7.36	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Yes	Concerning generation facility capability, "rated net Real Power" can produce fictitious numbers that will never be attained. This should be the historical or commissioning test maximum net Real Power continuous output, whichever is greater. Wide Area is a very large area for WECC, as WECC is the RC. We are not sure if there are any generation facilities in WECC that have an impact on the whole of WECC. We are also not sure if generation being "pre-designated as reliability 'must run'" is a practice in all areas. It is possible that some units may be designated using other terminology or have detailed contracts. It may be better to remove the quotes and define Must Run Generation in the Glossary. Not all generation that is designated by the Transmission Operator's restoration plan as Blackstart is critical to the plan. It may be listed as a possible resource, but not a primary first choice. Further, much of the restoration plans are out of date and due for revision; requiring generation owners and operators to upgrade for CIP compliance only to have their plant removed in the new restoration plan in the next year or so would be wasteful. The purpose of a Blackstart resource in an old (pre-mandatory reliability standard compliance) restoration plan may be for local level of service resource for the TOP's local distribution area rather than a resource for BES reliability, i.e. the old plans to not coordinate well with each other. Last of all, should there not be a rating qualifier?
7.37	Detroit Edison	Yes	Criteria 1.3 and 2.3 should be removed for the following reasons: 1. The term "reliability must run" is not defined. 2. There is no generator that is so essential to reliability that it would need to run 100% of the time. 3. A generator could be required to run on a given day to serve load in an area that cannot be otherwise served due to a transmission constraint. This would be a temporary condition and should not warrant a high or medium classification.
7.38	Cogeneration Association of California and Energy Producers & Users	Yes	Criteria 2.4 should be clarified. The criteria states "Transmission Facilities with four or more transmission lines operated at 200kV or above..." Do two transmission lines, each with two circuits that can operate independently for a total of four circuits, count as two

#	Organization	Yes or No	Question 7 Comment
	Coalition		transmission lines or four transmission lines?
7.39	Exelon Corporation	Yes	Each of the criteria needs to either align with the other existing standard requirements, or have a technical basis or business risk mitigation basis to be defined as criteria. It would be very beneficial to the industry's understanding of each requirement if the basis for each was included in the Attachment. A specific example is the 4 or more Transmission line requirement. The previous draft had a 3 or more Transmission line requirement, so what was the basis for the 3 or more and, moreover, what is the basis for now changing it to 4 or more? The technical basis for generation limits in Attachment II is not provided. That is, the basis for the 2000 MW and 1000 MW thresholds appear arbitrary. Combined losses of greater than these values have occurred without significant impact to the BES. No "reasonable bounds" are allowed. For example, if a common vendor provides a cyber product in multiple generating stations, it appears that the assumption is that this common product, no matter how local its impact, creates a common mode failure for all plants simultaneously, resulting in the determination before the fact that this product will be rated as High Impact. No allowance is made for geographical location. For example, if a common cyber system is used in several large generating stations in different regions of the country, their simultaneous loss may result in no significant impact to the BES. However the deterministic MWe thresholds and simple "in combination" wording will result in virtually all such cyber systems rated as high, deterring use of common vendors, standardization, and economies of scale. Although moving to a more deterministic approach can be seen as increasing consistency in application of the standard, it would appear that a deterministic approach will decrease the flexibility of operation now allowed and may in fact, reduce BES reliability. As a modification to the Attachment, Exelon suggests that the existing deterministic criteria could be used, unless an entity chooses to show by actual historical data or modeling that such losses do not result in significant impact on the BES. This performance-based criteria could be expanded to define high, medium, and low impacts on the BES in terms of stability, voltage swing, etc.

#	Organization	Yes or No	Question 7 Comment
7.40	American Transmission Company	Yes	For R1.4, we propose changing text from “designated as Blackstart Resources” to “designated as the primary Blackstart Resources” (similar to primary Cranking Path in 1.6). Add “restoration plan per EOP-005” (similar to 1.6). Note that Transmission Operators can only designate Blackstart Resources that have been volunteered to them by Generation Owners. All GO may choose not to volunteer any Blackstart Resources if they don’t want their associated cyber systems to be subject to this standard. For R1.10, we propose removing SPS from the criteria. SPSs cannot be approved by the Regional Entities unless they have been designed not to be critical to the BES (e.g., not critical if they operate when they should not or do not operate when they should).
7.41	SCE&G	Yes	How does the SDT see AGC coming into play in 1.1? Would every generator operated on AGC (if the aggregated total met the contigency reserve commitment) be considered high impact, or just the centralized AGC itself?" Must Run" units needs to be clarified. Who determines if a unit is "must run"? 1.4 This language needs to be clarified to identify resources designated as "Primary" Blackstart resources. 1.5 Transmission lines should be change to Transmission Lines to utilize the NERC Definition 1.8 Is this misusing/destroying one Transmission Facility at a time? SDT should consider defining "Transmission Facility" as a whole instead of utilizing separate NERC Definitions for "Transmission" and "Facility"
7.42	Entergy	Yes	If “size” of an electric facility remains the primary key differentiator for applicability of CIP requirements, which Entergy does not support, the following should be considered: 1. High Impact Rating (H)”Each BES Cyber System that can affect operations for: 1.1. Generation Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple generation Facilities), whose aggregate rated net Real Power

#	Organization	Yes or No	Question 7 Comment
			capability exceeds the largest value, for the 12 months preceding the categorization, of the Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group . In the case where no Contingency Reserve or total reserve sharing obligations have been established, Generation Facilities , singularly or in combination (if using a shared BES Cyber System), with aggregate higher of the most current and prior to the most current rated net Real Power capability of 2,000 MW." Attachment II of CIP-010-1 qualifier 1.1 as stated above includes those generation facilities that have the capability to exceed the Contingency Reserve as High Impact to the BES. This is not truly indicative of the impact to the reliability to the BES. Entergy has multiple generation facilities with the capability to exceed the contingency reserve. However, their Service Hours (SH) are less than 900 hours and a Service Factor (SF) is less than 1.0, averaged over the past five years, where: - Definitions from GADS Data Reporting Instructions - January 2010- Service Hours - SH is the sum of all Unit Service Hours.- Period Hours - PH is the number of hours in the period being reported that the unit was in the active state.- Service Factor - SF = SH/PH x 100% Entergy proposes that a better representation for how much a generation plant runs, and therewith potential adverse impact on BES reliability, would be better determined by a measurement of the percent of SH, e.g., running at least 80% of the year; SH greater than 7008 hours per year, or, a SF of greater than 80% per year. Therefore, suggested alternative language for 1.1 is: "Generation Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple generation facilities the unit with the highest Service Factor is used to determine applicability), whose Service Factor (Service Factor = Service Hours per Year / Hours per Year X 100%) is equal or greater than 80% for a five year average." Additionally, extending this logic to the Medium Impact BES Cyber Systems, Entergy suggests replacement of language concerning Medium Impact Rating (M) 2.1 from: "Generation Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate higher of the most current and prior to most current rated net Real

#	Organization	Yes or No	Question 7 Comment
			Power capability of 1000 MW or more, not included in Section 1." To: "Generation Facilities, singularly or in combinations (if using a shared BES Cyber System that affects multiple generation facilities the unit with the highest Service Factor is used to determine applicability) with equal to or greater than 70% for a five year average."
7.43	Edison Mission Marketing and Trading	Yes	If we are going to use the High, Medium, and Low and there is not going to be a does not apply category, then there should be an engineering analysis or study performed by the BA's, RC's or an independent firm and it should include which sites/generators are critical and which are not and why. Once completed then and only then do we begin categorizing them into whatever scale the Standard Drafting Team and the included entities agree upon. As it is stands now we not only have to include nominal size generators, but wind sites as well.
7.44	Puget Sound Energy	Yes	In 1.6, the restoration plan is linked to EOP-005, shouldn't the restoration plan mentioned in 1.4 be linked to EOP-005 as well? It appears that all BES Cyber Systems must fall into one of three categories. Are there any other criteria that would all for something not to be categorized as one of these three (i.e., such as non-dispatchable wind generation)? Also Blackstart should only classify as high those needed for primary region wide restoration since some (such as ours) are more secondary paths and there should be some minimum level of generation to be classified low. There is no need to classify as low a 20 MW hydro generator that does not impact BES reliability. We would recommend 300 MW.
7.45	Alliant Energy	Yes	In Article 1.3 we believe including "must-run" as listed is problematic. This could fluctuate in response to maintenance outages on lines, etc. The must-run units have to be tied to a long-term study that shows the need for a reliability must-run unit, not short-term analyses to reflect changing conditions.

#	Organization	Yes or No	Question 7 Comment
			Article 1.4 - By including "All Black-Start Units" the standard is utilizing a "one-size-fits-all" strategy that the industry has recognized does not work for everything, and is working to address. All Black-Start units do not carry the same importance and this should be recognized in the standard. This philosophy may be counter-productive to system reliability as one classification may reduce the number of Black Start units that would be made available to a TOP's restoration plan due to the high initial security cost and the future possible financial risk of strict compliance guidelines with penalties. There should be a recognized hierarchy for the Black-Start resources, similar to the High, Medium, and Low for BES Cyber Systems. This methodology would assure Black Start units could be categorized by attributes in general to support the BES during a blackstart event. Each Balancing Authority Area (BAA) could be required to have a minimum number of high priority Black Start units depending on the BAA size to support the area during a black out. Lower priority units would be used for stabilizing power at generating stations, local area islanded load and used as a backup plan if all other contingency plans would fail. Article 1.6 - This item should reflect the same categorizing as is recommended in the comment to Article 1.4 above. Article 2.1 - Please clarify "with aggregate higher of the most current and prior to most current rated net Real Power capability." We believe it would be clearer if stated as below: "Generation Facilities, singularly or in combination (if using a shared BES Cyber System) with a rated Real Power capability of 1000 MW or more, not included in Section 1." Article 2.3 - we believe including "must-run" as listed is problematic. This could fluctuate in response to maintenance outages on lines, etc. The must-run units have to be tied to a long-term study that shows the need for a reliability must-run unit, not short-term analyses to reflect changing conditions.
7.46	Public Service Enterprise Group companies	Yes	In general there is agreement with the R2 text. However, in Attachment II, statement 1.4 entails categorizing all Blackstart Units with a "High Impact Rating", while statement 1.6

#	Organization	Yes or No	Question 7 Comment
			requires that only the “primary cranking path” transmission facilities need to be categorized with a “High Impact Rating”. Statement 1.6 implies that some Blackstart Units, although categorized with a “High Impact Rating” would not be afforded transmission facilities with the same risk categorization. We recommend changing statement 1.6 to include only Blackstart Units that are in the primary cranking path.
7.47	ReliabilityFirst Staff	Yes	In Part 1.1, the referent for “largest value” does not seem to be appropriate. Suggest changing the wording to “average value.” In Part 1.4, a “Blackstart Resource” is only the first resource that starts in a system restoration. Suggest changing the wording to “Generation Facilities required to support the Cranking Path(s) identified in Part 1.6.” In Part 1.6, a “primary” Cranking Path is not required to be identified in an entity’s restoration plan by EOP-005. Suggest changing the wording to “Facilities required to support at least one Cranking Path.” In Part 1.10 “local area” should be defined. As we are not certain what is meant by this term, we have no suggested wording.
7.48	RRI Energy	Yes	Include or add a "No impact category" that is determined by the RC.
7.49	MRO's NERC Standards Review Subcommittee	Yes	Item 1.3 We believe this item may be problematic in nature, as the designation of reliability “must run” units is something that could fluctuate. This would create administrative difficulties for an entity and their RTO as a unit moves between Impact Ratings. We believe this item needs further clarification to indicate its true intent, such as who stipulates the “must run” designation, what constitutes “reliability must run”, etc. Item 1.4 Item 1.4 uniformly identifies all BES Cyber Systems associated with a Generation Facility designated as a Blackstart Resource in the Transmission Operator’s restoration plan as having a High Impact Rating with regards to the Bulk Electric System. Albeit on a smaller scale, this appears to be the same “one size fits all” approach of the current standards that the SDT is working so diligently to address. In reality, all Blackstart Resources do not carry the same importance to even the utility itself, let alone to the Bulk Electric System.

#	Organization	Yes or No	Question 7 Comment
			Therefore, we believe there should be a hierarchy for Blackstart Resources, similar to nearly all other elements being considered, categorizing their associated BES Cyber Systems as High, Medium, or Low Impact. To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. A 10 MW Blackstart Resource that directly supports restoration of a large generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies localized load during an outage. Therefore, we would propose judging the relative importance of a Blackstart Resource by the relative importance of the facilities it directly supports. We would recommend rewording item 1.4 as follows, leveraging the existing language of Item 1.8: "Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 1.1 above." We believe this approach should provide a better sense of a facility's true impact on the Bulk Electric System, resulting in High, Medium, and Low Impact Ratings that adequately address system reliability in a practical manner. Item 1.5 We need to clarify the meaning of "Transmission lines". If a 300 kV substation has a terminal connected to a 345/115 kV transformer, which then feeds a 115 kV transmission line leaving the facility, does this constitute a 115 kV or 345 kV "Transmission line" within the context of this item? For this example, we would interpret this to be a 115 kV line, so it would not be included in the Transmission line count for the substation bright line. We also believe the bright line should take higher voltages in to consideration. A substation with three 765 kV lines would not be High Impact, but a substation with four 345 kV lines would be. We propose additional criteria of two or more 500 kV lines, or

#	Organization	Yes or No	Question 7 Comment
			simply adding to/changing the High Impact criteria along the lines of the Medium Impact criteria (item 2.6), calling out "Transmission Facilities operated at 500 kV or higher..." Item 1.6 We would recommend rewording item 1.6 as follows for consistency in approach with the proposed Item 1.4: "Facilities required by the Transmission Operator's restoration plan to directly support a primary Cranking Path for a Generation Facility with aggregate rated capabilities as described in Part 1.1 above."We believe this approach should provide a better sense of a facility's true impact on the Bulk Electric System, resulting in High, Medium, and Low Impact Ratings that adequately address system reliability in a practical manner. Item 1.14 We would recommend rewording item 1.14 as follows:"Transmission Operator functions performed by primary or backup Control Centers that remotely control two or more BES Cyber Systems with a Medium Impact Rating, or one or more BES Cyber Systems with a High Impact Rating."We believe this approach should provide a better sense of a control center's true impact on the Bulk Electric System. Item 2.7 We would recommend rewording item 2.7 as follows:"Transmission Operator functions performed by primary or backup Control Centers that remotely control one or more BES Cyber Systems with a Medium Impact Rating, not included in Section 1."We believe this approach should provide a better sense of a control center's true impact on the Bulk Electric System. Section 2 Additions We would recommend adding the following items under section 2, Medium Impact Rating, for consistency in approach with the proposed Items 1.4 and 1.6: o "Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility

#	Organization	Yes or No	Question 7 Comment
			with aggregate rated capabilities as described in Part 2.1 above, not included in Section 1." o "Facilities required by the Transmission Operator's restoration plan to directly support a primary Cranking Path for a Generation Facility with aggregate rated capabilities as described in Part 2.1 above, not included in Section 1." We believe this approach should provide a better sense of a facility's true impact on the Bulk Electric System, resulting in High, Medium, and Low Impact Ratings that adequately address system reliability in a practical manner.
7.50	Minnesota Power	Yes	Item 1.4: Item 1.4 uniformly identifies all BES Cyber Systems associated with a Generation Facility designated as a Blackstart Resource in the Transmission Operator's restoration plan as having a High Impact Rating with regards to the Bulk Electric System. In theory, on a smaller scale, this appears to be a "one size fits all" approach, but in reality, all Blackstart Resources do not carry the same importance to even the utility itself, let alone to the Bulk Electric System. Therefore, Minnesota Power believes that there should be a hierarchy for Blackstart Resources, similar to nearly all other elements being considered, categorizing their associated BES Cyber Systems as High, Medium, or Low Impact. To implement this approach, Minnesota Power believes it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just the fact that it has been included. For example, a 10 MW Blackstart Resource that directly supports restoration of a large generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies localized load during an outage. Therefore, Minnesota Power proposes that the Standards Drafting Team allow Registered Entities to assess the relative importance of a Blackstart Resource based on the importance of the facilities it directly supports. Minnesota Power recommends rewording item 1.4 as follows utilizing the existing language of Item 1.8:

#	Organization	Yes or No	Question 7 Comment
			"Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 1.1 above." Minnesota Power believes this approach will provide a better sense of a facility's true impact on the Bulk Electric System, resulting in High, Medium, and Low Impact Ratings that adequately address system reliability in a practical manner. Item 1.14: Minnesota Power recommends rewording item 1.14 as follows:"Transmission Operator functions performed by primary or backup Control Centers that remotely control two or more BES Cyber Systems with a Medium Impact Rating, or one or more BES Cyber Systems with a High Impact Rating."Minnesota Power believes that this approach will provide a better sense of a control center's true impact on the Bulk Electric System. Item 2.7: Minnesota Power recommends rewording item 2.7 as follows:"Transmission Operator functions performed by primary or backup Control Centers that remotely control one or more BES Cyber Systems with a Medium Impact Rating, which are not included in Section 1."Minnesota Power believes that this approach will provide a better sense of a control center's true impact on the Bulk Electric System. Section 2 Additions: Minnesota Power recommends adding the following items under section 2, Medium Impact Rating, for consistency with the proposed Item 1.4:"Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 2.1 above, not included in Section 1."Minnesota Power believes that this approach will provide a better sense of a facility's true impact on the Bulk Electric System, resulting in High, Medium, and Low Impact Ratings that adequately address system reliability in a practical manner.

#	Organization	Yes or No	Question 7 Comment
7.51	The Empire District Electric Company	Yes	Item 1.4 Item 1.4 uniformly identifies all BES Cyber Systems associated with a Generation Facility designated as a Blackstart Resource in the Transmission Operator's restoration plan as having a High Impact Rating with regards to the Bulk Electric System. Albeit on a smaller scale, this appears to be the same "one size fits all" approach of the current standards that the SDT is working so diligently to address. In reality, all Blackstart Resources do not carry the same importance to even the utility itself, let alone to the Bulk Electric System. Therefore, we believe there should be a hierarchy for Blackstart Resources, similar to nearly all other elements being considered, categorizing their associated BES Cyber Systems as High, Medium, or Low Impact. A regional study performed by the regional entities would be an excellent approach to determine this. To implement this approach, we believe it is imperative to consider the Blackstart Resource's actual role in the restoration plan, not just its simple inclusion. A 10 MW Blackstart Resource that directly supports restoration of a large generating facility is much more important to the Bulk Electric System than a 10 MW Blackstart Resource that simply supplies localized load during an outage. Therefore, we would propose judging the relative importance of a Blackstart Resource by the relative importance of the facilities it directly supports. We would recommend rewording item #1.4 as follows, leveraging the existing language of Item #1.8: "Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 1.1 above." Since item #1.6 is also related to system restoration, we would recommend rewording it as follows for consistency in approach: "Facilities required by the Transmission Operator's restoration plan to directly support a primary Cranking Path for a Generation Facility with aggregate rated capabilities as

#	Organization	Yes or No	Question 7 Comment
			described in Part 1.1 above." We would also recommend adding the following items under section 2, Medium Impact Rating: o "Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 2.1 above." o "Facilities required by the Transmission Operator's restoration plan to directly support a primary Cranking Path for a Generation Facility with aggregate rated capabilities as described in Part 2.1 above." We believe this approach should provide a better sense of a facility's true impact on the Bulk Electric System, resulting in High, Medium, and Low Impact Ratings that adequately address system reliability in a practical manner. Item 1.5 We need to clarify the meaning of "Transmission lines". If a 300 kV substation has a terminal connected to a 345/115 kV transformer, which then feeds a 115 kV transmission line leaving the facility, does this constitute a 115 kV or 345 kV "Transmission line" within the context of this item? For this example, we would interpret this to be a 115 kV line, so it would not be included in the Transmission line count for the substation bright line. We also believe the bright line should take higher voltages in to consideration. A substation with three 765 kV lines would not be High Impact, but a substation with four 345 kV lines would be. We propose additional criteria of two or more 500 kV lines, or simply changing the High Impact criteria to mirror that of the Medium Impact (item 2.6), calling out "Transmission Facilities operated at 500 kV or higher...".
7.52	Lincoln Electric System	Yes	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS), which address the current structure of Attachment II as proposed. However, LES believes a better overall approach would be applying

#	Organization	Yes or No	Question 7 Comment
			Engineering studies to truly determine a facility's impact on the Bulk Electric System. We realize an Engineering study is not as simple as a "bright line" based metric. Unfortunately, the Bulk Electric System is not a simple system - it is actually very complex. So in order to properly assess the importance of the various facilities that make it up, LES feels a complex Engineering study is required.
7.53	Luminant	Yes	Medium Impact: an item for TO, TOP, GO, GOP Functions performed at primary or backup control centers has been left off of attachment 2. This was in the previous posting as item 2.6"Control Centers and backup Control Centers controlling transmission ...
7.54	Nuclear Energy Institute	Yes	Need to clarify the expectations for a multi unit generation site. For example: Under what conditions would a site containing two separate 900 MW generators be considered "Medium Impact Rating" because the total site would now be greater than 1000 MW? Similarly, when would a site that had three separate 900 MW generators be considered "High Impact Rating" because the total site would now be greater than 2000 MW?
7.55	NextEra Energy Corporate Compliance	Yes	NextEra finds that a catch-all for Low impact is a fatal flaw. There should be some threshold that is justified for low. For example, a proper minimum criteria for LOW impact BES Cyber Systems could be:Cyber Systems that control BES level facilities that meet one of the following: 1) three or more transmission circuits operated at 100 kV or above not covered in Section 1 or 2, 2) two or more transmission circuits and two or more autotransformer with a secondary voltage 100kV or above,3) two or more transmission circuits and generation capacity at the site of greater than 1000MW Alternatively, a NO IMPACT category may be added which eliminates subjectivity in which BES Cyber components need to be reviewed. Single point buses representing looped load serving type stations cannot produce results worse than single contingency which must be operated to at all times. An additional item that should be specifically covered is the use of remote access for transmission and / or generation control locations and their applicability to the High, Medium, Low and/or No impact criteria.

#	Organization	Yes or No	Question 7 Comment
			The term "affect operations" can be subjective and can be open to interpretation. NextEra suggests changing the15 minute requirement to “in real time (instantaneous). For example, closed loop control, which does not allow time for human intervention.” NextEra also recommends adding the word “both” prior to monitor and control. NextEra would also like to know what does 1.1.1 of section D mean? This is unclear. A suggestion would be eliminating or providing a specific definition.
7.56	Pacific Gas & Electric Company	Yes	Not all blackstart resources should necessarily be considered high impact. Suggest revising 1.4 as follows: Generation Facilities designated as Blackstart Resources and explicitly listed as essential to the restoration of the BES in the Transmission Operator’s restoration plan.
7.57	Northeast Utilities	Yes	NU is concerned with some of the impact criteria in Attachment II related to generation facilities. To base impact on “bright line" Facility Rating thresholds, i.e., MW, kV, MVAR, etc., could lead to mis-categorization and ultimately unprotected cyber systems. These thresholds do not take into consideration regional differences in configuration and load flows. Therefore, it is our suggestion that categorization could be based on the results of a regional engineering study, similar to what is currently required in the TPL Standards. This study could be conducted by the regional Planning Authority(s) or an independent third party and approved by the Regional Entity. The results of the study would identify the contingencies that have the potential to cause levels of impact to the BES.
7.58	Matrikon Inc.	Yes	Please describe how the 15-minute time horizon would fit into Attachment 2. Is the intent for the 15-minute horizon to provide a level of realism to determination of impact? To bring in more BES Cyber systems that could have indirect impact, or an escape clause if effects don’t occur within 15 minutes?
7.59	USACE HQ	Yes	Please read answer to question 4.

#	Organization	Yes or No	Question 7 Comment
7.60	BGE	Yes	Provide additional clarification of “automatic aggregate”. For instance, does automatic mean an application that is kicked off without human intervention or does automatic mean after an operator hits a button? Suggest adding the word “instantaneous” before load shedding to clarify. Additional clarification on 1.14 (What is meant by “functions”)
7.61	Southwestern Power Administration	Yes	Rather than numerous bright line requirements that may or may not actually have a significant effect on the BES, depending on the surrounding topology, operating procedures, or configuration of a particular Responsible Entity, a better approach may be to include performance/results-based criteria in Attachment II. However, if the current approach is forwarded, I would suggest the following improvements: 1.4. Generation Facilities designated as Primary Blackstart Resources in the entity’s restoration plan. 1.7 Transmission Facilities, including Flexible AC Transmission Systems (FACTS), that, if destroyed, degraded, misused or otherwise rendered unavailable, would violate one or more Interconnection Reliability Operating Limits (IROLs). 1.10 Special Protection Systems (SPS), Remedial Action Schemes (RAS) or automated switching systems that operate BES Elements that if destroyed, degraded, or misused, would violate one or more Interconnection Reliability Operating Limits (IROLs). 1.11. Delete. Is this not a Control Center issue? 1.12. Control Centers that perform the Reliability Coordinator functions. 1.13. Control Centers that perform the Balancing Authority functions for 4,000 MW or more in Eastern and Western Interconnections and 2,000 MW or more in the Texas and Quebec Interconnections. 1.14. Control Centers that perform the Transmission Operator functions for a Facility

#	Organization	Yes or No	Question 7 Comment
			with a High Impact Rating. 2.4. Transmission Facilities that, if destroyed, degraded, misused or otherwise rendered unavailable, would violate one or more System Operating Limits (SOLs) 2.7. Control Centers that perform the Transmission Operator for a Facility with a Medium Impact Rating, not included in Section 1. 2.8. Control Centers that perform the Balancing Authority functions for 2,000 MW or more in the Eastern and Western Interconnections and 1,000 MW or more in the Texas and Quebec Interconnections, not included in Section 1.
7.62	Southern California Edison Company	Yes	SCE believes Attachment II should be modified to account for only the capacity that can be controlled by qualifying systems. As currently written, Attachment II defines the amount of generation under control as the rated capacity of the resource. This is not accurate for some systems which can only control the resource between certain points (e.g. minimum operational output [Pmin] and maximum operational output [Pmax]). This could drastically overstate the impact of the cyber system on the BES. For example, suppose that a cyber system controlled a generating resource with maximum capacity of 2,000 MW. According to attachment II, this would then categorize as "high impact rating". However, suppose further that the system can only control the unit between its Pmin and Pmax which are 1,500 and 2,000 respectively. This would place the system in a "low impact rating" according to the attachment. For that reason, SCE believes that Attachment II should be modified to account for only the capacity that can be controlled by the system.
7.63	San Diego Gas and Electric Co.	Yes	SDG&E recommends aiming for a limitation of scope related to those assets that are truly high and medium impact categorizations. Some of the high and medium items could have "BES outage" or reliability implications but may not necessarily result in instability of the BES. We recommend having consistency in the application of the assets included in the impact categories to the BES as a whole.

#	Organization	Yes or No	Question 7 Comment
7.64	Constellation Energy Control and Dispatch, LLC	Yes	See answer to Question 4.
7.65	Constellation Energy Commodities Group Inc.	Yes	See answer to Question 4. Please clarify the intended treatment of a Generation Management System ("GMS"). Attachment II implies that capacity monitored by a GMS system would be aggregated to determine its impact categorization. However, to be consistent with the intention to protect connections that truly impact the BES net real power capability should only be aggregated within a balancing authority.
7.66	MWDSC	Yes	See comments for question 4 above.
7.67	Wolverine Power	Yes	See comments listed for 1.a
7.68	Dynegy Inc.	Yes	Show examples of how the identification and categorization and tie-in to Attachment II would work.Also, for 1.1, either increase the net MW rating or add an annual capacity factor to a generating unit to account for old units at a site that no longer run because no longer economical. These types of facilities should not have to meet High category requirements if they no longer run. Also, for 1.3 add more detail. Explain pre-designated. Assigned by who? Explain Wide Area reliability impacts.
7.69	WECC	Yes	Similar to our previous comment, if Attachment 1 is expanded to include in scope reliability coordination functions critical to reliable operation of the BES outside of 15 minutes the impact levels need to be updated. While many functions of a Reliability Coordinator are critical and should be an high impact, not all functions of reliability coordination should be made high impact. For instance, Coordinated Outage systems while important to the reliability of the BES and should be in scope, should best be classified as a low-impact BES Cyber System. The considerations for identification and categorization has been elevated to a high level such that BES Cyber Systems and not individual devices are identified based on their specific functionality. It is suggested that if BES Cyber Systems are to be indentified and

#	Organization	Yes or No	Question 7 Comment
			categorized there be some inclusion and development of a process to granulate these systems down to their individual component level. Further, the quantitative qualification bar has been set to level that precludes most BES Cyber Systems from reaching identification as a high or even medium level of impact. Taking into account. If a BES Cyber System can impact reliability a baseline set of security controls should be established that creates tracking for all assets, accountability for access to these assets, and physical and electronic protection for these assets. Specific Line Item Comments(1.1) The standard, as drafted, seemingly excludes all generation but large dams, large mine-based coal plant and nuclear plants?(1.1) The developed sentence structure lends itself to multiple interpretations and will prove to be difficult to audit consistently. (1.1) Is the term aggregated defined as geographically co-located, common substation, common communication paths, etc?(1.6) What about redundant paths? There is no requirement to identify and document multiple paths. (1.6) A reference to EOP-008 would also be appropriate.
7.70	Con Edison of New York	Yes	Specific comments on the Categorization: The impact categories should be linked to the reliability Standard functions in Attachment I. Therefore, the High, Medium and Low ratings should reference specific Standards whenever possible. o 1.1: This requirement should be broken down into two requirements. One should refer to BAL-002 and reserves needed to be compliant. The second should be any generation facility with a common BES Cyber System greater than 2,000 MW. o 1.2: This should be linked to the function of “controlling voltages”. Two other concerns; first - shunt reactors and capacitors are not included and second - there needs to be a technical basis for a Reactive Power capability limit. o 1.3: Suggest moving to “Low” category since reliability must run equipment is frequently a local congestion or voltage control situation. This would not qualify for a “High” impact rating.

#	Organization	Yes or No	Question 7 Comment
			o 1.4: Black start resources should only be designated as a High Impact Rating if they are the only resource in the TOP's restoration plan. If the TOP has multiple restoration resources and procedures, the resources should be a Medium Impact Rating. Reference this to EOP standards. o 1.5: OK o 1.6: This item should be included in item 1.4 o 1.7: FACTS devices are used to control voltage and power flow. o 1.8: This should be included in requirement 1.1 o 1.9: OK o 1.10: Refer to PRC standards o 1.11: A basis for the 300 MW or greater UFLS system should be provided. o 1.12, 1.13, and 1.14 address Control Centers and should be aggregated into one requirement based on RC functions, BA functions, TOP functions and TO functions. In addition, there may be a conflict between a Control Centers with a "Low Impact Rating" and a single substation with a "High Impact Rating". The DT should consider addressing this conflict where the "BES Cyber Security Components" on one side of a device (e.g. breakers) is a "high impact" while the command signal will be a "low impact" device. General comment on criteria for categorization: Overall, the high, medium, and low levels do not properly meet the needs of the BES. The DT should be looking at what the system does and determining its ability to impact the BES rating rather then the impacted equipment. For example, SCADA systems should be High whether they are on the 138 kV or 345 kV. Wide scale damage can be done with access to the SCADA system, however only local issues can occur with access into a single non-networked microprocessor relay. Alarm panels and other microprocessor that do not have direct impact should also be at lower level. Items that set levels should be a medium level. Basis for criteria for categorization is needed:

#	Organization	Yes or No	Question 7 Comment
			Attachment II to CIP-010 contains a number of what appear to be administratively determined "bright lines." Please provide both the detailed rational supporting each "bright line" and a specific quantification of the reliability benefits resulting from its implementation. In responding to this question, please focus more on the technical, reliability-related rational and improvements for each "bright line" selected, rather than on the source of any particular number. Reference any white papers, studies, expert opinion, or other documentation relied upon and supporting the "bright lines" selected. For example, in Attachment II category High Impact for item 1.11, please explain why 300 MW was selected. We are not so much interested in any reference to a 300 MW EOP-004 DOE reporting requirement, as we are in the specific criticality of the 300 MW level to BES reliability, e.g., 300 MW represents a large (>10%) percent of area load, or in the case of inadvertent actuation would cause an uncontrolled system instability(ies) and cascading, or in the event of a failure-to-actuate would cause the Interconnection UFLS program not to return frequency to nominal within the program required time period. What if for a given entity 300 MWs is not a significant percentage of local load, or inadvertent actuation would not cause uncontrolled instability and cascading, or failure-to-actuate would not prevent the return of frequency to normal within the required time period? Why rate such aggregate automatic load shedding "High" rather than "Medium" or "Low?" Are there any Interconnection-wide studies which would support this 300MW "bright line" value? Please provide any reference(s).
7.71	Allegheny Energy Supply	Yes	Suggested revision for 1.2: Synchronous condensers, static VAR compensators, capacitor banks and other Facilities not associated with Generation Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate rated net Reactive Power capability of 1,000 MVAR or more. The Standard needs a definition of Blackstart Resources that addresses, or modify the language in 1.4 to clarify, that only Blackstart Resources identified as essential to initial restoration of the BES in the TOP restoration plan are intended as High Impact.

#	Organization	Yes or No	Question 7 Comment
7.72	Allegheny Power	Yes	Suggested revision for 1.2: Synchronous condensers, static VAR compensators, capacitor banks and other Facilities not associated with Generation Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate rated net Reactive Power capability of 1,000 MVAR or more. Clarification is needed for the term “primary Cranking Path” (CIP-010-1 Attachment II item 1.6). Cranking Path is a NERC defined term, however, “primary Cranking Path” is not defined. Item 1.3 includes all generating facilities designated as Blackstart Resources in the Transmission Operator's restoration plan. Most larger entities submit multiple plans with multiple blackstart units and cranking paths. Protecting all blackstart units may divert finite resources from (better) protecting more valuable facilities. Moreover, it is not appropriate to create a perverse incentive for system owners and operators to reduce the current flexibility and diversity of multiple blackstart units and cranking paths by requiring a level of protection that is not proportional to the level of impact to restoration of the BES. Draft definition of “primary Cranking Path”: "Cranking Path and facilities included in the Transmission Operator’s restoration plan as the preferred path and facilities for restoring the BES system to a stable condition with sufficient generation capacity synchronized to complete the full restoration of native load”. Regarding 1.7, we recommend striking “Flexible AC Transmission Systems (FACTS)” because it would be included within Transmission Facilities. Although capitalized, it does not appear in the NERC Glossary of terms The Standard needs a definition of Blackstart Resources that addresses, or modify the language in 1.4 to clarify, that only Blackstart Resources identified as essential to initial restoration of the BES in the TOP restoration plan are intended as High Impact. Under Frequency Load Shed systems under a common control system.

#	Organization	Yes or No	Question 7 Comment
7.73	EEI	Yes	Suggested revision for 1.2: Synchronous condensers, static VAR compensators, capacitor banks and other Facilities not associated with Generation Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate rated net Reactive Power capability of 1,000 MVAR or more. Clarification is needed for the term “primary Cranking Path” (CIP-010-1 Attachment II item 1.6). Cranking Path is a NERC defined term, however, “primary Cranking Path” is not defined. Item 1.4 includes all generating facilities designated as Blackstart Resources in the Transmission Operator's restoration plan. As a result, the drafting team should consider whether to combine Items 1.4 and 1.6. Moreover, most larger entities submit multiple plans with multiple blackstart units and cranking paths. Protecting all blackstart units may divert finite resources from providing additional protections for more valuable facilities. Moreover, this may create incentives for system owners and operators to reduce the current flexibility and diversity of multiple blackstart units and cranking paths by requiring a level of protection that is not proportional to the level of impact to restoration of the BES. It is not appropriate to expand the definition of blackstart to include full restoration of native load, that would essentially include all or most of the BES. The objective here is to prioritize, and augment security for the elements needed to begin system restoration. EEI suggests the following definition of “primary Cranking Path”: "Cranking Path and facilities included in the Transmission Operator’s restoration plan as the preferred path and facilities for initial system restoration”. In addition, the drafting team should modify the wording to only include units designated on a seasonal or annual basis. Regarding 1.7, EEI recommends striking “Flexible AC Transmission Systems (FACTS)” because it would be included within Transmission Facilities. Although capitalized, it does

#	Organization	Yes or No	Question 7 Comment
			not appear in the NERC Glossary of terms Suggest Adding: 1.15 Control Centers including Generation Control Centers. Also, we suggest that the drafting team place the highest impact facilities earlier (e.g. 1.1) on the list. The Standard needs a definition of Blackstart Resources that addresses, or modify the language in 1.4 to clarify, that only Blackstart Resources identified as essential to initial restoration of the BES in the TOP restoration plan are intended as High Impact. EEI suggests that 1.11 in Attachment II be revised as follows:"BES Elements that perform automatic aggregate load shedding of 300 MW or more under a common control system."]
7.74	APPA Task Force	Yes	The APPA Task Force commends the drafting team on their work on CIP-010-1. We appreciate the team's consideration of our Task Force comments from the previous informal comment period. We feel it is especially important for entities to have the option of categorizing the impact level based on the Contingency Reserve or total of reserve sharing obligations as stated in 1.1. However, we are concerned with the "bright line" Facility Rating thresholds, i.e., MW, kV, MVAR, etc. These thresholds do not have a basis from industry experience and could be challenged by entities or regulators. We are concerned that having chosen these numbers without empirical data supporting them, the numbers can easily be changed without the supporting empirical data. It is our recommendation that these numbers be evaluated more closely. At a minimum, the thresholds should be quantified to show what percentage of generation and transmission facilities would be designated under each Impact Rating. Florida Municipal Power Association (FMPA) provided some suggested alternative calculation methods for the Impact Categorization of Attachment II. We provide them here for the drafting team's discussion in evaluating the bright line thresholds. FMPA Comments:

#	Organization	Yes or No	Question 7 Comment
			Categorization could be based on the results of a regional engineering study, similar to what is currently required in the TPL Standards. This study could be conducted by the regional Planning Authority(s) or an independent third party and approved by the Regional Entity. The results of the study would identify the contingencies that have the potential to cause the following levels of impact to the BES: o High (has the potential to cause an Adverse Reliability Impact) o Medium (has the potential to require planned/controlled loss of load) o Low impact (has no potential to cause loss of load) Make changes to existing criteria: 1.1, 1.8, 1.11 and 1.13 ought to be combined into a single supply-demand mismatch metric. Also, in 1.1, 2000 MW is arbitrary and in 1.13 4000 MW is arbitrary. And in 1.11, 300 MW is arbitrary and seems to coincide with DOE reporting requirements associated with EOP-004 which has nothing to do with BES Reliability. FMPA suggests: “Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple Facilities) or Control Centers that if destroyed, degraded, misused, or otherwise rendered unavailable, can cause a supply-demand mismatch exceeding the largest value, for the 12 months preceding the categorization, of the Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group. Such language addresses situations where a DC tie line may be the largest loss of source contingency for a region that is left as a gap in the existing definition, clarifies whether winter or summer generator capabilities are to be used, and used reliability related metrics instead of arbitrary targets. Similarly, the 1000 MW of 2.1 is arbitrary. A more appropriate metric would be the lowest expected value for a single contingency loss of source in the Reliability Coordinator area. For instance, assuming a 7% average forced outage rate for generators, using a metric of the second largest loss of source contingency in the Reliability Coordinator area for a supply-demand mismatch metric would give a greater than 99% confidence that the largest loss of source contingency at any given time is

#	Organization	Yes or No	Question 7 Comment
			greater than that metric. Since the system is always operated to the worst case single contingency at any moment, then, we would be quite confident in using the metric of the second largest loss of source contingency for Medium Impact. Hence, FMPA suggests that 2.1, 2.5 and 2.8 be combined using similar language to that which FMPA suggests for 1.1 using the second largest loss of source contingency in place of the reserve sharing obligation used in 1.1. that is: ”Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple Facilities) or Control Centers that can cause a supply-demand mismatch exceeding the second largest loss of source contingency in the Reliability Coordinator Area.” In 1.2, the 1000 MVARs is arbitrary. Additionally 1.2, 1.3, 1.7 and 1.10 ought to be combined using the same concept of exceeding IROLs. FMPA suggests: ”Transmission Facilities, active compensation devices (such as synchronous condensers and SVCs), reliability must-run generation, or Special Protection Systems, that, if destroyed, degraded, misused, or otherwise rendered unavailable, results in exceeding an IROL and/or an Adverse Reliability Impact.” Similarly, the 500 MVAR in 2.2 is arbitrary. FMPA suggests combining 2.2 with 2.3 and 2.5 in a similar fashion: ”Transmission Facilities, active compensation devices (such as synchronous condensers and SVCs), reliability must-run generation, or Special Protection Systems, that, if destroyed, degraded, misused, or otherwise rendered unavailable, results in exceeding a SOL.” Radial Facilities serving only load should not be included in 1.5 or 2.4. The term “Facilities” in these bullets is misused; a substation is NOT a Facility, but rather an interconnection point for multiple Facilities. Large auto-transformers and GSUs should not be excluded from the count. And, the distinction between the Interconnects is arbitrary and meaningless. We suggest:

#	Organization	Yes or No	Question 7 Comment
			”1.5 Transmission substations or switching stations with four or more Transmission Facilities operated at 300 kV or higher (for transformers, both primary or secondary winding > 300 kV, or a GSU of a registered generator).” By using the term Facilities, which by definition is a “... single BES Element”, we also exclude radial serving only load since that those Elements are not Facilities. 2.4 would then be identical except using the 200 kV metric instead of 300 kV. In 2.6, the distinction between the Interconnects is arbitrary and meaningless. The 300 kV metric should be used for all Interconnects. 1.14 is ambiguous. Is a tapped substation included in the count? Or a station on the end of a radial line? FMPA suggests associated the count of substations with 1.5, i.e.:”Transmission Operator functions performed by primary or backup Control Centers that remotely control two or more Transmission substations or switching stations identified in 1.5, or functionality that remotely controls a BES Cyber System with a High Impact Rating.” End of FMPA comments. The APPA Task Force also supports the proposal by the MRO-NERC Standards Review Subcommittee (MRO-NSRS) in their comments on Item 1.4 and 1.6 to assign the impact rating of blackstart units and cranking path relative to assigned impact rating of the generating facilities it directly supports. We feel that inclusion of all blackstart resources in the High Impact Rating will waste limited resources protecting facilities which are not in support of High Impact generation. MRO-NSRS proposal: High Impact:1.4 “Generation Facilities designated as Blackstart Resources in the Transmission Operator’s restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 1.1 above.” 1.6 “Facilities required by the Transmission Operator’s restoration plan to directly support a primary Cranking Path for a Generation Facility with aggregate rated

#	Organization	Yes or No	Question 7 Comment
			capabilities as described in Part 1.1 above."Medium Impact:2.X "Generation Facilities designated as Blackstart Resources in the Transmission Operator's restoration plan that directly support the start up of a Generation Facility with aggregate rated capabilities as described in Part 2.1 above, not included in Section 1." 2.X "Facilities required by the Transmission Operator's restoration plan to directly support a primary Cranking Path for a Generation Facility with aggregate rated capabilities as described in Part 2.1 above, not included in Section 1."
7.75	US Bureau of Reclamation	Yes	The criteria defined in this and several previous requirements are based around BES Cyber Systems, which under the definition of BES (per the WECC Glossary) does not include all power system assets. Therefore, there appears to be a category of Cyber Assets that do not presently require any protection measures (i.e., they might control a powerplant feeding a radial load or be associated with a system of less that 100kV. The classification "Low" will potentially include those systems which do not have an impact. It is counterintuitive to classify a system as low when it has No Impact. The Team should develop a description of "Low" similar to that which was provided for "High" and "Medium". Then the Drafting Team could issue a statement that systems not classified as "High", "Medium" , or "Low" would be classified as "No Impact".
7.76	Dominion Resources Services, Inc.	Yes	The criteria for categorization of Low Impact systems is too broad and uses the terminology "can affect" which the SDT has appropriately recognized is ambiguous. The following alternate wording is proposed:"All other BES Cyber Systems not categorized as having a High or Medium Impact rating that are required for the reliable operation of the BES."
7.77	Southern Company	Yes	The definition of "pre-designated as Reliability must run" in Attachment II, 1.3 is unclear and cannot be implemented with existing practices in some utilities. For utilities who designate units as must run on a day-ahead basis in some cases, a valuable practice, every unit in the fleet would have to be classified as high impact. The wording should be changed to only include units designated on a seasonal or annual basis. In addition, a

#	Organization	Yes or No	Question 7 Comment
			definition of “must run” should be provided or referenced from elsewhere in NERC documentation. The wording in 1.3 also creates a new requirement that all “must run” units be classified as to whether they have Wide Area impact, which is not currently required. Are there actually any “must run” units (or any units, for that matter) that have Wide Area impact? Because Blackstart Resources are included in Cranking Paths, 1.4 is redundant in light of 1.6 and should be removed. Alternatively, 1.4 should be limited to primary Blackstart Resources to match 1.6. In 1.4, consideration should be given to reducing the impact level for situations where multiple Blackstart Resources are available. Universally search for “effect” and replace with “adverse effect”. In 1.6, replace “support” with “is part of”.In 1.7, delete the phrase "including Flexible AC Transmission Systems (FACTS). This is redundant as it is referenced again in the following sentence.
7.78	Constellation Power Source Generation	Yes	The final sentence in 1.1 needs to be rewritten, as it’s extremely confusing. A suggestion would be to simply add the 2,000 MW bright-line at the end of the first sentence. It would read “Generation Facilities, singularly or in combination (if a singular BES Cyber System that affects multiple generation Facilities), whose aggregate rated net Real Power capability exceeds the largest value, for the 12 months preceding the categorization, of the Contingency Reserve, total of reserve sharing obligations for the Reserve Sharing Group, or 2000 MW (if no Contingency Reserve or total of reserve sharing obligations for the Reserve Sharing Group is established).” Is it the intent of the SDT for the MOD10 data to be the data used in this criteria? If so, that data changes seasonally, so a seasonal review would be needed, especially for units who are on the thresholds of the high/medium/low criteria. A suggestion would be to use nameplate data as that is a fixed rating that will not change. 1.4 and 1.6 should be

#	Organization	Yes or No	Question 7 Comment
			combined together, as they are referring to similar items. The combined High Impact Rating should read "Generation, Transmission, and other Facilities required to support a primary Cranking Path used in a Transmission Operator's restoration plan per EOP-005." However, 1.4 and 1.6, either combined or separate, still penalize generation entities that own numerous black start facilities within a single Balancing Authority's footprint. Generation entities in the aforementioned situation have already invested a lot to ensure the reliability of the BES, but under CIP-010 they will be forced to invest even more. A suggestion would be for the TOP to designate a percentage of the black starts as High, and the rest as medium or low depending on their MW size. Another suggestion would be for the TOP to specifically designate certain black start units as high, and the rest are classified based on their MVA size, with the caveat that the TOP should not designate all black start units as high to avoid liability.
7.79	Dairyland Power Cooperative	Yes	The impact ranking for blackstart should be equivalent to the highest impact of all transmission and control center systems. If an entity has only low or medium impact systems other than blackstart, a high impact for blackstart is not appropriate. 1.2 and 2.2 specify 1000 MVAR and 500 MVAR, respectively for categorizing reactive power facilities. Since reactive power problems are localized in general, these numbers seem to be high. It is difficult to set global criteria on reactive power as it is network dependent. I would advise about 50% of the proposed level to be more conservative.
7.80	Duke Energy	Yes	The quantities identified on Attachment II appear arbitrary, and need an engineering basis. We suggest an approach based upon Violation Risk Factor language, such that for the High Impact Rating, the qualifier should be whether or not the BES Cyber System could directly cause or contribute to Bulk Power System instability, separation, or a cascading sequence of failures, or could place the Bulk Power System at an unacceptable risk of instability, separation, or cascading failures. For the Medium Impact Rating, the qualifier should be whether or not the BES Cyber System could directly affect the electrical state or the capability of the Bulk Power System, or the ability to effectively monitor and control the Bulk Power System, but is unlikely to lead to Bulk Power System

#	Organization	Yes or No	Question 7 Comment
			instability, separation, or cascading failures. Need to clarify the expectations for a multi unit generation site. For example: Under what conditions would a site containing two separate 900 MW generators be considered "Medium Impact Rating" because the total site would now be greater than 1000 MW? Similarly, when would a site that had three separate 900 MW generators be considered "High Impact Rating" because the total site would now be greater than 2000 MW? o CIP10-1.4: We have many small sites (hydro's) listed in our Blackstart plan because they are available. They are not essential to our plan, but because they are available, we list them. Under this guidance, we would be required to include them as "High Impact", when in reality they are 'Low'. The wording should be revised to reflect that only those sites "REQUIRED" for Blackstart be secured under 1.4 o CIP10-1.6: We need a defined and clear understanding of what is intended in the use of the term "Cranking Path" as it relates to CIP and EOP-005. What is being sought under this requirement? The term is loosely defined in the glossary, and how it is interpreted by the industry may vary greatly from how it is intended by regulators. o Under our current understanding of the term, we would see minimal increase in sites added to our "High" list. However if we impose a severe interpretation, we could see an exponential increase to our 'High' list. o CIP10-1.7 & 2.5: The word 'Misuse' should be removed or very strictly defined. It is too vague to have meaning. o CIP10-1.11: Need a clear and functional definition of 'Element' for the industry to understand the intent of the requirement. Current glossary definition is poor at best. Also, revise 2.6. as follows: Transmission Facilities operated at 300 kV or higher, which have 2 or more 300kV or above lines, in the Eastern and Western Interconnections or operated at 200 kV or higher in Texas and Quebec Interconnections not included in Section 1.
7.81	Bonneville Power Administration	Yes	The sixth line in 1.1 begins with the words "Generation Facilities." Generation Facilities is not a defined term in the April 20, 2010, Glossary of Terms Used in NERC Reliability

#	Organization	Yes or No	Question 7 Comment
			Standards. Since this phrase is not used at the beginning of a sentence, it should be "generation Facilities." There is the same problem at the beginning of the second line in 1.2. That should also be changed to be "generation Facilities."The first line in 1.7 contains the phrase "Flexible AC Transmission Systems (FACTS)." That phrase is not defined in the April 20, 2010, Glossary of Terms Used in NERC Reliability Standards. Aren't all capitalized terms used in Standards supposed to be defined? Or does FACTS have a generally accepted definition in the industry? CIP-010-1 - Attachment II Impact Categorization of BES Cyber Systems High Impact Rating (H)Each BES Cyber System that can affect operations for:1.1. Generation Facilities, etc."can affect operations" does not relate to impact. We suggest it be reworded: "If the BES systems can change operation by the following amounts they will be in the HIGH CATEGORY: - Generation - 4,000 MW- trip or reduce output of "MUST RUN" generators to below their MUST RUN amount. - Transmission - de-energize at least 4 lines above 300 kV - MVAR support - change MVAR by 1,000 MVAR
7.82	US Army Corps of Engineers, Omaha Distirc	Yes	The word "affect" in the first sentence is somewhat ambiguious and does not fit the intent of all of the subsequent paragraphs(1.4 & 1.6) Paragraph 1.3 define wide area impacts. Paragraph 1.4 should be limited to BES Cyber Systems that are required to energize a Blackstart Resource listed in the TO's system restoration plan per the GO's written restoration plan. As written it appears to apply to any BES Cyber System that merely affects the Blackstart asset and that all BES at such a facility would be High Impact which could have a chilling effect on an entities willingness to provide Blackstart resources. Paragraph 1.6 should be limited to BES Cyber Systems required to operate or support equipment in the primary cranking path. Again this would appear to apply to all BES Cyber Systems at such a facility merely because the facility was part of the cranking

#	Organization	Yes or No	Question 7 Comment
			path regardless of their impact on system restoration. Paragraph 1.10 define impact beyond the local area.
7.83	Midwest ISO	Yes	There is no documentation for the justification of the selection of the various thresholds. Justification of these thresholds should be documented and defended.
7.84	SRW Cogeneration Limited Partnership	Yes	There needs to be a category for "no impact". We are a small Cogen plant that does not even sell firm power to the grid. In essence, we are a steam plant that happens to generate electricity. We have no "Critical Assets" as defined by CIP-002. There needs to be an equivalent level for that in CIP-010. If there needs to be a system study performed by the RC to support a "no impact" rating, that's fine. And if a facility is found to be "no impact", then that facility should be exempt from the majority of further CIP requirements, just like today where CIP-004 thru CIP-009 do not apply to facilities with no Critical Assets/Cyber Assets and only R2 of CIP-003 applies.
7.85	Covanta Energy	Yes	There still needs to be some allowance to fewer mandatory requirements associated with smaller generators.... those in the 20-50 MW range (which are unmonitored) who typically have to notify their TOP/BA that they are on the system or off the system (or reduced load if applicable).
7.86	Pepco Holdings, Inc. - Affiliates	Yes	We agree with EEI's comments.
7.87	We Energies	Yes	We Energies agrees with EEI Suggested revision for 1.2: Synchronous condensers, static VAR compensators, capacitor banks and other Facilities not associated with Generation Facilities, singularly or in combination (if using a shared BES Cyber System), with aggregate rated net Reactive Power capability of 1,000 MVAR or more. We Energies agrees with EEI comments Clarification is needed for the term "primary Cranking Path" (CIP-010-1 Attachment II item 1.6). Cranking Path is a NERC defined term,

#	Organization	Yes or No	Question 7 Comment
			however, “primary Cranking Path” is not defined. Item 1.3 includes all generating facilities designated as Blackstart Resources in the Transmission Operator's restoration plan. Most larger entities submit multiple plans with multiple blackstart units and cranking paths. Protecting all blackstart units may divert finite resources from (better) protecting more valuable facilities. Moreover, it is not appropriate to create a perverse incentive for system owners and operators to reduce the current flexibility and diversity of multiple blackstart units and cranking paths by requiring a level of protection that is not proportional to the level of impact to restoration of the BES. It is not appropriate to expand the definition of blackstart to include full restoration of native load, that would essentially include all or most of the BES. The objective here is to prioritize, and augment security for the elements needed to begin system restoration. Proposed definition of “primary Cranking Path”: "Cranking Path and facilities included in the Transmission Operator’s restoration plan as the preferred path and facilities for initial system restoration”. Regarding 1.7, we recommend striking “Flexible AC Transmission Systems (FACTS)” because it would be included within Transmission Facilities. Although capitalized, it does not appear in the NERC Glossary of terms. We Energies agrees with EEI. Suggest Adding:1.15 Control Centers including Generation Control Centers .Also, we suggest that the drafting team place the highest impact facilities earlier (e.g. 1.1) on the list. The Standard needs a definition of Blackstart Resources that addresses, or modify the language in 1.4 to clarify, that only Blackstart Resources identified as essential to initial restoration of the BES in the TOP restoration plan are intended as High Impact. Under Frequency Load Shed systems under a common control system.
7.88	Ameren	Yes	We generally agree with the criteria used to identify “High” impact facilities, but believe that the item 1.5 criterion should be expanded to include EHV transformers, and not

#	Organization	Yes or No	Question 7 Comment
			limited to 4 EHV lines. However, there are too many EHV facilities in item 2.6 that would be classified as “Medium” impact, but should be classified as “Low” impact. It is suggested that EHV facilities with three or less EHV lines and transformers should be considered as “Low” impact, as they likely have little impact on the BES. The use of TPL performance standards would confirm that many of these facilities have a “Low” impact. For 1.1 the 4th sentence should be reworded to say "total obligations for the entire Reserve Sharing Group." 1.3 needs clarification of what a "reliability must run" unit is. Also, clarify 1.4 if it refers to the actual black start unit, or the entire plant in which the black start unit resides. Last, clarify 1.6 on what magnitude of support is required by the facility. Currently this could apply to any Transmission or Generation Sub-system in the path. Performance criteria, such as the loss of 300 MW of system load to qualify for “High” impact or 100 MW of system load to qualify for “Medium” impact, should also be applied to the EHV facilities identified in items 1.7 and 2.6.
7.89	GTC & GSOC	Yes	We recommend that Attachment II be organized to more clearly indicate which items apply to which type of assets. In the case of Control Centers, it appears the primary applicable item in the High Impact category are 1.12, 1.13 and 1.14, but several other items could be misconstrued to apply as well, which could lead to those control centers being inadvertently given a High designation.
7.90	CenterPoint Energy	Yes	While it appears the SDT put a lot of effort in the development of Attachment II, the criteria to be used is arbitrary, is too prescriptive, does not allow for studies or analysis to determine whether or not the loss, compromise, or mis-use of an identified facility would have an impact on the reliable operation of the BES and, in some cases, appears inconsistent. For example; 1.5 Transmission Facilities with four or more Transmission lines operated at 300kV of higher in the Eastern or Western Interconnections or operated at 200kV or higher in the Texas or Quebec Interconnections would require any and all facilities meeting this criteria to be categorized as High Impact without any basis for this rating. Determining a facility’s impact to an electric transmission system involves

#	Organization	Yes or No	Question 7 Comment
			more analysis than counting the number of transmission lines operated at or above a threshold voltage level; 1.14 Transmission Operator functions is based on the number of substations a control center may be able to remotely control. The previous criterion, 1.13 Balancing Authority functions, is based on the mega-watt amount the Control Center operates. Neither offers a basis for either the number of substations or the mega-watt amount under the operation of the Control Center. While CenterPoint Energy would find Attachment II useful as a guide or systems to be considered it is apparent the SDT meant this to be a requirement and therefore CenterPoint Energy does not agree with Attachment II and suggests it be deleted.
7.91	Verizon Business	Yes	1) Attachment II, Item 1.1 regarding Generation Facilities – Suggest removing any reference to "Contingency Reserve" or "Reserve Sharing Group." Specifically, any Generation Facility, singularly or in combination with aggregate higher than 2,000 MW should be included as a High Impact Rating. Reference to the "Contingency Reserve" (etc.) comments can result in incorrect or inconsistent declaration of a generation asset being a High or Medium impact. 2. What is the status of OSI Layer 3 definition raised in the FAQs of March 2006? For the definition above and for CIP-002 earlier versions, OSI Layer 2 was not included; however, the inference above is that it now is included. This and any other questions from FAQ for CIP-002 should be addressed in the standard.

8. Do you have any other comments to improve this version of draft standard CIP-010-1? If so, please explain and provide specific suggestions for improvement.

Summary Consideration:

Many entities commented on the need to have the approach provided in the posted CIP-010 and CIP-011: it was pointed out that a substantial amount of work has been done in compliance with a Risk Based Methodology. Many entities commented on the the use of the systems approach, remarking that the flexibility allowed may not be appropriate. Other entities commented that the work done in the current CIP-002 through CIP-009 with Critical Assets should be preserved.

The SDT has reconsidered its approach to the structure of the standards and believes that Version 5 will provide an incremental approach while addressing the FERC directives.

#	Organization	Yes or No	Question 8 Comment
8.1	Constellation Power Source Generation		A guidance document is needed to add clarity, as some terms are still vague.
8.2	Allegheny Energy Supply		A lot of work went into the prepration of the existing CIP-002 standard. This new CIP-010 standard completely throws away that body of work in favor of this new approach. While there are many good things about the new approach, please consider the amount of work that entities have given to refine the CIP-002 drafts and to create and implement the current identification methodoligies and compliance plans. We suggest that you consider incorporating the new ideas as incremental changes to the existing standards. Suggest that the standard require controls that are commensurate with the amount of risk of compromise that a device presents. Not all BES Cyber System components present the same risk, or if compromised, have the same potential impact on the BES. For example: - Serially attached electronic components do not face or create the same risk as those that use routable protocols. - Devices that communicate to each other within a self-contained, isolated network

#	Organization	Yes or No	Question 8 Comment
			segment (for example within a substation) do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries. - Devices that use dedicated (and non-routable) point-to-point communications channels do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.
8.3	Entergy		A) Giving each individual Responsible Entity the 'freedom' to define "a system" any which way each prefers will almost certainly create similar problems as those experienced with CIP-002-1/2/3 that allowed each Entity to chose a 'risk based assessment methodology' of its own preference to identify Critical Assets. In the abstract the notion of self-conceptualization of "a system" may be appealing, but in terms of the confusion factor relative to NERC's goals for consistent interpretation, application, and subsequent audit-ability across the industry this portends trouble. Entergy suggests that "BES Cyber Systems" should be defined as collections/groups of hardware and software employed cooperatively to execute a Reliability Function in Attachment I. It is not necessary to explicitly define what a "SCADA system" is, but most can agree that there are cooperative components that must work together to execute the functions associated with 'SCADA.' Tangibly, this will no doubt be different in each setting in terms of specific gear used to assemble and operate the systems functions, but taken together they are indeed "a" system. It would seem more appropriate to instruct identification of groups of cooperative components that work together to be treated as a system, and extraneous or stand alone or single-purpose equipment could be distinctly characterized as "unitary systems" when appropriate. There is practical value in logically treating several cooperative components as a system, and requirements for implementation documentation will be more straightforward and simpler if they can be treated as such. B) The fundamental flaw in the combined logic of CIP-010-1 (and transitively CIP-011-1) is the notion that risk to reliable operation of the BES posed by use of cyber assets correlates exclusively with the size of the electric operating site at issue. This single-minded orientation ignores other highly salient cyber security threat vectors in play,

#	Organization	Yes or No	Question 8 Comment
			most notably, concerning what type of data communications technology is used to network within and between sites comprising a BES Cyber System. The CIP V1 SDT correctly recognized the especial vulnerabilities posed by use of routable protocols, if the BES Cyber System is not secured with proper cyber security procedural controls and technical countermeasures. At the same time, less vulnerable - in terms of adverse impact on reliable operation of the bulk electric system as a whole - BES Cyber Systems or Components thereof that communicate using legacy serial, dial-up, or other Data Link Layer data transmission paths pose less of a practical risk in terms of overall BES attack surface due to their inherent lack of an Inter-Network Layer. Absent routable protocols, miscreant cyber navigation to and attack of other systems or components not directly attached to the individual serial link (dial-up or hard line) or Data Link Layer (sub-)network is simply not possible. Furthermore, the binary orientation of applicability of a requirement discussed above actually creates unsavory unintended consequences: in a number of ways a single requirement can mandate unnecessary and costly countermeasures for sites of a certain size regardless of the attack surface presented by the communications medium. That is, rigorous requirements appropriate for BES Cyber Systems/Components at sites that employ routable protocols are also imposed on other sites that do not, e.g., operating sites where only legacy serial lines are used. Finally, requirements for BES Cyber Systems/Components at work in purportedly small-impact grid operating sites where routable protocols are employed are in many cases simply deemed to be not applicable (not required). Summarily, the use of "electrical rating" (size) as the sole determinant of applicability of cyber security requirements will result in both excessive expenditures and undue regulatory risk concerning sites that pose minimal risk of cyber attack. This approach simultaneously fails to apply the Requirements to sites that, while not significant from an electric reliability standpoint, could afford a cyber entry point which could be used to access the larger network via routable protocols. Please see comments under Question 54 for a continuation of the above train of thought for explicit recommendations for improvements concerning both the structural organization and logical substance of CIP-010-1 and CIP-011-1 when taken together.

#	Organization	Yes or No	Question 8 Comment
8.4	Allegheny Power		Allegheny Power does not believe it is necessary to abandon the Critical Asset approach described in CIP-002. The new impact categorization structure proposed by CIP-010 introduces a completely new approach. All of the investment in procedures, training, documentation and other efforts to date to ensure compliance with the CIP standards will need to be redone. AP believes that the objectives of the Standard Drafting Team to provide further clarification and remove the uncertainty of the current CIP-002 are proper and necessary. However, AP believes that these same objectives can be accomplished by incrementally revising the current CIP-002 standard and not abandoning the approach entirely, which would essentially force all entities to start their CIP compliance efforts over from the beginning. Changing the terms, concepts and numbering schemes alone will disrupt continuity of CIP programs and have a major impact on each entity. Not all BES Cyber System components (as defined by CIP-010) face the same risk, or if compromised, have the same potential impact on the BES. o Serially attached electronic components do not face or create the same risk as those that use routable protocols. o Devices that communicate to each other within a self-contained, isolated network segment (for example within a substation) do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries. o Devices that use dedicated (and non-routable) point-to-point communications channels do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.
8.5	Green Country Energy		An overall guidance document would be very helpful to the large number of entities that will have to comply with this standard that previously were not critical. Nothing specific, some reference links, examples of expectations, a resource guide.
8.6	CWLP Electric Transmission, Distribution		Any terms used, such as Operational Time Horizon, should be included in the NERC Glossary of Terms.

#	Organization	Yes or No	Question 8 Comment
	and Operations Department		
8.7	Dominion Resources Services, Inc.		Attachment II contains some errors and should be revised in accordance with the following; CIP-010-1 1.3. The term Wide Area is applicable only to a RC area. GOs do not have access to information necessary to make such a designation. This requirement should state that a RC must inform a GO within a certain specified time frame if the RC determines that the GO owns a "must run" unit. Also. there must be some "implementation period" for the GO to become compliant. Compliance may require extensive engineering, procurement and the expenditure of significant resources that must be considered when determining the appropriate implementation period. CIP-010-1 2.3. It is not clear which entities (e.g., BA, RC, TOP, other) have the responsibility to make such designation. GOs do not have access to information necessary to make such designation. The entities that have access to the information include the RC, TOP and possibly the BA. The RC should make the designation, but with the input of the BA and TOP. If the RC makes such a designation, it is proposed that this requirement be revised to contain a statement that the RC must inform the GO within a certain specified time frame. Also, there must be some "implementation period" for GO to become compliant. Compliance may require extensive engineering, procurement and the expenditure of significant resources that must be considered when determining the appropriate implementation period. NOTE - Currently, in PJM, units so designated do not impact the entire RTO (equivalent of Wide Area) but are designated due to local import constraint limits (CETL). It appears likely that such generator would be designated as Medium impact. However, in smaller RC areas (e.g., NY), this could result in generators that appear to be equal in size (to a generator designated as medium in PJM) being designated as High because the impact to that RC area is based on size of the area as well as the generators within that area.

#	Organization	Yes or No	Question 8 Comment
8.8	Constellation Energy Commodities Group Inc.		Based on the current CMEP the audit cycle will always be longer than a full calendar year, would it be clearer to state that the data retention period is for 3 years.
8.9	Constellation Energy Control and Dispatch, LLC		Based on the current CMEP the audit cycle will always be longer than a full calendar year, would it be clearer to state that the data retention period is for 3 years.
8.10	ReliabilityFirst Staff		Because the acronym "BES" is not included in the NERC Glossary of Terms, we suggest that BES should be spelled out in the Introduction to this standard.
8.11	Reliability & Compliance Group		Being more specific with better definitions is a tremendous help with interpreting the requirements. Right now, there is still too much open to interpretation and as such, this will be very hard to make auditably compliant anywhere but to our own procedures.
8.12	City Utilities of Springfield, Missouri		City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
8.13	IRC Standards Review Committee		Comments: NERC should lead a discussion of whether the proposed CIP standards provide an appropriate level of protection from attacks. By level, we mean the granularity of the requirements - or how far down to individual components and personnel procedures. Attempting to put requirements to protect from nearly every possible attack scenario possible on every possible asset and or component that touches the BES is an extraordinary effort that will certainly provide a perception that NERC and the registered entities are doing what they can to protect from threats. There is no argument that if every registered entity protects every asset/component from threats to the nth level of granularity, the industry would be able to state that it has made every possible effort to thwart attempts to sabotage the interconnected grid. But NERC should begin a discussion on whether it is necessary to have such extensive requirements to be able to prevent a system-wide incident. The proposed CIP standards do not seem to align with NERC's approach in setting reliability requirements for more "traditional" system threats such as facility loading and system frequency. With these "traditional" standards, there is a distinction between requirements and procedures that are local in

#	Organization	Yes or No	Question 8 Comment
			nature and those that are needed on a wider interconnection level. For these "traditional" reliability threats, it is accepted by industry and regulators that this is an appropriate approach. For example, NERC does not establish requirements for relay maintenance crews to properly disengage trip coils when testing relays. But NERC does establish standards for registered entities to maintain those relays that impact BES reliability. The details of how the registered entity ensures that maintenance programs are carried out requires a local or individual procedure/requirement. NERC's focus should remain on setting standards to protect from wide area impacts - not on establishing standards that manage individual system components. NERC and the industry need to take a hard look at what exactly the CIP standards should protect from and write standards that can leverage compliance resources to reducing the wider interconnection level threats and leave setting measures or requirements that are local in nature up to the registered entities.
8.14	Southwest Power Pool Regional Entity		Consider combining the Medium and Low categories into a single category. A three tier categorization is not necessary.
8.15	Public Service Enterprise Group companies		Considerable effort was spent by industry stakeholders in classifying assets as Critical Assets (CAs) and as Critical Cyber Assets (CCAs) for CIP v1-v3. An official guide to map identified assets using the CIP v1-v3 CA and CCA terms and the new BES Cyber System Component and BES Cyber System terms is needed. Such will be an aid in ensuring a smooth transition.
8.16	Oncor Electric Delivery LLC		Control Centers and substation need to be considered separately. What is prudent cyber protection at a control center may be totally unnecessary at a substation.
8.17	E.ON U.S.		cyber systems used exclusively for local distribution of electric energy is contrary to FPA Section 215 (1) & (3). Other comments on specific areas of the proposed standards: CIP-010-1 B Requirements Section 3.2,3.3 What constitutes a "change" under these requirements.

#	Organization	Yes or No	Question 8 Comment
			CIP-010-1 C. Measures, M3 E.ON U.S. requests that the SDT clearly define in which requirements this measure applies. CIP-010-1, Violation Severity Levels There is very little difference in risk between failing to update documentation for 60 versus 80 calendar days, yet there are various gradations based on the 10-15 day window from the low-to-severe. CIP-010-1, section 3 "Low Impact Ratings" Maintaining an inventory of all low-impact rated BES cyber systems/ components will result in a significant administrative burden. Given the few prescribed protective measures that apply under CIP-011 to low impact facilities the inclusion of low impact facilities appears to provide little in the way of additional BES reliability.
8.18	San Diego Gas and Electric Co.		Draft Standard CIP-010-1 is a significant paradigm shift from the currently effective Standard CIP-002-2. SDG&E has spent significant resources to be compliant with the current version of the CIP Standards including becoming knowledgeable with the current terminology and applying it within the current CIP Standards. Draft Standard CIP-010-1 departs from the current CIP Standards but at the end of the process, it is unclear whether this change in approach will in fact result in a material enhancement to the reliability of the BES. SDG&E suggests that before continuing to move forward, the SDT needs to specifically understand and communicate to the industry what it is trying to accomplish. What is the target that we are all trying to hit with these proposed changes to the CIP Standards? In so doing, the industry can provide specific alternatives that accomplish the goal at hand. When evaluating the alternatives to meet the goal, it is critical that there is a quantifiable incremental reliability benefit to the BES before proceeding. SDG&E and many other entities have spent significant resources to comply with the current CIP Standards. At this point in time, the industry needs to know that additional resources to

#	Organization	Yes or No	Question 8 Comment
			comply with the proposed CIP Standards will result in an incremental benefit to the reliability of the BES. SDG&E strongly recommends that before moving any further, these questions be answered and that the SDT actually "test" the proposed draft CIP-010-1 Standard on a handful of companies or scenarios to gain some practical experience from the proposed changes. Are the in-scope assets easy to identify and categorize? How does the quantity of in-scope assets compare to that of the current Standards? Perhaps the SDT will find that there is a significant enhanced reliability impact to the BES. On the other hand, the SDT may find that the results do not accomplish the goal that it is trying to achieve and thus another approach would make more sense. SDG&E advocates leveraging the existing CIP Standards as much as possible moving forward, because we (like many others) have a lot of time and resources invested in our current compliance efforts and we'd really like to build from those efforts instead of essentially starting over with a new process.
8.19	BCTC		Emergency Situations - The provision for "emergency situations" should remain at the policy level. BCTC is of the opinion that it is feasible for emergency situations to be unforeseen and, as such, does not agree with the assigning of such contingencies to specific requirements.<See CIP-011-1-R3 below for an example> TFEs - TFEs will continue to be required due to the limitations of technology - i.e. older systems being unable to enforce strong passwords, etc. These limitations are beyond the Utilities control and, as such, it would be considered unfair to be found in non-compliance for such instances. What should be required in such situations is that the Utility implement controls to minimize the vulnerability that results from the TFE.
8.20	Exelon Corporation		Exelon companies have embraced the development of logical, clear and effective reliability standards as evidenced by its commitment of time and resources to various standard development initiatives (including participation on several NERC and Regional Committees, Sub-Committees and Standard Drafting Teams). As evidence of our

#	Organization	Yes or No	Question 8 Comment
			commitment, Exelon has devoted in excess of 4 years and $11 million for the implementation and integration of the NERC CIP-002 to CIP-009 Standards. We have concerns with several aspects of the CIP Version 4 Standards. The CIP Version 4 Standards represent a significant change in the scope of the standards in the equipment/systems that fall under the standards as well as the elimination of terms/categories of assets. Exelon is also not in favor of changing the current CIP-002-009 standards to the new CIP-010 and CIP-011 format. Each change in itself represents a significant "change management" issue that impact databases used for the tracking/storing of evidence of compliance, training requirements, safeguards, and systems that have been put into place to ensure Exelon's continued compliance to all NERC Standards. Exelon feels strongly that the proposed changes must be accompanied by a risk based analysis as justification for such dramatic and costly changes which to date have not been shared with the industry. Essentially we are most interested in understanding the incremental difference or benefit of moving away from the current Regulatory approved CIP-002 to CIP-009 standards to a different set of standards that will result in many of us "starting from square one" to implement. If this shift to CIP-010 and CIP-011 is approved, policies, procedures, contracts, training, drawings, methodologies, systems, data structures, and countless other documents will need to change to reflect the new language and concepts. The confusion that this will cause within organizations to retrain personnel and realign around the new standards cannot be underestimated. In fact, Exelon may even need to put some value-added compliance projects on-hold because the entire design will need to change with the implementation of the new standards. Specifically, Exelon would like to see the SDT: Discard the concept of a wholesale rewrite of the CIP standards -- but use the standards drafting team work as an input to the process. Incrementally change the existing CIP-002 through CIP-009 standards to clarify and improve upon the established approach. Retain the fundamental terms, concepts, and standards numbering scheme to enable

#	Organization	Yes or No	Question 8 Comment
			continuity. This approach would more effectively build upon the work that has already been accomplished, while allowing the industry to continue to improve on security and compliance related to critical infrastructure.
8.21	Duke Energy		Explicitly state that terms found in the NERC glossary apply here unless otherwise stated.
8.22	USACE - Omaha Anchor		General comment - committee referred to relays as being addressed in this standard. We are unsure what that interpretation is based in attachment 1.
8.23	Powersouth Energy Cooperative		General Comments: The approach to classify cyber systems according to their impact seems to be a better approach for the industry. Taken in conjunction with CIP-011 that establishes security requirements, it is logical to establish security levels based upon the impact of compromising these assets. The drafting team is commended for this approach. Consideration should be given however to recognizing that while technically some assets are BES assets, they do not materially affect the BES. For example, a small DP may own UFLS relaying however the magnitude of the load that is shed by their entire UFLS program would insignificantly affect the overall objective of the regional UFLS programs to protect the BES. While identifying those assets is reasonable, to require any security measures in CIP-011 is not warranted. Perhaps a "No Material Impact" category should be considered based on load. R1. There is a perception that every cyber system associated with the BES owned by an entity must be identified to determine if the cyber system executes or enables one of the functions in the attachments. It would seem appropriate to review all facilities (i.e. locations) to determine and document the functions that are performed at that location. However, if it is determine that no BES functions are performed documenting each system seems to provide little benefit. Example: A small distribution station is served from a transmission line greater than 100 kV. The station does have multiple cyber systems none of which perform identified BES function. The perception is each system must be documented. Since on a higher level,

#	Organization	Yes or No	Question 8 Comment
			a functional assessment indicated no BES functions are performed, is it necessary to document each cyber asset?
8.24	American Municipal Power		I agree with the intent, but I disagree with the structure of CIP-010. The applicability section should not include Distribution Providers (DP), since many DP will have little to no impact to the reliability of the BES from a cyber standpoint and will have to comply with many burdensome and unnecessary requirements in CIP-010 and CIP-011 that will be performed by other entities. I feel the purpose of the standard should directly relate to an increase in reliability. I feel the CIP-010 standard is solely based upon documenting existing or planned systems, so the purpose should correlate documenting the cyber systems with an increase in reliability. There should only be two requirements. R1: Document BES Cyber Systems. R2: Review documented BES Cyber Systems. Please add sub-requirements only as necessary to fulfill the purpose.
8.25	Matrikon Inc.		I offer to provide a workflow decision diagram I have prepared (Visio or JPG) to show how CIP-010 could be interpreted, but also to see how each of the statements in the requirement are supposed to fit into evaluation of BES Cyber Systems. I am a visual person, and my goal was to visualize the interpretation of CIP-010 for myself and colleagues to have a clearer understanding of its application. Diagram has been sent directly to Lauren.Koller@nerc.net as part of my comments. Use at your discretion, feel free to leverage/expand on my diagram, and share with SDT. My intent is to simply help reduce misinterpretation of the standards and debate on how they should be applied.
8.26	Cogeneration Association of California and Energy Producers & Users Coalition		Is it the intent of the Drafting Team that a cyber system will not be classified as a BES Cyber System if it does not cause a disturbance to the BES within 15 minutes or does not have an effect on real-time operation of the BES within 15 minutes of it becoming unavailable, degraded, compromised, or misused? If yes, guidance will be needed on

#	Organization	Yes or No	Question 8 Comment
			what proof of lack of disturbance is necessary to support an entity not classifying a cyber system as a BES Cyber System.
8.27	EEI		It would be helpful for the drafting team to develop in a separate guidance document more information about the threat basis that the standard is intended to provide protection against. The opportunity is to inform asset owners/operators of how and where to prioritize efforts to protect components of the BES. Over the last several years, a number of parties have expressed concern about the risk associated with multiple, simultaneous remote attacks against BES Cyber Systems, potentially impacting multiple generation, transmission and control center facilities. If in fact, the primary concern is the issue of multiple, simultaneous remote attacks, it is not appropriate to mandate excessive controls over physical elements such as the copper or fiber optics cable plant within a generating facility or a building housing a control center. Security requirements and controls should be developed that are proportional to the potential or probability of compromise as well as impact of compromise.EEI suggests that the drafting team recognize that not all BES Cyber System components face the same risk based on their connectivity. o Serially attached electronic components do not face or create the same risk as those that use routable protocols. o Devices that communicate to each other within a self-contained, isolated network segment (for example within a substation) do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries. o Devices that use dedicated (and non-routable) point-to-point communications channels do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.
8.28	ISO New England Inc		Modify the purpose statement to be more clear and understandable. Proposed Purpose: To identify and categorize BES Cyber Systems that execute or enable

#	Organization	Yes or No	Question 8 Comment
			functions essential to reliable operation of the BES. Apply appropriate cyber security requirements commensurate with the adverse impact that loss, compromise or misuse of those BES Cyber Systems could have on the reliability of the BES.
8.29	Hydro One		Most North American utilities spent significant capital and manpower resources in order to achieve compliance with current version of CIP standards. Version 4 brings a multitude of changes that appear to significantly broaden compliance requirements. Hydro One understands and supports the intent to improve the overall reliability of the BES through reduction of the vulnerability to cyber attacks. Based on the previous experience, in the development of the version 4 implementation plan, the SDT should consider the long time periods necessary to implements the changes required for this version.
8.30	Michigan Public Power Agency		MPPA is concerned with how these standards would impact its members who are registered entities but do not own or operate facilities that are, by NERC definition, a part of the BES. MPPA recommends clarification in the applicability section with the insertion of ", that operates BES facilities, " between "...Functional Entities..." and "...will be collectively...". This segment of the sentence would then read as: "...Functional Entities, that operates BES facilities, will be collectively..."
8.31	MidAmerican Energy Company		Need to ensure the VSLs are not written with zero-defect quality prescriptions. The proposed VSL levels in CIP-010 are too prescriptive. Replace zero-based quality prescriptions in the requirements, measures and violation severity levels with based performance targets that correspond to the vulnerability of concerted, well-planned attacks against multiple points. For example, requirements and measures should focus on performance objectives as follows: o program implemented o program and security controls in place reviewed periodically (for example, every 12 months not to exceed 15 or every 90 days not to exceed 120) o correcting items found in the reviews timely (for example, within 30 days not to exceed 45). When an entity consistently performs, the security control objectives will be achieved. Violation severity

#	Organization	Yes or No	Question 8 Comment
			levels should correspond, for example: VSL For Severe program not implemented High controls not implemented Moderate reviews not completed Lower corrections from reviews not completed These should replace zero-defect quality prescriptions as perfection is not essential to achieving the objective of vastly reducing the risk of concerted, well-planned attacks against multiple points.
8.32	Progress Energy - Nuclear Generation		NERC should facilitate the Federal Energy Regulatory Commission (FERC) consideration to suspend implementation of Critical Infrastructure Protection (CIP) Reliability Standards CIP 002 through 009 for nuclear plants in favor of implementing CIP-010-1 and CIP-011-1. Originally, CIP-002 through 009, Version 4, were to be developed to address nuclear cyber requirements as a result of FERC Order 706-B. However, CIP-010-1 and CIP 011-1 are now being developed to address the nuclear cyber requirements. In the mean time, nuclear will be required to implement CIP-002 through 009, Version 3, which do not align with CIP-010-1 and CIP-011-1 to satisfy the FERC requirements. CIP-010-1 and CIP-011-1 could be implemented at the nuclear plants in the same time frame licensees committed to the Nuclear Regulatory Commission for the 10 CFR 73.54 required Cyber Security Plans. Using the current North American Electric Reliability Corporation (NERC) timeline approved by FERC, R+18 of CIP 002 through 009, Version 3, (~ August 2011), the timing of implementation of CIP-010-1 and CIP-011-1 will be well after CIP 002 through 009 and potentially 73.54. This will require multiple reiterations of nuclear licensee cyber security plans and implementing programs and procedures. These changing requirements create potential error opportunities.
8.33	NextEra Energy Corporate		NextEra suggests a re-write of the following provisions as set forth below to provide

#	Organization	Yes or No	Question 8 Comment
	Compliance		clarity: 4.2. Physical Facilities 4.2.1. All BES Facilities under NERC jurisdiction, including those nuclear generating plant facilities that as part of FERC Order 706-B (and other applicable FERC orders) processes are determined to be subject to this CIP Standard. B. Requirements R1. For each BSE Control Center, Generation Facility or Transmission Facility implicated by the Responsible Entity's application of High, Medium and Low Impact Risk in Attachment II to its BES, the Responsible Entity shall identify and document all BES Cyber System Components that it owns and indicate its association with a BES Cyber System. (Violation Risk Factor: High) R2. The Responsible Entity shall ensure that each BES Cyber System Component identified in R1 is in compliance with the applicable protections as required in CIP-011-1. (Violation Risk Factor: High) CIP-010-1 - Attachment I (For informational purposes only) Functions Essential to Reliable Operation of the Bulk Electric System The following provides an understanding of the operating functions which are essential to real-time reliable operation of the BES and are provided for informational purposes only.
8.34	Independent Electricity System Operator		No, but please see our comments under Q9.
8.35	USACE HQ		Please answer to questions 3 and 4.
8.36	FirstEnergy Corporation		Please see Question 1 for FE's Summary view on the CIP-010 and CIP-011 standard.

#	Organization	Yes or No	Question 8 Comment
8.37	BGE		Provide a definition for “Automatic Load Shedding”.
8.38	Puget Sound Energy		Puget Sound Energy notes that the Violation Severity Levels put specific metrics (5%, 10%, etc...) to previously commented on vague terminology. In order for NERC to determine “5% or fewer BES Cyber Systems have not been identified”, there has to be a total number of BES Cyber Systems at an entity. But, with vague, open to interpretation, terms like “restrict” or “affect”, the total list of BES Cyber Systems is subjective to different opinions on what it means to restrict or affect the BES.
8.39	Liberty Electric Power, LLC		RE: VSLs. Smaller facilities with limited cyber assets will pay a much larger penalty for a single miscategorized asset than a large utility. Example: TOP miscategorizes 49 of its 1000 cyber assets, and gets hit with a single lower VSL. Small generator miscategorizes 1 of 8 cyber assets, gets hit with a severe violation. Some method of recognizing the disproportionate affect on smaller entities must be included in the standard.
8.40	LCEC		Recommend that the development and release of implementation guidelines takes place sooner rather than later to assist entities in complying with the new standards.
8.41	Minnesota Power		Regarding the Violation Severity Levels, how does the Standards Drafting Team envision these being applied? If systems are not identified, how will an auditor know how many are missing? For example, VSL R2 mentions “incorrectly categorized” BES Cyber Systems. How will an auditor determine that a Registered Entity has incorrectly categorized systems when they have documented their review and categorization process? Also, for VSL R3, it seems arbitrary that a difference of 20 days takes a violation from a “Lower” to a “Severe” VSL. How were those numbers determined?
8.42	Wolverine Power		See comments listed for 1.a
8.43	Nuclear Energy Institute		Several:

#	Organization	Yes or No	Question 8 Comment
			a) In the Introduction, Section 3 (A.3), the word "could" should be replaced with "would." b) In the Introduction, Section 5: Clarification should be made that upon approval by FERC, CIP 010-1 supersedes, in their entirety, all prior versions of the CIP standards, and that compliance with the requirements of CIP-010-1 must be in accordance with the implementation schedule for CIP-010-1.
8.44	APPA Task Force		The APPA Task Force commends the drafting team on their work on CIP-010-1. We thank the team for its hard work and appreciate the team's consideration of our comments from the previous informal comment period. We think the standard is moving in the right direction and with this next round of comments should hopefully result in a set of standards that will meaningfully improve the reliability of the BES and address the cyber security issue for the industry.
8.45	US Bureau of Reclamation		The changes in the Standards to focus on Cyber Systems is reasonable, but the definitions for Cyber System Components, Cyber Systems, and Control Centers may need further refinement (or application examples) to help implementation staff address fundamental questions. As an example: Is an isolated electronic relay providing generator protection for a single large generation resource a BES Cyber System? Under the present definitions it would appear to be (it certainly qualifies as a BES Cyber System Component). If it is a BES Cyber System, it is subject the requirements of CIP-011 based on the impact of the "System." Is this really the intent of the drafting team(s)? Would it not be better to establish select security criteria for isolated components (specifically components such as cyber-based relays and synchronizing equipment) that fit the nature of their deployment - rather than trying to fit them into a "system" category?
8.46	Southern California Edison Company		The CIP-010 and CIP-011 drafts should indicate how these standards will replace or supplement the current CIP-002 through CIP-009. If the intent is to retire CIP-002 through CIP-009 then it would make more sense to call these standards CIP-002-5 and CIP-003-5 with CIP-004 through CIP-009 being retired. A gap of unused numbers

#	Organization	Yes or No	Question 8 Comment
			between CIP-001 and CIP-010 will potentially cause future confusion.SCE also requests the Standards Drafting Team clearly define what should be included as Protective Systems. Additionally, a matrix mapping CIP Version 3 requirements to CIP Version 4 requirements would be very helpful.
8.47	LADWP		The CIPs should evolve in a manner that does not minimize the investment of resources already expended to meet compliance but should leverage the work done already. The draft version 4 is a drastic change and would require multiple years for a Responsible Entity to approach compliance. If CIP version 4 is implemented as currently drafted, there would be a huge resource drain to rewrite language and requirement references that are now part of numerous policy and procedures as well as contract packages.
8.48	Xcel Energy		The definition of BES Cyber System uses criteria that the element must be capable of causing a system disturbance or other impact within 15 minutes. We would like to know if or classification based on the 15 minutes must rely on analysis or if judgment/expert opinion is allowed. 1.5 Please clarify that the “Texas Interconnection” refers to ERCOT. 1.5 If a cyber system can only impact 1 transmission line within a substation containing 4 or more lines, it should not be classified as high. Suggest 1.5 wording be changed to Each BES Cyber system that can affect operations for: “Four or more Transmission lines operated at 300 kV or higher in the Eastern and Western Interconnections or operated at 200 kV or higher located at Transmission Facilities within the Texas and Quebec Interconnections 1.9 It is not clear why facilities serving a nuclear site under NUC-001 are high impact if the nuclear site itself is not High impact.
8.49	Dairyland Power Cooperative		The distinctions between systems and facilities are unclear. The Requirements in CIP-010 shift to a systems oriented identification. Yet the Attachment I/II definitions still rely

#	Organization	Yes or No	Question 8 Comment
			on the concept of facilities and almost seem to equate facilities with systems. These distinctions need to be clear.
8.50	Con Edison of New York		The Drafting Team needs to take into account the fact that the ability to work on any cyber systems in a substation will typically already require a detailed work permit process which includes getting a work permit from an operating authority with jurisdiction on the equipment. The employee working on the cyber system must typically be an approved employee to work on these systems.
8.51	FEUS		The drafting team should consider an alternative for the VSL categorization. By basing it on a percentage, it could potentially unfairly affect smaller entities with fewer BES Cyber Systems. A smaller entity will inherently have fewer BES Cyber Systems, so missing a single classification of a BES Cyber System could automatically merit a severe violation. For example, an entity with as few as 5 BES Cyber Systems that misses the identification of a single system would be in a severe category. A larger entity with inherently more BES Cyber Systems can fail to identify more BES Cyber Systems and have a lesser severity level. An entity with 50 BES Cyber Systems can fail to identify 8 before reaching a severe violation level. The risk of failing to identify 8 BES Cyber Systems puts the BES at a much higher risk than failing to identify 1 BES Cyber System.
8.52	Indeck Energy Services, Inc		The FERC directed guidelines to Registered Entities on the risk based assessment methodology are missing.
8.53	PacifiCorp		The low, moderate and high violation severity levels for R3 do not seem to measure the correct violation criteria. The number of days after a change is completed should not be the sole criteria. The number of days after a change is completed should not be the sole criteria for determining whether a violation was harmless or severe. This is especially true for a standard that currently has no meaningful qualifier to allow for routine or de - minimus changes to elements of the BES without triggering a full review. These criteria should track other violation criteria that consider whether the violator had an adequate

#	Organization	Yes or No	Question 8 Comment
			process in place for the types of changes that merit a re-evaluation. Need to ensure the VSLs are not written with zero-defect quality prescriptions. The proposed VSL levels in CIP-010 are too perscriptiveprescriptive. Replace zero-based quality prescriptions in the requirements, measures and violation severity levels with based performance targets that correspond to the vulnerability of concerted, well-planned attacks against multiple points. For example, requirements and measures should focus on performance objectives as follows: o program implemented o program and security controls in place reviewed periodically (for example, every 12 months not to exceed 15 or every 90 days not to exceed 120) o correcting items found in the reviews timely (for example, within 30 days not to exceed 45). When an entity consistently performs, the security control objectives will be achieved. Violation severity levels should correspond, for example: VSL For Severe program not implemented High controls not implemented Moderate reviews not completed Lower corrections from reviews not completed These should replace zero-defect quality prescriptions as perfection is not essential to achieving the objective of vastly reducing the risk of concerted, well-planned attacks against multiple points.
8.54	National Rural Electric Cooperative Association (NRECA)		The Purpose section of CIP-010-1 and CIP-011-1 should be similar in regards to the facilities it refers to. Add the word in all CAPS to the CIP-010-1 Purpose to bring it in line with the Purpose in CIP-011-1:".... that execute or enable functions essential to reliable operation of the INTERCONNECTED BES..."
8.55	SCE&G		The SDT needs to consider how auditors may interpret the words of the standard

#	Organization	Yes or No	Question 8 Comment
			differently. The language needs to be written clearly and concisely enough so that a consistent interpretation of the standard will be applied by all auditors across all regions. Consideration of Nuclear Facilities: Definitions for BES Cyber System and BES Cyber System Component conflict with definitions that have been accepted by the Nuclear Regulatory Commission (NRC) in NEI 08-09 Revision 6 for Critical System and Critical Digital Asset; recommend for nuclear systems subject Federal Energy Regulatory Commission (FERC) 706-b definitions for FERC and NRC regulated systems are consistent. This will avoid regulatory uncertainty as well as human error at nuclear facilities. CIP-010-1 R2 and Attachment 1 - some of these functions are covered by NRC regulation. Will issuance of this document require re-submittal of systems for exemption after the Bright Line submittal of systems? The implementation schedule for CIP 10 - 11 versus CIPs 02-09 requires doing the same reviews twice and is an unnecessary burden on nuclear licensees as well as other FERC critical assets. The deterministic nature of the security controls in CIP 11 do not provide for acceptance of Common Controls as defined by NIST 800-53. In nuclear facilities with mature physical security programs, engineering control programs, and physical segregation of trusted industrial control system networks from un-trusted networks, CIP 11 should include provision for NIST 800-53 Common Control processes.
8.56	Consultant		There appears to be inconsistency in use of terminology throughout the standard as the terms apply to defined glossary terms, new definitions contained in this standard, and what appear to be 'common terminology' that is not defined. The terminology should be reviewed and applied consistently to avoid ambiguity and confusion. It is not clear that the implied process in the requirements (R1. Identify BES Cyber Systems, R2. Categorize Cyber Systems) is the best methodology. This seems to be missing the first step of the process: 1. Identify the BES assets (Facilities, Elements, &

#	Organization	Yes or No	Question 8 Comment
			Control Centers). The previous versions of CIP-002 started with the identification of BES assets followed by inclusion or exclusion as Critical Assets using the Risk-Based Methodology. As the current standard is written it seems to have lost the step to identify BES assets to which the CIP-010 R1 & R2 steps would be applied. Suggest adding the 'first step' to identify BES assets. This would probably require some restructuring of the current R1 & R2 statements to apply them to the identified BES assets.
8.57	Ameren		There are no system performance requirements as part of the determination of “High”, “Medium”, or “Low” impact to the BES other than item 1.7. The addition of performance requirements from the TPL standards (TPL-003 and 004) could further help to identify which facilities have the biggest impact on the BES and reduce the number of “High” and “Medium” impact facilities identified to provide significant cost savings to the industry.
8.58	WECC		Utilizing the prescriptive nature of CIP-010-1 Attachment II would be very useful as a rewrite of CIP-002-4. The CIP-002 through CIP-009 format lends itself very well to being audited. What is needed is clarification and explicit language. The current standard needs to be made better not replaced.
8.59	Kansas City Power & Light		Very concerned regarding the “lines” that have been drawn in Attachment II. What is the engineering basis for any of the “bright line” thresholds that have been expressed in Attachment II? Recommend thoughtful consideration regarding operating assumptions be developed an analysis be performed to establish the facilities that should be considered HIGH, MEDIUM and LOW reliability impact. Operating criteria should be established to determine what has HIGH, MEDIUM and LOW reliability impact. In addition, there are facilities that have NO IMPACT to reliability of the BES. Whatever criteria is established, a “smell test” should be done to see if the criteria works. There are numerous small Regional Entities that are obviously no impact to the reliability of the BES, and if any of these requirements and definitions draw any of the facilities of these small entities into the CIP Standards, something is wrong and adjustment to the criteria

#	Organization	Yes or No	Question 8 Comment
			needs to be considered.
8.60	ERCOT ISO		Violation Severity Levels: Recommend that VSLs address “identify” and “document” BES Cyber Systems. “Identify” and “document” are noted separately in the requirements. Attachment I: What is the originating source for this? Can it be referenced? What does “BES elements” mean?
8.61	Pepco Holdings, Inc. - Affiliates		We agree with EEI’s comments regarding not all BES Cyber System components face the same risk, or if compromised, have the same potential impact on the BES (e.g. serially attached electronic components versus those that use routable protocols; devices that communicate to each other within a self-contained, isolated network segment versus devices that communicate via routable protocols across multiple geographic or logical boundaries, and devices that use dedicated (and non-routable) point-to-point communications channels versus devices that communicate via routable protocols across multiple geographic or logical boundaries). Would suggest that consideration be given up front in CIP-010 to the types of communication/risk when developing security requirements.
8.62	We Energies		We Energies agrees with EEI. It would be helpful for the drafting team to develop additional documentation providing more information about the threat basis that the standard is intended to provide protection against. The opportunity is to inform asset owners/operators of how and where to prioritize efforts to protect components of the BES. Over the last several years, a number of parties have expressed concern about the risk associated with multiple, simultaneous remote attacks against BES Cyber Systems, potentially impacting multiple generation, transmission and control center facilities. If in fact, the primary concern is the issue of multiple, simultaneous remote attacks, it is not appropriate to mandate excessive controls over physical elements such as the copper or fiber optics cable plant within a generating facility or a building housing a control center. Security requirements and controls should be developed that are proportional to the potential or probability of compromise as well as impact of

#	Organization	Yes or No	Question 8 Comment
			compromise. Not all BES Cyber System components face the same risk, or if compromised, have the same potential impact on the BES. o Serially attached electronic components do not face or create the same risk as those that use routable protocols. o Devices that communicate to each other within a self-contained, isolated network segment (for example within a substation) do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries. o Devices that use dedicated (and non-routable) point-to-point communications channels do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.
8.63	Progress Energy (non-Nuclear)		We need definition of when the CIP requirements "turn on" during new plant construction, commissioning, and/or start-up. Recent major projects with CIP CCA's have been add-ons to existing facilities. We have used the model that until we "logically" connect to the existing facility ESP the full CIP requirements were not required. The next projects will be new facilities with no ESP logical connection to the existing steam plants. We should recommend wording that states that the CIP ESP and PSP requirements do not turn on until the plant is turned over to Energy Supply for commercial operation and it becomes available to ECC. Argument being that during testing ECC manages other generation assets to allow for testing impact on BES. Standard malware protection rules (A/V, etc.) would still apply. Have the regional entities auditing & compliance groups made an initial assessment as to the relative impact when compared to existing standards? For example do they anticipate significant increase in compliance records and audit evidence required? Unofficial Comment Form - CIP-010-1 and CIP-011-1 Cyber Security Order 706 (Project 2008-06)

#	Organization	Yes or No	Question 8 Comment
			Is there expected to be a TFE process for these standards - based on current experience the TFE process is more onerous and adds considerable paperwork without effectively enhancing security of BES. Need consideration for redundancy, backups, alternate systems in relation to required levels of protection - CIP-010-1 R1 makes no provision for considering redundancy, backup systems, or alternate systems which may be in place to 'provide assurance in the resiliency of these functions.' But according to the NERC document Guidance for the Electric Sector: Categorizing Cyber Systems, providing for the 'assurance in the resiliency of these functions' is part of 'The Purpose of Categorizing BES Cyber Systems'. Failure to consider these additional systems as layered safeguards and thereby reducing the criticality of any one of them may mandate that each such BES Cyber System be considered equally essential and critical. The result would be to provide disincentives for the responsible Entities to implement these additional layers - reducing the assurance in the resiliency of these functions. This would be contrary to the stated purpose of 'reducing risk to the performance of functions.' Need better provision for standards tailored to various asset types - Although the new standards will bring even more 'single use' equipment into focus, the standards are designed to protect 'multi function' PC based equipment from the attack vectors that they present. The standards need to take into consideration equipment that doesn't require protection (or extra work such as a TFE) for vulnerabilities that do not exist. Example: A terminal server which is a 'single use' type platform that only does protocol conversion between serial and Ethernet communications presents very few attack vectors. The same functions could be performed by a fully functional PC but that device would present a much larger opportunity for a hacker. The current version of the standards will actually make it more advantageous for entities to implement this function using the larger target of a fully functional PC rather the 'single use' type device simply because of ease of compliance. Recommend implementation timeline:

#	Organization	Yes or No	Question 8 Comment
			High - 4 years Medium - 4 years Low - 4 years
8.64	US Army Corps of Engineers		Will there be official guidance documents, such as the DRAFT Guidance for the Electric Sector: Categorizing Cyber Systems?
8.65	Verizon Business		1. It is not clear whether electricity trading was considered in the draft standard. 2. Attachment III Section 1.11 discusses "BES Elements that perform automatic aggregate load shedding of 300 MW or more." This statement should be revised to specifically exclude Smart Grid Distribution. 3. This standard should be compared to the elements included in the NERC Frequently Asked Questions for CIP-002 to ensure that any new and different perspectives from the FAQs woven into the CIP-002-4 version are addressed completely. 4. The inclusion or exclusion of "non-routable protocols" under CIP-002-4 needs to be addressed. For instance, if the standard included all protocols, then a substantial number of communications systems (e.g., Serial, SONET, etc.) would now be included in the list of "BES Cyber Systems." This would be a substantial change to the Registered Entities, and compliance would be difficult. Overall, non-routable protocols should be included in the CIPs as well as routable protocols. 5. An explanation is required for the inclusion of Distribution Provider in Section 4, Applicability. The inclusion herein has caused confusion for Smart Grid implementation. The Distribution Provider should not be included. 6. In the BES Cyber System Component definition, the word "Disturbance" is capitalized. This word should be defined in the Glossary and could be included as a

#	Organization	Yes or No	Question 8 Comment
			Local Definition in CIP-010. To assist implementing utilities, it would be useful to do some mapping and case studies of the transformation of “Critical Assets” and “Critical Cyber Assets” to “BES Cyber Systems” and “BES Cyber System Components.”

9. **Do you prefer the currently proposed format for CIP-011-1, which contains a complete single set of requirements? Do you prefer the alternate format, where the requirements are grouped in separate standards? Or do you have no preference?**

Summary Consideration:

There was no clear preference from the compilation of responses received. Many entities liked the approach and structure provided by the posted CIP-010 and CIP-011, while a substantial number would prefer to keep the current CIP-002 – CIP-009 structure. Reasons provided by the latter centered around substantial compliance management frameworks implemented to support the CIP-002-CIP-009 structure. Others offered a hybrid approach, with some grouping.

The SDT has considered these comments and has opted to keep, in large part, the current structure of CIP-002 – CIP-009, with the addition of two new standards, CIP-010 and CIP-011. The two additional standards allow for some requirements from previous standards, where the subject matter did not quite fit, to be separated into the additional standards. In this manner, the SDT believes that each standard consists of a set of related requirements that support an identified purpose.

#	Organization	Yes or No	Question 9 Comment
9.1	WECC		This seems to be essentially a formatting issue. If the same requirements are included in either on single standard or multiple standards, the preference is with the individual reader. Keeping it as one single CIP-011-1 standard will ease discussions throughout organization when talking about CIP as there will only be one standard for all controls and it makes sense based on the previous versions repeated statement that the standards should be treated as one standard.Breaking CIP-011-1 into multiple standards lends itself very well to being audited. In either option, what is needed is clarification and explicit language. Regardless of the format, the standard (s) needs to be made stronger, more clear, more concise.
9.2	ISO New England Inc	Break CIP-011-1 up into multiple standards	- Disagree with the current structure- Establish new standards by functional areas- Ensure there is not a circular loop relating to other requirements/standards, each requirement/standard should be standalone

#	Organization	Yes or No	Question 9 Comment
9.3	IRC Standards Review Committee	Break CIP-011-1 up into multiple standards	(i) We disagree with the current structure. We'd suggest the SDT to establish new standards by functional areas and ensure there is not a circular loop relating to other standards. Each standard should be standalone(ii) We understand the need for this standard to take care of cyber security concern when there does not currently exist an across-the-board cyber protection standards that apply generically to all sectors that utilize cyber components and cyber access for control and data exchange. However, over time, we urge NERC and the electric industry to assess if indeed it needs to have its own cyber protection standards at all. Cyber protection is not unique to the electric industry. Other sectors - airline industry, national security/ defense, financial sector, banking system, etc. all employ a high level of cyber security to protect fraud and invasions. Wouldn't the electric industry be better served if owners of BES Cyber Systems be required to adopt similar practices of these other sectors as opposed to developing it own very detailed set of requirements which, for the most part, seem to replicate the other sectors' requirements?It will be desirable to have a generic set of Cyber protection standards that is applicable to all sectors that use Cyber Systems - may they be for BES control or access to airline reservation, air traffic control, e-banking, security trading, etc. NERC and the electric industry should take the lead to initiate a continent-wide effort to consolidate all such standards and practices to avoid redundant efforts.
9.4	Entergy	Break CIP-011-1 up into multiple standards	A) Compliance Enforcement Problems: From the point of view of both implementation and auditing of Requirements it makes little difference as to the granularity of Requirements contained per Standard. However, from an enforcement perspective, using a single Standard document consisting of many Requirements is highly problematic. Per the current codified NERC Standards Development Process any Standard can be assigned only a single Violation Risk Factor (VRF). Consequently, even if only one Requirement in the single document approach is considered a "High" Risk Factor, then the entire Standard must be designated as High. This is problematic first in that not all CIP Requirements contained in either CIP-003-3 through CIP-009-3 or CIP-011-1 are of equal salience in terms of security vulnerability/risk created in virtue of failure to comply - some are indeed High, but by no means all. [However, note that

#	Organization	Yes or No	Question 9 Comment
			determination of Violation Severity Level (VSL) is not especially problematic - it's still a measure of just 'how far out of compliance' the Entity is.] Second, it is hard to imagine any Responsible Entity being 100% compliant with every Requirement in a single large Standard in any calendar year; it could well be that all Responsible Entities in the industry are found to be out of compliance with some aspect of a single large multi-Requirement Standard every year. Statistically, this does not speak accurately as to the quality of the NERC Standard, its Reliability Standards Program, or the industry's attentiveness or sense of urgency concerning the need for proper cyber security. For the reasons above, Entergy submits that a larger number of Standards, with fewer, more finely focused Requirements in each will serve our collective purposes much better.B) Cost Impact: Moreover, the cost of revising all the existing procedures, database systems, and other compliance programs to comport with a new numbering system alone is prohibitive for any company with a large number of cyber assets. There is no support in the administrative record for the notion that the current numbering system is a problem, or that the proposed combined "all-in-one" standard would improve grid reliability, security, or companies' efforts to comply with the standards. The change to a single CIP-011-1 Standard is arbitrary and of no salient value to anyone. Summarily, Entergy proposes that the: i) Organization and naming/labeling of Version 4 of the CIP Standards remain intact, i.e., simply the fourth iteration of Version 1. ii) SDT should lay FERC Order 706 side by side with CIP-003-3 through CIP-009-3 and make changes specifically attendant to 706 FERC directives - no more, no less. iii) Topical subjects addressed in CIP-003-3 through CIP-009-3 Standards respectively should remain the same, i.e., subject matter organization should not be moved under from under one Standard to another;iv) Concepts already well established and understood throughout the industry created under CIP V1, e.g., CA, CCA, ESP, PSP, etc., should be preserved intact; and,v) Orientation in Version 4 toward protection of "data in motion" is applauded.
9.5	CenterPoint Energy	Break CIP-011-1 up into	As stated above, many entities are now in the compliance phase of the current CIP Standards and have spent a great deal of effort in developing documentation and evidence gathering processes base on the CIP-002 through CIP-009 Standards.

#	Organization	Yes or No	Question 9 Comment
		multiple standards	CenterPoint Energy is concerned about the upheaval required to alter processes and procedures, currently tied to multiple Standards, to match a single Standard. CenterPoint Energy recommends keeping the current format.
9.6	Northeast Power Coordinating Council	Break CIP-011-1 up into multiple standards	Because of the number of requirements involved, combining all into one document will make it more difficult for stakeholders to use, and make it more difficult to assess compliance.
9.7	FirstEnergy Corporation	Break CIP-011-1 up into multiple standards	Break CIP-011-1 up into multiple standards. Multiple standards allows for easier ownership assignment and referencing (indexing) within policies and programs. The new format still provides multiple reference for the same item in multiple locations (e.g. Access), therefore this supports keeping multiple standards.
9.8	City Utilities of Springfield, Missouri	Break CIP-011-1 up into multiple standards	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
9.9	Reliability & Compliance Group	Break CIP-011-1 up into multiple standards	Combining some of the standards may make sense but combining them all does not make it easier to comply, it instead creates an administrative mess by requiring everyone to change all their document references to conform to the new standards and requirements.Some standard combinations that do make sense are physical, electronic and information access (CIP-003 R4, CIP-005 R2-R3, and CIP-006 R2-R6). Also, combining incident response and recovery makes sense.Has a decision yet been made how this would be audited as a single standard? Would we now have compliance violations reported on a requirement level instead of a standard level?

#	Organization	Yes or No	Question 9 Comment
9.10	San Diego Gas and Electric Co.	Break CIP-011-1 up into multiple standards	Due to our previous CIP compliance efforts and all the documentation and Standard Operating Procedures currently in place, SDG&E recommends keeping (as much as possible) the existing CIP Standards and Requirements in place, and augmenting each of the existing Standards with new and modified Requirements. This strategy will allow participating entities to transition to the new version 4 requirements in an easier fashion, while making better use of existing documentation and procedures. We've put a lot of time into the organization, layout, and design of our process and materials and it appears to be a daunting task to revamp all of this to comport with almost completely new Standards. For example, most participating entities would now recognize CIP-004 as having to do with Personnel and Training, whereas combining all the CIP-003 through 009 requirements in CIP-011 just makes it that much more difficult to leverage existing compliance efforts and documentation without a major revamping effort.SDG&E recommends maintaining the current format of standards as CIP-002 to CIP-009, and enhancing the required individual standards as necessary. The existing standards are clear by function and controls - based on general cyber security and systems security practices and controls with the goal of protecting Confidentiality, Integrity and Availability. The implemented standards cover policy, access, change control, monitoring, DR, etc..., and are simple to review, document, communicate, audit and coordinate activities against. Transitioning to a comprehensive single document requires Entities to perform additional translation, communication, implementation and review across departments, organizational structures and systems owners, and increases the potential for communication and task errors, and the potential probability of introducing an operational or security concern.
9.11	E.ON U.S.	Break CIP-011-1 up into multiple standards	E.ON U.S. prefers that individual standards be used instead of the combined standards as outline in CIP-011.

#	Organization	Yes or No	Question 9 Comment
9.12	Matrikon Inc.	Break CIP-011-1 up into multiple standards	For Responsible Entities, their Compliance Teams, their Employees, and their Contractors have all been indoctrinated with the terminology, standards and requirement numbering of CIP 002-009. One reason for continuing a similar number standard is to reduce the confusion for all those involved with compliance, and migration from CIP-002/009 to CIP-010/011.The second reasoning for maintaining similar numbering is the mapping exercise of CIP 002-009 to CIP-010 and CIP-011. If the first priority is to perform the mapping between the two evolutions of the standard, then organically CIP-010/011 will be organized. This will help all affected parties identify the differences, perform gap analysis, and implications to their environment much easier. Unfortunately, all organization will have the exercise of re-authoring a lot of their own NERC CIP compliance procedures to catch up with the new terminology, numbering, and requirements. This will help to maintain compliance with CIP-002/009 while implementing CIP-010/011. Regardless if this is performed by the SDT, every Responsible Entity and Auditor is going to have to do this exercise anyways, with subtle differences.My suggestion is to consider skipping CIP-010, and name it CIP-012. Then take the content related to CIP-003, and organize it into CIP-013. Effectively, putting the next evolution of the standards into the next “decade”, whereby the second-digit is incremented.
9.13	Exelon Corporation	Break CIP-011-1 up into multiple standards	Given the extensive work that has been done to establish monitoring and compliance tracking systems, the wholesale change in format will cause extensive rework to compliance programs (systems, procedures, governance models, etc...). One must ask how this re-work is intended to improve reliability. Unless there is a strong basis for making such a dramatic change to a set of standards that have not been in force for many years, Exelon sees neither need nor value in making such a dramatic change. This change will result in essentially starting from the beginning from a compliance program perspective. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements.

#	Organization	Yes or No	Question 9 Comment
9.14	USACE HQ	Break CIP-011-1 up into multiple standards	I suggest to break up the standard into three (3) standards, one (1) for low impact BES Cyber System, one (1) for medium impact BES Cyber System, and one (1) for high impact BES Cyber System. This way it is more clear what is required for each impact level system.
9.15	Progress Energy (non-Nuclear)	Break CIP-011-1 up into multiple standards	If NERC separates into multiple standards, need to make sure the CIP standards are stand alone.
9.16	Indeck Energy Services, Inc	Break CIP-011-1 up into multiple standards	In addition to breaking up the standards by grouping, they should be broken up by facility type and/or function. Not all of these standards apply equally to all facility types or functions. Unmanned facilities with direct communications with a BES control facility need a different set of requirements from a continuously staffed facility without direct communications with a BES control facility. Requirements for a BA are different than for a GOP.
9.17	MWDSC	Break CIP-011-1 up into multiple standards	It is confusing that the tables for each major category only show those requirements with different impacts, while there are other requirements that apply to all impacts. Suggest adding a matrix of all the requirements by a major category showing all the requirements and impacts, not just the ones which differ. Having one standard would require the entire standard to be re-issued for any change. This may cause more confusion whether anything else changed and create more wasted paper. Suggest multiple standards or using a numbering scheme such as CIP-011-1.1, CIP-011-1.2, CIP-011-1.3, etc to separate the requirements by major categories. If there is a change to a major category, the numbering would be CIP-011-1.2a, CIP-011-1.3c, etc.
9.18	Platte River Power	Break CIP-	It would be clearer if the requirements were organized based on their objectives:

#	Organization	Yes or No	Question 9 Comment
	Authority	011-1 up into multiple standards	physical security, system security, boundary security, personnel management, access, etc. One document would be fine if the requirements matched up with the standards and the sub-requirements matched up with the requirements.
9.19	Allegheny Energy Supply	Break CIP-011-1 up into multiple standards	It would be easier for entities to recognize and understand the similar or different requirements in version 4 if they were broken up in a manner similar to legacy CIP-003-009. Many organizations have made significant investments in training, policies, procedures, and document management systems that are based on the legacy CIP standard Requirement numbering structure. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements
9.20	Allegheny Power	Break CIP-011-1 up into multiple standards	It would be easier for entities to recognize and understand the similar or different requirements in version 4 if they were broken up in a manner similar to legacy CIP-003-009. Many organizations have made significant investments in training, policies, procedures, and document management systems that are based on the legacy CIP standard Requirement numbering structure. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements.
9.21	EEI	Break CIP-011-1 up into multiple standards	It would be easier for entities to recognize and understand the similar or different requirements in version 4 if they were broken up in a manner similar to legacy CIP-003-009. Many organizations have made significant investments in training, policies, procedures, and document management systems that are based on the legacy CIP standard Requirement numbering structure. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements.
9.22	MidAmerican Energy	Break CIP-011-1 up	MidAmercian Energy does not prefer the currently proposed format for CIP-011-1, which contains a complete single set of requirements. The revolutionary approach proposed

#	Organization	Yes or No	Question 9 Comment
	Company	into multiple standards	will cause confusion, which may adversely affect the reliability of the BES. The version 4 standards should be built upon the existing standards to avoid the unnecessary confusion that will be introduced during the implementation of CIP-011. Rewrite CIP-011 and apply the requirements to existing CIP-003 thru CIP-009 standards.
9.23	CWLP Electric Transmission, Distribution and Operations Department	Break CIP-011-1 up into multiple standards	Monitoring changes to the requirements would be easier if they were separated into different standards.
9.24	Con Edison of New York	Break CIP-011-1 up into multiple standards	Most owners of BES equipment have multiple departments that manage different corporate functions. These departments include Information Resources, System Operations, Human Resources, Relay Protection, Engineering, etc. Organizing the CIP requirements into topic-specific standards (as was done for CIP-002 through CIP-009), will facilitate corporate management of compliance.
9.25	Michigan Public Power Agency	Break CIP-011-1 up into multiple standards	Multiple standards that are logically separated is preferred. However, if separated the standards still should be approved as a complete set.
9.26	PacifiCorp	Break CIP-011-1 up into multiple standards	PacifiCorp does not prefer the currently proposed format for CIP-011-1, which contains a complete single set of requirements. The revolutionary approach proposed will cause confusion, which may adversely affect the reliability of the BES. The version 4 standards should be built upon the existing standards to avoid the unnecessary confusion that will be introduced during the implementation of CIP-011. Rewrite CIP-011 and apply the requirements to existing CIP-003 thru CIP-009 standards.
9.27	Florida Municipal Power	Break CIP-	The addition of sub-headings into CIP-011 is illustrative of the need to separate them.

#	Organization	Yes or No	Question 9 Comment
	Agency	011-1 up into multiple standards	From a presentation perspective, e.g., most frequency violated standards, we would be faced with tough decision of either having one standard with a very large bar in a top 10 bar chart, or possibly having multiple CIP standards is the bar chart, until the Industry gets used to the new standards. Either way is politically difficult, so, the simpler approach is probably the preferable approach of multiple standards on different security topics.
9.28	APPA Task Force	Break CIP-011-1 up into multiple standards	The APPA Task Force believes the addition of sub-headings to CIP-011 is illustrative of the need to separate this standard into multiple standards. We also feel with multiple standards the revision process would be simplified. If only one section needs to be revised, then NERC could just post that particular section for industry comment.
9.29	Emerson Process Management	Break CIP-011-1 up into multiple standards	The original setup seems indicating some logic on how cyber security should be addressed. Also, it has been there for several years. Most people probably have become used to the titles and subjects.
9.30	Southern California Edison Company	Break CIP-011-1 up into multiple standards	The section of standards that deal with controls should be divided into components that are grouped thematically. For instance, management of personnel may contain all requirements pertaining to training, background checks, etc., as one standard. Another standard should be used for governance functions such as policy making and management, audit documents, change management, etc. A third standard for Access Management can be used to list in detail end-to-end access controls for interactive access that is electronic, escorted and unescorted physical access and access to information. Boundary protections, physical and electronic, can be addressed as a family of security controls along with system security requirements as a fourth standard. A section that describes priority of controls within each requirement, in addition to a VRF/VSL document, should be provided so that RE's can implement controls at a granular level even within the High-Medium-Low framework.SCE supports the

#	Organization	Yes or No	Question 9 Comment
			modification of the CIP standards from a family of eight controls in the current version, and the reduction of the number of sub-levels within requirements. But on the other hand, combining all controls into "one standard" is a cause for concern.
9.31	LCEC	Break CIP-011-1 up into multiple standards	The standard grouping in CIP11 will result in a negative perception as to the progress industry is making in improving cyber security of the BES. Consider individual standards or a new approach to metrics reporting that focuses on the security domain versus the standard.
9.32	Old Dominion Electric Cooperative	Break CIP-011-1 up into multiple standards	This draft is far too cumbersome. Breaking up the requirements will allow emphasis to be placed on categories that may be more critical to security. Breaking up the requirements will also allow for much easier application.
9.33	Pepco Holdings, Inc. - Affiliates	Break CIP-011-1 up into multiple standards	We agree with EEI's comments.
9.34	We Energies	Break CIP-011-1 up into multiple standards	We Energies agrees with EEI comments: It would be easier for entities to recognize and understand the similar or different requirements in version 4 if they were broken up in a manner similar to legacy CIP-003-009. Many organizations have made significant investments in training, policies, procedures, and document management systems that are based on the legacy CIP standard Requirement numbering structure. Staying with the legacy structure, to the degree that it is possible, may reduce stranded investment that needs to be recreated simply as a function of the name and numbering of the requirements.

#	Organization	Yes or No	Question 9 Comment
9.35	Luminant	Keep CIP-011-1 as one document	future changes that do not impact the compliance domentation numbering should be considered
9.36	FEUS	Keep CIP-011-1 as one document	Having CIP-011-1 as one document makes it more streamlined and is easier to follow. The concern FEUS has is how multiple violations of several different sub-requirements will be looked at by the compliance enforcement agencies. If an entity is found in violation of CIP-011-1 R4 for example and is later found in violation of CIP-011-1 R26 will this be considered a second violation? If so, FEUS would prefer CIP-011-1 to be grouped into separate standards.
9.37	Public Service Enterprise Group companies	Keep CIP-011-1 as one document	Having the requirements in a single standard significantly improves understanding and ease of reading.
9.38	Ameren	Keep CIP-011-1 as one document	It is much easier to find all the requirements when all contained is a single document and the chance of discrepancies between documents is greatly reduced. However, the CMEP should be updated to monitor and report violations by standard and requirement not just standard. Otherwise, CIP-011 will always be in the list of Top 10 most violated standards and create a misleading impression that utilities cannot figure out how protect the reliability of the BES.
9.39	Southwestern Power Administration	Keep CIP-011-1 as one document	Keeping the controls in one document as proposed is preferable; provided that the intent is not that ALL requirements in CIP-011-1 have to be audited as a family of requirements.
9.40	Dairyland Power	Keep CIP-011-1 as	One document is better.

#	Organization	Yes or No	Question 9 Comment
	Cooperative	one document	
9.41	Green Country Energy	Keep CIP-011-1 as one document	One document makes it a lot cleaner for a smaller entity to deal with.
9.42	Progress Energy - Nuclear Generation	Keep CIP-011-1 as one document	Security controls included in CIP-011-1 are similar to the Security Controls established by Nuclear Energy Institute (NEI) 08-09, Revision 6, Appendices D and E. These security controls are based on one or more National Institute of Standards and Technology (NIST) 800 series standards and have been accepted by the Nuclear Regulatory Commission (NRC) in a letter dated May 5, 2010. Alignment of CIP security controls with security controls based on NIST 800 series standards and implemented in NEI 08-09, Revision 6, for nuclear plant systems would prevent regulatory uncertainty and potential dual regulation of a single system.
9.43	Consultant	Keep CIP-011-1 as one document	Subject to the following:1. Requirement number should be consistent with the Requirement table numbering. For example, currently requirement 3.1 Cyber Security Training does not relate to Table item 3.1 Electronic Access. The result is two items that would be referenced as CIP-011 3.1 on completely different topics.2. Every requirement should have a related table. Currently R1 & R2 do not have related tables for applicability. It is 'bad practice' to assume the interpretation that those requirements without a table apply to everything.3. The 'local definitions' should be gathered in a separate definitions section and numbered. Lacking a definitions section there is no convenient mechanism to refer to local definitions.4. While I understand the expressed opinion makes the standard easier to use, I don't agree with that opinion. The defined terms related to this standard should be listed in a separate section. My opinion is that the current format of the local definitions is more confusing than clarifying.5. Based on the CIP Standards Workshop information, I would suggest the Requirement statment (R1, R2, R3, etc.) be a statement of the requirement objective, and the Table rows be

#	Organization	Yes or No	Question 9 Comment
			implementing requirements for that objective. This approach should also resolve items 1 & 2 above.
9.44	RRI Energy	Keep CIP-011-1 as one document	The previous CIP-003 through CIP-009 required cross-referencing between the standards and standard owners to get it right. CIP-011 is much easier to follow and understand.
9.45	Bonneville Power Administration	Keep CIP-011-1 as one document	The single document format clearly states the requirements unlike the current standards which link to one another but do not clearly link the requirements.Having CIP-011-1 as one document rather than multiple standards is great. All of the requirements are in one place and easy to find.
9.46	Detroit Edison	Keep CIP-011-1 as one document	The tables holding the sub-requirements are a good feature that enhances readability. CIP-011 R3 and R4 have some requirements outside of the table and some in the table. Please move all sub-requirements to table format so each requirement would become a paragraph followed by a table with subrequirements. This will help minimize confusion caused by having a requirement and a table entry with the same number.
9.47	Dominion Resources Services, Inc.	Keep CIP-011-1 as one document	Using a single standard for all requirements is preferred, however the format internal to the single standard appears to be inconsistent. For example, some requirements are in paragraph form while others are embedded in a requirements Table. All requirements should be contained within a requirements Table. Where possible, information preceding the table should be used only to state the context and establish the security objective or intent behind the requirements.
9.48	Manitoba Hydro	Keep CIP-011-1 as one document	We agree with the proposed approach which creates a clear list of security requirements within a single standard. This addresses some of the complexity with the existing cyber security standards. We are, however, concerned about the current compliance monitoring and enforcement structure where the magnitude of fines and sanctions are levied based on prior violations, and the violations are reported per standard. The

#	Organization	Yes or No	Question 9 Comment
			proposed standard contains over one hundred requirements and sub-requirements, which increases an entity's exposure to multiple violations for a single standard, and increases the exposure of the industry to a large number of violations to a single standard.
9.49	Hydro One	Keep CIP-011-1 as one document	We agree with the proposed format for simplicity purposes. However, by consolidating the current version 3 standards into one document, this new CIP-011 standard would become one of the NERC's standards with the largest number of requirements. This could potentially make it "the most violated" one as well consequently impact the amount of monetary sanctions. If the proposed format is adopted, special compliance consideration should be adopted when dealing with violations
9.50	Minnesota Power	Keep CIP-011-1 as one document	With the requirements in a single document, it seems that it will be easier to arrange and consolidate requirements to alleviate the duplications and contradictions which have plagued the preceding CIP standards.
9.51	Tenaska	No preference	A personnel training issue can cause a violation of the whole standard that will be looked at as the same as a Cyber System boundary problem (Outsider Scanning). Until violations reporting and sanctions are reported at the requirement level only, then this could have a disproportionate impact on the entity relates to potential impact on the BES.
9.52	Network & Security Technologies Inc	No preference	Believe the SDT's time and effort are better spent on defining well-understood and auditable requirements that will enhance BES security & reliability than on trying to force-fit new/updated requirements into existing document structures.
9.53	US Army Corps of Engineers, Omaha Distirc	No preference	Combined this standard covers a very large number of requirements. Note the drafting committee divided the standard into several logical groupings for the presentation of the standard.

#	Organization	Yes or No	Question 9 Comment
9.54	ERCOT ISO	No preference	Either option is acceptable. Having them in one document could prevent public documentation of specific areas of weakness for an organization as audit results are public information and published on the NERC website. It also eliminates the need for circular referencing that is in the current CIP-002 to CIP-009 (e.g., CIP-005 R1.5).
9.55	Southwest Power Pool Regional Entity	No preference	Having all of the requirements in one document as opposed to many makes no difference to the compliance monitoring and enforcement process as long as Violation Severity Levels and Violation Risk Factors do not roll up higher than the main-level enumerated requirements. The advantage of keeping everything in one document is simpler version management and reducing the need for cross-standard references. The disadvantage is that more of the requirements will potentially be exposed to comments whenever the standard is being updated. Additionally, multiple standards permit parallel modification efforts whereas a single standard may result in single-threaded modifications over a prolonged development and approval timeframe.
9.56	Pacific Gas & Electric Company	No preference	Keeping CIP-011 as one document reduces complexity and makes overall understanding easierBreaking CIP-011 into multiple documents facilitates certain compliance and accountability aspects
9.57	SCE&G	No preference	The SDT should consider the advantages of breaking the Standard into multiple standards, as far as implementation goes. Some requirements will require more time to implement than others. Having the standard broken apart may make distinguishing these timeframes easier.
9.58	Southern Company	No preference	The tabular format for the requirements section is an excellent vehicle to capture the individual requirements. This should be expanded to include all requirement items. The numbering in the tables should be made unique to match the associated requirements in the standards body. (i.e., R3.1 is related to security training while table entry 3.1 is related to electronic access.)Sections of the table which do not apply should be marked N/A.

#	Organization	Yes or No	Question 9 Comment
9.59	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	No preference	Violations are by requirement, so whether it is one standard or multiple standards makes no difference.
9.60	Independent Electricity System Operator	No preference	We understand the need for this standard to take care of cyber security concern when there does not currently exist an across-the-board cyber protection standard that applies generically to all sectors that utilize cyber components and cyber access for control and data exchange. However, over time, we urge NERC and the electric industry to assess if indeed it needs to have its own cyber protection standards at all. Cyber protection is not unique to the electric industry. Other sectors - airline industry, national security/ defense, financial sector, banking system, etc. all employ a high level of cyber security to protect fraud and invasions. Wouldn't the electric industry be better served if owners of BES Cyber Systems be required to adopt similar practices of these other sectors as opposed to developing it own very detailed set of requirements which, for the most part, seem to replicate the other sectors' requirements?It will be desirable to have a generic set of Cyber protection standards that is applicable to all sectors that use Cyber Systems - may they be for BES control or access to airline reservation, air traffic control, e-banking, security trading, etc. NERC and the electric industry should take the lead to initiate a continent-wide effort to consolidate all such standards and practices to avoid redundant efforts.These comments notwithstanding we still offer some comments on the remaining questions.
9.61	Verizon Business	Keep CIP-011-1 as one document	One document eliminates potential confusion about the use of the correct version. However, during the initial implementation phase, there may be multiple revisions for CIP-011 being issued each month/quarter.

10. The Purpose of draft CIP-011-1 states, "To ensure Functional Entities develop cyber security policies and apply necessary cyber security protection to the BES Cyber Systems for which they are responsible and that execute or enable functions essential to reliable operation of the interconnected BES." Do you agree with this proposal? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration:

Suggestions for the purpose statement for the draft CIP-011 standard included several suggestions for rewording as well as comments expressing confusion around the term BES Cyber Systems. Several commenters expressed that the owner of BES Cyber Systems should have responsibility for compliance with the Standards and the Purpose statement did not reflect this.

In response to the industry comments received for draft CIP-011, the CSO706 SDT decided to divide up the draft CIP-011 requirements and include them in the multiple Version 5 CIP Standards (CIP-003 through CIP-011). Therefore, the purpose statement included with the draft CIP-011 no longer applies.

#	Organization	Yes or No	Question 10 Comment
10.1	PacifiCorp	Agree	: PacifiCorp agrees with EEI's suggested revision:"To ensure Responsible Entities develop cyber security policies and apply cyber security protection to the BES Cyber Systems for which they are responsible and that perform or enable functions essential to reliable operation of the BES."
10.2	WECC	Agree	Agree with the genearal purpose however, The term "necessary cyber security protection" in the purpose statement has no meaning without a frame of reference. The purpose statement may be used to clarify intent where the standard language is ambiguous or vague, so it should explicitly state the objectives of the standard.The phrase "...that perform functions essential to reliable operations of the interconnected BES" in the purpose statement is redundant. BES Cyber Systems are defined elsewhere so this clause adds confusion at best, and contradicts at worse.
10.3	Southwest Power Pool Regional Entity	Agree	As an overall purpose, the statement is OK. Consider addressing the issue of "responsibility" as it pertains to multiple entity aspects, including joint ownership

#	Organization	Yes or No	Question 10 Comment
			agreements, different owners versus operators, and the like.
10.4	Old Dominion Electric Cooperative	Agree	I agree under the assumption that this is in line with the enabling legislation in the Energy Policy Act. I disagree that this is the best way to go about achieving this goal.
10.5	Green Country Energy	Agree	I agree with the concept, however as I will repeat through the remainder of the comments, A guidance document is needed to address key points desired to be accomplished by these policies. This will also reduce the subjectivity during audits of this and all the following requirements
10.6	Progress Energy (non-Nuclear)	Agree	It is still unclear if cyber security implies that an external communications capability is available. Definitions and references seem to indicate that we can have a BES cyber system component without external connectivity.
10.7	US Bureau of Reclamation	Agree	Recommend that the Drafting Team change "Functional" to "Registered" in the 1st line of the Purpose. Add "they" between "that" and "execute" in the 3rd line of the Purpose statement.
10.8	Minnesota Power	Agree	This purpose statement is generally acceptable, with clarification or correction to the following: o What is the definition of “responsible”? Minnesota Power recommends changing this to “own” as is stated in CIP-010-1, R1. o The reference to “Functional Entities” should be replaced with “Registered Entities.” “Functional Entities” is not a defined term.
10.9	San Diego Gas and Electric Co.	Agree	While SDG&E agrees with the purpose of CIP-011 as applied to the various requirements, we would like to see additional language that would help clarify the meaning of the phrase “responsible for”. What if an entity owns a particular asset but does not operate it?
10.10	ISO New England Inc	Disagree	- Please provide additional clarification. Especially with regard to “necessary cyber security protection”.- Suggest changes from “cyber security protection” to “cyber

#	Organization	Yes or No	Question 10 Comment
			security controls".
10.11	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	Advise replacing "are responsible" with "operate." Where one Entity may own the BES Cyber System, and another Entity operates the same BES Cyber System, it must be clear who will be responsible for developing and implementing the policies. In many instances, the owner of a BES Cyber System only has monitoring capability, and no control or supervisory role in the BES Cyber System. Owners should not be responsible for creating policies for Systems they do not fully understand; owners should only be responsible for securing the BES Cyber System Components that they operate.
10.12	FirstEnergy Corporation	Disagree	As stated in our opening remarks, we fundamentally oppose the change in terminology. Additionally we disagree with the need for functional categorization as described in Attachment I. Therefore, we do not support the purpose statement of CIP-011.It is suggested that the proposed definitions for BES Cyber System and BES Cyber System Component could be combined to redefine the existing Critical Cyber Asset term allowing industry to better leverage its existing CIP implementation.Additionally, there is a concern, in going with the concept of "BES Cyber Systems" that it will expand beyond the systems that are directly responsible for the reliable/safety of the BES and into business systems.
10.13	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
10.14	ERCOT ISO	Disagree	Consider: "To ensure Responsible Entities develop cyber security programs to provide for appropriate protection of the BES Cyber Systems for which they are responsible that execute or enable functions essential to reliable operation of the interconnected BES."
10.15	Consultant	Disagree	Cyber security policies or cyber security protection do not 'execute' functions essential to reliable operation of the BES. Suggest removing the word 'execute'."interconnected BES" is not a defined term. Suggest removing the word 'interconnected'.

#	Organization	Yes or No	Question 10 Comment
10.16	US Army Corps of Engineers, Omaha Distirc	Disagree	Delete everything after "for which they are responsible." It reads awkward and is merely restating the meaning of BES Cyber System.
10.17	Kansas City Power & Light	Disagree	Do not agree with ensuring security policies in the purpose. The express purpose of these requirements should be to identify the cyber systems that require protection and the level of protection to achieve. There is no need to include a purpose of entering into the management of an organization and the levels an organization deems necessary to achieve compliance with the these CIP Standards or any other NERC Reliability Standard.
10.18	Dominion Resources Services, Inc.	Disagree	Dominion recommends changing the statement as follows: "To ensure Functional Entities develop cyber security policies and apply necessary cyber security protection to the BES Cyber Systems."
10.19	American Municipal Power	Disagree	I feel the purpose is not based on reliability. The purpose should not restate the applicability section.
10.20	Wolverine Power	Disagree	I have a concern with how to detrmine hat constitutes a "BES Cyber Ssystem" I don't think the standards are clear.See comments listed for 1.a fro explanation and proposed solution
10.21	Turlock Irrigation District	Disagree	Is the use of the words "the BES Cyber Systems for which they are responsible" above meant to be the same as the words "the BES Cyber Systems that it owns" which are used in CIP-010-1 R1? The Purpose of CIP-011-1 focuses compliance responsibility on the entity that is responsible for the BES Cyber Systems while CIP-010-1 R1 focuses compliance responsibility on the owner of the BES Cyber Systems.
10.22	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's suggested revision:"To ensure Responsible Entities develop cyber security policies and apply cyber security protection to the BES Cyber Systems for which they are responsible and that perform or enable functions essential to reliable operation of the BES."

#	Organization	Yes or No	Question 10 Comment
10.23	NextEra Energy Corporate Compliance	Disagree	NextEra believes implementation responsibility of protection methods should tie back to facilities under the entities control and ownership.
10.24	Reliability & Compliance Group	Disagree	Recommend adding the words “and implement”. Also the phrase “execute or enable functions essential to reliable operation...” needs a more concise definition.
10.25	Independent Electricity System Operator	Disagree	See response to Q9.
10.26	Network & Security Technologies Inc	Disagree	Suggest replacing “enable functions essential to...” with “support functions essential to...”
10.27	Allegheny Energy Supply	Disagree	Suggested Revision:”To ensure Responsible Entities develop cyber security policies and apply cyber security protection to the BES Cyber Systems for which they are responsible and that perform or enable functions essential to reliable operation of the BES.”
10.28	Allegheny Power	Disagree	Suggested Revision:”To ensure Responsible Entities develop cyber security policies and apply cyber security protection to the BES Cyber Systems for which they are responsible and that perform or enable functions essential to reliable operation of the BES.”
10.29	EEI	Disagree	Suggested Revision:”To ensure Responsible Entities develop cyber security policies and apply cyber security protection to the BES Cyber Systems for which they are responsible and that perform or enable functions essential to reliable operation of the BES.”
10.30	Nuclear Energy Institute	Disagree	The phrase “and that execute or enable functions essential to reliable operation of the interconnected BES” should be struck as it is redundant to the definition of BES Cyber Systems.
10.31	APPA Task Force	Disagree	The purpose is not to “develop ... policies” as the first item in the list currently indicates. The purpose is to protect cyber systems from attack, with policies, procedures, etc., to support that purpose. The APPA Taskforce suggests inserting the following “Purpose”

#	Organization	Yes or No	Question 10 Comment
			section:Purpose: To safeguard the reliability of the Bulk Electric System (BES) by protecting BES Cyber Systems from attack through the use of appropriate policies, procedures, tools and other resources.The APPA Task Force further recommends that each of the Requirements be reworded to separate out the stated objective to be accomplished from the text of the actual requirement and to state the objective prior the text of the Requirement. Auditors should not be placed in the position of having to evaluate if an entity has met the objective stated in the requirement, since this is essentially a subjective judgment. We feel this objective should not be part of the requirements. Here is one example of our proposed format illustrated with Requirement R5: Each Responsible Entity shall apply the criteria specified in CIP-011-1 Table R5 - Physical Security for BES Cyber Systems. The APPA Task Force recommends adding the following "Objectives" section after the Purpose in this standard:A. Introduction 1. Title: Cyber Security - BES Cyber System Protection 2. Number: CIP-011-1 3. Purpose: To ensure Responsible Entities develop cyber security policies and apply necessary cyber security protection to the BES Cyber Systems for which they are responsible and that execute or enable functions essential to reliable operation of the interconnected BES. 4. Objectives:a. Personnel Training, Awareness, and Risk Assessment: To ensure that personnel maintain awareness of the cyber security practices that are essential to protecting BES Cyber Systems. b. Physical Security for BES Cyber Systems: To prevent and/or detect unauthorized physical access to BES Cyber Systems.c. Personnel Risk Assessment: To ensure that personnel who have such access have been assessed for risk, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. d. etc...If the Objectives are not incorporated into the Introduction, we recommend they be removed from the requirement all together. If the team determines they are necessary, they must be in a separate sentence prior to the requirement. See comments on Question #12 and all other questions regarding the requirement title.
10.32	Florida Municipal Power Agency	Disagree	The purpose is not to "develop ... policies" as the first item in the list currently indicates. The purpose is to protect cyber systems from attack, with policies, procedures, etc., to support that purpose. FMPA suggests the following:np"To safeguard the reliability of the

#	Organization	Yes or No	Question 10 Comment
			Bulk Electric System (BES) by protecting BES Cyber Systems from attack through the use of appropriate policies, procedures, tools and other resources."
10.33	Indeck Energy Services, Inc	Disagree	The purpose of CIP-011, assumes that every facility registered with NERC is a cyber threat. It needs to differentiate functional entities to determine the impact on BES ALR. The functions identifies in Attachment I of draft CIP-010 are all important. Many of them are provided by hundreds or thousands of facilities. The cyber policies envisioned cannot ensure (that is guarantee) that there will be no blackouts due to cyber attack. [suggestion] "To require Functional Entities to develop, coordinate and apply adequate cyber security protection to the BES Cyber Systems for which they are responsible and that will achieve BES Adequate Level of Reliability." The coordination is to avoid unnecessary duplication of cyber security protection. This may require a different type of requirement that links connected parties, such as TO and GO, as to protecting particular facilities.
10.34	Manitoba Hydro	Disagree	The purpose statement appears to be missing words in the last line. Consider adding the words 'as outlined in this CIP-011-1' after the word 'responsible'.
10.35	Constellation Energy Control and Dispatch, LLC	Disagree	The purpose statement will need to be developed for each standard if CIP-011 is broken up into its major components.
10.36	Platte River Power Authority	Disagree	This comment is referring to an earlier comment suggesting a mechanism for identifying a "Responsible Entity" who is responsible for implementing and demonstrating compliance. With the "Responsible Entity mechanism in place I would suggest the following revision:To ensure the Responsible Entities develop cyber security policies and apply necessary cyber security protection to the BES Cyber Systems that execute or enable functions essential to the reliable operation of the BES.
10.37	Entergy	Disagree	This Requirement uses the qualifier: "for which they are responsible." In Requirement 1 of CIP-010-1 (Question 3) the qualifier is "that it owns" - these two requirement statements must be consistent one way or the other.

#	Organization	Yes or No	Question 10 Comment
10.38	ReymannGroup, Inc.	Disagree	Vendor management and due diligence of 3rd party vendors is a growing area of risk across multiple industries, including the bulk power system. We believe the "Purpose" language should be enhanced to clearly cover the Functional Entities' internal practices and those of its 3rd party resources. This should include all 3rd party vendors that may have on-site or off-site access to the BES hardware, software, or data. For example, the information security risk associated with a growing use of data recovery service providers is not addressed in the NERC guidelines. Data Recovery is defined in Wikipedia as the process of salvaging data from damaged, failed, corrupted, or inaccessible secondary storage media when it cannot be accessed normally. The definition of a BES includes programmable electronic devices such as hardware, software, and data. It makes sense that as the demand for such electronic storage devices continues to rise, more equipment will be damaged or will fail due to daily wear and tear, physical damage, data corruption, or natural disasters (e.g., flood, fire, etc.) If backup copies of lost data on the BES are not available, the need for data recovery services will increase to keep pace with the use of BES technology. It could be made more clear to emphasis that Cyber security protections are applicable while the BES is in operation and off-line. BES could be taken off-line for repair or other incidents such as a damaged hard drive and recovery of BES data, which will require a 3rd party vendor to recover sensitive data from the BES device.We recommend that NERC consider adding a new Requirement for Vendor Management as described in our comments to Security Governance and Policy (R1) and updating the R25 and R30 guidelines to address this 3rd party vendor data recovery risk. It is a very small aspect of day-to-day operations in the scheme of the Entity's priorities, which is why it has gone unnoticed - until now. As one regulator commented to us recently, "this is not a potential problem - it is a real problem." It can create a huge risk with a huge downside, if it is not controlled. Most organizations don't even realize that this "sleeper risk" exists, until it is too late. The good news is that with minor updates to proposed guidelines, NERC can educate entities and others about the risk associated with the use of data recovery service providers and provide meaningful tactical guidance on how to manage such risk. The current initiative to revise the CIP Cyber Security Reliability Standards is a timely opportunity to take the initial steps.

#	Organization	Yes or No	Question 10 Comment
			Perhaps some organizations have included data recovery security practices and protocols in incident response or recovery planning. The challenge here is that it usually requires a material event to activate the incident response or recovery plans. In such instances, these plans do not address the proper day-to-day use of data recovery service providers that would not be considered a material event. Frequently, the use of a data recovery service provider does not trigger a formal recovery plan or incident response plan. It is unlikely that most entities would execute a recovery or incident response plan to recover data from a failed BES device in the normal course of day-to-day activities. In the interim, it would be helpful to Functional Entities and others if NERC issued supplemental guidance specific to this topic. This will help establish an immediate awareness of the risk and share much needed guidance on appropriate due diligence and security protocols for data recovery service provider activities, selection, and use. Specifically, the data recovery risk exists from a lack of information security protocols and practices in the vetting, selecting, and use of data recovery service providers.Whether a breach of sensitive information occurs from a hacker, cyber threat, insider threat, or a data recovery service provider, the potential cost, fines, reputational damage, and loss of trust that an organization would experience is huge. In short, data recovery service provider risk can create as much damage as other risks that are addressed in existing NERC guidelines, if adequate controls are not defined and implemented. A typical security and compliance budget will allocate funds to protect people, information, and assets within the perimeter. Many entities are also focused on protecting data on the inside of their organization from outside attacks. Data recovery, however, frequently falls into a low priority category that does not pop-up on the CISO's radar or in an information security risk assessment. The need for data recovery is frequently associated with an immediate sense of urgency, e.g., the data contained on the damaged storage device must be recovered right away. o Help Desk personnel or office technicians are usually tasked with the responsibility of selecting an outside third party vendor to recover the data quickly. o Such third party vendors may or may not be listed on an approved vendor list. o Frequently, the due diligence and selection process of such a vendor is limited to its financial stability, the cost of its services, and a fast

#	Organization	Yes or No	Question 10 Comment
			“turnaround time.”According to an independent national study - Security of Data Recovery Operations - published by the Ponemon Institute in December 2009 and conducted among IT security and IT support practitioners, there is a gap in security guidelines when selecting data recovery service providers. Specifically, o Sixty-four percent of the respondents decentralize the selection for data recovery vendors to the local level, e.g., Help Desk, while 24 percent are not sure how the vendor is selected. o Sixty-nine percent of the respondents do not have or are unsure if they have a policy for ensuring the protection of data during the recovery process. o Forty-nine percent say IT security is not involved in the selection process. o Only 20 percent believe data security is a major selection criterion. o Eighty-two percent say that it should be.A large percentage of respondents in this study (83 percent) reported at least one data breach in the past two years. Of the 83 percent who said the organization had a data breach, 19 percent said the breach occurred when a drive was in the possession of a third-party data recovery service provider. Forty-three percent of those respondents who said the breach occurred while at the vendor say it was due to a lack of data security protocols. Most organizations also have some additional backup and recovery procedures that overshadow the sense of urgency for more attention to data recovery practices on devices that were not backed up. In short, even with a strong backup recovery program, data recovery needs still arise. Seventy-nine percent of the respondents to the Ponemon study noted that their organizations have used or will continue to use a third-party data recovery service provider to recover lost data.Additional guidance is needed on how to extend current information system program practices to clearly address the protection of sensitive data, while it is in the possession of a third party service provider for data recovery. If the Entity has a strong vendor risk management program, it should include ALL vendors that have access to sensitive data, including data recovery vendors. Mandated vendor management practices apply to all stages of the information life cycle. Specific to data recovery vendors, this includes:âˆš Pre-selection and negotiation of Master Service Agreements with appropriate vendors. These should be reviewed by a risk management committee and audited on an annual basis.âˆš Due diligence of all third party vendors (e.g., financial stability, client references, information security

#	Organization	Yes or No	Question 10 Comment
			practices, etc.)âˆš Verification of the vendor's security procedures to govern the transfer of devices and sensitive information.âˆš Proof of internal information technology controls and data security safeguards, e.g., ISO 27001 certification, NIST SP 800-53 Audit Report, FFIEC Service Provider Examination Report, BITS Shared Assessment Report, or SAS 70 Type II Audit Report (especially if the data recovery involves financial information). The appropriate certification and audit report will vary depending on the service provider's client base.âˆš Proof of current training and certifications of engineers in all leading encryption software products and platforms.âˆš Adequate chain-of-custody documentation and network security.âˆš Vetted and performed background checks of its employees.âˆš Adequate procedures for the secure and permanent destruction of devices, when required.âˆš Capabilities for encryption of data files in transit and storage.âˆš Adequate clean room facilities, e.g., certified ISO 5 (Class 100).âˆš A security procedure for the analysis of the information and device upon return to the organization to ensure malware and other malicious software has not been loaded.The lack of information security protocols and practices in the vetting, selecting, and use of data recovery service providers is not a potential problem - it is a real problem! NERC guidelines are a key resource that can help educate functional entities and others to this sleeper risk and identify prudent risk management practices and controls.
10.39	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
10.40	We Energies	Disagree	We Energies agrees with EEI: Suggested Revision:"To ensure Responsible Entities develop cyber security policies and apply cyber security protection to the BES Cyber Systems for which they are responsible and that perform or enable functions essential to reliable operation of the BES."
10.41	GTC & GSOC	Disagree	We recommend the language should be consistent with CIP-010 "owns" versus "responsible for." As indicated in comments on 1.b above, "owns" may be problematic.

#	Organization	Yes or No	Question 10 Comment
10.42	Xcel Energy	Disagree	We suggest the Purpose be revised to state "...and apply necessary cyber and physical security protection..."
10.43	Verizon Business	Agree	Any "carryover exceptions" from CIP-002 to CIP-009 need to be identified. Specifically, OSI Layer 2 Protocols need to be explicitly addressed.

11. Requirement R1 of draft CIP-011-1 states, "Each Responsible Entity shall develop, implement, and annually review formal, documented cyber security policies that address the following for its BES Cyber Systems:" and then provides a list of topics that must be addressed. Do you agree with this proposal and list? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration:

Many commenters requested more clarity regarding the terms used (including the following: "formal," "annually," "boundary protection," "security roles and responsibilities," "personnel," etc…). Commenters requested to have the terms used throughout the standard defined in this section. Additional clarity was sought in terms of the policy expectations, purpose, and structure. Specifically, there were numerous questions about what is meant by "policy language," along with concerns about how to demonstrate compliance with a policy. Some commenters also noted that the policy requirements were too prescriptive. There were some comments that led the SDT to believe that there was some possible confusion surrounding general policy hierarchy.

The SDT agrees with the need for additional clarification and clearer expectations with regard to the policy. The drafting team has provided clarification through the addition of guidance material related to items that should be included in policy, and has implemented a style for the measures in each requirement that can be used as an aid in setting clear expectations for possible audit evidence.

Some commenters raised questions about the requirements with respect to the Senior Manager; specifically with concerns about delegation and the potential for conflict with R3, or claims of double jeopardy between R1 and other requirements.

The SDT appreciates the concerns about double-jeopardy issues and the prescriptive nature of the requirements. As such, the SDT has proposed moving the prescriptive elements of the requirement to guidance. This approach will allow the Responsible Entity greater flexibility to create a policy that is meaningful for its unique environment, while still providing the foundation necessary for an effective cyber security program.

#	Organization	Yes or No	Question 11 Comment
11.1	Entergy	Agree	"Annually" must be defined. At least once every twelve months? At least once per calendar year (this could extend past 12 months). Please clarify.
11.2	Green Country Energy	Agree	Agree with the list, however I really see the need for a reference document or footnotes pointing to sources for guidance on the expectations for these policies. Because the policies / requirements were designed not to be to prescriptive they in turn need references to give some expectations as to the points to be addressed within the

#	Organization	Yes or No	Question 11 Comment
			policies. This will allow flexability as to tailor the policy to each business, the policy will meet with the objectives of NERC / FERC and make the policies easier to audit. Is this what results based standards is all about...
11.3	Covanta Energy	Agree	Annually may be needed due to frequent challenges and changes to cyber hacking techniques.
11.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
11.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent, but believes the following improvements should be made:What does “formal” mean, does the drafting team intend a Company Policy?Terms used in later requirements ought to be defined here, such as unauthorized access, Cyber Security Incident(s), and electronic access controls.Terms that are ambiguous, such as “Boundary protection” and “media sanitization” ought to have definition boxes associated with them. In general, definition boxes should be adjacent to the term as it is first used in the standard. Alternatively, a definitions sections such as is used in typical contracts could be a new standard section for those definitions that are used only in this standard that are not included in the Glossary.It should be clear the “Personnel ...” used in 1.4 includes external contractors.1.7 seems to encompass 1.5, 1.6 and 1.8, consider making 1.5, 1.6 and 1.8 sub-bullets of 1.7
11.6	National Grid	Agree	In 1.2 please elaborate on “security roles and responsibilities”. What is the SDT looking the entities to include as part of this document?
11.7	Minnesota Power	Agree	Minnesota Power would like to see more detail regarding each of the topics on the list to help clarify the expected content of these policies. For example, item 1.3 requires the naming of a single senior management official, with no mention of the ability to also name delegates. Yet, Requirement R3 includes the following language: “...that are approved by the single senior management official...or their delegate...”

