, VRFs and VSLs are in development. Reliability*First* expects to complete the drafting of the VRFs and VSLs in 2011, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2011 DEVELOPMENT

MOD-025-RFC-1 — Verification and Data Reporting of Gen Gross and Net Reactive Power Capability

Summary:

The purpose of this standard is to establish Reliability*First* requirements for verification and data reporting of generator gross and net Reactive Power capability to support NERC Reliability Standard MOD-025. The objective of this standard is to ensure that accurate information on generator gross and net Reactive (MVAR) Power capability is available for steady-state models used to assess Bulk Electric System reliability.

Standards affected:

MOD-025-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011 and subsequent filing with the FERC is expected to occur in 2012.

2011 DEVELOPMENT

PRC-002-RFC-1 — Disturbance Monitoring and Reporting Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for Disturbance monitoring and reporting to support NERC Reliability Standard PRC-002.

Standards affected:

PRC-002-1

Status:

Reliability*First* is currently working on the technical justification for the locational requirements for DME equipment. This Regional standard has been approved by the Reliability*First* Board. Reliability*First* expects submission of this standard to the NERC Board of Trustees and subsequent filing with the FERC to occur in 2012.

2012 DEVELOPMENT

PRC-006-RFC-1 — Automatic Under Frequency Load Shedding Requirements

Summary:

The purpose of this standard is to establish Reliability*First* requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency and assist in the recovery of frequency following underfrequency events, providing last resort system preservation measures. The standard goes beyond the NERC PRC-006-1 standard and prescribes with more certainty aspects that the Planning Coordinator's UFLS program must contain, further details on certain procedural matters with respect to how islands are addressed, and assessment of UFLS program implementation as well as program design. This standard also attempts further consolidating requirements of the Reliability*First* legacy underfrequency load shedding programs, permitting retirement of legacy documents to ensure appropriate coordination among the Reliability*First* legacy regional UFLS programs.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur later in 2012.

2012 DEVELOPMENT

PRC-012-RFC-1 — Special Protection System Requirements

Summary:

To purpose of the standard is to establish Reliability*First* requirements for the review, development and application of Special Protection Systems (SPS).

Standards affected:

PRC-012-0

Status:

This Regional project is currently in the initial drafting stage. Reliability*First* expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with the FERC to occur early in 2013.

2011 DEVELOPMENT

PRC-006-SERC-01 — Automatic Underfrequency Load Shedding Requirements

Summary:

The SERC UFLS Standard: PRC-006-SERC-1 ("SERC UFLS Standard") was developed to provide regional UFLS requirements to entities in SERC. UFLS requirements have been in place at a continent-wide level and within SERC for many years prior to implementation of federally mandated reliability compliance standards in 2007.

In 2008, SERC commenced work on PRC-006-SERC-1. NERC also began work on revising PRC-006-0 at a continent-wide level. The SERC standard has been developed to be consistent with the continent-wide UFLS standard.

PRC-006-1 clearly defines the roles and responsibilities of parties to whom the standard applies. The standard identifies the Planning Coordinator ("PC") as the entity responsible for developing UFLS schemes within their PC area. This regional standard PRC-006-SERC-1 adds specificity not contained in the NERC standard for development and implementation of a UFLS scheme in the SERC Region that effectively mitigates the consequences of an underfrequency event.

Standards affected:

PRC-006-1

Status:

This Regional standard will be submitted to the NERC Board of Trustees in November 2011, and subsequent filing with FERC is expected to occur in 2012.

2012 DEVELOPMENT

PRC-006-SPP-1 — Under Frequency Load Shedding

Summary:

PRC-006 (Development and Documentation of Regional UFLS programs) has been identified by NERC as one of the Regional "Fill-in-the Blank" Standards. At a minimum, the requirements developed in this standard need to meet the requirements for the Regional Program as identified in NERC's PRC-006-0. Operating experience and regional studies have resulted in a well developed UFLS program that is very resilient to frequency excursions resulting from severe and extreme contingencies. This standards development effort intends to effectively use the proven high performance characteristics of the existing SPP UFLS program and refine its requirements and coordination procedures through an open process as described in the SPP Standard Development Process Manual.

Standards affected:

PRC-006-1

Status:

This Regional project is currently in the standard drafting stage. SPP expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

IRO-006-TRE-1 — IROL and SOL Mitigation in the ERCOT Interconnection

Summary:

IRO-006-TRE-1 was developed to support bulk power system reliability by providing enforceable requirements associated with certain existing non-routine ERCOT congestion management procedures. This Regional Standard addresses the FERC directive in Paragraph 964 of Order 693, where FERC found that the ERCOT transmission loading relief procedures were superior to the national standard, and directed the ERO to provide Reliability Standards including Requirements, Measures and Levels of Non-Compliance corresponding to the ERCOT procedures for application in the ERCOT Region.

Standards affected:

IRO-006-5 (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of IRO-006-5.)

Status:

This Regional Standard was approved by the Texas RE Board of Directors on June 28, 2011, and it will be submitted to the NERC Board of Trustees in November 2011. Subsequent filing with FERC is expected to occur in 2012.

2011 DEVELOPMENT

BAL-001-TRE-1 — Primary Frequency Response in the ERCOT Region

Summary:

This Regional Standard is intended to support reliability by ensuring adequate primary frequency response performance in the ERCOT Interconnection. The standard addresses frequency response at the Interconnection level, as well as by individual generating units and facilities. Specific maximum governor droop and deadband settings are provided, along with primary frequency response performance standards (initial and sustained) that allow actual unit-specific performance to be measured.

In 2002, NERC approved a regional difference for ERCOT that made it exempt from Requirement R2 in BAL-001-0 (CPS2), because of ERCOT's lack of synchronous connection to other control areas and the nature of the ERCOT energy market. FERC approved the ERCOT regional difference, finding that ERCOT's practice of (a) determining the minimum frequency response needed for reliability, and (b) requiring generators to have specific governor droop, to be a more stringent practice than Requirement R2 in BAL-001-0. FERC directed NERC to file a modification of the ERCOT regional difference to include the requirements concerning frequency response contained in section 5 of the ERCOT protocols. This Regional Standard is responsive to that directive.

Standards affected:

BAL-001-0.1a (Note: This regional standard provides additional requirements; it does not alter the requirements or applicability of the continent-wide standard.)

Status:

This project has been approved by the Texas RE Board of Directors, with expected submission to the NERC Board of Trustees in 2011 and subsequent filing with FERC to occur in 2012.

2012 DEVELOPMENT

BAL-002-WECC-1 — Contingency Reserves

Summary:

On Oct. 21, 2010, FERC found that BAL-002-WECC-1 did not meet the statutory criteria for approval and remanded the regional standard to NERC/WECC for further modification (RM09-15-000; Order 740). FERC held that BAL-002-WECC-1's less stringent requirements had not been supported by the technical data provided.

On remand, the Commission instructed WECC to modify the regional reliability standard to include a number of specific items contained in Order 740. This Request is submitted with the specific and narrow purpose of addressing only those issues mandated for modification in the October 2010 Oder 740.

Standards affected:

BAL-002-WECC-1

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2012 DEVELOPMENT

BAL-004-WECC-1 — Automatic Time Error Correction

Summary:

In the order approving BAL-004-WECC-1 the FERC directed WECC to make several clarifying modifications to the standard. FERC directed WECC to use the FERC-approved Process for Developing and Approving WECC standards to make these clarifying modifications

In addition, the WECC staff has identified the opportunity to make additional modifications to the existing standard to clarify the intent without changing the requirements.

There is also confusion regarding the R3 requirement that the ACE used for NERC reports shall be the same ACE as the AGC operating mode in use. This seems to conflict with the NERC response to NOPR comments that entities may use ATEC ACE for control but should use Raw ACE for reporting. WECC is developing a proposed regional variance to BAL-001-0.1a to address this apparent conflict.

Standards affected:

BAL-004-WECC-1
BAL-001-0.1a

Status:

This Regional project is currently in the standard drafting stage. WECC expects to complete the drafting of this standard in 2012, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

2011 DEVELOPMENT

VAR-001-WECC-1 — Voltage and Reactive Control

Summary:

The current draft has been converted from a Standard into a Regional Variance to the NERC VAR-001-2 Standard. The format incorporates the NERC Standard into the document with minor additions to address the scope of the variance. The regional variance specifics are included as Section E of the proposed document (see hyperlink above), and in this case, are intended to replace NERC VAR-001-2 requirements R3 and R4 as noted at the beginning of Section E.

The purpose of this regional variance to a NERC Reliability Standard is to ensure that voltage levels are within limits in real time to protect equipment and the reliable operation of the Western Interconnection. The "Rules of Procedure of the North American Electric Reliability Corporation" (Appendix 3A, page 31) permits the development of a regional variance to a NERC reliability standard on an Interconnection-wide basis when the Regional Reliability Organization has valid justification and when the variance is not inconsistent with or less stringent than the NERC Reliability Standard. The variance is an alternative method for obtaining the same reliability objective as the continent standard and is typically necessitated by a physical difference. A variance is embodied within a reliability standard and as such, if adopted by NERC and approved by the electric reliability organization governmental authority, shall be enforced within the applicable Regional Entity(ies) pursuant to delegated authority.

Standards affected:

VAR-001-2

Status:

This Regional project has been approved by the WECC Board of Directors. WECC expects to submit the draft for the mandatory NERC 45-day comment period in the near future, with expected submission to the NERC Board of Trustees and subsequent filing with FERC to occur later in 2012.

Cyber Security Order 706 Version 5 CIP Standards

Activity: Version 5 CIP Standards (Phase III)

Status: Ten CIP standards (CIP-002-5 through CIP-009-5, CIP-010-1, and CIP-011-1 – collectively referred to as the 'Version 5 CIP Standards'), the associated implementation plan, and the associated definitions are posted for a parallel formal comment period and twelve separate initial ballots (ten for the standards, one each for the definitions and implementation pla). In consideration of the volume of documents and the significant changes to the format and substance of the standards, the Standards Committee authorized extending the comment period to 60 days and the initial ballot window to 20 days, through January 6, 2012.

CIP Version 5 Standards Format

Sharon Edwards, Duke Energy

RELIABILITY | ACCOUNTABILITY

Format – Example/Overview

Rationale for R3: *Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable components of a Bulk Electric System (BES) Cyber system. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System. …*

Summary of Changes: *In prior versions, this requirement has arguably been the single greatest generator of TFE's as it prescribed a particular technology to be used on every CCA regardless of that asset's susceptibility or capability to use that technology. …The drafting team …made… this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every component.* ***…****Beginning in paragraph 619-622 of FERC Order 706, …FERC agrees that the standard "does not need to prescribe a single method…"*

R3. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in CIP-007-5 Table R3 – Malicious Code Prevention. [Violation Risk Factor: Medium]

M3. Evidence must include each of the documented processes that collectively include each of the applicable items in CIP-007-5 Table R3 – Malicious Code Prevent. and add'l evidence to demonstrate implementation as described in ..Measures in the table.

CIP-007-5 Table R3 – Malicious Code Prevention			
Part	**Applicability**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Deploy method(s) to deter, detect, or prevent malicious code.	Evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (i.e. through traditional antivirus, system hardening, policies, etc.).
Reference to prior version: *CIP-007-4 R4*		**Change Rationale:** *See the Summary of Changes.*	

Format – Rationale/ Summary of Changes

Rationale for R3: *Malicious code prevention has the purpose of limiting and detecting the addition of malicious code onto the applicable components of a BES Cyber system. Malicious code (viruses, worms, botnets, targeted code such as Stuxnet, etc.) may compromise the availability or integrity of the BES Cyber System. …*

Summary of Changes: *In prior versions, this requirement has arguably been the single greatest generator of TFE's as it prescribed a particular technology to be used on every CCA regardless of that asset's susceptibility or capability to use that technology. …The drafting team …made… this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every component.* ***…****Beginning in paragraph 619-622 of FERC Order 706, …FERC agrees that the standard "does not need to prescribe a single method…"*

- **Rationale –** Purpose of requirement and any assumptions made about the requirement
- **Summary of Changes –** High level overview of changes in this requirement

Format – High Level/ Requirement and Measure

R3. Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable items in CIP-007-5 Table R3 – Malicious Code Prevention. [Violation Risk Factor: Medium]

M3. Evidence must include each of the documented processes that collectively include each of the applicable items in CIP-007-5 Table R3 – Malicious Code Prevent. and add'l evidence to demonstrate implementation as described in ..Measures column of the table.

- **Requirement** specifies what is needed for compliance
- **Measure** explains the type of evidence that must be included to demonstrate compliance
- Most requirements reference a **table** immediately below

Format – Requirement Rows

CIP-007-5 Table R3 – Malicious Code Prevention			
Part	**Applicability**	**Requirements**	**Measures**
3.1	High Impact BES Cyber Systems Medium Impact BES Cyber Systems. Associated Physical Access Control Systems Associated Electronic Access Control or Monitoring Systems Associated Protected Cyber Assets	Deploy method(s) to deter, detect, or prevent malicious code.	Evidence may include, but is not limited to, records of the Responsible Entity's performance of these processes (i.e. through traditional antivirus, system hardening, policies, etc.).
Reference to prior version: *CIP-007-4 R4*		**Change Rationale:** *See the Summary of Changes.*	

- **Requirement row specifies:**
  - Sub requirement number
  - Applicability – Identifies the groups of assets which must comply with requirement
  - Requirement – Specifies what is needed for compliance with sub requirement
  - Measures – Explains how compliance with sub requirement may be demonstrated
  - Reference to prior to version – Identifies where the requirement was previously found in CIP

Format – Applicability

- **All Responsible Entities**
- **BES Cyber System:** One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services
  - High Impact BES Cyber Systems
  - Medium Impact BES Cyber Systems
  - Low Impact BES Cyber Systems
- **Electronic Access Control or Monitoring Systems:** Cyber Assets used in the access control or monitoring of the Electronic Security Perimeter(s) or BES Cyber Systems

Format – Applicability

- **Physical Access Control Systems:** Cyber Assets that control, alert, or log access to the Defined Physical Boundary(s), exclusive of locally mounted hardware or devices at the Defined Physical Boundary such as motion sensors, electronic lock control mechanisms, and badge readers.
- **Protected Cyber Asset:** A Cyber Asset connected using a routable protocol within an Electronic Security Perimeter that is not part of the BES Cyber System. A Transient Cyber Asset is not considered a Protected Cyber Asset.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Additional Format

- The following slide illustrates additional format:
  - Identification of Assets
  - Application of Cyber Security Controls commensurate with risk to the BES

High Level Structure Assets/Controls

High Impact	**Large Control Centers**
Medium Impact	**Generation + Transmission Small Control Centers That meet Criteria** • **Generation- >1500 MW** • **Gen - BlackstartResource** • **Substation - >500 KV** • **Sub - Blackstart Path** • **See additional criteria in posting**
Low Impact	**Everything else**

Additional layer of Controls apply Only to High Impact BES Cyber Systems

CIP 004	CIP 006	CIP 007	CIP 010	CIP 010
Revoke individual user acct access within 30 days	2 or more physical controls	Review a summary or sampling of logged events every 2 weeks	For each change to baseline, test and document CS controls	Perform Active Vulner. Assessment every 3 years (test environment)
Chg. passwords for shared accts within 30 days			Monitor for changes to the baseline	Prior to adding a device perform Vulnerability Assessment

Controls for Medium and High BES Cyber System Controls roughly equate to previous versions of CIP with some modifications:

- FERC Order 706 Directives have been incorporated into requirements
- Access Control requirements previously in CIP 003, 004, 005, and 007 are combined
- Efforts have been made to eliminate the need for TFE's
- New Standards for Info. Protection and Configuration Mgt/Vul. Assessments
- Efforts to remove documentation only based requirements. Performance based std.
- Other modifications for problem areas, i.e., passwords, transient assets, etc.

Requirements that apply to LOW Impact BES Cyber Systems include Governance and non-technical controls

CIP 003	CIP 004	CIP 005	CIP 006	CIP 007	CIP 008
ID Sr. Manger + Maintain CS Policy	Awareness	If routable protocol is used, define technical and procedural controls to restrict access	Define technical and procedural controls to restrict physical access	Initially change default passwords	Incident Response Plan + Testing and Review of Plan

Definitions Retired and Replaced

- Critical assets
  - Replaced by CIP002 Attachment 1 and BES Reliability Operating Services definition
- Critical cyber assets
  - Replaced by BES Cyber Asset and BES Cyber System
- Physical security perimeter
  - Replaced by Defined Physical Boundary
  - No more “six-wall” specification

Definitions
New Scoping Concepts

- BES Cyber Asset
  - A Cyber Asset that if rendered unavailable, degraded, or misused would, within 15 minutes of its operation, mis-operation, or non-operation, when required, adversely impact one or more BES Reliability Operating Services.
  - This is regardless of the delay between the point in time of unavailability, degradation, or misuse of the Cyber Asset and the point in time of impact on the BES Reliability Operating Services.
  - The timeframe is not in respect to any cyber security events or incidents, but is related to the time between when the Cyber Asset can send or receive instructions to operate and the time in which that operation occurs and impacts the BES.
  - Redundancy shall not be considered when determining availability.
  - A Transient Cyber Asset is not considered a BES Cyber Asset.
- BES Cyber System
  - One or more BES Cyber Assets that are typically grouped together, logically or physically, to operate one or more BES Reliability Operating Services.