#	Organization	Yes or No	Question 11 Comment
11.8	Bonneville Power Administration	Agree	NOTE: This following comment deals more with structure of the document than it does with content: NIST SP 800-53 lists 19 families of security controls for Government systems. Although the purposes of 800-53 and CIP-011 are not equivalent, there seem to be 800-53 families missing from CIP-011 that address areas that should be of interest in CIP-011. Even if the individual controls are addressed in CIP-011, listing the families would be useful. In particular, it is unclear why Audit and Accountability, Contingency Planning, Identification and Authentication, Personnel Security, System and Communications Protection, System and Information Integrity, and Program Management are not addressed. We believe that incorporating these would be an improvement to the document. In the CIP versions 1, 2 and 3 standards organizations have had numerous and almost endless discussions about what “annual,” “annually review,” etc. means. Hours have been spent trying to figure out what these terms mean. Some have said that “annual” means within 13 months. Annual meaning “within 13 months” makes absolutely no sense. It would be extremely helpful to the industry if clarity were provided in CIP-011-1. The debate needs to end. There appear to be four different phrases that could be used to provide more clarity:1. “at least once every 12 months” - let’s assume that the organization reviews all of the various policies referenced in R1 on July 15, 2010, and again on March 15, 2011. Using this phrase and example, however, raises a couple of questions. When must the next review be completed? Is it no later than July 15, 2011, or no later than March 15, 2012? In other words, is there a window in which "annual" events must occur, "12 months +/- a month" or if you perform something early for efficiency's sake, does your annual date reset to the earlier date?2. “every 12 months” - the review would occur on the same date each year. This would be virtually impossible to manage. 3. “within 12 months of the last . . .” - in this case let’s assume that a review is performed on March 15, 2010. The next review would have to occur no later than March 15, 2011, but could occur earlier (let’s say it occurred on December 15, 2010). If it occurred on December 15, 2010, the subsequent review would have to occur no later than December 15, 2011.4. "anytime during the calendar year" - which would give the organization maximum flexibility in accomplishing the compliance activities.The Standards Drafting Team (SDT) should

#	Organization	Yes or No	Question 11 Comment
			provide more clarity as to what is intended and use an exact phrase rather than the word “annually” review. #3 - “within 12 months of the last . . . .” appears to be clearer than either of the others while #4 would provide a hard deadline that would not result in "date creep."
11.9	Dominion Resources Services, Inc.	Agree	Please see Dominion’s response to Question 9.
11.10	Reliability & Compliance Group	Agree	This could be better clarified. Some may interpret this to mean that procedures that address those topics will satisfy the requirement. A global definition of cyber security policy might help.
11.11	ISO New England Inc	Disagree	- Suggest changing the word “annually” to “a defined time frame” provided example at the end.- Suggest removing the “one or more formal” and add “documented and approved cyber security policies.”
11.12	Garland Power and Light	Disagree	* Please clarify the words "one or more" - does this require the review of all policies for the following functions
11.13	Consultant	Disagree	1. The list should include "Governance" as the first item. Suggest the first three items should be subheadings to the Governance item.2. Technically, R1 does not require designation of a CIP Senior Manager. As worded it requires a policy addressing the "Identification of a single senior management official...". Suggest an additional requirement statement requiring the Responsible Entities to designate a CIP Senior Manager, and document that designation.3. The mechanism for assigning responsibility is typically not a policy. Consider modifying the statement "Identification of a single senior management official with overall authority..." with "The senior management official's authority..." as an item to be addressed in the policy.
11.14	FEUS	Disagree	1.3 does not allow for delegation of authority for situations when the identified senior manager is unavailable. The Drafting Team should consider allowing a delegate or

#	Organization	Yes or No	Question 11 Comment
			alternative designated by the senior manager.
11.15	USACE HQ	Disagree	1.3 is missing the language that the single senior management official has the power to delegate some or all of the functions and/or actions to one or more named delegates. Also, double jeopardy is present since Requirements 6, 7, 11, 14, 15, 16, 17, 18, 20, 21, 23, 24, 25, 26, 27, 29, 30, and 32 cover part of or all of the policy documentation been required in 1.5, 1.6, 1.7, 1.8, 1.9, 1.10, 1.11, 1.12, and 1.13.
11.16	Alliant Energy	Disagree	Alliant Energy agrees with EEI on verbiage suggestions and clarifications.
11.17	FirstEnergy Corporation	Disagree	As written the requirement and the list will require significant rework of existing policies for negligible benefit. In fact, the retraining that will be required will cause confusion and increase the challenge of achieving and maintaining compliance.Provide a standard that addresses all access issues (physical, logical, informational, etc.) instead of it being in multiple sections. Would also like to see emergencies being brought back into the main document, instead of having it part of each section.
11.18	Poplar Bluff Municipal Utilities	Disagree	Based on past experience, saying "Each Responsible Entity shall..." causes the Regional Entity to apply all CIP Standard requirements to all entities even if they own no Critical Cyber Assets. CIP-011 should clearly state that its requirements only apply to Entities that own BES Cyber Systems.
11.19	Con Edison of New York	Disagree	CIP-011-1 refers to timed requirements in various ways. The requirements should define the meaning and differences between annual, every year, within 3 calendar years, once every 12 months etc. There continues to be multiple interpretations of how within 365 days, within 12 months or in 2 calendar years, etc is defined.The term “annual” and “annually” should be defined. A suggested definition follows:Annual and Annually shall mean approximately every 12 months, but any period of no less than 9 and no more than 15 months.
11.20	E.ON U.S.	Disagree	CIP-011-1, R1.3 does not specify delegation by senior manager as currently permitted

#	Organization	Yes or No	Question 11 Comment
			under CIP-003-2. E ON U.S. proposes that delegation of authority by the senior manager be included as currently provided in CIP-003-2.
11.21	Dairyland Power Cooperative	Disagree	Communications between components/systems at different facilities or between different entities is an area lacking governance. Boundary protection is not sufficient.
11.22	ERCOT ISO	Disagree	Consider: “Each Responsible Entity shall develop, implement, approve, and annually review formally documented cyber security policies that address the following for its BES Cyber Systems:” Please clarify the meaning of “1.1. Applicability to organizational and third-party personnel”.
11.23	Progress Energy - Nuclear Generation	Disagree	Existing nuclear document hierarchy programs require review of policies, procedures, programs, and directives. The periodicity of the reviews should be consistent for nuclear generating facilities.See attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
11.24	Southern Company	Disagree	For R1, What does “Addresses” mean? For 1.1...These are not usually actual third parties; the correct term is probably “non-employees acting on behalf of the Entity”.R1.3 and R3 create a requirement (a single responsible figure) that does not exist in any other NERC standard. Governance structures should be determined by the Entity and should not be regulated; the focus should be on the meeting of the other requirements and on the overall culture of compliance, so that the Entity can focus on creating the organizational structure that allows it to best meet the needs of CIP-011. This clause should be removed.Change the word "policy" in R1 to "policy or equivalent document".”Boundary protection” is undefined.
11.25	ReymannGroup, Inc.	Disagree	In many situations, outsourcing information technology tasks offers the Entity a cost effective alternative to in-house capabilities. Outsourcing, however, does not reduce the fundamental risks associated with information technology or the business lines or BES Systems that use it. Because the functions are performed by an organization outside the

#	Organization	Yes or No	Question 11 Comment
			Entity, the risks may be realized in a different manner than if the functions were inside the Entity resulting in the need for controls designed to monitor such risks. An additional security policy on 3rd Party Due Diligence and Vendor Management should be included. Functional Entities' should be required to establish a formal risk management processes to establish, manage, and monitor IT outsourcing relationships.
11.26	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	It is not clear what the Entity is responsible for if they do not own or operate any BES Cyber Systems. The assumption is not clear if the BES Cyber Systems list is null that Requirement R1 is then not applicable. Further, if a Low Impact BES Cyber System is the one and only System an Entity is responsible for, it is not clear whether a policy corresponding to an item (such as 1.5. Physical security) is required when the subsequent related Requirement pertaining to that item has a null listing for the Low Impact column in the following table (see Requirement R5). We advise the following change: "Each Responsible Entity who owns or operates one or more BES Cyber System shall develop, implement, and annually review formal, documented cyber security policies addressing applicability found in Requirements R2 through R32. The cyber security policies shall address each of the following categories, and include a statement of non-applicability for a category where appropriate:"
11.27	Western Area Power Administration	Disagree	It seems the requirement wants us to make the Physical Security Plan a part of the Cyber Security Policies? Is that what is intended?
11.28	Duke Energy	Disagree	List of topics need to be better defined. For example, 1.8. "boundary protection" may need to be changed to "electronic boundary protection". 1.9 should be changed to "Change Management" and "BES Cyber system maintenance" to "Configuration Management" for better alignment with NIST, COBIT and other control framework documents. Also, this policy is the only place where a Sr. Management official is mentioned. Does one or more imply a different policy per requirement or per business unit? If we have more than one policy, does the same Senior Manager need to manage and implement the requirements of the standard?

#	Organization	Yes or No	Question 11 Comment
11.29	NextEra Energy Corporate Compliance	Disagree	NextEra comments that during an emergency situation, a utility's primary objective is to end the emergency situations as soon as possible. For example, before, during and after the impact of a hurricane, the affected utility will mobilize much of its workforce to address system and customer restoration efforts. This may cause certain CIP requirements or deadlines to be missed for a short period of time. Moreover, there may be a need to relax CIP requirements, such as contractor qualification requirements for unescorted physical access into substations. Given the unforeseeable nature of emergencies, it is not possible to ensure all deadlines are met ahead of time, nor is it possible to pre-qualify all contractors, because it is not always known which contractors will be available or needed for emergency situations. A provision for emergency situations in the cyber security policy provides the utility and auditors alike with a framework and vehicle to ensure that any missed CIP deadlines or requirements that were relaxed are tracked, documented and that after the event, any missed or relaxed CIP requirements are addressed within a reasonable time after the emergency situation has ended. To implement emergency provisions and add clarity to other issues, NextEra proposes the following revisions:Each Responsible Entity shall have a documented cyber security policy related to the protection of BES Cyber System Components and BES Cyber Systems. The cyber security policy shall be reviewed every year during the month of March and updated, as necessary, no later than March 31st . The cyber security policy may also be updated as necessary. The cyber security policy shall include the following:B. The applicability of cyber security policy to employees and contractor personnel, including the manner in which the cyber security policy will be made available to employees and contractor personnel; C. The list of employees responsible for authorizing unescorted physical and/or cyber access to a BES Cyber System component consistent with R2-R4; D. The identification of a single senior management official with overall authority and responsibility for leading and managing implementation of requirements within this standard, including contact information; E. A provision that addresses the Responsibility Entity's response to emergency circumstances in the context of CIP compliance. This provision shall address how the Responsibility Entity will track and document any missed CIP deadlines or CIP requirements held in abeyance

#	Organization	Yes or No	Question 11 Comment
			because of the emergency, and documents how, after the emergency condition has ended, any missed CIP deadlines or CIP requirements held in abeyance were brought back into compliance. An overview of the Responsibly Entity's approach to compliance is indicated with the following:
11.30	Ameren	Disagree	Overall this Requirement is vague and it will be open for interpretation during an audit. Suggest adding references to the corresponding requirements for sub-requirements R1.1 through R1.13. Also, if corporate policies cover all these areas would that be sufficient to prove compliance? Does the Senior Manager still need to approve this policy? These questions need to be answered to provide necessary clarity.
11.31	Tenaska	Disagree	R2 Clarify Sound Security PracticeR3 If a CCA were to go DOWN (NOT running) and the only vender that is available at that time that can fix it is not trained and/or criminal background and identity verified, does the standard address how to utilize the vendor and not violate the standard?
11.32	Exelon Corporation	Disagree	Requirement 1.3 should be revised to state a "Single Senior Management Official as per the entity's registration". Exelon is concerned that as presently written, Requirement 1.3 could be interpreted that Exelon as a corporate entity would need to have one and only one "single senior management official with overall authority and responsibility for leading and managing implementation of requirements within this standard".
11.33	Manitoba Hydro	Disagree	Requirement R1 states that each Responsible Entity shall "... annually review one or more .... cyber security policies..." which implies that a entity could review a single policy in a year. If an entity developed a policy for each of the R1 sub-requirements, it would take 13 years to complete the policy review. Consider including cross references to each of the specific Requirement numbers in 1.1 to 1.13.
11.34	Southern California Edison Company	Disagree	SCE first makes the following specific comments in relation to this Requirement: (1) R1.1 "third-party personnel" is vague and needs to be more clearly defined; (2) CIP-001-1-R1 does not include provisions for emergency situations; and (3) R1 appears to exceed the

#	Organization	Yes or No	Question 11 Comment
			mandates of FERC Order 706, paragraph 355, in that a finite list of topics to include in the policy were not required by FERC.In addition to those specific comments, SCE also makes the following general comment: the contained list attempts to be too prescriptive but does not seem to be exhaustive at the level of detail that is chosen. For instance, R1.5 and R1.6 are essentially sub-components of R1.8. Policy objectives should be such that they are at a higher level and yet clearly state the desired cyber security control objective in a manner that can drive the development of procedures and tools. The drafting team should consider dividing the standards into thematic areas that require policy statements for each thematic area.
11.35	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that the Requirement R1 in CIP-011 be re-worded to change the text “annually review formal documented cyber security policies” to "annually review a formal documented cyber security policy framework that includes policies, standards, and guidelines." Not everything within the framework would be a policy.
11.36	Independent Electricity System Operator	Disagree	See response to Q9.
11.37	Allegheny Energy Supply	Disagree	Suggested Revision:”Each Responsible Entity shall develop, implement, and annually review, documented cyber security policies that address the following for its BES Cyber Systems:”Suggested Revision for R1 1.3:Identification of a senior manager with overall responsibility for leading and managing the entity’s implementation of, and adherence to requirements within this standard; R1 1.7: System security; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.7.R1 1.8: Boundary protection; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.8.It is unclear as to the distinction between 1.9. Configuration change management; and 1.11. BES Cyber System maintenance; Suggest addition of language to bring clarity or removing R1 1.11.
11.38	Allegheny Power	Disagree	Suggested Revision:”Each Responsible Entity shall develop, implement, and annually review, documented cyber security policies that address the following for its BES Cyber

#	Organization	Yes or No	Question 11 Comment
			Systems:"Suggested Revision for R1 1.3:Identification of a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to requirements within this standard; R1 1.7: System security; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.7.R1 1.8: Boundary protection; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.8.It is unclear as to the distinction between 1.9. Configuration change management; and 1.11. BES Cyber System maintenance; Suggest addition of language to bring clarity or removing R1 1.11.
11.39	EEI	Disagree	Suggested Revision:"Each Responsible Entity shall develop, implement, and annually review, documented cyber security policies that address the following for its BES Cyber Systems:"Suggested Revision for R1 1.3:Identification of a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to requirements within this standard; R1 1.7: System security; is unclear as to meaning or intent. EEI suggests additional language to bring clarity or removing R1 1.7.R1 1.8: Boundary protection; is unclear as to meaning or intent. EEI suggests additional language to bring clarity or removing R1 1.8.It is unclear as to the distinction between "1.9. Configuration change management;" and "1.11. BES Cyber System maintenance;" EEI suggests additional language to bring clarity or removing R1 1.11.
11.40	Alberta Electric System Operator	Disagree	The AESO suggests removing "formal, " from the proposal as it is subjective.
11.41	APPA Task Force	Disagree	The APPA Task Force agrees with the intent, but believes the following improvements should be made:What does "formal" mean? Does the drafting team intend a Company-wide Policy?Terms used in later requirements ought to be defined hereTerms that are ambiguous, such as "Boundary protection" and "media sanitization" ought to have definition boxes associated with them. In general, definition boxes should be adjacent to the term as it is first used in the standard. Alternatively, a definitions sections such as is used in typical contracts could be a new standard section for those definitions that are used only in this standard that are not included in the Glossary.It should be clarified that

#	Organization	Yes or No	Question 11 Comment
			"Personnel ..." as used in 1.4 includes external contractors.1.7 seems to encompass 1.5, 1.6 and 1.8. Consider making 1.5, 1.6 and 1.8 sub-bullets of 1.7The APPA Task Force believes that a number of the requirements listed in the tables throughout CIP-011 should be part of an overarching policy developed by each registered entity. While each utility's approach may be different, each registered entity should establish a coherent approach to cyber-security for its BES facilities. Requirement R1 should be viewed as the cornerstone of defining what is important to that utility. We believe the subsections of R1 are confusing and need clarification. Since revocation of access is common to many of the requirements The APPA Task Force believes the following Additional/Edited cyber security policies should be addressed in each entity's policy:1.2.1 Revocation of Access - Triggering Criteria
11.42	Southwestern Power Administration	Disagree	The phrase "leading and managing" is too restrictive, particularly for larger entities whose single Senior Management Official may have overall authority and responsibility, but his or her managers are the personnel who are responsible for leading and managing the details of the cyber program.1.3 Identification of a single senior management official with overall authority and responsibility for implementation of requirements within this standard;
11.43	Kansas City Power & Light	Disagree	The requirements here for a policy statement are much too prescriptive and are unnecessary. Policy statements should be global and encompassing and provide overall guidance. Recommend removal of a policy statement requirement from this proposed Standard. What purpose does this requirement serve or problem does this requirement solve? If this requirement is not included, what process or procedure will not be done in support of the remainder of the requirements? What is important are the processes and procedures that are in place to support the meat of the Standard. Mandatory and enforceable requirements are sufficient to stand alone. If a company feels they need a policy statement to support the CIP Standards, or any other Standard, let that be their decision.Do not agree with the need for requirement 1.3 regarding the need to appoint a single senior management official for overall authority and responsibility for leading and managing implementation of the CIP requirements. These requirements cover a broad

#	Organization	Yes or No	Question 11 Comment
			spectrum of systems and can engage many organizational parts of a company that one person may not be meaningful over all parts. NERC Reliability Standards compliance is sufficient weight to allow a company to determine the level of approval it needs to achieve and ensure compliance throughout an organization for CIP and any other NERC Reliability Standard.This Standard should focus on identification of cyber systems that need protection and an appropriate level of protection needed and move away from requirements that manage an organization such as R1.
11.44	LCEC	Disagree	The requirements of a formal policy should be defined.Boundary protection should be definedmedia sanitization should be definedCyber Security incident should be defined
11.45	Progress Energy (non-Nuclear)	Disagree	The term annual needs to be defined. Is it during a year, per 12 months, Jan 1 to Jan 1, 365 days, from what starting date, etc.R1 1.7: System security; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.7.R1 1.8: Boundary protection; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.8.It is unclear as to the distinction between 1.9. Configuration change management; and 1.11. BES Cyber System maintenance; Suggest addition of language to bring clarity or removing R1 1.11.
11.46	Michigan Public Power Agency	Disagree	The term annually is not consistently applied throughout the industry. For some organizations, this term means sometime in a calendar year, others apply it to their fiscal years. Some have applied it to mean a 12 month period based on the last event. The term either needs to be defined similarly to R3, where there is a local definitions box or the wording should be altered to remove the ambiguity.
11.47	US Bureau of Reclamation	Disagree	There are 6 "definitions" provided in CIP-011 which are needed to enforce the standards. Those 6 "definitions" need to be formally proposed as definitions in order to ensure enforceability of the standard.
11.48	Southwest Power Pool Regional Entity	Disagree	This requirement is not objectively auditable as written. Some level of explanation or direction needs to be defined to assist the entity and the auditor in a common

#	Organization	Yes or No	Question 11 Comment
			understanding of the expectation. While a simple regurgitation of the applicable enumerated (not "R") requirements is undesirable, the required polic(ies) need to state expectations in sufficient detail for the entity and its contract / vendor support personnel to understand the requirements of the policy as they pertain to implementing the standard(s).
11.49	American Municipal Power	Disagree	This requirement seems to be too prescriptive.
11.50	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
11.51	We Energies	Disagree	We Energies agrees with EEI: Suggested Revision:"Each Responsible Entity shall develop, implement, and annually review, documented cyber security policies that address the following for its BES Cyber Systems:"We Energies agrees with EEI: Suggested Revision for R1 1.3:Identification of a senior manager with overall responsibility for leading and managing the entity's implementation of, and adherence to requirements within this standard; R1 1.7: System security; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.7.R1 1.8: Boundary protection; is unclear as to meaning or intent. Suggest addition of language to bring clarity or removing R1 1.8.It is unclear as to the distinction between 1.9. Configuration change management; and 1.11. BES Cyber System maintenance; Suggest addition of language to bring clarity or removing R1 1.11.
11.52	American Electric Power	Disagree	What burden of proof is needed for items 1.4-1.13 to demonstrate implementation? Would this be the same proof that would be required to prove R2-R32 have been met? Is this an instance of double jeopardy? Failure to meet an item in R2 would also mean failure to implement the cyber security policy in R1. Suggest removing "implement" and allowing the R2-R32 requirements stand as proof of implementation.To what level of detail must the cyber security policy address the items? Is it sufficient to outline how they will be addressed? Different auditors may have different levels of detail in mind. Is this meant to outline a Responsible Entities Cyber Security Policy? The majority of the

#	Organization	Yes or No	Question 11 Comment
			details for compliance will be found in the procedures, not in policy statements. Does this do anything more than demonstrate a Cyber Security culture for a Responsible Entity?
11.53	ReliabilityFirst Staff	Disagree	What does the term “addresses” in Requirement R1 mean? How does an entity “address” sub-requirements 1.1 through 1.13? Sub-requirement 1.3 needs clarification regarding the definition of the phrase “single senior management official”. Does this phrase mean one individual for an enterprise or one individual for each registered function, or either?
11.54	WECC	Disagree	While we agree with the general proposal and list, this requirement should be rewritten to more clearly indicate what is required. The word formal should be defined in this context. The level of detail required in the policies should be indicated. Suggest changing review annually to "review at least every 365 days" or to "once during the calendar year" depending on what SDT's intent is for the requirement.(1.1) The phrase,” Organizational and third-party”, is inconsistent with phrases used in other requirements. Consider utilizing the same language used to describe individuals with access to cyber systems, or simply state “everybody”. (1.3) No specific documentation is required.(1.4 through 1.13) These requirements are very vague and offer no guidance at all as to the level at which these topics must be addressed. As written this requirement provides no value whatsoever, and is essentially unauditable.
11.55	Verizon Business	Disagree	1) Revise 1.9 Configuration Change Management to two separate lines – one for “Change Management” (which would apply to procedure compliance, etc.) and one for “Configuration Management. 2) The list is too vague. The prior approach with CIP-003 identifying the specific policies needed is preferable. 3) Item 1.8, “Boundary Protection” should be defined. The requirement should state whether it is consistent with the definition in NIST 800-53. 4) Revise 1.5 to read “Physical Security of BES Cyber System Components.”

12. Requirements R2 to R4 of draft CIP-011-1 concern personnel training, awareness, and risk assessment, which were previously contained in CIP-004. Do you agree with this proposal? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration:

Note: CIP-011-1 R2 through R4 now resides in CIP-004-5 R1 through R3.

Several commenters suggested training related to networking, hardware, software, and electronic interconnectivity was either unnecessary or inappropriately targeted to individuals who have no working knowledge of the subject. The SDT agrees, and has made the training 'role-appropriate'; meaning only individuals whose roles necessitate such knowledge must receive the training.

Some commenters suggested the awareness requirements were not clear; specifically, use of the terms "proper use", "essential", and "sound security practice" were highly subjective. In response, the SDT has removed those terms and provided a requirement that can be audited more objectively.

In addition, some commenters suggested the quarterly reinforcement timeframe was too frequent. However, the SDT believes the requirement to update security awareness material is not overly burdensome and serves the reliability benefit of getting up-to-date threat information to a wide audience of individuals who can protect the BES Cyber Systems.

Some commenters suggested the annual timeframe for training individuals was inflexible and should allow for additional time to have individuals trained. The SDT agrees and has suggested the alternative use of the phrase "at least once every calendar year, but not to exceed 15 months between training."

Some commenters suggested the requirement for photographic identification was not necessary, since it adds the additional requirement for individuals to be on site for a personnel risk assessment. In response, the SDT acknowledges the requirement for photographic identification would necessitate individuals to be physically present. However, the requirement has been modified to require identity verification only for the initial personnel risk assessment performed for each individual.

Some commenters also suggested background checks were overly burdensome by requiring entities to cover all of the locations of residents within the past seven years. The SDT appreciates these comments but does not feel an adequate personnel risk assessment can be made without such information.

#	Organization	Yes or No	Question 12 Comment
12.1	Alliant Energy		Alliant Energy agrees with EEI to strike "sound" and "essential from R2. Also, additional

#	Organization	Yes or No	Question 12 Comment
			clarity around awareness training and the term “provide” and whether that requires completion tracking. Suggestion: Use the term “distribute” instead of “provide” to remove that implied obligation for awareness training.Additionally, R3.2 is not a practical requirement. Role based training is good; however, training should be specific to the responsibilities within the BES Cyber System and should not be prescribed by the standard. What is “specified” and why is training on networking hardware and connectivity required for users/operators of BES Cyber System Components who are not network administrators. What benefit is provided by providing technical training to personnel whose core competency and job duties do not require this level of expertise or understanding?R3.5 introduces a rolling creeping calendar. Recommend changing all 12 month timeframes to either 13 calendar months or 5 calendar quarters from the previous completion to allow entities to maintain a program with an annual training rollout with the appropriate amount of lead time to be successful in annual renewal. A 12 month timeframe will create a training program that becomes administered on a user by user, day by day basis without considerations for consistent annual content updates and bulk annual renewal.R4.1 is too prescriptive and does not take into consideration personnel with access and zero need for onsite presence.
12.2	National Rural Electric Cooperative Association (NRECA)		In R4, other than performing, documenting and updating personnel risk assessments, is there anything else that is required regarding personnel risk assessments? It does not appear there is, but wanted your confirmation on that.In R4.3, please specify what "at least once every seven years" means. This needs to be made clear so there are no misunderstandings. For example, if the last assessment was done on Jan. 15, 2001, does this provision mean the next one must be completed by Jan. 15, 2008?In R4.3, if a person never had an assessment completed and they already has access to BES Cyber Systems, when must the initial assessment be completed?
12.3	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.R2The phrase “to ensure that personnel maintain awareness ...” should be removed from the requirement as it adds ambiguity to the requirement. Is the auditor going to measure “quarterly reinforcement” or “personnel ... awareness” or both? It

#	Organization	Yes or No	Question 12 Comment
			seems like the drafting team is trying to add an objective for the requirement. If that is the case, then consider one of two other alternatives: (1) adopt International Standards Organization format where they have an objective for each requirement introducing each requirement; or (2) develop a longer Purpose section where the purpose of each of the requirements is further embellished. This comment should be carried on to all of the requirements.What does “reinforcement” mean?R3The term “granted authorized ... access” seems to be superfluous. Authorizing and granting are two different activities and the standard seems to prohibit granting access without first authorizing access (unless under certain specified exceptions). Consider just using the term “granted” in this requirement. The confusion between the terms “granted” and “authorized” is throughout the document and ought to be clarified.Consider correlating the training requirements in R3 with whether the person is a “user” or “administrator”, and whether the training is “job training”, a “refresher”, or “awareness”, with separate levels of training frequency and content for each of these categories.3.1 should not include “procedures” since these procedures are not identified elsewhere in the standard. The word “program” should be struck from “Visitor control program” since nowhere else in the standard is there a requirement for such a program. There should be no “back-door” requirements for procedures or programs such as these.3.5 should use the term “annually” instead of “at least once every twelve months” to give entities flexibility around various business needs on when during the calendar year to hold training flexible.R4The term “granted authorized” is superfluousConsider shortening “ensure a personnel risk assessment is performed” to “perform a personnel risk assessment”
12.4	Regulatory Compliance	Agree	R2 - Awareness - please clarify what are accetable forms of awareness.R3.2 - suggestion - STRIKE the reference to networking hardware and softwareR4 - Question: How do you propose to close the gap in regards to a criminal background check of an employee who has lived outside the country for a period of time in the past seven years that may not equal the 6 month period but long enough to be involved in supicious activities?
12.5	Emerson Process	Agree	R2 and R3 do not have tables for their applicability to three impact-types of BES cyber systems. Would it be better to include the tables for consistency with the rest of the

#	Organization	Yes or No	Question 12 Comment
	Management		standard?
12.6	Northeast Utilities	Agree	Recommend that R2 be clarified to indicate whether or not documentation must be provided that awareness material was received and understood by the CIP authorized personnel.Also, it is recommended that more guidance is provided on the level of training expected under R3.2 when stating "include training on networking hardware and software and other issues of electronic interconnectivity". The clarification is important to acknowledge that the intent is clearly not to have all personnel with electronic access to any BES Cyber System to become network engineers. For example: for operations personnel, what is the level of knowledge expected concerning networking hardware and software?
12.7	Green Country Energy	Agree	Will their be any guidance, footnotes or would ANY cyber security training be acceptable?
12.8	Independent Electricity System Operator	Disagree	- Suggest changing R3.2 so that it is only required based on personnel having a role in networks, etc. An operator and other personnel do not need to know how a firewall or switch works or its software. They may need to know how to use their token for t
12.9	Reliability & Compliance Group	Disagree	: "Sound security practices" is too vague of a term. How is this going to be audited? Who will determine what a sound security practice is? There needs to be an industry standard used. Is it going to be security practices listed under NIST 800-53? What about physical security practices? Without a benchmark, how can we measure adherence to the standard?R3 is way too cumbersome the way it is written. Keep the first part of the standard written the way it is. Then start a new sentence that says, "exceptions to this requirement must be specifically outlined in the responsible entities policies and are limited to emergency situations and acceptable alternative training." The part of the standard that reads, "impact the reliability of the BES or emergency response, to ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems" is just confusing to read and understand. No matter what is done, try and make this requirement more than one sentence.R3 is better than the old

#	Organization	Yes or No	Question 12 Comment
			standard in how it defines how training should be handled for different roles and responsibilities. The 12 month timeframe needs to be tightened down even further. Is that 12 months +/- one month or is it every 365 days?
12.10	USACE - Omaha Anchor	Disagree	3.2 - should be worded closer to 3.3. or 3.4. You are giving training on network hardware and electronic connectivity to everyone with electronic access. This is counterintuitive - these folks for the most part do not have a need to know. They should only be given as much information as necessary to do their job.
12.11	Luminant	Disagree	3.5 We would prefer that training be conducted annually (completed within a calendar year) to avoid the confusion of tracking multiple comliance dates. How much documentation must be maintained? 12 months? 24 months, 36?
12.12	Platte River Power Authority	Disagree	Access to “any BES Cyber System” shouldn’t automatically require training on networking hardware and software or other issues of electronic interconnectivity. The training should be tailored to the individual’s job junction and not based on the BES Cyber System they have access to. For example, an operator doesn’t need to know the brand, model, configuration, or connectivity of the networking hardware that they’re using. They need only know the proper use of the asset they’ve been granted access to. I would like to avoid training individuals on the interworkings of our network when they have only been granted limited electronic access.
12.13	Liberty Electric Power, LLC	Disagree	CIP-011 R2 requires quarterly training for all plant personnel in cyber security. This is too frequent, and I would suggest changing to annual.CIP-011 R4.3 repeats the error of CIP-004 concerning the word “update”. There were many comments about requiring entities to have their long-time employees provide government-issued ID every “update” in the RFI, and the recordkeeping and potential for violation over trivia continues by not addressing the issue. I suggest changing the wording to define update as doing the background check again, and not getting into the realm of potential violations over lost wallets.

#	Organization	Yes or No	Question 12 Comment
12.14	E.ON U.S.	Disagree	CIP-011-1, R3.5 unnecessarily inhibits an organization's flexibility by mandating training every 12 months. E ON U.S. proposes that the Standard state "annual training", as currently required.CIP-011-1, R4 contains requirement of the Personnel Risk Assessment that should be revised. When seeking information from foreign nations concerning someone having resided in those foreign nations, compliance with these literal requirements may not be possible or feasible. An exception should be included to address a failure to obtain this level of evidence following a good faith attempt to do so.CIP-011-1, R4.3 ignores practical problems with requiring background checks of contractors and/or service vendors. Privacy concerns have raised many questions as to whether literal compliance is possible (especially in the context of this Standard which eliminates some of the language from the former CIP-004). E ON U.S. proposes that the requirement provided by the Regional Compliance Implementation Group ("RCIG") in RCIG-A-002 be adopted conceptually in this Standard.
12.15	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
12.16	LADWP	Disagree	Consultants or employees who lived abroad for a time may not be able to meet the 4.1 requirement to cover all locations where subject has resided. This could prevent proper authorization to BES systems.
12.17	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes Personnel Training, Awareness, and Risk Assessment should only apply to personnel with access to high impact BES cyber systems and not include personnel with access to medium and low impact systems. CenterPoint Energy also suggests changing R3.2 to: "For personnel having job duties that require a role in BES Cyber System networking and electronic interconnectivity, this cyber security training shall additionally include training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems."Numbering of sub-requirements for R3 and R4 conflicts with numbering of requirements in Tables R3 and R4 (there are two 3.1 and 3.2 and two 4.1 and 4.2).

#	Organization	Yes or No	Question 12 Comment
			CenterPoint Energy suggests moving all sub-requirements for R3 and R4 to tables to be consistent with other sections in CIP-011.
12.18	FEUS	Disagree	Disagree with Comments: 3.2 requires personnel with electronic access to have training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems. Extensive training on networking hardware and software should be limited to support staff or personnel with administrative privileges. It is not clear what 'other issues of electronic interconnectivity' is?3.5 requires training to be conducted every 12 months from the date of 'initial' training. The Drafting Team should consider revising the wording to allow for training more frequent to align with a regular training schedule for more personnel.4.1 requires a seven year criminal history check covering all locations where, during the previous seven years up to the current time, the subject has resided, been employed, and/or attended school for six months or more. How would the Responsible Entity verify 'all locations' were identified by the subject for the criminal history check? If a subject is attending an out-of-area school via online courses it is not logical to perform a criminal background check for the location of the school.
12.19	Southern Company	Disagree	For R2, This requires the Entity to either track which personnel have access to every low-impact system or to include all personnel company-wide, including vendors and contractors, in the awareness program. A table should be added excluding low-impact Cyber Systems to parallel R3 and R4.For R3, How does "granted authorized electronic access" interact with the situation where a network service on a system is available to anyone who can get a packet to it? For 3.5, A specified 12-month cycle makes the training program much more difficult to administer without any benefit to reliability. A 14-month cycle would allow a reasonable annual training program to work.3.2 does not actually address any security need for the large majority of personnel with access. While Order 706 requires that NERC address the issue, that FERC requirement could be considered to have been met by the standards comment process without the wording making it into the final standard.Suggested rewrite of R3: Each Responsible Entity shall ensure that all personnel who are granted authorized electronic access and/or

#	Organization	Yes or No	Question 12 Comment
			authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training, when specified in CIP-011-1 Table R3 - Cyber Security Training, prior to their being granted authorized access in order to ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems.Temporary authorized access may be granted for specified exceptional circumstances that are approved by the senior management official identified in Requirement R1.3 or their documented delegate; for circumstances that require temporary access for emergency response; or for circumstances that would otherwise negatively impact the reliability of the BES. Suggested rewrite of R4: Each Responsible Entity shall ensure that all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, undergo a personnel risk assessment, when specified in CIP-011-1 Table R4 - Personnel Risk Assessment, prior to their being granted authorized access in order to ensure that personnel have been assessed for risk, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements.Temporary authorized access may be granted, without prior personnel risk assessment, for specified exceptional circumstances that are approved by the senior management official identified in Requirement R1.3 or their documented delegate; for circumstances that require temporary access for emergency response; or for circumstances that would otherwise negatively impact the reliability of the BES. R4 is difficult to implement for the case of vendor support through remote access and for vendor support staff who are not citizens of the US, Canada, or Mexico.
12.20	Progress Energy (non-Nuclear)	Disagree	For R3 - the definitions in the box should be included as formal definitions. It is confusing with these text boxes hanging with only certain R#s.R2 contains two very subjective words: “sound” and “essential.” Suggest striking these words.For 3.1 - cyber training included incorrectly here...last bullet. Move to 3.2.4.1 First bullet comments- this new requirement appears to be a duplication of the E-Verify/I-9 process in which employment eligibility is verified for all new hires. All employers are required to verify their employees’ employment authorization and confirm that the identification documents presented are legitimate, thus establishing an individual’s identity covering

#	Organization	Yes or No	Question 12 Comment
			both the employee and contractor population. Additional verification through the PRA or requiring completion of the PRA after completion of the employment eligibility requirements adds additional steps to the process with no added value.4.1 Second bullet comments - the current regulation requires a 7 year criminal check. It does not specify that the check needs to cover everywhere the person worked or went to school and lived for > 6 months. The new language appears to be taken from a response to the interpretation given to the Army Corp of Engineers by NERC regarding how a PRA should be performed, which PE disagrees with.The current wording requires companies to gather much more data on an individual from the individual (as that is the only source of the information). Not even Nuclear attempts to gather this kind of data (everywhere worked and went to school for > 6 months) when they perform their checks. Based on historical experience, for those who have had multiple employments the information provided by the individual with regard to employment will likely not be accurate.PE suggests running a 7 year criminal history on all addresses that show up on the application or in the credit databases and then running a nationwide search to cover any other areas. An alternate to that may be fingerprint checks if utilities can be given access to the data.Either of these approaches will streamline the process.CIP-011-1 R3.1 (Cyber Security Training) - It appears that R3.1 was written with the intention of providing a level of training appropriate to job functions (language which was explicitly in previous versions) in regard to those with only unescorted physical access (such as janitors, electricians, HVAC technicians, etc); however the last bullet point 'Identification and reporting of a Cyber Security Incident' could easily be misinterpreted to be requiring training of a cyber nature rather than those of a physical nature directed against cyber assets (which I believe is the training we should be providing an individual with the aforementioned responsibilities)
12.21	Alberta Electric System Operator	Disagree	For R3.1, consider removing "and storage media" from bullet "The proper handling of BES Cyber Systems information and storage media" because information handling should be implemented regardless of the media type.For R4.1, consider changing the seven year time horizon, and make time horizon dependent on BES Cyber System impact level. For example, Low Impact could be seven years, Medium Impact five years, and High Impact

#	Organization	Yes or No	Question 12 Comment
			three years.
12.22	American Municipal Power	Disagree	I agree with the intent, but I feel there is some redundancy between requirements for training, awareness, risk assessment, etc. that should be addressed more concisely (less requirements)
12.23	GE Energy	Disagree	i) R3.2 lists a requirement for training on networking hardware for all users having electronic access. Perhaps this should only be for users with administrative access to network hardware. If this requirement is really calling out the need for VPN or similar training, this should be more specific than "network hardware".ii) Is it possible for vendors' personnel risk assessment process and records to be ratified/certified by NERC, so that individual Responsible Entities do not have to duplicate the effort for those vendors who have teams providing services to multiple REs? This would be more efficient and secure.iii) Vendor privacy issues are a concern regarding the background screens. Some clarity on the expectation between the client and vendor and the paperwork required to validate a screen, and clarity on who should actually conduct the screens would be helpful (client versus vendor). The expectation should be for the vendor to maintain their own records.
12.24	Public Service Enterprise Group companies	Disagree	In CIP v1~v3 the requirement for refresher training was "Annual", where "Annual" was understood to mean sometime within a calendar year. The new requirement of "once every 12 months from the date of initial training" implies that a daily checks are required for each person that had previously been training on whether training has expired. This imposes undue administrative overheard on Registered Entities without significantly enhancing cyber security. More flexibility is needed to accommodate vacations, illness, etc. One possibility is that training is required annually, with an up to 90 day extension for good cause or administrative efficiency.
12.25	National Grid	Disagree	In R2, National Grid recommends an annual reinforcement.Recommend that R3.2, R3.3 and R3.4 change "training" to "role appropriate training"

#	Organization	Yes or No	Question 12 Comment
12.26	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
12.27	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's suggested revision:R2 contains two very subjective words: “sound” and “essential.” Suggest striking these words. Has the drafting team considered the challenge of performing photographic identification verification for personnel who may need authorized electronic access yet never come on site? Make requirement for photo ID apply to physical access only.
12.28	Minnesota Power	Disagree	Minnesota Power requests that the Standards Drafting Team consider replacing the phrase “provide all” with “make available to all,” in order to ensure clarity and avoid the potential that this phrase may be interpreted to include the requirement to document that the materials were actually received by all personnel. For example, it would be difficult to document that bulletin board postings were “provided” to each individual employee.Regarding Requirement R2, “...under their security awareness program to ensure that personnel maintain awareness of the cyber security practices that are essential to protecting BES Cyber Systems” Minnesota Power has the following comments: o What security awareness program is being referenced? The Standard does not require the creation or implementation of a security awareness program. Minnesota Power recommends removing “under their security awareness program” from the Requirement. o What are “the cyber security practices that are essential?” The way this is stated infers that there is a known list of essential practices, which are particular to BES Cyber Systems (as opposed to general IT security practices), though none are referenced. Regarding Requirement R3, Minnesota Power recommends rewording the purpose statement as follows:"Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to access being authorized as specified in CIP-011-1 Table R3 - Cyber Security Training. This training is required except in exceptional circumstances that are approved by the single senior management official or their authorized delegate and

#	Organization	Yes or No	Question 12 Comment
			impact the reliability of the BES or emergency response." In addition, Minnesota Power has the following comments regarding Requirement R3: o R3 makes reference to a delegate for the senior management official, however R1 does not allow for the ability to assign a delegate for any purpose. o The box of definitions for R3 includes definitions for "routable protocol" and "non-routable protocol" however; these definitions are not used in R3 and therefore should be removed. o Sub-section 3.1 references a visitor control program which is not defined anywhere in this requirement. In light of the Standards Drafting Teams intentions to remove the "how-to" components of these Requirements, Minnesota Power recommends removing references such as this to a "program" and replacing with a statement such as "How visitor access is managed." o Regarding sub-sections 3.2, 3.3 and 3.4, as these sub-sections are currently written, it is not clear that this training is required for those individual's with a "need to know" only. o Regarding sub-section 3.2, what is the word "specified" in "specified electronic access" referring to? Minnesota Power recommends removing this term from the phrase as it doesn't add to the meaning of the sentence. o Regarding sub-section 3.2, "training on the networking hardware and software and other issues of electronic interconnectivity" is overly broad and could be interpreted as in-depth technical training, which would go beyond the intent of this Requirement. Minnesota Power recommends the following alternate wording, "training on the cyber security policies, access controls and procedures for the BES Cyber Systems to which they have electronic access." o For sub-sections 3.3 and 3.4, Minnesota Power recommends adding a comma following "...BES Cyber System recovery," for 3.3 and "...BES Cyber System incident response," for 3.4. o Regarding sub-section 3.5, the term "This" at the beginning of the sentence should be replaced with "Each" to be consistent with the other Requirements. o Minnesota Power recommends adding a statement to Requirement 3 that the training referenced in subsections 3.1 through 3.4 can be performed in a single training session or in multiple training sessions each covering one or more of the required topics. Regarding Requirement R4, Minnesota Power recommends rewording the purpose statement as follows:"Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems,

#	Organization	Yes or No	Question 12 Comment
			including contractors and service vendors, have undergone a personnel risk assessment prior to access being granted as specified in CIP-011-1 Table R4 - Personnel Risk Assessment. The completion of this assessment is required except in exceptional circumstances that are approved by the single senior management official or their authorized delegate and impact the reliability of the BES or emergency response. This is to ensure that personnel who have such access have been assessed for risk, subject to existing collective bargaining unit agreements, in accordance with federal, state, provincial, and local laws."In addition, Minnesota Power has the following comments regarding Requirement R4: o Regarding sub-section 4.1, the use of the phrase "personnel risk assessment program" seems inaccurate. Rather, 4.1 only defines what a personnel risk assessment itself shall, at a minimum, include. Minnesota Power recommends that the term "program" be removed from this sub-section as it's not required to demonstrate compliance. o The addition of "via photographic identification documentation issued by a government agency" to sub-section 4.1 could create an unnecessary burden on Registered Entities, especially for those vendors and contractors who do not come on-site. Minnesota Power recommends utilizing the language of the current CIP-004-2 Standard and requiring SSN verification for U.S. residents and photographic identification documentation for non-U.S. residents. o In the event that Standards Drafting Team chooses to leave the language of sub-section 4.1 as is, Minnesota Power recommends that photographic verification of identity be done at the time of initial access and that it is not necessary to renew this verification every 7 years. o Regarding sub-section 4.2, what does "document the results" mean? Under the current NERC CIP-002 - CIP-009 Standards there has been some confusion regarding what a Registered Entity needs to show compliance with this type of Requirement. Does this mean keep a redacted copy of the personnel risk assessment or would logging a summary of the results (e.g., "no findings"), including dates, source of background check, etc., be adequate? The Standards Drafting Team should consider clarifying what is meant by "document the results" so that consistency can be established.
12.29	NextEra Energy Corporate	Disagree	NextEra believes that the former standard provided valuable examples of awareness training methods which should be part of this revised standard. One question that arises

#	Organization	Yes or No	Question 12 Comment
	Compliance		is how will the delivery of this awareness training be measured? The standard should clarify the requirement. Also, the standard should provide examples of exceptional circumstances under which exception from training and PRA requirements may be documented.
12.30	Garland Power and Light	Disagree	o Disagree or need clarification with 3.1 - 1st bullet "The proper use of BES Cyber Systems" What does "use" mean - The EMS control system is operated by NERC certified operators and updated / maintained by qualified technical personnel. For CIP training, what is meant by train on the "use" of this system o Clarification on 3.2 should apply only to personnel having a role specific to support services for "networking hardware, and software and other issues of electronic interconnectivity supporting the operation and control of the BES cyber systems" and should be limited to security features. Training of all personnel in these areas will reduce cyber security.
12.31	PacifiCorp	Disagree	PacifiCorp agrees with EEI's suggested revision:R2 contains two very subjective words: "sound" and "essential." Suggest striking these words. Has the drafting team considered the challenge of performing photographic identification verification for personnel who may need authorized electronic access yet never come on site? Make requirement for photo ID apply to physical access only.
12.32	Kansas City Power & Light	Disagree	Quarterly reinforcement is excessive and places an unnecessary administrative burden on Regional Entities and a poor investment of time and effort distracting from the productive work of maintaining cyber system security and integrity. Annual training is sufficient for the FERC Standards of Conduct, for important reliability functions in the EOP Standards such as black start and energy capacity emergencies, and for CIP sabotage recognition and reporting. Annual training for the personnel with access to identified cyber systems is sufficient to ensure the importance of maintaining the security and operation of identified cyber systems.R3.2 requires training that is much too detailed for personnel with access to a cyber system. Would this make sense for someone whose task was to wire in a Remote Terminal Unit for acquisition of field data into an EMS? The training specified in requirement R3.1 is sufficient for these kinds of

#	Organization	Yes or No	Question 12 Comment
			personnel. Recommend removal of R3.2.R3.5: Requiring annual cyber security training 12 months "from the date of initial training" is an unnecessary burden on the Regional Entity. It is enough provide for an annual training within a calendar year for those personnel who have physical and electronic access to cyber systems. What issue is this addressing? It is more important to focus investments of time, energy, and finances toward the actual security and integrity of the cyber systems than to support an administrative system to ensure training is done at a specific time rather than the training itself.R4.1 is too prescriptive in specifying the actions that are required to achieve the background check objectives. There may be other regulatory restrictions that prevent adherence to the prescription described here. Recommend removal of such prescription and include the language from CIP-004-2 that states to perform such checks "as permitted by law and subject to existing collective bargaining unit agreements".
12.33	Con Edison of New York	Disagree	Quarterly training is excessive for the large number of people likely to be involved. This training should be annual or at maximum twice a year. This training will get very expensive given the large number of people to be added to the training pool.
12.34	Dominion Resources Services, Inc.	Disagree	R2 - Based on the SDT's comments at the workshop, the intention of the Awareness program is not to require documentation of security awareness at an individual level. This interpretation is evidenced by the differentiation between the intent of security awareness versus the intent of security training. As defined in NIST Special Publication 800-50, "Building an Information Technology Security Awareness and Training Program", awareness is not training. The purpose of awareness is to focus attention on security. Many of the techniques commonly used to deliver security awareness topics (e.g., posters) do not lend themselves to tracking at an individual level. On one hand, awareness topics are intended to allow individuals to recognize IT security concerns and respond accordingly and, on the other hand, training strives to produce relevant and needed security skills and competencies. The most significant difference between training and awareness is that training seeks to teach skills, which allow a person to perform a specific function, while awareness seeks to focus attention on an issue or set

#	Organization	Yes or No	Question 12 Comment
			of issues. Consequently, the SDT's intentions are correct and consistent with industry best practices. Given that the intent of this requirement is to reinforce cyber security program expectations for those personnel with access to BES Cyber Systems and not to document evidence of individual training, the following alternate wording is proposed: "Each Responsible Entity shall establish a security awareness program. The program shall provide for reinforcement, at least quarterly, on selected topics of security expectations and practices required to ensure the protection of BES Cyber Systems." 3.2 - Requirement R3.2 proposes training personnel who have electronic access to a BES Cyber System "on the networking hardware and software and other issues of electronic connectivity supporting the operation and control of BES Cyber Systems." Dominion recognizes that networking and network transport mechanisms (i.e., connectivity) involve specialized skills requiring a high level of expertise and experience. Because of the specialized nature of networking, providing this training would provide only a very limited security benefit at best, and could encourage personnel without the full qualifications and experience necessary, to take actions affecting network connectivity that would adversely impact the reliability of the BES. Based on Paragraph 434 of the Directives in FERC's Order No. 706, the Commission's intent was only that training programs encompass this training, not that any individual who has electronic access to a BES Cyber System receive such training. This requirement should be removed.3.5 - The change from annual to 12 months appeared to cause some confusion at the workshop and does not provide for a grace period (e.g., 12 months plus or minus a month to allow for shift workers and emergencies). Dominion requests that the SDT consider returning to using "Annual" and define how annual is to be used for these standards. Dominion prefers that "Annual" be defined as "12 months plus or minus a month" since this provides some flexibility in completing the task and also allows the Responsible Entity to not be forced into 11 month cycles so as not to miss a 12 month deadline. For example, Dominion had a training session set up for certain field personnel. The night before the meeting, a storm came through the system and caused enough damage that the meeting had to be cancelled because everyone was needed for restoration activities. The logistics involved in setting up these training sessions are often complex and a grace

#	Organization	Yes or No	Question 12 Comment
			period would provide the flexibility for rescheduling without compromising the spirit or intent of the training objective. Dominion understands that the "12 months plus or minus a month" definition is being used throughout the nuclear industry. Dominion suggests the following alternate wording for R3.5:"Initial training shall be conducted prior to granting access to BES Cyber Systems. Re-training shall be conducted annually."R3.5 contains requirements that are not identified in Table R3. All requirements should be contained within the associated table. Please see Dominion's response to Question 9. 4.1 - With inclusion of the nuclear plants, time horizons for personnel risk assessments are shorter than currently required by the standard. For example, Nuclear does background checks for unescorted access authorization every 5 years. Since they are done every 5 years, they do not check history for the last 7 years. To accommodate this difference, which effectively exceeds the requirements of this standard, it is recommended that the language in the 2nd bullet of R4.1 be revised to read:R4.1 o A criminal history records check initially and at least every 7 years thereafter, covering all locations where, during the time from the last check to the current time, the subject has resided . . .
12.35	Southwestern Power Administration	Disagree	R2 - Replace "shall provide" with "shall make available to" to clarify that the Responsible Entity must make quarterly awareness available, and not document that all personnel have reviewed and understand the awareness material.R3 & R4 - what would be an exceptional circumstance that would warrant training exception and/or investigative exception from the senior manager for personnel who are granted authorized electronic access and/or authorized unescorted physical access? If this is where the SDT is attempting to replace the previous "Exception to Policy" requirement, the placement of that language in R2 and R4 may need to be revisited, as these requirements seem to focus only on managing controls for personnel that DO have authorized access rights - not emergency personnel or non-authorized personnel access in emergency situations.R3.2 - This requirement is ambiguous in its inclusion of the phrase "other issues of electronic interconnectivity" A better approach would be to list the minimum coverage or topics to be covered. R3.5 - The requirement can be interpreted to read that everyone with authorized access will have to be trained exactly 12 months from his or

#	Organization	Yes or No	Question 12 Comment
			her initial training date. This would cause the responsible entity to be continually training and tracking staggered dates and creates an overly burdensome documentation effort, leading to the opportunity for mistakes and missed course deadlines. It is much more efficient and advantageous to do annual training in a group format. A better approach would be to state: "The Responsible Entity shall maintain documentation that such cyber security training is provided or offered once every 12 months, and documentation that personnel having authorized electronic access and/or authorized physical access to BES Cyber Systems have completed such training within 60 calendar days of such training being offered."
12.36	Ameren	Disagree	R2 - Without examples of what minimally constitutes reinforcement, this requirement will be problematic to audit. Would oral reinforcement count and how would you document that? Give examples such as posters, emails, events, or meetings would at least give an indication of the need to document evidence of the reinforcement taking place. A quarterly review seems extensive and an administrative burden. Once or twice per year should be sufficient.â€,â€,The bullets under R3.1 and R4.1 should be numbered as sub-requirements so that they can be cross referenced for audit purposes, i.e. R3.1.1 or R4.1.1 etc. Using the same numbering in the tables and in the requirements is confusing. The tables should use letters or roman numerals so they would not be confused with the sub-requirements indexing.
12.37	EEI	Disagree	R2 contains two very subjective words: "sound" and "essential." EEI suggests striking these words.For R2, This requires the Entity to either track which personnel have access to every low-impact system or to include all personnel company-wide, including vendors and contractors, in the awareness program. A table should be added excluding low-impact Cyber Systems to parallel R3 and R4.
12.38	Allegheny Energy Supply	Disagree	R2 contains two very subjective words: "sound" and "essential." Suggest striking these words.

#	Organization	Yes or No	Question 12 Comment
12.39	Allegheny Power	Disagree	R2 contains two very subjective words: “sound” and “essential.” Suggest striking these words.
12.40	Constellation Power Source Generation	Disagree	R2 states quarterly reinforcement in sound security practices under their security awareness program. This may be training, but it does not have to be, as stated in the CIP V4 Workshop. However, this requirement as written does not seem to be auditable. How can an entity prove that an email/screensaver/poster/meeting meets the reinforcement stated in the requirement? Further clarity is needed, either within the requirement or in a guidance document.
12.41	Madison Gas and Electric Company	Disagree	R2, We would propose replacing the terms “provide all” with “make available to all”, as we are concerned the word “provide” could be interpreted to include documenting that the materials were actually received by all personnel. For example, it would be very difficult to document that bulletin board postings were “provided” to each individual employee.Within R3 and R4 there is an exception of “except for program specified exceptional circumstances “ that is modified with the phrase “and impact the reliability of the BES or emergency response” (R3 only), please clarify. Is this exception giving the single senior manager the ability to wave cyber security training in the event that a non trained person is required to accomplish a task that they alone have the skill set for completion of said task (ie, a software engineer associated with the company that designed your SCADA system)?R3.1, The first bullet states “The proper use of BES Cyber Systems” and should be deleted since that is assumed as stated within the actual requirements of R3.1. The intent should be that training should be focused on protection of the BES Cyber System not how the particular BES Cyber System works, Please clarify.R3.2, The word “specified” is used and is not understood. Please clarify. If this is to mean additional training outside of the training within R3, than please “specify” that the entity shall have additional training program (module) for “specified” training that is not covered by R3. Please clarify if this is the required training differences between users and system administrators?The following requirements do not include a table of Low Impact, Medium Impact and High Impact (where the word “required” is

#	Organization	Yes or No	Question 12 Comment
			used under each column):R2R3.3R3.4R3.5R4.3Is this to indicate that all Entities must comply with these requirements whether or not they have BES Cyber Systems? Please clarify?
12.42	LCEC	Disagree	R2. The reliability benefit statement should not be included within the requirement section. This would be better positioned under the purpose section of the standard where it does not add confusion to the specific requirements that are being audited. The ISO27001 standards include an "objective" statement for each set of security controls which adds clarity and serves as a good best practice example.What is meant by reinforcement? How will this be demonstrated to an auditor?What is meant by sound security best practices? How will this be demonstrated to an auditor?R3 Remove or rewrite all content in the first paragraph after Table R3 - Cyber Security Training. The intent of this is unclear and very confusing.Split performance and program requirements into separate requirements for ease of auditing. If there is a requirement to have a program it should reside in its own requirement. Ref bullet 3 3.1Personnel with electronic access need to have an understanding of the risk associated with interconnectivity not necessarily the specific hardware involved. Personnel with the ability to change hardware configurations should have an understanding of hardware, software and interconnectivity impact.Training requirements should be tailored to user versus administrator and job based versus.The table should include the full range of requirements, like Table R5, and if not applicable should explicitly state that, not through blank cells. This leads entities to interpret that no training is required for these systems.4.2 in the table R4 should read unescorted physical access.
12.43	US Army Corps of Engineers, Omaha Distirc	Disagree	R2. meaning of quarterly reinforcement is vauge seems like it could be difficult to maintain audit records. 3.2 All users with electronic access do not need to know or understand networking hardware and software. Such information is usualy limited to those who support the network/system and have a need to know.
12.44	CWLP Electric Transmission, Distribution	Disagree	R2. Quarterly reinforcement training of cyber security practices seems excessive. This could be reduced to an annual obligation consistent with the training obligation in

#	Organization	Yes or No	Question 12 Comment
	and Operations Department		requirement 3.5. R3.2. This appears to require training on all systems connected to the BES, not just the specific system a user may require access to. A user accessing a server, PC or relay should not require training on network devices such as switches, routers, etc. This should be limited to requiring training on the specific area of the BES Cyber system the user is utilizing. R3.3. Similar to R3.2 this requirement should provide wording specifying that the training obligation is limited to the specific role the user has in regards to the Cyber System. R4. Requires a definition of “Electronic Access”.
12.45	Consultant	Disagree	R2. Suggest deleting the word "all" as redundant.R2. Suggest deleting the words "practices under their security awareness program". The requirement should be for dissemination of security information, not to create a program.R2. Change the words "that are essential to" to "associated with". Essential is a subjective term.R2 - R3 This is an example of where the insertion of 'local definitions' makes reading the requirement text difficult. Also, "For the purpose of this standard" is unnecessary and essentially not true. If the term is defined in the standard it is expected to be included in the next update to the NERC glossary, as that is how terms get in the glossary.General Comment- the term "and/or" is bad grammar. The word "or" is all that is necessary.R3 - Suggest deleting the word "all" as it is not consistent with the requirements identified in Table R3.R3 - This is three requirements and an objective statement stuffed into one convoluted sentence.R3[-1] shall ensure personnel complete training prior to be being granted access as required in the Table.R3[-2] personnel under this requirement includes employees, contractors, and service vendors.R3[-3] Designated CIP Senior Manager shall approve instances where exceptional circumstances related to BES reliability or emergency situations may allow access without completed training.R3[-4] cyber security training objective is to ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems.-- Suggest rewriting as individual requirements for better clarity.R3.2 Suggest deleting "specified" as an unnecessary word.R3.2 Suggest deleting "any" as it is not consistent with the requirements in Table R3. Training is not required for "any" access, only for those systems identified.R3.2 Suggest specifying the training is for the security aspects of "networking hardware and software and other issues of electronic interconnectivity" not training on installation,

#	Organization	Yes or No	Question 12 Comment
			programming, or other aspects of these components.R4 - Suggest deleting the word "all" as it is not consistent with the requirements identified in Table R4.R4 - This is three requirements and an objective statement stuffed into one convoluted sentence.R4[-1] shall ensure a personnel risk assessment is performed prior to be being granted access as required in the Table.R4[-2] personnel under this requirement includes employees, contractors, and service vendors.R4[-3] Designated CIP Senior Manager shall approve instances where exceptional circumstances related to BES reliability or emergency situations may allow access without a completed personnel risk assessment.R4[-4] cyber security training objective is to ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems.Suggest rewriting as individual requirements for better clarity.R4 - "assessed for risk, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements." The personnel risk assessment is not performed in accordance with "federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements". It is performed in accordance with the Registered Entitie's policies and procedures, and should be in compliance with "federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements." Suggest modifying the wording of to clarify.Wording between R3 and R4 is inconsistent. R3 - completed security training & R4 - personnel risk assessment is performed. Suggest consistent wording as completed security training & completed personnel risk assessment. R4.1 suggest deleting the word "program" as unnecessary. It is the personnel risk assessment that has the specified identity check & background checkLogically, the topic in R3 should precede R2. It would seem to make more sense to grant access prior to providing security awareness on that access.Likewise, the topic R3.4 should precede R3.3. It would seem to make more sense to respond to an incident prior to recovery from an incident.Clarify annual for review of the policies, and for training. Suggest using the regulatory basis of over 30 years from the nuclear industry in dealing with periodicity for defining these periodic timelines. Should probably be a definition in both new standards to relate to periodic requirements.

#	Organization	Yes or No	Question 12 Comment
12.46	Western Area Power Administration	Disagree	R2: Please clarify whether "all personnel" includes "contractors and service vendors".R2: Please clarify what is meant by "reinforcement" required quarterly.R2: Needs some language clarifying intent. Does authorized electronic access = unescorted physical access? If so, this has major ramifications for support.R3: Requires the Responsible Entity to ensure that contractors and service vendors complete cyber security training - it does not specify that they must complete OUR training, just that they can provide proof of training that includes the specifics of R3.1. Is this the correct intent?R3.2: This requirement is too vague. What training on networking hardware and software are required? Is the intent to have training on the various forms of electronic access (VPN, dial-up, direct connection to equipment with a laptop or other diagnostic tool, etc.)? Is it directed at users like dispatchers who connect to the system via a console or workstation? All of the above? Each category of electronic access would have different training requirements.R3.3: Does this requirement specifically relate to disaster recovery/COOP/Business Resumption Plan? Would it also include training for field staff doing repairs on specific systems? Will we have to document all of the training they receive, including training on the maintenance and repair of all substation electronic equipment?R4: What is the definition of “program specified exceptional circumstances”? R4.1: Why are we changing to photographic versus finger printing? Photographic is easily fooled.R4.1: Would an entity be responsible for maintaining the results of a 7 year criminal check for outside entities having physical access (foreign utility workers, vendors, contractors, etc.)? If the other entity is also a NERC defined CIP applicable entity, is verification by that entity that the employee is properly vetted satisfactory? This is sensitive information that other entities may not be able to divulge due to local, state or national laws.
12.47	Southwest Power Pool Regional Entity	Disagree	R3 and its included requirements should be clarified to require training appropriate to the roles and responsibilities of the recipients. It is likely inappropriate to train a janitor or security guard with physical-only access on the proper use of BES Cyber Systems the same way a person with electronic access would be trained. Similarly, it is likely unnecessary to train a vendor support staff with only remote electronic access on the

#	Organization	Yes or No	Question 12 Comment
			physical access controls and visitor control program. 3.2 requires training for personnel having "specified" electronic access. What is "specified" electronic access? Additionally, it is likely not appropriate to train a dispatcher/operator on networking hardware, software, and connectivity issues, although they have electronic access. Greater granularity or assignment of responsibilities to roles may be necessary. 3.5: is the 12-month requirement a hard 12 months? Or is there some grace period permitted, such as +/- one month, to avoid calendar creep? And, does the 12-month timer reset with the completion of the latest training received or is the expectation that the training is actually performed approximately the same time every year regardless of any training that might be completed at a different time of the year? Additionally, rather than specifying the "date of training" shall be documented, consider using language similar to "[t]he responsible entity shall maintain documentation demonstrating that the required cyber security training is completed at least once every 12 months." Let the entity determine what is necessary to demonstrate compliance. R3 Overall, consider requiring a minimum expectation as to the quality of training. For example, should there be some sort of post-training assessment to determine if the recipient understands the course material? 4.3: Consider clarifying the requirement to "...update each personnel risk assessment within seven years of the previous personnel risk assessment" and make it clear that in this instance the requirement is from the actual date of the previous personnel risk assessment, not "in the same calendar year" or "+ / - some grace period."
12.48	The United Illuminating Co	Disagree	R3. Introduction is a run-on sentence with clauses nested within it. It is unduly confusing. I would reword for the SDT, but I can not understand the clausa relationships.R3.1 to R 3.4: There are employees who will require training in 3.1 thru 3.4. This amount of training could cover multiple days separated by periods of time. The requirement does not allow for General training on one day, Vyber incident response with the response team on another day, and training in backup restoration with a third team on a different day. R3.2: What specified electronic access triggers this requirement? Electronic access is not synonymous with remote electronic access, so what is being directed with this requirement. A user with a password does not require these topics. R 3.5 annual training from the initial date of training is too restrictive.

#	Organization	Yes or No	Question 12 Comment
			Union workforces are trained in groups and training schedules shift from year to year. Also a new union higher may receive an initial one-on-one training session and then be synchronized with the rest of the workforce by repeating the training in under 12 months.Suggest “once every 12 months from the date of the initial training, or the last completed training date” This will allow flexibility to reset the training date without going over the 12 months between training classes.Also request the SDT consider allowing a two month grace period in the requirement. UI suggests including a requirement for venors/contractors who provide support via remote access only (EMS/SCADA vendors). These vendors do not require training in physical access control procedures, or visitor control processes. Additionally, they often service multiple organizations and should not be required to view the same cyber security program as the BES cyner system owner employees. The suggested wording is:”For personnel requiring electronic access only training shall include at a minimum:- The proper use of BES Cyber Systems o The proper handling of BES Cyber Systems information o Identification and reporting of a Cyber Security Incident
12.49	Black Hills Corporation	Disagree	R3.1 & R3.2 does not allow for role-based training. Need to have unique numbering between sub-requirement and table references. (There should only be one 3.1 in R3)
12.50	Detroit Edison	Disagree	R3.2 requires “training on the networking hardware and software and other issues of electronic interconnectivity”. Training system operators on network gear is beyond the scope of their job duties. At the Dallas workshop, the drafting team stated that this training was required by FERC order 706 paragraph 434. That paragraph also says “we clarify that our proposal discussion on this topic was not intended to suggest that personnel have training that is not appropriate for an employee’s duties, functions, experience, or access level”. We don’t believe that FERC is requesting all personnel be trained on network gear, only that the training is appropriate to the person’s job functions. System administrators and network engineers would need to have training on the network, operations personnel do not.R3.2 also requires training prior to access of any BES Cyber System which is inconsistent with table entry 3.1 which does not require training for Low Impact or Medium Impact with routable connectivity.R3.5 removes the

#	Organization	Yes or No	Question 12 Comment
			term “annual” that was used in CIP-004 and replaces it with once every 12 months. This is too restrictive. Consider an entity that has a window for training in the month of May. Requiring every 12 months would cause the calendar to creep earlier in the year so eventually the training would be moved to April. We prefer “at least once per calendar year, not to exceed 14 months between instances”. The identity verification via photographic identification required in R4.1 is too prescriptive. The standard should be the “what” not the “how”. Previous versions of CIP-004 required an identity verification with the example of SSN verification. Consider changing the first bullet to “Identity verification (e.g., Social Security Number verification in the U.S. or via photographic identification documentation issued by a government agency i.e. Federal, State or Provincial)”.Table 4.2 should only require a PRA for unescorted physical access.
12.51	SCE&G	Disagree	R3.5 12 months should be changed to annually to allow entities to utilize a "calendar year" to setup training pools to conduct the necessary CIP training. Otherwise provisions should be made to allow initial training to be conducted during the implementation period of the standard.R4 SDT should consider allowing entities to leverage PRA controls in place (i.e. Nuclear PRA process)SDT should develop requirements for entities to validate a vendor's/contractor's PRA process. This would impose the burden of conducting the administrative work for the PRAs on the contractors/vendors, while still maintaining the compliance burden with the entity.
12.52	Powersouth Energy Cooperative	Disagree	R3.5 Suggest additional consideration be given to the requirement “every 12 months from the date of initial training.” Suggest the following wording: “no later than the end of the calendar month that the 12 month anniversary of the individual’s initial or previous training falls in” or similar to extend the window to a reasonable time to allow training to be done in a schedule fashion to allow some leeway for unanticipated delays that could previously lead to non-compliance due to a hard deadline. R4. Request additional language be added to clarify the allowance of reciprocity of PRA’s between a contractor or vendor and the responsible entity. It is understood that PRA’s are an important component of proper security but due to the volume of contractors and vendors used at any given time, a mechanism for the third party to perform their own

#	Organization	Yes or No	Question 12 Comment
			PRA and provide assurance that the PRA meets the requirements of the registered entity in both substance and time requirements will reduce cost and complexity greatly.
12.53	American Electric Power	Disagree	R3: In regards to "are approved by the single senior management official identified in Requirement R1 or their delegate and...", does this statement add any benefit to security? Is a senior manager or delegate's approval needed each time an emergency situation is declared?3.2, 3.3, 3.4: This is an attempt at role based training. Would it be better to combine 3.2, 3.3, and 3.4 together into a single requirement? Suggested wording: "The cyber security training must be role based for personnel that are users, administrators, responsible for system recovery, and responsible for responding to or investigating cyber security incidents of BES Cyber Systems."3.5: Regarding "conducted at least once every 12 months from the date of initial training", will this result in a date backup? Does an entity need to keep the initial date of training for all users? Does it seem feasible to still have the initial training records 20 years down the road?If training is completed on 6/30/2011, would it need to be completed before 6/30/2012? If it was then completed on 4/15/2012 would the next date of training be before 6/30/2013 or before 4/15/2013?Suggested wording: "at least once every 12 months from the last completed training date".
12.54	ISO New England Inc	Disagree	Recommend rephrasing R3 so that is clear that the Entity does not need to list all potential emergency responseTraining should be on policy, procedures, standards, and process and how to conduct oneself. Training should not be on networking,hardware,software. Companies have personnel that have the background in each function that are subject matter experts. That is there job and should not need to be trained each year on it since that's what they do every day. For R3 there is a sub requirement 3.2 and then another requirement in table 3 numbered 3.2 this can confusing.R3.2 in table 3 please defined what is meant by external connectivity. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary?For R4 there is a sub requirement 4.2 and then another requirement in table 4 numbered 4.2 this can confusing.R4.2 in table 4 please defined what is meant by external connectivity. External to BES Cyber

#	Organization	Yes or No	Question 12 Comment
			System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary?The term "annual" should be replaced with the phrase: "no fewer than X (e.g. 9) months, but no greater than Y (e.g. 18) months". The time duration in "X" and "Y" should be clarified by the Standard Drafting Team, taking into consideration the appropriate level of exposure the time duration would provide. This phrase would provide Registered Entities with flexibility within any given calendar year to accomplish the prescribed action, but at the same time restrict companies from taking action in December of one calendar year, and then again in January of the next. This should be done to all the section that have 12 months. Scenario...In 2010, we roll out the training on June 1.Person A, who has access to CCAs, completes the training on June 15. In 2011, we roll the training out again on June 1.Person A, who has access to CCAs, completes the training on June 25. Under the new language, it could be interpreted that Person A has been out of compliance for 10 days if access was not revoked.The following are items we have in our training today, that will become requirements under the new standard: o Visitor control program (R3.3.1) o Identification and reporting of a Cyber Security Incident required(R3.3.1) o Recovery - note, this was required, but the language is more specific here (R3.3.3)The following are new requirements that will impact the training programs: o Training on networking hardware and software and other issues of electronic interconnectivity (R3.3.2) o BES Cyber System incident response action plans and procedures (R3.3.4)
12.55	Hydro One	Disagree	Recommend rephrasing R3 so that it is clear that the Entity does not need to list all potential emergency responses.We were wondering if the intent of R3.2 is to prevent access to a launch point for a multi location attack. (i.e. why limit the physical access to only sites with external connectivity?)
12.56	Northeast Power Coordinating Council	Disagree	Recommend rephrasing R3 so that it is clear that the Entity does not need to list all potential emergency responses.Recommend that R3.2, R3.3 and R3.4 change "training" to "role appropriate training".

#	Organization	Yes or No	Question 12 Comment
12.57	ERCOT ISO	Disagree	Recommend the following be more clearly stated as an exception: “except for program specified exceptional circumstances that are approved by the single senior management official identified in Requirement R1 or their delegate and impact the reliability of the BES or emergency response”. R3.1: Consider: This cyber security training shall cover these requirements as well as policies, access controls, and procedures developed for the BES Cyber Systems, and include, at a minimum, the following required items: R3.2. Please clarify the intent of “training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems”. Examples of curriculum would help. R3.5. The requirement does not address retaining records of completion of initial training. R4: Recommend that “except for program specified exceptional circumstances that impact the reliability of the BES or emergency response” be addressed more clearly as an exception.R4.2. Consider: “Each Responsible Entity shall document the results and review of each personnel risk assessment.”
12.58	ReliabilityFirst Staff	Disagree	ReliabilityFirst is not clear on the meaning of the phrase “. . . except for program specified exceptional circumstances that are approved by the single senior management official. . .” If this is intended to cover the language of CIP-003 Requirement R1.1 referring to, “. . . including provision for emergency situations.” we believe the proposed language needs more clarity. In Requirement R3.1, the use of the word “specified” is unclear as to the intent of this requirement. We believe the drafting team should add language to clearly express the intent of this requirement and, more importantly, the intent of the word “specified”. Regarding Requirement R3.5, please provide guidance on the phrase, “once every 12 months”. For example, if an individual is trained on December 1st one year, can the individual receive the training on December 12th the following year and still be in compliance? Regarding R2, there is no documentation of implementation required, making auditing of the requirement impossible. A requirement to document the quarterly reinforcement is needed. Also regarding R2, a “security awareness program” is mentioned, but not required here or elsewhere and should be added.

#	Organization	Yes or No	Question 12 Comment
12.59	Constellation Energy Control and Dispatch, LLC	Disagree	Remove the phrase "sound security practices" or identify and define what the phrase means, i.e. sound security practices as defined in the cyber security policies.
12.60	BGE	Disagree	Remove the verbiage “sound security practices” or identify and define what this means.
12.61	US Bureau of Reclamation	Disagree	Requirement 2: Agree, but requirement should emphasize Program first then quarterly awareness refreshers.Requirement 3: AgreeRequirement 3.1: Agree, but revise "at a minimum" to "in addition" in the introductory statement.Requirement 3.2: Disagree. The requirement for network training should not be applied to everyone with logical (electronic) access, only to those who administer network and/or system administration. As written, this requirement could be taken to apply to operations staff (operators) with access to operations consoles. They do not need network training. Further, what is "specified network access." Requirement 3.3: Agree. Role-based training is probably a good idea, but this might be handled with a general statement.Requirement 3.4: Agree, see above.Requirement 3.5: Agree, but there should be some tolerance so that there is no date creep.Requirement 3 (in Table): The requirements R3 and R4 include tables which are in themselves requirements. Since the numbering system is the same as other requirements, this could result in confusion with what the actual requirements are. It is suggested that Tables R3 and R4 be clarified.Requirement 4: This requirement needs to be simplified. It is wordy and confusing.Requirement 4.1: The requirement should not limit identification processes to photographic means. Fingerprints are and should be acceptable. Further, the criminal check requirement, with local information, is beyond what can normally be addressed. Suggest this check be limited to a national level only. The risk assessment process needs to specify that an adjudication process needs to be completed.Requirements 4.2 and 4.3: Agree.
12.62	Network & Security Technologies Inc	Disagree	Requirement 3.2 (training on networking hardware and software), as written, seems to require that ALL personnel with electronic access to BES Cyber Systems receive such training. This frankly makes no sense. Will SCADA/EMS operators be expected to understand the intricacies of Cisco IOS? Furthermore, it violates the principal of “need to

#	Organization	Yes or No	Question 12 Comment
			know." Suggest this requirement be reworded in a manner that makes it similar to 3.3 and 3.4 and limits its scope to personnel responsible for hardware and software.
12.63	Oncor Electric Delivery LLC	Disagree	Requirement 3.2 is not appropriately worded. Most users with electronic access to our Cyber Systems have no need to know anything about the networking hardware, software, or interconnectivity issues. The personnel responsible for maintaining this equipment may need additional training but most have required skill sets as specified by their job descriptions.Requirement R4.2 uses the term "results" of a Personnel Risk Assessment. Different auditors may interpret this term differently. We propose this to be a binary result, ie pass/fail and stated as such, for clarity.
12.64	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	Requirement R2 has all BES Cyber System operators to have a security awareness program that will maintain cyber security practices. However Requirement R3, R5 and R6 exempt Low Impact BES Cyber Systems. How can an Entity begin a security awareness program where Initial training (R3) and physical security (R5 & R6) is not required? This is very confusing.
12.65	San Diego Gas and Electric Co.	Disagree	Requirements 3.2 - 3.4 in CIP-011-1 seem to imply that a Registered Entity must have a separate training program for these three subjects. Unless the requirement is intended to be that prescriptive, SDG&E recommends a single training requirement that addresses the requirements in R3.1 - 3.4. This will help make the training requirements more manageable.Attempting to split hairs between training requirements for physical and cyber access to BES Cyber Systems for Medium and High Impact systems seems to unnecessarily increase risk exposure for a Registered Entity and complicates the process and controls needed to meet R3 and R4 of CIP-011-1.
12.66	Southern California Edison Company	Disagree	SCE requests clarification on the scope of R3.1. This requirement requires people listed on Table 5 (those with physical or electronic access to "high impact BES system[s]" to receive training on the "proper use of the BES cyber system". This requirement as currently written is unclear whether the training requirement only applies to people who work with affected systems, or whether the requirement more broadly applies to

#	Organization	Yes or No	Question 12 Comment
			everyone who is permitted unescorted physical access to a PSP. If it is the former, then SCE believes that would be the correct application of this rule. However, if it is the latter case, then persons who are granted unescorted physical access rights to a PSP, but who do not themselves operate these systems (for example, CIP-cleared security guards), would have to receive training on the "proper use" of the protected system. Such training should only be required of individuals who actually work with protected systems, and not to everyone who has unescorted physical access rights to a PSP.SCE also seeks clarification on Requirement R2. As written, R2 requires quarterly "reinforcement". The drafting team should clarify the distinction they imply by using the term "reinforcement" rather than "training" as used in R3. Finally, SCE ask for clarity on Requirement R3. As written, Requirement R3 seems to allow for exceptions in the training requirement. The drafting team should clarify why an "organizational infeasibility" is being allowed while a structured method to seek technical feasibility exceptions is being eliminated. Both conditions create a situation where strict compliance with the standard is impossible to implement.
12.67	Progress Energy - Nuclear Generation	Disagree	See attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
12.68	Idaho Power Company	Disagree	Sub requirement 3.2 is too broad. Dispatcher/operating personnel who have electronic access via an EMS application would not need training on networking hardware and software but it would be appropriate for EMS support staff. Cyber security incident identification and reporting would be sufficient for Dispatch/Operations personnel.
12.69	APPA Task Force	Disagree	The APPA Task Force agrees with the changes proposed by MRO-NSRS to replace "provide all" with "make available to all." We also believe the term "reinforcement" is not a defined term and should be replaced with "awareness material." As stated in our response to question 11 above, it is important to reference the required policies under requirement R1.If the drafting team does not follow Objective format suggested in response to Question 10, the APPA Task Force recommends the following format:R2.

#	Organization	Yes or No	Question 12 Comment
			Objective:Personnel Training, Awareness, and Risk Assessment: To ensure that personnel maintain awareness of the cyber security practices that are essential to protecting BES Cyber Systems. R2. Requirement:Each Responsible Entity shall make available to all personnel who have authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems at least quarterly awareness material in sound security practices under their security awareness program. The security awareness program will be part of the policy developed under requirement R1.The APPA Task Force cautions the drafting team on using the terms “grant” and “authorize” interchangeably. The following is our recommended revision to R3 with the Objective removed from the requirement:R3. Objective:To ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems.R3. Requirement:Each Responsible Entity shall ensure all personnel who are granted electronic access and/or unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being authorized access when specified in CIP-011-1 Table R3 - Cyber Security Training, except for program specified exceptional circumstances that are approved authorized by the single senior management official identified in Requirement R1 or his/her delegateR4. Objective:To ensure that personnel who have such access have been assessed for risk, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements. R4. Each Responsible Entity shall ensure a personnel risk assessment is performed for all personnel who are granted electronic access and/or unescorted physical access to its BES Cyber Systems, including contractors and service vendors, prior to their being authorized access when called for in CIP-011-1 Table R4 - Personnel Risk Assessment, except for program specified exceptional circumstances that impact the reliability of the BES or emergency response,
12.70	Indeck Energy Services, Inc	Disagree	The definition of Cyber System is so broad that these requirements are applied on a one size fits all basis. A control center computer system requires a different level of requirement than a substation RTU. This lends itself to differentiating the standards by function and/or functional entity. R3.2 applies IT networking requirements on the operator who logs in to use the functionality, without any ability to program it. The term

#	Organization	Yes or No	Question 12 Comment
			"specified electronic access" is overly broad.
12.71	Manitoba Hydro	Disagree	The meaning of "quarterly reinforcement" is unclear. Consider whether Requirement R3.5 should refer to "Each Responsible Entity", rather than "This Responsible Entity". Requirement R4 appears to be missing the explicit requirement that access would be prohibited based on the negative or poor results of a personnel risk assessment; it just speaks of a personnel risk assessment being required. The structure of Requirement R3 and Requirement R4 is confusing and needs to be corrected. As written, the Table CIP-011-1 R3 applies to each of the sub-requirements, which may not meet the intent of the requirement - how does Table 3 item 3.2 for physical access relate to Requirement 3.2 for electronic access? What does "specified" mean in Requirement 3.2? The duplicate use of the same numbering of the requirements and the table items is very confusing. The format of requirements together with the use of tables for R2 to R4 should be consistent with the rest of the proposed standard. Manitoba Hydro agrees that cyber security training is not a standard requirement for all personnel who have unauthorized physical access to Low Impact BES Cyber Systems, and therefore is not auditable. We do not agree that training is not a requirement for personnel who have authorized electronic access to Low Impact BES Cyber Systems, and suggest that it be an auditable requirement.
12.72	WECC	Disagree	The new way these requirements are written is very confusing. Too many levels, sub-levels, bullets and tabled criteria. Please simplify. Consider replacing with a requirement for Training and Awareness program that addresses the criteria that the SDT feels is critical for security and reliable operation of BES Cyber Systems.Regarding the phrase, "all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors", consistent language should be used through the standards. It may be useful to create a term for this group of people, define it, and use it in place of this long phrase.The last half of the requirement sentence lacks clarity. It is difficult to understand what is being required. If the intent is to create an exception process for training, the text should be removed. Standards should not have exceptions written into

#	Organization	Yes or No	Question 12 Comment
			them; they should establish a high bar of excellence.(3.1) “Visitor control program” needs definition or explanation.(3.2) The training requirements in this sub requirement seem vague.(3.3) Regarding the reference to “Systems;” most controls apply at the device level, and therefore should be required at that level.(3.5) Time intervals need to be clearer and well defined.(Table R3) Why no training for low impact systems? Seems arbitrary.
12.73	Bonneville Power Administration	Disagree	The objectives of these requirements (“to ensure that personnel maintain awareness of the cyber security practices that are essential to protecting BES Cyber Systems,” “to ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems,” and “to ensure that personnel who have such access have been assessed for risk, in accordance with federal, state, provincial, and local laws, and subject to existing collective bargaining unit agreements”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action(s) that the Responsible Entity must take.R3: Exception is somewhat confusing. In particular, is "or emergency response" an alternative to "...are approved by..."? In other words, it could be read that exceptional circumstances require either approval or an emergency. However, it could also be that the "or emergency response" is an alternative to "impact the reliability..." It appears that the former is more likely, but the reader should not have to parse the sentence to get there. Some selected bulleting would help.Suggested rewrite of R3:Recommended Changes - Objective 3 - To ensure that personnel are aware of the policies, access controls, and procedures in place to protect BES Cyber Systems. R3. The Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, have completed cyber security training prior to their being granted authorized access when specified in CIP-011-1 Table R3 - Cyber Security Training, except for - Program specified exceptional circumstances that are approved by the single senior management official identified in Requirement R1 or their delegate and impact the

#	Organization	Yes or No	Question 12 Comment
			reliability of the BES, or - Emergency responseThis assumes the first interpretation of "or"3.1 is acceptable3.2 Needs clarification, as it is not clear what the intent is. In a non control center environment, persons who have electronic access to BES Cyber Systems often do not have nor require knowledge or training in networking hardware and software. They make electronic connections and use their electronic access to collect electrical system information such as fault data, monitor device functions or do electrical systems analysis. It is not their job to understand networking.R3.3 and R3.4 are acceptable.R3.5 requires that training be conducted, but does not specifically require that every individual complete it. Also, it addresses the first annual training, but doesn't clearly stated what to do afterwards. The intent seems to be that each person complete training within each year. In other words, if the initial training was on July 1 2010, then training would be needed sometime in 2011 (say September), some time in 2012 (January?) and so forth. As currently written, a separate 12-month clock would be needed for each person. Finally, it's not clear if the required documentation is for the initial training, the annual training, or both. The SDT should be very specific as to what it means for how frequently an individual must take cyber security training. Suggested rewrite: Rewrite 3.5 to address annual training only: "This Responsible Entity shall ensure that all such persons receive annual training at least once each calendar year, starting the calendar year after they are granted access. The Responsible Entity shall remove authorized access from any individual who fails to complete such training in a timely manner." This removes some flexibility from the entities, but produces an unambiguous and manageable annual training program.We believe that a new requirement, 3.6, is needed to address documentation: "This Responsible Entity shall maintain documentation of any cyber training addressed in R3 or its subrequirements, includinge the date the individual's training in completed."Header in Table R3: Doesn't address annual training: Suggest "Cyber Security Training is Required Prior to Obtaining and For Continued:"R4: Has the same issue with the intent of "or emergency response" that R3 has. We suggest the same solution.The way that R 3.5 is written, it appears that two things must be done: the Responsible Entity must maintain documentation and each individual who is required to take cyber security training must take it as specified.

#	Organization	Yes or No	Question 12 Comment
			Would a violation of R 3.5 be due to an organization not maintaining documentation or due to an individual not having taken the required cyber security training in a timely manner? Or could there be two violations of R 3.5 - one for an organization not having up-to-date documentation and one (or many) for an individual(s) not having taken the required cyber security training in a timely manner? There is no indication in R 3.5 what should happen if an individual does not take the cyber security training as and when required. Should that individual's electronic access and/or unescorted physical access be revoked until the cyber security training has been completed? Or is what is important here only that the documentation be maintained regardless of whether each individual takes the cyber security training as and when required?For large organizations with a thousand or more people that must take cyber security training, is it possible that R 3.5 could indicate those organizations can provide the cyber security training during specific times of the year (say within a 3-month window) without regard for each individual having to take the training at a specific time? In this case, there would be no violation in an individual did not take the training exactly 12 months apart (or whatever the time requirement is) if the individual took the training within the 3-month window in each of two years.
12.74	Exelon Corporation	Disagree	The quarterly reinforcement requirement as spelled out in CIP-004 R1 Versions 1 through 3 is more specific and should be continued into this version. Requirement 3.2 as currently stated could cause someone such as a control room operator using an EMS system to be required to receive training on networking hardware and software for which they have no business need to know. It also could impact job specific training that is focused on improving reliable operations, due to the loss of precious training time being used for training that is not required for their position. We would suggest including wording such as "....appropriate to personnel roles and responsibilities"Requirement 4.1 second bullet states that "a seven year criminal history check" be performed. It is not clear from the requirement as to what agencies would need to be contacted to accomplish such a check. If local Police agencies are envisioned to be part of this check, that does not seem to be a very practical approach. R4. The need to show a photo ID is unnecessary to ensure a valid Identity Verification. The methods currently used to cross

#	Organization	Yes or No	Question 12 Comment
			reference and verify identity are satisfactory. To now require photo identification provides no additional benefit but would make it extremely difficult for remote personnel since we would now need someone to personally view the original photographic document. This would eliminate the ability to electronically transmit the required information.
12.75	Duke Energy	Disagree	The reinforcement requirement in R2 is vague and is up for interpretation by auditors. The Responsible Entity should only have to prove that the reinforcement information is provided. Previously, various means to provide the information, including posters, etc. were acceptable. This should still be the case. If so, is should not be necessary to prove that all personnel read the poster. R2 is open to interpretation as to what kind of evidence is sufficient. Explicitly state that materials are sufficient. Explicitly state which levels of Impact apply to R2. Need clarification on the program exception in R3. Does this apply to electronic and physical access? Must every situation need to be accounted for in the program or may it be case-by-case? Also, Requirement R3 contains a run-on sentence that makes the requirement hard to understand. Please consider breaking this into 2 or more smaller sentences.Requirement R3.2: What is meant by "specified electronic access?" Also, the requirement is vague in that it can be interpreted that the user of a BES cyber system needs detailed networking hardware and software training, when this is not the case. The user typically needs to know that device A is connected to device B and needs to know how to use the software. Said user does not need to know that the network communication routes through a brand XYZ switch using Ethernet and that the software was written in C# and so on. Clarification needed for audits, etc.Requirement R3.3: This requirement also needs bounds. If Employee A has a role in the recovery of BES Cyber System 123 only, then Employee A needs training on action plans and procedures to cover only BES Cyber System 123.R3.4 seems to be incomplete.Requirement R3.5: Is there any grace period on the 12 months? If there were "exceptional circumstances" such as in R4? For example, what if Technician A was due for training in June and was called for emergency storm duty and missed the training as a result? For 4.1, who will keep track of photographic identification? What is BA/TOP doing for Areva evidence of photo IDs? Will we have to gather the photo ID every 7

#	Organization	Yes or No	Question 12 Comment
			years? Suggest changing 4.3 to only include the criminal history check.
12.76	Nuclear Energy Institute	Disagree	The use of the expression "authorized electronic access" should be clarified, in all requirements in this standard where used. The correct expression should be "authorized electronic administrative access." Users who have access but no authorization to perform administrative functions on a BES Cyber System Component are of greatly less concern than those individuals having administrative access. Performing, as required by R4.1 a seven year background check, on each individual with non-administrative access to a Component is inappropriate. The focus should be on individuals who would pose a direct challenge to the system's reliable operation. An alternate solution may be to define "authorized electronic access" in the "Definitions" section.
12.77	FirstEnergy Corporation	Disagree	Though role based training is appealing, this activity is difficult to manage and maintain. It becomes administratively difficult to develop, maintain and track different training programs. A better approach would be having training that is differentiated by access (e.g. logical vs. physical.)For R3.2 qualifications should be made for only those people responsible for supporting networking hardware and software. There is no valid reason to provide networking training to non-networking personnel.If 3.3 and for 3.4 remain: Replace '...having a role...' with '...responsible for...'. Training for recovery plans and incident response is fundamentally different than the general cyber security training and should not be rolled into a 'one size fits all' training requirement.More clarity is needed on identity verification, how often does it need to be checked, does a copy need to be retained.
12.78	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
12.79	We Energies	Disagree	We Energies agrees with EEI suggestion: R2 contains two very subjective words: "sound" and "essential." Suggest striking these words.
12.80	GTC & GSOC	Disagree	We recommend removing the word "all" in R2 to ensure that you do not have to track

#	Organization	Yes or No	Question 12 Comment
			and document reinforcement for each and every individual. We also recommend that R3.2 “For personnel having specified electronic access to any BES Cyber System” be clarified to identify to what “specified” access this is intended to apply.We recommend R2 through R4 should distinguish between the different types of users and administrators that have different responsibilities and access and therefore need different levels of training.R4 needs to be revised to better reflect the limitations of performing background checks on persons who have resided even briefly in foreign countries.
12.81	Xcel Energy	Disagree	We think R2 should be clarified to note that wide-distribution information such as company newsletters or e-mails satisfy the quarterly reinforcement requirement and that tracking on an individual basis is not required.
12.82	MRO's NERC Standards Review Subcommittee	Disagree	We would propose replacing the terms “provide all” with “make available to all”, as we are concerned the word “provide” could be interpreted to include documenting that the materials were actually received by all personnel. For example, it would be very difficult to document that bulletin board postings were “provided” to each individual employee.
12.83	The Empire District Electric Company	Disagree	We would propose replacing the terms “provide all” with “make available to all”, as we are concerned the word “provide” could be interpreted to include documenting that the materials were actually received by all personnel. For example, it would be very difficult to document that bulletin board postings were “provided” to each individual employee.
12.84	Entergy	Disagree	Wording in R2 is very awkward. Language needs to be written more concisely to show that awareness modules simply need to be disseminated. Current language allows for misinterpretation. It could be assumed that evidence to prove that modules have not only been disseminated but have also been received by appropriate personnel is required. The language incorporated into R3 for emergency provisions is similar to that found in CIP-003-3, R1.1, but seems to be restrictive to only cyber security training and personnel risk assessments in R4. These emergency provisions (which should be approved by the Senior Manager or Delegate) should continue to be allowed for all

#	Organization	Yes or No	Question 12 Comment
			standards/requirements, if a potential impact to emergency response or the BES subsists. Efforts to add newly created topics to the cyber security training module should be minimal. R3.5 adds clarity by replacing the word "annual" with "every 12 months". CIP-011, R4 is largely unchanged from CIP-004-3, R3. Criteria for an acceptable personnel risk assessment appears to be more lenient and allows for identity verification via a government-issued photo ID, as opposed to the social security check that was required for v3. Language is a little unclear as to which types of government-issued IDs are permissible. Are government-issued IDs from different countries (Mexico, Iran, etc.) acceptable? Additional specificity is needed.
12.85	Verizon Business	Agree	For section 3.1, "Escort Management:" should be a required item for the Cyber Security Training. In paragraph R4, the first sentence should be revised to read as follows (bolded is added text): "Each Responsible Entity shall ensure a personal risk assessment is performed and reviewed and approved by the Responsible Entity for all personnel…." 4.1, First Bullet – This could refer to the requirements of U.S. Form "I-9" for verification to work in the U.S. By passing the requirements of I-9, one satisfies this CIP-011 requirement. In paragraph 4.2, the requirement should be amended to read (bold is added text): "Each Responsible Entity shall document the results of each personnel risk assessment and they shall document that the results were reviewed and accepted or rejected as an acceptable risk for the Responsible Entity.

13. Do you agree with the proposed definitions for external connectivity, routable protocol, and non-routable protocol? Please explain and provide any suggestions for modification.

Summary Consideration:

While some commenters indicated support for local definitions, most commenters suggested moving the definitions to the NERC Glossary instead. In response, the SDT has moved all definitions to the NERC Glossary and discontinued the use of local definitions.

Several commenters expressed the need to bring back the concept of an Electronic Security Perimeter, because otherwise, the definition of "external connectivity" makes it difficult to determine at what point in the communication path a device is external. The SDT generally agrees with these comments and has reintroduced the definition of an "Electronic Security Perimeter" as a collection of Electronic Access Points.

Several commenters made suggestions about the use of the term "routable." The suggestions provided include more examples of routable versus non-routable protocols and the use of the OSI seven-layer network model. Others noted the term "routable external connectivity" is used, but "routable protocol" is never used. In response, the SDT has only defined the term "**External Routable Connectivity**" as follows: *"The BES Cyber System is accessible from any Cyber Asset that is outside its associated ESP via a routable protocol."*

Commenters expressed confusion about the term BES Cyber System and requested additional guidance. In response, the SDT has added considerably more detail about the Reliability Operating Services a BES Cyber System performs along with the types of assets considered as part of the BES Cyber System.

#	Organization	Yes or No	Question 13 Comment
13.1	WECC		This should be defined at the top of the standard, dislike the definition box in the middle of a requirement.The use of external connectivity and/or enabled routable protocols to differentiate between required and non-required controls should be reconsidered. In most cases, the controls are still necessary to protect against insider threats.
13.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.

#	Organization	Yes or No	Question 13 Comment
13.3	ReliabilityFirst Staff	Agree	Does the drafting team intend to include these terms in the NERC Glossary of Terms?
13.4	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	However, this does not come up until well into the Standard. It is not clear how programmable electronic devises having no external connectivity, routable protocol, or non-routable protocol are treated. How shall programmable devises be treated when the only connectivity is on site connection to a laptop computer?
13.5	Puget Sound Energy	Agree	Puget Sound Energy would like to note that, with the widespread use of Internet Protocol (IP) as the communication protocol for the majority of Cyber Systems on the planet, if the standard is trying to be more inclusive of routable protocols than just IP, it should give some examples of others. "Routable Protocols" is an extremely technical concept, when talking about routable protocols other than IP, which could greatly impact scope, reliability, response, and overall compliance. If the standard is being specific to IP, then it should clarify that. If the standard is referencing other routable protocols than IP, then it should give some examples. (Ex: Routable protocols include, but are not limited to, IP, DecNet, MPLS, etc...).
13.6	Kansas City Power & Light	Agree	Recommend moving these definitions with R6 where routable protocol is first referenced.
13.7	Emerson Process Management	Agree	The current draft standard does away with the perimeter concept. It becomes slightly difficult in defining "internal" and "external."
13.8	LCEC	Agree	The definitions sound good but I do not agree with the use of "Required for external connectivity only" within the tables as they do not make sense most of the time.
13.9	SCE&G	Agree	The proposed definintions should be added to the "definitions table" at the front of the standard, rather than just in the boxes throughout the standard.
13.10	Allegheny Power	Agree	The proposed definitions are helpful, and should be used more extensively within the requirements to identify controls that are appropriate to devices based upon their

#	Organization	Yes or No	Question 13 Comment
			functionality/vulnerability.
13.11	EEI	Agree	The proposed definitions are helpful, and should be used more extensively within the requirements to identify controls that are appropriate to devices based upon their functionality/vulnerability.Suggested modification for R3:"Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access except for emergency circumstances that are approved by the senior management official identified in Requirement R1 or their delegate and impact the reliability of the BES or emergency response."Suggest elimination of Table R3.Suggested modification for Requirement 3.2:"For personnel that have a role in maintaining networking hardware and software supporting a BES Cyber System, this cyber security training shall additionally include training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems" In general, the drafting team needs to account for a person's "need to know" within the training program.
13.12	Florida Municipal Power Agency	Agree	These definitions ought to be associated with the first requirement that uses the definitions. As it appears now, these definitions seem associated with R3 on training, which has nothing to do with these definitions.
13.13	Electricity Consumers Resource Council (ELCON)	Agree	We agree with the definitions but they should be applied to limit the applicability of all the requirements in the standard.
13.14	Cogeneration Association of California and Energy Producers & Users Coalition	Agree	We agree with the definitions; however, they should be applied to limit the applicability of all of the requirements in the standard.
13.15	We Energies	Agree	We Energies agrees with EEI comment: The proposed definitions are helpful, and should

#	Organization	Yes or No	Question 13 Comment
			be used more extensively within the requirements to identify controls that are appropriate to devices based upon their functionality/vulnerability.We Energies agrees with EEI: Suggested modification for R3:Each Responsible Entity shall ensure all personnel who are granted authorized electronic access and/or authorized unescorted physical access to its BES Cyber Systems, including contractors and service vendors, complete cyber security training prior to their being granted authorized access except for emergency circumstances that are approved by the senior management official identified in Requirement R1 or their delegate and impact the reliability of the BES or emergency response.We Energies agrees with EEI: Suggest elimination of Table R3.Suggested modification for Requirement 3.2:For personnel having electronic access to any BES Cyber System, this cyber security training shall additionally include training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems.
13.16	FirstEnergy Corporation	Agree	While in agreement with the definition of routable protocol, it does not provide enough clarity. Would like to see the definition expanded to include protocol encapsulation.
13.17	US Bureau of Reclamation	Agree	Yes, but the definitions appear in the wrong location within the Standard.
13.18	Independent Electricity System Operator	Disagree	- External connectivity needs to be defined. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary?
13.19	Consultant	Disagree	1. Suggest deleting the words "for the purpose of this standard". These words are unnecessary and obfuscate the term being defined. Once the standard is approved these terms should be added to the NERC glossary as part of the next update process for that document.2. The term being defined should be capitalized, as it is now a defined term.3. Suggest listing these definitions in a section of the standard, and deleting these text boxes. Locating them in these text boxes makes the requirements difficult to read.4. If the definitions have to be injected like this, it is not clear why these definitions are located here. Nothing in these requirements discusses the terms being defined.5.

#	Organization	Yes or No	Question 13 Comment
			Suggest deleting "is defined as" as unnecessary. Suggest the format below:External Connectivity - Data communication across the protected electronic boundary. (Addressed in R20.) This definition also relates to the definition of Electronic Access Point in R20.Routable Protocol - a communications protocol that contains a network address as well as a device address thereby allowing packets to be forwarded from a device on one network to a device on another network. Non-Routable Protocol - a communications protocol that contains only a device address and not a network address that not incorporate an addressing scheme for sending data from a device on one network to a device on another network.
13.20	NextEra Energy Corporate Compliance	Disagree	Although on the surface these definitions are straight forward, NextEra believes there is a need to make a transition from the previous requirements for access points. There is not a strong tie between the definition for external connectivity (routable or not) to the requirements in the following sections. For example, Is a serial connection to a BES Cyber considered an Access Point to be protected? The definitions and requirements for protection need to be consistently applied across different levels of impact.
13.21	Garland Power and Light	Disagree	Comment - TOP definition needs to reword as follows:For the purpose of this standard, external connectivity is defined as a data communication path from a BES Cyber System Component to a device external to the BES Cyber System.Suggest better routable and non-routable protocols definitions - give examples of routable and non-routable protocols ie. tcp/ip, netbios, ipx, appletalk,
13.22	Network & Security Technologies Inc	Disagree	Current proposed definition of “external connectivity” is basically circular and could be interpreted in a number of ways. As written, it could even be applied to situations where two discrete BES Cyber Systems are connected to the same LAN segment, which we assume is not what the SDT intended. Suggestion: Unless the SDT really does intend for any network connection not entirely “within” a BES Cyber System to be considered “external,” rewrite the definition to provide a better point of reference than the BES Cyber System itself. Towards that end, the SDT might reconsider its decision to scrap the term, “Electronic Security Perimeter” (which, we note, still appears in CIP-011 in the

#	Organization	Yes or No	Question 13 Comment
			language of R20). We believe that in the context of current CIP Standard CIP-005, "external" connections are widely understood to be defined relative to the logical boundary of an ESP.
13.23	US Army Corps of Engineers, Omaha Distirc	Disagree	Definition of external connectivity is loose and problematic in the interplay with the loose definition of BES Cyber System. Does a communication path exist through a firewall? Does the term mean only intended paths?
13.24	Dominion Resources Services, Inc.	Disagree	Dominion has concerns about the definitions of external connection and electronic access point (Boundary Protection) as illustrated in the following example:A power station has 3 units with the same control system and a shared process I/O bus. Each unit has a control room with MMI, a dedicated server that is networked to the servers at the other 2 units, a front-end processor that is networked to multiple PLCs which are connected to smart I/O controllers. The servers are connected through a firewall to the central engineering office.Under this scenario, it is unclear where the BES Cyber System boundaries should be drawn. If the boundary is drawn around the station, everything is likely to be classified as High Impact and hundreds of I/O transmitters would be included that would normally be Low Impact. If an attempt is made to break the BES Cyber Systems down by unit, every interconnection between the units becomes an external connection and an electronic access point. Excluding a PLC from being part of the High Impact system is difficult because the PLC becomes the electronic access point and its data becomes an external connection. Boundary Protections with the PLC or its connection to the data bus cannot be met.The definition of a "communications path" needs to be clarified. Dominion proposes the following alternate wording to clarify the intent of the definition for external connectivity: ".....external connectivity is defined as any digital communication with a BES Cyber System component from a source external to the BES Cyber System."
13.25	E.ON U.S.	Disagree	E.ON U.S. believes that external connectivity should specify that it is going through an "access point" per the current definition of an access point. The definition of "external connectivity" references the existence of a "data communications path." Does this take

#	Organization	Yes or No	Question 13 Comment
			into consideration any protective measures that assist in the isolation or blocking of data communications? For instance, if a BES Cyber System or Component has a network connection, even an indirect one with multiple levels of firewalls and other security protective devices, to another "external" devices, does it have external connectivity? If so, virtually every system is externally connected; only those that are completely electronically/network-isolated would not be
13.26	USACE - Omaha Anchor	Disagree	External connectivity definition is incorrect. Would prefer a definition external to the facility or external to the electronic security perimeter (understanding that term doesn't exist in this standard.)
13.27	Black Hills Corporation	Disagree	External Connectivity is too open to interpretation; needs to distinguish between external and remote connectivity.
13.28	Luminant	Disagree	External connectivity should include any path and not just those that are considered part of the system functionality. Should also only include routable connectivity
13.29	Progress Energy (non-Nuclear)	Disagree	How are these terms applicable? Is this the key that will take many of our microprocessor relays in Transmission out of scope? If so, we need a clearer linkage to the definitions. It is still not clear if a non-routable protocol like VanCom is definitely excluded. If VanCom is not excluded as it was with previous standards, then every transmission RTU is pulled into consideration.Why have these definitions if the programmable electronic device definition is in play? Again is NERC's intent to manage at component, subsystem, or plant system level? Seems like impact would vary depending to what level of detail we need to get to.These terms are used very limited in CIP 11 and when used they are not used as individual terms. They are combined ie. "external routable connectivity".Do we have to use "routable protocols" term versus the ISO model...like layer 3 and greater?
13.30	Turlock Irrigation District	Disagree	In the definition of external connectivity the use of the words "data communications path" are confusing. Perhaps external connectivity could be defined as "Any electronic

#	Organization	Yes or No	Question 13 Comment
			access point that allows data to be transmitted and/or received between a defined BES Cyber System and a device that is not part of the defined BES Cyber System".
13.31	Southwest Power Pool Regional Entity	Disagree	It is unclear whether the definition of routable protocol includes Layer 2 devices in its scope, understanding that entities have had a difficult time distinguishing between a communications protocol and the networking infrastructure supporting the protocol's use. Additionally, given that the standard is now identifying BES Cyber Systems based upon the reliability functions they perform or support, is it even appropriate to continue to distinguish between routable and non-routable protocols? It is the function and the span of control of the Cyber Asset that determines the impact categorization and requirements applicability.
13.32	National Grid	Disagree	National Grid recommends changing from "from a device external to the BES Cyber System" to "from a device external to the BES Cyber System Boundary"
13.33	LADWP	Disagree	Needs brighter lines.
13.34	ISO New England Inc	Disagree	needs work - removable of ESP has implications. Needs better definition, use of routable protocol clouds issue. External connectivity needs to be defined. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary?Recommend changing from "from a device external to the BES Cyber System " to "from a device external to the BES Cyber System Boundary"
13.35	Dairyland Power Cooperative	Disagree	Once the identification of external connectivity is made, why is it relevant to distinguish routable vs. non-routable? A serial cable connected to an unprotected facility may be much more risky than a routable protocol with strict limitations on routing. There may be distinctions to be made in system or communication related requirements, but for training, the external connectivity criteria alone would be the best criteria for the impact level distinctions.

#	Organization	Yes or No	Question 13 Comment
13.36	Public Service Enterprise Group companies	Disagree	Please define the meaning of “routable external connectivity”. The terms “external connectivity”, “routable protocol”, and “non-routable protocol” were defined but not “routable external connectivity” is not. In particular, please clarify the language to provide that if an IP based protocol is in use for a BES Cyber System (e.g. at a substation) where the network address is not required and there is no “external connectivity” (i.e. the IP routing capabilities are disabled - there are no routers or devices capable of routing an IP datagram), this would result in the BES Cyber System being categorized as not having “routable external connectivity”.
13.37	Hydro One	Disagree	Recommend changing from “from a device external to the BES Cyber System” to “from a device external to the BES Cyber System Boundary”.
13.38	Northeast Power Coordinating Council	Disagree	Recommend changing from “from a device external to the BES Cyber System” to “from a device external to the BES Cyber System Boundary”.
13.39	Con Edison of New York	Disagree	Routable Protocol is defined as a communications protocol that contains a single address which identifies both the network and a unique device on that network.
13.40	San Diego Gas and Electric Co.	Disagree	SDG&E recommends rewording and clarifying the definitions of an External and Internal BES Cyber System and Remote Access. Connectivity is defined as “a data communication path existing to a BES Cyber System Component from a device external to the BES Cyber System.” 1) What are the standard elements, configuration items, or technology implementations which would distinguish an internal and external BES Cyber System? For example, using this definition, Cyber System A could be on the same LAN as Cyber System B, but considered “external” because the “data communication path” exists (and is switched and not routed) between the 2 Cyber Systems, and 3) does a “data communication path” include serial, USB, Wireless, Channel Attached, or other data communication types of transport? We feel that the access concepts and Remote Access definitions are unclear and difficult to decipher.

#	Organization	Yes or No	Question 13 Comment
13.41	Northeast Utilities	Disagree	Suggest revising the local definition for external connectivity to add “boundary” so the definition would read “... from a device external to the BES Cyber System Boundary”.
13.42	Allegheny Energy Supply	Disagree	Suggest that the External Access definition be revised to include the concept that external access is communcations path access outside of the electronic and physical protection boundaries of BES Cyber System or its connected networks.
13.43	Duke Energy	Disagree	Suggest using these definitions in CIP-010. For generation stations in particular, external connectivity and remote connectivity (R11) should be defined as remote/external to the protected network rather than to the BES cyber system. There are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). As written, the requirement in R12 for remote access is particularly burdensome with little value to cyber security. Same for R13.
13.44	Alberta Electric System Operator	Disagree	The AESO would like to see the terms “network address” and “device address” further defined, to limit possible ambiguity. Consider taking frames (e.g. Ethernet or 802.3) into account in the definition, in addition to packets.
13.45	Southern Company	Disagree	The definition of external connectivity should make it clear that a data communication path does not include human action as an intermediate step.
13.46	Matrikon Inc.	Disagree	The definition of routable protocol should be congruent with the OSI networking stack <http://en.wikipedia.org/wiki/OSI_model>. Routable protocols are those which provide capabilities to communicate at OSI "Network" Layer 3.External connectivity definition still has room for interpretation. If we continue the approach of following the OSI model, then external connectivity is: a communication data "session" using a routable protocol, to an external network requiring OSI Layer 3 "router" or "access point"in order to communicate to an extended network.

#	Organization	Yes or No	Question 13 Comment
13.47	Entergy	Disagree	The definitions for routable and non-routable protocol appear to be satisfactory. However, the definition of external connectivity could prove troublesome, depending upon one's interpretation of a BES Cyber System. For example, a backup site may be classified as a different BES Cyber System than that of a primary site, thus making each one external from the other. Utilizing this interpretation could cause complications from an external connectivity perspective. Conversely, if both sites were classified as a single BES Cyber System, then the issue for external connectivity would not exist.
13.48	US Army Corps of Engineers	Disagree	The proposed definition states that external connectivity is defined as a data communication path existing to a BES Cyber System Component from a device external to the BES Cyber System. Does the use of the word "existing" mean that the data communication path is permanent? If a plant allowed dial-up connectivity to their BES Cyber System, but would need to physically connect the modem for the outside person to dial-in everytime, and then disconnect the modem when completed, leaving an air-gap, would that count as "external connectivity" in this definition?
13.49	Indeck Energy Services, Inc	Disagree	The term “routable protocol” is used only once and the term “non-routable protocol” is never used except in the definition. “Routable connectivity” or “routable external connectivity” are used multiple times without definition.
13.50	Nuclear Energy Institute	Disagree	These definitions should appear in the “Definitions” section.Additionally, for generation stations in particular, external connectivity and remote connectivity (R11) should be defined as remote/external to the station rather than to the BES cyber system. There are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). As written, the requirement in R12 for remote access is particularly burdensome with little value to cyber security. Same for R13.
13.51	MidAmerican Energy Company	Disagree	This definition depends on the definition of a BES Cyber System Component, deferring to the functionality of the connected device as the differentiating factor between internal

#	Organization	Yes or No	Question 13 Comment
			and external connectivity. By this definition, a device providing "control" of the BES is by definition a "BES Cyber System Component" and thus, is NOT qualified as external connectivity. For example, a personal home PC, using an Internet connection, could provide "control" of the BES, and thus be considered a BES Cyber System Component, and thus by definition, is not considered remote access.We propose that the definition of external connectivity somehow incorporate the concept of communication medium and endpoint/host control. If the entity does not have 'control' of the medium over which the communications occur, then the communication path must be deemed 'external connectivity'. Additionally, if the entity does not have 'control' over the endpoints/hosts on both ends of the communications path, then the communication path must also be deemed 'external connectivity'. In short, any communication path to a BES Cyber System Component for which the entity does not "control" the communication medium or does not have "control" over both communication endpoints and devices communicating through the endpoints, should be considered 'external connectivity'.Of course, the key consideration in this definition is what constitutes 'control'. The CIP standard for physical security perimeter protections for hosts and endpoints is a good place to start, with the understanding that logical controls such as encryption are viable alternatives for communication paths.If the definition of external connectivity is intended to include dial-up connectivity it should be expressly stated.
13.52	PacifiCorp	Disagree	This definition depends on the definition of a BES Cyber System Component, deferring to the functionality of the connected device as the differentiating factor between internal and external connectivity. By this definition, a device providing "control" of the BES is by definition a "BES Cyber System Component" and thus, is NOT qualified as external connectivity. For example, a personal home PC, using an Internet connection, could provide "control" of the BES, and thus be considered a BES Cyber System Component, and thus by definition, is not considered remote access.We propose that the definition of external connectivity somehow incorporate the concept of communication medium and endpoint/host control. If the entity does not have 'control' of the medium over which the communications occur, then the communication path must be deemed 'external connectivity'. Additionally, if the entity does not have 'control' over the

#	Organization	Yes or No	Question 13 Comment
			endpoints/hosts on both ends of the communications path, then the communication path must also be deemed 'external connectivity'. In short, any communication path to a BES Cyber System Component for which the entity does not "control" the communication medium or does not have "control" over both communication endpoints and devices communicating through the endpoints, should be considered 'external connectivity'.Of course, the key consideration in this definition is what constitutes 'control'. The CIP standard for physical security perimeter protections for hosts and endpoints is a good place to start, with the understanding that logical controls such as encryption are viable alternatives for communication paths.If the definition of external connectivity is intended to include dial-up connectivity it should be expressly stated.
13.53	GTC & GSOC	Disagree	We recommend that local definitions for a specific Reliability Standard be documented in a section prior to the requirements sections instead of interspersed throughout the requirements. While it may improve the initial readability of the requirements, it is problematic in the long term determining if and where a particular word is defined.We also recommend "external connectivity" should be limited to situations where an external device can initiate a connection to the BES System Component. If a firewall limits connections to only those initiated by the BES System Component itself (i.e., connections are only one-way: out), the component should not be considered to have external connectivity.We recommend deleting the portion referring to network and device addresses because not all protocols make a clear distinction between a network address and a device address. The functional packet-related distinction is sufficient. The second and third paragraphs of the definition would read: "For the purpose of this standard, a routable protocol is defined as a communications protocol that allows packets to be forwarded from one network to another.For the purpose of this standard, non-routable protocol is defined as a communications protocol that does not incorporate an addressing scheme for sending data from one network to another."
13.54	Bonneville Power Administration	Disagree	We understand the need to keep definitions close to where they're used, it is also important to have them centrally located. We understand that this leads to a document maintenance issue. However, most document creation tools have solutions. For

#	Organization	Yes or No	Question 13 Comment
			instance, in Microsoft Wordâ„¢, you can make the definition a bookmark, and then insert a cross-reference somewhere else. The definition of "External Connectivity" is too broad. Consider an example: A user in a Control Center is logged into a workstation that is part of a BES Cyber System. The user opens a connection from that workstation to another BES Cyber System in the same Control Center. The communications path is totally under the control of the Responsible Entity, and all systems and communication paths involved are under the physical and electronic protections of the Control Center. Yet, this would constitute and external connection to the second BES Cyber System, and thus constitute remote access to that system. This is an untenable situation, especially considering the tight controls justifiably required for connections from outside the control of the Responsible Entity.Recommendation: "...defined as a data communications path to a BES Cyber System that encompasses, in some or all portions, links outside the control of the Responsible Entity." The definition of "Routable Protocol" is acceptable.The definition of "Non-routable Protocol" is slightly broader than necessary. It excludes point-to-point protocols. For instance, RS232 is one of many serial communications protocols that contains no address of any kind. Recommend changing "...that contains only a device address and not a network address." to "...that contains at most a device address and no network address."
13.55	Verizon Business	Disagree	1) The definition should explicitly state that a “Routable Protocol” includes TCP/IP. Also, the definition should explicitly state that MPLS is considered a “Routable Protocol” because MPLS is considered OSI Layer “2 ½” and hence there may be disagreement whether it is routable. For a “Non-Routable Protocol,” an example like a protocol in the OSI Layer 2 should be provided. 2) The term “external connectivity” requires more explanation. It is unclear whether it would include two BES Cyber Components that are connected to each other, regardless of the length of separation.

14. Tables R3 and R4 provide direction concerning what impact level of BES Cyber Systems to which Requirements R3 and R4 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R3 and R4 have moved to CIP-004-5 R1 through R3.

Several commenters expressed confusion regarding the purpose of specifying routable connectivity in the applicability for training requirements. The SDT agrees and has modified the applicability to include all High and Medium BES Cyber Systems.

In addition, several commenters suggested the training and personnel risk assessment should apply across all impact levels. One commenter suggested the training and personnel risk assessment should only apply to the High Impact level of BES Cyber Systems, and another commenter suggested there should also be a "no-impact" level. The SDT has changed the requirements for training and personnel risk assessments to apply to High and Medium Impact BES Cyber Systems. These requirements do not apply to Low Impact BES Cyber Systems because of the significant effort required to track the Low Impact BES Cyber Systems and the persons who have authorization to access those systems.

#	Organization	Yes or No	Question 14 Comment
14.1	US Army Corps of Engineers		In Tables R3 and R4, the phrase "Physical access to BES Cyber Systems" is qualified with the words "with routable external connectivity" but these words are not referenced in any of the paragraphs R2-R4. Paragraphs R2-R4 state physical access as "authorized unescorted physical access to BES Cyber Systems." Should we assume that both terms are the same?
14.2	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.
14.3	Northeast Utilities	Agree	Please change Table R4 to read "Personnel Risk Assessment".
14.4	Madison Gas and Electric Company	Agree	Thank you for adding these helpful tables immediately after the requirement. This reduces the confusion of turning a page to an appendix.

#	Organization	Yes or No	Question 14 Comment
14.5	GTC & GSOC	Agree	We recommend making sure there is consistency with impact levels for authorizing physical and authorizing electronic access
14.6	Black Hills Corporation	Agree	Would like to know if an entity exceeded any NERC requirements as internal policy, and subsequently had an individual miss training who did not interact with a BES Cyber System, would this be considered a violation by NERC.
14.7	ERCOT ISO	Disagree	3.2 & 4.2: Please clarify why "with routable external connectivity" is addressed.
14.8	US Army Corps of Engineers, Omaha Distirc	Disagree	3.2 not clear as to purpose of this training or how external connectivity relates. Without electronic access the most they could do is damage hardware. Does this only apply to hardware providing external connectivity such as firewall etc?
14.9	Tenaska	Disagree	5.3 Consider leaving the word "uniquely" out or change it to say individually identify.
14.10	BCTC	Disagree	Â We are in strong disagreement with R3.2. We have various parties who have electronic access to our BES Cyber Systems but do not agree that training these individuals on networking hardware and connectivity would increase the security of the BES. Could you please clarify the objective of this requirement? - i.e. why would someone who simply accesses a console to view BES Cyber System data require network-related training? We recommend that the requirement be worded something like "... personnel will be supplied training on applicable NERC CIP devices that they are authorized to work on and the associated related security controls, as identified in the CIP Standards..." Above we have recommended above that "emergency situation" language remain at the security policy level. A potential scenario in this requirement is an emergency occurs (i.e. a critical piece of equipment breaks) whereby the closest service provider available to fix the problem is minutes away but has not completed CIP training or a PRA; from an operations (i.e. "keeping the lights on") perspective we would identify this as an emergency situation, seek approval from our Senior Manager or delegate to allow this person to access our facility, and allow the repair to occur. In this scenario we are assuming our 'regular' service technicians are unavailable or far way

#	Organization	Yes or No	Question 14 Comment
			from the facility.Â We have encountered an issue where some non-North American countries will not disclose criminal histories so it will be difficult to meet the requirement that states ... “A seven year criminal history records check covering all locations where, during the previous seven years up to the current time, the subject has resided, been employed, and/or attended school for six months or more, including current residence regardless of duration.” We can have new employees from these countries start employment but lived in North America for less than 7 years. For such a scenario we recommend that the language be revised to indicate that the Utility requests a seven year criminal history check on a best efforts basis; i.e. we can ask for the information but there is no guarantee the originating country will provide us with the results - this is beyond our control. FYI, simply denying a person on these grounds in Canada violates out employment legislation.Â R4.2 We currently retain a “clear”/ “not clear” result with all PRAs for contractors and employees. Please confirm that this requirement does not require the Utility to retain detailed records (i.e. listing of criminal offenses, charges, etc.)
14.11	Hydro One	Disagree	Agree provided the external connectivity definition is revised per the response to question 13.Recommend changing Table R4 from “personal” to “personnel”.Suggest changing to annually for consistency.Such classification will add additional unnecessary burden since specific training will need to be generated and tracked depending on the type of system access
14.12	Northeast Power Coordinating Council	Disagree	Agree provided the external connectivity definition is revised per the response to question 13.Recommend changing Table R4 from “personal” to “personnel”.Clarify “12 months”.
14.13	ISO New England Inc	Disagree	Agree provided the external connectivity definition is updated per answer #13 Table 4 title uses “personal” instead of personnel.
14.14	San Diego Gas and Electric	Disagree	Attempting to split hairs between PRA and Training requirements for physical and cyber access to BES Cyber Systems for Medium and High Impact systems seems to

#	Organization	Yes or No	Question 14 Comment
	Co.		unnecessarily increase risk exposure for an Entity and complicates the process and controls needed to meet R3 and 4 of CIP-011-1. SDG&E recommends that the requirements for both of these tables be required for High Impact BES Cyber Systems only
14.15	E.ON U.S.	Disagree	CIP-011, R3 states that contractors and service vendors with authorized electronic or unescorted physical access are to complete cyber security training before given this access. However, this begs the question of what constitutes satisfactory evidence of this training for these individuals? If vendor-provided training is adequate, what evidence is needed to maintain this training?a. (3.2) "...shall additionally include training on the networking hardware and software and other issues of electronic interconnectivity..." For most users of these systems, training on the networking hardware and software provides little or no value. Unless these are systems administrators tasked with responsibilities for managing / monitoring these systems, users (and associated training) should be focused on the functions of the system to support operation, monitoring, and control for which they are responsible.CIP-011, R4 requires background checks for contractors and service vendors. The new requirements do not clarify the acceptable evidence required to be maintained by entities. Is it acceptable for a service provider to conduct the background checks? If so, what evidence of background checks does the registered entity need to maintain?Does the requirement apply for everyone that has access to the BES cyber system ? Would this include support personnel and janitorial staff? E.ON U.S. suggests that the requirement be tied to job function rather than a blanket requirement for all.E.ON U.S. requests clarification as to how personnel that only have remote access to the system should be verified. Photo IDs are neither practical nor required.
14.16	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
14.17	US Bureau of Reclamation	Disagree	Cyber access training and personnel risk assessment requirements should be applied to

#	Organization	Yes or No	Question 14 Comment
			all three impact levels.
14.18	BGE	Disagree	Define “electronic access” as noted in table R3 (3.1). 3.2 Should say “Physical access to BES Cyber Systems (remove routable external connectivity). Table R4 (4.2) should add “unescorted” physical access to BES.....
14.19	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes Personnel Training, Awareness, and Risk Assessment should only apply to personnel with access to high impact BES cyber systems and not include personnel with access to medium and low impact systems. This requirement as currently drafted is unduly burdensome for field personnel that have local access to programmable electronic devices. These personnel need not be aware of network considerations to securely perform their job duties.
14.20	Luminant	Disagree	Does R4, 4.1 need to be modified to address valid identification for foreign nationals with remote (overseas) access to BES Cyber Systems?
14.21	MRO's NERC Standards Review Subcommittee	Disagree	For item 3.1 and 3.2, we propose making the Low Impact criteria “Required”. Cyber Security Training is something that should probably be carried out across the BES.For item 3.2, we would propose removing “with routable external connectivity”, and then adding the following under Medium Impact:”Required for routable external connectivity only”.For item 4.2, we would propose removing “with routable external connectivity”, and then adding the following under Medium Impact:”Required for routable external connectivity only”.If an entity is required to restrict physical access, then they should also be required to provide training.
14.22	The Empire District Electric Company	Disagree	For item 3.1 and 3.2, we propose making the Low Impact criteria “Required”. Cyber Security Training is something that should probably be carried out across the BES.For item 3.2, we would propose removing “with routable external connectivity”, and then adding the following under Medium Impact:”Required for routable external connectivity only”.For item 4.2, we would propose removing “with routable external connectivity”, and then adding the following under Medium Impact:”Required for routable external

#	Organization	Yes or No	Question 14 Comment
			connectivity only".If an entity is required to restrict physical access, then they should also be required to provide training.
14.23	Platte River Power Authority	Disagree	Is the intent that prior training is not required for Physical access to BES Cyber Systems without routable external connectivity? In other words, the table says that prior training is only required if Physical access is granted to a BES Cyber Systems with external connectivity. Is that the intent?
14.24	Entergy	Disagree	It appears nonsensical to require cyber security training and personnel risk assessments for electronic access to BES Cyber Systems classified as Medium-impact, but not for physical access to Systems with external connectivity. Requiring these items for only one type of access and not the other merely increases the likelihood of misinterpretation of the requirements by the Entity. PRAs and training should be required for both types of access or neither.
14.25	FirstEnergy Corporation	Disagree	It would be very difficult to administer training and PRAs based on impact levels. It seems like it would be easier to just have one level for all. We suggest eliminating the tables/impact levels for R3 and R4.Training and PRAs should be required for all levels. It is easier to maintain, track and move employees around if they are all trained and background checked, especially with the need to continuously reassign employees.
14.26	Manitoba Hydro	Disagree	Manitoba Hydro agrees that cyber security training is not a standard requirement for all personnel who have unauthorized physical access to Low Impact BES Cyber Systems, and therefore should not be auditable. We do not agree that training is not a requirement for personnel who have authorized electronic access to Low Impact BES Cyber Systems, and suggest that it be an auditable requirement.
14.27	Progress Energy (non-Nuclear)	Disagree	May not be an issue since most our personnel that require access will very likely require access to all three impact levels and will require adherence to the highest security level anyway. It does not seem practical and reasonable to develop and maintain three different security programs based on the three impact levels.The question with most of

#	Organization	Yes or No	Question 14 Comment
			the impact level requirements is the difficulty and cost associated with developing and maintaining three different levels of security, monitoring and controls and making sure that the appropriate levels are applied with an increase in impact level.Again is NERC's intent to manage at component, subsystem, or plant system level? Impact will vary depending to what level of granularity we need to get to.Section R3.1 appropriately provides for a level of NERC CIP training consistent with physical only access. The last point 'Identification and reporting of a Cyber Security Incident' should be clarified to be the physical aspects of a cyber security incident. Since this is the type of training that we will be providing to janitors/HVAC repair technicians/electricians, there should not be a requirement to provide any type of cyber training. The full 'Identification and reporting of a Cyber Security Incident' can be included under R3.2 - which is intended for those with actual cyber access.
14.28	National Grid	Disagree	National Grid agrees provided the external connectivity definition is updated per answer 13.Recommend changing Table R4 from "personal" to "personnel".
14.29	LCEC	Disagree	No. These tables should include all standards and clearly indicate their intent.
14.30	American Municipal Power	Disagree	Please add a little or no impact category.
14.31	Puget Sound Energy	Disagree	Puget Sound Energy, as stated earlier in this document, would need to see more specific definition to "Low", "Medium", and "High" impact, as well more specific definition to subjective terms such as "restrict" and "affect". If specificity can be provided to the subjective areas of the definition to "Low Impact", "Medium Impact", "High Impact", "restrict control", and "affect situational awareness", Puget Sound Energy agrees with the tables.
14.32	ReliabilityFirst Staff	Disagree	Requirement R4.1; ReliabilityFirst is concerned that permitting documents other than Social Security Identification for identity verification could lead to questionable results. Requirement R4.3 only addresses updating a PRA every seven years but does not include

#	Organization	Yes or No	Question 14 Comment
			a requirement to update the PRA "for cause." Table R3 and R4, Medium Impact BES Cyber Systems should be required for rows 3.2 and 4.2 respectively.
14.33	Southwest Power Pool Regional Entity	Disagree	Some degree of physical and electronic access training is basic security training that should be applicable to all impact categories. The extent of the training could perhaps be adjusted to reflect the impact categorization. 4.2: See the discussion regarding the need for distinguishing between routable and non-routable protocols. The Personnel Risk Assessment should be required prior to access for at least High and Medium impact BES Cyber Systems, both physical and electronic, regardless of any communications protocol being used.
14.34	Network & Security Technologies Inc	Disagree	Suggest (1) dropping "routable external connectivity" qualifier for High Impact systems in 3.2 and 4.2 and adding Medium Impact systems to 3.2 and 4.2.
14.35	EEI	Disagree	Suggest elimination of Table R3. EEI suggests making training mandatory for any personnel with authorized electronic access and/or authorized unescorted physical access to any BES Cyber Systems.Suggest elimination of Table R4. EEI suggests making personnel risk assessment mandatory for any personnel with authorized electronic access and/or authorized unescorted physical access to any BES Cyber Systems.Has the drafting team considered the challenge of performing photographic identification verification for personnel who may need authorized electronic access yet never come on site?
14.36	Emerson Process Management	Disagree	Table R3 implies that Cyber Security Training is not required for people who have physical access to a high impact BES Cyber System as long as this system does not have routable external connectivity.Per 3.1, the training shall cover the policies, access controls and procedures.This is unclear about the connection between the needed training and the lack of routable external connectivity.Same note applies to Tabe R4.
14.37	American Electric Power	Disagree	Table R3, 3.2: Regarding "Physical access to BES Cyber Systems with routable external connectivity", suggested wording: "Authorized, unescorted physical access".Current

#	Organization	Yes or No	Question 14 Comment
			wording seems to require training for all physical access. Would a group taking a walking tour of a generation control room, transmission substation, or control center need cyber security training?Table R4, 4.2: Regarding "Physical access to BES Cyber Systems with routable external connectivity", suggested wording: "Authorized unescorted physical access"Current wording seems to require personnel risk assessment checks for all physical access. Would a group taking a walking tour of a generation control room, transmission substation, or control center need personnel risk assessments?
14.38	Alberta Electric System Operator	Disagree	The AESO suggests that security training and PRA are required for all impact levels for 3.1, 3.2, 4.1, 4.2 in the tables. The SDT should consider devising a graduated implementation scheme, or let the RE determine how much and to what extent the training and PRA should include for each impact level.
14.39	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS proposal to require cyber security training in Table 3.1 and Table 3.2 for all impact levels. The training requirements for Table 3.1 and Table 3.2 Low Impact, should only be required to comply with R3 sub-requirement 3.1, at a frequency of every 2 years. These Low impact facilities should not be required to comply with the specific requirements detailed in R3, sub-requirements 3.2-3.5. We suggest the table state; “Applies to sub-requirement 3.1 only, Frequency: Every 2 years” for Low Impact facilities. We agree with the MRO-NSRS comments on item 3.2; MRO-NSRS proposes removing “with routable external connectivity.”The APPA Task Force feels there is confusion with blanks in the tables. For example, in Table 4.1 we have assumed that a blank under the Low Impact category means a Low Impact BES cyber system is not required to conduct any Personal Risk Assessments Prior to Obtaining Table 4.1 and 4.2 access. If this is the meaning of such blanks it is our recommendation that the drafting team make that clear and insert a N/A for Not Applicable in all blanks throughout the document and define N/A in the introduction.For R4 Table 4.2, the APPA Task Force agrees with the MRO-NSRS proposal to remove “with routable external connectivity”, and to add the following under Medium Impact: “Required for routable external connectivity only”.The APPA Task Force suggests the following text for the noted tables:R3 Table 3.1: Low Impact: Required (Applies to sub-requirement 3.1 only) at

#	Organization	Yes or No	Question 14 Comment
			least once every 24 monthsMedium Impact: RequiredHigh Impact: RequiredR3 Table 3.2: Low Impact: Required (Applies to sub-requirement 3.1 only) at least once every 24 monthsMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR4 Table 4.1: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR4 Table 4.2: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required
14.40	Duke Energy	Disagree	The format in these tables is confusing. The requirements tell “what” the requirement is, and the table tells “who” the requirement applies to.
14.41	Con Edison of New York	Disagree	The R3 Dialog box defines external connectivity. It is not clear whether external activity is between systems in all cases, or does it mean between systems that are within different electronic boundaries. The wording needs to make this clear.The requirement to check photographic ID’s seem appropriate initially, or during the hiring process. As written it will require checking photo ID’s every seven years for an employee that has been working in for the Company for the entire period and whose identity should no longer be in question. The recurring requirement should not apply. R3.2 - it is unrealistic to expect to train operators on network equipment, software, and protocols, which is a separate and distinct job function.R3.3 - Review of DR procedures is appropriate, but specific training on DR is not
14.42	Consultant	Disagree	The 'required' blocks for electronic access would seem to imply that there is no connectivity between low impact assets and medium or high impact assets. If this is the case, then the table seems adequate. Or there should be a 'highest impact rules the network access controls' qualifying statement.The 'required' block for physical access would seem to imply that there is no co-located assets of different impact levels. This seems less likely than electronic access segregation. There should be a 'highest impact rules the physical boundary access controls' qualifying statement.
14.43	Idaho Power Company	Disagree	The table does not address training requirements for personnel with access to sensitive information about BES cyber systems but do not otherwise have electronic or physical

#	Organization	Yes or No	Question 14 Comment
			access to the system itself. It would be difficult to be compliant with R24 if personnel are not trained to recognize sensitive information or trained on the proper labeling and handling procedures.
14.44	Florida Municipal Power Agency	Disagree	The tables are ambiguous. For instance, is the blank in the table for R3 for Low Impact supposed to mean that no training is required, as FMPA interprets? FMPA believes that some level of training ought to be provided for all levels of impact, correlated with the impact level (e.g., biennially instead of annually for Low Impact for instance). FMPA suggests embedding the bullets into the table in a similar manner as R5 and leaving no blanks in the table to make clear what is required for each impact level.
14.45	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The tables should clearly specify unescorted physical access.
14.46	Constellation Energy Control and Dispatch, LLC	Disagree	-There should be a row in the R3/R4 tables for each Requirement/Sub-Requirement-Define "electronic access" in table R3 (3.1).-Table R4 (4.2) should say "unescorted" physical access to BES Cyber Systems with routable external connectivity.
14.47	Bonneville Power Administration	Disagree	Training and especially a PRA should be required for physical access to any High or Medium impact system, regardless of whether it has routable external connectivity. A hammer to a RAS system could cause severe issues, whether or not the system connects to field units with a routable protocol. In addition, physical access to BES Cyber Systems is potentially far more dangerous that Electronic Access (especially at field sites) The requirements in the table should be at least the same for physical and electronic access. In both Tables R3 and R4, the word “unescorted” should be added at the beginning of Items 3.2 and 4.2.
14.48	WECC	Disagree	Training should be done for all employees with any level of access to a minimum level. Additional criteria for training should be done dependent on the level of access and their

#	Organization	Yes or No	Question 14 Comment
			role. See previous comments about suggestion to replace with a requirement for a training and awareness program with specific criteria.These requirements should apply to all impact levels. Awareness, training, overall education, and personnel risk assessment are the building blocks for a successful security program.
14.49	We Energies	Disagree	We Energies agrees with EEI: Suggest elimination of Table R3. Make training mandatory for any personnel with authorized electronic access and/or authorized unescorted physical access to any BES Cyber Systems.We Energies agrees with EEI: Suggest elimination of Table R4. Make personnel risk assessment mandatory for any personnel with authorized electronic access and/or authorized unescorted physical access to any BES Cyber Systems.We Energies agrees with EEI: Has the drafting team considered the challenge of performing photographic identification verification for personnel who may need authorized electronic access yet never come on site?
14.50	Minnesota Power	Disagree	While the impact levels seem reasonable, it is the inclusion of the term “external connectivity” as a qualifier in sections 3.2 and 4.2 of Tables 3 and 4 respectively that creates confusion. The relevance of connectivity to implementing appropriate physical security measures is not clear. Physical Access averts the need for electronic access, so this seems counterintuitive to include “external connectivity” as a provision. Minnesota Power recommends that sections 3.2 and 4.2 of Tables 3 and 4 respectively simply state “Physical access to BES Cyber Systems.”

15. Requirements R5 and R6 of draft CIP-011-1 concern procedures for physical security, which were previously contained in CIP-006. Do you agree with this proposal? If not, please explain why and provide specific suggestions for improvement.

Summary Consideration:

Many of the commenters expressed concerns with the timing of the revocation requirements as being unrealistic, especially for authorized unescorted physical access to areas protecting BES Cyber Systems for personnel who no longer require such access. Commenters stated that the time required for revocation should be extended to 72 hours or to the next business day, whichever is longer, to allow for communications of this circumstance. Timing issues regarding the termination of access for contractors and/or service vendors were also raised.

The SDT has clarified that the timely revocation of electronic access to cyber systems is an essential element of an access management regime. When an individual no longer requires access to a BES Cyber System to perform the assigned functions, that access should be revoked. Access is considered to be physical, logical, and remote permissions granted to all Cyber Assets comprising or allowing access to the BES Cyber System. When granting, reviewing, or revoking access, the Responsible Entity must address the Cyber Asset specifically as well as the systems used to enable such access (i.e.: physical access control system, remote access system, directory services). CIP-004-5 Requirement 7 enumerates the proposed requirements under a variety of conditions regarding revocation of access.

Some commenters expressed confusion regarding the use and meaning of the terms “grant” and “authorize” and their use in these requirements. Also, the term “Physical Access Control Systems” was requested to be defined, as the term will likely have different meanings for different entities and auditors and could lead to difficulties in implementation and auditing. The SDT has provided additional clarity in the requirements and has proposed the following definition for **Physical Access Control Systems**: *“Cyber Assets that control, alert, or log access to the Defined Physical Boundary(s), exclusive of locally mounted hardware or devices at the Defined Physical Boundary such as motion sensors, electronic lock control mechanisms, and badge readers.”*

Physical security at remote substation sites was also raised as not being cost effective in preventing or detecting cyber attacks, especially for remote substations with only dial-up communications. Commenters indicated that physical security should only be required at Control Centers and High Impact substations with IP-based communications. While some commenters generally liked having all the Physical Security requirements in one standard versus references to multiple standards and multiple requirements within standards, the commenters expressed concern that the clarity that was intended was not provided, as the language used is vague and confusing. Some restructuring of the requirements was suggested to improve the clarity of the standards.

While some restructuring of the requirements for physical security has been implemented by the SDT in the Version 5 standards, each Responsible Entity is required to ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. CIP-006-5 defines the requirements for physical protection for Low, Medium, and High Impact BES Cyber Systems. While the requirements place the

emphasis for physical protection on the High and Medium Impact BES Cyber Systems, each Responsible Entity's Physical Security Plan is required to address how it will protect Low Impact BES Cyber Systems.

#	Organization	Yes or No	Question 15 Comment
15.1	National Rural Electric Cooperative Association (NRECA)		In R5.5, the statement to "Authorize unescorted physical access....." makes it sound like the utility should provide blanket authorization for unescorted physical access. I don't believe that is the case. Please clarify R5.5 -- I believe what is intended here is to have policies and procedures in place to detemine who has authorization to have unescorted physical acess.
15.2	Idaho Power Company		R6 is confusing. The headings suggest the need for a physical security plan but the tables pertain to requirements to protect physical access control systems. 6.1 should read "Restricting physical access to physical access control systems that are protecting BES Cyber systems identified in Requirement R5 Part 5.1, 5.2 5.3." 6.2 should read similarly. The current wording suggests that a physical access control system would be identified in Requirement 5 but it is not a BES cyber system because it does not perform a function listed in the attachment 1.
15.3	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.In R5 and R6, "prevent" is an objective (or purpose) and should not be embedded in the requirement, e.g., if unauthorized physical access occurs such as someone driving a bull-dozer through a building, is the entity non-compliant? Objectives should not be mixed with the actual requirement.In the bullets to R5 and R6, the areas in and of themselves do not "protect" BES Cyber Systems, they "contain" them.R5The requirement to "apply criteria" is not a strong requirement. FMPA suggests: "Each Responsible Entity shall apply the security controls specified in CIP-011-1 Table 5 - Physical Security for BSE Cyber Systems."In the bullets, there is confusion among the terms "grant" and "authorize". "Authorize" is senior manager approval, "grant" is being given the key or card. The requirements should keep these two concepts clear. For instance, in 5.5, "authorize" should be changed to something like: "Grant unescorted physical access to areas containing BES Cyber Systems only to those who are authorized

#	Organization	Yes or No	Question 15 Comment
			such access". Also, in order for 5.8 and 5.9 to apply to Medium, then 5.5 needs to apply to Medium.5.7, 5.9 and 5.9 will be open to interpretation. If an employee was given key and card access, is revoking card access sufficient or both the key and the card?5.7 should apply to Medium5.8 and 5.9 should be combined and the time durations correlated with the impact level instead of Control Center vs. Facility.5.10 strike "access"R6The order of R5 and R6 seems backwards. It would seem development of the physical security plan (R6) should come before implementing the plan (R5)
15.4	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comments for question 12.
15.5	Independent Electricity System Operator	Disagree	- R5.1 in table 5 please define what is meant by external connectivity. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary?- 5.3 and 5.4 should be consistent in
15.6	Reliability & Compliance Group	Disagree	: Putting data retention into a separate section of the standard is confusing without a reference. If you want to keep data retention separate, you should refer to the data retention rules in the standard. i.e. Retention rules for R5 can be found in section 1.4.1 and 1.4.3 of this standard.Also, visitor control should be included for medium impact systems as well. If not, why are we restricting access to those systems if we can routinely open the door for anyone to come in and wander around unescorted. One interpretation of this would be to have some employees given access rights and others would be daily guests who are not logged or monitored.
15.7	Regulatory Compliance	Disagree	5.7 - qualification should be made in regards to a service vendor that the 24 hour period should start once notice is received from their company.5.8 - prefer 7 day revocation deadline5.9 - prefer 7 day revocation deadline
15.8	USACE - Omaha Anchor	Disagree	A) Dislike that methods to achieve compliance were removed from standard and will be placed in a guidance document. Guidance documents aren't binding. B) 5.9 - how do

#	Organization	Yes or No	Question 15 Comment
			you revoke access when it was never formally granted in the first place?
15.9	Duke Energy	Disagree	a) We generally like having all the Physical Security requirements in one standard versus references to multiple standards and multiple requirements within standards. However, the clarity that was intended is not provided as the language is vague and confusing.b) The standard has eliminated terms like the Physical Security Perimeter, 6 wall boundary and Physical Security Plan but it appears that they will be expected in order to achieve compliance. In fact, R6 includes a reference to "...one or more physical security plans..." that is not mentioned in the R5 requirement which appears inconsistent since R5 is the Physical Security for the BES Cyber Systems. Provide clarity and make consistent. c) Requirements 5.1, 5.2 and 5.3 appear to be less prescriptive than previous CIP 006 versions. However, is it left up to the Responsible Entity to determine the requirements for controlling access, monitoring access and logging access? Are some of the expectations from previous CIP 006 Rev. 3 still expected, but not documented? d) General Comment: V4 is very vague and unclear as to what is required. We would suggest additional wording to provide clarity as to what is intended for the responsible entity to physically meet R5.1, R5.2 and R5.3Physical security will be extremely difficult to implement on components located throughout the plant.For 5.9, assuming a key is used to access a system, revoking access within 72 hours maybe impossible. Changing locks may not be able to happen that fast. Face to face terminations may not be the case. Costs associated with card readers to replace locks is extremely high ($5-7k per reader, average 6 readers per hydro station and about 5 hydro stations this will apply to is a minimum of $150,000). Some systems are in cabinets that must be left open to do work. Card readers will set off alarms before work can be completed.For 5.11, should be deleted, as this should be included in the incident response procedures.For 5.2, what does monitoring entail?For 5.8, should be 48 hours.6.3 states "implementing maintenance and testing program....function properly". "Properly" is a vague term open for interpretation.
15.10	SCE&G	Disagree	Again, SDT should allow provisions for entities to leverage existing controls (i.e. Nuclear Facility Physical Security). NPP's have one of the most effective Physical Security

#	Organization	Yes or No	Question 15 Comment
			Programs of all Critical Infrastructures. CIP-011 R5/R5 should acknowledge this progam.5.2 SDT needs to better define what constitues appropriate "Monitoring". 6.3 "physical access control systems" should be defined. Is there an expectation for entities to walk fences around substations/generation facilities every 3 years?
15.11	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comment.
15.12	Liberty Electric Power, LLC	Disagree	CIP-011 R5 has very short times to revoke access. If an entity gives a contractor a code to enter the a room so he can download data on a Friday night shutdown, the code will have to be changed prior to the next business day -even if he is physically incapable of entering the plant.
15.13	E.ON U.S.	Disagree	CIP-011-1, R5.7, R5.8 and R5.9 does not fairly address the termination of access of contractors and/or service vendors. These types of requirements have generated many self reports to the NERC regions, and it is clear that this will continue so long as registered entities are presumed to have immediate knowledge of a change in the status of each contractor's employees. E ON U.S. proposes the requirements read as follows:R5.7 - "Revoke authorized unescorted physical access to areas protecting BES Cyber Systems within 24 hours for employees terminated for cause. For contractors/service vendors, access shall be revoked within 24 hours from the time of notification from the contracting/service vendor company."R5.8 - "Revoke authorized unescorted physical access to areas protecting BES Cyber Systems for employees who no longer require such access within 36 hours. For contractors/service vendors, access shall be revoked within 36 hours from the time of notification from the contracting/service vendor company."R5.9 - "Revoke authorized unescorted physical access to areas protecting BES Cyber Systems for employees who no longer require such access within 72 hours. For contractors/service vendors, access shall be revoked within 72 hours from the time of notification from the contracting/service vendor company."Additionally, CIP-011-1, R5.11 is ambiguous. E ON U.S. requests that the SDT clarify "review" to address is expected.

#	Organization	Yes or No	Question 15 Comment
15.14	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
15.15	LADWP	Disagree	Commensurate security measures need to be defined. If 6 wall is no longer the standard, what is replacing it?
15.16	Public Service Enterprise Group companies	Disagree	Comments: R5.8 requires physical unescorted access be revoked within 36 hours. This is too short a period, especially if the event occurs over a weekend or holiday. The timeframe should be changed to 5 calendar days or 3 business days. At a minimum, 72 hours.Physical protection of assets that are located within a NRC mandated Security Boundary / Perimeter that complies with NRC security regulations for Nuclear plants should be deemed to satisfy NERC CIP physical security requirements. NRC background checks, training, etc. for unescorted access and the physical security provided at Nuclear plants is more than adequate to satisfy NERC reliability physical security needs. Registered entities should not be required to implement duplicative procedures and programs for physical security of BES cyber assets located inside the NERC security Boundary/Perimeter. The drafting team should develop appropriate language to this effect.
15.17	CenterPoint Energy	Disagree	Disagree - For R5.8 and R5.9, CenterPoint Energy recommends increasing the timeframe for revocation of authorized unescorted physical access for personnel who no longer require such access to seven days as is found in the current Standard. CenterPoint Energy also believes physical access methods employed at a control center should differ versus those at a remote substation environment and therefore recommends revisions allowing for such differences.
15.18	FEUS	Disagree	Disagree with comments: 5.5 and 5.6 require authorization and quarterly reviews of unescorted physical access. It is not clear what type of authorization process would be required or what is required to be reviewed.

#	Organization	Yes or No	Question 15 Comment
15.19	Black Hills Corporation	Disagree	In 5.1, do not understand the significance of external connectivity only. Also in 5.1, restrict physical access is not defined (what evidence would be required to prove if we are not required to monitor, log, authorize, etc?) In 5.6, quarterly is a good goal, but without a solid definition of the window associated with "quarterly", this will be an evidence gathering problem - suggest changing to semi-annual. 5.2 & 5.3, and 6.2 & 6.3 should have consistent impact applicability.
15.20	Constellation Power Source Generation	Disagree	In R5.2, what is meant by the term monitor? Is that continuous, automated monitoring, or can it be an inspection during an operator's round? A suggestion would be to include the phrase "automated or manual" to add clarity. R5.4 defines the action of logging as "manual or automated." This definition should also be used in R5.3 and R5.2. In R5.6, why is the review on a quarterly basis? Other requirements ensure that a terminated employee has access revoked extremely quickly, so the review in R5.6 can be extended out to an annual review without an adverse reliability impact on the BES. In R5.9, why is the term generation lowercase? Is this implying a different meaning? R6.3 is requiring testing and maintenance of all physical security mechanisms on a cycle no longer than 3 calendar years. However, some plants are on a 3 to 5 year maintenance schedule and are otherwise expected to be running. This will force a plant to take an outage it otherwise would not have just to comply with a physical security requirement.
15.21	Luminant	Disagree	It does not make sense to physically protect BES Cyber System for Meduim Impact systems that have external connectivity. The impact of physical access is no different that for systems not externally connected. 5.8 change to 48 hours (2 days) 5.9 1 week. Also remove 5.8 and 5.9 from the Medium impact requirements, as you cannot revoke access since it is not a requirement to restrict or grant unescorted access.
15.22	Emerson Process Management	Disagree	It is unclear about the relevance of physical access control and external connectivity.
15.23	WECC	Disagree	Low and Moderate impact assets must have some baseline physical security. It appears

#	Organization	Yes or No	Question 15 Comment
			that some requirements have differences between the levels for their own sake without the justification of security risk analysis. The standard should be adjusted to provide baseline physical security for all systems regardless of impact and/or method of communication.
15.24	Manitoba Hydro	Disagree	Manitoba Hydro does not agree with the drafting team approach to defer the FERC Order 706 directive for multiple physical security perimeters. Upgrading physical security at facilities is costly and time consuming and deferring the multiple perimeter requirement will require entities to later rework physical security at many facilities. The drafting team should either include the multiple physical security perimeters in version 4 or limit all physical security requirements to those already completed under CIP V1-V3. The reference in Requirement R5.11 to incident response procedures should be cross-referenced to Requirement R27, assuming that these are the procedures being referenced in Requirement R5. Requirement 5.7 could be interpreted as a subset of Requirement 5.8. Requirement 5.8 should explicitly exclude personnel terminated for cause. There are no specifics given with respect to 'restricting' access in Requirement 6.1 so it is assumed to be at the Responsible Entity's discretion in terms of to whom, by what means, etc. It is not clear if the "Required for routable access only" in the impact columns refers to routable BES Cyber Systems or routable physical access control systems.
15.25	Network & Security Technologies Inc	Disagree	Minimum retention period for logs should be specified. 5.11 does not specify a time frame for reviewing and handling unauthorized physical access attempts.
15.26	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R5, but recommends changes as follows: o Regarding Table R5, Minnesota Power recommends changing "areas protecting" to "areas containing BES Cyber Systems" to reduce ambiguity and confusion. o For Section 5.1 of Table 5, for Medium Impact Systems, the inclusion of the term "external connectivity" as a qualifier that creates confusion. The relevance of connectivity to implementing appropriate physical security measures is not clear. Physical Access averts the need for electronic access, so this seems

#	Organization	Yes or No	Question 15 Comment
			counterintuitive to include “external connectivity” as a provision. Minnesota Power recommends that the reference to “external connectivity” be removed from sections 3.2, 4.2, and 5.1 of Tables 3, 4, and 5 respectively. o As currently written, sections 5.3 and 5.4 seem to be similar and could be combined. If it is the Standards Drafting Teams intent that 5.3 apply to those individuals authorized for access, then Minnesota Power recommends the following revision to R5.3:"Log physical access to areas containing BES Cyber Systems for individuals with authorized cyber access and/or authorized physical access. Logging should..." o For sections 5.5, 5.6, 5.7 and 5.10 Minnesota Power recommends that the Medium Impact column match section 5.1. Since 5.1 requires restricted access, that implies that authorization needs to exist for access as well as access review, revocation, and visitor escorting procedures.Minnesota Power generally agrees with the proposed Requirements R6, but recommends changes as follows: o Requirement R6 discusses preventing and/or detecting unauthorized physical access to BES Cyber Systems while the sections of Table 6 discuss “physical access control systems.” This inconsistency creates confusion regarding what should be included in the physical security plan(s). o Regarding Table R6, Minnesota Power recommends changing “areas protecting” to “areas containing BES Cyber Systems” to reduce ambiguity and confusion. o Parts 6.1, 6.2, and 6.3 of Table 6 refer to the “physical access control systems” identified under Requirement R5, Part 5.1, 5.2, 5.3,” but R5 does not identify or use the term “physical access control systems.” Rather, it requires restricting, monitoring and logging physical access and does not require an access control system to do so. Certainly, as a result of its analysis and implementation of Parts 5.1, 5.2 and 5.3, a Registered Entity may implement an electronic system for access control, monitoring and logging, but it is not explicitly required. These parts should be reworded to state that if the Registered Entity has implemented an electronic physical access control system, then these requirements apply.
15.27	NextEra Energy Corporate Compliance	Disagree	NextEra believes it is not specifically clear what relations the different requirements have for the Medium Impact BES systems. For example, 5.1 requires that physical access be restricted, however, it would appear that this access does not need to be logged, authorized, or reviewed in 5.4 through 5.6. Similarly, 5.9 requires revocation of this

#	Organization	Yes or No	Question 15 Comment
			restricted access which may not have been authorized. We believe that R5 needs further clarification.Also, provide clarity regarding 5.1 "External connectivity only" requirement in Medium Impact column. For a site with Medium Impact BES Cyber systems, why would access not be restricted only if the BES Cyber Systems had no external connectivity. Granting access to the site may result in same impact once the individual is at the site as if they had remote connectivityRegarding R5 & R9 - 24 hour revocation requirement “for cause”, technical infrastructure does not support wide scale user administration to revoke cyber access within 24 hours. User administration for site cyber devices is not centralized. NextEra suggests providing specific definition of “revocation of access” to specify physical / cyber access. For example, if an individual has cyber access only and physical access and remote access to the systems is removed, this effectively revokes access. Regarding R5 & R9, what triggers “for cause” termination / no longer requires access?There needs to be consistency of administration in the industry. What starts the 24 hour clock?NextEra believes it should be at the point where the decision is officially entered into the system and/or communicated to the individual no longer requiring access.
15.28	Consultant	Disagree	NOTE: The format of these two requirements and tables is better than that for Requirements R1 through R4. For R5 & R6 the 'requirement' states the objective and the table specifies the required activities.R5 & R6 - The wording to implement the criteria in the tables is incorrect. The tables are specifying the requirements and application of requirements to the classes of assets resulting from the impact categorization process. The wording of the statement should be modified to reflect this distinction.R6. A physical security plan does not "prevent or detect unauthorized physical access..."It appears that R6 is misidentified as Physical Security Plans, when it seems to address protection for cyber systems providing physical protection to BES Cyber Systems.Based on the reconfiguration of the requirements in this standard a physical security plan is not necessary to meet the requirements.Suggest this requirement be restated to replace the term "Physical Security Plans" with "Protect Physical Access Control Systems" Table item 6.1 would require protection of cyber systems performing the functions identified in Table R5 items 5.1, 5.2, and 5.3 (See next comment regarding deleting 5.2).Table item

#	Organization	Yes or No	Question 15 Comment
			6.2 would require protection of cyber systems performing logging functions for physical access points.Table item 6.3 would require implementation of a maintenance & testing program for the assets identified in 6.1 & 6.2.A better option would be to include in Attachment 1 a function that relates to physical access control systems as part of the BES Cyber System identification. Such as:Physical Access Controls - activities, actions and conditions necessary to restrict and to log physical access to BES Cyber Systems. This would allow items 6.1 & 6.2 to be deleted, and the protections for "BES Cyber Systems" to apply to the physical access control cyber systems. Should the maintenance and testing requirements apply to BES Cyber Systems identified during the identfication and categorization proces, including those that are used to control physical access?
15.29	Garland Power and Light	Disagree	o Requirement 5.10 - clarify that continuous escort does not include entering bathroom facilities - some bathrooms are small non-partitioned one room facilities and it is inappropriate for escort in such areas.
15.30	PacifiCorp	Disagree	PacifiCorp generally agrees, except R5.9 should be expanded to control centers as well, and R5.8 should be removed. There is not a significant or compelling reason for different deadlines which add to the complexity of the standards and the administrative workload to parse the circumstances of each revocation.Define Physical Access Control Systems and ensure the controls in others requirements are suitably applied to those components.
15.31	Progress Energy (non-Nuclear)	Disagree	PE agrees with the 24 hour timeline for access revocation for employees terminated for cause, however it believes this will continue to pose a considerable challenge to many in the industry for its contractor population and would suggest “upon notification” be added to the beginning of the sentence. Thus, Section 5.7 would read, “Upon notification, revoke authorized unescorted physical access to areas protecting BES Cyber Systems within 24 hours for personnel terminated for cause.”PE disagrees with content set forth in R5.8 and R5.9 and believes it will be difficult for many entities to meet and likely result in significant violations throughout the industry. PE suggests language be added to include “upon notification” for both sections and change 36 hours to 48 hours

#	Organization	Yes or No	Question 15 Comment
			for Control Centers so that Section R5.8 reads: "Upon notification, revoke authorized unescorted physical access to areas protecting BES Cyber Systems for personnel who no longer require such access within 48 hours," and Section R5.9 reads: "Upon notification, revoke authorized unescorted physical access to areas protecting BES Cyber Systems for personnel who no longer require such access within 72 hours."5.1 implies that we could have a cyber component without external connectivity. 5.7 revocation of access within a 'hours' timeframe implies that the access would be controlled through a security group with 24/7 coverage. Other requirements appear to be in line with requirements of previous standards.CIP-011 R5.7 thru .9 what is the decision process to be used to determine "when job duties no longer require ... access"? What would be suitable compliance evidence that is to be collected that indicates "when job duties no longer require access" as this is critical in determining if revocation has been accomplished within the mandated 1 hour, 4 hours, 6 hours, 24 hours, 36 hours, 72 hours?Need clarification on period allowed for revocation of access due to expiration of training of background check - recommend that this be included with 5.8, 5.9 (no longer require access - or fail to meet necessary criteria).R5.7 - poor wording "handle...access attempts" Propose: "process such physical..."
15.32	Allegheny Energy Supply	Disagree	Physical Access Control Systems need to be defined. The term will have different meanings for different entities and auditors. It will be difficult to implement and audit without a definition in place. Physical Access Control Systems will require additional controls in other standards. Specificity is required to determine the components that may need additional controls.
15.33	Allegheny Power	Disagree	Physical Access Control Systems need to be defined. The term will have different meanings for different entities and auditors. It will be difficult to implement and audit without a definition in place. Physical Access Control Systems will require additional controls in other standards. Specificity is required to determine the components that may need additional controls.

#	Organization	Yes or No	Question 15 Comment
15.34	EEI	Disagree	Physical Access Control Systems need to be defined. The term will have different meanings for different entities and auditors. It will be difficult to implement and audit without a definition in place. Physical Access Control Systems will require additional controls in other standards. Specificity is required to determine the components that may need additional controls.
15.35	MidAmerican Energy Company	Disagree	Physical Access Control Systems need to be defined. The term will have different meanings for different entities and auditors. It will be difficult to implement and audit without a definition in place. Physical Access Control Systems will require additional controls in other standards. Specificity is required to determine the components that may need additional controls. Define Physical Access Control Systems and ensure the controls in others requirements are suitably applied to those components.
15.36	Oncor Electric Delivery LLC	Disagree	Physical security at remote substation sites is not cost effective in preventing/detecting cyber attacks. Remote substations with only dial-up communications cannot support the 24-hr time frame of Requirement 5.7 when systems are non-functional (phone line damage, etc). Five to seven days may be required, depending whether some communication system has been installed to the facility. Physical security should only be required at control centers and High impact substations with IP based communications.
15.37	American Electric Power	Disagree	Please see comments as provided in response to Question 15.
15.38	Puget Sound Energy	Disagree	Puget Sound Energy has the following suggested changes:Table 5:5.3 - Suggest changing to “Logging shall record sufficient information to uniquely identify known individuals, or assist in the identification of unknown individuals, and the time of access...”Table 6:6.1/6.2 - Puget Sound Energy would like clarity on how restricting physical access to areas protecting control or monitoring systems for physical access protects the BES Cyber Systems. Physical protection of the BES Cyber Systems (Table 5) is understandable to protect the BES. But, a malicious or inadvertent act solely against the Cyber Systems that provide physical security in no way impact the BES or the Cyber Systems that make

#	Organization	Yes or No	Question 15 Comment
			up the BES unless the physical location of both types of Cyber Systems is the same.6.3 - Puget Sound Energy requests clarity on "...of all physical security mechanisms...". Like many entities, Puget Sound Energy employs physical security measures that are made up of components that do not use routable protocols. Is 6.3 suggesting a full test of all mechanisms (routable protocol or not) involved in restricting, monitoring, and logging? (Ex: card key strikes at doors)
15.39	LCEC	Disagree	R5 - and/or should simply read or. "To prevent and/or detect unauthorized physical access" should read "limit access to authorized personnel through detection and prevention."Medium impact for "external connectivity only" doesn't make sense from a physical security perspective. Change to Control center only.Move 5.8 and 5.9 to 5.7 and base the timings on whether or not it is a control center. CC should be 36 hours and others should be 72 hours.5.5 should be required for Medium as well since there is a requirement to revoke access in 5.8 & 5.9The term "areas protecting" is confusing and should be replaced with "areas containing" BES Cyber Systems.Please consider identifying at what level of access granting must be removed to sufficiently mitigate the personnel risk.R6 Need to clarify "required for routable connectivity only" in regard to physical security controlsMost physical security systems do not require preventive maintenance which makes it difficult for an entity to provide a basis for maintenance performed. Testing is also a challenge because these systems either work or they do not work. What is the intent of the testing and maintenance requirement? Can this requirement be better served by reviewing the configuration of the system and comparison to approved access lists?
15.40	Southwest Power Pool Regional Entity	Disagree	R5 does not address the expectations of FERC Order 706 and subsequent orders. 5.3 needs to include both ingress and egress. 5.4 needs to include identification of the escort staff. 5.3 and 5.4 could be combined. 5.7: The time to revoke physical access can be much faster for control center environments; suggest 2 hours for the control center and 8 hours elsewhere. Ideally, the person's primary access credentials (badge, keys, etc.) should be lifted and access revoked concurrently with the person being notified of the termination for cause. 5.8 and 5.9 can be combined and the timeframe should be

#	Organization	Yes or No	Question 15 Comment
			expressed in business days. 5.10: define "continuous escort" somewhere. R5 overall: consider defining the concept of specifying an "effective date" of a transfer that reflects the reality that often a transferred employee will back fill or support the losing department for a period of time after the HR date of the transfer. 6.3 needs to be much more frequent in a control center environment where the inspection program can be readily performed; weekly is suggested. Additionally, the frequency needs to be commensurate with the impact category regardless of site characteristics.
15.41	ISO New England Inc	Disagree	R5.1 in table 5 please defined what is meant by external connectivity. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary?R5.8 and 5.9 Is the 36 hours or 72 hours from the time the access is reviewed? Or is it that access should be reviewed within 36 hours of personnel that change job responsibilities, transfer, etc. Then require access be modified based on the review. Suggest changing the 36 hours to 72 hours. If a transfer were to occur on a Friday at 5 pm then access would need to be reviewed by Sunday.
15.42	Western Area Power Administration	Disagree	R5.2: What is the definition of "monitoring" physical access? Since the concept of the physical security perimeter has been dropped, what specifically is meant by "access to areas protecting BES cyber systems? What constitutes sufficiency in monitoring?R5.3: What constitutes sufficient logging? Is a self-written logbook sufficient? Does logging have to be performed electronically or by a third party if manually logged, or is self-logging sufficient?R5.5: How does 5.5 differ from the requirements of R4?R5.7: Can be very difficult if someone is terminated on a Friday afternoon. Communication is very critical and requires more people knowing in advance, which in itself may cause an additional risk. R5.8: 36 hours could be an issue on 3 day weekends. Suggest 48 hours. Then is will only be an issue at Thanksgiving.R6, 6.3: Needs more guidance on testing and maintenance program what they must cover besides a blanket statement of testing and maintenance of all physical security mechanisms. Shouldn't we follow the installers or manufacturers recommendation on this? Documentation of these tests and maintenance evidence should be kept for how long?R6: what is meant by "routable

#	Organization	Yes or No	Question 15 Comment
			connectivity only"?
15.43	Kansas City Power & Light	Disagree	R5.3: What does "sufficient information" mean? This may encourage too much interpretation and recommend some clarity in the Table R5.R5.10: How do you prove someone who requires an escort was escorted at all times? From an audit perspective this is "proving the negative". It is understood what is intended in this requirement, but this is not measurable or auditable.R6.1 through R6.3: qualification here of "routable connectivity only" is not clear with respect to physical access controls. Routable implies electronic security measures rather than physical.
15.44	Con Edison of New York	Disagree	R5.8 and R5.9 - Add the words "Required for" before "Control Center" or before "Generation or Transmission Facility".R5.1 Need clarification to this item. If I have an enclosure which secures and isolated my cyber system, do I need to restrict access into the enclosure or do I need to restrict access to the area around the enclosure?R5.6 - Quarterly reviews are excessive. Annual or bi-annual would be reasonable.R5.9. - Should be business days, for example 3 business days. Support staff may not be available 24/7 to do this work.R5.10 - Continuous escort access is not practical in the numerous substations. The requirement should be relaxed to say oversight or supervisor, or any other mean which will limit the total escort and allow the operator to perform tasks while people may come to the station.R5.1 Medium Impact; not sure what external connectivity means? R3 clarification may resolve this.R5.8 (and others) - 36 hour requirements for compliance criteria will be a challenge
15.45	San Diego Gas and Electric Co.	Disagree	R5.8 and R5.9 require revoking authorized unescorted physical access to areas protecting BES Cyber Systems for personnel who no longer require such access within 36 hours for medium and high impact control centers and within 72 hours for medium and high impact generation or transmission facilities. CIP-006-2 R1.5, by reference to CIP-004-2 R4, currently requires such revocation within 7 days for all PSPs. Revocation within 36 or 72 hours will be much more difficult to capture, especially for internal personnel reassignments. SDG&E believes that the risk to BES Cyber Systems associated with reassignment of an employee does not justify the effort (and potential non-

#	Organization	Yes or No	Question 15 Comment
			compliance) associated with this change. These time-periods approach the 24-hour limit for personnel terminated for cause in CIP-006, which does carry genuine risk to BES cyber systems.R6.1 and R6.2 in CIP-011-1 concern restricting and monitoring physical access to "areas protecting physical access control systems". Does this mean areas equivalent to PSPs have to be set up around these physical access control systems? Currently, CIP-006-2 R2 and R2.2 concern protection of "cyber assets that authorize and/or log access" to PSPs. Thus, server racks and control panels are locked and monitored, but PSPs are not required around these systems.
15.46	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R5.8 and R5.9 should be extended to 72 hours or next business day, whichever is longer, to allow for communications for this circumstance. A late Friday occurrence could be addressed early Monday instead of over the weekend.
15.47	Dominion Resources Services, Inc.	Disagree	R5.8 and R5.9. To meet regulatory directives, if job duties are changed due to disciplinary actions or are "forced" on the user, then a shorter time frame to revoke access may be necessary. However, the current 24 hour time period is the least time period that can be reasonably accommodated through the business processes.Requirement R4 establishes the process for personnel risk assessments. This practice determines the loyalty, reliability and trustworthiness of an individual as a prerequisite to authorizing logical or physical access. This is a standard practice used throughout the physical and cyber security industry and accepted by other regulatory agencies and Federal programs. Similar to R4.3, personnel risk assessments typically must also re-validate this trustworthiness periodically - commonly within 7 years and in some cases more frequently depending on the nature of the access. The presumption is that, once trustworthiness is established, it is not invalidated unless there is cause to reconsider or an individual voluntarily terminates their employment or retires. Only in instances where the established trustworthiness is in question, is prompt access revocation appropriate and warranted. Consequently, for personnel who "no longer require access", but for which there is no cause to question their trustworthiness, there is no basis for immediate or prompt revocation of access within the time frames

#	Organization	Yes or No	Question 15 Comment
			specified in this standard. The DHS Catalog for Control System Security Controls, Sections 2.3.4 and 2.3.5 reflect this practice - requiring revocation of access for cause within 24 hours and revocation of access for personnel reassigned or transferred to another position within 7 days. In other regulatory programs, revocation of access, not involving a question of change in trustworthiness, is handled via a periodic (e.g., monthly) review of access only. The 7 day requirement in the current standards would meet or exceed standard practice in this case. The requirements should be clarified to state that if there is no triggering event indicating that access is no longer required, then that determination should be made at the quarterly review.
15.48	ERCOT ISO	Disagree	Recommend moving requirements 5.5 through 5.9 to a common access management section which addresses cyber access and information access. The remaining parts of Requirements R5 and R6 could be combined.
15.49	US Bureau of Reclamation	Disagree	Requirement R5: Physical security requirements are not adequately addressed in the present Standard. Much of the language from the previous version of the Standard should be re-established in version 4. In addition low and medium systems should include the equivalent of a 6-wall boundary around the cyber systems.Requirement R6: Physical security plans should be required for more than just electronic physical access control systems.
15.50	Progress Energy - Nuclear Generation	Disagree	See attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
15.51	Xcel Energy	Disagree	The 36 and 72 hour timeframes to revoke unescorted physical access for individuals no longer requiring access under 5.8 and 5.9 are not justified. When the change is for a business reason such as a job change 7 days is sufficient for access removal. When the access change is unrelated to a termination for cause, the individual's trustworthiness and reliability are not in question and the short timeframes are not needed. "Restrict physical access" in Requirement 5.1 also needs further definition. Does this mean locks?

#	Organization	Yes or No	Question 15 Comment
			Fencing?There appears to be inconsistencies between R5 and R6. Specifically;1) Table R5, R5.1 applies to Medium impact systems with external connectivity, while Table R6 6.1 applies to Medium impact systems with routable connectivity. 2) Table R6 refers back to 5.1, 5.2, and 5.3 for Medium impact systems, however 5.2 and 5.3 do not apply to Medium impact systems.
15.52	GTC & GSOC	Disagree	The 36 hour requirement for a person who no longer needs access (R5.8) is too stringent. If a transfer or retirement occurs on a Friday there is no reason you cannot wait until Monday. We recommend changing this to "within 36 hours or the next business day, whichever is greater".
15.53	APPA Task Force	Disagree	The APPA Task Force recommends the following edits to R5-R6:R5. Objective:To prevent and/or detect unauthorized physical access to BES Cyber Systems.R5. Requirement:Each Responsible Entity shall apply the criteria specified in CIP-011-1 Table R5 - Physical Security for BES Cyber Systems." R6. Objective:To prevent and/or detect unauthorized physical access to BES Cyber Systems.R6. Requirement: Each Responsible Entity shall document and implement one or more physical security plans that apply the criteria specified in CIP-011-1 Table R6 - Physical Access Control Plans
15.54	Bonneville Power Administration	Disagree	The objective of these requirements ("to prevent and/or detect unauthorized physical access to BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action(s) that the Responsible Entity must take.The objective of R5 and R6 should be changed to read "to prevent and detect unauthorized physical access to BES Cyber Systems." They should not say "and/or". Isn't the objective to prevent unauthorized physical access to BES Cyber Systems and to detect unauthorized physical access to BES Cyber Systems?R6: The entries in Table R6 refer to "Part 5.1, 5.2, 5.3". It is unclear whether these refer to subrequirements R5.1, R5.2, and R5.3, which do not exist, or in Table R5, entries 5.1, 5.2, and 5.3.5.7-5.9 refer to timeliness of revocation. Twenty-four hours for terminations for

#	Organization	Yes or No	Question 15 Comment
			cause is reasonable, however having two additional categories complicates matters and could potentially lead to confusion and someone not revoked in the appropriate category. For 5.8-5.9 this should be the same and be reviewed to take place within 3-5 business days. 5.11 is good in that unauthorized physical access is a procedural violation and not necessarily an incident.
15.55	Exelon Corporation	Disagree	The requirement to revoke access (5.8 & 5.9) in 36/72 hours for personnel who no longer require access is far too severe and places unnecessary administrative burden on the entity without technical or risk analysis justification. This would imply that there is little differentiation between an employee terminated for cause and a person who we regard as a solid member of our organization and in turn, we deem as having integrity. This would also become an undue burden to the business as our employees require transition time to ensure there is reliable transfer of information to the new owner of a role or task. This requirement would make that transition period extraordinarily difficult. Also, the ability to capture and store the transfer data to the hour would be impossible with our current human resource data systems. Modifying this system would result in major expense with little to no stated benefit to BES reliability. Exelon's position is that the current 7 day requirement is reasonable from a technical and risk perspective. This would also keep the CIP requirements in alignment with the DHS Catalog of Control Systems Security requirement 2.34 - Personnel Termination and DHS Catalog of Control Systems Security requirement 2.35 - Personnel Transfer.
15.56	Ameren	Disagree	The short period of time to remove access for 5.8 does not extend well across weekends or through the 2nd business day in cases where access is no longer required at the end of the day. Suggest that this requirement be extended to a week to remain in line with current CIP standards. This will allow for proper hand off time in cases where job duties need to be transferred. Also, R6 should be a stand alone requirement, remove circular reference to R5.â€,
15.57	Pepco Holdings, Inc. -	Disagree	We agree with EEI's comments.

#	Organization	Yes or No	Question 15 Comment
	Affiliates		
15.58	Entergy	Disagree	We disagree with 5.1 "Restrict physical access to areas protecting BES Cyber Systems" for Medium Impact BES Cyber Systems with external connectivity only. What difference does it make if the physical security of Medium Impact BES Cyber Systems access is restricted to the Physical Security Perimeters if the access mode to be protected is external, but there is no other requirement to monitor, or log access into or out of the PSP for these cyber systems.How can access be revoked from a Medium Impact BES Cyber Systems if there is no requirement to monitor or log access in and out of the PSP? There seems to be conflict with these requirements. Remove the requirements 5.1, 5.7 and 5.8 for Medium Impact BES Cyber Systems.Instead of having different access revocation time frames for High Impact BES Cyber Systems based on the locations as described in requirements 5.7, 5.8 and 5.9 it would be easier to manage evidence for compliance if all locations was the same. During the Dallas CIP Workshop it was apparent that the SDT was struggling with the interval for access revocation. It is suggested that the revocation of physical access for employees terminated for cause be by the end of the business day the first normal business day after the employee is terminated i.e. if the entities normal business week is Monday - Friday 8:00 - 5:00 and an employee is terminated Friday to Sunday then revocation should be completed prior to 5:00 on Monday for all High Impact BES Cyber Systems regardless were the cyber systems is located, control center, transmission facility or generating station. This would provide a consistent method of tracking the access revocation across the entities facilities and reduce requirements and potential compliance shortcoming and reduce the vulnerability of not taking actions to terminate employees for cause if the 24 hour requirement cannot be achieved on the weekend and the termination be held off until the normal work week when the requirement can be met.
15.59	We Energies	Disagree	We Energies agrees with EEI comment: Physical Access Control Systems need to be defined. The term will have different meanings for different entities and auditors. It will be difficult to implement and audit without a definition in place. Physical Access Control Systems will require additional controls in other standards. Specificity is required to

#	Organization	Yes or No	Question 15 Comment
			determine the components that may need additional controls.
15.60	PNM Resources, Inc.	Disagree	We would prefer that all accress granting and revocation, for physical and logical access, be identified in a single table. In the current draft, they are scattered through several unrelated requirements.

16. Tables R5 and R6 provide direction concerning what impact level of BES Cyber Systems to which Requirements R5 and R6 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Some commenters expressed concern that the electric industry already physically protects its cyber assets from the public for reliability, business, and safety reasons, and that making physical security a standard requirement for Low Impact BES Cyber Systems creates an additional compliance burden that does not contribute any additional reliability to the Bulk Electric System.

Each Responsible Entity is required to ensure that physical access to all BES Cyber Systems is restricted and appropriately managed. The SDT has revised CIP-006-5 R1 to define the requirements for physical protection for Low, Medium, and High Impact BES Cyber Systems. While the requirements place the emphasis for physical protection on the High and Medium Impact BES Cyber Systems, each Responsible Entity's Physical Security Plan is required to address how it will protect Low Impact BES Cyber Systems.

Some commenters also expressed concern that there appears to be a discrepancy in the Medium Impact category, where there could be sites that are not required to restrict access because there is no external connectivity, but they are required to revoke access. The SDT has revised these requirements and has removed the consideration for external connectivity from the applicability portion of this requirement, such that all Medium Impact BES Cyber Systems are required to have a Physical Security Plan. The revocation of access requirements are enumerated in CIP-005-5 R7, and have eliminated the identified potential for conflict.

Some commenters expressed disagreement with the requirements for restricting, monitoring, and maintenance testing for systems that provide physical access control over Medium BES Cyber Systems, when there is no requirement to monitor or log access into a Medium BES Cyber System. This likely is a conflict with the requirements for Medium BES Cyber Systems. The tables need to document basic physical security requirements for all Low and Medium Impact BES Cyber Systems. The SDT has revised the requirements for physical and electronic access for Low, Medium, and High Impact BES Cyber Systems to address these concerns. These requirements are stated in CIP-005-5 and CIP-006-5.

#	Organization	Yes or No	Question 16 Comment
16.1	American Municipal Power		Please provide a little or no impact category.
16.2	Regulatory Compliance	Agree	BUT:5.1 Medium Impact - "Required" only.

#	Organization	Yes or No	Question 16 Comment
16.3	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.Blanks are ambiguous. If Low Impact is “Not Applicable”, then the blanks should be replaced with “NA”FMPA recommends making more clarity to the terms “required for external connectivity only” or “required for routable connectivity only” with: “required for areas containing BES Cyber Systems with routable external connectivity”FMPA believes that even Low Impact BES Cyber Systems should have restricted physical access and believes 5.1 ought to be applicable to Lower Impact “for areas containing BES Cyber Systems with routable external connectivity”R6 assumes card access and a “physical access control system” where the physical access may be restricted through lock and key (especially in substation environments for Medium Impact) and monitored through an alarm signal of a substation control house door opening through a SCADA system. It is unreasonable to require testing of simple padlocks or door-locks in 6.3.Maintenance of such system in 6.3 is unreasonable. Such electronic systems are usually just tested on a periodic basis and maintained as necessary. And, we assume that use of the system is testing the system. If not, what type of testing would be required in 6.3?
16.4	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.
16.5	Manitoba Hydro	Agree	Manitoba Hydro agrees that physical security is not a standard requirement for Low Impact BES Cyber Systems, and should not be auditable. The electric industry already physically protects its cyber assets from the public for reliability, business and safety reasons. Making physical security a standard requirement for Low Impact BES Cyber Systems creates an additional compliance burden which does not contribute any additional reliability to the Bulk Electric System.
16.6	San Diego Gas and Electric Co.	Agree	Most of the requirements in Tables R5 apply to “high impact” BES cyber systems. Table R6, dealing with physical access control systems, applies to medium impact systems with

#	Organization	Yes or No	Question 16 Comment
			routable connectivity and high impact systems. This seems reasonable, but the scope will depend on what SDG&E determines will fall into these impact levels. Except as noted in the comments for Question no. 15, there are no apparent increases in physical security requirements for covered systems.
16.7	NextEra Energy Corporate Compliance	Agree	NextEra agrees but would like clarification regarding "Required for routable connectivity only" on Medium Impact physical access control systems. Also, as written, the standard does not have consistency in application of the different requirements as noted above.Also, in 5.11, how is the "unathorized physical access attempt" defined? Should this apply to all attempted access card swipes for electronic access systems. We do not believe that application of the incident response plan should apply to attempts such as these at the physical boundary. We believe a tie to suspicious activity threshold or physical boundary damage may be a better definition.NextEra also questions table R6, do training and PRA requirements apply to individuals with access to Physical Access Control Systems for BES Cyber Systems?
16.8	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comments for question 12.
16.9	Northeast Utilities	Agree	Suggest merging 5.8 and 5.9 and using 72 hours for the allowable revocation period for all personnel terminated not for cause.
16.10	Minnesota Power	Agree	With the implementation of the changes and clarifications described in Question 15, the impact levels seem reasonable.
16.11	Independent Electricity System Operator	Disagree	- For R 5.8 and 5.9, if restricting physical access is not required for Medium impact assets (R5.1) then why does access need to be revoked?
16.12	PacifiCorp	Disagree	: PacifiCorp agrees with EEI's observations below:Table R5 Row 5.1 needs to document basic physical security requirements for all low and medium BES Cyber Systems.Table R5

#	Organization	Yes or No	Question 16 Comment
			Row 5.2: There should be additional language describing what “Monitoring” means. Does Monitoring mean 100% guarantee of any alert or alarm that would indicate an attempt or actual breach in physical security? Suggested language: Monitoring means: The act of conducting a systematic and repeated sequence of measurements, or observations, to assess a particular item or location.Regarding Table 6, it is unclear what the benefit is for having requirement differentiation for Medium BES Cyber Systems with routable connectivity vs. those without.Table R6 Row 6.3, it is appropriate to validate those basic controls, e.g. a padlock or substation fence protecting a low Impact BES Cyber System are tested and maintained periodically.
16.13	Madison Gas and Electric Company	Disagree	: Recommend 5.3 to use the same wording as 5.4 concerning logging access. This would reduce any confusion and provide uniform outcome to each sub requirement. Recommend 5.3 to read:”Log (manual or automated) ...” 5.7 states “Revoke authorized unescorted physical access to areas protecting BES Cyber Systems within 24 hours for personnel terminated for cause”. It may be possible to turn off someone’s electronic access but if there are combination locks, key locks, etc, this may not be possible to accomplish within 24 hours. This also applies to 5.8 and 5.9..
16.14	National Grid	Disagree	1. 5.1 - for Medium Impact BES CS, is it external connectivity with both routable and non-routable protocols? Please specify.2. There appears to be a discrepancy between 5.1 vs 5.7 & 5.8 in the Medium impact category. There could be sites that are not required to restrict access per 5.1 because there is no external connectivity. But, they are required to revoke access per 5.7 & 5.8. Could this be clarified?3. Recommend that revising unescorted physical access depends on BES Impact. Requirement 5.8 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirement 5.9.4. In 5.11, is the SDT considering providing the timeline for reviewing any unauthorized physical access attempts?5. Should the “routable connectivity” be “external connectivity” or “external routable connectivity” for Requirements 6.1, 6.2 and 6.3?
16.15	Consultant	Disagree	5.1 Physical access "Required for External Connectivity Only" is not logical. Suggest rewording to clarify.It is not clear why the change from Physical Security Perimeter to

#	Organization	Yes or No	Question 16 Comment
			the words "areas protecting BES Cyber Systems" makes sense. The new wording is not as clear and removes what was a "bright line". Suggest retaining the Physical Security Perimeter term in this version of the standards. 5.3 As this is currently stated it would appear to require monitoring and logging of both ingress & egress from "areas protecting BES Cyber Systems". Based on the discussion at the workshop, this is not the intent of this requirement. If that is the case then the wording should be modified to reflect the intent. 5.2 and 5.3 The distinction between "logging physical access" and "monitoring physical access" is not clear. If access is logged, then by default it has been monitored. Suggest deleting 5.2, or clarifying the difference between monitoring and logging in this context.5.4 The parenthetical after the word visitors is a definition, and as such should be listed as a definition, rather than being embedded in the requirement statement.5.4 Suggest replacing "to and from" with "entry and exit" or "ingress & egress". A more logical sequence of the requirements list by topic flow would be 5.1, 5.5, 5.3,5.2(see above comment), 5.4, 5.10, 5.7, 5.8, 5.9, 5.6.5.7, 5.8, 5.9 - Personnel transactions are typically measured in days. Setting a requirement in hours for a transaction that is not recorded at that level will create compliance problems. Suggest checking with the nuclear industry about time frames for access revocation. The answers there would be based on over 30 years of regulatory scrutiny.5.8 & 5.9 - There is no difference for personnel transactions based on the facility type, so creating a differential time frame for revocation by facility type would seem to imply that some facilities have less impact than other facilities outside of the impact categorization criteria. Suggest the access revocation time frames should be consistent based on the impact categorization, or adjust the impact categorization criteria to be consistent with the listed revocation time frames. The current table would imply that control center are high impact, and generation and transmission facilities are medium impact.5.11 Suggest deleting the word "any" as the current wording is unnecessarily restrictive. For example, the current wording implies that a single "bad swipe" of an access card should be reviewed, while entities typically have defined 3 to 5 consecutive bad swipes as an adverse event.5.1, 6.1, 6.2 & 6.3 - These table items create another dimension to the impact categorization process. If an asset has been categorized as Medium Impact, it should be afforded the

#	Organization	Yes or No	Question 16 Comment
			same level of protection as any asset categorized as Medium Impact. If the asset does not require the same level of protection then the impact categorization criteria should be adjusted to have it excluded from that impact level.
16.16	US Army Corps of Engineers, Omaha Distirc	Disagree	5.1 unclear why medium impact for "required for external connectivity only." Does this only apply to external connectivity hardware or is it for systems with external connectivity only? 5.8 & 5.9 are inconsistent with 5.5 granting of access is not required for Medium impact BES Cyber Systems.
16.17	Reliability & Compliance Group	Disagree	5.1, 5.5 and 5.8 are contradictory. They make you restrict and revoke access to medium impact systems but how do you do that if you don't have to authorize access to medium impact systems?Also, table R6 contradicts table R5 with regard to medium impact systems.
16.18	ERCOT ISO	Disagree	5.1: Please clarify why "Required for external connectivity only" is specified for medium impact BES Cyber System. 5.2-5.7: Should apply to medium impact BES Cyber System.5.10-5.11: Should apply to medium impact BES Cyber System.6.1-6.3: Please clarify why "Required for external connectivity only" is specified for medium impact BES Cyber System.
16.19	Dairyland Power Cooperative	Disagree	5.11 seems to say that known physical security incidents can be ignored for low and medium impact systems. This seems wrong. If a non-routable protocol terminates at some other facility, it seems there potentially should be physical access controls for that other facility as well-perhaps this would be required for high impact systems.
16.20	LCEC	Disagree	5.5 should be required for Medium as well since there is a requirement to revoke access in 5.8 & 5.9R6 Need to clarify "required for routable connectivity only" in regard to physical security controls
16.21	Duke Energy	Disagree	a) CIP-011-1 Table R6 is identified as applying to "Physical Access Control Systems" but is very confusing to understand as written because the columns describe levels of impact

#	Organization	Yes or No	Question 16 Comment
			to the BES Cyber System but there are no impacts if the Physical Access Control System is operated on a network that is separate and distinct from the SCADA system. Is that the intended interpretation?b) Table R5 Physical Security for BES Cyber Systems state that requirement 5.1 applies only to Medium Impact BES Cyber Systems with "...External Connectivity Only". Does this mean that since 5.1 only requires restricting access to BES Cyber Systems; an acceptable method would be mechanical lock and key control?c) Table R6 Physical Access Control Systems state that Medium Impact BES Cyber Systems requirements R6.1, R6.2 and R6.3 for physical security are "Required for Routable Connectivity Only". Does this mean "Routable Connectivity" of the BES Cyber System or Physical Access Control System?d) Was the access control system intended to be included or intended to be excluded if it is on a separate network and not connected with any BES Cyber Systems? e) General Comment: V4 Tables R5 & R6 are very vague and unclear as to what is required. We would suggest additional wording to provide clarity as to what is intended for the responsible entity to physically meet R6.1, R6.2 and R6.3For Table R5, we propose the addition of "for external connectivity only" in the high impact column. Same for Table R6. Suggest changing "routable" in the table to "external" in Table R6Remove requirement for Medium impact in 5.1. Remove requirements for Medium Impact Systems in Table R6Requirement R6, Medium Impact: allowances should be included to exclude BES cyber systems which incorporate one way connectivity (e.g. outside the ESP via a one way hardware device), even if the protocol is routable. This would be in addition to the existing non-routable protocols.
16.22	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.5.8 - 5.10 is the first of many occurrences where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the business need change. Terminations for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any

#	Organization	Yes or No	Question 16 Comment
			distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement.
16.23	Southwest Power Pool Regional Entity	Disagree	At a minimum, access revocation should extend to all impact categories. Access to a BES Cyber System is an available attack vector. 5.2: Restricting access without monitoring access is an ineffective control; 5.1 is not auditable in the absence of some sort of verification that the control is in place. 5.3 needs to consider that automated logging systems cannot guarantee 100% up time. Consider adding a requirement for recognizing the automated process has failed and responding to the failure (not the same as repairing the failure, which will be situation dependent. 5.11: There should be a clearly defined maximum timeframe for reviewing unauthorized access attempts. Simply leaving it to the discretion of an entity's incident response plan is not an effective control. R6: The Cyber security plan applicability will need to be updated to reflect any changes to the R5 applicability matrix.
16.24	US Bureau of Reclamation	Disagree	At a minimum, physical security controls should be required for low and medium systems, even if it is just a lock on the door.
16.25	FirstEnergy Corporation	Disagree	CIP -011-1 Table R5- Physical Security for BES Cyber SystemsItem 5.1: Should specify minimum expectations regarding how physical access should be restricted. There appears to be not difference in the level of security required for Medium and High impact facilities.Item 5.8, 5.9: Why two different revoke authorized unescorted physical access time periods to complete this task? It should be consistent for Control Centers, Generation and Transmission sites to revoke access in one time period to revoke access when no longer required. As stated this is open for confusion and separate corporate polices and procedures for personnel to train, track and manage. If desired to separate time frames it should be based on Low - Medium - High impacts which is not reflected.Additionally, we do not agree with the shortened time frame to revoke access to those who no longer require access -what justifies change? It should remain consistent with current CIP Ver 2 - Certain business processes and day to day operations will cause unrealistic burden in tracking from manual or automated process to revoke

#	Organization	Yes or No	Question 16 Comment
			access for no cause in shortened time frameItem 6.1 Should specify minimum expectations regarding how physical access should be restricted. There appears to be not difference in the level of security required for Medium and High impact facilities.
16.26	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
16.27	Ameren	Disagree	Due to the scope of the number of medium facilities it will be burdensome and labor intensive to maintain documentation of R5.1 physical security controls with no added protection to the BES. Suggest removing Medium Impact Systems from R5.1.
16.28	Entergy	Disagree	Entergy disagrees with the requirements 6.1, 6.2 and 6.3 to restricting, monitoring and maintenance testing to the systems and provide physical access control over Medium BES Cyber Systems when there is no requirement to monitor or log access into a Medium BES Cyber System, again there is a conflict with the requirements for Medium BES Cyber Systems. High BES Cyber Systems access for unescorted access and visitors alike logged and monitored for ingress and egress. If a systems is going to put in place to monitor egress for visitors then the same system could monitor unescorted personnel as well, this would reduced the maintenance of logs for visitors verses unescorted should be into and out unescorted and visitor alike for HIGH BES Systems should have a very high degree of control including the security systems providing access and monitoring.
16.29	Southern Company	Disagree	For 5.1, More specificity is probably called for here. What standard of care is called for? What does “protecting BES Cyber Systems” mean? Does it just mean “containing”?In 5.2, what are the boundaries of “monitoring”? Does this require real-time observation, alarm response, or after-the-fact review? What constitutes monitoring?5.5 “Authorize” should be replaced with “Control” or “Place limits on”.5.9 creates a responsibility for an Entity to monitor the employment status of all of its contracting companies; the requirement should be eliminated, changed to cover employees only, or changed to 72 hours from notification by contracting company.There is a need for greater differentiation based on connectivity and BES component types in R5 and R6. Having

#	Organization	Yes or No	Question 16 Comment
			one set of physical security standards for the differing types of BES components leads to trying to implement standards in an environment to which they are not suited - for example, several of the requirements do not make sense in a substation environment. The tables for R5 and R6 should be reviewed on a per-requirement basis to take these differences into account.
16.30	MRO's NERC Standards Review Subcommittee	Disagree	For item 5.1, we propose making the Low Impact and Medium Impact criteria "Required". Restricting physical access is something that should, and is probably already, being carried out almost everywhere in the BES. Physical security is one of the first lines of defense for all facilities, but the most important defense for those facilities without routable external connectivity.For item 5.2 through 5.11, we would propose adding the following under Medium Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability. This approach builds consistency within R5 and R6.Item 5.3 requires entities to "log" access, and item 5.4 requires entities to "log (manual or automated)" access. Either item 5.3 should define the scope of "logging" access, or "manual or automated" should be deleted from item 5.4 because "log" by itself could already indicate either manual or automated processes.For item 5.7, since termination with cause could occur without warning, revoking access within 24 hours may not be practical at distributed locations without routable external connections, where changes may need to be implemented locally. We would propose including a longer timeline for areas without routable external connections. We also believe a two tiered approach would be practical, where personnel specific access devices (manual keys, key cards, etc.) are removed immediately, and then wide scale access changes (shared combination locks, etc.) are allowed more time to be addressed. We believe this approach is similar to that of the NRC.For items 6.1 - 6.3, we would propose all Medium Impact criteria to be changed to "Required for routable external connectivity only", to maintain consistency with existing wording within the standard.For items 6.1 - 6.3, the drafting team may want to consider how these requirements apply to areas without any

#	Organization	Yes or No	Question 16 Comment
			type of automated physical access control system. What if access is simply restricted by keys, manual logging, and door alarms transmitted by the local RTU to a Control Center? This approach would appear to meet the requirements of R5, but would not seem to be applicable to the requirements of R6.
16.31	The Empire District Electric Company	Disagree	For item 5.1, we propose making the Low Impact and Medium Impact criteria "Required". Restricting physical access is something that should, and is probably already, being carried out almost everywhere in the BES. Physical security is one of the first lines of defense for all facilities, but the most important defense for those facilities without routable external connectivity.For item 5.2 through 5.11, we would propose adding the following under Medium Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability. This approach builds consistency within R5 and R6.Item 5.3 requires entities to "log" access, and item 5.4 requires entities to "log (manual or automated)" access. Either item 5.3 should define the scope of "logging" access, or "manual or automated" should be deleted from item 5.4 because "log" by itself could already indicate either manual or automated processes.For item 5.7, since termination with cause could occur without warning, revoking access within 24 hours may not be practical at distributed locations without routable external connections, where changes may need to be implemented locally. We would propose including a longer timeline for areas without routable external connections.For items 6.1 - 6.3, we would propose all Medium Impact criteria to be changed to "Required for routable external connectivity only", to maintain consistency with existing wording within the standard.For items 6.1 - 6.3, the drafting team may want to consider how these requirements apply to areas without any type of physical access control system. What if access is simply restricted by keys, manual logging, and door alarms transmitted by the local RTU to a Control Center? This approach would appear to meet the requirements of R5, but would not seem to be applicable to the requirements of R6.

#	Organization	Yes or No	Question 16 Comment
16.32	BGE	Disagree	General: What is an "area"? With the elimination of PSP this leaves "area" up for debate. Provide definition for "monitor" (is this manual, automated, 24x7??). 5.1 - Remove the requirement for medium impacted systems (currently says "required for external connectivity only, this requirement is pertaining to physical access). Combine 5.3 & 5.4 and reword to say "Log the entry and exit of all individuals with access to an area protecting BES Cyber Systems." 5.8 & 5.9 should not be restricted to removal from Control Center Only. This should be "areas protecting BES Cyber Systems" to maintain consistency. Define "Generation or Transmission Facility". Define "invalid access". To what extent does physical access mean, does it mean dispatching a guard for every single invalid access attempt? Under 5.8 access is revoked for Medium and High impacted systems but in 5.11 there is no requirement to review access for Medium impacted Systems.6.3 Physical access control systems were not defined in 5.1, 5.2 & 5.3. Should read "Implementing a maintenance and testing program for systems used to comply with 5.1, 5.2 & 5.3)." Define "physical security mechanism".
16.33	Constellation Energy Control and Dispatch, LLC	Disagree	-In 5.1 remove the requirement for medium impacted systems, which is not appropriate for a requirement pertaining to physical access.-Eliminate the timing differences for revoking access between Control Centers, generation or transmission facilities and use a single timing requirment for access to all BES cyber systems.
16.34	Bonneville Power Administration	Disagree	In general, Table R5 is acceptable, other than the items discussed below.We understand the impact of FERC requiring immediate revocation. However, it is difficult to see how to achieve that in every case. The standard should be based upon what is achievable and reasonable for both routine revocation and revocation for cause. The table should have a closer resemblance to R9.Section 5.8 and 5.9: 36 or 72 hours seems very short for revoking access for people who, presumably, are still trustworthy, but merely no longer need access or who have left the entity under routine circumstances. They simply no longer require access because of a job change. Such revocation should be a routine, normal business-day action. 72 hours does not allow for business-day action during a long weekend. In fact, for a large organization revocation for field assets in such a short

#	Organization	Yes or No	Question 16 Comment
			time period would often be impossible. Recommend changing this to five business days or five calendar days. We also recommend using the same criteria for all assets: Control Center, generation, or Transmission Facility.Section 5.11 is very good: it makes it clear that unauthorized access is an incident, not a violation.Table R6, 6.1-6.3 require the plans to address Part 5.1-5.3 if identified as "Medium". However, 5.2 and 5.3 do not require physical security under "Medium". How can a plan address elements that are not required?
16.35	Idaho Power Company	Disagree	In R5, if access authorization is not required for medium impact systems then why is there a requirement to revoke authorized access if it was never authorized in the first place.
16.36	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
16.37	Southern California Edison Company	Disagree	Local logical (electronic) access is and should be recognized as a type of role based access where one has to be physically present, near a device, to operate it. The boundary protection for this type of role is: (1) the physical security boundary; and (2) the device level electronic security boundary. The proposed standard as it is currently worded allows for the removal of at least one access mechanism at the time of revocation. In that case, removal of access through the physical boundary will ensure the immediate revocation of a component critical for this type of role. The drafting team should add additional revocation criteria to adequately address this type of revocation.While this control is easily implemented in a control center or data center environment, field devices that are often located over vast geographic areas pose compliance challenges. This requirement may result in the creation of substantial organization capabilities for compliance without a comparable improvement in reliability of the BES. SCE believes Requirement 5.1 should apply to low impact BES Cyber Systems and Requirement 5.5 should apply across all impact levels. For many field devices, where enforcement of cyber security controls in a timely fashion may be a challenge given the large geographic operational areas, limitation of physical access may be the most

#	Organization	Yes or No	Question 16 Comment
			effective control. Limiting unrestricted access, even to Low impact devices and the ability to control such access, could be a mitigating factor for the inability to perform device by device access revocation where no external access exists.
16.38	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's observations below:Table R5 Row 5.1 needs to document basic physical security requirements for all low and medium BES Cyber Systems.Table R5 Row 5.2: There should be additional language describing what "Monitoring" means. Does Monitoring mean 100% guarantee of any alert or alarm that would indicate an attempt or actual breach in physical security? Suggested language: Monitoring means: The act of conducting a systematic and repeated sequence of measurements, or observations, to assess a particular item or location.Regarding Table 6, it is unclear what the benefit is for having requirement differentiation for Medium BES Cyber Systems with routable connectivity vs. those without.Table R6 Row 6.3, it is appropriate to validate those basic controls, e.g. a padlock or substation fence protecting a low Impact BES Cyber System are tested and maintained periodically.
16.39	Oncor Electric Delivery LLC	Disagree	Physical security should only be required at control centers and High impact substations with IP based communications.
16.40	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation 'Required for external connectivity only' in R5.1. This is an odd mix of physical and electronic access requirements. Please define the stipulations 'Required for external connectivity only' in R6.1, 6.2 and 6.3 for the same reasons.
16.41	WECC	Disagree	Recieved a uniform disagree from all but a vast range of responses to this question depending on the function of the entity reviewin the question.Low levels seem inappropriate as there is veryminimal requiremens for security based on the current tables.andShould apply to all impact levels.
16.42	Hydro One	Disagree	Recommend that revising unescorted physical access depends on BES Impact. Requirement 5.8 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirement 5.9. For consistency with Requirement 5.1, Requirements

#	Organization	Yes or No	Question 16 Comment
			5.5, 5.6, 5.7 and 5.11 should have a specification for BES Medium Impact Cyber System.Please clarify Requirements 6.1, 6.2 and 6.3. Is the routable connectivity on the BES Cyber System or the physical access control system?Should the "routable connectivity" be "external connectivity" for Requirements 6.1, 6.2 and 6.3?
16.43	ISO New England Inc	Disagree	Recommend that revising unescorted physical access depends on BES Impact. Requirement 5.8 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirement 5.9. For consistency with Requirement 5.1, Requirements 5.5, 5.6, 5.7 and 5.11 should specify something for BES Medium Impact Cyber System.Request clarification on Requirements 6.1, 6.2 and 6.3 is the routable connectivity on the BES Cyber System or the physical access control system?Should the "routable connectivity" be "external connectivity" for Requirements 6.1, 6.2 and 6.3?
16.44	Northeast Power Coordinating Council	Disagree	Recommend that revising unescorted physical access depends on BES Impact. Requirement 5.8 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirement 5.9. For consistency with Requirement 5.1, Requirements 5.5, 5.6, 5.7 and 5.11 should have a specification for BES Medium Impact Cyber System.Request clarification for Requirements 6.1, 6.2 and 6.3. Is the routable connectivity on the BES Cyber System or the physical access control system?Should the "routable connectivity" be "external connectivity" for Requirements 6.1, 6.2 and 6.3?
16.45	ReliabilityFirst Staff	Disagree	ReliabilityFirst believes the existing defined term "Physical Security Perimeter" should be retained and used in CIP-011. The current proposed language, "Restrict Physical access to areas protecting BES Cyber Systems", could lead to many questions for an auditor. Further, we believe that all rows of Table R5 (5.1 through 5.11) should be "required" for Medium Impact BES Cyber Systems. For Table R5, row 5.11; what constitutes an unauthorized physical access attempt? If unintended triggering of a magnetic card reader (such as simply walking too close to a reader and unintentionally activating it) indicates "failed attempts", are those to be considered unauthorized access attempts? Also in row 5.11, within what time frame must the review be conducted and we believe

#	Organization	Yes or No	Question 16 Comment
			there should be a requirement to document the review.
16.46	Luminant	Disagree	Remove the requirements for Medium Impact systems
16.47	Nuclear Energy Institute	Disagree	Requirement R6, Medium Impact: allowances should be included to exclude BES cyber systems which incorporate one way connectivity (e.g. outside the ESP via a one way hardware device), even if the protocol is routable. This would be in addition to the existing non-routable protocols.
16.48	Exelon Corporation	Disagree	Requirements 5.8 and 5.9 contain time parameters in hours. Exelon's tracking systems that would be used to demonstrate compliance are tracked in time increments of days, not hours. If an hourly timeframe is required, it will cause extensive modifications to numerous enterprise wide systems to allow tracking at an hourly level. One must ask how this improves reliability. What is the basis for time levels and having a different timeframe for a control center than other locations? It is difficult to understand how the impact levels were determined. The basis of the original CIP Standards addressed the critical sites and took into account the nature of the Critical Cyber Assets that could impact the BES, not the functional/operational parameters of the equipment that is connected to the BES. Exelon's position is that the access revocation should remain at the 24 hours with cause and 7 days without cause. This would also keep the CIP requirements in alignment with the DHS Catalog of Control Systems Security requirement 2.34 - Personnel Termination and DHS Catalog of Control Systems Security requirement 2.35 - Personnel Transfer.We are also concerned about the practicality of potentially applying these standards to multiple unmanned locations. Items 5.1, 5.2, 5.3: Requiring this level of physical security for any BES Cyber System that has no external connectivity should be reconsidered. No matter what level of impact, entities should not have to provide more physical security for a cyber based device or protective relay when it has no external connectivity and therefore would have no more impact to the BES than the other electromechanical devices, protective relays or control switches mounted in the same control panel.

#	Organization	Yes or No	Question 16 Comment
16.49	Progress Energy - Nuclear Generation	Disagree	See attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
16.50	Xcel Energy	Disagree	See comments on question 15
16.51	Western Area Power Administration	Disagree	See previous comments
16.52	Emerson Process Management	Disagree	Since physical access restriction is not required for low and, maybe, medium impact BES Cyber Systems, according to R2 and R3, everyone in a generation plant will be subject to awareness and training requirements. Further, per R3.1, the training will cover the proper use of BES Cyber Systems, the proper handling of BES Cyber Systems information and storage media, and others. Why do plant's administrative staffs need to know how to use BES Cyber System?
16.53	Detroit Edison	Disagree	Table entries 5.8 and 5.9 require access revocation for Medium Impact access that is not required to be explicitly authorized.Table entries 5.8 and 5.9 should address the concept of expired PRA and/or training requirements. Propose changing 5.8 and 5.9 to read:"...who no longer require such access or no longer meet the training or PRA requirements as specified in R3 or R4..."Table entries 6.1, 6.2, and 6.3 Medium Impact states "Required for routable connectivity only". This term is not defined. We suggest replacing that language with "BES Cyber Systems that use a routable protocol".
16.54	EEI	Disagree	Table R5 Row 5.2: There should be additional language describing what "Monitoring" means. Does Monitoring mean 100% guarantee of any alert or alarm that would indicate an attempt or actual breach in physical security? Suggested language: Monitoring means: The act of conducting a systematic and repeated sequence of measurements, or observations, to assess a particular item or location.Table R5 Row 5.9 creates a responsibility for an Entity to monitor the employment status of all of its contracting companies; the requirement should be eliminated, changed to cover

#	Organization	Yes or No	Question 16 Comment
			employees only, or changed to 72 hours from notification by contracting company.In general, there is a need for greater differentiation based on connectivity and BES component types in R5 and R6. Having one set of physical security standards for the differing types of BES components leads to trying to implement standards in an environment to which they are not suited - for example, several of the requirements do not make sense in a substation environment. The tables for R5 and R6 should be reviewed on a per-requirement basis to take these differences into account.
16.55	Allegheny Energy Supply	Disagree	Table R5 Row 5.3: This requirement should be consistent with Row 5.4 with respect to logging entry and exit.Table R6 Row 6.3, it is appropriate to validate that basic controls, e.g. a padlock or substation fence protecting a low Impact BES Cyber System are tested and maintained periodically.
16.56	Allegheny Power	Disagree	Table R5 Row 5.3: This requirement should be consistent with Row 5.4 with respect to logging entry and exit.Table R6 Row 6.3, it is appropriate to validate that basic controls, e.g. a padlock or substation fence protecting a low Impact BES Cyber System are tested and maintained periodically.
16.57	American Electric Power	Disagree	Table R5:5.1, Column "Medium Impact BES Cyber System", regarding "Required for external connectivity only", this should be stated "routable external connectivity"?5.8 & 5.9, Column "Medium Impact BES Cyber System", regarding "Control Center only" and "generation or Transmission Facility only". Authorized unescorted physical access is not required for medium impact facilities in row 5.5. If it is not required in 5.5, how can it be revoked in 5.8?5.11, regarding "...unauthorized physical access attempts". Suggested wording: "unauthorized physical access or physical access attempts".Table R6:6.1: Row 5.1 only requires access to areas protecting BES Cyber Systems be protected. It does not say that it needs to be done with a control system. A pad lock can used to restrict physical access. It also requires it for any external connectivity, not just routable.6.2: Monitoring of Medium Impact BES Cyber Systems is not required in section 5.26.3: A physical security control system is not needed to meet row 5.1 on Medium impact

#	Organization	Yes or No	Question 16 Comment
			Facilities since no other requirements from Table 5 are needed.
16.58	Alberta Electric System Operator	Disagree	Tables R5 and R6 do not log, monitor, or control physical security and access to Low Impact BES Cyber Systems. Consider making the requirements in tables R5 and R6 more restrictive. For example, restrict physical access for all impact levels, but make frequency and time horizon of reviews dependent on impact level - Low Impact review semi-annually, Medium Impact quarterly, and High Impact monthly.In table 5.4 - Change to "Log (manual or automated) visitor access (individuals not authorized..." to be consistent with Table 5.3.
16.59	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS proposal to include the Low and Medium Impact requirement in 5.1, but as stated in our response to Question 14, we believe the implementation of this requirement must be for a reasonable physical access policy, for example, as required for employee and public safety code compliance. Compliance with this requirement should be straight forward: locked gates, locked control house doors and/or locked fence around BES Cyber systems. Table R5 Item 5.1 should state for Low and Medium Impact; "Required".The APPA Task Force supports the MRO-NSRS proposal For items 5.2 through 5.6; we would propose adding the following under Medium Impact: "Required for routable external connectivity only". We also suggest the following language for the tables noted:R5 Table 5.1: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR5 Table 5.2: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR5 Table 5.3: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR5 Table 5.4: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR5 Table 5.5: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR5 Table 5.6: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredThe APPA Task Force recommends removal of Table Items 5.7 - 5.9, dealing with "revoking authorized unescorted access," since this is covered in Table 9.2-9.5, Access Revocation. We believe there should not be a distinction between the two revocations and the timeframes for the revocation should be the same. There

#	Organization	Yes or No	Question 16 Comment
			should be only one set of revocation requirements.R5 Table 5.10: (renumber if 5.7-5.9 are removed)Low Impact: N/AMedium Impact: N/AHigh Impact: RequiredR5 Table 5.11: (renumber if 5.7-5.9 are removed)Low Impact: N/AMedium Impact: N/AHigh Impact: RequiredThe APPA Task Force supports the MRO-NSRS proposal for items 6.1 - 6.3; hence, we would propose all Medium Impact criteria to be changed to "Required for routable external connectivity only", to maintain consistency with existing wording within the standard. The tables would then read:R6 Table 6.1: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR6 Table 6.2: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR6 Table 6.3: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredThe APPA Task Force believes the 3 year maintenance and testing requirement on "all physical security mechanisms" in 6.3 is unreasonable. The term "all" should be replaced with "major" and the timeframe should be based on manufacturer recommendations, not an arbitrary 3 year timeframe.
16.60	Black Hills Corporation	Disagree	The concept makes sense, but 5.2 & 5.3, and 6.2 & 6.3 should have consistent impact applicability.
16.61	Network & Security Technologies Inc	Disagree	There are a number of inconsistencies in these and other tables related to grant and revocation of access (e.g., 5.1 requires restriction of physical access to areas protecting Medium Impact systems with external connectivity but 5.5 does not indicate such access must be authorized). Recommend a complete "scrub" of all requirements pertaining to authorization of, control of, and revocation of physical and electronic access.
16.62	We Energies	Disagree	We Energies agrees with EEI comment: Table R5 Row 5.1 needs to document basic physical security requirements for all low and medium BES Cyber Systems.We Energies agrees with EEI comment: Table R5 Row 5.2: There should be additional language describing what "Monitoring" means. Does Monitoring mean 100% guarantee of any alert or alarm that would indicate an attempt or actual breach in physical security? We Energies agrees with EEI: Suggested language: Monitoring means: The act of conducting a systematic and repeated sequence of measurements, or observations, to assess a

#	Organization	Yes or No	Question 16 Comment
			particular item or location.We Energies agrees with EEI comment: Regarding Table 6, it is unclear what the benefit is for having requirement differentiation for Medium BES Cyber Systems with routable connectivity vs. those without.We Energies agrees with EEI comment: Table R6 Row 6.3, it is appropriate to validate that basic controls, e.g. a padlock or substation fence protecting a low Impact BES Cyber System are tested and maintained periodically.
16.63	Progress Energy (non-Nuclear)	Disagree	Why does Table R6 require access control to systems identified in 5.1, 5.2, 5.3 medium impact with routable connectivity, but 5.1 does not reference routable and 5.2, 5.3 have no requirements for medium impact?See comment 14.

17. Requirement R7 of draft CIP-011-1 states "Each Responsible Entity shall document BES Cyber System accounts by incorporating the criteria specified in CIP-011-1 Table R7 – Account Management Specifications to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of electronic access control requirements that are included in Requirements table R7? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please Explain and provide any suggestions for modification.

Summary Consideration:

Comments concerning the requirement language in Requirement R7 with regard to "acceptable use" and the requests for clarity of the term "account types" indicated that these terms were misunderstood. The term "acceptable use" has been replaced with a requirement to authorize the use of account types, and the associated guidance document has been expanded to include descriptions of account types as used in this requirement.

Many commenters indicated that the format of Requirement R7 was causing confusion, suggesting that consistency in the use of columns and the format of the requirements and other information included in the tables would be helpful. The SDT agreed, and made consistency changes in the format and content of the columns in the tables, including the information required for High, Medium, and Low Impact BES Cyber Systems and BES Cyber Assets.

#	Organization	Yes or No	Question 17 Comment
17.1	ERCOT ISO	Agree	7.1: Please clarify "identification" and "group account".
17.2	Duke Energy	Agree	It's unclear how R7 tasks accomplish the purpose statement for low impact systems.
17.3	Minnesota Power	Agree	Minnesota Power generally agrees with the list of electronic access control requirements included in Table R7. However, it believes that some confusion exists regarding what distinguishes a "group" account from a "shared" account or a "system" account from an "administrative" account as described in Part 7.1.In addition, many types of equipment found in generating facilities or substations do not have typical "accounts," although they may have some type of access control (i.e., configuration password). To add further clarity, Minnesota Power recommends that the following be added to the end of purpose statement for Requirement 7:"...Required for only BES Cyber System

#	Organization	Yes or No	Question 17 Comment
			Components with account management capabilities."
17.4	Puget Sound Energy	Agree	Puget Sound Energy suggests that, because a BES Cyber System is made up of multiple components (hardware, operating system, application) that there should be a little clarity added. For example: "Identification of account types...and administrative accounts, in use for the BES Cyber Systems at the operating system, and applicable application(s) on the BES Cyber System Components."
17.5	Progress Energy - Nuclear Generation	Agree	R7 can be improved by incorporating information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
17.6	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comments for question 6.
17.7	Bonneville Power Administration	Agree	The objective of this requirement ("to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.
17.8	Entergy	Agree	This matches the guidance presented in the nuclear industry document NEI-08-09 Rev 6 Section 1.2.
17.9	Green Country Energy	Agree	Would it be possible throughout the standard to footnote sources for guidance such as DHS catalog of control systems or specific NIST documents? Hopefully this would remove some of the ambiguity and lead towards a more results based standard.

#	Organization	Yes or No	Question 17 Comment
17.10	Independent Electricity System Operator	Disagree	- Should R7.1 include anonymous to be consistent with R8.3.- R7.2 appears to be a policy statement vs something that can be audited. Some violations of acceptable use can't be detected or monitored so how can this be audited? If this is a policy stateme
17.11	Southwest Power Pool Regional Entity	Disagree	7.1 needs to include both local and domain user accounts. Elaborate a bit more on what is meant by "group" account. In many cases, a group account and a shared account are the same account. Very easy to overlook the group categorization the way the requirement is written as it is not defined in the current CIP standards.
17.12	US Army Corps of Engineers, Omaha Distirc	Disagree	7.2 implies that the user agreements would be so detailed as to differentiate the valid uses of individual systems and account types. It should be possible to have user agreements that allow them to work on authorized systems for authorized purposes (ie sysadmin account is authorized for sysadmin work) and restrict use for unlawful and non business purposes.
17.13	BCTC	Disagree	Please provide a definition of Acceptable Use. It is recommended that the term "acceptable use" be replaced (i.e. are we looking to define the roles within the BES Cyber System and define what actions each can take within the system?)
17.14	Idaho Power Company	Disagree	Acceptable use is a broad term when it comes to administrative accounts. As long as acceptable use can be defined in general terms and does not require a definitive list, this requirement will be OK. If it requires a definitive list, then there is risk in trying to define every situation or use of an administrative account.
17.15	Constellation Energy Control and Dispatch, LLC	Disagree	Account types should be defined.
17.16	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.

#	Organization	Yes or No	Question 17 Comment
17.17	The Empire District Electric Company	Disagree	Comments: Many types of equipment found in generating facilities or substations do not have typical “accounts”, although they may have some type of access control (configuration password). To alleviate this, we propose adding the following to the end of R7: “Required for only BES Cyber System Components with account management capabilities.”
17.18	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes a technical feasibility exception may be required based on the current wording of this requirement when considering local access to programmable electronic devices in a substation environment that do not support the ability to demonstrate acceptable use. Also for R7.2, CenterPoint Energy is not sure what is meant by "Acceptable use of each identified account types" and suggests adding specific examples.
17.19	Kansas City Power & Light	Disagree	Do all cyber systems and component that may be identified here have the capability to have an account? Recommend consideration of additional language such as “where equipment capabilities allow” for R7.
17.20	CWLP Electric Transmission, Distribution and Operations Department	Disagree	Documentation requirements would be burdensome without preventing malicious activity.
17.21	Dominion Resources Services, Inc.	Disagree	Dominion presumes that the word “acceptable” used in 7.2 will be defined by the Reliability Entity and will not be dictated by an outside group.
17.22	E.ON U.S.	Disagree	E.ON U.S, does not believe a compliance requirement is necessary for the low impact category.
17.23	Western Area Power Administration	Disagree	How is the responsible entity to meet this requirement for BES Cyber system components that do not have specific account types? For example...relays, comm equipment, other substation equipment that may now be part of the “affect situational

#	Organization	Yes or No	Question 17 Comment
			awareness of the BES" portion of the requirement.
17.24	Matrikon Inc.	Disagree	I would separate the requirements of creating an "inventory of user accounts" and its application to BES Cyber Systems, from the requirement of assigning "ownership and authorization of user accounts".The key separation is the "inventory" and the "authorization/use" of those accounts. A Cyber system may have 5 user accounts, of which some are disabled, some are shared, and some are actively used by specific individuals.
17.25	Florida Municipal Power Agency	Disagree	Is R7 needed since the real reliability goal is accomplished in R8? "Shall document" is not a strong requirement. The requirement is really account management. FMPA suggests: "Each Responsible Entity shall manage accounts and account permissions in the manner described in CIP-011-1 Table R7 - Account Management Specifications".Many types of equipment found in generating facilities or substations do not have typical "accounts", although they may have some type of access control (configuration password). To alleviate this, if R7 is kept, we propose adding the following to the end of R7: "Required for only BES Cyber System Components with account management capabilities." Without this addition, we believe this item sets the stage for numerous TFE's within the industry.
17.26	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
17.27	American Transmission Company	Disagree	Many types of equipment found in generating facilities or substations do not have typical "accounts", although they may have some type of access control (configuration password). To alleviate this, we propose adding the following to the end of R7: "Required for only BES Cyber System Components with account management capabilities."
17.28	MidAmerican Energy Company	Disagree	Many types of equipment found in generating facilities or substations do not have typical "accounts", although they may have some type of access control (configuration

#	Organization	Yes or No	Question 17 Comment
			password). To alleviate this, we propose adding the following to the end of R7: "Required for only BES Cyber System Components with account management capabilities." Without this addition, we believe this item sets the stage for numerous TFE's within the industry.
17.29	MRO's NERC Standards Review Subcommittee	Disagree	Many types of equipment found in generating facilities or substations do not have typical "accounts", although they may have some type of access control (configuration password). To alleviate this, we propose adding the following to the end of R7: "Required for only BES Cyber System Components with account management capabilities." Without this addition, we believe this item sets the stage for numerous TFE's within the industry.
17.30	NextEra Energy Corporate Compliance	Disagree	NextEra believes requirement 7.1 within table 7 should provide guidance to identify role based access controls for accounts on the BES Cyber System components. The current way the requirement reads, it is unclear if the specific account types listed are the only ones required for identification. Additionally, the BES Cyber Systems may not have the specific account types listed in requirement 7.1. Furthermore, NextEra believes requirement 7.2 should provide additional guidance related to acceptable use. It is unclear if the acceptable use requirement should be defined per account on each BES Cyber System Component. The requirement should require acceptable use based on role based access controls for categories of accounts. What is the criteria for 7.2 "Acceptable use" of each identified account types? Please add a local definition of "acceptable use" within the standard.Regarding R7, this table seems to apply the CIP electronic account standards to all units. Is this the intent?If so, then for 7.1 - the volume of research and account management, we suggest applying this to high impact only.As for R11.1 does the user restriction for wireless technologies include Blackberries and SmartPhones, NextEra believes this would impact on volume of devices and would be burdensome to manage.NextEra would like to see statement treating personal communication devices the same as company issued laptops since there are internal access controls designed to prevent misuse.

#	Organization	Yes or No	Question 17 Comment
17.31	Indeck Energy Services, Inc	Disagree	Not all Cyber Systems have logins and accounts. [suggestion] “For any Cyber System permitting login access, each Responsible Entity shall document BES Cyber System accounts by incorporating the criteria specified in CIP-011-1 Table R7 - Account Management Specifications to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems.”
17.32	Network & Security Technologies Inc	Disagree	Purpose of R7.1 is unclear. Is it intended to require that every type of account a given individual has authorization to use be identified? If so, please clarify.Suggest “acceptable use” be addressed in R1 (policy) rather than here.
17.33	LCEC	Disagree	R7 - “access to its BES Cyber Systems “ should read “Access to a BES Cyber System or its components “Roles should be identified during the creation of accounts.R8 - R7 and R8 should be combined into managing accounts.In CIP 10 there should be an air-gap exclusion for the thousands of relays connected to medium impact or lower systems that would require access revocation.
17.34	Consultant	Disagree	R7 - The wording to implement the criteria in the tables is incorrect. The tables are specifying the requirements and application of requirements to the classes of assets resulting from the impact categorization process. The wording of the statement should be modified to reflect this distinction.R7 & Table: In this section there is a change in terminology from the requirement to the table name to the column heading for the requirements. For this requirement:R7: document BES Cyber System accountsTable Name: Account Management Specificationscolumn Heading: Account Management DocumentationThis is confusing, as it is not clear what the topic is being addressed. Suggest consistent terminology for these locations. NOTE: There are multiple requirements where this condition exists and should be addressed.R7 - Account management would not seem to prevent malicious operation of BES Elements. It would seem to maintain control of access to BES Cyber Systems. The grouping of Electronic Access Controls would be more likely to be used to prevent malicious operation. R7 - Suggest deleting the word "maintaining" as account management controls access to BES

#	Organization	Yes or No	Question 17 Comment
			Cuber Systems, and the word maintaining control is unnecessary.7.1 Suggested rewording: For each BES Cyber System identify the account types in use on that system, including individual, group, shared, system, and administrative accounts.7.2 The intent is not clear. Does this mean document the acceptable use of each account type on each system, or document the acceptable use of the account types in use across all BES Cyber Systems? The resulting documentation is significantly different.
17.35	Southern Company	Disagree	R7 creates a workload requirement with very little benefit to overall reliability.
17.36	SCE&G	Disagree	R7 Is every BES Cyber Sytem required to have account types. Will there be provisions for equipment incapable of having an "account type"?R9 When does the timetable start for personnel terminated for cause? Once paperwork is completed?R10 SDT should consider the high volume of TFEs that may be generated for equipment with hardcoded passwords that cannot be changed. The TFE process should be evaluated and revised to make it less burdomesome on entities to document that a password is incapable of being changed every 12 months, or a provision should be added to the requirments. Overall provisions should be added to allow entities to utilize more secure methods of account access control, such as RSA tokens, without burdening the entity with additional adminsitrative work for choosing an access control method which is inherently more secure.R11: The box containing the definition for remote access: is this remote 2-way or 1-way?
17.37	Luminant	Disagree	R7.1 should not be required for low impact.
17.38	ISO New England Inc	Disagree	R7.2 appears to be a policy statement vs something that can be audited. Some violations of acceptable use can't be detected or monitored so how can this be audited? If this is a policy statement then it should be relocated to R1.
17.39	Ameren	Disagree	R7.2 does not list a monitoring frequency, it implies continual monitoring. Recommend that a monitoring frequency be added to this requirement.

#	Organization	Yes or No	Question 17 Comment
17.40	Powersouth Energy Cooperative	Disagree	R7-14. The required electronic security measures should be limited to the access or gateway point. Strong security measures at the gateway can effectively protect all the cyber assets that are accessed through the gateway. An argument can be made for example that the frequent changing of passwords on tens if not hundreds of devices inside a boundary that has very strong security measures lessens reliability should a qualified employee need to access the device but not be able to do so due to a recently changed password. Little is gained by requiring hundreds of devices inside a secure boundary to have the same level of protection that is provided through a secure gateway. Just because "it can be done" does not mean that "it should or must be done". The objective is to protect the assets. It should be recognized that protecting the assets can be done by focusing on the gateway that allows access to the devices. This allows entities to keenly focus on managing the security of those points of access rather than spending time, capital and other resources that provide limited if any added security. Prior to the workshop it was felt that strong gateway protection would meet the objectives of the standard. However, that is no longer clear. For example, it was felt that at a substation strong security measures at the gateway that allowed access to the cyber devices would meet the objective of standard with the cyber system (a collection of protective relays or other devices) being protected by the secure gateway. It appears that may not be the case. This results, for example, in the failure to change a password in a single device on a secured network being non-complaint with the standard for a situation where the BES reliability was never jeopardized. That type approach will likely result in numerous non-compliances that will on serve wasted resources even though the BES was never jeopardized. If it is intended that protecting only the gateway meets the objective that needs to be made clear.
17.41	BGE	Disagree	Replace the word "element" with "Cyber System Component" to maintain consistency with the defined terms. What is the difference between group and shared? What is the definition of "Acceptable use"?
17.42	San Diego Gas and Electric	Disagree	SDG&E recommends separating Wireless concepts from Access Concepts. Wireless is a

#	Organization	Yes or No	Question 17 Comment
	Co.		method of access, as is VPN, Citrix, dial-up, etc..., while Access implies a physical and logical service provided to a client.
17.43	Garland Power and Light	Disagree	Shared & group accounts should not be created or allowed because there is no accountability for these accounts
17.44	APPA Task Force	Disagree	The APPA Task Force does not believe the description of R7 follows the intent of the requirement. The following are recommended edits:R7. Objective:To prevent malicious operation of BES Elements by maintaining control of access to the Responsible Entity's BES Cyber Systems.R7. Requirement:Each Responsible Entity shall document manage BES Cyber System accounts Components with account management capabilities by incorporating the criteria specified in CIP-011-1 Table R7- Account Management Specifications R8. Objective:To prevent malicious operation of BES Elements by maintaining control of access to the Responsible Entity's BES Cyber Systems. R8. Requirement: Each Responsible Entity shall apply the criteria specified in CIP-011-1 Table R8 - Account Management Implementation R9. Objective: To prevent malicious operation of BES Elements by maintaining control of access to the Responsible Entity's BES Cyber Systems. R9. Requirement: Each Responsible Entity shall revoke system access to its BES Cyber Systems as specified in CIP-011-1 Table R9 - Access Revocation R10. Objective: To prevent malicious operation of BES Elements by maintaining control of access to the Responsible Entity's BES Cyber SystemsR10. Requirement:Each Responsible Entity shall implement the account management access control actions specified in CIP-011-1 Table R10 - Account Access Control Specifications The drafting team uses the word "any" in the description in R11 and R12. This appears to require the all BES Cyber Systems be included in the requirement, even if the wireless functionality is disabled. The APPA Task Force believes the description should read: R11. Objective:To ensure that only authorized access is allowed to BES Cyber Systems that have remote or wireless electronic access.R11. Requirement: Each Responsible Entity that allows remote or wireless electronic access to a BES Cyber System shall apply the criteria specified in CIP-011-1 Table R11- Wireless and Remote Electronic Access Documentation for that specific BES Cyber System R12. Objective:To ensure that only authorized access is allowed to BES

#	Organization	Yes or No	Question 17 Comment
			Cyber Systems that have remote or wireless electronic access.R12. Requirement:Each Responsible Entity that allows wireless and remote electronic access to a BES Cyber System shall manage that electronic access in accordance with the criteria specified in CIP-011-1 Table R12 - Wireless and Remote Electronic Access Management for that specific BES Cyber System. R13. Objective:To prevent malicious operation of BES Elements by maintaining control of access to the Responsible Entity's BES Cyber Systems.R13. Requirement:Each Responsible Entity shall revoke remote access by disabling one or more of the multiple factors required for such remote access to BES Cyber Systems [it owns and operates?] by implementing the criteria specified in CIP-011-1 Table R13 - Remote Access Revocation R14. Objective:To ensure that only authorized access is allowed to BES Cyber Systems that have remote or wireless electronic access.R14. Requirement:Each Responsible Entity shall document and implement its organizational processes, technical mechanisms, and procedures for control of wireless and remote access to electronic access points to the BES Cyber Systems including wireless and remote access if it is used, that incorporate the criteria specified in CIP-011-1 Table R14 - Wireless and Remote Electronic Access Controls.
17.45	Southern California Edison Company	Disagree	The drafting team should clarify mapping of controls, as identified in CIP-005 R1.5, and unbundle these requirements for access control devices. This would be in agreement with the drafting team's stated objective to leverage the financial and organizational capital invested by registered entities in providing cyber security through compliance with current versions of the CIP standards. SCE believes that all instances of electronic access, whether to the boundary or a system/device within the boundary, should be in one requirement. A new standard for access may include these account related controls in addition to others.The drafting team should provide guidance for R7.2. As written, R7.2 suggests that the acceptable use for each identified account type is required across all impact levels. It is not clear whether the intent here is to document business justification(s) for the acceptable use, the posting of signage describing acceptable use, or both. SCE recommends that the drafting team explicitly state the intent of this requirement.

#	Organization	Yes or No	Question 17 Comment
17.46	US Bureau of Reclamation	Disagree	The use of terminology is a problem in this standard. It is suggested that the term "electronic access" should be used instead of the term "account";or, a definition should be developed to clearly differentiate the difference, if there is one. The term electronic access is more precise.
17.47	Public Service Enterprise Group companies	Disagree	This is too short a period, especially if the event occurs over a weekend or holiday. The timeframe should be changed to 5 calendar days or 3 business days. At a minimum, 72 hours.
17.48	Pepco Holdings, Inc. - Affiliates	Disagree	What is a Cyber System account? Does this exclude Cyber System Component accounts? Would microprocessor relays passwords be in scope? Please reference comments on BES Cyber System Components and BES Cyber System definitions.
17.49	Manitoba Hydro	Disagree	What is the definition of “Acceptable use” for Requirement R7.1?

18. Table R7 provides direction concerning what impact level of BES Cyber Systems to which Requirement R7 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011 R7 was moved to CIP-007-5 R5.

Several commenters expressed concern that the documentation requirements for Low Impact BES Cyber Systems would be burdensome and would not prevent malicious activity. In response, most documentation and technical requirements applying to Low Impact BES Cyber Systems have been removed. However, the requirement for changing the default password remains, because this addresses a significant vulnerability and does not require periodic maintenance.

Some commenters suggested the standards need to be more explicit as to whether the requirement applies at the BES Cyber System level or to the individual BES Cyber System Components. In response, the SDT provided additional clarity as to when a requirement applies to individual Cyber Assets. However, the requirements are written to allow flexibility in implementation.

In addition, commenters suggested adding "Required for routable connectivity only" to the applicability for Low and Medium Impact BES Cyber Systems. In response, the applicability for this requirement has been modified to High and Medium Impact BES Cyber Systems. For Medium Impact BES Cyber Systems, the SDT does not believe that the communication attributes of the BES Cyber System adequately mitigate the vulnerability this requirement addresses.

#	Organization	Yes or No	Question 18 Comment
18.1	Idaho Power Company	Agree	Account types will not vary by BES impact.
18.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
18.3	The Empire District Electric Company	Agree	Comments: We agree, assuming the suggested statement under question 17 is included.
18.4	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.

#	Organization	Yes or No	Question 18 Comment
18.5	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comments for question 6.
18.6	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels of R7 if the drafting team accepts our edits proposed in response to question 17.
18.7	Duke Energy	Agree	This is a lot of work to do for low impact systems. We suggest the requirement be removed from R7. Please provide insight as to how these tasks accomplish the purpose for low impact systems.
18.8	MRO's NERC Standards Review Subcommittee	Agree	We agree, assuming the suggested statement under question 17 is included.
18.9	BGE	Disagree	7.1 and 7.2 remove the requirement for low and medium since we do not need to log and monitor those systems per R8.
18.10	The United Illuminating Co	Disagree	7.1 and 7.2 should not apply to Low Impact devices.
18.11	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
18.12	LCEC	Disagree	Clarify if 7.1 & 7.2 are for account types only or if this includes specific accounts.
18.13	Indeck Energy Services, Inc	Disagree	Cyber Systems without login access need to be excluded.
18.14	CWLP Electric Transmission, Distribution and Operations Department	Disagree	Documentation requirements would be particularly burdensome for low impact BES cyber systems.

#	Organization	Yes or No	Question 18 Comment
18.15	E.ON U.S.	Disagree	E.ON U.S, does not believe a compliance requirement is necessary for the low impact category.
18.16	Minnesota Power	Disagree	It appears inconsistent with the other Requirements of CIP-011-1 to apply the criteria specified in Parts 7.1 and 7.2 to Low Impact BES Cyber Systems. If those using accounts on Low Impact Systems are not required to have Training, as required in R3, how are they to know the acceptable use of these accounts and therefore, why inventory and document it?
18.17	LADWP	Disagree	Low impact BES Cyber Systems should not be required.
18.18	National Grid	Disagree	National Grid suggests removing controls for Low Impact BES CS in table R8 to be consistent with table R7.7.2 - Elaborate on “acceptable use” and documentation required for acceptable use
18.19	NextEra Energy Corporate Compliance	Disagree	NextEra believes the requirement to identify and document acceptable use of accounts on Low Impact BES Cyber systems should not be required. The exercise of complying to that requirement for Low Impact BES Cyber systems will take considerable effort but will provide little if any security value or improve the reliability or security of the BES Infrastructure. It is recommended to have the requirement apply to both Medium and High Impact BES Cyber Systems.
18.20	American Municipal Power	Disagree	Please provide a little or no impact category.
18.21	Hydro One	Disagree	Presently, R7.1 specifies identification of account types. We suggest that the requirement R7.1 is modified to delete the word “types”.
18.22	Puget Sound Energy	Disagree	Puget Sound Energy notes that physical security measures are only applicable to High Impact and some Medium Impact BES Cyber Systems. Puget Sound Energy suggests aligning Table 7 to Tables 5 and 6, or clarifying “Required for routable connectivity only”

#	Organization	Yes or No	Question 18 Comment
			for Low and Medium Impact BES Cyber Systems. At the very least, Puget Sound Energy suggests aligning Table 7 account identification to Table 8 account management.
18.23	Progress Energy (non-Nuclear)	Disagree	R7.1 - account management for "low" assets may be significant when you consider all of the intelligent programmable field instrumentation they will likely be categorized this way.Acceptable use is too broad a requirement. If someone is deemed competent to have access this requirement is not needed.Use of 'BES Cyber System' vs. 'BES Cyber System Component' - Some requirements (e.g., R7.1 - identification of account type; R16.1 - security patches) use the term 'BES Cyber System', while others use the term 'BES Cyber System Component' (e.g., R23.1 - inventory of the BES Cyber System Component). SDT needs to be specific when the requirement applies at the BES Cyber System level or to the individual BES Cyber System Components.
18.24	Constellation Energy Control and Dispatch, LLC	Disagree	Remove Required status for low and medium BES Cyber Systems, since R8 does not require logging or monitoring of those systems.
18.25	Garland Power and Light	Disagree	Requirement 7.1 & 7.2 should not be required for Low Impact BES Cyber Systems
18.26	Network & Security Technologies Inc	Disagree	See response to 17, previous.
18.27	Constellation Energy Commodities Group Inc.	Disagree	Should not be required for low impact systems.
18.28	Ameren	Disagree	Suggest removing R7.1 and R7.2 for Low Impact Systems. Creating and maintaining recordkeeping for all BES Systems will be a massive undertaking with no added protection to the BES.
18.29	Entergy	Disagree	The requirements should apply across the board for sites where routable protocols and dial-up communications are employed.

#	Organization	Yes or No	Question 18 Comment
18.30	Allegheny Energy Supply	Disagree	Use of 'BES Cyber System' vs. 'BES Cyber System Component' - Some requirements (e.g., R7.1 - identification of account type; R16.1 - security patches) use the term 'BES Cyber System', while others use the term 'BES Cyber System Component' (e.g., R23.1 - inventory of the BES Cyber System Component). SDT needs to be specific when the requirement applies at the BES Cyber System level or to the individual BES Cyber System Components.
18.31	Allegheny Power	Disagree	Use of 'BES Cyber System' vs. 'BES Cyber System Component' - Some requirements (e.g., R7.1 - identification of account type; R16.1 - security patches) use the term 'BES Cyber System', while others use the term 'BES Cyber System Component' (e.g., R23.1 - inventory of the BES Cyber System Component). SDT needs to be specific when the requirement applies at the BES Cyber System level or to the individual BES Cyber System Components.
18.32	EEI	Disagree	Use of 'BES Cyber System' vs. 'BES Cyber System Component' - Some requirements (e.g., R7.1 - identification of account type; R16.1 - security patches) use the term 'BES Cyber System', while others use the term 'BES Cyber System Component' (e.g., R23.1 - inventory of the BES Cyber System Component). SDT needs to be specific when the requirement applies at the BES Cyber System level or to the individual BES Cyber System Components.
18.33	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments. Please also reference comments on BES Cyber System Components and BES Cyber System definitions.
18.34	American Transmission Company	Disagree	We agree, assuming the suggested statement under question 17 is included.
18.35	We Energies	Disagree	We Energies agrees with EEI use of 'BES Cyber System' vs. 'BES Cyber System Component' - Some requirements (e.g., R7.1 - identification of account type; R16.1 - security patches) use the term 'BES Cyber System', while others use the term 'BES Cyber System Component' (e.g., R23.1 - inventory of the BES Cyber System Component). SDT

#	Organization	Yes or No	Question 18 Comment
			needs to be specific when the requirement applies at the BES Cyber System level or to the individual BES Cyber System Components.
18.36	FirstEnergy Corporation	Disagree	We feel there could be limited value in maintaining account type information for low impact BES Cyber Systems. Suggest removing 'required' for that column of table for R7.
18.37	Manitoba Hydro	Disagree	What is the purpose of Requirement 7.1 for Low Impact BES Cyber Systems? It is not clear that this information is needed for other requirements. Requirement 7.2 is inconsistent with Requirement R3, where no training is required for Low and Medium Impact BES Cyber Systems. Defining acceptable use of account types serves no purpose if it is not provided in training. The meaning of the references in Requirement R7.1 to "account types" and in Requirement R10.8 to "non-privileged accounts" is unclear. The reference in Requirement R7.2 to "Acceptable use of each identified account types" is incomplete. What is it that the Responsible Entity is required to do - develop criteria related to acceptable use, monitor for compliance with such criteria, etc? There are no specifics given with respect to "restrictions" in Requirement R11.1 or "allowed methods" in Requirement R11.2 1, so it is assumed to be at the Responsible Entity's discretion. It is unclear whether Requirement R11.3 requires a written policy to be in place - one would assume no written policy was required by the opening language of Requirement R11.

19. At the present time, the Access Control requirements for Physical Access have not been combined with the Access Control requirements related to Electronic Access. Do you agree with this method? Or would you prefer to have the Physical Access control requirements combined with the Electronic Access control requirements? Please explain and provide any suggestions for modification.

Summary Consideration:

Some commenters expressed concern that physical and electronic access controls may use the same terms, but they can actually mean different things, so there is a need to keep the requirements separate. In response, the terms physical and electric access control have been kept separate, but the controls for authorization, review, and revocation have been combined to ensure consistency across the requirements.

Some commenters expressed the need to combine requirements so that all "revoke" requirements are in one place. The SDT agrees with this suggestion, and the requirements to revoke access have been combined.

Some commenters expressed the need to combine the physical and electronic access control requirements based on the concern that being in separate requirements might lead to an entity missing something. The SDT agrees with this suggestion. The terms physical and electric access control have been kept separate, but the controls for authorization, review, and revocation have been combined to ensure consistency across the requirements.

Some commenters suggested continuing the use of ESP and PSP terminology, since it is now well understood. Upon further review, the SDT decided to continue use of the term Electronic Security Perimeter (ESP), but PSP has been modified to Defined Physical Boundary (DPB) to focus the requirements on controlling access rather than creating a perimeter.

#	Organization	Yes or No	Question 19 Comment
19.1	Duke Energy	Agree with proposed method	Access control for physical and electronic should continue to be separate.
19.2	Dairyland Power Cooperative	Agree with proposed method	Access to a physical area is different than access to an account that provides access to system(s) or application(s). Separate handling is appropriate.

#	Organization	Yes or No	Question 19 Comment
19.3	City Utilities of Springfield, Missouri	Agree with proposed method	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
19.4	Platte River Power Authority	Agree with proposed method	Electronic security and physical security are different disciplines and should be kept separate.
19.5	LCEC	Agree with proposed method	I agree that these should be separate but think that the retired terminology like Electronic Security Perimeter (ESP) and Physical Security Perimeter (PSP) are well understood and should not be retired for the sake of change. A lower level of controls does not make sense for physical access in some areas like data centers or control centers but may make sense in areas like substations.
19.6	Southwest Power Pool Regional Entity	Agree with proposed method	Physical access control includes certain requirements, such as escort, that are not applicable to electronic access. If combined, the standard will need to carefully make the appropriate distinction between physical and electronic access controls as necessary.
19.7	Bonneville Power Administration	Agree with proposed method	Physical and Electronic access controls may sometimes use the same terminology, and appear similar, but they are very different disciplines. Physical security may use electronic tools are part of its tool kit. However, it is still primarily a physical and geographical control methodology. Electronic access controls are more amorphous, with boundaries being at once more difficult to define, but more easily and absolutely controlled. Combining them would only lead to confusion and probably to failure in the end.
19.8	FirstEnergy Corporation	Agree with proposed method	Preference is to keep all electronic access requirements together, all physical access requirements together, and all informational access requirements together, but keep the three separate from each other.

#	Organization	Yes or No	Question 19 Comment
19.9	San Diego Gas and Electric Co.	Agree with proposed method	SDG&E recommends separation of the concepts of Logical (electronic) and Physical access.
19.10	APPA Task Force	Agree with proposed method	The APPA Task Force agrees with the SDT's proposal to separate requirements for Physical Access and Electronic Access. We do want to point out that both are interdependent. If a BES Facility has physical access control and does not have external routable connectivity, you do not need cyber system access control. This is covered in our comments for a number of the requirements where we recommend changing the impact level from "Required" to "Required for Routable External Connectivity Only."
19.11	Madison Gas and Electric Company	Agree with proposed method	The separation allows for clarity in these two distinct areas.
19.12	Progress Energy - Nuclear Generation	Agree with proposed method	To improve this Requirement, see attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
19.13	Xcel Energy	Agree with proposed method	We believe the separation is beneficial because it recognizes cases where physical access is needed but electronic access is not required, such as in the case for a mechanical maintenance vendor who performs no duties requiring electronic access.
19.14	Regulatory Compliance	Agree with proposed method	Would not want the controls for Physical Access and Electonic Access to be mixed.
19.15	US Bureau of Reclamation	Combine Access	Agree, but physical, logical, and information access control requirements should all be

#	Organization	Yes or No	Question 19 Comment
		Control requirements	included under a single set of requirements.
19.16	ERCOT ISO	Combine Access Control requirements	All access control areas should be combined (i.e., electronic access, physical access, information access). This will enable ease of use of the standard and a clearer understanding of the requirements. The current practice of having to go from standard to standard to find the requirements makes it more likely to miss a requirement and risk potential violations.
19.17	Puget Sound Energy	Combine Access Control requirements	As stated in the comments for question 18, Puget Sound Energy would prefer to see consistency (or an explanation of the differentiation of physical and logical controls).
19.18	Detroit Edison	Combine Access Control requirements	Combine all access control and revocation requirements into one requirement and one table.
19.19	Garland Power and Light	Combine Access Control requirements	Combine Tables R5, R9, R13, and R24.4 into one table so one can look at one table and see all the “revoke” requirements in one place - for most companies, the same people are going to be involved with “revoking” regardless of the Requirement #.
19.20	Consultant	Combine Access Control requirements	If the requirements for access control are the same, then combining them is better.Consideration should be given to combining information protection access and wireless access as well.It will also be clearer if there are any differences in access requirements for different types of access to have them combined so differences are obvious.
19.21	Idaho Power Company	Combine	It makes sense to combine some of them such as authorization, PRA and training,

#	Organization	Yes or No	Question 19 Comment
		Access Control requirements	revocation. Others are more specific to the type of access and may not lend themselves to combining.
19.22	USACE - Omaha Anchor	Combine Access Control requirements	Makes it easier to know which access must be terminated without looking through the entire document.
19.23	Southern California Edison Company	Combine Access Control requirements	The drafting team may not have adequately addressed the intent of Order 706 with respect to system security controls. Local logical (electronic) access is and should be recognized as a type of role based access where one has to be physically present near a device to operate it. The boundary protection for this type of role is (a) the physical security boundary and (b) the device level electronic security boundary. The proposed standard as it is currently worded allows for the removal of at least one access mechanism at the time of revocation. In that case, removal of access through the physical boundary will ensure the immediate revocation of a component critical for this type of role. The drafting team should add additional revocation criteria to adequately address this type of revocation.
19.24	Reliability & Compliance Group	Combine Access Control requirements	Tracking is easier if they are combined. We suggest that information access control be also included.
19.25	American Municipal Power	Combine Access Control requirements	Whenever possible, please eliminate redundancy in the requirements.
19.26	Progress Energy (non-	Combine	Will these be two distinct groups or will many have both accesses? Many people with

#	Organization	Yes or No	Question 19 Comment
	Nuclear)	Access Control requirements	physical access to transmission facilities will also need electronic access, suggesting that a single group/list may be easier to maintain.
19.27	Florida Municipal Power Agency	Combine Access Control requirements	Without a change in the definition of BES Cyber System to include an exclusion similar to the existing CIP-002-2 R3.1, R3.2 and R3.3, then there can be thousands of digital relays covered by this standard. A relay technical could have electronic access to thousands of such relays. It would be impossible to change all of those accounts within the time limits proposed in R9. We need to be careful in developing the standards that we do not cause unintended consequences of changing behavior that would reduce the reliability of the BES. This requirement R9 (and others within the standard) may have an unintended consequence of causing entities to revert to electro-mechanical relays to avoid onerous requirements in the standards. Reverting to electromechanical relays would likely increase costs as far as increased maintenance and testing requirements, but, would save costs of having to change accounts at numerous remote locations every time an employee changed positions.FMPA suggests combining physical and electronic (including wireless) access requirements to develop more reasonable requirements for situations such as these, e.g., revoking physical access to BES Cyber Systems with no external routable protocol should be enough. Thinking through these combinations is important to developing reasonable requirements.

20. Requirement R8 of draft CIP-011-1 states "Each Responsible Entity shall apply the criteria specified in CIP-011-1 Table R8 – Account Management Implementation to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of criteria that are included in Requirements Table R8? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification. Do you agree with the impact levels for each criteria as represented in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R7 and R8 have been moved to CIP-004-5 and CIP-007-5.

Some commenters expressed confusion regarding the definition of "monitor" with respect to shared and guest account access privileges. In response, the specific term "monitor" has been removed from these account access requirements in favor of clearly defining the functions and actions associated with monitoring. Requirements to monitor access control have been moved to the Security Event Monitoring requirements in CIP-007-5.

Some commenters expressed a belief that the requirement for quarterly review of accounts and access privileges is excessive. The SDT notes that the quarterly review is required for Medium and High Impact BES Cyber Systems. The drafting team has clarified that it is not necessary to perform a detailed quarterly review of entitlements at the individual asset level.

Some commenters expressed a need to make the requirements for Account Management Specifications (CIP-011-1 R7) and for Account Management Implementation (CIP-011-1 R8) more consistent. In response, the drafting team has attempted to supply consistency as suggested by the commenters and has included these requirements in CIP-007-5.

Some commenters suggested removal of allowance of "guest" accounts. The drafting team believes there are reasons to retain "guest" accounts, and that complete removal would cause a hardship to some entities or may not be possible. Those using such accounts should be identified as required in the modified requirement.

Some commenters suggested combining Account Management Implementation (CIP-011-1 R8) with Access Revocation (CIP-011-1 R9). The drafting team has combined requirements in all cases where it seems feasible. However, what was formerly R9 concerned revocation, which carries a different VRF than most other access control requirements, and the subject matter concerns personnel actions. The Access Revocation requirements are now defined in CIP-004-5 R7.

Some commenters suggested changing R8.3 to "maintain a list of those who have access to guest/shared accounts." After review, the SDT determined that this part of the requirement was unnecessary and has removed it.

#	Organization	Yes or No	Question 20 Comment
20.1	National Rural Electric Cooperative Association (NRECA)		In R8.3, how do your demonstrate "monitor" to an auditor? This should be reworded such that both the auditor and the utility understand this the same way.
20.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
20.3	The Empire District Electric Company	Agree	Comments: Note impact level comments under question 21.
20.4	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.”Apply criteria” is not a strong requirement. The activity is account management, so, the requirement ought to be account management and R7 and R8 can be combined.Quarterly reviews of all accounts and privileges could be an onerous activity, and could actually decrease the reliability of the BES due to the higher rate of human error. FMPA suggests annual review of accounts and associated access privileges.
20.5	Puget Sound Energy	Agree	Puget Sound Energy suggests that R8.1 include wording regarding the removal of accounts. Example: “Establish and implement a process for authorizing the addition of account(s) and associated access. This process shall include necessary steps for the removal of accounts when no longer necessary.”
20.6	Progress Energy - Nuclear Generation	Agree	R8 can be improved by incorporating information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
20.7	APPA Task Force	Agree	The APPA Task Force Agrees with the criteria. See our response to Question #21 for

#	Organization	Yes or No	Question 20 Comment
			the Impact Levels discussion.
20.8	FEUS	Agree	The drafting team should clarify 8.3 what is intended to 'monitor' the use of shared and guest accounts.
20.9	Bonneville Power Administration	Agree	The objective of this requirement ("to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Item 8.2 in Table R8 states "Conduct a quarterly review and verification of accounts and associated access privileges." It does not indicate what type of documentation is required to demonstrate compliance. Is an attestation sufficient documentation? Or is the Responsible Entity required to have specific documentation of its quarterly review by account types, etc?
20.10	Reliability & Compliance Group	Agree	The requirements in table 8 really should apply to medium impact systems as well.
20.11	Independent Electricity System Operator	Disagree	- R8.3 is anonymous synonymous with null sessions? If so then this will be difficult since anyone in the same network can connect with a null session.
20.12	Southwest Power Pool Regional Entity	Disagree	8.1: Authorization should be required for both the addition and the modification of a user account. 8.3: Define what is meant by "monitoring" the use of the shared and guest/anonymous accounts. Is it sufficient to know that someone used the account or must their activities with the account be monitored? Is monitoring required in real-time or after the fact? Is there a requirement to review account activity after the fact?
20.13	Con Edison of New York	Disagree	8.2 Quarterly reviews are excessive, suggest annual reviews and a documented

#	Organization	Yes or No	Question 20 Comment
			process for adding, removing or modifying access8.3 Need clarification on what monitoring means outside of annual review of if it is still required
20.14	Progress Energy (non-Nuclear)	Disagree	8.2 Quarterly seems to be too frequent - propose 6 months or longer. We are required in R9 to revoke access for those that are terminated or do not need access within 72 hours.
20.15	American Electric Power	Disagree	8.3, regarding "Monitor the use of shared and guest/anonymous accounts". This is not technically feasible on all systems. What level of detail is required to monitor the use? Does this need to be an automated electronic process? Is it even feasible to believe this can be done manually? How long must this monitoring data be kept?This should be removed.
20.16	Michigan Public Power Agency	Disagree	A quarterly review and verification of accounts would be overly burdensome and would not improve the electronic security of the system compared to a defined "annual" review.
20.17	BCTC	Disagree	Â Suggest removing “guest” from the language; guest accounts should not be permitted to be used in a secure systemÂ R 8.3 why single out monitoring of shared and guest accounts; should we not monitor all accounts?; unsure what the objective of this requirement is
20.18	Entergy	Disagree	Again, this is similar to NEI-08-09 Rev 6 Section 1.2. However, we question the advantage of having Account Management Implementation separate from Access Revocation. Please consider combining R9 with R8 by adding requirements 8.4 and 8.5 (below) and modifying the language in 8.1, as well as adding ‘required’ to low and medium impact BES Cyber Systems for 8.2 and 8.3.
20.19	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes a technical feasibility exception may be required base on the current wording of this requirement when considering local access to programmable electronic devices in a substation environment that do not

#	Organization	Yes or No	Question 20 Comment
			support the ability to demonstrate acceptable use.
20.20	Dominion Resources Services, Inc.	Disagree	Dominion recommends changing the wording of R8.3 to read:"Maintain a list of who has access to shared and guest/anonymous accounts."
20.21	US Bureau of Reclamation	Disagree	If the requirements of R7 are going to be implemented/established at all levels, an account management process should be required at the same levels.
20.22	LCEC	Disagree	In 8.1, changes to existing accounts that grant additional access should be authorized as well.
20.23	Black Hills Corporation	Disagree	In 8.2, quarterly is a good goal, but without a solid definition of the window associated with "quarterly", this will be an evidence gathering problem - suggest changing to semi-annual.
20.24	Minnesota Power	Disagree	In Part 8.3 of Table 8 the Standards Drafting Team needs to clarify what is meant by the term "monitor." Does this mean that Registered Entities need to be able to review who (named individual) accessed a shared account, and when this access occurred, or does this require logging their actions while utilizing the shared account? In addition, does this include system/admin accounts (as they are listed above as being different than shared accounts)? These measures seem to be appropriate, but implementation and providing auditable evidence could be difficult.
20.25	Idaho Power Company	Disagree	Monitor in 8.3 is vague. Would it require just that we know who used the account when or more detail about what the user did while using the account.
20.26	National Grid	Disagree	National Grid recommends changing Requirement 8.2 from "quarterly review" to "annual review" since the extra work is noticeably less than the benefit. Request clarification on 8.3 "monitor"
20.27	NextEra Energy	Disagree	NextEra believes the standard requirement 8.3 needs to be clarified regarding the

#	Organization	Yes or No	Question 20 Comment
	Corporate Compliance		ability to "Monitor" the use of shared and guest/anonymous accounts. What is the extent of this monitoring? If allowed by the standard, we do not believe effective monitoring of the use of these generic accounts is feasible due to their generic nature. This may be better stated as maintaining logging information and ensuring that quarterly reviews ensure access is documented to individuals with valid business need and credentials.The impact levels are appropriate for the requirement. However, for Requirement 8.2 it is unclear what an acceptable verification method is. Clarification regarding recommended methods for verifying accounts and privileges especially for legacy BES Cyber System components should be included in the requirement.Additionally, Requirement 8.3 is concerning because it is unclear what monitor means in the context of the requirement, the word should be clearly defined. Multiple users can use shared accounts at the same time and that would be something impossible to monitor. If monitor means who has approval to use shared accounts and who is has access to the password for shared accounts that should be defined in the requirement. Likewise, it is unclear how to monitor anonymous access. Clarification should be provided regarding the definition, intent, and appropriate evidence to demonstrate monitoring.
20.28	Oncor Electric Delivery LLC	Disagree	Not all BES Elements can monitor the use of shared and guest/anonymous accounts. TFE should be applicable. Requirement 8.3 should only apply to remote routable communications.
20.29	American Municipal Power	Disagree	Please provide a little or no impact level category
20.30	Pepco Holdings, Inc. - Affiliates	Disagree	Please reference to question 17.
20.31	Ameren	Disagree	R8.2 - Exhaustive review of all accounts quarterly will be time consuming with no added protection to the BES; this requirement should be changed to annually.

#	Organization	Yes or No	Question 20 Comment
20.32	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R8.2. Due to the requirements of R9 the review and verification time should be extended to an annual time frame.
20.33	Western Area Power Administration	Disagree	R8.3 - What constitutes “monitoring” of the use of shared and guest/anonymous accounts?
20.34	EEI	Disagree	R8.3 may create the possibility that an Entity would have to be able to show who used a shared account or password each time that it was used. This is an unimplementable requirement; the requirement should be clarified to make it clear that what must be tracked is the ability to use the shared account.
20.35	Southern Company	Disagree	R8.3 may create the possibility that an Entity would have to be able to show who used a shared account or password each time that it was used. This is an unimplementable requirement; the requirement should be clarified to make it clear that what must be tracked is the ability to use the shared account. In addition, . this requirement could require a large number of TFE’s for systems which do not support multiple passwords.
20.36	Kansas City Power & Light	Disagree	R8.3: What does the “Monitor” represent?
20.37	Hydro One	Disagree	Recommend changing Requirement 8.2 from “quarterly review” to “annual review”. There are no additional benefits to the shorter review period.Request clarification of the use of “monitor” in 8.3.
20.38	ISO New England Inc	Disagree	Recommend changing Requirement 8.2 from “quarterly review” to “annual review” since the extra work is noticeably less than the benefitR8.3 is anonymous synonymous with null sessions? If so then this will be difficult since anyone in the same network can connect with a null session. clarification on monitoring use of shared accounts.

#	Organization	Yes or No	Question 20 Comment
			"use" not provisioning. login/logout, all activity while logged in? commands used?
20.39	Northeast Power Coordinating Council	Disagree	Recommend changing Requirement 8.2 from “quarterly review” to “annual review”. There are no additional benefits to the shorter review period.Request clarification of the use of “monitor” in 8.3.
20.40	BGE	Disagree	Replace the word “elements” with Cyber System Component to maintain consistency with the defined terms. R7 & R8 requirements need to be synchronized. What is the definition of “monitor” (track actions, how much detail, will sudo suffice?)
20.41	Northeast Utilities	Disagree	Request clarification:- Are shared accounts included in 8.2 and required to be reviewed quarterly?- What does monitor mean in 8.3?
20.42	Garland Power and Light	Disagree	Requirement 8.3 - Do not believe that shared and guest/anonymous accounts should be allowed.
20.43	Network & Security Technologies Inc	Disagree	SDT should clarify intent of 8.3 (monitor use of shared and guest/anonymous accounts).
20.44	GE Energy	Disagree	Some type of account and privilege review should be required for Medium Impact systems, but not on a quarterly basis. These systems may well be used to validate software before promoting it to High Impact systems, and thus should have some account management due diligence.
20.45	Platte River Power Authority	Disagree	Suggested Revision:8.3 Track individuals that have been granted access to shared and guest/anonymous accounts.
20.46	Duke Energy	Disagree	Table 8: 8.2 quarterly reviews are too frequent. Suggest annually8.3 explain what is meant by “Monitor”What are the expectations for monitoring use of shared and guest/anonymous accounts? Is that up to the Responsible Entity? If the RE provides a procedure/policy and follows the policy, is that sufficient to pass audit?What is the

#	Organization	Yes or No	Question 20 Comment
			acceptable practice? 24/7?
20.47	ReliabilityFirst Staff	Disagree	Table R8; row 8.1 - suggest adding the word “document”, row 8.2 - what constitutes “review” and suggest the review should be documented, row 8.3 - what does “monitor” mean?
20.48	Constellation Energy Control and Dispatch, LLC	Disagree	The phrase "monitoring the use" of accounts is too vague.
20.49	ERCOT ISO	Disagree	The requirements of R7 and R8 can be combined. The purpose of each requirement is so similar that there appears to be no reason to separate them.
20.50	WECC	Disagree	The table lists three procedures for account management. Suggest this requirement be written to state: “Each Responsible Entity shall have implemented and documented procedures as described in Table...”The requirements should mandate additional rigor around access management, including the maintenance of access lists or automated provisioning systems. Additional specificity should be added to clarify the level of detail at which access must be tracked.
20.51	Consultant	Disagree	The word 'criteria' should be changed to requirements, as the table is listing requirements.Suggest replacing the words "to prevent malicious operation of BES Elements by maintaining..." with to maintain control..."Table R8-8.3 Not clear why this only applies to shared and guest accounts? And the difference between 'monitoring' and 'logging' is not clear.Suggest requirement is to "Log electronic access to BES Cyber Systems." and keep as required for High Impact Systems.
20.52	Dairyland Power Cooperative	Disagree	Validating whether users are assigned to appropriate roles or accounts should follow this timing. A detailed review to insure that the roles (or account groups) have proper permission settings can be a very time consuming and complex task depending on the complexity of a system. The detailed role definition review should be no more frequent than annually. The language used is not clear as to whether a distinction is

#	Organization	Yes or No	Question 20 Comment
			intended.
20.53	GTC & GSOC	Disagree	We recommend in R8.3 the term "Monitor" be replaced by "Review monthly". The term "monitor" could be taken to imply real time monitoring. Many entitities do not have the communication links required to meet such a real time requirement.
20.54	Alliant Energy	Disagree	We recommend retaining the annual requirement for 8.2 account review while retaining a quarterly requirement for personnel access review.8.3 needs more clarification regarding the activities included in the term “use” so as to provide specific guidance as to what constitutes a sufficient audit record.
20.55	The United Illuminating Co	Disagree	What is the intent of 8.3? It is difficult to discern what Monitor means in this requirement.
20.56	Manitoba Hydro	Disagree	word “Monitor” in Requirement 8.3 is unclear.

21. Table R8 provides direction concerning what impact level of BES Cyber Systems to which Requirement R8 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R8 has been moved to CIP-007-5 R5.

Some commenters expressed concern CIP-011-1 R8.1 (Account Authorization) should apply to all three impact levels. In response, the SDT notes that authorization also implicitly carries with it requirements for account review, revocation, and training. The SDT did not believe that the effort required to comply with these requirements for all three impact was appropriate given the risk posed to the Bulk Electric System.

Other commenters expressed concern that only Medium Impact BES Cyber Systems with routable external connectivity should be subject to the Table R8 requirements. The SDT disagrees and believes regardless of a BES Cyber System's communication characteristics, it is important to ensure that access to BES Cyber System is properly authorized and subject to periodic review.

Other commenters also expressed concern that the requirements in Table R8 should be aligned with those in Table R7. In response, the Table 7 and Table 8 requirements have been combined into CIP-007.

Some commenters expressed that the impact levels in R8.2 should have different review periods. The SDT believes a quarterly review period for access authorization and an annual review period for access privileges are appropriate for both High and Medium Impact BES Cyber Systems.

#	Organization	Yes or No	Question 21 Comment
21.1	Florida Municipal Power Agency	Agree	For item 8.1 through 8.3, we would propose adding the following under Medium Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections.
21.2	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.

#	Organization	Yes or No	Question 21 Comment
21.3	Puget Sound Energy	Agree	Puget Sound Energy suggests aligning Table 7 account identification to Table 8 account management. If account management is not required for Low Impact BES Cyber Systems then it is unclear what benefit is there in identification of those accounts.
21.4	Progress Energy - Nuclear Generation	Agree	R8 can be improved by incorporating information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
21.5	Progress Energy (non-Nuclear)	Agree	See comment 14.
21.6	FirstEnergy Corporation	Agree	While the proposal provides flexibility based on Impact Categorization from a practicality viewpoint it will be easier to administer if all are treated equally. FE would likely take a conservative approach and treat all the same to simplify administration of this requirement.
21.7	ReliabilityFirst Staff	Disagree	8.1 should apply to all BES Cyber Systems. 8.2 should provide different periods of review for different levels of impact. Suggest making these annual for Low Impact, semi-annual for Medium Impact, and quarterly for High Impact.Suggest “required” Medium Impact for row 8.3.
21.8	ERCOT ISO	Disagree	8.1: Should be required for all. 8.2: Could be documented temporally. Low Impact required annually. Medium Impact required quarterly. High Impact required quarterly. 8.3: Please clarify meaning of “monitor”. Should be revised to address who has access to the accounts.
21.9	US Army Corps of Engineers, Omaha Distirc	Disagree	8.3 "monitor the use of" is somewhat vague. What would the measure be? Please define

#	Organization	Yes or No	Question 21 Comment
21.10	Southwest Power Pool Regional Entity	Disagree	Account authorization is a basic security control and should be applicable at all impact levels. Periodic review is also important and should be done for at least Medium impact systems as well, albeit more frequently for High impact than lesser impact.
21.11	Alliant Energy	Disagree	Alliant Energy agrees with EEI's comments relative to 8.3 and the consideration of capabilities and connectivity.
21.12	USACE HQ	Disagree	At a minimum, 8.2 should be required for all impact levels. Requirement 7 creates a document of every account type and its acceptable use, but for low and medium impact systems it is not required to update the same as per requirement 8.2.
21.13	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
21.14	The Empire District Electric Company	Disagree	Comments: For item 8.1 through 8.3, we would propose adding the following under Medium Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.
21.15	FEUS	Disagree	Disagree: The drafting team should consider 8.1 be applicable to LOW BES Cyber Systems for consistency with 7.1, 7.2, and 9.1. Without a process for authorizing new accounts it is difficult to review approved accounts and to revoke access that was not authorized.
21.16	WECC	Disagree	Even "Low Impact" systems have the capability of impacting operation of the BES within 15 minutes, thus these requirements should be required for all impact levels. Again, this requirement could then be rewritten without the table to provide more clarity.These requirements should apply to all impact levels

#	Organization	Yes or No	Question 21 Comment
21.17	San Diego Gas and Electric Co.	Disagree	For entities that own both Medium & High impact assets, they will likely perform all of the requirements contained in Table 8 for both classes of assets instead of maintaining separate procedures and mechanisms that will have a higher risk of compliance errors. SDG&E believes it just adds potential confusion to the process to have different requirements for Medium and High impact assets in this instance.
21.18	MRO's NERC Standards Review Subcommittee	Disagree	For item 8.1 through 8.3, we would propose adding the following under Medium Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.
21.19	American Transmission Company	Disagree	For R8.1 through R8.3 suggest adding "Required for routable external connectivity only." At the present there is no practical method to monitor the use of devices such as relays and IMUXs when accessed from inside a substation. They may be able to be front-ended, but as yet it has not proven viable.
21.20	Consultant	Disagree	If 8.1 requires authorizing accounts for Medium Impact Systems, then quarterly review of 8.2, and the logging access of 8.3 (see previous comment) should be required for those systems.Or, remove the requirement in 8.1 for Medium Impact Systems.
21.21	US Bureau of Reclamation	Disagree	If the requirements of R7 are going to be implemented/established at all levels, an account management process should be required at the same levels.
21.22	Black Hills Corporation	Disagree	In 8.3, do not understand why guest/anonymous accounts would be allowed. Should be limited to shared accounts only.
21.23	E.ON U.S.	Disagree	It is not clear what is meant by the term "monitor." Does monitor in 5.2 mean active

#	Organization	Yes or No	Question 21 Comment
			monitoring, e.g., video" Does it mean log?
21.24	Emerson Process Management	Disagree	It is prudent that account and privilage can only be created and granted with proper authorization. This principal should be applied to any BES Cyber System.
21.25	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
21.26	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's comments below:Regarding Table R8 Row 8.1:There can be a documented process even for low impact systems. It may not be as rigorous as for medium or high impact systems.Regarding Table R8 Row 8.3:There needs to be consideration of capabilities and connectivity options for different devices. For example, devices without external connectivity or that use non-routable protocols may not be able to provide monitoring functionality. Moreover, even devices that use routable protocols may not have the ability to provide information about account use.
21.27	Con Edison of New York	Disagree	Modified 8.2 should be required for medium (annual review)
21.28	American Municipal Power	Disagree	Please provide a little or no impact category
21.29	BGE	Disagree	R7 & R8 requirements are not synchronized.
21.30	Ameren	Disagree	R8.3 - should be required for Medium Impact Systems.
21.31	Allegheny Energy Supply	Disagree	Regarding Table R8 Row 8.3:There needs to be consideration of capabilities and connectivity options for different devices. For example, devices without external connectivity or that use non-routable protocols may not be able to provide monitoring functionality. Moreover, even devices that use routable protocols may not have the ability to provide information about account use.

#	Organization	Yes or No	Question 21 Comment
21.32	Allegheny Power	Disagree	Regarding Table R8 Row 8.3:There needs to be consideration of capabilities and connectivity options for different devices. For example, devices without external connectivity or that use non-routable protocols may not be able to provide monitoring functionality. Moreover, even devices that use routable protocols may not have the ability to provide information about account use.
21.33	EEI	Disagree	Regarding Table R8 Row 8.3:There needs to be consideration of capabilities and connectivity options for different devices. For example, devices without external connectivity or that use non-routable protocols may not be able to provide monitoring functionality. Moreover, even devices that use routable protocols may not have the ability to provide information about account use.
21.34	Southern California Edison Company	Disagree	SCE believes it may be possible to leverage the NERC PRC standards to effect compliance. In R8.2, an additional control with a timeframe longer than a quarter may be added for low and medium impact systems. It seems that access to low and medium impact systems never has to be verified. Although monitoring under R8.3 is not required for low and medium, which SCE is in agreement with, SCE believes that R8.2 should be modified where list of accounts and access privileges are tracked on a time bound basis.[MVL-HOW?] This may be an opportunity for the drafting team to review the appropriate NERC PRC standard on protection relay maintenance schedules and leverage the compliance requirements stated there.
21.35	GE Energy	Disagree	See question 20 comments
21.36	Entergy	Disagree	Suggest 8.2 apply to medium assets as 8.1 required a process for authorization. There is value in reviewing access lists from a security perspective.
21.37	Network & Security Technologies Inc	Disagree	Suggest adding a periodic review of access privileges to Medium Impact systems (8.2), perhaps every 12 months in lieu of quarterly.

#	Organization	Yes or No	Question 21 Comment
21.38	Alberta Electric System Operator	Disagree	The AESO believes that reviews should also be performed for Low and Medium Impact levels. Consider creating additional rows in the table to perform annual reviews for Low and Medium Impact BES Cyber Systems.For Table 8.1 - A process should be required for all impact levels.For Table 8.3 - Monitoring should be performed for all impact levels, however frequency of monitoring can be dependent on the impact level.
21.39	APPA Task Force	Disagree	The APPA Task Force supports the proposal by the MRO-NSRS to change 8.1 - 8.3 under Medium Impact to read "Required for routable external connectivity only." As stated in our response to Question #19, the physical security is covered in requirement R5 so only routable external connected devices are vulnerable. The tables should therefore read:R8 Table 8.1: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR8 Table 8.2: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: RequiredR8 Table 8.3: Low Impact: N/AMedium Impact: Required for routable external connectivity onlyHigh Impact: Required
21.40	Constellation Power Source Generation	Disagree	The impact levels mapped out in R8 should be changed to mimic those in R7. Why identify all account types for every BES Cyber System, but then require processes for authorization and quarterly reviews of privileges for some of the impacts?
21.41	Reliability & Compliance Group	Disagree	The requirements in table 8 really should apply to medium impact systems as well.
21.42	Southern Company	Disagree	The scoping levels of R7-R14 are vastly expanded when compared to R5 and R6. Each requirement should be examined to determine the correct scope to best support overall reliability. The lack of differentiation based on connectivity and BES component type, in conjunction with the inclusion of requirements that have a per-low-system-component impact, mean that the vast majority of the effort involved in CIP compliance will have to be spent on low-impact, relatively unimportant assets,

#	Organization	Yes or No	Question 21 Comment
			often at the expense of overall reliability.
21.43	Oncor Electric Delivery LLC	Disagree	These requirements should only apply to systems with routable communications.
21.44	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments regarding Table R8 Row 8.3.
21.45	We Energies	Disagree	We Energies agrees with EEI regarding Table R8 Row 8.1:There can be a documented process even for low impact systems. It may not be as rigorous as for medium or high impact systems.We Energies agrees with EEI regarding Table R8 Row 8.3:There needs to be consideration of capabilities and connectivity options for different devices. For example, devices without external connectivity or that use non-routable protocols may not be able to provide monitoring functionality. Moreover, even devices that use routable protocols may not have the ability to provide information about account use.

22. FERC has mandated immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset. Requirement R9 of draft CIP-011-1 states "Each Responsible Entity shall revoke system access to its BES Cyber Systems as specified in CIP-011-1 Table R9 – Access Revocation to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of criteria that are included in Requirements Table R9? Please explain and provide any suggestions for modification, including time proposals. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R9 has been moved to CIP-004-5 R6 and R7.

A number of commenters requested that the Standards make a distinction between "primary" access and "secondary" access, based on an understanding that an individual would need primary access to be able to use any secondary access (such as a database account). The SDT has revised the access revocation requirements (CIP-004 R7) to state that revocation of access includes remote, electronic, and physical access to the BES Cyber Systems. The requirements also address the revocation of "the ability to access" BES Cyber Systems and BES Cyber System Information as well as the resulting follow up actions related to additional assets (such as applications and databases). The SDT believes this best captures the concept of primary and secondary access.

Other commenters suggested revocation "with cause" should remain at 24 hours, and revocation "without cause" should remain at 7 days. This timing would keep the CIP requirements in alignment with the DHS Catalog of Control Systems Security requirement 2.34 - Personnel Termination and DHS Catalog of Control Systems Security requirement 2.35 - Personnel Transfer. In response, the SDT notes the FERC Order directs revocation of access to occur immediately in all cases where access is no longer needed. The requirement has been modified to simply revoke access when a person no longer needs it. Given that organizations usually have termination procedures to return company property and perform exit interviews, the SDT believes the processes for revoking access (both physical and remote electronic) can be incorporated into an organization's termination and transfer procedures.

Some commenters expressed concern that the revocation timeframe requirements based on combinations of BES Cyber System type and Impact Level are overly complex, and add confusion and undue administrative overhead in situations of job changes. To address this, commenters recommended more consistent timeframes. In response, the requirement has been modified to simply revoke access when a person no longer needs it. Evidence showing termination down to the hour is not practical in many cases. In the revised requirements, entities will show revocation of access as part of their termination procedures and demonstrate they follow these procedures (i.e., through dated sign-off records, system logs or actual system access control databases).

#	Organization	Yes or No	Question 22 Comment
22.1	Green Country Energy	Agree	Additionally addressing the transfer of responsibilities to another individual shpould be addressed if the terminated employee is a system administrator or such. If a "key" individual is terminated it may be quite a process to remove them from the system within 24 hours,leaving a system vulnerable or a backup plan unable to be executed. In summary termination with cause of a high security level employee could be very difficult to accomplish in 24 hours.
22.2	Oncor Electric Delivery LLC	Agree	One of the few examples where “Control Center” is separated from Transmission and Generation.
22.3	FEUS	Agree	The drafting team should consider revising the wording for revocation as ‘immediately but not to exceed XX hours’
22.4	Progress Energy - Nuclear Generation	Agree	To improve implementation of this requirement incorporate information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
22.5	Regulatory Compliance	Disagree	9.1 - clarify for service vendor that the clock should start upon notification to the entity.9.2-9.4 - 7 day revocation across the board
22.6	American Electric Power	Disagree	9.2 - 9.4: Recommend rewording 9.2-9.4 to match 5.7-5.9 or vice versa.Recommend removing physical access and external connectivity within a short-time window, and application rights later.
22.7	ISO New England Inc	Disagree	9.2, 9.3, 9.4 - all should be within the same time frame 72 hours. Same level of security issues or concerns across all (control center, trans, gen). Remove Requirements 9.3 and 9.4R9.2, R9.3 a d R9.4 suggest changing the requirement to “Review access to BES Cyber Systems for personnel that change job responsibilities as a result of reassignment, transferred to other positions within x hours of the

#	Organization	Yes or No	Question 22 Comment
			change."The purpose of the requirement is so that personnel have the least amount of access that is needed to do their jobs and so that they don't accumulate access as they move around. Also this is to limit possible segregation of duty violations and to require that authorized access permissions are the minimum necessary to perform work functions. (R10.6)
22.8	Dominion Resources Services, Inc.	Disagree	9.2, 9.3, and 9.4. To meet regulatory directives, if job duties are changed due to disciplinary actions or are "forced" on the user then a shorter time frame may be necessary. However, the current 24 hour time period is the least time period that can be reasonably accommodated through the business processes. And 24 hours is only possible if Revoking System Access is limited to controls that prevent the user from physically and electronically accessing the system. For example, if the user must either have physical access to the device or authenticate through a corporate system (e.g., active directory) before being allowed to access a BES Cyber System, then removal of physical access rights and of the ability to authenticate in the corporate system meets the Requirement for revoking system access, even though an account may still exist on the BES Cyber System. The account on the BES Cyber System would be removed within 7 days since many BES Cyber Systems are not administered 24x7.Requirement R4 establishes the process for personnel risk assessments. This practice determines the loyalty, reliability and trustworthiness of an individual as a prerequisite to authorizing logical or physical access. This is a standard practice used throughout the physical and cyber security industry and accepted by other regulatory agencies and Federal programs. Similar to R4.3, personnel risk assessments typically must also re-validate this trustworthiness periodically - commonly within 7 years and in some cases more frequently depending on the nature of the access. The presumption is that, once trustworthiness is established, it is not invalidated unless there is cause to reconsider or an individual voluntarily terminates their employment or retires. Only in instances where the established trustworthiness is in question, is prompt access revocation appropriate and warranted. Consequently, for personnel who "no longer require access", but for which there is no cause to question their trustworthiness, there is no basis for immediate or prompt revocation of access

#	Organization	Yes or No	Question 22 Comment
			within the time frames specified in this standard. The DHS Catalog for Control System Security Controls, Sections 2.3.4 and 2.3.5 reflect this practice - requiring revocation of access for cause within 24 hours and revocation of access for personnel reassigned or transferred to another position within 7 days. In other regulatory programs, revocation of access, not involving a question of change in trustworthiness, is handled via a periodic (e.g., monthly) review of access only. The 7 day requirement in the current standards would meet or exceed standard practice in this case. The requirements should be clarified to state that if there is no triggering event indicating that access is no longer required, then that determination can be made at the quarterly review.
22.9	Con Edison of New York	Disagree	9.2,3,4 - may be dependent on a company's existing HR/Payroll business system capabilities and introduce significant costs to remediate. Even though the individuals were trusted and the trust did not change as a result of cause. A week may be more realistic
22.10	US Bureau of Reclamation	Disagree	A requirement for revocation needs to be included for all impact levels. Suggest the timeframes for Requirements 9.2 through 9.4 be established on the basis of business days (for example 2 business days) or that the number of hours be increased cover long weekends.
22.11	MidAmerican Energy Company	Disagree	Access removal should be considered complete by removing physical and remote access. Removing physical and remote access effectively removes access to any BES Cyber Systems. Also see MidAmerican Energy's response to question 54.
22.12	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.Also, 9.2 - 9.4 is the second of many occurrences where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the business need change. Terminations

#	Organization	Yes or No	Question 22 Comment
			for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement.
22.13	Kansas City Power & Light	Disagree	Are these requirements applicable for electronic and physical access? 36 and 72 hours are too short a time frame for considering personnel who have changed access status other than that of termination when consideration of weekends and holidays. 5 to 7 business days would be an appropriate time frame. For personnel terminated for cause, 24 hours is acceptable.
22.14	Xcel Energy	Disagree	As noted in our response to a previous question, the 36 and 72 hour timeframes to revoke unescorted physical access for individuals no longer requiring access under 5.8 and 5.9 are not justified. When the change is for a business reason such as a job change 7 days is sufficient for access removal. When the access change is unrelated to a termination for cause, the individual's trustworthiness and reliability are not in question and the short timeframes are not warranted.
22.15	E.ON U.S.	Disagree	CIP-011-1, R9 references "system access." Does this mean physical or electronic access? For requirements 9.3 an d 9.4 it can be difficult to determine the exact time a person no longer needs access if, for example, the person has not required access for an extended period of time.E.ON U.S. does not believe compliance requirements are necessary for the low impact category.
22.16	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
22.17	The Empire District Electric Company	Disagree	Comments: If physical access is removed per R5, and remote access is removed per R13, this effectively removes all avenues to electronic access. Therefore, we propose

#	Organization	Yes or No	Question 22 Comment
			that the period for removing electronic access be lengthened.
22.18	BGE	Disagree	Define “immediate”. The table does not specify that the revocation is for personnel with electronic access. Combine 9.2, 9.3 & 9.4 revocation for any high impacted system should be consistent.
22.19	USACE HQ	Disagree	Does not make sense to create “for cause” requirement in any environment but a “no longer require” for only three (3) specific environment. I suggest to only have a two requirements, one (1) “for cause” and one (1) “no longer require”.
22.20	Duke Energy	Disagree	For 9.2, change 36 hours to 48 hours. Is the FERC mandate for ALL BES systems? Is there any room for loosening the requirement for low impact system?
22.21	Reliability & Compliance Group	Disagree	For personnel transferring to new positions where access is no longer available, 36 hours seems unduly burdensome. Recommend that this be changed to 72 hours for personnel no longer needing access to control center BES Cyber Systems.Also, this contradicts R5. Why do you need to revoke physical access at all for medium impact systems if you did not authorize it in the first place?
22.22	LCEC	Disagree	I agree with the intent of this requirement but need additional clarification to determine what is meant by revoking system access. Access may be granted at a system or component level. If system, network & wireless access is removed is this requirement satisfied? If audited at the component level, it may not be possible to make all of the necessary changes within the timeframes that are being dictated. The scope of this requirement should be clarified to indicate remote or wireless access only. Component level access will be mitigated by the physical security controls.
22.23	MRO's NERC Standards Review Subcommittee	Disagree	If physical access is removed per R5, and remote access is removed per R13, this effectively removes all avenues to electronic access. Therefore, we propose that the period for removing electronic access be lengthened.

#	Organization	Yes or No	Question 22 Comment
22.24	WECC	Disagree	If the goal is to revoke access at termination (“immediate”) then the requirement should state simply, “The Responsible Entity will remove electronic and physical access at the time of termination.” This should be possible for any entity that has use physical tokens for physical or electronic access (such as RSA SecurID, keys, RFID badges), however it would NOT be possible for entities that are still using access control systems with passwords, combination locks, or other access methods where revoking access requires reprogramming of devices. Note- this could indirectly require token based authentications for perimeter access which is not necessarily a bad requirement for medium and high impact systems.Terminations for cause should require immediate revocation of access - performed in conjunction with the termination notification to the employee. This is already standard practice at many entities. Additional criteria regarding employee suspensions should be added.
22.25	Consultant	Disagree	Immediate revocation is not achievable as indicated by the fact that there is a time frame for each identified revocation condition. Suggest using rules similar to the nuclear plants for access revocation, as those rules have over 30 years of regulatory basis for being adequate to control access revocation.R9. - Suggest deleting the words "...by maintaining control of access to its BES Cyber Systems," Revoking access does prevent malicious operation.9.1 - If access to Low Impact Systems does not require an authorization process(R8), then it is illogical to require the undocumented access to be revoked.9.1, 9.2, 9.3, & 9.4 - Whatever time frame is selected, the revocation time should be stated in days, either working days or calendar days, as personnel transactions typically are not conducted or tracked on an hourly basis.9.2, 9.3, & 9.4 - Having a different time frame for different types of facilities is an added dimension to the impact categorization that should be eliminated. If there is a basis for a difference in revocation times for different facility types, that difference should be included in the impact categorization criteria, not by trying to add additional categorization criteria in the requirements.9.2, 9.3, & 9.4 - the word "such" in the statement is unnecessary. Suggest deleting the word "such".Similar to combining access requirements, the revocation requirements should be combined. This makes both

#	Organization	Yes or No	Question 22 Comment
			similarities and differences easier to understand.
22.26	Minnesota Power	Disagree	In extreme circumstances, it may not be possible to adhere to proposed the 24 and 36 hour revocation timeframes, especially in instances where BES Cyber System support is 8 hours a day, 5 days a week or where notification of termination comes from corporate systems that are also updated on an 8 hours a day, 5 days a week schedule.Are we to interpret “revoke system access” to mean access to individual accounts, or does it also include shared/group/system/admin accounts known by the person who no longer requires access?
22.27	LADWP	Disagree	It is infeasible to revoke access to Medium and High BES systems within the max 72-hour requirement. a. Revocation of Hard-Copy information should not be considered under the standard. b. The current 7 day window for revocation of access for individuals no longer needing access is reasonable and should remain a part of the standard.
22.28	Allegheny Energy Supply	Disagree	It may be appropriate to address revocation of access within the context of “Effective Access.” For example, if an individual requires a multi-factor method to access BES Cyber Systems remotely, and one or more of the elements of the multi-factor access is disabled, the individual will not have effective access to the BES Cyber System. Another example is if the BES Cyber System has no electronic communications outside of its physical boundary, then revoking physical access is effectively revoking access. Regarding the issue of shared passwords for devices such as relays or PLCs that may exist in hundreds or thousands of locations, if an individual does not have physical access or electronic access to a device, they do not have effective access, even if they have knowledge of a shared password.
22.29	Allegheny Power	Disagree	It may be appropriate to address revocation of access within the context of “Effective Access.” For example, if an individual requires a multi-factor method to access BES Cyber Systems remotely, and one or more of the elements of the multi-factor access is disabled, the individual will not have effective access to the BES Cyber System.

#	Organization	Yes or No	Question 22 Comment
			Regarding the issue of shared passwords for devices such as relays or PLCs that may exist in hundreds or thousands of locations, if an individual does not have physical access or electronic access to a device, they do not have effective access, even if they have knowledge of a shared password.
22.30	EEI	Disagree	It may be appropriate to address revocation of access within the context of "Effective Access." For example, if an individual requires a multi-factor method to access BES Cyber Systems remotely, and one or more of the elements of the multi-factor access is disabled, the individual will not have effective access to the BES Cyber System. Regarding the issue of shared passwords for devices such as relays or PLCs that may exist in hundreds or thousands of locations, if an individual does not have physical access or electronic access to a device, they do not have effective access, even if they have knowledge of a shared password.
22.31	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
22.32	Southwest Power Pool Regional Entity	Disagree	Make a distinction between "primary" access and "secondary" access. Primary access includes the domain user account, remote access (e.g., VPN, dial-up) credentials, and physical access (badge, keys) credentials. The idea is that the individual would need to gain access using the primary access in order to be able to use any secondary access such as a database account. Revoke primary access in much less than 24 hours for termination for cause, especially for control center systems access. Ideally, primary access should be revoked at the same time the individual is being terminated. Express revocation timeframes for terminations other than for cause in terms of business days. Provide for a negotiated "effective transfer date" other than the HR effective date; transferred personnel often back fill or otherwise continue to provide assistance to the losing department for some period of time.
22.33	National Grid	Disagree	National Grid recommends that Requirement 9.2 should use 72 hours for all BES High and Medium Impact Cyber Systems (transmission, generation, and control centers)

#	Organization	Yes or No	Question 22 Comment
			and remove Requirements 9.3 and 9.4.
22.34	Manitoba Hydro	Disagree	NERC should request from FERC a clarification on their meaning of “immediate”. “Remote access” in Requirements R11 - R14 could be considered a subset of “system access” in Requirement R9. Is the intent for Requirement R9 to refer to local, electronic access?
22.35	NextEra Energy Corporate Compliance	Disagree	NextEra believes the requirements for access revocation for personnel who are still employed by the responsible entity but no longer in a job function that requires access to BES Cyber Systems are too restrictive. The responsible entity should be able to develop timelines and processes to support the removal of access for a person who transfers, since a transfer is not an indication that the employee is a security risk or threat to the BES Cyber System.For personnel terminated for cause, the access should be removed before notification to the impacted personnel. The access that is revoked would be considered global access, as in the terminated personnel’s physical access to the BES Cyber Systems as well as network access. The responsible entities could then create a process, which gives them additional time up to two weeks, to remove individual system access to each BES Cyber system component. For personnel who separate from a responsible entity due to retirement or resignation should go thru a deprovisioning process based on the responsible entities internal processes. The risk posed by normal termination or transfer is extremely small and if malicious behavior or intent is planned, then the actions will happen before the scheduled termination. The recommendation is to revoke network and corporate cyber access and physical access, which would be considered global access within a 2-week timeframe. The responsible entities could then create a process, which gives them additional time up to thirty days, to remove individual system access to each BES Cyber system component. NextEra would also like to establish what is meant by revoking System Access? Is this revocation time frame applicable to removal of access rights at the Boundary Level, BES Cyber System level, or BES Cyber System Component Level?â€,Access is given to individuals on different levels beginning with access to entity networks and facilities, and flowing to access to individual BES Cyber System

#	Organization	Yes or No	Question 22 Comment
			components. The revocation of the individual's access to entity networks and facilities should be referenced or defined as accomplishing the desired result. This effectively removes the individual's ability to access any BES Cyber Systems and allows for the timely execution to approach the "immediate" completion as defined in Table R9.â€,This item should also reference upstream requirements to grant access at either the BES Cyber System level or the BES Cyber System Component level. What level of documentation is required for access rights?â€,Transmission Faciltities' IEDs (such as protective relays) utilitze shared passwords as the method of access control. What are the expectations regarding R9 - Access Revocations for those BES Cyber System Components? Are the expectations to change every IED shared password the user being revoked had access to in every High and Medium BES Transmission Facilities within 72hrs? This task of changing hundreds of protective relay passwords within 72hrs is currently not operationally feasible.R9 - indicates that NERC CIP password schemes will be applied to all units. Many systems with passwords have never had a password change.Large volume to manage. Control systems were not designed to have password changed regularly.When we implemented the NERC rules on the Load Control Computers in December, we found that they wouldn't run properly without the administrator password from when the software was originally installed. On one machine, we ended up having to reload the software to get it to work againThe OPC connections between the Toshiba ST and Ovation systems are the same way, they will only work with the logon credentials from the original software loading and configuration.NextEra suggests not requiring changes for legacy systems with embedded passwords.
22.36	PacifiCorp	Disagree	Per question 15 above, PacifiCorp believes revocation when access is no longer needed should be consistent among the different types of facilities. Specifically, R9.2 should be merged with both R9.3 and R9.4 resulting in a consistent 72-hour requirement.Access removal should be considered complete by removing physical and remote access. Removing physical and remote access effectively removes access to any BES Cyber Systems.

#	Organization	Yes or No	Question 22 Comment
22.37	American Transmission Company	Disagree	Propose maintaining time frame in 24 hour increments. Revocation for Medium impact should be revised from 36 hours to 48 hours.
22.38	Southern Company	Disagree	R9 should be modified to make it clear that the goal is effective removal of access - for example, that can be accomplished through revocation of physical access and revocation of network access without action at the individual BES Cyber System Component level.Removal of access within 24 hours for low-impact systems is unnecessarily burdensome.An unachievably short time limit for revocation due to dismissal for cause will actually result in damaging security as Entities are forced to delay dismissal until revocation can be accomplished in order to maintain compliance.Requiring that an Entity monitor the employment status of its contracting companies' employees creates an impossible burden. The requirement should be modified to require removal of access within a given number of hours after notification by the contracting company, combined with requirements that communication requirements are to be given to the contracting company.
22.39	Luminant	Disagree	R9 should not be required for low impact. 9.2 could 36 hours be changed to 48 (2 days) 9.3 and 9.4 1 week
22.40	Detroit Edison	Disagree	R9 uses the term "system access" while in other places the term is "authorized electronic access". Table entries 9.2, 9.3 and 9.4 should address the concept of expired PRA and/or training requirements. Propose changing to read:"...who no longer require such access or no longer meet the training or PRA requirements as specified in R3 or R4..."
22.41	Ameren	Disagree	R9.2, R9.3, and R9.4 - The short period of time to remove access does not extend well across weekends or through the 2nd business day in cases where access is no longer required at the end of the day. Suggest that these requirements be extended to a week to remain in line with current CIP standards. This will allow for proper hand off time in cases where job duties need to be transferred.

#	Organization	Yes or No	Question 22 Comment
22.42	Black Hills Corporation	Disagree	Recommend that in all cases, network/remote and physical access shall be revoked within 24 hours. All other access shall be revoked within 72 hours. This creates a balance of risk between immediately securing the BES systems and removing "all" access which can become quite intricate.
22.43	ERCOT ISO	Disagree	Recommend: "Each Responsible Entity shall revoke the ability to access its BES Cyber Systems as specified in CIP-011-1 Table R9 - Access Revocation to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Requirements should be revised to address primary and secondary access. Primary access being access to electronic and physical security perimeters (i.e., domain, remote access, badge access). Secondary access being access to assets within the protection of the primary access means (i.e., applications, databases, internal doors within facilities). The timelines listed in 9.1 - 9.4 are acceptable for primary access. Secondary access should allow a more reasonable timeframe. This also needs to address situations where a person may have access to a shared account that would require an outage to change the password. Doing this in a rushed manner would pose a risk to the BES Cyber System and to reliability. Access revocation should be consistent with R5. Recommend SDT consider language addressing access for system administrators and others with high risk access privileges.
22.44	Garland Power and Light	Disagree	Requirement 9.1 - For many companies, it is physically impossible to travel to all substations and change locks within the 24 hour deadline - don't put out a requirement that you know companies cannot comply with - especially for Low and Moderate Impact classified systems.Requirements for 9.1 should be 7 days for Low Impact, 48 hours for medium, and 24 hours high impact location.For requirements 9.3 and 9.4 should the medium impact time requirements should be 7 days.Removing physical access to non-external connected devices (or that only have data output ports connected, i.e. can not be reprogrammed or logged into from that port) should meet the requirements for revoking access for any terminated employee.

#	Organization	Yes or No	Question 22 Comment
22.45	Hydro One	Disagree	Requirement 9.2 should use 72 hours for all BES High and Medium Impact Cyber Systems. We suggest removing requirements 9.3 and 9.4.Requirement 9.1 should be revised to include wording that “terminated for cause” should encompass employees terminated for not only cause, but for suspension or other reasons.
22.46	Northeast Power Coordinating Council	Disagree	Requirement 9.2 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirements 9.3 and 9.4.Requirement 9.1 should be revised to include wording that “terminated for cause” should encompass employees terminated for not only cause, but for suspension or other reasons.
22.47	Exelon Corporation	Disagree	Requirements 9.2, 9.3 and 9.4 contain time parameters in hours. Exelon’s tracking systems that would be used to demonstrate compliance are tracked in time increments of days, not hours. If an hourly timeframe is required it will cause extensive modifications to numerous enterprise wide systems to allow tracking at an hourly level. One must ask how this improves reliability. What is the basis for time levels and having a different timeframe for a control center than other locations? Exelon’s position is that the access revocation should remain at the 24 hours with cause and 7 days without cause. This would also keep the CIP requirements in alignment with the DHS Catalog of Control Systems Security requirement 2.34 - Personnel Termination and DHS Catalog of Control Systems Security requirement 2.35 - Personnel Transfer.
22.48	Progress Energy (non-Nuclear)	Disagree	Revoking access within 24 hours will most likely require a special procedure. Revocation of access within a ‘hours’ timeframe implies that the access would be controlled through a security group with 24/7 coverage.Generation subsystems are much less sensitive than any of the control center subsystems. Leave this at 168 hours revocation other than for cause.
22.49	Southern California Edison Company	Disagree	SCE does not feel that reliability is served by imposing a 36 hour revocation for medium impact systems in a control center, and does not see any great distinction

#	Organization	Yes or No	Question 22 Comment
			between medium impact in transmission, generation, or a control center - these should all use a 72 hour timeframe. The timeframe for revocation of access to servers, applications, systems, sensitive information, relays, and equipment, etc. within a physically controlled area should be longer (e.g. 7 days). SCE also requests clarification on what devices must be revoked. The standard does not clarify what immediate revocation of access is - be it access to the "front gate" of an electronic and/or physical boundary versus the revocation of access to each "door" to every system and or component. As such, the potential scope of system access under R9.1 is unclear. SCE Recommends the drafting team revise this so that there is a single requirement for access revocation that and have it sub-divided into sections for physical, electronic, and information artifacts.
22.50	SCE&G	Disagree	SDT needs to consider utilizing the layers of access control leveraged by the exisiting standards here to meet the FERC mandate. Consider allowing entities to revoke access at the firewall level or password level within the timeframes suggested, and then give entites additional time to remove access at all of the other access control layers.
22.51	Florida Municipal Power Agency	Disagree	See comments to Question 19.In 9.2, 9.3 and 9.4 "who no longer require" is an ambiguous term separate from a more defined process of "granting" or "authorizing" access. FMPA suggests: "For personnel who have changed job responsibilities such that authorized access ... is no longer justified".9.3 and 9.4 can be combined into "non-Control Center BES Cyber Systems"
22.52	Liberty Electric Power, LLC	Disagree	See R5 comments on the short times to revoke access. It should be "next business day", not 24 hours in most cases. Further, it should be clear that revoking physical access to an entire facility would serve to revoke physical access to a secure are within the facility.
22.53	Constellation Power	Disagree	Some systems have a single username and password (shared), so when an employee is terminated, is the expectation that every component (such as a similar relay used

#	Organization	Yes or No	Question 22 Comment
	Source Generation		all over the system) have their shared passwords changed? A suggestion would be to allow physical revocation of access in these instances to trump cyber access. R9.4 should state “Generation” with a capital ‘G’ instead of “generation.”
22.54	Entergy	Disagree	Suggest combining 9.2 thru 9.4 and making all 72 hours. CIPv1 is very prescriptive in this area. It is easier from a compliance point of view to have a 24 hour revocation requirement for termination and 72 hour requirement for everything else.
22.55	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	The 24 hour requirement of 9.1 will be particularly burdensome for small entities that do not have 24/7 dispatch. While terminations can and should happen after hours when the situation calls for it, those who can revoke access may not necessarily be available. The unintended consequence may be a needed termination being delayed. Another fix would be to increase the number of those able to revoke access, but this may create more problems than it solves.
22.56	San Diego Gas and Electric Co.	Disagree	The access revocation timeframes listed for R9.2 - R9.4 should be consistent, since there is not a significant enough difference in risk between the three requirements warranting different time-periods. R9.4 is contradictory with R9.2 if, by the proposed definition of Control Center, a BES Cyber System controls two or more generation facilities or transmission facilities.SDG&E believes that the requirements in Table R9 should include language clarifying that contractors and service vendors that have access shall have that access revoked (within whatever time frame is appropriate) once the RE is notified by the contactor/service vendor of a contractor/service vendor’s termination. The RE cannot and should not be held responsible for the lack of timely notifications of termination of contractor/service vendor personnel from a contractor/service vendor company. In other words if a contractor were to terminate someone on 1/1/XX and they do not notify the RE until 1/3/XX, the RE should not have to be held to a revocation time period that ends sometime on 1/2/XX.
22.57	Seattle City Light	Disagree	The most mature user provisioning systems with effective processes would unlikely meet the parameters in this requirement. As a result, utilities will modify their

#	Organization	Yes or No	Question 22 Comment
			organizational processes to redefine when "access is no longer needed." For example, rather than submitting a request to remove user access after termination, utilities will await completion of the revocation request before officially terminating employment. This would make the requirement ineffective in accomplishing it's intent.
22.58	Bonneville Power Administration	Disagree	The objective of this requirement ("to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.The requirement should refer to electronic access, not just system access. The 36/72 hour requirement to remove access for routine changes is overly confining, as detailed in the answer to Question 16. Table 5 Part 5.7-5.9 also refer to timeliness of revocation. Twenty-four hours for terminations for cause is reasonable, however having two additional categories complicates matters and could potentially lead to confusion and someone not revoked in the appropriate category. For 5.8, 5.9, 9.2, 9.3 and 9.4, the 36/72 hour requirement to remove access for routine changes is overly confining. We suggest that routine revocation be accomplished within 5 business or 5 calendar days.
22.59	Northeast Utilities	Disagree	The table must be simplified; making a distinction by type of asset only increases risk of non-compliance. For personnel terminated not for cause why not make them all the same?
22.60	FirstEnergy Corporation	Disagree	There is much emphasis in properly categorizing facilities in Attachment II but that information seems to disregarded in information presented in Table 9 of CIP-011. If different timeframes for revoking access is warranted then it should be bases on Low-Medium-High impact - its unclear why a control center and generation/transmission facility is treated differently if each are deemed High Impact. This seems to be an issue in multiple tables dealing with revocation of access privileges - logical and

#	Organization	Yes or No	Question 22 Comment
			physical.Consider replacing 9.2, 9.3 and 9.4 with one row that say 'BES Cyber Systems' with appropriate timeframes for Low, Medium and High impact if needed. However, FE believes the R9.2, R9.3, R9.4, 36 and 72 hours is too restrictive and would like it to remain at the Version 2/3 timeframe of 7 days. To simplify, we recommend consistent revocation of all employees regardless of impact level. In practice most entities will likely implement consistently throughout their organization to the most restrictive requirement. Therefore, not sure the H/M/L levels has a practical use in this situation due to an administrative burden to implement and track differing time periods.
22.61	Powersouth Energy Cooperative	Disagree	This will be greatly affected by the ability to revoke access by account management at the gateway to the cyber system versus the changing of each component that makes up the system. Password/account management on systems such as relays that don't allow individual user accounts will be extremely complicated and time consuming. Consideration should be given to clarifying if managing access at the gateway and revoking physical access is sufficient, especially for low impact systems.
22.62	CWLP Electric Transmission, Distribution and Operations Department	Disagree	Time frames for 9.2 to 9.4 should be extended to 72 hours or next business day, whichever is longer.
22.63	USACE - Omaha Anchor	Disagree	Timelines are unreasonable for removal of electronic access - we do not have 24/7 coverage for revocation of electronic access. Revocation of physical access should be allowed for this section. If they don't have physical access - they can't access the electronic access. Electronic access removal should then be changed to two business days or next business day.
22.64	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.

#	Organization	Yes or No	Question 22 Comment
22.65	We Energies	Disagree	We Energies agrees with EEI. It may be appropriate to address revocation of access within the context of "Effective Access." For example, if an individual requires a multi-factor method to access BES Cyber Systems remotely, and one or more of the elements of the multi-factor access is disabled, the individual will not have effective access to the BES Cyber System. Regarding the issue of shared passwords for devices such as relays or PLCs that may exist in hundreds or thousands of locations, if an individual does not have physical access or electronic access to a device, they do not have effective access, even if they have knowledge of a shared password.
22.66	GTC & GSOC	Disagree	We recommend changing this to "36 hours or 1 business day, whichever is greater".
22.67	GE Energy	Disagree	Why introduce a time interval not based on a day? 36 hours may as well be 48 hours.Time periods should be specific to business days and take into account weekends.
22.68	APPA Task Force	Disagree	With physical access control as covered in R5 and remote access control as covered in R13, the greatest risk to the BES is presented by employees and contractors who have been terminated for cause. We therefore recommend the following conforming changes should be made to R9 Table 9.2 - 9.4: R9 Table 9.1: For personnel terminated for cause. Low, Medium and High Impact: "24 hours".APPA recommends elsewhere in these comments that (i) all impact levels have physical access controls in R5 Table 5.1, (ii) requirements in R5 Table 5.7-5.9 be removed, and (iii) requirement R10 Table 10.2 be edited to require passwords to be changed annually, If these comments to the drafting are accepted, the risk of malicious operations is minimal. We therefore recommend the following conforming changes be made to R9 Table 9.2-9.4:R9 Table 9.2: For personnel and others previously granted unescorted access who no longer require such access to Control Center BES Cyber Systems. R9 Table 9.3: For personnel and others previously granted unescorted access who no longer require such access to Transmission BES Cyber Systems. R9 Table 9.4: For personnel and others previously granted unescorted access who no longer require such access to Generation BES

#	Organization	Yes or No	Question 22 Comment
			Cyber Systems.

23. Table R9 provides direction concerning what impact level of BES Cyber Systems to which Requirement R9 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R9 has been moved to CIP-004-5 R6.

Commenters expressed concern that Table R9 is inconsistent with Table R8 for Low Impact BES Cyber Systems, as there should be no requirement to revoke access if there is no requirement to authorize it. In addition, many commenters raised concerns about entities being able to meet proposed revocation times, especially for Low Impact BES Cyber Systems due to the expected large numbers of such systems. The SDT agrees with these concerns, and the requirements for revocation of access for Low Impact BES Cyber Systems have been removed.

#	Organization	Yes or No	Question 23 Comment
23.1	BCTC		Â Recommend collapsing requirements 9.1 to 9.3 into one requirement.Â The time requirements for the one requirement are recommended to be:Â Medium Impact - within 72 hoursÂ High Impact - within 24 hours
23.2	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.
23.3	Florida Municipal Power Agency	Agree	See comments to Questions 19 and 22. Also consider adding “Required for remote access or routable external connectivity only” to Medium and Lower Impact. Lower Impact should be not applicable for 9.1 to be consistent with 5.7. Also, for Medium Impact, 9.1 and 5.7 ought to be consistent.
23.4	Bonneville Power Administration	Agree	The table should refer to electronic access, not system access. The revocation time frames should be adjusted, as discussed above.
23.5	E.ON U.S.	Disagree	: CIP-011-1, R9 has stringent commitments for Low Impact and Medium Impact BES Cyber Systems. E ON U.S. proposes that these time requirements be extended. It is

#	Organization	Yes or No	Question 23 Comment
			not a hard and fast rule as to when employees no longer requires access to 9.4 cyber systems. This is particularly true when an employee is moving to another position within the Company and a certain amount of training is required to backfill their position. Three days does not allow time for that situation. A monthly or quarterly time frame would be adequate in most instances.
23.6	Network & Security Technologies Inc	Disagree	9.1 - Access to Low Impact systems needs to have been explicitly granted (8.1) or at least documented (7.1??) in order to be revoked (consistency issue - also see comments on Question 16).
23.7	Consultant	Disagree	9.1 - If access to Low Impact Systems does not require an authorization process(R8), then it is illogical to require the undocumented access to be revoked.9.1, 9.2, 9.3, & 9.4 - Whatever time frame is selected, the revocation time should be stated in days, either working days or calendar days, as personnel transactions typically are not conducted or tracked on an hourly basis.9.2, 9.3, & 9.4 - Having a different time frame for different types of facilities is an added dimension to the impact categorization that should be eliminated. If there is a basis for a difference in revocation times for different facility types, that difference should be included in the impact categorization criteria, not by trying to add additional categorization criteria in the requirements.
23.8	Detroit Edison	Disagree	9.1 requires access revocation for Low Impact but there is no requirement to specifically authorize access for Low Impact.
23.9	American Electric Power	Disagree	9.1, Column "Low Impact BES Cyber System", regarding "Within 24 hours". There is no requirement to formally request, authorize, or review access to low impact BES Cyber Systems. How would it be possible to effectively remove that access?
23.10	Constellation Energy Commodities Group Inc.	Disagree	Align time requirement for 9.2 with the other 9.3 and 9.4 (all at 72 hours) to eliminate confusion.
23.11	Oncor Electric Delivery	Disagree	As stated earlier, depending on the type of communication to Cyber Systems, it may

#	Organization	Yes or No	Question 23 Comment
	LLC		not be possible to comply with these requirements due to communication failures. This requirement is particularly burdensome as it applies to contractors and service vendors. Many entities have resorted to weekly verification with their contractors/vendors to verify this requirement. A 24-36 hour requirement, other than "for cause", is not practical.
23.12	Northeast Power Coordinating Council	Disagree	Because the Low Impact levels do not have an access control requirement, Requirement 9.1 is not applicable. Remove the entry from the 9.1/Low Impact BES Cyber System box in the table. Requirement 9.2 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirements 9.3 and 9.4.
23.13	USACE - Omaha Anchor	Disagree	Believe revocation of physical access should be adequate for this standard - if that were so timelines and impact levels would be acceptable.
23.14	ReliabilityFirst Staff	Disagree	By not specifying a time for revocation of access for low impact assets, the requirement will not be enforceable for these assets. Suggest something like 30 or 90 calendar days for Low Impact BES Cyber System for 9.2, 9.3 and 9.4.
23.15	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
23.16	BGE	Disagree	Combine 9.2, 9.3 & 9.4 revocation for any high impacted system should be consistent. Can the drafting team declare why the time elements were changed from 1 week to 36 or 72 hours?
23.17	The Empire District Electric Company	Disagree	Comments: For item 9.1 through 9.4, we would propose adding the following under Medium Impact: "Required for remote access or routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.For item 9.1, we believe the Low Impact requirement

#	Organization	Yes or No	Question 23 Comment
			should be deleted, to maintain consistency with R5.7 (revoking physical access for cause) and R8.1 (authorizing electronic access).
23.18	Exelon Corporation	Disagree	Does this apply to protective relays, even if there is no external access? If so, entities should not have to provide more physical security for a cyber based device or protective relay when it has no external connectivity and therefore would have no more impact to the BES than the other electromechanical devices, protective relays or control switches mounted in the same control panel.Exelon's position is that the access revocation should remain at the 24 hours with cause and 7 days without cause. This would also keep the CIP requirements in alignment with the DHS Catalog of Control Systems Security requirement 2.34 - Personnel Termination and DHS Catalog of Control Systems Security requirement 2.35 - Personnel Transfer.
23.19	Allegheny Energy Supply	Disagree	Effective Access to low impact systems should be removed within seven calendar days.
23.20	Allegheny Power	Disagree	Effective Access to low impact systems should be removed within seven calendar days.
23.21	San Diego Gas and Electric Co.	Disagree	Even though the compliance timeframes are reasonable in Table R9, two versus three timeframes are preferred. SDG&E believes that the control center timeframe (36 hours) should also be 72 hours, like R9.3 and R9.4.
23.22	USACE HQ	Disagree	First, requirements 9.1, 9.2, 9.3, and 9.4 should be required for every level of impact. Second, to avoid the "Friday 5PM termination with cause" scenario, the language should be change as follow: 9.1, from "within 24 hours" to "Close of Business Day (COB) of the following day after the termination", 9.2 from "within 36 hours" to "Close of Business Day (COB) of the second day after access is no longer required", and 9.3 and 9.4 from "within 72 hours" to "Close of Business Day (COB) of the third day after access is no longer required", OR if requirements 9.2 - 9.4 are collapsed into one requirement (please refer to my answer to previous question) from "within XX

#	Organization	Yes or No	Question 23 Comment
			hours" to "Close of Business Day (COB) of the third day after access is no longer required".
23.23	MRO's NERC Standards Review Subcommittee	Disagree	For item 9.1 through 9.4, we would propose adding the following under Medium Impact: "Required for remote access or routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.For item 9.1, we believe the Low Impact requirement should be deleted, to maintain consistency with R5.7 (revoking physical access for cause) and R8.1 (authorizing electronic access).
23.24	American Transmission Company	Disagree	For item 9.1, we believe the Low Impact requirement should be deleted, to maintain consistency with R5.7 (revoking physical access for cause) and R8.1 (authorizing electronic access).
23.25	LCEC	Disagree	I agree with the intent of this requirement but need additional clarification to determine what is meant by revoking system access. Access may be granted at a system or component level. If system, network & wireless access is removed is this requirement satisfied? If audited at the component level, it may not be possible to make all of the necessary changes within the timeframes that are being dictated. The scope of this requirement should be clarified to indicate remote or wireless access only. Component level access will be mitigated by the physical security controls.
23.26	APPA Task Force	Disagree	If our comments in response to Question #22 are accepted, we believe the Low Impact requirement should be deleted, to maintain consistency with R5.7 (revoking physical access for cause) and R8.1 (authorizing electronic access). We feel for remote and unmanned BES facilities ensuring and demonstrating compliance with this requirement will be difficult if not impossible to comply with from a logistical standpoint. We also recommend the drafting team allow more time to comply with 9.3 and 9.4. We know there are pressures to have access restricted as soon as

#	Organization	Yes or No	Question 23 Comment
			possible. But there are substantial difficulties in doing so, as many systems have multiple owners, are in remote locations and have numerous devices to access. The drafting team appears to be basing its timetable on a control center environment where the cyber systems are more IT focused and have controls that can be turned on and off easily. We therefore recommend the following changes be made to the impact levels: R9 Table 9.1: Low Impact: For remote access or routable external connectivity only, 24 hoursMedium Impact: For remote access or routable external connectivity only, 24 hoursHigh Impact: 24 hours.R9 Table 9.2: Low Impact: N/AMedium Impact: For remote access or routable external connectivity only, 36 hoursHigh Impact: 36 hoursR9 Table 9.3: Low Impact: N/AMedium Impact: For remote access or routable external connectivity only, 1 week.High Impact: Within 1 weekR9 Table 9.4: Low Impact: N/AMedium Impact: For remote access or routable external connectivity only, 1 week.High Impact: Within 1 week
23.27	US Bureau of Reclamation	Disagree	If the requirements of R7 are going to be implemented/established at all levels, the account revocation requirements should be required for the same levels
23.28	Manitoba Hydro	Disagree	Is 24 hours a reasonable and achievable time interval to revoke electronic access to Low Impact BES Cyber Systems? This is too short in consideration of the large number of Low Impact BES Cyber Systems.
23.29	Progress Energy (non-Nuclear)	Disagree	It seems reasonable that access for all impact levels, even low, should be revoked if and whenever it is no longer needed.The complexity and compliance risk of managing all of these requirements at different levels, for different functional areas will be very problematic to substantiate compliance.
23.30	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
23.31	MidAmerican Energy Company	Disagree	MidAmerican Energy does not agree with the timelines specified in Table R9. See the response to question 54.