Definitions Nested for Impact

- **BES Reliability Operating Services**

  BES Reliability Operating Services are those services contributing to the real-time reliable operation of the BES. They include the following Operating Services:

  - Dynamic Response to BES conditions
  - Balancing Load and Generation
  - Controlling Frequency (Real Power)
  - Controlling Voltage (Reactive Power
  - Managing Constraints
  - Monitoring & Control
  - Restoration of BES
  - Situational Awareness
  - Inter-Entity Real-Time Coordination and Communication

- **Integral to CIP002 scoping of BES Cyber System and BES Cyber Asset impact levels**

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

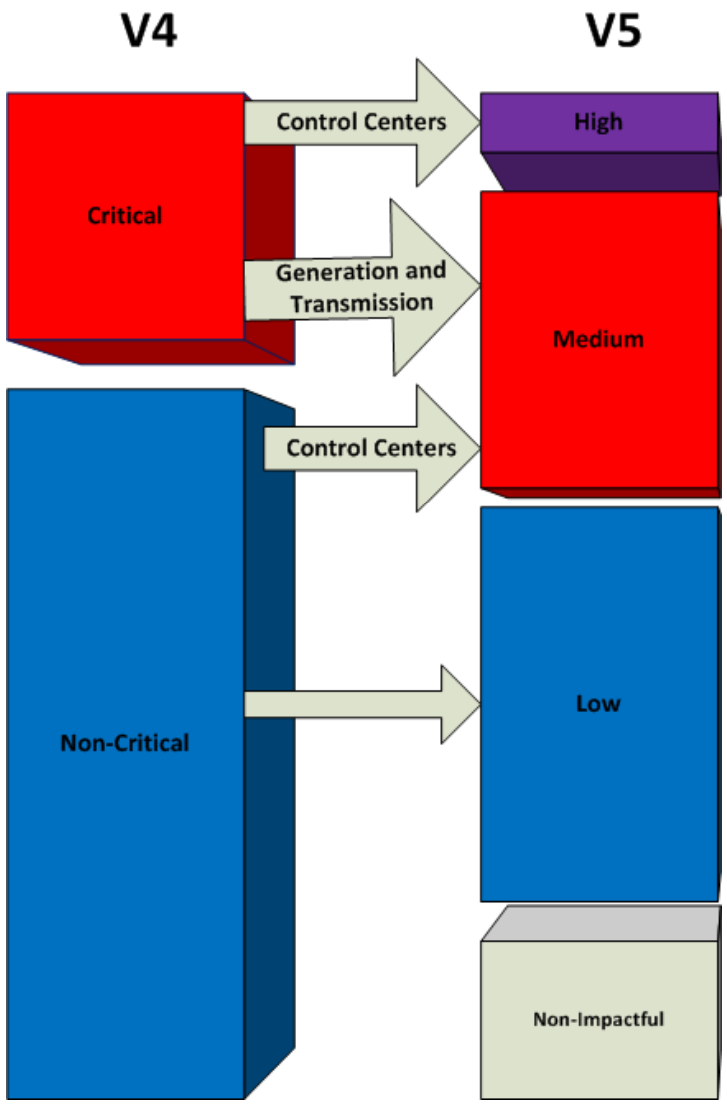
CIP-002-5: BES Cyber Asset and BES Cyber System Categorization

John Lim, Consolidated Edison

RELIABILITY | ACCOUNTABILITY

Levels of Impact

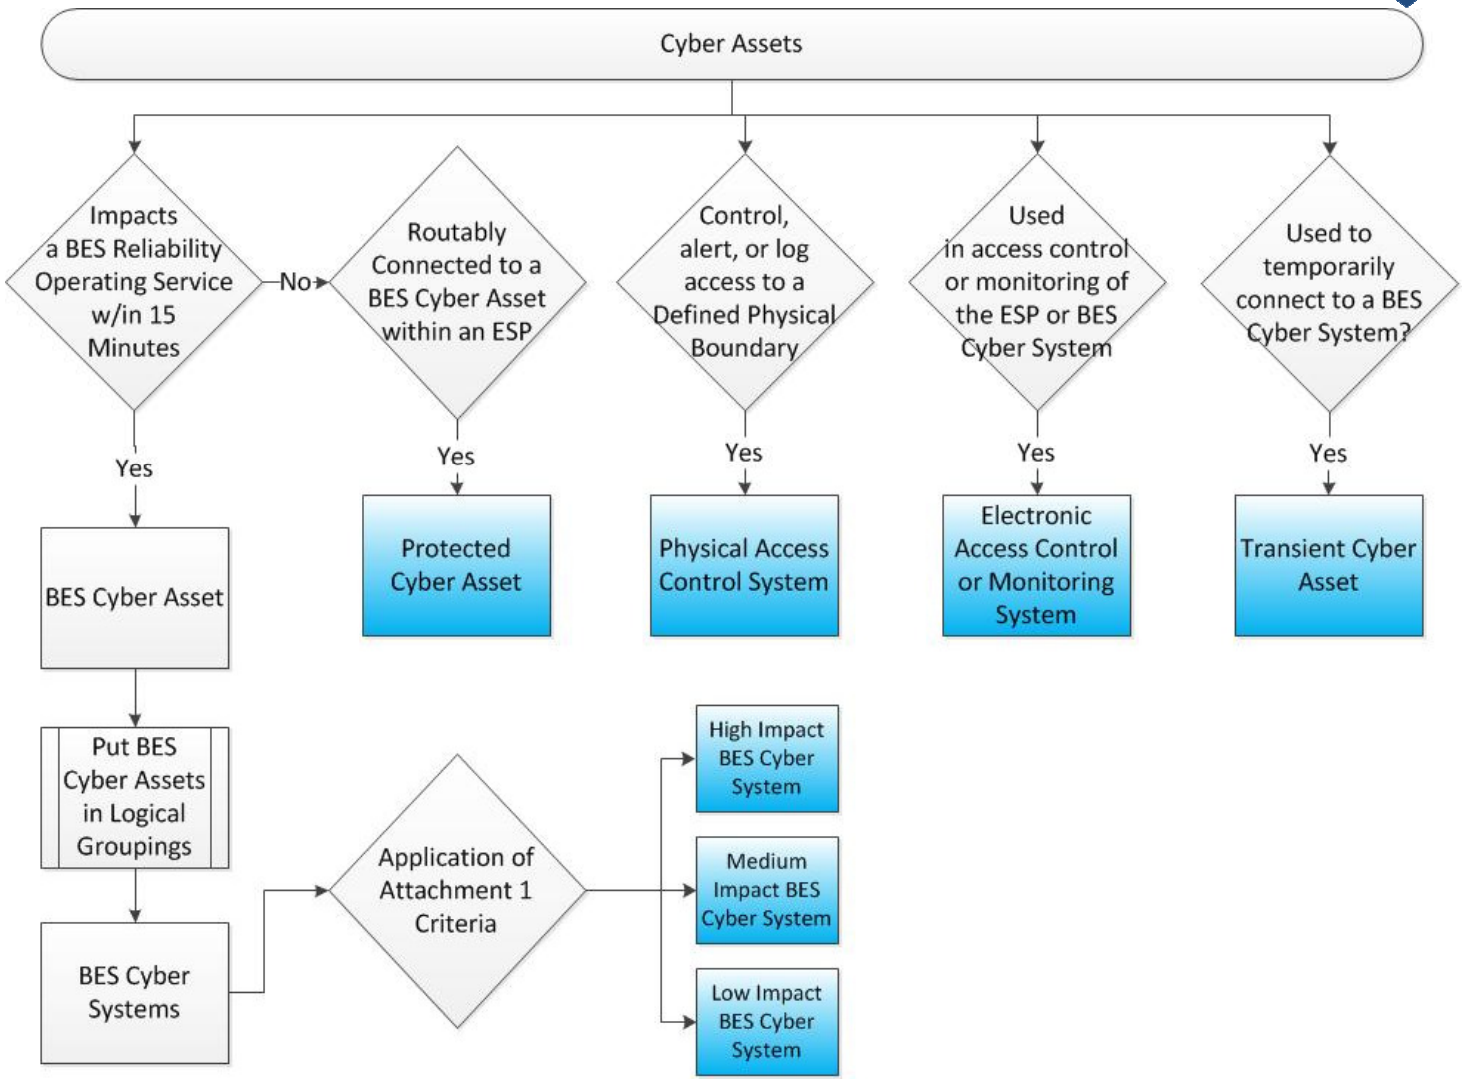
- High Impact
  - Large Control Centers
  - CIP-003 through 009+
- Medium Impact
  - Generation and Transmission
  - Other Control Centers
  - Similar to CIP-003 to 009 v4
- All other BES Cyber Systems
  - Security Policy
  - Security Awareness
  - Incident Response
  - Boundary Protection



Summary of Modifications CIP-002-5

- Categorized list of high and medium impact
  - Attachment 1 criteria
- Other BES Cyber Systems deemed to be low impact by default
- Update required lists for significant changes to BES that affect high/medium categorization
- Senior manager or delegate annual review and approval

Categories of Cyber Assets Under CIP v5



CIP-002-5 Impact Criteria (Attachment 1)

- High: Large control centers (e.g., RC, BA, TOP)
- Medium: Significant impact field assets, other control centers
- Other BES Cyber Systems deemed to be low impact by default
- Based on V4 criteria
  - Modification to transmission voltage threshold

CIP-002-5 R1

- Identify and categorize its high and medium impact BES Cyber Assets and BES Cyber Systems according to the criteria contained in *CIP-002-5 Attachment I – Impact Categorization of BES Cyber Assets and BES Cyber Systems*
- All other BES Cyber Assets and BES Cyber Systems that it owns shall be deemed to be low impact and do not require discrete identification
- *[Violation Risk Factor: High][Time Horizon: Operations Planning]*

CIP-002-5 R1 – Part 1.1

- Update the identification and categorization within 30 calendar days of a change to BES Elements and Facilities:
  - Intended to be in service for more than 6 calendar months and
  - Causes a change in the identification or categorization of the BES Cyber Assets or BES Cyber Systems from a lower to a higher impact category.

CIP-002-5 R2

- CIP Senior Manager or delegate approve the identification and categorization required by R1:
  - Initially upon the effective date of the standard and
  - At least once each calendar year thereafter, not to exceed 15 calendar months between approvals
- *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

CIP-002-5 Attachment 1 (1 of 9) High Impact

- Each BES Cyber Asset or BES Cyber System that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more BES Reliability Operating Services used by and located at:
  - 1.1. Each Control Center or backup Control Center used to perform the functional obligations of the Reliability Coordinator.
  - 1.2. Each Control Center or backup Control Center used to perform the functional obligations of the Balancing Authority.
  - 1.3. Each Control Center or backup Control Center used to perform the functional obligations of the Transmission Operator or Transmission Owner that includes control of one or more of the assets identified in criteria 2.2, 2.5, 2.6, 2.7, 2.8, 2.9, 2.10, 2.11 or 2.12 below.
  - 1.4 Each Control Center or backup Control Center used to perform the functional obligations of the Generation Operator that includes control of one or more of the assets identified in criteria 2.1, 2.3, 2.4, or 2.12, below.

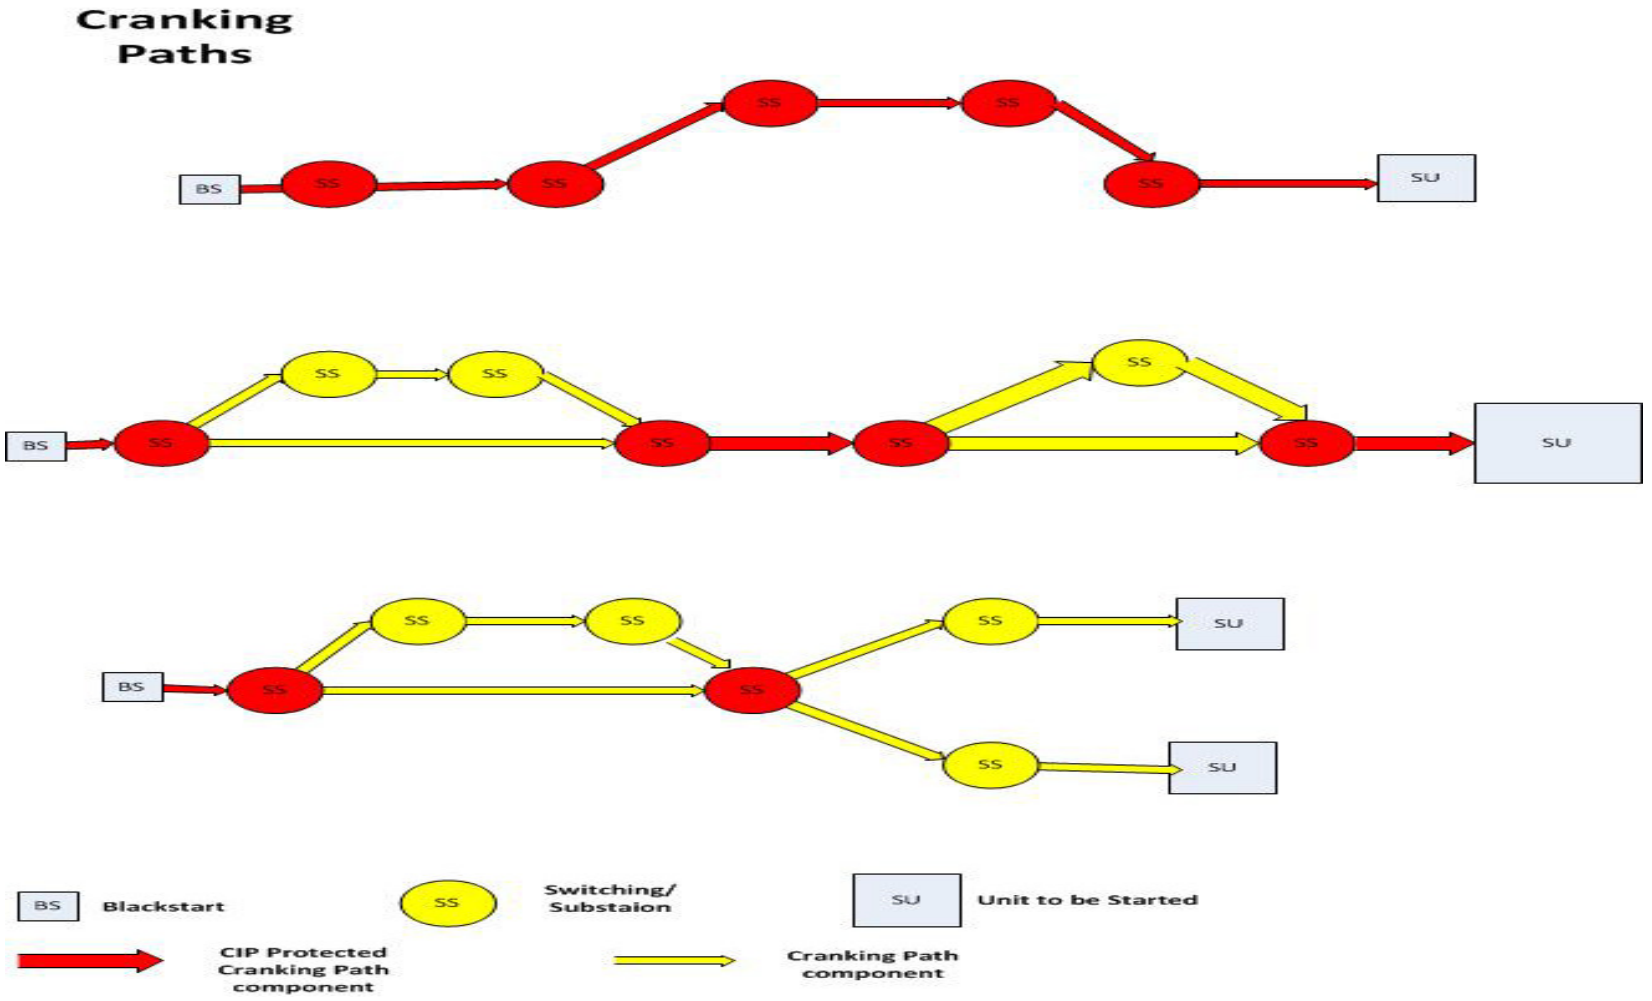
CIP-002-5 Attachment 1 (2 of 9) Medium Impact

- Each BES Cyber Asset or BES Cyber System, not included in Section 1, above, that if rendered unavailable, degraded, or misused would, within 15 minutes adversely impact one or more BES Reliability Operating Services for:
  - 2.1. Generation with an aggregate highest rated net Real Power capability of the preceding 12 calendar months equal to or exceeding 1500 MW in a single interconnection.
  - 2.2. An aggregate net Reactive Power nameplate rating of 1000 MVAR or greater (excluding those at generation Facilities).
  - 2.3. Each generation Facility that its Planning Coordinator or Transmission Planner designates and informs the Generator Owner or Generator Operator as necessary to avoid BES Adverse Reliability Impacts in the long-term planning horizon.

CIP-002-5 Attachment 1 (3 of 9) Medium Impact

- 2.4. Each Blackstart Resource identified in its Transmission Operator's restoration plan.
- 2.5. The Facilities comprising the Cranking Paths and meeting the initial switching requirements from the Blackstart Resource:
  - Up to and including the first interconnection point of the generation unit(s) to be started, or
  - up to the point on the Cranking Path where two or more path options exist and including any single failure points in the Cranking Path to and including the first interconnection point of the generation unit(s) to be started, or
  - up to and including the point on the Cranking Path where two or more path options exist to two or more independent generation unit(s) to be started as identified in its Transmission Operator's restoration plan.

CIP-002-5 Attachment 1 (4 of 9)
Medium Impact



CIP-002-5 Attachment 1 (5 of 9) Medium Impact

- 2.6. Transmission Facilities operated at 500 kV or higher.
- 2.7. Transmission Facilities operating at 200 kV or higher, but at less than 500 kV,… connected to three or more transmission stations or substations…and where the "total weighted aggregate value" … exceeds a value of 3,000.

Voltage Value of a Line	Weight Value per Line
200 kV to 299 kV	700
300 kV to 499 kV	1300

CIP-002-5 Attachment 1 (6 of 9) Medium Impact

- 2.8. Transmission Facilities … critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.
  - In the WECC Region, Transmission Facilities … critical to the derivation of SOLs and their contingencies for transmission paths listed in the most current Table titled "Major WECC Transfer Paths in the Bulk Electric System".
- 2.9. Flexible AC Transmission Systems (FACTS), … critical to the derivation of Interconnection Reliability Operating Limits (IROLs), and their associated contingencies.
  - In the WECC Region, Flexible AC Transmission Systems (FACTS), … critical to the derivation of SOLs and their contingencies for transmission paths listed in the most current Table titled "Major WECC Transfer Paths in the Bulk Electric System."