#	Organization	Yes or No	Question 23 Comment
23.32	Tenaska	Disagree	Most of these are doable on SCADA and EMS hosts only and/or ingress/egress of perimeters/boundaries.10.1 Some DCSes will not allow this for some processes to work.10.2 Same as 10.110.3 must have a way of handling old equipment.10.4 Should be for SCADA/EMS/DCS hosts only and/or ingress/egress of perimeters/boundaries .10.5 Should be for SCADA/EMS/DCS hosts only and/or ingress/egress of perimeters/boundaries.10.5 Should be for SCADA/EMS/DCS hosts only and/or ingress/egress of perimeters/boundaries.10.6 Should be for SCADA/EMS/DCS hosts only and/or ingress/egress of perimeters/boundaries.10.7 Should be for SCADA/EMS/DCS hosts only and/or ingress/egress of perimeters/boundaries.10.8 Should be for SCADA/EMS/DCS hosts only and/or ingress/egress of perimeters/boundaries.
23.33	National Grid	Disagree	o Since the Low Impact does not have an access control requirement, how can Low Impact have Requirement 9.1? National Grid recommends removal of this combination. o The text in 9.2/9.3/9.4 - “who no longer require such access” is vague and should be specific such as transfers, suspensions, or change in job duties.
23.34	American Municipal Power	Disagree	Please provide a little or no impact category
23.35	NextEra Energy Corporate Compliance	Disagree	Please see response to item 22. NextEra believes while it is appropriate to require access revocation requirements for Medium and High Impact BES Cyber Systems, the periods are too restrictive for personnel who transfer, or who separated from the responsible entity via normal means not for cause. NextEra does not believe that 9.1 should apply to Low Impact or No Impact BES Cyber System. In previous section, 8.1 (Authorizing Access) is not required for Low Impact BES Cyber System and the standards should be consistent.
23.36	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 7 account identification to Table 8 account management and Table 9 Access Revocation. If account management is not

#	Organization	Yes or No	Question 23 Comment
			required for Low Impact BES Cyber Systems how can account access be revoked within 24 hours? Additionally, if physical security is not required for Low Impact BES Cyber Systems, then Puget Sound Energy suggests including wording similar to Table 5: "Required for routable connectivity only".
23.37	Luminant	Disagree	R9 should not be required for low impact. 9.2 could 36 hours be changed to 48 (2 days) 9.3 and 9.4 1 week
23.38	Ameren	Disagree	R9.1 - Without accounting for who has access this will be a difficult requirement to maintain documentation for Low Impact Systems.
23.39	Black Hills Corporation	Disagree	Recommend that in all cases, network/remote and physical access shall be revoked within 24 hours. All other access shall be revoked within 72 hours. This creates a balance of risk between immediately securing the BES systems and removing "all" access which can become quite intricate.
23.40	Minnesota Power	Disagree	Regarding Part 9.1, Low Impact BES Cyber Systems cannot require revocation, because creation of accounts for these was not tracked in Requirement R8.
23.41	EEI	Disagree	Regarding Table 9 Row 9.1, Effective Access to low impact systems should be removed within 24 hours for the "termination for cause" requirements See question 22 for definition of Effective Access.
23.42	Idaho Power Company	Disagree	Registered Entities will potentially have a large number of low impact systems. One individual may have access to many of the low impact systems. It may not be possible to remove the access from all of them individually within 24 hours.
23.43	Southern Company	Disagree	Removal of access within 24 hours for low-impact systems is unnecessarily burdensome.
23.44	Garland Power and Light	Disagree	Requirement 9.1 - For many companies, it is physically impossible to travel to all

#	Organization	Yes or No	Question 23 Comment
			substations and change locks within the 24 hour deadline - don't put out a requirement that you know companies cannot comply with - especially for Low and Moderate Impact classified systems.Requirements for 9.1 should be 7 days for Low Impact, 48 hours for medium, and 24 hours high impact location.For requirements 9.3 and 9.4 should the medium impact time requirements should be 7 days.Removing physical access to non-external connected devices (or that only have data output ports connected, i.e. can not be reprogrammed or logged into from that port) should meet the requirements for revoking access for any terminated employee.
23.45	Alberta Electric System Operator	Disagree	Revocation criteria should be specified for Low Impact BES Cyber Systems as well. The AESO suggests the following timelines in Table R9:9.1 Low, Medium, and High all Within 24 Hours9.2, 9.3 and 9.4 Low, Within 120 Hours, Medium and High, Within 72 Hours
23.46	Southern California Edison Company	Disagree	SCE does not agree with 36 hour revocation for medium impact systems in a control center, and does not see any great distinction between medium impact in transmission, generation, or a control center. These should all use 72 hour timeframe.Table R9 is that Requirements R9.3 and R9.4 are identical and can be combined. The time constraint for access revocation for low impact system as written is identical across impact levels. This does not reflect the intent of Order 706 where controls are commensurate with impact to BES reliability. The drafting team has selectively interpreted Order 706's directive for "immediate" revocation but has not given adequate consideration to the impact on BES reliability.
23.47	Alliant Energy	Disagree	See response for Question 22.
23.48	ISO New England Inc	Disagree	Since the Low Impact do not have an access control requirement, how can Low Impact have Requirement 9.1? Recommending removal of this combination.Requirement 9.2 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirements 9.3 and 9.4

#	Organization	Yes or No	Question 23 Comment
23.49	Northeast Utilities	Disagree	Since the Low Impact does not have an access control requirement, how can Low Impact have Requirement 9.1? Recommend removal of this combination (i.e., Low Impact / For Cause).Requirement 9.2 should use 72 hours for all BES High and Medium Impact Cyber Systems. Remove Requirements 9.3 and 9.4.
23.50	Entergy	Disagree	Suggest combining 9.2 thru 9.4 and making all 72 hours. CIPv1 is very prescriptive in this area. It is easier from a compliance point of view to have a 24 hour revocation requirement for termination and 72 hour requirement for everything else.
23.51	Southwest Power Pool Regional Entity	Disagree	Termination of access, whether or not for cause, is a basic security control and needs to be applicable to all impact categories.
23.52	The United Illuminating Co	Disagree	The time frames should specify what T=0 is. For example, for termination for cause does the clock start with the termination, or with the notice from Human Resources.
23.53	Dairyland Power Cooperative	Disagree	There should be some time frame for revoking access to low impact systems. 30 days?
23.54	Reliability & Compliance Group	Disagree	They contradict R5.
23.55	FirstEnergy Corporation	Disagree	Timeframes should not be in 'hours' (i.e. less than a full day). Tracking by time rather than days would not be logistically possible on all systems and compliance could not be maintained.The new requirements now have too many different time frames to meet. Again, not logistically possible on all systems and compliance could not be maintained for larger utilities. In practice we would likely enforce the most restrictive. As stated in our response to Question 22 the revocation times for a high or medium impact facility should not be different for control centers and other facilities - otherwise why is it "high impact"?Why is Low Impact not covered? This implies a need for a "no impact" category which we believe is warranted.

#	Organization	Yes or No	Question 23 Comment
23.56	ERCOT ISO	Disagree	Timelines should be identified for low impact systems on 9.2, 9.3, and 9.4. The current timeline of 7 days would be appropriate.
23.57	Con Edison of New York	Disagree	Timeliness of access removal is important. This criteria can be interpreted to mean (R9.1 for example) as access needs to be revoked within 24 hours of the actual time of termination for cause. This can be unrealistic. The controlling department, for access, may not be notified by the individuals department of the termination within the time period. This is more likely when contract personnel are considered. The requirement should be clearly worded to provide 24 hours from notification of the termination for cause.
23.58	US Army Corps of Engineers, Omaha Distirc	Disagree	Times will be near impossible to meet for 9.1. Particularly when they cover high medium and low impact systems. Recommend that the emphasis be placed on removing remote electronic access and physical access to facilities. Time frames in terms of business days would be an improvement. 9.1 could be remove remote and physical access by next business day. 9.2 could be remove remote and physical assess within 2 business days. 9.3 & 9.4 within 3 business days. Also have concerns about meaning of "when no longer required" and how this would be tracked and audited. Example would be of an employee that leaves a job but retains system rights in order to train new person.
23.59	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
23.60	Hydro One	Disagree	We believe that changing passwords on non-routable devices isn't realistic and depending on final version of BES CSC list, this may even be unachievable. The standard should allow for other methods of revocation and permit appropriate implementation time.Because the Low Impact levels do not have an access control requirement, Requirement 9.1 is not applicable. Remove the entry from the 9.1/Low Impact BES Cyber System box in the table. Requirement 9.2 should use 72 hours for

#	Organization	Yes or No	Question 23 Comment
			all BES High and Medium Impact Cyber Systems. Remove Requirements 9.3 and 9.4.
23.61	We Energies	Disagree	We Energies agrees with EEI recommendation: Effective Access to low impact systems should be removed within seven calendar days.
23.62	PacifiCorp	Disagree	While we PacifiCorp agrees that terminations for cause require more immediate action to remove access than other terminations; we do not believe that normal terminations and transfers require such timeframes and believe that the current timeframes are more than adequate to ensure the safe operation of the BES. If these timeframes are unavoidable, business days should be considered as opposed to the currently proposed number of hours as this imposes significant risk to our ability todifficulty comply given the lack of available automated access removal solutions in the market place that can be realistically deployed across a wide-range of systems.

24. Requirement R10 of draft CIP-011-1 states "Each Responsible Entity shall implement the account management access control actions specified in CIP-011-1 Table R10 – Account Access Control Specifications to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of criteria that are included in Requirements Table R10? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R10 has been moved to CIP-007-5 R5.

Some commenters expressed concern that password criteria should be provided as guidance, and that entities can increase password strength and meet security requirements without meeting all criteria for password complexity. The drafting team believes that moving all password criteria to guidance would create a significant challenge in auditing this requirement, and would lead to the continued use of Technical Feasibility Exceptions, as entities and auditors may not agree on the most appropriate password policy. However, flexibility in the periodicity of changing passwords has been incorporated in the standards, and the requirement for password complexity was modified to allow more equally effective complexity requirements to be attainable.

Other commenters expressed that Table R10 focuses only on passwords, when there are other mechanisms for authentication (such as tokens). A more flexible requirement has been added to validate credentials before granting access to BES Cyber Systems. This requirement is intended to allow for other types of authenticators.

Some commenters expressed the need to have certain password changes occur during outages, and not necessarily be time based. In response, revisions were made to the password requirements to allow an entity to consider system characteristics when developing a password policy dealing with periodicity of change.

Some commenters suggested combining the requirements R10.6 to R10.8, and they also have concerns about having multiple IDs for different systems and permission levels. In response, the requirement for administrators to have an account for privileged functions was removed because it was too prescriptive. This requirement would not be reasonable to apply on all systems.

Some commenters expressed general concern about being able to enforce the Account Access Control requirements in R10.1 to R10.5. In response, the requirements have been modified to allow for procedural enforcement mechanisms. However, the measure makes clear the challenge in auditing procedural enforcement: entities may be required to divulge their passwords prior to immediately changing them to show compliance.

Some commenters expressed that in R10.7 "explicit authorization" is not defined, and questioned how this differs from R10.8. In response, the term "explicit authorization" has been removed from the requirement. Authorization requirements have been combined

into CIP-004-5, and CIP-003-5 now addresses the delegation of authorization responsibility.. Anywhere authorization is needed in the Standards, the requirement states the authorization occurs by the "CIP Senior Manager or Delegate".

Some commenters requested that the SDT define “privileged” and “other system functions” as used in R10.8. The SDT has removed these terms from the requirements.

#	Organization	Yes or No	Question 24 Comment
24.1	National Rural Electric Cooperative Association (NRECA)		In R10.1, the wording appears to permit changing vendor passwords "anytime" after installation. Do we mean prior to installation or within some specific time after installation. Please clarigy so there is not auditor confusion on what is required here.In R10.7, what what "explicit autorization" mean? Is this different from "authorization?" If yes, please ensure the requirement is clear on what is required.
24.2	WECC		SDT should reevaluate the password complexity requirements as many systems do not support special characters but could still have strong passwords by increasing lengths or changing more frequently. Consider replacing with a requirement that passwords have a minimum bit length (which is what requiring certain lengths, and character sets is prescribing).The password requirements are too weak to be effective. Strong password construction should be required at all levels.
24.3	FEUS	Agree	Agree with comments: The drafting team should clarify when default vendor passwords must be changed after installation (10.1)
24.4	RRI Energy	Agree	Could possibly need a TFE for field installed intelligent electronic devices - meters, monitors, plcs, rtus
24.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.Passwords or equivalent should not be so prescriptive and such requirements can result in many TFEs. Also, by creating onerous password requirements, it is more likely to create reliability issues in the BES by having to keep track of complicated passwords; passwords should be both reasonable and functional.The focus of the requirement should be on user accounts. “System”

#	Organization	Yes or No	Question 24 Comment
			accounts should be excluded from many of these requirements (possibly considering new requirements concerning the security of system passwords) to avoid numerous TFEs while maintaining security.User accounts should focus on the password entropy, not on the specifics of number of characters and types of characters. Password entropy is the term used in the computer industry and a much better metric for defining password complexity vs. having to give a specific length or number of characters. For instance, there are 94 ASCII printable characters as described in 10.3, 10.4 and 10.5, so, a 6 character password can have about 36 bits of password entropy. An 8 character password consisting of non-case sensitive alpha-numeric characters (36 characters) has 40 bits of entropy; more than what is described in the standard. FMPA suggests using a metric of 36 bits of entropy for medium-impact password requirements. Such a step will avoid numerous TFEs for older equipment that cannot handle special characters, but can handle longer passwords for instance. FMPA suggests using the NIST's Electronic Authentication Guideline as a baseline for the standard. A copy can be found at http://csrc.nist.gov/publications/nistpubs/800-63/SP800-63V1_0_2.pdfA password's information entropy can be expressed by the formula: where N is the number of possible symbols and L is the number of symbols in the password. The function log2 is the base-2 logarithm. H is measured in bits. (See Appendix A in NIST Electronic Authentication Guide referenced above for more detailed information).Even these simple requirements will not pose much of a threat to automated attack which is why these requirements must work together in order to best secure the BES. If securing the BES is the objective, passwords alone are not enough to secure devices; they must be accompanied by logging and alerting systems to ensure industry best practices. For example, a 56-bit password could be cracked in under a day with specialized hardware. A 72-bit password would take over 1,000 years to crack, while 128 bit passwords are currently considered uncrackable by brute force. A 22-character alpha-numeric password has entropy of 128 bits.Footnote 1 is unnecessarily onerous, e.g, if a device cannot support special characters or case sensitivity, but does support 32 character passwords, then the footnote would require use of all 32 characters with around 180 bits of entropy.Also, the focus on passwords

#	Organization	Yes or No	Question 24 Comment
			excludes other, even more secure tools, such as multifactor authentication, that ought to be accounted for.10.1 and 10.2 can be combined “Passwords much be changed upon installation and at least once every twelve months”On bullet 10.6 the wording “the minimum necessary to perform work functions.” is subjective and difficult to measure. We propose this be replaced with “in accordance with the policy required in R1.” In addition, 10.6 is account management and should be in R8, not R10.10.7 is duplicative of 8.1 and should be removed.10.8 is duplicative of requirements in R7 and R8 and should be removed or embedded within that requirement.
24.6	Green Country Energy	Agree	Guidance?
24.7	Emerson Process Management	Agree	In the popular Windows Active Directory, there is no enforcement of complying with password complexity policy. So, the policy can be set for password complexity, the user can still implement weak password without rejection.
24.8	Puget Sound Energy	Agree	Puget Sound Energy suggests including “Where Technically Feasible” to R10, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 10.
24.9	Progress Energy - Nuclear Generation	Agree	R10 can be improved by incorporating information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
24.10	National Grid	Agree	Requirements 10.3, 10.4, and 10.5 indicate the “how” which NERC wants to move away from. Suggest moving this to the guidance document.
24.11	US Bureau of Reclamation	Agree	Row 10.4 and 10.5 would be easily reworded into a specific requirement for password construction. Also refer to question #54, comment 2.
24.12	PNGC-Cowtitz-Central	Agree	See comment for question 6.

#	Organization	Yes or No	Question 24 Comment
	Lincoln-Benton-Clallam Group		
24.13	Network & Security Technologies Inc	Agree	Suggestion offered at recent workshop to substitute “ensure authenticity” for “use passwords” has merit and should be considered.
24.14	Alberta Electric System Operator	Agree	The AESO thinks that it is impossible to guarantee a RE can “prevent malicious operation,” however the RE can “mitigate malicious operation.”Please define the term "BES Elements".We agree with the list of criteria that are included in Requirements Table R10.
24.15	Independent Electricity System Operator	Disagree	- R10.2 broaden the scope of passwords and allow for certificates, keys, etc. Some vendors deliver default certificates. In addition, keys may be used for authentication and should be changed. If using two factor or multi factor authentication it techn
24.16	LADWP	Disagree	1. The footnote [1] for CIP-011-1 R10 appears to allow entities to assess TFEs for Account Access Control / Passwords within their own judgment. I would recommend that for 10.3, 10.4, and 10.5 be replaced by footnote [1]. a. The current FERC-Approved TFE process is inefficient; the incorporation of all TFEs into their appropriate requirements should suffice the standard.
24.17	Progress Energy (non-Nuclear)	Disagree	10.1 may be better to indicate ‘upon commissioning’10.7 and 10.8 are too broadly defined to effectively control.It needs to be clarified that it is not required that each device be capable of being configured to automatically enforce authentication requirements (forcing password change, password length, password sophistication, etc.).R10.6 - Recommend clarification of language to indicate that ‘access permission are the minimum necessary to perform work functions’ means normal work functions for each particular individual. There should be no intention to require a single individual to maintain multiple logins for each function for which they are responsible (beyond an administrative login and a ‘normal functions’ login).Consider combining 10.6 and 10.8. If you meet the intent of 10.6 then you should be meeting 10.8.

#	Organization	Yes or No	Question 24 Comment
24.18	LCEC	Disagree	10.1 should be changed passwords prior to production as opposed to after installation.10.1-10.5 lead back to TFE issues. Consider applying only to interactive users.Must address current compliance challenge of requiring technical enforcement of password policies. 10.2 is not auditable as a performance requirement.Footnote [1] is subject to major interpretation: complexity is ambiguous. May not be legally defensible. Maximum should be maximum comparable.We suggest removing 10.6 it is too subjective.
24.19	Idaho Power Company	Disagree	10.1 should specify a period of time after installation or require it before putting it in production. As long as default passwords are changed, low impact systems should have a longer password change cycle
24.20	American Electric Power	Disagree	10.1: Regarding "Change default vendor passwords after installation", suggest using "Default vendor password shall be changed before or during commissioning", or "Change default vendor passwords". The word "after" fails to establish a time frame for the change.10.3: Regarding "Implement a password scheme that has the following attributes:[1]Minimum of six characters", and its footnote. While the footnote potentially allows for some exceptions, this could still be subject to a Technical Feasibility Exception (TFE) process. The TFE process is very cumbersome and provides little value. Based on the direction of CIP-010, the number of TFEs could grow exponentially.10.7: Regarding "Require explicit authorization of access to system and security administrative functions within the BES Cyber System". This seems redundant to 10.6. Would these not be granted based on job function? If not, how is it different than 10.6?10.8: Regarding "Require users of BES Cyber Systems and security administrative accounts to use non-privileged accounts when accessing other system functions". What security benefit does this provide? This defeats any single sign-on functionality. To what level do you limit each account? Why are users required to have more than one account? Will they need more than 2 accounts? What is the limit?

#	Organization	Yes or No	Question 24 Comment
24.21	Dominion Resources Services, Inc.	Disagree	10.8. Some equipment does not support non-privileged accounts. A footnote similar to the one added for 10.3 to eliminate the need for a TFE should be added to 10.8.
24.22	BCTC	Disagree	Â BCTC can see the need for a TFE with requirement 10.2, 10.3, and 10.4Â Requirement 10.7 - we are uncertain as to the objective of this requirement. Does this simply require System Owner, or delegate, approval fro personnel assigned Admin accounts?Requirement 10.8 - we would appreciate some guidance on what type of evidence would be required to demonstrate compliance to this requirement. This seems very difficult to enforce.
24.23	Public Service Enterprise Group companies	Disagree	A rework of the language is needed to address the following questions to avoid confusion and misunderstanding. Please define for 10.7 what is meant by “security administrative functions” and for 10.8 what is meant by “other system functions”. Does the Operating System need automatically to check a user account against a list of “security administrative functions” before allowing access? What needs to be done if the Operating System does not have this capability? Meeting this requirement may not be technically feasible.
24.24	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.Also 10.3 - 10.8 seem to suggest technical authentication enforcement capability for all systems. Suggest softening the language to allow for administrative controls to compensate where technical controls are not possible. Also recommend verbiage that provides consideration for said technical limitations to eliminate the requirement for TFEs.
24.25	FirstEnergy Corporation	Disagree	As written, it appears that this would eliminate many TFEs and we like this change.10.4, 10.5 - Make text in table more generic - ‘implement a password scheme that utilizes as many of the four attributes as possible for the device to which the password applies’. As written, 10.5 would still mean TFE’s for any Microsoft-based authentication systems.Need to provide guidance for 2nd factor authentication (which is typically all numeric) and non-password authentication sources (e.g. smart

#	Organization	Yes or No	Question 24 Comment
			cards)
24.26	Constellation Energy Commodities Group Inc.	Disagree	Choose a single standard for password complexity, rather than differentiating by risk level. Either choose a standard that is compatible with MS Windows, or explicitly state that implementing the maximum password complexity that the device supports is sufficient to meet the requirement without requiring documentation of an exception.
24.27	Liberty Electric Power, LLC	Disagree	CIP-011 R10 changing passwords every 12 months. This is a “feel good” requirement which does not advance security, but rather degrades is as the new passwords are more likely to be written down than the old passwords. The number one method of password theft is reading off a written document.The better method for password security is requiring changes "for cause".
24.28	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
24.29	GTC & GSOC	Disagree	Dictating password attributes requires a specific technology, one that is rapidly becoming obsolete. We recommend the standard should require adequate authentication measures to prevent unauthorized access to systems without specifying passwords as the method for doing so.
24.30	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy is concerned for entities without routable connectivity this requirement is overly burdensome and would require the manual resetting of passwords on thousands of remotely distributed programmable electronic devices. Emergency response would be hampered with the resulting manual password modification and management process. An unintended consequence of not excluding unconnected devices from this requirement may cause an entity to establish connectivity to meet this requirement. This potentially exposes BES cyber system to additional unnecessary security risks which should not be the intention of this requirement. Additionally, password protection may not be available on all BES Cyber

#	Organization	Yes or No	Question 24 Comment
			Systems since some may use other authentication schemes, such as digital certificates or encryption keys. TFEs may be necessary for this requirement.
24.31	Exelon Corporation	Disagree	Exelon is concerned that this will require unique identifiers and passwords for each BES Component despite the ambiguity resulting from the use of the term BES Element which could be read to mean group of components. Exelon suggests that this be limited to only those BES Components which can be remotely accessed via routable or dial-up protocol.
24.32	Constellation Power Source Generation	Disagree	For R10.1, instead of changing passwords "after installation," it should state "upon installation" in case the password is changed before physical installation. R10.2 requires passwords to be changed every 12 months, but in the case of relays for a base loaded generation facility that has planned outages every 3-5 years, this is not possible. The verbiage should add flexibility for planned outages. For R10.4, passwords are not the only way to authenticate, so requiring a password scheme is troublesome.
24.33	Southwest Power Pool Regional Entity	Disagree	Ideally, require user authentication before granting access without prescribing any particular technology. For the requirements specific to password management, add "if used" to the requirement. As written, R10 can be read to mandate the use of passwords. 10.3: Longer is better, especially for administratively privileged accounts. Require 10 or more characters for administratively privileged accounts and at least 8 characters for less-privileged accounts. Where the BES Cyber System Component cannot support the defined length, mandate the maximum password length supported. 10.4 and 10.5: Instead of defining the complexity characteristic, require complex passwords as enforced by the BES Cyber System Component's operating system. 10.7: Define what "explicit authorization" means and clarify if for all types of access or only interactive access. 10.8: Consider rewording the requirement to read "Require users of security administrative accounts to use non-privileged accounts when performing non-administrative functions on BES Cyber Systems."

#	Organization	Yes or No	Question 24 Comment
24.34	Detroit Edison	Disagree	In 10.1 the term “after installation” is vague. Change the sentence to “Change default vendor passwords prior to putting any BES Cyber System Component in service”.In 10.2 change 12 months to “at least once per calendar year, not to exceed 14 months between instances”
24.35	San Diego Gas and Electric Co.	Disagree	In Table R10, Requirement 10.5, SDG&E believes that passwords for high impact systems should be longer, not necessarily more complex. We recommend that high impact system passwords be a minimum of 10 characters. Complexity requirements should be the same for high and medium systems (SDG&E recommends 10.4).Certain legacy devices won’t be able to comply with these password requirements as listed (such as substation serially connected relays), so TFEs may be required for some of these Requirements in CIP-011.The drafting team also may want to consider changing R10 to include other technologies for controlling access besides passwords, such as special locks, biometric devices, etc.
24.36	Hydro One	Disagree	In the case of R10.2 we believe that the change of passwords every 12 months for all three categories would be very difficult to implement and would not provide increased benefit to the overall reliability of the BES. Recommend removing 10.7 and 10.8 since these are covered by 8.1, and 10.8 repeats 7.2.The use of the “minimum” will make 10.6 difficult to audit (refer to the response to Question 54).
24.37	Minnesota Power	Disagree	Is it the Standards Drafting Teams intent that Part 10.7 of Table R10 requires explicit approval for every login to system or security administrative accounts? If yes, Minnesota Power believes that this is excessive and will inhibit proper administration of BES Cyber Systems. Minnesota Power believes that the intent of authorizing access privileges is adequately covered by Requirement R8, subject to the comments made in Question 20.
24.38	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).

#	Organization	Yes or No	Question 24 Comment
24.39	Pacific Gas & Electric Company	Disagree	Need to consider physical security interaction with “cyber” security. An example is a substation control panel (handles, etc, which you can physically operate various devices in a sub) that is physically co-located with electronic devices that perform the same functions. In this case “electronic access control” for local access to should not be required.
24.40	NextEra Energy Corporate Compliance	Disagree	NextEra comments that in reference to the footnote regarding the situation where the "device is not capable of meeting the password threshold, then implement the maximum password complexity that the device can support", isn’t this better presented for the Responsible Entitiy to have a mechanism to file for a TFE or any other exception process proscribed by the Standards?Regarding 10.8, what is the expected documentation and/or account management access control actions to demonstrate requiring users of BES Cyber Systems and security administrative accounts to use non-privileged accounts when accessing other system functions?Regarding R10.2, how are BES Cyber Systems not capable of technically enforcing password changes handled? Are procedural controls sufficient to meet this requirement?Additionally, how could one demonstrate compliance with R10.2 if the BES Cyber System Component is not capable of logging when the password was last changed (e.g. protective relays)?Requirement 10.2 time requirement for changing passwords at least once every 12 months does not take into account or include verbiage for legacy systems that do not have the functionality to change passwords, Is there an opportunity for an exception with evidence from the BES Cyber System component manufacturer? There should also be verbiage included in the requirement for exceptions related to BES Cyber system components that passwords cannot be changed due to operational and reliability impacts to the BES. For requirements 10.3 - 10.5, it is unclear how responsible entities document implementing the password scheme requirements. Does the responsible entity comply with having a policy that indicates the necessary requirements or is it necessary that these requirements are enforced technically by the BES Cyber System component? It is recommended that these requirements are satisfied by policies

#	Organization	Yes or No	Question 24 Comment
			instituted by the Responsible Entities and the verbiage indicates that the requirements do not have to be technically enforced. Another recommendation is that there are allowable exceptions to this requirement if a BES Cyber System component cannot technically enforce the requirements, since there are a number of legacy systems that cannot enforce this requirement.For requirement 10.6, there needs to be direction on documenting how access permissions are the minimum necessary to perform work functions. A recommended approach should indicate that the responsible entities administer policies requiring the concept of least privilege concerning their role-based access control administration. Lastly, it is unclear how requirements 10.7 and 10.8 differ from requirement 8.1, since authorization of adding account and subsequent access has to be included in a process based on the requirement. Requirements 10.7 and 10.8 should be moved to 8.X requirements section and clarification should be made as to what explicit authorization means. Is this authorization required each time a user has to access system and security administrative functions? In addition, how is the Responsible Entity supposed to demonstrate compliance to 10.7 and 10.8?
24.41	Southern Company	Disagree	Password requirements written to the level specified in R10.3 through R10.5 have proven unworkable in past versions of the standard. What should be included is only a requirement for strong authentication measures so that alternative, possibly superior, technology is not disallowed.
24.42	Platte River Power Authority	Disagree	Question:Require users of BES Cyber Systems and security administrative accounts to use non-privileged accounts when accessing other system functions What is meant by “other system functions”? What if the “other system functions” require a privileged account?
24.43	Consultant	Disagree	R10 (and others) Suggest the wording "to prevent malicious operation of BES Elements by maintaining control of access to its ES Cyber Systems." be modified to remove the phrase "to maintain control of access to its ES Cyber Systems." Account management and access control do not prevent malicious operation. The objective of

#	Organization	Yes or No	Question 24 Comment
			the standard is to prevent malicious operation, but the requirements control access (in this group), which is only one of the actions required by the standards "to prevent malicious operation."Table R10 - Items 10.3, 10.4, and 10.5 - These are statements of "How To" regarding technical implementation and should be changed to be a "What" requirement by using the words from the footnote: "implement the maximum password complexity that the device can support."Suggest items 10.6 & 10.7 be moved to the table R8, as these statements regard account management rather than access control.Item 10.8 This item should be removed. "Non-privileged account" is not an account type required by R7, and is a subjective term. "other system functions" is not defined and is also a subjective term. "security administrative accounts" is not a defined term. This statement uses multiple undefined and subjective terms and does not establish a requirement that can be implemented or audited.
24.44	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R10. System functionality and capabilities may not allow an entity to meet this requirement. Will there be language added to relieve this requirement if the system is not capable? R10.8 should contain language specifying that it applies to other system functions that do not require system level access.
24.45	Con Edison of New York	Disagree	R10.1 Changing passwords on equipment that are not networked, such as relays, is very labor intense. This activity and will be a year-long job because by the time you finish, you will need to go back to the first relays and start changing those again. The requirement to change these passwords on a yearly basis should be on systems that are networked. There must be a lower level requirement on the non-networked equipment.R10.6 Some system may not technically have the ability to perform this function.R10.8 The purpose of this requirement is not clear.R10.7 requires “explicit” authorization. This requirement should allow for specific personnel designation to be authorized for access and not require it be by name. For example LAN administrators by job definition should be able to be authorized for a specific level of access.R10.8 requires LAN administrators to log in differently if they do not need full access for the current task. This can be enforced procedurally although there should be no expectation that this can be documented to show that in each case the correct login

#	Organization	Yes or No	Question 24 Comment
			was used.R10.8 - Impossible to verify compliance or audit this, should be removed
24.46	Kansas City Power & Light	Disagree	R10.8 is unmanageable in the "windows" world. These requirements are too prescriptive and consideration should be given toward what needs to be accomplished and less on how to accomplish it.
24.47	Western Area Power Administration	Disagree	R10: Biometric and token-based factors not addressed. They need to be. R10.3 - Suggest combining 10.3 & 10.5 to number 10.3 with a 10.3.1 & 10.3.2. R10.4 - Delete 10.4 & just use 10.5 for both Medium & High.R10.4 - Are there exceptions for any equipment that doesn't handle special characters?R10.5 - Are there exceptions for any equipment that doesn't handle special characters?
24.48	ISO New England Inc	Disagree	Recommend removing 10.7 and 10.8 since these are covered by 8.1 and 10.8 repeats 7.2Concerned that 10.6 will be hard to audit, should be a policy statement and included in R1. There is no clear way to audit this requirement and is open to auditor interpretation. This can be easy to audit if an administrator has admin access everywhere or a dispatcher has admin access in the application as well as components. But really an auditor's opinion may differ from BES cyber system's owner.R10.8 Should be a policy statement and included in R1. There is no clear way to audit this requirement. How is this going to be audited? Whether a user has two accounts?R10.7 Please explain "explicit" authorization, versus authorization? They seem to be the same why the emphasis.
24.49	Northeast Power Coordinating Council	Disagree	Recommend removing 10.7 and 10.8 since these are covered by 8.1, and 10.8 repeats 7.2.The use of the "minimum" will make 10.6 difficult to audit (refer to the response to Question 54).
24.50	Black Hills Corporation	Disagree	Recommend that 10.4 be eliminated and medium impact systems be subject to 10.5 (subject to the footnote). Implementing both adds training complexity that has little value.

#	Organization	Yes or No	Question 24 Comment
24.51	Northeast Utilities	Disagree	Regarding 10.4 and 10.5 - Most, if not all, security software can not make the distinction to this level of detail nor can it be effectively monitored manually. Recommend that the criteria MS Windows defines today for password complexity is used. Additionally, trying to make a distinction by BES impact can lead to unnecessary confusion when going to this level of granularity.
24.52	EEI	Disagree	Regarding Table R10 Row 10.1:Default vendor passwords should be changed before or during commissioning for use.Regarding footnote 1, change to: If a device is not capable of meeting the password threshold, then implement as many of the following password attributes as possible: o Minimum of six characters o Lower case alphabetic, o upper case alphabetic, o numeric, o “special” characters (e.g. #, $, @, &)Regarding Table R10 Row 10.7:It is not clear what “security administrative functions” means. Moreover, it appears duplicative of requirement 10.6.
24.53	Allegheny Energy Supply	Disagree	Regarding Table R10 Row 10.1:Where possible, default vendor passwords should be changed before being commissioned for use.Regarding footnote 1, change to: If a device is not capable of meeting the password threshold, then implement as many of the following password attributes as possible: o Minimum of six characters o Lower case alphabetic, o upper case alphabetic, o numeric, o “special” characters (e.g. #, $, @, &)This should also include the ability to provide alternatives such as 2 factor authentication where all the types of characters for a single password may not be possible.Regarding Table R10 Row 10.7:It is not clear what “security administrative functions” means. Moreover, it appears duplicative of requirement 10.6.
24.54	Allegheny Power	Disagree	Regarding Table R10 Row 10.1:Where possible, default vendor passwords should be changed before being commissioned for use.Regarding footnote 1, change to: If a device is not capable of meeting the password threshold, then implement as many of the following password attributes as possible: o Minimum of six characters o Lower case alphabetic, o upper case alphabetic, o numeric, o “special” characters (e.g. #, $, @, &)Regarding Table R10 Row 10.7:It is not clear what “security administrative

#	Organization	Yes or No	Question 24 Comment
			functions" means. Moreover, it appears duplicative of requirement 10.6.
24.55	BGE	Disagree	Replace the word "element" with "Cyber System Component" to maintain consistency with the defined terms.
24.56	Duke Energy	Disagree	Requirement 10.1: Passwords should be changed BEFORE making the system operable as opposed to "after installation," as written currently.Requirement 10.2: change passwords once every 12 months. Nuclear plants are on an 18 month fuel cycle. Some are moving to a 24 months. Ideally, systems would be started up at the end of a refueling outage and not touched, save for required maintenance activities until the beginning of the next refueling outage. If the maintenance activity didn't require electronic access, then having each technician/engineer/operator go to the device and change their user specific password on a 12 month basis is actually adding more risk to the BES. Alternate controls can be just as effective with less risk - for instance, installing a stand-alone (e.g. not network/serial/wireless connected) device located in a locked/alarmed cabinet. Is there any allowance for such an alternate control? Also, can this requirement be lessened for low impact systems?10.3 State that multi factor token may be used in place of password.Requirement 10.6: Require that authorized access permissions are the minimum necessary to perform work functions. This applies to user permissions as opposed to administrator functions, correct? Administrator privileges typically include all permissions.
24.57	Nuclear Energy Institute	Disagree	Requirement 10.1: Passwords should be changed before making the system operable as opposed to "after installation," as written currently.Requirement 10.2: change passwords once every 12 months. Frequencies for all requirements should be defined by the Entity, and not defined in these Standards. If a time must be specified in the Standard, then a process must exist for the frequency to be tailored to meet operational requirements.
24.58	USACE HQ	Disagree	Requirement 10.3 should include the language in the footnote to make it clear that

#	Organization	Yes or No	Question 24 Comment
			that is an option under the standard.
24.59	Garland Power and Light	Disagree	Requirement R10 - Paragraph needs to state that a policy or procedure requiring password length, complexity, and password changes are adequate and do not need to be technically enforced by the device.
24.60	Oncor Electric Delivery LLC	Disagree	Requirements 10.5 and 10.7 cannot be applied to all legacy systems currently in-service as they do not support account management. These should allow for TFE. Mandated password change should only be on High impact systems with routable/dial-up communications.
24.61	Xcel Energy	Disagree	Since not all deices are capable of supporting these password requirements, this is an area where TFE need to be allowed. We are concerned with Requirement 10.2 to change passwords every 12 months. For substation devices this would a significant burden, especially for low and medium impact systems.
24.62	ERCOT ISO	Disagree	Since the purpose of this is basically the same as the previous requirements, these could all be combined into a single requirement. 10.1: Recommend specifying a time-frame for changing passwords. 10.2-10.5: Recommend that the requirements address the use of alternate authentication means, such as biometrics and RSA SecurID. TFEs should be allowed for the requirements under this section.
24.63	MidAmerican Energy Company	Disagree	Sufficient Password security can be accomplished by combining table items 10.1 through 10.5 into one line item. The item should state: Implement a process for authenticating all users prior to granting access to BES Cyber Systems. If additional security measures are desired for high impact BES Cyber Systems require dual authentication when possible.
24.64	Ameren	Disagree	Suggest changing R10.1, R10.2, and R10.3 for Low Impact BES Cyber System requirement to “Required, unless system is behind a firewall or other protective measures.” Giving password strength criteria is too specific when entities may use

#	Organization	Yes or No	Question 24 Comment
			other ways to implement security that meet or exceed this requirement. The manpower necessity for changing passwords yearly and maintaining a protected/immediately accessible database to store passwords so that those who need to access relays can when needed for Low Impact Systems is not needed. If all the High Impact System relays have firewall protection that should be enough. The industry needs to be able to access relays to keep the BES system functional and respond to operational issues. Also, for R10.1 need to clarify how long after installation should a vendor password be changed.â€,â€,R10.4 and R10.5 - These requirements will be difficult to prove in an audit. Should be changed to provide a documented process should be sufficient and should be less trouble in dealing with an audit on these requirements. However, some systems may not be able to adhere to these policies, and TFE's may be required.R10.6 - Documentation of the permission check will be volumes of data that will have to be performed in the audit. This requirement needs a periodic review time associated with it.R10.7 - What is the intention of this requirement? If all access is already accounted for in R10.6 isn't this requirement duplicate effort?
24.65	Entergy	Disagree	Suggest simplifying requirements 10.4 and 10.5 by combining and rewriting into: “Implement a password scheme that cannot be found in the dictionary and has at least three of the following four attributes: Lower case alphabetic, upper case alphabetic, numeric, “special” characters (e.g. #, $, @, &)”Requirement 10.8 should be reviewed from a technology perspective. While use of a “normal” user account and gaining “root” access through “sudo” is robust in the UNIX variant operating systems, performing the same function in the Windows operating system can be problematic with logging in as a different user all together. Suggest possibly relaxing this requirement.
24.66	ReliabilityFirst Staff	Disagree	Table R10; row 10.2 - High Impact BES Cyber Systems should have the password changed at least every 6 months. Regarding footnote 1, for devices that are not capable of meeting the password threshold, the entity should be required to

#	Organization	Yes or No	Question 24 Comment
			document this situation, including compensating measures, for audit review.
24.67	Southern California Edison Company	Disagree	Technical capability is not a homogenous quantity in a system with diverse classes of devices and thus the ability to implement generic controls over a heterogeneous system does not always exist. A means to seek exception from the "word" of the standard, while still complying with the intent which is to clearly identify technical situations where a prescribed control, is not implementable while maintaining cyber security protections is needed. Requirements R10.4 and R10.5 are too prescriptive and do not allow registered entities to seek out alternative access authentication mechanisms. For instance, biometrics or 2-factor authentication based on numerical passwords generated by a key-based security architecture may not meet the word of the standard but go above and beyond the intent of the standard.
24.68	USACE - Omaha Anchor	Disagree	TFE will be required for this section if verbiage isn't added to address lower level machines where some items (10.7, 10.5) are not possible.
24.69	Manitoba Hydro	Disagree	The account access control requirements should be more generic and technology independent, allowing the entity to apply a variety of account access controls. If passwords are needed, Requirement R10.3 should also require some "special" characters, to the extent that the device is capable. The standard should also allow protection by layers of security, which may be provided by other methods or cyber systems.
24.70	APPA Task Force	Disagree	The APPA Task Force supports the proposal by MRO-NSRS to be more generic in the wording of the requirements in R10, to account for innovations such as biometric controls used in lieu or in conjunction with password controls.We propose the following edits to R10:R10 Table 10.1: Restrict electronic access to BES Cyber Systems through use of an electronic access control that does not use/rely on the vendor defaut password.R10 Table 10.2: Electronic access controls must be updated/modified at least once annually.Since numerous devices would be exempt from this requirement due to their inability to support password protection, the term

#	Organization	Yes or No	Question 24 Comment
			"Electronic Access Controls" should replace "Passwords". This is non-limiting and will not lock into the standard a current technology, for example, keyboard-based "password access."APPA proposes that items 10.3 - 10.5 be removed from this requirement and be submitted to the "guideline in support of the standard" drafting team to be included as a best practice for account access control. If 10.3-10.5 must remain in the requirement we recommend they be less technology-specific. We propose the following language:R10 Table 10.3: Implement a password scheme that has a minimum of six characters, or an electronic access control with an equivalent or superior technology option.R10 Table 10.4: Implement a password scheme that has at least two of the following four attributes: Lower case alphabetic, upper case alphabetic, numeric, "special" characters (e.g. #, $, @, &), or an electronic access control with an equivalent or superior technology option. R10 Table 10.5: Implement a password scheme that has at least three of the following four attributes: Lower case alphabetic, upper case alphabetic, numeric, "special" characters (e.g. #, $, @, &), or an electronic access control with an equivalent or superior technology option.In Table 10.6 the wording "the minimum necessary to perform work functions" is subjective and will be difficult to measure. We propose this be replaced with "Require that access permissions are in accordance with the entity access authorization policy required in R1."
24.71	Constellation Energy Control and Dispatch, LLC	Disagree	The appropraite account access control mechanisms should not be specifically defined in the Table R10.
24.72	Bonneville Power Administration	Disagree	The objective of this requirement ("to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.In today's electronic world there are many methodologies for electronic access control. Many systems now make use of multi-factor passwords, and/or biometrics. They use passwords or

#	Organization	Yes or No	Question 24 Comment
			pass-codes are randomly generated, encrypted and time sensitive. Access codes or passwords may be one time, expiring after one use, and/or after a specified time (usually 60 seconds). The systems implemented may also provide checks to insure that the passwords are not captured and hijacked. These modern methodologies are far more effective and secure than the stated requirements. This requirement is prescriptive and too specific. The way it is written it would preclude the use of modern and stronger tools because they may technically not meet one or more of the specifications, even though they are bigger, better and stronger. If the requirements must remain this prescriptive, then the following changes should be made:- There should be a second footnote, "Stronger methods, such as multi-factor authentication of one-time passwords, may be used in lieu of username/password combinations."- 10.1: A time frame for "after installation" needs to be specified.- 10.3: Given the efficacy and availability of Rainbow Tables, a 6-character password is woefully inadequate. The minimum should be at least 10, and 14 would be better. - 10.6: There's a difference between "minimum necessary" and "minimum practical and necessary". Strict interpretation would require that access grants would change depending on the task being performed, which is probably not the intent. Suggest the wording be changed as described. An alternative would be to use the NIST definition of "Least Privileges - The security objective of granting users only those accesses they need to perform their official duties" (NIST IR 7298 - NIST Glossary of Key Information Security Terms) and then require the use of Least Privileges.Item 10.2 in Table R10 states that “/p/asswords must be changed at least once every 12 months”. Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently passwords must be changed.
24.73	Reliability & Compliance Group	Disagree	This requirement does not consider the use of biometric access systems such as finger print readers that could be used in place of password verification.Also, it should include the word “electronic” when it talks about “maintaining control of access to its BES Cyber Systems.”

#	Organization	Yes or No	Question 24 Comment
24.74	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments regarding footnote 1 and Table R10 Row 10.7.
24.75	American Transmission Company	Disagree	We believe the depth of detail in R10 needs to be better coordinated with the rest of the standard, where the entity is told what they need to do, not explicitly how to do it. R10 appears to be overly prescriptive, which could potentially box entities in if they want to exceed the requirements of the standard.We would propose replacing item 10.1 with something more generic, like "Restrict electronic access to BES Cyber Systems", similar to how physical access is handled under R5.1. Passwords may not apply in all cases, and some entities may wish to implement alternative methods of user authentication that are superior, but as currently worded they would be limited by the standard.We would also propose replacing item 10.2 with something more generic, like "Electronic access controls shall be reviewed at least once every 12 months". A requirement for changing the access controls every 12 months is not applicable for an entity using biometrics scanning as opposed to passwords.We would propose deleting items 10.3 - 10.5, as they would not apply under the approach proposed here. Finally, the standard should allow for other control methods such as front ending a device with a fully password protected access control device instead of the required password controls directly on the device.
24.76	MRO's NERC Standards Review Subcommittee	Disagree	We believe the depth of detail in R10 needs to be better coordinated with the rest of the standard, where the entity is told what they need to do, not explicitly how to do it. R10 appears to be overly prescriptive, which could potentially box entities in if they want to exceed the requirements of the standard.We would propose replacing item 10.1 with something more generic, like "Restrict electronic access to BES Cyber Systems", similar to how physical access is handled under R5.1. Passwords may not apply in all cases, and some entities may wish to implement alternative methods of user authentication that are superior, but as currently worded they would be limited by the standard.We would also propose replacing item 10.2 with something more generic, like "Electronic access controls shall be reviewed at least once every 12

#	Organization	Yes or No	Question 24 Comment
			months". A requirement for changing the access controls every 12 months is not applicable for an entity using biometrics scanning as opposed to passwords.Finally, we would propose deleting items 10.3 - 10.5, as they would not apply under the approach proposed here.
24.77	The Empire District Electric Company	Disagree	We believe the depth of detail in R10 needs to be better coordinated with the rest of the standard, where the entity is told what they need to do, not explicitly how to do it. R10 appears to be overly prescriptive, which could potentially box entities in if they want to exceed the requirements of the standard.We would propose replacing item 10.1 with something more generic, like "Restrict electronic access to BES Cyber Systems", similar to how physical access is handled under R5.1. Passwords may not apply in all cases, and some entities may wish to implement alternative methods of user authentication that are superior, but as currently worded they would be limited by the standard.We would also propose replacing item 10.2 with something more generic, like "Electronic access controls shall be reviewed at least once every 12 months". A requirement for changing the access controls every 12 months is not applicable for an entity using biometrics scanning as opposed to passwords.Finally, we would propose deleting items 10.3 - 10.5, as they would not apply under the approach proposed here.
24.78	We Energies	Disagree	We Energies agrees with EEI: Regarding Table R10 Row 10.1:Where possible, default vendor passwords should be changed before being commissioned for use.We Energies agrees with EEI: Regarding footnote 1, change to: If a device is not capable of meeting the password threshold, then implement as many of the following password attributes as possible: o Minimum of six characters o Lower case alphabetic, o upper case alphabetic, o numeric, o "special" characters (e.g. #, $, @, &)We Energies agrees with EEI: Regarding Table R10 Row 10.7:It is not clear what "security administrative functions" means. Moreover, it appears duplicative of requirement 10.6.

#	Organization	Yes or No	Question 24 Comment
24.79	PacifiCorp	Disagree	While the criteria themselves are not onerous for the long term/future development of the systems, the fact is that current BES technology in place or available, will require technical feasibility exceptions as not all systems within the BES can support all criteria listed.The standard needs to allow for non-password based authentication systems or one time passwords. Modify 10.2 through 10.5 with “or equivalent or greater authentication methods”The current password requirements in table 10 are too burdensome and unnecessary. The requirements as written are also confusing. Passwords should not be the only acceptable way to authenticate a user prior to granting access.
24.80	Luminant	Disagree	Will require TFE for some systems

25. Table R10 provides direction concerning what impact level of BES Cyber Systems to which Requirement R10 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R10 moved to CIP-007-5 – Cyber Security - Systems Security Management - Requirement R5.

Commenters indicated that passwords on Low Impact BES Cyber Systems should not be subject to any periodic change as stated in Table R10 (10.2). In response, the SDT revised the password requirements, and they are not applicable for Low Impact BES Cyber Systems.

Commenters suggested a single criterion for password complexity. In other words, do not differentiate by risk level. The SDT agreed and reduced the password complexity requirement to be the same regardless of applicable risk or impact level.

#	Organization	Yes or No	Question 25 Comment
25.1	US Army Corps of Engineers	Agree	Agree with impact levels, but disagree on item Table R10, 10.8: "Require users of BES Cyber Systems and security administrative accounts to use non-privileged accounts when accessing other system functions." Add to the end of the statement, if the system function does not require the use of using a privileged account.
25.2	CWLP Electric Transmission, Distribution and Operations Department	Agree	As long as TFEs are available for systems that do not support the password requirements.
25.3	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.
25.4	US Bureau of Reclamation	Agree	Recommend we establish Requirement 10.6 for all impact levels. Also, please refer to question #54, comment 2
25.5	Southern California	Agree	Requirement 10.7 may be interpreted that access need not be denied as a default

#	Organization	Yes or No	Question 25 Comment
	Edison Company		setting. If the intent of the drafting team is a different control, the team should consider rephrasing this requirement.
25.6	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
25.7	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels for R10 if it is understood that a blank in the table means N/A. The APPA Task Force agrees with the MRO-NSRS proposal:"If the standard were to remain as written, we would propose that the 10.1 - 10.3 requirements be removed for Low Impact systems, and be "Required for remote access or routable external connectivity only" for Medium Impact systems."
25.8	GTC & GSOC	Agree	We recommend 10.8 to be changed to: "Require persons to use non-privileged accounts when accessing system functions that do not require privileged accounts"
25.9	Exelon Corporation	Agree	We would suggest the password items begin with "Where passwords are utilized they must ...." These requirements should allow entities the flexibility to use other user authentication methods besides just passwords such as two factor tokens or other methods that provide even better protection than just passwords. Exelon appreciates the clarification provided in footnote #1 which has the potential to limit the number of TFEs that would be required.
25.10	Regulatory Compliance	Disagree	10.1 - 10.3 STRIKE "Required" for Low Impact10.6 - STRIKE "Required for medium impact - inconsistent with level.
25.11	LCEC	Disagree	10.2 is not auditable as a performance requirement.Footnote [1] is subject to major interpretation: complexity is ambiguous. May not be legally defensible. Maximum should be maximum comparable.We suggest removing 10.6 it is too subjective.
25.12	BGE	Disagree	10.2 maintain consistency for timeframes (i.e. use 12 months or annual). 10.3, 10.4

#	Organization	Yes or No	Question 25 Comment
			and 10.5 should be combined.10.6 needs a definition for “minimum”. 10.8 needs clarification for the meaning of “other system functions”.
25.13	Dominion Resources Services, Inc.	Disagree	10.2. It is anticipated that there will be thousands of Low Impact devices geographically spread across a utility’s system. By definition these devices provide little risk to the BES. It is impractical from a resource perspective and unnecessary from a reliability perspective to change the passwords of low impact components every 12 months. The requirement should be removed from Low Impact.
25.14	ERCOT ISO	Disagree	10.7-10.8: Should apply to Medium Impact BES Cyber System.
25.15	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
25.16	Southern Company	Disagree	As long as there are requirements which include per-component action for each low-impact BES Cyber System, the effort needed to implement those actions will overwhelm the rest of the CIP compliance effort. For example, a reasonable estimate is that our Entity will have approximately 2,500 low-impact substations with an estimated 100 programmable devices in scope per substation. Without any other consideration of work required, that represents 250,000 password changes each year to be performed, tracked, and communicated. The majority of those devices have hardware override switches which disable password protection for anyone who has physical access to the device, so no reliability advantage is gained by performing the password change. This is just one example of the scope of work with little or no benefit to the BES that is required as long as there are per-component low-impact requirements.The standards should be modified so that requirements for low-impact cyber systems include only program-wide efforts such as policy, governance, incident response planning, and disaster recovery planning.If low-impact requirements cannot be eliminated completely, then at least the specific requirements for password changes for components with no external connectivity should be removed, as they provide no additional benefit when paired with physical security requirements.In addition, vendor contracts with sole suppliers of necessary equipment may conflict

#	Organization	Yes or No	Question 25 Comment
			with 10.1. At the least, this creates the necessity for a large, cumbersome TFE program.In 10.1, the phrase "after installation" should be replaced by "before, during, or immediately after installation".10.4 and 10.5 create a TFE burden without any substantial benefit and disallow advanced technology that provides stronger authentication but does not meet the literal wording. Instead, the requirement should be modified to require authentication.
25.17	Tenaska	Disagree	At the end of R11 just add "identify restrictions and uses for accesses". And remove table.
25.18	Constellation Energy Commodities Group Inc.	Disagree	Choose a single standard for password complexity, rather than differentiating by risk level.
25.19	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
25.20	The Empire District Electric Company	Disagree	Comments: With the changes proposed in question 24, we would propose that revised items 10.1 and 10.2 be "Required" for Low, Medium, and High Impacts.We would agree with the current impact levels for items 10.6 - 10.8.However, it the standard were to remain as written, we would propose that the 10.1 - 10.3 requirements be removed for Low Impact systems, and be "Required for remote access or routable external connectivity only" for Medium Impact systems. Once someone has gained physical access to a facility, the hurdle of a password does very little to limit the amount of physical damage or misuse that can be done. However, for remote access, the password becomes critical to preventing damage or misuse. We also believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.
25.21	Southwest Power Pool	Disagree	Complex passwords and minimum password lengths are a basic security control and

#	Organization	Yes or No	Question 25 Comment
	Regional Entity		should be applicable to all impact categories.
25.22	E.ON U.S.	Disagree	E.ON U.S. does not believe a requirement is necessary for low impact items.
25.23	Consultant	Disagree	Item 10.2 - There is no requirement for account management for Low Impact assets, and it is illogical to require password controls where there are no account controls.
25.24	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
25.25	Progress Energy (non-Nuclear)	Disagree	Low impact BES systems should not have this requirement. By virtue of their definition they do not need this requirement.CIP-011 R10 - Would like to compliment the SDT for constructing a realistic and reasonable approach with regard to effective use of complex passwords. The SDT has recognized that there may be password complexity limitations with older existing electronic gear that is in operational service and rather than try to mandate a standard that is technically not feasible to implement, they have provided the footnote to require that practical password complexity should be set to the maximum that the device is capable of supporting.CIP-011 R10 - Account management access control & passwords is this meant to include BIOS or only interactive logins to devices?10.2 - “Passwords must be changed at least once every 12 months”, If this is referring to cyber system components, this represents unreasonable costs to utilities. Password changes for relays with no remote capability will be cost prohibitive, and password changes for individual relays with remote capability will require excessive time.
25.26	NextEra Energy Corporate Compliance	Disagree	NextEra believes for Low Impact BES Cyber Systems, requiring passwords to be changed at least once every 12 months should be changed at least every 24 months; for Medium Impact BES Cyber Systems, we suggest changing passwordsat least every eighteen months.
25.27	Alberta Electric System	Disagree	Please consider the following changes to increase security and make the

#	Organization	Yes or No	Question 25 Comment
	Operator		requirements more restrictive:Table 10.2 - passwords changes at least once every three months.Table 10.3 - minimum eight character password (with same footnote)Table 10.4 - change to “three of the following five attributes” and include two-factor authentication as an additional attribute.Table 10.5 - change to “four of the following five attributes” and include two-factor authentication as an additional attribute.Table 10.6 - required for Low, Medium, and High impact levelsTable 10.7 - required for Medium and High impact levelsTable 10.8 - required for Medium and High impact levels
25.28	American Municipal Power	Disagree	Please provide a little or no impact category
25.29	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 7 account identification to Table 8 account management, Table 9 Access Revocation, and Table 10 Account Access Controls. Additionally, if physical security is not required for Low Impact BES Cyber Systems, then Puget Sound Energy suggests including wording similar to Table 5: “Required for routable connectivity only”.
25.30	Con Edison of New York	Disagree	R10.6 should not be required for medium impact
25.31	Ameren	Disagree	R10.8 - Should be added for Medium Impact Systems.
25.32	ISO New England Inc	Disagree	Recommend removing 10.7 and 10.8 since these are covered by 8.1 and 10.8 repeats 7.2
25.33	Hydro One	Disagree	Recommend removing 10.7 and 10.8 since these are covered by 8.1, and 10.8 repeats 7.2.We’d like to know the full meaning of “explicit authorization”. If possible please add the definition in the glossary.
25.34	Northeast Power Coordinating Council	Disagree	Recommend removing 10.7 and 10.8 since these are covered by 8.1, and 10.8 repeats 7.2.

#	Organization	Yes or No	Question 25 Comment
25.35	Black Hills Corporation	Disagree	Recommend that 10.4 be eliminated and medium impact systems be subject to 10.5 (subject to the footnote). Implementing both adds training complexity that has little value. Similarly, 10.7 & 10.8 should also apply to medium impact systems.
25.36	Northeast Utilities	Disagree	Recommend that the 10.4 scheme (use 2 of 4) is used for both medium and high impact and that the 10.5 scheme (use 3 of 4) is eliminated. Trying to make a distinction by BES impact can lead to unnecessary confusion when going to this level of granularity.
25.37	Minnesota Power	Disagree	Regarding Part 10.2, Minnesota Power believes that the requirement to change passwords for Low Impact Systems at least once every 12 months is excessive. The requirement that a Registered Entity change passwords within this time frame for all BES Cyber Systems is unnecessarily cumbersome and time consuming. In addition, the coordination that would go into making these changes is infeasible and could result in an inability to access the system. In addition, Minnesota Power recommends that the Standards Drafting Team consider adding the following qualifier to Parts 10.1 through 10.5 of Table R10:"...where passwords are used for access control."
25.38	MidAmerican Energy Company	Disagree	Requirement 10.1 needs to state “Change default passwords prior to production operation” or words to that effect. It is imperative that vendor passwords are never placed into a production environment.
25.39	PacifiCorp	Disagree	Requirement 10.1 needs to state “Change default passwords prior to production operation” or words to that effect. It is imperative that vendor passwords are never placed into a production environment.
25.40	SCE&G	Disagree	SDT should consider not requiring Low Imapct systems to have passwords changed annually. This could potentially generate a high volume of TFEs for hardcoded passwords as previously described.

#	Organization	Yes or No	Question 25 Comment
25.41	Constellation Energy Control and Dispatch, LLC	Disagree	See comment provided to question 24
25.42	LADWP	Disagree	See previous
25.43	Western Area Power Administration	Disagree	See previous
25.44	WECC	Disagree	Several of the actions should be done for low impact assets, such as “Require that authorized access permissions are the minimum necessary to perform work functions”. Consider relooking at the impact levels.The password requirements should apply to all impact levels.
25.45	Allegheny Energy Supply	Disagree	Sufficient Password security can be accomplished by combining table items 10.1 through 10.5 into one line item. The item should state: Implement a process for authenticating all users prior to granting access to BES Cyber Systems. If additional security measures are desired for high impact BES Cyber Systems require dual authentication when possible.
25.46	Allegheny Power	Disagree	Sufficient Password security can be accomplished by combining table items 10.1 through 10.5 into one line item. The item should state: Implement a process for authenticating all users prior to granting access to BES Cyber Systems. If additional security measures are desired for high impact BES Cyber Systems require dual authentication when possible.
25.47	EEI	Disagree	Sufficient Password security can be accomplished by combining table items 10.1 through 10.5 into one line item. The item should state: Implement a process for authenticating all users prior to granting access to BES Cyber Systems. If additional security measures are desired for high impact BES Cyber Systems require dual authentication when possible.If low-impact requirements cannot be eliminated completely, then at least the specific requirements for password changes for

#	Organization	Yes or No	Question 25 Comment
			components with no external connectivity should be removed, as they provide no additional benefit when paired with physical security requirements.
25.48	Duke Energy	Disagree	Table 10: o All of Table 10 will potentially require a TFE o 10.1 change 'after installation' to "prior to being placed in service" o Suggest all password verbiage be replaced with 'authentication method' and remove specified attributes. Otherwise TFEs will be required for 10.3-10.5. o For 10.2 change 'at least every 12 months' to 'when security conditions require' o Requirement 10.2: Can this requirement be lessened for low impact systems? o 10.8 requires multiple accounts for individuals with admin rights on individual accounts. Suggest making this applicable only for shared admin accounts or removing for Windows based systems.
25.49	ReliabilityFirst Staff	Disagree	Table R10; rows 10.7 and 10.8, should be "required" for medium Impact BES Cyber Systems.
25.50	Dairyland Power Cooperative	Disagree	The focus is entirely on passwords, but other forms of credentials can be used. For example there are certificate or key based authentication to many systems. Many vendors use default keys that need to be changed, just as default passwords. The password rules are very weak compared to common practices. This seems to be an attempt to encourage the strongest possible password on legacy components/systems, but the by-product is that this weakens the requirements for modern systems. There should be a better way to deal with legacy systems while requiring new systems to use stronger passwords.
25.51	FirstEnergy Corporation	Disagree	The impact levels are agreeable assuming the changes suggested in Q24.10.1 Vendor default passwords should be changed based upon a clear definition of "installation." Non-password authentication sources need to be addressed. Possibly combine 10.4 and 10.5, but keep the note on implementing the maximum password complexity.FE request that the "Required" shown in the Low Impact column of rows 10.2 and 10.3 be removed. Password changes to Low Impact items should not be a requirement in the standard but left as a "best practice" guideline. A requirement to annually change

#	Organization	Yes or No	Question 25 Comment
			passwords to multiple digital protection relays associated with Low Impact facilities would be extremely burdensome with little reliability improvement. Each relay would require individual attention as there is no method of globally changing all digital relay passwords. If retained, consider allowing entities to synch up the changing of passwords on these devices with their normal PRC-005 maintenance cycles.
25.52	Southwestern Power Administration	Disagree	The language in this requirement should be changed to include a broader scope of technology or to be technologically neutral so that new or emerging technology (such as biometrics) which may be more secure than passwords will still be considered as in compliance.
25.53	Entergy	Disagree	The requirement indicates that the drafting team believes protection of sensitive information associated with allegedly “low impact” BES Cyber Systems/Components that provide routable protocol attack vector access to control hosts, etc., is unnecessary. Suggest this be rethought.Suggest making password requirements for all assets meet the requirements for high assets and let foot note as written take care of the assets that are unable to meet the requirement.
25.54	American Transmission Company	Disagree	The standard should allow for other control methods such as front ending a device with a fully password protected access control device instead of the required password controls directly on the device.
25.55	Florida Municipal Power Agency	Disagree	The table should have different levels of password entropy required for the different impact areas. For example, medium impact systems should have 40-bits of required entropy, while high impact systems should require 64-bits of entropy. Low impact may be able to get by with 32-bits of entropy.
25.56	Oncor Electric Delivery LLC	Disagree	These requirements should only apply to Control Center Cyber Systems.
25.57	We Energies	Disagree	We Energies agrees with EEI: Sufficient Password security can be accomplished by

#	Organization	Yes or No	Question 25 Comment
			combining table items 10.1 through 10.5 into one line item. The item should state: Implement a process for authenticating all users prior to granting access to BES Cyber Systems. If additional security measures are desired for high impact BES Cyber Systems require dual authentication when possible.
25.58	MRO's NERC Standards Review Subcommittee	Disagree	With the changes proposed in question 24, we would propose that revised items 10.1 and 10.2 be "Required" for Low, Medium, and High Impacts.We would agree with the current impact levels for items 10.6 - 10.8.However, if the standard were to remain as written, we would propose that the 10.1 - 10.3 requirements be removed for Low Impact systems, and be "Required for remote access or routable external connectivity only" for Medium Impact systems. Once someone has gained physical access to a facility, the hurdle of a password does very little to limit the amount of physical damage or misuse that can be done. However, for remote access, the password becomes critical to preventing damage or misuse. We also believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.
25.59	Emerson Process Management	Disagree	With the latest Windows OS, there is really no great difficulty of asking for complex password. This requirement can be easily applied. The only thing is enforcement. This enforcement may be retuired for high or medium impact BES Cyber Systems.

26. Requirement R11 of draft CIP-011-1 states "Each Responsible Entity that allows remote or wireless electronic access to any of its BES Cyber Systems shall apply the criteria specified in CIP-011-1 Table R11– Wireless and Remote Electronic Access Documentation to ensure that no unauthorized access is allowed to its BES Cyber Systems. Do you agree with the list of criteria that are included in Requirements Table R11? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

The remote access requirements from CIP-011-1 have been moved to CIP-005-5 - Cyber Security - Electrnic Security Perimeters – Requirement R2. The wireless requirements have been removed.

Commenters suggested more clarity was needed in the terms "remote access" and "external connections" and "wireless". The SDT proposed the following formal definitions for additional clarity on "remote access" and "external connectivity," and removed wireless access requirements from the revised Standard.

External Connectivity: *Routable or dial-up data communication through an Electronic Access Point between a BES Cyber Asset and a device external to the Electronic Security Perimeter*.

External Routable Connectivity: *The BES Cyber System is accessible from any Cyber Asset that is outside its associated ESP via a routable protocol.*

Interactive Remote Access: *Any user interactive access by a person that originates from a Cyber Asset that is not an Intermediate Device and not located within any of the Responsible Entity's Electronic Security Perimeter(s), whether network-based or dial-up access. Remote access can be initiated from: 1) Cyber Assets used by the Responsible Entity, 2) Cyber Assets used by employees, and 3) Cyber Assets used by vendors, contractors, or consultants.*

Commenters suggested that wireless and remote access be broken out into separate requirements. In response, the SDT notes that wireless access requirements have been removed from the Standard. There is a single requirement for Remote Access in CIP-005-5 R2.

Commenters stated that given the local definition of Remote Access, the requirements of Table 11 Row 11.2 are extremely unclear. In response, a new requirement for Remote Access Management (CIP-005-5 R2) was created based on the Urgent Action Revisions to CIP-005-3.

#	Organization	Yes or No	Question 26 Comment
26.1	Regulatory Compliance	Agree	BUT:11.1 Please clarify whether these are wireless technologies within the electronic boundary or wireless technologies originating outside the electronic boundary.
26.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
26.3	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made."shall implement the requirements ..." makes the bullets individual requirements, which FMPA does not believe what the intent of the drafting team. FMPA suggests "shall implement the security controls ..." as an alternative.Consider combining R7, R8, R11 and R12. FMPA believes the standard should be more clear as to if this is wireless connection that is under the complete control (end-to-end) of the Responsible Entity or not. There is no way an individual can ensure that their data path, once outside of their control, routes over a wireless device or not. For access that is not under the control of the RE, the standard should refer to it just as it might for any other remote access control, demanding that the data is encrypted and the end point is protected.
26.4	Progress Energy - Nuclear Generation	Agree	R11 can be improved by incorporating information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
26.5	BCTC	Agree	Suggest rewording from Wireless and Remote Electronic Access to Wireless or Remote Electronic Access
26.6	APPA Task Force	Agree	The APPA Task Force believes disabling the wireless functionality should be an option. If the description is not changed as proposed in Question #17 then we recommend that R11 Table 11.1 should include "and/or document that the wireless functionality is disabled."

#	Organization	Yes or No	Question 26 Comment
26.7	Bonneville Power Administration	Agree	The objective of this requirement ("to ensure that no unauthorized access is allowed to its BES Cyber System") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.It it not clear that wireless needs to be specifically addressed. It is one of many access methods that may be use. If it is to be specifically addressed, then it should be treated separately, but as a sub-class of remote access. (Even if wireless access is intended to be used for access by Entity personnel, its very nature means that access could be gained from other locations.)If it is addressed at all it should be limited to requiring adequate protection for Wireless Access Points, but not to the level of specifically prescribing the methods that need to be taken.Finally, "Wireless Access" needs to be defined. The most common usage refers to wireless local area networks under one of the 802.11 standards. But, technologies such as point-to-point communications using microwave or laser are also wireless technologies. We offer no suggestions for the definition, since we do not know the intent of the team.
26.8	Progress Energy (non-Nuclear)	Agree	We like the clarity provided by the use of the term "interactive" remote access.
26.9	Independent Electricity System Operator	Disagree	- R11 combines Wireless and Remote access. It is suggested that this be broken out in to separate requirements. Seems like an assumption that if you are connecting via wireless you are remote - not always the case.- R11.1 - Is this just a policy stat
26.10	BGE	Disagree	11.1 Define "wireless technology" (i.e. could implicate a cell phone). Throughout the table when "external connectivity only" is stated this can be interpreted as a connection from the DMZ or other company network.
26.11	Black Hills Corporation	Disagree	All BES systems should have should have access controls regardless of hard line /

#	Organization	Yes or No	Question 26 Comment
			remote / wireless connection.
26.12	Southern California Edison Company	Disagree	All forms of access documentation should be required along with the level of protction and type of access granted.
26.13	Southwest Power Pool Regional Entity	Disagree	An important aspect of wireless access was overlooked. Prescribe the use of available security features on all wireless access points. If possible word the requirement to not prescribe specific characteristics of configurations (WEP versus WPA, SSID broadcast, MAC address filtering, etc.) in order to not preclude next generation technology.
26.14	Southern Company	Disagree	Better specificity is needed as to what constitutes wireless access. Is the intent limited to 802.11x access or is the intent to include all communication done without wired connectivity?R11.1 This requirement could be interpreted to include all wireless, including voice. Insert “network” prior to “technologies”.
26.15	Luminant	Disagree	Combine 11 and 12? Does this apply to a remote user that may be connected via a wireless network connection at a remote location?
26.16	CenterPoint Energy	Disagree	Disagree - For R11.1, CenterPoint Energy is not clear as to what is meant by "use restrictions". Table R11 is titled "Wireless AND Remote Electronic Assess..." but R11 states "Each Responsible Entity that allows remote OR wireless electronic access..." CenterPoint Energy suggests separating remote and wireless access requirements. CenterPoint Energy also suggests adding clarification as to type of wireless protocols that should be included.
26.17	Exelon Corporation	Disagree	Exelon feels that definition of access needs clarity. Is this meant to include “view only” access or is it limited to administrative access that allows for maintenance, trouble shooting or modification of BES Cyber Systems?
26.18	Duke Energy	Disagree	For generation stations in particular, external connectivity (R3) and remote

#	Organization	Yes or No	Question 26 Comment
			connectivity (R11, R12, R13) should be defined as remote/external to the station rather than to the BES cyber system. There are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). As written, the requirement in R12 for remote access is particularly burdensome. Same for R13.Distinction between "remote access" and "external connectivity" is not clear. More clear definitions may need to be provided. Such as, external connectivity allows for direct Internet access vs. remote connectivity allows for access from the enterprise WAN.Table 11: suggest removing 11.3 for low impact systems. No need to authorize remote access when physical or electronic access is not authorized.
26.19	Allegheny Energy Supply	Disagree	Given the local definition of Remote access, the requirements of Table 11 Row 11.2 are extremely unclear.The requirements of requirements of Table 11 Row 11.3 appear to be duplicative of R8.1 and should be removed.
26.20	Allegheny Power	Disagree	Given the local definition of Remote access, the requirements of Table 11 Row 11.2 are extremely unclear.The requirements of requirements of Table 11 Row 11.3 appear to be duplicative of R8.1 and should be removed.
26.21	EEI	Disagree	Given the local definition of Remote access, the requirements of Table 11 Row 11.2 are extremely unclear.The requirements of requirements of Table 11 Row 11.3 appear to be duplicative of R8.1 and should be removed.
26.22	Constellation Power Source Generation	Disagree	In general, Constellation Power Generation believes that wireless controls should be combined with network controls, as the same controls will be applied.
26.23	Minnesota Power	Disagree	In reading and applying the definitions of "remote access" and "external connectivity," remote access is a specific type of external connectivity. Therefore, any reference to criteria for remote access based on whether or not it is externally connected is redundant. In addition, by definition all wireless access is also remote access and this should be stated or otherwise clarified.Regarding Part 11.3 of Table

#	Organization	Yes or No	Question 26 Comment
			R11, does this require explicit approval for every remote login to BES Cyber System accounts? If yes, Minnesota Power believes that this is excessive and will inhibit proper administration of BES Cyber Systems. Minnesota Power recommends changing the language to clarify that Part 11.3 requires that a Registered Entity determine who has authorized remote access privileges.
26.24	Southwestern Power Administration	Disagree	Is a separate requirement for wireless access really necessary when a requirement already exists for protecting access to a BES Cyber System by any means of entry? If so, then suggest separating wireless from remote access.
26.25	Dairyland Power Cooperative	Disagree	It is unclear if the standard wants to make a distinction between wireless and remote access, or an equivalence.
26.26	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with SPP's observation below:We question the need for a specific requirement for wireless devices. We understand there have been inquiries about treatment of wireless devices. But a wireless access point has the same impact on a BES Cyber System as any other access point. A requirement to protect access to a Cyber System already includes any possible means of entry. The use of a wireless device to access a BES Cyber System can be determined with an audit of access logs and a further audit of control of that access would reveal whether appropriate protections were in place. There is not a need for a separate distinct requirement subject to records retention and audit for specific wireless devices. NERC must realize that the more requirements that are added, the more questions/interpretations of words that can result from the requirement. Registered entities become more subject to violations not because they have neglected to protect their BES Cyber Systems, but rather because of differences in understanding of the words of a requirement - all the while the intent of the requirement had never really been “violated”.
26.27	FirstEnergy Corporation	Disagree	Need clarification wireless technology (does it include Wi-Fi, Bluetooth, Routable Protocol).

#	Organization	Yes or No	Question 26 Comment
26.28	National Grid	Disagree	o National Grid recommends changing 11.1 to “Identify the use and security restrictions for wireless technologies”. Are smart phones which have wireless capabilities considered as wireless technologies? Suggest providing examples of wireless technologies in the guidance document. o For 11.2 and 11.3 National Grid recommends changing from “Required for external connectivity only” to “Required” since the criteria already limits the scope to “remote access”
26.29	PacifiCorp	Disagree	PacifiCorp agrees with EEI's observations below:Given the local definition of Remote access, the requirements of Table 11 Row 11.2 are extremely unclear.The requirements of requirements of Table 11 Row 11.3 appear to be duplicative of R8.1 and should be removed.
26.30	Puget Sound Energy	Disagree	Puget Sound Energy requests clarity to NERC’s definition of “wireless”. If NERC means the 802.1x protocol, then it should specify that so as not to confuse entities with radio telecommunication networks and other wireless technologies.
26.31	LCEC	Disagree	R11 - Any wireless portion of a control or administrative session should be included. Remove the term remote and replace with non-console.Many issues surrounding wireless including encryption and open transport, relay communication, PLCs. Need to clearly define scope and expectations.
26.32	ISO New England Inc	Disagree	R11.1 - Is this just a policy statement and belong in R1 or does it need to be enforced and detect violations of the restrictions? How can this be audited? If there are no restrictions is this a violation?For 11.2 and 11.3 recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”
26.33	Ameren	Disagree	R11.1 what is meant by "use Restrictions" does this apply to the type of device allowed to be used on wireless, of the type of use allowed on wireless technology. Please add more detail on this requirement.R11.2 and R11.3 - Does this include Serial communications such as RTU connectivity or other non-routable protocols? Please

#	Organization	Yes or No	Question 26 Comment
			add more description in these requirements.
26.34	Northeast Power Coordinating Council	Disagree	Recommend changing 11.1 to “Identify the use and security restrictions for wireless technologies”.For 11.2 and 11.3 recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.
26.35	Detroit Edison	Disagree	Remove requirement 11.1. Wireless electronic access is not an access method; it is just the medium to obtain access. In an effort to remove reference to specific technology, wireless should not be identified anywhere in the standard. References to specific technologies should be addressed in the guidance documentation.R11, R12 and R14 use term “remote electronic access” and R13 uses the term “remote access”. Revise to maintain consistency.
26.36	WECC	Disagree	Requirements R11 and R12 could be combined into a requirement to produce and implement a Remote Access Plan.There are no specific requirements regarding use restrictions on wireless technologies. This criterion cannot be audited.”Wireless” and “remote electronic access” are two different things and should be addressed in separate requirements.There are no specific requirements regarding remote access. These criteria cannot be audited.
26.37	San Diego Gas and Electric Co.	Disagree	SDG&E recommends that the definition be reworded to say "...a device external to the BES Cyber System's network.”
26.38	Network & Security Technologies Inc	Disagree	Section is unclear. Is wireless an example of a technology that might be employed for remote access, or is the SDT positing other uses? Please clarify. In addition, beyond 11.3, section does not contain any explicit requirements for controlling remote access. 11.1 and, possibly, 11.2 as written would more appropriately be included in a policy (R1). Requirements in R11 should be more aimed towards enforcement of “use restrictions” and exclusion of access methods that are not explicitly allowed.

#	Organization	Yes or No	Question 26 Comment
26.39	American Electric Power	Disagree	Security controls for wireless access seem out of place in the remote access area. Wireless Access controls is a form of boundary protection for the network and should be moved to R20-R22.
26.40	Manitoba Hydro	Disagree	Since Requirement R11 refers to external access, the words “for external connectivity only” are unnecessary in the impact columns and should be removed. Requirement 11.3 is unclear if it refers to authorizing remote access as a design, or operational requirement, or does it refer to the authorization of user access and privileges? Please clarify.
26.41	Entergy	Disagree	Suggest breaking out wireless access from other remote access. These are two distinct technology types, and breaking out within this document the use restrictions and minimum security countermeasures (e.g., WPA, WPA2) for wireless technologies is appropriate.
26.42	Alberta Electric System Operator	Disagree	The AESO believes that wireless access and remote access should be two separate concepts.
26.43	E.ON U.S.	Disagree	The definition of remote access includes the criteria “...from a device external to the BES Cyber System . . . “ With the removal of the concepts of an electronic security perimeter, the boundaries to these systems are not clearly defined, and “external” becomes difficult to determine. It is unclear, for example, whether accessing a BES Cyber System from an internal workstation (though external to the BES Cyber System) constitutes remote access. The definitions for BES Cyber System and BES Cyber Component also do not address the concept of a perimeter.
26.44	Kansas City Power & Light	Disagree	The scope of “wireless” is not clear and can result in interpretation issues throughout these requirements.
26.45	Consultant	Disagree	There is no difference in "remote access" and "wireless electronic access" as remote access is defined in the standard. Suggest deleting reference to wireless electronic

#	Organization	Yes or No	Question 26 Comment
			access in requirement. But if you must have wireless addressed, include it in the definition of remote access.R11. This phrasing is awkward - "to ensure that no unauthorized access is allowed to its BES Cyber Systems" Suggest using wording comparable to R8 "to maintain control of access to its BES Cyber Systems." Table R11 - 11.1 Removing the wireless term from the requirement eliminates the need for this item. Suggest deleting this item.Item 11.3 - This is an account management requirement, and should be moved to R8, and deleted from R11.Item 11.2 - The terminology "Required for external connectivity only" is redundant in this requirement. This requirement is about allowing external connectivity via remote access. Suggest deleting "for external connectivity only"
26.46	Northeast Utilities	Disagree	There is not enough information provided - please specify minimum acceptable security standard allowed (i.e., two-factor, level of encryption, etc.) associated with the use of wireless technologies.
26.47	Emerson Process Management	Disagree	This is a very confusing requirement. Remote does not equal to wireless.The requirement states "allows remote OR wireless electronic access.." The table title is "Wireless AND Remote..."If a remote access is carried out through wired VPN, doesn't this table apply?Does this "remote access" only emphasize on "interactive user session?" If so, this requirement is not applicable to wireless I/O when only data are transmitted to and from BES Cyber System via wireless communications.
26.48	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
26.49	Hydro One	Disagree	We don't understand why the wireless communication is getting special attention. We believe that the protection should remain the same regardless of the type of access point (i.e if it is wired, Wi-Fi, ZigBee etc.). Please explain the rational behind the decision.Recommend changing 11.1 to "Identify the use and security restrictions for wireless technologies".For 11.2 and 11.3 recommend changing from "Required for external connectivity only" to "Required" since the criteria already limit the scope to

#	Organization	Yes or No	Question 26 Comment
			"remote access".
26.50	We Energies	Disagree	We Energies agrees with EEI: Given the local definition of Remote access, the requirements of Table 11 Row 11.2 are extremely unclear.We Energies agrees with EEI: The requirements of requirements of Table 11 Row 11.3 appear to be duplicative of R8.1 and should be removed.
26.51	RRI Energy	Disagree	While the statement 'an interactive user session with a BES Cyber System" is clear to me, examples of "interactive non-user" should be clarified so that the users of this standard know when R11 does not apply. The most common non-user interaction, I would term as "interactive application session". One prevalent wireless "interactive application session" would be a GPS antenna to time synch a cyber asset. Another example would be a wireless serial data IO application. Since these are non-user sessions, R11 does not apply.
26.52	US Army Corps of Engineers, Omaha Distirc	Disagree	Wireless and remote access should be separated.
26.53	NextEra Energy Corporate Compliance	Disagree	Wireless and remote electronic access should be two distinct and separate categories of requirements. Wireless should be defined and it should be established that the term wireless in the context of the requirements is a technology based on 802.1X. As it stands right now, wireless could additionally be considered both blue tooth and radio technologies.Moreover, interactive user session needs to be defined and clarified. It should explain if interactive includes a user session where the user only has read capabilities or if an interactive user session is only applicable when the end user had modification capabilities to the BES Cyber System component. It is unclear how requirement 11.1 adds to the reliability or security of the BES Cyber system. Are the use restrictions per user or are these network restrictions? Moreover, if a Responsible Entity's documented use restrictions are overly broad and insecure, they still comply with the requirement as is. The recommended approach should provide guidelines on acceptable means of securing wireless access to BES Cyber System

#	Organization	Yes or No	Question 26 Comment
			components.Requirement 11.2 should be modified to include the requirement for strong technical and procedural controls for remote access. Requirement 11.3 is vague and unclear as it is currently stated. A responsible entity could misinterpret the requirement for establishing and implementing a defined process for authorizing the establishment of remote access and associated remote access privileges to approve the initial remote access infrastructure and not approving each individual that has remote access capabilities.Requirement 11.3 should be worded to state the following, “If remote access is used and/or implemented, establish, and implement a defined process for authorizing the establishment of remote access infrastructure”NextEra suggests an additional requirement be added and stated as follows:”If remote access is used and/or implemented, establish a defined process for authorizing users to utilize remote access for unescorted interactive cyber access to BES Cyber Systems.”There are not any requirements related to logging or monitoring of remote electronic access and the current requirements within Boundary Protection (R20-R22) requirements do not address this issue either.Finally in 11.2 and 11.3, why make the distinction for "for external connectivity only" rather than just stating that it is "required"? When remote access is used and/or implemented, does it imply "external" connectivity based on the local definition?
26.54	Platte River Power Authority	Disagree	Wireless technology shouldn’t be specifically called out in the standards. Security controls should be broad enough to cover all technologies including wireless and should be handled in their respective sections.

27. Do you agree with the definition of remote access as proposed for this standard? Please explain and provide any suggestions for modification.

Summary Consideration:

The remote access requirements from CIP-011-1 have been moved to CIP-005-5 - Cyber Security - Electronic Security Perimeters – Requirement R2.

Commenters expressed concern that the Standards need better definitions to clarify remote access vs. external access. In response, a new requirement for Remote Access Management (CIP-005-5 R2) for Interactive Remote Access was created based on the Urgent Action Revisions to CIP-005-3.

Commenters expressed that there should be some governance of automated data exchange with remote systems. In response, the SDT noted that automated data exchange (or data in motion) requirements are not considered within scope of this Standard.

The SDT has proposed three formal definitions to provide greater clarity around external connectivity and remote access as they apply to NERC's Reliability Standards:

External Connectivity: *Routable or dial-up data communication through an Electronic Access Point between a BES Cyber Asset and a device external to the Electronic Security Perimeter.*

External Routable Connectivity: *The BES Cyber System is accessible from any Cyber Asset that is outside its associated ESP via a routable protocol.*

Interactive Remote Access: Any user interactive access by a person that originates from a Cyber Asset that is not an Intermediate Device and not located within any of the Responsible Entity's Electronic Security Perimeter(s), whether network-based or dial-up access. Remote access can be initiated from: 1) Cyber Assets used by the Responsible Entity, 2) Cyber Assets used by employees, and 3) Cyber Assets used by vendors, contractors, or consultants.

#	Organization	Yes or No	Question 27 Comment
27.1	WECC		Consider renaming to Remote User Access since it is specific to user not other systems or machines. Move to the beginning of the standard. Don't like box in the middle of requirement.Additional language should be added to clarify what constitutes a remote interactive session.

#	Organization	Yes or No	Question 27 Comment
27.2	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	Definition is good, but please see comments for questions 1.a and 1.b.
27.3	Exelon Corporation	Agree	Exelon would like clarity on whether “view only” access would be included in the definition of “interactive user session”? If the answer is no, this should be explicitly stated in the definition of remote access.
27.4	Dairyland Power Cooperative	Agree	However, there should be some governance of automated data exchange with remote systems, perhaps in another section. Also, there is no governance as to how wireless technology can be used for non-interactive data communications.
27.5	Alliant Energy	Agree	However, we recommend consideration of adding clarity to the use of the term “external” in the definition or the replacement of the word “external” with “geographically or logically separate”.
27.6	Consultant	Agree	If "wireless access" has to be specifically stated it should be included in the definition as a method of remote access.
27.7	Southern California Edison Company	Agree	Remote Access is defined without reference to boundaries, logical or physical. For example, access from any device residing in the same local area network, but not part of the BES Cyber System, can be interpreted as Remote Access.
27.8	Florida Municipal Power Agency	Agree	The review periods of the access may need to change with the different levels (12 months for low, 6 for medium, and 4 for high). The standard should require end-to-end encryption between the BES Access Point and the endpoint. Wireless should require minimum standards for 802.11 access points, such as WPA/AES encryption.
27.9	Progress Energy (non-Nuclear)	Agree	This can imply a non routable protocol since a command to open a breaker does result in an operation and provides a subsequent indication that the breaker actually

#	Organization	Yes or No	Question 27 Comment
			did open.
27.10	FirstEnergy Corporation	Agree	We agree fundamentally with the definition, but are concerned about impact to areas outside the BES Cyber System (e.g. Remote access to corporate networks bordering the BES Cyber Systems). Need clarity of "interactive user session".
27.11	Xcel Energy	Agree	We feel it would be beneficial to define the remote access point. For example, a case where a user uses a desktop VPN access to dial-up access a substation relay.
27.12	Independent Electricity System Operator	Disagree	- For 11.2 and R11.3 is Required for external connectivity only. If you connect remotely, how is this not external connectivity to the BES Cyber system - shouldn't these entries just be "required"
27.13	PacifiCorp	Disagree	(See comments on #13) The problem is conflicting definitions. The BES Cyber System Component definition requires that any device providing "control" of the BES Cyber System is to be considered a component of the BES Cyber System. (pg 2, Standard CIP-010-1) Yet, remote access is defined as an "interactive user session with a BES Cyber System from a device external to the BES Cyber System". (pg 12, Standard CIP-011-1)In short, all devices providing 'control' must be considered "BES Cyber System Components", which corresponds to 'internal access'. This definition eliminates remote access that provides control, because the provided function of 'control' requires reclassification as 'internal'.
27.14	US Army Corps of Engineers, Omaha Distirc	Disagree	Agree with general concept of remote access referring to an interactive session from an external location. Definition of external to BES Cyber System is poorly defined. Requirement is too stringent. Breaking systems up into small groups to provide levels of control and protection appropriate to the group of components would be common good practice. This requirement would seem to restrict communication among BES Cyber Systems within a facility and make them cumbersome to manage and protect at appropriate levels. entities need more leeway in defining communication amongst systems and different levels would apply between different systems.

#	Organization	Yes or No	Question 27 Comment
27.15	MRO's NERC Standards Review Subcommittee	Disagree	As written, the definition could be interpreted to include simple data exchanges between an RTU and a SCADA master, although we do not believe this was the intent of the drafting team. We would propose adding the following to the end of the existing definition: "Automated data exchange systems would not be considered remote access".
27.16	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
27.17	The Empire District Electric Company	Disagree	Comments: As written, the definition could be interpreted to include simple data exchanges between an RTU and a SCADA master, although we do not believe this was the intent of the drafting team. We would propose adding the following to the end of the existing definition: "Automated data exchange systems would not be considered remote access".
27.18	Luminant	Disagree	Controls for Remote access should include only the machines that have direct acces.
27.19	Network & Security Technologies Inc	Disagree	Current definition suffers from inadequacy of the definition of "external connectivity." As suggested in our response to Question 13, we think the definition might be helped by recasting it as meaning interactive access to a BES Cyber System from "outside" an electronic boundary such as an ESP.
27.20	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy is concerned this definition would apply to laptop computers used to perform maintenance on programmable electronic devices and believes that a temporary laptop connection to perform maintenance on an on-site programmable electronic device does not involve the same process as a typical interactive user session through remote access. Therefore CenterPoint Energy believes this requirement should not apply to temporary laptop connections which are otherwise in compliance with section R26 and recommends an exception be included.

#	Organization	Yes or No	Question 27 Comment
27.21	E.ON U.S.	Disagree	E.ON U.S. suggests that the standard specify access is through an “access point”.
27.22	RRI Energy	Disagree	Give more clarity on non-user sessions so that it is well understood that application data sessions are not a part of the “remote access” terminology of R11.
27.23	San Diego Gas and Electric Co.	Disagree	If a device can establish an interactive user session with a BES Cyber System and thus either respond to a BES condition or disturbance or enable control and operation, this “external device” should be named a “BES Cyber System Component.SDG&E recommends that the definition be reworded to say "...a device external to the BES Cyber System's network.”
27.24	US Bureau of Reclamation	Disagree	In addition, however, a mechanism needs to needs to be established to deal with devices locally connected for the purpose of "testing" and "configuration" so that these devices can be periodically connected for a specified and limited purposes. Per discussions during the recent Grapevine, TX, meeting, the drafting teams indicated that they would address this issue during their revision process.
27.25	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
27.26	National Grid	Disagree	National Grid recommends this definition be consistent with the “external connectivity” definition -recommend changing from “from a device external to the BES Cyber System” to “from a device external to the BES Cyber System Boundary”.
27.27	Black Hills Corporation	Disagree	Need a better definition to clarify remote access vs. external access. This creates policy issues for entities with respect to their definitions of these terms.
27.28	Northeast Utilities	Disagree	Need to clarify external connectivity (i.e., from other security domains within the company’s internal network or directly from the public internet). Level of authentication required should differ.

#	Organization	Yes or No	Question 27 Comment
27.29	LADWP	Disagree	Needs more clarification
27.30	NextEra Energy Corporate Compliance	Disagree	NextEra suggests defining external connectivity should be defined and clarified. It is unclear if external connectivity means external to the network the BES Cyber System resides or if it means connectivity from any device to any BES Cyber System component whether it is on the same network. External connectivity should be defined as any remote connection established through the BES Cyber System network access point devices, which includes examples of access point devices, such as dial-up connections, firewalls, SSL VPN connections, etc to a BES Cyber System component. As a point of clarification, since remote access is defined as "an interactive user session with a BES Cyber System from a device external to the BES Cyber System", is the device external to the BES Cyber System now considered a BES Cyber System with the same BES Impact Level as the BES Cyber System in which the device is remotely connecting to? For example, if we have a High Impact BES Cyber System which is an Energy Management System (EMS) within a Control Center, a laptop is used to remotely connect to this EMS, is the laptop now considered a High Impact BES Cyber System?
27.31	Tenaska	Disagree	not needed
27.32	USACE - Omaha Anchor	Disagree	Per your definition one cyber system talking to another cyber system that are side by side would be considered remote access - there seems to be no way to mitigate this. Remote access would be better served defined as communication from outside of the “physical security perimeter” or outside the plant.
27.33	Con Edison of New York	Disagree	R11 dialog box refers to Remote access as an interactive session with a BES Cyber System from a device “external” to a BES Cyber System. It is expected that external means from outside the electronic boundary.
27.34	Hydro One	Disagree	Recommend this definition be consistent with the “external connectivity” definition - recommend changing from “from a device external to the BES Cyber System” to “from

#	Organization	Yes or No	Question 27 Comment
			a device external to the BES Cyber System Boundary".
27.35	ISO New England Inc	Disagree	Recommend this definition be consistent with the "external connectivity" definition - recommend changing from <<from a device external to the BES Cyber System >> to << from a device external to the BES Cyber System Boundary>>
27.36	Northeast Power Coordinating Council	Disagree	Recommend this definition be consistent with the "external connectivity" definition - recommend changing from "from a device external to the BES Cyber System" to "from a device external to the BES Cyber System Boundary".
27.37	American Electric Power	Disagree	Regarding "Remote access for the purpose of this standard means an interactive user session with a BES Cyber System from a device external to the BES Cyber System", should this be "Remote electronic access"? Table R11 refers to "Wireless and Remote Electronic Access Documentation". Adding "electronic" to the definition would maintain consistency.
27.38	Regulatory Compliance	Disagree	Remote access - access originating from outside the eletronic boundary.
27.39	Southwest Power Pool Regional Entity	Disagree	Remote access can be application-to-application and should not be limited to just interactive access. For example, an FTP file transfer works the same way whether invoked interactively by a human user or programmatically by an application. It makes no sense to establish requirements for interactive access only.
27.40	Duke Energy	Disagree	See above, external to station. For generation stations in particular, external connectivity (R3) and remote connectivity (R11, R12, R13) should be defined as remote/external to the station rather than to the BES cyber system. There are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). As written, the requirement in R12 for remote access is particularly burdensome. Same for R13.The definition may need to state "a device external to the BES Cyber System and outside the BES Cyber System electronic boundary".

#	Organization	Yes or No	Question 27 Comment
27.41	MidAmerican Energy Company	Disagree	Specific requirements for wireless devices are not necessary.
27.42	Allegheny Energy Supply	Disagree	Suggest clarifying similar to the following: Remote access should be interactive access of a BES Cyber System from a device external to the electronic and physical protection boundaries of that BES Cyber system.
27.43	Platte River Power Authority	Disagree	Suggested Revision:Remote access for the purpose of this standard means an interactive user session with a BES Cyber System Component from a device external to the BES Cyber System.That would better match the definition of external connectivity.
27.44	APPA Task Force	Disagree	The APPA Task Force agrees with the MRO-NSRS proposal to add the following to the end of the existing definition: "Automated data exchange systems would not be considered remote access".
27.45	Minnesota Power	Disagree	The current definition of "remote access," along with definition of "external connectivity," leaves open to interpretation whether Requirement R11 applies to host-based controls, or if it mandates network-based controls even within isolated or protected networks. It would appear that any interactive network access to a BES Cyber System is by definition remote access unless a portion of the network is included in the definition of that particular BES Cyber System. If the latter approach is adopted then multiple, otherwise independent, BES Cyber Systems might be arbitrarily selected to be a single BES Cyber System in order for this requirement to be met and still allow for reasonable security management.
27.46	Detroit Edison	Disagree	The definition may be interpreted to include maintenance devices. Revise as follows "Remote access for the purpose of this standard means an interactive user session with a BES Cyber System from a device external to the Electronic Boundary of the BES Cyber System."

#	Organization	Yes or No	Question 27 Comment
27.47	Ameren	Disagree	The phrase "from a device external to the BES Cyber System," is open to interpret. Please clarify if this refers to a device physically external or electrically external.â€,â€,â€,
27.48	Alberta Electric System Operator	Disagree	The word “user” should be removed from “interactive user session” because it implies human interaction and does not consider automated malware.
27.49	Progress Energy - Nuclear Generation	Disagree	This definition is not clear to me. I recommend Remote Access be defined based on NIST 800-53 Appendix B slightly modified to accommodate industrial control systems. “Access to a BES Cyber Security System by a user or process communicating from an untrusted network”
27.50	Bonneville Power Administration	Disagree	This has the same issues as the definition of "External Connectivity". In fact, the definition could simply be "an externally connected interactive user session. Recommend that the definition be reworded to use the definition of External Connectivity, along with a suitable redefinition of that term, as described in question 13. If not, recommend - "Remote Access - For the purposes of this standard, remote access is defined as an electronic connection with control capabilities to a BES Cyber System, using a data communications path that encompasses, in some or all portions, links outside the control of the Responsible Entity. "Also add a definition of wireless access that makes it clear that such access is always an example of external connectivity. The definition should exclude such protocols as Bluetooth and infrared, which are intra-system, not inter-system methods. Note that even non-interactive wireless access should be controlled.Suggestion: Wireless electronic access for the purpose of this standard means access to or from a BES Cyber System to another cyber system using wireless communications. Even if both systems and any wireless access points are under the control of the Responsible Entity, the wireless communications path itself is not. For that reason, any wireless electronic access is considered to be external connectivity."

#	Organization	Yes or No	Question 27 Comment
27.51	Kansas City Power & Light	Disagree	This is too broad and could include devices such as Remote Terminal Units.

28. Table R11 provides direction concerning what impact level of BES Cyber Systems to which Requirement R11 applies. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R11 has moved to CIP-005-5- Cyber Security - Electronic Security Perimeters, Requirement R2.

Commenters expressed concern that for items R11.2 and R11.3, given the definitions provided in the standard, how is remote access provided without external connectivity? The SDT agrees and notes that a new requirement for Remote Access was created based on the Urgent Action Revisions to CIP-005-3.

Commenters also expressed concern that there are inconsistent definitions for "external connectivity" and "remote access". The SDT has proposed three formal definitions to provide greater clarity around external connectivity and remote access as they apply to NERC's Reliability Standards:

External Connectivity: Routable or dial-up data communication through an Electronic Access Point between a BES Cyber Asset and a device external to the Electronic Security Perimeter.

External Routable Connectivity: The BES Cyber System is accessible from any Cyber Asset that is outside its associated ESP via a routable protocol.

Interactive Remote Access: **A**ny user interactive access by a person that originates from a Cyber Asset that is not an Intermediate Device and not located within any of the Responsible Entity's Electronic Security Perimeter(s), whether network-based or dial-up access. Remote access can be initiated from: 1) Cyber Assets used by the Responsible Entity, 2) Cyber Assets used by employees, and 3) Cyber Assets used by vendors, contractors, or consultants.

#	Organization	Yes or No	Question 28 Comment
28.1	WECC		Again consider replacing with requirement for remote access plan that provides specific requirements and conditions for remote access.
28.2	Florida Municipal Power Agency	Agree	For items 11.2 and 11.3, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the

#	Organization	Yes or No	Question 28 Comment
			BES Cyber System.
28.3	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.
28.4	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
28.5	Bonneville Power Administration	Agree	This agreement assumes that External Connectivity is suitably redefined. Also, consider the following changes:1 - Remove Wireless from the title and the requirements.2 . If wireless is to be addressed, add a new requirement item specifically for wireless, dealing with the requirements on wireless access that are in addition to those for remote access in general.
28.6	E.ON U.S.	Disagree	: E.ON U.S. does not believe that compliance requirements are necessary for low impact systems
28.7	Southwest Power Pool Regional Entity	Disagree	“Required for external connectivity only” does not make sense. A properly configured wireless access should never directly connect within the secured network, thus any access will be “external.”
28.8	Luminant	Disagree	11.2 and 11.3 should be for Routable External Connectivity only
28.9	American Electric Power	Disagree	11.2: Regarding "If remote access is used and/or implemented, document the allowed methods for remote access", does this mean the list of approved ports and services? If not, what is meant by "allowed methods"?
28.10	US Army Corps of Engineers, Omaha Distirc	Disagree	Agree with general concept of remote access referring to an interactive session from an external location. Definition of external to BES Cyber System is poorly defined.

#	Organization	Yes or No	Question 28 Comment
			Requirement is too stringent. Breaking systems up into small groups to provide levels of control and protection appropriate to the group of components would be common good practice. This requirement would seem to restrict communication among BES Cyber Systems within a facility and make them cumbersome to manage and protect at appropriate levels. entities need more leeway in defining communication amongst systems and different levels would apply between different systems.
28.11	Southern California Edison Company	Disagree	All forms of access documentation should be required along with the level of protction and type of access granted.
28.12	Black Hills Corporation	Disagree	Applicability needs to be consistent previous non-wireless requirements.
28.13	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
28.14	LCEC	Disagree	Clarify what is meant by external connectivity only. Is this referring to any access to a BES cyber system component as defined earlier in the standard?
28.15	The Empire District Electric Company	Disagree	Comments: For items 11.2 and 11.3, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the BES Cyber System.
28.16	Platte River Power Authority	Disagree	Disagree with the inclusion of Wireless.
28.17	Hydro One	Disagree	For 11.2 and 11.3 recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.
28.18	ISO New England Inc	Disagree	For 11.2 and 11.3 recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”

#	Organization	Yes or No	Question 28 Comment
28.19	Northeast Power Coordinating Council	Disagree	For 11.2 and 11.3 recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.
28.20	American Transmission Company	Disagree	For items 11.2 and 11.3, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the BES Cyber System.
28.21	MRO's NERC Standards Review Subcommittee	Disagree	For items 11.2 and 11.3, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the BES Cyber System.
28.22	NextEra Energy Corporate Compliance	Disagree	For Low Impact BES Cyber Systems, (1) documenting the allowed methods for remote access per 11.2, and (2) establishing and implementing a defined process for authorizing the establishment of remote access and associated remote access privileges per 11.3 should not be required. The identification of use restrictions for wireless technologies per 11.1 should be a sufficient security management control for Low Impact BES Cyber Systems. 11.2 and 11.3 will be administratively burdensome if required for practically every BES Cyber System.
28.23	San Diego Gas and Electric Co.	Disagree	Instead of defining requirements by using the impact levels, SDG&E feels it would be more appropriate to factor in the level of risk associated with the BES Cyber Systems to define the requirements for wireless and remote access.
28.24	Dairyland Power Cooperative	Disagree	Is external connectivity considered to be from outside the entity’s premises, or is it considered to be from outside the protected BES system (including for instance a corporate LAN). If it means outside the premises, then it seems deficient to not document the access-especially when later enabling of external connectivity could occur without the involvement of the supporting the BES cyber system. If it means external to the BES cyber system, then “external connectivity” and “remote access”

#	Organization	Yes or No	Question 28 Comment
			are redundantly used in 11.2 and 11.3.
28.25	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
28.26	FirstEnergy Corporation	Disagree	Need clarification on "external connectivity", because the nature of remote is external.
28.27	National Grid	Disagree	o For 11.2 and 11.3 National Grid recommends changing from “Required for external connectivity only” to “Required” since the criteria already limits the scope to “remote access” o National Grid also suggests deleting the requirement 11.3 for Low Impact BES CS.
28.28	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation ‘Required for external connectivity only’. Without understanding the defined intent suggested specific changes may be vague. Remote access is defined but not external connectivity. Is there a distinction?
28.29	American Municipal Power	Disagree	Please provide a little or no impact category
28.30	BGE	Disagree	Remove the requirement for Low on 11.1, 11.2 and 11.3
28.31	Garland Power and Light	Disagree	Requirement 11.1, 11.2, 11.3 - remove Low Impact classification from all 3
28.32	Detroit Edison	Disagree	Requirements 11.2 and 11.3 specify “Required for external connectivity only”. This is redundant. It is not possible to have remote access without external connectivity by definition.
28.33	Emerson Process Management	Disagree	Since this standard is for remote access, is the "external connectivity" potentially redundant or extra? If there is no external connectivity, how can user establish an interactive session remotely?

#	Organization	Yes or No	Question 28 Comment
28.34	MidAmerican Energy Company	Disagree	Specific requirements for wireless devices are not necessary.
28.35	ERCOT ISO	Disagree	Table 11 should address remote and wireless access across all requirements in keeping with the title of the section.
28.36	Consultant	Disagree	Table R11 - 11.1 Removing the wireless term from the requirement eliminates the need for this item. Suggest deleting this item.Item 11.3 - This is an account management requirement, and should be moved to R8, and deleted from R11.Item 11.2 - The terminology "Required for external connectivity only" is redundant in this requirement. This requirement is about allowing external connectivity via remote access. Suggest deleting "for external connectivity only"There is an inconsistency between Table R11 and Table R12. If R11 requires all impact levels to have documented controls, then R12 should require account management controls for all impact levels. To be consistent with previous account management requirements, the account management controls should be applied to medium & high impact systems, and removed from low impact systems, and Table R11 items should not be required for low impact systems. Or all impact levels should be required in both R11 & R12.
28.37	Alberta Electric System Operator	Disagree	The AESO suggests moving row 11.1 in Table R11 to a separate section governing wireless as a standalone requirement.
28.38	APPA Task Force	Disagree	The APPA Task Force agrees with the MRO-NSRS comment that “for external connectivity only” is redundant and should be removed from R11 Table 11.2 and Table 11.3 impact levels.
28.39	Reliability & Compliance Group	Disagree	the external connectivity qualifier
28.40	Minnesota Power	Disagree	The impact levels seem well defined however inconsistencies in the definitions of “remote access” and “external connectivity,” (see response in Question 26) create

#	Organization	Yes or No	Question 28 Comment
			confusion regarding the applicability of the criteria for each impact level.
28.41	US Bureau of Reclamation	Disagree	The level for Low Impact is not consistent with Electronic Access Management requirement in R8.

29. Requirement R12 of draft CIP-011-1 states "Each Responsible Entity that allows wireless and remote electronic access to any of its BES Cyber Systems shall manage that electronic access in accordance with the criteria specified in CIP-011-1 Table R12 – Wireless and Remote Electronic Access Management to ensure that no unauthorized access is allowed to its BES Cyber System." Do you agree with the list of criteria that is included in Requirements Table R12? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification. Do you agree with the impact levels for each item as represented in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R12 has moved to CIP-005-5 – Cyber Security - Electronic Security Perimeters, Requirement R2

Commenters suggested the need to separate wireless and remote access, and Requirement R12.1 appears to be duplicative of R8.2 and has been removed. The SDT agrees and notes a new requirement for Remote Access was created based on the Urgent Action Revisions to CIP-005-3, and the wireless access requirements have been removed.

Several commenters suggested that R8 and R12 are duplicative as both require quarterly review and verification of accounts and associated access privileges. The SDT moved all requirements for verification of accounts and associated access privileges into the revised CIP-004-5.

Other commenters suggested this requirement should have increased applicability (Low, Medium, and High rather than High only). In response, the SDT notes that the applicability for remote access requirements extends to Medium Impact BES Cyber Systems. The SDT does not feel it necessary to extend this requirement to Low Impact BES Cyber Systems. The SDT does not feel that the risk reduction for reliability justifies the administrative overhead of applying this requirement to all Low Impact BES Cyber System.

#	Organization	Yes or No	Question 29 Comment
29.1	WECC		See comments for R10/R11 consider combining this into a requirement for a Wireless Plan and Remote Access PlanThis requirement could be rolled into R8.
29.2	Southern California Edison Company	Agree	Additional clarification may be provided on criteria for control systems. It seems that a control center is temporally viewed as a distributed control system; each node (footprint restricted to one facility but electronically extends scope of control to at least one other facility) can be treated as a "control center". The drafting team should

#	Organization	Yes or No	Question 29 Comment
			develop a guideline document that presents a discussion of the local definition of a control center as a facility or system that has the ability to control more than one BES asset, side by side, with definition of the electronic boundaries of a BES system. Remote access within a facility and from beyond a particular physical facility can have different risk profiles.
29.3	Southwest Power Pool Regional Entity	Agree	Agree with the wording as presented. See comments to question 30 about applicability.
29.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
29.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.Consider combining R7, R8, R11 and R12.
29.6	MRO's NERC Standards Review Subcommittee	Agree	Note impact level comments under question 30.
29.7	Progress Energy - Nuclear Generation	Agree	R12 can be improved by incorporating information contained in attached Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
29.8	BCTC	Agree	Suggest rewording from Wireless and Remote Electronic Access to Wireless or Remote Electronic Access
29.9	Bonneville Power Administration	Agree	The objective of this requirement ("to ensure that no unauthorized access is allowed to its BES Cyber System") should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that

#	Organization	Yes or No	Question 29 Comment
			the Responsible Entity must take.Our agreement with this Requirement is contingent on the redefinition as discussed in Question 27 and the definition of wireless electronic access stated above.
29.10	GTC & GSOC	Agree	We generally agree but disagree with the inclusion of the term Wireless in the requirement and associated table. Neither have anything to do with wireless as distinguished from other remote access.
29.11	Independent Electricity System Operator	Disagree	- R12 combines Wireless and Remote access. It is suggested that this be broken out in to separate requirements. Seems like an assumption that if you are connecting via wireless you are remote - not always the case.
29.12	Luminant	Disagree	12.1 should be for Routable External Connectivity only
29.13	US Bureau of Reclamation	Disagree	Access management should be established for all impact lelvels. If the requirements of R11 are going to be established, R12 needs to be established to support enforcement. Further, what is meant by quarterly review.
29.14	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
29.15	Black Hills Corporation	Disagree	Do not understand why wireless has its own table. Even if the overall requirement is a little more difficult, consistency of approach will result in greater security.
29.16	Entergy	Disagree	Entergy agrees with the list of criteria, but believes it should apply equally to high, medium and low assets.We also suggest eliminating R12 and combine it with R8.2 (quarterly review and verification of accounts and associated access privileges), as these are part and parcel of account rights management.
29.17	Hydro One	Disagree	For consistency with 12.1, recommend removing “wireless” from R12.Recommend changing Requirement 12.1 from “quarterly review” to “annual review”. There are no additional benefits to the shorter review period.Similarly to our previous comment

#	Organization	Yes or No	Question 29 Comment
			to R11, we don't understand why the wireless communication is getting special attention. We believe that the protection should remain the same regardless of the type of access point (i.e. if it is wired, Wi-Fi, ZigBee etc.). Please explain the rational behind the decision.
29.18	ISO New England Inc	Disagree	For consistency with 12.1, recommend removing "wireless" from R12R12 combines Wireless and Remote access. It is suggested that this be broken out in to separate requirements. Seems like an assumption that if you are connecting via wireless you are remote - not always the case.
29.19	Northeast Power Coordinating Council	Disagree	For consistency with 12.1, recommend removing "wireless" from R12.Recommend changing Requirement 12.1 from "quarterly review" to "annual review". There are no additional benefits to the shorter review period.
29.20	Duke Energy	Disagree	For generation stations in particular, external connectivity (R3) and remote connectivity (R11) should be defined as remote/external to the station rather than to the BES cyber system. There are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). As written, the requirement in R12 for remote access is particularly burdensome. Table 12 o redundant with Table 11 and Table 8. Suggest including this review as part of the review conducted in 8.2. o suggest removing 'and verification.' We don't understand the benefit to this and question if it is possible for remote access.
29.21	Constellation Power Source Generation	Disagree	In general, Constellation believes that wireless controls should be combined with network controls, as the same controls will be applied.
29.22	Southwestern Power Administration	Disagree	Is a separate requirement for wireless access really necessary when a requirement already exists for protecting access to a BES Cyber System by any means of entry? If so, then suggest separating wireless from remote access.

#	Organization	Yes or No	Question 29 Comment
29.23	Northeast Utilities	Disagree	It is our belief that the review of access privileges conducted under Requirement 8 would satisfy the intent of this requirement as well and that R12 should be eliminated.Hence, this requirement is not needed as long as it is clear that remote access will not be granted unless explicit specific rights are granted to some asset they connect with. Access should not be given access to a protected area unless there is a need to access a specific asset, i.e., there is no business need to just grant network only access.
29.24	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with SPP's observation below:We question the need for a specific requirement for wireless devices. We understand there have been inquiries about treatment of wireless devices. But a wireless access point has the same impact on a BES Cyber System as any other access point. A requirement to protect access to a Cyber System already includes any possible means of entry. The use of a wireless device to access a BES Cyber System can be determined with an audit of access logs and a further audit of control of that access would reveal whether appropriate protections were in place. There is not a need for a separate distinct requirement subject to records retention and audit for specific wireless devices. NERC must realize that the more requirements that are added, the more questions/interpretations of words that can result from the requirement. Registered entities become more subject to violations not because they have neglected to protect their BES Cyber Systems, but rather because of differences in understanding of the words of a requirement - all the while the intent of the requirement had never really been “violated”.
29.25	NextEra Energy Corporate Compliance	Disagree	NextEra believes that if remote access is used and/or implemented, document and implement a quarterly review and verification of the personnel with remote access and their associated access privileges, it is unclear how this access is supposed to be verified and what is accepted as part of the verification process. This is the same as the comments to address question #20 of this questionnaire. If remote access is used and/or implemented, documenting and implementing a quarterly review and verification of the personnel with remote access and their associated access privileges

#	Organization	Yes or No	Question 29 Comment
			may not be sufficient. This process needs to be tied in with personnel (1) gaining authorized remote access to a BES Cyber System, (2) modifying their access privileges to a BES Cyber System due to change of the user's access rights due to change in role or responsibility and, (3) loosing authorized remote access to a BES Cyber System due to a revocation of electronic access to a BES Cyber System.
29.26	National Grid	Disagree	o National Grid recommends an annual review for verification since quarterly review does not have much benefit. o National Grid recommends changing from “Required for external connectivity only” to “Required” under High Impact BES CS since the criteria already limits the scope to “remote access”
29.27	Progress Energy (non-Nuclear)	Disagree	Quarterly seems to be too frequent - propose 6 months or longer. We are required in R9 to revoke access for those that are terminated or do not need access within 72 hours.
29.28	LCEC	Disagree	R12 - 12.1 is covered in the account review requirements in R8. This should be changed to review the need for wireless as opposed to wired connectivity and reviewed annually.
29.29	Consultant	Disagree	R12 is an account management requirement. The requirement should be moved to R8 as an aspect of account management.There is no difference in "remote access" and "wireless electronic access" as remote access is defined in the standard. Suggest deleting reference to wireless electronic access in requirement. But if you must have wireless addressed, include it in the definition of remote access.R12. This phrasing is awkward - "to ensure that no unauthorized access is allowed to its BES Cyber Systems" Suggest using wording comparable to R8 "to maintain control of access to its BES Cyber Systems."
29.30	CWLP Electric Transmission, Distribution and	Disagree	R12. Due to the requirements access revocation in R9 this requirement should be extended to an annual review.

#	Organization	Yes or No	Question 29 Comment
	Operations Department		
29.31	Southern Company	Disagree	R12.1 addresses remote access only and does not include wireless, the table title and R12 includes wireless.
29.32	Allegheny Energy Supply	Disagree	Requirement R12.1 appears to be duplicative of R8.2 and should be removed.
29.33	Allegheny Power	Disagree	Requirement R12.1 appears to be duplicative of R8.2 and should be removed.
29.34	EEI	Disagree	Requirement R12.1 appears to be duplicative of R8.2 and should be removed.
29.35	PNM Resources, Inc.	Disagree	Requirements for disabling access or user accounts in periods that are less than 6 hours are unrealistic, especially on weekends or during off-hours.
29.36	San Diego Gas and Electric Co.	Disagree	SDG&E recommends that the wireless and remote electronic access management apply to devices external to the BES Cyber System's network.
29.37	Manitoba Hydro	Disagree	Since Requirement R12 refers to external access, the words “for external connectivity only” are unnecessary in the impact columns and should be removed. Consider adding a requirement for securing the wireless access point.
29.38	ERCOT ISO	Disagree	Table 12 should address remote and wireless access across all requirements. 12.1: Should be combined with other access management requirements (physical, cyber, information).
29.39	BGE	Disagree	Tables 11 and 12 are out of synch.
29.40	Kansas City Power & Light	Disagree	The scope of “wireless” is not clear and can result in interpretation issues throughout these requirements.
29.41	FirstEnergy Corporation	Disagree	The Table is titled “Wireless and Remote ...”For consistency we suggest that 12.1 be

#	Organization	Yes or No	Question 29 Comment
			revised to state "... personnel with wireless and remote access ..."
29.42	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
29.43	We Energies	Disagree	We Energies agrees with EEI: Requirement R12.1 appears to be duplicative of R8.2 and should be removed.
29.44	Alberta Electric System Operator	Disagree	Wireless access and remote access should be two separate concepts.
29.45	Detroit Edison	Disagree	Wireless electronic access is not an access method; it is just the medium to obtain access. In an effort to remove reference to specific technology, wireless should not be identified anywhere in the standard. References to specific technologies should be addressed in the guidance documentation.R11, R12 and R14 use term "remote electronic access" and R13 uses the term "remote access". Revise to maintain consistency.Requirement 12.1 specifies "Required for external connectivity only". This is redundant. It is not possible to have remote access without external connectivity by definition.

30. Table R12 provides direction concerning what impact level of BES Cyber Systems to which Requirement R12 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R12 has moved to CIP-005-5 – Cyber Security - Electronic Security Perimiters, Requirement R2.

Commenters suggested a reword of this item to remove "for external connectivity only", since remote access cannot be granted without external connectivity. The SDT agrees and has made this change.

Other commenters suggested this requirement should have increased applicability (Low, Medium, and High rather than High only). In response, the SDT notes that the applicability for remote access requirements extends to High Impact BES Cyber Systems and Medium Impact BES Cyber Systems. The SDT does not feel it necessary to extend this requirement to Low Impact BES Cyber Systems. The SDT does not feel that the risk reduction for reliability justifies the administrative overhead of applying this requirement to all Low Impact BES Cyber System.

Several commenters suggested that R9 and R12 are duplicative. The SDT moved all requirements for revocation of access privileges into the revised CIP-004-5.

#	Organization	Yes or No	Question 30 Comment
30.1	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.Consider combining R7, R8, R11 and R12. At minimum, R12 should be consistent with R8.
30.2	Kansas City Power & Light	Agree	In general, this appears appropriate, however, these tables require considerable thoughtfulness and to the extent these requirements may be altered for presentation in the formal comment period, final judgment is reserved.
30.3	Progress Energy (non-Nuclear)	Agree	See Comment 14.Not needed. There already is another requirement for cyber access reviews.
30.4	Northeast Utilities	Agree	Suggest eliminating R12 - see response to Question 29.

#	Organization	Yes or No	Question 30 Comment
30.5	Independent Electricity System Operator	Disagree	- For R12.1 is Required for external connectivity only. If you connect remotely, how is this not external connectivity to the BES Cyber system - shouldn't these entries just be "required"
30.6	ERCOT ISO	Disagree	12.1: Should apply to Medium Impact BES Cyber System.
30.7	Southern California Edison Company	Disagree	All forms of access documentation should be required along with the level of protection and type of access granted. Wireless technology needs full security and encryption in regards to any level of BES Cyber System.
30.8	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
30.9	USACE HQ	Disagree	At a minimum, 12.1 should be required for all impact levels. Requirement 11 creates a document of remote access procedure and who has the right to use it, but for low and medium impact systems it is not required to update the same as per requirement 12.1.
30.10	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
30.11	Tenaska	Disagree	Combine 12 and 13
30.12	The Empire District Electric Company	Disagree	Comments: For item 12.1, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the BES Cyber System.
30.13	Alberta Electric System Operator	Disagree	Create additional requirements in Table R12 for Medium and Low impact levels. Suggest semi-annual review for Medium Impact, and Annual review for Low impact.
30.14	Black Hills Corporation	Disagree	Do not understand why wireless has its own table. Even if the overall requirement is

#	Organization	Yes or No	Question 30 Comment
			a little more difficult, consistency of approach will result in greater security.
30.15	Entergy	Disagree	Entergy agrees with the list of criteria, but believes it should apply equally to high, medium and low assets.
30.16	Duke Energy	Disagree	For generation stations in particular, external connectivity (R3) and remote connectivity (R11) should be defined as remote/external to the station rather than to the BES cyber system. There are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station).
30.17	American Transmission Company	Disagree	For item 12.1, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the BES Cyber System.
30.18	MRO's NERC Standards Review Subcommittee	Disagree	For item 12.1, given the definitions provided in the standard, how can you have remote access without external connectivity? Both terms as defined seem to represent communications between a BES Cyber System and a device external to the BES Cyber System.
30.19	Consultant	Disagree	Item 12.1 - The terminology "Required for external connectivity only" is redundant in this requirement. This requirement is about allowing external connectivity via remote access. Suggest deleting "for external connectivity only"There is an inconsistency between Table R11 and Table R12. If R11 requires all impact levels to have documented controls, then R12 should require account management controls for all impact levels. To be consistent with previous account management requirements, the account management controls should be applied to medium & high impact systems, and removed from low impact systems, and Table R11 items should not be required for low impact systems. Or all impact levels should be required in both R11 & R12.

#	Organization	Yes or No	Question 30 Comment
30.20	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
30.21	WECC	Disagree	Medium Impact should still have the requirement as well.This should apply to all impact levels.
30.22	National Grid	Disagree	National Grid recommends changing from “Required for external connectivity only” to “Required” under High Impact BES CS since the criteria already limits the scope to “remote access”.
30.23	FirstEnergy Corporation	Disagree	Need clarification on "external connectivity", because the nature of remote is external.
30.24	NextEra Energy Corporate Compliance	Disagree	NextEra believes that regarding 12.1, why make the distinction for "for external connectivity only" rather than just stating that it is "required"? When remote access is used and/or implemented, does it imply "external" connectivity based on the local definition?
30.25	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation ‘Required for external connectivity only’.
30.26	American Municipal Power	Disagree	Please provide a little or no impact category
30.27	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 11 with Table 12. Specifically, if 11.2 and 11.3 require documenting allowed methods and processes for remote access, then table 12 should require quarterly review of the access granted via 11.2 and 11.3. Puget Sound Energy suggests including wording similar to Table 11: “Required for external connectivity only”.

#	Organization	Yes or No	Question 30 Comment
30.28	LCEC	Disagree	R12 - 12.1 is covered in the account review requirements in R8. This should be changed to review the need for wireless as opposed to wired connectivity and reviewed annually.
30.29	Hydro One	Disagree	Recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.Recommend that Medium Impact BES Cyber System should be Required.
30.30	Northeast Power Coordinating Council	Disagree	Recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.Recommend that Medium Impact BES Cyber System should be Required.
30.31	Southwest Power Pool Regional Entity	Disagree	Remote access should be periodically reviewed for all impact categories. Ideally, a more frequent review should be required for High impact systems.
30.32	Allegheny Energy Supply	Disagree	Requirement R12 appears to be duplicative of R8.2 and should be removed.
30.33	Allegheny Power	Disagree	Requirement R12 appears to be duplicative of R8.2 and should be removed.
30.34	EEI	Disagree	Requirement R12 appears to be duplicative of R8.2 and should be removed.
30.35	ISO New England Inc	Disagree	Should be across the board, and annually for allRecommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”
30.36	MidAmerican Energy Company	Disagree	Specific requirements for wireless devices are not necessary. Furthermore, requirement R12.1 is duplicative of R8.2.
30.37	ReliabilityFirst Staff	Disagree	Suggest “Required for external connectivity only” for Medium Impact in row 12.1.
30.38	Network & Security	Disagree	Suggest including Medium Impact systems with external connectivity.

#	Organization	Yes or No	Question 30 Comment
	Technologies Inc		
30.39	US Bureau of Reclamation	Disagree	Table R12 should be applied to all Impact levels in keeping with requirements established in R11.
30.40	APPA Task Force	Disagree	The APPA Task Force agrees with the MRO-NSRS that “for external connectivity only” is redundant and should be removed from R12 Table 12.1. The table should therefore read:R12 Table 12.1: Low Impact: N/AMedium Impact: N/AHigh Impact: Required
30.41	Minnesota Power	Disagree	The impact levels seem well defined however inconsistencies in the definitions of “remote access” and “external connectivity,” (see response in Question 26) create confusion regarding the applicability of the criteria for each impact level.
30.42	PacifiCorp	Disagree	The term verification needs further definition. Requirement R12.1 appears to be duplicative of R8.2 and should be removed.
30.43	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
30.44	We Energies	Disagree	We Energies agrees with EEI: Requirement R12 appears to be duplicative of R8.2 and should be removed.

31. Requirement R13 of draft CIP-011-1 states "Each Responsible Entity shall revoke remote access by disabling one or more of the multiple factors required for such remote access to BES Cyber Systems by implementing the criteria requirements specified in CIP-011-1 Table R13 – Remote Access Revocation to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems." Do you agree with the list of criteria that is included in Requirements Table R13? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R13 has moved to CIP-004-5 – Cyber Security - Personnel and Training, Requirement R7.

Commenters suggested making the timeframes for revocation in R13 the same as R9. In response, the timeframes for revocation requirements have been simplified as follows:

- Revocation of access to BES Cyber Systems at the time of the termination or resignation and by by the end of the next calendar day for reassignments or transfers action,
- Revocation of access to BES Cyber System Information by by the end of the next calendar day for terminations or reassignments, and
- Additional requirements were added to address revocation of user accounts on BES Cyber Systems and shared accounts.

Commenters expressed concerns that persons who transfer are not automatically considered a threat to the system, and the timeframes for revocation should reflect this. In response, the requirement for transfers now states a review of access is required on the transfer date, and any unneeded access is revoked when it is no longer needed.

Commenters suggested keeping the revocation timeframes the same as defined in CIP Version 3. The SDT notes that FERC Order 706 directs revocation of access to occur immediately in all cases where access is no longer needed. The requirement has been modified to simply revoke access when a person no longer needs it. Organizations usually have termination procedures to return company property and perform exit interviews. Processes for revoking access (both physical and remote electronic) can be incorporated into an organization's termination and transfer procedures.

#	Organization	Yes or No	Question 31 Comment
31.1	WECC	Agree	Agree with criteria but recommend combining with R9 Revoking Access.This could be rolled into R9

#	Organization	Yes or No	Question 31 Comment
31.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
31.3	Florida Municipal Power Agency	Agree	Consider combining R9 with R13 and making the timing consistent. In 13.1, 13.2 and 13.3, "when job duties no longer require ..." is ambiguous and should be tied back to the policy of R1.
31.4	Progress Energy - Nuclear Generation	Agree	R13 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
31.5	Minnesota Power	Agree	These criteria are generally acceptable, except for the statement that "Each Registered Entity shall revoke remote access by disabling one or more of the multiple factors required..." The requirement to implement multi-factor authentication is not included in CIP-011-1.
31.6	Independent Electricity System Operator	Disagree	- There is no requirement for removing external access for cause. Does R9.1 cover this access? Should for cause be changed to involuntarily terminated to include those that are terminated unwillingly due to layoffs, job cuts, fired/performance, etc.- R1
31.7	PacifiCorp	Disagree	: The list of criteria is inconsistent with BES system access as outlined in Table 9. Remote access to BES should follow the same revocation criteria as system access.
31.8	USACE - Omaha Anchor	Disagree	13.1 - '... when job duties no longer require remote access' should either be changed 'when terminated for cause' or if the verbiage is deemed appropriate then the length of time to change the password needs to be greatly expanded. Just because an employee changes jobs does not mean they are a threat to the system, they still have the appropriate clearances and training.13.2 & 13.3 - since we are talking about a current employee who is just changing jobs the high impact numbers are crazy. The person is not a threat to the system, they have the necessary background.

#	Organization	Yes or No	Question 31 Comment
			Recommend times be the same as medium impact system.
31.9	Xcel Energy	Disagree	A 1 hour revocation time in R13.1 is completely unworkable. Examples where this is impossible include a termination by a vendor or joint access partner, or a termination during evening hours or weekends/holidays, when IT staff needed to terminate the access can not respond within 1 hour. The 4 and 6 hour revocation times for job duty changes are unjustified and unneeded. When the change is for a business reason such as a job change 7 days is sufficient for access removal. When the access change is unrelated to a termination for cause, the individual's trustworthiness and reliability are not in question and the short timeframes are not warranted.
31.10	BCTC	Disagree	Â Suggest collapsing Requirements 13.1 to 13.3 into one.Â Time targets would be the same as those suggested in Requirement 9 above
31.11	Alberta Electric System Operator	Disagree	Are the "multiple factors" referenced in R13 defined?
31.12	Tenaska	Disagree	Combine 12 and 13
31.13	BGE	Disagree	Combine 13.1, 13.2 and 13.3 into one requirement. Revocation for high impacted systems should be 24 hours to maintain consistency with other requirements with CIP-011.
31.14	Entergy	Disagree	Consider eliminating R13 altogether or combining it with R8.4 and R8.5.Suggest combining 9.2 thru 9.4 and making all 72 hours. CIPv1 is very prescriptive in this area. It is easier from a compliance perspective to have a 24 hour revocation requirement for termination and 72 hour requirement for everything else.
31.15	E.ON U.S.	Disagree	E.ON U.S. believes that the proposed time requirements are not reasonable and require 24x7 support personnel with the privilege to revoke access. Revocation of remote access within one hour for Control Centers is unreasonable for high-impact

#	Organization	Yes or No	Question 31 Comment
			Systems when the revocation is unrelated to termination with cause. If revocation is the result of one's job duties no longer requiring access, then E ON U.S. suggests next-business day should be adequate. Likewise, six hours for Transmission substation systems, and four hours for Generation Systems is unreasonable. Next business-day revocation should be adequate for all of these situations and presents little, if any, additional risk. E.ON U.S. requests clarification as to what is included in the term "multiple factors" for remote access.
31.16	EEI	Disagree	EEI suggests the following revision:"Each Responsible Entity shall revoke remote access by disabling one or more of the multiple factors required for such remote access to BES Cyber Systems by implementing the criteria requirements specified in CIP-011-1 Table R13 - Remote Access Revocation to prevent unauthorized operation of BES Elements by maintaining control of access to its BES Cyber Systems."
31.17	Constellation Energy Control and Dispatch, LLC	Disagree	-Eliminate the timing differences for revoking access when no longer required that exists between Control Centers, generation or transmission facilities and use a single timing requirment for access to all BES cyber systems.-The previous requirements have
31.18	FirstEnergy Corporation	Disagree	For 13.1, 13.2, 13.3 - Change text to '...when job responsibilities no longer requires BES Cyber System remote access'.This table should include a consideration when termination for cause. Should parallel Table 9 expectations.The recommended times are unreasonable for transfers/job reassignments.We have the same concerns with inconsistent application in regards to Impact Level as we previously identified in Table 9. See our comments to Questions 22 and 23.
31.19	Exelon Corporation	Disagree	Implementing revocation of access in as short a time as those proposed would require major changes to many enterprise wide systems in order to document compliance. Why do these time periods differ from those for physical and electronic access? Exelon feels these requirements are too restrictive and might necessitate moving to a 24/7 position to monitor the need for access revocation. Exelon's position is that the

#	Organization	Yes or No	Question 31 Comment
			access revocation should remain at the 24 hours with cause and 7 days without cause. This would also keep the CIP requirements in alignment with the DHS Catalog of Control Systems Security requirement 2.34 - Personnel Termination and DHS Catalog of Control Systems Security requirement 2.35 - Personnel Transfer.
31.20	USACE HQ	Disagree	It does not make sense to create three (3) separate requirements for three specific environments only, I suggest to have only one requirement that reads “Revoke remote access when job duties no longer require BES Cyber System remote access”.
31.21	APPA Task Force	Disagree	New: R13 Table 13.1: For personnel terminated for cause on a preplanned basis. Low Impact: N/AMedium Impact: 8 hourHigh Impact: 8 hourThe Existing 13.1 - 13.3 will need to be renumbered if this new 13.1 is accepted.
31.22	National Grid	Disagree	o National Grid recommends changing from “Required for external connectivity only” to “Required” under High Impact BES CS since the criteria already limits the scope to “remote access” o Reword “remote access” as “Remote access (LAN and wireless) communication interface o 24 hours is the minimal practical time for revoking access. A 1 or 4 hour revocation of access is not reasonable. National Grid suggests keeping times same as in Table R9.
31.23	NextEra Energy Corporate Compliance	Disagree	Please refer to comments submitted for questions 22 and 23. Furthermore, NextEra believes the timeframes suggested will be burdensome to administer since personnel that have authorized remote access have by definition also authorized electronic access. With this current draft, it connotes that when revoking access to High Impact Control Center BES Cyber Systems when job duties no longer require BES Cyber System remote access; the Responsible Entity has 1 hour to revoke remote access per 13.1 and has 36 hours to revoke electronic access per 9.2. We suggest making the time requirements consistent and up date the timeframe to "as soon a practical but within 36 hours" for both 13.1 and 9.2
31.24	Dominion Resources	Disagree	Please see Dominion’s response to Questions 15 and 22. Dominion also requests that

#	Organization	Yes or No	Question 31 Comment
	Services, Inc.		the removal of authentication needed for remote access suffice to meet the intention of this requirement for "immediate" revocation.
31.25	American Electric Power	Disagree	Please see response to Question 32 for additional detail.
31.26	Puget Sound Energy	Disagree	Puget Sound Energy disagrees with the current wording of the criteria. "...when job duties no longer require BES Cyber System remote access" is an abstract concept that will be impossible to quantify in order to validate compliance with the requirement. Puget Sound Energy suggests rewording to "Revoke remote access to...BES Cyber Systems when notification by personnel that job duties no longer require BES Cyber System remote access. In light of the 4 hr to 72 hr clock to revoke access, Puget Sound Energy suggests some measurable trigger from which to start the countdown to required revocation timeframes.
31.27	Detroit Edison	Disagree	R11, R12 and R14 use term "remote electronic access" and R13 uses the term "remote access". Revise to maintain consistency.
31.28	LCEC	Disagree	R13 requirements should be moved to the account management section.
31.29	Southwest Power Pool Regional Entity	Disagree	R13: The objective states that access will be revoked by disabling one or more of the multiple factors required for such access, yet multiple factor access authentication has yet to be prescribed. 13.1, 13.2, and 13.3 simply states "revoke access." As stated, the requirement is unclear and inconsistent between the object statement (Requirement) and the criteria. It may be beneficial to swap Requirements 13 and 14, prescribing remote access authentication controls before prescribing revocation of such access.
31.30	Hydro One	Disagree	Recommend using the same thresholds as R9.Recommend changing from "Required for external connectivity only" to "Required" since the criteria already limit the scope to "remote access".Recommend moving this Requirement to the Boundary Protection Requirements.

#	Organization	Yes or No	Question 31 Comment
31.31	Northeast Power Coordinating Council	Disagree	Recommend using the same thresholds as R9.Recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.Recommend moving this Requirement to the Boundary Protection Requirements.
31.32	ISO New England Inc	Disagree	Recommend using the same thresholds as R9Recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”Recommend moving this Requirement to the Boundary Protection RequirementsR13.1, R13.2 and R13.3 Is the 36 hours or 72 hours from the time the access is reviewed? Or is it that access should be reviewed within 36 hours of personnel that change job responsibilities, transfer, etc. Then require access be modified based on the review. Suggest changing the 36 hours to 72 hours. If a transfer were to occur on a Friday at 5 pm then access would need to be reviewed by Sunday. R13.1, R13.2 and R13.3 suggest changing the requirement to “Review access to BES Cyber Systems for personnel that change job responsibilities as a result of reassignment, transferred to other positions within x hours of the change.”
31.33	Black Hills Corporation	Disagree	Remote access revocation should be no different that other types of access and the 24 hour should apply.
31.34	Regulatory Compliance	Disagree	Remove R13 altogether and treat revocation of remote access the same as system access.
31.35	Garland Power and Light	Disagree	Requirement 13.1 - Medium Impact should read 48 hours instead of 36 hours and High Impact should read 4 hours instead of 1 hour. To be as strict as written is not necessary for just a job duty change
31.36	Reliability & Compliance Group	Disagree	Revocation for employees terminated for cause needs to be included.

#	Organization	Yes or No	Question 31 Comment
31.37	Southern California Edison Company	Disagree	SCE recommends matching R13 with R9. The time limits for high-impact generation BES is less than transmission substation BES, whereas they are the same in R9. SCE also suggest that 13.2 and 13.3 be given the same time limit.Also, SCE requests clarification about the types of devices that must be revoked. Order 706 seeks immediate revocation to devices and facilities. While order 706 has been unequivocal in the requirement of this control, they do not specify that access to “each” device must be individually revoked. The drafting team should be asked to provide supplemental guidance with this requirement to state that immediate revocation in timeframes shorter than 24 hours to “boundaries” electronic and physical be instituted.
31.38	SCE&G	Disagree	SDT needs to account for transitional periods when incumbent needs to train a replacement for job tasks. In this case when would time period begin for "no longer requiring access". There would be no timestamped document to start the clock.
31.39	ERCOT ISO	Disagree	Should be combined with other access management requirements (physical, cyber, information).
31.40	Manitoba Hydro	Disagree	Since Requirement R13 refers to external access, the words “for external connectivity only” are unnecessary in the impact columns. Please clarify if the “one or more of the multiple factors required for such remote access...” refers to the electronic access controls in Requirement R14. Please clarify what “such access” means.
31.41	Alliant Energy	Disagree	Specifically 1 hour system access removal is not even possible in an environment that is largely automated and unreasonably creates an environment of non-compliance. More generally, Table 13 is another occurrence where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the

#	Organization	Yes or No	Question 31 Comment
			business need change. Terminations for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement.
31.42	Allegheny Energy Supply	Disagree	Suggest the following revision:"Each Responsible Entity shall revoke remote access by disabling one or more of the multiple factors required for such remote access to BES Cyber Systems by implementing the criteria requirements specified in CIP-011-1 Table R13 - Remote Access Revocation to prevent unauthorized operation of BES Elements by maintaining control of access to its BES Cyber Systems."
31.43	Allegheny Power	Disagree	Suggest the following revision:"Each Responsible Entity shall revoke remote access by disabling one or more of the multiple factors required for such remote access to BES Cyber Systems by implementing the criteria requirements specified in CIP-011-1 Table R13 - Remote Access Revocation to prevent unauthorized operation of BES Elements by maintaining control of access to its BES Cyber Systems."
31.44	Duke Energy	Disagree	Table 13: How will this apply in case of a death?13.1 change 36 hours to 48 hours
31.45	MidAmerican Energy Company	Disagree	The list of criteria is inconsistent with BES system access as outlined in Table 9. Remote access to BES should follow the same revocation criteria as system access.
31.46	Ameren	Disagree	The short period of time to remove access does not extend well across weekends or through the 2nd business day in cases where access is no longer required at the end of the day. Suggest that these requirements be extended to a week to remain in line with current CIP standards. This will allow for proper hand off time in cases where job duties need to be transferred.
31.47	Southern Company	Disagree	The time limits in 13.1 are needlessly short in the context of an employee who is not

#	Organization	Yes or No	Question 31 Comment
			being dismissed for cause but is simply having his job duties changed. In addition, it is not clear exactly what the trigger point is for the start of that time table.
31.48	Northeast Utilities	Disagree	The timeframe is extreme for routine personnel changes (1 - 6 hours). Suggest a "for cause" termination for these timeframes and make routine more reasonable (3 days to align with R9?) Also, it is not needed if you agree with comment to 29. Host/application and network access should be treated the same.
31.49	Dairyland Power Cooperative	Disagree	These rules seem redundant to table R9. Why are there redundant rules for remote access accounts vs regular accounts? Any rules here should be for something that is unique to remote access.
31.50	US Bureau of Reclamation	Disagree	This requirement appears to be in conflict with R9. In reading R9 it is not clear that it does not also include remote access. Just as in R11 remote needs to be defined especially since R9 does not indicate remote access is excluded as this standards implies. Further, requirements need to be established for all system impact levels and timeframes need to be realistic and achievable. Shorter timeframes, as established in the table, would appear to be more applicable to individuals terminated for cause.
31.51	Consultant	Disagree	This requirement is access revocation and should be included in R9 as it relates to account management and access revocation.13.1, 13.2, & 13.3 - Whatever time frame is selected, the revocation time should be stated in days, either working days or calendar days, as personnel transactions typically are not conducted or tracked on an hourly basis.13.1, 13.2, & 13.3 - Having a different time frame for different types of facilities is an added dimension to the impact categorization that should be eliminated. If there is a basis for a difference in revocation times for different facility types, that difference should be included in the impact categorization criteria, not by trying to add additional categorization criteria in the requirements.Suggest deleting "for external connectivity only" as redundant & unnecessary. This requirement is for remote access and is by definition external access.

#	Organization	Yes or No	Question 31 Comment
31.52	Bonneville Power Administration	Disagree	This requirement is not necessary. It is already covered under R9. Revocation of electronic access applies to all electronic access regardless of whether it is local, remote or wireless. There is no difference.If the Requirement is retained, then the objective of this requirement ("to prevent malicious operation of BES Elements by maintaining control of access to its BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the Requirement rather than appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.
31.53	Progress Energy (non-Nuclear)	Disagree	This revocation is not based on termination for cause. It will be very difficult to meet the 1 - 6 hour revocations. If termination was for cause would an individual not need physical access to get remote access - we are required to physically secure areas around remote access? Shouldn't all access, system, physical, remove etc. have consistent revocation times?Revocation of access within a 'hours' timeframe implies that the access would be controlled through a security group with 24/7 coverage.This should be no different than the revocation of cyber access. This requirement is not needed. Also the time limits as proposed for High Impact are impractical and will only lead to unnecessary self-reports that provide no benefit to system security.CIP-011 R13.1 thru .3 What is the decision process to be used to determine "when job duties no longer require ... access"? What would be suitable compliance evidence that is to be collected that indicates "when job duties no longer require access" as this is critical in determining if revocation has been accomplished within the mandated 1 hour, 4 hours, 6 hours, 24 hours, 36 hours, 72 hours?The complexity and compliance risk of managing all of these requirements at different levels, for different functional areas will be very problematic to substantiate compliance.
31.54	CWLP Electric Transmission, Distribution and	Disagree	Time frames should be extended to 72 hours or next business day, whichever is longer.

#	Organization	Yes or No	Question 31 Comment
	Operations Department		
31.55	Con Edison of New York	Disagree	Timeliness of access removal is important. These criteria can be interpreted (R13.1 for example) to mean remote access needs to be revoked within 7 hours of the actual time of change of job duties. This can be unrealistic. The controlling department, for access, may not be notified by the individuals department of the change within the time period. This is more likely when contract personnel are considered. The requirement should be clearly worded to provide 7 hours from notification of the need for change.R13.2 and 13.3: it is not clear that the standard defines either a Transmission or Generation BES Cyber System.
31.56	We Energies	Disagree	We Energies agrees with EEI: Suggest the following revision:"Each Responsible Entity shall revoke remote access by disabling one or more of the multiple factors required for such remote access to BES Cyber Systems by implementing the criteria requirements specified in CIP-011-1 Table R13 - Remote Access Revocation to prevent unauthorized operation of BES Elements by maintaining control of access to its BES Cyber Systems." We Energies agrees with EEI: Suggest adding requirements to address the removal of remote access for low impact systems.
31.57	GTC & GSOC	Disagree	We recommend this requirement include language that would allow personnel to retain access during a transition period while training their replacement. We recommend the language used in requirement 5, row 5.8: "personnel who no longer require such access."We also recommend that termination for cause should be handled seperately. All other time lines should be commensurate with the associated risk and consistent throughout all requirements.We recommend the language in Table 13 should be consistent with 5.8 and 5.9 in Table 5.We recommend requirements 13.1, 13.2, 13.3 should include the words "the entity determines the" between the words "when" and "job"; this would prevent an auditor from second guessing an entity's decision on required access. The requirement should also specifically state that this does not preclude a person from retaining access in order to assist his replacement with fulfilling his old job duties during a transition of

#	Organization	Yes or No	Question 31 Comment
			responsibilities.
31.58	Network & Security Technologies Inc	Disagree	Wording suggests multi-factor authentication is required for all systems subject of R13, but R14 only requires multiple factors for High Impact systems. Also suggest swapping order of requirements in R13 and R14.

32. Table R13 provides direction concerning what impact level of BES Cyber Systems to which Requirement R13 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R13 has moved to CIP-004-5 – Cyber Security - Personnel and Training, Requirement R5.

Commenters suggested aligning with R9 normal revocations. In response, the requirements for revocation have been consolidated to CIP-004-5 R7.

Commenters suggested including targets for Low Impact BES Cyber System revocation. The SDT notes the applicability to Low Impact BES Cyber Systems has been removed.

Commenters suggested times need to be stated in business days. In response, times have been changed to calendar days. The use of business days is not appropriate because this can be interpreted to include exclusions for weekends and holidays.

#	Organization	Yes or No	Question 32 Comment
32.1	Luminant	Agree	13.1 should be changed to 48 hours (2 days)
32.2	USACE - Omaha Anchor	Agree	Agree - just want to reiterate the times associated with removal for a job transfer are ridiculous. The person has been trusted and trained - it's not an emergency just because they changed jobs. (Due to lack of personnel - if this happened on a Friday - we would have to treat it as an emergency.)
32.3	Idaho Power Company	Agree	Need to make this consistent with revocation requirements for normal electronic access. Why would these timelines be shorter?
32.4	SCE&G	Agree	The timeframes, specifically for High Impact Control Center assets, are extreme.
32.5	US Army Corps of Engineers, Omaha Distirc	Disagree	"when job duties no longer require" will be very hard to account for. Time frames are unrealistic / impossible. Times should be stated in terms of business days. It would be more realistic for High Impact BES Cyber Systems to be Next Business Day and for Medium Impact Cyber Systems to be 2 and 3 business days.

#	Organization	Yes or No	Question 32 Comment
32.6	Florida Municipal Power Agency	Disagree	1 hour is not reasonable. Planned termination for cause can be 1 hour, but, otherwise the 1 hour is not reasonable. Consider aligning the times with R5 and R9. Access revocation alternatives/mitigation techniques should allow for deviation from the standard, or be recognized. For example, escorted supervision while restricting access to communication devices/computers should be a reasonable way to get around the 1-hour requirement if it can't be met for some particular reason.
32.7	American Electric Power	Disagree	13.1 - 13.3, regarding all information in column "High Impact BES Cyber System". These values are not feasible on a system unless it is managed with a domain controller or has only a few network components. Suggest using the 36/72/72 as required in the R9. There is no need to make this more restricted than the local access.There also does not appear to be a requirement to revoke access within 24 hours for a termination for cause. Is that the intent?
32.8	Con Edison of New York	Disagree	13.1,2,3- may be dependent on a company's existing HR/Payroll business system capabilities and introduce significant costs to remediate. Even though the individuals were trusted and the trust did not change as a result of cause. A week may be more realistic
32.9	ERCOT ISO	Disagree	13.1: 1 hour may not be possible. Especially in light of access granted to external organizations (ie: an RC or BA with access a TOP's systems).
32.10	Southern California Edison Company	Disagree	A longer time frame (range of <72 hours for high medium and low impact systems) should be instituted for each device. Revocation should not be treated as a monolithic requirement and should be such that it leverages controls instituted by boundary protections.
32.11	Constellation Energy Commodities Group Inc.	Disagree	Align all high and medium impact systems on the 72 hour standard to eliminate confusion and allow consistent administration.