CIP-002-5 Attachment 1 (7 of 9) Medium Impact

- 2.10. Transmission Facilities identified as essential to meeting Nuclear Plant Interface Requirements.
- 2.11. Each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system… that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more Interconnection Reliability Operating Limits (IROLs) violations.
  - In the WECC Region, each Special Protection System (SPS), Remedial Action Scheme (RAS) or automated switching system …that, if destroyed, degraded, misused or otherwise rendered unavailable, would cause one or more System Operating Limits (SOLs) violations … in the most current Table titled "Major WECC Transfer Paths in the Bulk Electric System" and each RAS listed in the most current table titled " Major WECC Remedial Action Schemes (RAS)."

CIP-002-5 Attachment 1 (8 of 9) Medium Impact

- 2.12. Each system or Facility that performs automatic load shedding,… of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by its regional load shedding program.
- 2.13. Control Centers not included in High Impact Rating (H), above, that perform (1) the functional obligations of Transmission Operators or Transmission Owners; or (2) generation control centers that control 300 MW or more of generation.

CIP-002-5 Attachment 1 (9 of 9) Low Impact

Low impact:

- All other BES Cyber Assets and BES Cyber Systems not categorized in Section 1 as having a High Impact Rating (H) or Section 2 Medium Impact Rating (M).

CIP Version 5 Implementation Plan

Philip Huff, Arkansas Electric Cooperative Corporation

RELIABILITY | ACCOUNTABILITY

Effective Date

The later of:

- January 1, 2015
- 18 Months Minimum – seven calendar quarters after regulatory approval

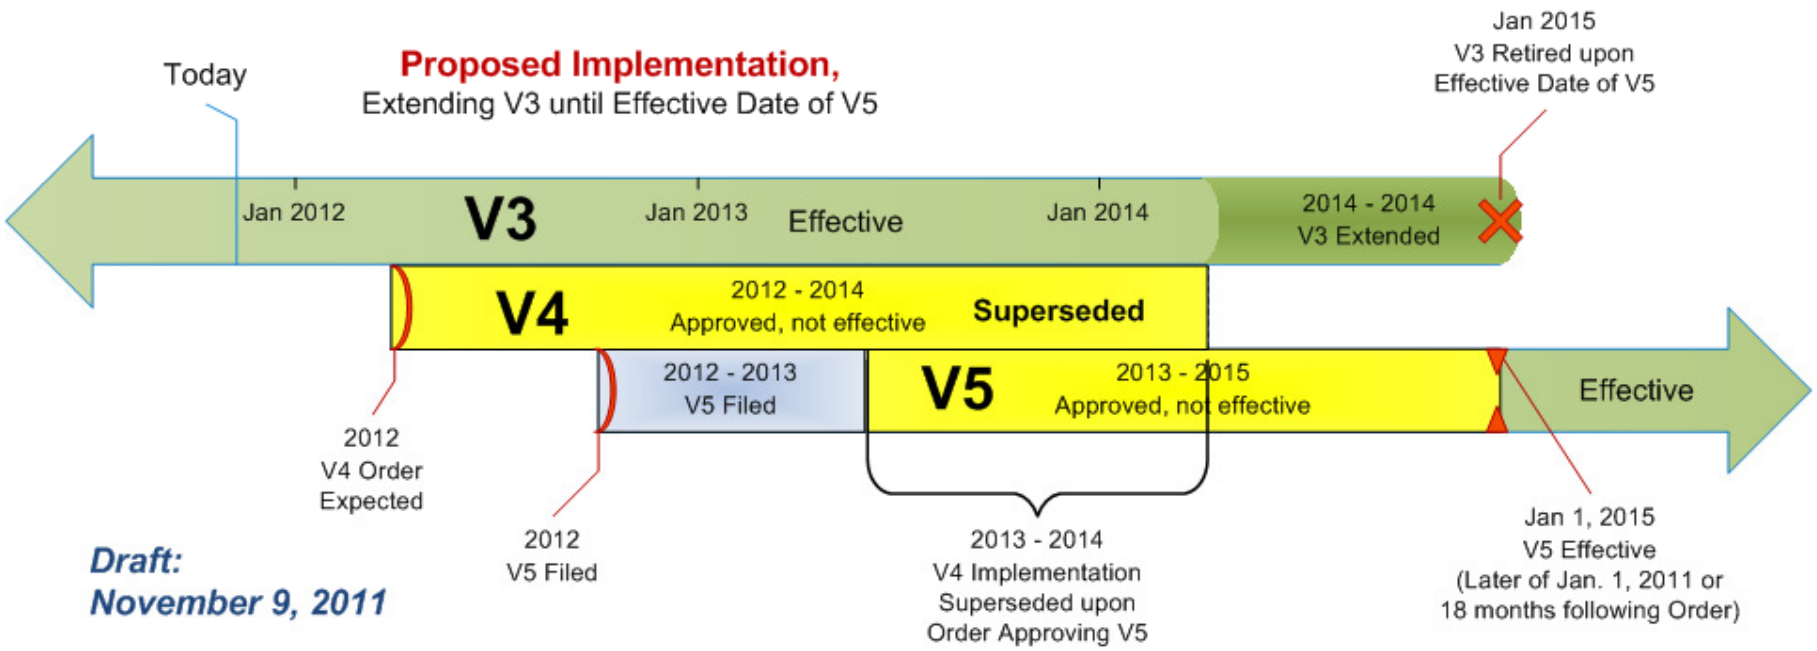
Effective Date – Version Transition

Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.

Effective Date – Version Transition

Implementation Plan for Version 5 of CIP Cyber Security Standards

(Graphic for illustrative and comparative purposes only; dates are estimates only and based on assumptions. There is no way to know or anticipate when FERC may take action on pending matters)



Effective Date – Canadian Entities

In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Implementation Plan Other Changes

- **Single Implementation Plan**
  - Incorporated Unplanned Changes from “Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities”
- **Single Effective Date**
  - No staggered implementation. No Compliant/Auditably Compliant dates

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

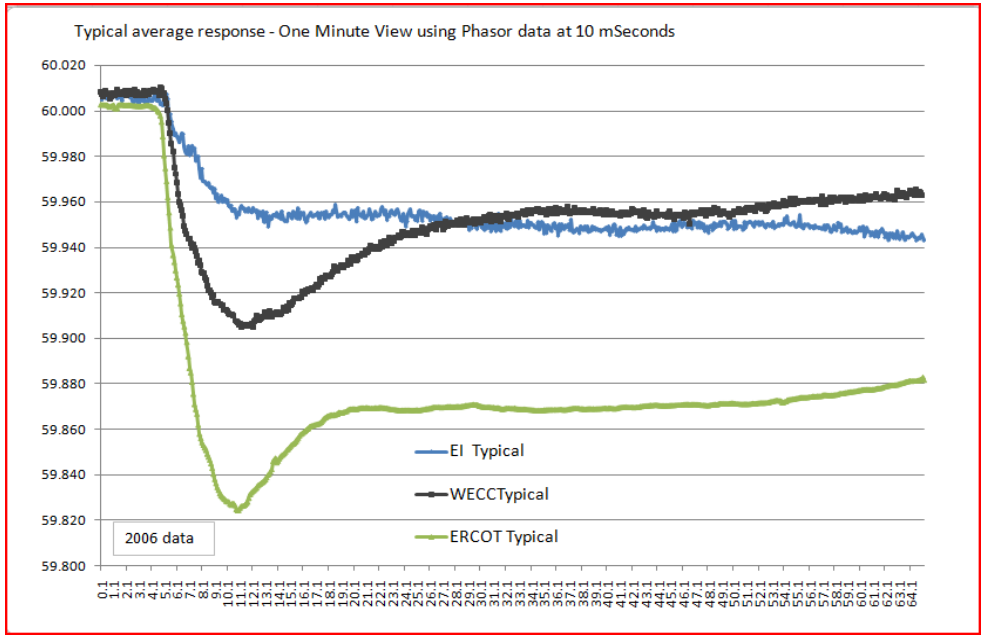
Background

- FERC Order 693 directed specific changes for BAL-003
- Standard Authorization Request (SAR) drafted to address the issues identified by FERC
- NERC Operating Committee (OC) authorized Frequency Response field trial to help standard development at the June 7–8, 2011 OC meeting
- Frequency Response, termed beta (β), is
  - A fundamental reliability service
  - A combination of governor and load response

Background

- Following a generator (or load loss)
  - β stabilizes frequency at a new point
  - The contingent BA is responsible for replacing the lost resource in order to release Frequency Response of non-contingent BAs within the Interconnection



NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Frequency Response

- Frequency Bias (B) is not the same as Frequency Response (β)
  - Frequency Response is actual MW contribution to stabilize frequency
  - Bias is an approximation of β used in the Area Control Error (ACE) equation – prevents Automatic Generation Control (AGC) withdrawal of β
- Both are negative numbers (as frequency drops, MW output increases and vise versa)
- Both are measured in MW/0.1Hz
- Bias (absolute value) must be $\geq$ β (absolute value)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Frequency Response

- In the East, B (absolute value) is about 2-3 x as large as β (absolute value)
- Bias (absolute value) must be at least 1% of BA peak load under current standard
- If there is to be a difference between B and β, it is preferable to be over-biased

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Original Goals

- Original SAR
  - Objectively benchmark and track BA and Interconnection performance
    - Confirm trends
    - Learn why and where response trending down
  - Additional generator level data from low responders
  - Accurate data for models
  - Enable technically sound decisions on setting any future performance obligations
- FERC Order No. 693 directed additional work

Reasons for Change

- FERC directives in Order No. 693
  - Determine the appropriate periodicity of Frequency Response surveys
  - Define the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the Frequency Response is achieved
- Details are described in the *Background Document* that is posted with the standard
- NERC has committed to file BAL-003-1 with FERC in May of 2012

BAL-003-1 Overview

- Drafting team proposing 5 requirements
  - Frequency Response to frequency events
  - Frequency Bias Setting implementation*
  - AGC to operate in Tie Line Bias mode*
  - Appropriate Frequency Bias Setting for those providing Overlap Regulation Service*
  - And Minimum Frequency Bias Setting*

*Similar to existing standard

Requirement R1

- Each BA or Reserve Sharing Group (RSG) shall achieve an annual FRM (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its FRO to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency Response in the Interconnection

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Attachment A

- Details how to calculate FRM based on actual responses to frequency excursions throughout a year
- Calculation will be for both frequency drops and frequency spikes
- NERC will publish list of events for each interconnection at least quarterly so BAs can calculate performance throughout the year
- More detail provided later in presentation

Measure M1

- The BA or RSG shall have FRS Form 1 with data to show that its FRM is equal to or more negative than FRO to demonstrate compliance with Requirement R1
  - Data required to fill out forms is scan rate data from Emergency Management System (EMS) for time, frequency and Net Actual Interchange

Requirement R2

- Each BA not participating in Overlap Regulation Service shall implement the Frequency Bias Setting (fixed or variable) validated by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control
  - Similar to existing R1

Measure M2

- The BA shall have evidence such as a dated document in hard copy or electronic format showing the ERO validated Frequency Bias Setting was entered into its ACE calculation on the date specified or other evidence to demonstrate compliance with Requirement R2

Requirement R3

- Each BA not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the BA's Area
  - Similar to existing R3

Measure M3

- The BA shall have evidence such as a dated operating log, database or list in hard copy or electronic format, or operator interviews supported by other evidence showing the AGC operating mode including explanation when operating in other than Tie Line Bias mode to demonstrate compliance with Requirement R3

Requirement R4

- Each BA that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to the sum of the Frequency Bias Settings of the participating BAs as validated by the ERO or calculate the Frequency Bias Setting based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled
  - Similar to existing R6

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Measure M4

- The BA shall have evidence such as a dated operating log, database, or list in hard copy or electronic format showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4

Requirement R5

- In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following:
  - The minimum percentage of the BA Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B
  - The minimum percentage of the BA Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Attachment B

- Allows for the minimum Frequency Bias Setting to be reduced based on measured Frequency Response in each Interconnection
- Initial minimum setting to be .8% of peak load or generation (reduction from existing 1.0% of peak load or generation)
- More information will be provided later in presentation

Measure M5

- The BA shall have evidence such as dated data plus documented formula to support the calculation retained in either hardcopy or electronic format showing the monthly average Frequency Bias Setting or other evidence to demonstrate compliance with Requirement R5

Bias Setting Process

- The Bias Setting process will be very similar to what is done today
- Form 1 will automatically calculate a proposed Bias Setting for the upcoming year
  - The data submitted by the BA will be validated
  - CPS Limits, Bias Settings and FRO for upcoming year will be posted on NERC website
- BAs will be given an implementation date for the new Bias Setting (typically March 1)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Attachment A

- Sets out the ERO's criteria for selecting events used for Bias Setting and FRM
- Measurement Cycle is December 1 (previous year) through November 30 (current year)
- Outlines the Frequency Response Obligations in each Interconnection and the allocation process to BAs
- Field Test proposes to use historic peak load and generation data from FERC Form 714 as basis for allocation to BAs

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Example of Annual Cycle

- January 10, 2012: BAs submit FRS Forms 1 and 2
- January-February 2012: NERC and RS validate data, NERC posts CPS, Bias Setting, FRO
- March 1, 2012: Implement 2012 Bias Settings
- March-November 2012: NERC periodically posts and updates list of candidate events likely to be used for current year's FRM and next year's Bias Setting
- December 7, 2012: NERC posts:
  - Official list of events for Bias Setting and FRM (Forms 1 and 2)
  - BAs notified

Attachment B

- Adjusting Minimum Bias Setting
  - Present minimum Bias Setting is 1% of peak/0.1Hz
  - For most BAs, Frequency Response is < this 1% value
  - Control theory says Bias and Frequency Response should closely match
  - Attachment B lays out process for an Interconnection to adjust minimum Bias Setting
  - Field test in 2012 to adjust minimum Bias Settings
    - 0.8% of peak
    - If no issues observed, process used in Attachment B will be used to consider further reduction in out years

Frequency Response Obligation

- The process will determine an FRO for each Interconnection
- The Interconnection FRO will be allocated across all BAs in that Interconnection

IFRO Calculation

	Eastern	Western	Texas	Québec	
Resource Loss Criteria	4,500	2,740	2,750	1,700	MW
Base IFRO	-1,125	-548	-229	-113	MW/0.1Hz
25% Margin	-281	-137	-57	-28	MW/0.1Hz
IFRO	-1,406	-685	-286	-141	MW/0.1Hz
IFRO as % of Interconnection Load	0.233 %	0.460 %	0.448%	0.688 %	

Where

Interconnection	Resource Contingency	Basis	MW
Eastern	Largest Resource Event in Last 10 Years	August 4, 2007 Disturbance	4,500
Western	Largest N-2 Event	2 Palo Verde Units	2,740
Texas	Largest N-2 Event	2 South Texas Project Units	2,750

Balancing Authority FRO

- BAs will be allocated a portion of the Interconnection FRO based on peak load and generation
- The drafting team recommends historical peak load and generation from FERC Form 714 or comparable
- NERC will do this allocation each year, probably through the Resources Subcommittee
- NERC will allocate FRO based on formula and transmit this information to each BA with the Frequency Bias Setting
- This allocation should not change for the 12 month period used for evaluation of compliance

Frequency Response Measure

- The BA FRM will be compared to the BA FRO to determine compliance with R1
- FRM is calculated using the frequency events listed on FRS Form 1 at the end of each 12 month period
  - The 12 months run from December 1 through November 30 of the following calendar year

Calculation of BA FRM

- BA will fill out FRS Form 2 for each event listed on FRS Form 1
- Summary information from each FRS Form 2 will be moved into FRS Form 1
- FRS Form 1 will use all events to determine median response
- Median response is the BA FRM for that period

Selection of Events

- Minimum of 25 events will be used for FRM calculation
- If few events occur during a 12 month period, older events will be used to make 25 events
- List will be Interconnection specific
- Determination of “event” based on specifics in Attachment A

FRS Form 1 and 2

- Phase 1 successes and problems
- Lessons learned
- Details of each Form

Field Trial Phase I Participation

- East
  - Form 1 and 2 provided: 30 BAs
  - Form 1 only provided: 5 BAs
  - No Form provided: 32 BAs
- West
  - Form 1 and 2 provided: 13 BAs
  - Form 1 only provided: 0 BAs
  - No Form provided: 24 BAs
- Hydro-Quebec and Texas
  - Form 1 and 2 provided: 2 BAs

Form 1 Issues

- East
  - Event time on two events incorrect
  - Two events from 2009
- West
  - Event selection, out of 15 events
    - Three events had two contingencies – March 7, March 22 and July 3
    - Two events: B Value recovered within normal governor dead-bands – May 11 and May 24
    - Three events: Slow decay in frequency – May 31, March 14 and March 16
    - Good events to evaluate – March 26, April1, April 28, June 1, June 24, June 25 and July 10

Form 1 Issues

- Hydro-Quebec
  - Event selection, multiple events where frequency recovered to pre-disturbance level before the end of the B Value time period (20 to 52 seconds)
- Event selection process requires proper review before the event is placed on Form 1
  - Team from each Interconnection should be involved in the selection of events
  - Frequency graphs of each event should be generated before final selection