#	Organization	Yes or No	Question 32 Comment
32.12	MidAmerican Energy Company	Disagree	As noted in question 31 we believe that the list of criteria should align with Table 9, the impact levels should begin with termination for cause and then address the criteria. In addition, the impact between transmission and generation is inconsistent and not understood why these would be different, again inconsistent with Table 9. With regards to the impact levels - time to revoke access - we disagree that this too would be different than as outlined in Table 9. All revocation requirements under 24 hours is concerning as this imposes significant risk to our ability to comply given the lack of available automated access removal solutions in the market place that can be realistically deployed across a wide-range of systems.
32.13	PacifiCorp	Disagree	As noted in question 31 we believe that the list of criteria should align with Table 9, the impact levels should begin with termination for cause and then address the criteria. In addition, the impact between transmission and generation is inconsistent and it is not understood clear why these would be different, again inconsistent with Table 9. With regards to the impact levels - time to revoke access - we disagree that this too would be different than as outlined in Table 9. All revocation requirements under 24 hours is concerning as this imposes significant risk difficulty to our ability to comply given the lack of available automated access removal solutions in the market place that can be realistically deployed across a wide-range of systems.
32.14	American Transmission Company	Disagree	As written, we believe the timelines specified for the High Impact criteria are not practical. The tight requirements seem to set up the entire industry for non-compliance, especially with regards to control centers where revocation must occur within one hour. We propose timelines that are more consistent with R5 (physical access) and R9 (electronic access), but would be in agreement with terminology urging entities to expedite this process as much as possible with regards to remote access.
32.15	MRO's NERC Standards Review Subcommittee	Disagree	As written, we believe the timelines specified for the High Impact criteria are not practical. The tight requirements seem to set up the entire industry for non-

#	Organization	Yes or No	Question 32 Comment
			compliance, especially with regards to control centers where revocation must occur within one hour. We propose timelines that are more consistent with R5 (physical access) and R9 (electronic access), but would be in agreement with terminology urging entities to expedite this process as much as possible with regards to remote access.
32.16	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
32.17	Tenaska	Disagree	Combine 14 and 11
32.18	The Empire District Electric Company	Disagree	Comments: As written, we believe the timelines specified for the High Impact criteria are not practical. The tight requirements seem to set up the entire industry for non-compliance, especially with regards to control centers where revocation must occur within one hour. We propose timelines that are more consistent with R5 (physical access) and R9 (electronic access), but would be in agreement with terminology urging entities to expedite this process as much as possible with regards to remote access.
32.19	Alberta Electric System Operator	Disagree	Consider adding “120 hours for external connectivity only” to all Low Impact BES Cyber System levels (13.1, 13.2, 13.3).
32.20	Entergy	Disagree	Consider eliminating R13 altogether or combining it with R8.4 and R8.5.Suggest combining 9.2 thru 9.4 and making all 72 hours. CIPv1 is very prescriptive in this area. It is easier from a compliance perspective to have a 24 hour revocation requirement for termination and 72 hour requirement for everything else.
32.21	Duke Energy	Disagree	Drafting team, please explain the basis for the 1 hour, 6 hour, and 4 hour requirements for the High Impact column. These appear to be overly restrictive and arbitrary. Similar to the comment above, these items are much more achievable if "remote" and "external" are defined as external to the plant in a generation

#	Organization	Yes or No	Question 32 Comment
			environment. Also, as stated above (question 27), remote connectivity requires more unambiguous definition.
32.22	E.ON U.S.	Disagree	E.ON U.S. believes that the proposed time requirements are not reasonable and require 24x7 support personnel with the privilege to revoke access
32.23	USACE HQ	Disagree	First, requirements 13.1, 13.2, and 13.3 should be required for every level of impact. Second, to avoid the "Friday 5PM no longer required access" scenario, the language should be change as follow: for High Impact BES Cyber System in 13.1, 13.2, and 13.3, from "XX hours for external connectivity only" to "Close of Business Day (COB) of the following day after the no longer access required for external connectivity only", for Medium Impact BES Cyber System in 13.1, 13.2, and 13.3, from "XX hours for external connectivity only" to "Close of Business Day (COB) of the second day after the no longer access required for external connectivity only", and for Low Impact BES Cyber System in 13.1, 13.2, and 13.3 (please refered to my answer to question 31), from "----" to "Close of Business Day (COB) of the third day after the no longer access required for external connectivity only".
32.24	Network & Security Technologies Inc	Disagree	If authentication is required for remote access to Low Impact systems (R14), it should be covered by R13 revocation.
32.25	WECC	Disagree	If the employee can access the system remotely why can the entity not remotely disable the access? Please have another look at the hours for the medium impact level.This should apply to all impact levels and Medium and Low impact systems should require not more than 24 hour timelines for revocation.
32.26	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
32.27	BGE	Disagree	Low impacted systems should have a timeframe defined for revocation

#	Organization	Yes or No	Question 32 Comment
32.28	FirstEnergy Corporation	Disagree	Need clarity on '...for external connectivity...'. For example, does this mean consoled in (directly connected) as well as remote electronic logon?Timeframes should not be in 'hours' (i.e. less than a full day). Tracking by time rather than days would not be logistically possible on all systems and compliance could not be maintained.The new requirements now have too many different time frames to meet. Again, not logistically possible on all systems and compliance could not be maintained for larger utilities.Similar concerns as previously stated with Table 9. See Questions 22 and 23.
32.29	Detroit Edison	Disagree	Please explain the reason for different revocation times between High Impact on 13.2 and 13.3.
32.30	American Municipal Power	Disagree	Please provide a little or no impact category
32.31	NextEra Energy Corporate Compliance	Disagree	Please refer to comments submitted for questions 22 and 23.
32.32	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 11 with Table 12 and Table 13. Puget Sound Energy suggests including wording similar to Table 11: "Required for external connectivity only".
32.33	Progress Energy - Nuclear Generation	Disagree	R13 durations should align with those described in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
32.34	LCEC	Disagree	R13 requirements should be moved to the account management section.
32.35	ISO New England Inc	Disagree	Recommend using the same thresholds as R9 Recommend changing from "Required for external connectivity only" to "Required" since the criteria already limit the scope

#	Organization	Yes or No	Question 32 Comment
			to “remote access”
32.36	Hydro One	Disagree	Recommend using the same thresholds as R9.Recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.
32.37	Northeast Power Coordinating Council	Disagree	Recommend using the same thresholds as R9.Recommend changing from “Required for external connectivity only” to “Required” since the criteria already limit the scope to “remote access”.
32.38	Black Hills Corporation	Disagree	Remote access revocation should be no different that other types of access and the 24 hour should apply.
32.39	Public Service Enterprise Group companies	Disagree	Remote access should be governed by the same rules are normal access. The time frame in 13.1 for High Impact BES Cyber Systems is unreasonably short. Notifying and securing the appropriate personnel to disable access once the job duties no longer require access may not be possible in all circumstances to guarantee that access is always revoked within 1 hour. This may not be operationally feasible. The timeframe should be similar to access revocation for user with non-remote access as specified in Table R9 item 1.9 (i.e. within 24hrs).
32.40	Manitoba Hydro	Disagree	Remote electronic access to BES Cyber Systems should be revoked for Low Impact BES Cyber Systems, and not permitted indefinitely. The remote access revocation period for generation High Impact BES Cyber Systems should be 6 hours, the same as for the Transmission High Impact BES Cyber System.
32.41	Exelon Corporation	Disagree	Requirements 13.1, 13.2 and 13.3 contain time parameters in hours. Exelon’s tracking systems that would be used to demonstrate compliance are tracked in time increments of days, not hours. If an hourly timeframe is required it will cause extensive modifications to numerous enterprise wide systems to allow tracking at an hourly level. One must ask how this improves reliability. What is the basis for time

#	Organization	Yes or No	Question 32 Comment
			levels and having a different timeframe for a control center than other locations? With the exception of a termination for cause, what is the basis for requiring access removal for someone who was a trusted employee on such an aggressive timeframe? What is the risk that is being addressed by making a 1 hour timeframe requirement?
32.42	Southwest Power Pool Regional Entity	Disagree	Revocation timeframes should be expressed in business days.
32.43	National Grid	Disagree	Same as in Q. 31.
32.44	San Diego Gas and Electric Co.	Disagree	SDG&E feels that the key for this requirement is the definition of the phrase "when job duties no longer require remote access". This phrase can be interpreted in a couple of different ways. The more strict interpretation is that a person would no longer need access after their session is complete, or perhaps after taking a break or going to lunch. This could happen a few times per day, depending on the work. A second interpretation could mean that a person no longer needs access after a 6 month long project is completed or there is a reassignment to another part of the company after 3 years of working on the BES Cyber Systems, etc. In the former case, it becomes a large burden to revoke access within one hour several times per day, and could be a manual process on some systems. On the other hand, if you consider the second interpretation (6 month project or transfer after 3 years), SDG&E would ask why is it so important to revoke remote access with 1, 4, or 6 hours after such a long period of time that a person has had access? Sometimes it takes time for a person to get reassigned, change locations, change projects, etc. In this case, 4 hours would be the minimum that SDG&E feels is practical to be able to comply with.
32.45	Progress Energy (non-Nuclear)	Disagree	See comment 14.This should be no different than the revocation of cyber access revocation. This requirement is not needed.
32.46	GTC & GSOC	Disagree	See comments to question 31 above

#	Organization	Yes or No	Question 32 Comment
32.47	BCTC	Disagree	See our response for table 9 time targets
32.48	Constellation Energy Control and Dispatch, LLC	Disagree	See response to Question 31.
32.49	Regulatory Compliance	Disagree	STRIKE Table R13
32.50	EEI	Disagree	Suggest removal of the words “for external connectivity only” from the table 13 columns, as the requirement themselves discuss the issue of remote access, therefore the words “for external connectivity only” are unnecessary and redundant.EEI suggests using a uniform number of hours across various facility types for high and medium.EEI suggests using 7 calendar days for medium.EEI suggests using 8 hours for high impact.EEI suggests adding a footnote here to reference the definition put forth in R11: “Remote access for the purpose of this standard means an interactive user session with a BES Cyber System from a device external to the BES Cyber System.”
32.51	Allegheny Energy Supply	Disagree	Suggest using a uniform number of hours across various facility types for high, medium and low.Suggest using 7 calendar days for medium and 14 calendar days for low impact.Suggest using 12 hours for high impact.
32.52	Allegheny Power	Disagree	Suggest using a uniform number of hours across various facility types for high, medium and low.Suggest using 7 calendar days for medium and 14 calendar days for low impact.Suggest using 12 hours for high impact.
32.53	APPA Task Force	Disagree	The APPA Task Force agrees with the MRO-NSRS comments noting that as written, the timelines specified for the High Impact criteria are not practical. The tight requirements seem to set up the entire industry for non-compliance, especially with regards to control centers where revocation must occur within one hour. We propose timelines that are more consistent with R5 (physical access) and R9 (electronic access). However we feel the one area where an entity is vulnerable is when personnel are terminated for cause. We see this as the most extreme case when an

#	Organization	Yes or No	Question 32 Comment
			entity should be diligent in protecting remotely accessible BES cyber systems and act within the time of a normal shift. We suggest 8 hours for termination for cause, except when a termination is preplanned, in which case a shorter time period may be feasible. Similar to the comments we provided regarding R9: We know there are pressures to have access restricted as soon as possible but we are trying to be realistic given the time it will take to remove access from systems which have multiple owners, are in remote locations and which have numerous devices to access. It seems that the drafting team is basing their proposed timetable on a control center where the cyber systems are more IT focused and have controls that can be turned on and off easily.We propose the following changes to the Impact Levels of R13:R13 Table 13.1: (NEW) Low Impact: N/AMedium Impact: 8 hoursHigh Impact: 8 hoursR13 Table 13.2: (Old 13.1)Low Impact: N/AMedium Impact: 36 hoursHigh Impact: 36 hourR13 Table 13.3: (Old 13.2)Low Impact: N/AMedium Impact: 1 WeekHigh Impact: 1 WeekR13 Table 13.4: (Old 13.3)Low Impact: N/AMedium Impact: 1 WeekHigh Impact: 1 Week
32.54	Minnesota Power	Disagree	The impact levels seem well defined however inconsistencies in the definitions of “remote access” and “external connectivity,” (see response in Question 26) create confusion regarding the applicability of the criteria for each impact level.In certain circumstances, it may not be possible to adhere to the proposed timeframes, especially in instances where BES Cyber System support is 8 hours a day, 5 days a week or where notification of termination comes from corporate systems that are also updated on an 8 hours a day, 5 days a week schedule. The need for more immediate time constraints, when compared to electronic access as defined in Requirement R9 that is not remote is understood, but both the Requirements in R9 and R13 need to take into account reasonable business processes that impact notification of employee reassignment and separation.Minnesota Power recommends that the timelines for R13 be consistent with those established in R5 and R9, but would agree that terminology should be included urging Registered Entities to expedite this process as much as possible with regards to remote access.

#	Organization	Yes or No	Question 32 Comment
32.55	GE Energy	Disagree	The revocation targets for High Impact systems will be almost impossible to meet for revoking vendor personnel access (Table R13 HI BES remote access must be terminated within 1 hour of access no longer being required). It also seems to be in conflict with the revocation times in Table R9? These need to be linked together.
32.56	Northeast Utilities	Disagree	The timeframe is extreme for routine personnel changes (1 - 6 hours). Suggest a "for cause" termination for these timeframes and make routine more reasonable (3 days to align with R9?) Also, it is not needed if you agree with comment to 29. Host/application and network access should be treated the same.
32.57	US Bureau of Reclamation	Disagree	The timeframes for High Impact are not consistent with R9 and appear to be too stringent. Further, requirements need to be established for all system impact levels.
32.58	Oncor Electric Delivery LLC	Disagree	These proposed time frames are not practical as most HR systems are separate (and should be) from real-time operations of the BES. The time-frames for High Impact cannot be different from Medium, as they utilize the same back-office information systems.
32.59	Bonneville Power Administration	Disagree	These requirements are not necessary. They are already covered under R9. Revocation of electronic access applies to all electronic access regardless of whether it is local, remote or wireless. There is no difference. In addition, this requirement could force Cyber System administrative personnel to take action to revoke access even if it means not performing other actions needed to support real-time operations, or risk non-compliance. As an example, if a BES Cyber System has failed for some reason, the corrective actions should take precedence over revoking access. Under those circumstances, an entity could find itself in the position of deliberately allowing non-compliance in order to restore the integrity of the BES. The required time frames are impossibly short for high impact systems. It is difficult to justify dropping all other actions to revoke access for someone unless there is reason to believe that the individual poses a threat. In that case the requirements of R9 are in effect.This

#	Organization	Yes or No	Question 32 Comment
			requirement seems to conflict with R9 and Table R9. Table R9 allows 24 hours for access revocation due to termination for cause. Table requires revocation within 1 hour, even if termination for cause is not required.Recommendation: Remove this requirement entirely. Treat revocation of remote access as just another revocation of access under R9. Otherwise, increase the time frames to something achievable.
32.60	Consultant	Disagree	This requirement is access revocation and should be included in R9 as it relates to account management and access revocation.13.1, 13.2, & 13.3 - Whatever time frame is selected, the revocation time should be stated in days, either working days or calendar days, as personnel transactions typically are not conducted or tracked on an hourly basis.13.1, 13.2, & 13.3 - Having a different time frame for different types of facilities is an added dimension to the impact categorization that should be eliminated. If there is a basis for a difference in revocation times for different facility types, that difference should be included in the impact categorization criteria, not by trying to add additional categorization criteria in the requirements.Suggest deleting "for external connectivity only" as redundant & unnecessary. This requirement is for remote access and is by definition external access.
32.61	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
32.62	We Energies	Disagree	We Energies agrees with EEI: Suggest removal of the words "for external connectivity only" from the table 13 columns, as the requirement themselves discuss the issue of remote access, therefore the words "for external connectivity only" are unnecessary and redundant.We Energies agrees with EEI: Suggest using a uniform number of hours across various facility types for high, medium and low.We Energies agrees with EEI: Suggest using 7 calendar days for medium and 14 calendar days for low impact.We Energies agrees with EEI: Suggest using 8 hours for high impact.We Energies agrees with EEI: Suggest adding a footnote here to reference the definition put forth in R11: "Remote access for the purpose of this standard means an interactive user session

#	Organization	Yes or No	Question 32 Comment
			with a BES Cyber System from a device external to the BES Cyber System.”

33. Requirement R14 of draft CIP-011-1 states "Each Responsible Entity shall document and implement its organizational processes, technical mechanisms, and procedures for control of wireless and remote access to electronic access points to its BES Cyber Systems including wireless and remote access if it is used, that incorporate the criteria specified in CIP-011-1 Table R14 – Wireless and Remote Electronic Access Controls to ensure that no unauthorized access is allowed to its BES Cyber Systems." Do you agree with the list of criteria that is included in Requirements Table R14? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Requirements for remote access in CIP-011-1 R14 have moved to CIP-005-5 - Cyber Security — Electronic Security Perimeters.

Commenters expressed concern that the scope of the "Banner" requirement should be clarified and that having a banner is not a security control. The SDT agrees and notes that the requirement to have appropriate use banners was considered administrative and has been removed.

Several other commenters suggested splitting wireless and remote access requirements. The SDT notes that a new requirement for Remote Access Management (CIP-005-5 R2) was created based on the Urgent Action Revisions to CIP-005-3, and the wireless access requirements have been removed.

#	Organization	Yes or No	Question 33 Comment
33.1	WECC		Don't see the security value of requiring login banner as required in 14.4. This requirement seems to stem from the belief that in a legal prosecution the court would need to show that the system was misused or accessed inappropriately and that a login banner accomplishes this by notification. Since most attacks are done via automation today, and internal attackers are likely required to sign an acceptable use policy this requirement seems to only add operational cost. Additionally, one can prove that inappropriate use was done by the mere fact that the person is using the system without authorization. Also keeping this in for only high impact systems would let attackers easily know which systems are high impact/value. Recommend dropping criteria all together. The appropriate use banner criterion does not belong here. This is a legal protection, not a security control, and would be better placed in a policy type requirement. Consider replacing "multi-factor" with "strong", and offering

#	Organization	Yes or No	Question 33 Comment
			additional language to clarify the term. "Strong" auth should be required for all remote access. Provide distinction between remote access from untrusted locations, such as the internet, and remote access from trusted locations, such as a backup control center.
33.2	Duke Energy	Agree	14.4 requires a TFE
33.3	Regulatory Compliance	Agree	BUT14.2 - What is the risk protection versus cost, time and overhead to implement?
33.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
33.5	CWLP Electric Transmission, Distribution and Operations Department	Agree	Is multifactor access control limited to electronic methods only? Can the use of enabling or disabling a device such as a modem equal to a portion of multifactor controls?
33.6	Puget Sound Energy	Agree	Puget Sound Energy agrees with the criteria, but suggests NERC provide clarity in regards to 14.4. Is NERC requiring an "appropriate use banner" on the user screen for the initial attempt of remote access, or for all interactive attempts established after successfully authenticating remotely? Example: Is an appropriate use banner only needed for a 2-factor VPN connection screen, or at all systems accessed through a 2-factor VPN (operating system and application(s) on BES Cyber System Components?
33.7	Progress Energy - Nuclear Generation	Agree	R14 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
33.8	GTC & GSOC	Agree	We recommend references to wireless should be removed from R14 and the associated table. The actual requirements are not related to wireless as distinct from

#	Organization	Yes or No	Question 33 Comment
			other remote access
33.9	Green Country Energy	Agree	Will their be guidance? How about changing the statement to "reasonably ensure" that no unauthorized access is allowedExample: If my processes allow anyone to be authorized, I then can "ensure" no unauthorized access will occur.
33.10	Independent Electricity System Operator	Disagree	- R14.1 and R14.2 seem to be stating the same thing. R14.2 is covered by R14.2.- R14.4 - Shouldn't the use banner be required to be installed on the BES cyber components themselves prior to login. If port 22 is open on a firewall, the firewall will
33.11	American Electric Power	Disagree	14.1: Regarding "If remote access is used and/or implemented, include authentication controls". Suggest replacing "include" with "document".
33.12	FirstEnergy Corporation	Disagree	14.2 this could be difficult to implement depending on the definition of "interactive user session" within the definition of remote access.14.2 - add '...authentication controls for remote access mechanisms'14.3 - add 'remote access' somewhere in this sub-requirementWith R14.4, it requires an appropriate use banner; there is no allowance for equipment that can not support a banner.
33.13	Luminant	Disagree	14.4 - where technically feasible
33.14	Southwest Power Pool Regional Entity	Disagree	14.4 is overly prescriptive. Consider revising the requirement to simply state "Display an "appropriate use banner" upon an interactive attempt to access a BES Cyber System, stating that unauthorized use of the system is prohibited."
33.15	BCTC	Disagree	Â R 14.1: remove Required as the requirement is satisfied under R14.2R14.4: text "remote electronic access" devices; suggest that the language be rewritten/ simplified so the objective is clear - i.e. ensure appropriate CCAs display appropriate use banner when connecting to these assets remotely
33.16	Southern California	Disagree	As stated above, remote access should be thoroughly documented and full encryption

#	Organization	Yes or No	Question 33 Comment
	Edison Company		and authentication methods applied.Also, SCE requests that the drafting team review the intent of R14.4 and R7.2 and consider combining the requirements.
33.17	Tenaska	Disagree	Combine 14 and 11
33.18	Alliant Energy	Disagree	Consideration should be given to whether or not the access provides control capability or simply read only.
33.19	ISO New England Inc	Disagree	Did the SDT assume that wireless is a form of remote access for R11 - R14? If YES, please update the wording. If NO, the Requirements are confusing because we use wireless that is not remote access, plus wireless includes more than WiFi.Depending on that answer, R14 should move into R11 or into the Boundary Protection RequirementsR14.1 and R14.2 seem to be stating the same thing.14.2 should have requirement for medium. 14.4 appropriate use banner - is this required for legal steps in the event of an issue... this is not a security control.If the banner is need then the use banner should be required to be installed on the BES cyber components themselves prior to login. If port 22 is open on a firewall, the firewall will allow the traffic through without displaying a banner.
33.20	Northeast Power Coordinating Council	Disagree	Did the SDT assume that wireless is a form of remote access for R11 - R14? If YES, the wording should be revised. If NO, the Requirements are confusing. Wireless that is not remote access may be used, plus wireless includes more than WiFi.Depending on that answer, R14 should move into R11 or into the Boundary Protection Requirements.
33.21	Florida Municipal Power Agency	Disagree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.Item 14.4 is very specific in requiring “appropriate use banner” this should be removed or reworded to cover various methods of notification. Also the standard should demand that no identifiable details be given about the system before authentication is complete.We believe items 14.3 and 14.4 are going to set the stage for numerous TFE’s within the industry. Many devices (e.g.,

#	Organization	Yes or No	Question 33 Comment
			protective relays) do not support explicit access permissions and appropriate use banners.
33.22	USACE - Omaha Anchor	Disagree	Have concerns about 14.2 “multifactor authentication.” Would prefer terms either “multi-authentication.” If we were to implement multifactor we would be removing levels of access to our system and potentially making it easier to hack if they can overcome the multifactor issue.
33.23	Black Hills Corporation	Disagree	If two cyber systems are on the same protected network, and within the same physical boundary, should two-factor authentication be required? We don’t think so, but according to the definition of remote access and this requirement it would be.
33.24	LCEC	Disagree	Is this for remote access and wireless network access or does it also apply to wireless communications between BES Cyber System Components?
33.25	NextEra Energy Corporate Compliance	Disagree	NextEra believes the multifactor controls required in section 14.2 is too specific. “Strong technical controls” is a preferred update to the requirement. There may be better controls from a security and reliability standpoint, but as the requirement stands, Responsible Entities are limited in the technological implementations to support compliance to the requirement.Requirement 14.3 specifying that responsible entities must “deny access by default; [specifying] explicit access permissions” is unclear. Since this is supposed to be related to remote electronic access, the requirement should clarify that the end user is explicitly denied access thru the access point(s) of the network containing the BES Cyber System unless explicitly allowed access into that network.Requirement 14.4 requires the displaying “of an ‘appropriate use banner’ on the user screen of remote electronic access control devices that, upon an interactive attempt to access a BES Cyber System, states that unauthorized use of the system is prohibited.” This appropriate use banner should be required upon every new connection and entry attempt to the BES Cyber System network, for example a firewall or SSL VPN connection that controls remote access. Also, allowance for TFE's in 14.2 through 14.4 should be included.Regarding 14.2, NextEra

#	Organization	Yes or No	Question 33 Comment
			would like clarifaction for the required multifactor authentication controls. Is it required for assets within the boundary or does it only apply to the control of wireless and remote access to electronic access points to BES Cyber Systems? or both?
33.26	Constellation Energy Commodities Group Inc.	Disagree	Provide clarification regarding acceptable use banner (14.4) - in some instances such banners cannot be added to system. Make clear that the requirement may be met by displaying a banner upon workstation sign-on or upon user entry to the remote access environment. What is the specific meaning of authentication controls in 14.1? Since this is called out separately from two-factor authentication, I interpret it to mean that remote access cannot be enabled via generic accounts, only via user specific accounts with authentication (password) known only to the individual. Is that the idea?
33.27	Detroit Edison	Disagree	R11, R12 and R14 use term “remote electronic access” and R13 uses the term “remote access”. Revise to maintain consistency.Wireless electronic access is not an access method; it is just the medium to obtain access. In an effort to remove reference to specific technology, wireless should not be identified anywhere in the standard. References to specific technologies should be addressed in the guidance documentation.
33.28	Ameren	Disagree	R14.1 - The complexity and scope of the documentation of the Low Impact Systems will be challenging to keep succinct for auditors.R14.3 - Deny access by default is not needed. Requiring authentication implies access is denied by default.R14.4 - Not all systems support user banners. This will be hard to keep from being a TFE on many “high” systems.
33.29	Southern Company	Disagree	R14.1-4 addresses remote access only and does not include wireless, the table title and R14 includes wireless.
33.30	Entergy	Disagree	R14.2 dictates multifactor authentication controls for only high impact BES Cyber Systems. Entergy recommends serious consideration of extending this to low and medium impact BES Cyber Systems where localized wireless technology is employed.

#	Organization	Yes or No	Question 33 Comment
			Eliminate 14.4. We understand the purpose of this requirement but do not believe that it adds to the protection of any cyber system. If it is to be added then it should be placed outside of the wireless and remote electronic access control section and placed elsewhere. Entergy believes some aspects of R11 and R14 are redundant and suggests combining them. We also believe criteria in R14 should apply to high, medium and low risk assets and provide a footnote indicating that where requirements are unable to be met explicitly that the strongest possible controls should be employed alternatively.
33.31	US Bureau of Reclamation	Disagree	R14.3: Add deny access by default requirement for low systems. Specific access permissions are not required, however.
33.32	San Diego Gas and Electric Co.	Disagree	SDG&E recommends that a definition of what is meant by “multifactor authentication controls” be included in a definition box near R14.
33.33	APPA Task Force	Disagree	The APPA Task Force agrees with the MRO-NSRS proposal. Criteria in 14.3 and 14.4 are very specific in application of technology that may not be supported by devices in the field. These criteria should be removed or reworded to cover various methods of operation. If the drafting team keeps these requirements the following is our recommended language: R14 Table 14.3: If a BES cyber system component supports explicit access permission capability, the device should deny access by default. R14 Table 14.4: If a BES cyber system component supports notification capability, remote electronic access control device users should be notified that unauthorized use of the system is prohibited.
33.34	MidAmerican Energy Company	Disagree	The new definition of BES Cyber System creates confusion over what technologies are intended to be in-scope. The core changes significantly changes how a responsible entity (RE) establishes and secures remote access to these systems. The REs will develop their own unique determination on how to deal with this situation. Which is likely not going to deliver the intended result the Standards drafters are looking for industry-wide? As this relates to R22 - firewalls, our CIP defined access points, are

#	Organization	Yes or No	Question 33 Comment
			defined as part of a given BES Cyber System. One likely scenario is that we will define a separate BES Cyber System that manages these firewalls that might include a client PC, a firewall manager, and some network infrastructure components. The remote access rules and even the other general protections of these cyber components to manage this type of communication become very ambiguous.Retain the existing ESP concept versus adopting the BES Cyber system concept and make some of the other operational improvements this draft makes.While the criteria themselves are not onerous for the long term/future development of the systems, the current BES technology in place or available, will require technical feasibility exceptions as not all systems within the BES can support all criteria listed.
33.35	PacifiCorp	Disagree	The new definition of BES Cyber System creates confusion over what technologies are intended to be in- scope. The core changes significantly changes how a responsible entity (RE) establishes and secures remote access to these systems. The REs will develop their own unique determination on how to deal with this situation. Which is likely not going to deliver the intended result the Standards drafters are looking for industry-wide? As this relates to R22 - firewalls, our CIP defined access points, are defined as part of a given BES Cyber System. One likely scenario is that we will define a separate BES Cyber System that manages these firewalls that might include a client PC, a firewall manager, and some network infrastructure components. The remote access rules and even the other general protections of these cyber components to manage this type of communication become very ambiguous.Retain the existing ESP concept versus adopting the BES Cyber system concept and make some of the other operational improvements this draft makes.While the criteria themselves are not onerous for the long term/future development of the systems, the current BES technology in place or available, will require technical feasibility exceptions as not all systems within the BES can support all criteria listed.
33.36	Bonneville Power Administration	Disagree	The objective of this requirement (‘to ensure that no unauthorized access is allowed to its BES Cyber System”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than

#	Organization	Yes or No	Question 33 Comment
			appearing at the end of the Requirement (i.e., the text of the Requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.In addition: Table R14, Section 14.2 is excessive. Given the draft Standard's definition of external connectivity, remote access could also be a case of accessing a system from a nearby system over secured communications paths. An example would be a user on one BES Cyber System accessing another BES Cyber System in the same Control Center. It is not reasonable to justify multi-factor authentication in these circumstances. In addition, many existing systems do not have the capability of enforcing multi-factor authentication. Finally, there are other authentication controls stronger than username/password which are not multifactor: biometric, one time passwords, dial-back, and so forth. Recommendation: Delete the requirement. If not, change the definition of "external connectivity" as discussed in question 13, and change the requirement from "multifactor authentication controls" to "authentication controls stronger than username/password".Section 14.4. There are significant issues with this requirement. - The warning banner is a legal requirement, not a security requirement. Its only purpose is to provide support for legal recourse if someone violates what it says. - No unauthorized person should be accessing High Impact Cyber Systems. Any user with authorized electronic access will have completed security training, which includes proper use of BES Cyber Systems. Any unauthorized user will ignore the banner. - It does not prevent unauthorized access, and therefore does not support the purpose of the requirement. - The requirement has technical feasibility issues. To provide specific scenarios: 1. The user connects from a device controlled by the Responsible Entity, using networks owned by the RE. The user authenticates at the local device. When attempting to connect the the BES Cyber System, the firewall access point allows the traffic, based on the originating point within the trusted network. The user again authenticates at the BES CYber System. At no time does the user authenticate at the access point itself (nor does the rest of Table R14 require authentication at the access point.) In fact, under these circumstances firewalls generally do not have the capability to request authentication or present a banner. 2. The user connects via a

#	Organization	Yes or No	Question 33 Comment
			VPN. The VPN client authenticates the user, then uses a PKI certificate to authenticate to the access point. The user is then granted access to the network and can proceed to authenticate and connect to a BES Cyber System. At no point did the user authenticate to the access point, nor was there an opportunity to present a banner.Recommendation: The best solution is to eliminate the requirement. If the requirement cannot be removed:First, change the definition of remote access and/or external connectivity as discussed above. This would eliminate the requirement to present a banner to users attempting access from equipment belonging to the Responsible Entity. Second, allow the banner to be present at locations other than the access point. A possible revised requirement would be: "Display an "appropriate use banner" to the user that, upon an interactive attempt ..." Also, change "Required" to "Required for external connectivity only".
33.37	Consultant	Disagree	The terminology "wireless and remote access" is redundant. The definition of remote access (near requirement R11) includes wireless access implicitly. Suggest using the defined term "Remote Access" rather the redundant terminology.Table R14 - Item 14.1 It seems illogical to require authentication controls on Low Impact systems when there is no Account Management required for these systems. Suggest deleting the requirement for Low Impact BES Cyber Systems.Items 14.1 & 14.2 - The terminology "is used and/or implemented" seems redundant. It appears that being "implemented" creates the vulnerability, and the requirement for control. Suggest changing the words "is used and/or implemented" to "is implemented".Item 14.3 - This includes two different requirements: (1) Deny access by default & (2) specify explicit access permissions. The first requirement is a technical implementation and should remain here. The second is an account management requirement and should be moved to the account managment requirement R8.
33.38	Minnesota Power	Disagree	These criteria are generally acceptable; however, Minnesota Power requests that the Standards Drafting Team consider defining “authentication controls.”Also in Part 14.2, the requirement regarding the use of multifactor authentication controls sets a technology-specific direction that may not stand over time, including the possibility of

#	Organization	Yes or No	Question 33 Comment
			biometric authentication that, while not multifactor, is a stronger control.
33.39	Dominion Resources Services, Inc.	Disagree	To avoid the potential for TFE's associated with R14.4, a footnote similar to the one used for Table R10 on Page 11 of CIP-011 should be added. Also, access controls related to access points would be better addressed in the Boundary Controls Section of CIP-011.
33.40	Hydro One	Disagree	We don't understand the emphasis on wireless communication and believe that in the present form, it would be very complex to implement. It's our opinion that the protection should remain the same regardless of the type of access point.
33.41	Progress Energy (non-Nuclear)	Disagree	What conditions would dictate different authentication controls for different impact levels? Is it better for them to all be the same?R14.4 is unnecessary. The population of persons granted remote access rights is extremely limited and these people are highly trained and trustworthy. The appropriate use banner is used in situations where a general population was granted this type of access and that is not the case for remote access to any control systems.
33.42	National Grid	Disagree	What types of authentication controls are valid? (Authentication level such as a shared password or a user level control)
33.43	Alberta Electric System Operator	Disagree	Wireless access and remote access should be two separate concepts.
33.44	Network & Security Technologies Inc	Disagree	Wording of 14.4 gives the (doubtless unintended) impression a banner must be displayed on the user screen of electronic access control devices. Re-word to clarify banner must be displayed on the user screen of the accessing device.

34. Table R14 provides direction concerning what impact level of BES Cyber Systems to which Requirement R14 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 R14 has moved to CIP-005-5 R1.

Commenters expressed that the 'deny by default' requirement should also apply to Low impact BES Cyber Systems. In response, the SDT agrees that some network access control should apply to all BES Cyber Systems, including the Low Impact BES Cyber Systems. CIP-005-5 R1 – Electronic Security Perimeter allows considerable flexibility for the entity to determine which security controls to apply, because of the significant number of Low Impact BES Cyber Systems.

Commenters suggested requiring a banner on Medium and Low Impact BES Cyber Systems. However, the SDT disagrees and felt the requirement to have "appropriate use banners" was administrative; therefore, it has been removed.

#	Organization	Yes or No	Question 34 Comment
34.1	CWLP Electric Transmission, Distribution and Operations Department	Agree	As long as TFEs are available for systems that do not support the password requirements.
34.2	Bonneville Power Administration	Agree	But see comments on R14.2, above. In addition, 14.4 is only acceptable if the definitions of remote access and external connectivity are changed, as discussed above. A banner is appropriate for someone accessing a BES Cyber System from completely outside the control of the entity.
34.3	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
34.4	FirstEnergy Corporation	Agree	With the exception of the concerns presented in the previous question.

#	Organization	Yes or No	Question 34 Comment
34.5	Oncor Electric Delivery LLC	Disagree	(R14.2)Multifactor authentication in legacy substation devices is extremely difficult and not needed. Appropriate logging and access controls will eliminate most threats. (R14.4)Appropriate Use Banners are not possible on many legacy dial-up devices used in substations. Appropriate logging and access control will eliminate most threats.
34.6	Southwest Power Pool Regional Entity	Disagree	14.2 and 14.4 should also apply to Medium impact BES Cyber Systems.
34.7	US Army Corps of Engineers, Omaha Distirc	Disagree	14.2 Multifactor authentication will be a major burden for small IT staffs. Standard should offer alternatives to mitigate - stronger passwords and or more frequent password changes.
34.8	WECC	Disagree	14.3 should be required for low impact.Remote access controls should apply to all impact levels.
34.9	Black Hills Corporation	Disagree	14.4 should be “Required” for all. Others are OK.
34.10	ERCOT ISO	Disagree	14.4: Should apply to Medium Impact BES Cyber System.
34.11	Tenaska	Disagree	18.1 all should be each.19.1 Validation of inbound data is more often done on the host application level and not at the boundary or host level.19.2 Is this RTU data? The protection is done at the applications level and I cannot examine data at my perimeter if it is encrypted at the host level.
34.12	Progress Energy (non-Nuclear)	Disagree	Believe it should be required for Low, Medium and High for R14.1, R14.2 and R14.2.
34.13	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
34.14	The Empire District	Disagree	Comments: We believe items 14.3 and 14.4 are going to set the stage for numerous

#	Organization	Yes or No	Question 34 Comment
	Electric Company		TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.15	E.ON U.S.	Disagree	E.ON U.S. believes that the proposed time requirements are not reasonable and require 24x7 support personnel with the privilege to revoke access.
34.16	Entergy	Disagree	Entergy believes some aspects of R11 and R14 are redundant and suggests combining them. We also believe criteria in R14 should apply to high, medium and low risk assets and provide a footnote indicating that where requirements are unable to be met explicitly that the strongest possible controls should be employed alternatively.
34.17	Dominion Resources Services, Inc.	Disagree	High Impact should be removed from 14.1 since it is covered by 14.2.
34.18	GE Energy	Disagree	If user accounts are audited on Medium Impact systems (see question 20), there should be an appropriate use banner.
34.19	LCEC	Disagree	Is this for remote access and wireless network access or does it also apply to wireless communications between BES Cyber System Components?
34.20	US Bureau of Reclamation	Disagree	It would seem that this criteria is in conflict with sound business practices. The concept of allowing access by default to Low Impact BES Cyber Systems does not make sense. Add deny access by default requirement for low systems. Specific access permissions are not required, however.
34.21	MidAmerican Energy Company	Disagree	Items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.Table R14 should be rewritten in a manner that minimizes TFEs. As an example, eliminate the word upon in 14.4 to eliminate TFE for systems that can only display banners immediately after access.

#	Organization	Yes or No	Question 34 Comment
34.22	National Grid	Disagree	National Grid suggests having 14.3 for Low Impact systems as well.
34.23	NextEra Energy Corporate Compliance	Disagree	NextEra believes Medium Impact BES Cyber Systems should have to comply with requirement 14.4. However, the rest of the impact levels are appropriate.
34.24	American Municipal Power	Disagree	Please provide a little or no impact category
34.25	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 11 with Table 12. Table 13, and Table 14. Puget Sound Energy suggests including wording similar to Table 11: “Required for external connectivity only”.
34.26	Garland Power and Light	Disagree	Requirement 14.3 and 14.4 Should add "required" to all impact levels
34.27	USACE HQ	Disagree	Requirements 14.3 should be required for every level of impact.
34.28	San Diego Gas and Electric Co.	Disagree	SDG&E believes that Medium impact assets should also be required to have multifactor authentication controls (within the definition question mentioned in Question 33).
34.29	ISO New England Inc	Disagree	Should apply to all
34.30	ReliabilityFirst Staff	Disagree	Suggest “Required” for Medium Impact in row 14.2.
34.31	Consultant	Disagree	Table R14 - Item 14.1 It seems illogical to require authentication controls on Low Impact systems when there is no Account Management required for these systems. Suggest deleting the requirement for Low Impact BES Cyber Systems.
34.32	Alberta Electric System Operator	Disagree	The AESO suggests adding the following to Table R14: o 14.3 - Required for Low Impact. o 14.4 - Required for Low and Medium Impact.

#	Organization	Yes or No	Question 34 Comment
34.33	Southern California Edison Company	Disagree	The same authentication methods should be applied to all Levels.Also, SCE requests that the drafting team provide justification for the lack of a deny access by default for low impact system.
34.34	Minnesota Power	Disagree	These impact levels are generally acceptable, however to maintain consistency with Table R10, Parts 10.4 and 10.5, the High Impact cell in Part 14.1 should be blank since it is addressed in Part 14.2.
34.35	American Transmission Company	Disagree	We believe items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.36	Florida Municipal Power Agency	Disagree	We believe items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.37	MRO's NERC Standards Review Subcommittee	Disagree	We believe items 14.3 and 14.4 are going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicit access permissions and appropriate use banners.
34.38	Hydro One	Disagree	We don't understand the emphasis on wireless communication and believe that in the present form, it would be very complex to implement. It's our opinion that the protection should remain the same regardless of the type of access point.
34.39	APPA Task Force	Disagree	We propose the following changes to the Impact Levels of R14:R14 Table 14.1: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR14 Table 14.2: Low Impact: N/AMedium Impact: N/AHigh Impact: RequiredR14 Table 14.3: (if this requirement is retained)Low Impact: N/AMedium Impact: N/AHigh Impact: RequiredR14 Table 14.4: (if this requirement is retained)Low Impact: N/AMedium Impact: N/AHigh Impact: Required

35. Requirements R15 to R19 of draft CIP-011-1 concern procedures for system security protection. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R15 to R19? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1 R15 through R19 have moved to CIP-007-5 R1 through R4.

For physical ports and services, several commenters expressed confusion around the term "externally accessible." The SDT agrees, and "externally accessible physical ports" was removed and substituted with physical ports used for "network connectivity, console commands, or removable media."

In addition, for physical ports and services, commenters expressed concern that physical port protection seems unnecessary, since overall physical security and personnel vetting is required, and many devices do not allow for configurable disabling of ports. The SDT agrees the objective of disabling unnecessary physical ports is primarily to prevent accidental propagation of malicious code. In response, the requirement was modified to "restrict" access. A description of acceptable forms of restriction is included in the measures; for example, these could be physically disabling the port or including signage about the use of ports.

For security event monitoring, several commenters stated that there is no need for weekly log review/clarity or manual log review since continuous monitoring is required. The SDT disagrees and references paragraph 528 of the FERC Order 706 that provides context for a weekly log review. The requirement allows for a review to include a sampling or summarization of security event logs.

For security event monitoring, several commenters expressed concern that there is no definition of "cyber security event" (i.e., a normal good logon is a "security event"). The SDT agrees and has modified the requirement to ensure that audit events must be organizationally defined. An enumerated list of events in the Standard is of little value.

For security event monitoring, commenters expressed concern that the requirement can be interpreted to include monitoring and logging for systems that don't support this functionality. The SDT agrees, and in response, this requirement was modified to apply log generation to the BES Cyber System (rather than the component) and allow the entity to define the generated events to audit.

For patch management, commenters expressed concern that not every patch is applicable to a BES Cyber System. The SDT agrees with this observation and notes that this requirement should be covered through the patch evaluation process. The focus of the requirement should be a proactive way of monitoring and addressing known security vulnerabilities in software before those vulnerabilities can be exploited in a malicious manner."

For patch management, commenters expressed concern that flexibility is needed for the installation of patches; these dates can be based on equipment outage schedules, which could change the frequently or grid conditions that may or may not allow patching. The SDT agrees that the date of installation needs to be flexible to take into account equipment outage situations or high risk system conditions that could present an undesirable time for installing patches. Requiring an install date for the patches does nothing to improve BES Cyber System reliability. The overall goal of security patching should be to decrease the latency between security patch release date, application vendor certification date, entity testing, and implementation date. The SDT has revised the patch management requirements to achieve this goal.

For patch management, some commenters posed the question of what starts the clock for patching (release vs. availability vs. OS vendor vs. control system vendor). The SDT agrees there should be a starting point, but requiring an install date for the patches does nothing to improve BES Cyber System reliability. In response, the requirement has been modified so that Responsible Entities are required to create or revise an implementation plan within 30 days of the patch release from the identified source of the patches.

For malicious code prevention, commenters posed the question of whether the standard requires testing against actual malicious code. In response, the SDT disagrees and feels the intent was strictly focused on insuring that the update does not negatively impact the BES Cyber System before those updates are placed into production.. This has been clarified in the guidance for the standards.

For malicious code prevention, commenters expressed there is still nothing specifying that malicious code prevention does not apply to field or network equipment. The SDT agrees, and in response, the requirement was modified to include malware prevention processes. It is now much more a “what” and not a “how” level of requirement.

#	Organization	Yes or No	Question 35 Comment
35.1	Dairyland Power Cooperative		15. It is good that this section is not wrongly specific as CIP-007:R4 is. This should allow for solutions that are not specifically signature based. This should allow for a network-based solution rather than individual solutions on each component. BES systems should not be used like typical Internet user systems, and therefore it should not be enforced that Internet user solutions be applied.16.2 requires a fixed implementation schedule of patches. However there should be an allowance that not every little security patch needs application, and it should be acceptable to defer insignificant patches until a later date when a significant patch needs to be applied. Additional controls to compensate may not be needed other than the security already designed to isolate a BES cyber system.17.1 Focusing on documenting the process to

#	Organization	Yes or No	Question 35 Comment
			harden seems wrong-the focus should be on requiring/verifying that a system is hardened. 19.1/19.2 How is validating inbound data (19.1) different than determining if inbound data has been compromised (19.2)? Was the intent of 19.1 to validate/authenticate the remote host/application on inbound connection? There should be requirements to restrict inbound connections from known remotes only. Validation of data should be defined. Perhaps inbound need definition too. Is it inbound initiated connection vs. data transferred inbound regardless of initiation direction?
35.2	National Rural Electric Cooperative Association (NRECA)		In R17.1, what specifically is the mitigation plan required to address/accomplish? Please ensure this requirement is clarified to explain this better.
35.3	Progress Energy (non-Nuclear)		R16.2 fixed dates for generating stations that depend on outages for implementing this is impractical as outage dates frequently change. Also, the ambiguity from v1-v3 (resulting in so many TFEs) remains here and still needs to be addressed.R17.2 - do not understand the externally accessible port requirement, there are no externally accessible physical ports outside of the six-walled boundaries, requirement not needed.CIP-011 R15 - Require detecting and responding to introduction of malicious for Medium Impact Cyber Systems which could be an electronic relay, what if there isn't a commercial solution for installing malware detection for relays or any other electronic device that runs with only proprietary closed firmware? Would it be impractical to require this only for devices that run a general purpose programmable commercially available operating system such as Microsoft Windows Operating System variants/UNIX and LINUX variants/SUN SOLARIS variants/Apple OS variants, etc --- or Is there going to be TFE process for these such as for switches, etc.?We like that this requirement does not require the use of traditional virus protection software.CIP-011 R18.3 - Requirement to keep logs of system events for 1 year for each high impact device could be massive in terms of storage and archive and may not be technically feasible for electronic relays.CIP-011 - R19 table - Need additional clarification as to what data validation methods (data integrity checking) are to be

#	Organization	Yes or No	Question 35 Comment
			employed. Can this be satisfied solely by employing Secure FTP or Secure ICCP for all inbound data?Calibration ports on programmable relays must remain open for calibration but this requirement would require rendering them unusable. We want to ensure this use is interpreted as “normal” operations.CIP-011-1 R15.3 (System Security) - The statement ‘Implement processes to test and update malicious code protections’ should be clarified to specify that in no case should malicious code be purposefully exposed to operational BES Cyber Systems as a part of this testing.CIP-011-1 R16.2 (Security Patch Management) - Requiring a ‘fixed date for either installation of the applicable patches or completion of mitigating measures that address the vulnerability’ is too inflexible in a real world where such activities may need to be accomplished during the next plant outage.CIP-011-1 R19 (Communications and Data Integrity) - This sounds like a ‘best practices’ type of requirement, but depending on how BES Cyber Systems are defined, this could require redesign/implementation of front-end processors on all inbound traffic to all Control Center BES Cyber Systems. Such a requirement cannot be quickly implemented without significant potential impact on the BES. We would like to suggest that this be listed as a requirement for any new BES Cyber System implemented at a Control Center.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: “Implement and document one or more security processes for security monitoring that issue alerts for detected system events related to cyber security.”
35.4	FEUS	Agree	Agree with Comments: The drafting team should consider revising the wording of 17.1 from ‘implement a mitigation plan’ to ‘implement mitigating measures’ to reduce confusion with mitigation plans submitted to correct a violation.
35.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.R15.This is very poorly worded, and too open to interpretation on a number of areas.15.1 - how do you audit this item? FMPA suggests: “Document and implement procedures implemented to limit the

#	Organization	Yes or No	Question 35 Comment
			propagation of malicious code."15.3 - This could be interpreted to read that you need a full-scale development environment/copy of your production system to introduce malware to and guage the responsiveness of the mitigation techniques you put in place. If the intent of the standards is to protect the BES, by testing malicious code on systems that's not helping anyone. Time should be spent making sure it doesn't happen, not testing to see what happens when you introduce it. FMPA suggests "Review logs of malware detection systems within the following time periods: 30 calendar days for medium impact, 7 calendar days for high impact."R16.FMPA agrees with the intent of this standard; however there are some underlying issues that should be addressed before the standard is implemented. One such example might be a requirement to change out hardware to meet a new patch released by a vendor; before equipment is purchased it has to be tested - in some cases equipment shortages may make it impossible to comply with the 30-day requirement.R17.17.1 - How does "external connectivity" apply to network ports being shut down? Does that mean for devices that route data to other external networks?17.2 - What does "externally accessible physical ports" mean? Does this refer to ports that are connected via Ethernet cable to an area outside of the protected area? If so, the standard should explicitly say this.R18.18.1 - Requiring components that do not have logging capabilities to be monitored could be a real problem. While there are a number of technical ways to accomplish logging of systems, there is no clarity in the standard as to what is and is not acceptable levels of logging on a device - this needs to be better defined. FMPA suggests "Implement automated tools or organizational processes to monitor and log all available system events that are related to cyber security for all BES Cyber System components." This would give more flexibility in collecting data from other centralized devices (such as SCADA systems) and limit the data collection to what is available.18.2 - what is the definition of "Cyber Security"? How does one know what does or doesn't relate if there is no defining criteria?18.3 - what is the definition of "Cyber Security"? How does one know what does or doesn't relate if there is no defining criteria?18.4- what is the definition of "Cyber Security"? How does one know what does or doesn't relate if there is no defining

#	Organization	Yes or No	Question 35 Comment
			criteria?R19.This is a very difficult implementation. As a general comment, if the intent is to protect the BES, perhaps more effort spent on ensuring that no unauthorized machine can communicate with BES components is a better place to spend effort.
35.6	Emerson Process Management	Agree	For R16, keeping cyber systems current so that they can be supported with security patches is very essential in maintaining system security. This should be a requirement under R16 and provide a TFE opportunity if this can not be met immediately, but with a auditable mediation plan.
35.7	SCE&G	Agree	How does the SDT intend to account for equipment incapable of supporting certain requirement (e.g. malicious code)? Will the TFE process be utilized. If so, it would be helpful for entities to see where the SDT envisions initially allowing for TFEs.
35.8	Southern California Edison Company	Agree	SCE requests guidance on whether the list of requirements apply to each component or if they only apply at a system level. For instance, can testing and malicious code protection in R15.3 be performed at a system level or should each component demonstrate this capability?A separate standard with highly prescriptive methods to document situations where it is not technically possible to implement a certain control, controlled and auditable documentation of mitigation plans will enable registered entities to record instances of non-conformity.A prime example would be that R 17.1 may be impossible to implement because of the technical design for a particular device. While the standard allows or a mitigation plan, the draft does not indicate whether or not the lack of such capability is a case of strict compliance.
35.9	Nebraska Public Power District	Agree	Security protection for cyber components that cannot connect to an external network do not require the same level of protection as those cyber components with connectivity to an external network. I recommend adding an exclusion to R16 and R18 for cyber components that cannot be connected to an external network.
35.10	USACE - Omaha Anchor	Agree	This is a less strenuous requirement than previous version of CIP. Previously every

#	Organization	Yes or No	Question 35 Comment
			item in the ESP had to comply - requirement states every system must comply - implying not every item must comply as long as the system does.
35.11	Xcel Energy	Agree	While we agree overall, we do have some suggestions/requests for clarification1. R15 to R19 should allow for TFEs2. R18.4/R20.6 We do not agree with a need to review logs every 7 days.3. R19.1 Further definition is needed of the expectation to "Validate data". Our concern is if were to include RTU data that can not be validated. A TFE allowance may be needed in this case.
35.12	Independent Electricity System Operator	Disagree	- R15.1 define malicious code. For R15 and sub requirements, does malicious code mean AV or Spyware detection/prevention or does Malicious code require a code review when deploying code and patches to systems?- - R16.2 does not require that the mitigatio
35.13	National Grid	Disagree	1. Inconsistency in using "processes" versus "one or more processes" in all requirements. National Grid suggests using "one or more processes". 2. Recommend new wording for 15.2 similar to 26.2 -Respond to the detection of malicious code.3. Recommend new wording for 15.3 - Implement processes to test and update protections in place to respond to the detection of malicious code.4. Recommend using the controls for Low Impact BES CS too since once the code is propagated it spreads across network irrespective of low/medium/high BES CS.5. Recommend changing 16.1 from "release" to "availability". 6. Recommend removing "with a fixed date" from 16.2 because the cyber system may not be available for maintenance due to grid system conditions.7. Request a R17 local definition of "attack surface".8. 17.2 - recommend changing "externally accessible physical ports" to "externally accessible physical communication ports". Also please clarify external to what.9. Request a local definition of "security events".10. In 18.2, is the SDT considering providing the timeline for issuing alerts and also to respond to those alerts? 11. Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber Systems.12. Recommend that 18.4 be re-worded to be consistent with FERC Order P526 - "Some manual review of logs to improve automated detection settings, even if

#	Organization	Yes or No	Question 35 Comment
			alerts are employed on the logs."13. Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days since 18.2 continuous monitoring satisfies the NOPR directive of seven days.14. Recommend that R19 should "insure the integrity of the data."15. Recommend that 19.1 should be "Entity should document process to insure the integrity of the data link between the BES Cyber System and the remote node." This new 19.1 should be "Required" for High Impact and Medium Impact BES Cyber Systems.16. Recommend that 19.2 should be "Where links cannot be secured, the Entity shall document the mitigation in use." This new 19.2 should be "Required" for High Impact and Medium Impact BES Cyber Systems.
35.14	Southwest Power Pool Regional Entity	Disagree	15.1: The criteria should "limit the introduction and propagation of malicious code." 15.3 should require such testing prior to implementation rather than assuming. The objective statements in R16 and R18 are prescribing a requirement through the use of the statement "to ensure." 16.1: Clarify who is "releasing" the security patch. For example, is it being released by the operating system vendor (e.g., Microsoft) or the third-party application vendor (e.g., the EMS/SCADA vendor) subsequently certifying the patch against the supported application? 16.2: Clarify that compensating measures must be implemented within a prescribed timeframe after determining a security patch to be applicable unless the patch is installed within that prescribed timeframe. If compensating measures are implemented as an interim measure, they must remain in place until the security patch is installed with the understanding that the compensating measures can be improved during the interim period. 17.1: The term "mitigation plan" has an enforcement connotation. Consider requiring the documentation and implementation of compensating measures instead. 17 overall: there are a number of additional system hardening techniques other than disabling logical and physical ports. Additional hardening should be required for High impact systems. See the baseline configurations found on the Center for Internet Security web site for additional information. 18.2: This requirement presumes 100 percent availability of the monitoring process, which is unreasonable for automated solutions. Additionally, prescribe a timeframe for issuing alerts for detected system events.

#	Organization	Yes or No	Question 35 Comment
			18.3: Consider rewording the criteria to read “Maintain logs of system events related to cyber security for the specified time period.” 18.4: The requirement to maintain records documenting the review of logs is a compliance evidence issue and should not be included in the requirement. 19.1: Questionable if this is an auditable requirement. Clarify what is intended by inbound data validation? 19.2: Encrypted data does not mean uncompromised / valid data. Is this requirement essentially the same as 19.1? Is this asking for the validation process to be external to the normal validation processes included in the application software running on the BES Cyber System? Is this an indirect requirement to implement “Secure ICCP?”
35.15	Regulatory Compliance	Disagree	15.3 - STRIKE "testing" from the criteria. There is very little bennefit to test signature. 16.1a - Need clarification on components not patchable.16.b for those devices that are patchable - assessment of patches within 30 days.16.2 - Clarification - assess whwther vulnerabilities exist for a device.17.2 - need definition of external connectivity - more guidance on physical switch ports18.4 - propose 30 days for 30 days for manual review of automated systems - it is redundantR19 - wait and see - need guidance
35.16	LADWP	Disagree	15.3 states to test and update malicious code protections. Testing the code protections should be removed.
35.17	Network & Security Technologies Inc	Disagree	16.1 - Please clarify meaning of “release” of security patches by specifying patch source (the corporation, organization, or individual that wrote it?). This matters because some application vendors combine O/S patches in “bundles” they release to customers with service contracts.17.2 - Given the restrictions on physical access and the requirements to train and background check personnel with unescorted physical access to BES Cyber Systems, this requirement seems unnecessary. Moreover, on any given day it may be very difficult to predict whether a given physical port might be of use in an emergency troubleshooting or restoration situation. Could be contentious during audits.R18 - Does the SDT intend that Responsible Entities be able to, if necessary, determine what user(s) was on what system and when? If so, this

#	Organization	Yes or No	Question 35 Comment
			requirement should be made explicit.19.1 - Please clarify types of “inbound” data this requirement applies to. Operational data only? Mirrored backup data received at a backup Control Center from a primary Control Center? An emergency “hot fix” from a SCADA/EMS vendor? Meaning of “validate” also needs to be clarified. SDT has solicited input on which proposed requirements should be “eligible” for TFEs - surely this is one. Depending on the intent of this requirement, “data validation” may be something that can only be done in a useful/meaningful way by application logic.19.2 - We consider this to be an unenforceable requirement and therefore suggest it be dropped unless compelling evidence exists that replay and/or MITM attacks are a real and growing problem. Investigating a single occurrence of invalid data could consume scores of person-hours, lengthy interactions with communication providers, other Responsible Entities (e.g., for a BA that operates a Control Center that receives all its data feeds from other companies), and even law enforcement with no guarantee of success. Cryptographic protection of in-transit data, even if achievable (probably not unless a Responsible Entity owns and/or controls both ends of the data feed), offers no protection against corruption of data at the source and could also cause latency issues.
35.18	ERCOT ISO	Disagree	16.1: Clarify “release” from whom--the product vendor (e.g., Microsoft) or other vendor that prohibits installation of a patch until certified with their applications?17.1: Compensating measures should be allowed in instances where a mitigation plan to achieve strict compliance is not possible. 18.2: Specify the timing for responding to alerts. 18.3: Should be removed to data retention section. 18.4: Should address the use of automated security event monitoring systems. TFEs should be allowed for R16. TFEs should be allowed for R17.TFEs should be allowed for R18.TFEs should be allowed for R19.
35.19	MidAmerican Energy Company	Disagree	16.2 - Define when the implementation schedule needs to be completed by and define how far in the future the installation can be scheduled. For example a patch is assessed within 30 days; the currently wording would allow me to develop an implementation schedule a year later and the schedule could call for the installation

#	Organization	Yes or No	Question 35 Comment
			to take place three years later. 17.2 Change to “Disable, render unusable or configure such that it has no access to a BES System” This would allow us to put ports into logical VLANS that do not have access to the BES Systems.19.1 What does “validate data” mean? This sounds like in would need to be an application level control. Is that what is intended?
35.20	PacifiCorp	Disagree	16.2 - Define when the implementation schedule needs to be completed by and define how far in the future the installation can be scheduled. For example a patch is assessed within 30 days; the currently wording would allow me to develop an implementation schedule a year later and the schedule could call for the installation to take place three years later. 17.2 Change to “Disable, render unusable or configure such that it has no access to a BES System” This would allow us to put ports into logical VLANS that do not have access to the BES Systems.19.1 What does “validate data” mean? This sounds like in would need to be an application level control. Is that what is intended?
35.21	ReliabilityFirst Staff	Disagree	16.2 - need a time frame (60 days), for row 17.1 does there need to be a time frame for implementation of a mitigation plan?
35.22	Luminant	Disagree	17.1 implement a mitigation plan or compensitory measures
35.23	Progress Energy - Nuclear Generation	Disagree	Agree with Table 15, R16.2, Table 17, 18.1 AND 18.2. R15-R19 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments. Durations for R16.1, R18.3, and R18.4 should align with comments in Attachment 1.
35.24	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.15.3 should include more clarification on what "testing" entails and whether that just refers to signature updates.Recommend replacement of the word "known" with "discovered" in R18. 18.4: more clarity

#	Organization	Yes or No	Question 35 Comment
			needed regarding the allowance of both automated and manual review of logs. R19 creates a potentially impossible level of obligation. Recommend striking.
35.25	American Transmission Company	Disagree	As written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings, requiring an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We believe this item should be deleted.As written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously.
35.26	MRO's NERC Standards Review Subcommittee	Disagree	As written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings, requiring an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We believe this item should be deleted.As written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously.
35.27	Western Area Power Administration	Disagree	Assuming one can detect and respond to the introduction of malicious code, how is it expected that we limit propagation of malicious code? By definition, malicious code is often not detected, and if it is detected (by virus prevention software, for instance), that software generally quarantines or deleted the malicious code automatically. This section seems to need a little thought as to what is really being required. This opens up technical interpretation of what "limits" malcode. This also assumes only a specific

#	Organization	Yes or No	Question 35 Comment
			vector (rootkit, malware, virus/worm) but doesn't address Denial of Service attacks which could be much more serious. Maybe they need to specify intent. R16: A plan for every patch as opposed to relying on the change control process? This seems excessive.R17: Seems to be an improvement. For 17.2, does this mean plug up physical ports like USB? This is unclear. If it does, cannot rely on physical perimeter for protection?R19: Since this applies only to external connectivity (ICCP connections or equivalent), how is it intended that we validate the actual data coming into the system? What level of validation? Ex: end-point validation (ipsec and certs) vs application endpoint (ssl), the way this is worded it goes WAY beyond this. This is not a communications validation issue. Are they wanting to get to MITM attacks? If so it isn't clear.
35.28	E.ON U.S.	Disagree	CIP-011, R15.1 Limiting propagation of malicious code is an integral part of any standard A/V protection. If this requirement is calling for something more than this then the requirement should be clarified to remove this ambiguity. If it is one and the same as R15.2, then E ON U.S. suggests combining these two sub-requirements.CIP-011, R17.2 The term "...externally accessible physical ports" is ambiguous. Does this refer any externally-facing port through which a party may attempt to gain unauthorized electronic access to a BES Cyber System Component? Or, does this refer to an externally-facing port directly on the BES CSC itself?CIP-011, R18.3 The requirement to maintain logs for one year is a significant burden. This can be a tremendous amount of data depending on the level of logging enabled.CIP-011, R18.4The expectations regarding review of logs should be more clearly defined. The whole point in having "continuous security monitoring for detected system events" is to avoid the extremely burdensome requirement of manually sifting through tremendous volumes of log data. Though some mechanism should be in place to ensure the automated logging and alert systems are not disabled, the requirement to manually review system logs is excessive and provides little if any security enhancement.CIP-011, R19.1The expectations for validation of data inbound to a BES Cyber System should be more clearly defined. How is this reasonable to be accomplished? Parameter checking is already a common mechanism within most

#	Organization	Yes or No	Question 35 Comment
			SCADA / DCS systems, but this does not protect against tampering or data manipulation within the prescribed bounds for a given data point.CIP-011, R19.2 Same comment as for R19.1...how is this to be accomplished?
35.29	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
35.30	The Empire District Electric Company	Disagree	Comments: As written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings, requiring an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We believe this item should be deleted.As written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously.
35.31	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy has the following concerns with requirements R15 - R19:R15 - A TFE may be required for programmable electronic devices within a substation environment where is not technically feasible to manage malicious code.R16.1 - The definition of a “release” needs to allow for vendor verification of the applicability of a patch to a given systems functionality before the thirty day clock begins.R17.2 - CenterPoint Energy recommends clarification as to what are considered "externally accessible physical ports" R18 - the phrase "related to cyber security" is ambiguous. R18.2 -implementing "continuous security monitoring that issue alerts for detected system events related to cyber security" would seem to require installation of external communications to remote substations increasing their vulnerability. R18.4 - A manual review every 7 calendar days is overly burdensome. Automated processes are already mandated to detect and alert personnel of cyber security events. CenterPoint Energy recommends a 30 day review.R19.1 - Concerned

#	Organization	Yes or No	Question 35 Comment
			with the method to "validate data inbound to a BES Cyber System". This requirement is intended to address data integrity issues associated with man-in-the-middle attacks, but it does not specifically address the issue. It leaves open the issue of data which was intentionally or unintentionally manipulated by responsible entities. The issue becomes something different if our Control Center must validate data from a Reliability Coordinator or Transmission Operator which has been intentionally or unintentionally modified by trusted personnel. Data integrity implies encryption. This requirement should state: “One or more of the following encryption standards are required to ensure data integrity inbound to the Control Center.R19.2 - Concerned with ability to provide evidence that we "evaluate invalid data inbound to a BES Cyber System" to determine whether the data has been compromised maliciously with current systems capability. As stated previously, this requirement does not address the issue of malicious entities entering malicious data from the endpoints. This requirement is an attempt to address issues associated with MITM attacks. Inherent in the various SCADA protocols is error detection and data delivery, but not data integrity. The ICCP protocol is encapsulated within TCP/IP. The TCP/IP protocol will ensure communication reliability and error detection, but it will not ensure data integrity.
35.32	Entergy	Disagree	Entergy suggests making requirements in general apply to high, medium, and low assets alike and provide a footnote to allow a TFE for assets which are not capable of meeting the requirements. 17.1 suggests that unused network ports only have to be disabled in the event there is external connectivity. This requirement appears to be extremely relaxed from version 1. The current language suggests that the perimeter firewall can be used to control port usage thus relieving the requirement to control at the asset itself. In 17.2 there is a reference to externally accessible physical network ports. Entergy suggests language change to just say “unused physical network ports.” In 18.2 there is a time requirement of maintaining logs for 1 year for high and 90 days for medium. Maintaining logs for 1 year can be problematic due to the amount of space required. Suggest making requirement for 90 days for high, medium and adding the same requirement for low assets. Also suggest adding a footnote to allow TFE for

#	Organization	Yes or No	Question 35 Comment
			assets that are unable to meet requirements. In R19 it appears the requirement is to encrypt all data coming into a BES Cyber System. The intent is to ensure data integrity. Most EMS systems have CRC checks, and reasonability checks, etc., embedded in the systems to validate the integrity of the data being received. Entergy does not believe that encryption is required for all digital data as it greatly increases overhead, operation and troubleshooting of the data networks. Entergy suggests that encryption should be required for remote access as remote access connectivity many times traverses the Internet or some non-private network links at some point. Entergy suggests providing alternate methods to validate inbound data rather than encryption.
35.33	Southern Company	Disagree	For 17.2, what does this mean? An externally accessible physical port would require a switch next to an open window or something.R15.3 requires testing of malicious code protections. This is an effort better left for malware protection suppliers. Often only the production system is available to the end user, the quantity and frequency of malware release prohibit an effective end user test program.R16.1 requires assessment of security patches within 30 days of release. This assessment is typically performed by control system supplier to assure that no adverse impact occurs to their product. Often only the production system is available to the end user. The end user has no control over vendor testing schedules. If this requirement is placed on the end user MS KB977165 type “blue screen” events may occur.R16.2 The requirement of a fixed date for patch installation may not be possible in all cases if a system restart is required for an operating unit.For R15 & R16, there is the potential that implementing malicious code detection and security patch management on substation devices could interfere with the primary function of these substation devices which is the reliable delivery of power.For R17.2, what will be considered acceptable for rendering physical ports unusable? We should not be required to permanently disable ports thereby making the ports unavailable for future use.For R18, not all BES Cyber System components in substations are capable of monitoring and logging system events.For R18, implementing security monitoring processes on substation devices may interfere with the primary function of these substations devices which is the reliable delivery of

#	Organization	Yes or No	Question 35 Comment
			power.R18.2 Clarify intention, is continuous monitoring with manual review of logged alerts acceptable? What is a "detected system event"? Is a single or double incorrect password attempt an alarmed event?R18.1 requires an automated log system R18.4 requires a review of log events. Is a manual review of all logs required in an automated system or just the alarms?
35.34	Detroit Edison	Disagree	In 15.2, "respond" is vague. Propose rephrase to read "Detect the introduction and mitigate the effects of malicious code."Remove table entry 19.1 since it is redundant to 19.2.The term "applicability" in 16.1 is vague. Consider introducing vulnerability severity classifications to patch management that determines the action and timetable required. Please note that this is submitted for consideration as a concept. The language and time tables will need further review and editing before this would be ready to add to the standard. o Level 4 - Intruders can easily gain control of a BES Cyber System Component, which can lead to the compromise of BES Cyber System security. For example, vulnerabilities at this level may include full read and write access to files, remote execution of commands, and the introduction of backdoors. High: patch within 7 days; Medium: patch within 14 days; Low: patch within 30 days. o Level 3 - Intruders can possibly gain control of a BES Cyber System Component, or there may be potential leakage of highly sensitive information. For example, vulnerabilities at this level may include full read access to files, potential backdoors, or a listing of all the users on the host. High: patch within 14 days; Medium: patch within 30 days; Low: patch within 90 days. o Level 2 - Intruders may be able to gain access to specific information stored on a BES Cyber System Component, including security settings. For example, vulnerabilities at this level may include partial disclosure of file contents, access to certain files, directory browsing, disclosure of filtering rules and security mechanisms, and unauthorized use of services. High: patch within 30 days; Medium: patch within 60 days; Low: patch during next system maintenance window. o Level 1 - Intruders may be able to collect sensitive information from a BES Cyber System Component, such as the precise version of software installed, open ports, services, etc. High: during next system maintenance window; Medium: during next

#	Organization	Yes or No	Question 35 Comment
			system maintenance window; Low: Patch during next system maintenance window.
35.35	RRI Energy	Disagree	In regards to 17.1, for clarification purposes, based on the definition of external connectivity written in the Standard, if a web server is actively listened on port 80 inside the BES boundary protection but is not accessible externally from the outside of the BES boundary protection, the Responsible Entity does not have to report and assess that port and service.In R17.2, what does externally accessible mean? Ex. Physical port is on a device that is in a cabinet, the cabinet is within a building, and the building is within a fence-lined property. Is the port non-accessible? What type of physical ports are we trying to protect? Is it only physical "network" ports? How about USB ports, PC (PCMCIA) Card slots, CD/DVD drives?Not all devices can be logged such as PLC's, meters, etc.; therefore 18.1 should allow for a TFE.In regards to R19, what defines an internal versus external boundary. Within a single facility, are all boundaries internal? If cables transverse hallways between "computer rooms" within a Control Center does an external connection exist? Can a back-up control center be an extension of a primary control center where all data connections between the control centers are considered "internal"?
35.36	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
35.37	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R16, but recommends changes as follows: o Regarding Part 16.2, this requirement contains no timeframe by which this schedule must be developed. If it was intended that the development of this schedule is to coincide with the activity described in Part 16.1, then that should be explicitly stated. Also, there is no limitation regarding how far in the future is reasonable to set the "fixed date." Minnesota Power recommends that if a timeframe for the "fixed date" is not established in the Standard then there should be a stipulation that if the date for installation of the patch is greater than a pre-determined amount (say 45 days), then mitigating measures need to be in place until the security patch is implemented.Minnesota Power generally agrees with the

#	Organization	Yes or No	Question 35 Comment
			proposed Requirements R17, but recommends changes as follows: o Regarding Part 17.1, the first sentence creates some confusion. Minnesota Power recommends that it be reworded as follows: “One or more processes to ensure that for each BES Cyber System Component, only those network accessible ports and services that are required for normal and emergency operations are enabled.” o For Part 17.2, is it the Standards Drafting Teams intent that a CD or DVD drive be considered an “externally accessible physical port?” If so, this should be explicitly defined. Logically, mounting a DVD is no different than plugging a memory stick into a USB port.Minnesota Power generally agrees with the proposed Requirements R18, but recommends changes as follows: o If it is the Standards Drafting Teams intent that Requirement R18 apply only to cyber security events, then Minnesota Power recommends that the term “security events,” which is used throughout this requirement, is reworded to state “cyber security events.” o Regarding Part 18.1, the Standards Drafting Team should consider clarifying the timeframe within which the monitoring of system events should occur (i.e., real-time, minutes, hours, days, etc.). If monitoring is done using a manual process, rather than an automated tool, real-time may not be possible, and guidelines should be established regarding how quickly events must be examined. o Is it the Standards Drafting Teams intent that Part 18.1 address the collection of security events into logs and Part 18.2 address the process to review and act upon the logs collected under Part 18.1? If so, the Standards Drafting Team should consider wording that would clarify the differences between these two Parts. o In Part 18.2, does the term “continuous” refer to “real-time?” If so, Minnesota Power recommends changing the term to real-time to avoid confusion. o Minnesota Power recommends rewording Part 18.3 as follows: "Retain logs of system events related to cyber security for the specified time period." o Minnesota Power recommends communicating all time frames in calendar days to eliminate confusion regarding what constitutes “1 year.” o Regarding Part 18.4, if 18.2 provides for “continuous” monitoring of system events for these same systems, why is it also required that a Registered Entity manually review these logs? In addition, can the Standards Drafting Team provide guidance regarding what should be included in this review? On an SEIM, for instance,

#	Organization	Yes or No	Question 35 Comment
			these logs can be enormous - to the point that manual review is not possible within reasonable time constraints.Minnesota Power generally agrees with the proposed Requirements R19, but recommends changes as follows: o Regarding Part 19.1, How, in real-time operation, can external data be validated (protocols already validate message structure)? For example, an LBA receives unit set-points from its ISO-BA via ICCP. If the data being received is within operating limits for that unit, it is "valid." The ISO may truly be requesting the unit to drop by xx MW. How is that differentiated from someone altering an inbound message to maliciously tell a unit to drop by the same xx MW value? The process for echoing values back to the external system does not solve this, since this, too, can be manipulated. o Part 19.2 appears to be a specific instance of Part 19.1 and given that this Part starts with the phrase "Where not cryptographically protected," it seems that Part 19.1 may be misstated. Is Part 19.1 supposed to discuss "protecting" inbound data, rather than "validating" it, via encryption, authentication, etc.? Also, in Part 19.2, what constitutes "invalid" data? Is this data which is outside of normal operating limits? Or maybe outside of reasonability limits? Again, maliciously inserting perfectly normal or valid data could have detrimental effects to the BES, whereas "invalid data" should, by default, be thrown out by normal processing.
35.38	Idaho Power Company	Disagree	Need to put a limit on how far out the fixed date should occur for implementation or mitigation of security patches. R18 refers to security events but the sub-requirements refer to system events related to cyber security. Need to make this clearer that the focus is on abnormal system events as a normal authorized log-in is a normal security event but not one that needs review or response.
35.39	NextEra Energy Corporate Compliance	Disagree	NextEra believes the current language did not provide clear guidance and is too lax which leaves room for interpretation. The following are the recommended updates for the requirements:15.1 - Implement technical, procedural and/or process controls to limit the impact of code which modifies or destroys data, steal data, allow unauthorized access Exploits or damage a system, and does something that user did not intend to do. o Implement technical controls, where technically feasible, to

#	Organization	Yes or No	Question 35 Comment
			detect and mitigate malicious code o Implement technical and/or procedural controls to limit the propagation of malicious code o Implement technical and/or process and procedural controls to respond to introduction of malicious code15.2 - Malicious code protections should be updated at least on a quarterly basis if applicable updates are available and technically feasible. Updates should be tested prior to implementation to ensure no adverse impact by the software updates.As far as the order of requirements, detection should come first and it should be a requirement by itself. Combined 15.1 and 15.2 and removed 15.3 from the initial version.NextEra believes the implementation of processes incorporating the criteria specified in CIP-011-1 Table R16 - Security Patch Management in order to ensure that security vulnerabilities in BES Cyber Systems are mitigated was not clearly identifiedThe current language did not provide clear guidance and left room for interpretation. The following are the recommended updates for the requirement: 16.1 - The Responsible Entity shall establish a security patch management assessment program to track, evaluate, and test cyber security patches within 30 calendar days of their release to validate their applicability to its BES Cyber Systems.16.2 - The Responsible Entity shall develop an implementation schedule with a fixed date for either installation of the applicable security patches or the completion of mitigating measures that address the vulnerability if application of the security patch is not technically feasible.It should be stated that there needs to be a program to track, evaluate, and test cyber security patches within the defined timeframe that are applicable to the BES Cyber System.It is also recommended that there is more in depth guidance on the implementation schedule.CIP-011-1/R17Did not account for technical feasibility for disabling of ports.The following are the recommended updates to the requirements:17.1 - Implementation of process (es) to ensure that only those network accessible ports and services required for normal and emergency operations are enabled. In cases where unused network accessible ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document and implement compensating measures to mitigate the risk of exposure.If it is not technically feasible, the entity must have documented compensating measures to mitigate the

#	Organization	Yes or No	Question 35 Comment
			risk of exposure. This requirement should be applied to Medium and High BES Cyber Systems.The CIP CIP-011-1 Table R18 - Security Event Monitoring to ensure that security events are known, logged, and responded to on BES Cyber Systems did not provide enough guidance.The current language did not provide clear guidance and left room for interpretation. The following are the recommended updates: 18.1 - Implement automated tools or organizational processes to monitor and log system events that are related to cyber security for all BES Cyber System components, where technical feasible. Instances, that are not technical feasible the Responsible Entity shall implement manual processes to mitigate risk exposure.18.2 - Implement and document security processes for continuous (24/7 365 days, except when conducting system maintenance of the monitoring devices) security monitoring that issue alerts for detected system events related to cyber security.18.3 - Maintain system logs of system events where technical feasible, related to cyber security within the specified time period. If not technically feasible, the Responsible Entity shall document and implement manual processes to mitigate risk exposure.18.4 - The Responsible Entity shall verify that the log and alerting system is working in the time intervals mentioned. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs within 90 daysAdded language provides more definition.The CIP-011-1 Table R19 - Communications and Data Integrity to protect the real-time operation of the BES from the use of maliciously modified data by BES Cyber Systems did not provide enough guidance.The current language did not provide clear guidance and left room for interpretation. The following are the recommended updates:19.1 - Validate data inbound in the Control Center for specific connections and verify if those are the correct connections. 19.2 - Where not cryptographically protected, develop and implement a process to evaluate invalid data inbound to the BES Cyber System in a Control center to determine whether the data has been compromised. All unauthorized access attempts to a control center must be identified and investigated.Added language provides more definition.Also, In 15.1, please clarify the term "limit propagation". How would a Responsibility Entitity demonstrate the compliance to 15.1? Is a documented

#	Organization	Yes or No	Question 35 Comment
			technical or procedural control to limit the propagartion of malicious code sufficient? Furthermore, NextEra asks that examples be provided on how to meet this requirement at BES Transmission Facilities where all BES Cyber System Components are not capable of running anti-virus software.In 16.1, is the assessment necessary when regular patch cycle or planned installation is under 30 calendar days?In 16.2, what is a reasonable "implementation schedule with a fixed date for either installation of the applicable security patches or completion of mitigating measures that address the vulnerability"In 16.2, is an implementation schedule necessary when regular patch cycle or planned installation is under 30 calendar days?In 16.2, if the "installation of the applicable security patches" would cause a risk on the availability and performance of BES Cyber System, is it sufficient to complete the mitigation measures that address the vulnerability? If so, we propose that the language of 16.2 be modified to have this as an option in lieu of the installation of the applicable security patchesIn 17.1, does this apply only to BES Cyber System Components that are accessible from the outside? If yes, does this apply only to the ports that are externally connected or for all ports if the BES Cyber system Component has external connectivity?In 18.4, please clarify the term "review logs of system events" -- how will compliance be demonstrated?In 19.1, how do we validate data inbound to a BES Cyber System in a Control Center? Please provide methods that could be employed by the Responsible Entity. Could 19.1 and 19.2 be simplifeid by jjust requiring cryptographic protection for High Impact BES Cyber System in a Control Center?Regarding R-18, the log review of assets is too short. (i.e. 30 / 7 days). With this constraint, there will be limited knowledgeable personnel available for review. Some systems do not provide data to allow for this type of analysis. Need support from external vendors, which may not be feasible on a weekly / monthly basis. Due to volume in the industry, it is anticipated that vendor resources will be limited to support us in this capacity. NextEra suggests at least quarterly for Medium / High.18.1 states logging events "related to cyber security". This is subject to broad interpretation and should be clarified. NextEra suggest providing specific examples, such as: Abnormal System Shutdown Account Lockouts Admin User Account Changes

#	Organization	Yes or No	Question 35 Comment
			All Domain Account Logon Failures All Group Account Changes All User Account Changes All Policy Changes Domain Admin Acct Logon Failures Domain Admins-Admin Group Acct ChgDomain Admins-Admin Group ChgDomain Trust Rel Policy ChangesEvent Log FullLogon Logoff SummaryNormal System Startup-ShutdownPassword Changes and ResetsSecurity Log ResetsSrv Wkst All Logon FailuresTerm Srv All Logon Logoff SuccessesTerm Srv All Session Discon-ReconUser Account Creation or DeletionUser Account Password ChangesUser Rights Policy Changes18.2 uses the term "issue alerts" which could imply alarming or otherwise performing a notification. If NextEra had to raise an alert for every system event we could potentially have a continuous alarm stream. If it is determined that event alarms are necessary, then the events have to be further defined and our systems have to be specifically tuned on site for the real running environment.NextEra recommends defining the term further to either include explicit alarm/notification or not. Would also push further for alert in the form of logging to be reviewed or alarmed for review.19.1 states validate data inbound to a control center. Data should be further classified as data directly related to real-time BES operation. If a Monitoring and Diagnostics Center is classified a control center they would potentially have to perform data validation on all historical data made available to that center, depending on interpretation. An alternative is to further classify or define "validate" to allow validation simply by verification of traffic from a reliable source, i.e. identifying the source historical data server.NextEra proposes considering validation of the originating source rather than validating the data itself.
35.40	Con Edison of New York	Disagree	o R16.2 requires a “fixed date” for apply security patches or mitigation. This requirement does not take into consideration that entities may require vendors to test the patches on their systems before they will be applied to operational systems. The release dates for these patches is not fixed by the vendor. The requirement should allow for the planned install date to be a fixed period after the patch is tested and available to the user. A fixed date may be a challenge when predicated on manufacturer certification which may introduce unnecessary risks to operations. o R17.1 “external connectivity” is expected to mean external to the (ESP) boundary. o

#	Organization	Yes or No	Question 35 Comment
			R17.2 It is not clear what externally accessible physical ports includes. External to the location or external to the device (i.e.: located on the front of the workstations) o R18.2 - need clarification on type of events that need continuous monitoring; security logs can be voluminous with excessive informational notifications o R18.4 - if automated tools are used this should not be required o R19 - need more info on ensuring data integrity. What does "external" mean? Does this require special checks of RTU inbound data? Unclear what will be considered validation. Is Encryption validation? If the RTU data is not encrypted is the EMS validation of data sufficient? If the systems (especially legacy equipment) do not support integrity checks the addition or development may not be possible or recommended. Will this require a TFE?
35.41	Puget Sound Energy	Disagree	Puget Sound Energy has the following comments:R15.1 - Puget Sound Energy feels that "Limit propagation..." is an abstract term and needs clarity to it in order for NERC to be able to consistently validate compliance.R15.3 - Puget Sound Energy suggests clarity to what type of testing is required of malicious code protections. Is NERC requiring functional testing that the malicious code protections are reliably functioning or security testing (penetration testing)?R17.1 - Puget Sound Energy would like clarity into the degree of documentation required to validate compliance with "...required for normal and emergency operations are enabled." Puget Sound Energy would also like clarity into NERC's definition of "enabled" and "disabled". For example, can network accessible ports be "enabled" and "disabled" through the use of host based firewalls?R17.2 - Puget Sound Energy suggests that the disabling of physical ports on BES Cyber System Components only be required where physical security protections are not required, as outlined in Table 5. If physical security is provided, per Table 5, then the disabling of physical ports seems unnecessarily redundant. Puget Sound Energy would like clarity on "externally accessible physical ports", in cases where the BES Cyber System Component is physically protected by measures outlined in Table 5.Table 18 - Puget Sound Energy suggests including "Where Technically Feasible" to R18, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 18. For example, entities may incorporate

#	Organization	Yes or No	Question 35 Comment
			dialup accessible devices that, by the nature of a connection that is built up and torn down as necessary, is incapable of providing “continuous security monitoring that issues alerts”.R19.1 - Puget Sound Energy requests clarity into what NERC means by “validate data inbound”. “Validate” is subjective and Puget Sound Energy would like clarity on how entities can prove compliance. Puget Sound Energy would also like clarity into the scope of the inbound data it must validate. For example, is NERC asking for validation of interconnections with other utilities and balancing authorities or validation of every RTU that provides an inbound data stream to a control center’s BES Cyber System?
35.42	BCTC	Disagree	R15 - Â Change title to “Prevent Malicious Code”Â 15.1 - suggest replacing the words “Limit propagation” to “Prevention”Â 15.3 - we do not agree with this requirement. Recommend removal of the words “to test”. It is not a good practice to introduce malicious code into a BES Cyber System - even in QA!Â Another potential area for TFEsR16 - Â R 16.2: if the patch results in a system upgrade it could take up to 6 months to implement the patches; if the patch does not result is a system upgrade then recommend allowing 30 days to implement said patchesR17 - Â The requirements needs to provide more guidance on how to provide evidence for open/ closed TCP (static) versus UDP (dynamic) ports Â R 17.1 Guideline would be appreciated on how to meet this requirement. We have struggled with this one in the past.Â Provide a definition of what is “system hardening” R 17.2 - what is the objective of this requirement? We feel that simply disabling a physical report does not provide much value from a security perspective (i.e. can unplug an active port and plug in an unapproved device); instead we recommend locking down devices’ MAC addresses as this would result in a more secure environmentR18 - Â R18.3. A year seems excessive to require an entity to retain ALL logs. What is the objective in requiring utilities to do this?R18.4. Suggest breaking this one in to two requirements - one for log review and the other for maintaining records - current wording can be interpreted as having to retain events for medium impact systems for a longer period than high impact? R19 - Â R19.1. We request a definition of what is meant by “validation” as well as guidance on how to perform this taskÂ Potential area for TFEsÂ

#	Organization	Yes or No	Question 35 Comment
			R19.2. We are struggling with how to comply with this requirement. We have an IDS implemented in our environment where users are alerted on suspect packets - is this what this is referring to? Intent not clear with the current wording.
35.43	WECC	Disagree	R15 - alright with all criteria, R16 - alright with all criteria, R17 - Item 17.1 should cover local ports and services not just network ports and services. Consider removing the words "network accessible" like text in previous standards and make required for Medium and High impact levels. Physical ports should be rendered unavailable on components of Medium impact systems as well as High. Item 18.2 needs to define "continuous" or remove it from the criteria. R17 - Consider adding more criteria for system hardening including system base-lining or move system base-lining from the change management section to here. Look for other overlap between R17 and change management. R19 - agree with criteria but would suggest adding the following after validate data "(eg. syntax checking, bounds checking, sanity checking, etc)"There needs to be more language specifying a definition of malicious code, what it means to limit its propagation, and to detect and respond to its introduction. As written, there is very little to audit against in this requirement.Additional language is needed to describe what it means for a patch to be released.System hardening should be required for all systems, not just those that are externally connected.Additional language is needed to clarify the requirements for security event monitoring, for example, what continuous monitoring means.Log review intervals are too long to be effective.The data integrity criteria are good additions but need additional language to clarify the intent. What does it mean to validate inbound data? Also, consideration should be given to the fact that cryptographic protection is not fully effective in all circumstances. More direction is needed as to when cryptography is an acceptable control. Also there are no requirements in the standard that define criteria for cryptographic controls.
35.44	Alberta Electric System Operator	Disagree	R15 - Change requirement to include confidentiality, to address potential MITM or MITB attacks. "...malicious software that could affect availability, integrity, or confidentiality of the..."Table R16 - include additional row similar to 16.1, but to

#	Organization	Yes or No	Question 35 Comment
			assess security patches within 60 days. Make this a requirement for Low Impact BES Cyber Systems. All BES Cyber Systems should be assessed, however High and Medium Impact systems should be assessed sooner.Table R19 - 19.1 states "Validate data inbound to a BES Cyber System in a Control Center." And the corresponding impact states "Required for external connectivity only." Based on the definitions, "inbound to a BES Cyber System" can only be from a device "external to the BES Cyber System" so the impact is redundant. Similar situation for 19.2. Suggest changing "Required for external connectivity only" to "Required". Table R19 - consider adding additional rows to Table R19 to address validating inbound data to BES Cyber Systems that are not in a control centre. 19.1 Validate data inbound to a BES Cyber System in a Control Center. Required for Medium and High 19.2 Validate data inbound to a BES Cyber System. Required for High19.3 Where not cryptographically protected, develop and implement a process to evaluate invalid data inbound to a BES Cyber System in a Control Center to determine whether the data has been compromised maliciously. Required for Medium and High19.4 Where not cryptographically protected, develop and implement a process to evaluate invalid data inbound to a BES Cyber System to determine whether the data has been compromised maliciously. Required for High.
35.45	LCEC	Disagree	R15 - Testing for malicious code protection is not auditable.R16 - Device end of life support issues need to be addressed. Release needs to be clarified to address the situation where a vendor may release a security patch for a BES Cyber System Component but it is not yet approved by the BES Cyber System vendor.R17 - o It is not often clear whether the standard is referring to logical and physical ports. Physical, logical or both should be specified any time the term port is used.R18 - What constitutes a security event?Is the 90 day requirement meant to be an absolute 90 days as opposed to 3 years and 90 days to be able to show compliance?R19 - How would one validate inbound data? Was this clearly meant to be data integrity as opposed to data protection? Why was this scope chosen?
35.46	Dominion Resources	Disagree	R15 - The stated intentions of the SDT at the May Workshop were to reduce TFEs and to distinguish between Control Centers vs. Substations and Power Stations. Neither

#	Organization	Yes or No	Question 35 Comment
	Services, Inc.		of these stated goals is presented in R15. TFEs will be required for 15.2 and 15.3 and there is nothing indicating that these should not apply to field equipment or network equipment (e.g., firewalls, routers, switches). Dominion agrees with the stated intentions of the SDT team.To avoid the potential for TFE's associated with R15.2 and R15.3, a footnote similar to the one used for Table R10 on Page 11 of CIP-011 should be added. Also, access controls related to access points would be better addressed in the Boundary Controls Section of CIP-011.R16.2. The word "fixed" should be replaced with "planned" to allow some flexibility for installing the patch. 17.2. It should be clarified that an alternative where the equipment does not provide a configurable method of disabling the port is that methods, such as using security tape, to indicate any tampering with the port may be used.18.2. This section will require a TFE since many devices do not have the capability of issuing alerts. A footnote to avoid need for a TFE should be added.18.3. One year is too long to maintain logs for network devices. Storage space is at a premium. There will be a substantial increase in cost to increase storage space for each high impact cyber system This should be changed back to 90 days for High Impact cyber systems. 18.4. Logs of system events should only be required to be reviewed every 90 days. Logs should be reviewed only when an alert is issued for a detected system event. Routine reviews would take an extraordinary amount of time with no expected substantial results. R19. Common methods for ensuring data integrity include physical protection of the asset, authentication and authorization of data sources/inputs, using data validation and error checking rules at the application or database level, and a variety of other technical, operational and management controls. Dominion recommends the wording used in R19.1 be modified as follows to state the objective without specifying how it should be accomplished since the methods vary depending on the nature of the system and the technology in use:"19.1 Implement methods to maintain the integrity of data inputs to a BES Cyber System in a Control Center. " 19.2. It is sometimes impossible to determine if data has been compromised. Dominion understands that the proposed re-wording for 19.1 will also suffice to meet the requirements for 19.2 and recommends that 19.2 be removed.

#	Organization	Yes or No	Question 35 Comment
35.47	FirstEnergy Corporation	Disagree	R15 - We prefer the new text over the old CIP standards and it would reduce TFEs. In R15/Table 15: need some type of exception for devices incapable of running anti-malware.R16 - We prefer the new text over the old CIP standards. R17 - We prefer the new text over the old CIP standards.R17/Table 17: Need clarity on "externally accessible and physical ports". Does that mean serial, parallel, USB, Fireware, etc. or ports that are capable of transmitting routable protocols (e.g. network interface cards).R18 - 18.4 - Need greater clarity around whether automated alarming can be used rather than manual review of system event logs. Also - should it be specified somewhere in R18 that these sub-requirements apply to electronic security only, not physical security events (which is spelled out in R6)? 18.2 - We question the use of the word 'continuous' in this sub-requirement as this would be difficult for those entities that use 'organizational processes' to monitor and log.R19 - Overall this requirement appears to be too broadly worded. 19.1 - The use of the word 'validate' seems vague. Is the intent of the SDT that entities provide the specifics on what 'validate' means - e.g. the appropriate data or a point-for-point comparison, how often, etc? 19.2 - Many existing systems do not provide a means to accomplish compliance with this sub-requirement - for example, legacy RTU protocols. R19/Table 19: Need clarity on "invalid data". How do you evaluate invalid data?
35.48	US Army Corps of Engineers, Omaha Distirc	Disagree	R15 needs to be limited to general processing equipment. Requirement for anti-virus type software on all systems will numerous TFE's. R18 logging of all BES Cyber System components will generate numerous TFE's. R19 concerned about what realistic measures are available to meet requirements.
35.49	US Bureau of Reclamation	Disagree	R15.3 - If it is truly intended that entities test malicious code protections (not just ensure signatures are up to date and that protection software is running, the Standard should provide some additional guidance. Few entities are going to be willing to introduce malicious code, even into a test system, to verify malicuious code protection. Further, there is not timeline for when the malicious code protection must be tested. It would not be unreasonable to require and annual test of the

#	Organization	Yes or No	Question 35 Comment
			malicous code protections. The malicious code protections should be an intelligent requirement. Some devices that are not addressable may not need malicious code protection. R16.2 - Suggest the phrase "if the patch will not be installed" be added to the end of the requirement. R17.2 - Is locking within an enclosure satifactory? R18.3 - Suggest medium impact requirement be "for at least 90 calendar days" and that high impact timeframe be considered for reduction, perhaps to at least 180 calendar days.R19.1 - Explain how this is to be accomplished within the Standard - based on some specific criteria. This requirement is too open-ended. Since the concept of BES Cyber Systems now includes such devices as programmable multifunction or solid state relays, the requirement to "validate data" inbound makes no sense. Many of these devices reside within a control center. The definition now includes those center which are used to control more than one BES generator. The data going into the relays is from transducers either inside or outside the physical security perimeter but within another physical security perimeter. This data may be digital or analog. How would it be validated, cryptographically progracted or analyzed for malicious compromise?It is not clear how an "interactive user" session would apply to "programmable" relays.
35.50	Ameren	Disagree	R16.1 - This requirement should address documenting the installation date of patches and that patches have been installed.R18 - should only apply to network based systems with external connections only; currently this required is not limited on what it applies to.R19.1 and R19.2 - There is no way to comply with this standard without requiring the vendors to write better code. Suggest removing these requirements.
35.51	Northeast Utilities	Disagree	R17 appears to be significantly weaker than the previous standards. It also does not appear to align with the draft change control standards. Ports and services are a strong control to ensure only services required for operation are allowed. At minimum the High Impact BES Cyber systems should be “Required”.R19 needs more explanation. What does validate data mean?

#	Organization	Yes or No	Question 35 Comment
35.52	Hydro One	Disagree	Recommend new wording for 15.2 - Respond to the detection of malicious code.Requirement 15.3 implies that testing ensures that the deployment will not adversely impact security. However, the existing words could be interpreted as testing the malicious code prevention by introducing malicious code.Recommend changing 16.1 from “release” to “availability”.Recommend removing “with a fixed date” from 16.2. The cyber system may not be available for maintenance due to grid system conditions.Request a R17 local definition of “attack surface”.Recommend changing 17.2 from “Disable, or render unusable, externally accessible physical ports” to “Disable or secure externally accessible physical communications ports”.Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber Systems.Requirement 18.4 seems to have one purpose and that is to prove 18.2. To us this seems redundant since R18.2 require alert for system events. Why do we need a review at some later point? We recommend removing the requirements R18.4 Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days. Requirement 18.2 continuous monitoring satisfies the NOPR directive of seven days.Recommend that R19 should “ensure the integrity of the data”.Recommend that 19.1 should read “Entity should document process to ensure the integrity of the data link between the BES Cyber System and the remote node.” This new 19.1 should be “Required” for High Impact and Medium Impact BES Cyber Systems.Recommend that 19.2 should read “Where links cannot be secured, the Entity shall document the mitigation in use.” This new 19.2 should be “Required” for High Impact and Medium Impact BES Cyber Systems.Please clarify the applicability of R19. Does this requirement apply only to code releases into the system or it applies only to external data streams (e.g. weather data from a service provider, data from RTUs etc)?
35.53	ISO New England Inc	Disagree	Recommend new wording for 15.2 - Respond to the detection of malicious codeBelieve the SDT meant that 15.3 testing insures that the deployment will not adversely impact security. However the existing words could be interpreted as testing the malicious code prevention by introducing malicious code.Recommend changing

#	Organization	Yes or No	Question 35 Comment
			16.1 from “release” to “availability”Recommend removing “with a fixed date” from 16.2 because the cyber system may not be available for maintenance due to grid system conditions, implement based on your documented patch process. Request a R17 local definition of “attack surface”Recommend changing 17.2 from <<Disable, or render unusable, externally accessible physical ports>> to <<Disable or secure externally accessible physical communications ports>>Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber SystemsR18.3 Some automated tools do not have separate log retention based on the asset. The log retention applies to all assets. It is unclear if the log retention is the actual log from each Cyber System component or the log that an automated tool keeps (ie parsed out info from syslog). Either way a years worth of logs will require terrabytes upon terrabytes of storage for useless information. Recommend that 18.4 be re-worded to be consistent with FERC Order P526 - <<Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs. >>Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days since 18.2 continuous monitoring satisfies the NOPR directive of seven daysRecommend that R19 should “insure the integrity of the data.”Recommend that 19.1 should be “Entity should document process to insure the integrity of the data link between the BES Cyber System and the remote node.” This new 19.1 should be “Required” for High Impact and Medium Impact BES Cyber Systems.Recommend that 19.2 should be “Where links cannot be secured, the Entity shall document the mitigation in use.” This new 19.2 should be “Required” for High Impact and Medium Impact BES Cyber Systems.
35.54	Northeast Power Coordinating Council	Disagree	Recommend new wording for 15.2 - Respond to the detection of malicious code.Requirement 15.3 implies that testing ensures that the deployment will not adversely impact security. However, the existing words could be interpreted as testing the malicious code prevention by introducing malicious code.Recommend changing 16.1 from “release” to “availability”.Recommend removing “with a fixed date” from 16.2. The cyber system may not be available for maintenance due to grid system conditions.Request a R17 local definition of “attack surface”.Recommend changing

#	Organization	Yes or No	Question 35 Comment
			17.2 from "Disable, or render unusable, externally accessible physical ports" to "Disable or secure externally accessible physical communications ports".Recommend 18.3 should be 90 calendar days for High Impact and Medium Impact BES Cyber Systems.Recommend that 18.4 be re-worded to be consistent with FERC Order 706 paragraph 526 - "Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs."Recommend that 18.4 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days. Requirement 18.2 continuous monitoring satisfies the NOPR directive of seven days.Recommend that R19 should "ensure the integrity of the data".Recommend that 19.1 should read "Entity should document process to ensure the integrity of the data link between the BES Cyber System and the remote node." This new 19.1 should be "Required" for High Impact and Medium Impact BES Cyber Systems.Recommend that 19.2 should read "Where links cannot be secured, the Entity shall document the mitigation in use." This new 19.2 should be "Required" for High Impact and Medium Impact BES Cyber Systems.
35.55	USACE HQ	Disagree	Requirement 15.1 should be deleted from the list. Limiting the propagation of malicious code is a logical step in the "respond to the introduction of malicious code" phase, process which is required in 15.2. Therefore 15.1 present a possible double jeopardy since it is logical to think that when responding to the introduction of malicious code in the environment the steps will include limiting the propagation of the same before removing it from the system. Also, requirement 15.1 language is to broad in the interpretation of it. "Limit propagation of malicious code" implies that the code has moved through some part of the system, therefore the question is, how much movement of the code is acceptable when creating a response process?. The acceptable answer to this question could depend on the auditor's subjective views of what is acceptable safe propagation of the code inside the system.
35.56	Garland Power and Light	Disagree	Requirement 16.1 - Reword requirement to say assess within 60 days - reason is because we feel it is adequate to check the vendor web site every 30 days and allow 30 days for testing and determination of implementationRequirement 18 - Reword

#	Organization	Yes or No	Question 35 Comment
			requirement to allow for Responsible Entity to develop a definition of a "system security event". The words are used in the main requirement and each subrequirement. Requirement 19 - o Delete Requirement R19 - Control systems currently validates data for quality and limits and then tags the data with any issues so that downstream applications can handle appropriately. This is sufficient for the security and reliability of the BES. R19 is impractical for implementation in the field for large or small utilities. This will reduce reliability of the overall system.
35.57	Oncor Electric Delivery LLC	Disagree	Requirements 15.1 and 15.3 are not necessary. The use of antivirus and malware software is problematic on some systems, while “whitelisting” requires additional hardware which may contain its own vulnerabilities. Detection and response should be sufficient. Many programmable devices are not capable of propagating malicious code or running prevention software.Requirement 18.2 does not apply to many legacy cyber systems and should only be applicable to systems which utilize routable communications.
35.58	Manitoba Hydro	Disagree	Revise the wording of Requirement R15 to “... integrity of the BES Cyber Systems.” Please clarify the intent of “test and update malicious code protections”. Requirement R16.2 should be revised to indicate the development AND implementation of the schedule. The wording of Requirement 16.2 currently does not require the application of mitigating measures prior to the installation of the applicable patch, and may need to be revised. For Requirement R17, please what is the meaning of “network accessible ports”, and “externally accessible physical ports”. Are physical ports enclosed within an unlocked cabinet “externally accessible ports”? Are physical ports within a non-public space, “externally accessible ports”? Requirement R18 does not contain any requirement for response to security event alerts or monitoring. Remove the word “maliciously from Requirement R19.2. It may be very difficult to determine if the data compromise was malicious or not. There are no specifics given with respect to “limit” propagation in Requirement R15.1. It is assumed to be at the Responsible Entity’s discretion in terms of criteria, means, etc. There are no specifics given with respect to “validate” data in Requirement R19.1 so it is assumed to be at the

#	Organization	Yes or No	Question 35 Comment
			Responsible Entity's discretion in terms of criteria, means, etc.
35.59	San Diego Gas and Electric Co.	Disagree	SDG&E thinks that R17.2 sounds good in theory (disabling external physical ports on assets), but in practice this can be difficult to achieve without damaging the port for future legitimate use. Many shops use epoxy or other glue-based products to physically disable / protect such ports, and these solutions tend to be permanent. If we are physically protecting the asset from access anyway with card readers and other physical means, why is it necessary to take this redundant step of sealing physical ports on assets when only people with authorized physical access (who have had training) can actually access the asset?SDG&E has concerns about the viability of complying with R19.1 (validating inbound data to a BES Cyber System in a control center) in a situation where the incoming data is encrypted. How does the SDT define "validate"? Where does the validation need to occur?SDG&E also has concerns about the viability of complying with R19.2 (evaluate invalid data for malicious compromise) without MUCH additional vendor support. How does the SDT define "evaluate invalid data"?
35.60	Platte River Power Authority	Disagree	Suggested Revision (clarify what to test):15.3 Implement processes to update malicious code protections including testing security controls
35.61	Duke Energy	Disagree	Table 15: will need a TFEWithin generation, we have differing opinions on the definition of code. Suggest clarifying that it does not include programming code.Requirement 16.1: Assessment of security patches within 30 calendar days of their release for applicability to its BES Cyber Systems. Release from whom? It makes a big difference if the patch is released from Microsoft, for example, or the patch is released from the control system vendor (e.g. Emerson, Invensys, Areva, etc.) as to how/if the patch is implemented to prevent risk to the BES cyber system.Table 17: for devices inside a locked cabinet, are the physical ports on that device externally accessible?Requirement 17.2: how does the definition of "externally" in "externally accessible physical ports" compare with the definition of external in "external connectivity" in R3? Also, this definition implies that there are physical ports that are

#	Organization	Yes or No	Question 35 Comment
			NOT “externally accessible”. Need to make definition more clear. Suggest taking out reference to “externally accessible”.Table 18: 18.1 - not all devices are capable of logging, need a TFE18.2 - it would be helpful to have a definition of ‘events related to cyber security’18.4 - remove for systems where automated tools are in place. Requirement 18.2: " one or more security processes for continuous security monitoring" - is there any interpretation of the expectation here so that we don't have disagreement at audit? Are alternate controls allowed for BES Cyber Components that don't support logging/monitoring (example: manual review of physical access logs for stand-alone equipment)?Table19:Item 19.1 & 19.2 Additional explanation is needed to explain acceptable threshold for “validation of inbound data.”Clarify validate in 19.1. Is encryption a form of validation?What is meant by Data in 19.1?Requirement 19.1: What types of data validation controls are acceptable to meet this requirement? For example, control totals, presence check etc. Requirement 19.2: Need to provide an example with what methods can invalid data be evaluated to conclude that the data has been compromised maliciously?
35.62	Consultant	Disagree	Table R15 - Item 15.3 The requirement to "Implement processes to test and update malicious code protections." is confusing. Is the intent to "test malicious code protections and update malicious code protections" or to "test updates to malicious code protections" Please clarify the intent. There is a need to distinguish between updates to the malicious code protection "software" and malicious code protection "signature files". The software should be implemented in accordance with change control processes. The "signature files" are a specific subset of update to malicious code protection where it is unlikely a registered entity would have the capability to test what are typically vendor proprietary file formats. The extent of the 'testing' necessary for these signature files should be clarified.Table R16 - Item 16.2 While the concept of a "fixed date" sounds good, the requirement should allow for reasonable scheduling, including rescheduling, of the installation of applicable security patches or completion of mitigating measures. An option could be to remove the words "with a fixed date" and add a new item that would require that "Events that delay a security patch implementation schedule greater than thirty days shall be documented."Table

#	Organization	Yes or No	Question 35 Comment
			R17 Item 17.1 The first sentence uses the terminology "network accessible ports and services" and the second sentence uses the terminology "network accessible services and communication methods". Suggest using consistent terminology to avoid confusion.Suggest defining the term "network accessible ports and services" (may be multiple terms) as they are intended for use in the standards. There does not appear to be a standardized definition for this term in the industry. The term "network accessible ports and services" appears to imply access across the protection boundary? If it does then the requirement statement of "Required for external connectivity only" is unnecessary and should be changed to "Required".Table R18 - Item 18.3 Suggest changing the word "within" to the word "for" for clarity of meaning.Item 18.4 - Weekly log review appears to create an excessive administrative burden without a corresponding decrease in risk to the High Impact assets. Items 18.1 and 18.2 require continuous monitoring of the same activity. Manual log review is redundant to these requirements. While there may be a reason for manual log review to confirm the continuous monitoring is occurring as expected a more reasonable periodicity of monthly or quarterly should be required for both Medium and High Impact assets.Table R19 - The limitation of these items to a Control Center is an added dimension of Impact that is not included in the impact categorization criteria. If data is an issue, then these requirement should apply to all assets based on impact categorization without addendum or modification by the requirement. Suggest modifying the impact categorization criteria to clearly identify those assets.Table R19 - "Inbound data" implies remote access, and the terminology "Required for external connectivity only" is redundant. Suggest changing the wording to "Required".Items 19.1 and 19.2 are inconsistent. Item 19.1 requires validation of inbound data, and item 19.2 provides an exception to validation for encrypted data. If you comply with item 19.1, then item 19.2 is irrelevant. If you comply with item 19.2, then you are in violation of item 19.1.R19 - Overall, this requirement should be removed in it's current form. Automatic system operation cannot exist if "inbound data" is required to be validated. Automatic system operation is dependent on responses to external data inputs. If the intent is to return the BES to manual operation, this requirement

#	Organization	Yes or No	Question 35 Comment
			will achieve that end.
35.63	American Electric Power	Disagree	Table R15: 15.1, regarding "Limit propagation of malicious code", suggest replacing "propagation of" with "propagation and introduction of".15.2, regarding "Detect and respond to the introduction of malicious code." Would this be covered in a traditional cyber security incident response program? This should already be covered in R27.Table R16:16.1: Regarding the word "release" within "Assessment of security patches within 30 calendar days of their release for applicability to its BES Cyber Systems." Release from who? For example, is it the release of a new patch by Microsoft, or is it the certification of the patch by the control system vendor that the patch does not negatively impact the control system? Further clarification is needed. Patches released by Microsoft are not typically tested for several days or weeks by Control System vendors to validate that the patch does not impact functionality. Industry cannot test software patches as thoroughly as the Control System vendors.16.2: Is it a violation if you do not meet the fixed date? Suggested wording: replace "fixed date" with "scheduled date". Add a provision to supply reasoning for not meeting scheduled dates. The rewording provides flexibility to the Responsible Entity to push installation of the patch to a later date without being in violation.17.2: Add a sentence similar to the last sentence in 17.1, "In the case where unused, externally accessible physical ports cannot be disabled, the Responsible Entity shall document and implement a mitigation plan." The disabling of physical ports is not supported by all network devices. To meet the literal wording an entity may need to physically damage equipment which would void warranties and prevent further vendor support.18.1: Regarding "organizational processes" and "system events that are related to cyber security". Is it reasonable to think this can be done without automated tools?18.2: Regarding "continuous security monitoring", is this redundant to 18.1? If you are implementing automated tools to monitor and log system events are you not providing continuous security monitoring? Suggest removing these words to eliminate double jeopardy.This requirement should be focused on issuing an alert.Regarding "system events related to cyber security", what constitutes a system event related to cyber security? What criteria should be used? Is there an accepted

#	Organization	Yes or No	Question 35 Comment
			standard that an entity will be held to in an audit? If the right system events are not classified in an auditors' eyes, is this a violation? Suggest rewording to reference an acceptable set of minimal system events to monitor. What if a BES Cyber System does not generate a sufficient amount of detail to determine if a cyber security event occurred? Suggest allowing a TFE in this instance.18.3: Regarding "Maintain logs of system events related to cyber security within the specified time period", what if a BES Cyber System cannot store events for the duration required? Is a responsible entity required to go out to a device repeatedly to export their logs if they cannot meet the 90 day or 1 year increment? Suggest rewording to take into account limitations of BES Cyber Systems. Possibly use as a TFE item, if TFE's are maintained.What benefit does this provide for reliability or security? 18.4 is the important element, not the data retention.R19: With real-time or near real-time control systems, these requirements could increase latency and pose a negative impact to reliability.19.1: Regarding "Validate data inbound to a BES Cyber System in a Control Center", validate against what? Is the source being validated? Is the data itself being validated? Is providing encryption on the data sufficient? Who determines the appropriate level of validation? Is it being left to an auditor?Reliability could be compromised if this induces extra latency on the systems sending and receiving real-time data. This should be included as a TFE; older systems may not be able to handle the latency.19.2: Would "bad quality" indicators in the EMS system be an example of this?
35.64	APPA Task Force	Disagree	The APPA Task Force believes that Requirement R15 as currently drafted will require numerous TFE's. Each entity will need to document that they are not following this requirement since a vast array of devices in substations and generation stations are BES Cyber System Components but are not capable of propagating malicious code. Therefore we recommend the following edits for R15:R15. Objective:To protect BES Cyber Systems from malicious software that could affect availability or integrity of the Reliability Functions.R15. Requirement:Each Responsible Entity shall document and implement one or more processes incorporating the criteria specified in CIP-011-1 Table R15 - Malicious Code Protection. This requirement applies only to BES Cyber

#	Organization	Yes or No	Question 35 Comment
			System Components that have the capability to propagate malicious code. Change the Table legend to "Malicous Code Protections".The APPA Task Force is concerned that the criteria in R15 Table 15.3 do not constitute a reasonable requirement when looking at the transmission and generation environments that will be required to comply. The drafting team may not fully appreciate the full magnitude and implications of the phrase "test and update". We recommend that the criteria in Table 15.3 be removed or only be required for control centers.R16 Objective:To ensure that security vulnerabilities in BES Cyber Systems are mitigated. R16. Requirement:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R16 - Security Patch Management R17. Objective:To reduce the available attack surface of the BES Cyber System.R17. Requirement:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R17 - System Hardening The APPA Task Force agrees with the MRO-NSRS proposal noting that as written, item 17.2 does not appear to be applicable to many BES Cyber System Components. Many devices do not allow for disabling ports via software settings. This would require an entity to either file a TFE, or physically disable the ports, resulting in voided warranties for new equipment. Plus, if all of the BES Cyber System Components are already within a physically secure area (per the standards), is disabling ports really necessary? We recommend that this item be deleted.R18. Objective:To ensure that security events are known, logged, and responded to on BES Cyber Systems.R18. Requirement:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R18 - Security Event Monitoring R19. Objective:To protect the real-time operation of the BES from the use of maliciously modified data by BES Cyber Systems.R19. Requirement:Each Responsible Entity shall implement processes incorporating the criteria specified in CIP-011-1 Table R19 - Communications and Data Integrity The APPA Task Force is extremely concerned with the actual ability of the industry to comply with the criteria in R19 as proposed. A discussion is necessary to understand if this requirement is actually feasible for all entities with High Impact facilities.

#	Organization	Yes or No	Question 35 Comment
			Utilities hire capable operators to make decisions on incomplete data all the time. If validating the data inbound means another electronic verification, this is impractical. If validating the data inbound means calling a lineworker in the field to check a setting in a substation when an operator is not comfortable with the data he is receiving, this is reasonable, but still not an auditable requirement. We agree with the MRO-NSRS evaluation of 19.2, which notes that as written, item 19.2 could be interpreted to include all of the RTU communications back to the SCADA master within the control center. We believe it may be impractical to evaluate all data of this type marked as potentially invalid (i.e., out of range alarms, bad scan alarms, etc.), and to prove it was not compromised maliciously. We recommend that this requirement be removed and placed in the guidance in support of the standard as a future technology.
35.65	Bonneville Power Administration	Disagree	The objectives of these requirements ("to protect its BES Cyber Systems from malicious software that could affect availability or integrity of the Reliability Functions," "to ensure that security vulnerabilities in BES Cyber Systems are mitigated," "to reduce the available attack surface of the BES Cyber System, "to ensure that security events are known, logged, and responded to on BES Cyber Systems," and "to protect the real-time operation of the BES from the use of maliciously modified data by BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirements rather than appearing at the end of the requirements (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.The phrase "Reliability Functions" at the end of R15 is not a defined term in the April 20, 2010, Glossary of Terms Used in NERC Reliability Standards. Does the drafting team mean CIP-01-01 - Attachment 1, Functions Essential to Reliable Operation of the Bulk Electric System? If so, that should clearly be stated. If not, there should be a definition in the Glossary. Table 16, Section 16.2. We applaud the new standard, which makes it clear that immediate mitigation or installation of patches is not required. However, there are still some issues:1. Security patches arrive weekly to daily to multiple times a day. Many may be applicable to systems, but of minimal

#	Organization	Yes or No	Question 35 Comment
			threat. Entities should be able to not only evaluation the applicability, but the threat and risk of the threat to their systems within their environment, and choose to escalate or deescalate patches as appropriate to them. Low impact, or low risk patches may be assigned to a regular patch or maintenance cycle, while high risk patches may be tested and implemented immediately. This should be up to the system owners, and not prescribed in the requirement.2. Mitigation plans are not necessarily applicable. Some patches, while technically applicable to specific equipment or operating systems, may have such a low risk or impact that they entity may choose not to apply the patch.3. There are instances where a patch may be applicable from a security perspective, but the risk it presents from a reliability perspective may outweigh it. 4. Where systems are isolated from external affects, even a patch that applies to a specific device may not be necessary.5. Meaning of "fixed date" is not clear. Does it mean "the same for every patch", or "the date can't be changed"? Both are bad choices. Different patches might require different schedules, depending on their impact and the availability of outage time on the system.R17: Rename this back to "Ports and Services" to avoid confusion. In the electrical industry "Hardened" systems are those that meet specific electrical requirements and interference requirements.Also, the use of the word surface implies something physical rather than electronic.Recommendation for R17: "Objective 17 - To reduce the available electronic attack points of the BES Cyber System.R17. Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R17 - Ports and Services"Table 17, Section 17.1. A mitigation plan might not be appropriate. In the context of NERC standards, a mitigation plan describes the actions that will be taken to achieve compliance. That is not the situation here. Recommendation: "cannot be disabled, the Responsible Entity shall document the reasons for the inability and compensating measures used."Section 17.2. We understand that FERC wishes the standard to address physical ports. However, this could have negative conquences:1. There are hundreds of thousands of devices in service that have physical ports that may not be used. The fact that they are not needed or used normally means that there is nothing connected

#	Organization	Yes or No	Question 35 Comment
			to them. If there is nothing connected to them, they are not vulnerable to any kind of external or remote attack.2 - Disabling physical ports on electrical system components may be: o Impossible o Degrade the operation of the equipment o Render the warranties on the equipment void thereby removing vendor service o Create such a huge national work load that it could never be accomplished.Recommended change - Eliminate 17.2Table R18:18.1 & 18.2 - The use of the term "all BES Cyber System Components" is not accomplishable:1. Many, if not most "components" in the field do not capture what would be considered cyber security related events. They only capture electrical system events. They don't even have the capability to capture access events.It is the access points to these devices that may have the ability to capture even the most rudimentary cyber security information (Access Attempt, Date, Time, Account, Source, Target)2. It may not be possible to place monitoring equipment within electronic monitoring proximity of these components. 3. The term "events that are cyber security related" is not defined. What exactly does it mean? Is this access events, Intrusion Detection systems, Antivirus, ??? Much of this cannot be implemented on or even for "all BES Cyber Components". Recommendation: 1. Remove "components", so that the requirement is at the BES Cyber System level.2. Change "...security for all..." to "...security, as defined by the Responsible Entity, for all..."18.3 has the same issue with the definition of "events related to cyber security". In addition, this time frame has caused some confusion from an audit perspective. - Some have read that to mean that there must be, on the originating system, at all times, at least 90 days worth of logs. While others (rightfully, we feel) are maintaining archives of their logs in alternate locations for 90 days or longer. Recommendation: replace with "Maintain captured log information within the specified time period on-line, in archives, or in some other readily accessible form."Section 18.4. Consistently accomplishing manual review of logs could be difficult for large entities with large numbers of devices, especially within the 7 days required for high impact systems. The obvious solution is the use of an automated log review tool. This should be explicitly addressed in the standard. Recommendation: "Review, either manually or by automated means, logs...." Entries in Table R19 are acceptable only if the

#	Organization	Yes or No	Question 35 Comment
			definition of external connectivity is changed, as discussed above. Otherwise, entities would be forced to validate data inbound from one BES Cyber System to another BES Cyber System, all within the same Control Center. This does not seem to be the intent: using the existing definition of external connectivity, any data inbound to a BES Cyber System uses external connectivity. In that case, why state it so? Clearly, the intent was to validate traffic inbound from outside the Control Center, at most.
35.66	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The requirements are to prescriptive for the range of systems that it will apply to.
35.67	Constellation Power Source Generation	Disagree	The term “release” in R16.1 needs to be further defined. The issue with it being vague is that some patches for a system may be released for all users, but if that system is tied to a distributed control system, the distributed control system vendor has to validate the patch before its implemented by a facility. Using this example, there are really 2 release dates. For auditing purposes, a suggestion would be to define release locally as “the date of which a security patch has been safely validated by a vendor. If another vendor must validate this release before implementation, than the date it has been released by the second vendor will be used as the release date.” R16.2 is not worded correctly. A suggested change would be “Development of an implementation schedule with a fixed date for installation of the applicable security patches and a fixed date for completion of mitigating measures that address the vulnerability, until implementation of the patch.” In R18.1, is the monitoring and logging continuous, or on a fixed schedule? The SDT should add clarity to this requirement. R18.2 discusses issuing alerts but does not give a timeframe for issuing them. A suggestion would be 90 days to ensure a proper review of an incident to determine if it was a cyber event. At the CIP V4 Workshop, the drafting team stated that R18.4 was not meant to be an exhaustive manual review of logs, but rather a check to ensure the automated log is functioning. This needs to be included in the verbiage of the requirement. R19.1 should be reworded to say “Implement a process to validate data received by a

#	Organization	Yes or No	Question 35 Comment
			Control Center's BES Cyber System." Doing so would clarify R19 as a whole, and R19.2 can be removed due to its redundancy with R19.1.
35.68	Public Service Enterprise Group companies	Disagree	There are several clarifications necessary to make the language understandable and ensure that entities know what is required. [1] Please clarify the distinction between requirements 15.1 and 15.2. Performance degradations and potentials for false positives from detection mechanisms that inspect each file when accessed, as possibly implied by 15.2, may not appropriate for real-time systems. [2] In requirement 18.2 please specify what is meant by "continuous"? Is a periodic check sufficient? [3] Please clarify the distinction between requirements 19.1 and 19.2. In requirement 19.1 please specify what is meant by "Validate"?
35.69	Constellation Energy Commodities Group Inc.	Disagree	There is no definition of malicious code provided. Clarify the scope of malicious code to include virus, malware and spyware protection, as currently generally commercially understood.Please define the stipulation 'Required for external connectivity only'.Are the tools and processes listed in R18 intended to provide automated detection, or manual\narrative logging of events detected under the heading of other controls? If automatic, what sorts of events are contemplated? What is intended by the term 'Validate' in 19.1? Does this mean the identification of a separate, independent source for the data, business rules, or something else? Without understanding the intent of the standards drafting team, I cannot suggest specific changes.
35.70	Allegheny Energy Supply	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. Requirement 15.3 is unclear as to what is meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of

#	Organization	Yes or No	Question 35 Comment
			the BES cyber systems/BES cyber components to be protected. Is it sufficient for a relay (which has very limited operating system capability) to validate the specific version of firmware operating on it? It may be appropriate to add discrete requirements for systems that support the addition of anti-virus software. These requirements could require a validation of signature file updates prior to use on a production BES system. Specify in Table 19 that the requirements for Communications and Data Integrity apply to only to Control Centers.
35.71	Allegheny Power	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. Requirement 15.3 is unclear as to what is meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of the BES cyber systems/BES cyber components to be protected. These requirements could require a validation of signature file updates prior to use on a production BES system. Specify in Table 19 that the requirements for Communications and Data Integrity apply to only to Control Centers.
35.73	Reliability & Compliance Group	Disagree	To help eliminate TFE's here, you need to add a qualifier such as "to protect its BES Cyber Systems from malicious software that could affect availability or integrity of the Reliability Functions if mechanisms exist that can protect the BES Cyber System Component."
35.74	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
35.75	We Energies	Disagree	We Energies agrees with EEI: There needs to be more refined requirements based on the characteristic of the devices to be protected. If the purpose of this requirement is to limit the potential for automated propagation of malicious software, the requirement should be more specific and state that. The security problem of automated propagation of malicious software is different than the issue of change management and change control to verify that only authorized software is used. With respect to requirement 15.1, We Energies believes this may not be possible for non-windows based devices/systems.We Energies agrees with EEI: Requirement 15.3 is unclear as to what is meant by "Implement processes to test and update malicious code protections." Suggest "Implement processes to detect malicious software, and review annually".It may be appropriate to add language that is more precise regarding the attributes of the BES cyber systems/BES cyber components to be

#	Organization	Yes or No	Question 35 Comment
			protected. Is it sufficient for a relay (which has very limited operating system capability) to validate the specific version of firmware operating on it? It may be appropriate to add discrete requirements for systems that support the addition of anti-virus software. These requirements could require a validation of signature file updates prior to use on a production BES system. We Energies agrees with EEI: Specify in Table 19 that the requirements for Communications and Data Integrity apply to only to Control Centers.
35.76	GTC & GSOC	Disagree	We Recommend: 1. In R15.3: taking out the words "test and" or, alternatively, clarifying what is meant by "test"2. In R19.1: clarifying whether encryption is required or if CRC will be sufficient3. Completely removing R19.2 because of the following reasons referenced from the DHS Catalog of Control System Security: a. The use of cryptography within a control system will introduce latency to control system communication. The latency introduced from the use of cryptographic mechanisms must not degrade the operational performance of the control system or impact personnel safety. b. Failure of a cryptographic mechanism must not create a denial of service. Control systems generally support the objectives of availability, integrity, and confidentiality. Therefore, the use of cryptography should be determined after careful consideration.
35.77	Midwest ISO	Disagree	What does it mean to validate data in R19.1. What is the expectation if a piece of data has been changed/modified when the value received is within reasonable limits but is not the actual value sent? This could be particularly troubling for the Interregional Security Network and ICCP. For example, how can an RC validate that the SCADA system sent valid data to the ICCP server at a TOP if it is within an expected range? More details around the expectation of validating data would be helpful to ensure entities can be compliant.

36. Tables R15 to R19 provide direction concerning what impact level of BES Cyber Systems to which Requirements R15 to R16 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note: CIP-011-1 Requirements R15 through R19 have moved to CIP-007-5 Requirements R1 through R4.

Many commenters disagreed with the proposed BES Cyber System impact levels and made suggestions for improving these requirements, including suggestions to revise or refine the impact levels based on the particular characteristics of the BES Cyber Systems involved. For example, some suggested that certain requirements should apply only to Medium Impact BES Cyber Systems with external connectivity. Others suggested that there were key requirements such as malware prevention that should apply at all BES Cyber System impact levels. In response, the SDT has made changes to include an applicability column in each table for each requirement. The applicability column further refines the set of BES Cyber Systems and assets to which each part of the requirement must be applied. The intent of this approach is to refine, as commenters suggested, the scope of requirements that apply to each type of BES Cyber System or device based on its characteristics. The drafting team recommends that commenters carefully review the proposed applicability column in the table for each requirement in CIP-003-5 through CIP-011-1.

#	Organization	Yes or No	Question 36 Comment
36.1	Northeast Utilities	Agree	Need TFE language added; not all CCAs or protecting assets require malicious code protection.
36.2	FirstEnergy Corporation	Agree	R17 - Does ‘external connectivity only’ mean only firewalls? If not, please provide intent of SDT.
36.3	BGE	Disagree	15.1, 15.2 and 15.3 should also apply to Low impacted systems. 16.2 implies that the patching can only occur on the same day every month.19.1 Define “validate”.
36.4	ERCOT ISO	Disagree	15.1-15.3: Should apply to Low Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
36.5	American Electric Power	Disagree	17.1: Regarding "Required for external connectivity only" within the High and Medium

#	Organization	Yes or No	Question 36 Comment
			impact categories. Is this required for "routable external connectivity" only, or all connectivity?How will items in R18 and R19 be performed on systems with nonroutable connectivity? Will dedicated IT Security Operation staff need to be added to isolated networks to perform the security status monitoring?
36.6	US Bureau of Reclamation	Disagree	Add R15.1, R15.2 and either R18.1 or R18.2 to the requirements for a low impact system. Concept of REMOTE connectivity is not defined. Without that definition, it is hard to assess if a High Impact is appropriate or if no Medium Impact is reasonable..
36.7	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
36.8	Black Hills Corporation	Disagree	At least 15.2 and 16.1 should also apply to low impact BES Cyber Systems.
36.9	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
36.10	The Empire District Electric Company	Disagree	Comments: For items 15.1 - 15.3, 16.1 - 16.2, and 17.1 we would propose using the following under Medium Impact and High Impact: “Required for routable external connectivity only”. We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.We believe the time frames for item 18.4 may not be practical at distributed locations without routable external connections, where logs would need to be reviewed locally.
36.11	US Army Corps of Engineers, Omaha Distirc	Disagree	define terms "continuious security monitoring" and "detected system events."
36.12	CWLP Electric Transmission, Distribution and	Disagree	Due to the requirement for continuous monitoring and alerts defined in R18.2 the requirement for log reviews every 7 days should not be needed. A standard 30 day review as in the medium impact area should be appropriate for both high and

#	Organization	Yes or No	Question 36 Comment
	Operations Department		medium impact levels.Does the fact that the data has been successfully passed through a Firewall or Access List meet the obligation to validate data incoming to a Control Center in R19 or does this require the data be inspected all the way down to the packet level?
36.13	American Transmission Company	Disagree	For items 15.1 - 15.3, 16.1 - 16.2, and 17.1 we would propose using the following under Medium Impact and High Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.
36.14	MRO's NERC Standards Review Subcommittee	Disagree	For items 15.1 - 15.3, 16.1 - 16.2, and 17.1 we would propose using the following under Medium Impact and High Impact: "Required for routable external connectivity only". We believe this makes an important distinction between protecting just the BES Cyber System in question, or protecting all other BES Cyber Systems that may be externally connected to it via routable connections, where there would be a real threat of a propagating attack/vulnerability.We believe the time frames for item 18.4 may not be practical at distributed locations without routable external connections, where logs would need to be reviewed locally.
36.15	Southern California Edison Company	Disagree	In order to appreciate the impact based categorization and reflect the actual impact on BES reliability, an additional requirement can be added to R16 for medium and low impact system. The drafting team should look at NERC PRC standards on maintenance schedules and synchronize CIP patching and upgrades to a maintenance and inspection schedule that is already mandated by NERC.Requirement R18 requiring logs be reviewed manually every seven days, when controls to automatically monitor such logs are already in place, is a control that does not seem to add additional security value. If the intent of the drafting team is to manually ensure and certify that the logging capability is functioning adequately, the drafting should include such verbiage. The current draft language of the standard seeks only a manual review of

#	Organization	Yes or No	Question 36 Comment
			the log rather than the manual verification of the logging capability.
36.16	Progress Energy - Nuclear Generation	Disagree	Incorporate information contained in the matrix in Attachment 1 for durations to ensure consistency by aligning CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
36.17	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
36.18	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's observations below:There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. Externally accessible physical ports not needed for normal and emergency operations on BES Cyber System Components are already subject to physical protection requirements.Suggested change for overarching R18:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R18 - Security Event Monitoring to collect and as appropriate, respond to security events on BES Cyber Systems that are able to detect and transmit such events.Requirement 18.1 needs to have refined requirements based on the characteristic of the devices to be protected. Not all BES Cyber Systems have the ability to capture or transmit cyber security logs. These requirements should be written in a manner to exclude a requirement for TFEs. The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: “Implement and document one or more security processes for security monitoring

#	Organization	Yes or No	Question 36 Comment
			that issue alerts for detected system events related to cyber security."Requirement R19 creates a potentially impossible level of obligation for responsible entities. The requirements should be more refined based on the characteristics and ability of the devices to be protected. Not every device has the ability to review or evaluate the data that is present to it.
36.19	NextEra Energy Corporate Compliance	Disagree	NextEra believes requirement R17 should be applied to both high and medium BES Cyber Systems.
36.20	PacifiCorp	Disagree	PacifiCorp agrees with EEI's observations below:There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. Externally accessible physical ports not needed for normal and emergency operations on BES Cyber System Components are already subject to physical protection requirements.Suggested change for overarching R18:Each Responsible Entity shall document and implement processes incorporating the criteria specified in CIP-011-1 Table R18 - Security Event Monitoring to collect and as appropriate, respond to security events on BES Cyber Systems that are able to detect and transmit such events.Requirement 18.1 needs to have refined requirements based on the characteristic of the devices to be protected. Not all BES Cyber Systems have the ability to capture or transmit cyber security logs. These requirements should be written in a manner to exclude a requirement for TFEs. The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: "Implement and document one or more security processes for security monitoring that issue alerts for detected system events related to cyber security."Requirement R19 creates a potentially impossible level of

#	Organization	Yes or No	Question 36 Comment
			obligation for responsible entities. The requirements should be more refined based on the characteristics and ability of the devices to be protected. Not every device has the ability to review or evaluate the data that is presented to it.
36.21	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation 'Required for external connectivity only'.
36.22	American Municipal Power	Disagree	Please provide a little or no impact category
36.23	The United Illuminating Co	Disagree	R15.2, introduction of malicious code, responding to the introduction of malicious code is a specific cyber security incident. Suggest 15.2 be limited to processes to detect malicious code. Response is already part of cyber incident response.
36.24	Southwest Power Pool Regional Entity	Disagree	R15: Malicious code prevention is a basic security control and should be applicable to all impact categories. R17 and R19 should not make a distinction between external and non-external connectivity. R17: Once access is gained into the network by any means to any cyber system on the network, external access is immaterial.
36.25	Southern Company	Disagree	R19 comes from the DHS catalog, requirement 2.8.8. In the DHS catalog, there are 4 requirement enhancements, two of which are warnings which could greatly affect reliability. The DHS catalog presumes this requirement would be implemented on a case by case basis after appropriate research and testing. It therefore has no place in a mandatory standard that will force its use everywhere without regard to the reliability impacts. This requirement should be removed from a reliability standard.
36.26	National Grid	Disagree	Refer to answers in Q. 35.
36.27	Manitoba Hydro	Disagree	Requirement 18.4 can be very onerous for the industry for legacy systems which don't support automated log consolidation or review. The requirements must allow more flexibility.

#	Organization	Yes or No	Question 36 Comment
36.28	Garland Power and Light	Disagree	Requirement 19, 19.1 and 19.2 should not be required for any level
36.29	San Diego Gas and Electric Co.	Disagree	SDG&E feels that if R17.1 is a requirement for Medium Impact systems, then R17.2 should be as well for Medium Impact systems. For R18.3 and R18.4, SDG&E recommends that consistency be applied to the requirements to help ease the compliance burden of companies that have both High and Medium Impact BES Cyber systems. SDG&E also feels that instead of using the word "impact" for these Requirements, apply a concept of "risk" for inclusion. We would want to identify the risks with associated systems security and protect accordingly.
36.30	Con Edison of New York	Disagree	Section 15 & 16 should be limited to networked systems. Isolated microprocessors not part of a network should not have the same requirement.
36.31	ISO New England Inc	Disagree	see answer to question 35
36.32	Progress Energy (non-Nuclear)	Disagree	See comment 14.
36.33	WECC	Disagree	See comments for Q35Criteria should aplpy to all impact levels
36.34	LCEC	Disagree	See previous comments
36.35	BCTC	Disagree	See response to Q35.
36.36	Hydro One	Disagree	see response to Question 35
36.37	Entergy	Disagree	See response to Question 35 immediately above.
36.38	Northeast Power Coordinating Council	Disagree	See response to Question 35.

#	Organization	Yes or No	Question 36 Comment
36.39	ReliabilityFirst Staff	Disagree	Suggest “Required” for Medium Impact in rows 15.1, 15.2, 15.3, and 17.2. Suggest “Required for external connectivity only” for Medium Impact in rows 19.1 & 19.2.
36.40	Duke Energy	Disagree	Table 18: Manual reviews every 7 days is not practical.
36.41	Consultant	Disagree	Table R15 - Item 15.3 The requirement to "Implement processes to test and update malicious code protections." is confusing. Is the intent to "test malicious code protections and update malicious code protections" or to "test updates to malicious code protections" Please clarify the intent. There is a need to distinguish between updates to the malicious code protection "software" and malicious code protection "signature files". The software should be implemented in accordance with change control processes. The "signature files" are a specific subset of update to malicious code protection where it is unlikely a registered entity would have the capability to test what are typically vendor proprietary file formats. The extent of the 'testing' necessary for these signature files should be clarified.Table R16 - Item 16.2 While the concept of a "fixed date" sounds good, the requirement should allow for reasonable scheduling, including rescheduling, of the installation of applicable security patches or completion of mitigating measures. An option could be to remove the words "with a fixed date" and add a new item that would require that "Events that delay a security patch implementation schedule greater than thirty days shall be documented."Table R17 Item 17.1 The first sentence uses the terminology "network accessible ports and services" and the second sentence uses the terminology "network accessible services and communication methods". Suggest using consistent terminology to avoid confusion.Suggest defining the term "network accessible ports and services" (may be multiple terms) as they are intended for use in the standards. There does not appear to be a standardized definition for this term in the industry. The term "network accessible ports and services" appears to imply access across the protection boundary? If it does then the requirement statement of "Required for external connectivity only" is unnecessary and should be changed to "Required".Table R18 - Item 18.3 Suggest changing the word "within" to the word "for" for clarity of

#	Organization	Yes or No	Question 36 Comment
			meaning.Item 18.4 - Weekly log review appears to create an excessive administrative burden without a corresponding decrease in risk to the High Impact assets. Items 18.1 and 18.2 require continuous monitoring of the same activity. Manual log review is redundant to these requirements. While there may be a reason for manual log review to confirm the continuous monitoring is occurring as expected a more reasonable periodicity of monthly or quarterly should be required for both Medium and High Impact assets.Table R19 - The limitation of these items to a Control Center is an added dimension of Impact that is not included in the impact categorization criteria. If data is an issue, then these requirement should apply to all assets based on impact categorization without addendum or modification by the requirement. Suggest modifying the impact categorization criteria to clearly identify those assets.Table R19 - "Inbound data" implies remote access, and the terminology "Required for external connectivity only" is redundant. Suggest changing the wording to "Required".Items 19.1 and 19.2 are inconsistent. Item 19.1 requires validation of inbound data, and item 19.2 provides an exception to validation for encrypted data. If you comply with item 19.1, then item 19.2 is irrelevant. If you comply with item 19.2, then you are in violation of item 19.1.R19 - Overall, this requirement should be removed in it's current form. Automatic system operation cannot exist if "inbound data" is required to be validated. Automatic system operation is dependent on responses to external data inputs. If the intent is to return the BES to manual operation, this requirement will achieve that end.
36.42	Alberta Electric System Operator	Disagree	Table R15 - make 15.1, 15.2, 15.3 required for Low Impact BES Cyber Systems, but possibly on a longer time horizon than for Medium and High Impact BES Cyber Systems.Table R16 - make 16.2 required for Low Impact BES Cyber Systems.Table R17 - make 17.1 “Required for external connectivity only” for Low, and “Required” for Medium and High. Make 17.2 required for Medium also.Table R18 - make 18.1 and 18.2 required for Low Impact systems. Make 18.3 90 calendar days for Low Impact systems. Make 18.4 30 calendar days for Low Impact systems.

#	Organization	Yes or No	Question 36 Comment
36.43	Idaho Power Company	Disagree	The review of logs every 7 days or even 30 days is extreme unless the logs are filtered for only abnormal events and only logs of abnormal events are reviewed.
36.44	Ameren	Disagree	The system hardening in Table for R17 is rendundant when other standards already restrict physical access to these systems.â€,â€,â€,R18.1, R18.2, R18.3, and R18.4 - Log file monitoring at Medium Impact Systems will be costly as there may not be bandwidth available to send the logs to a central location to be reviewed. Suggest removing these requirements for Medium Impact Systems.
36.45	Allegheny Energy Supply	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. Externally accessible physical ports not needed for normal and emergency operations on BES Cyber System Components are already subject to physical protection requirements.Requirement 18.1 needs to have refined requirements based on the characteristic of the devices to be protected. Not all BES Cyber Systems have the ability to capture or transmit cyber security logs. These requirements should be written in a manner to exclude a requirement for TFEs. The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 18.2 creates the need for 100% perfection regarding security monitoring. This is not appropriate. Suggest the following language for 18.2: “Implement and document one or more security processes for security monitoring that issue alerts for detected system events related to cyber security.”Requirement R19 creates a potentially impossible level of obligation for responsible entities. The requirements should be more refined based on the characteristics and ability of the devices to be protected. Not every device has the ability to review or evaluate the data that is present to it.

#	Organization	Yes or No	Question 36 Comment
36.46	Allegheny Power	Disagree	There needs to be more refined requirements based on the characteristic of the devices to be protected. In addition, the requirement should acknowledge that certain BES Cyber Systems may not be updated with security patches until the patches are certified for use by the vendor or integrator of the BES Cyber Systems. These requirements should be written in a manner to exclude a requirement for TFEs.The creation of a mitigation plan should not be deemed an exception requiring a TFE.Requirement 17.2 does not add to the reliability of the BES. 37. Requirements R20 to R22 of draft CIP-011-1 concern procedures for boundary protection. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R20 to R22? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note: CIP-011-1Requirements R20 through R22 have moved to CIP-005-5 Requirement R1.

Many commenters suggested phrases or aspects of the requirements that needed to be clarified. Several commenters questioned the need for weekly review of log entries, indicating that reviewing log entries at this interval would be burdensome with little or no positive impact on reliability.

Several commenters suggested reverting to the old name of Electronic Security Perimeter in place of Electronic Boundary Protection. In addition, several commenters suggested removing the system boundary protection requirement because it is overly prescriptive.

The drafting team agrees with commenters that some aspects of the requirement were too prescriptive, and has made significant changes to update the requirement both to clarify it and make it less prescriptive, while still addressing FERC Order 706 directives. The drafting team also agreed to revert to the Electronic Security Perimeter designation.

#	Organization	Yes or No	Question 37 Comment
37.1	WECC		Agree with concept, however, some work on the wording might make this more clear. R21 should have an additional item 21.3 - Cyber System components will not be shared with non-BES cyber systems or BES Cyber Systems of different impact levels.The former requirements for ESPs were better. The new language describing access points on communication paths may be an indirect way to get there, but it does not make things clearer or more auditable. This method of describing controls will make matters more complex and create additional work for entities.
37.2	GE Energy	Agree	"Logical Separation." Logical separation should be clarified. Logical separation could mean network access separation through an access point or it could be account separation by having separate user, system or service accounts that are different

#	Organization	Yes or No	Question 37 Comment
			amongst BES systems.
37.3	USACE - Omaha Anchor	Agree	Define 'unauthorized access attempts' is this a ping, or is this when a bad password is given to the system.
37.4	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.R20.20.2 - How does one implement a deny access by default for a dialup modem? That effectively either takes the modem out of service, or if you were to rely on the PSTN to do any kind of 'validation' of the incoming call, this is at best security through obscurity as it is trivial to spoof the callerid which is the only form of data validation that can be done over a dialup line.20.4 - What does "unauthorized access" mean? Does that mean an access attempt? Would a port scan of a firewall qualify as "unauthorized access"?20.5 - What does "unauthorized access" mean? If something as simple as a connection attempt qualifies, this requirement puts a tremendous burden on staff to track every little event that might happen on the firewall, and would not accomplish much in the end. If the intent of the standard is to keep unauthorized login attempts at bay, it should say that.R21.21.2 - Communication through an "electronic access point" for dial-up communications could prove difficult for some devices. Some devices are extremely sensitive to any sort of jitter introduced to a data stream, and having a security device in front of these kinds of devices may introduce enough jitter to make the communications unusable. R22.This seems duplicative of R14, R16, R18 and R23. FMPA suggest modifying those requirements to incorporate the protective cyber systems elements.22.2 - This should be consistent with R16; medium should be required to patch access control points. Also, low should have to patch at least quarterly. For access points, consider forcing high impact to asses 'critical' patches within 7 days.
37.5	Green Country Energy	Agree	Footnotes, guidance document?
37.6	Exelon Corporation	Agree	If systems are connected to a master station/location that is a BES Cyber system, do all the connected systems become BES Cyber systems? At what level do these

#	Organization	Yes or No	Question 37 Comment
			requirements apply - for example at the relay level where someone is logging into the relay? Exelon would like clarification on the definition of the electronic access point - is it at the component level or at the system level?
37.7	Progress Energy - Nuclear Generation	Agree	R20-22 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
37.8	Independent Electricity System Operator	Disagree	- R20.1 R20.4 20.5 and 20.6 External and External connectivity needs to be defined. External to BES Cyber System or components, boundary, connections with 3rd parties? What if multiple BES Cyber Systems are in the same boundary? - - R20.5 Please define
37.9	National Grid	Disagree	1. National Grid requests clarification on “all communication paths” in 20.1 which can be every possible communication path between two end points. The entity should be required to document only external communication paths with dial up access or routable protocol. Recommend removing R20.1 and 20.2 from LOW impact category.2. National Grid recommends removing “within the following time period” from 20.5 and 20.6. Also, for dial ups it would be difficult to review the alerts in the given time period. Suggest 30 days for logging related to dial-ups. 3. National Grid recommends that 20.6 be re-worded to be consistent with FERC Order P526 - “Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs.”4. National Grid recommends that 20.6 High Impact BES CS should be 30 calendar days since 18.2 continuous monitoring satisfies the NOPR directive of seven days. Also should it be included for Medium Impact BES CS?5. National Grid recommends removing 21.2 since it is covered in 20.26. National Grid recommends removing R22 since it is redundant and move it’s table into the respective Requirements o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23

#	Organization	Yes or No	Question 37 Comment
37.10	Dairyland Power Cooperative	Disagree	20. What are the boundary rules for serial connectivity vs. routable protocols. Serial connections can be external to different systems and they can be internal. How do we determine if there is a boundary to protect?21. The logical separation rule needs more detail "Logical Separation" should have a definition. What is the impact for an RTU field device than can be scanned by multiple systems or entities? Is the mere configuration of available data on each physical or logical port enough to satisfy logical separation? What about components used as system-to-system gateways?
37.11	Regulatory Compliance	Disagree	20.1 - clarify - are these communication paths external to the electronic boundary?20.2 - clarify - This implies a firewall for even low impact?20.3 - guidance on what required elements to document20.6 - Clarify if this is for firewall logs only21.1 - Major clrification needed - what about BES Sytems that rely on input and out from system to system in having the logical separations?
37.12	Dominion Resources Services, Inc.	Disagree	20.1. The language "Document all communication paths" is too vague and suggests a need to map out the entire LAN/WAN infrastructure. Based on the May workshop discussion, the intent of the requirement is to document inputs and outputs associated with the BES Cyber System. Dominion recommends the following alternate wording for R20.1:"Document all digital interfaces associated with each BES Cyber System."20.4. Dominion recommends revising the language of this requirement to read:"Document and implement one or more processes for logging all access attempts at each electronic access point."Firewall logs cannot identify all "actual unauthorized access." Someone using a trusted source to gain access to a BES Cyber System would be permitted through a firewall. That is "actual unauthorized traffic" but it is not detectable. Blocked access attempts are shown in firewall logs as a dropped or denied entry.20.5. As explained in the comment for requirement 20.4, firewall logs cannot identify all "unauthorized access attempts." Therefore, Dominion recommends rewording this requirement to read as follows: "Document and implement one or more processes for alerting and review of alerts by designated response personnel at each electronic access point within the following time period."

#	Organization	Yes or No	Question 37 Comment
			20.6. Compliance with this requirement is labor intensive and, therefore, not practical for a large number of BES Cyber Systems. Requiring a manual review every 7 days is excessive for the benefit received and does not make allowances for reviewer unavailability due to sickness, emergency work or vacation. At minimum Dominion recommends extending the review requirement to every 30 calendar days or revising the requirement to allow for selected BES Cyber Systems to be reviewed every 7 calendar days as follows: "Document and implement a process for manual review of a sampling of log entries or sorted or filtered logs for selected BES Cyber Systems within the following time period."21.1. The word "either" should be inserted after the word "provide." The phrase "or controlled access from one system to the other" should be added after "between each system." This modification is reflected in the revised language below: "Cyber System Components in Control Centers that are shared between BES Cyber Systems must provide either logical separation that prevents access between each system or controlled access from one system to the other."The issue is devices that provide a gateway between 2 systems. An example is the node that passes data between the EMS and ICCP networks.
37.13	Network & Security Technologies Inc	Disagree	20.2 - Current wording could be interpreted to mean an access point is required between a BES Cyber System and any other BES Cyber System the Responsible Entity may have defined, even if on a shared network. Could also be interpreted to mean access points are required on a per routable protocol basis. Assuming these interpretations were not intended, 20.2 should be rewritten for greater clarity.20.3 - Except for "document," this requirement seems to duplicate 20.2.20.6 - Wording suggests this requirement applies to all BES Cyber Systems. Is this what was intended, or is it to be applied to access point devices? Please clarify.21.1 - Please clarify intent and applicability of this requirement. Is it intended to apply to virtual machines? Disk arrays shared by multiple application servers? Both? Neither?21.2 - Redundant if all access points are properly identified. Suggest eliminating it or combining the statement with one of R20's sub-requirements.R22 - Seems to overlook physical protections for cyber systems that establish electronic boundaries.22.4 - Configuration changes such as updating access control settings on a firewall or

#	Organization	Yes or No	Question 37 Comment
			revising the physical access permissions associated with a card key should not be subject to this requirement, and it should so state.
37.14	American Electric Power	Disagree	20.2 & 20.3: Regarding "Document and implement access control at each electronic access point established in Part 20.2", is this redundant to R14 - lines 14.1 through 14.3? Suggest rewording or removing if it poses double jeopardy.20.6: Regarding "Document and implement a process for manual review of a sampling of log entries or sorted or filtered logs for each BES Cyber System within the following time period", does this provide any security benefit? If a system event for cyber security was missed by an automated tool, is it reasonable to expect it to be found in a manual review? What is an entity supposed to look for in this manual review?21.2: Regarding "Cyber system components that provide external communication to the BES Cyber System must only communicate externally through an electronic access point as specified in Requirement R20", it appears that this is a restatement of the elements of R20. If that is not a correct assumption, the SDT need to provide additional information.
37.15	ERCOT ISO	Disagree	20.2: Recommend using “ingress or egress point” instead of “access point”. 22.1-22.3: Please remove reference to other standard. Address the content in the appropriate standard only. The circular references in the existing standards are very difficult to navigate and provide opportunity to miss the requirement.
37.16	BGE	Disagree	20.5 timeframe should be consistent for medium and high.
37.17	Alliant Energy	Disagree	Alliant Energy agrees with the EEI comments.
37.18	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
37.19	Southwest Power Pool Regional Entity	Disagree	Clarify the requirement. A reader could interpret the criteria as requiring an access point between each defined BES Cyber System regardless of network segment placement. 20.4: More often than not, authentication is performed at the end host

#	Organization	Yes or No	Question 37 Comment
			system. Rather than prescribing logging of attempted or actual unauthorized access at the access point, simply require such logging at the point such unauthorized access is detected. 20.6: What are the minimum expectations for a log sampling program (e.g., how much, how often?). 21: Clarify that shared BES Cyber System Components (e.g., a networked storage device) must be afforded the highest impact categorization of all of the BES Cyber Systems sharing the component (similar to the sharing aspect of the electronic access point definition). 22: Include the requirement to protect the access control system from unauthorized physical access.
37.20	CenterPoint Energy	Disagree	Disagree - R20.2 CenterPoint Energy suggests striking the word dial-up. If dial-up is not stricken a TFE may be required to comply with this requirement for serial dial-up paths.CenterPoint Energy believes requirements, R20.3-R20.6, may require a TFE for compliance for non-routable protocols.R20.6 CenterPoint Energy believes the 7 day calendar requirement to review sampling of log entries is overly burdensome and unnecessary. Controls and alert processes to notify appropriate personnel of unauthorized access attempts are mandated in prior requirements. CenterPoint Energy recommends a 30 day review.
37.21	E.ON U.S.	Disagree	E.ON U.S. interprets R20.1 to require documentation of “all” communication paths which could include communication links to all RTUs, etc. This level of documentation is not necessary
37.22	Duke Energy	Disagree	Elimination of terms such as electronic security perimeter without a completely thought through substitute concept contributes to industry frustration. The industry, at least, had come to understand the concept of an ESP. How the “boundary” is identified does not seem well thought through. In the text box, information such as “...cyber systems sharing one or more common electronic access points ...will be treated at the highest BES Cyber system impact categorization level of the BES Cyber system...” seems to belong in CIP 010 where the actual categorization occurs. This information is NOT a technical control and does not seem to belong in CIP 011. Rather it provides additional information concerning the categorization. This standard

#	Organization	Yes or No	Question 37 Comment
			will cause entities to document a lot of confidential information, which then must be protected. R20 - electronic security perimeter is a retired term, suggest replacing with a different term.Table 20: 20.2 is confusing for initial setup processes. How can we explicitly authorize?Requirement 20.2: The electronic access point can therefore be shared between systems as defined in the text box beside R20. For generation stations in particular, there are many connections between equipment that are required/desired for the plant to operate (e.g. feedwater control system to the plant process computer in a nuclear station). Sharing such an access point is highly desirable. Requirement 20.2, as written, seems to contradict the definition in the text box in requiring that the Responsible Entity establish an electronic access point on EACH routable protocol or dialup communication path between BES Cyber Systems.Requirement 20.4: this requirement makes sense if remote/external access is defined by the "shared access point" as described here (which seems to be in agreement with comments made in sections R11, R12, R13, where the emphasis was on communication between the devices rather than "at the access point").Requirement 20.6: please consider including the words "related to electronic boundary protection" to make the sentence read as follows: Document and implement a process for manual review of a sampling of log entries or sorted or filtered logs relating to electronic boundary protection for each BES Cyber System within the following time period. Also, where logs are accumulated, there is no way to tell if the user was internal or external to the edge device.Table 2121.1 Suggest changing 'prevents' to 'limits' or remove 'that prevents access'. Within Generation, that access is required. Also, Does "logical separation" include "virtual separation"?21.2. Verify this is not just for control centers.
37.23	RRI Energy	Disagree	For 20.1, define communication path, eg., source and destination(s) only or everything in between?For 20.5, what does "all unauthorized access attempts" mean? If an operator fat-fingered login password, does the standard expect alert and follow up each time? "all unauthorized access attempts" needs to be redefined with some threshold before declaring it as unauthorized access attempt. Otherwise, Entities and operators will spend a lot of time documenting unauthorized access and instead of

#	Organization	Yes or No	Question 37 Comment
			securing their assets.
37.24	Northeast Utilities	Disagree	For 20.5, please provide clarification on the meaning of "all unauthorized access". Every password violation for example, is not an unauthorized access attempt but could be interpreted as such. Do we really need to follow-up on every invalid password attempt? Instead of every invalid password attempt, are password lockouts an appropriate trigger? Also, please consider addressing repeated lockouts in the criteria specified.R22 appears to be significantly weaker than the previous standards. One area that is specifically weaker is with regard to access control to Protective Cyber Systems. How can an entity not authorize, review and revoke a role as important as a firewall administrator?
37.25	Constellation Power Source Generation	Disagree	In R20.1 as well as the definition box, the term digital information needs to be defined further. R21 inherently forces entities to further segment their BES Cyber Systems, which is counter to the entire premise of allowing the entities to define their own BES Cyber Systems. Allowing the entities to define their own BES Cyber Systems would limit the scope of an attack, which the SDT stated in the CIP V4 Workshop as their goal in R21. Constellation suggests removing this requirement entirely. Likewise, R22 should be removed as it is completely redundant. Note that in each sub requirement it merely points to another requirement in the document. A suggestion would be to implement the verbiage found in Table R22 to each of the requirements it points to.
37.26	Alberta Electric System Operator	Disagree	In Table R21, was the intent of 21.1 only for Control Centers? The AESO would suggest removing the Control Center parameter and make 21.1 applicable to all High and Medium BES Cyber Systems.
37.27	Constellation Energy Commodities Group Inc.	Disagree	Is the intent to require use of hardware firewalls? If so, is it possible to state that clearly? If not, what is the intent?
37.28	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).

#	Organization	Yes or No	Question 37 Comment
37.29	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's observations below:Suggest using electronic security perimeter rather than “Boundary Protection.”Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.For R 20.5: Document and implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.For R 20.6: Document and implement a process for manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.R21: Suggest using electronic security perimeter rather than “System Boundary Protection.”Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.There may need to be additional requirements for “Protective Cyber Systems” to include remote access controls, patch management, security event alerting, change control and change management.
37.30	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R20, but recommends changes as follows: o Regarding Part 20.2, since Low Impact BES Cyber

#	Organization	Yes or No	Question 37 Comment
			Systems do not require any Physical Security as defined in previous requirements, it seems inconsistent to require electronic access point security for those systems. o Regarding Part 20.4, how does the Standards Drafting Team envision that a Registered Entity would log "actual unauthorized access?" Actual unauthorized access is not identifiable since it would appear to have been authorized (or the attempt would not have succeeded. o Regarding Part 20.4, in reading and applying the definitions of "remote access" and "external connectivity," remote access is a specific type of external connectivity. Therefore, any reference to criteria for remote access based on whether or not it is externally connected is redundant. o Is it the Standards Drafting Teams intent that Part 20.5 require an after the fact review of unauthorized access attempts? If so, it may not be possible to adhere to proposed timeframes, especially in instances where BES Cyber System support is 8 hours a day, 5 days a week. If it is the Standards Drafting Teams intent that Part 20.5 address responding and monitoring a potential malicious attack situation, then the time frames are not sufficient.Minnesota Power generally agrees with the proposed Requirements R22, but recommends changes as follows: o The language in Part 22.1 creates confusion. The requirement states that remote access is to be restricted as stated in R14 and that for Low Impact BES Cyber Systems this is required. However, in reviewing Requirement R14, only Part 14.1 is required for Low Impact BES Cyber Systems. As a result, does this mean that only Part 14.1 needs to be implemented for Low Impact Cyber Systems in 22.1 or do 14.1-14.4 need to be implemented? The same should be addressed for Medium Impact BES Cyber Systems. o The same type of confusion regarding the language in Part 22.1 exists in Parts 22.2, 22.3, and 22.4. The Standards Drafting Team should consider whether these cross-references are necessary. It does not appear that Parts 22.1-22.4 are identifying specific criteria, but rather are a reminder that these assets need to comply with R14, R16, R18, and R23.
37.31	NextEra Energy Corporate Compliance	Disagree	NextEra believes requirement 20.1 is unclear as written. Is the communication path expected to end at each and every end point that receives digital information to each BES Cyber System? If this communication path is to each end point, it would be difficult to demonstrate compliance. Does compliance to this requirement also

#	Organization	Yes or No	Question 37 Comment
			require all the communications paths within a WAN or ISP?Requirement 20.2 does not allow a responsible entity to put more than one BES Cyber System inside an access point since it requires access points between systems. This is highly inefficient and creates access points where not needed and could potentially impact the reliability a BES Cyber System. It is unclear why the requirements are moving away from the well established ESP concept. This concept is well established in 'defense in depth' and other security frame works. The requirements for boundary protection should follow the ESP model from V1 and V2 of the NERC CIP requirements. In addition the definition also (inadvertently) conflicts with the definition given at the start of this requirement related to access points and therefore is open to interpretation by auditors.Requirement 20.4 requires the documentation and implementation of one or more "processes for logging of all authorized remote access and all attempts at or actual unauthorized access at each electronic access point." Until the definition of remote access is clearly defined, it is unclear how responsible entities must comply and demonstrate compliance. In addition, it is unclear if remote access is considered any an access attempt from outside of the access point.Requirement 20.5 requires, "Document and implement one or more processes for alerting and review of alerts by designated response personnel on all unauthorized access attempts at each electronic access point within the following time period." The responsible entity should be able to determine the threshold for unauthorized access attempts. The way the requirement is written now, personnel would have to investigate every single denied access attempt including someone who accidentally fat fingered their credentials when trying to gain authorized access to a BES Cyber System component. The recommended approach would be to require a review of 4 or more failed attempts against a common UserID without a successful login within 1 hour. Also consider more than X total bad access attempts within one hour for User ID brute force attacks or reconnaissance. Also, in 20.1, please define what is meant by the word "paths" Is it logical or is it physical path?In 20.4, is a single failed login classified as an attempt? The wording states "all attempts at or actual unauthorized access at each electronic access point"In 21.1, does this mean that for example, a SAN

#	Organization	Yes or No	Question 37 Comment
			(Storage Area Network) can be shared by Cyber System Component and other devices as long as there is logical separation?In 21.1, if two BES Cyber Systems "share" a network switch, does this meet the requirement of "logical separation"?
37.32	PacifiCorp	Disagree	PacifiCorp agrees with EEI's observations below:Suggest using electronic security perimeter rather than “Boundary Protection.”Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.For R 20.5: Document and implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.For R 20.6: Document and implement a process for manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.R21: Suggest using electronic security perimeter rather than “System Boundary Protection.”Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.There may need to be additional requirements for “Protective Cyber Systems” to include remote access controls, patch management, security event

#	Organization	Yes or No	Question 37 Comment
			alerting, change control and change management.
37.33	Puget Sound Energy	Disagree	Puget Sound Energy has the following comments:R21.1 - Puget Sound Energy has concerns that Cyber System Components that are shared between BES Cyber Systems must provide logical separation. For example: For entities with Control Centers that utilize a Microsoft infrastructure, multiple BES Cyber Systems may centrally authenticate (or have logical security controls) facilitated by a single or clustered Microsoft Active Directory domain controller. As the requirement is currently written, Puget Sound Energy feels that those shared domain controllers would not be able to reside on the same local area network segment as the domain they participate in. Puget Sound Energy requests clarity be added in to this requirement.Table 22 - Puget Sound Energy suggests including "Where Technically Feasible" to R22, as some Protective Cyber Systems may be incapable of meeting all the requirements in Table 22.Puget Sound Energy suggests aligning Table 11 with Table 12. Table 13, Table 14, and Table 22. Puget Sound Energy suggests including wording similar to Table 11: "Required for external connectivity only".
37.34	LCEC	Disagree	R20 - 20.1 Must define what is included in communication paths. If needed specify physical interface. Digital information is actually digital data, control, or signals.20.3 is not auditable. What is access control. There is no defined scope.20.5 includes requirements for cyber incident response which is covered in a later requirement.Need to clearly identify what is considered an access point on multiple interface devices.20.6 what's the difference between this and 18.4?21.2 A BES Cyber System could include components at different physical locations that communicate with each other. This is not technically external to the system so does it apply here?
37.35	FirstEnergy Corporation	Disagree	R20 - 20.6 - Need greater clarity around whether automated alarming can be used rather than manual review of logs. This sub requirement is unnecessary with an automated system in place.R21 - We agree with the use of 'logical separation' in this requirementR22 - We do not like the way R22 refers back to other requirements. This

#	Organization	Yes or No	Question 37 Comment
			is redundant and the requirement should be eliminated.
37.36	Consultant	Disagree	R20 - The terminology appears to be incorrect. Electronic access points do not define an electronic security perimeter. It also seems odd to say the defined term Electronic Security Perimeter is going to be retired, and then use that same term to define a requirement. "Electronic Boundary Protection" is created by identifying an electronic security perimeter based on the logical network connections of cyber assets, which includes electronic access points for External Connectivity that provides Remote Access to the assets within the electronic security perimeter. Suggest retaining the term Electronic Security Perimeter as described here.Table R20 - Items 20.1 & 20.2 - This appears to be "Identifying the Electronic Security Perimeter" as describe in the comment above regarding the usage of the term Electronic Security Perimeter, but stated in more confusing language in both cases.Item 20.3 Suggest rewording as "Implement and document access control mechanisms for each electronic access point (to the Electronic Security Perimeter)."As a general comment you would "implement and document" rather than "document and implement"Item 20.4 Suggest rewording as "Implement and document access attempts and access authorizations at each access point." Item 20.4 - The terminology "Required for external connectivity only" is redundant as the access point is where external connectivity occurs. Suggest changing to "Required"Item 20.5 contains two requirements:1. Implement and document processes to identify unauthorized access attempts at each electronic access point.2. Responsible entities shall review unauthorized access attempts in the time frame specified.Item 20.4 - The terminology "Required for external connectivity only" is redundant as the access point is where external connectivity occurs. Suggest changing to "48 hours" & "12 hours".Item 20.4 - It would appear to create an excessive administrative burden without corresponding decrease in risk to require this review every 12 hours for High Impact Assets. Suggest changing required review time to "Daily".Item 20.6 - The requirement statement is subjective in regard to the degree of sampling, sorting, and filtering allowed, expected, or required. This is a requirement similar to event log review of Table R18 - Item 18.4 and the wording of these two requirements should be similar.Item 20.6 -

#	Organization	Yes or No	Question 37 Comment
			This requirement is regarding access through electronic access points and "7 calendar days for external connectivity only" is redundant. Suggest deleting "for external connectivity only"Item 20.6 - Weekly log review appears to create an excessive administrative burden without a corresponding decrease in risk to the High Impact assets. Items 20.4 and 20.5 (as commented) require continuous monitoring of the same activity. Manual log review is redundant to these requirements. While there may be a reason for manual log review to confirm the continuous monitoring is occurring as expected a more reasonable periodicity of monthly or quarterly should be required for both Medium and High Impact assets.Items 20.1, 20.4, & 20.5 - Delete the word "all" It is redundant and unnecessary to the requirement statement. (The word "all" should be removed from "all" requirement statements in the standard")Table R21 - Item 21.1 This requirement appears to create a mutually exclusive situation where shared cyber system components are separated. The wording needs to be clarified or, as it is worded it should be deleted.Item 21.1 The application of the requirement to control centers creates an added dimension to the impact categorization. The application of requirements is based on impact categorization. Modify the impact categorization criteria to capture the assets where this requirement should be applied.Item 21.2 This item appears to restate what is previously stated in the referenced R20. If some additional requirement is intended, then that requirement should be included in the reference R20 requirements list, rather than a 'hidden' requirement that is cross-referenced here.R22 - This requirement appears to be redundant. The requirements referenced in the Table R22 (R14, R126, R18, & R23) appear to include whatever is listed in this requirement. If there is some additional requirement that is intended, that requirement should be put in the respective referenced requirements. Each requirement statement and table should be contain everything related to that requirement, rather than having a separate requirement that 'adds' to other requirements.
37.37	Xcel Energy	Disagree	R20.1 - The definition and level of detail for “communication paths” is needed. For example, does this include a commercial telephone carrier used to communicate between relays?R20.2 - Clarifying language is needed for “Establish an electronic

#	Organization	Yes or No	Question 37 Comment
			access point". Does this mean in documents, drawings, etc?R20.5 - This requirement needs clarification. Are these intended to be automatically generated alerts, such as logs? The current language could be interpreted to require a 12 hour review of a login attempted that failed due to an incorrectly typed login ID, as automated software may interpret this as an authorized login attempt. Also, 12/48 hours to complete a review of a failed unauthorized login attempt is unreasonable and unnecessary. R21.1 - We would like additional information on what type of "logical separation" is expected.
37.38	Ameren	Disagree	R20.1 - This will require use of a firewall at all locations or similar devices. Simply documenting this information is not practical for non routable devices. Also, clarify if communication paths, refer to physical equipment or locical paths. R20.2 - What is the difference between R20.2 and R20.3? Suggest combining the two requirements.R20.5 - 12 hours does not allow for weekends or for events that occur outside business hours. This should be increased to 24 hours or lowered to 24x7 (continuous). Also, need to clarify whether the alerts need to be reviewed during the time frame given (48 hours, 12 hours, or 7 days) or that alerts need to be sent every 48 hours, 12 hours, or 7 days. Please clarify how often should alerts be sent and how often do they need to be reviewed. R21.2 - Where does an RTU or serial communication fit into this requirement? Need to add more clarification on this requirement of what devices are included. R22 - Need to add requirements at a minimum for account listings, approvals, and access controls. There are no considerations for risk assessment or training for users of these devices. Also, these devices should be included in the Vulnerability Assessment.
37.39	US Bureau of Reclamation	Disagree	R20.2 should be modified to read "Establish an electronic access point on each routable protocol or dialup communication path between BES Cyber Systems." Define the use of "other devices" in this context. R20.4 - add "where feasible" to this requirement.R21.2 - Please provide and example...

#	Organization	Yes or No	Question 37 Comment
37.40	Entergy	Disagree	R20.5 Entergy cannot understand the reasoning behind the criteria of 12 hours? Why not 6 or why not 24?R21.1 is unclear and must be reworded to better reflect exactly what the SDT had in mind. We cannot guess at what that might have been.R22 - Entergy suggests R22 apply equally for high, medium and low assets; and thatthe requirements for processes and procedures in this section should be placed back into each of the respective sections (R14, 16, R18 and R23).
37.41	Western Area Power Administration	Disagree	R20.6 - Is this a requirement to review, and document the review, of logs weekly?R21.2 - Unclear. Does it mean our "one-way" rule from internal to external? Or does it mean use a proxy located outside the ESP?
37.42	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R20.6. With the obligation of reviewing alerts designated in R20.5 the requirement for manual review of logs should be extended to a 30 day window.
37.43	BCTC	Disagree	R22. Suggest just removing this requirement as it just references previous requirements
37.44	Hydro One	Disagree	Request clarification on “all communication paths” in 20.1 which can be every possible communication path between two end points.Recommend removing R21 because: o 21.1 is prescriptive in requiring Entity’s to segment their BES Cyber System o 21.2 is covered in 20.2Recommend removing R22 and move its table into the respective Requirements: o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23
37.45	ISO New England Inc	Disagree	Request clarification on “all communication paths” in 20.1 which can be every possible communications between two end points20.3 should be part of 20.2 - denys and explicit allows might be better language. R20.5 Please define what is an unauthorized access attempt. A user may be authorized but may try to connect using telnet where telnet is disabled. Is this considered unauthorized? Recommend

#	Organization	Yes or No	Question 37 Comment
			removing R21 because: o 21.1 is prescriptive in requiring Entity's to segment their BES Cyber System o 21.2 is covered in 20.2Recommend removing R22 and move it's table into the respective Requirements o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23R21.1 = question on what is "logical separation" very vague
37.46	Northeast Power Coordinating Council	Disagree	Request clarification on "all communication paths" in 20.1 which can be every possible communication path between two end points.Recommend removing R21 because: o 21.1 is prescriptive in requiring Entity's to segment their BES Cyber System o 21.2 is covered in 20.2Recommend removing R22 and move its table into the respective Requirements: o Move 22.1 into R14 o Move 22.2 into R16 o Move 22.3 into R18 o Move 22.4 into R23
37.47	Oncor Electric Delivery LLC	Disagree	Requirement 20.4, 20.5 and 20.6 are not applicable to some legacy cyber systems. These requirements should only be required for systems which utilize routable communication.Requirement 22 references other requirements and should be eliminated because it is redundant.
37.48	Garland Power and Light	Disagree	Requirement 20.6 - What we really feel is that this is impractical and should be deleted. However, it was stated at the NERC CIP workshop that the intent was to verify that the automated system capturing various logs off cyber devices was actually capturing each log - intent needs to be added to the requirement or wording changed to better express the intent at a minimum. Requirement 22 - Keep life simple - add the words "and Protective Cyber Systems" after the words BES cyber systems in each of the referenced requirements (14, 16, 18, and 23) and DELETE Requirement 22 - that way, everything is covered by the referenced requirements that this R22 uses
37.49	San Diego Gas and Electric Co.	Disagree	SDG&E feels that R20.1 is not clear. What is the point of documenting paths that transmit or receive digital information external to each BES Cyber System if they may not interface with other BES Cyber Systems? In addition, another observation from SDG&E related to R20.1 has to do with non-routable protocols. If this requirement

#	Organization	Yes or No	Question 37 Comment
			includes the documentation of non-routable protocols, it can become VERY expensive to document "chatty" protocols that broadcast to lots of assets (DHCP and BOOTP, to name just two examples).In R20.2, SDG&E asks for a clarification of the term "explicitly".SDG&E recommends grammatical changes for R20.4. We feel it should read "Document and implement one or more processes for logging all authorized remote access sessions and all successful and unsuccessful attempts of unauthorized access at each access point within the following time period. SDG&E suggests the following changes to R20.5: "Document and implement one or more alert processes that includes review of alerts by designated response personnel..." SDG&E feels that R21.1 is a bit confusing and worthy of discussion. If affected cyber systems and components are on the same network anyway, then what are the benefits of logical separation?
37.50	Allegheny Energy Supply	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection." (In general, using the existing terms where possible will cause much less confusion.)
37.51	Allegheny Power	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection."
37.52	EEI	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection."Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.For R 20.5: Document and implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.For R 20.6: Document and implement a process for

#	Organization	Yes or No	Question 37 Comment
			manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.R21: Suggest using electronic security perimeter rather than "System Boundary Protection."Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.There may need to be additional requirements for "Protective Cyber Systems" to include remote access controls, patch management, security event alerting, change control and change management.
37.53	Progress Energy (non-Nuclear)	Disagree	Suggest using electronic security perimeter rather than "Boundary Protection." Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.Is the relay communications port for local interface with a laptop considered as an electronic access point? If so, this complicates these requirements.R20.1 by external to each BES system do you mean outside individual six walled boundaries?R20.6 is not needed, as long as we do R20.5.For 20.5 - Don't see the need for more than one capability.For 20.6 - change to "document process to ensure automatic monitoring and alerting process is working properly"CIP-011 - R20 - Are communications between Control centers and field RTUs/IEDs which do not employ routable protocols considered remote external communications?R20.6 - Need additional guidance as to what constitutes a manual review and the minimum sampling required.CIP-011 - R21 - Need clarification with guidance as to what constitutes "Cyber systems components in control Centers that are shared between BES Cyber Systems"

#	Organization	Yes or No	Question 37 Comment
37.54	Detroit Edison	Disagree	Table entries 20.4, 20.5, and 20.6 specify external connectivity only. This text is not necessary since the requirement is boundary protection and that implies external connectivity is the scope.
37.55	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS comments on this question, but also provides the following drafting suggestions:R20. Objective:To define an electronic security perimeter thereby minimizing the risk of system intrusion.R20. Requirement:Each Responsible Entity shall document and implement processes that establish electronic access controls point that incorporate the criteria in CIP-011-1 Table R20 - Electronic Boundary Protection. In R20 Table 20.2 we are concerned about the term “explicitly authorized communication.” It is our assumption that a password is sufficient to comply with this requirement. If the drafting team intended another meaning we believe this will not be reasonable and we could not support this definition. We propose the following revised language:Table 20.2: Establish electronic access control on each routable protocol or dialup communications path between BES Cyber Systems and other devices.We recommend that R20 Table 20.4 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. We recommend that R20 Table 20.5 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. We recommend that R20 Table 20.6 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. R21. Objective:To protect each BES Cyber System from other cyber systems by establishing protected boundaries between each cyber system and any shared components. R21. Requirement:Each Responsible Entity shall document and implement processes that incorporate the criteria in CIP-011-1 Table R21 - System Boundary Protection. The APPA Task Force supports the MRO-NSRS proposal to delete criteria in R21 Table 21.2. This is a redundant requirement and would put an entity in noncompliance of 2 requirements for one violation. The APPA Task Force recommends removal of R22. All of the criteria in Table 22.1 - 22.4 refer to previous requirements and will put an entity in noncompliance of 2 requirements for one violation.

#	Organization	Yes or No	Question 37 Comment
37.56	Bonneville Power Administration	Disagree	The objectives of these requirements ("to define an electronic security perimeter thereby minimizing the risk of system intrusion," "to protect each BES Cyber System from other cyber systems by establishing protected boundaries between each cyber system and any shared components," and "to protect each cyber system that establishes physical or electronic boundaries of BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirements rather than appearing at the end of the requirements (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R20Section 20.1 This is unacceptable. The requirement does not limit the extent of the documentation. Conceivably, it could require documentation of the entire Internet, if the BES Cyber Asset had direct or even indirect access to the Internet. The requirement needs to be limited. Recommendation: Remove the requirement. It is difficult to see how to write it in a way that encompasses all possibilities without leading to results such as the one described above. Instead, document external interfaces as part of the configuration management process.20.2: Requiring an electronic access point between a BES Cyber System and any other system produces unacceptable complication, latency, and administrative burden for a facility with multiple BES Cyber Assets in close proximity. As an example: 20.2 would require that all traffic from one BES Cyber System within a Control Center to any other system within the Control Center to go through a firewall or some other access control device. It is unlikely that this was the intent of the entry. Recommendation: Replace "Required" with "Required for external connectivity only", using the redefinition of external connectivity described above.20.3 Similar issue to 20.2 Recommendation: Replace "Required" with "Required for external connectivity only" throughout the table.20.4 - 20.6. Remove, the are already covered under 18.3 and 18.4. R18 and Table R18 require monitoring of all cyber security events, whether at access points or at BES Cyber Systems themselves.20.6. First, the requirement is already covered more clearly in Table R18. Second, it is unclear why a Electronic Boundary Protection requirement should be addressing BES Cyber Systems. Third, The intent is unclear,

#	Organization	Yes or No	Question 37 Comment
			due to the plethora of "ors" in the requirement. It could be that a manual review is always required, using sampled, sorted or filtered logs. It could also be that a manual view of logs is required, using sorted or filtered logs. It could also be that either a manual review or {sorted or filtered logs} is required. Part of the confusion is that filtering is clearly a method to sample, and sorting may be, as well. It would probably be better not to use those terms at all. In addition, there should be a provision to allow automated review of log entries. Recommendation: Delete the entry.Table R21Section 21.1 is completely unacceptable. It is quite possible in a Control Center for a single Dispatch workstation to provid access to several BES Cyber Systems. The requirement in 21.1 would make this impossible. The alternate would be to provide a separate workstation for each such system, which is unacceptable.Section 21.2 is acceptable only with externally connected redefined as described above.R22 and Table R22: These are references to other requirements. It seems that rather than referring to the other standards from this one, it would be cleaner to simply include this requirement as part of those other standards. That is, put the necessary references in R14, R16, R18 and R23.
37.57	Constellation Energy Control and Dispatch, LLC	Disagree	The timeframe in 20.5 for medium and high should be the same.
37.58	ReliabilityFirst Staff	Disagree	To eliminate confusion, we believe the drafting team should develop a definition for “protective cyber system”. We also believe that Table R22 should include an additional requirement stating, “Implement processes as specified in Requirement R15 - System Security.” and make this new requirement TFE eligible. Further, this new requirement should be “Required” for medium and High Impact BES Cyber Systems.
37.59	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
37.60	American Transmission	Disagree	We believe item 20.2 is going to set the stage for numerous TFE’s within the industry. Many devices (i.e., protective relays) do not support explicitly authorized

#	Organization	Yes or No	Question 37 Comment
	Company		communication.We believe items 20.4 - 20.6 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. These items do not appear to be applicable for non-routable connections, and adding this language would assure they are limited to routable and dialup connections only.Items 21.1 and 21.2 use the term Cyber System Components, which is undefined. This term either needs to be defined, or replaced with BES Cyber System Components.Item 21.2 requires that all external communications flow through an electronic access point as established in R20. However, R20.2 only establishes electronic access points for routable and dialup connections. If an entity employs non-routable connections, these would not be defined under R20.2, and thus R21.2 would not allow the entity to communicate through them. We believe item 21.2 should just be deleted, as it seems to add nothing to the standard.
37.61	MRO's NERC Standards Review Subcommittee	Disagree	We believe item 20.2 is going to set the stage for numerous TFE’s within the industry. Many devices (i.e., protective relays) do not support explicitly authorized communication.We believe item 20.4 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. This item does not appear to be applicable for non-routable connections, and adding this language would assure it is limited to routable and dialup connections only.We believe item 20.5 should specify “at each electronic access point established in Part 20.2”, similar to item 20.3. This item does not appear to be applicable for non-routable connections, and adding this language would assure it is limited to routable and dialup connections only.We believe the following should be added to the end of item 20.6: “at each electronic access point established in Part 20.2”. This item does not appear to be applicable for non-routable connections, and adding this language would assure it is limited to routable and dialup connections only. It also makes for a consistent approach with item 20.3.Items 21.1 and 21.2 use the term Cyber System Components, which is undefined. This term either needs to be defined, or replaced with BES Cyber System Components.Item 21.2 requires that all external communications flow through an electronic access point as established in R20. However, R20.2 only establishes electronic access points for routable and dialup connections. If an entity employs

#	Organization	Yes or No	Question 37 Comment
			non-routable connections, these would not be defined under R20.2, and thus R21.2 would not allow the entity to communicate through them. We believe item 21.2 should just be deleted, as it seems to add nothing to the standard.
37.62	The Empire District Electric Company	Disagree	We believe item 20.2 is going to set the stage for numerous TFE's within the industry. Many devices (i.e., protective relays) do not support explicitly authorized communication.We believe items 20.4 - 20.6 should specify "at each electronic access point established in Part 20.2", similar to item 20.3. These items do not appear to be applicable for non-routable connections, and adding this language would assure they are limited to routable and dialup connections only.Items 21.1 and 21.2 use the term Cyber System Components, which is undefined. This term either needs to be defined, or replaced with BES Cyber System Components.Item 21.2 requires that all external communications flow through an electronic access point as established in R20. However, R20.2 only establishes electronic access points for routable and dialup connections. If an entity employs non-routable connections, these would not be defined under R20.2, and thus R21.2 would not allow the entity to communicate through them. We believe item 21.2 should just be deleted, as it seems to add nothing to the standard.
37.63	We Energies	Disagree	We Energies agrees with EEI: Suggest using electronic security perimeter rather than "Boundary Protection."We Energies agrees with EEI: Suggest changing R20.1 to: Document all communication methods including authentication measures used to connect devices that transmit and/or receive digital information external to each BES Cyber System.We Energies agrees with EEI: There needs to be more refined requirements based on the characteristic of the devices to be protected. Dialup communication path should be defined for clarity.We Energies agrees with EEI: Requirement 20.4 creates the need for 100% perfection regarding remote access monitoring. This is not appropriate. Suggest the following language for 20.4: We Energies agrees with EEI: Document and implement one or more processes for logging of authorized remote access and attempts at or actual unauthorized access at each electronic access point.We Energies agrees with EEI: For R 20.5: Document and

#	Organization	Yes or No	Question 37 Comment
			implement one or more processes for alerting and review of alerts by designated response personnel to unauthorized access attempts at each electronic access point within the following time period.We Energies agrees with EEI: For R 20.6: Document and implement a process for manual validation that ensures that log events are being collected. This review can include of a sampling of log entries or sorted or filtered logs for a sampling of BES Cyber System within the following time period. We Energies agrees with EEI: Not every BES Cyber System has the ability to create or transmit log entries. This requirement should not create the need for TFEs.We Energies agrees with EEI: R21: Suggest using electronic security perimeter rather than "System Boundary Protection."We Energies agrees with EEI: Requirements R21.1 and R21.2 only make sense for components that use a routable protocol. This should be made clear. We Energies agrees with EEI: R22 Needs to include additional scoping language to include or exclude certain devices. For example, proximity card readers may not have any physical protection, but are an integral part of an overall physical security solution.We Energies agrees with EEI: Suggest breaking up requirements associated with the electronic security of systems from the physical security of systems.We Energies agrees with EEI: There may need to be additional requirements for "Protective Cyber Systems" to include remote access controls, patch management, security event alerting, change control and change management.
37.64	GTC & GSOC	Disagree	We recommend rewording R21.1 to provide clear direction on what is expected to comply with this requirement because the wording is ambiguous. We are unable to suggest alternative language because we are not certain of the intent. If this requirement would prevent, for example, the use of a shared backup system for two Cyber Systems we do not see the reliability based justification for the requirement and would recommend its elimination.
37.65	Emerson Process Management	Disagree	What is the difference between "Electronic Access" in R20-R22 and the "Remote and Wireless Electronic Access" in R11-R13?

#	Organization	Yes or No	Question 37 Comment
37.66	Manitoba Hydro	Disagree	What is the meaning of "dial-up"? The wording for Requirement R20.2 is unclear. The suggested wording for Requirement 20.2 is "Establish an electronic access point that denies access by default and allows explicitly authorized communications on each routable protocol or dial-up communication path between BES Cyber Systems and other devices. Requirement R20.2 is inconsistent with Requirement R20.3. It is unclear how explicitly authorized communication is allowed without the implementation of access controls for Low Impact BES Cyber Systems. Requirement R20 does not contain any requirement for response to alerts. The wording for Requirement 21.1 is unclear. The suggested wording for Requirement 21.1 is "Cyber System Components that are shared between BES Cyber Systems must provide logical separation that prevents access between each system." and change the wording in the impact columns to "Control Centre Only". The wording for Requirement R21.2 is unclear. The suggested wording for Requirement R21.2 is "All external communication to the BES Cyber System must occur through an electronic access point as specified in Requirement R20." Requirement R22 is missing the requirement for the physical protection of the cyber system that establishes the physical or electronic boundaries of the BES Cyber System. There are no specifics given with respect to 'logical' separation in Requirement R21.1 so it is assumed to be at the Responsible Entity's discretion to determine.

38. Do you agree with the proposed definition of electronic access point? Please explain and provide any suggestions for modification.

Summary Consideration:

Many commenters agreed with the definition of Electronic Access Point, but other commenters requested clarifications in the definition. A number of commenters recommended changes to language concerning systems sharing an electronic access point. Some commenters suggested removing the sharing of electronic access points from the definition.

In response, the SDT has modified the definition of an **Electronic Access Point** to: *"An interface on a Cyber Asset that restricts routable or dial-up data communications between Cyber Assets"*.

The sharing of electronic access points is likely not an issue because High Impact BES Cyber Systems are Control Centers and would rarely share an Electronic Access Point with Medium Impact BES Cyber Systems.

#	Organization	Yes or No	Question 38 Comment
38.1	WECC		Move to definition to beginning of the standard; dislike the definition box in the middle of a requirement. Make clear that access points can be anything that meets the definition and not only firewalls or devices specifically created for this purpose that must be put "in line". Ie. an Access Point can be the actual device itself providing access control.The phrase "where electronic access can be controlled" will prove difficult to audit. Inherently it allows an exception. All communication paths should be in scope regardless of the ability to control electronic access. It is not foreseen that communication paths could not be controlled.
38.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
38.3	NextEra Energy Corporate Compliance	Agree	Is a serial connection to a BES Cyber System considered an electronic access point? Please clarify in requirements.
38.4	Minnesota Power	Agree	Minnesota Power agrees with the proposed definition of electronic access point, but recommends replacing "All cyber systems sharing..." with "All BES Cyber Systems

#	Organization	Yes or No	Question 38 Comment
			sharing..."
38.5	Duke Energy	Agree	The second sentence is a requirement, not part of a definition; consider moving. Specify that "All cyber systems" only applies to BES Cyber Systems. This definition, particularly the concept of "sharing one or more common electronic access points or components" is much more practical in a power plant environment. See previous comments on R11, R12, R13.
38.6	Public Service Enterprise Group companies	Agree	There is general agreement, but need for clarification in the language in one regard. Please clarify whether this requirement would necessitate classifying a Distribution cyber system at a High Impact level if both the Distribution cyber system a High Impact BES cyber system at substation are interconnected using a single router/firewall device to a communications provider. I.e., effectively an additional router/firewall would be required in this situation to not entail classification of the Distribution cyber system at a High Impact level.
38.7	Consultant	Disagree	According to this definition electronic access point where electronic access cannot be controlled for communication paths that transmit and/or receive digital information would not be considered an access point?An access point should defined as locations where information crosses the established protection boundary, or as the locations where external connectivity or remote access occurs. An access point is not dependent on the ability to control the communication path. The sentence "All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s)." is a requirement. It is not a definition nor part of a definition. The concept is sensible, but still not a definition. Suggest moving this to the requirements table.Suggest modifying this definition to be consistent with "External Connectivity" and "Remote Access" definitions.

#	Organization	Yes or No	Question 38 Comment
38.8	Northeast Utilities	Disagree	Agree in principle with the definition but disagree that all cyber assets sharing the access point will be treated at the highest BES Cyber System impact categorization. This will have a big impact on development and test systems as well as other related but not critical systems. How will this impact DMZ systems which by design are not trusted?
38.9	Alliant Energy	Disagree	Alliant Energy agrees with EEI in that it is appropriate to apply protective measures to the literal ingress points (interfaces) on the electronic access points, but not the requirement to apply protective measures to all of the components that connect to said ingress interfaces (to require this creates a house of mirrors.)
38.10	E.ON U.S.	Disagree	CIP-011, R20.1 See previous comments regarding the definition of “external”.CIP-011, R20.1 “Document all communication paths that transmit and/or receive digital information external to each BES Cyber System.” Does this include the WAN if the defined BES Cyber System is inclusive of multiple sites/locations? All equipment and communication paths such as a Sonet ring?CIP-011, R20.3 The term “access control” should be further clarified. Does implementation of firewall rules alone limiting access as defined in R20.2 meet this requirement, or does this require further mechanisms to provide “access control” on an individual user-basis?CIP-011, R20.4, R20.5, R20.6 See previous comments regarding the definition of “external.”CIP-011, R21.1 How might the logical separation called for here be implemented?CIP-011, R21.2 See previous comments regarding the definition of “external.”
38.11	Progress Energy (non-Nuclear)	Disagree	Communication paths may be better defined by including routable protocol and/or ‘external to the BES Cyber System’.Assuming this is the same as external access point it does seem somewhat repetitious.
38.12	American Electric Power	Disagree	Electronic access point for the purpose of this standard is defined as a point where electronic access can be controlled for communication paths that transmit and receive; or only receive digital information. All cyber systems sharing one or more

#	Organization	Yes or No	Question 38 Comment
			common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).Rational: An electronic access point that provides a transmit and receive path or a receive only path to a BES Cyber System provides an access path into the system to be used for possible exploit. By limiting traffic to transmit only communications the risk to the protected BES Cyber System is reduced since an electronic access point is not provided.
38.13	Entergy	Disagree	Entergy suggests adding specific language to the definition that includes “uses routable protocol or is dial-up accessible”
38.14	APPA Task Force	Disagree	In the APPA Task Force comments for Question 37 we proposed changing electronic access point to electronic access control. We do not feel it is necessary to define an electronic access point. We do believe it is necessary for entities to have control of their boundaries. We have proposed using electronic access control in R10, Account Access Control Specifications, in the place of the term Password since we feel there are other methods of controlling access that are equivalent or superior to password protection. We recommend the drafting team use electronic access control rather than defining another High Impact BES Cyber System outside of CIP-010-1.
38.15	Dairyland Power Cooperative	Disagree	In trying to be general, it adds more question as to the intent. Is an access point one a device physically connecting multiple communications paths? What about a terminal server? Is an authentication server or policy managing server an access control point even if it is not in-line with the path?
38.16	Constellation Energy Commodities Group Inc.	Disagree	Is the intent to require use of hardware firewalls? If so, is it possible to state that clearly? If not, what is the intent?
38.17	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's suggestion below:Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact

#	Organization	Yes or No	Question 38 Comment
			categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement fails to recognize that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.18	LCEC	Disagree	Need to clarify the specific access point from an interface perspective. What is meant by the term controlling access? Is this from a network protocol perspective? Is a radio link that extends serial communications considered to be an access point?
38.19	Progress Energy - Nuclear Generation	Disagree	Not all EAPs constitute the highest degree of risk especially is nuclear facilities which are highly secure.
38.20	PacifiCorp	Disagree	PacifiCorp agrees with EEI's suggestion below:Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement fails to recognize that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.Further, PacifiCorp believes the proposed definition is too broad. The preference would be to and should be restricted it to communications supporting routable protocols and or dial-up communication. In 20.2 the standard refers to the use of an access point on routable protocol and or dial-up paths but the definition is currently proposed to be broader. In plant control systems, we have many devices which use an IP routable protocol and an industrial communication control protocol such as fieldbus or profibus in the same device. The new definition would require each of these devices to be defined as an access point.
38.21	American Municipal Power	Disagree	Please provide a little or no impact category

#	Organization	Yes or No	Question 38 Comment
38.22	FirstEnergy Corporation	Disagree	Please provide clarification and examples on definition. Propose changing the second sentence to “All BES cyber systems sharing one or more common electronic access points or components will be logically separated such that each logical system is treated at its own categorization level or, where not separated, electronic access points will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).”
38.23	Dominion Resources Services, Inc.	Disagree	Please see Dominion’s response to Question 13. The interface between systems contained wholly within an access controlled facility should not constitute an electronic access point or be subjected to the Boundary requirements.
38.24	Southern Company	Disagree	R20.5 Is a single or double access attempt on a single access point required to be reviewed?
38.25	San Diego Gas and Electric Co.	Disagree	SDG&E has concerns about the last half of the proposed definition for electronic access points. If two medium or one medium and one low BES Cyber System share an access point, this definition makes the shared access point High impact? Regardless of other controls that may be in place? We feel that this definition is not reasonable.SDG&E suggests the definition of electronic access points should include the words "...between networks." Otherwise, every device on the network becomes an access point.
38.26	BGE	Disagree	Should include wording to clearly define the communication paths that transmit and or receive digital information to a BES Cyber System.
38.27	Allegheny Energy Supply	Disagree	Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security

#	Organization	Yes or No	Question 38 Comment
			requirements.
38.28	Allegheny Power	Disagree	Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.29	EEI	Disagree	Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.30	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The concept of sharing access points must be better defined. Does connectivity to an outside entity at a firewall constitute a shared access point?
38.31	Luminant	Disagree	The definition of access points infers that cyber systems and BES Cyber Systems can share an access point but 20.2 states that BES Cyber systems must be seperated from other devices. re. Cyber systems protected by same firewall but in different zone
38.32	US Bureau of Reclamation	Disagree	The definition proposed is that "ALL cyber system sharing one or more common electronic access point or components..." Components can mean many things and almost all devices share components which have not impact on the BES. It would be better to indicate that "ALL BES cyber systems sharing one or more common

#	Organization	Yes or No	Question 38 Comment
			electronic access point or BES CYBER SYSTEM components...."
38.33	Constellation Energy Control and Dispatch, LLC	Disagree	The definition should clearly establish that the access point is a place where digital information is transmitted or received.
38.34	US Army Corps of Engineers	Disagree	The definition states that an electronic access point is a point where electronic access can be controlled for communication paths that transmit and/or receive digital information. What does "controlled" mean? Would network switches fall under this definition because network switch ports can be electronically controlled with port security?Suggest definition be changed to: An electronic access point is an electronic security point where traffic flowing from different security areas are restricted, controlled, and monitored from entering or leaving a particular security area. This may be restricting traffic from a lower security area (devices external to the BES Cyber System) from entering a higher security area (BES Cyber System.) It may also be restricting sensitive traffic from leaving a higher security area to a lower security area.
38.35	Bonneville Power Administration	Disagree	The first sentence, "Electronic access point for...digital information.", is acceptable, but only because it says what an electronic access point is, not where one has to be located. Second sentence is completely unacceptable, more so than anything else in the standard, for numerous reasons:First, it leads to the equivalent of CIP-007's including every network device within the Electronic Security Perimeter. In retrospect, that inclusion caused additional workload and costs which far exceeded the gain in security. To repeat that error would be totally unacceptable. The requirement should apply only to BES Cyber Systems, and not all cyber systems.Second, it ignores the level of threat posed by the various systems. Just because a cyber system or even a BES Cyber System is behind the same access point as a High impact BES Cyber System does not mean that poses the same risk to the BES, or even any risk at all.Third, it ignores the possibility of nested access point. For instance, consider systems A and B residing within a highly protected network and sharing a single access point. Add system C residing with a less protected network with an access point to the internet. If A and B access the internet through the same

#	Organization	Yes or No	Question 38 Comment
			access point that C uses, then C has to be treated as stringently as the highest impact of A or B.Fourth, applying impact levels based on the highest level of the BES Cyber System is a problematic issue that has been discussed at length. The mere fact that a cyber component exists within a High Impact BES cyber system does not make that specific component a high impact component. There are levels of impact that should be applied within and to the Cyber System. Devices or equipment (Components) within a High impact BES cyber system, may actually have little or no impact on that cyber system regardless of what happens to them. The standard that applies to that device should not necessarily be tied to the Impact rating for the whole BES cyber system.Finally, the second sentence is a statement of a requirement, not a definition. To use an example, assume a Control Center that relies on nested networks, with the outermost controlling external access, and further firewalls controlling access to their nested layers. The outermost firewall would be a common access point, shared by all systems within the Control Center. In that case, all the cyber systems would have to be treated as BES Cyber Systems at the highest impact level of any BES Cyber Systems in the Control Center. Such a treatment ignores the threat a system might or might not pose to the BES. To provide a somewhat absurd but demonstrative limiting case, a minimally functional print server residing in the outermost layer, barely able to accept an IP address, and having no connectivity except Ethernet on one side and a printer interface on the other, would have to be treated the same as an AGC system within the innermost layer controlling thousands of megawatts of generation at sites scattered across multiple states.Recommendation: Delete the second sentence.
38.36	Southern California Edison Company	Disagree	The requirement does not adequately address the technical nuances of virtualization. The central point of virtualization capability can be interpreted as the “shared” access point. At the same time, the centrally located virtualization device may also be interpreted as a BES critical cyber system. In the first case, the controls for the virtualization system will be those afforded to an access point, which may be less stringent than those afforded to a BES critical cyber system. In the second case, where the virtualization device is a BES critical system, on the user end, end user computing devices such as mobile laptops can potentially be considered as BES cyber system

#	Organization	Yes or No	Question 38 Comment
			component, and on the SCADA end, automation devices would be considered as BES cyber system components. Requirement R21 does not make drawing such distinctions clear of subjective interpretation.
38.37	Oncor Electric Delivery LLC	Disagree	The term “public communication paths” should replace “communication paths”. Systems which are isolated from the internet are less susceptible to cyber attacks.
38.38	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
38.39	Xcel Energy	Disagree	We believe the second sentence places an unnecessary burden on lower impact systems if they are unable to communicate with the higher impact system, as is the case with dial-up based systems.
38.40	We Energies	Disagree	We Energies agrees with EEI Suggest removing the requirement: “All cyber systems sharing one or more common electronic access points or components will be treated at the highest BES Cyber System impact categorization level of the BES Cyber Systems sharing the electronic access point(s) or component(s).” from the definition of electronic access point. In addition, the requirement is not clear that a firewall with multiple interfaces has the ability to support multiple electronic security perimeters with differing security requirements.
38.41	US Army Corps of Engineers, Omaha Distirc	Disagree	What does "controlled" mean? Definition also appears to contain a requirement "All cyber systems sharing one or more . . " The requirement doesn't appear to be in line with industry practice. A firewall can protect 2 or more networks from external connections and from each other. Both networks do not have to be at the same sensitivity level. suggest definition be changed to:An electronic access point is an electronic security point where traffic flowing from different security areas are restricted, controlled and monitored from entering or leaving a particular security area. This may be restricting traffic from a lower security area (devices external to the BES Cyber System) from entering a higher security area (BES Cyber System.) It may

#	Organization	Yes or No	Question 38 Comment
			also be restricting sensitive traffic from leaving a higher security area to a lower security area.

39. Tables R20 to R22 provide direction concerning what impact level of BES Cyber Systems to which Requirements R20 to R22 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Many commenters disagreed with the proposed BES Cyber System impact levels and made suggestions to clarify them, including suggestions to revise or refine the impact levels based on the particular characteristics of the BES Cyber Systems involved. In response, the SDT has made changes to include an applicability column in each table for each requirement. The applicability column further refines the set of BES Cyber Systems and assets to which each part of the requirement must be applied. For example, the SDT made changes to the applicability column to include the scoping filter of External Routable Connectivity where the use of a routable connection would be required to comply with the requirement, such as the requirement to have Electronic Access Points.

The intent of this approach is to refine the scope of requirements that apply to each type of BES Cyber System or device based on its characteristics. The drafting team recommends that commenters carefully review the proposed applicability column in the table for each requirement in the CIP Version 5 standards.

#	Organization	Yes or No	Question 39 Comment
39.1	US Army Corps of Engineers		The statement in Table R21, 22.1 "Cyber system components that provide external communication to the BES Cyber System must only communicate externally through an electronic access point as specified in Requirement R20.", is confusing. What is the standard trying to say here?
39.2	GE Energy	Agree	20.2: Low BES systems should be required to document and implement access controls.
39.3	Black Hills Corporation	Agree	21.1 requires further definition of logical separation requirements in a disaster recovery scenario. As stated, this does not allow for control centers to back-up each other in a fail-over mode for disaster recovery.
39.4	Duke Energy	Agree	Agree if the external connectivity is via a shared electronic access point as discussed in previous comments.Apply all requirements, where currently in place, only for external connectivity. 20.6: Review of logs every 7 days is not practical.21.2: Only

#	Organization	Yes or No	Question 39 Comment
			require for external connectivity
39.5	Progress Energy (non-Nuclear)	Agree	See comment 14.
39.6	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
39.7	GTC & GSOC	Agree	We recommend a slight rewording of R20.2 as follows “Establish an electronic access point that denies access by default and allows explicitly authorized communication on each path where a routable protocol or dialup communication exists between BES Cyber Systems and other devices.”
39.8	E.ON U.S.	Disagree	: E.ON U.S. does not believe there is a need for compliance requirements for low impact systems. High Impact has such a short timeframe for revocation, that it would require employees be available to revoke privileges 24/7. The SDT should adopt a more reasonable time frame- at least 24 hours. E.ON U.S. believes that R22 is merely a repeat of other requirements and therefore should be deleted
39.9	NextEra Energy Corporate Compliance	Disagree	: NextEra believes it is unclear what the timeframes for Medium Impact and High Impact BEST Cyber Systems are supposed to mean. Do response personnel have to review security logs related to external connectivity every 48 hours or are the expectation for designated personnel supposed to respond to an alert within a 48 hour period? The recommendation is to document and establish one or more processes for automated alerting and response to alerts by designated response personnel for unauthorized access attempts at each electronic access point. This requirement would be applicable to both Medium and High Impact BES Cyber Systems. If automated alerting and notification is not technically feasible, Responsible Entities should be able to develop a process to manually review security logs to determine potential cyber security incidents.

#	Organization	Yes or No	Question 39 Comment
39.10	Regulatory Compliance	Disagree	20.1 STRIKE "Required for Low Impact20.5 Propose - 72 hours for Medium Impact Propose - 48 hours for High Impact21.1 - STRIKE "required" for Medium Impact
39.11	BGE	Disagree	20.5 timeframe should be consistent for medium and high.
39.12	Florida Municipal Power Agency	Disagree	22.2 - Add medium, require low to asses quarterly. Consider high impact to review 'critical' patches within 7 days.22.3 - This should be consistent with R18; medium should be required to monitor their systems. Low should review logs at least quarterly for events, or at least have an automated system in place to alert for specific threats.
39.13	ERCOT ISO	Disagree	22.2-22.3: Should apply to Medium Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
39.14	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
39.15	The Empire District Electric Company	Disagree	Comments: For items 20.4 - 20.6, we believe "for external connectivity only" should be removed from the impact levels to properly coordinate with the comments on these items made under question 37.
39.16	Progress Energy - Nuclear Generation	Disagree	Durations should align with information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
39.17	EEI	Disagree	EEI recommends deleting R21 because it is vague and the risks are addressed in R20. Introducing boundaries within engineered systems will result in decreased reliability.
39.18	Entergy	Disagree	Entergy suggests making R20.3 and R20.4 apply to low impact assets.

#	Organization	Yes or No	Question 39 Comment
39.19	MRO's NERC Standards Review Subcommittee	Disagree	For items 20.4 - 20.6, we believe “for external connectivity only” should be removed from the impact levels to properly coordinate with the comments on these items made under question 37.
39.20	US Army Corps of Engineers, Omaha Distirc	Disagree	Intent of 22.1 is unclear
39.21	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
39.22	Luminant	Disagree	Low impact BES Cyber Systems should be protected but not have to be seperated from all other cyber systems. re introduces the concept of cyber systems in "ESP". R21 How can cyber systems be shared and not be a BES Cyber System
39.23	LADWP	Disagree	Low impact requirements will become an administration issue.
39.24	Minnesota Power	Disagree	Per the discussion regarding these tables in Question 37, Minnesota Power recommends that for Parts 20.1, 20.2, 21.2 and 22.1 “Required” be removed for Low Impact BES Cyber Systems.
39.25	Constellation Energy Commodities Group Inc.	Disagree	Please define the stipulation ‘Required for external connectivity only’. In 20.5, aligning the time requirement on 48 hours for clarity and consistency.
39.26	American Municipal Power	Disagree	Please provide a little or no impact category
39.27	Puget Sound Energy	Disagree	Puget Sound Energy suggests aligning Table 11 with Table 12. Table 13, Table 14, and Table 22. Puget Sound Energy suggests including wording similar to Table 11: “Required for external connectivity only”.
39.28	FirstEnergy Corporation	Disagree	R20 - Timeframes should not be in ‘hours’ (i.e. less than a full day). Tracking by time

#	Organization	Yes or No	Question 39 Comment
			rather than days would not be logistically possible on all systems and compliance could not be maintained.The new requirements now have too many different time frames to meet. Again, not logistically possible on all systems and compliance could not be maintained for larger utilities.R21 - R21.2 - Remove 'Required' for Low Impact Cyber Systems.R22 - Eliminate - see Q37 above.
39.29	Con Edison of New York	Disagree	R20 dialog box; speaks to inheritance of HIGH Impact BES requirements for all cyber systems with shared access points.o Does the inheritance only apply to R20 requirements or does this mean all requirements for these devices would be at the High Impact level?o If all cyber systems regardless of BES use that are within the same boundary require High, this may cause significant manpower or create the need to isolate the true BES systems. The isolation will take significant time to plan and implemento This standard must allow the use of 1 physical firewall, logically separated to isolate networks without inheritance of BES levelR21.1 does this require Cyber Components on the same isolated network be logically separated? Is that correct?o This should not apply to devices on the same network.o Should only be required for high.R20.6 - if automated review and alerting is used this should not be requiredR22 mentions established physical boundaries --- the draft CIP standards do not mention physical boundaries are the PSP requirements defined in this version?
39.30	Southwest Power Pool Regional Entity	Disagree	R20: Distinction between external and non-external connectivity is not appropriate. R22: Patch management should be applicable to all impact categories.
39.31	Hydro One	Disagree	Recommend that 20.4 and 20.5 should be Required instead of specifying "external connectivity" since the criteria limits the scope to remote access. Also recommend removing "within the following time period" from 20.5.Recommend that 20.6 be re-worded to be consistent with FERC Order 706 paragraph 526 - "Some manual review of logs to improve automated detection settings, even if alerts are employed on the logs."Recommend that 20.6 High Impact and Medium Impact BES Cyber Systems should be 30 calendar days. Requirement 18.2 continuous monitoring satisfies the NOPR directive of seven days.Recommended removing R21 in the response to

#	Organization	Yes or No	Question 39 Comment
	Reclamation		and wireless access.
39.37	San Diego Gas and Electric Co.	Disagree	SDG&E feels that too many classifications make compliance more difficult and likely more risky. We would suggest making the time in R20.5 24 hours for both High and Medium impact systems.SDG&E also feels that instead of using the word “impact” for these Requirements, apply a concept of “risk” for inclusion. We would want to identify the risks with associated systems security and protect accordingly.
39.38	LCEC	Disagree	See previous comments
39.39	Bonneville Power Administration	Disagree	See Question 37, above.
39.40	Constellation Energy Control and Dispatch, LLC	Disagree	See response to question number 37.
39.41	ReliabilityFirst Staff	Disagree	Suggest “30 calendar days for external connectivity only” for Medium Impact in row 20.6. Suggest “Required” for Medium Impact in rows 22.2. and 22.3.
39.42	Ameren	Disagree	Suggest removing R21.2 from Low Impact Systems.
39.43	Alberta Electric System Operator	Disagree	Table R20 - For 20.5 set Low Impact to “120 hours for external connectivity only”; for 20.6, set Medium Impact to “30 calendar days for external connectivity only”Table R22 - Consider making 22.1, 22.2, 22.3, 22.4 Required for all Low, Medium, and High Impact BES Cyber Systems because they are protecting the boundary.
39.44	Consultant	Disagree	The impact levels would be impacted by previous comments on this group of requirements.The terminology "for external connectivity only" is redundant as the access point is where external connectivity occurs. Suggest removing these words from the table where they occur.

#	Organization	Yes or No	Question 39 Comment
39.45	Southern California Edison Company	Disagree	The standard should read such that the centralized/federated primary virtualization system and its back-up are afforded protections commensurate with the impact level of the automation devices that support a particular reliability function. The standard should comply with the intent of Order 706 to prevent intentional or accidental misuse of BES components and limit BES cyber system classification to the automation nodes and virtualization nodes. End-user computing devices in a virtualization system should be classified as conduits to the virtual system that is protected by an electronic border.
39.46	CWLP Electric Transmission, Distribution and Operations Department	Disagree	The time frame for requirement 2.5 would be difficult to comply with for smaller entities.
39.47	APPA Task Force	Disagree	We propose the following changes to the Impact Levels of R20 - R22 if our changes proposed in Question 37 are accepted:R20 Table 20.1: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.2: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.3: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.4: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR20 Table 20.5: Low Impact: N/AMedium Impact: 48 hoursHigh Impact: 12 hoursR20 Table 20.6: Low Impact: N/AMedium Impact: N/AHigh Impact: 7 calendar daysR21 Table 21.1: Low Impact: N/AMedium Impact: RequiredHigh Impact: RequiredR21 Table 21.2: (Removed)R22 Table 22.1 - 22.4: (Removed)
39.48	MidAmerican Energy Company	Disagree	While the concept of applying various levels of security controls to BES Cyber Systems based upon their impact level appears to be appealing, until the assessment of each BES Cyber System is made by a utility and the catalog of security controls that must be maintained for each BES Cyber System is understood, the impact level strategy cannot be accessed.

#	Organization	Yes or No	Question 39 Comment
39.49	PacifiCorp	Disagree	While the concept of applying various levels of security controls to BES Cyber Systems based upon their impact level appears to be appealing, until the assessment of each BES Cyber System is made by a utility and the catalog of security controls that must be maintained for each BES Cyber System is understood, the impact level strategy cannot be accessed.

40. The configuration change management requirement is centered on the identification of a component inventory and baseline configuration. Do you agree with the list of criteria that are included in the baseline configuration? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the baseline and managed through the configuration change management process? Do you agree with the list of criteria that are included in Requirements Table R23? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in Table R23? Please explain and provide any suggestions for modification.

Summary Consideration:

Commenters are concerned about a lack of clarity on what is expected for a baseline configuration, and if it should be applicable to an entire BES Cyber System or to individual components. Commenters also expressed a lack of understanding on how detailed inventories should be and to what category they should apply. Many comments addressed the requirements that include component-based actions for low-impact BES Cyber Systems. These are viewed as potentially overwhelming in the overall CIP compliance process. Also, identifying the physical location of a virtual component is identified in several comments as "confusing." Concerns were also identified about the definitions and clarification around terms. For example, what is meant by "Other documentation," "baseline configuration," and "virtual BES Cyber System component" were the primary terms mentioned. Also, more specific information on "security controls" was requested.

This requirement has been moved into a new standard, CIP-010-1 -- Cyber Security — Configuration Management and Vulnerability Assessments. In response to stakeholder comments, the drafting team has provided additional guidance in the 'Application Guidelines' section for the standard regarding the elements of a baseline configuration. The requirement to have an explicit inventory has been removed. This requirement is effectively inferred by the requirement to document a baseline configuration. The drafting team also agrees that maintaining an inventory for all Low Impact BES Cyber Assets within the current compliance framework in which the NERC CIP standards exist is problematic. As such, the drafting team has made an effort to prioritize controls for Low Impact BES Cyber Assets that don't require the documentation of every individual component and may be managed on a site-by-site basis, where feasible.

Several commenters suggested that inventories and monitoring should also apply to Medium and High Impact categories, since impact of the Low category to the BES Cyber System is minimal, and the effort appears to be greater than the benefit. In addition, there are questions on the timeframe and processes for monitoring. Does it need to be real time or can the Responsible Entity establish a tailored schedule for response to the detection of unauthorized changes? With regard to Requirement 23, Part 23.2, several commenters stated that it was written around typical IT equipment configurations and not the multitude of devices within generating or transmission facilities. They believe that because of this situation, the requirement should be limited to control centers similar to Requirement 23, Part 23.6. They further state that for generating facilities and substations, it would be adequate to require the entity to document and implement one or more processes for configuration change management, and that this would be applied to all Low Impact, Medium Impact, and High Impact BES Cyber Systems.

The drafting team intends for the monitoring and alerting capabilities to occur on a near real-time basis. The drafting team appreciates the concerns regarding substation and generation environments and believes that tools to perform these processes on a near real-time basis in these environments are either too immature to be included as part of a mandatory standard or simply do not exist, particularly since a large number of these cyber assets have no external communication method. Additionally, the drafting team believes that other NERC reliability standards, such as those regarding protective relay maintenance and testing, provide some level of mitigation for this lack in currently available technology.

The configuration management requirements state that an inventory must be developed of the physical or virtual BES cyber components "excluding software running on the component". Several commenters questioned why software should not be considered as constituting a "virtual" BES cyber component. Many comments were also submitted on what is perceived as a cumbersome process around inventory, monitoring, and responding to changes in the baseline configuration. They state that the criteria should be simplified, with items such as removing "physical location" from the requirement.

The drafting team has attempted to address these concerns by modifying the impact levels to which they apply. The drafting team, however, continues to believe that a rigorous configuration management program, including documented baseline configurations, is essential to an effective cyber security program.

#	Organization	Yes or No	Question 40 Comment
40.1	USACE - Omaha Anchor		23.2 - clarify "software" - is this all software on the machine or version of the OS?
40.2	US Army Corps of Engineers		Does requirement R23.7 "Monitor changes to the baseline configuration and respond to the detection of any unauthorized changes" imply or require automated monitoring?
40.3	WECC		Not sure that baseline is the right word to use as many entities define baselines only at specific times in implementation projects or as part of system hardening. Item 23.5 says to "assess potentially impacted security controls" then Item 23.6 says to test them. Is this the same requirement? The second bullet in 23.6 is very difficult to read. Consider having a separate requirement for 1) Change Management Criteria, 2) Testing Criteria, 3) Test Environment Criteria.Virtualization is mentioned in 23.1. This is good, but should probably be considered in other requirements as well. In 23.2 an inventory is required of components. Based on the current definition of component,

#	Organization	Yes or No	Question 40 Comment
			this would not need to be done down to the device level; however, management at the device level is needed for effective application of change management.In 23.6 there does not appear to be a provision for changes to the baseline configuration itself. Also, the requirement for established procedures was removed. This will lead to inconsistent testing and makes auditing much more difficult.
40.4	Exelon Corporation	Agree	Exelon seeks clarification on the following questions. Do Requirements 23.2 and 23.4 include relay and SCADA equipment settings and settings changes? Would documentation of an assessment be required in a test environment before each and every relay or SCADA setting change?
40.5	Florida Municipal Power Agency	Agree	FMPA agrees with the intent of the requirements but believes significant improvements can be made.There is no process to identify when any changes made to the BES might affect the actual identification of the BES component(s) as a new impact rating.FMPA does not believe that a Responsible Entity will be able to fully comply with some of these standards as they are written. For example, to fully assess how a change might impact the BES Cyber System could be interpreted to mean the RE would need a fully functional replicated copy of the production environment. FMPA does not believe this is reasonable.
40.6	Progress Energy - Nuclear Generation	Agree	R23 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
40.7	CWLP Electric Transmission, Distribution and Operations Department	Agree	R23.5. What are the ramifications to the Responsible Entity if the assessment is inaccurate and a change does adversely affect the BES Cyber System? Conducting an assessment does not guarantee success as there are always unforeseen incidents that may impact upgrades and new installations.
40.8	Xcel Energy	Agree	We believe additional guidance is requires as to what type of monitoring is expected

#	Organization	Yes or No	Question 40 Comment
			in R23.7. Is active monitoring expected, or periodic review of logs sufficient?
40.9	Dairyland Power Cooperative	Disagree	23 Note that on many SCADA systems, the simple matter of summing two telemetered values may require the modification of software/scripts. For simple calculations such as these the overhead of change control and security track will serious slow the process of making adjustments during a field checkout. Are there any further criteria that can be used to minimize the overhead on changes that are not reasonably expected to impact security posture?
40.10	FirstEnergy Corporation	Disagree	23.1 - Should also exclude data.23.2 - Cyber System Components is used two different ways in 23.1 and in 23.2. And neither uses really match the definition provided in CIP 010. What is expected for a baseline configuration for an entire BES Cyber System as opposed to a configuration for an individual component?23.3 - Change 30 days to 90 days. Remove 'other documentation as necessary' or be more specific as to what that means.23.2 - 23.4: Is the standard requiring the Responsible Entity to update the baseline documentation every time a patch is applied?
40.11	Dominion Resources Services, Inc.	Disagree	23.1 & 2 & 3(inventory only). It should be clarified that the inventory is for in-service equipment and that location refers to an area or room and not to a rack or slot. 23.4. A definition of "Authorize" should be provided.23.5. At the May workshop, an entity said they were audited by 2 regions and each region had a different definition of what cyber security controls were. On this point Dominion recommends that the word "Assess" be changed to "Define cyber security controls and assess." 23.7 Dominion is unclear how this requirement can be met. For example, an alarm is received when a relay is placed into "configure" mode, but there is no ability to see what is being changed. Stated differently, Dominion can respond to a change, but cannot monitor what is being changed. If the relay is in a remote location, Dominion's response time will be impeded. This is the best case scenario. Much equipment does not alarm when its configuration has been changed (e.g., a computer does not generate an alarm when a new program is loaded.) Dominion requests that this requirement be

#	Organization	Yes or No	Question 40 Comment
			removed.
40.12	BGE	Disagree	23.2 custom software/scripts should not be part of the baseline inventory. Recommend having 1 inventory for Low, medium and High.
40.13	American Electric Power	Disagree	23.3: Regarding "Authorize and document changes to the BES Cyber System that deviate from the existing inventory and update the inventory and other documentation as necessary within 30 days of the change being completed", what changes must be authorized and documented? Is this targeting physical network changes or adding/deleting equipment? Is this targeting software changes?23.7: Regarding "Monitor changes to the baseline configuration and respond to the detection of any unauthorized changes", is this a continuous monitoring requirement? If not, what is the frequency that a comparison between the actual and latest approved baseline be conducted? Comparing baseline to existing configurations would be a manual process is most instances. Suggest rewording to specify that this will be conducted on the individual BES Cyber System components at some frequency, possibly quarterly.
40.14	Regulatory Compliance	Disagree	23.4 - propose adding - "Authorize and document changes that present a high risk to the BES....23.4a - additional criteria - Entity documents changes into categories of risk, based on the risk assessments determines if changes are in or out of scope.23.7 - unreasonable expectation based on the definition of baseline configuration. Instead propose the following: Do an annual review, recapturing the baseline configuration. Review for unauthorized changes during this process. If unauthorized changes are found remediate and document within 60 days of the documented annual review.
40.15	Southwest Power Pool Regional Entity	Disagree	23.5: Clarify what is meant by “deviation from the existing baseline configuration.” A new or replacement BES Cyber System Component needs to be validated before placing into service even if it uses an existing baseline configuration if for no other reason than to verify the configuration as built matches the baseline. Additionally, “potentially impacted cyber security controls” is highly subjective and open to

#	Organization	Yes or No	Question 40 Comment
			interpretation. Remove the "potentially impacted" language. 23.6: "included in the baseline configuration of the BES Cyber System" has a vendor baseline connotation. Consider clarifying to refer to the currently approved configuration of the production BES Cyber System. Additionally, the criteria need to clarify just what is meant by "baseline configuration." Does this mean the currently approved hardware and software, including versions or release levels? Or is it less granular, such as "a server running Linux and EMS/SCADA software." Without the clarification, the term is open to interpretation and the ability to audit will be affected.
40.16	MidAmerican Energy Company	Disagree	23.7 Most entities do not have the capability, resources or tools currently to live monitor configuration changes on all category A devices. There could be impacts to performance to run agents on equipment and some vendor supported devices may not allow live monitoring.
40.17	BCTC	Disagree	Â R23. Define in more explicit terms the definition of a "baseline configuration" - what comprises a baseline config - i.e. patch level, etc. R23.6. There are expected to be scenarios whereby a test environment may not exist for a high impact BES Cyber System. In such cases would a scenario like rolling out changes to a non-critical environment represent a test environment from a compliance perspective?
40.18	Southern Company	Disagree	As long as there are requirements which include per-component action for each low-impact BES Cyber System, the effort needed to implement those actions will overwhelm the rest of the CIP compliance effort. With 100's of low impact BES substations, there are 1000's of BES Cyber System components. These substation devices are being changed daily. The documentation requirements of R23 are overly burdensome with little benefit for low impact BES Cyber Systems. We recommend removing Low Impact BES Cyber Systems from all R23 controls.
40.19	E.ON U.S.	Disagree	CIP-011, R23.1 The requirement states that an inventory must be developed of physical or virtual BES CSC's excluding software running on the component. What

#	Organization	Yes or No	Question 40 Comment
			constitutes a "virtual" BES CSC if not software?
40.20	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
40.21	Constellation Energy Commodities Group Inc.	Disagree	Clarify R23 to not require tracking of routine changes within the container of existing software (example, add a point or change data type of a point), but to track code migrations and changes to the baseline of deployed components.
40.22	The Empire District Electric Company	Disagree	Comments: This requirement, especially evident in item 23.2, appears to be written around typical IT equipment, and not the multitude of electronic programmable devices an entity will encounter in the field at a generating facility or substation. Therefore, we believe the current intent of this requirement should only apply to control centers, similar to item 23.6, where typical IT equipment is becoming more of the standard.For generating facilities and substations, we believe it would be adequate to require the entity to document and implement one or more processes for configuration change management, and this would be applied to all Low Impact, Medium Impact, and High Impact systems.
40.23	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy disagrees with the list of criteria in the baseline configuration. Maintenance of such a list including, software versions, active ports and services, any patches and custom software/scripts will be burdensome and subject to unintended error as the list will contain a significant number of entries. CenterPoint Energy is unsure of the value of such a list regardless of R23 assertion that it is meant "...to prevent and detect unauthorized modifications to BES Cyber Systems." Unless such a list is reviewed on a daily basis, or perhaps even more often, there is no "detection" involved. As to "protection", CenterPoint Energy fails to see where that would occur from the development of and maintenance of such a list. CenterPoint Energy does understand the need to maintain current configuration data, however this criteria is too prescriptive.

#	Organization	Yes or No	Question 40 Comment
40.24	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Disagree	Having a hard time with the idea of documenting the physical location of the cell phone described in question 1.a, and with documenting every change in its location within 30 days of every move.
40.25	Progress Energy (non-Nuclear)	Disagree	If the BES Cyber System Component is a microprocessor relay/device, this can get complicated. These devices have numerous 'configurations' based on an application. Also, firmware versions would need to be considered. Today, most utilities lock firmware on many relay models. Another issue may be when a cyber component is returned to a manufacturer for repair - how do we verify that a replaced operating system component is compliant.R23.2 need to be explicit that the baseline is the inventory in existence at compliance time for existing systems.R23.7 in most existing generating plant systems would not be able to meet this requirement and the value is questionable since the use of administrator accounts is highly restricted by multiple other requirements.CIP-011 - R23 - Need clarification as to what constitutes a "virtual BES Cyber System Component".
40.26	Midwest ISO	Disagree	It is not clear how R23 inventories differ from those inventories that must be identified in CIP-010 R2. To the extent that these are duplicate, the duplications should be eliminated.
40.27	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
40.28	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R23, but recommends changes as follows: o For Parts 23.1 and 23.2, Minnesota Power recommends that Standards Drafting team define what constitutes a "Virtual BES Cyber System Component." o Regarding Part 23.2, Minnesota Power recommends that the Standards Drafting Team further define the level of software versions are required for tracking purposes. For example, an EMS has hundreds of small programs that make up the system. Each of these individual programs is combined under an

#	Organization	Yes or No	Question 40 Comment
			overall version number. In addition, different Registered Entities, with the same EMS version, may have different internal applications with different levels of fixes. To what level should those be documented? o For Parts 23.5 and 23.6, Minnesota Power recommends that the Standards Drafting Team define the term “cyber security control.” o For Part 23.6, what constitutes a “deviation?” What level of baseline is required? o Regarding Part 23.7, Minnesota Power requests that the Standards Drafting Team consider defining the term “monitor” and identify the level of detail required for these changes. For example many EMS sub-programs constantly create/modify/remove files as a normal course of business. Would these changes need to constantly be reviewed and verified?In general, Minnesota Power believes that the list of items to be tracked/tested/monitored is vague and could cause Registered Entities to incorrectly implement processes to satisfy this Requirement.
40.29	NextEra Energy Corporate Compliance	Disagree	Nextera believes there is not an agreement for the list of criteria that should be included in the baseline configuration, the requirement is a big undertaken to manage the software on BES Cyber Systems and provides little improvement to the reliability of the BES Cyber Systems.The following is the recommended updates:23.2 - Develop a baseline configuration of the BES Cyber System, which shall include an inventory of its physical or virtual BES Cyber System Components (excluding software running on the component), physical location, active ports and services, any patches, and any custom software/scripts.Keeping inventory on running software on medium and high impact BES systems will be a big undertaken. With the other levels of controls to develop baseline configurations, software should be excluded.In 23.7, this implies implementation of automated tools to detect configuration changes. Not all systems will support these tools. If not possible to automate, are manual processes acceptable? If so, wording should specify "automatic or manual detection".
40.30	LCEC	Disagree	No. The baseline configuration is not specific enough and leaves much open to interpretation.

#	Organization	Yes or No	Question 40 Comment
40.31	National Grid	Disagree	o National Grid suggests rewording 23.5 - "Assess changes to baseline configuration to verify controls are not adversely affected ..." o 23.6 - Need more information on testing requirements. o23.7 - Expand on "monitor changes". Is the SDT considering a timeline to respond to detection of any unauthorized changes o National Grid recommends the SDT to check the new EOP Backup Facility Standard for testing in 23.6
40.32	PacifiCorp	Disagree	PacifiCorp seeks clarity on 23.2 as to the 'components'. In the case of a server, is this every component in the case (including fans?) or additionally all apparatus which are directly attached (Mouse, Keyboard etc) which would not normally be included in a change record.
40.33	RRI Energy	Disagree	Part 1: does "active ports and services" refer to the network accessible ports and services as mentioned in the above requirement 17.1?Part 2: Some application uses port ranges. Netstat command only reports actively listening port(s). The requirement explicitly states "active ports and services". Some ports in the port ranges may not be active when the netstat command runs. So when the inactive ports are not in use, depending on the vendor/program, entity could be out of compliance. Active could be replaced with "Active or documented system design ports and services".What does "closely models" mean?Is a "test environment" an actual thing or a state? Example: a generation unit is online generating x MWs - no test environment "state' exists due to the unit being online; a generation unit is in a 2 week maintenance outage, all cyber assets related to the unit are in a test environment "state".
40.34	Northeast Utilities	Disagree	Please clarify 23.7. Specifically, does this monitoring need to be automated? If not, how often will the monitoring need to be performed to meet the standard?
40.35	Network & Security Technologies Inc	Disagree	R23 - Sound configuration change management practices can minimize the risk of unauthorized modifications but cannot "prevent and detect" in all instances. Suggest

#	Organization	Yes or No	Question 40 Comment
			revising the overall goal here.23.6 - Suggest adding a provision allowing a Responsible Entity to suspend this requirement under emergency conditions (e.g., to apply an emergency hot fix needed to restore a disabled or impaired BES Cyber System).23.7 - Absent the use of automated tools, this may be a very hard requirement for Responsible Entities to meet. Suggest SDT consider reasonable approaches to how it might be done on a manual basis (e.g., periodic comparisons of running configurations and stored configuration profiles) without imposing an undue burden on Responsible Entities with large numbers of High Impact systems and no current investment in automated monitoring.
40.36	Consultant	Disagree	R23. The terminology "incorporate the criteria" seems incorrect. The table is actually listing the requirements. Suggest changing to "incorporate the requirements".Table R23 - Item 23.1 The terminology "virtual BES Cyber System Components (excluding software running on the component)" seems confusing. Software would seem to be the 'virtual' component, so if software is excluded then the 'virtual' aspect seems unnecessary. Please clarify the intent of this requirement. Item 23.1 The "physical location" of a "virtual component" does not appear to make sense. Suggest rewording to specify physical location of hardware. Item 23.1 & 23.2 Qualification of "physical or virtual" components should be unnecessary. The defined term 'BES Cyber System Component' should be the basis for the requirement. Adding these qualifiers implies that the definition is not adequate. Suggest removing the qualifiers physical or virtual.Item 23.2 Suggest changing "software (including version)" "installed software versions".Item 23.2 & 23.6 The terminology "any patches, and any custom software/scripts" is vague. Suggest changing to "installed patches, and installed custom software or custom scripts".Items 23.3, 23.4, & 23.6 - Suggest changing "that deviate from the existing" to "that modify the existing".Item 23.4 - The terminology "and other documentation" is vague and subjective. Suggest deleting that phrase from this item. While "other documentation" may require an update this requirement should stay focused on configuration status.Items 23.3, 23.4, & 23.5 - The terminology shifts from 'BES Cyber System Components' used in Items 23.1 & 23.2 to 'BES Cyber System' in the last three items. If the inventory & baseline configuration is on the

#	Organization	Yes or No	Question 40 Comment
			component level then these three items should address changes on the component level to be dealing at the same level of detail. Suggest using consistent terminology in this table, either 'systems' or 'components'.Item 23.6 - Suggest deleting "each" as an unnecessary word. "For changes that modify the..." is better phrasing.Item 23.6 - Suggest deleting "software versions, active ports and services, any patches, and any custom software/scripts included in the" as unnecessary wording. The statement that the test environment closely models the baseline configuration should be adequate.Item 23.6 - Suggest punctuation or reformatting the second bullet for clarity. Possibly a separate line item: "For testing changes that modify the document: (1) the results of the testing (2) the difference between the test environment and the baseline configuration..., and (3) a description of measures used to account for the differences in operation between the test environment and the baseline configuration...."Item 23.7. This requirement statement is vague. Does it mean an inventory of hardware to monitor if any additional hardware was added, or hardware was removed? It appears to relate to some type of software status monitoring, but is not clearly stated. The terminology "respond to the detection of any unauthorized changes" is not clear and is subjective. As it is written, suggest deleting this item, or clarify the wording so it is a viable requirement.
40.37	ISO New England Inc	Disagree	r23.2 - custom software/scripts? Maybe better language is those custom software scripts that are required for the function of the BES cyber system component would be more appropriate. Recommend that 23.2 should remove physical location since it is covered in the updated 23.1 (see answer to question 41)R23.5 A entity may define that it's only security control is password complexity while other may try to adopt a Security Controls from the Center for Internet Security. As an entity defines more security controls the higher the risk for violating a requirement. Can cyber security controls be defined or identify requirements within this standard?R23.5 looks like the wording of the requirement allows the change to be made to production then test (after the change is made) to determine if the security has been adversely affected? Appears to contradict R23.6.As written, 23.5 is confusing. Suggest using “Assess changes to baseline configuration to verify controls are not adversely affected

#	Organization	Yes or No	Question 40 Comment
			..."Recommend the SDT check the new EOP Backup Facility Standard for testing in 23.6R23.7 What is the timeframe for monitoring? R23.4 gives 30 days to document the difference so can you monitor 30 days after the change. Does monitoring need to be real-time or can a daily process be used (other than weekends and holidays) to detect changes and reconcile to change management requests?
40.38	Independent Electricity System Operator	Disagree	R23.2 - what is meant by "software". Is this requiring that the version of Notepad, Wordpad, WinZip be recorded or only software that is needed to operate the component?- R23.5 A entity may define that it's only security control is password complexity while other may try to adopt a Security Controls from the Center for Internet Security. As an entity defines more security controls the higher the risk for violating a requirement. Can cyber security controls be defined or identify requirements within this standard?- - R23.5 looks like the wording of the requirement allows the change to be made to production then test (after the change is made) to determine if the security has been adversely affected? Appears to contradict R23.6.- - R23.7 What is the timeframe for monitoring? R23.4 gives 30 days to document the difference so can you monitor 30 days after the change. Does monitoring need to be real-time or can a daily process be used (other than weekends and holidays) to detect changes and reconcile to change management requests?- R23.3: replace "existing inventory" with "existing baseline" since above the baseline configuration was defined to include an inventory...; replace "update the inventory" with "update the baseline"- R23.3: what is "other documentation"- R23.3: is 30 days calendar days or business days?- Not clear on the difference between 23.3 and 23.4- R23.5: define "cyber security controls"- R23.6: could the statement "test the changes to the BES Cyber System in a test environment..." be changed to replace the second "test" with another word-what if it is tested in an environment that is not "test" but meets the requirements as stated?
40.39	Ameren	Disagree	R23.3 - Does change only constitute replacing hardware as inventory and replacement of software is not a requirement for low systems? Need to clarify requirement.R23.4 - This requirement will be challenging to audit as there is no clear lower threshold for

#	Organization	Yes or No	Question 40 Comment
			changes to the baseline configuration. Suggest adding the term significant changes.R23.7 - Is this requiring the installation of additional software to perform this function? Some systems may not allow the addition of this type of software, this requirement will likely end up needing a TFE.
40.40	Allegheny Energy Supply	Disagree	R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.
40.41	Allegheny Power	Disagree	R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.
40.42	EEI	Disagree	R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high

#	Organization	Yes or No	Question 40 Comment
			impact cyber systems.
40.43	Constellation Power Source Generation	Disagree	R23.7 describes monitoring, but not how the monitoring should be implemented (automated, manual, etc). What is the timeline to respond to the detection of unauthorized changes? Yearly? Daily? Continuously? A suggestion would be a yearly manual monitoring system.
40.44	Hydro One	Disagree	Recommend that 23.2 should remove physical location since it is covered in the updated 23.1 (see response to Question 41).As written, 23.5 is confusing. Suggest rewording to “Assess changes to baseline configuration to verify controls are not adversely affected ...”Recommend the SDT check the new EOP Backup Facility Standard as it applies to testing in 23.6.Please explain the rational to limit 23.6 to Control Centers only.
40.45	Northeast Power Coordinating Council	Disagree	Recommend that 23.2 should remove physical location since it is covered in the updated 23.1 (see response to Question 41).As written, 23.5 is confusing. Suggest rewording to “Assess changes to baseline configuration to verify controls are not adversely affected ...”Recommend the SDT check the new EOP Backup Facility Standard as it applies to testing in 23.6.
40.46	Garland Power and Light	Disagree	Requirement 23.2 23.4, 23.6 and 23.7 - should not apply to database changes or display changes
40.47	Alliant Energy	Disagree	Requirement 23.7 forces entities to implement discovery tools where they may not already exist into environments that may incur negative impact from the very nature of these discovery mechanisms. Where the operational risk of discovery tool deployment precludes its introduction, this requirement would necessitate manual processes. These manual processes would tax the operational resources normally dedicated to increasing the reliability of the BES.
40.48	Public Service Enterprise	Disagree	Requirement 23.7 may not be technically feasible for certain types of BES Cyber

#	Organization	Yes or No	Question 40 Comment
	Group companies		System Components such as older generation or legacy Remote Terminal Unit (RTU) products. To implement this requirement, an Operating System level change to the component may be required, which may be infeasible or not available from the Original Equipment Manufacturer (OEM). This requirement needs to be qualified with the phrase “where technically feasible”.
40.49	San Diego Gas and Electric Co.	Disagree	SDG&E feels that unless there is a major change in the number of types of assets that fall into the low category, there is little reason to have these assets be subject to a different set of requirements than those in the medium and high impact areas. Also, if there is consistency in the application of medium and high impact assets for R23.2 and R23.4, then why is R23.5 only required for high impact assets? SDG&E also requests an example of a virtual BES Cyber System Component (excluding software running on the component).
40.50	Duke Energy	Disagree	Some software on a BES Cyber system may not be relevant to the system (ex. Microsoft calculator or other bundled software) we don’t want to include a version of that. Suggest removing software since the software itself may be the BES cyber systemRequirements 23.3, 23.4, 23.5 - authorization should be able to be made more than 30 days BEFORE the installation.Requirements 23.3, 23.4: documentation via "red-marked" drawings ("interim as built") should satisfy this requirement. Is that the case?Requirement 23.5: as written, it allows the assessment to occur AFTER the fact. Should this not occur BEFORE the change is made?Requirement 23.6: with the proposed definition, it is open for interpretation how closely test environment should model the production environment.Requirement 23.7: what is the expectation for implementing this control? Manual? Automatic? Suggest removing. We are unaware of any device capable of doing this.
40.51	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS comments to require the current drafted language of R23 Table 23.1 - 23.7 for Control Centers Only. We also offer the following recommendation to cover a Configuration Change Management process for the rest of the facilities:R23 Table 23.8 (NEW): Develop one or more processes for

#	Organization	Yes or No	Question 40 Comment
			configuration change management for BES Cyber System Components in generation and transmission facilities.R23 Table 23.8: Low Impact: RequiredMedium Impact: RequiredHigh Impact: RequiredR23. Objective:To prevent and detect unauthorized modifications to BES Cyber Systems. R23. Requirement:Each Responsible Entity shall document and implement processes that incorporate the criteria in CIP-011-1 Table R23 - Configuration Change Management.
40.52	Bonneville Power Administration	Disagree	The objective of this requirement ("to prevent and detect unauthorized modifications to BES Cyber Systems") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.In addition, Section 23.7 of Table R23 has issues.It is not clear what is meant by "monitor changes...." If this implies some form or ongoing or periodic "monitoring" consider the following:Depending upon the definition of "change" and because of the nature of devices located at substations and other BES equipment, any form of ongoing check or monitoring would be extremely difficult. Because there is the potential for each device to have specific configurations and settings depending up the conditions of the circuit it might be connected to, this would mean that each piece of equipment would have to be manually connected to and checked on a periodic basis. These are industrial controls that are not normally connected to unless service is required for some reason. The definition of a change should not include day to day work processes that are performed to keep the lights on such as settings changes, resetting relays, AV signature updates, or other services and settings kinds of activities. Nor should it necessarily include data changes that do not affect the executable code or configuration of the system. We would expect to be able to define what a change is within our environment.Recommendation: Delete 23.7. Modify R23 to read:Objective 23 - To prevent and detect unauthorized modifications to BES Cyber Systems.R23. Each Responsible Entity shall document and implement processes that incorporate the criteria in CIP-011-1 Table R23 - Configuration Change Management. Such processes shall include an Entity-specific

#	Organization	Yes or No	Question 40 Comment
			definition of what constitutes a system change.
40.53	US Bureau of Reclamation	Disagree	The table requires additional clarification, particularly for different sorts of devices (relays, etc.)
40.54	Con Edison of New York	Disagree	These systems are constantly be upgraded all year long with little impact on any security. The need to do this within 30 days is excessive and should be limited to an annual review.
40.55	MRO's NERC Standards Review Subcommittee	Disagree	This requirement, especially evident in item 23.2, appears to be written around typical IT equipment, and not the multitude of electronic programmable devices an entity will encounter in the field at a generating facility or substation. Therefore, we believe the current intent of this requirement should only apply to control centers, similar to item 23.6, where typical IT equipment is becoming more of the standard.For generating facilities and substations, we believe it would be adequate to require the entity to document and implement one or more processes for configuration change management, and this would be applied to all Low Impact, Medium Impact, and High Impact systems.
40.56	Western Area Power Administration	Disagree	This requires a near-identical test system and makes no adjustments for risk analysis, and does not allow testing on failover devices (maybe) as it says "test environment" specifically. Is that truly the intent?
40.57	We Energies	Disagree	We Energies agrees with EEI: R23.3Implement and document a process to authorize and document changes to the BES Cyber System and update the inventory and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.We Energies agrees with EEI: R23.4Implement and document a process to authorize and document changes to the BES Cyber System and update the baseline configuration and other documentation as necessary within 90 days for low impact cyber systems, 60 days for medium impact cyber systems, and 30 days for high impact cyber systems.

#	Organization	Yes or No	Question 40 Comment
40.58	Manitoba Hydro	Disagree	We support the baseline approach to change management. It is unclear as to what "other documentation" in Requirements R23.3 and R23.4 is being referenced.
40.59	Emerson Process Management	Disagree	What is the significance of excluding software from the inventory requirement in 23.1 for low-impact BES Cyber System? Cyber security is mostly related to software than hardware. This exclusion does not give any value to the low impact systems.

41. Table R23 provide direction concerning what impact level of BES Cyber Systems to which Requirement R23 applies. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Configuration Change Management" is now addressed in CIP–010–1 — Cyber Security — Configuration Change Management

Commenters raised concerns about requirements that include component level actions for Low Impact BES Cyber Systems, such as inventories and development and maintenance of documentation. Commenters believed that the effort needed to implement those actions will detract from other, more critical actions on Medium and High Impact BES Cyber Systems and Components. Some recommendations are to remove Low Impact BES Cyber Systems from all Requirement R23 controls. In addition, because inventories are required in R23.1-2 for Low Impact components, commenters recommend that these should be limited to devices that have an external accessible connection with a potential direct impact on BES reliability. The drafting team appreciates the concern regarding the level of effort necessary for compliance on Low Impact assets. As such, the drafting team has attempted to implement a framework where the controls for Low Impact assets are those that can be implemented at a higher level of abstraction (such as on a site-by-site basis versus a component level basis) or are primarily programmatic or organizational in nature.

Commenters recommended that monitoring changes to the baseline configuration and responding to the detection of any unauthorized changes be limited to control centers only. The commenters submit that although the requirement may be appropriate for certain types of assets, the technology required to monitor many devices in generation and transmission facilities does not exist. As indicated in its response to Question 40, the drafting team appreciates these concerns and has modified the applicability for configuration monitoring to High Impact control centers.

Commenters noted that Requirement R23.2 adds a requirement for a detailed level of inventory including software versions. Commenters were not clear on the granularity required of this inventory. In addition they question how custom code is tracked for systems such as EMS and scripts that are routinely developed to streamline operational functions. In response, the specific language of the requirement regarding the necessary elements in a baseline configuration has been updated by the drafting team with the intent to provide additional clarity. (See Requirement R1, Part 1.1 in CIP-010-5)

Comments were submitted that recommend one inventory be required to cover all Low, Medium and High Impact BES Cyber Systems. It was also suggested that in Requirement R23.6, the requirements identified for Control Centers should only be extended to High Impact BES Cyber Systems as well as Control Centers. In response, the drafting team has adjusted the impact levels of the items that require an inventory to more suitably focus the effort of the Responsible Entity on items that are not as documentation-centric. None of the requirements in proposed CIP-010-5 apply to Low Impact BES Cyber Systems.

Regarding the testing of changes, commenters recommended testing of all High and Medium Impact BES Cyber Systems, not just those in Control Centers. They also recommended, however, that developing a test environment that models the production environment and documents differences should be applied only to High Impact BES Cyber Systems in Control Centers. In response, the drafting team has modified the standard to require testing of security controls for both High and Medium Impact BES Cyber Systems, but only requires testing in a test environment for those High Impact BES Cyber Systems in Control Centers. (See Requirement R3, Part 3.2 in the proposed CIP-010-5).

#	Organization	Yes or No	Question 41 Comment
41.1	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
41.2	Reliability & Compliance Group	Agree	You need to provide a definition of a virtual BES cyber system component.
41.3	LCEC	Disagree	23 What level does the software inventory include? Driver versions? What about devices with embedded OSes? Needs to include functionality testing.Is the requirement in 23.6 for control center only in reference to the cyber system components?
41.4	Black Hills Corporation	Disagree	23.5 should apply to Medium impact BES cyber systems.
41.5	ERCOT ISO	Disagree	23.5-23.7: Should apply to Medium Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
41.6	Regulatory Compliance	Disagree	23.7 - High Impact - "required for Control Center only"
41.7	US Bureau of Reclamation	Disagree	All impact levels should have some minimum level of requirement established.
41.8	Southwest Power Pool Regional Entity	Disagree	Although the language will work as written, it could be improved by separating the component inventory requirement defined in 23.1 from the more comprehensive

#	Organization	Yes or No	Question 41 Comment
			requirements in 23.2, making 23.1 applicable to all impact categories. Similar improvement is possible with 23.3 and 23.4. 23.6: Testing prior to implementation should apply to Medium category systems.
41.9	Southern Company	Disagree	As long as there are requirements which include per-component action for each low-impact BES Cyber System, the effort needed to implement those actions will overwhelm the rest of the CIP compliance effort. With 100's of low impact BES substations, there are 1000's of BES Cyber System components. These substation devices are being changed daily. The documentation requirements of R23 are overly burdensome with little benefit for low impact BES Cyber Systems. We recommend removing Low Impact BES Cyber Systems from all R23 controls. R23.1-2 requires an inventory of all Low Impact components, this is an intensive work load addition for the Low category components. Components as identified in the definition include all programmable devices. This includes most instrumentation in a generation unit. This should be limited to devices which have an external accessible connection with a potential direct impact on BES reliability.
41.10	WECC	Disagree	Change management and testing should be done for all medium and high impact level BES Cyber System Components not just control center or high.Criteria should apply to all impact levels.
41.11	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
41.12	The Empire District Electric Company	Disagree	Comments: See comments under question 40.
41.13	US Army Corps of Engineers, Omaha Distirc	Disagree	Define "changes" as used in 23.4. Does requirement R23.7 "Monitor changes to the baseline configuration and respond to the detection of any unauthorized changes" imply or require automated monitoring? If automated monitoring is required this could result in numerous TFE's for other than general processing equipment.

#	Organization	Yes or No	Question 41 Comment
41.14	Alberta Electric System Operator	Disagree	In 23.5 and 23.7, consider setting Medium Impact both to Required
41.15	Entergy	Disagree	Inventory and component baseline configuration management are basic care and feeding requirements generally accepted as best practice - 'systems management 101'; and should therefore apply for intelligent infrastructure employed throughout a control system. It is also clear from Order 706 that this is what FERC intends.
41.16	Consultant	Disagree	Item 23.6 - Stating that this is required for Control Centers only adds an additional dimension to the impact categorization. The impact categorization criteria should clearly identify the assets that go into a particular impact classification. The table should only state whether the requirement is required for that classification or not, it should not add an additional classification criteria.
41.17	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
41.18	Oncor Electric Delivery LLC	Disagree	Need an inventory for Medium and High systems(R23.1) and should document changes for Medium and High systems(R23.3) Requirement R23.7 should allow for manual processes to detect changes. It is also unclear how an entity would document a phased implementation - is it based on "in-service" designation?
41.19	Con Edison of New York	Disagree	o R23 changes and adds to Change Management Configuration requirements. This requirement mentions the need for an inventory of BES cyber components. This is not mentioned in CIP-010 o R23.2 This requirement adds a much more detailed level of inventory including software versions. This would be an extensive task, and does this require an inventory of all, such as any Microsoft Office on the workstations, non- MS app's etc? Shouldn't this be limited to knowing the release level you are on, without the line-by-line level information? How do you handle custom code for custom systems such as EMS?How do you manage scripts, they can be written to pull information from the database as shorthand; would that count? These are routinely

#	Organization	Yes or No	Question 41 Comment
			written by staff to get something quickly, and to address repetitive solutions/commands.
41.20	American Municipal Power	Disagree	Please provide a little or no impact category
41.21	Madison Gas and Electric Company	Disagree	R23.1 states: Develop an inventory of its physical or virtual BES Cyber System Components (excluding software running on the component), including its physical location.The BES Cyber System Component definition states: One or more programmable electronic devices (including hardware, software and data).... This requirement excludes software, but what about data?
41.22	BGE	Disagree	Recommend having 1 inventory for Low, medium and High.
41.23	Hydro One	Disagree	Recommend that 23.1 and 23.3 should be Required for High Impact, Medium Impact and Low Impact BES Cyber Systems.Recommend 23.6 High Impact BES Cyber Systems should be Required, not Required for Control Center Only.Recommend a clarification of “monitor” in 23.7.
41.24	ISO New England Inc	Disagree	Recommend that 23.1 and 23.3 should be Required for High Impact, Medium Impact and Low Impact BES Cyber SystemsRecommend 23.6 High Impact BES Cyber Systems should not be Requireed for Control Center Only
41.25	Northeast Power Coordinating Council	Disagree	Recommend that 23.1 and 23.3 should be Required for High Impact, Medium Impact and Low Impact BES Cyber Systems.Recommend 23.6 High Impact BES Cyber Systems should be Required, not Required for Control Center Only.Recommend a clarification of “monitor” in 23.7.
41.26	National Grid	Disagree	Refer to comments in Q. 40.
41.27	San Diego Gas and Electric	Disagree	SDG&E feels that unless there is a major change in the number of types of assets that

#	Organization	Yes or No	Question 41 Comment
	Co.		fall into the low category, there is little reason to have these assets be subject to a different set of requirements than those in the medium and high impact areas. Also, if there is consistency in the application of medium and high impact assets for R23.2 and R23.4, then why is R23.5 only required for high impact assets?
41.28	American Electric Power	Disagree	See comments under question 40.
41.29	MRO's NERC Standards Review Subcommittee	Disagree	See comments under question 40.
41.30	Southern California Edison Company	Disagree	Should be unilateral across all levels.
41.31	ReliabilityFirst Staff	Disagree	Suggest “Required” for Medium Impact in rows 23.5, 23.6, and 23.7.
41.32	Network & Security Technologies Inc	Disagree	Suggest requiring changes be tested for all High and Medium Impact Cyber Systems. Requirements to use a test environment that models production environment and to document differences could be applied only to High Impact systems in Control Centers.
41.33	Midwest ISO	Disagree	The requirement to document changes to the inventories in R23 is 30 days. The requirement to update inventories CIP-010 R2 is 45 days per CIP-010 R2. These should be consistent and we recommend it should be 60 days per our response in Q5.
41.34	APPA Task Force	Disagree	We propose the following changes to the Impact Levels of R23 if our changes proposed in Question 40 are accepted:R23 Table 23.1: Low Impact: Required for Control Centers OnlyMedium Impact: N/AHigh Impact: N/AR23 Table 23.2: Low Impact: N/AMedium Impact: Required for Control Centers OnlyHigh Impact: Required for Control Centers OnlyR23 Table 23.3: Low Impact: Required for Control Centers OnlyMedium Impact: N/AHigh Impact: N/AR23 Table 23.4: Low Impact: N/AMedium Impact: Required for Control Centers OnlyHigh Impact: Required for Control Centers

#	Organization	Yes or No	Question 41 Comment
			OnlyR23 Table 23.5: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyR23 Table 23.6: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyR23 Table 23.7: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyR23 Table 23.8: Low Impact: RequiredMedium Impact: RequiredHigh Impact: Required
41.35	GTC & GSOC	Disagree	We recommend that R23.7 be applicable for control centers only. This requirement is more appropriate for control centers and not for transmission and generations operations. While this requirement may be feasible for certain types of protective relays, this technology generally does not exist for a wide range of devices including certain RTUs and meters. In fact, some RTU's must be taken offline in order to retrieve their configuration. Thus, compliance with this requirement would have a negative reliability benefit.
41.36	Progress Energy (non-Nuclear)	Disagree	We see 23.5 as documented lab and field testing for any change to an existing relay/gateway/etc. configuration. Is this what was intended?Baseline configuration is not clear - does this start with the implementation date of the standard or the original production of the facility/element.Virtual BES is not clear. Please specify intention.

42. The definition of sensitive information was derived from the previous version of the CIP standards to minimize disruption to entity information protection programs that are already in place. Do you agree with the proposed definition? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

The definition of "sensitive information" that was originally posted as an informal definition adjacent to Requirement R24 in the draft CIP-011-1 was:

For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.

The primary issue identified with sensitive information was the term itself. Many commenters indicated that this term is already being used by organizations for other purposes, and its inclusion in the NERC CIP standards will cause much confusion. There were several suggestions of alternative terms to use including "CIP-sensitive information" and "protected information." In response to these comments, the drafting team has changed the term to "BES Cyber System Information." The commenters also included numerous suggestions for the improvement of the definition. One commenter indicated that this was not really a definition at all, but rather a list of examples. The drafting team did recognize this as a list of examples, and as such removed it from the requirement language and included the suggestions in the definition of the term BES Cyber System Information.

Several commenters indicated that "floor plans of computing centers" should be removed from the definition. The drafting team agrees that floor plans are problematic as they often are required to be submitted as part of work permits or other items. As such, the drafting team has clarified that only those floor plans that include impact designations of BES Cyber Systems should be identified as BES Cyber System Information, since it is the aggregate data that rises to the level of required protections and not just floor plans alone. This modification was also made to other elements of the definition such as equipment layouts.

A few commenters suggested that the scope of the definition was not broad enough and should be modified by saying "includes but not limited to" or changed entirely to include all data that affects the confidentiality, integrity, and availability of the BES. The drafting team appreciates this suggestion, but sees difficulty in the ability to measure such a broadly scoped definition. Additionally, the drafting team wanted to base the definition on the elements previously defined in CIP-003-3 R4.1 to leverage the investment that Responsible Entities have already made in their existing NERC CIP Information Protection Programs.

The proposed definition of "**BES Cyber System Information**" is:

"Information, about one or more BES Cyber Systems or BES Cyber Assets, that include one or more of the following: security procedures developed by the responsible entity; network topology or similar diagrams; BES Cyber System, Electronic Access Control System, and Physical Access Control System security configurations (e.g., network addresses, security patch levels, list of logical network accessible ports); floor plans that contain BES Cyber System Impact designations; equipment layouts that contain BES Cyber System Impact designations; BES Cyber System disaster recovery plans; and BES Cyber System incident response plans."

#	Organization	Yes or No	Question 42 Comment
42.1	Florida Municipal Power Agency	Agree	24.4 - How can a RE "revoke access" from data which may have been copied by personnel?
42.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
42.3	CWLP Electric Transmission, Distribution and Operations Department	Agree	Does network topology or similar diagrams include in-house wiring or plant wiring that may include fiber and Ethernet facilities?
42.4	Exelon Corporation	Agree	Exelon seeks clarification on the following question. Is it the intention of the Standard Drafting Team to include blueprints (schematics and one lines diagrams) for relay and SCADA components in the definition of sensitive information? And, to the extent that such information described large generation facilities or combinations of facilities greater than 2000 MW, then would the electronic record system be considered a High BES Cyber System?
42.5	USACE - Omaha Anchor	Agree	Question - it's difficult to electronically distribute controlled information - however the incident response plan and the recovery plan are supposed to be easily available to all folks. Seems a bit of an oxymoron.

#	Organization	Yes or No	Question 42 Comment
42.6	Northeast Utilities	Agree	The prior version had a concern with user lists, logon-ids, etc. Was applicability to that type of information intentional removed? Also, please clarify whether a recipient of CIP sensitive information must be CIP cleared (PRA & trained).
42.7	Consultant	Disagree	"...network topology or similar diagrams..." should be modified to "network topology that includes BES Cyber Systems" Corporate network topology should not be included in the standards, but this wording would include such diagrams."...floor plans of computing centers that contain BES Cyber Systems..." should be removed, or clarified to specify "floor plans that indicate locations of BES Cbyer Systems". Building floor plans exist in many places that are beyond the control of the Responsible Entities, e.g. architects, landlords, building maintenance companies. A better option might be rewording to qualify the entire list of items as applying to BES Cyber Systems. "... includes (1) security operational procedures, (2) network topology or similar diagrams, (3) floor plans of computing centers, (4) equipment layouts, (5) disaster recovery plans, (6)incident response plans, and (7) security configuration information that contain BES Cyber System information.The definition should be written as a definition, i.e. Sensitive Information - (1) security operational procedures, (2) network topology or similar diagrams, (3) floor plans of computing centers, (4) equipment layouts, (5) disaster recovery plans, (6)incident response plans, and (7) security configuration information that contain BES Cyber System information.The definition is NOT 'For the purposes of this standard', it is expected to be included in the next Glossary update after approval of the standard, and the defined term is hidden somewhere in the statement.
42.8	Luminant	Disagree	"floor plans of computing centers that contain BES Cyber Systems" should be changed to "floor plans that specifically identify BES Cyber Systems or their locations". " BES Cyber System disaster recovery plans" should be “BES Cyber System recovery plans"
42.9	Tenaska	Disagree	24.1 should say: Identify sensitive information.24.2 should say: implement procedures protect sensitive information25.1 should say: render sensitive information unusable

#	Organization	Yes or No	Question 42 Comment
			when disposing of documents and equipment that may contain that information.
42.10	Alliant Energy	Disagree	Alliant Energy agrees with EEI on all points and timeframe consistency. Table 24 is another occurrence where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the business need change. Terminations for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement.
42.11	Dairyland Power Cooperative	Disagree	BES systems actually contain information/data about the BES that is sensitive as well, but are ignored. Definitions for SCADA, electrical network topology, schematics, and other information can also be BES information related to critical infrastructure that requires protection.
42.12	E.ON U.S.	Disagree	CIP-011, R24 The definition of sensitive information should provide examples of what constitutes a “security operational procedure.”
42.13	CenterPoint Energy	Disagree	Disagree - CenterPoint Energy believes the Responsible Entity should identify and classify data as sensitive information and therefore the definition is too restrictive. CenterPoint Energy recommends it be revised as follows: For the purpose of this standard, sensitive information includes but is not limited to, security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and

#	Organization	Yes or No	Question 42 Comment
			security configuration information.
42.14	Dominion Resources Services, Inc.	Disagree	Dominion recommends changing “contain” to “identify” and adding the phrase “that specifically identify Medium or High Impact components” after the phrase “equipment layout of BES Cyber Systems.” This modification is reflected in the revised definition below: For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that identify BES Cyber Systems, equipment layouts of BES Cyber Systems that specifically identify Medium or High Impact components, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.
42.15	Bonneville Power Administration	Disagree	FERC, NERC and the Regional Entities do not have the information necessary to determine what information is sensitive or not as it regards any Responsible Entity. This is conditional and depends on more that just the types of information involved. The determination of what is sensitive information, and what is not can only be done by the Responsible Entity and under the laws and regulations they must comply with. Floor Plans, network diagrams, equipment layouts and other information may or may not be sensitive depending upon what additional information is provided with it. In addition, legal contracts, Federal, state and municipal laws, regulations, and fiduciary requirements may also govern what information may be protected and what must be released.Recommended Change - For the purpose of this standard, sensitive information may include security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information as determined by the Responsible Entity.
42.16	NextEra Energy Corporate Compliance	Disagree	In R24, is it a requirement to map every user's access privileges to sensitive information?In R24, for every new document that contain security operational procedures, network topology or similar diagrams, floor plans of computing centers

#	Organization	Yes or No	Question 42 Comment
			that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information, do we need to record the explicit authorization of every personnel that has access privileges for each type of documents?In 24.2, does this mean that the handling procedures for hard copies of sensitive information include a documentation for chain-of-custody for High Impact BES Cyber Systems?
42.17	Regulatory Compliance	Disagree	Incident Response plans and Diaster and Recovery plans should not be included as sensitive information - these plans should be psuedo public as long as they have written without security configuration information in them.
42.18	Progress Energy (non-Nuclear)	Disagree	It is not clear if this includes relay device information such as electrical diagrams/schematics.Incident response plans typically do not contain any system specific information. The plans provide the actions that must be taken and must be freely available to many. Will that approach meet the intention of the new standard?
42.19	MidAmerican Energy Company	Disagree	Many entities including MEC use "Sensitive" information as one of the classifications for information that needs to be protected. Calling all information to be protected sensitive will cause confusion. Change the term "sensitive information" to "protected information" in CIP-011.
42.20	Con Edison of New York	Disagree	o R24.3 does the word explicitly mean we cannot say all EMS staff has access to information? Does it need to be by name?
42.21	Network & Security Technologies Inc	Disagree	R24 and/or its sub-requirements should be modified to make it clear they apply sensitive information regardless of media type (including paper copies).24.4 - Revocation of access can be hard to do, and even harder to verify, in cases where an individual has taken either electronic or paper copies of sensitive documents off the Responsible Entity premises (sometime for legitimate reasons). Suggest revising this requirement in a manner that acknowledges this reality - something like “best effort” to retrieve sensitive information the individual may have in his or her possession,

#	Organization	Yes or No	Question 42 Comment
			accompanied by warnings that subsequent unauthorized disclosure of any such information may result in prosecution.
42.22	Hydro One	Disagree	Recommend that the definition change “includes” to “includes but not limited to”.
42.23	ISO New England Inc	Disagree	Recommend that the definition change “includes” to “includes but not limited to”
42.24	Northeast Power Coordinating Council	Disagree	Recommend that the definition change “includes” to “includes but not limited to”.
42.25	US Army Corps of Engineers, Omaha Distirc	Disagree	Remove "floor plans of computing centers"
42.26	Allegheny Energy Supply	Disagree	Requirement 24.3 is in conflict with 24.1 and 24.2 as it brings specific obligations that may or may not be appropriate.The existing definition of sensitive information:For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.is overbroad and inappropriate. A corporate procedure or signage indicating that visitors to a facility must register their presence could be considered a security operational procedure, and be considered sensitive information. A diagram “similar” (but not identical) to a network topology diagram, even if written on the back of a napkin, could be considered sensitive information. Floor plans are routinely required to be filed (generally publically) by municipal building and zoning authorities before construction permits are issued. Elements of BES Cyber System incident response plans such as local or regional law enforcement personnel contact information should be made widely available to responsible entity personnel. Elements of incident response plans that call for the protection of human life and safety as a primary directive should be made widely available to responsible entity personnel. Acceptable Use Banners could be considered part of security

#	Organization	Yes or No	Question 42 Comment
			configuration information.The definition of sensitive information and associated requirements needs extensive revision. Before beginning, the revision, some effort should be invested to define the security objective. For example the objective may be to prevent an unauthorized party from receiving information that could directly lead to the compromise of BES Cyber Systems. To achieve this objective, it would be desirable to protect BES Cyber System passwords. It may also be desirable to protect documents that provide a complete listing of BES Cyber System dial-in numbers or TCP/IP addresses. Operational plans to protect certain information must reasoned and be balanced with other requirements e.g. the training requirements that are part of this standard.
42.27	LCEC	Disagree	Sensitive is a classification that is specific to the CIP standards per this definition but is used in organizations as one of the levels of information classification. To differentiate, the term BES Sensitive might be considered.
42.28	Public Service Enterprise Group companies	Disagree	Sensitive should be changed to “protected Information”, the definition is fine.
42.29	Progress Energy - Nuclear Generation	Disagree	Sensitivity levels for information are established for nuclear generation facilities by CFR. This definition should be adjusted to acknowledge information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
42.30	Southwest Power Pool Regional Entity	Disagree	Should include more than “security” operational procedures. IT-specific operating procedures (“run books”) are very sensitive and could be used to exploit a system. Operations procedures may also be sensitive to some extent if they describe the use of the BES Cyber System.
42.31	San Diego Gas and Electric Co.	Disagree	The "definition" is only a list of examples, not a real definition. SDG&E suggests the following definition: "Sensitive information is defined as any information owned by

#	Organization	Yes or No	Question 42 Comment
			the Responsible Entity, or for which the Responsible Entity is the custodian of, that, if inappropriately disclosed, modified, or rendered unavailable, could adversely impact human safety or the reliability of the BES. Examples include...(their list)"
42.32	APPA Task Force	Disagree	The APPA Task Force would like to comment on the definition of sensitive information: As pointed out in Question 44, the following disclaimer needs to be added to that definition: "To the extent that state/local laws allow"
42.33	Entergy	Disagree	The definition of sensitive information is nearly identical to the one currently being used in version 3. R24.1 and R24.2 explicity allow the Entity to classify and protect "sensitive" information under its own auspice. As long as the classification guidelines are left for the Entity to decide, this definition should prove sufficient.The requirement indicates that the drafting team believes protection of sensitive information associated with allegedly "low impact" BES Cyber Systems/Components that provide routable protocol attack vector access to control hosts, etc., is unnecessary. Suggest this be rethought.Please define "Explicitly Authorize"? Does this mean that every individual with access to a particular piece of information needs some type of documented approval? Can this be done at a group level based on job function? Is approval documentation all that's required, or is a maintained list required as well?
42.34	Manitoba Hydro	Disagree	The definition should also reference control rooms.
42.35	Southern California Edison Company	Disagree	The definition should clearly distinguish BES operational information and cyber security related information. A smaller subset of the former and larger subset of the latter form potential candidates for "protected information".
42.36	Oncor Electric Delivery LLC	Disagree	The definition should not prescribe items as being "sensitive". The identification and classification process of Requirement 24.1 should do that. "For the purpose of this standard, sensitive information includes procedures, diagrams and any other document which provides proprietary information about BES Cyber Systems or BES

#	Organization	Yes or No	Question 42 Comment
			Cyber System Components."
42.37	Allegheny Power	Disagree	There is no reasoned basis to simply bring forward a historic definition then add significant additional requirements based on a legacy definition.Requirement 24.3 is in conflict with 24.1 and 24.2 as it brings specific obligations that may or may not be appropriate.The existing definition of sensitive information:For the purpose of this standard, sensitive information includes security operational procedures, network topology or similar diagrams, floor plans of computing centers that contain BES Cyber Systems, equipment layouts of BES Cyber Systems, BES Cyber System disaster recovery plans, BES Cyber System incident response plans, and security configuration information.is overbroad and inappropriate. A corporate procedure or signage indicating that visitors to a facility must register their presence could be considered a security operational procedure, and be considered sensitive information. A diagram "similar" (but not identical) to a network topology diagram, even if written on the back of a napkin, could be considered sensitive information. 			available to responsible entity personnel. Acceptable Use Banners could be considered part of security configuration information.We Energies agrees with EEI: The definition of sensitive information and associated requirements needs extensive revision. Before beginning, the revision, some effort should be invested to define the security objective. We Energies agrees with EEI: For example the objective may be to prevent an unauthorized party from receiving information that could directly lead to the compromise of BES Cyber Systems. To achieve this objective, it would be desirable to protect BES Cyber System passwords. It may also be desirable to protect documents that provide a complete listing of BES Cyber System dial-in numbers or TCP/IP addresses. Operational plans to protect certain information must reasoned and be balanced with other requirements e.g. the training requirements that are part of this standard.
42.43	American Transmission Company	Disagree	We propose deleting “floor plans of computer centers” from the definition of sensitive information. Floor plans do not typically include information specific to devices, IP addresses, etc which could be used to compromise a BES Cyber System. Moreover, a computer center is an undefined term which could mean anywhere there was more than one computer.
42.44	LADWP	Disagree	Word sensitive needs to be changed as it can coincide with actual classification used by entities.
42.45	FirstEnergy Corporation	Disagree	Would like to see the definition even more narrow, to focus on information that truly can compromise the BES (e.g. Vulnerability assessments’, mitigation strategies, passwords, and DR plans).

43. Do you agree with the proposed definition of Media? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

The definition of "media" that was originally posted as an informal definition adjacent to Requirement R25 in draft CIP-011-1 was:

Media for the purpose of this standard means any mass storage devices within a BES Cyber System Component including, but not limited to, magnetic tapes, optical disks, and magnetic disks onto which information is recorded and stored.

The proposed definition of "media" received significant agreement from those entities that chose to respond to this question. The majority of comments on the definition of media indicated that the definition should be expanded to include additional storage types as well as more traditional media types such as paper. The drafting team intends for Responsible Entities to protect media, such as paper, through the required handling procedures included in the Information Protection requirement.

One commenter indicated that USB drives, CDs, and floppy disks should be included in the definition of media. It was the intent of the drafting team that these device types would be considered devices used to perform maintenance and thus treated in accordance with the maintenance requirements. As the maintenance requirements evolved with the inclusion of additional remote access requirements, the drafting team considered expanding the scope of the media definition.

Another commenter made an interesting case regarding the media being "within" a BES Cyber System and suggested that once the media was removed that it no longer met the definition. The drafting team considered this comment and has modified the standard to require sanitization of BES Cyber System Information contained on media. The remaining comments focused primarily on the requirements themselves and not the definition. Specifically, commenters were concerned about the level of sanitization that would be required on the media. Several commenters noted that the level of sanitization should be commensurate with the potential threat to BES reliability, while others suggested that there be a defined minimum acceptable sanitization process, such as an NSA standard. The drafting team understands the need for a minimum acceptable sanitization process. However, the NERC Standards Development Process does not allow the drafting team to simply reference another standard. As such, we have modified the language in the revised standard to require that media be destroyed or other actions taken to prevent unauthorized retrieval.

Given the potential confusion with establishing a NERC Glossary definition for media, the drafting team has elected to define the term within the language of the standard itself.

#	Organization	Yes or No	Question 43 Comment
43.1	Florida Municipal Power Agency		How would one define the process used to render the media unrecoverable? What does unrecoverable mean? Unrecoverable by NSA standards or unrecoverable by means of something like phase transition?
43.2	Black Hills Corporation	Agree	Believe that solid-state mass-storage (flash drives, thumb drives, jump drives, etc,) should be included as examples in the definition.
43.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
43.4	Northeast Utilities	Agree	Suggest that a minimum acceptable sanitization process (i.e., NIST standard) is specified.
43.5	APPA Task Force	Agree	The APPA Task Force agrees with the definition.
43.6	Dairyland Power Cooperative	Agree	With the proliferation of flash memory solutions, the only way to sanitize some media is physical destruction. Many devices use flash memory in a way that is not removable. Is destruction of this equipment intended?
43.7	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
43.8	FirstEnergy Corporation	Disagree	Believe the definition should not include example because of the quickly changing storage technologies.
43.9	Xcel Energy	Disagree	Further clarification, similar to the definition of Maintenance in R26, is needed to make it clear that media such as hard drives on laptops used for maintenance do not need to be sanitized after temporary connection to BES Cyber Systems.

#	Organization	Yes or No	Question 43 Comment
43.10	LADWP	Disagree	Is portable storage included here?
43.11	Emerson Process Management	Disagree	It should include USB memory stick which is becoming very popular.
43.12	LCEC	Disagree	Media can be removed from the BES Cyber System and it should still be considered media per this requirement. Remove the word "within" and replace with "used by" or "written to by" a BES Cyber System.
43.13	Public Service Enterprise Group companies	Disagree	Media should also include persistent configuration data that is stored in solid state devices (e.g. flash memory, EEPROM (electrically-erasable programmable read-only memory), etc.)
43.14	Southwest Power Pool Regional Entity	Disagree	Portable media, including CD/DVD and USB devices should be included. Basically, anything that sensitive information can be written to.
43.15	Reliability & Compliance Group	Disagree	Recommend removing the word “mass” and instead use the term storage devices.
43.16	USACE - Omaha Anchor	Disagree	Sanitization should only apply to media internal to the devices.
43.17	San Diego Gas and Electric Co.	Disagree	SDG&E notes that the proposed definition does not appear to include "old school" media like paper that is often used to store sensitive information.
43.18	ERCOT ISO	Disagree	Should also specifically address CDs and USB storage devices in the definition.
43.19	Progress Energy (non-Nuclear)	Disagree	Should the definition also clearly state device hard drives?
43.20	Manitoba Hydro	Disagree	The current definition would also require the sanitization of other mass storage devices, such as flash memory, which could render the cyber component unfit for

#	Organization	Yes or No	Question 43 Comment
			reuse outside of the BES Cyber System. The strict sanitization requirement does not permit the return of a failed BES Cyber System or BES Cyber System Component to the vendor for failure analysis. The information protection requirements must provide more flexibility, which may also be achieved through processes and procedures.
43.21	ReliabilityFirst Staff	Disagree	The definition does not need to specify “mass storage devices” and, in fact, should include devices such as flash drives. Media should also be defined to include media types other than electronic such as paper.
43.22	Consultant	Disagree	The definition is technology limited by magnetic and optical technologies. While pervasive, there are and will be other technologies to retain information.Suggest: Media - computer components and recording media that retain digital data used for computing for some interval of time.Might also consider making the definition "Electronic Media" to eliminate books, notebooks, paper, etc. which are also 'information storage media'.
43.23	Entergy	Disagree	The definition of "media" includes the open-ended term "including, but not limited to", which could practically bring anything into scope. A more concise definition with specific examples would remove ambiguity and leave less room for interpretation. The examples of Media in the box should also include flash memory as well.An example of the type of sanitization required should be provided.
43.24	Alberta Electric System Operator	Disagree	The definition states “including, but not limited to,”. The AESO suggests modifiying the definition to explicitly include non-volatile storage to ensure coverage of memory cards and flash drives.
43.25	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI’s comments.
43.26	We Energies	Disagree	We Energies agrees with EEI: When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of

#	Organization	Yes or No	Question 43 Comment
			voltage or frequency does not pose a risk to the BES.
43.27	Allegheny Energy Supply	Disagree	When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of ambient air temperatures does not pose a risk to the BES.
43.28	Allegheny Power	Disagree	When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.
43.29	EEI	Disagree	When writing the definition, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.

44. Requirements R24 and R25 of draft CIP-011-1 concern procedures for information protection and media sanitization. Do you agree with the list of criteria that are included in each Requirements Table for R24 and R25? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

Concerns regarding the requirement for information protection centered around the revocation timeline and scope as well as differentiating access to information vs. access to systems. The drafting team is attempting to address the FERC directive that requires the revocation of access to BES Cyber System Information. The drafting team is proposing to address revocation of access to BES Cyber Systems and to BES Cyber System Information all in one place to ensure more consistency in the requirements and their implementation.

There were a number of commenters who raised concerns with the requirement for media sanitization regarding media failure conditions or disposal. The word "sanitization" appeared to cause confusion for a number of commenters and as such has been removed from the revised standard. Additionally, a couple of commenters raised concerns about the burden of proof, compliance requirements, legal issues, and ownership responsibilities.

As with other areas of this standard, there were a significant number of the comments asking for clarity of phraseology and terminology, including words such as consequence, annually, explicitly, acceptable, commensurate, etc. The drafting team eliminated the words, "explicitly, acceptable, commensurate, and annual" from the revised CIP-011-1 standard.

#	Organization	Yes or No	Question 44 Comment
44.1	ISO New England Inc		Recommend changing 24.4 to Revoke physical/logical access to sensitive information for personnel terminated for causeWhat about revoking access for other than cause?Recommend changing R25.1 to avoid the gap of High Impact to Low Impact to reuse outside of BES Cyber Systems. Suggest changing "reuse outside of BES Cyber Systems" to "reuse outside of the Entity's High Impact or Medium Impact BES Cyber Systems"
44.2	Northeast Utilities	Agree	Agree that this requirement covers the key cyber assets but how does this apply to

#	Organization	Yes or No	Question 44 Comment
			protective systems such as the physical access system, firewalls and logging devices?
44.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
44.4	Black Hills Corporation	Agree	Legally Required Release: There may be "legal" situations in which we may be required to share certain information with outside entities, both government and non-government. Examples could include OSHA or MSHA investigations, employee lawsuits (with the associated discovery). There does not appear to be any provision in the regulation to allow this sharing. We could be placed in the position of violating this regulation, or violating some other legal requirement (subpoena, etc)
44.5	Puget Sound Energy	Agree	Puget Sound Energy suggests modifying R24.4 to "Revoke access to media containing sensitive information within 24 hours..." to align with the NERC definition in R25 and to provide clarity around sensitive information in a hardcopy format.
44.6	GTC & GSOC	Agree	We recommend the verbiage and timelines for R24.4 be consistent with tables R5 and R13.
44.7	Independent Electricity System Operator	Disagree	- R24.4 define for cause. Should the wording be involuntarily terminated to include those that are terminated unwillingly due to layoffs, job cuts, fired/performance, etc.- R24.4 how do you remove access where personnel may have physical copies offsite o
44.8	ERCOT ISO	Disagree	24.2: Recommend: "Implement labeling and handling procedures for sensitive information according to its defined classification level." 24.3: It is unclear whether the requirement includes internal and external personnel. 24.4: Should be combined with other access management requirements (physical, cyber)24.5: Should also address "need to know". The requirement did not address the access control means for protecting information or the access to hard copies of information.
44.9	Duke Energy	Disagree	24.3 - We don't feel it is realistic to explicitly authorize access to paper copies of

#	Organization	Yes or No	Question 44 Comment
			information. Add 'repositories' at the end of the sentence.Include "repository" in 24.4 and 24.5 as well. Requirement 24.3 is particularly burdensome in a nuclear environment where there is already heavy physical security. There are thousands of drawings, for example, available for the plant. There are hundreds of personnel that have a business need to know certain things about the plant that are contained in these drawings. During outages that number often goes above 1000 personnel. Segregating all drawings/manuals/equipment layouts/floor plans/procedures and EXPLICITLY authorizing personnel for access is difficult at best. Certainly, protecting cyber specific information such as firewall rules, group policies, passwords, and other specific cyber information makes sense and is done already.
44.10	Regulatory Compliance	Disagree	24.4 - Strike altogether. Revocation should go back and be included in the scope of System revocation.25.1 - Propose : Sanitize only media containing sensitive information prior to disposal for reuse outside of BES Cyber Systems, using a method to render the data unrecoverable.
44.11	Southwest Power Pool Regional Entity	Disagree	24.4: Is this requirement prescribing Information Rights Management? There are many types of access, including access to information no longer under the direct control of the entity. 24.5 is poorly worded. Would be better to require that access is authorized, not that it reflects authorization. 25.1 should require either sanitization or physical destruction.
44.12	American Electric Power	Disagree	25.1: Regarding "Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a method to render the data unrecoverable", what evidence would be required from an audit perspective? If a USB harddrive is used to copy patches onto a system, would that USB harddrive need to be destroyed with documented evidence if it failed 2 weeks down the road?Suggested rewording:Media for the purpose of this standard means any mass storage devices within a BES Cyber System Component including, but not limited to, magnetic tapes, optical disks, and magnetic disks onto which sensitive information is recorded and stored.Rational: Adding sensitive to the "Media" definition will clarify that this is intended to be used

#	Organization	Yes or No	Question 44 Comment
			to protect the inadvertent distribution of protected information, not all media devices that are plugged into a BES Cyber System will need to be sanitized.
44.13	BCTC	Disagree	Â R24.4. We need clarification on revocation of access. We are assuming it is from the point the person departs their job - i.e. access to the BES Cyber System is revoked. Such personnel could have hard copies of information but how would you prove that such documentation was shredded? What about information they have retained within their brain? ï?Š We need some clarity on what the parameters are herePlease provide a concise definition for 'sanitize'. We discussed scenarios such as patching the BES Cyber System via a CD - would compliance require that we 'sanitize' the CD? If yes, seems like overkill from our discussions on the subject. Please provide more concise language to define the scope.over real time to either. Yet, in reading the requirements we could potentially be found non-compliant based on the wording of the version 4 standards - this should not be! FYI, I raised this point at the recent 2 day workshop in Texas and the drafting team was in agreement that our current configuration is an example of excellence ... yet is a potentially non-compliant based on current wording ... this needs to be revisited.
44.14	Progress Energy - Nuclear Generation	Disagree	Agree with R24.1, R24.2 and R25.1. Disagree with R24.3, R24.4 and R24.5 which are governed for nuclear generating facilities by CFR. R24-24 should acknowledge information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
44.15	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
44.16	E.ON U.S.	Disagree	CIP-011-1, R24.4 is unnecessary and difficult to impossible to document. At this point, all authorized unescorted physical and electronic access would have been removed per other requirements. E ON U.S. proposes that this requirement be deleted.

#	Organization	Yes or No	Question 44 Comment
44.17	USACE - Omaha Anchor	Disagree	Definition would include external hard drives and other external media. It seems ridiculous if you are installing patches to sanitize the media before going to the next cyber system. You are treating the cyber system as a classified system. This is serious overkill. External media for the most part should be exempt from this requirement unless sensitive information is placed on the media in which case it should follow the rules of R24.
44.18	Dominion Resources Services, Inc.	Disagree	Dominion recommends revising Requirement R24.1 to read:"Identify and designate controls for protection of sensitive information commensurate with its importance to the security and reliable operation of the associated BES Cyber System."24.3. With the heavy industry reliance on vendors and contractors and the requirements throughout other NERC standards to share data with other entities, it is impractical to "Explicitly authorize personnel for access to sensitive information." For example, when information is sent outside Dominion, it is impossible to know every person who sees it. Moreover it is unlikely that whoever does see it would want to sign an agreement with every entity that can submit information. The controls specified above in the requested revision to 24.1 should cover the requirements for access to the information. Dominion requests that this requirement be removed.24.4. It is possible to revoke electronic access to company-controlled devices containing sensitive information and to revoke physical access to company-controlled areas containing sensitive information within 24 hours. It is not reasonable to identify and retrieve information within 24 hours that may have been taken by an authorized user prior to being terminated for cause and it may not be possible to ever retrieve this information if it has been hidden by the individual. Please restate this requirement to indicate that it covers physical and electronic access as follows:"24.4 Revoke electronic access to company-controlled devices containing sensitive information and physical access to company-controlled areas containing sensitive information within 24 hours."24.5. As stated in Dominion's comment to 24.3, it is impractical to authorize individuals. As applied to this requirement it is also impractical to track individuals. In the example given in the above response to 24.3, any non-company

#	Organization	Yes or No	Question 44 Comment
			personnel that might see sensitive data would need to be authorized by every Registered Entity and their companies would have to keep every RE appraised of every personnel change and provide annual lists of all personnel. Dominion requests that this requirement be removed.Note: At Dallas, the SDT requested input as to requiring training and a PRA for access to sensitive information. Dominion requests that training and a PRA NOT be required. Training and a PRA are not required by versions 1, 2, and 3 of the CIP standards and could be impossible to implement across vendors within the electric industry. In the example given in the above response to 24.3, every vendor or business partner would have to take the training from every Registered Entity or have their training approved by every entity (including annually providing the training program to each RE for approval) and ES-ISAC would have to keep every RE appraised of every personnel change and provide annual lists of all personnel. And then, PRAs would have to be addressed. Registered Entities should be required to have internal requirements for access to sensitive information.
44.19	ReymannGroup, Inc.	Disagree	Expand the list of procedures to include 3rd party data recovery services in accordance with an approved vendor management policy for all impact levels.
44.20	RRI Energy	Disagree	Explicitly define “access” as related to sensitive information. Data can be locally cached on web browsers, remote or personal pc’s, etc. These cannot easily be removed let alone 24 hrs removal.
44.21	Constellation Power Source Generation	Disagree	In R24.1, what classifications for sensitive information should be used? The SDT should develop classifications specifically for CIP. As written, this is not an auditable requirement.
44.22	ReliabilityFirst Staff	Disagree	In row 24.1, what is meant by “consequence”? In Table R24, row 24.5, we suggest the verification of access privileges be performed at least quarterly. To Table R24, add a new row 24.6 stating, “Revoke access to sensitive information within 72 hours for personnel terminated not for cause.” And assign this requirement an impact level of “Required” for both Medium and High Impact BES Cyber Systems. Table R25, row

#	Organization	Yes or No	Question 44 Comment
			25.1; we believe there should be a definition of “sanitize” to eliminate confusion regarding what actions must be taken to comply with this requirement.
44.23	MidAmerican Energy Company	Disagree	It was mentioned in the May workshop that the SDT would consider the necessity for Personnel risk assessments and training required prior to granting access to protected information.Personnel risk assessments and training should not be required prior to granting access to protected information. As an example, entities would have a nearly impossible task of completing personel risk assessments for international employees at global help desks that are allowed view only access to a BES Cyber System.
44.24	WECC	Disagree	Item 24.2 should be made clear that individual hard drives, servers, laptops, etc do not need to be labeled. Perhaps “labeling of media” was meant. Item 24.3 will have great impact on the ability to have technical support from large global vendors such as Cisco. Consider exception to this requirement for maintenance or add something to Maintenance requirement R26 to deal with it.Clarify how sensitivity and consequence are determined.Clarify the requirements for authorization for access to sensitive information (i.e. need to know).
44.25	LCEC	Disagree	Need to clarify the acceptable methods.
44.26	NextEra Energy Corporate Compliance	Disagree	NextEra believes that R24 did not take into consideration access privileges with sensitive information. It does not provide clear guidance and left room for interpretation. The following are the recommended updates:R24.5 Verify at least every 12 months that the access privileges to sensitive information reflect the appropriate need with the personnel roles and responsibilities. Access privileges to sensitive should correspond with the needs and appropriate personnel roles and responsibilities.Regarding CIP-011-1/R25, R25 did not provide a standard to sanitize media. The current language did not provide clear guidance and left room for interpretation. The following is the recommended updates:25.1 - Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using clearing

#	Organization	Yes or No	Question 44 Comment
			utility supporting the Department of Defense clearing and sanitation standard. R24.4 - Requirement covered by revocation of physical and cyber access.Revoking physical and cyber access would revoke access to protected information. Therefore, NextEra suggests removing 24.4
44.27	National Grid	Disagree	o Provide timelines for access revocation for reasons other than "terminated for cause" o Do laptops and devices that maintain the BES Cyber Systems need to be sanitized?
44.28	PacifiCorp	Disagree	PacifiCorp asks that the reference to "at least every 12 months" is modified to read "annuallyonce every calendar year." Allowing responsible entities the flexibility to require trying once every calendar year rather than at least every 12 months would relieve entities of the significant administrative burden of tracking specific training deadlines for each individual employee. At the same time, this change will still ensure that employees are trained at regular enough intervals to achieve the reliability goal of the training requirement.
44.29	Ameren	Disagree	R24.3 - Listing people who have access to information serves no purpose in protecting BES systems from Cyber attack. The list of people with this information is not the same as the list of people that have access to the systems. This requirement should be removed.R24.4 - This requirement is impossible to prove for printed documentation. Suggest removal.
44.30	Liberty Electric Power, LLC	Disagree	R25 appears to require the hard drives of laptops used in relay calibrations to be wiped before leaving site. This is a serious issue for smaller entities, due to almost all of the relay work being done by outside contractors. These contractors often need the data taken to write reports which are required by other NERC standards. This requirement needs to be removed.
44.31	Allegheny Energy Supply	Disagree	R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the responsible entity is unable to

#	Organization	Yes or No	Question 44 Comment
			perform sanitization on the media.Requirement 25.1 uses the word “Unrecoverable”. This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of ambient air temperature does not pose a risk to the BES.
44.32	Allegheny Power	Disagree	R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the responsible entity is unable to perform sanitization on the media.Requirement 25.1 uses the word “Unrecoverable”. This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.
44.33	EEI	Disagree	R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the responsible entity is unable to perform sanitization on the media.Requirement 25.1 uses the word “Unrecoverable”. This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.

#	Organization	Yes or No	Question 44 Comment
44.34	Hydro One	Disagree	Recommend changing 24.4 to Revoke physical/logical access to sensitive information for personnel terminated for cause.Revoking access for other than cause should be addressed.Recommend changing R25.1 to avoid the gap of High Impact to Low Impact to reuse outside of BES Cyber Systems. Suggest changing “reuse outside of BES Cyber Systems” to “reuse outside of the Entity’s High Impact or Medium Impact BES Cyber Systems”.
44.35	Northeast Power Coordinating Council	Disagree	Recommend changing 24.4 to Revoke physical/logical access to sensitive information for personnel terminated for cause.Revoking access for other than cause should be addressed.Recommend changing R25.1 to avoid the gap of High Impact to Low Impact to reuse outside of BES Cyber Systems. Suggest changing “reuse outside of BES Cyber Systems” to “reuse outside of the Entity’s High Impact or Medium Impact BES Cyber Systems”.
44.36	Idaho Power Company	Disagree	Revocation of access to sensitive information is virtually impossible if the person terminated has the information in their possession either hard copy or portable media. Access to additional information can be revoke. Consider rewording this requirement to accommodate this reality.
44.37	Southern California Edison Company	Disagree	SCE feels the standard, as written, may be operationally difficult to implement. As such SCE recommends allowing for the revocation of electronic access to sensitive information within 24 hours, or make a written demand (which may be followed up by legal process) for such information within a 24 hour timeframe. This distinction is crucial as not all sensitive information may reside within the physical confines of the registered entity. Business concerns may require registered entities to allow sensitive information (if adequately protected by contractual or employment terms) to leave the confines of the company. For example, employees may have CIP-protected information in company-issued laptops. In some scenarios, it may be impossible to recover those laptops if they were left offsite when the employee was terminated. However, it would be possible to issue a written demand, supported by law, for such

#	Organization	Yes or No	Question 44 Comment
			documents. The drafting team is requested to rephrase R24.4 with a view on implementability, enforceability and auditability.
44.38	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that R24.3 should read "Explicitly authorize role-based access to sensitive information."In R24.4, SDG&E asks how would we do this for hard-copy information?In R24.5, SDG&E suggests changing the wording to read "Verify at least every 12 months that the role-based access privileges to sensitive information reflect authorization."
44.39	Progress Energy (non-Nuclear)	Disagree	Should there be an item in table R25 to identify the media to be sanitized that may be overlooked, i.e. printers/plotters/scanners, relay test sets, etc.
44.40	Consultant	Disagree	Table R24 - Item 24.3 This is an access control requirement, and should be moved to access control requirement table. Access control should cover cyber access, physical access, and information access together, as the process for attaining each type of access is related.Item 24.4 is an access revocation requirement, and should be moved to the access revocation requirement table. Access revocation should cover cyber access, physical access, and information access together, as the process for revoking each type of access is related. The comments related to timeframes in those sections are applicable to information access revocation as well.Item 24.5 is an account management requirement, and should be moved to the account management requirement table. Account Management and reviews should cover cyber access, physical access, and information access together, as the process for reviewing and confirming each type of access is related. The comments related to timeframes in those sections are applicable to information access access review as well.Table R26 - Item 26.1 Replace the word "all" with "BES Cyber System" as a better statement.Item 26.1 If 'media' is a defined term it should be capitalized. (See comments on definition of Media.)
44.41	APPA Task Force	Disagree	The APPA Task Force cautions the drafting team on the information protection requirements in R24. Nearly every state in the United States has a public records law

#	Organization	Yes or No	Question 44 Comment
			that applies to public power systems as units of state or local government (These laws are often referred to as “Government in the Sunshine” laws.). We recommend that the drafting team consult with NERC legal counsel prior to revising this requirement. We do not want public power systems to have to choose between being in noncompliance with the proposed requirements or violating their state open records laws. Rebecca Michaels of NERC Staff is familiar with this issue. If this must move forward as proposed we recommend that the following be added to the requirement: “To the extent that state/local laws allow.”R24.Objective:To prevent unauthorized access to sensitive information associated with BES Cyber SystemsR24. Requirement:To the extent permissible under federal and state laws, each Responsible Entity shall document and implement one or more processes that incorporate the criteria in CIP-011-1 Table R24 - Information Protection.
44.42	Reliability & Compliance Group	Disagree	The method of sanitizing media should be done in an industry accepted manner to provide for auditability of the standard.
44.43	Bonneville Power Administration	Disagree	The objectives of these requirements (“to prevent unauthorized access to sensitive information associated with BES Cyber Systems” and “to prevent the unauthorized dissemination of BES Cyber System information”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R24, Section 24.1. Recommend replacing "classify" and "classification" with "categorize" and "category" and "categorization", . "Classify" and "classification" have very specific meanings to any Federal agency. Those meanings are restricted to the realm of National Security Information and are different from what is presented here. Such information requires storage in General Services Administration-approved safes, transmission using National Security Agency-approved encryption, and can be only be processed on computer systems if those systems are dedicated to such use, totally isolated from any publicly accessible network, and stored in secure facilities when not

#	Organization	Yes or No	Question 44 Comment
			in use. Furthermore, the Federal Agencies do not have the option of using a different definition. In fact, using Regional Entity standard forms marked "Confidential" is problematic for Federal agencies, as such a marking is reserved for a particular level of classified information. Given the large number of Federal organizations to which this standard applies, it would simplify matters to restrict the use of "classify" and similar terms to the realm of National Security Information.Recommend deletion of Table 24, Section 24.3. Requiring formal authorization is a process more stringent to that required to gain access to National Defensed Information at the Confidential and Secret level: A formal determination of trustworthiness, but no formal further formal authorization required for access once the clearance has been granted. For sensitive information other than National Defense Information, Federal agencies are required only to determine the the recipient needs the information to support the activities of the agency. Such a determination can be made informally, by any person with custody of the information. We realize that there seem to be conceptual difficulties about revoking access without formally authorizing it. But, they are resolved when we note that authorizing access is not the same as granting it. Authorizing access is a declaration that the person is allowed to have access. Granting access is giving them the info. It is not clear to which of these "revoke" is intended to apply. However, R24 is only concerned about revocation following termination for cause. In those cases, electronic and physical access to all Entity assets is generally revoked. That would effectively deny access to the information, as well. Thus, revocation can be accomplished even though a formal access authorization is not used.
44.44	US Bureau of Reclamation	Disagree	The use of the term classification is not appropriate, suggest "categoruize" to avoid conflict with other requirements in the federal sector.
44.45	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments regarding Requirement 25.1.
44.46	We Energies	Disagree	We Energies agrees with EEI: R25 Needs to contemplate how organizations should handle situations where media has failed or is failing to operate properly and the

#	Organization	Yes or No	Question 44 Comment
			responsible entity is unable to perform sanitization on the media.We Energies agrees with EEI: Requirement 25.1 uses the word "Unrecoverable". This creates an unreasonable mandate for responsible entities to be measured against. Suggest alternative along the lines: Sanitize all media prior to disposal or release for reuse outside of BES Cyber Systems, using a methods, tools or techniques to render BES Cyber System information such as passwords unavailable using commercially available means.We Energies agrees with EEI: When writing the requirement, it is appropriate to consider the threat to BES reliability that is to be mitigated. A series of measurements of voltage or frequency does not pose a risk to the BES.
44.47	FirstEnergy Corporation	Disagree	We would like to have clearer definition on what is acceptable sanitation methods.
44.48	Entergy	Disagree	What exactly does "Explicitly Authorize" mean? Does this mean that every individual with access to a particular piece of information needs some type of documented approval? Can this be done at a group level based on job function? If so, it should be stated as such.Is approval documentation all that's required, or is a periodically maintained list required as well?What is the definition of "Revoking Access"? Does the individual need to be removed from every Cyber System he/she had access to?
44.49	Manitoba Hydro	Disagree	What is the meaning of "consequence" in Requirement R24.1? There is currently no requirement for revocation of access to sensitive information for any other reason than "for cause". There are no specifics given with respect to "classify" sensitive information in Requirement R24.1 so it is assumed to be at the Responsible Entity's discretion in terms of criteria, methodology, etc. There are no specifics given with respect to "method" in Requirement R25.1 so it is assumed to be at the Responsible Entity's discretion.

45. Tables R24 and R25 provide direction concerning what impact level of BES Cyber Systems to which Requirements R24 and R25 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Information Protection and Media Sanitization" is now addressed in CIP–011–1 — Cyber Security — Information Protection.

Concerns were raised by commenters regarding the applicability of the information protection and media sanitization requirements. The issues centered around the tables being too broad brushed. There was also concern surrounding the differentiation of information sensitivity vs. impact categorization. The drafting team modified the standard to only include information protection for High and Medium Impact BES Cyber Systems and associated Physical Access Control Systems, associated Electronic Access Control or Monitoring Systems, and associated Protected Cyber Assets.

#	Organization	Yes or No	Question 45 Comment
45.1	WECC		Criteria should apply to all impact levels
45.2	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
45.3	Consultant	Agree	Table R24 - Items 24.3, 24.4, & 24.5 should be moved to their respective subject areas as suggested in the comment on Question 44. (Cyber access, physical access, and information access requirements should be addressed together, as the requirements and processes for each type of access is related.)
45.4	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels proposed for R24-R25 if it is understood that a blank in the table means N/A.
45.5	PacifiCorp	Disagree	: Lines 24.1 and 24.2 imply that multiple classifications levels for "Sensitive Information" will be required. Need to allow for entities to use one classification for "Sensitive Information".24.4 The requirement to revoke access to sensitive information within 24 hours is impractical. The information may be offsite on paper hardcopy or electronically on media. 24.5 Entities should also be required to correct

#	Organization	Yes or No	Question 45 Comment
			access privileges found to be inaccurate once they have been verified.
45.6	Southwest Power Pool Regional Entity	Disagree	24.1, 24.2, and 25.1 should be applicable to all impact categories.
45.7	US Army Corps of Engineers, Omaha Distirc	Disagree	24.3 does a job description constitute "explicit authorization?" Restrictions on media use as written would preclude using media to transfer information to external systems using media. Should be reworded with the intent that the media be sanitized before disposed of or released outside the organization or allowances made for transfering information. Also could be interpreted to mean an update disk used to update BES Cyber System 1 would have to be wiped and could not be used to update system 2.
45.8	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
45.9	Allegheny Energy Supply	Disagree	As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.
45.10	Allegheny Power	Disagree	As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.
45.11	EEI	Disagree	As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.
45.12	MidAmerican Energy Company	Disagree	Lines 24.1 and 24.2 imply that multiple classifications levels for “Sensitive Information” will be required. Need to allow for entities to use one classification for “Sensitive Information”.24.4 The requirement to revoke access to sensitive information within 24 hours is impractical. The information may be offsite on paper hardcopy or electronically on media. 24.5 Entities should also be required to correct access privileges found to be inaccurate once they have been verified.

#	Organization	Yes or No	Question 45 Comment
45.13	American Municipal Power	Disagree	Please provide a little or no impact category
45.14	US Bureau of Reclamation	Disagree	Requirements should be applied to information sensitivity, not the impact level of the system(s).
45.15	Southern California Edison Company	Disagree	SCE feels that R24 and R25 apply regardless of the BES Control System impact level.
45.16	Progress Energy (non-Nuclear)	Disagree	See comment 14.
45.17	LCEC	Disagree	See previous comments
45.18	BCTC	Disagree	See Question 44 response
45.19	Bonneville Power Administration	Disagree	See the response to question 44.Item 24.5 in Table R24 states as follows: "Verify at least once every 12 months that the access privileges to sensitive information reflect authorization". Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently verifications must occur.
45.20	LADWP	Disagree	Should be restricted to high level only.
45.21	ReliabilityFirst Staff	Disagree	Suggest "Required" for Low Impact in row 25.1.
45.22	Entergy	Disagree	The requirement indicates that the drafting team believes that protection of sensitive information associated with allegedly "low impact" BES Cyber Systems/Components that provide routable protocol attack vector access to control hosts, etc., is unnecessary. Suggest this be rethought.
45.23	Pepco Holdings, Inc. -	Disagree	We agree with EEI's comments.

#	Organization	Yes or No	Question 45 Comment
	Affiliates		
45.24	We Energies	Disagree	We Energies agrees with EEI: As previously documented, the requirements in tables 24 and 25 are overbroad and not appropriate.

46. The BES Cyber System Maintenance requirement is intended to cover the instances where it is necessary to directly connect a device to the BES Cyber System temporarily to perform a support function, provide appropriate controls on the maintenance device to protect the BES Cyber System. Do you agree with the definition of maintenance as provided?

Summary Consideration:

The definition of "maintenance" that was originally posted as an informal definition adjacent to Requirement R26 in draft CIP-011-1 was:

Maintenance for the purpose of this standard includes the activities associated with the support, testing and upkeep of a BES Cyber System. Examples of maintenance activities for BES Cyber Systems include configuration changes, vulnerability assessments, and software patches. Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System.

There were questions and concerns raised by commenters about what is included in the scope of maintenance activities. There were comments that the term "maintenance devices" needs to be defined. In addition, there was a question regarding whether remote access is included as maintenance. There were suggestions that the definition of maintenance should be focused on the temporary connections.

One commenter suggested the following definition: "Maintenance for the purpose of this standard includes any activity requiring the temporary connection of digital equipment (e.g., laptops) capable of altering the configuration of, or introducing malicious code, to the BES Cyber System." The drafting team considered this feedback, and removed the definition of maintenance from the revised standard, and instead focused on temporarily connecting to a BES Cyber System (such as for maintenance) rather than on the activity being performed. (See proposed CIP-007-5 – System Access Control.)

The requirement for Transient Cyber Assets and media in CIP-007-5 R3.4 is intended to ensure that devices used for temporary access to the BES Cyber System (such as for maintenance) do not accidently introduce malicious code into the BES Cyber System or introduce an unauthorized external access point to the BES Cyber System. This requirement also clarifies that these devices may be temporarily connected to the BES Cyber System, but do not become a part of the BES Cyber System, nor are they considered Protected Cyber Assets. The definition for **Transient Cyber Asset** is as follows:

A Cyber Asset that is: 1) directly connected for 30 calendar days or less to a BES Cyber Asset or Protected Cyber Asset, 2) used for data transfer, maintenance, or troubleshooting purposes, and 3) capable of altering the configuration of or introducing malicious code to the BES Cyber System.

#	Organization	Yes or No	Question 46 Comment
46.1	WECC		Provide a separate definition of maintenance device. The requirement does not state that maintenance devices "directly connect" to BES Cyber Systems. In practice, much maintenance is done via network connections. These criteria need to be reassessed if they are intended to apply to network or remote access.
46.2	SCE&G	Agree	Are maintenance devices also to be treated as remote access, as it is a device external to the BES cyber system?26.2: TFEs may be necessary for maintenance devices not capable of supporting malicious code prevention.
46.3	Regulatory Compliance	Agree	BUT -Please clarify definition of "not permanently connected"What if you have a device that might be connected for several months?
46.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
46.5	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	Definition is good, but please see comments for questions 1.a and 1.b.
46.6	NextEra Energy Corporate Compliance	Agree	NextEra comments that if a laptop is used to remotely connect to a High Impact Control Center BES Cyber System to debug a problem or view Operator issues by temporarily gaining alarm permissions that are assigned to the Operator, is this considered a maintenance activity?
46.7	Progress Energy - Nuclear Generation	Agree	Nuclear facilities have maintenance programs based on CFR. This definition can be improved by acknowledging 10CFR50.65.
46.8	APPA Task Force	Agree	The APPA Task Force agrees with the definition.

#	Organization	Yes or No	Question 46 Comment
46.9	GTC & GSOC	Agree	We recommend the last sentence in this definition (“Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System”) be removed from R.26 and instead be included as part of the BES Cyber System definition, as suggested in our comment to 1.b. above.
46.10	Consultant	Disagree	"Examples of maintenance activities for BES Cyber Systems include configuration changes, vulnerability assessments, and software patches." NONE of these activities are maintenance activities.Configuration changes & software patches are changes covered by change control. Vulnerability assessments are tests covered by vulnerability assessments."Devices that are used for maintenance activities that are not permanently connected to BES Cyber Systems are not considered part of a BES Cyber System." This is not a definition of "Maintenance". This is (or should be) part of the definition of BES Cyber System Component. Suggest both of these statements be removed from the "definition".
46.11	Dairyland Power Cooperative	Disagree	26.2 A definition of a maintenance device seems needed here. I’m presuming this typically would be the computer used by the support staff to access the BES system for maintenance. What if maintenance is being directly performed on a BES system, is there no maintenance device involved in that case?
46.12	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
46.13	Network & Security Technologies Inc	Disagree	Definition is good overall but should address the question of whether a maintenance device is “external” and must therefore connect via an access point.
46.14	National Grid	Disagree	Does testing the capabilities of the relays part of the maintenance activities?
46.15	Dominion Resources Services, Inc.	Disagree	Dominion recommends revising the definition of Maintenance as follows:”Maintenance for the purpose of this standard includes any activity requiring the temporary connection of digital equipment (e.g., laptops) capable of altering the

#	Organization	Yes or No	Question 46 Comment
			configuration of, or introducing malicious code, to the BES Cyber System.”
46.16	MidAmerican Energy Company	Disagree	MidAmerican Energy agrees with EEI's comment below:The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.17	Black Hills Corporation	Disagree	Middle sentence of Maintenance definition should add ... include but are not limited to configuration...
46.18	Minnesota Power	Disagree	Minnesota Power recommends that the following definitions be adopted by the Standards Drafting Team:Maintenance: Maintenance, for the purpose of this standard, is defined as activities associated with the support, testing and upkeep of a BES Cyber System. Maintenance Equipment: Maintenance Equipment, for the purpose of this standard, is defined as any programmable, electronic device used for maintenance activities that are not permanently connected to the BES Cyber System(s). These devices are not considered part of the BES Cyber System(s).
46.19	PacifiCorp	Disagree	PacifiCorp agrees with EEI's comment below:The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.20	Southwest Power Pool Regional Entity	Disagree	Programmable, general purpose devices connected temporarily are a potentially high risk to the BES Cyber System and should have some minimum set of applicable requirements to minimize that risk. An example is the “wandering laptop” that the support staff uses to connect to High impact BES Cyber Systems and also to surf the Internet from a home Internet connection.
46.21	Duke Energy	Disagree	Suggest replacing “Cyber System Maintenance” with “Cyber System Configuration Management”. The definition (first sentence) states: "Maintenance for the purpose of this standard includes the activities associated with the support, testing and upkeep of a BES Cyber System." There are numerous activities that are associated

#	Organization	Yes or No	Question 46 Comment
			with support, testing, and upkeep of a BES Cyber System that are not related to cyber. This could be tuning, calibrating, etc. and could be done with a screwdriver and a meter. The second sentence includes configuration changes, vulnerability assessments, and software patches. These items are more applicable to the cyber related definition. The suggestion is to combine these sentences:"Maintenance for the purpose of this standard includes the cyber security related activities associated with the support, testing and upkeep of a BES Cyber System, including configuration changes, vulnerability assessments, and software patches."Also, please clarify if non-portable test systems that are connected to BES Cyber Systems thru an access point are included. Otherwise define “permanently connected.”
46.22	BGE	Disagree	Systems used for maintenance should be protected and sanitized per 25.1.
46.23	FirstEnergy Corporation	Disagree	The definition does not clearly specify that the intention is for temporary direct connections.
46.24	Allegheny Energy Supply	Disagree	The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.25	Allegheny Power	Disagree	The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.26	EEI	Disagree	The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.27	Southern California Edison Company	Disagree	The justification of separating end users of BES systems and those involved in maintenance is not consistent with the justification for systems that are used for maintenance. The drafting team has chosen to treat ancillary systems used to perform maintenance type activities on a BES system as equally critical. However, a distinct list of maintenance personnel is required to be maintained. The suggestion for the drafting team is to move this requirement to the section dealing with personnel.

#	Organization	Yes or No	Question 46 Comment
46.28	Progress Energy (non-Nuclear)	Disagree	Troubleshooting also needs to be explicitly included as an example.
46.29	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
46.30	We Energies	Disagree	We Energies agrees with EEI: The definition of maintenance is overbroad, and could include any number of non-electronic activities that may reasonably be performed on a BES Cyber System.
46.31	LADWP	Disagree	Will require multiple list management. Individual doing maintenance will already be on physical and electronic access list. Now another list is introduced which will also need to be maintained with the same revocation requirements. 26.1 is not necessary.

47. Requirement R26 of draft CIP-011-1 concerns procedures for BES Cyber System maintenance. Do you agree with the list of criteria that are included in Requirements Table R26? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the table? Please explain and provide any suggestions for modification.

Summary Consideration:

Commenters raised concerns about the interaction between the list of personnel in draft CIP-011-1 R26.1 and the lists of those granting authorized electronic and physical access. In addition, commenters were concerned about the interaction with other user/account management requirements. Some commenters suggested that all maintenance devices should be documented in a list. In addition, there were comments regarding the allowance for emergency maintenance situations.

Some commenters suggested that Requirement R26.1 is duplicative of Requirement R8 and should be removed, and that Requirement R26.2 is duplicative of Requirement R23 and should also be removed. The drafting team considered this feedback and has attempted to address these concerns by incorporating the requirements associated with maintenance into the requirement in CIP-007-5 – System Access Control regarding preventing the introduction of malware into the BES Cyber System, as the objective of these two requirements is the same.

#	Organization	Yes or No	Question 47 Comment
47.1	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
47.2	National Grid	Agree	Please provide clarification on 26.2.
47.3	Puget Sound Energy	Agree	Puget Sound Energy suggests additional language to clarify if personnel referenced in R26.1 are required to be maintained on the lists associated with Table 5.
47.4	Southern California Edison Company	Agree	SCE requests the Standards Drafting Team combine Requirement R26.1 with other requirements for personnel management and rationalize compliance requirements across personnel.
47.5	APPA Task Force	Agree	The APPA Task Force has no comment on this question.

#	Organization	Yes or No	Question 47 Comment
47.6	Emerson Process Management	Agree	This seems to be a typical task for properly maintaining a cyber (or computer) system. The personnel for doing this task should be already identified in the personnel training, awareness, and risk assessment. This requirement seems to be extra.
47.7	Independent Electricity System Operator	Disagree	- R26.2 define malicious code. Does malicious code mean AV or Spyware detection/prevention or does Malicious code require a code review when deploying code and patches to systems?- R26.1: suggest using a word other than “personnel”
47.8	Network & Security Technologies Inc	Disagree	26.1 - Should be reworded to distinguish “maintenance” personnel from System Administrators, who in most instances also perform maintenance activities. If the SDT concludes there is really no distinction, this requirement becomes redundant and should be eliminated, as lists of users and the permissions they have (including “System Administrator”) are already required.26.2 - Many test devices are appliances and may not be capable of meeting other CIP-011 requirements, including malicious code protection. Thus, this requirement needs to be eligible for TFEs.
47.9	Dairyland Power Cooperative	Disagree	26.1 This overlaps with the requirement of limits access based on electronic accounts. How can this be blended with user/account management?
47.10	ERCOT ISO	Disagree	26.1: Recommend addressing emergency situations more clearly. How should an entity address listing authorized personnel where support companies use a call center and cannot provide dedicated resources for the entity? This is particularly relevant for after-hours issues.
47.11	Regulatory Compliance	Disagree	26.2 - Propose this phrasing:Insure maintenance devices are free and clear of malicious code prior to the intoduction to the BES System.
47.12	Luminant	Disagree	26.2 should read "Detect and respond to the introduction of malicious code."
47.13	Southwest Power Pool	Disagree	26.2: Requirement is not necessarily applicable to special purpose testing devices, such as Fluke meters. Need to revise to limit the requirement to general purpose

#	Organization	Yes or No	Question 47 Comment
	Regional Entity		devices for which malware prevention is possible.
47.14	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
47.15	Liberty Electric Power, LLC	Disagree	CIP-026 will penalize entities if malware gets on any device, even if we employ the best available technology and processes to prevent it. This requirement needs to be removed.
47.16	Alberta Electric System Operator	Disagree	Consider revising R26.1 (or creating a new sub-requirement) to include verifying and updating the list of authorized personnel.
47.17	PacifiCorp	Disagree	Devices used for maintenance should also meet the system hardening criteria of R16 and R17.
47.18	MidAmerican Energy Company	Disagree	Devices used for maintenance should meet the system hardening criteria of R16 and R17.
47.19	Dominion Resources Services, Inc.	Disagree	Dominion appreciates the SDT's thoughts in providing this section and its associated exclusions and is very much in favor of this type of requirement. Dominion agrees with the need to protect the BES Cyber System from harm during this process, but is concerned that these requirements are overly broad.26.1. Dominion recommends that this requirement be deleted. All of these actions are covered by other requirements - access controls, change management, training (roles and responsibilities). It adds another layer of administrative paperwork to track every action made by every authorized technician with no corresponding protection to the BES. 26.2. It appears that this requirement intends to allow technicians to connect their personal laptops to relays without having to reformat them afterwards. This requirement has the unintended consequence of including any device used for maintenance (e.g., fluke meters, etc.). A footnote to avoid the necessity of a potential TFE should be added.