Form 1 Improvements

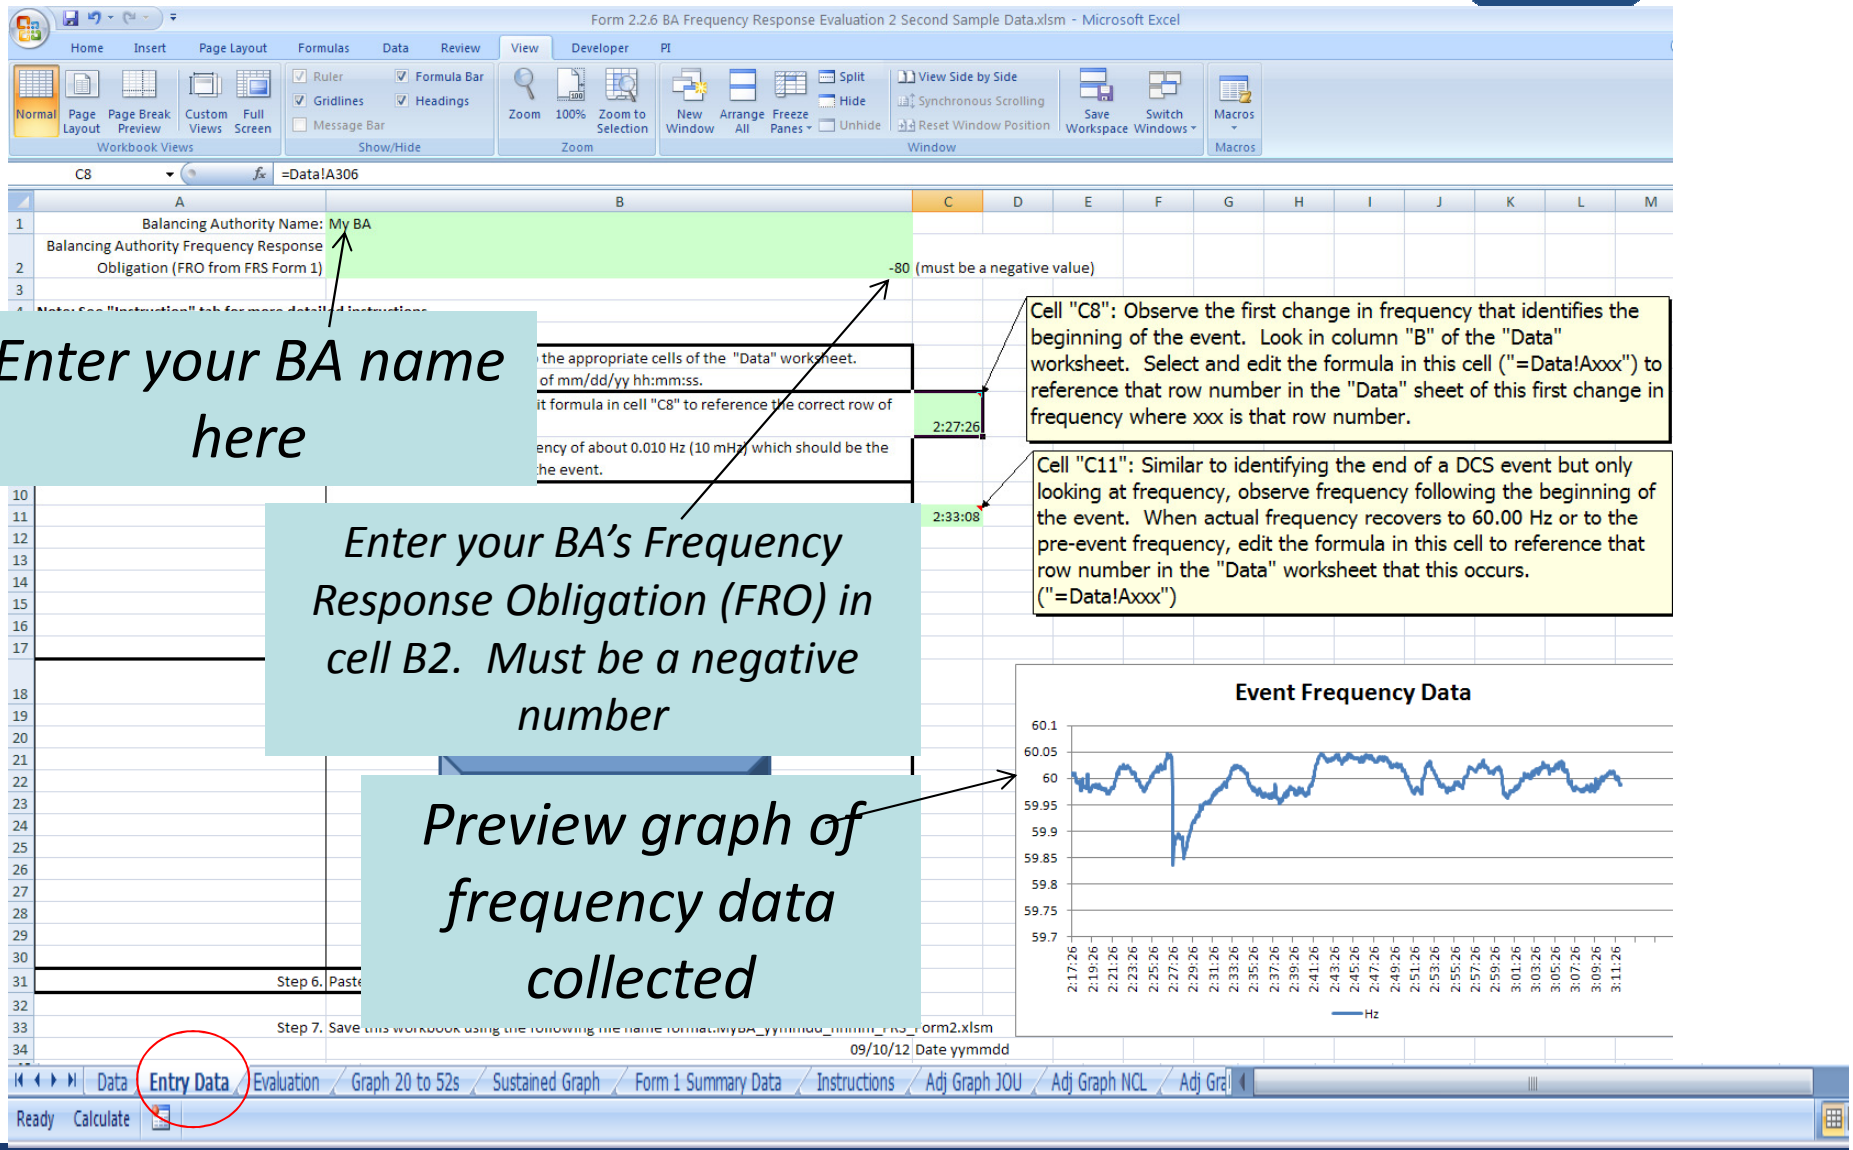
- Event selection process improving
  - Process in place for event identification
  - Process in place for event review and selection
  - Included frequency graph of each event selected in Form 1 for the East and West
  - Added UTC time of event

FRS Form 2

- FRS Form 2 receives BA AGC scan rate data to measure the BA's primary Frequency Response performance to a single, identified frequency perturbation on the system
- Measures the change in Net Actual Interchange and the change in frequency due to the perturbation
- Standardizes the measurement process for all BAs in all Interconnections
- Value B average period of 20 to 52 seconds selected as the standard measure
  - Other average periods removed from both Forms

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Entry Data Worksheet



Enter your BA name here

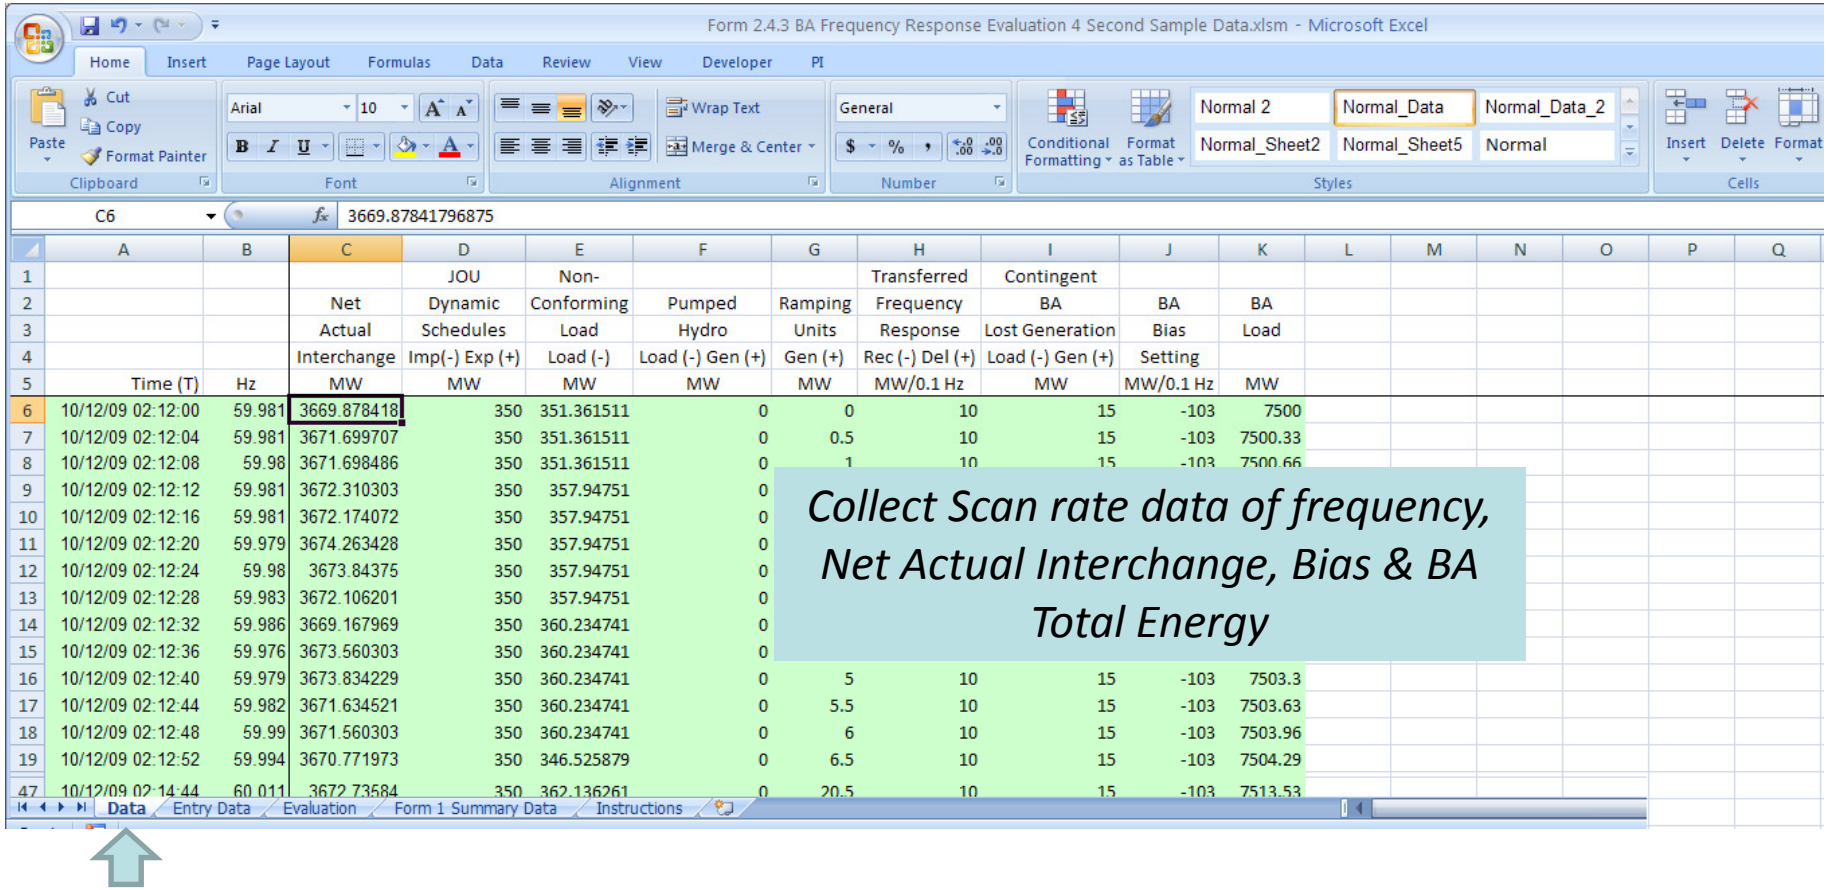
Enter your BA's Frequency Response Obligation (FRO) in cell B2. Must be a negative number

Preview graph of frequency data collected

Cell "C8": Observe the first change in frequency that identifies the beginning of the event. Look in column "B" of the "Data" worksheet. Select and edit the formula in this cell ("=Data!Axxx") to reference that row number in the "Data" sheet of this first change in frequency where xxx is that row number.

Cell "C11": Similar to identifying the end of a DCS event but only looking at frequency, observe frequency following the beginning of the event. When actual frequency recovers to 60.00 Hz or to the pre-event frequency, edit the formula in this cell to reference that row number in the "Data" worksheet that this occurs. ("=Data!Axxx")

Collect Data and Place in Form 2



"Data" Tab: BA Event scan rate data placed in specific columns

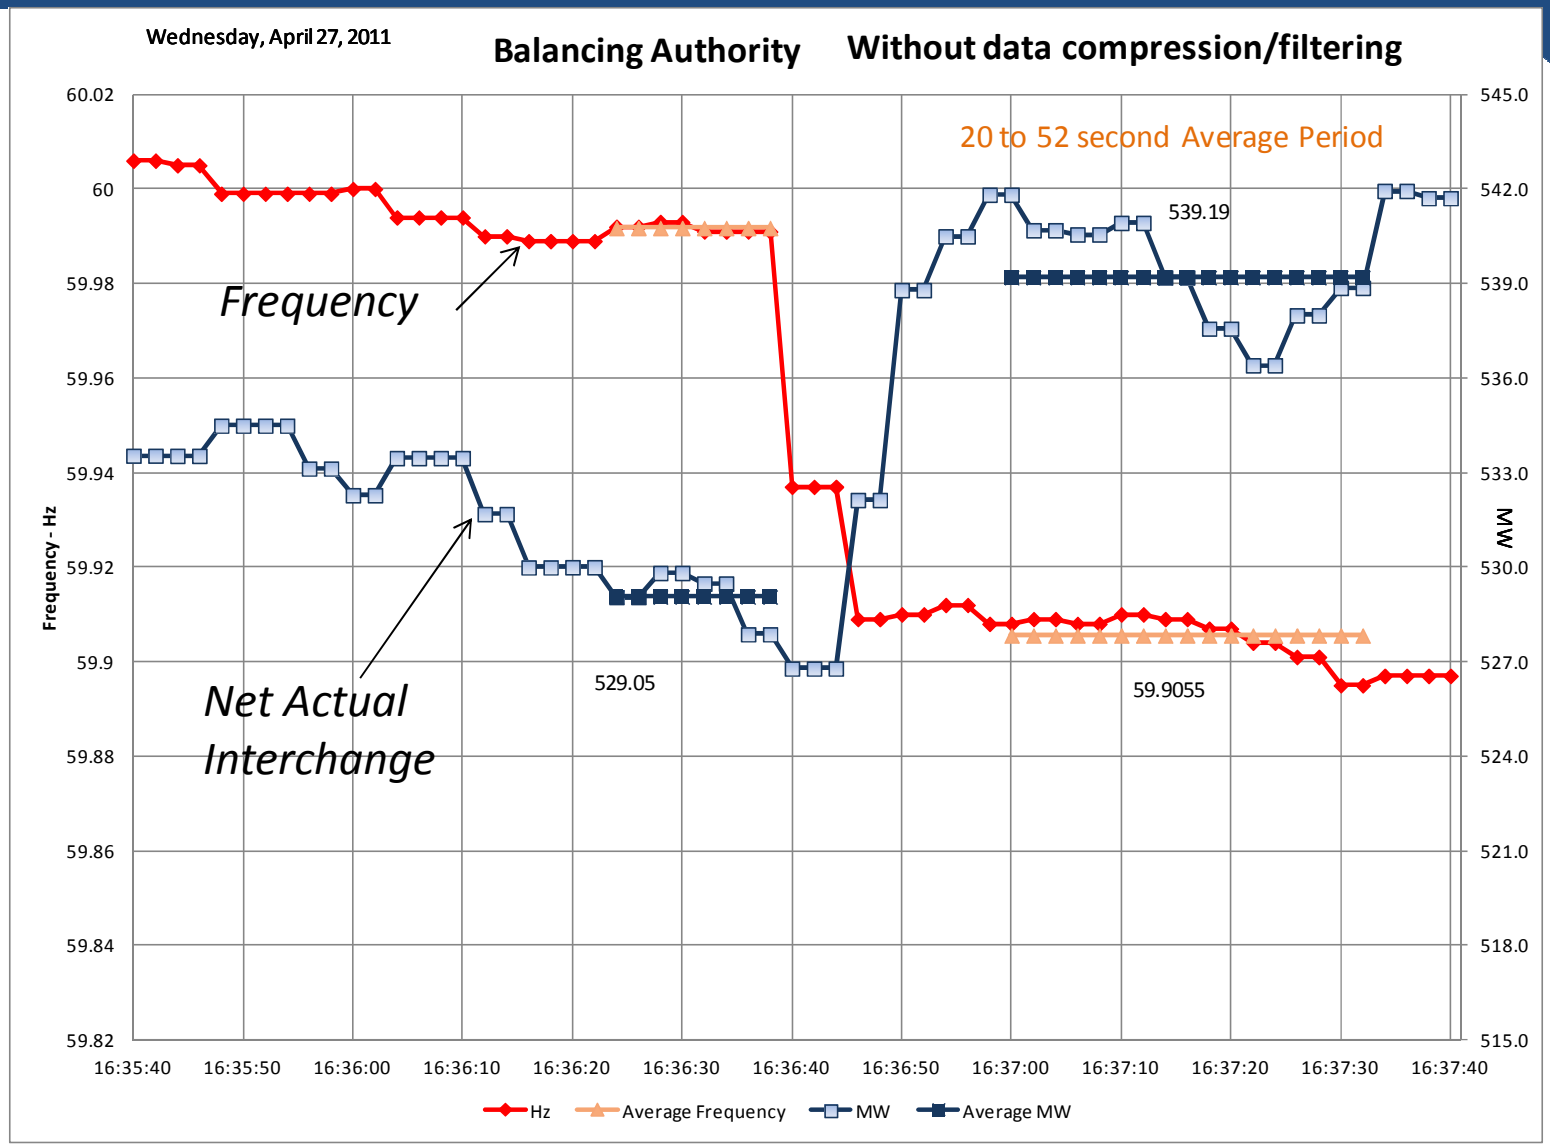
Lessons Learned on Data Collection

- Date/Time data must be in time format, it cannot be text.
  - If your historian returns text for the time values, create correct time format data in the time field. Evaluation requires a valid time format.
- Frequency data and Net Actual Interchange data must be discrete data values each sample (AGC scan). Data compression techniques should not be used on this data.
- Must have a minimum of two minutes of data before beginning of the event for full analysis.

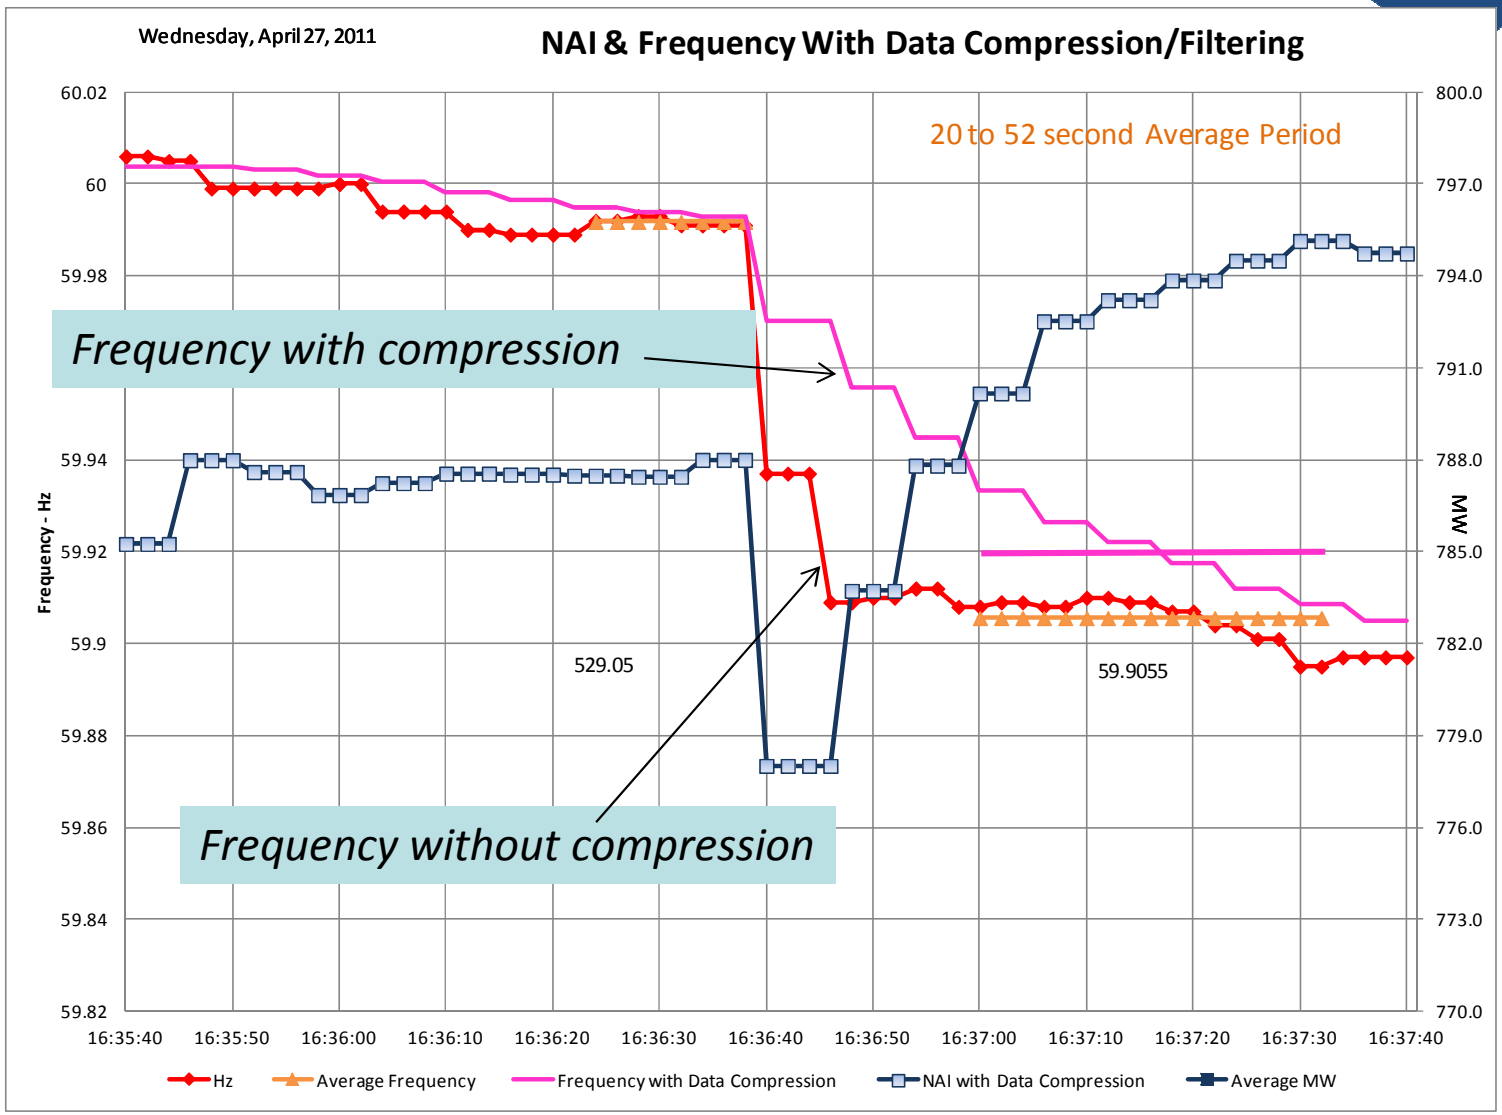
Lessons Learned on Data Collection

- Form 1 contains the exact time of t(0) using 2 second scan rate data. If you begin data collection exactly 10 minutes before this time, t(0) should always be in the same row in the data worksheet.
  - Using different scan rates may cause you to adjust up or down one row when setting t(0) but it should always be within one or two rows on each event.
- Some BAs added an additional worksheet into Form 2 for their data collection formulas and retrieval.
- Some BAs built automatic detection of t(0) and the recovery period time.