#	Organization	Yes or No	Question 47 Comment
47.20	US Bureau of Reclamation	Disagree	Either individuals have access authorization or they don't. This would appear to be an unnecessary tracking requirement.
47.21	RRI Energy	Disagree	Even if a maintenance device is completely up-to-date on all security patches, and also has up-to date virus detection software with the most recently release virus pattern definitions, I can not 100% ensure that malicious code will not accidentally be introduced to a BES cyber system while connected. "Ensure" is a very absolute word that is hard to match in practice. It would be better to "require " that maintenance devices have the same level of virus protection and patch management as BES Cyber Assets which the maintenance devices are being used to maintain.
47.22	ReliabilityFirst Staff	Disagree	How do personnel get authorized for addition to the list in row 26.1 and how often does this list get reviewed and updated. Add requirements for the conduct of a vulnerability assessment and actions to be taken (i.e., mitigation plan) resulting from this vulnerability assessment.
47.23	Western Area Power Administration	Disagree	How do we differentiate between "maintenance" and "administration"? This seems like a new role? This should be worked into Table R10.
47.24	WECC	Disagree	Item 26.1 would have strong impact on the ability to get timely technical support from large global companies such as Cisco Systems. Perhaps there needs to be distinct definitions for "authorized access" vs "maintenance access"? Item 26.2 seems to be covered in previous R15.The requirement does not state that maintenance devices "directly connect" to BES Cyber Systems. In practice, much maintenance is done via network connections. These criteria need to be reassessed if they are intended to apply to network or remote access.
47.25	NextEra Energy Corporate Compliance	Disagree	NextEra believes that Requirement R26 does not provide anytime frame in which the list should be reviewed nor does it take into consideration vendors. The current language does not provide clear guidance and leaves room for interpretation. The following are the recommended updates:26.1 - NextEra suggests maintaining a list of

#	Organization	Yes or No	Question 47 Comment
			personnel authorized to perform maintenance on the BES Cyber System, allow authorized personnel to escort cyber and physical vendors, and allow only authorized personnel to perform maintenance on the BES Cyber System. The list of personnel authorized to perform maintenance of the BES Cyber System should be updated at least annually.Maintenance devices not permanently connected to BES Cyber Systems are not considered part of the BES Cyber System.
47.26	Allegheny Energy Supply	Disagree	R 26.1 is duplicative of Requirement 8 and should be removedR 26.2 is duplicative of Requirement 23 and should be removed.
47.27	Allegheny Power	Disagree	R 26.1 is duplicative of Requirement 8 and should be removedR 26.2 is duplicative of Requirement 23 and should be removed.
47.28	EEI	Disagree	R 26.1 is duplicative of Requirement 8 and should be removedR 26.2 is duplicative of Requirement 23 and should be removed.
47.29	Southern Company	Disagree	R.26.1 If personnel are required to have a PRA, are granted physical access, system usage is logged and the individual has access credentials for cyber systems, the additional list generation should not be required.Vendor personnel supporting systems would need to be added to the personnel listing, these personnel frequently change. The addition of a name to the list would become a common event.
47.30	Consultant	Disagree	R26 - Suggest changing wording to "implement and document"Suggest changing wording to: "Systems and to ensure that" for correct grammar.R26 - Delete the word "accidentally" from the statement. It would appear a better objective is to prevent the introduction of malicious code, "accidentally" or "intentionally" is not relevant to the objective.Table R26 - Item 26.1 This is a new account management requirement. There are account management activities for cyber access, physical access, information access, and now maintenance access. As such this requirement should be moved to the account management requirements table.Item 26.2 This is not a requirement statement, it is a statement of a desired objective. It is not clear what

#	Organization	Yes or No	Question 47 Comment
			requirement or requirements are intended to meet this objective. Please clarify the requirement.
47.31	FirstEnergy Corporation	Disagree	R26 text needs to be more specific that the intention is for temporary direct connections. Otherwise, R26 appears to be covering CIP 7R1 and 7R3.
47.32	Progress Energy (non-Nuclear)	Disagree	R26.1 - do not see need for this requirement. Changes can only be made with cyber access rights which is covered by other requirements.R26.2 - either eliminate this requirement or make additional provisions for the safe use of maintenance components. CIP standards shouldn't mandate malware protection on all test equipment. The BES Cyber Systems components should already be adequately protected from threats as a result of being compliant with the other requirements.We like the use of the footnote earlier in the standard that allowed the use of the highest level of protection the components can support maybe something like that could be used here too.
47.33	Public Service Enterprise Group companies	Disagree	R26.1 requires maintaining another list of personnel who perform maintenance on a BES Cyber System. These individuals are already tracked and documented under other access lists. Seems like a duplication of effort with no benefit and thus the requirement should be deleted.
47.34	Xcel Energy	Disagree	R26.2 - The requirement should be worded to require anti-malware protection on all maintenance devices. The current wording would make it an enforceable violation if, in spite of best efforts, malware was introduced in to a device.
47.35	Hydro One	Disagree	Recommend adding a Requirement for listing the devices used for maintenance activities.
47.36	Northeast Power Coordinating Council	Disagree	Recommend adding a Requirement for listing the devices used for maintenance activities.

#	Organization	Yes or No	Question 47 Comment
47.37	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that different sections with similar requirements be aligned to avoid confusion. In Table 26, with respect to R26.1, other sections contain similar requirements for Physical Security, Electronic Access, and System Security. We'd prefer to see them re-aligned in a fashion similar to the way the older version of the Standards have them. The new maintenance requirements can be added into those Standards. Similar comment for 26.2; SDG&E feels that this could have been added to the System Security/Protection area.
47.38	LADWP	Disagree	See previous
47.39	BGE	Disagree	Should not have a separate list for maintenance personnel. All personnel should be included on the access control lists created per R7 - R14.
47.40	Duke Energy	Disagree	Suggest replacing "Cyber System Maintenance" with "Cyber System Configuration Management".Requirement 26.1: Please consider adding the word "cyber security related" to make the definition read as follows:Maintain a list of personnel authorized to perform cyber security related maintenance on the BES Cyber System and allow only authorized personnel to perform maintenance on the BES Cyber System.Requirement 26.2: Please consider changing as highlighted below:Detect and prevent the introduction and propagation of malicious code on all computer based maintenance devices.Remove 'accidently' from R26. Suggest removing all of R26.26.1 Specify maintenance performed is done with the maintenance device. We interpret 26.1 to be that the maintenance personnel would not have to be background screened and trained. Suggest including screens and trains for these folks. Or remove the requirement with the understanding that these personnel will have electronic or unescorted physical access to the BES Cyber System. This is extra work for no added security.26.2 will need a TFE. Within generation, we have differing opinions on the definition of code. Suggest clarifying that it does not include programming code.
47.41	Detroit Edison	Disagree	Table R26.2 only addresses the introduction and propagation of malicious code into

#	Organization	Yes or No	Question 47 Comment
			the BES Cyber System. It is likely however, that a device may be modified not to introduce or propagate code but act as a bridge to another rogue network via wireless, cellular or other medium. This would be akin to introducing an unsecured access point into the boundary if this system is not subject to the same requirements equal to or greater than that of highest impact BES Cyber System component. A possible solution could be to require mitigation for multi-homed or bridged networks for all components used for BES Cyber System maintenance, and/or append R26 to read "...and ensure that systems used for maintenance do not introduce malicious code into the BES Cyber System or act as an unauthorized access point into an Electronic Security Perimeter."
47.42	Bonneville Power Administration	Disagree	The objective of this requirement ("to prevent unauthorized maintenance on BES Cyber Systems and ensure that systems used for maintenance do not accidentally introduce malicious code into the BES Cyber System") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R26, Section 26.2. It is impossible to prevent the introduction and propagation of malware. This is already addressed in Requirement 15. Recommendation: Delete Section 26.2.
47.43	Manitoba Hydro	Disagree	The personnel authorized to perform maintenance on the BES Cyber System should be identified by roles, not individual names. There are no specifics given with respect to "prevent" in Requirement R26.2 so it is assumed to be at the Responsible Entity's discretion in terms of means, criteria, etc.
47.44	Reliability & Compliance Group	Disagree	There is a possible issue that could occur with this requirement regarding collective bargaining unit rules. It may require that job classifications be created for individuals who work on these systems.

#	Organization	Yes or No	Question 47 Comment
47.45	Constellation Energy Commodities Group Inc.	Disagree	There is no definition of malicious code provided. Clarify the scope of malicious code to include virus, malware and spyware protection, as currently generally commercially understood.
47.46	Minnesota Power	Disagree	Using the definitions proposed in Question 46, Minnesota Power recommends that Requirement R26 state that "prior to connecting Maintenance Equipment or importing data, patches, code or other electronic files into the BES Cyber System, the device and/or files shall be scanned for malware and up-to-date on security patches."
47.47	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
47.48	We Energies	Disagree	We Energies agrees with EEI: R 26.1 is duplicative of Requirement 8 and should be removedWe Energies agrees with EEI: R 26.2 is duplicative of Requirement 23 and should be removed.
47.49	Florida Municipal Power Agency	Disagree	Why is malware mentioned in 26.2, when it already has been covered in R15? FMPA believes this should be removed.

48. Table R26 provides direction concerning what impact level of BES Cyber Systems to which Requirement R26 applies. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Several commenters suggested that the types of connectivity used for temporary connections should be considered. In addition, several commenters suggested that the criteria should be applied to all impact levels. There was also a comment for a no impact category.

The drafting team considered this feedback and attempted to address these concerns by incorporating the requirements associated with maintenance activity into the requirement in CIP-007-5 – System Access Control regarding preventing the introduction of malware into the BES Cyber System, as the objective of these two requirements is the same.

#	Organization	Yes or No	Question 48 Comment
48.1	WECC		Criteria should apply to all impact levels
48.2	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels proposed for R26 if it is understood that a blank in the table means N/A.
48.3	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
48.4	Progress Energy - Nuclear Generation	Agree	R26 can be improved by incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments.
48.5	Allegheny Energy Supply	Disagree	R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extend an electronic security perimeter.

#	Organization	Yes or No	Question 48 Comment
48.6	Allegheny Power	Disagree	R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extend an electronic security perimeter.
48.7	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
48.8	American Municipal Power	Disagree	Please provide a little or no impact category
48.9	BGE	Disagree	Should not be separate requirements for maintenance of BES Cyber Systems.All personnel should be included on the access control lists created per R7 - R14.
48.10	Consultant	Disagree	The comments on Question 47 regarding moving item 26.1 elsewhere, and Item 26.2 not being a requirement statement preclude an evaluation of application to impact categories.
48.11	Duke Energy	Disagree	Require for low when the maintenance device also connects to medium or high systems.
48.12	EEI	Disagree	R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extent an electronic security perimeter.
48.13	Entergy	Disagree	Basic Maintenance requirements should apply equally for all components of a control system
48.14	FirstEnergy Corporation	Disagree	Until clarity is provided on the above comments (Q46 and Q47), we can not provide a

#	Organization	Yes or No	Question 48 Comment
			response to this question.
48.15	Florida Municipal Power Agency	Disagree	FMPA believes this standard should be removed entirely, as it is already addressed under account control, R7.
48.16	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
48.17	Progress Energy (non-Nuclear)	Disagree	See comment 14.
48.18	Public Service Enterprise Group companies	Disagree	General agreement, but Requirement 26.2 may not be technically feasible for certain types of maintenance devices. To implement this requirement, an Operating System level change to the component may be required, which may be infeasible or not available from the Original Equipment Manufacturer (OEM). This requirement needs to be qualified with the phrase "where technically feasible".
48.19	ReliabilityFirst Staff	Disagree	Suggest "Required" for Low Impact in rows 26.1 and 26.2.
48.20	San Diego Gas and Electric Co.	Disagree	SDG&E suggests that different sections with similar requirements be aligned to avoid confusion. In Table 26, with respect to R26.1, other sections contain similar requirements for Physical Security, Electronic Access, and System Security. We'd prefer to see them re-aligned in a fashion similar to the way the older version of the Standards have them. The new maintenance requirements can be added into those Standards. Similar comment for 26.2; SDG&E feels that this could have been added to the System Security/Protection area.
48.21	Southern California Edison Company	Disagree	The drafting team has chosen to treat ancillary systems used to perform maintenance type activities on a BES system as equally critical. If this is not the intent of the team, the wording of the standard should be modified to reflect the difference in impact levels.

#	Organization	Yes or No	Question 48 Comment
48.22	Southwest Power Pool Regional Entity	Disagree	26.2 should be applicable to all impact categories.
48.23	US Army Corps of Engineers, Omaha Distirc	Disagree	There needs to be a provision for emergency work. Whether that means talking someone through a fix at 2am or hiring a vendor for additional expertise.
48.24	We Energies	Disagree	We Energies agrees with EEI: R26 is problematic as it does not effectively address the different possible methods that may be used to perform 'Maintenance'. For example a configuration change may be made to certain equipment using a serial cable between a BES Cyber System and a technician craft terminal. This does not create or extent an electronic security perimeter.

49. Requirements R27 to R29 of draft CIP-011-1 concern procedures for Cyber Security Incident response. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R27 to R29? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Cyber Security Incident Response" is now addressed in CIP–008–5 — Cyber Security — Incident Reporting and Response Planning.

One of the primary focus areas of the comments concerned coordination with the reporting requirements in CIP 001 and EOP-004 for reporting to the ES-ISAC, and additional guidance in determining incident classifications. The SDT has attempted to coordinate with the drafting team working on revisions to CIP-001 and EOP-004 to ensure the two sets of requirements are coordinated. As the two teams are working in parallel, continued coordination will be necessary.

Several commenters asked for definitions for cyber security incidents and reportable cyber security incidents. The SDT developed a revised definition for "**BES Cyber Security Incident**" as follows:

A malicious act or suspicious event that:

- *Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or*
- *Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System, or*
- *Results in unauthorized physical access into a Defined Physical Boundary.*

The SDT also proposed a new definition of "**Reportable Cyber Security Incident**" as follows:

Any BES Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service.

Several requests were made to clarify the periodic timing requirements such as annual, calendar year, and 12 months. The drafting team reviewed the timing elements of all requirements and where there was a reference to "annual" the SDT replaced this with the following:

". . . at least once each calendar year, not to exceed 15 calendar months between. . ."

Some commenters recommended placing all requirements in the table, not in the objective or in the "pre-amble" for cyber incident reporting, and the drafting team has included all mandatory performance in the requirements.

Many commenters requested clarifications for plan testing requirements, operational exercises, test environment, as well as the number of tests required. The drafting team did attempt to add more clarity to plan testing requirements along with operational exercise, test environment, and number of tests required in the revised standard (CIP-008-5).

Guidance was requested regarding review of the results of incident response tests in less than 60 days. The revised standard now requires the review to take place within 30 calendar days and the update, based on lessons learned, to take place within 60 calendar days of the test.

Some commenters asked for clarity on the inclusion of physical breach aspects of cyber security incidents as reportable. The drafting team is coordinating its revisions with the revisions to CIP-001 and EOP-004 underway through Project 2009-01 – Disturbance and Sabotage Reporting.

There were concerns raised as neither logging nor monitoring are required for Low Impact BES Cyber Systems, there is no basis for requiring Cyber Security Incidents on these systems to be tracked or classified. The applicability section of the entire suite of CIP Version 5 standards has been revised to provide greater clarity on which BES Cyber Systems (High, Medium, and Low Impact) are applicable to specific requirements.

#	Organization	Yes or No	Question 49 Comment
49.1	National Rural Electric Cooperative Association (NRECA)		In R27.1 a "process" is required, but it is not clear as to how a utility is required to "classify" events. Please provide further clarification as to how one is required to "classify" these events.In R29.1 the requirement is to review the plan once every 12 months. Please provide specificity as to what "once every 12 months" means. If I review the plan on Jan. 15, 2001, am I in compliance if I review it again by Jan. 25, 2002? Please make sure that this is clear in the requirement and in all requirements of CIP-010-1 and CIP-011-1.
49.2	Tenaska		Consider combining 28 and 29
49.3	Black Hills Corporation	Agree	Request that the language in 27.3 be broadened to include contacting appropriate law enforcement authorities, similar to CIP-001.
49.4	FEUS	Agree	Agree with Comments: the drafting should clarify the reporting time requirement for

#	Organization	Yes or No	Question 49 Comment
			27.3, reporting to the ES-ISAC
49.5	Green Country Energy	Agree	I really see the need for a reference document or footnotes pointing to sources for guidance on the expectations for these requirements.
49.6	SCE&G	Agree	R29 is a good example of an instance where there are a lot of timing requirements embedded in the requirements. It would be helpful to entities if timing requirements were consistently put in the same location in the tables (under the low, medium, and/or high columns) rather than embedded in the text. The SDT should evaluate the number of timed requirements in relation to the low, medium, and high impact categories. Once the requirements are finalized it would be of benefit to entities to have a list of the timeframe type requirements which must be met for each low, med, and high impact system, as these often present some of the greatest administrative burden in documenting these timeframes were met.
49.7	Allegheny Energy Supply	Disagree	Suggested modification to R27.3: "Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC)."If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.
49.8	Allegheny Power	Disagree	Suggested modification to R27.3: "Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC)."If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.
49.9	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
49.10	Ameren	Disagree	R27 would be better suited in CIP-001, Sabotage Reporting.â€,â€,â€,

#	Organization	Yes or No	Question 49 Comment
49.11	American Electric Power	Disagree	27.1 - 27.3: Recommend requiring this for systems with routable external connectivity only. To properly monitor and alert on cyber security events, a trained IT Security Operations staff and dedicated set of monitoring tools are required. If there is no external connectivity, there is no access for the IT teams to monitor these cyber systems.
49.12	APPA Task Force	Disagree	The APPA Task Force supports the drafting team's efforts on incident response. We propose the following edits:The APPA Task Force believes that NERC, as the ES-ISAC, should have a standard process for entities to use in reporting Cyber Security Incidents. Therefore, we propose the following wording for R27 Table 27.3: 27.3: Use the reporting guidance developed by the ES-ISAC for reporting Cyber Security Incidents, either directly or through an intermediary, or develop a process equivalent or superior to that guidance.28.1, recommend changing "once every 12 months" to "Annually."29.1, recommend changing "once every 12 months" to "Annually."
49.13	Bonneville Power Administration	Disagree	The objectives of these requirements ("so that responses to Cyber Security Incidents involving BES Cyber Systems can occur" and "to verify its response plan's effectiveness in responding to a Cyber Security Incident impacting a BES Cyber System") should be clearly labeled as "Objective of Requirement" and shown as a separate sentence prior to the text of the requirement rather than appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table 28, Section 28.1. It's not clear whether testing in January 2010 and June 2011 would satisfy the requirement, since February 2010 through January 2011 would be a 12-month period with no testing. Recommendation: Replace "every 12 months" with "each calendar year". Also, there are other ways to test, as well. Recommendation: "Test the execution of the incident response plan (by recovering from an actual incident, or with a test at least as comprehensive as a paper drill) at ... Table 29, Section 29.1. Same comment as 28.1

#	Organization	Yes or No	Question 49 Comment
49.14	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
49.15	Consultant	Disagree	R27 - "...so that responses to Cyber Security Incidents involving BES Cyber Systems can occur." should be reworded. Suggest "to identify responsibilities and actions in response to an incident associated with BES Cyber Systems."Table R27 - should specify in each statement that it applies to BES Cyber Systems."Cyber Security Incident" is defined in the Glossary using the terminology from CIP-002 through CIP-009. That definition should be revised by including a new definition in this standard using the terminology associated with CIP-010 and CIP-011.Item 27.3 Not all Cyber Security Incidents are reportable to ES-ISAC as indicated in The Security Guidelines for the Electricity Sector: Threat and Incident Reporting, version 2.0, dated April 1, 2008. Suggest clarifying the statement about reporting.Table R28 - Item 28.1 Clarify the periodicity to be consistent throughout the standard. Annual, 12 months, or other statement. Suggest getting information from the nuclear industry on stating and handling periodicity of requirements.Table R28 - Item 28.1 It is not clear from the table whether one test is required, or two tests (one for High Impact & one for Medium Impact) Suggest some clarification wording in the requirement statement.Table R29 - Item 29.1 Clarify the periodicity to be consistent throughout the standard. Annual, 12 months, or other statement. Suggest getting information from the nuclear industry on stating and handling periodicity of requirements.Item 29.2 - Suggest deleting the word "each" as an unnecessary word.Item 29.3 - Actions necessary to address documented plan deficiencies may not be completed within 30 days, so requiring an update to the plan with 30 days would appear to create a situation where compliance is not viable, or sensible. Suggest modifying to be based on completion of corrective actions.Item 29.5 Suggest deleting the word "all" as an unnecessary word.
49.16	Detroit Edison	Disagree	Table 28.1 and 29.1 refer to a period of "12 months". We prefer “at least once per calendar year, not to exceed 14 months between instances”.

#	Organization	Yes or No	Question 49 Comment
49.17	Dominion Resources Services, Inc.	Disagree	Per R18, neither logging or monitoring are required for Low Impact Systems, hence there is no basis for requiring Cyber Security Incidents on these systems to be tracked or classified.
49.18	Duke Energy	Disagree	Requirement 27: The requirements need a definition of a "Cyber Security Incident". This needs to differentiate between a cyber security attack and a mistake that a technician makes in the plant. We don't need to report every time a technician forgets their password.Requirement 28 only has one item and it is related to Requirement 29. Perhaps combine these two?Table 28: 28.1 assumes there is only one incident response plan when R27 allows for multiple plans. We would like to test AN incident response plan instead of all of them. Or allow for a different time frame (12 months per plan) to test all of them. Combine 28 with 29 if the VSL is the same.Table 29: 29.1 We would like to review AN incident response plan instead of all of them. Or allow for a different time frame (12 months per plan) to review all of them.
49.19	E.ON U.S.	Disagree	Comments: CIP-011, R27 The application of this standard to low-impact BES CS's seems inconsistent. There are not requirements for monitoring security events associated with these assets.CIP-011, R29.1 The application of this standard to low-impact BES CS's seems inconsistent with other requirements for monitoring security events associated with these assets.CIP-011, R30.2 Please clarify whether "...identification of the personnel responsible..." require naming individuals, or job functions?
49.20	EEI	Disagree	Suggested modification to R27.3: "Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC)."If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.

#	Organization	Yes or No	Question 49 Comment
49.21	Emerson Process Management	Disagree	Without being required to perform tasks in System Security, low impact BES Cyber systems may not be able to easily classify cyber security incidents.
49.22	Entergy	Disagree	The current definition of “Cyber Security Incident” will need to be changed as it references ESPs and PSPs. As such, it may be a good idea to define what this term means here.It is observed that as written there is no longer a requirement to keep documentation associated with a Cyber Security Incident (i.e., akin to CIP-008 R2). Is this the intent?
49.23	ERCOT ISO	Disagree	29.2: Should be 30 days rather than 60 days to align with FERC Order 706.
49.24	FirstEnergy Corporation	Disagree	27.1: From CIP-008 R1.1, what happened to the concept of "reportable"?
49.25	Independent Electricity System Operator	Disagree	- R27.1: note that the word “reportable” has been removed; CIP-008-2, R1.1 stated “Procedures to characterize and classify events as reportable Cyber Security Incidents”- R28.1: modify the sentence to state “Test the execution of the Cyber Sec
49.26	ISO New England Inc	Disagree	see recommendation for review in prior requirements use same for all annual/ 12 month review.
49.27	Manitoba Hydro	Disagree	The wording of Requirement R28.1 should be revised as the phrase “with a paper drill” could be misinterpreted. There are no specifics given with respect to ‘classifying’ events in 27.1 so it is assumed to be at the Responsible Entity’s discretion in terms of criteria, etc.
49.28	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R27, but recommends that the last phrase be changed from “so that responses to Cyber Security Incidents involving BES Cyber Systems can occur” to “so that responses to Cyber Security Incidents involving BES Cyber Systems follow a defined plan.” Responses can (and will) happen with or without a plan. The purpose of R27 is to define, ahead of time, a process to ensure an orderly response.Minnesota Power

#	Organization	Yes or No	Question 49 Comment
			generally agrees with the proposed Requirements R29, but recommends that this Requirement should be revised to ensure consistency with Requirement R32. For example, Part 29.1 should state "Review the incident response plan(s) at least once every 12 months or when BES Cyber System(s) have any system, organization or technological changes. Document any identified deficiencies, changes or improvements.") If this language was consistent with Requirement R32, the following issues could be resolved. In addition, the Standards Drafting Team should consider whether or not Parts 29.2 - 29.5 should also be required of Medium Impact Systems (since Part 28.1 requires testing for those systems) with a longer timeframe.
49.29	Network & Security Technologies Inc	Disagree	R27 - should clarify whether cyber security incidents of a physical nature are included and, if so, should tie back to 5.11.29.2 - Sixty days seems like a very long time to wait before evaluating the effectiveness of response actions, esp. if they were taken in response to an actual incident. Suggest revising to require a much more immediate "after action" review, at least for actual incidents. Should be a matter of days - perhaps 7 or less, not months. Even for tests, 60 days seems overly generous. Suggest revising to 30 days.
49.30	Nuclear Energy Institute	Disagree	Does the definition of cyber security incident, as used in this Standard, comport with the definition in Section 215 of the FPA? ("The term "cybersecurity incident" means a malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communication networks including hardware, software and data that are essential to the reliable operation of the bulk power system.")
49.31	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
49.32	Progress Energy - Nuclear Generation	Disagree	Incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security

#	Organization	Yes or No	Question 49 Comment
			Plans for comments for nuclear generating facilities.
49.33	Progress Energy (non-Nuclear)	Disagree	What makes 28.1 and 29.1 different that requires 2 different requirements? If you test the execution every 12 months then you have effectively done a review.
49.34	ReliabilityFirst Staff	Disagree	Problem with auditing the "effectiveness" of R28 without some clear guidelines that would lead to consistent application by all auditors. For R29.4, please clarify what is meant by system, organizational, and technology changes.
49.35	San Diego Gas and Electric Co.	Disagree	SDG&E believes that the Incident Response Plan requirements should only apply to Medium and High impact assets. Including Low impact assets in these requirements seems like overkill. For example, in R27.3, we don't feel that we would necessarily report a "Cyber security incident" on a Low impact item to ES-ISAC.
49.36	Southwest Power Pool Regional Entity	Disagree	27.1: Should be a "reportable" cyber incident. May be appropriate to add as a separate requirement to identify Cyber Security Incidents as "reportable." 27.2: "Communication plans" needs to be defined somewhere. 28.1: Consider changing "Test the execution of the incident response plan" to "Exercise the incident response plan." Clarify that the exercise scenario must involve a covered BES Cyber System and that the exercise must follow (actually exercise) the incident response plan steps. Also need to clarify whether each BES Cyber System, or at least one in each impact category represented, must be included in the exercise. Requiring the inclusion of each BES Cyber System is not recommended due the potential burden; this is a clarification issue to ensure the entities and the auditors have the same understanding. 29.1: Should the 12-month requirement be +/- one month? 29.2: Reviewing an exercise or actual response 60 days after the fact is too long. To keep it fresh in the minds of the responders, 30 days max is suggested, 15 days for High impacting systems is preferred.
49.37	US Bureau of Reclamation	Disagree	Why would we have incident reporting requirements related to systems that we have no processes to track them on...? This would appear to be in conflict with many of

#	Organization	Yes or No	Question 49 Comment
			the previous requirements that did not apply to low systems.
49.38	We Energies	Disagree	We Energies agrees with EEI: Suggested modification to R27.3: “Process for providing reports of Cyber Security Incidents to the Electricity Sector Information Sharing and Analysis Center (ES-ISAC).”We Energies agrees with EEI: If Cyber Security Incidents are different than sabotage reports as required in CIP-001, then they need to be defined. If they are the same as required in CIP-001, then R27.3 should be deleted.

50. Tables R27 to R29 provide direction concerning what impact level of BES Cyber Systems to which Requirements R27 to R29 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Cyber Security Incident Response" is now addressed in CIP–008–5 — Cyber Security — Incident Reporting and Response Planning, and "Cyber Security Incident Response Plan Testing" is addressed in CIP-009-5 - Cyber Security — Recovery Plans for BES Cyber Assets and Systems."

The primary focus areas of the comments received was on impact levels and the concern for coordination with the reporting requirements in CIP 001. The SDT has coordinated with the drafting team working on revisions to CIP-001 to ensure the two sets of requirements are coordinated.

Many commenters requested that Incident Response requirements for Low Impact BES Cyber Assets or non-routable connections be removed along with providing improved consistency between requirements related to impact level. The revised requirements (now contained in CIP-008-5) do not apply to Low Impact BES Cyber Assets. The SDT updated the applicability section of all requirements in the entire suite of CIP Version 5 standards.

It was suggested that Requirement R28.1 should be modified to clarify that test plans should be exercised once each calendar year (vs. every 12 months), and that these tests will be conducted on an overall system basis and not on a per system or per component level basis. This requirement is defined in CIP-009-5 Requirement R2.1, Recovery Plan Implementation and Testing. There were suggestions regarding the clarification of the plan testing requirements, operational exercises, and test environment, and there were comments regarding the addition of guidance on Cyber Security Incident classification by adding glossary definitions of Cyber Security Incident and Reportable Cyber Security Incident. The testing requirements, operational exercises, and test environment are described in CIP-009-5, and a couple of terms were added to the NERC Glossary for completeness.

The SDT developed a revised definition for "**BES Cyber Security Incident**" as follows:

"*A malicious act or suspicious event that:*

- *Compromises, or was an attempt to compromise, the Electronic Security Perimeter, or*
- *Disrupts, or was an attempt to disrupt, the operation of a BES Cyber System, or*
- *Results in unauthorized physical access into a Defined Physical Boundary."*

The drafting team proposed a new definition of "**Reportable Cyber Security Incident**" as follows:

" Any BES Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service."

A few comments were directed at reviewing of results of Incident Response tests in less than 60 days, including the physical aspects of Cyber Security Incidents. The SDT modified this requirement and now requires that this review be performed within 30 days of the BES Cyber Security incident or test and to update the BES Cyber System Incident response plan based on lessons learned within 60 calendar days of the BES Cyber Security incident or test.

Issues identified in comments for the SDT to consider for modifications included additional guidance on performing Cyber Security Incident classification. This is now covered in the guidance documentation for CIP-008 and CIP-009..

With Version 5, the drafting team has worked to make the applicability for each requirement very clear.

#	Organization	Yes or No	Question 50 Comment
50.1	Hydro One		Recommend for consistency incident response plan for medium and high impact mirrors 31.1 and 31.2 time frames not to exceed 24 and 12 months respectively.
50.2	APPA Task Force	Agree	The APPA Task Force agrees with the impact levels proposed for R27-R29 if it is understood that a blank in the table means N/A.
50.3	Bonneville Power Administration	Agree	Items 28.1 in Table R28 and 29.1 in Table R29 states that the incident response plan shall be tested "at least once every 12 months" and that the incident response plan should be reviewed at least once every 12 months." Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently testing or review must occur.
50.4	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
50.5	Florida Municipal Power	Agree	FMPA believes "12 months" should be changed to "annual"

#	Organization	Yes or No	Question 50 Comment
	Agency		
50.6	PacifiCorp	Agree	29.3 - Does the requirement to update each response plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency?29.4 - When does the clock start ticking? There could be a series of changes, whether technological or organizational, which is part of a project. What is considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is introduced or is modified. Modifications to the response strategy or response activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the response.
50.7	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	Agree	See comment for question 6.
50.8	Southern California Edison Company	Agree	SCE recommends that the standards drafting team use the phrase “cyber security incident” or “physical security incident” to differentiate them from the occurrence of system events that may or may not result from the breach of a “cyber” or “physical” control. As the Requirements are currently written, there is no logging and monitoring requirements for low impact systems. It is inconceivable how a registered entity could implement an incident response plan at these facilities when per CIP standards access and use of these facilities is not required. If the drafting team intends for incident response, as it pertains to Sabotage Reporting under CIP 001, they should state it.
50.9	Alberta Electric System Operator	Disagree	In Table R29, for 29.2, consider revising to review results for High Impact systems to within 30 days, and Medium Impact systems to within 60 days.
50.10	Allegheny Energy Supply	Disagree	R 28.1 should be modified to be clear that testing of incident response plans need not

#	Organization	Yes or No	Question 50 Comment
			include every possible BES Cyber System.
50.11	Allegheny Power	Disagree	R 28.1 should be modified to be clear that testing of incident response plans need not include every possible BES Cyber System.
50.12	Alliant Energy	Disagree	Alliant Energy agrees with the EEI Comments
50.13	Ameren	Disagree	R28.1 - Based on the number of Medium Impact Systems this will be labor intensive with no added protection to the BES. Suggest that this requirement only remain for High Impact Systems.
50.14	American Electric Power	Disagree	Please see response to Question 49.
50.15	American Municipal Power	Disagree	Please provide a little or no impact category
50.16	American Transmission Company	Disagree	R27 requires a response to cyber security incident for all Low Impact BES Cyber Systems; however R18 does not require monitoring and/or logging of Low Impact BES Cyber Systems. How do you respond to an incident unless it is being monitored?
50.17	BGE	Disagree	R29 should apply to any BES Cyber System required in R28.
50.18	Black Hills Corporation	Disagree	28.1 and 29.2 should also be required for Low Impact BES Cyber Systems.
50.19	Consultant	Disagree	Table R27 to Table R29 - It doesn't appear to make sense that the Incident Response Plan applies to all impact level categorizations, while testing the plan applies to Medium Impact & High Impact assets, and actions related to updating the plan only apply to High Impact assets.It would seem logical that the columns in this table should indicate the requirements apply to the same impact level assets, which would be either only High Impact assets, or Medium & High Impact assets, but not a mix.
50.20	Dominion Resources	Disagree	29.2 - 29.5 should be required for Medium Impact to be consistent with R28. R29.2 thru R29.5 currently use text to convey numbers (e.g., sixty vs. 60). This is not

#	Organization	Yes or No	Question 50 Comment
	Services, Inc.		consistent with the convention used throughout CIP-011 and is more difficult to read. A single convention using numerical values should be used throughout.
50.21	Duke Energy	Disagree	Requirement 28.1: is this one test of the cyber incident response plan (global) once per 12 months or is this the test of test of the cyber incident response plan for EACH BES cyber system per 12 months? Once globally per 12 months should be plenty.Requirement 29.5: is the communication of updates a broadcast or is specific feedback from each person required? Remove these requirements for Low Impact.
50.22	EEI	Disagree	EEI suggest that R 28.1 should be modified to be clear that test plans should be exercised annually and not at a per system or per component level.
50.23	Entergy	Disagree	These Requirements should apply for all three BES Cyber System/Component Impact categories.
50.24	Garland Power and Light	Disagree	Requirement 27.1, 27.2, 27.3 and 29.1 - remove from “Low Impact” classification
50.25	ISO New England Inc	Disagree	If the Entity’s Incident Response Plan is tested (instead of testing each BES Cyber System), recommend that “Require” should apply for High Impact, Medium Impact, and Low Impact BES Cyber Systems
50.26	LADWP	Disagree	Table 27 - low impact should not be included.
50.27	Manitoba Hydro	Disagree	Cyber Security Incidents for Low Impact BES Cyber System should not require reporting to the ES-ISAC.
50.28	MidAmerican Energy Company	Disagree	29.3 - Does the requirement to update each response plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency? 29.4 - When does the clock start ticking? There could be a series of changes, whether technological or organizational, which is part of a project. What is

#	Organization	Yes or No	Question 50 Comment
			considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is introduced or is modified. Modifications to the response strategy or response activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the response.
50.29	Minnesota Power	Disagree	With the implementation of the changes discussed in Question 49, these impact levels are generally acceptable.
50.30	National Grid	Disagree	o National Grid recommends deleting 27.3 for Low Impact BES CS o National Grid recommends the timeframes for Medium and High Impact in R28 similar to Table R31 31.1 and 31.2 for consistency.
50.31	Network & Security Technologies Inc	Disagree	Table 27 includes Low Impact systems, but Table 18 (event monitoring) does not. Need to change one or the other.
50.32	Northeast Power Coordinating Council	Disagree	Recommend for consistency incident response plan for medium and high impact mirrors 31.1 and 31.2 time frames not to exceed 24 and 12 months respectively.
50.33	Oncor Electric Delivery LLC	Disagree	The Incident Response Plan should be required for the entity, not for every High Impact cyber system. Requirement 29.4, update of Incident Response Plan, we suggest these reviews be conducted quarterly.
50.34	Pepco Holdings, Inc. - Affiliates	Disagree	We agree with EEI's comments.
50.35	Progress Energy (non-Nuclear)	Disagree	Need to clarify the annual/12 month/365 day issue.
50.36	ReliabilityFirst Staff	Disagree	For R29, each subrequirement should be "Required" for all the "Medium" impact BES Cyber Systems.

#	Organization	Yes or No	Question 50 Comment
50.37	San Diego Gas and Electric Co.	Disagree	SDG&E also feels that instead of using the word “impact” for these Requirements, apply a concept of “risk” for inclusion. We would want to identify the risks with associated systems security and protect accordingly
50.38	Southwest Power Pool Regional Entity	Disagree	28.1 should be applicable to all impact categories. An incident response plan should be tested to verify that it will work when needed. 29.2 through 29.5 should be applicable to all impact categories, perhaps with shorter time frame for higher impact systems.
50.39	US Bureau of Reclamation	Disagree	Why would we have incident reporting requirements related to systems that we have no processes to track them on...? This would appear to be in conflict with many of the previous requirements that did not apply to low systems.
50.40	We Energies	Disagree	We Energies agrees with EEI R 28.1 should be modified to be clear that testing of incident response plans need not include every possible BES Cyber System.
50.41	WECC	Disagree	All items should be required for medium impact levels in R29Criteria should apply to all impact levels.

51. Requirements R30 to R32 of draft CIP-011-1 concern procedures for BES Cyber System Recovery. Do you agree with the list of criteria that are included in each Requirements Table for Requirements R30 to R32? Please explain and provide any suggestions for modification. Are there any additional criteria that you believe should be included in the tables? Please explain and provide any suggestions for modification.

Summary Consideration:

Note that "Recovery Plans" are now addressed in CIP–009–5 — Cyber Security — Recovery Plans for BES Cyber Systems

The primary focus areas of the comments were concerns with improving the clarity of the periodic timing requirements, the requirement to reinstall and configure any application and system software using its baseline configuration vs. functionality, and the recognition that a large amount of test equipment will be necessary to develop representative environments for numerous disparate facilities.

Some commenters noted the different terms used for references to annual activities. The SDT reviewed the use of annual, calendar year, 12 months, etc. and in the revised standards used the phrase, ". . .at least once each calendar year, not to exceed 15 calendar months between. . ." .

There were suggestions that the testing requirements should only apply to control centers. Additional guidance was requested for operational testing, the use of redundant sites as an acceptable means to address recovery, and for testing of information that is stored on backup media. The SDT added some information about testing in the Rational Box for the proposed CIP-009-5 R1. Testing is necessary to verify the Responsible Entity's Recovery Plan's effectiveness. Planned and unplanned maintenance activities may also present opportunities to execute and document an Operational Exercise (see NIST SP 800-84, Functional Exercise). This is often applicable to operational systems where it may be otherwise disruptive to test certain aspects of the system or contingency plan. NIST SP 800-53, Appendix I, contains supplemental guidance.

Recovery Testing – Operational Test every 36 months should count for the annual test. The SDT notes that there is a FERC directive to add a requirement to conduct a full operational test of the recovery plan once every three years – so the suggestion to count the full operational test as the annual test was adopted. Areas of opportunity suggested for modification of the standards by the SDT were to provide recovery plan testing clarifications, data retention plan clarification, identification requirements of "Personnel Responsible", and incident recovery plan reviews.

Commenters suggested changes and provided various requests/suggestions for re-wording/wordsmithing and improved coordination of backup and recovery with EOP-008. The SDT has coordinated its proposed requirements with the now FERC approved EOP-008-1 – Loss of Control Center Functionality. Commenters suggested that all requirements should be in the table, not in the objective or in the "pre-amble" to the requirements and that the SDT should consider providing a summary table for all periodic requirements and remove the "how to" statements from the requirements. The SDT has included all mandatory performance in the requirements of the revised

standards. The SDT did not adopt the suggestion to develop a summary table for periodic requirements as the format for Version 5 is considerably different from the format proposed when the requirements were all combined in CIP-011.

Several commenters suggested adding definitions for terms such as "initially stored," and the SDT believes that these terms do not have a unique meaning when used in the standard and do not require a formal definition. The team has tried to limit its proposed definitions to those terms that either have a unique meaning when used in a NERC Reliability Standard, or when misunderstanding a word may have a material impact to reliability.

#	Organization	Yes or No	Question 51 Comment
51.1	Dairyland Power Cooperative		30.5 does the system test require a test of every element in the recovery plan? If a recovery plan covers multiple systems, must all systems be tested annually? Or is it sufficient to test some scenarios affecting some systems?
51.2	National Rural Electric Cooperative Association (NRECA)		In R31.1 and R31.2 there are references to "once every 24 months" and "once every 12 months." Please ensure these timeline requirements are clear similar to my comments in Question 49 regarding R29.1.
51.3	SCE&G		R31.3: What constitutes and operational exercise? What is the scope of the recovery and systems to be covered (all high impact cyber systems, or one sample system if the same recovery plan is used acroos all)?
51.4	WECC		Item 31.2 looks like it should be two separate items. Consider making a separate item for "Test any information used..." at the same required level for high impact.
51.5	City Utilities of Springfield, Missouri	Agree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
51.6	Florida Municipal Power Agency	Agree	30.5 mentions restoring to the previous baseline configuration, without regard to the fact that the baseline may have been the source of the problem. FMPA suggests "prior", giving the RE the flexibility to restore systems based on what they know to be a working system.

#	Organization	Yes or No	Question 51 Comment
51.7	Independent Electricity System Operator	Agree	- R30.1 Please define Recovery Plan. Some regions are not accepting a backup control center, with redundant systems and data as suffice for recovery and think it means building a component from scratch (ie install os, configuration, install application,
51.8	PacifiCorp	Agree	30.4 - Define “protection of information required to successfully restore”.30.5 - The requirement to reinstall and configure any application and system software using its baseline configuration does not consider strategies, such as redundancy or high availability, making the reinstall of a system unlikely and impractical.Define “secure backups” and “functionality”.31.2 - By including the testing of information used in the recovery of BES Cyber systems that is stored on backup media in 31.2 means that Low and Medium Impact BES Cyber Systems do not require testing of such information? If so, it should be a standalone requirement.Define “initially stored”, “useable and current”. This could be interpreted as a full restore to a system, one file being restored as verification that data is not corrupt and process to restore are in place to looking at a tape log and seeing that a backup was made of the data.32.4 and 32.6 - When does the clock start ticking. There could be a series of changes, whether technological or organizational, which is part of a project. What is considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is introduced or is modified. Modifications to the recovery strategy or recovery activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the recovery.31.5 - Does the requirement to update each recovery plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency?
51.9	Southern California Edison Company	Agree	The standard should clarify that the time line for the operational exercise that is required by R31.3 is not 36 months for every device is scope, but rather than every disaster recovery plan has to be tested on a scheduled basis.The operational impact of protecting backups at par with operational BES systems is substantial. The backup

#	Organization	Yes or No	Question 51 Comment
			does not support real time BES reliability and should be treated as an ancillary system (i.e. climate control, fire prevention etc.) or similar to systems such as access points and boundary protection devices.
51.10	Alberta Electric System Operator	Disagree	In Table R30, for 30.5, consider changing “known secure backups” to “known good backups” since availability and integrity are more important than confidentiality during system recovery.
51.11	Ameren	Disagree	R30.1 - If you miss listing all conditions or you fail to activate your plan if the certain condition is met makes this difficult to provide complete documentation for an audit. Suggest removal or changing the phrase to "List possible conditions that may activate the recovery plan, update these conditions within 30 days of an actual incident that was not included within the scope of the originally documented conditions."
51.12	American Electric Power	Disagree	31.2: Regarding "Test any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least every 12 months to ensure that the information is useable and current", should this be a separate line item? It seems out of place in 31.2.
51.13	APPA Task Force	Disagree	The APPA Task Force supports the drafting team’s efforts on System Recovery. We propose the following edits:31.2, recommend changing “once every 12 months” to “Annually.”32.1, recommend changing “once every 12 months” to “Annually.”32.4, recommend changing “once every 12 months” to “Annually.”
51.14	BGE	Disagree	Provide definition of “operational exercise”
51.15	Bonneville Power Administration	Disagree	The objectives of these requirements (“so that BES Cyber Systems can be restored to a defined state,” “to verify recovery plan readiness and effectiveness,” and “to ensure that the recovery plan(s) will function as intended and that personnel are aware of any relevant changes”) should be clearly labeled as “Objective of Requirement” and shown as a separate sentence prior to the text of the requirement rather than

#	Organization	Yes or No	Question 51 Comment
			appearing at the end of the requirement (i.e., the text of the requirement should not include the objective). That would clearly separate the objective from the action that the Responsible Entity must take.Table R30, Section 30.5 is too prescriptive. For example, one way to do backups is to take a complete image of the system. Restoration becomes merely an issue of restoring that image. There is no need to reinstall and reconfigure. Recommendation: Remove 30.5Table R31, Sections 31.1 and 31.2. There are other ways to test, as well. Testing methods should be devised by the RE, not the standard. The frequency may vary based on the Impact status of the system. However, standardization on the middle ground of at least once every 24 months would simplify compliance.
51.16	Con Edison of New York	Disagree	This criterion should be for control centers or SCADA system only. Many cyber systems which would need to comply with CIP-011 do not have back-ups. The BES can be operated effectively even if other cyber systems are down.
51.17	Constellation Energy Control and Dispatch, LLC	Disagree	Provide a definition of operational exercise.
51.18	Constellation Power Source Generation	Disagree	R31.3 uses the term “representative environment.” At the CIP V4 Workshop, the team stated they used this vague term to give entities flexibility in their operational exercises, but this is not auditable.
51.19	Consultant	Disagree	Table R30 Item 30.5 - First bullet - Suggest changing the word "defined" to "documented" or "identified" or "identified and documented". R23 does not define the baseline.Item 30.5 - Second Bullet - Suggest deleting the words "any" & "most" & "known" & "secure" New wording: "Load information from recent backups." Suggest deleting this bullet. Reloading backup date should be an operational decision made based on the conditions that exist at the time of recovery, and not "forced" by a requirement.Table R32 - Item 31.2 This is two requirements. Suggest separating each into it's own line item.Table R32 - The periodicity requirements of this table should be adjusted. The testing and operational exercise statements are not consistent with the

#	Organization	Yes or No	Question 51 Comment
			incident response plan requirements. Suggest making the requirements for incident response plans and recovery plans consistent.Item 32.2 & 32.3 Suggest changing the word "execution" to "occurrence".Item 32.5 - Actions necessary to address documented plan deficiencies may not be completed within 30 days, so requiring an update to the plan with 30 days would appear to create a situation where compliance is not viable, or sensible. Suggest modifying to be based on completion of corrective actions.Item 32.7 Suggest deleting the word "all" as an unnecessary word.
51.20	CWLP Electric Transmission, Distribution and Operations Department	Disagree	R31.2 the term “current” is not valid if any data has changed since the backup. A backup completed 12 months earlier could never be considered current on an operational system. Consider removing this term.
51.21	Detroit Edison	Disagree	Table 31.2 and 32.1 refer to a period of "12 months". We prefer “at least once per calendar year, not to exceed 14 months between instances”.Table 32.4 should not be an annual update but should be triggered on the required review in 32.2. Consider revising to a sixty day window after the review.Table 32.6 The term "any" is too broad. Consider revising to read "...changes that impact the recovery plan."Table 32.7 Revise "recover" to "recovery"
51.22	Dominion Resources Services, Inc.	Disagree	30.2. The phrase “including identification of the personnel responsible” should be removed from this requirement. Roles and responsibilities should be adequate for the plan. There should not be a need to list 20 relay technicians that could be allowed to recover a substation system. 31.2. The second paragraph of this requirement should be revised to state “Verify BES system can be restored from backup initially and at least annually thereafter”.32.1. The phrase “or when BES Cyber Systems are replaced” should be changed to “or when impacted by BES Cyber System changes.”32.6. The phrase “technology changes” should be changed to “technology changes that impact the recovery plan.” (e.g., not all organizational changes affect the recovery plan.)32.7. The word “recover” should be changed to “recovery”.

#	Organization	Yes or No	Question 51 Comment
51.23	Duke Energy	Disagree	Table 30:30.2 remove “including identification of the personnel”30.3 change ‘personnel responsible’ to “responders”30.5 CIP should not prescribe HOW we restore the system. Suggest removing and adding ‘restoration’ to the list in 30.4Table 31:31.1 multiple plans may be required. Same comment as 28.1 above. Is this once per 12 months per the plan or once per 12 months for each BES cyber system? Suggest allowing 12 months per plan to test.31.2 specify that verifying backup media functionality is an acceptable test.31.3 operational exercises at some generation stations may be unrealistic (unrealistic for availability or costs)Table 32:32.6 this should be part of change managementSuggest allowing 12 months per plan for review.Remove ‘incident’ from 32.2 and 32.3
51.24	EEI	Disagree	Suggested revision for R30.2:Roles and responsibilities of responders, including identification of the personnel (using Job title or job function) responsible for recovery efforts.
51.25	Emerson Process Management	Disagree	It seems there is a conflict between 31.2 and 31.3. If the operational exercise needs to be donw every 36 months per 31.3, then, it should not be needed again every 12 months per 31.2.
51.26	Entergy	Disagree	Entergy agrees for High and Medium Impact Cyber Systems it is important to be able to recover and demonstrate that the recovery plan and backup media used in the process is sufficient to recover the BES Cyber System however, requirement 31.2 and 31.3 appear to be a little redundant although not completely. In requirement 31.3 the entity is required to demonstrate recovery in a representative environment where 31.2 only the backup media is required to be verified as useable and current. Both of these activities provide validation that data can be recovered from the backup media. Requirement 31.3 should be deleted - testing the plan every 12 months either via paper drill or full operational exercise or actual incident coupled with validating the backup media is readable is sufficient to the demonstrate recovery. Requirement 31.1 should be change to include: “Testing any information used in the recovery of

#	Organization	Yes or No	Question 51 Comment
			the BES systems that is stored on backup media when initially stored and at least every 24 months to ensure that the information is useable and current."
51.27	ERCOT ISO	Disagree	30: Request that the use of redundant sites is an acceptable means to address recovery.30.2: Recommend noting what information is necessary here. Are group notifications considered sufficient (e.g., on-call rotations)? 32.2: Should be 30 days rather than 60 days to align with FERC Order 706.
51.28	FirstEnergy Corporation	Disagree	R31 - 31.3 - Need clarity on what is meant by 'Operational' exercise. We believe the intent was business operations, not IT system operations and related DR plan recovery. A business operational exercise is a business continuity planning issue. (example: EMS Operation hot-site testing) Sub-requirement 31.3 would need to be answered by each business unit and not within an IT DR Team response as business operational (BCP) tests are not performed for DR Plans. DR Plans have physical and media type testing which it appears to be what the intent was for 31.1 and 31.2. Need clarity on ownership. It seems like 31.1 and 31.2 are owned by IT, and 31.3 is owned by business units. R32 - 32.6 - We do not agree with changing names in individual recovery plans except during the annual review. Normally organization changes affect the recovery plan approvers list and if changed, would require re-approval of the DR plan. Given the complexity of our critical DR plans, this requirement is not reasonable, and certainly not within a 30 day window - especially if the new name is for someone just starting in a position. We agree that interim organizational changes could be made for call trees of 'personnel expected to respond to/perform a recovery using the recovery plans', but call trees are not part of the individual recovery plans and are instead part of an overall recovery plan. R32 - 32.7 - Recovery is misspelled ('communicate all recover plan...')
51.29	Garland Power and Light	Disagree	Requirement R30 requires the implementation of the plan to be in compliance - Concern is that for some business reason (perhaps a certain business strategy or the economy) some system or facility might not need to be rebuilt. There should be a provision for the Responsible Entity to provide justification to Regional Entity for not

#	Organization	Yes or No	Question 51 Comment
			rebuilding and not be in violation for not implementing and actually rebuilding the "whatever" that failed.
51.30	GE Energy	Disagree	36 months is too long between operational recovery exercises. This should be at maximum 24 months, and should require re-validation if a large system configuration change is made, such as hardware changes, version upgrades, or 3rd party software upgrades.
51.31	GTC & GSOC	Disagree	We recommend R32.1 be changed to the following: "Review and update recovery plan(s) at least once every 12 months or when a Cyber Security Incident recovery of BES Cyber System(s) does not effectively proceed according to the documented plan."We recommend the word "incident" be replaced throughout R30 through R32 with the words "Cyber Security Incident"
51.32	Hydro One	Disagree	Recommend changing the bullets for 30.5 to start with "plans for". The first bullet should be "install" not "reinstall." The recovery plan does not need to include non-BES Cyber Systems. The third bullet should test the BES Cyber System Component(s).
51.33	ISO New England Inc	Disagree	31.2 - "Test any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least every 12 months to ensure that the information is useable and current. "impossible to test " - is this to test if your backup works and is usable? Realtime data is never restored - clarification on information and is this test your media for usability? "Test when initially stored"?? Not feasible. More appropriate Verify backup completed successfully, not verify data that was backed up. Control Centers utilize full functioning backup facilities for recovery from the main center being compromised and or rendered unavailable, so for control centers the recovery should be to run from the backup control center once a year. The media should be tested on an annual base to make sure that the data from the offline storage is still recoverable. For facilities that do not have a backup BES cyber systems then I would agree that they need to recover in the way stated. Recommend changing 30.5 bullets to start with "plans for". The first bullet should be "install" not

#	Organization	Yes or No	Question 51 Comment
			"reinstall." Recommend that the recovery plan does not need to include non-BES Cyber Systems. Recommend that the third bullet should test the BES Cyber System Component(s).
51.34	LADWP	Disagree	CIP-011-1 R30 Cyber System Recovery (CSR) should not require to document identification of the personnel responsible for recovery effort (R30.2) within the CSR. Identification of specific personnel will lead to revision of the document when personnel are reassigned.
51.35	Manitoba Hydro	Disagree	The wording of Requirement R31.1 should be revised as the phrase "with a paper drill" could be misinterpreted. There are no specifics given with respect to the Requirements of R30 (in terms of "conditions", "roles and responsibilities", etc., so it assumed to be at the Responsible Entity's discretion in terms of criteria, etc. Consider whether Requirement R31.2 should be two separate Requirements - R31.2 with respect to "Conduct a test..." and R31.3 with respect to "Test any information...". There are no specifics given with respect to "demonstrates readiness" in Requirement R31.3 so it assumed to be at the Responsible Entity's discretion as to whether the test has demonstrated readiness or not. The word "recover" in Requirement R32.7 should be "recovery".
51.36	MidAmerican Energy Company	Disagree	Define "protection of information required to successfully restore".30.5 - The requirement to reinstall and configure any application and system software using its baseline configuration does not consider strategies, such as redundancy or high availability, making the reinstall of a system unlikely and impractical.Define "secure backups" and "functionality".Define "initially stored", "useable and current". This could be interpreted as a full restore to a system, one file being restored as verification that data is not corrupt and process to restore are in place to looking at a tape log and seeing that a backup was made of the data.32.4 and 32.6 - When does the clock start ticking? There could be a series of changes, whether technological or organizational, which is part of a project. What is considered an organizational change? Is it when a phone number changes, a person leaves or when a new role is

#	Organization	Yes or No	Question 51 Comment
			introduced or is modified. Modifications to the recovery strategy or recovery activities should cause an update to the plan, not changes to systems, technology or organization. Changes to those resources may or may not affect the recovery.31.5 - Does the requirement to update each recovery plan based on any documented deficiencies assume that the deficiencies can be resolved prior to the end of thirty calendar days or does the plan get updated with the statement that there is a deficiency?
51.37	Minnesota Power	Disagree	Minnesota Power generally agrees with the proposed Requirements R30, but recommends that the Standards Drafting Team consider defining the term "known secure backups" as it is not currently defined in the Standard and is open to interpretation. Part 31.2 requires that data be "tested" at the time of backup and every 12 months to ensure that it is "useable and current" and to ensure consistency with that requirement, Minnesota Power recommends that the Standards Drafting Team replace "known secure" with "useable". Minnesota Power generally agrees with the proposed Requirements R31, but recommends that the Standards Drafting Team further define what is meant by "test" data stored on backup media to "ensure that the information is useable and current" in Part 31.2. While testing usability can be done by verifying one can read the tapes' contents, how does one test that data is current? This would require more of a manual verification or comparison function than a test, correct? In addition, is R31.3 requiring a full restoration, or is it requiring that each scenario documented in the Restoration Plan be fully tested every 36 months? Minnesota Power recommends that the Standards Drafting Team revise the wording of Part 31.3 to eliminate confusion regarding their intent.Minnesota Power generally agrees with the proposed Requirements R32, but to be consistent with the "update" portion R32, Minnesota Power recommends that Part 32.1 be modified to state "Review the recovery plan(s) at least once every 12 months, or when BES Cyber System(s) have any system, organization or technological changes. Document any identified deficiencies, changes or improvements."Minnesota Power generally agrees with the proposed Requirements R32, but recommends that the term "recover" be

#	Organization	Yes or No	Question 51 Comment
			changed to “recovery” for Part 32.7.
51.38	National Grid	Disagree	National Grid recommends changing 30.5 bullets to start with “plans for”. The first bullet should be “install” not “reinstall.” Also recommends that the recovery plan does not need to include non-BES Cyber Systems and that the third bullet should test the BES Cyber System Component(s).
51.39	Network & Security Technologies Inc	Disagree	30.5 - Suggest revising to require use of either baseline configuration or most recent known “good” configuration. Covers the possibility a (new) baseline configuration is causing problems (can and does happen - even if tests pass).30.5 - Need to define what “secure” backup means.31.2 - Requirement to test information “when initially stored” may be extremely burdensome in some environments, depending on backup mechanisms used. Some types of backup systems use on-the-fly techniques to verify a copy/write operation is “good” but SDT should use language that is less prescriptive. Should also drop the word, “current.” Certain types of operational data will cease to be “current” moments after it is copied. Only real-time mirroring can satisfy this requirement and entities should not be compelled to implement it.
51.40	NextEra Energy Corporate Compliance	Disagree	NextEra believes the CIP-011-1 Table R30 - Recovery Plan Specifications so that BES Cyber Systems can be restored to a defined state did not provide enough guidance and left room for interpretations.The following are the recommended updates:30.1 - The Responsible Entity shall define conditions for activation of the recovery plan(s).30.4 - Processes and procedures for the backup, storage and protection of information required to successfully restore a BES Cyber System30.5 - Implement a test plan to identify the processes and procedures for the restoration of BES Cyber Systems to include the following: o Reinstall and configure any application and system software using its baseline configuration defined in Requirement R23, o Load any information from the most recent, known secure backups, o Conduct a system test to verify functionalityModified the wording and additional guidance should be provided by NERC on the minimum conditions which would activate the plan.NextEra also believes that Table R31 - Recovery Plan Testing Specifications to verify recovery

#	Organization	Yes or No	Question 51 Comment
			plan readiness and effectiveness did not talk about documenting test resultsThere should be documentation of test results to validate that it was performed. The following are the recommended updates:31.1 - Conduct a test (by recovering from an actual incident, with a paper drill, or with a full operational exercise) of the recovery plan at least once every 24 months. All testing results shall be documented.31.2 - Conduct a test (by recovering from an actual incident, with a paper drill, or with a full operational exercise) of the recovery plan at least once every 12 months. Test any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored and at least every 12 months to ensure that the information is useable and current. All testing results shall be documented.31.3 - Conduct an operational exercise at least once every thirty-six months that demonstrates recovery in a representative environment unless an actual incident response occurred within the thirty-six month timeframe that demonstrates readiness. All testing results shall be documented.In 30.5, the recovery plan expands the current backup and restore of any application and system software using its baseline configuration. Is the definition of baseline the current or previous version of an application and system software?In 31.2, does the testing of any information used in the recovery of BES Cyber systems that is stored on backup media when initially stored to ensure that the information is useable and current require the Responsible Entity to "load back" the data that is stored on backup media to an operational system to prove usability? Is loading it back to a test environment sufficient?In 31.2, "Test any information used in the recovery of BES Cyber systems." Does the requirement imply that in the case of protective relays at a BES Transmission Facilities, the backup settings file for every protective relay at High Impact facilities should be tested every 12 months?
51.41	Northeast Power Coordinating Council	Disagree	Recommend changing the bullets for 30.5 to start with “plans for”. The first bullet should be “install” not “reinstall.” The recovery plan does not need to include non-BES Cyber Systems. The third bullet should test the BES Cyber System Component(s).
51.42	Oncor Electric Delivery LLC	Disagree	These requirements are unnecessarily burdensome. Entities have been recovering from man-made and natural disasters for many years without these requirements.

#	Organization	Yes or No	Question 51 Comment
			Entities should be able to leverage Business Continuity, High Availability architectures and Standardization to demonstrate their ability to recover from unforeseen events. Requirement 32.6, update of Recovery Plan, we suggest this review be conducted quarterly.
51.43	Progress Energy - Nuclear Generation	Disagree	Agree with R30 and R31. Disagree with R32. Incorporating information contained in the matrix in Attachment 1 which aligns CIP 011-1 Requirements with CFR(s), National Institute of Science and Technology (NIST) and Nuclear Regulatory Commission accepted NEI 08-09 Rev. 6 Nuclear Cyber Security Plans for comments for consistency in regulation for R30-32.
51.44	Progress Energy (non-Nuclear)	Disagree	R30.5 the first bullet should not be a requirement based on the second bullet.
51.45	Regulatory Compliance	Disagree	30.5 - STTRKE all the bullet points. Recovery plan should be system wide. Test restoration annually - document processes.31.2 - Make the second item a separate criteria line item - it's too confusing the way it is currently written. "Required" for High Impact.32.2 - "Annually" review the results.....
51.46	ReliabilityFirst Staff	Disagree	For R30, change “or failure” to “failure, or destruction.” For 30.4, please clarify what is meant by “successfully restore”. For R30.5, please clarify what is meant by “known secure backups”. For R31.3, change “incident response” to “activation of the recovery plan”. For R32, delete “relevant” so all changes are communicated. For R32.7, change “recover” to “recovery”.
51.47	ReymannGroup, Inc.	Disagree	R30.4 should be expanded to include processes for the recovery, restoration, and protection of data from a damaged or failed BES Cyber System. R30.5 should be expanded to include a review to ensure that malicious code has not been installed on the recovered files or device.
51.48	RRI Energy	Disagree	What constitutes a representative environment?

#	Organization	Yes or No	Question 51 Comment
51.49	San Diego Gas and Electric Co.	Disagree	R30 - R32 were originally covered in CIP-009-3. Referencing Table R30 - SDG&E suggests that R30.4 and R30.5 be removed. The IT Disaster Recovery Plan covers this and it would not normally be part of our Business Continuity Recovery Plan. The Responsible Entity (RE) should not be required to develop Recovery Plans with detailed IT processes for storage, backup, protection and reinstallation of software, etc. Referencing Table R31 criteria 31.3, SDG&E suggests that this wording be changed. CIP-009-3 R2 provides the RE with more options for "exercising" the recovery plan and we prefer the way the Requirement is worded in CIP-009. Referencing Table R32, CIP-009-3 R3 provides the RE more options when developing plans and procedures to comply with the Requirements. The new table seems to hold the Entities (both Medium and High) to several compliance timetables that are extremely restrictive. SDG&E suggests that we utilize the same wording for this Requirement from CIP-009-3 R3.
51.50	Southwest Power Pool Regional Entity	Disagree	R30: Is a recovery plan required for each BS Cyber System or is a generic plan acceptable? Recovery plans need to range from device component failure to catastrophic failure (e.g. physical facility disaster). 30.2: Is the identification by individual name or by position title? 30.5: What is meant by "secure" backups? Encrypted? Securely stored? Something else? Also, the backup and restoration processes should be "as applicable." Not all recovered systems are restored from a "backup." 31.2: Does the requirement to test backup media when initially stored apply to every daily backup, or only after BES Cyber System updates? Does the test include a restoration to an offline environment to verify the backup is not only readable but also complete? 31.3: Clarify that the operational exercise is more than a system or site fail over (NERC Standard EOP-008 exercise) but must also include performing the necessary steps to recover from the failure and restore the failed systems to normal operation by following the steps of the plan. 32.1: Include BES Cyber Systems that are significantly updated / upgraded requiring an update to the recovery plan. 32.4: Require the update within a much shorter time following determination of the need through the methods defined in the criteria. Delayed

#	Organization	Yes or No	Question 51 Comment
			updates are at risk of being overlooked and out of date plans pose a risk to the entity's ability to quickly recover. 60 days is recommended.
51.51	USACE - Omaha Anchor	Disagree	A) 30.5 - how often must system test be conducted? B) 31.2 Clarify "initially stored" is this the first time the tape is used?C) 32.6 - this could be interpreted to require a change in the recovery plan every time a software change occurs. This is very extensive - and unrealistic. Potential verbiage could be 'whenever system, organizational, or technology changes effect the recovery plan.'
51.52	We Energies	Disagree	We Energies agrees with EEI: Suggested revision for R30.2:Roles and responsibilities of responders, including identification of the personnel (using Job title or job function) responsible for recovery efforts.
51.53	Xcel Energy	Disagree	Definition is needed as to what constitutes an "operational Exercise". Is this a table top drill, or something more.

52. Tables R30 to R32 provide direction concerning what impact level of BES Cyber Systems to which Requirements R30 to R32 apply. Do you agree with the impact levels as indicated? If not, what specific changes would you suggest?

Summary Consideration:

Note that "Recovery Plans" are now addressed in CIP–009–5 — Cyber Security — Recovery Plans for BES Cyber Systems

The primary focus areas of the comments were concerned improving the clarity of the periodic timing requirements and the large amount of test equipment it would take to develop representative environments for numerous disparate facilities.

Some commenters noted the different terms used for references to annual activities. The SDT reviewed the use of annual, calendar year, 12 months, etc. and in the revised standards used the phrase, ". . .at least once each calendar year, not to exceed 15 calendar months between. . ."

There were suggestions that the testing requirements should only apply to control centers as Recovery Plans apply to Medium & High Impact Level categorizations, while some aspects of the recovery plan may only apply to High Impact assets. Additional guidance was requested for operational testing and for testing of information that is stored on backup media. The SDT added some information about testing in the Rationale Box for Requirement R1 in the revised CIP-009-5. Testing is necessary to verify the Responsible Entities Recovery Plan's effectiveness. Planned and unplanned maintenance activities may also present opportunities to execute and document an Operational Exercise (see NIST SP 800-84, Functional Exercise). This is often applicable to operational systems where it may be otherwise disruptive to test certain aspects of the system or contingency plan. NIST SP 800-53, Appendix I, contains supplemental guidance.

Issues identified in comments for SDT consideration were Recovery Testing – Operational Test every 36 months should count for the annual test, recovery plan testing clarifications, data retention plan clarification, identification requirements of "Personnel Responsible", coordination of physical aspects of Cyber Security Incidents, and incident recovery plan reviews. The SDT notes that there are FERC directives (e.g., P686, P687, P725) to add a requirement to conduct a full operational test of the recovery plan once every three years – so the suggestion to count the full operational test as the annual test was not adopted. (CIP-009-5 R2)

Commenters suggested changes and provided various requests/suggestions for re-wording/wordsmithing and improved coordination of backup and recovery with EOP-008. The SDT has coordinated its proposed requirements with the now FERC approved EOP-008-1 – Loss of Control Center Functionality. Commenters suggested that all requirements should be in the table, not in the objective or in the "pre-amble" to the requirements and that the SDT consider providing a summary table for all periodic requirements and remove the "how to" statements from the requirements. The SDT has included all mandatory performance in the requirements of the revised standards. The SDT did not adopt the suggestion to develop a summary table for periodic requirements as the format for Version 5 is considerably different from the format proposed when the requirements were all combined in CIP-011.

	Organization	Yes or No	Question 52 Comment
52.1	Alberta Electric System Operator	Agree	There appears to be a typo in 32.7 - "Communicate all recover plan updates" - recover should be recovery.
52.2	Emerson Process Management	Agree	In reality, it would be a good practice to exercise recovery plan during or toward the end of each scheduled unit outage for generation.
52.3	Florida Municipal Power Agency	Agree	FMPA suggests changing “12 months” to “annual” and “24 months” to “biennial”
52.4	PacifiCorp	Agree	31.2 - By including the testing of information used in the recovery of BES Cyber systems that is stored on backup media in 31.2 means that Low and Medium Impact BES Cyber Systems do not require testing of such information? If so, it should be a standalone requirement.
52.5	American Municipal Power	Disagree	Please provide a little or no impact category
52.6	American Transmission Company	Disagree	Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.7	APPA Task Force	Disagree	The APPA Task Force supports the MRO-NSRS comments on impact levels and therefore proposes the following changes:R31 Table 31.3: Low Impact: N/AMedium Impact: N/AHigh Impact: Required for Control Centers OnlyThe APPA Task Force agrees with the impact levels for the rest of R30-R32 if it is understood that a blank in the table means N/A.
52.8	BGE	Disagree	R30 - R32 should synchronized with R29 to include both Low and medium impacted

	Organization	Yes or No	Question 52 Comment
			BES Cyber Systems.
52.9	Black Hills Corporation	Disagree	30.4 should also apply to Medium Impact systems. Without this basic information, recovery would have to start from scratch.
52.10	Bonneville Power Administration	Disagree	Table R32Sections 32.2 and 32.3. Both should allow 60 days for review.Section 32.4: 12 months is too long. No more than 6 months should be allowed. Items 31.1 through 31.3 in Table R31 and 32.1 and 32.4 in Table R32 states certain events must occur "at least once every 12, 24, or 36 months." Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. The SDT should be very specific as to what it means for how frequently the events referenced above must occur.
52.11	City Utilities of Springfield, Missouri	Disagree	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
52.12	Con Edison of New York	Disagree	See 51
52.13	Consultant	Disagree	Table R30 - It doesn't appear to make sense that the Recovery Plans applies to Medium & High impact level categorizations, while aspects of the recovery plan only applies to High Impact assets.Table R31 & R32 - How many test and exercises are required? The structure here will create an administrative burden to track what was done when that has no corresponding risk reduction.Mixed requirements would force multiple recovery plans based on categorization of assets, which could mean two recovery plans for the same asset type where the application of each asset has a different impact categorization. This does not appear to be a sensible approach to recovery plans.Suggest deciding on a consistent set of requirements that can be applied equally to High Impact and Medium Impact assets.
52.14	CWLP Electric Transmission, Distribution	Disagree	R32.6. In order to meet the required change management process in R23 this window should be extended to 60 days.

	Organization	Yes or No	Question 52 Comment
	and Operations Department		
52.15	ERCOT ISO	Disagree	All requirements should apply to Medium Impact BES Cyber System due to interconnectivity to other BES Cyber Systems.
52.16	FirstEnergy Corporation	Disagree	R32 - Combine R32.5 and R32.6 and eliminate the word 'organizational'.
52.17	Garland Power and Light	Disagree	Requirements 30.1 & 30.2 - remove Medium Impact classification
52.18	ISO New England Inc	Disagree	32.6 - clarification on scope of "any" technology and system change scope. (organizational change is fine). R32.7 spelling "recover" should be recovery? CIP Standard use of the term "annual": The term "annual" should be replaced with the phrase: "no fewer than X (e.g. 9) months, but no greater than Y (e.g. 18) months". The time duration in "X" and "Y" should be clarified by the Standard Drafting Team, taking into consideration the appropriate level of exposure the time duration would provide. This phrase would provide Registered Entities with flexibility within any given calendar year to accomplish the prescribed action, but at the same time restrict companies from taking action in December of one calendar year, and then again in January of the next.
52.19	LADWP	Disagree	Medium Impact should not be a factor.
52.20	Lincoln Electric System	Disagree	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
52.21	Manitoba Hydro	Disagree	Medium Impact BES Cyber System should be included as "Required" in sections 30.3 to 30.5
52.22	MidAmerican Energy Company	Disagree	Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous

	Organization	Yes or No	Question 52 Comment
			disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.23	MRO's NERC Standards Review Subcommittee	Disagree	Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.24	Oncor Electric Delivery LLC	Disagree	Verification of the entity's Recovery Plan for High Cyber Systems every 12 months should cover Requirement 31.1. This should require only one test for the entity - remove low/medium/high)
52.25	Progress Energy (non-Nuclear)	Disagree	See comment 14.What is meant by an operational exercise in a representative environment? Does it mean individual components that can be easily tested for recovery plans?
52.26	ReliabilityFirst Staff	Disagree	For R30, each subrequirement should be "Required" for all the "Medium" impact BES Cyber Systems. For R32.6, should be "Required" for "Medium".
52.27	San Diego Gas and Electric Co.	Disagree	SDG&E would agree with Table R30 if item 30.5 were to be removed. Similarly, SDG&E would agree with Table R31 if item 31.3 were to be removed. Referencing Table R32 - SDG&E prefers the wording in CIP-009 R3 in this area because it provides more flexibility for the Entities while still covering the issues.
52.28	Southern California Edison Company	Disagree	The drafting team should state in CIP 010 that back-up systems should be treated at par with system key to real time BES reliability if the intent of this requirement is that CIP-011 be applied to all BES systems.
52.29	Southwest Power Pool	Disagree	30.3, 30.4, and 30.5 should be applicable to Medium impact systems. 32.6 should be

	Organization	Yes or No	Question 52 Comment
	Regional Entity		applicable to Medium impact systems with perhaps a 60-day update timeframe.
52.30	The Empire District Electric Company	Disagree	Comments: Item 31.3 could potentially require a large amount of test equipment, when you consider what it would take to develop representative environments for numerous disparate generating facilities and substations. We believe this item should only apply to Control Centers, with testing of the recovery plan (as specified under items 31.1 and 31.2) sufficient at generating facilities and substations.
52.31	WECC	Disagree	All items should be required for medium impact levels in R30Criteria should apply to all impact levels.

53. Which requirements in draft CIP-011-1 should allow for TFE submissions? Note that not all requirements will be considered as being applicable for TFE submissions. The drafting team has attempted to minimize the need for TFEs by modifying the language to allow for flexibility in meeting the requirements. Please provide suggestions on how the language of the standard may be modified to eliminate the need for TFEs. If TFEs are still needed, please provide specific examples to justify the inclusion of a requirement as being TFE eligible.

Summary Consideration:

Some commenters stated that the requirements should be written around the specific device types. The drafting team considered this option, but believes that it becomes problematic for entities and auditors to determine when a device is multi-purpose versus purpose-built. Some purpose-built devices can be considered multi-purpose depending on how the device was manufactured and implemented.

A variety of comments were received regarding the TFE process and its applicability to the specific CIP Cyber Security requirements. While the TFE process itself was outside the scope of the drafting team's work, commenters stated that TFEs should be allowed for passwords, malicious code monitoring, system hardening, system event monitoring, wireless and remote access, as well as for communications and data integrity. The drafting team considered these comments and revised the requirement text where necessary to allow entities more flexibility in implementing these requirements thereby reducing the need for TFEs. In some cases, the requirement was removed or written at a system level to prevent the need for TFEs.

#	Organization	Question 53 Comment
53.1	Detroit Edison	14.4, 17.1, 17.2, 16.2, 10.1-10.8 should retain TFE status.
53.2	Network & Security Technologies Inc	19.1 (see comments on Question 35), 26.2 (see comments on Question 47)
53.3	ISO New England Inc	Actual language on several requirements need to be clarified, many are still open to interpretation which may lead to TFE's.
53.4	EEI	Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.

#	Organization	Question 53 Comment
53.5	Progress Energy - Nuclear Generation	All CIP 011-1 Requirements should contain provisions similar to NIST 800-53, Regulatory Guide (RG) 5.71, and NEI 08-09, Revision 6, CIP standards should provide for nuclear facilities' use of alternative methods which implement security controls equivalent to those required by CIP. Nuclear programs, required by regulation, currently in place at nuclear facilities provide these alternate methods. Technical Feasibility Evaluations (TFE) should not be required with such documentation. One example is that nuclear facilities have one of the most effective Physical Security Programs of Critical Infrastructures. CIP-011-1 requirements R5 and R6 should acknowledge nuclear generating station physical security programs.
53.6	Ameren	All of the following requirements would need a TFE o R10 for passwords complexity o R14.4 for user banners o R15 for malicious code protection o R16 for installing patches o R18 for logging security events o R19 for validating data inbound o R23.7 for monitoring changes to a baseline configuration.
53.7	US Army Corps of Engineers, Omaha Distirc	All requirements that require existing hardware and software be capable of performing any function should allow for the possibility of TFE's. Sections R10, R15, R17, R18, R19, & R23 have requirements that are likely to require TFE's.
53.8	Southwest Power Pool Regional Entity	Any time a requirement specifies "continuous", "all", or prescribes a specific solution or characteristics of a technical solution, a TFE may be necessary. Try to avoid specific technology requirements as discussed elsewhere in these submitted comments.
53.9	The Empire District Electric Company	Comments: See comments under questions 34, 35, and 37.
53.10	RRI Energy	Cyber assets that are not on your standard IT equipment list are the most likely devices to need TFEs. This list could include meters, vibration monitors, PLCs, DCS, RTUs, cpu based test equipment.
53.11	E.ON U.S.	E.ON U.S. believes that many of the requirements remain ambiguous and additional clarity is needed. Absent such clarity it is difficult to ascertain where TFE ability can be eliminated. In fact, the proposal to provide greater compliance flexibility for responsible entities makes this determination even more difficult. As the requirements currently read, E.ON U.S. believes that more, not less, TFE requests will

#	Organization	Question 53 Comment
		result. Areas where responsible entities have requested additional clarity need to be addressed prior to issuance of a final industry draft. The informal comment period does not provide an adequate forum to identify all areas of concern and suggest specific replacement language.
53.12	Cogeneration Association of California and Energy Producers & Users Coalition	Entities should be able to use TFEs for any instance where unsupported technology is in place that may not be compliant with CIP-011 requirements due to age or vendor proprietary technology. Patches, updates, virus scanning, or firewalls may not be available for older, unsupported technology. An entity should not be required to upgrade or replace a system that currently satisfies the needs of the entity. The entity should be able to use other mitigation methods to protect a system if patches, updates, virus scanning, or firewalls cannot be applied.
53.13	Northeast Utilities	Equipment that never has security software patches or virus protection should be exempt. Also, those cyber assets that do not have user authentication capabilities should be exempt from password requirements.
53.14	ERCOT ISO	ERCOT ISO supports the proposed form of combining all requirements into a single reliability standard. The use of a single standard will eliminate the need for cross-referencing to other reliability standards. ERCOT ISO does request a realignment of some requirements. All requirements for access authorization, revocation, and review should be combined to eliminate confusion of how access should be managed.The timing of updates to documentation should be consistent throughout the requirements. Recommend the use of 30 days to be in compliance with the directives of FERC Order 706.
53.15	Bonneville Power Administration	If the standards present the overall security controls required, and do not attempt to dictate how those controls are accomplished, there should be no need for TFEs.If there is a need:First, the TFE process as presently constituted has shown to be cumbersome, not well understood, and inflexible. Neither NERC nor The Regional Entities have the detailed internal system knowledge or manpower to do make an intelligent judgment. At best, they can make a broad, industry best guess. The TFE approval process belongs within the Responsible Entity, at a technical level where there are people who know the environment, the systems, and their capabilities can evaluate them. They should be audited as part of the normal compliance audit.Second, if a system will not, or can not perform a

#	Organization	Question 53 Comment
		required function, it should be up to the RE to determine what steps should be taken to meet the standard. Third, because there are so many ways to accomplish the security of systems, the only time a TFE should be necessary is when all methods have been exhausted that could provide a level of protection required.That being said - Any time a situation arises where for technical reasons, or because implementation of security features may present BES reliability issues, or where application of one security measure would compromise others, the RE should have the authority to choose how to proceed. If this is called a TFE, the RE should approve it and document it as part of the overall security planEven if TFEs with approval required by the REs or NERC are used under CIP-010 and CIP-011, the process needs to be revised. As examples:1. There needs to be an opportunity for entities to appeal or request reconsideration of a rejection of the initial submission. Under the current, at best they can resubmit one time to correct errors.2. It should be possible to submit TFEs under multiple justifications.3. There are claims that the regional entities have been instructed to reject any TFEs other than those based on legacy equipment. If true, this violates the process, which allows TFEs for both new and legacy systems. It is also unreasonable: there are still systems today, and will be for the foreseeable future, that may be the best overall solution for reliable operation of the grid but which do not allow full compliance. Having said that:10.6 may not be possible for all systems. For overly simplistic example, routers intended for small office/home office use often allow either full access or no access. If all that is necessary is to review a log, full administrative access is overkill. To avoid the need for a TFE, recommend "To the extent possible for the particular device or system, require that authorized..."10.8. Same comment as 10.6.14.2. Unless the definitions of external connectivity and/or remote access or change, 14.2 may not be possible in every instance. For example, consider a legacy multi-user system in a Control Center that is not capable of multi-factor authentication. Any access from a system not part of the BES Cyber System containng the legacy system would constitute remote access and require multi-factor authentication for a High Impact system. It is not clear from R14 whether that multi-factor authentication is required at the BES Cyber System itself or at the access point. If it is required at the system itself, then a TFE would be required. Recommendation: Redefine external connectivity and remote access as described above. Multi-factor could then be required clearly at the external access point.14.4. It is not always possible to display an appropriate use banner under such circumstances. As an example, consider remote connection using a VPN. The access point in that case would the device at the endbound end of the encrypted tunnel. The user never sees a

#	Organization	Question 53 Comment
		screen on that access point, and therefore sees no such banner. Recommendation: See the suggested revisions to 14.4 R19. For both 19.1 and 19.2, validation might not be possible. In particular, commercial off the shelf software (COTS) may or may not provide such validation. If the COTS is the best solution otherwise, a TFE would be required.
53.16	Public Service Enterprise Group companies	Implementation of requirements 10 (Response to Question 24), 13(Response to Question 32), 23.7 (Response to Question 40) and 26.2 (Response to Question 48) may not be feasible in all situations. Please see comments in the questions that relate to these requirements for description of the potential infeasibility.
53.17	Idaho Power Company	In R19, data validation and encryption may in some control center applications, introduce a data latency that renders the application degraded or useless and may result in a more secure environment but less reliability. In R19.2, I am unaware of technology that can determine whether invalid data has been maliciously compromised. Most EMS/SCADA systems which would be the most common BES cyber system in a control center filter or ignore invalid data anyway and I do not see that the benefit of this requirement outweighs the technology investment needed to meet this requirement.The ability to alert on unauthorized access attempts may require a TFE depending on the boundary device that is protecting the system. Some boundary devices do not lend themselves to providing alerting and may require a TFE until they are replaced with a device that can meet this requirement.
53.18	Lincoln Electric System	LES supports the comments submitted by the MRO NERC Standards Review Subcommittee (MRO NSRS).
53.19	MidAmerican Energy Company	MidAmerican Energy agrees with EEI's comment below:Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.
53.20	Minnesota Power	Minnesota Power recommends that the following requirements should still be eligible for Technical Feasibility Exceptions:Requirement 8, Part 8.3:Depending on the definition of “monitor the use,” it may be impossible to do this for many devices. For example, for Windows computers, how does one monitor the use of someone when much of the interaction involves mouse clicks? Will software be

#	Organization	Question 53 Comment
		required to log, not just keystrokes, but mouse clicks? Further, certain devices do not even maintain an audit trail of logins/logouts (e.g.: networked KVMs for remote console access to servers to allow for efficient system administration).Requirement 10, Part 10.2:While this is certainly good IT Security practice, implementing this on every BES Cyber System could very well put the reliability of the BES at greater risk. Since there is no way to change all passwords in all the various devices simultaneously, especially in a utility that is geographically distributed and remote, this will result in a continual need to change passwords. As a result, it could become commonplace for technicians and engineers to not know/remember what password to use on what device. Not only will this keep them from accessing devices at potentially critical times to perform needed maintenance, but EVERY failed login attempt will then have to be investigated in detail. This could be minimized by requiring this for only Medium and High Impact systems.Requirement 10, Parts 10.4 and 10.5:It is quite probable that devices exist that cannot meet these requirements.Requirement 10, Parts 10.8:It is quite probable that devices exist that do not allow for the creation of accounts, whereby all functions must be performed from the system/admin account(s).Requirement 15:For any BES Cyber Systems that are not on routable protocol networks, it is not possible to have network-based malware detection/prevention. Thus, if the device itself does not support the installation of malware-prevention software, Requirement R15 would be not technically feasible.Requirement 18:For any BES Cyber Systems that are not on routable protocol networks, it is not possible to have network-based malware detection/prevention. Thus, if the device itself does not support the security event logging, R18 would be not technically feasible.Requirement 19:The way this is written, the requirement is likely technically infeasible for most any system. To correct, Part 19.1 could be changed by replacing the word “Validate” with “Encrypt”.Requirement 23, Part 23.7:This implies detecting changes that have occurred outside of the approved methods of Parts 23.3-23.6. As such, not all devices may support the installation of software that would allow for such monitoring.
53.21	Progress Energy (non-Nuclear)	Need to include language that allows for procedural controls - example as for password requirements which cannot typically be enforced technologically.
53.22	WECC	No requirements should be so prescriptive to required a TFE. The SDT has done a good job in rewriting requirements to describe WHAT is required without describing HOW it must be achieved.It is impossible to draft standards language that anticipates all possible limitations for implementation.

#	Organization	Question 53 Comment
		The standards, or Rules of Procedure should allow for exceptions to any requirement if an entity could provide justifiable basis and acceptable alternative controls.
53.23	Nuclear Energy Institute	Older computer based equipment may not support all of the controls such as logging/monitoring and accounts/passwords. Alternate controls should be allowed in these cases.
53.24	PacifiCorp	PacifiCorp agrees with EEI's comment below:Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.R10 - equipment still exists in the field that cannot meet the requirement of a 6 character password. R14 - equipment still exists in the field that cannot meet the requirements.
53.25	Dominion Resources Services, Inc.	Please see Dominion's responses above suggesting the addition of footnotes to avoid required TFEs for requirements 10.8, 14.4, 15.2, 15.3, 18.2, 26.2.
53.26	Puget Sound Energy	Puget Sound Energy suggests Table 10, Table 18, and Table 22 as inclusive for TFE eligibility for the following reasons (also stated in those sections):Table 10 - Puget Sound Energy suggests including "Where Technically Feasible" to R10, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 10.Table 18 - Puget Sound Energy suggests including "Where Technically Feasible" to R18, as some BES Cyber Systems may be incapable of meeting all the requirements in Table 18. For example, entities may incorporate dialup accessible devices that, by the nature of a connection that is built up and torn down as necessary, is incapable of providing "continuous security monitoring that issues alerts".Puget Sound Energy suggests including "Where Technically Feasible" to R22, as some Protective Cyber Systems may be incapable of meeting all the requirements in Table 22.
53.27	FEUS	R10: Access Controls; some legacy systems do not allow for default factory accounts to be changed; some legacy systems only allow for a single level of access.R14: For systems not connected to an external network that use Dial-Up access for remote support multifactor authentication may not be technically feasible. Keeping some systems/networks separate from an external cooperate network can reduce cyber vulnerabilities.

#	Organization	Question 53 Comment
53.28	Southern California Edison Company	R7.2: Enforcing this control may be limited by the technical capability of a SCADA device. A device such a PLC that has preset accounts forces the RE to develop acceptable use for a set of accounts retroactively rather than have the capability to limit the account types.R10.4 and R10.5: There are SCADA devices in service that are not at the end of their service life that do not offer this capability. R15.1, 15.2 and 15.3: While these capabilities may be possible at the electronic boundary, individual SCADA devices may not support this functionality. Strict compliance is restricted by technical limitation.R17.1: The mitigation plan that is suggested should be a part of a formal technical feasibility exception program.R28.1: The phrase "or a full operational exercise" is expected to result in technical feasibility exceptions since this will require test data/ setting to be loaded onto in-service SCADA systems.
53.29	Alliant Energy	Recommended changes for any TFE program implemented:Security patch TFEs should be programmatic and not based on individual patch releases.Cyber Asset counts should be stricken. Approved changes to the environment create an immediate ad-hoc obligation for TFE update to the RRO for what is already a burdensome process.Quarterly updates should be removed and replaced by re-approval on an annual basis by the Sr. Manager or delegate.NERC should create a standard Class-Type list as originally proposed.
53.30	USACE HQ	Requirements 10, 14.4, 15 and 17, among others, should have a TFE.
53.31	San Diego Gas and Electric Co.	SDG&E recommends that the TFE processes be changed and incorporated into the Vulnerability Management Process; where the Entity would identify, track, and mitigate any TFEs as a Vulnerability. This methodology will streamline and enhance the TFE process and thereby 1) allow Entities to manage their TFE's internally, 2) reduce Entity, NERC, Reliability Coordinators and Regional Reliability Organization resource requirements, 3) reduce paperwork, resources, and overhead, 4) reduce the potential for errors or leakage of secured information, 5) enhance the audit process and 6) standardize and clarify the process across all Entities.
53.32	BGE	See comments for R13 under Q31-31 and R23 comments under Q40-41.

#	Organization	Question 53 Comment
53.33	MRO's NERC Standards Review Subcommittee	See comments under questions 17, 34, 35, and 37.
53.34	American Transmission Company	See comments under questions 34, 35, and 37.
53.35	Florida Municipal Power Agency	See comments under R7, R14, R16, R23, R20
53.36	CenterPoint Energy	See references to possible TFE issues in comments above.
53.37	SCE&G	Similar to RG 5.71 and NEI 08-09, allowances should be provided for use of alternatives to the required security controls. Alternate controls would be justified and documented that the Threat Vector has been mitigated. TFEs are administartively burdomesome and currently require annual certification and ultimate elimination. The scope of equipment eligible for TFEs will drastically increase the number of filed TFEs, especially for eligble requirements with low impact categories. The SDT needs to consider the feasibility and practicality of implementing the current TFE process with these standards.
53.38	ReliabilityFirst Staff	Table R10, requirements 10.1 and 10.2, Table R14, requirement 14.4, requirement R15, Table R19, requirement 19.2.
53.39	Consultant	Technical Feasibility Exceptions should be allow for any requirement. There are about 2,000 registered entities. Trying to address every configuration of every asset across that spectrum would result in either the requirements being written in a convoluted and confusing manner to address the multiple configurations or being written with little detail to allow the multiple configurations, neither of which could even approach a "bright lines" concept of the requirements. The Technical Feasibility Exception should include a technical basis that shows implementing the specific requirement as stated would not achieve the requirement objective, or improve the security position as it relates to the requirement objective.The Technical Feasibility Exception process probably needs to be improved to deal with exceptions as described here.

#	Organization	Question 53 Comment
53.40	Kansas City Power & Light	TFE should continue to be allowed. Unsure of all the requirements that this may apply to at this point. Recommend the Drafting Team at least consider a direct translation from the CIP version 2 requirements to these CIP-011 requirements at a minimum since CIP-011 is intended to be a translation but less prescriptive.
53.41	USACE - Omaha Anchor	TFE's will still be required in several standards - I've addressed the requirement for TFE in applicable standards.
53.42	Allegheny Energy Supply	TFEs can be reduced by providing additional language in the standard that recognizes the limitations of certain BES Cyber Components.
53.43	Allegheny Power	TFEs can be reduced by providing additional language in the standard that recognizes the limitations of certain BES Cyber Components.
53.44	National Grid	TFEs related to Password and Appropriate Use Banner.
53.45	CWLP Electric Transmission, Distribution and Operations Department	TFEs should be allowed for requirements R10, R13, R14, R15, R16, R17, R18, R19, and R23.
53.46	Reliability & Compliance Group	The best thing that could be done for this Standard is to ensure that everything is well defined so that there is no ambiguity when it comes to identifying BES Cyber Systems and also categorizing their impact.
53.47	Manitoba Hydro	The language or the requirements should be written such that there should be no need for TFE submissions. The standards should allow for compensating measures. For all instances where it is not technically possible to meet strict compliance with a requirement, the Responsible Entity should apply compensating controls which are documented and approved by the senior manager or delegate, similar to the policy exception process in CIP-003-1. The current TFE process creates a enormous administrative burden on the electric industry which provides no additional value to the reliability of

#	Organization	Question 53 Comment
		the Bulk Electric System.
53.48	LADWP	The need for TFEs still exist as certain control systems are legacy systems that may not have current update or patch capability (e.g. SCADA systems). Removal of TFEs for these systems would result in non-compliance as replacement or upgrade of these systems must be done on a planned and scheduled manner.
53.49	Garland Power and Light	There are 2 requirements specifically listed below that need TFE's but there should be provision for any equipment that cannot be made strictly compliant with any requirement that either a TFE or a mitigation plan can be written and implemented such as is stated in 16.1 or 17.1.Requirement R10 - Unless the requirement is rewritten to allow for procedural controls to suffice for compliance or the language in the footnote is actually included in the requirement, a TFE is needed for this requirementRequirement R14 - A printed circuit board (with a network connection) in most cases will not allow for any process to be loaded onto it to protect against malicious software - need a TFE for this requirement
53.50	GE Energy	These changes should eliminate the need for the vast majority of TFEs. There may still be a requirement for TFEs on systems that cannot enforce the password complexity rules.
53.51	FirstEnergy Corporation	This question should be postponed until the Standards are in a more final state so that entities can better see how the new requirements would apply to specific devices, etc. It appears that R20 would necessitate new TFEs.
53.52	NextEra Energy Corporate Compliance	Though NextEra believes TFEs are very important part of the CIP process, given the number of changes proposed, NextEra will wait until the next draft to comment on TFEs.
53.53	Oncor Electric Delivery LLC	To eliminate the need for TFE’s the standard will have to be more granular. Many legacy systems are immune to cyber attacks, yet cannot satisfy the requirements of this standard. R8.3 as an example, there is no system to monitor access at the physical port of relays. R10 - legacy devices do not support account management.

#	Organization	Question 53 Comment
53.54	American Electric Power	We encourage the SDT efforts in drafting requirements in such a manner that will eliminate the need for a TFE. The TFE process should be standardized between the Regional Entities. Currently, Responsible Entities are required to submit multiple forms and varying information for the TFE process depending on the Regional Entity. AEP suggests standardizing on a single submission form and process and have all TFE data submitted to a single source maintained by NERC that can be used by all Regional Entities. This will allow Responsible Entities to submit and/or modify TFE data once and have it available to all Regional Entities on a consistently.See comments under questions 24 and 35.
53.55	We Energies	We Energies agrees with EEI: Additional language regarding the features and functions of devices need to be added to the requirements. TFEs can be reduced by providing additional language that recognizes limitations of certain equipment.
53.56	Regulatory Compliance	We feel that TFE's should still be considered for the following tables:R10 - Account Access Control SpecificationsR14 - Wireless and Remote Access ControlsR16 - Security Patch ManagementR17 - System HardeningR18 - Security Event MonitoringR19 - Communications and Data IntegrityR20 - Electronic Boundary ProtectionR23 - Configuration Change Management
53.57	BCTC	We have embedded this information in our individual responses to previosu questions.
53.58	US Bureau of Reclamation	We have not had an opportunity to assess which requirements may require a TFE yet. We will evaluate the requirements during the next evaluation period.
53.59	Duke Energy	We prefer that all of the requirements allow for an exception. Older computer based equipment may not support all of the controls such as logging/monitoring and accounts/passwords. Alternate controls should be allowed in these cases.
53.60	GTC & GSOC	We recommend that TFEs should be considered for all requirements with the exception R1 because of the ability of the regional entity and NERC to review the appropriateness of the TFE. We recommend adding language to the requirements on acceptable use banners and passwords to clarify that they do not require TFEs.If our recommendation to allow TFEs for all requirements is not viable then the following requirements should allow an entity to request a TFE. (R5, R6, R8, R9, R10, R13, R14, R15,

#	Organization	Question 53 Comment
		R16, R17, R18, R19, R21, R22, R23, R26)Example justifications are as follows:R5: BES Cyber Systems where physical security cannot reasonably be provided such as devices that are physically hung on a transmission line such (i.e. transmission line fault detectors). R6: While physical protection of the physical security systems should be feasible in most instances, there may still be instances where mitigation measures need the oversight provided by the TFE process.R8: The majority of substation devices use the concept of "shared" accounts. While an entity can add a device to facilitate logging into substation devices, there is not a feasible way to "monitor" these accounts on the purpose built devices themselves such as protective relays. R9: Depending on the method chosen to physically protect the BES Cyber System, it may not be technically feasible to revoke physical access to every location within 24 hours for an individual terminated for cause if an individual does not return their key (physical key, electronic key, or otherwise).R10: There are numerous examples of legacy devices which cannot meet the requirement of a 6 character password, or a password with special characters, etc.R13: Depending on the method chosen to electronically protect remote access to the BES Cyber System, it may not be technically feasible to revoke remote access to every location within 1 hour for an individual terminated for cause if an individual does not return their key (physical key, electronic key, or otherwise).R14: There are rare instances where remote access may be needed without 2-factor authentication such as for the administration of the device that authenticates the remote access itself. There are also instances where a display of appropriate use banner is not technically feasible.R15: While this requirement should greatly reduce the number of TFE's submitted based on the existing CIP v3 malware requirement, there will still be existing legacy purpose built BES Cyber Systems that do not have the ability to detect and respond to the introduction of malicious code. Specifically, consider the case of a protective relay with no external connectivity.R16: The allowance for TFE's should carry over from the existing CIP-007-3 R3.R17: Based upon the existing TFE framework, the language "shall document and implement a mitigation plan" from row 17.1 would necessitate that a TFE be filed.R18: There exists no such tool or process to monitor for system events related to cyber security on protective relays with no external connectivity.R19: Not all data protocols include a checksum. Whereas most SCADA protocols do contain this data error detection functionality, this requirement (19.1) is not limited to those inbound SCADA connections. There are a number of reasons, supported by the DHS Catalog of Control System Security itself, where an entity may choose not to encrypt all data inbound to a BES Cyber System (19.2).R21: There may be shared

#	Organization	Question 53 Comment
		cyber system components between BES Cyber Systems that do not provide logical separation. Clarification of this requirement may resolve the need for a TFE allowance on R21.R22: The TFE allowance justification for R22 carries over from the justifications for R14, R16, R18, and R23.R23: There are a number of devices for which there exist no such tool to monitor changes to the baseline configuration (23.7). In addition, it will not be feasible to monitor and detect changes for those systems with no external connectivity.R26: There are maintenance devices for which there are no known methods to detect and prevent the introduction and propagation of malicious code. Examples include devices such as data analyzers, birdogs, etc.
53.61	Constellation Energy Commodities Group Inc.	We support the effort to reduce the need for TFEs; however, the complexity and variability of systems across industry make it difficult and inappropriate to expect one-size-fits-all requirements.The password complexity requirements should either be written so as to avoid the need for TFE's, or clarified to specify that the use of maximum complexity allowed by the device is sufficient.
53.62	Entergy	Where the need for TFE has been obvious to us we have noted as such in comment to the respective requirements. We will be more thorough during the formal comment period.
53.63	Con Edison of New York	Will Technical Feasibility Exceptions still be accepted, required or will this process no longer be enforced? The Password requirements would still drive the need for TFE's. TFE's may be avoidable if the standard allows for internal documentation and approval of exceptions. There will be many TFE required because the net has been cast on so many different unique type systems that are located on the power system. Many of these systems are 20 to 30 years old. The CIP is written to address concerns for new technology computer network systems. Much of the equipment used on the power system is uniquely built and not designs with a full wide area network design.It would be a much better approach to address the SCADA systems (remote control and indications) & EMS systems and pay less attention to trying to force all the other unique (less critical) equipment in the same square hole.

54. Do you have any other comments to improve this version of draft standard CIP-011-1?

Summary Consideration:

Many of the commenters stated that the Standards need additional clarity. Define what is meant by words like monitor and review and remove potential ambiguity. Make clear the intent or objective of each requirement. The timing requirements of the standards need to be clearly defined. In response to these comments, the drafting team has made several steps to improve the clarity of the standards. These steps include moving to a Results-Based Standard approach, where the reliability objective must be specified for each requirement. Also the Drafting Team reviewed these standards with regional CIP auditors, with FERC, and with industry representatives ahead of the NERC Quality Review process to gain additional clarity in the requirements. The Drafting Team agrees and has made efforts to eliminate inconsistent terms and phrases and to consistently and unambigouously use timing phrases throughout the standards.

Commenters stated that the Implementation Plan should address the significant amount of effort required to comply with the standards for the many new cyber systems that will be in scope. Significant time should be included in the Implementation Plan for the categorization of BES Cyber Assets and for the transition from previous versions of the CIP standards to the Version 5 standards. The Drafting Team is proposing to allow 2 years for the Responsible Entities become compliant with all of the CIP standards and to allow entities the option to become compliant earlier if they choose to bypass Version 4 compliance.

Many commenters expressed a common theme to remove or minimize requirements for Low Impact BES Cyber Systems. Since the overarching objective is to provide for some level of security for all BES Cyber Assets, the Drafting Team has kept the requirements for physical and electronic boundary protection as well as basic security program elements such as policy, awareness and incident response, for the Low Impact BES Cyber Systems.

#	Organization	Question 54 Comment
54.1	Independent Electricity System Operator	- Specify calendar or business days when referring to a time frame- Issue with the bundled approach-- if you violate more than 3 in the same standard, this affects the VSL? need to look at NERCs governing procedure on VSLs- Strongly suggest that standards
54.2	Consultant	1. Each requirement should have a unique title. Currently the requirements are grouped by the subject area, but the requirements typically are just a statement. This makes it difficult to reference requirements except by number. What will really happen is everyone will develop their own "short title" for each requirement number, and it will not be consistent across the industry, and will result in

#	Organization	Question 54 Comment
		confusion.2. There should be consistency for the requirement title, the associated table name, & the requirements column heading for each requirement. Currently these three items are not necessarily consistent, and in some cases there doesn't seem to be a connection or relationship in the terminology in these locations.3. If the Requirements Groups are going to stay in the standard then they should be numbered in order to facilitate cross referencing the groups.4. The word "criteria" in the requirement statement should be change to "requirements" where it occurs. The tables list requirements, not criteria. (Multiple instances throughout CIP-011)5. There is different sentence structure and grammatical structure throughout CIP-011. While it is a good idea to combine the requirements in a single standard, it still appears to be written by multiple authors. There are still access control and account management requirements scattered across multiple requirement groups, and each is a bit different. Another example, the incident response and the recovery plan requirements groups should be very similar, but are, in fact, very different in the requirement and the wording of the requirements, much like the differences noted in CIP-008 and CIP-009. The structure of the "local definitions" is different throughout.Suggest a "wide area" review to make the standard appear to be written by a single author rather than multiple authors.6. The definitions should be written as definitions. [Defined Term - Definition statement.] The wording "for the purpose of this standard" is not correct, and thus unnecessary. The glossary collects definitions from the standards when the glossary is updated. The next update should add the terms defined in these standards, and therefor they are not "for the purposes of this standard". Also, the words "is defined as" are redundant as it is a definition.7. Data retention requirements should be included as requirements. Moving data retention to Section D isn't logical. If there is no requirement for data retention, then it isn't a viable compliance activity. At the workshop it was stated that this was a NERC format. In this case NERC is wrong and needs to correct the format, both for these standards and for the other reliability standards. 8. Suggest dropping all requirements for assets categorized as Low Impact. They are after all, low impact on the BES. Based on the discussion at the workshop, looking at a 10 year implementation timeline for low impact assets is effectively the same as no implementation. Many things will change in 10 years, and expenditure of resources in the low impact is unlikely to have any increase in BES security. The Low Impact category needs to remain as part of the categorization process in order to include all BES assets in that process.9. There are multiple requirements that differentiate between types of facilities in the requirements tables. This is an indication that the categorization criteria is incomplete or incorrect, or

#	Organization	Question 54 Comment
		that the requirements are not properly stated. If a requirement currently indicates in the High Impact column that it applies to Control Centers only, then either (1) the transmission, generation, and special systems are not "High Impact", or (2) the requirement statement doesn't properly address all asset classes.The categorization criteria should properly place each asset in each asset class in the appropriate category with "bright lines" to eliminate adding categorization in the requirements.10. While this format for commenting and collecting comments seems good, there should be a mechanism to complete the form 'non-sequentially'. For example, as comments are made through the form's current sequence, if a 'general' comment arises, the only method to enter that comment is to page through to the end, save the comments, and then reopen and page back to the location where you started. This is not very user friendly.11.The commenting tool should have a "Save and Continue" option to allow saving work in progress without exiting and re-entering the tool.12. An improvement to the "status bar" of the commenting tool would be a table of the questions with an indication for each question if a response has been entered.
54.3	Con Edison of New York	A few general questions:Will there be an implementation plan? The document for comments indicates there will be an implementation schedule that will take into consideration existing BES Systems (CCA's) and newly defined BES Systems (CCA's). In order to be able to meet the requirements in CIP-011, the devices on secured networks that are not currently CCA's by definition but are "treated as" since they are on the same network need to be considered as part of the implementation plan. The inheritance rules may require newly defined CCA's in order to allow the time that we be needed to address these additions. If they are considered existing since they are "treated as" a short implementation period could be an issue.Is there a six-wall physical boundary requirement in this version of the standards? Suggested additional defined terms:"BES Cyber System Failure": should be defined to serve as shorthand for the long list of items currently used in the draft CIP-010/011 Reliability Standards.Current Wording: "disruption, compromise or failure of BES Cyber Systems""if destroyed, degraded, misused or otherwise rendered unavailable"Proposed Wording:The term 'failure' when used in conjunction with the terms BES Cyber Component and/or BES Cyber System shall encompass the meanings 'malfunction, disruption, compromise, failure, destruction, degradation, misuse or unavailability' of those.Suggest replacing term "affect" with already defined term "adverse reliability impact". The drafting team (DT) uses the terms "affect" and/or "affects" without providing any specific meaning, system impacts, or other bounding explanation to describe that term. Proposed

#	Organization	Question 54 Comment
		Alternative Wording:NERC Glossary of Terms - Substitute definition for BES Cyber System "affect" or "affects." [Causes] Adverse Reliability Impact - The impact of an event that results in o frequency-related instability; o unplanned tripping of load or generation; or o uncontrolled separation or cascading outages, that affects a widespread area of the Interconnection.
54.4	Allegheny Energy Supply	A lot of work went into the prepration of the existing CIP-002 through CIP-009 standards. This new CIP-011 standard completely throws away that body of work in favor of this new approach. While there are many good things about the new approach, please consider the amount of work that entities have given to helping to refine the CIP-003 through CIP-009 drafts and to create and implement the current compliance plans and related software systems. We suggest that you consider incorporating the new ideas as incremental changes to the existing standards. It would be helpful for the drafting team to develop additional documentation providing more information about the threat basis that the standard is intended to provide protection against. The opportunity is to inform asset owners/operators of how and where to prioritize efforts to protect components of the BES.Suggest that the standard require physical security controls for BES Cyber Systems that no more stringent than other requirements for the BES equipment that the BES Cyber System controls, protects, or monitors.Suggest that the standard require controls that are commensurate with the amount of risk of compromise that a device presents. Not all BES Cyber System components face the same risk, or if compromised, have the same potential impact on the BES. For example: - Serially attached electronic components do not face or create the same risk as those that use routable protocols. - Devices that communicate to each other within a self-contained, isolated network segment (for example within a substation) do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.- Devices that use dedicated (and non-routable) point-to-point communications channels do not face or create the same risk as devices that communicate via routable protocols across multiple geographic or logical boundaries.
54.5	Allegheny Power	Allegheny Power does not understand the need to eliminate and combine CIP-003 thru CIP-009 into a new standard CIP-011. AP believes that the objectives of the Standard Drafting Team to provide further clarification and remove the uncertainty of the current CIP standards are proper and necessary. However, AP believes that these same objectives can be accomplished by incrementally revising the current CIP standards and not force changes in terms, concepts and numbering schemes

#	Organization	Question 54 Comment
		which would essentially force all entities to start their CIP compliance efforts over from the beginning. AP would like the SDT to abandon the concept of completely rewriting the CIP standards in favor of incrementally revising the existing standards to accomplish the same objectives.
54.6	Lincoln Electric System	Although much of the standard seems very practical, LES believes it was written with routable systems in mind. When applied to systems with only non-routable connections, or even no connections, many of the requirements are not very applicable, and would set the stage for numerous TFE's within the industry. LES believes this either needs to be addressed requirement-by-requirement, as in the approach taken by the MRO NERC Standards Review Subcommittee (MRO NSRS), or there should be a blanket statement that removes non-routable systems from the requirements that are not applicable. Either way, LES believes this differentiation is extremely important, since non-routable connections (or even better, no connections) are inherently more secure against, and limit potential damage from, remote attacks, and by default eliminate the threat of propagating localized attacks to other facilities.
54.7	Oncor Electric Delivery LLC	As the tables of CIP-011-1 specify certain requirements for "Control Center Only" or "External Connectivity", the additional requirement of "Routable Communication or Dial-up Only". Many requirements do not even make sense without integral communications being part of the cyber systems. If there isn't communication involved, the cyber system should be excluded from a requirement.
54.8	Garland Power and Light	At the CIP workshop, there were several comments that were made that were "depends" or "our intent was" o The "depends" requirements need to be reworded so that requirement is clear. o The "intents" need to be expressed clearly in the document because it is almost guaranteed that the will be many different interpretations if they are not expressed.
54.9	Constellation Power Source Generation	At the workshop, it was stated that an assumption of the SDT that High Impact BES Cyber Systems were most likely already Critical Cyber Assets per the older standard. This is false. Non routable protocols and other criteria used by Registered Entities have excluded certain assets at critical locations from being critical cyber assets. A 3 year timeframe should be implemented for High BES Cyber Systems to be fully compliant if it was previously not classified as a CCA. Another suggestion for implementation is to make the procedural requirements auditable first, and then implementing the

#	Organization	Question 54 Comment
		other requirements in stages. Furthermore, as stated in the workshop, allowing an entity to declare advanced implementation for audits would be of great benefit, as compliance with the new standard will take years to implement. The blank boxes found in the requirements tables of CIP-011 are implying that a high/medium/low BES Cyber System does not need to comply with that requirement's particular control, but that is not written anywhere. A blanket statement in the beginning of CIP-011 needs to state that the intent of an empty box to avoid confusion. An audit standardization or guidance document should be developed for use by auditors/reviewers of compliance to NERC CIP standards. Even though the formalization of cyber protection compliance programs are relatively new within the NERC standards body, there are mature examples of cyber protection and information security controls frameworks comprised of formalized cyber security standards, compliance management methodologies and auditing guidance such as defined in NIST 800-XX and ISO 2700X regimens . These regimens include guidance and standardization for auditing compliance (e.g., NIST SP800-53A). Other examples of formalized auditing guidance include guidance documents published by ISACA (Information System Audit and Control Association). These regimens include formal auditing guidance to ensure comprehensive coverage of compliance requirements, consistency in auditing approaches and better insight for auditees in ensuring auditability for their compliance audits. This improves the effectiveness as well as the business efficiency of companies' compliance programs. This rationale also applies to the NERC CIP program.
54.10	E.ON U.S.	Because Distribution Providers are for the first time made subject to CIP standards they may need additional time to come into compliance
54.11	ReliabilityFirst Staff	Because the acronym "BES" is not included in the NERC Glossary of Terms, we suggest that BES should be spelled out in the Introduction to this standard.
54.12	Reliability & Compliance Group	By dividing up the Standards and just revising CIP-002 through CIP-009, it makes it easier for the Registered Entities to update their existing documentation. It allows for the creation of a "crosswalk" document that helps examine the changes. While it may not be able to be done requirement by requirement and sub-requirement by sub-requirement, it can be done Standard by Standard. Where possible, it would be good to create a change crosswalk document that lists the version 3 requirements and the points to where they are now covered in the version 4 standards and note that

#	Organization	Question 54 Comment
		there is either a major change or a minor change.
54.13	LADWP	CIP-011-1 R16 The patch management does not specify a required time for installation of patch. The entity should be given the ability to determine the schedule as systems vary on when they can be brought down to install a patch. The language in R16.2 addresses the issue and no additional language to restrict the installation time needs to be included.
54.14	City Utilities of Springfield, Missouri	City Utilities of Springfield, Missouri supports the comments of the APPA Task Force.
54.15	US Army Corps of Engineers	Definitions within the standard need to be improved so they are less ambiguous.Statements like those found in Table R21, 22.1 "Cyber system components that provide external communication to the BES Cyber System must only communicate externally through an electronic access point as specified in Requirement R20", are confusing. What is the standard trying to say here?
54.16	USACE HQ	Definitions within the standard need to be more direct and narrower scope. Also, the relocation of all of them to a separate attachment would help too.
54.17	Dominion Resources Services, Inc.	Dominion recommends placing all requirements into a requirements table. It is sometimes difficult to distinguish requirements mixed into the preambles.Using a single standard for all requirements is preferred; however the format internal to the single standard is inconsistent. For example, some requirements are in paragraph form while others are embedded in a requirements Table. All requirements should be contained within a requirements Table. Where possible, information preceding the table should be used only to state the context and establish the security objective or intent behind the requirements.
54.18	EEI	EEI would like to thank the members of the Drafting Team for their significant efforts on this important issue.
54.19	Black Hills Corporation	Emergency Response: Emergency Response provisions are limited to R3 & R4, and address training and risk assessment controls. There are many possible scenarios that could be identified which would

#	Organization	Question 54 Comment
		require emergency exceptions to most of the requirements of CIP-011. There should be a general emergency clause that allows appropriate response to many possible emergency situations.Outside Vendors: There is no mention in the rules how the use of outside vendors should be addressed. A common solution could be to have the responsible entity extend the necessary requirements of these regulations to the third party via contract. (Example from other regulatory efforts includes the HIPAA regulations and their business associate requirement). An example of this in action could be the requirement that a contractor conduct the personal risk assessment, according to the requirements specified in CIP regulations.
54.20	Exelon Corporation	Exelon companies have embraced the development of logical, clear and effective reliability standards as evidenced by its commitment of time and resources to various standard development initiatives (including participation on several NERC and Regional Committees, Sub-Committees and Standard Drafting Teams). As evidence of our commitment, Exelon has devoted in excess of 4 years and $11 million for the implementation and integration of the NERC CIP-002 to CIP-009 Standards. We have concerns with several aspects of the CIP Version 4 Standards. The CIP Version 4 Standards represent a significant change in the scope of the standards in the equipment/systems that fall under the standards as well as the elimination of terms/categories of assets. Exelon is also not in favor of changing the current CIP-002-009 standards to the new CIP-010 and CIP-011 format.. Each change in itself represents a significant “change management” issue that impact databases used for the tracking/storing of evidence of compliance, training requirements, safeguards, and systems that have been put into place to ensure Exelon’s continued compliance to all NERC Standards. Exelon feels strongly that the proposed changes must be accompanied by a risk based analysis as justification for such dramatic and costly changes which to date have not shared with the industry. Essentially we are most interested in understanding the incremental difference or benefit of moving away from the current Regulatory approved CIP-002 to CIP-009 standards to a different set of standards that will result in many of us “starting from square one” to implement. Policies, procedures, contracts, training, drawings, methodologies, systems, data structures, and countless other documents will need to change to reflect the new language and concepts. The confusion that this will cause within organizations to retrain personnel and realign around the new standards cannot be underestimated. In fact, Exelon may even need to put some value-added compliance projects on-hold because the entire design will need to change with the implementation of the new standards.Specifically, Exelon

#	Organization	Question 54 Comment
		would like to see the SDT: Discard the concept of a wholesale rewrite of the CIP standards -- but use the standards drafting team work as an input to the process. Incrementally change the existing CIP-002 through CIP-009 standards to clarify and improve upon the established approach. Retain the fundamental terms, concepts, and standards numbering scheme to enable continuity.This approach would more effectively build upon the work that has already been accomplished, while allowing the industry to continue to improve on security and compliance related to critical infrastructure.Compliance with NERC cyber security standards should be re-scheduled for nuclear generation. That is, nuclear generation is currently in the process of compliance with Version 3 of CIP-002 thru -009 by September, 2011. However, it appears that compliance with Version 4 of the standards may be required by 2013. In terms of resource expenditures, ultimately borne by consumers of electricity, it seems wasteful to build a program for nuclear generators based on CIP-002 thru 009 that will be scrapped roughly two years later to be compliant with CIP-010 and CIP-011. Such scheduling will result in maintenance of a program based on CIP-002 thru -009, including audit support, and purchasing and installing equipment during refueling outages, at the same time a new program built on CIP-010 and -011 is being constructed. This new Version 4 program will include doing away with the concept of Critical Assets so that purchase and installation of the equipment previously installed may no longer be required. The existing cyber security programs and regulations in place or in process to protect nuclear generators, e.g., NEI-04-04 and 10CFR73.54, the limited contribution of nuclear generation to the BES (roughly 20%), and the limited time until Version 4 of the NERC Standards are expected to be in force all limit the cyber vulnerability of nuclear units. It is recommended that the implementation of Version 3 of CIP-002 thru -009 for nuclear units be deferred, and compliance with NERC cyber security standards for nuclear generation be re-scheduled for Version 4.
54.21	BGE	General - The wording was changed to “at least every 12 months” instead of “annually” in previous CIP versions. Can the exercise or test occur in the same month each year or must it be 11 months 29 days or less from the previous exercise/test?
54.22	Network & Security Technologies Inc	Good start! Strive for clarity. Ask both individuals responsible for compliance and auditors for their interpretation of every requirement. Be explicit about what’s required (e.g., documentation of, records to demonstrate compliance with, etc.). It’s okay to not be very prescriptive but try to avoid

#	Organization	Question 54 Comment
		implied requirements - they will be a source of endless debate.
54.23	CWLP Electric Transmission, Distribution and Operations Department	Guidance documents should be available before balloting these standards. All terms used should be defined in the NERC Glossary of Terms or in the standard.
54.24	Green Country Energy	I really like the way the standard is developing it is a huge improvement and hopefully with industry comments it will develop into a fine standard that meets everyones expectations.I would like to see a Guidance Document, footnotes, measures and VSLs etc to make compliance and auditability a lot clearer and less subjective.
54.25	US Bureau of Reclamation	It seems that the standards are applying a postage stamp level of security to Cyber elements involved in BES reliability. Multifunction relays or Solid State relays which are programmable must now have eletronic access attributes which are normally associated with BES computer control systems. The SDT should reexamine the true nature and scope of these types of systems before lumping these deviced together with traditional computer control systems. Lumping everything into one standard will make adminstration by the Responsible Entities and Reliability Entities difficult and may add to confusion with respect to individual table elements.While the tables applied to requirements in CIP-011 are an excellent way to establish security requirements for the 3 levels of system impact addressed, the empty fields should be avoided as they lead to confusion on the part of readers. All blocked fields should indicate something, even if it is an indication that the requirement is “Not Applicable,” “Not Required,” “Addressed under Requirement xx.x, above,” or “In accordance with entity policy.” Further, all requirements should include the 3-level requirement application table, even if the requirement applies equally to all three levels. This will further avoid confusion when reading the Standards.Appreciate the “blocked-out” area-specific definitions, but the drafting team must ensure that this feature is only used for area-specific needs and not global definitions. If the scope of the definition extends beyond a specific section there could be problems with sub-dividing the document to simplify what is handed over to organizational components with different functional responsibilities, particularly if the definitions do not also appear in the NERC glossary.The use of “objective statements” is very much appreciated, both as a guide to entities addressing

#	Organization	Question 54 Comment
		implementation and also (we would assume) to reviewers and audit staff addressing compliance. We encourage the drafting team(s) to continue this direction and to strengthen and refine the objective statements in order to provide clear direction for Standards users, including down to the sub-requirement level (as applicable).
54.26	Luminant	Measures need to be defined
54.27	Minnesota Power	Minnesota Power believes that, for all requirements which specify that something must be completed within X hours, the Standards Drafting Team consider using the following statement:"As soon as practical, but not exceed x business days from the date reported."This would preserve the spirit of the requirement, but also allow for more practical time frames.With so many auditable elements included in these Draft Standards, Minnesota Power believes that the VSL's cannot be written with the current zero-defect mentality. It would be more practical to allow for minor issues to be identified and scheduled for corrective action without representing immediate non-compliance which will result in extended investigations and settlement proceedings.Minnesota Power recommends that the Standards Drafting Team consider using a technical writer and/or solicit feedback from multiple proofreaders who have not been involved in the creation of this Standard to ensure that the following items are addressed: o any interpretable vocabulary is defined o grammar is correct o punctuation is correct o meaning is clear and does not require any guessing as to the intention of the Standards Drafting Team.This should be done prior to the official comment period, so that the Industry can concentrate on technical aspects of the review, rather than spending time on interpretation. The ability of Registered Entities to properly interpret the Requirements is highly dependant upon clear wording, good grammar and proper punctuation. This has been one of the greatest problems with the version 1 through 3 CIP standards. Minnesota Power requests that the Standards Drafting Team ensure that improper writing does not change or hide the intended meaning. The misuse of
54.28	Progress Energy (non-Nuclear)	More examples of requirement application to the real world would aid auditors and the industry.In CIP-011 If the record keeping and retention for compliance is similar to previous standards this standard significantly increases the record keeping administrative burden on utilities and compliance authorities due to the number of devices which are now to be declared without actually increasing security of BES.Implementation plan (when developed) needs to consider how it will overlap existing

#	Organization	Question 54 Comment
		standards compliance record-keeping and documentation, then establish a phased-in approach of the new standards to eliminate double record-keeping and double documentation across audit compliance periods.Implementation schedule needs to be developed that allowsHigh - 4 yearsMedium - 4 yearsLow - 4 yearsNeed clearer definitions of annual, quarterly, etc.Need to resolve issues/questions with current standards:How is communication/wiring covered by the standards? This becomes even more of a question when a BES Cyber System could be defined as a SCADA system including all of the RTU's which support it.Within ESPBetween ESP'sInto/Out of ESPPassword strength/management. Improvement has been made here, but it is still not clear if requirements must be enforced by the assets in question or if policies are sufficient. For instance, regarding the requirement to change passwords at least once every 12 months, must the device force this password change, or is it sufficient for an entity to have a policy requiring compliance along with documentation to attest that the policy was followed?Timeframe for revocation of access for expired training/background checks. NERC CIP Training is required at least every 12 months. It can be assumed that if the training is not completed in the allowed timeframe that access must be revoked; however, it isn't clear if this revocation must be done immediately, within 24 hours, 36 hours, 72 hours.There is currently no provision for moving cyber systems from one ESP to another (such as between a primary and backup ECC). Although this type of even will need to happen from time-to-time, it is left up to each entity to determine how that can be accomplished within the standards.There is no clear distinction between various types of Access control. It is obvious that the standards apply to network facing logins for BES Cyber System Components;however there are other types of access that are not clearly addressed or excluded such as-Access to configuration controls for something like a time standard which are only available to someone with physical access to the front of the device-Access to the BIOS on a typical PC-Access to various functions/programs on a machine - some of which may require special login - others which don't.How 7 year background checks are handled for someone under the age of 25 since juvenile records prior to the age of 18 may not be legally searched in many cases.Will the TFE process continue? What a TFE is, where it is/is not allowed, how it is to be handled (regarding documentation, approvals, submittals, periodic reviews, etc)
54.29	Michigan Public Power Agency	MPPA is concerned with how these standards would impact its members who are registered entities but do not own or operate facilities that are, by NERC definition, a part of the BES. MPPA recommends clarification in the applicability section with the insertion of ", that operates BES facilities,

#	Organization	Question 54 Comment
		" between "...Functional Entities..." and "...will be collectively...". This segment of the sentence would then read as: "...Functional Entities, that operates BES facilities, will be collectively..."
54.30	ISO New England Inc	Need more precise, well-defined language. Several requirements are measures, not standard requirements to measure against. Provide examples, FAQ, what is the actual risk/ driving requirement - what are we trying to protect against? Understanding the background to the requirement will help to define defenses to perceived threats that this standard is trying to protect. Clearer definitions of Cyber Systems, Cyber System Components, Control Center. Suggestion for an additional page that repeats all of the local definitions - this means the local definitions exist in the document as is plus this additional pageRequest that the tables and time constraints be consistentEliminate confusion caused by two 3.1's. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (see R5-R32)Request a cross-reference of CIP-011 Requirements that refer to another CIP-011 Requirement - especially the Access Control Requirements. Diagram might help.
54.31	WECC	Need to have consistency in spelling out time periods versus numerically showing them (ie thirty-six months vs 36 months). Also need consistency in use of the tables as some say "criteria" and others say "procedures" or "processes". In many cases when a requirement states that you should have a process or a procedure it might be easier for audit purposes to instead require a program that addresses many of the processes or procedures required. A single requirement for a program or plan that meets a table of criteria might reduce the number of requirements and ease audits. For instance "Wireless Security Program covering the following risks" "Remote Access Program addressing the risks in Table X" "Maintenance Program addressing the criteria in Table X" "Physical Security Program addressing the criteria in Table X"
54.32	US Army Corps of Engineers, Omaha Distirc	Next draft should include the measurement criteria. Standards are very computer center centric.
54.33	Regulatory Compliance	NRG Energy Inc. is concerned with some of the impact criteria in Attachment II related to transmission and generation Facilities. To base impact on "bright line" Facility Rating thresholds, i.e., MW, kV, MVAR, etc., could lead to mis-categorization and ultimately unprotected cyber systems. These thresholds do not take into consideration regional differences in configuration and load flows.

#	Organization	Question 54 Comment
		Therefore, it is our suggestion that categorization could be based on the results of a regional engineering study, similar to what is currently required in the TPL Standards. This study could be conducted by the regional Planning Authority(s) or an independent third party and approved by the Regional Entity. The results of the study would identify the contingencies that have the potential to cause the following levels of impact to the BES: Â· High Impact (has the potential to cause an Adverse Reliability Impact) Â· Medium Impact (has the potential to require planned/controlled loss of load) Â· Low impact (has no potential to cause loss of load)
54.34	National Grid	o There is inconsistency in using “processes” or “one or more processes” in several requirements. For example R25 states that Each Responsible Entity shall document and implement one or more processes...” while R26 states that Each Responsible Entity shall document and implement processes...”. National Grid recommends using “one or more processes”. o Request that the tables and time constraints be consistent o Eliminate confusion caused by two 3.1’s. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (see R5-R32) o Request a cross-reference of CIP-011 Requirements that refer to another CIP-011 Requirement - especially the Access Control Requirements. Diagram might help.
54.35	Southwest Power Pool Regional Entity	Overall auditing issue: The requirements need to consider issues of sufficiency (adequacy of the entity solution) without being prescriptive in the solution. Where possible, clearly define the objective and do not prescribe technical solutions. Also, avoid the use of adjectives in defining the objective and / or specific requirement. Terms such as “adequate”, “sufficient”, and the like are very difficult to objectively audit. Overall observation: The implementation plan concept presented at the May 19-20 workshop in Dallas, coupled with the proposed applicability matrix for Medium and Low impact BES Cyber Systems will likely reduce, not improve the overall cyber security protection afforded the BES Cyber Systems today. A good number of existing Critical Cyber Assets will fall out of the High impact category, many becoming Low impact, with the resultant relaxation of protections. The applicability matrix as it appears today does not define a reasonable baseline of protections for Low and Medium impact systems. Re-categorization of BES Cyber Systems: While this will hopefully not happen very often, a BES Cyber System that sits on the cusp between two categories could find itself being re-categorized more than necessary unless some sort of a dead-band is introduced that would preclude re-categorization as a result of a small change. Implementation Plan: There needs to be a consistent

#	Organization	Question 54 Comment
		implementation plan for any BES Cyber Systems represented under today's standards as Critical Cyber Assets regardless of their ultimate categorization. Any existing Critical Cyber Asset should be afforded a very short timeframe to achieve compliance under the new standard(s) as it can be reasonably be expected to be already compliant. This is similar to the Table 1 entities concept for Version 1 of the existing standards where entities subject to the UA 1200 standard were given the shortest timeframe to comply. Consideration needs to be given to how an entity will migrate from compliance with the existing standards to the new standards. A piecemeal approach will be very difficult for the entity to maintain and for an auditor to evaluate compliance.
54.36	Alliant Energy	Per previous comments, all occurrences where prescriptive timeframes for removal of access are based on a complicated combination of impact level and BES Cyber System type. This level of complexity adds confusion and undue administrative overhead in situations of job change, which would cause low risk to the BES. Recommend a solution that provides consistent timeframes based on the cause of the business need change. Terminations for cause should remain at 24 hours for all removals of BES system access. Other changes in business need should allow for processing over extended holiday weekends without being treated like an emergency response. These changes should remain at 7 calendar days. Any distinction between low, medium, and high impact BES Cyber Systems should be made in the wholesale application or omission of this requirement. Per previous comments, all instances where 12 calendar months are used as the outside allowance for renewal a rolling creeping calendar is introduced. Recommend changing all 12 month timeframes to either 13 calendar months or 5 calendar quarters from the previous completion to allow entities to maintain a program with an annual training rollout with the appropriate amount of lead time to be successful in annual renewal. A 12 month timeframe will create a training program that becomes administered on a user by user, day by day basis without considerations for consistent annual content updates and bulk annual renewal.
54.37	FirstEnergy Corporation	Please see our response to Question 1 for the FE Summary view of the proposed CIP V4 standards.The new format, tables, information boxes is a good change o We question whether the new format (low-to-high impact, in particular) will encourage us to categorize more as high so we track things in a similar way. It seems like an administrative burden to try to track things at three levels. It is hard enough to track everything now with just one level. This 'administrative burden' issue crops up in

#	Organization	Question 54 Comment
		several places.
54.38	PacifiCorp	Procedural exceptions are onerous to manager operationally; the standards would be more effective if less differences in revocation of access were implemented across the BES system and criteria.The term "Annual" is not defined. "Annual" requirements were changed to 12 months in most cases (not consistently). The 12 month requirement causes "schedule creep". Define "Annual" in the NERC glossary to be 12 months not to exceed 15 months. Change all 12 month references back to "Annual" or, preferably, use the definition of annual defined for the NERC FERC Standards of Conduct (calendar year). The following FERC Directives need to be addressed with version of of CIP-010 and CIP-011: o 2 or more diverse security measures for defense in depth at the security boundaries o Active vulnerability assessments every 3 years o Incorporate forensic data collection and proceduresThe framework is in place to incorporate requirements in CIP-011 that address the directives. CIP-011 has a potentially long implementation time. FERC will likely not wait for the implementation of CIP-011-1 to be complete prior to making NERC address these directives. Incorporating these directives in the middle of the implementation of CIP-011-1 will be confusing and cause additional expense and effort. Don't wait. Address the following FERC Directives in version 1 of of CIP-010 and CIP-011.
54.39	Southern California Edison Company	SCE recommends revising the numbering of CIP-0011-1. Between CIP-010 and CIP-011 the drafts should indicate the intention of the intent is to retire CIP-002 through CIP-009 then it would make more sense to call these standards CIP-002-5 and CIP-003-5 with CIP-004 through CIP-009 being retired. Otherwise, the gap of unused numbers between CIP-001 and CIP-010 will potentially cause confusion. SCE also suggests rearranging the structure of these new requirements. for example, by breaking up CIP 011 into functional areas such as Governance & Personnel, System Security & Boundary Protection (with Incident response since “incidents” are cyber security incidents), Access Management (Physical, Electronic and Information), and Disaster Recovery Planning & Capability. From a policy formulation perspective, this would result in fewer policies than CIP 011 as it is currently structured. For example, combining physical access controls with electronic access controls provide the means of utilizing a combination of both to determine sufficient total security. Providing secure physical access controls and disconnecting routable communications such as gateways and/or modems.Finally, separate and apart from the recommendations made above, SCE also recommends allowing use of local definitions as in-line guidance at the requirement level. The use of local

#	Organization	Question 54 Comment
		definitions in addition to the NERC glossary is good approach. The text of each requirement objective should be such that it is only a objective and not a control statement. A control should reside within the impact level table. For instance, R11, R12, R18 contains control statements within the objective.
54.40	San Diego Gas and Electric Co.	SDG&E notes that it appears the drafting team took the approach of defining the details and then working up to the bigger picture items, i.e., BES Cyber Systems Component to BES Cyber System. SDG&E feels that there is risk associated with taking this "bottom up" approach to the standard setting process vs. the "top down" as used in the previous three versions of the standards. The risk is that components posing no significant risk to the BES system can get "swept up" into BES Cyber System definition and require protection commensurate with components that are correctly required to have strong security measures.SDG&E feels that part of the issue with Versions 1-3 of the CIP standards was that the "top down" approach to critical asset identification was not started high enough; it was started at the Responsible Entity level rather than at the Region / Reliability Coordinator level. If that level is deemed too high, even a sub-region level would be more appropriate. In SDG&E's case, it has a view of its assets in the context of its service territory that serves 1.4 million retail customers. Independent generators on the other hand don't have that regional view. In Southern California, for instance, congestion is high in some places and regulatory mandates for incorporating renewable energy are growing. Thus, the risk to the BES can only be fully evaluated when considering sources (generation - fossil and renewable) and uses of energy (load) in the region as well as the adequacy of transmission to balance and move power. In such a scenario, the assets critical to BES stability and/or restoration are much easier to identify and so too are the BES Cyber Systems that support them. For those entities that do not have a region or sub-region view, perhaps the Regional Entity, Reliability Coordinator or Balancing Authority could be responsible for identifying which assets are critical.
54.41	Manitoba Hydro	Section D Compliance: 1.4 Data Retention should include all documentation, inventories, logs, etc that are mentioned throughout the Requirements, or include a "catch all" requirement for data retention for all other documentation referenced by the Requirements.General Comments: The language in Requirement R1 indicates that each Responsible Party shall "develop, implement and annually review one or more formal, documented cyber security policies" addressing the listed Requirements. This should be clarified to confirm whether a formal written policy is required for each of the listed Requirements or only for selected Requirements. From the language of the specific Requirements one

#	Organization	Question 54 Comment
		could assume that those Requirements that indicate "document and implement" require the Responsible Entity to prepare a written policy/process of some kind, while those Requirements that indicate only "implement" do not. Then there are those Requirements that require the Responsible Entity to "create, document and implement" - it is not clear if this would require something different than "document and implement". There are also those Requirements that simply require that certain criteria be applied which would seem to indicate that no documentation is necessary. If the Responsible Entity is to assume that the Requirements that indicate "document and implement" require the Responsible Entity to prepare a written policy/process of some kind, it is assumed that there may be one master policy covering all elements of the Requirements that must be documented given the language in Requirement R1 "one of more formal documented cyber security policies" and that separate documented policies for each of the Requirements requiring documentation are not necessary. Certain references to "review" in the Requirements should be clarified to indicate on what basis the review is to be conducted, what criteria should be applied, what the Responsible Entity should do with the results, etc. i.e. Requirements R5-5.6, R12-12.1, R18 -18.4. The same comment applies for certain references to "monitor" (i.e. Requirements R8-R8.3) and "verify" (i.e. Requirements R24-R24.5). Where no review or monitoring of developed protections or processes is specified, is it to be assumed that no review or monitoring is required? (Requirements R15 and R16) Each of the Requirements seems to provide a reason or justification for their inclusion i.e. Requirement R2 ".....to ensure that personnel maintain awareness of the cyber security practices that are essential to protecting BES Cyber Systems." Consider whether it is necessary to state the justification for each Requirement, especially if it could be that the objectives achieved by the Requirement are not exactly as specified or if the Requirement does not necessarily meet the objective as set out. It would be preferable to just have the broad purpose statement in the introduction which is stated to apply to each of the Requirements that follow. What is the purpose of the Measures in these standards? If they are to re-state the wording of the Requirement, they provide no value and create opportunities for legal interpretation if the wording in the measure does not exactly match the wording in the specific requirement. Entities should be allowed to employ multiple layers and tailor their approaches to cyber security to meet the intent of the requirement, such as including the inherent security benefits provided by private entity owned and managed communication networks. Manitoba Hydro is also concerned that the multiple layers of physical and electronic security directed by FERC Order 706 are

#	Organization	Question 54 Comment
		not included in this proposed version of the CIP-010 and CIP-011. While we understand that these directives were not included at this time for the sake of expediency, there is a risk that the electric industry may expend considerable resources to meet the requirements these proposed standards, only to revisit the electronic and physical security issues and expend more resources in the near future. Implementing physical security changes for electric facilities is proving to be a monumental task. This standard does a disservice to the industry if it does not provide the complete scope of the physical security changes required. If the entire scope of the physical security requirements, including the directives in FERC Order 706, cannot be provided to the industry in this proposed version of the standard, then all the requirements for physical security should be removed at this time and submitted to the industry, in its entirety, at a later date.
54.42	Alberta Electric System Operator	Specifying the units of measure (e.g. business vs. calendar days) and exact ordinal amounts ("365 days from date of implementation" vs. "annually") might help resolve some ambiguity surrounding some of the criteria.
54.43	Northeast Power Coordinating Council	Suggestion for an additional page that repeats all of the local definitions - this means the local definitions exist in the document as is plus this additional page.Request that the tables and time constraints be consistent. Also where the document refers to processes in some cases it specifies one or more processes and in others just processes. Eliminate confusion caused by two 3.1's. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (refer to R5-R32).Request a cross-reference of CIP-011 Requirements that refers to another CIP-011 Requirement, with emphasis on the Access Control Requirements. A diagram might help.Remove adjectives such as substantial, adequate, minimum, etc., as these are difficult to measure and can lead to different interpretations.Situational awareness displays currently in use at the Regions and FERC should not be included in the applicability of these standards. No operational actions or decisions are being made based on the information on those displays.
54.44	Nuclear Energy Institute	Terms should be clearly defined and unambiguous. Examples of items covered by the term and not covered by the term should be given. CIP-011-1 is a vast change from the prior CIP-003 through CIP-009, and clear definitions with examples will be valuable.

#	Organization	Question 54 Comment
54.45	Puget Sound Energy	The amount of work relative to CIP-010 is almost as much as CIP-010 because of the broad application of BES Cyber Systems. It would be prefereable to be able to manage this scope better up front so that entities don't have to evaluate and record so much to then only focus possibly a much smaller pool of work as more defined by CIP-011. It still not clear how to evaluate a system for "misuse" effectively and defensibly. Further guidance would be appreciated. Lastly their should be some grace period and easier interpretation process when these versions become effective in order to more quickly flush out interpretations of concepts once implementation starts. To date the interpretation is a lengthy process or determined in an audit as a result of a violation when the entity may have been well intended.
54.46	APPA Task Force	The APPA Task Force commends the drafting team on the overall development of CIP-011-1. We believe this document is another step in the right direction of cyber system protection. We did, however, notice a theme throughout the requirements that caused us some concern. There is an IT focus to a number of the requirements. The drafting team seemed to be focusing on control centers when developing requirements to protect critical facilities. As a result, a number of the requirements are not practical for remote substations and generation stations, that may be owned by many entities and operated by only one of them, or another entity. What may be simple in a control center environment may be next to impossible for a transmission substation or a generator.
54.47	Constellation Energy Commodities Group Inc.	The blank boxes in CIP-011 tables need to be filled in. While the intent appears to be that if the box is blank the control is not required, by leaving it blank, liability questions could be raised. Compensatory measures should be allowed in the compliance structure. Entities may find that alternative, but comparable protection measures will better fit the circumstances of their system.An audit standardization or guidance document should be developed for use by auditors/reviewers of compliance to NERC CIP standards. Even though the formalization of cyber protection compliance programs are relatively new within the NERC standards body, there are mature examples of cyber protection and information security controls frameworks comprised of formalized cyber security standards, compliance management methodologies and auditing guidance such as defined in NIST 800-XX and ISO 2700X regimens . These regimens include guidance and standardization for auditing compliance (e.g., NIST SP800-53A). Other examples of formalized auditing guidance include guidance

#	Organization	Question 54 Comment
		documents published by ISACA (Information System Audit and Control Association). These regimens include formal auditing guidance to ensure comprehensive coverage of compliance requirements, consistency in auditing approaches and better insight for being audited in ensuring auditability for their compliance audits. This improves the effectiveness as well as the business efficiency of companies' compliance programs. This rationale also applies to the NERC CIP program.The Implementation Plan should allow for sufficient time to complete the comprehensive task of identifying and categorizing BES cyber systems.The R3 and R4 tables should address each requirement. All tables should be completed in full stating either not applicable or required.
54.48	Midwest ISO	The categorization approach in CIP-010 appears to require any BES Cyber System that touches the BES in any way to be included no matter how minimal the impact of the Cyber System on the BES, we are concerned that the Midwest ISO energy and ancillary services markets will be impacted. We believe that market portals could become High, Medium or Low Impact facilities and, thus, require application of the CIP standards or modification of the systems to isolate them so that CIP standards don't apply. Our conservative estimate is that we could easily spend in excess of $10 million dollars without anywhere close to this impact because our existing processes would prevent the market from negatively impacting reliability. We request that the drafting team make clear that market systems should not be included per NERC standard development tenets. In some cases, drawing in market systems could present impossible challenges. For instance, if a market portal becomes a High Impact BES Cyber System, CIP-011 R4 appears to require that we would have to conduct personnel risk assessments on all users which would include thousands of employees from market participants submitting bids and offers. State laws make this impossible. The drafting team could help solve this problem by making clear that personnel does not include market participants/customers who already have significant financial incentive to enter good bid and offer data. Opportunity costs do not appear to be considered in the development of these standards. All business resources are limited. Requiring registered entities to focus on these specific issues may divert attention away from other important cyber and physical security initiatives and work that offer greater improvements to reliability.We are also concerned that cyber and physical security could initially be compromised as entities focus on becoming compliant for Low and Medium impact cyber systems. Likely, High Impact Cyber systems will meet the new requirements because they were likely Critical Cyber Assets under the existing CIP standards. Thus, their reliability could degrade as entities may lose focus on the High Impact BES

#	Organization	Question 54 Comment
		Cyber Systems.
54.49	Florida Municipal Power Agency	The drafting team seems to have added an objective into the requirements which adds ambiguity to the requirement. For instance, R2 adds the phrase “to ensure that personnel maintain awareness ...” which adds ambiguity to the requirement. Is the auditor going to measure “quarterly reinforcement” or “personnel ... awareness” or both? If the drafting team wishes to add an objective to each of the requirements, then consider one of two other alternatives: (1) adopt International Standards Organization format where they have an objective for each requirement introducing each requirement; or (2) develop a longer Purpose section where the purpose of each of the requirements is further embellished.Throughout the standard, there is confusion among the terms “grant” and “authorize”. “Authorize” is senior manager approval, “grant” is giving the person a key, keycard, or user account. The requirements should keep these two concepts clear. For instance, in 5.5, “authorize” should be changed to something like: “Grant unescorted physical access to areas containing BES Cyber Systems only to those who are authorized such access”.Overall, added complexity to the cyber systems will reduce the reliability of the BES, so this needs to be kept in mind when drafting these standards.Almost all of the standards need to have stronger language in them to remove ambiguity and give specific guidelines as to what it expected.
54.50	NextEra Energy Corporate Compliance	The following are specific language changes for clarity:1. Title: Cyber Security - BES Cyber System Protection 2. Number: CIP-011-1 3. Purpose: To provide clear understanding of the protections that are to be applied to BES Cyber System Components identified as a result of the applicable of CIP-010-1 to the Responsible Entity’s BES.Also, for clarity, this section should be re-written as follows:R2. Each Responsible Entity shall reinforce sound security practices to all employee and contractor personnel who have authorized cyber access and/or authorized unescorted physical access to a BES Cyber System Component reinforcements in sound security practices at the beginning of each quarter. The Responsible Entity also has the discretion to reinforce sound security practices at any time, it deems appropriate. The reinforcement may be delivered via e-mail, intranet, posters, classes or other educations methods. .R3. Prior to granting employee and contractor personnel who have authorized cyber access and/or authorized unescorted physical access, each Responsible Entity shall ensure the personnel requesting access completes cyber security training consistent with that required in. CIP-011-1 Table R3 - Cyber Security Training,.3.1. For employees and contractor personnel requesting

#	Organization	Question 54 Comment
		authorized cyber access, this cyber security training shall cover the following: o The proper use of BES Cyber Systems o Physical access controls to BES Cyber Systems o Visitor control program o The proper handling of BES Cyber Systems information and storage media o Identification and reporting of a Cyber Security Incident For employees and contractor personnel requesting only unescorted physical access, this cyber security training shall cover the following: Procedures for not intervening with a BES Cyber System ComponentVisitor control programIdentification and reporting of a Cyber Security Incident 3.2. For employees and contractors personnel who engage in the operation or control of the BES via authorized cyber access to a BES Cyber System Component, cyber security training shall additionally include training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber System Components and BES Cyber Systems. 3.3. For employees and contractor personnel who have a role in BES Cyber System recovery this cyber security training shall additionally include those related action plans and procedures to recover or re-establish BES Cyber Systems. For employee and contractor personnel who have a role in BES Cyber System incident response this cyber security training shall additionally include those related action plans and procedures.3.4. For employee and contractor personnel who have a role in BES Cyber System incident response this cyber security training shall additionally include those related action plans and procedures. 3.5. Each Responsible Entity shall maintain document for each employee and contractor personnel required to take cyber security training as required in R3 and its sub-requirements that the training was conducted at least once every 12 months plus or minus one month. R4. Prior to granting employee and contractor personnel who have authorized cyber access and/or authorized unescorted physical access, each Responsible Entity shall perform or have performed a personnel risk assessment on the employee or contractor personnel requesting access consistent with CIP-011-1 Table R4 - Personnel Risk Assessment, expect as prohibited or limited by federal, state, provincial, and local laws, and existing collective bargaining unit agreements. 4.1. This personnel risk assessment program shall at a minimum include: o Identity verification via photographic identification documentation issued by a government agency (i.e., Federal, State or Provincial); and o A seven year criminal history screened against specific criteria developed and documented by the Responsible Entity. The seven year criminal history shall include a records check that covers all locations where, during the previous seven years up to date the check was performed, the subject has resided, been employed, and/or attended school for six months or more, including

#	Organization	Question 54 Comment
		current residence regardless of duration. 4.2. Each Responsible Entity shall document the results of each personnel risk assessment. 4.3. Each Responsible Entity shall update or have updated each personnel risk assessment at least once every seven years after the initial personnel risk assessment.
54.51	Entergy	The industry has now had experience grappling with a one-size-fits-all set of cyber security standards' requirements for its grid and generation control systems. At a high level of abstraction the problems with this approach are manifest in two major ways. The first concerns the age of the control system components we have at work relative to cyber vulnerabilities, threats, and hence risk. In brief, our control host systems and operator consoles by and large today use mainstream "IT" commercial off the shelf computer (COTS) hardware, operating systems, and application code bases. These are the very same networked-computing systems components that are widely hacked on the Internet and within mainstream commercial businesses around the world, and accordingly represent highest risk to reliable grid operation from cyber malfunction or nefarious attack. If hacked, they provide the ability for perpetrators to commandeer and use the systems against us - which represents the worst case scenario (e.g., a widespread unplanned "load shedding event" - trip all). On the other far extreme, we have often decades-old computing equipment still widely used "in the field" at substations, switching stations, hydro dams, etc. Increasingly these field sites are connected to control hosts over ("Internet") routable protocol communications networks, and increasingly emergent wireless communications transmission technologies. But there also remains very high dependency on "legacy serial" and "POTS" dial-up communications. So, we have both very old and very new networked-computing control systems technology woven together that requires some kind of cyber security protection. The second major distinction is the physical orientation of control host and generating plant sites on the one hand, and the far flung field assets on the other. The former are typically referred to in security circles as "bastion sites," in that they can be defended in much the same way as castles of old using concentric rings of physical defenses, complimented by armed guards. The field sites on the other hand have more in common with gas and oil pipelines, rail infrastructure, and the like that are characterized by long stretches of geographical separation between sites. These are hard to physically defend economically, and, through use of protocols that by design enable "network navigation" akin to being able to telephone-dial anyone in the country on demand, provide an attack vector path back to control hosts, and therewith also creating opportunities for "island hoping" from one organizational network to another. Given these two decidedly different continuums of variables that the industry needs to

#	Organization	Question 54 Comment
		defend, “one size fits all” standards’ requirements result in situations where the requirements are expensive overkill in one circumstance, and if watered-down to ease this burden do not provide robust enough protections for the circumstance at the other end of the spectrum. The only standards-writing approach that affords appropriate cost-effective security is to define granular sets of standards that are specific to the real vulnerabilities and threats incumbent to each scenario. From this perspective, specific recommendations for improving the current Version 4 draft CIP Standards are outlined below.The SDT was directed in Order 706 to consider adaptation of the NIST Security Risk Management Framework, especially noting SP800-53. This comment is neither about the individual requirements themselves nor the fact that most of the specific CIP-011-1 requirement language was drawn from the DHS Catalog of Controls. Rather, this comment focuses on the fact that the SDT has diverged from FERC directive in not employing a major foundational construct of SP800-53. Specifically, the SDT has developed a single set of requirements, and then through use of sub-requirement tables indicate in binary fashion whether or not each (sub)requirement of note is applicable or not, based strictly on the high-medium-low “impact categorization” based exclusively upon a facility’s size (electrical operating characteristics). Contrast this with the SP800-53 paradigm, where there are three graduated, hierarchical layers of cyber security control and countermeasure requirements. First, there is a baseline set of requirements, which applies for all cyber systems, and these are the only requirements applicable for low-impact-on-mission cyber systems. Then, there is a second and third set of requirements that apply cumulatively for medium and high mission-impact cyber systems respectively. The SP800-53 approach is responsive to the stated FERC preference that there be a baseline set of requirements that must apply for all grid BES Cyber Systems/Components. Draft CIP-010-1 is not responsive to FERC Order 706 - many requirements as stated in the Standards’ language simply do not apply for BES Cyber Systems/Components in use at low and medium-sized grid sites.Recommendation: A) Modify the categorization of grid assets (Attachment II) into two groups:i) “Bastion Installations” consisting of data centers, control centers, and generation sites. Rationale: At least the ‘data center’ part tends to employ mainstream IT COTS HW/OS/and to some degree appl code; and, physical security measures can be used to greater advantage as compensating measures where cyber security measures may be difficult to implement for a variety of reasonsii) “Grid Field Assets” consisting of any physical site that does not have a control host/control center within their physical perimeters, regardless of what protocols are in use. The distinction again revolves around

#	Organization	Question 54 Comment
		physical security, in this case the difficulty in physically securing far flung field sites.B) Create layers of requirements akin to the SP800-53 paradigm, labeled 'a-z': i) The lowest enumerations being baseline requirements; e.g., 'a' could be associated with bastion installations, and 'b' could pertain for field grid asset sites. Important distinctions at the baseline can pertain for each site type.ii) Similarly, create appropriate sets of succeeding requirements applicable specifically to each column (bastion/field) depending on the type of data networking communications employed. This way appropriate requirements - not more nor less than necessary - and be specified for the unique characteristics and attack surfaces posed by each technology. As technologies are retired, e.g., serial legacy, POTS dial-up, so can entire categories of requirements.C) Create a "Scoping Table" consisting of: i) Two columns: Bastion/Field - #1 above); and,ii) X number of rows: #2 above - list of different communications technologies, i.e., routed, legacy serial, dial-up, non-routed LAN, non-routed wireless, etc., as the SDT deems appropriate. D) Apply requirements sets (a-z) as appropriate within each box on the grid.2) Entergy submits that NERC's intention to address the following FERC Order 706 directives in action subsequent to adoption of CIP Version 4 will create undue hardship for the industry. The following Order 706 directives are central to implementation of any organizational cyber security program, and it is unreasonable, inefficient, and potentially financially wasteful to require the industry to implement one approach per Version 4 Requirements, and then be made to re-visit entire cyber security programs in order to comply with post Version 4 changes. Entergy submits that the entire puzzle should be addressed at once, i.e., including the following FERC Order 706 directives, at the same time while recasting the CIP Standards under Version 4:...develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter... a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process.... consider, based on the content of the modified CIP-005-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.... revise the Reliability Standard to require two or more defensive measures.... modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years... that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a

#	Organization	Question 54 Comment
		physical security perimeter around critical cyber assets.... consider, based on the content of the modified CIP-006-1, whether further guidance on this defense in depth topic should be developed in a reference document outside of the Reliability Standards.... provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan.... to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard.... to revise CIP-009-1 to require data collection, as provided in the Blackout Report.... proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years.Entergy recommends that NERC appeal to FERC for permission to extend the deadline for final Version 4 drafting a modest amount of time necessary for the entire puzzle to be grappled at once. The industry is now hardly complete in implementation of CIP V1-V3 Standards' Requirements. The prospect of having to endure adaptation to two more waves of fundamental change to the tenets of these standards is not only onerous, but also not responsive to the imperative to provide service at lowest reasonable cost to ratepayers. We didn't build our national electric infrastructure overnight, and apt response to relatively recent emergence of cyber security threats will not be accomplished overnight either.
54.52	IRC Standards Review Committee	The organization of the 32 requirements and all of the subrequirements is lesser of a concern to us, although separate standards that group similar requirements allows for better administration. The greater concern is the degree of specificity of many of these standards. As discussed in the response to Q #8, many of these requirements go into exacting detail specific to technology and may duplicate either other industry standards or practices already employed. Many of these requirements can be elevated to "higher level" requirements that requires certain types of protections, e.g. - require user access identification, rather than specific password practices. For examples, the list of criteria that are included in Requirements Table R9, the details in the Tables for R10 and R11, and the specific treatment of wireless access in R12, to name a few.
54.53	Public Service Enterprise	The requirements for wireless and remote access (R11 to R14) are not well integrated with other

#	Organization	Question 54 Comment
	Group companies	requirements for access to BES Cyber Security Systems (R7 to R10).
54.54	PNGC-Cowtitz-Central Lincoln-Benton-Clallam Group	The table format is great, makes it very easy to see what applies.If we say “CIP-011-1 R3.1” do you know what we am referring to? There is a sub-requirement 3.1 as well as a line 3.1 in Table R3. This could lead to confusion. Suggest extending the table to cover all sub-requirements, or otherwise avoid repeating numbers. This occurs only in R3 and R4.Regarding R21, no definitions have been provided for “other cyber systems” and “Cyber System Components” (without “BES” in the phrase.) Note that “Cyber System Components” is capitalized as if it was defined, but no definition exists or is proposed. While “other cyber systems” is not capitalized, it should also be defined to avoid any ambiguity over what the SDT intends. We appreciate the objectives that the SDT has included in the requirements, since this will help us to see the SDT’s intent. There is the risk, however, that auditors will see this as more than guidance when placed in the requirement. For example, an auditor might read R5 and R6 as requiring the prevention and/or detection of all unauthorized physical access, and find an entity non-compliant for an undetected or un-prevented intrusion. We suggest the objectives (“to prevent..”, “to ensure..”, etc.) be placed in the guidance document, or otherwise be removed from the requirements. Note that some of these objectives when read as requirements are absolute, such as R14; “..to ensure no unauthorized access is allowed.
54.55	MidAmerican Energy Company	The term "Annual" is not defined. Define "Annual" in the NERC glossary to be 12 months not to exceed 15 months. Change all 12 month references back to "Annual".The following provides a summary of the reasons for using a definition of “12 months not to exceed 15 months.” o It does not force “creep.” A definition of 365 days or 12 months, without a “not to exceed” clause means that work must be planned to be done enough before the 365 days to allow time for unexpected situations. This can result in doing “annual” requirements every 10 months or less to ensure compliance is not jeopardized. o It does not jeopardize compliance for either delivery or supply due to current implementation plans. A calendar year definition could unintentionally jeopardize compliance if delivery did not complete a task between June 30 and Dec. 31, 2009. o There is no effect of leap years, which could be a problem with a definition of 365 days._____Requirements that are defined to be completed within x hours are impractical and unnecessary. Entities do not currently document the precise hour that (as an example) a termination takes place. Thus hourly requirements are impractical to measure or audit.