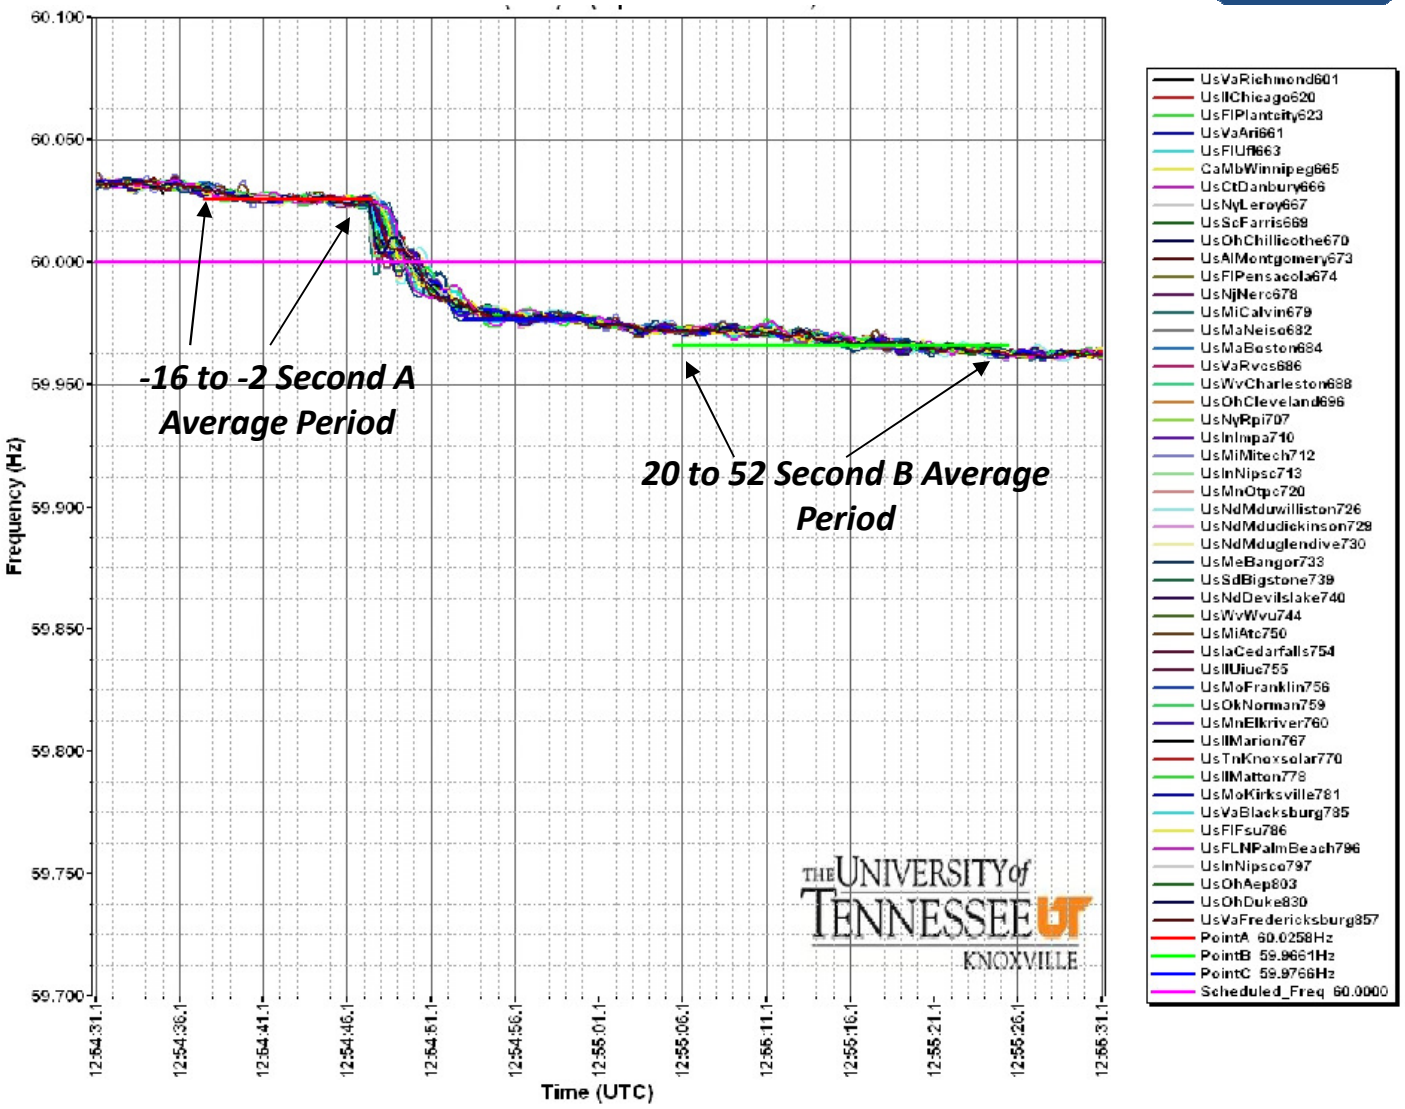
Example of No Data Compression



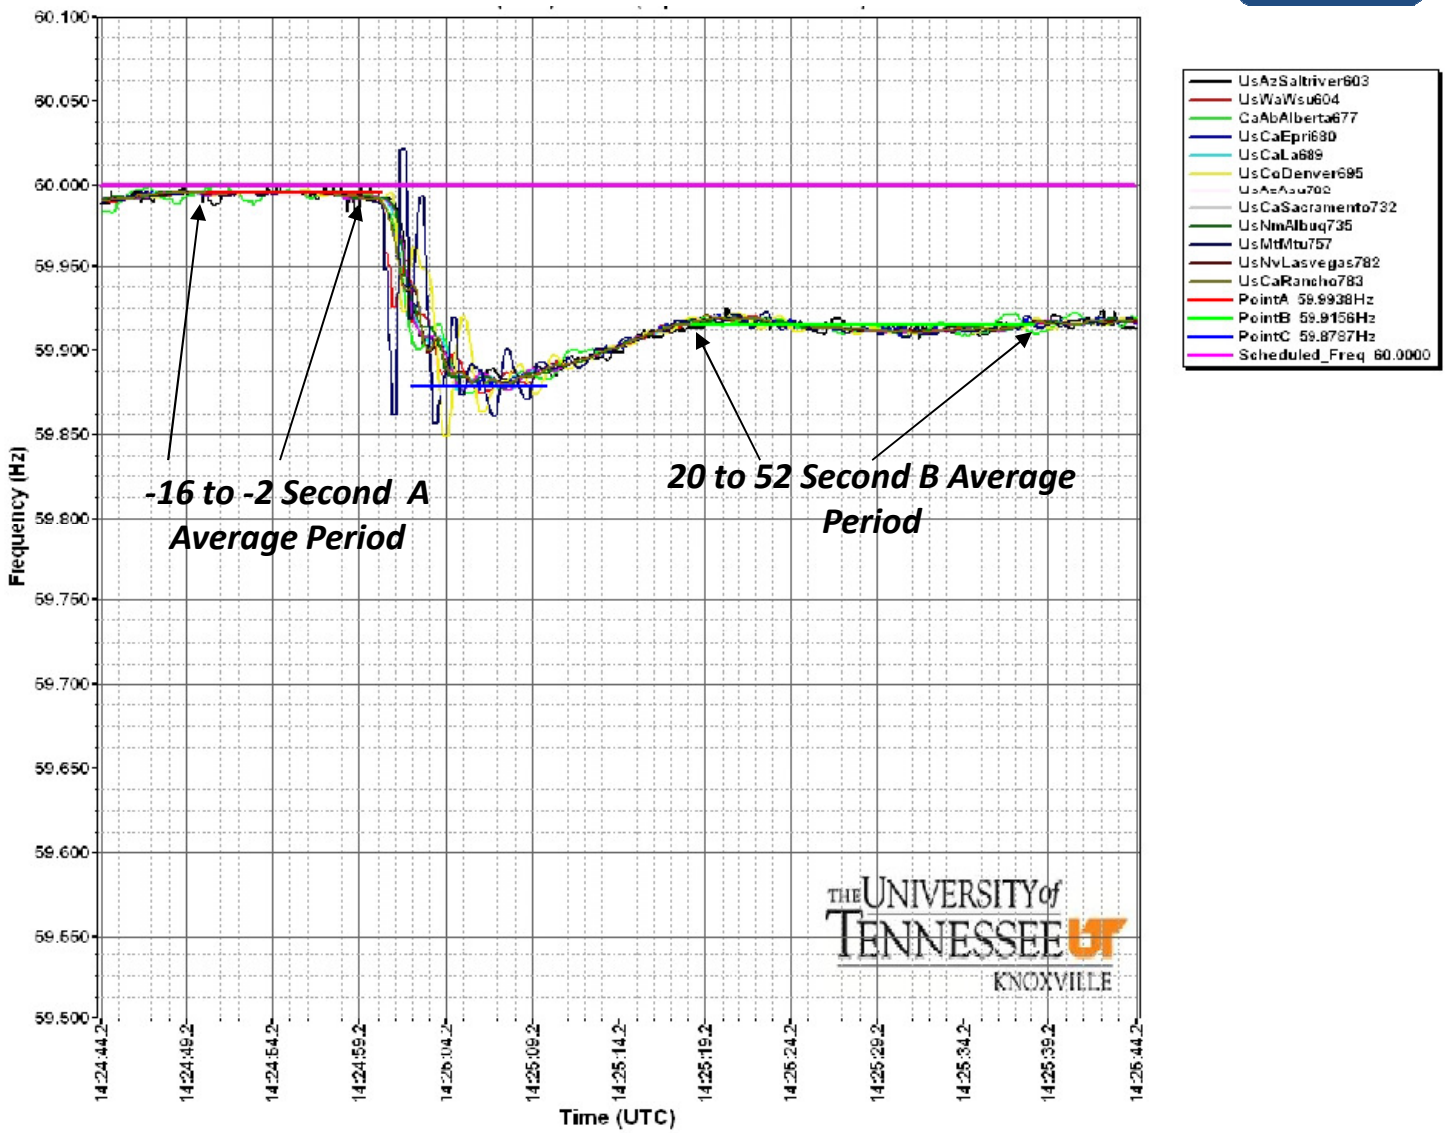
Hz and NAI with Compression



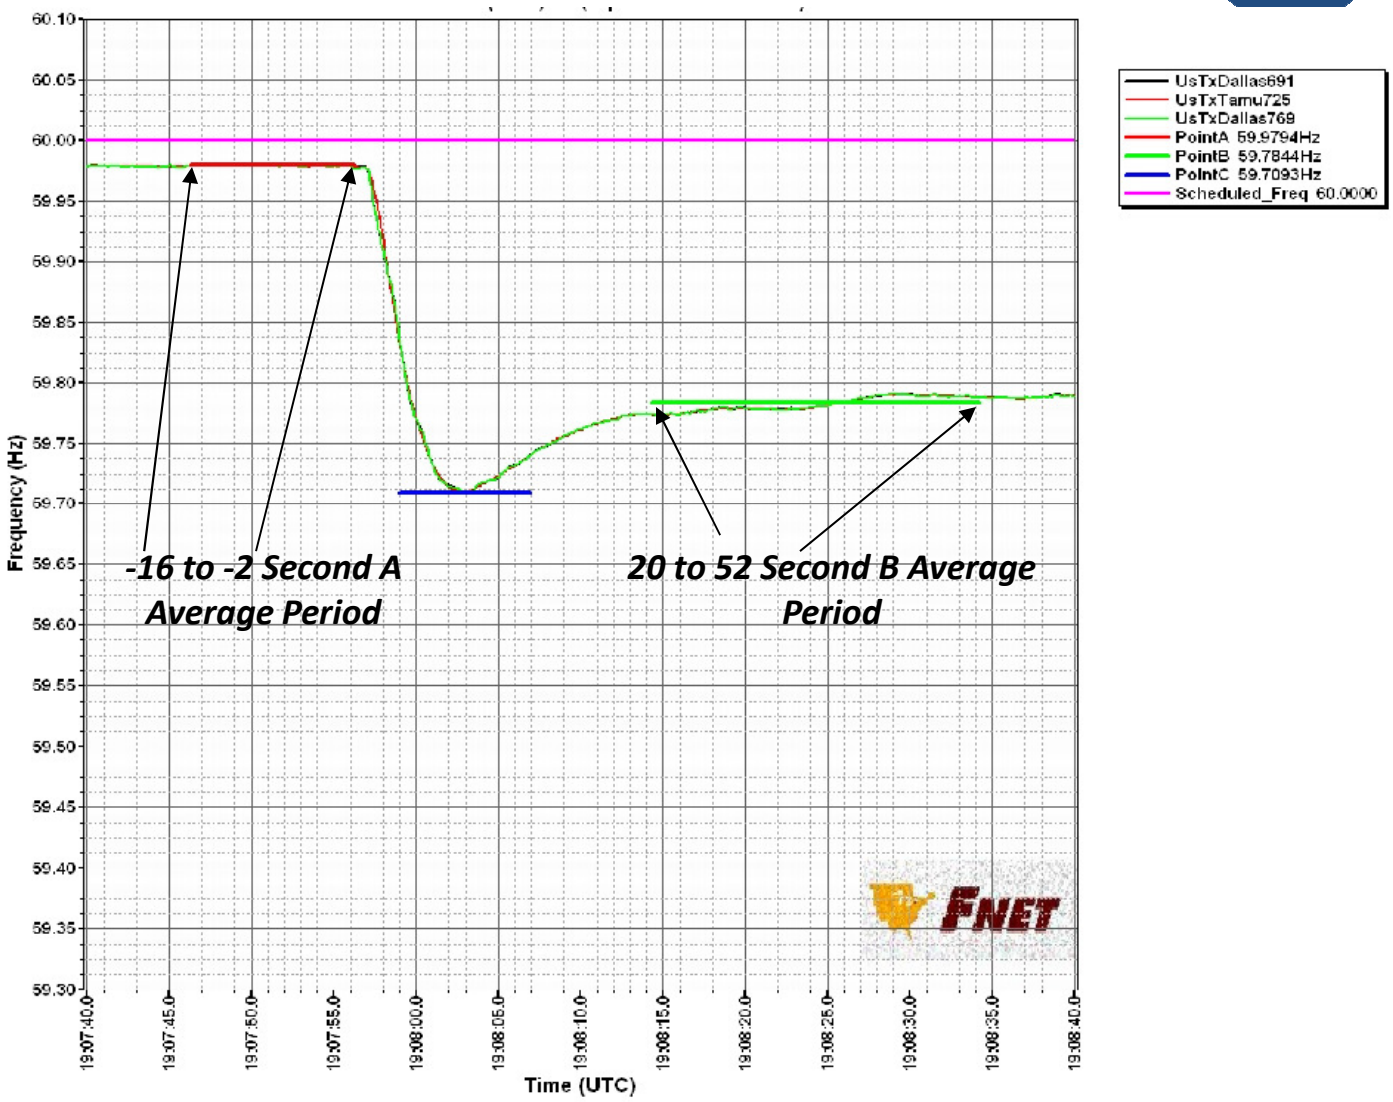
Frequency Diversity Across the Eastern U. S.



Frequency Diversity Across the Western U. S.



Frequency Diversity Across Texas



FNET Graphs

Courtesy of …

THE UNIVERSITY of TENNESSEE KNOXVILLE

Frequency Diversity

- Frequency during the measurement periods of this standard is virtually the same across each Interconnection
  - If the BA's frequency data measures a significantly different deviation between the A Value and B Value than that in Form 1, it indicates that the data may be compressed or filtered

Form 2 Set-up for the Evaluation

- Find “t(0)” on Data worksheet
- Edit formula on Entry Data worksheet
  - Cell “C8”
- Find “event recovery time” on Data worksheet
- Edit formula on Entry Data worksheet
  - Cell “C11”

Identification of t(0) in Data

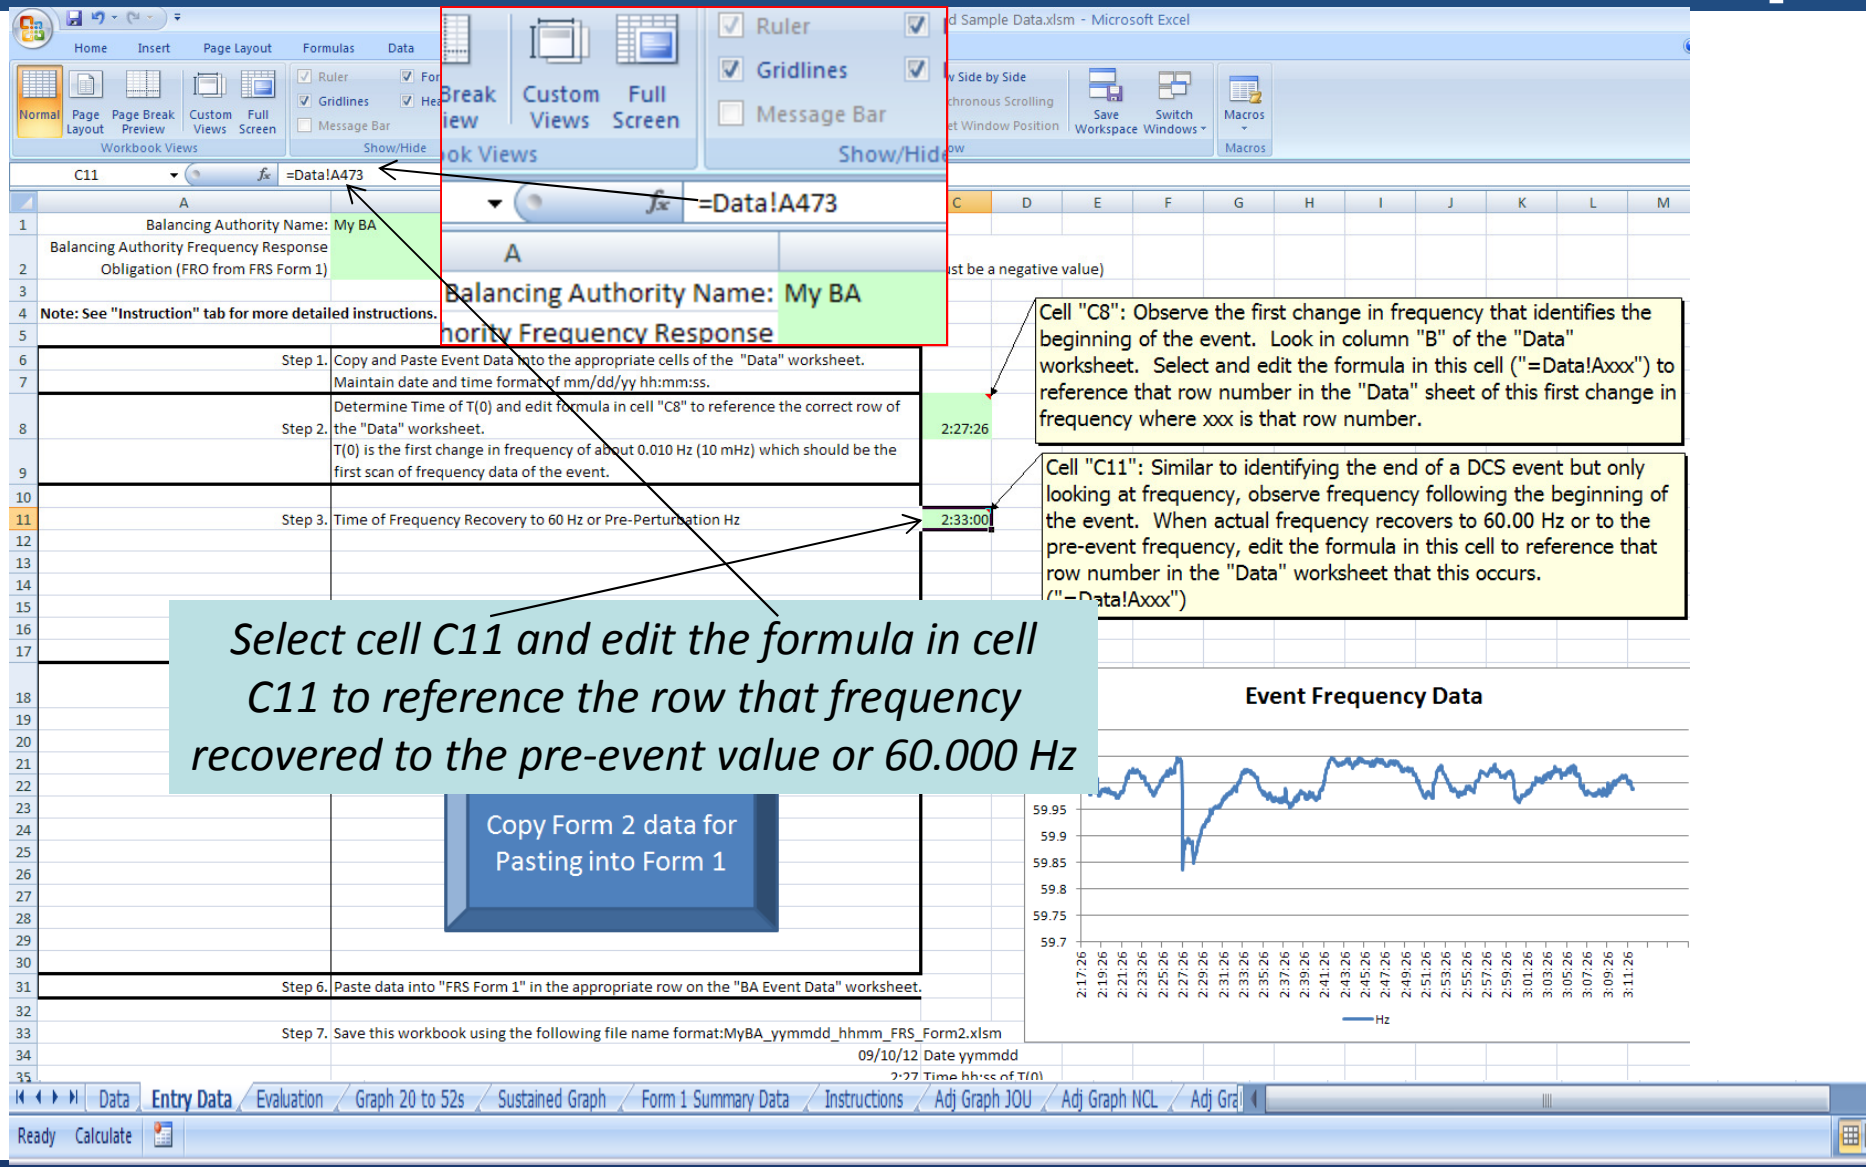
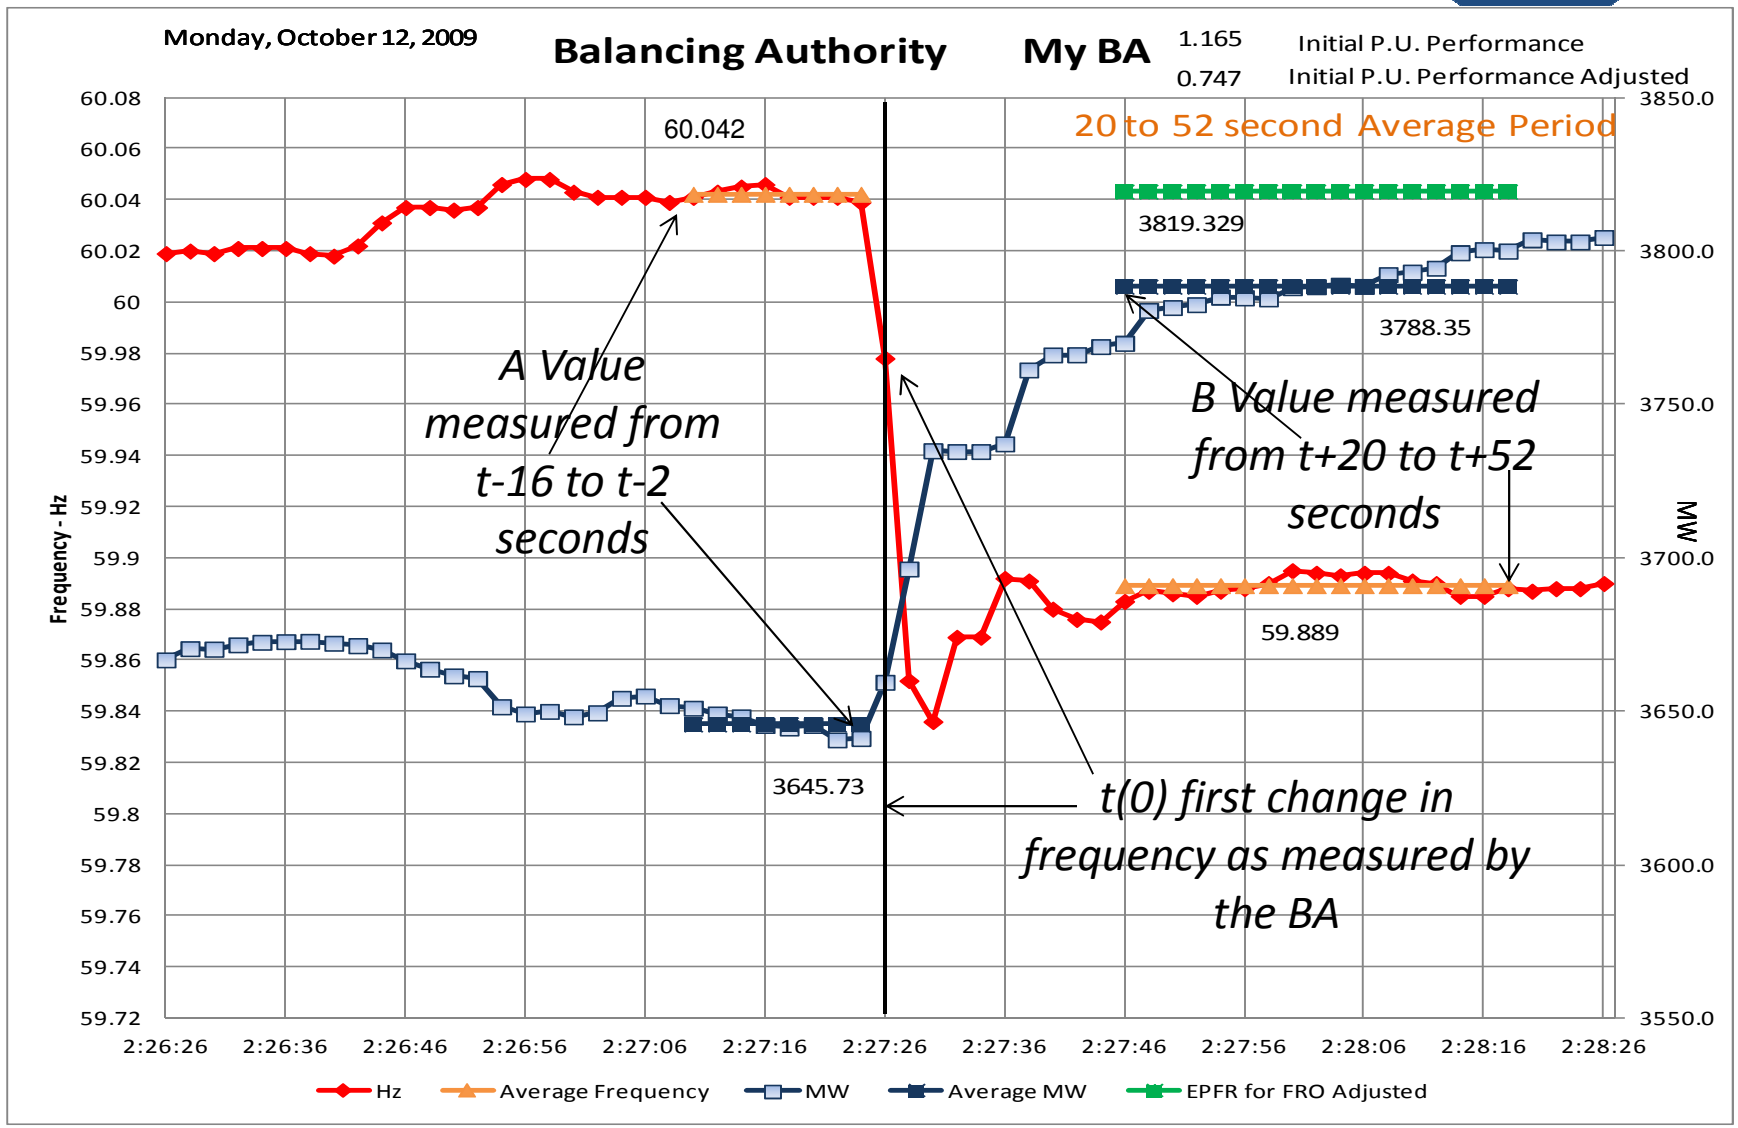
Entry Data Worksheet Final Step



Lessons Learned – Setting t(0)

- Many BAs set t(0) one cell late
  - Properly set, the first change in frequency will be in the exact center of the Graph on the “Graph 20 to 52s” worksheet
  - The best performance measure will be assured if the A Value average period data does not contain a data point of the event, frequency or NAI
  - Setting t(0) late can cause the Frequency Response measure to be low due to Frequency Response still increasing and/or B Value frequency measuring too low

Form 2 Frequency Graph



Data Worksheet Details

Critical Data: Time, frequency and NAI

Important Data: Transferred Frequency Response, Contingent BA Loss, Bias Setting and BA Load

			JOU	Non-			Transferred	Contingent		
		Net	Dynamic	Conforming	Pumped	Ramping	Frequency	BA	BA	BA
		Actual	Schedules	Load	Hydro	Units	Response	Lost Generation	Bias	Load

Optional Data: Adjustments – JOU, Non-conforming load, Pumped Hydro, Ramping Units

DO NOT delete columns for any optional data not utilized or any non-applicable data for Transferred Frequency Response, Contingent BA Loss or Load,. Leave data as zero or blank.

Data Sign Convention

- Net Actual Interchange +/-
- Joint Owned Unit
  - Import (-) Export (+)
- Non-Conforming Load (-)
  - Option on Evaluation worksheet to flip sign to positive in cell “Z1”. Enter “+” if your load data is positive. Enter “-” if your load data is negative
- Pumped-Hydro
  - Load (-) Gen (+)
- Ramping Units Gen (+)

Sign Convention – Part 2

- Transferred Frequency Response
  - Receiving BA Rec (-)
  - Delivering BA Del (+)
  - Interconnection Transferred Frequency Response should net to zero
- Contingent BA
  - Lost Load (-)
  - Lost Generation (+)
- BA Bias Setting (-)
- BA Load (+)

Pasting Data into Worksheet

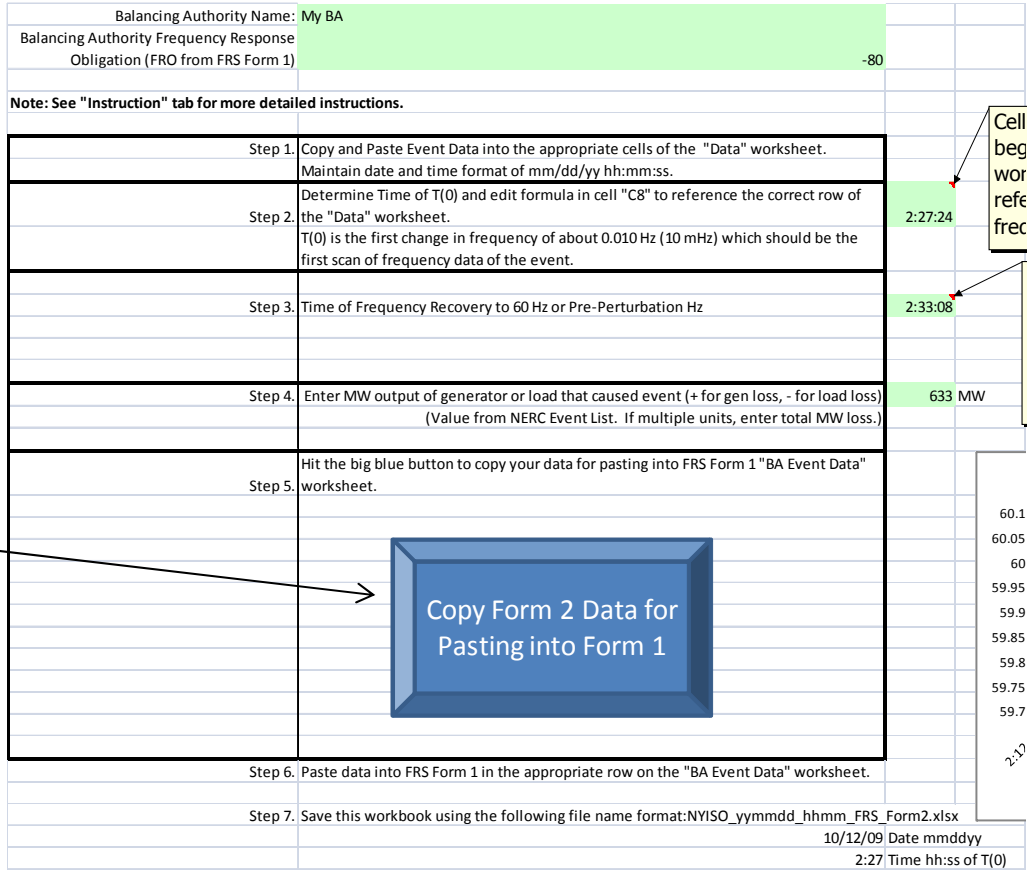
- Historian data collection formulas should be removed from Form 2 before submitting. Use PasteSpecial/Values to strip formulas and only paste data values into the Data worksheet.
- Do not delete any data columns.
- Provide a minimum of 5 minutes of data before the beginning of the event and a minimum of 15 minutes of data after the event. The spreadsheet will easily accommodate 60 minutes of data.

Evaluation Complete

- Execution is now complete.
  - Performance of your BA for all the average periods in the field trial is ready to be copied into FRS Form 1.
  - Perform a mouse click on the “Copy Form 2 Data for Pasting into Form 1” macro on the “Entry Data” worksheet. The correct data is now copied.

Form 2 Data Copy Button

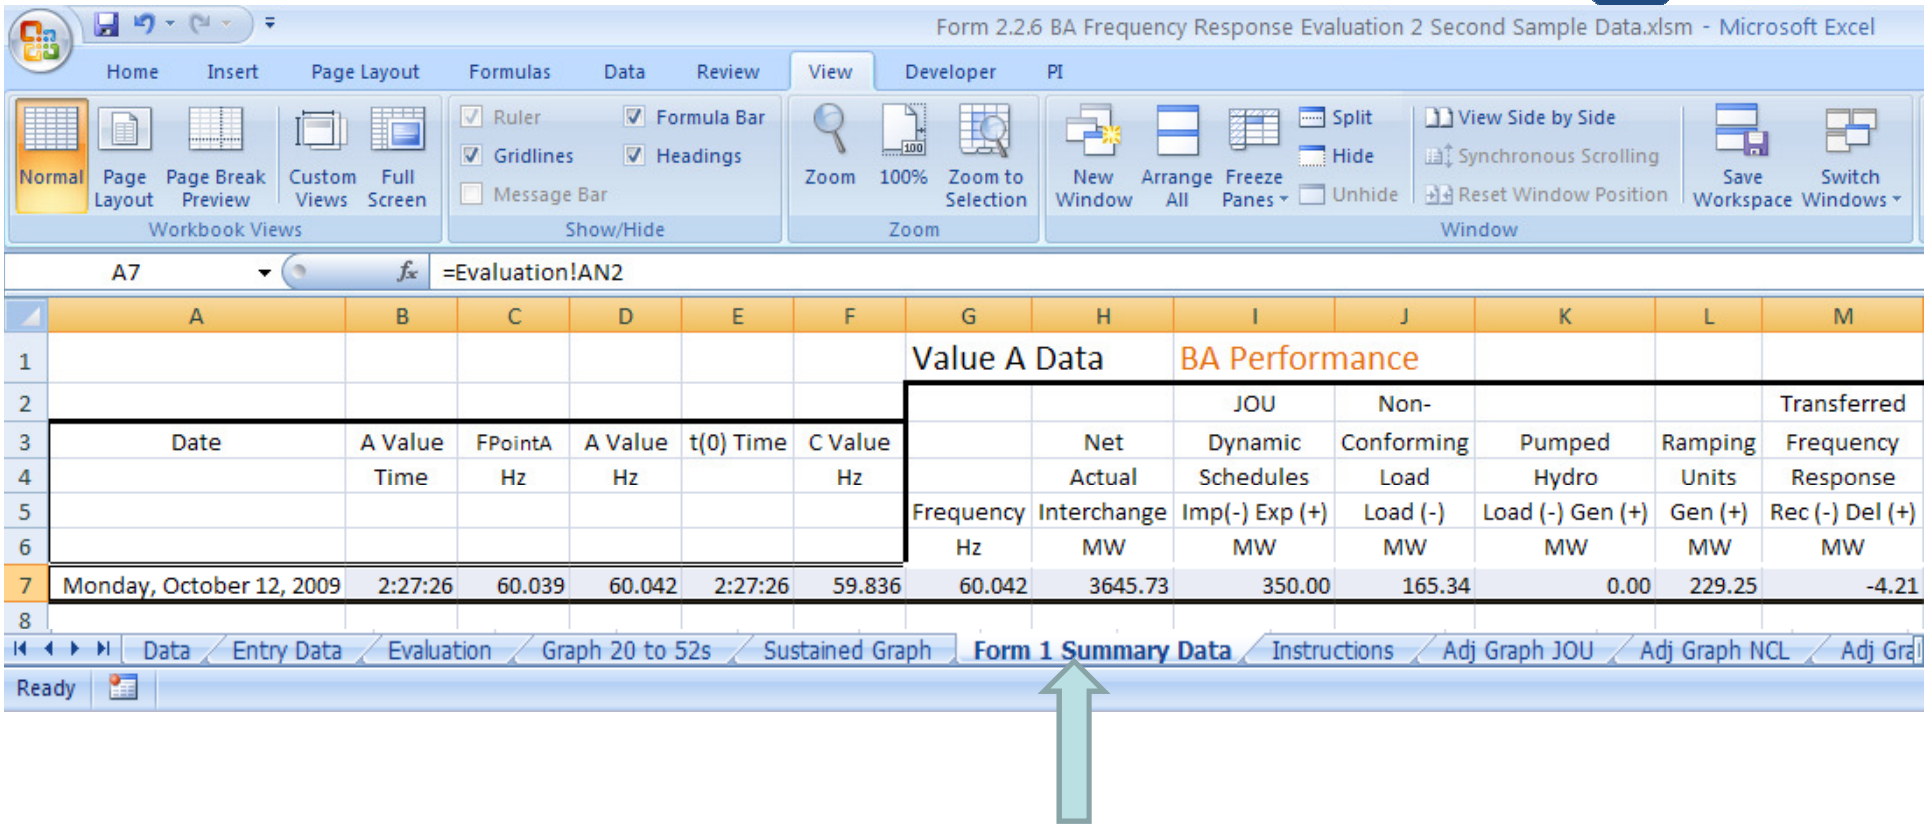
Copy Button on Entry Data worksheet



Alternate Copy without Macro

- If you prefer not to enable macros
  - Navigate to the “Form 1 Summary Data” worksheet
  - Select cells “A7 through AE7”
  - Select copy
  - PasteSpecial/Values into FRS Form 1 on the appropriate event row

Location of Data for Form 1



"Form 1 Summary Data" Tab: This single event data and performance results needed for FRS Form 1 is contained in row 7, columns A through AE

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Detail Instructions

	A	B
1	**Steps**	**To be completed for each event evaluated.**
2	**1**	Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
3		Column A: Date and Time in this format, mm/dd/yy HH:MM:SS
4		Column B: Frequency Hz
5		Column C: Net Actual Interchange
6		Column D: Joint Owned Unit dynamic schedule
7		Column E: Non Conforming Load
8		Column F: Pumped Hydro
9		Column G: Ramping units
10		Column H: Transferred Frequency Response
11		Column I: Contingent BA Lost load or generation
12		Column J: BA Bias Setting
13		Column K: BA Load
14		
15	**2**	Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign (+/-) convention defined in FRS Form 1.
16	**3**	Data compression must be turned off for each data point. Quality data will give you quality results in the evaluation.
17	**4**	Data must be at 4 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event.
18		The spreadsheet will work with larger sample size data.
19		If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data.
20	**5**	Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list.
21		Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency.
22		This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 237 of the data.
23	**6**	Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data!A237"
24	**7**	Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz
25		pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 323.
26	**8**	Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data!A323"
27	**9**	In cell "R41" of the "Evaluation" spreadsheet, enter the MW value of the unit(s) that tripped (from the Master Event List). This is only necessary for the "Interconnection" evaluation if you're interested.
28		It is not necessary to do this for the BA evaluation but it will provide a comparison of the BA frequency response as compared to the Interconnection frequency response.
29	**10**	Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook.
30		Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.
31		
32		
33	**Steps**	**To be completed once at the initial setup of the evaluation spreadsheet for your BA.**
34	**A**	Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO".
35	**B**	Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: -80 MW/0.1 Hz (This value could change annually)
36	**C**	For informational and educational purposes, a "Sustained" performance evaluation is provided in the "Evaluation" worksheet and in the "Sustained" Graph. This evaluation uses a Time Constant (TC) to model the frequency respc
37		The time constant is located in cell "L13" of the "Evaluation" spreadsheet and should be edited for the types of generators in your BA. Presently this time constant is set at 0.35.

"Instructions" Tab: Detailed instructions for each step of the process

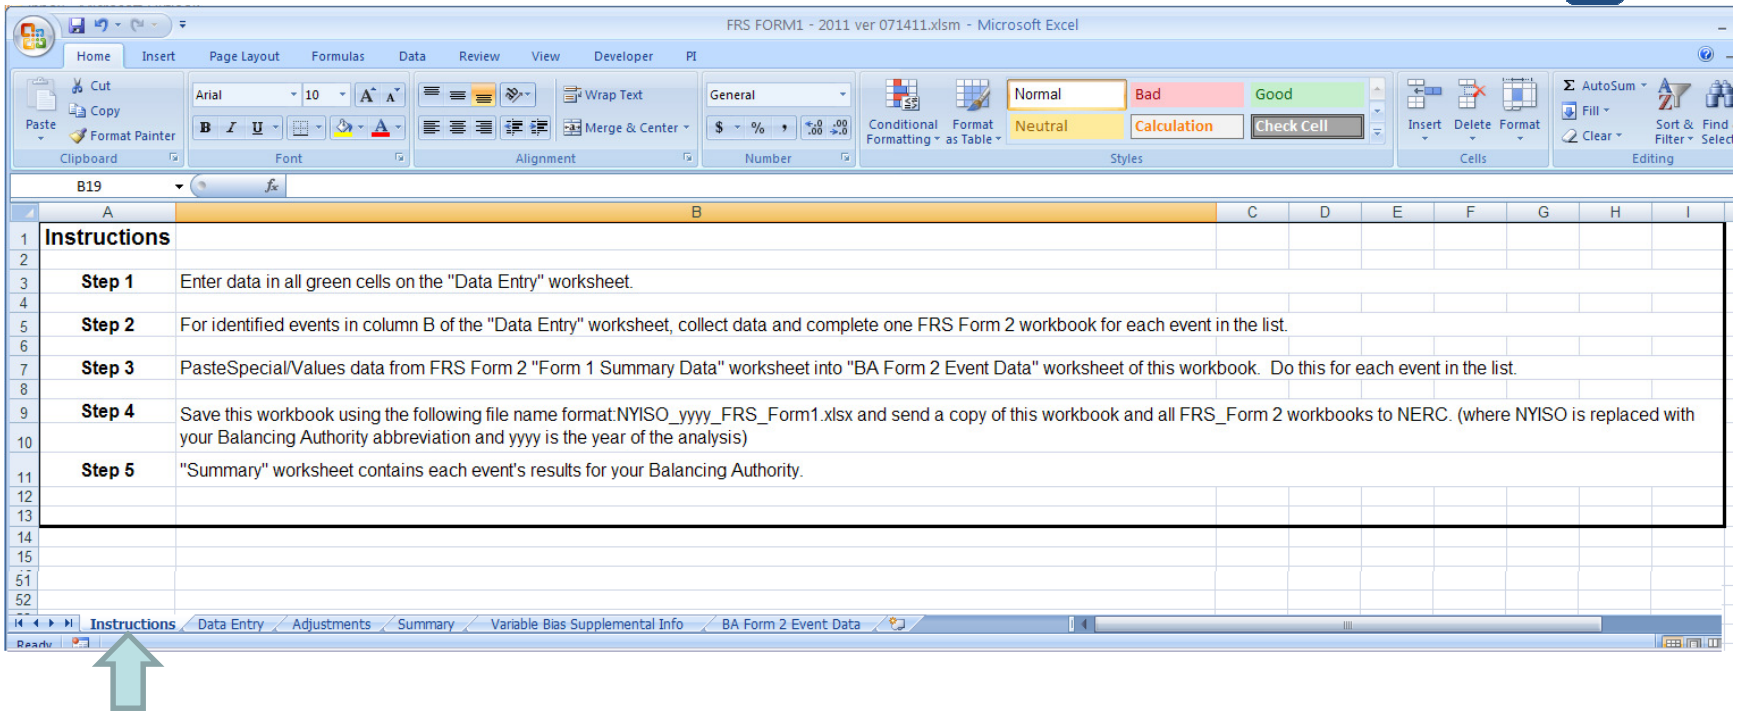
FRS Form 2 File Naming Convention

- Use the following file name convention:
  - Xxxxx_yymmdd_hhmm_FRS_Form2.xlsm
    - Where xxxxx is your BA mnemonic
    - yy is year
    - mm is month
    - dd is day
    - hh is hour
    - mm is minute

FRS Form 1

- One FRS Form 1 for each Interconnection will be generated and posted by NERC
- Contains list of events: date and time that each BA in that Interconnection must measure performance by completing a FRS Form 2
- As each FRS Form 2 is completed, the resulting BA performance data is added to FRS Form 1 by using the PasteSpecial/Values action
- Each BA creates a FRS Form 1 with the performance of their BA to each event

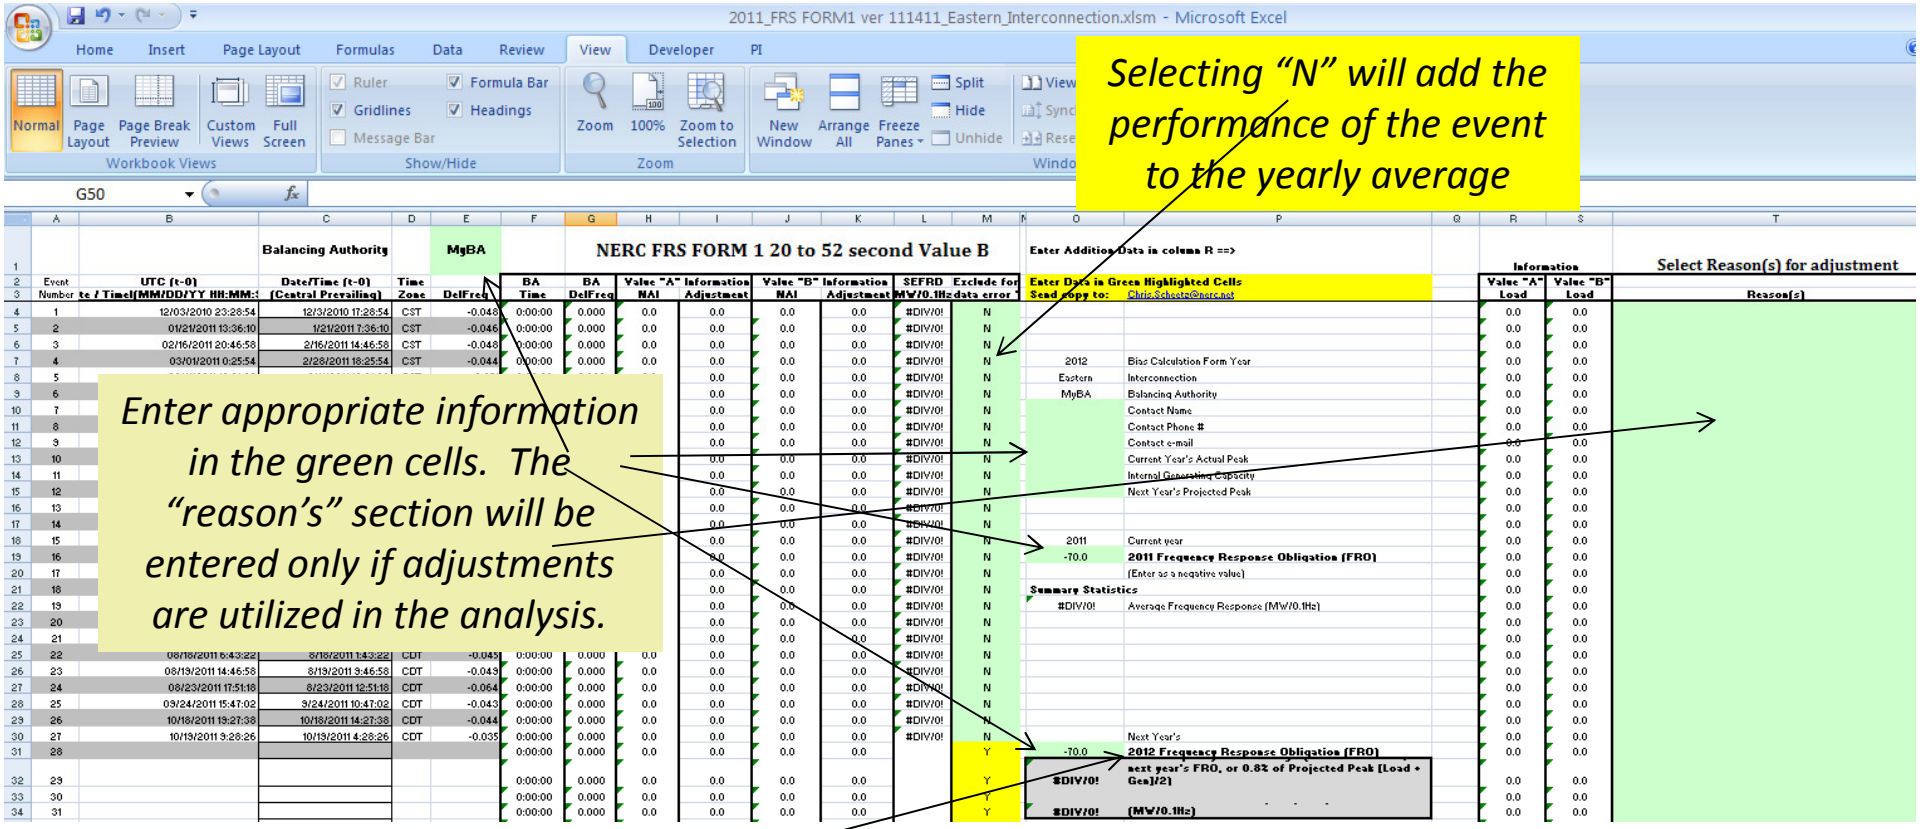
FRS Form 1 Instructions



"Instructions" Tab: Basic instructions for completing FRS Form 1

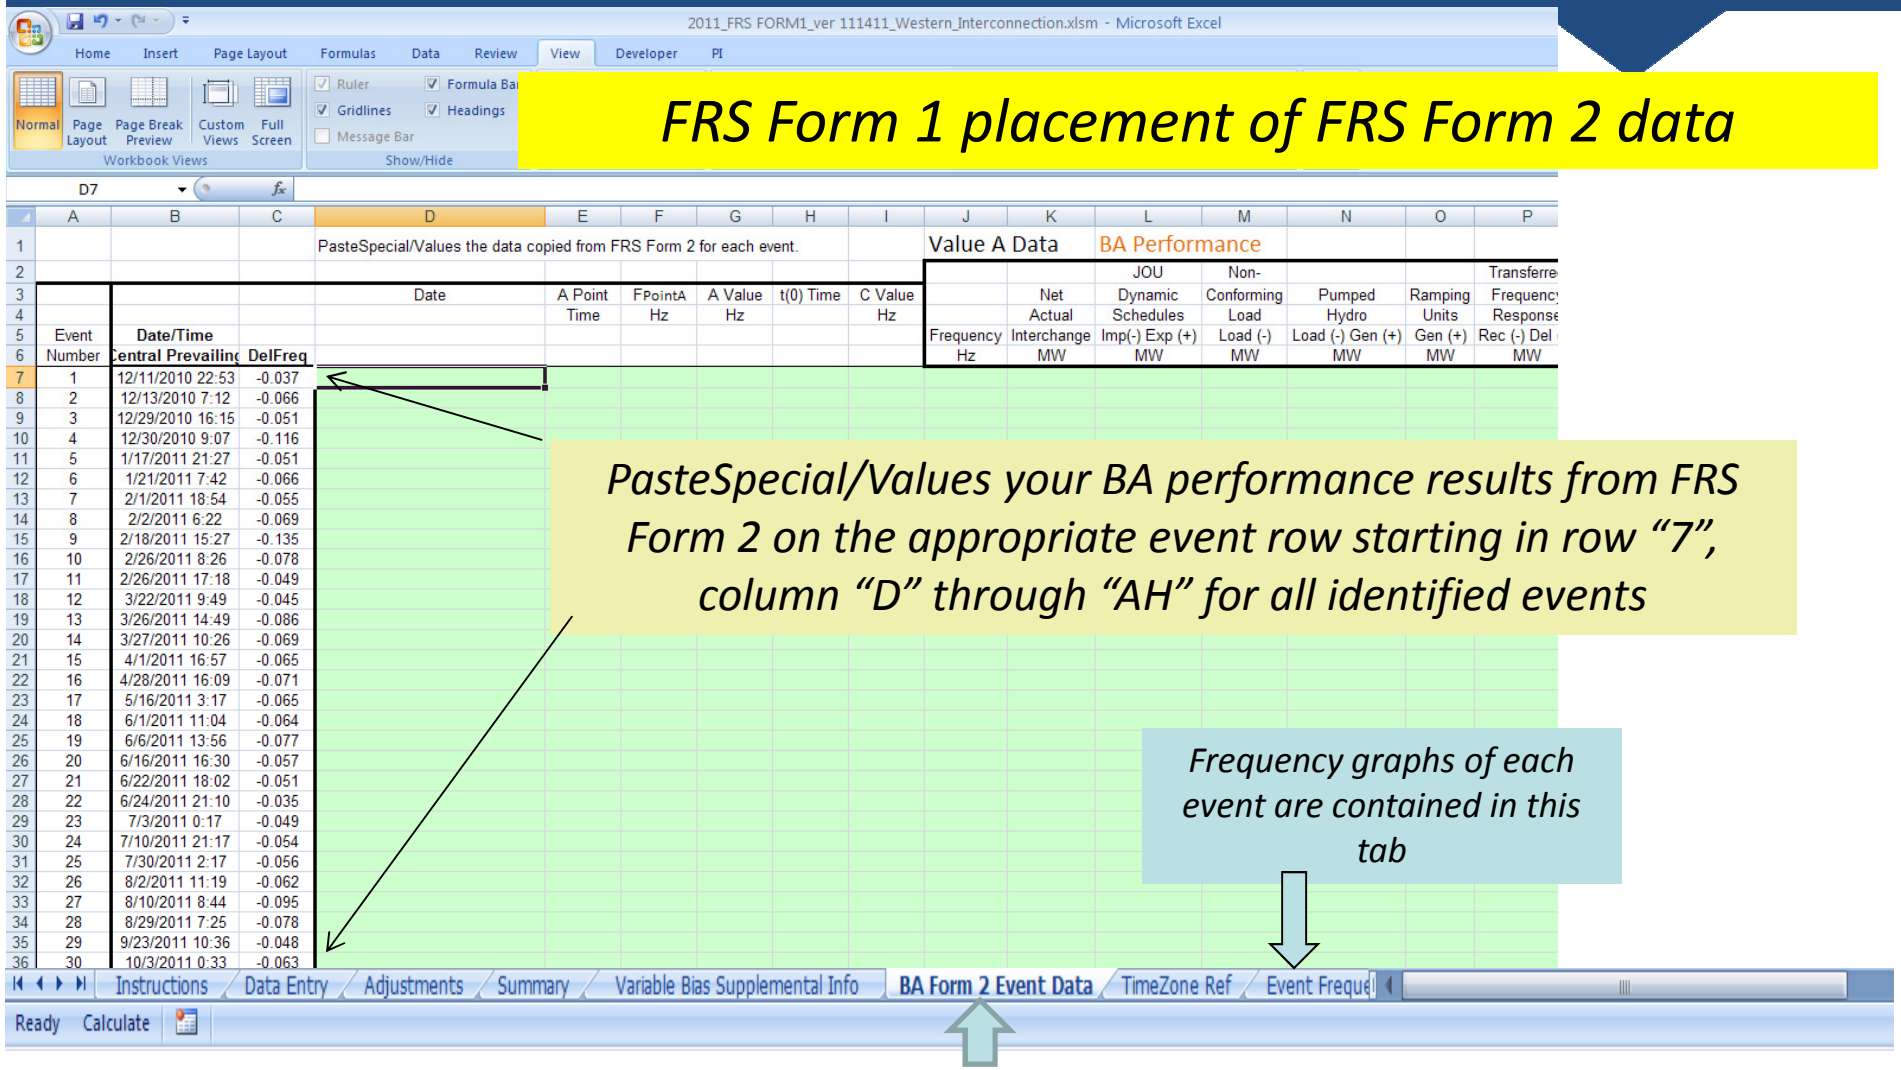
NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

FRS Form 1 Data Entry Worksheet



Correct "year" information will automatically update when the 24th frequency event is identified by NERC and added to the Event Date/Time column

BA Form 2 Event Data



FRS Form 1 placement of FRS Form 2 data

PasteSpecial/Values your BA performance results from FRS Form 2 on the appropriate event row starting in row "7", column "D" through "AH" for all identified events

Frequency graphs of each event are contained in this tab

"BA Form 2 Event Data" Tab: The BA will enter the performance data from FRS Form 2 in this section

FRS Form 1 File Naming Convention

- Use the following file name convention.
  - Xxxxx_yyyy_FRS_Form1.xlsm
    - Where xxxxx is your BA pneumonic
    - yyyy is year

Graphs

- Additional Graphs
  - Graphs of BA Initial performance as measured in the field trial
  - Graphs of BA Sustained Frequency Response performance as a function of the FRO
    - Per Unit evaluation (P.U.) is used for this measure where 1.0 P.U. represents that the BA delivered exactly its FRO during the measurement period
  - Graphs of BA Adjustments are available if the BA utilized this functionality

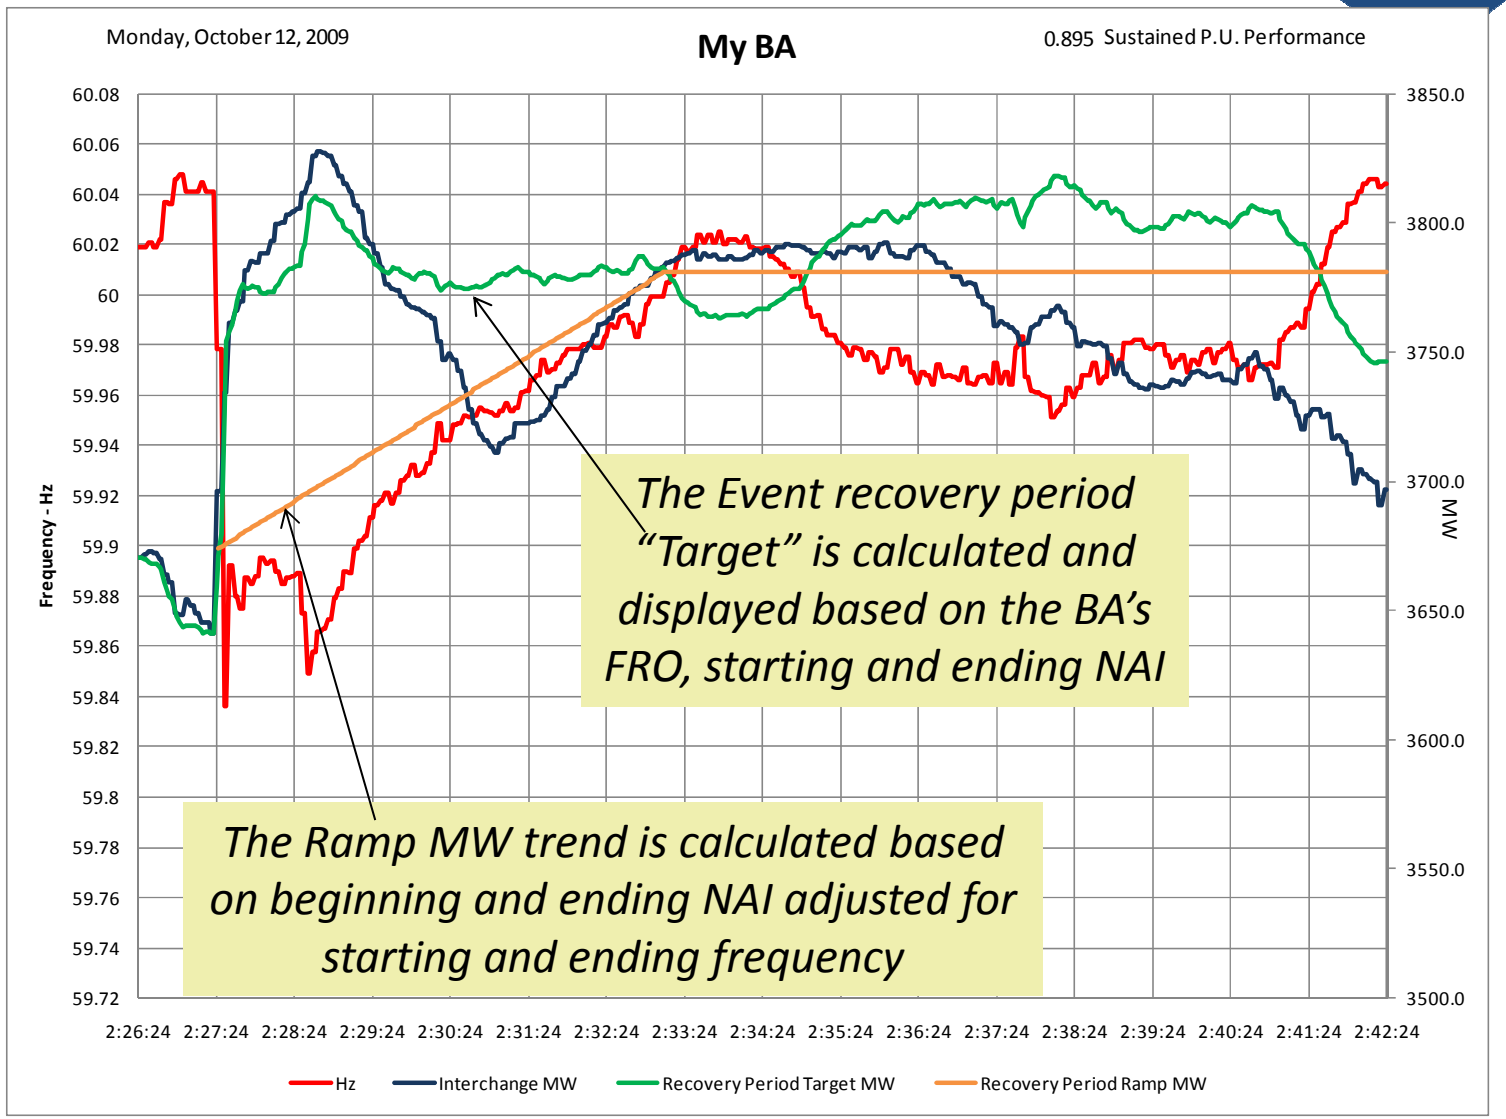
BA Sustained Measure



FRS Form 1 and 2 New Versions

- FRS Form 2 revised with new version number (6)
  - Use appropriate AGC Scan rate form
  - Re-build previously evaluated events using this new version
    - Copy/PasteSpecial old data from previous Form 2 into new version
      - No change to the Data sheet layout
    - Set t(0) and Event Recovery time
    - Copy data into new Form 1
  - Some events on the original Form 1 are not in the new Form 1 version
    - Removed due to issues identified earlier
    - Replacement events added

Contact Information

- If you have questions related to the data request, contact:
  - Questions concerning FRS Form 1 and FRS Form 2
    - Sydney Niemeyer

Questions?

- Please submit your questions via the chat feature in ReadyTalk
- The presenters will respond to as many questions as possible during remainder of the scheduled webinar
- The webinar presentation and slides will be posted to the NERC website