#	Organization	Question 54 Comment
		Convert all hourly requirement as follows: o Convert 1 Hour requirements to "As soon as possible not to exceed date reported". o Convert 4 Hour requirements to "As soon as possible not to exceed date reported". o Convert 6 Hour requirements to "As soon as possible not to exceed date reported". o Convert 12 Hour requirements to "As soon as possible not to exceed date reported". o Convert 24 Hour requirements to "As soon as possible not to exceed next day from date reported". o Convert 36 Hour requirements to "As soon as possible not to exceed next day from date reported". o Convert 48 Hour requirements to "As soon as possible not to exceed next day from date reported". o Convert 72 Hour requirements to "As soon as possible not to exceed second day from date reported"._____The following FERC Directives need to be addressed with version 1 of CIP-010 and CIP-011: o 2 or more diverse security measures for defense in depth at the security boundaries o Active vulnerability assessments every 3 years o Incorporate forensic data collection and proceduresThe framework is in place to incorporate requirements in CIP-011 that address the directives. CIP-011 has a potentially long implementation time. FERC will likely not wait for the implementation of CIP-011-1 to be complete prior to making NERC address these directives. Incorporating these directives in the middle of the implementation of CIP-011-1 will be confusing and cause additional expense and effort. Entities will be required to make additional expenditures at greater cost if these issues are resolved in later versions. NERC should ask FERC for more time to implement version 1 if necessary.
54.56	Dairyland Power Cooperative	There are very few requirements that apply to low impact systems and many that do not apply to medium impact systems. Considering that many high impact systems will connect with lower impact systems, how will data integrity be adequately implemented? Consider a large RTO/ISO connecting a shared communications system to all entities in a region, regardless of impact to the BES.The standard basically excludes serial communications from being governed. This not only does not address protecting serial systems, but it introduces oddities and ambiguities about routable connections in relation to serial connections. There are security questions, as well as questions as to how such connections will be viewed by an auditor. Serial communications should not be ignored.
54.57	Ameren	These standards will require a substantional amount of effort to implement for entities while also maintianing compliance with the previous versions of the CIP standards, how will the implementation schedule address this? Will their be a period were the entity does not have to comply with the old

#	Organization	Question 54 Comment
		standards while implementing the new standards, for examle 30 days to 90 days while the entity is updating systems or updating/revising procedures for the new standards. Also, the local definitions should be included in the NERC glossary of terms rather than by the standard to which they apply.
54.58	Bonneville Power Administration	This is far better than the current standards. The requirements are more straight forward by not cross referencing each other in separate standards. Much time is spent "mapping" out how the standards relate to each other and under what specific requirements. If misinterpreted it could lead to potential violations. This is a much better approach. Not directly relating to the newly proposed standards but still a concern is the time for implementation. Numerous resources have been extended and significant dollars spent to meet the current requirements. There needs to be sufficient time to review the new standards, identify Cyber Systems and allow for proper prior planning to physically protect these systems. Depending on the category, low-high, significantly more dollars could be spent. There needs to be sufficient time to address the new standards and implement in a manner that is cost effective. The overall approach is superb: target the standards only at systems that can actually affect the BES in near-real time, include other systems only to the minimum extent necessary, require outcomes rather than specify actions. However, this draft has some wording issues that apparently have inadvertently broadened the scope far beyond the intent of the SDT, or even practicality. As described above, correcting these errors will produce a set of standards that enforce security where it needs to be, but do not waste time, money, and people addressing tasks that do not improve the security of the BES. In particular, we find that the following questions address issues that must be corrected before the standards could be acceptable:- Q5, addressing CIP-010 Table R3 Section 3.2- Q12, addressing CIP-011 Table R3 Section 3.2- Q13, addressing the the definition of "External Connectivity". Note that several other questions rely upon changing this definition.- Q16, addressing CIP-011 Table R5, sections 5.8 and 5.9- Q22 and Q23, addressing revocation time limits- Q24, addressing authentication schemes- Q27, definition of "Remote Access"- Q32, addressing revocation of remote access- Q33, addressing Table R14 Sections 13.2 and 14.4- Q35, addressing Table R16, Section 16.2 and patch risk assessment- Q35, addressing Table R17, Section 17.2 and disabling of physical ports- Q35, addressing Table R18, Sections 18.1, 18.2, 18.3, and 18.4- Q37, addressing Table R20, Sections 20.1, 20.2, 20.3, 20.6- Q37, addressing Table R21, Section 21.1- Q38, addressing the second part of the definition of electronic access point. This is the most serious flaw in the standard. It must be corrected.- Q40, addressing Table R23 section 23.7- Q42, addressing the definition of

#	Organization	Question 54 Comment
		sensitive information- Q44, addressing Table R24, Section 24.1 and 24.3- Q47, addressing Table R26, section 26.2- Q51, addressing Table R30, Section 30.5- Q51, addressing Table R31, sections 31.1 and 31.2- Q53, addressing TFEs Overall, an excellent start. Here are some additional suggestions:1. In all cases - Write the standards to identify the outcome of the requirement. Never say how to do something, say what you intend for it to accomplish. Let the Responsible Entities figure out the "how".2. Use Industry Standard wording wherever possible. For example, the term "Hardened" means one thing in IT and another in a substation.3. Define any terms that may present confusion - Example - Ports and services. There is a common IT understanding when you hear that term. It is almost always assumed to mean logical ports 0 to 65535 and the networking services they support. However, it can also mean physical ports like Ethernet jacks, RJ45, Serial connectors, parallel connections etc. If there is a question, put it in the definitions.4. Wherever possible, include all the elements of a standard into one standard. Only break requirements apart where it makes real sense to do so. So If you get to R32 and find that something there seems to fit in 20, go back and put it there rather than making a reference back. 5. Keep paring this down in size. It is so much better.6. If any of your experts know that equipment used in the electrical generation and distribution industry cannot perform specific functions, don't write the standards to say they have to.7. There were questions in the May webinar about the meaning of "revocation". Our suggestion is this: revocation is the act of ensuring that a person can no longer gain access to a system, physical area, or information. It can be accomplished directly or indirectly. For instance, if a cyber asset is only accessible from within a physical facility, then denying physical access to the facility also denies cyber access to the cyber asset. If sensitive information on a system resides only in electronic form on particular servers, then denying cyber access to those servers denies access to the information. The emphasis should be on the denial of access, not how that denial is accomplished.Definition of "annual" or "annually": There are numerous occurrences of these terms in the Requirements. Also now, Requirements state that activities must occur “at least once every 12, 24, or 36 months.” Similar to the comment on R1, the SDT should ensure that the highlighted language says exactly what it means. “/A/t least once every 12 months” could lead to some confusion. Let’s assume that the event occurred on July 15, 2010, and again on March 15, 2011. That is “at least once every 12 months.” But it raises the question of when the next activity or compliance event must occur. Is it no later than July 15, 2011, or no later than March 15, 2012? The exact questions could be asked for events that are supposed to occur “at

#	Organization	Question 54 Comment
		least once every 24 or 36 months."Following on to comment 1 immediately above, there are two other phrases that could be used depending on what NERC intends. o "every 12 months" - in this case, the event would occur on the same date each year. This would be virtually impossible. Same concern with "every 24 or 36 months." o "within 12 months of" the event - in this case let's assume that the event occurred on March 15, 2010. The next event would have to occur no later than March 15, 2011, but could occur earlier (let's say it occurred on December 15, 2010). If it occurred on December 15, 2010, the next event would have to occur no later than December 15, 2011. The same example with different dates would work for "at least once every 24 or 36 months."The SDT should be very specific as to what it means for how frequently the events referenced above must occur. BPA appreciates the opportunity to provide comments. Thank you.
54.59	MRO's NERC Standards Review Subcommittee	We believe all of the requirements that specify something to be completed within X hours would be better suited to the following language: "As soon as practical, but not to exceed x business days from the date reported". This would maintain the spirit of the requirement, while also allowing for more practical time frames.With so many auditable elements included within the requirements, we believe the VSL's cannot be written with the current zero-defect mentality. We feel a practical approach is required, where minor issues are allowed to be addressed without representing immediate non-compliance and associated investigations and settlement proceedings, but instead are identified and scheduled for corrective action.We understand the burden on the drafting team to meet FERC's deadlines, but we would propose that all outstanding FERC directives be addressed as part of the current process, as opposed to leaving some items for a later date.
54.60	Idaho Power Company	We commend the SDT on its efforts to draft a standard that meets the FERC directives but is feasible for the industry to implement. That is an extremely difficult assignment. This version will greatly expand the number of cyber assets that are impacted by the CIP requirements and represents a major shift in the identification and classification of an entities BES cyber systems. We are certainly willing to implement the standards because we understand the impact of failure to do so. However, the standards must be accompanied by as much guidance documentation as possible along with realistic implementation plans that take into account the technology required, time required to realistically implement the controls, the fact that registered entities must first assess the financial impact and then

#	Organization	Question 54 Comment
		budget appropriately, and the massive volume of work that implementation represents.
54.61	Xcel Energy	We do not agree that Low impact systems should have mandatory, enforceable cyber security standards. By their very definition, Low impact systems have very little potential to impact the BES. As such, cyber security controls on these systems is best left to the business judgment of each individual entity. The terms defined throughout the standard have not followed the convention of being capitalized. They should be capitalized so that it is clear to the reader that they are defined terms when they are used later in the standard. The Standard would be enhanced if it were to differentiate between software based versus firmware based devices.The Standard would also be enhanced if it were to separately define requirements for Control Centers, Substations, and Generation Facilities. The cyber security issues between these different types of facilities are vastly different. Transmission Control Centers are typically fully digital control systems with the ability to have wide area impacts. On the other extreme, where Generation facilities typically have digital systems are for retrofits to older, analog systems controlling individual components within the facility, such as digital feedwater or digital turbine controls. These are much different that Transmission Control Centers as they have only limited, local impact. Additionally, they typically have mechanical controls that can override the digital systems providing limited, if any benefit from protecting the digital aspects of the system from malicious attacks.
54.62	We Energies	We Energies agrees with EEI: Please see the earlier discussion about identification of a rational and understandable threat basis that should be used when constructing security requirements. The requirements should focus on the highest probability risks that will have the most negative impact. The requirements should not treat all threats and impacts equally.
54.63	Duke Energy	We had previously gone a long way towards getting common understanding on terms such as “Critical Assets”, Critical Cyber Assets”, “Electronic Security Perimeter” and Physical Security Perimeter”. Moving away from these terms in the current Version 4 draft creates uncertainty.Tables and subrequirements should have different numbering schemes so that, for example, there are not two 3.1 listings.If the standard is broken into smaller standards, please provide separate measures for each standard.

#	Organization	Question 54 Comment
54.64	Hydro One	We noticed that combined CIP-011-4 standard excluded vulnerability management program. We'd like to know what the rationale was behind this decision and if this might be considered in the next draft.Suggestion for an additional page that repeats all of the local definitions - this means the local definitions exist in the document as is plus this additional page.Request that the tables and time constraints be consistent. Also where the document refers to processes in some cases it specifies one or more processes and in others just processes. Eliminate confusion caused by two 3.1's. Some Requirements list sub-requirements. Most Requirements use tables for sub-Requirements (refer to R5-R32).Request a cross-reference of CIP-011 Requirements that refers to another CIP-011 Requirement, with emphasis on the Access Control Requirements. A diagram might help.Remove adjectives such as substantial, adequate, minimum, etc., as these are difficult to measure and can lead to different interpretations.
54.65	GTC & GSOC	We recommend a local definition of "Implement" should be added to CIP 011: "Implement means to put into place and consistently utilize. An entity has implemented a policy, procedure, or plan when it has created such policy, procedure or plan and consistently uses it in appropriate circumstances."Throughout the standards the inclusion of the words "for external connectivity only" in the tables is redundant and confusing. If used at all, the qualifier should be on "access" in the text of the standard rather than in the table.We recommend Annual be defined as recurring at least once every Calendar year and at least once within any thirteen (13) consecutive calendar months. Otherwise, annual training will necessarily have to take place earlier each calendar year to ensure all personnel are trained within twelve (12) months.We appreciate the significant effort that the NERC Cyber Security Order 706 Standards Drafting Team has put into developing these proposed standards and communicating them to the industry, especially the CIP Workshop held in Grapevine, TX. We are in full support of the NERC standards development process for the development of reliability standards to secure and protect North America's critical electric infrastructure. In particular, we appreciate the multiple opportunities to guide the development of the CIP standards through both informal and formal comment periods. We are supportive of the proposed standards. We believe these standards are a significant step forward in terms of being able to clearly understand the expectations that are placed upon the entity as well as the security that they provide for the Bulk Electric System.

#	Organization	Question 54 Comment
54.66	PNM Resources, Inc.	We suggest not removing explicit examples from the language of the standards. The incorporation of examples provides clarity and brightline guidance that improves a Responsible Entity's opportunity to comply with the standard. The introduction of new and additional "flexibility" can lead to ambiguity and differences of opinion between the entities and auditors and creatr more opportunities for Regional Entities to allege violations.
54.67	MWDSC	When looking at logical tasks to mitigate risk, e.g., malicious code propagation, could a malicious code in one cyber component affect another component and result in a change in the impact categorization, e.g., low vs medium?
54.68	Progress Energy - Nuclear Generation	Yes, see comments a - f below.a. Comments: Attachment 1 included in responses above follows this question. To obtain full benefit of this review, see Attachment 1.b. The security controls in CIP-011-1 should provide for acceptance of Common Controls as defined by NIST 800-53. CIP-011-1 would offer a more consistent approach in cyber security regulation by considering the mature physical security programs, engineering control programs, emergency plans and physical segregation programs within the nuclear industry that offer alternative countermeasures. These countermeasures provide at least the same degree of cyber security protection as the corresponding cyber security control. c. NIST 800-53 establishes provision for tailoring security controls and states that the level of detail required in documenting tailoring decisions in the security control selection process is strictly at the discretion of the organization consistent with the impact level of the information system. CIP-010-1 and CIP-011-1 should allow use of this provision in the nuclear industry consistent with acceptance by nuclear regulators.d. Nuclear applicability is specified in CIP-010-1, Section 4.2.1. The following comments are based on applicability to nuclear generating facilities: o Definitions for Bulk Electrical System (BES) Cyber System and BES Cyber System Component conflict with definitions that have been accepted by the NRC in NEI 08-09, Revision 6, for Critical System and Critical Digital Asset. Recommend, that for nuclear systems subject to FERC Order 706-B, that definitions for FERC and NRC regulated systems be consistent. o CIP-010-1 requirement R2 and Attachment 1 - some of these functions are covered by NRC regulation. Will issuance of this document require re-submittal of systems for exemption after the Bright Line submittal of systems? o The implementation schedule for CIP-010-1 and CIP-011-1 versus CIPs 002 through 009 requires doing the same reviews twice and is an unnecessary burden on

#	Organization	Question 54 Comment
		nuclear licensees as well as other FERC critical assets.e. Several requirements include periodic review of controls (e.g., R8.2, R12.1). This CIP should contain a provision that permits nuclear facilities to use the periodicities in its NRC approved Cyber Security Program in lieu of those in the CIP standards. This allowance would minimize the administrative burden of having two sets of requirements for the same Cyber Security programmatic element so that plant digital systems that support safety, security, EP or BOP functions are not regulated differently. The following are used to establish frequency or periodicity for security controls with identified durations: o NRC Regulations, Orders o Operating License Requirements (e.g., Technical Specifications) o Site operating history o Industry operating experience o Experience with security control o Guidance in generally accepted standards (e.g., NIST, IEEE, ISO) o Audits and Assessments o Benchmarking o Availability of new technologies. f. R27.1 - The definition of "Cyber Security Incident" should be revisited in light of current definitions, especially NRC and NEI, and revised to align with the definition of "Cyber Attack." It is not on the list of terms to be defined. From NERC Glossary of Terms used in NERC Reliability Standards updated April 20, 2010, the "Cyber Security Incident" definition is: o Any malicious act or suspicious event that:o Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or,o Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset.o It is unclear what NERC does with cyber incident reports and whether these reports are consistent with those required by the NRC in the event of a "cyber attack." Progress Energy Nuclear Generation Group CommentsCIP- 011-1ATTACHMENT 1NIST Security Control Description NIST 800-53 NEI 08-09 NEI 08-09 Description CIP-011-1 CIP-011 Description NRC CommentsSecurity Planning Policy and Procedures PL-1 N/A N/A R1 Security Governance and Policy 50 App B 50 App E73.5473.5573.56 The development and implementation of cyber security policies that address the requirements identified in R1 are mandated for nuclear by one or more Code of Federal Regulations (CFR). This requirement duplicates and/or is not consistent with the CFR and could lead to regulatory uncertainty. Review of cyber security is mandated by 73.55(m) and R1 conflicts with its duration. This would result in conflicting requirements for BOP systems and would result in dual regulation for the nuclear plant.Security Awareness AT-2 E9.2 Awareness Training R2 Personnel Training, Awareness and Risk Assessment 73.5450 App B Training requirements for nuclear personnel are established by CFR. R 3.3.2 would result in personnel without a need to know becoming knowledgeable in technical aspects of digital equipment. R3.3.4 is not required for users to perform

#	Organization	Question 54 Comment
		their job. This conflicts with 73.54 requirements that personnel are trained to the extent necessary to perform their assigned duties. This would result in conflicting requirements for BOP systems and would result in dual regulation for the nuclear plant.Security Training AT-3 N/A N/A R3 Personnel Training, Awareness and Risk Assessment 73.5473.55 Physical and logical access to plant digital systems is governed by CFR. Personnel who are granted access to these systems are required to complete training that result in their receiving formal and documented Qualifications. Requalification is at established intervals required by plant procedures. Whether the plant system performs functions associated with safety, security, emergency preparedness or BOP, the requirements are the same. Additional training and duration not consistent with established mature training programs would result in conflicting requirements for BOP systems and would result in dual regulation for the nuclear plant. R4 Personnel Risk Assessment 73.56 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. Results are documented and stored in Records. The requirements in R4 conflict with the requirements in the CFR that nuclear personnel supporting plant system performs functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from requirement R4. R5.1 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. before being granted unescorted physical access to nuclear plants. The nuclear plant is protected by armed security officers and other protective strategy that restricts access. The requirements in R5.1-3 are covered by the CFR for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement. R5.2 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. before being granted physical access to nuclear plants. Results are documented and stored in Records. The requirements in R5.2 are covered by the CFR for restricting physical access for all plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement. R5.3 Physical Security for BES Cyber

#	Organization	Question 54 Comment
		Systems 73.55 Nuclear personnel must pass through security access points before being granted physical access to nuclear plants. Automated scanning records entry. The requirements in R5.3 are covered by the CFR for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement.Monitoring Physical Access PE-6 E5.8 Monitoring Physical Access R5.4 Physical Security for BES Cyber Systems 73.55 Visitors must receive approval prior to arriving at the security access points and are subject to search before being granted physical access to nuclear plants. Entry and exit are documented. The requirements in R5.4 are covered by the CFR for nuclear visitors supporting plant systems performing functions associated with safety, security, emergency preparedness, BOP or other. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement.Physical Access Authorizations PE-2 E5.4 Physical Access Authorizations R5.5 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to rigorous background checks including criminal investigation, credit investigation, psychological evaluation, random drug screens, etc. before being granted unescorted physical access to nuclear plants. Results are documented and stored in Records. The requirements in R5.5 are covered by the CFR for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement.Physical Access Control PE-3 E5.5 Physical Access Control R5.6 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are subject to annual retraining in order to maintain unescorted physical access to nuclear plants. Results are documented and stored in Records. The requirements in R5.6 conflict with the CFR that cover access authorization for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Plant digital systems that support safety, security, EP or BOP functions should not be regulated differently. Consider exempting nuclear facilities from this requirement. R5.7 Physical Security for BES Cyber Systems Part 2673.56 Requirements for nuclear personnel terminated for cause are covered by the CFR. The requirements in R5.7 conflict with the CFR that direct termination for cause of nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting

#	Organization	Question 54 Comment
		nuclear facilities from this requirement. R5.8 Physical Security for BES Cyber Systems 73.55 N/A to nuclear - applicable to Control Center R5.9 Physical Security for BES Cyber Systems 73.55 Requirements for nuclear personnel who no longer require physical access are covered by CFR. The requirements in R5.9 conflict with the CFR that covers removing physical access for nuclear personnel supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from this requirement.Monitoring Physical Access PE-6 E5.8 Monitoring Physical Access R5.10 Physical Security for BES Cyber Systems 73.55 Nuclear personnel are trained and qualified to provide continuous escort for visitors while they are granted physical access to nuclear plants. The requirements in R5.10 are covered by the CFR for nuclear personnel who escort visitors supporting plant systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from this requirement. R5.11 Physical Security for BES Cyber Systems 73.55 Unauthorized physical access is handled by armed security officers in nuclear security. The requirements in R5.11 are covered by the CFR for unauthorized physical access to the plant where systems performing functions associated with safety, security, emergency preparedness or BOP. Consider exempting nuclear facilities from this requirement. R6.1 Physical Access Control Systems 73.55 Physical access control systems are covered by CFR requirements. The requirements in R6.1 are covered by the CFR and this physical access control system is subject to nuclear cyber security regulation only. Consider exempting nuclear facilities from this requirement. R6.2 Physical Access Control Systems 73.55 Physical access control systems are covered by CFR requirements. The requirements in R6.2 are addressed in the CFR and this physical access control system is subject to nuclear cyber security regulation only. Consider exempting nuclear facilities from this requirement. R6.3 Physical Access Control Systems 73.55 Physical access control systems are maintained and tested per CFR requirements. The requirements in R6.3 are addressed in the CFR. Therefore, this physical access control system is subject to nuclear cyber security regulation only. Consider exempting nuclear facilities from this requirement.Account Management AC2 D1.2 Account Management R7 Account Management Specifications Consistent with nuclear cyber security plan.Least Privilege AC6 D1.6 Least Privilege R8.1 Account Management Implementation Consistent with nuclear cyber security plan.Account Management AC2 D1.2 Account Management R8.2 Account Management Implementation Duration is inconsistent with nuclear cyber security plan. 		should not be regulated differently. R32 Recovery Plan Review, Update, and Communications Specifications Neither nuclear regulation nor NIST 800-53 contain expectations reviews, updates and communication of recovery plans at the frequencies established by R32. The bases for R32 requirements are unclear and consideration should be given to removing it.

END OF REPORT

Project 2008-06 Cyber Security Order 706

Consideration of Issues and Directives — DRAFT

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 25 We direct NERC to address revisions to the CIP Reliability Standards CIP-002-1 through CIP-009-1 considering applicable features of the NIST framework.	FERC Order 706	It is important to highlight differences between NERC's and NIST's approaches. At the root of these differences is the divergent responsibilities and goals. NIST is providing standards and guidance for U.S. Federal Agencies in managing risks to their information and systems in support of their unique missions. NERC, on the other hand, has the role of setting standards for managing risks to systems in support of a shared community mission to ensure the reliability of the BES. This difference is important because it enables the industry to develop better detail about the impacts that they need to avoid in order to achieve their mission. NIST does not enjoy this benefit, as they are providing standards to almost two hundred different organizations, each with vastly different missions. The advantage that the NERC Standards enjoy enables a focus on a relatively small number of reliability services that need to be protected.
		This ultimately means that the NERC Standards can be more tailored and appropriate to the industry than a wholesale adoption of the NIST Risk Management Framework. Four key

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		features of the NIST Risk Management Framework were incorporated into version 5 NERC CIP Standards: (1) ensuring that all BES Cyber Systems associated with the Bulk-Power System, based on their function, receive some level of protection, (2) customizing protection to the mission of the cyber systems subject to protection, (3) a tiered approach to security controls which specifies the level of protection appropriate for systems based upon their importance to the reliable operation of the Bulk-Power System, and (4) the concept of the BES Cyber System itself. Features 2 and 3 above are tightly coupled. In the NIST Risk Management Framework, there is a concept of tailoring and scoping which allows the organization to determine which controls are applicable to their specific environment. In the NERC compliance framework, all requirements are mandatory and enforceable and therefore this concept does not translate directly. As such, the customization of protections by mission is based upon the environment that the BES Cyber System supports (control center, transmission facility, generation facility) and utilizes the tiered model and the requirement applicability to provide this customization to the individual environments that together support a combined mission of Bulk Power System Reliability. The NIST security control catalogue in 800-53 revision 3 was also used as a reference in addressing many of the FERC directives in Order 706.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 258 and 252 "Para 258. As to Entergys suggestion that the ERO provide a DBT profile of potential adversaries, the ERO should consider this issue in the Reliability Standards development process. Para 252. Entergy suggests, as an alternative approach to critical asset identification, that the ERO provide a Design-Basis Threat (DBT) a profile of the type, composition, and capabilities of an adversary that would assist the industry as a technical baseline against which to establish the proper designs, controls and processes. Entergy claims that a DBT approach would address many of the Commission's concerns regarding the risk-based methodology. For example, a DBT would focus the appropriate emphasis on the potential consequences from an outage of a critical asset. In addition, a DBT would address the Commissions concern that responsible entities will not have enough guidance in developing a risk-based methodology and not know how to identify a critical asset. Entergy contends that a DBT approach would provide the industry with more certainty in implementing the CIP Reliability Standards."	FERC Order 706	CIP-002-5 classifies BES Cyber Systems through impact thresholds, and does not use risk-based assessments performed by individual entities. Risk-based approaches to applying cyber security requirements is a worthy objective and will continue to be explored, but the complexity and subjectivity it adds is beyond the scope of these revisions.
Para 282 The Commission directs the ERO to specifically require the consideration of misuse of control centers and control systems in the determination of critical assets.	FERC Order 706	The definition of BES Cyber Asset as used in CIP-002-5 requires Responsible Entities to consider misuse of the Cyber Assets in identifying BES Cyber Systems.
Para 285 The Commission directs the ERO to consider the comment from	FERC Order 706	The exclusion of Cyber Assets based on non-routable protocols has been removed from CIP-002-5 and added as a

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
ISA99 Team [ISA99 Team objects to the exclusion of communications links from CIP-002-1 and non-routable protocols from critical cyber assets, arguing that both are key elements of associated control systems, essential to proper operation of the critical cyber assets, and have been shown to be vulnerable by testing and experience].		scoping filter for requirements where: (i) the use of non-routable protocols is a mitigating factor for the vulnerabilities a requirement addresses and (ii) implementation of routable protocols would be required to comply with the requirement (e.g. malware updates, security event monitoring and alerting, etc.).
Para 321 "Para 321. SPP and ReliabilityFirst suggest modifying CIP-002-1 to allow an entity to rely upon the assessment of another entity with interest in the matter. We believe that this is a worthwhile suggestion for the ERO to pursue and the ERO should consider this proposal in the Reliability Standards development process. We note that, even without such a provision, an entity such as a small generator operator is not foreclosed from consulting with a balancing authority or other appropriate entity with a wide-area view of the transmission system."	FERC Order 706	The SDT considered this suggestion, and it believes that the change to “bright line” criteria for identifying BES Cyber Systems, along with refining the scope of certain requirements through applicability columns based on impact and connectivity characteristics, addresses this concern.
Para 376 “the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards.”	FERC Order 706	The SDT removed the CIP-003-4 requirement to document exceptions to the Cyber Security Policy. • The SDT considers this a general management issue that is not within the scope of a compliance requirement. • The SDT found no reliability basis in this requirement. • Removal of this requirement provides clarity that the

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		only exceptions to the requirements is through the defined Technical Feasibility Exception process, where specifically allowed.
Para 386 The Commission adopts its CIP NOPR proposal and directs the ERO to develop modifications to Reliability Standards CIP-003-1, CIP-004-1, and/or CIP-007-1, to ensure and make clear that, when access to protected information is revoked, it is done so promptly.	FERC Order 706	To address this directive, in CIP-004-5, Requirement R7, Responsible Entities are required to revoke access to BES Cyber System Information. This could include records closets, substation control houses, records management systems, file shares or other physical and logical areas under the Responsible Entity's control.
Para 397 and 398 "The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes."	FERC Order 706	Two new requirements were added to address this change CIP-010-1, Requirement R1 (item 1.4), requires additional testing prior to a configuration change in a test environment. CIP-010-1, Requirement R2 (item 2.1), requires monitoring of the configuration of the BES Cyber System. • The SDT proposes the introduction of a defined baseline configuration and an explicit requirement for monitoring for changes to the baseline configuration in High Impact Control Centers in order to capture malicious changes to a BES Cyber System. • Additionally, the SDT proposes that changes to High Impact Control Centers be tested in a test environment prior to their implementation in the

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		production environment to aid in identifying any accidental consequences of the change.
Para 433 “we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard.”	FERC Order 706	The SDT addressed this by determining that identification of certain core training elements would be beneficial, and the identification of those core training elements that must be provided in the training program should be role based, as required in CIP-004-5, Requirement R2
Para 434 “The Commission adopts the CIP NOPR’s proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of critical cyber assets.”	FERC Order 706	The SDT added this as a topic for role-specific training in CIP-004-5, Requirement R2 (item 2.10). Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems.
Para 435 “Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made to assure that security trainers are adequately trained themselves.”	FERC Order 706	The SDT has considered the issue and has determined that no modifications are necessary. In practice, this training is often conducted as computer based training (CBT). As such, as long as the training material itself is adequate, which can be evaluated through the existing audit process, security trainers themselves do not need any particular or specialized training.
Para 446 "Para 446. APPA/LPPC seek clarification regarding discretion in reviewing results of personnel risk assessments and in coming to conclusions regarding the subject employees. SDG&E seeks	FERC Order 706	The SDT clarifies the discretion in reviewing personnel risk assessments in CIP-004-5, Requirement R4, by establishing criteria for personnel risk assessments.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
refinements on various issues, including an industry-wide protocol for periodic background and criminal checks, and the use of pre-employment background check procedures for current employees. The ERO should consider these issues when developing modifications to CIP-004-1 pursuant to the Reliability Standards development process."		
Para 460 "The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination)."	FERC Order 706	In CIP-004-5, Requirement R7, the SDT has addressed this directive by requiring revocation of access concurrent with the termination or disciplinary action (item 7.1) or by the end of the calendar day in cases of transfers or reassignments (item 7.2). In reviewing how to modify the requirement relating to transfers or reassignments, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement (item 7.2) from NIST 800-53 version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers. CIP-004-5, Requirement R7 (item 7.4) augments the requirements in items 7.1 and 7.2 that respond to the directive. In order to meet the immediate timeframe, Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		access revocation on individual Cyber Assets and applications without affecting reliability. This requirement (item 7.4) provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.
Para 464 We also adopt our proposal to direct the ERO to modify Requirement R4 to make clear that unescorted physical access should be denied to individuals that are not identified on the authorization list, with clarification.	FERC Order 706	CIP-004-5, Requirement R5 (item 5.1), requires a personnel risk assessment as a condition of being granted access, with exceptions only for specific CIP Exceptional Circumstances which are outlined in the proposed glossary definition of the aforementioned term.
Para 473 The Commission adopts its proposals in the CIP NOPR with a clarification. As a general matter, all joint owners of a critical cyber asset are responsible to protect that asset under the CIP Reliability Standards. The owners of joint use facilities which have been designated as critical cyber assets are responsible to see that contractual obligations include provisions that allow the responsible entity to comply with the CIP Reliability Standards. This is similar to a responsible entitys obligations regarding vendors with access to critical cyber assets.	FERC Order 706	CIP-002-5, Requirement R1 makes clear that asset owners are responsible for complying with the Standards.
Para 476 We direct the ERO to modify CIP-004-1, and other CIP Reliability Standards as appropriate, through the Reliability Standards development process to address critical cyber assets that are jointly owned or jointly used, consistent with the Commissions	FERC Order 706	Guidance in CIP-002-5 advises the owning Responsible Entities determine who is responsible for complying with the CIP Cyber Security Standards.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
determinations above.		
Para 496 "The Commission adopts the CIP NOPRs proposal to direct the ERO to develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter"	FERC Order 706	The proposed requirement requires a Responsible Entity to deploy methods to inspect communications and detect potential malicious communications for all External Connectivity (Intrusion Detection). The drafting team addresses this in CIP-005-5, Requirement R1 (item 1.4). Per FERC Order 706, p 496-503, ESP's need two distinct security measures such that the cyber assets do not lose all perimeter protection if one measure fails or is mis-configured. The Order makes clear this is not simple redundancy of firewalls, thus the drafting team has decided to add the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs.
Para 502 "The Commission directs that a responsible entity must implement two or more distinct security measures when constructing an electronic security perimeter, the specific requirements should be developed in the Reliability Standards development process."	FERC Order 706	The directive for two defensive measures when constructing an ESP indicates a defense-in-depth approach and not simple redundancy of firewalls. CIP-005-5 adds the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs as a second security measure for High Impact BES Cyber Systems.
Para 503 "The Commission is directing the ERO to revise the Reliability Standard to require two or more defensive measures."	FERC Order 706	The directive for two defensive measures when constructing an ESP indicates a defense-in-depth approach and not simple redundancy of firewalls. CIP-005-5 adds the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs as a second security measure for High Impact BES Cyber Systems.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 511 The Commission adopts the CIP NOPRs proposal to direct the ERO to identify examples of specific verification technologies that would satisfy Requirement R2.4, while also allowing compliance pursuant to other technically equivalent measures or technologies.	FERC Order 706	CIP-005-5, Requirement R2 has additional security requirements for remote access from the work started in the Urgent Action Revisions to CIP-005-3. One of these requirements is two-factor authentication and specific examples of two-factor authentication are provided in the referenced guideline.
Paras 525, 526, 528, and 628 Para 525. "The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-005-1 to require logs to be reviewed more frequently than 90 days, but clarifies its direction in several respects. At this time, the Commission does not believe that it is necessary to require responsible entities to review logs daily…" Para 526. "the Commission directs the ERO to modify CIP-005-1 through the Reliability Standards development process to require manual review of those logs without alerts in shorter than 90 day increments. The Commission directs the ERO to modify CIP-005-1 to require some manual review of logs, consistent with our discussion of log sampling below, to improve automated detection settings, even if alerts are employed on the logs." Para 528. "The Commission clarifies its direction with regard to reviewing logs. In directing manual log review, the Commission does not require that every log be reviewed in its entirety. Instead, the ERO could provide, through the Reliability Standards development process, clarification that a responsible entity should perform the manual review of a sampling of log entries or sorted	FERC Order 706	In CIP-007-5, Requirement R4, the SDT proposes the performance of a review of log summaries or samples every two weeks. CIP-007-5, Requirement R4, combines CIP-005-4, Requirement R5 and CIP-007-4, Requirement R6, and addresses FERC's directives from a system-wide perspective. The primary feedback received on this requirement from the informal comment period was the vagueness of terms "security event" and "monitor". The term "security event" or "events related to cyber security" is problematic because it does not apply consistently across all platforms and applications. To resolve this term, the requirement takes an approach similar to NIST 800-53 and requires the entity to define the security events relevant to the system. In addition, this requirement sets up parameters for the monitor and review processes. It is rarely feasible or productive to look at every security log on the system. Paragraph 629 of the FERC Order 706 acknowledges this reality when directing a manual log review. As a result, this

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
or filtered logs." Para 628. "Requirement R6 of CIP-007-1 does not address the frequency with which log should be reviewed. Requirement R6.4 requires logs to be retained for 90 calendar days. This allows a situation where logs would only be reviewed 90 days after they are created. The Commission continues to believe that, in general, logs should be reviewed at least weekly…"		requirement allows the manual review to consist of a sampling or summarization of security events occurring since the last review. Additionally, consistent with FERC Order 706, the requirement makes clear that the objective of this control is to identify unanticipated Cyber Security Incidents and potential event logging failures, thereby improving automated detection settings.
Paras 541, 542, and 547 Para 541. we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments." Para 542. "the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems." Para 547. "we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years"	FERC Order 706	In CIP-010-1, Requirement R3, the SDT has added requirements for an "active vulnerability assessment" to occur at least once every three years for High Impact Control Centers using a test system so as to prevent unforeseen impacts on the Bulk Electric System. Requirement R3 requires annual paper assessments in the intervening years.
Para 544 "the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant change is made to the electronic security perimeter or defense in depth measure, rather than with every modification." "we are directing the ERO to determine, through the Reliability Standards development process, what would constitute a modification that would require an active vulnerability	FERC Order 706	The SDT addresses this paragraph in CIP-010-1, Requirement R3. • The SDT has proposed that prior to adding a new cyber asset into a BES Cyber System, that the new Cyber Asset undergoes an active vulnerability assessment. • An exception is made for specified CIP Exceptional

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
assessment”		Circumstances. • Additionally, the new requirement in CIP-010, Requirement R1 (item 1.5) requires testing of all changes for High Impact BES Cyber Systems that deviate from the baseline configuration in a test environment to ensure that required security controls are not adversely affected.
Para 572 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify this CIP Reliability Standard to state that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a physical security perimeter around critical cyber assets."	FERC Order 706	The SDT addressed this in CIP-006-5, Requirement R1 (item 1.3) for High Impact BES Cyber Assets
Para 581 “The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years.”	FERC Order 706	The SDT addressed this in CIP-006-5, Requirement R3 (item 3.1) by changing the frequency to a 24 month testing cycle; after deliberation and consideration, the SDT determined that a requirement of more frequent testing (e.g., 12 months), was too often.
Paras 609, 610, and 611 Para 609. “We therefore direct the ERO to develop requirements addressing what constitutes a “representative system” and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document.” Para 610. “we direct the ERO to revise the Reliability Standard to	FERC Order 706	CIP-010-1, Requirement R1 (item 1.4), provides clarity on when testing must occur and requires additional testing to ensure that accidental consequences of planned changes are appropriately managed. • The SDT proposes to require a “representative system” or test system for those High Impact Control Centers to use for the purposes of testing proposed

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above." Para 611. "the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production."		changes and performing active vulnerability assessments. • The SDT proposes using the defined baseline configuration of a BES Cyber System for the measuring stick as to whether a test system is truly representative of the production system. • To account for any additional differences between the two systems, the SDT proposes using the words directly from FERC Order 706 "Document the differences between the test environment and the production environment including a description of the measures used to account for any differences in operation between the test and production environments."
Paras 620 and 622 Para 620. "The Commission will not adopt Consumers' recommendation that every system in an electronic security perimeter does not need antivirus software. Critical cyber assets must be protected, regardless of the operating system being used. Consumers has not provided convincing evidence that any specific operating system is not directly vulnerable to virus attacks. Virus technology changes every day. Therefore we believe it is in the public interest to protect all cyber assets within an electronic security perimeter, regardless of the operating system being used…"	FERC Order 706	The drafting team addressed this in CIP-007-5, Requirement R3. The drafting team is taking the approach of making this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every component. The BES Cyber System is the object of protection. The drafting team believes that addressing this issue holistically at the BES Cyber System level and regardless of technology, along with the enhanced change management requirements, meets this directive.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 622. "The Commission also directs the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above.		• The SDT rewrote the requirement as a competency based requirement that does not prescribe technology. • The SDT added Maintenance to cover malware on removable media. The drafting team also created a new requirement, CIP-007-5, Requirement R3 (item 3.4), to protect against personnel introducing malicious code when temporarily connecting to a BES Cyber Asset for Maintenance purposes. When remote access is used to connect to a BES Cyber Asset, an intermediate device is required in CIP-005-5, Requirement R2 (item 2.1) and guidance is further included for the cyber security policy in CIP-003-5, Requirement R2 to maintain up-to-date anti-malware software and patch levels before initiating interactive remote access.
Para 628. The Commission continues to believe that, in general, logs should be reviewed at least weekly and therefore adopts the CIP NOPR proposal to require the ERO to modify CIP-007-1 to require logs to be reviewed more frequently than 90 days, but leaves it to the Reliability Standards development process to determine the appropriate frequency, given our clarification below, similar to our action with respect to CIP-005-1	FERC Order 706	In CIP-007-5, Requirement R4, the SDT proposes the performance of a review of log summaries or samples every two weeks.
Paras 633 and 635	FERC Order 706	The SDT addresses these directives in CIP-011-1,

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 633. "The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it." Para 635. "the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data."		Requirement R2. The requirements clarify that the goal is to prevent the unauthorized retrieval of information from media. The SDT removed the word "erase" as, depending on the media itself, erasure may not be sufficient to meet this goal.
Para 643 "The Commission adopts its proposal to direct the ERO to provide more direction on what features, functionality, and vulnerabilities the responsible entities should address when conducting the vulnerability assessments, and to revise Requirement R8.4 to require an entity-imposed timeline for completion of the already-required action plan."	FERC Order 706	In CIP-010-1, R3 (item 3.4), the SDT added a requirement for an entity planned date of completion to the remediation action plan following a vulnerability assessment. In order to provide more direction on what "features, functionality, and vulnerabilities" should be addressed in a vulnerability assessment, the SDT included guidance on active and paper vulnerability assessment. The SDT further referenced NIST SP800-115 to provide entities additional guidance on how to conduct a vulnerability assessment.
Para 661 "the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed results in a Reliability Standard that can be audited and enforced."	FERC Order 706	CIP-008-5 addresses the four parts of this directive as follows: 1. Added: Reportable Cyber Security Incidents include as a minimum any Cyber Security Incident that has compromised or disrupted a BES Reliability Operating Service. 2. Retired CIP-008-4, R1.3 which contained provisions for reporting Cyber Security Incidents. This is now addressed in the draft EOP-004-2, Requirement 1, Part 1.3.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		3. See 1 above 4. Guidance and measurements have been developed to be auditable and enforceable.
Para 673 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report."	FERC Order 706	Cyber Security - Incident Reporting and Response Planning: Retired CIP-008-4, R1.3 which contained provisions for reporting Cyber Security Incidents. This is now addressed in the draft EOP-004-2, Requirement 1, Part 1.3
Para 676 "The Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report."	FERC Order 706	Cyber Security - Incident Reporting and Response Planning: Retired CIP-008-4, R1.3 which contains provisions for reporting Cyber Security Incidents. This is addressed in the draft EOP-004-2, Requirement 1, Part 1.3.
Para 686 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of which must include lessons learned.The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.."	FERC Order 706	In CIP-008-5, R3 (items 3.3 and 3.4), the SDT includes additional specification on the update of response plan and modifies the response plan requirements to incorporate lessons learned. Maintenance of documentation of paper drills, full operational drills, and responses to actual incidents is part of the documentation required to demonstrate compliance with the security controls in CIP-008-5 and is already subject to the evidence retention requirements associated with all

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		NERC Reliability Standards.
Para 694 “For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan.We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not be in compliance with this Reliability Standard”	FERC Order 706	The SDT added in CIP-009-5, R1, a requirement to implement the recovery plan
Para 706 "The Commission adopts, with clarification, the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to incorporate use of good forensic data collection practices and procedures into this CIP Reliability Standard."	FERC Order 706	CIP-009-5, R1 (item 1.5) requires a process to preserve data for analysis or diagnosis of the cause of any problem that adversely impacts a BES Reliability Operating Service. The SDT captured the objective of this control, but did not explicitly use the term “forensics” due to the legal interpretations associated with the term.
Para 710 and 706 "Therefore, we direct the ERO to revise CIP-009-1 to require data collection, as provided in the Blackout Report."	FERC Order 706	CIP-009-5, R1 (item 1.5) requires a process to preserve data for analysis or diagnosis of the cause of any problem that adversely impacts a BES Reliability Operating Service.
Para 725 "The Commission adopts, with modifications, the CIP NOPR proposal to develop modifications to CIP-009-1 through the Reliability Standards development process to require an operational exercise once every three years (unless an actual incident occurs, in which case it may suffice), but to permit reliance on table-top exercises annually in other years."	FERC Order 706	CIP-009-5, R2 (item 2.3) requires an operational exercise at least once every three calendar years.

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Para 739 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP- 009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes."	FERC Order 706	In CIP-009-5, R1 (item 1.4), the SDT added requirements related to restoration processes based on review of the DHS Controls, and requires verification initially after backup to ensure that the process completed successfully. In CIP-009-5, R2 (item 2.2), the SDT requires an initial and once every calendar year test of the data at High Impact BES Cyber Systems or Medium Impact BES Cyber Systems at Control Centers.
Para 748 "The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are successful and backup failures are addressed, so that backups are available for future use."	FERC Order 706 NERC Alert regarding remote access VPN vulnerabilities	In CIP-009-5, R1 (item 1.4), the SDT added requirements related to restoration processes based on review of the DHS Catalog of Control Systems Security: Recommendations for Standards Developers (a derivation of NIST SP800-53 for Control Systems), and requires verification initially after backup to ensure that the process completed successfully. Addressed in CIP-005-5 ▪ Creates basic requirements to protect critical systems from untrusted networks. ▪ Identifies protective measures that provide secure access to critical systems. ▪ Helps ensure secure practices by employees, contractors, and service vendors to minimize exploitation of vulnerabilities. ▪ Addresses questions regarding ability to audit or

Project 2008-06 Cyber Security Order 706		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		enforce the requirement through the design of clear measures. ▪ Significant guidance provided to address implementation options for organizations of differing sizes, capabilities, and complexity. Additionally, remote access is specifically required to be included in an entity's cyber security policy. Guidance is included to assist the entity in determining what this topic in the cyber security policy should address.
Para 13. "The Commission recognizes and encourages NERC's intention to address physical ports to eliminate the current gap in protection as part of its ongoing CIP Reliability Standards project scheduled for completion by the end of 2010. Should this effort fail to address the issue, however, the Commission will take appropriate action, which could include directing NERC to produce a modified or new standard that includes security of physical ports."	Order Approving Interpretation of Reliability Standard CIP-007-2 in Docket No. RD10-3-000, March 18, 2010	The SDT addressed this issue in CIP-007-5, R1, by having a requirement to disable or restrict use of physical I/O ports. The SDT changed the 'needed for normal or emergency operations' to those ports that are documented with reasons why they are necessary. In the March 18, 2010 FERC issued an order to approve NERC's interpretation of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports and services" refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the drafting team to address unused physical ports.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Implementation Plan For Version 5 CIP Cyber Security Standards

November 7, 2011

Prerequisite Approvals

All Version 5 CIP Cyber Security Standards and the proposed additions, modifications, and retirements of terms to the *Glossary of Terms Used in NERC Reliability Standards* must be approved before these standards can become effective.

Applicable Standards

The following standards and definitions, collectively referred to as "Version 5 CIP Cyber Security Standards[1]," are covered by this Implementation Plan:
CIP–002–5 —Cyber Security — BES Cyber System Identification
CIP–003–5 — Cyber Security — Security Management Controls
CIP–004–5 — Cyber Security — Personnel and Training
CIP–005–5 — Cyber Security — Electronic Security Perimeter(s)
CIP–006–5 — Cyber Security — Physical Security
CIP–007–5 —Cyber Security — Systems Security Management
CIP–008–5 — Cyber Security — Incident Reporting and Response Planning
CIP–009–5 — Cyber Security — Recovery Plans for BES Cyber Systems
CIP–010–1 — Cyber Security — Configuration Change Management
CIP–011–1 — Cyber Security — Information Protection
"Definitions of Terms Used in Version 5 CIP Cyber Security Standards" document, which includes proposed additions, modifications, and retirements of terms to the *Glossary of Terms Used in NERC Reliability Standards*.

These standards and Definitions of Terms Used in Version 5 CIP Cyber Security Standards are posted for ballot by NERC concurrently with this Implementation Plan.

When these standards and Definitions of Terms Used in Version 5 CIP Cyber Security Standards become effective, all prior versions of these standards are retired.

Compliance with Standards

Once these standards and Definitions of Terms Used in Version 5 CIP Cyber Security Standards become effective, the Responsible Entities identified in the Applicability section of the standard must comply with the requirements. These Responsible Entities include:
• Reliability Coordinator
• Balancing Authority

[1] Although CIP-010-1 and CIP-011-1 are proposed as first versions, any reference to "Version 5 CIP Cyber Security Standards" includes CIP-010-1 and CIP-011-1 in addition to CIP-002-5 through CIP-009-5 because CIP-010-1 and CIP-011-1 were developed as part of the "Version 5 CIP Cyber Security Standards" development process.

- Interchange Authority
- Transmission Owner
- Transmission Operator
- Generator Owner
- Generator Operator
- Load Serving Entity
- Distribution Provider
- NERC
- Regional Entity

Proposed Effective Date for Version 5 CIP Cyber Security Standards

Responsible Entities shall comply with requirements in CIP-002-5, CIP-003-5, CIP-004-5, CIP-005-5, CIP-006-5, CIP-007-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1, and the Definitions of Terms Used in Version 5 CIP Cyber Security Standards as follows:

1. **18 Months Minimum** – The Version 5 CIP Cyber Security Standards shall become effective on the later of January 1, 2015, or the first calendar day of the seventh calendar quarter after the date of the order providing applicable regulatory approval. Notwithstanding any order to the contrary, CIP-002-4 through CIP-009-4 do not become effective, and CIP-002-3 through CIP-009-3 remain in effect and are not retired until the effective date of the Version 5 CIP Cyber Security Standards under this implementation plan.[2]
2. In those jurisdictions where no regulatory approval is required, the standards shall become effective on the first day of the seventh calendar quarter following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Unplanned Changes Resulting in a Higher Categorization

Planned changes refer to any changes of the electric system or BES Cyber System as described in CIP-002-5 R1.1 which were planned and implemented by the Responsible Entity.

For example, if an automation modernization activity is performed at a transmission substation, whereby Cyber Assets are installed that meet the criteria in CIP-002-5 Attachment 1, then the new BES Cyber System has been implemented as a result of a planned change, and must therefore be in Compliance with the Version 5 CIP Cyber Security Standards upon the commissioning of the modernized transmission substation.

[2] In jurisdictions where CIP-002-4 through CIP-009-4 have not yet become effective according to their implementation plan (even if approved by order), this implementation plan and the Version 5 CIP Cyber Security Standards supersede and replace the implementation plan and standards for CIP-002-4 through CIP-009-4.

In contrast, *unplanned* changes refer to any changes of the electric system or BES Cyber System as described in CIP-002-5 R1.1 which were not planned by the Responsible Entity. Consider the scenario where a particular BES Cyber System at a transmission substation does not meet the criteria in CIP-002-5 Attachment 1. Then, later, an action is performed outside of that particular transmission substation, such as a transmission line is constructed or retired, a generation plant is modified, changing its rated output, or load patterns shift resulting in corresponding transmission flow changes through that transmission substation, and that unchanged BES Cyber System may become a Medium Impact BES Cyber System based on the CIP-002-5 Attachment 1 criteria. The actions that cause the change in power flows would have been performed by a neighboring entity and would result in a change in impact level the of the affected BES Cyber System.

For *planned* changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the Version 5 CIP Cyber Security Standards on the update of the identification and categorization of the affected BES Cyber System as required in CIP-002-5 R1.1

For *unplanned* changes resulting in a higher categorization, the Responsible Entity shall comply with all applicable requirements in the Version 5 CIP Cyber Security Standards according to the following timelines following the identification and categorization of the affected BES Cyber System as required in CIP-002-5 R1.1:

Scenario of Unplanned Changes	Compliance Implementation
New High Impact BES Cyber System	12 months
New Medium Impact BES Cyber System	12 months
Newly categorized High Impact BES Cyber System from Medium Impact BES Cyber System	12 months for new requirements
Newly categorized Medium Impact BES Cyber System	12 months
Responsible Entity Identifies first Medium or High Impact BES Cyber System	Add 12 months from time above

Additional Guidance and Implementation Time Periods for Disaster Recovery

A special case of restoration as part of a disaster recovery situation (such as storm restoration) shall follow the emergency provisions of the Responsible Entity's policy required by CIP-003-5 R2.

The rationale for this is that the primary task following a disaster is the restoration of the power system, and the ability to serve customer load. Cyber security provisions are implemented to support reliability

and operations. If restoration were to be slowed to ensure full implementation of the CIP compliance implementation program, restoration could be hampered, and reliability could be harmed.

However, following the completion of the restoration activities, the entity is obligated to implement the CIP compliance implementation program at the restored facilities, and be able to demonstrate full compliance in a spot-check or audit; or, file a self-report of non-compliance with a mitigation plan describing how and when full compliance will be achieved.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Mapping Document Showing Translation of CIP-002-4 to CIP-009-4 into CIP-002-5 to CIP-009-5, CIP-010-1, and CIP-011-1

November 7, 2011

Standard: CIP-002-4 – Cyber Security—Critical Asset Identification		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-002-4 R1.	DELETED	Critical Asset Identification – Removed this requirement because new Standard identifies and categorizes BES Cyber Systems directly without declaring assets as critical.
CIP-002-4 R2.	CIP-002-5 R1	Critical Cyber Asset Identification – New Standard identifies BES Cyber Systems as a grouping of Critical Cyber Assets because it allows entities to apply some requirements at a system rather than asset level. BES Cyber Systems are also identified using BES Reliability Operating Services, which provides more detail on what it means for a Cyber Asset to be critical to reliable operation.
CIP-002-4 R2.	DELETED	Routable protocol exemption – A complete exemption or cyber assets based on communication characteristics no longer applies. This is because the vulnerability some security requirements address is not mitigated by the lack of routable protocols (e.g. training, response, recovery, etc.). Where the lack of routable protocols itself meets the requirement objective, the exemption is applied at the requirement level.
CIP-002-4 R2.	DELETED	Control Center – No longer applicable since R2 has been deleted.
CIP-002-4 R2.	DELETED	Dial-up Accessible – No longer applicable since R2 has been deleted.
CIP-002-4 R3.	CIP-002-5 R2	Annual Approval – No significant changes.
NEW	CIP-002-5 1.1	Update and re-categorize for changes to BES – Specifies timeframe for complying with all categorization and associated security requirements following a planned change.

Standard: CIP-003-4 – Cyber Security—Security Management Controls		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-003-4 R1.	CIP-003-5 R2	Cyber Security Policy – Clarified that the cyber security policy needs to only reference the subject matter topics at a high level rather than each individual requirement in the CIP Cyber Security Standards.
CIP-003-4 R1.1.	CIP-003-5 R2, 2.10	Provision for emergency situations – Identified the specific exceptional circumstances in which emergency exceptions can be taken in response to the directive in FERC Order 706 paragraph 443.
CIP-003-4 R1.2.	CIP-003-5 R4	The cyber security policy is readily available – The Responsible Entity only needs to make individuals aware of elements of the cyber security policy related to their job function. This was in response to general confusion around the term "readily available". Examples of how to make individuals aware are listed in the Measures.
CIP-003-4 R1.3.	CIP-003-5 R3	Annual review and approval – No significant change.
CIP-003-4 R2.	CIP-003-5 R1	Single senior manager – Created a definition of CIP Senior Manager to prevent cross referencing across Standards.
CIP-003-4 R2.1.	CIP-003-5 R1	The CIP Senior Manager shall be identified by name, title, and date of designation – The CIP Senior Manager only needs to be identified by name. The other details were considered unnecessary, administrative requirements.
CIP-003-4 R2.2.	CIP-003-5 R6	Changes to the CIP Senior Manager and any delegations must be documented within thirty calendar days of the change.

CIP-003-4 R2.3.	CIP-003-5 R5	Delegate authority – Made clear that the CIP Senior Manager can delegate the ability to delegate. For example, a senior manager can delegate the ability to further delegate responsibility for a plant control system to a plant manager.
CIP-003-4 R2.4.	DELETED	Authorize and document any exception – The FERC Order 706 made clear that you could not take exceptions to the policy. As a result, it did not achieve a reliability objective to require individuals to maintain documentation about exceptions to their policy outside of the Standards.
CIP-003-4 R3.	DELETED	Exceptions – The FERC Order 706 made clear that you could not take exceptions to the policy. As a result, it did not achieve a reliability objective to require individuals to maintain documentation about exceptions to their policy outside of the Standards.
CIP-003-4 R3.1.	DELETED	Requirement R3 is deleted.
CIP-003-4 R3.2.	DELETED	Requirement R3 is deleted.
CIP-003-4 R3.3.	DELETED	Requirement R3 is deleted.
CIP-003-4 R4.	CIP-011-1 R1, 1.1, 1.2	Information Protection - Removed the explicit requirement for classification as there was no requirement to have multiple levels of protection. This modification does not prevent having multiple levels of classification, allowing more flexibility for entities to incorporate the CIP information protection program into their normal business. Removed language to “protect” information and replaced with “Implement handling and access control” to clarify the protection that is required.
CIP-003-4 R4.1.	Definition	Identification – Replace this requirement with the defined term BES Cyber System Information.

CIP-003-4 R4.2.	CIP-011-1 1.1	Classification – Removed the explicit requirement for classification as there was no requirement to have multiple levels of protection. This modification does not prevent having multiple levels of classification, allowing more flexibility for entities to incorporate the CIP information protection program into their normal business.
CIP-003-4 R4.3.	CIP-011-1 1.3	Assessment – No significant changes.
CIP-003-4 R5.	CIP-004-5 6.3, CIP-011-1 1.2	Authorize personnel for access to protected information – Clarified the "program for managing access" included the authorization of access as well as handling and access control procedures.
CIP-003-4 R5.1.	DELETED	Authorizing personnel – Personnel are still required to have authorization, and the CIP Senior Manager authorizes or delegates this responsibility. So the additional requirement to have and maintain a list is considered duplicative and unnecessary.
CIP-003-4 R5.1.1.	DELETED	Personnel shall be identified – 5.1 is deleted.
CIP-003-4 R5.1.2.	DELETED	Verification – 5.1 is deleted.
CIP-003-4 R5.2.	CIP-004-5 6.6	Verify access privileges annually – Moved requirement to ensure consistency among access reviews. Clarified precise meaning in the term annual. Clarified what was necessary in performing verification by stating the objective was to confirm access privileges are correct and the minimum necessary for performing assigned work functions.
CIP-003-4 R5.3.	CIP-011-1 1.3	Annual Review – No significant changes.

CIP-003-4 R6.	CIP-010-1 R1, R2	Change Control and Configuration Management – Moved configuration change management to a separate Standard because of the additional requirements necessary for satisfying FERC directives and the subject matter is currently spread across CIP-003-4 and CIP-007-4. The baseline requirement is incorporated from the DHS Catalog for Control Systems Security. The baseline requirement is also an attempt to clarify precisely when the change management process must be invoked and which elements of the configuration must be managed. Added requirement to explicitly authorize changes. This requirement was previously implied by CIP-003-4 R6.

Standard: CIP-004-4 – Cyber Security—Personnel & Training		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-004-4 R1.	CIP-004-5 R1, 1.1	Security awareness program and quarterly reinforcement - Changed to remove the need to ensure everyone with authorized access receive this material and moved example mechanisms to guidance..
CIP-004-4 R2.	CIP-004-5 R2, R3	Training - Addition of identifying the roles that require training. Adding specific role-based training for the visitor control program and storage media as part of the handling of BES Cyber Systems information. Also added the FERC Order 706-directed electronic interconnectivity supporting the operation and control of BES Cyber Systems. This requirement is also reorganized into the respective requirements for "program" and "implementation" of the training.
CIP-004-4 R2.1.	CIP-004-5 3.1	Training prior to authorized access – No significant changes.
CIP-004-4 R2.2.	CIP-004-5 2.1-2.10	Training subject matter – This requirement is reorganized into the respective requirements for "program" and "implementation" of the training.
CIP-004-4 R2.2.1.	CIP-004-5 2.2	Proper use of CCAs – Minor wording changes. Changed to address cyber security issues, not the business or functional use of the BES Cyber System.
CIP-004-4 R2.2.2.	CIP-004-5 2.3,2.4	Physical and electronic access controls training – No significant changes.
CIP-004-4 R2.2.3.	CIP-004-5 2.6	Information handling training – Core training added for the handling of BES Cyber System Information, with the addition of storage media
CIP-004-4 R2.2.4.	CIP-004-5 2.7,2.8,2.9	Incident identification and notification, incident handling and CCA recovery training – Core training on the action plans and procedures to recover or re-establish BES Cyber Systems for individuals having a role in the recovery to address FERC Order 706 paragraph 413.

CIP-004-4 R2.3.	CIP-004-5 3.2	Annual training – Replaced Annually with calendar year, not to exceed 15 months. .
CIP-004-4 R3.	CIP-004-5 R4, R5, 5.1	Personnel Risk Assessment –Split into two requirements, R4 to define the PRA program and R5 to implement the program for individuals prior to obtaining authorized access.
CIP-004-4 R3.1.	CIP-004-5 4.1, 4.2	Identification and 7 year criminal check – Addressed interpretation request in guidance. Specified that identify verification is only required for each individual's initial assessment. Specify that the seven year criminal history check covers all locations where the individual has resided, been employed, and/or attended school for six months or more, including current residence regardless of duration. Added additional wording based on interpretation request. Provision is made for when a full seven year check cannot be performed.
CIP-004-4 R3.2.	CIP-004-5 5.2	Perform the PRA every 7 years.– Removed the "for cause" part of the requirement.
CIP-004-4 R3.3.	CIP-004-5 4.4	Addresses the contractor or vendor performed PRA.
CIP-004-4 R4.	CIP-004-5 6.1, 6.2	Authorize access - CIP-003-4, CIP-004-4 CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a "need to know" basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.
CIP-004-4 R4.1.	CIP-004-5 6.4	Quarterly review of access – Feedback among team members, observers, and regional CIP auditors indicates there has been confusion in implementation around what the term "review" entailed in CIP-004-4 R4.1. This requirement clarifies the review should occur between the provisioned access and authorized access.

CIP-004-4 R4.2.	CIP-004-5 R7	Prevent further access - The FERC Order 706 Paragraph 460 and 461 directs modifications to the Standards to require immediate revocation for any person no longer needing access. To address this directive, this requirement specifies revocation concurrent with the termination instead of within 24 hours. For transfers, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement from NIST 800-53 version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers.
NEW	CIP-004-5 2.1	Added to help facilitate understanding what roles the entity has to support the role based training program.
NEW	CIP-004-5 2.5	Visitor control program training – Personnel administering the visitor control program and/or providing escort should have be part of the core training per FERC Order 706 - paragraph 432.
NEW	CIP-004-5 2.10	Electronic interconnectivity training – Core training programs are intended to encompass networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of BES Cyber Systems per FERC Order 706 - paragraph 434.
NEW	CIP-004-5 4.3	PRA failure criteria – There should be documented criteria or a process used to evaluate personnel risk assessments.

NEW	CIP-004-5 7.2	Transfers – The FERC Order 706 Paragraph 460 and 461 directs modifications to the Standards to require immediate revocation for any person no longer needing access, including transferred employees. In reviewing how to modify this requirement, the SDT determined the date a person no longer needs access after a transfer was problematic because the need may change over time. As a result, the SDT adapted this requirement from NIST 800-53 version 3 to review access authorizations on the date of the transfer. The SDT felt this was a more effective control in accomplishing the objective to prevent a person from accumulating unnecessary authorizations through transfers.
NEW	CIP-004-5 7.3	Completion of revocation – The FERC Order 706 Paragraph 460 and 461 directs modifications to the Standards to require immediate revocation for any person no longer needing access. In order to meet the immediate timeframe, Entities will likely have initial revocation procedures to prevent remote and physical access to the BES Cyber System. Some cases may take more time to coordinate access revocation on individual Cyber Assets and applications without affecting reliability. This requirement provides the additional time to review and complete the revocation process. Although the initial actions already prevent further access, this step provides additional assurance in the access revocation process.
NEW	CIP-004-5 7.4	Completion of revocation (shared accounts) – To provide clarification of expected actions in managing the passwords

Standard: CIP-005-4a – Cyber Security—Electronic Security Perimeter(s)		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-005-4a R1.	CIP-005-5 R1.1	Electronic Security Perimeter identification – Changes include referencing the defined terms Electronic Access Point and BES Cyber System.
CIP-005-4a R1.1.	Definition	Access Points – This was moved to the definition of Electronic Access Points.
CIP-005-4a R1.2.	Guidance	Dial-up accessible CCA – This is a clarifying statement that was moved to guidance.
CIP-005-4a R1.3.	Guidance	Communication links between ESPs – This is a clarifying statement that was moved to guidance.
CIP-005-4a R1.4.	Applicability	Non-Critical Cyber Asset – To remove any cross referencing, these Cyber Assets are now included in the Applicability column for each cyber security requirement.
CIP-005-4a R1.5.	Applicability	Access control and monitoring cyber assets – To remove any cross referencing, these Cyber Assets are now included in the Applicability column for each cyber security requirement.
CIP-005-4a R1.6.	Measures	Maintain Documentation – This is a measure for the requirement to have an ESP.
CIP-005-4a R2.	CIP-005-5 R1	Electronic Access Controls – No significant changes.

CIP-005-4a R2.1.	CIP-005-5 1.2	Deny access by default - Changes include referring to the defined term Electronic Access Point and to focus on the entity knowing and having justification for what it allows through the EAP. The requirement explicitly states the network admission control includes both inbound and outbound connections.
CIP-005-4a R2.2.	CIP-007-5 1.1	Enable specific ports/services – Consolidated port hardening requirements to CIP-007.
CIP-005-4a R2.3.	CIP-005-5 1.3	Secure dial-up – Changed to refer to the defined term Electronic Access Point. Added clarification as to the goal of “secure”, which is that the BES Cyber System should not be directly accessible with a phone number only
CIP-005-4a R2.4.	CIP-005-5 R2,2.3	Strong access control – Added a new requirement for remote access in response to increased vulnerabilities in VPN technology. This requirement also clarified strong access control meant two-factor (or more) authentication.
CIP-005-4a R2.5.	Measures	Evidence requirements are considered as part of the measure.
CIP-005-4a R2.5.1.	CIP-004-5 R6	The processes for access request and authorization – Consolidated with other similar requirements to CIP-004-5
CIP-005-4a R2.5.2.	Measures	The authentication methods - Evidence requirements are considered as part of the measure.
CIP-005-4a R2.5.3.	Measures	The review process for authorization rights, in accordance with Standard CIP-004-3 Requirement R4. - Evidence requirements are considered as part of the measure.
CIP-005-4a R2.5.4.	Measures	The controls used to secure dial-up accessible connections. - Evidence requirements are considered as part of the measure.

CIP-005-4a R2.6.	DELETED	Appropriate Use Banner – The drafting team considered this requirement administrative. The objective of having an appropriate use banner is to prevent accidental use of the system and help allow prosecution of unauthorized individuals accessing the system. The drafting team did not consider either of these rising to the level of meeting a reliability objective.
CIP-005-4a R3.	CIP-007-5 R4, 4.1	Monitoring Electronic Access – Consolidated monitoring requirements to CIP-007-5 R4 to ensure consistent language across all monitoring requirements in the Standards.
CIP-005-4a R3.1.	CIP-007-5 R4, 4.1	Dial-up Accessible – Removed specific references to dial-up devices. The drafting team did not feel further referencing this technology was necessary.
CIP-005-4a R3.2.	CIP-007-5, R4, 4.2	Alerts – Consolidated monitoring requirements to CIP-007-5 R4 to ensure consistent language across all monitoring requirements in the Standards.
CIP-005-4a R4.	CIP-010-1 R3	Cyber Vulnerability Assessment – Consolidated vulnerability assessment requirements to CIP-010-1 R3 to ensure consistent language across all vulnerability assessment requirements.
CIP-005-4a R4.1.	Measures	A document identifying the vulnerability assessment process - Evidence requirements are considered as part of the measure.
CIP-005-4a R4.2.	CIP-010-1 3.1, 3.2	A review to verify that only ports and services required for operations at these access points are enabled - Consolidated vulnerability assessment requirements to CIP-010-1 R3 to ensure consistent language across all vulnerability assessment requirements. As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.

CIP-005-4a R4.3.	CIP-010-1 3.1, 3.2	The discovery of all access points to the Electronic Security Perimeter - Consolidated vulnerability assessment requirements to CIP-010-1 R3 to ensure consistent language across all vulnerability assessment requirements. As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.
CIP-005-4a R4.4.	CIP-010-1 3.1, 3.2	A review of controls for default accounts, passwords, and network management community strings - Consolidated vulnerability assessment requirements to CIP-010-1 R3 to ensure consistent language across all vulnerability assessment requirements. As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.
CIP-005-4a R4.5.	CIP-010-1 3.4	Mitigation plan - Consolidated vulnerability assessment requirements to CIP-010-1 R3 to ensure consistent language across all vulnerability assessment requirements. Added element to have an entity defined date of completion of the mitigation plan per FERC Order 706 para 643.
CIP-005-4a R5.	DELETED	Documentation Review and Maintenance – The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.
CIP-005-4a R5.1.	DELETED	The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.
CIP-005-4a R5.2.	DELETED	The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.
CIP-005-4a R5.3.	CIP-007-5 4.5	Retain relevant log information – Log retention requirements are consolidated to CIP-007-5 R4

NEW	CIP-005-5 1.6	Inspect & detect potential malicious communications – Per FERC Order 706, paragraph 496-503, ESP's need two distinct security measures such that the cyber assets do not lose all perimeter protection if one measure fails or is misconfigured. The Order makes clear this is not simple redundancy of firewalls, thus the drafting team has decided to add the security measure of malicious traffic inspection (IDS/IPS) a requirement for these ESPs.
NEW	CIP-005-5 2.1,2.2	Remote Access: intermediate device and encryption– This is a new requirement to continue the efforts of the Urgent Action team for Project 2010-15: Expedited Revisions to CIP-005-3.

Standard: CIP-006-4c – Cyber Security—Physical Security of Critical Cyber Assets		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-006-4c R1.	CIP-006-5 R1	Physical Security Plan – Removed the requirement for Senior Management approval of the physical security plan because there is already approval of the physical security policy and delegation of the task in complying for this program. Additional approval is not considered necessary to meeting the reliability objective of physically security for the BES Cyber System.
CIP-006-4c R1.1.	CIP-006-5 1.2, 1.3	Physical Security Perimeter - Reworded to reflect the change from Physical Security Perimeter to Defined Physical Boundary.
CIP-006-4c R1.2.	DELETED	No longer requires identifing physical access points and controls at them to reflect the change from Physical Security Perimeter to Defined Physical Boundary
CIP-006-4c R1.3.	CIP-006-5 1.4	Monitor physical access – A documented plan is required as part of CIP-006-5 R1 that references the new alerting term in table row 1.4, which replaces the monitoring term. Otherwise, no significant change.
CIP-006-4c R1.4.	CIP-004-5 2.3	Appropriate use of access controls – The term “appropriate’ is subject to a high degree of subjectivity. The training requirement specifies role-based training on physical access controls.
CIP-006-4c R1.5.	CIP-004-5 R6 and R7	Review of access authorization requests and revocation of access authorization requirements were consolidated to CIP-004-5.
CIP-006-4c R1.6.	CIP-006-5 R2	Visitor control program - A documented program is required as part of CIP-006-5 R2. Otherwise, no significant change.

CIP-006-4c R1.6.1.	CIP-006-5 2.2	Log entry and exit of visitors - Addressed multi entry requirements and added the point of contact who can be considered the sponsor for the person to enter the DPB. There is no need to document the escort or handoffs between escorts.
CIP-006-4c R1.6.2.	CIP-006-5 2.1	Continuous escorted access of visitors – No significant change.
CIP-006-4c R1.7.	DELETED	Update of the physical security plan - The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.
CIP-006-4c R1.8.	DELETED	Annual review of the physical security plan - The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.
CIP-006-4c R2.	Applicability	Protection of Physical Access Control Systems – Applicability to Physical Access Control and Monitoring Systems were moved to the applicability section of each security requirement and added this as a defined term in the glossary.
CIP-006-4c R2.1.	Applicability	Physical Access Control Systems be protected from unauthorized physical access - Applicability to Physical Access Control Systems were moved to the applicability section of each security requirement. For this particular requirement see CIP-006-5 item 1.1
CIP-006-4c R2.2.	Applicability	Protection of Physical Access Control Systems - Applicability to Physical Access Control Systems were moved to the applicability section of each security requirement.
CIP-006-4c R3.	Applicability	Protection of Electronic Access Control Systems - Applicability to what protections Electronic Access Control and Monitoring Systems need were moved to the applicability section of each security requirement.

CIP-006-4c R4.	CIP-006-5 1.2, 1.3	Physical Access Controls - Reworded to reflect the change from Physical Security Perimeter to Defined Physical Boundary. Also addressed FERC Order 706 defense in depth. Examples of methods to implement have been moved to the guidance section of this requirement.
CIP-006-4c R5.	CIP-006-5 1.4, 1.5, 1.6	Monitor physical access – Changed the term to alert for unauthorized access and clarified the actions taken for review of unauthorized physical access alerts. Examples of methods to implement have been moved to the guidance section of this requirement.
CIP-006-4c R6.	CIP-006-5 1.7	Log physical access – CIP-006-4 R6 was specific to the logging of access at identified access points. This now more generally requires logging of physical access into the Defined Physical Boundary. Examples of methods to implement have been moved to the guidance section of this requirement.
CIP-006-4c R7.	CIP-008-5 Evidence Retention	Retain relevant incident related log information is addressed in CIP-008-5
CIP-006-4c R8.	CIP-006-5 R3	Maintenance and Testing
CIP-006-4c R8.1.	CIP-006-5 3.1	Physical access control system 3 yr. testing and maintenance – Shortened periodicity of testing to 2 years to address FERC Order 706 paragraph 581 directives. Added testing of locally mounted security hardware devices.
CIP-006-4c R8.2.	REMOVED	Testing and maintenance records are considered the measurement of item 3.1.
CIP-006-4c R8.3.	CIP-006-5 3.2	Retain outage records – No significant changes.
NEW	CIP-006-5 1.1	Entity based Operational or procedural controls to restrict physical access – To allow for programmatic protection controls as a baseline for Low Impact BES Cyber Assets and Physical Access Control Systems. This does not require detailed lists of individuals with access.

Standard: CIP-007-4 – Cyber Security—Systems Security Management		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-007-4 R1.	CIP-010-1 1.4	Assess security controls following changes - Provides clarity on when testing must occur and requires additional testing to ensure that accidental consequences of planned changes are appropriately managed. This change addresses FERC Order ,paragraphs 397, 609, 610, and 611
CIP-007-4 R1.1.	CIP-010-1 1.4	Test procedures – See description and justification for CIP-007-4 R1.
CIP-007-4 R1.2.	CIP-010-1 1.4	Testing reflects production environment - See description and justification for CIP-007-4 R1.
CIP-007-4 R1.3.	CIP-010-1 1.4	The Responsible Entity shall document test results. - See description and justification for CIP-007-4 R1.
CIP-007-4 R2.	CIP-007-5 R1	Ports and Services – The requirement focuses on the entity knowing and only allowing those ports that are necessary. The additional classification of 'normal or emergency' added no value and has been removed.
CIP-007-4 R2.1.	CIP-007-5 1.1	Enable only those ports and services required for normal and emergency operations – See description and justification for CIP-007-4 R2.
CIP-007-4 R2.2.	CIP-007-5 1.1, 1.2	Disable other ports/services – See description and justification for CIP-007-4 R2.
CIP-007-4 R2.3.	DELETED	Compensating measures – See description and justification for CIP-007-4 R2.

CIP-007-4 R3.	CIP-007-5 R2	Security Patch Management – The existing wording or CIP-007-4 R3, R3.1, and R3.2 was separated into individual line items to provide more granularity. The documentation of a source (s) to monitor for release of security related patches, hotfixes, and/or updates for BES Cyber System or BES Cyber Assets was added to provide context as to when the "release" date was. The current wording stated "document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades" there has been confusion as to what constitutes the availability. Due to issues that may occur regarding Control System vendor license and service agreements flexibility must be given to Responsible Entities to define what sources are being monitored for BES Cyber Assets.
CIP-007-4 R3.1.	CIP-007-5 2.2	Assess patches – Similar to the current wording but added "from the identified source" to establish where the release is from. The current wording: "The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades" has led to varying opinions as to what constitutes "availability" of the patches or upgrades. The addition attempts to clarify where the release is from.
CIP-007-4 R3.2.	CIP-007-5 2.3	Implement patches - This is the same concept as in the current CIP-007 R3.2 wording however a 30 day window was given to allow for documentation of the actual implementation in a less time constrained manner where manual processes are used. Splitting the implementation of security related patches, hotfixes, and/or updates into a separate item from compensating measures will provide granularity. Automated processes allow the implementation to be documented and confirmed electronically in a short time period. Manual processes may take an extended period of time to complete documentation of the installation. Priority should be given to the implementation rather than the documentation.

CIP-007-4 R4.	CIP-007-5 R3, 3.1, 3.2, 3.3, 3.4, 3.5	Malicious Software Prevention – In prior versions, this requirement has arguably been the single greatest generator of TFE's as it prescribed a particular technology to be used on every CCA regardless of that asset's susceptibility or capability to use that technology. As the scope of cyber assets in scope of these standards expands to more field assets, this issue will only grow exponentially. The drafting team is taking the approach of making this requirement a competency based requirement where the entity must document how the malware risk is handled for each BES Cyber System, but it does not prescribe a particular technical method nor does it prescribe that it must be used on every component. The BES Cyber System is the object of protection. Beginning in paragraph 619-622 of FERC Order 706, and in particular 621, FERC agrees that the standard "does not need to prescribe a single method…However, how a responsible entity does this should be detailed in its cyber security policy so that it can be audited for compliance…" In paragraph 622, FERC directs that the requirement be modified to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software through remote access, electronic media, or other means. The drafting team believes that addressing this issue holistically at the BES Cyber System level and regardless of technology, along with the enhanced change management requirements, meets this directive.
CIP-007-4 R4.1.	CIP-007-5 R3, 3.1, 3.2, 3.3	Malware prevention tools – See description and justification for CIP-007-4 R4.
CIP-007-4 R4.2.	CIP-007-5 3.4	Update malicious code detections – See description and justification for CIP-007-4 R4.

CIP-007-4 R5.	CIP-007-5 5.1	Use at least one authentication method – The requirement to enforce authentication for all user access is included here. The requirement to establish, implement, and document controls is included in this introductory requirement. The requirement to have technical and procedural controls was removed because technical controls suffice when procedural documentation is already required. The phrase “that minimize the risk of unauthorized access” was removed and more appropriately captured in the rationale statement.
CIP-007-4 R5.1.	CIP-004-5 6.1	Access authorization – CIP-003-4, CIP-004-4 CIP-006-4, and CIP-007-4 all reference authorization of access in some form, and CIP-003-4 and CIP-007-4 require authorization on a “need to know” basis or with respect to work functions performed. These were consolidated to ensure consistency in the requirement language.
CIP-007-4 R5.1.1.	CIP-003-5 R5	Access authorization – CIP-003-5 R5 requires CIP Senior Manager or delegate approval for all requirements for authorization in the CIP Cyber Security Standards.
CIP-007-4 R5.1.2.	CIP-007-5 4.1	Identify security events for after-the-fact investigation – This requirement is derived from NIST 800-53 version 3 AU-2, which requires organizations to determine system events to audit for incident response purposes. The industry expressed confusion in the term “system events related to cyber security” from informal comments received on CIP-011. Changes made here clarify this term by allowing entities to first define these security events. Access logs from the ESP as required in CIP-005-4 R3 and user access and activity logs as required in CIP-007-5 R5 are also included here.

CIP-007-4 R5.1.3.	CIP-004-5 6.5	Annual account privilege verification – Moved requirements to ensure consistency and eliminate the cross-referencing of requirements. Clarified what was necessary in performing verification by stating the objective was to confirm that access privileges are correct and the minimum necessary for performing assigned work functions.
CIP-007-4 R5.2.	CIP-007-5 5.2	Identify account types and determine acceptable use – CIP-007-4 requires entities to minimize and manage the scope and acceptable use of account privileges. The requirement to minimize account privileges has been removed because the implementation of such a policy is difficult to measure at best.
CIP-007-4 R5.2.1.	CIP-007-5 5.4	Change default vendor passwords – The requirement for the "removal, disabling or renaming of such accounts where possible" has been removed and incorporated into guidance for acceptable use of account types. This was removed because those actions are not appropriate on all account types. Added the option of having unique default passwords to permit cases where a system may have generated a default password or a hard-coded uniquely generated default password was manufactured with the BES Cyber System.
CIP-007-4 R5.2.2.	CIP-007-5 5.2	Identify account types and determine acceptable use
CIP-007-4 R5.2.3.	CIP-007-5 5.3	Identify account types and determine acceptable use – No significant changes. Added "authorized" access to make clear that individuals storing, losing or inappropriately sharing a password is not a violation of this requirement.

CIP-007-4 R5.3.	CIP-007-5 5.5	Implement a password policy – CIP-007-4 R5.3 requires the use of passwords and specifies a specific policy of 6 characters or more with a combination of alpha-numeric and special characters . The level of detail in these requirements can restrict more effective security measures. The password requirements have been changed to permit the maximum allowed by the device in cases where the password parameters could otherwise not achieve a stricter policy. This change still achieves the requirement objective to minimize the risk of unauthorized disclosure of password credentials while recognizing password parameters alone do not achieve this. The drafting team felt allowing the Responsible Entity the flexibility of applying the strictest password policy allowed by a device outweighed the need to track a relatively minimally effective control through the TFE process.
CIP-007-4 R5.3.1.	CIP-007-5 5.5	Password length – See description and justification for CIP-007-4 R5.3.
CIP-007-4 R5.3.2.	CIP-007-5 5.5	Password complexity – See description and justification for CIP-007-4 R5.3.
CIP-007-4 R5.3.3.	CIP-007-5 5.5	Password change frequency – See description and justification for CIP-007-4 R5.3.
CIP-007-4 R6.	CIP-007-5 R4	Security Status Monitoring – Consolidated requirements for monitoring electronic events into CIP-007-5 R4.
CIP-007-4 R6.1.	CIP-007-5 4.1	Identify security events – This requirement is derived from NIST 800-53 version 3 AU-2, which requires organizations to determine system events to audit for incident response purposes. The industry expressed confusion in the term “system events related to cyber security” from informal comments received on CIP-011. Changes made here clarify this term by allowing entities to first define these security events. Access logs from the ESP as required in CIP-005-4 R3 and user access and activity logs as required in CIP-007-5 R5 are also included here.

CIP-007-4 R6.2.	CIP-007-5 4.2	Identify security events for real-time alerting – This requirement is derived from alerting requirements in CIP-005-4 R3.2 and CIP-007-4 R6.2 in addition to NIST 800-53 version 3 AU-6. Previous CIP Standards required alerting on unauthorized access attempts and detected Cyber Security Incidents, which can be vast and difficult to determine from day to day. Changes to this requirement allow the entity to determine events that necessitate an immediate response.
CIP-007-4 R6.3.	CIP-007-5 4.1	Identify security events for after-the-fact investigation – See description and justification for CIP-007-4 R6.1.
CIP-007-4 R6.4.	CIP-007-5 4.4	Retain relevant log information – No significant changes.
CIP-007-4 R6.5.	CIP-007-5 4.3	Review logs – Beginning in paragraph 525 and also 628 of the FERC Order 706, the commission directs a manual review of security event logs on a more periodic basis and suggests a weekly review. The Order acknowledges it is rarely feasible to review all system logs. Indeed, log review is a dynamic process that should improve over time and with additional threat information. Changes to this requirement allow for a weekly summary or sampling review of logs.
CIP-007-4 R7.	CIP-011-1 2.1	Erase media no longer needed to store protected information – Consistent with FERC Order 706, paragraph 631, clarified that the goal was to prevent the unauthorized retrieval of information from the media, removing the word “erase” as, depending on the media itself, erasure may not be sufficient to meet this goal. Removed requirement explicitly requiring records of destruction/redeployment because this was implied as a measure of compliance.
CIP-007-4 R7.1.	CIP-011-1 2.2	Disposal – See description and justification for CIP-007-4 R7.
CIP-007-4 R7.2.	CIP-011-1 2.1	Redeployment – See description and justification for CIP-007-4 R7.

CIP-007-4 R7.3.	Measures	See description and justification for CIP-007-4 R7.
CIP-007-4 R8.	CIP-010-1 R3	Cyber Vulnerability Assessment – Consolidated requirements for vulnerability assessments from CIP-005-4 and CIP-007-4.
CIP-007-4 R8.1.	Measures	A document identifying the vulnerability assessment process – This is example evidence required for compliance.
CIP-007-4 R8.2.	CIP-010-1 3.1, 3.2	Ports and services review – As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.
CIP-007-4 R8.3.	CIP-010-1 3.1, 3.2	A review of controls for default accounts – As suggested in FERC Order 706 paragraph 644, the details for what should be included in the assessment are left to guidance.
CIP-007-4 R8.4.	CIP-010-1 3.4	Mitigation plan – Added a requirement for an entity planned date of completion as per the FERC directive in Order 706, paragraph 643.
CIP-007-4 R9.	DELETED	Documentation Review and Maintenance – The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.
NEW	CIP-007-5 1.2	Restrict physical I/O ports – In the March 18, 2010 FERC issued an order to approve NERC's interpretation of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports and services" refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the drafting team to address unused physical ports.

NEW	CIP-007-5 2.1	Identify patch sources – Defining the source(s) that a Responsible Entity monitors for the release of security related patches, hotfixes, and/or updates will provide a starting point for assessing the effectiveness of the patch management program. Documenting the source is also used to determine when the assessment timeframe clock starts. This requirement also handles the situation where security patches can come from an original source (such as an operating system vendor), but must be approved or certified by another source (such as a control system vendor) before they can be assessed and applied in order to not jeopardize the availability or integrity of the control system.
NEW	CIP-007-5 4.3	Generate real-time alerts and respond to audit-processing failures – This requirement was derived from NIST 800-53 version 3 AU-5, which addresses response to audit processing failures. Some interpretations of version 4 CIP Cyber Security Standards considered the failure of the security event monitoring and alerting system to be a violation. The purpose of this requirement is to have mitigation in place rather than penalizing audit processing failures.
NEW	CIP-007-5 5.6	Limits or alerts on exceeding unsuccessful log in attempts threshold – Minimizing the number of unsuccessful login attempts significantly reduces the risk of live password cracking attempts. This is a more effective control in live password attacks than password parameters.

NEW	CIP-007-5 R6	Limit malicious code on maintenance devices – This is a new requirement to address the FERC Order 706 paragraph 621 directive to protect against personnel introducing malicious code into the BES Cyber System. This requirement also clarifies that these devices may be temporarily connected to the BES Cyber System, but do not become a part of the BES Cyber System, nor are they considered Protective (Protected??) Cyber Assets. These devices may be temporarily connected locally to the BES Cyber System for maintenance, but must be protected from introducing malicious code or creating an additional electronic access point.

Standard: CIP-008-4 – Cyber Security—Incident Reporting and Response Planning		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-008-4 R1.	CIP-008-5 R1	Cyber Security Incident Response Plan – Separated requirement into multiple requirements in a comparable manner as CIP-009-4 where individual aspects of maintaining the plan are listed as separate requirements. The requirement to have an Incident Response Plan now applies to all Responsible Entities as a foundational element of a cyber security program for BES Cyber Systems.
CIP-008-4 R1.1.	CIP-008-5 1.1	Identify reportable cyber security events – Defined the term Reportable Cyber Security Incident and further described the meaning in relation to CIP-008-5.
CIP-008-4 R1.2.	CIP-008-5 1.2	Roles and responsibilities of incident response teams – No significant changes.
CIP-008-4 R1.3.	DELETED	Reporting cyber security incidents – Coordinating with EOP-004-2 drafting team to ensure EOP-004-2 becomes the single Standard for reporting incidents, and ensure EOP-004-2 references the defined term Reportable Cyber Security Incidents.
CIP-008-4 R1.4.	CIP-008-5 3.3	Update incident response plan following review – Included additional specification on update of response plan Addresses FERC Order 706 Paragraph 686 directive to modify on lessons learned and aspects of the DHS Controls.
CIP-008-4 R1.5.	CIP-008-5 3.1	Review incident response plans annually – No significant changes.
CIP-008-4 R1.6.	CIP-008-5 2.1	Test incident response plans annually – No significant changes.
CIP-008-4 R2.	DELETED	Cyber Security Incident Documentation – The drafting team considered this requirement fully administrative and as part of the internal program to maintain compliance evidence.

NEW	CIP-008-5 3.5	Communicate incident response plan updates – Added specific timing requirement on communication of plan changes based on review of the DHS Controls and NIST 800-53 guideline.

Standard: CIP-009-4 – Cyber Security—Recovery Plans for Critical Cyber Assets		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
CIP-009-4 R1.	CIP-009-5 3.1	Recovery Plan – Added the requirements to additionally review plans after system replacement. Also added requirement for documentation of any identified deficiencies or lessons learned.
CIP-009-4 R1.1.	CIP-009-5 1.1	Conditions for activation of recovery plan – Reworded to address FERC Order 706 paragraph 694 directive and simplified the requirement.
CIP-009-4 R1.2.	CIP-009-5 1.2	Roles and responsibilities of recovery plan responders – No significant changes.
CIP-009-4 R2.	CIP-009-5 2.1	Test recovery plan annually – No significant changes.
CIP-009-4 R3.	CIP-009-5 3.2	Review results of recovery plan activities (tests, events) – Added the timeframe for update.
CIP-009-4 R4.	CIP-009-5 1.3	Backup processes – No significant changes.
CIP-009-4 R5.	CIP-009-5 2.2	Test information used for recovery – Combined Requirement from CIP-009-4 R5 and included requirement to test when initially stored. Addresses FERC Order 706 directives 739 and 748 related to testing of backups.
NEW	CIP-009-5 1.4	Testing of backup media – Addresses FERC Order 706 paragraph 739 and 748 directives regarding the testing of backup media.
NEW	CIP-009-5 1.6	Process to preserve data for analysis – Added requirement to address FERC Order 706, paragraph 706 regarding the necessity to have procedures in place to retain cyber asset evidence as part of the recovery planning.

NEW	CIP-009-5 3.5	Communicate recovery plan updates – This change ensures that recovery personnel are aware of any changes to recovery plans.

Standard: New Requirements in CIP-010-1 and CIP-011-1		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
NEW	CIP-010-1 1.1	Baseline configuration – Baseline requirement incorporated from the DHS Catalog for Control Systems Security (also NIST 800-53). The baseline requirement is also an attempt to clarify precisely when the change management process must be invoked and which elements of the configuration must be managed.
NEW	CIP-010-1 2.1	Monitor for changes to the baseline configuration – Monitoring of the configuration of the BES Cyber System provides an express acknowledgement of the need to consider malicious actions along with intentional changes. This change addresses FERC Order 706, paragraph 397 directive and is based on a review of DHS Catalog of Security Controls (or NIST 800-53).
NEW	CIP-010-1 3.2	Live Vulnerability Assessment – Addresses FERC Order 706 paragraph 541, 542, 544 and 547 directives regarding the performance of a live vulnerability assessment in a test environment.
NEW	CIP-010-1 3.3	Perform active VA on new BES Cyber Assets - Addresses FERC Order 706 paragraph 541, 542, 544 and 547 directives regarding the performance of a vulnerability assessment prior to placing a new Cyber Asset into production.

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CIP Standards Version 5 Requirements & Status

Philip Huff – Arkansas Electric Cooperative Corporation
Doug Johnson – Commonwealth Edison Company
David Revill – Georgia Transmission Corporation

CSO706 SDT Webinar
August 24, 2011

Agenda

- Background
- Version 4 - Overview
- Version 5 – Requirements Summary
- Schedule and Implementation Plan

Project Background

Version 1

- Filed with FERC August 28, 2006
- Approved by FERC January 18, 2008
- Effective July 1, 2008 through January 1, 2010 (phased)

Version 2

- Low-hanging fruit
- Filed with FERC May 22, 2009
- Approved by FERC September 30, 2009
- Effective April 1, 2010

Version 3

- Compliance filing to Version 2
- Filed with FERC December 29, 2009
- Approved by FERC March 31, 2010
- Effective October 1, 2010

CIP-002-4 Overview

- **Version 4** of the CIP Standards
- Approved by Industry **December 30, 2010**
- Submitted to FERC **February 10, 2011**
  - 2,232 page filing
  - Filing included CIP-002-4 through CIP-009-4, but only changes in CIP-002-4

Looking Ahead to Version 5

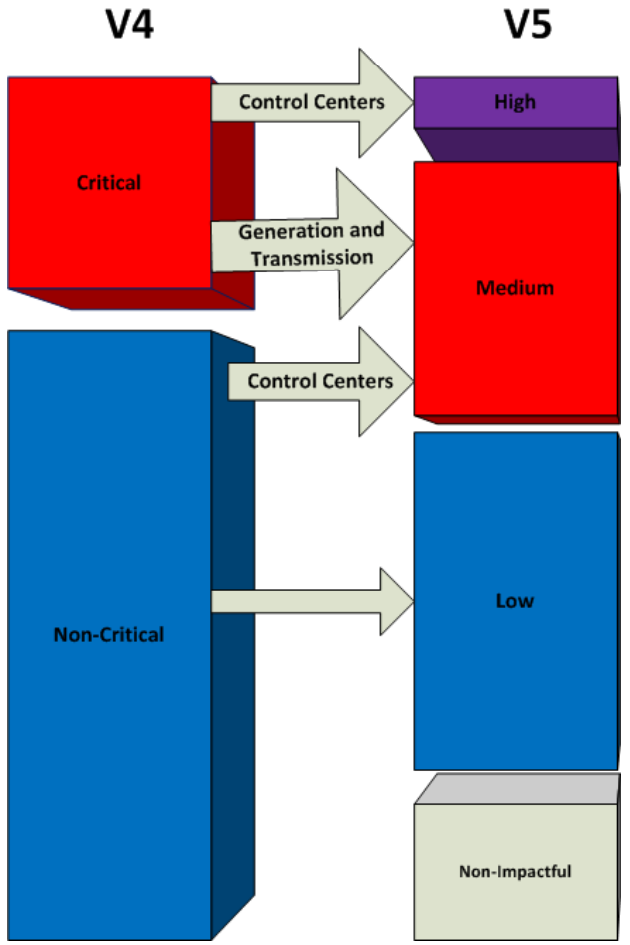
- The SDT continues work to address the remaining 50+ issues in Order 706
  - Version 5 builds on CIP-002-4 and previous drafts of CIP-010 & 011
  - Use similar content structure and terminology as previous CIP Standards (CIP-002 through CIP-009)

Development Goals

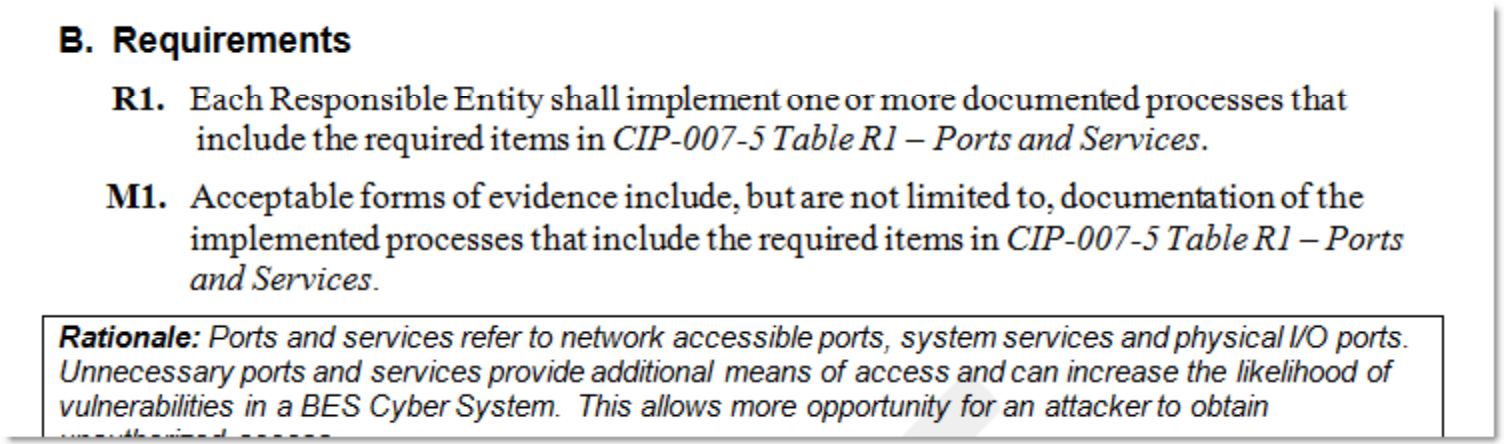
Goal 1: To address the remaining Requirements-related directives from all CIP related FERC orders, all approved interpretations, and CAN topics within applicable existing requirements	**Goal 5**: To minimize technical feasibility exceptions
Goal 2: To develop consistent identification criteria of BES Cyber Systems and application of cyber security requirements that are appropriate for the risk presented to the BES	**Goal 6:** To develop requirements that foster a "culture of security" and due diligence in the industry to complement a "culture of compliance"
Goal 3: To provide guidance and context for each Standard Requirement	**Goal 7:** To develop a realistic and comprehensible implementation plan for the industry
Goal 4: To leverage current stakeholder investments used for complying with existing CIP requirements	

Levels of Impact

- High Impact
  - Large Control Centers
  - CIP-003 through 009+
- Medium Impact
  - Generation and Transmission
  - Other Control Centers
  - Similar to CIP-003 to 009 v4
- All other BES Cyber Systems
  - Security Policy
  - Security Awareness
  - Incident Response
  - Boundary Protection



Format (1/4) – Introductory Requirement



B. Requirements

R1. Each Responsible Entity shall implement one or more documented processes that include the required items in *CIP-007-5 Table R1 – Ports and Services*.

M1. Acceptable forms of evidence include, but are not limited to, documentation of the implemented processes that include the required items in *CIP-007-5 Table R1 – Ports and Services*.

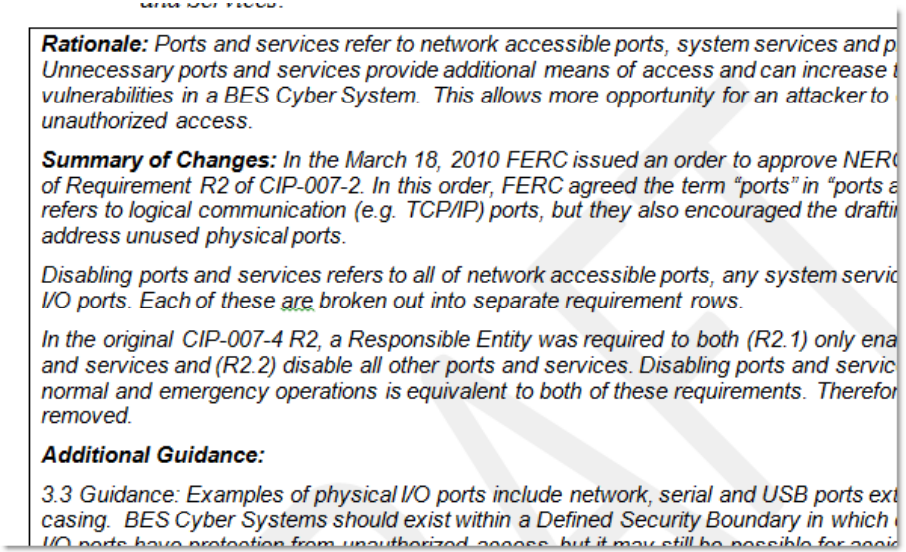
Rationale: *Ports and services refer to network accessible ports, system services and physical I/O ports. Unnecessary ports and services provide additional means of access and can increase the likelihood of vulnerabilities in a BES Cyber System. This allows more opportunity for an attacker to obtain*

- Requirement/measures for implemented procedures in most requirements
- Most requirements reference a table immediately below

Format (2/4) – Contextual Boxes

- **Rationale –** Purpose of requirement and any assumptions made about the requirement
- **Summary of Changes –** High level overview of changes in this requirement
- **Guidance –** Additional guidance in applying the requirement

Work in Progress



Rationale: *Ports and services refer to network accessible ports, system services and p*
Unnecessary ports and services provide additional means of access and can increase t
vulnerabilities in a BES Cyber System. This allows more opportunity for an attacker to
unauthorized access.

Summary of Changes: *In the March 18, 2010 FERC issued an order to approve NERC*
of Requirement R2 of CIP-007-2. In this order, FERC agreed the term "ports" in "ports a
refers to logical communication (e.g. TCP/IP) ports, but they also encouraged the draftin
address unused physical ports.

Disabling ports and services refers to all of network accessible ports, any system servic
I/O ports. Each of these are broken out into separate requirement rows.

In the original CIP-007-4 R2, a Responsible Entity was required to both (R2.1) only ena
and services and (R2.2) disable all other ports and services. Disabling ports and servic
normal and emergency operations is equivalent to both of these requirements. Therefor
removed.

Additional Guidance:

3.3 Guidance: Examples of physical I/O ports include network, serial and USB ports ext
casing. BES Cyber Systems should exist within a Defined Security Boundary in which

Format (3/4) – Requirement Row

	CIP-007-5 Table R3 – Malicious Code Prevention		
	Applicability	**Requirement**	**Measurement**
3.1	High and Medium Impact BES Cyber Systems	Deploy method(s) to deter, detect, or prevent malicious code.	Examples of acceptable evidence include, but are not limited to, policies and/or processes that show for the types of BES Cyber Assets in the BES Cyber System how the Responsible Entity is limiting the introduction of malicious code (i.e. through

- Measurement specifies acceptable evidence of compliance associated with the requirement row

Format (4/4) – Applicability

- All Responsible Entities
- High Impact BES Cyber Systems
- Medium Impact BES Cyber Systems
- External Connectivity Attributes – Routable or Dial-up connectivity
- Associated Electronic Access Control Systems – CIP-005-4 R1.5
- Associated Physical Access Control Systems – CIP-006-4 R2
- Associated Protected Cyber Systems – Non-Critical Cyber Assets within an ESP

NERC

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

CIP-002-5 – CIP-011-5

to ensure the reliability of the bulk power system

CIP-002-5 Summary of Modifications

- Categorized list of High and Medium Impact
  - Attachment 1 criteria
- Other BES Cyber Systems deemed to be Low Impact by default
- Update required lists for significant changes to BES that affect High/Medium categorization
- Senior manager or delegate annual review and approval

CIP-002-5 Impact Criteria (Attachment 1)

- High: Large Control Centers (e.g. RC, BA, TOP)
- Medium: Significant impact field assets, other Control Centers
- Other BES Cyber Systems deemed to be Low Impact by default
- Based on V4 criteria
  - Review of Transmission voltage threshold by SDT for V5
  - Use of MVA bright-line under consideration

CIP-003-5 Summary of Modifications (1/2)

- CIP-003-5 was reorganized to only include elements of policy and cyber security program governance
  - Elements that addressed Change Control and Configuration Management were moved to CIP-010-5
  - Elements that address Information Protection were moved to CIP-011-5

CIP-003-5 Summary of Modifications (2/2)

- Additional flexibility was added to the Cyber Security Policy requirement by explicitly allowing for multiple policies and specifying the topical areas (as opposed to all requirements) that the policy must address
- The SDT has removed the requirement to document exceptions to the policy, although discussions of this approach with FERC staff are ongoing

CIP-003-5 Addressing FERC Directives

FERC Order 706 Para. 376

"the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards."

- The SDT considers this a general management issue that is not within the scope of a compliance requirement.
- The SDT found no reliability basis in this requirement.
- The SDT has proposed removing the requirement for documented exceptions to the Cyber Security Policy.

CIP-004-5 Summary of Modifications (1/3)

- Security Awareness
  - Continues to be general awareness that is refreshed quarterly and not formal tracked training
- Training
  - Addition of visitor control program
  - electronic interconnectivity supporting the operation and control of BES Cyber Systems
  - storage media as part of the handling of BES Cyber Systems information
  - Reorganization of requirements into the respective requirements for “program” and “implementation” of the training.

CIP-004-5 Summary of Modifications (2/3)

- Personnel Risk Assessment
  - Changed to only initial identity verification
  - Now includes documenting the processes used to determine when to deny access
  - Reorganization of requirements into the respective requirements for “program” and “implementation”

CIP-004-5 Summary of Modifications (3/3)

- Authorization
  - Consolidated authorization and review requirements from CIP-003-4, CIP-004-4, CIP-006-4 and CIP-007-4
  - Allow quarterly and annual reviews to find and fix problems rather than self-report everything as a violation
- Revocation
  - Remove ability to access BES Cyber System when access no longer needed

CIP-004-5 Addressing FERC Directives (Training)

FERC Order 706 Para. 433	""we direct the ERO to consider, in developing modifications to CIP-004-1, whether identification of core training elements would be beneficial and, if so, develop an appropriate modification to the Reliability Standard."
FERC Order 706 Para. 434	"The Commission adopts the CIP NOPR's proposal to direct the ERO to modify Requirement R2 of CIP-004-1 to clarify that cyber security training programs are intended to encompass training on the networking hardware and software and other issues of electronic interconnectivity supporting the operation and control of critical cyber assets."
FERC Order 706 Para. 435	"Consistent with the CIP NOPR, the Commission directs the ERO to determine what, if any, modifications to CIP-004-1 should be made to assure that security trainers are adequately trained themselves."

- The SDT addressed this by identifying the training topics that should be provided in the Training Program.
- The SDT added this as a topic for role specific training.
- Take actions to remove the ability to access the BES Cyber System when access is no longer required

CIP-004-5 Addressing FERC Directives (Immediate Revocation)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

FERC Order 706 Para. 460

"The Commission adopts the CIP NOPR proposal to direct the ERO to develop modifications to CIP-004-1 to require immediate revocation of access privileges when an employee, contractor or vendor no longer performs a function that requires physical or electronic access to a critical cyber asset for any reason (including disciplinary action, transfer, retirement, or termination)."

- Take actions to remove the ability to access the BES Cyber System when access is no longer required

CIP-005-5 Summary of Modifications

- Define ‘External Connectivity’ for scope modification
- Focus on ‘Electronic Access Points’ vs. ESP
- Require IDS at Control Centers
- Add clarity to ‘secure’ dialups
- Consolidated Monitoring and Vulnerability Assessment Requirements in CIP-007 and CIP-011 respectively
- Removed Appropriate Use Banner
- Incorporated CIP-005-4 Urgent Action revisions

CIP-005-5 Addressing FERC Directives (2 Security Measures – Defense in Depth)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

FERC Order 706 Para. 496

"Commission adopts the CIP NOPR's proposal to direct the ERO to develop a requirement that each responsible entity must implement a defensive security approach including two or more defensive measures in a defense in depth posture when constructing an electronic security perimeter."

- Deploy methods to inspect communications and detect potential malicious communications for all External Connectivity (Intrusion Detection)

CIP-006-5 Summary of Modifications

- Physical Security Program
  - Must define the operational or procedural controls to restrict physical access
  - Removed current “6 wall” wording to instead require Defined Physical Boundary
  - For High Impact, added the need to utilize two or more different and complementary physical access controls to restrict physical access
  - Testing changed to a 24-month cycle with ongoing discussions of different cycles based on environment

CIP-006-5 Addressing FERC Directives

FERC Order 706 Para. 572

"The Commission adopts the CIP NOPR proposal to direct the ERO to modify this CIP Reliability Standard to state that a responsible entity must, at a minimum, implement two or more different security procedures when establishing a physical security perimeter around critical cyber assets."

- The SDT added this for High Impact BES Cyber Assets

FERC Order 706 Para. 581

"The Commission adopts the CIP NOPR proposal and directs the ERO to develop a modification to CIP-006-1 to require a responsible entity to test the physical security measures on critical cyber assets more frequently than every three years,."

- The SDT changed to a 24 month testing cycle but is also still discussing different cycles based on environment

CIP-007-5 Summary of Modifications (1/2)

- Addition of physical I/O port requirement
- Security Patch mgt source requirement
- Non-prescriptive malware requirement
- Security Event Monitoring failure handling
- Bi-weekly log summary/sampling reviews

CIP-007-5 Summary of Modifications (2/2)

- Simplified access-control requirements, removed TFE language while strengthening password requirements
- Added requirement for maintenance devices
- Consolidated vulnerability assessment in CIP-010-5
- Disposal requirement moved to CIP-011-5

CIP-007-5 Addressing FERC Directives (Log Review)

FERC Order 706 Para. 525	"The Commission adopts the CIP NOPR proposal to require the ERO to modify CIP-005-1 to require logs to be reviewed more frequently than 90 days, but clarifies its direction in several respects. At this time, the Commission does not believe that it is necessary to require responsible entities to review logs daily…"
FERC Order 706 Para. 628	"Requirement R6 of CIP-007-1 does not address the frequency with which log should be reviewed. Requirement R6.4 requires logs to be retained for 90 calendar days. This allows a situation where logs would only be reviewed 90 days after they are created. The Commission continues to believe that, in general, logs should be reviewed at least weekly…"

- The SDT Proposes the performance of a review of log summaries or samples every two weeks.

CIP-007-5 Addressing FERC Directives (Malware)

FERC Order 706 Para. 620

"The Commission will not adopt Consumers' recommendation that every system in an electronic security perimeter does not need antivirus software. Critical cyber assets must be protected, regardless of the operating system being used. Consumers has not provided convincing evidence that any specific operating system is not directly vulnerable to virus attacks. Virus technology changes every day. Therefore we believe it is in the public interest to protect all cyber assets within an electronic security perimeter, regardless of the operating system being used…"

FERC Order 706 Para. 622

"The Commission also directs the ERO to modify Requirement R4 to include safeguards against personnel introducing, either maliciously or unintentionally, viruses or malicious software to a cyber asset within the electronic security perimeter through remote access, electronic media, or other means, consistent with our discussion above.

- Rewrote the requirement as a competency based requirement that does not prescribe technology.
- Added Maintenance to cover malware on removable media.

CIP-007-5 Addressing FERC Directives (Ports & Services)

March 18th Order on ports/services

"The Commission recognizes and encourages NERC's intention to address physical ports to eliminate the current gap in protection as part of its ongoing CIP Reliability Standards project scheduled for completion by the end of 2010. Should this effort fail to address the issue, however, the Commission will take appropriate action, which could include directing NERC to produce a modified or new standard that includes security of physical ports."

- The SDT proposes to address this directive by having a requirement to disable or restrict use of physical I/O ports

CIP-008-5 Summary of Modifications

- Defined Reportable Cyber Security Incident
- Working to harmonize with EOP-004-2
- Includes additional specification on update and lessons learned associated with the response plan

CIP-008-5 Addressing FERC Directives

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

FERC Order 706 Para. 661

"the Commission directs the ERO to develop a modification to CIP-008-1 to: (1) include language that takes into account a breach that may occur through cyber or physical means; (2) harmonize, but not necessarily limit, the meaning of the term reportable incident with other reporting mechanisms, such as DOE Form OE 417; (3) recognize that the term should not be triggered by ineffectual and untargeted attacks that proliferate on the internet; and (4) ensure that the guidance language that is developed results in a Reliability Standard that can be audited and enforced."

A1

1. Added: Reportable Cyber Security Incidents are either:

- Any malicious act or suspicious event or events that compromise, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a BES Cyber System.
  or
- Any event or events which have either impacted or have the potential to impact the reliability of the Bulk Electric System (Reliability Function CIP-002-5).

2. Retired R1.3 which contained provisions for reporting Cyber Security Incidents. This is now addressed in EOP-004-2, Requirement 1, Part 1.3. Will need to give instruction to report as a "Reportable Cyber Security Event" in EOP-004 space.

3. See R1.1 above

4. Guidance and measurements are being developed accordingly

Slide 33

A1 Rework text format to be consistent with other slide formats (bullets and fonts).Applied to tother slides in CIP-008 and CIP-009 as well.

Author, 8/19/2011

CIP-008-5 Addressing FERC Directives

FERC Order 706 Para. 673

"The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1 to require each responsible entity to contact appropriate government authorities and industry participants in the event of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.."

Cyber Security - Incident Reporting and Response Planning: Retired R1.3 which contained provisions for reporting Cyber Security Incidents. This is now addressed in EOP-004-2, Requirement 1, Part 1.3 and Attachment 1

CIP-008-5 Addressing FERC Directives

FERC Order 706 Para. 676

"the Commission directs the ERO to modify CIP-008-1 to require a responsible entity to, at a minimum, notify the ESISAC and appropriate government authorities of a cyber security incident as soon as possible, but, in any event, within one hour of the event, even if it is a preliminary report.."

– Cyber Security - Incident Reporting and Response Planning: Retired R1.3 which contains provisions for reporting Cyber Security Incidents. This is addressed in EOP-004-2, Requirement 1, Part 1.3.

CIP-008-5 Addressing FERC Directives

FERC Order 706 Para. 686

"The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-008-1, Requirement R2 to require responsible entities to maintain documentation of paper drills, full operational drills, and responses to actual incidents, all of which must include lessons learned.The Commission further directs the ERO to include language in CIP-008-1 to require revisions to the incident response plan to address these lessons learned.."

R3.3 and R3.4 Includes additional specification on update of response plan Addresses FERC Requirement (686) to modify on lessons learned and aspects of the DHS Controls

CIP-009-5 Summary of Modifications

- Added requirement to implement the response plan
- Verification of backup media information prior to storage
- Preservation of data for analysis

CIP-009-5 Addressing FERC Directives

FERC Order 706 Para. 694

"For the reasons discussed in the CIP NOPR, the Commission adopts the proposal to direct the ERO to modify CIP-009-1 to include a specific requirement to implement a recovery plan..We further adopt the proposal to enforce this Reliability Standard such that, if an entity has the required recovery plan but does not implement it when the anticipated event or conditions occur, the entity will not be in compliance with this Reliability Standard"

Added specific R1 requirement to implement recovery plan

CIP-009-5 Addressing FERC Directives

FERC Order 706 Para. 739

"The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP- 009-1 to incorporate guidance that the backup and restoration processes and procedures required by Requirement R4 should include, at least with regard to significant changes made to the operational control system, verification that they are operational before the backups are stored or relied upon for recovery purposes."

R1.5 Added requirements related to restoration processes based on review of the DHS Controls

CIP-009-5 Addressing FERC Directives

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

FERC Order 706 Para. 748

"The Commission adopts the CIP NOPR proposal to direct the ERO to modify CIP-009-1 to provide direction that backup practices include regular procedures to ensure verification that backups are successful and backup failures are addressed, so that backups are available for future use."

R1.5 : Processes for the restoration of BES Cyber Systems to the most current baseline configuration

CIP-009-5 Addressing FERC Directives

FERC Order 706 Para. 706

"Preserve data for analysis"

CIP-009-5 1.6
Requires process to preserve data for analysis

CIP-010-5 Requirements Summary

- The SDT proposes the development of a new Standard CIP-010-5 that consolidates all references to Configuration Change Management and Vulnerability Assessments.
  - Previously these requirements were dispersed throughout CIP-003-4, CIP-005-4, and CIP-007-4

CIP-010-5 Requirements Summary

- The SDT has made changes the Vulnerability Assessment requirements to:
  - Consolidate the previous requirements in CIP-005-4 and CIP-007-4 into a single requirement
  - Make provisions for differences between Control Centers and field assets
  - Respond to FERC Order 706 regarding the performance of “active vulnerability assessments”

CIP-010-5 Addressing FERC Directives

FERC Order 706 Para. 397

"The Commission directs the ERO to develop modifications to Requirement R6 of CIP-003-1 to provide an express acknowledgment of the need for the change control and configuration management process to consider accidental consequences and malicious actions along with intentional changes."

- The SDT proposes the introduction of a defined baseline configuration and an explicit requirement for monitoring for changes to the baseline configuration in High Impact Control Centers in order to capture malicious changes to a BES Cyber System.
- Additionally, the SDT proposes that changes to High Impact Control Centers be tested in a test environment prior to their implementation in the production environment to aid in identifying any accidental consequences of the change.

CIP-010-5 Addressing FERC Directives

FERC Order 706 Para. 609	"We therefore direct the ERO to develop requirements addressing what constitutes a "representative system" and to modify CIP-007-1 accordingly. The Commission directs the ERO to consider providing further guidance on testing systems in a reference document."
FERC Order 706 Para. 610	"we direct the ERO to revise the Reliability Standard to require each responsible entity to document differences between testing and production environments in a manner consistent with the discussion above."
FERC Order 706 Para. 611	"the Commission cautions that certain changes to a production or test environment might make the differences between the two greater and directs the ERO to take this into account when developing guidance on when to require updated documentation to ensure that there are no significant gaps between what is tested and what is in production."

- The SDT proposes to require a "representative system" or test system for those High Impact Control Centers to use for the purposes of testing proposed changes and performing active vulnerability assessments.
- The SDT proposes using the defined baseline configuration of a BES Cyber System for the measuring stick as to whether a test system is truly representative of the production system.
- To account for any additional differences between the two systems, the SDT proposes using the words directly from FERC Order 706 "Document the differences between the test environment and the production environment including a description of the measures used to account for any differences in operation between the test and production environments."

CIP-010-5 Addressing FERC Directives

FERC Order 706 Para. 541	"we adopt the ERO's proposal to provide for active vulnerability assessments rather than full live vulnerability assessments."
FERC Order 706. Para 542	"the Commission adopts the ERO's recommendation of requiring active vulnerability assessments of test systems."
FERC Order 706 Para. 547	"we direct the ERO to modify Requirement R4 to require these representative active vulnerability assessments at least once every three years, with subsequent annual paper assessments in the intervening years"

- The SDT has added requirements for an "active vulnerability" assessment to occur at least once every three years for High Impact Control Centers using a test system so as to prevent unforeseen impacts on the Bulk Electric System.

CIP-010-5 Addressing FERC Directives

FERC Order 706 Para. 544	"the Commission directs the ERO to revise the Reliability Standard so that annual vulnerability assessments are sufficient, unless a significant change is made to the electronic security perimeter or defense in depth measure, rather than with every modification."
FERC Order 706 Para. 544	"we are directing the ERO to determine, through the Reliability Standards development process, what would constitute a modification that would require an active vulnerability assessment"

- The SDT has proposed that prior to adding a new cyber asset into a BES Cyber System, that the new cyber asset undergo an active vulnerability assessment.
  - An exception is made for specified exceptional circumstances such as an emergency.

CIP-011-5 Requirements Summary

- The SDT proposes the development of a new Standard CIP-011-5 that consolidates all references to Information Protection and Media Sanitization
  - Previously these requirements were dispersed throughout CIP-003-4 and CIP-007-4
- The SDT has also moved the requirements regarding the authorization and revocation of access to BES Cyber System Information to CIP-004-5, consolidating these requirements with those for electronic and physical access

CIP-011-5 Requirements Summary

- The SDT has introduced a definition of a glossary term “BES Cyber System Information” which defines what needs to be protected
  - Previously, this list was a requirement itself

CIP-011-5 Summary

- The SDT has shifted the focus of the requirements for media sanitization from the Cyber Asset to the information itself
  - In version 4, these requirements are invoked when the Critical Cyber Asset is to be disposed of or redeployed
  - In version 5, the requirement is triggered when either:
    - BES Cyber System Information no longer needs to be stored on specific media, or
    - Media containing BES Cyber System Information is designated for disposal

CIP-011-5 Addressing FERC Directives

FERC Order 706 Para. 633	"The Commission adopts the CIP NOPR proposal to direct the ERO to clarify what it means to prevent unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it."
FERC Order 706 Para 635	"the Commission directs the ERO to revise Requirement R7 of CIP-007-1 to clarify, consistent with this discussion, what it means to prevent unauthorized retrieval of data."

- The SDT has proposed that preventing unauthorized retrieval of data means to "render the data unrecoverable."
- The SDT understands that this may be too high of a bar and is continuing discussions in this area.

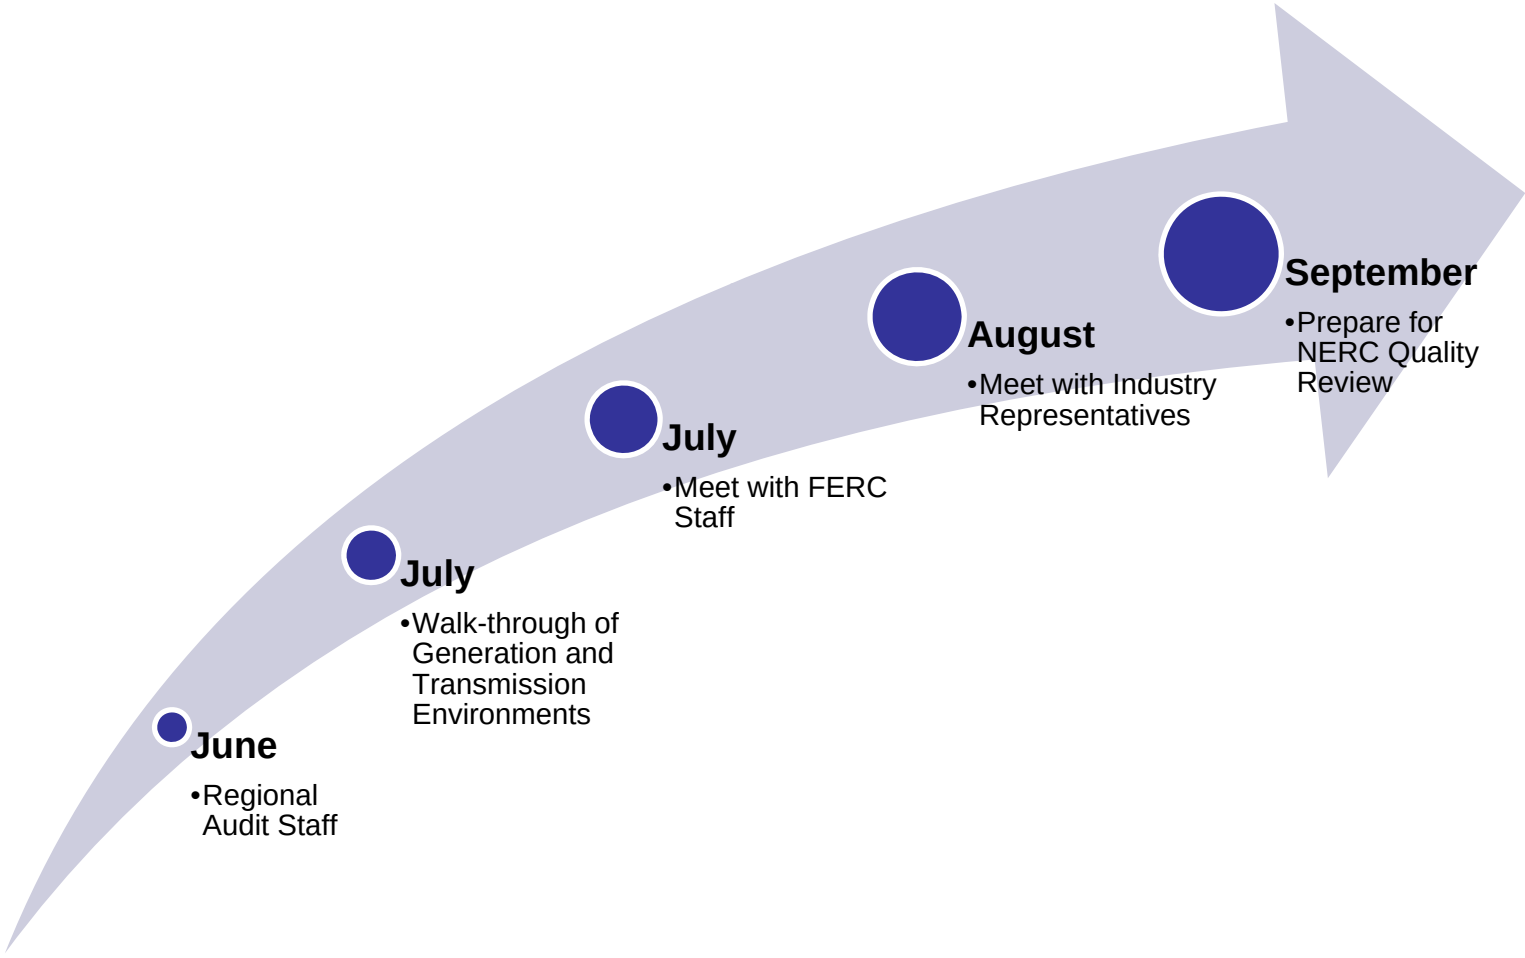
Implementation Plan

- Implementation plan is in the very early phases of development
- Current concepts include staggered Effective Dates for:
  - CIP-002-5
  - Organizational Requirements (CIP-003-5, CIP-008-5)
  - Technical Requirements (CIP-005-5, CIP-006-5, etc.)
- Technical Requirements would be further staggered by:
  - High Impact BES Cyber Systems
  - Medium Impact BES Cyber Systems
  - Low Impact Cyber Systems

Implementation Plan

- Currently evaluating a single implementation plan that would include compliance timelines for future newly identified BES Cyber Systems and those BES Cyber Systems that change categories
  - Eliminates the separate Implementation Plan for Newly Identified Critical Cyber Assets and Newly Registered Entities (IPFNICCANRE)

Schedule to Date – 2011



Key Dates Moving Forward

- **November 3rd, 2011 –**
  First Posting for Comment and Ballot
  - Webinars – November 15th and 29th, 2011
  - Ballot Opens – December 9th, 2011
  - Ballot Closing – December 19th, 2011

Standards Announcement

Project 2008-06 Cyber Security Order 706 Version 5 CIP

Ballot Pool Now Open: November 7 – December 15, 2011
Formal Comment Period Now Open: November 7, 2011 – January 6, 2012
Twelve Initial Ballot Windows Open for Ten Standards, Implementation Plan and Definitions: Friday, December 16 – Friday, January 6, 2012

Now Available

Ten CIP standards (CIP-002-5 through CIP-009-5, CIP-010-1, and CIP-011-1), a set of new and revised NERC Glossary definitions, and a proposed implementation plan have been posted for a formal 60-day comment period through Friday, January 6, 2012.

CIP-002-5 requires the categorization of these BES Cyber Systems according to bright-line criteria that characterize their impact on the Reliability Operations Services according to "bright-line" criteria contained in Attachment 1 – Impact Categorization of BES Cyber Assets and BES Cyber Systems of the draft CIP-002-5 standard.

CIP-003-5 through CIP-009-5, CIP-010-1 and CIP-011-1 in the draft Version 5 CIP Cyber Security Standards define the cyber security requirements to be applied to the BES Cyber Systems according to the categorization performed in CIP-002-5.

CIP-003 through CIP-009 generally follow the organization of Versions 1-4 of CIP-003 through CIP-009. CIP-010-1 is a new standard that contains the Configuration Management and Vulnerability Assessment requirements previously defined across several CIP standards in Versions 1 through 4. CIP-011-1 is a new standard that defines Information Protection and Media Sanitization requirements previously defined across many standards in Versions 1 through 4.

In addition, the following documents have been posted to assist stakeholders in their review:

- Consideration of Comments Report – Provides a summary of the modifications made to the proposed standards based on comments on CIP-010-1 and CIP-011-1 submitted during an informal comment period that ended June 3, 2010. (Note that the previously posted CIP-010-1 and CIP-011-1 are not the same standards as those posted for this comment period. The version of CIP-010 posted May 4 – June 3, 2010 addressed requirements associated with an earlier version of CIP-002, and the version of CIP-011 posted May 4 – June 3, 2010 was a single

standard that contained all the requirements associated with earlier versions of CIP-003 through CIP-009.)

- Mapping Document - Identifies each requirement in the already-approved Version 4 CIP standards and identifies how the requirement has been treated in the Version 5 CIP standards (which includes CIP-002-5 through CIP-009-5 and CIP-010-1 and CIP-011-1).
- Clean versions of the approved versions of CIP-002-4 through CIP-009-4 - these are posted because the extent of the changes to each of the standards makes a redline of the posted draft standards against the approved standards impractical.
- Unofficial comment form in Word format – This is for informal use when compiling responses – the final must be submitted electronically.

Note that the Standards Committee has authorized an extended formal comment period (60 days), along with an extended ballot window (20 days), in consideration of the large number of standards and substantive changes to the format and content of the Version 5 CIP standards. In addition, the Standards Committee has authorized a deferral of the non-binding polls to allow stakeholders an opportunity to focus more closely on the requirements, definitions, and implementation plan during this posting period. The non-binding polls will take place in parallel with the next ballot of these standards.

Instructions for Joining Ballot Pool for Version 5 CIP Standards

A single ballot pool is being formed for the balloting of all ten standards, the implementation plan, and the definitions associated with the ten standards. The ballot pool that is formed will be cloned to create twelve separate ballot pools (one for each of the ten standards, one for the implementation plan, and one for the definitions). All members of the original ballot pool will automatically be eligible to vote in the twelve individual ballots.

The standards, implementation plan, and set of definitions are being balloted individually to provide stakeholders an opportunity to cast separate ballots for each item. The individual ballots will provide the drafting team better feedback on which standards require additional development to achieve stakeholder consensus, as well as allow the team to gauge stakeholder support for the proposed implementation plan and definitions. Stakeholders are encouraged to consider each standard on its own merits and cast individual ballots, rather than casting the same ballot for all ten standards, in order to assist the drafting team with evaluating which standards require additional development to achieve consensus.

To join the ballot pool to be eligible to vote in the upcoming ballots, as well as future ballots and non-binding polls for the Version 5 CIP standards, go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their “ballot pool list server.” (Once the balloting begins, ballot pool members are prohibited

from using the ballot pool list servers.) One ballot pool list server has been set up and can be used for communication on each of the standards being balloted for this project. The list server is: bp-2008-06_CIP-002-5_in@nerc.com

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Friday, January 6, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Special Instructions for Submitting Comments

Please note that comments submitted during the formal comment period and the ballot for the standard both use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments. The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Next Steps

The drafting team will host a series of three webinars – two on the substance of the standards, and a third to address process questions. The webinars on the substance of the standards, which have already been announced, will be held on November 15, 2011, and November 29, 2011. A separate announcement for the webinar that will address process questions will be sent with registration information as soon as details have been finalized.

Twelve initial ballots (one for each of the ten standards, one for the definitions, and one for the implementation plan associated with these standards) will be conducted beginning on Friday, December 16, 2011 through 8 p.m. Eastern on Friday, January 6, 2011.

Background

In 2008, FERC Order No. 706 directed the ERO to develop modifications to Version 1 of the NERC CIP Cyber Security Standards to address a range of concerns in various areas of the Version 1 standards.

A Standard Drafting Team (SDT) was appointed by the NERC Standards Committee on August 7, 2008 to develop these modifications as part of Project 2008-06 – Cyber Security Order 706. The SDT has been charged to review each of the CIP reliability standards and address the modifications identified in the FERC Order No. 706. The SDT began meeting in October 2008.

Prior to this posting, the SDT developed CIP-002-2 through CIP-009-2 to comply with the near-term specific directives of FERC Order No. 706. This version of the Standards was approved by FERC in September of 2009 with additional directives to be addressed within 90-days of the order. In response, the SDT developed CIP-003-3 through CIP-009-3, which FERC approved in March 2010.

Throughout this period, the SDT has continued efforts to develop an approach to address the remaining FERC Order No. 706 directives. An original draft version of CIP-010 and CIP-011, which included the categorization of cyber systems in CIP-010 and associated cyber security requirements consolidated into a single CIP-011, were posted for informal comment in May of 2010. After reviewing and analyzing responses from the industry, the SDT determined it was infeasible to address all of the concerns and achieve industry consensus on CIP-010 and CIP-011 by the planned target date of December 2010. Consequently, the SDT developed a limited scope of requirements in Version 4 of the CIP Cyber Security Standards (CIP-002-4 through CIP-009-4) as an interim step to address the more immediate concerns raised in FERC Order No. 706, paragraph 236, especially those associated with CIP-002's identification of Critical Assets and the risk-based methodology used for the identification. CIP-002-4, which included a bright-line based approach for criteria used to identify Critical Assets in lieu of an entity defined risk-based methodology, and the conforming changes to CIP-003 through CIP-009, was approved by the Board of Trustees in January of 2011. On September 15, 2011, FERC issued a Notice of Proposed Rulemaking (RM11-11) to approve Version 4 of the Cyber Security Standards with a 60 day comment period.

This draft Version 5 of the NERC CIP Cyber Security Standards is intended to address the remaining standards related issues of FERC Order No. 706.

The SDT believes the NERC Version 5 CIP Cyber Security Standards provide a cyber security framework for the categorization and protection of BES Cyber Systems to support the reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the cyber systems needed to support Bulk Electric System reliability, and the risks to which they are exposed.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Appendix 4B

Proposed Revisions 11-7-2011

Sanction Guidelines of the North American Electric Reliability Corporation

Effective: ~~January 1, 2011~~ _____, 2012

Table of Contents

1. ~~Preamble and~~ Overview

The North American Electric Reliability Corporation ("NERC"), as the electric reliability organization ("ERO"), and regional entities to whom NERC has delegated authority (hereinafter referred to collectively as "regional entities" or individually as a "regional entity"[1]) shall determine and may levy monetary penalties and non-monetary sanctions and remedial action directives against owners, operators, and users of the bulk power system for violations of the requirements of NERC Reliability Standards ("reliability standards") approved by the Federal Energy Regulatory Commission ("FERC") and applicable authorities in Canada and/or Mexico. This document sets out the processes and principles to be followed, and factors that will be considered when determining penalties, sanctions, or remedial action directives for violations. Collectively these processes, principles and factors are NERC's penalties, sanctions, and remedial action directive guidelines.

NERC and the regional entities will ~~exclusively~~ follow the directives, principles and processes in these Sanction Guidelines when determining penalties, sanctions, or remedial action directives for a violation. ~~However,~~ The adjustment factors in these Sanction Guidelines~~are also~~ provide~~d to afford~~ NERC ~~or~~and the regional entities~~entity~~ the flexibility needed to ~~accommodate~~take into account the facts surrounding each violation. ~~In this manner, rigid prescription of specific penalty formulae can be avoided at the same time that appropriate limitations on the degree of discretion and flexibility available to address each violation on its merits is maintained.~~ The outcome will be ~~remedies~~penalties and sanctions that are commensurate ~~and fair compared~~ to the reliability impact of the violation and to ~~remedies~~those levied for similar violations, yet appropriately reflective of any unique facts and circumstances regarding the specific violation and violator.

~~The adjustment factors established in this document are generally consistent with those listed in the FERC Policy Statement on Enforcement issued on October 20, 2005. However, discussion of the factors presented in this document is not exhaustive as other facets of these factors, or other additional factors not discussed herein, may also be considered to determine a given penalty, sanction, or remedial action, as NERC or the regional entity deems appropriate under the circumstances.~~

Regional entities shall follow these Sanction ~~g~~Guidelines when ~~to~~ determin~~ing~~e penalties, sanctions, or remedial action directives. NERC shall oversee the regional entities' application of the Sanction ~~g~~Guidelines to ensure that regional entities achieve acceptable levels of consistency ~~are achieved~~. NERC's oversight will ~~also~~ ensure ~~comparable outcomes; i.e.~~ that there is acceptable similarity in the degree and type of sanction for violations constituting comparable levels of threat to reliability of the bulk power system. ~~In order to facilitate this oversight, regional entities' reporting to NERC of penalties and sanctions they have determined will be thorough and in sufficient detail that NERC can understand and reasonably replicate the outcomes reached;~~ NERC may develop reporting requirements or a standard reporting form for use by the regional entities for this purpose, as NERC deems necessary or appropriate.

As experience is gained by NERC and the regional entities through the use and application of these Sanction ~~g~~Guidelines, NERC will review the Sanction ~~g~~Guidelines and may modify them as NERC deems appropriate or necessary. Authority delegated by NERC to the regional entities with respect to penalties, sanctions, or remedial action directives does not include the authority to modify these Sanction ~~g~~Guidelines.

NERC and the regional entities will apply the provisions of this document in accordance with applicable statutory provisions and with the regulations, orders, and statements of policy of FERC and other ERO governmental authorities that are applicable to the determination and imposition of penalties and sanctions for violations of reliability standards in the respective jurisdictions.

[1] For purposes of this footnote, the term "regional entity" shall be read as either as single or plural, as necessary, to refer to the applicable regional entity or regional entities.

Any revision to this document ~~or to the principles and factors identified or addressed within it~~ must first be approved by the NERC board, then by FERC, appropriate authorities in Canada or appropriate authorities in Mexico prior to becoming effective and applicable within the United States or these authorities' respective jurisdictions.

2.Document Scope and Exclusions

This document identifies and discusses the processes and principles to be followed, and factors that will be considered to determine penalties, sanctions, or remedial actions for violations of the reliability standards.

This document notes but does not otherwise address the progression of actions and steps that NERC or the regional entity will follow to process a violation from its initial incoming status upon discovery as a possible violation, through to its possible final determination as a confirmed violation. This is set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure.

This document notes but does not otherwise address how a possible violation or alleged violation is reviewed in order to confirm or dismiss it. NERC's process and requirements for this review are set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure. Regional entities will undertake such reviews using the processes and requirements set out in the NERC Compliance Monitoring and Enforcement Program.

This document notes but does not otherwise address the processes and procedural steps by which a confirmed violation can be appealed, or by which a penalty, sanction, or remedial action determined and levied for a violation can be appealed. These procedures are set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure, and applicable regional entity program documents.

The NERC Compliance Monitoring and Enforcement Program provides for the possibility of settlements within NERC or regional entity compliance enforcement programs. This document makes reference to settlements to but does not address them further.

3.2. Basic Principles

The following paragraphs identify and discuss the basic principles underpinning why and how NERC and the regional entities will determine penalties, sanctions, and remedial action directives for violations of the requirements of the reliability standards.

The principles are unique and complimentary; the order in which theythe principles are presented in this document does not set or indicate order of precedence.

3.1Necessary Element of NERC Compliance Program

Primary objectives of NERC as the ERO include the promotion and enforcement of compliance with the reliability standards by owners, operators, and users of the bulk power system; standards made mandatory by duly-authorized legislative bodies in the U.S and Canada, and designed to maintain and promote the reliability of the two countries' shared power grids. Consistent with these objectives, NERC and the regional entities will monitor and act to verify compliance with standards' requirements; however, beyond monitoring and acting only to verify compliance, NERC and the regional entities will also hold bulk power system owners, operators, and users — or their delegates — accountable for confirmed compliance violations. This accountability will include determination and the possible levying of penalties, sanctions, or remedial actions.

Penalties, sanctions, and remedial actions are valid and necessary mechanisms to NERC and the regional entities for the enforcement and promotion of compliance to the reliability standards, in part because they can:

a.promote compliance behavior;

b.provide deterrence to future incidents, actions or situations of noncompliance by the violator or others;

c.implement actions that will promptly correct behavior;

d.disgorge benefits that may or may have accrued to a violator as a consequence of violating;

e.visit upon a violator some portion of any damage their violation may or may have visited upon others.

Accordingly, the determination and potential levying of appropriate penalties, sanctions, or remedial actions by NERC or the regional entity upon those responsible for violations shall be a required step within the NERC and regional entity compliance enforcement programs.

3.2Settlement of Compliance Violations

NERC and the regional entities shall maintain the reliability of the bulk power system by enforcing compliance with NERC and regional entity reliability standards. NERC and regional entity compliance enforcements programs will lay out how NERC and the regional entities will do this. In particular and by necessity, elements of these programs regarding the confirmation of violations, the determination and levying of penalties, sanctions, or remedial actions, and appeals are rigid and legalistic in form and nature in order to respect the basic tenets of due process and natural justice inherent within United States and Canadian justice systems, respectively, upon which they are being based. However, absolute adherence to the compliance programs, to the exclusion of other options, may not be the most appropriate, efficient or desirable means by which to achieve the end goal in all circumstances, to all entities party to a violation.

2.1 Settlement of Compliance Violations

Pursuant toAs set out in the NERC Compliance Monitoring and Enforcement Program, Appendix 4C to the NERC Rules of Procedure, possible or alleged violations of the reliability standards may be resolved dealt with through settlements reached between NERC, a regional entity and the registered entity or entities to whom a possible, or alleged, or confirmed violation is attributed to by NERC or

the regional entity. Any provisions ~~made~~ within a settlement regarding penalties~~,~~ or sanctions~~, or remedial actions~~ can supersede any corresponding penalties or~~,~~ sanctions that would otherwise be determined pursuant to these guidelines.

~~3.1Settlement Request~~

~~Any entity found in or being investigated for a violation may request settlement negotiations at any time, including prior to issuance of a notice of alleged violation; however, NERC or the regional entity may decline to enter into or continue settlement negotiations after the possible violation or alleged violation becomes a confirmed violation.~~

~~3.2Settlement Effect on Continuation of Determination of Penalties, Sanctions, or Remedial Actions~~

~~Until a settlement is finalized or parties to that settlement agree otherwise, NERC or the regional entity may continue activities and actions towards the determination and levying of a penalty, sanction, or remedial action that would otherwise be applicable pursuant to these guidelines, or that will be applicable if the settlement is not finalized.~~

~~3.5Timing of Determination of Penalty, Sanction or Remedial Action~~

~~All possible violations and alleged violations will be reviewed by NERC or the regional entity with the outcome that either the violation will be confirmed or the violation will be dismissed.~~

2.2 Timing of Determination of Penalty, Sanction or Remedial Action Directive

The penalty~~,~~ or sanction~~, or other remedial action~~ for a violation will be determined during the enforcement process in accordance with Section 5.0 of Appendix 4C ~~when the violation becomes a confirmed violation or is resolved as part of a settlement agreement~~.

At any time during the enforcement process, including any ~~confirmation review,~~ hearings~~,~~ or appeals, NERC or the regional entity may determine that a remedial action directive to the registered entity is warranted and, in accordance with Section 7.0 of Appendix 4C,~~by the subject entity of the review, hearing, or appeals. NERC or the regional entity~~ may direct that the registered entity implement the~~such~~ remedial action~~s~~ directive ~~be undertaken by the subject entity at any time, including prior to confirmation of a violation, and without regulatory approval~~.

~~3.6Determining Party~~

~~The determination of penalty, sanction or other remedial action for a violation will generally be undertaken by the same entity determining the violation to be a confirmed violation, but subject to review by NERC if the determination is made by a regional entity.~~

~~3.7No Influence of Penalty, Sanction or Remedial Action upon Violation Confirmation Process~~

~~The penalty, sanction, or remedial action determined for a violation will not influence the outcome of the regional entity' or NERC's confirmation review of the violation. In particular, if the determination of penalty, sanction, or remedial action for a probable violation is being undertaken by the same entity undertaking the confirmation review, the entity will insure that there is sufficient separation, in such terms as time, process, personnel or the like, to preclude that the penalty, sanction, or remedial action determined influences the outcome of the confirmation review.~~

~~3.8~~2.3 Reasonable Relationship to Violation

Penalties and~~,~~ sanctions~~, and remedial actions~~ levied ~~or applied~~ for the violation of a reliability standard shall bear a reasonable relation to the seriousness of the violation while also reflecting consideration of the other factors specified in~~that~~ these Sanction gGuidelines ~~direct to take into account. In the United States, the legislation establishing mandatory enforceable reliability standards and the ERO requires that "Any penalty imposed … shall; (A) bear a reasonable relation to the~~

~~seriousness of the violation; and (B) take into consideration the efforts of the user, owner, or operator to remedy the violation in a timely manner~~[2].

~~3.9~~2.4 Use ~~and Facets~~ of Factors to Determine Penalties

Penalties levied for a ~~given~~reliability standard violation will be based on all facts and ~~other~~ information relevant to the violation~~incident or situation~~. To that end, these Sanction ~~g~~Guidelines include factors ~~which~~that NERC and the regional entities will consider while determining the penalty or sanction for a violation~~to be levied~~.

~~NERC considers, and these guidelines direct, that t~~The presence of some factors in connection with~~within~~ a violation aggravates the seriousness of that violation and should ~~cause an~~ increase ~~or expansion of~~ the penalty ~~to be levied~~. Conversely, the presence of certain~~some~~ other factors mitigates the~~that~~ seriousness of the violation and should ~~cause a decrease or reduction of~~reduce the penalty ~~to be levied~~. ~~Also, some factors may mitigate or aggravate, and should have commensurate impact. NERC considers, and these guidelines direct, that t~~The absence of an aggravating or mitigating factor will have no impact~~, as opposed to a mitigating or aggravating impact, respectively, to~~ on the~~a~~ penalty.

This document identifies many aggravating and mitigating ~~presents many of the relevant facets of the~~ factors that, if present in connection with a violation, should be considered in determining the penalty or sanction, and describes how these factors should be taken into account ~~included in these guidelines~~. ~~However, additional facets of these factors, or a~~Additional factors not identified in this document~~discussed herein,~~ may also be considered ~~into~~ determining~~e~~ a ~~given~~ penalty~~,~~ or sanction, ~~or remedial action,~~ as NERC or the regional entity deems appropriate under the circumstances. Where additional factors ~~or facets~~ are considered~~used~~ they will be identified, and their use will be justified, in the notice of penalty, and the~~. The~~ effect of using these factors ~~or facets~~ on the penalty~~,~~ or sanction~~, or remedial action~~ determined will ~~also~~ be fully and clearly disclosed.

~~3.10~~2.5 Multiple Violations

A violation is a failure ~~or inadequacy~~ to meet a requirement of a reliability standard by a bulk power system owner, operator or user ~~party~~ responsible to comply with that requirement.

The ~~failure or inadequacy of a violator to~~entity's noncompliance ~~comply~~ may involve more than one standard or several requirements of a single standard~~.; as~~ As such, multiple individual violations may exist~~be in play~~ when NERC or the regional entity determines penalties or~~,~~ sanctions~~, or remedial actions~~ for a~~n incident or situation of~~ noncompliance ~~are being determined~~.

~~Strictly speaking,~~ NERC or the regional entity may~~can~~ determine and levy a separate penalty or sanction~~, or direct remedial action,~~ upon a violator for each individual violation of a reliability standard requirement. However, where~~in instances of~~ multiple violations relate~~d~~ to a single act or common incidence of noncompliance, or where the penalties or sanctions for several unrelated violations by the entity are being determined at the same time, NERC or the regional entity or entities may~~will generally~~ determine and issue a single aggregate penalty~~,~~ or sanction~~, or remedial action directive~~ bearing reasonable relationship to the aggregate of the ~~related~~ violations. In such a case, ~~T~~the penalty~~,~~ or sanction~~, or remedial action will not be that determined individually for the least serious of the violations; it~~ will generally be at least as large or expansive as what would be called for individually for the most serious of the violations.

Some entities may ~~be~~ register~~ed as being responsible~~ for more than one reliability function in the NERC Compliance Registry (e.g., transmission owner, transmission operator, balancing authority, generation operator), and as a result, a single requirement in ~~some~~certain reliability standards may apply to the ~~responsible~~ entity for several of its registered functions. Where an entity performs several registered functions ~~are performed by the same entity~~, NERC or the regional entity will assess a

[2] ~~H.R.6, Energy Policy Act of 2005, Section 215, Paragraph c, subparagraph 6.~~

violation and associated penalty or sanction ~~will be assessed~~ against the entity, not against each function.

~~3.11~~2.6 Relation of the Penalty to the Seriousness of the Violation and Violator's Ability to Pay

As stated~~discussed~~ in Section ~~3.8,~~2.3 above, penalties levied for the violation of a reliability standard shall bear a reasonable relation to the seriousness of the violation. As part of the assessment of the seriousness of the violation, NERC or the regional entity shall ~~The seriousness of a given violation by a given violator shall be assessed by~~ review ~~of the applicability of~~ the Violation Risk Factors[3] associated with the violation and~~to~~ the characteristics of the violator's operation or power system. NERC or the regional entity may consider the size of the violator.~~Size is a characteristic of a violator's operation or system. The size of the violator can be considered in the assessment but shall not be the only characteristic considered. Where size is considered in such a review the facts relating to the violation in question will be reviewed~~ NERC or the regional entity will also consider the facts of the violation so ~~such~~ that the "actual" size of the violator is ~~properly discerned and~~ appropriately considered~~;~~. ~~t~~The following are provided as illustrative examples:

- If the violator belongs to a generation and transmission cooperative or joint-action agency, size will be attributed to the particular violator, rather than to that generation and transmission cooperative or joint-action agency.
- If the violator constitutes part of a corporate family the size of the violator will be attributed to that violator alone, in the absence of any facts indicating involvement of the whole corporation or corporate affiliates of the violator.
- If the violator is an entity established solely as a shell to register as subject to one or more Reliability Standards the size of the entity will be disregarded in favor of consideration of the size of the parent entity or any affiliates that NERC or the regional entity deems involved and constituting the "actual" size of the violator.

At the request of the violator, NERC or the applicable regional entity or entities may review the penalty in light of the violator's financial ability to pay the penalty. Financial ability shall include ~~both~~ the financial strength of the entity as well as its financial structure (e.g., for-profit versus non-profit). Where penalties are reduced or eliminated, NERC or the regional entity ~~shall~~may consider non-monetary sanctions ~~or remedial action~~ as alternatives or substitutes to ~~the~~a monetary penalty, pursuant to Sections ~~3~~2.12~~17~~, ~~3~~2.13~~18~~ and ~~3~~2.14~~19~~, below, of these Sanction Guidelines~~this document~~.

~~The above actions will: (i) promote that violators are penalized or sanctioned commensurate with the risk or effect that their specific violation of the reliability standards had or is having to the reliability of the bulk power system while also; (ii) mitigating overly burdensome penalties to less consequential or financially-limited entities concurrent with; (iii) promoting that no penalty is inconsequential to the violator to whom it is assessed. This will promote that penalties levied for violations of reliability standards bear a reasonable relation to the seriousness of the violation while also addressing violators' ability to pay the penalties they are assessed.~~ Consideration of the factors described in this subsection is intended to (i) promote that violators are penalized or sanctioned commensurate with the risk or effect that their specific violation of the reliability standards had or is having on the reliability of the bulk power system while also (ii) mitigating overly burdensome penalties to less consequential or financially-limited entities concurrent with (iii) promoting that no penalty is inconsequential to the violator to whom it is assessed. Consideration of these factors is intended to result in penalties levied for violations of reliability standards bearing a reasonable relation to the seriousness of the violation while also addressing violators' ability to pay the penalties they are assessed.

[3] See Section ~~4 Part 4~~3.1.1 for a discussion of these factors.

~~3.12~~2.7 Violation Time Horizon

Reliability standards involving longer and broader time horizons, such as long-term planning activities, may have a lesser immediate impact and pose less immediate risk to the reliability of the bulk power system than standards ~~addressing~~involving shorter and narrower timeframes, such as entities' conduct in real time. Similarly, standards involving longer and broader time horizons typically will provide a longer time period over which to discover and remedy a violation when compared to standards involving~~addressing~~ more immediate activities such as next-day planning, same-day operations or real-time operations. Using a time horizon element in the determination of penalties for violations provides for recognition of the "more immediate" nature — and hence higher risk — of the threat of some violations as opposed to the lesser-risk "future threat if not corrected" nature of other violations.

NERC or the regional entity ~~Penalties levied for the violation of a reliability standard~~ shall consider the time horizon of the standard violated~~;~~. ~~v~~Violations of standards involving ~~more~~ immediate or real-time activities will generally incur larger penalties than violations of standards with longer or broader time horizons.

Time horizons inherent in reliability standard requirements are not reflected in the~~ir assigned~~ Violation Risk Factors or Violation Severity Levels for the requirement.[4]~~.~~ Accordingly, the time horizon element of a violation will be considered when determining the Base Penalty Amount[5] for the violation.

NERC or the regional entity will utilize judgment and will analyze the facts of the violation to determine ~~T~~the time horizon for the violation~~considered~~ and its impact on the selection of the Base Penalty Amount~~ for the violation will be decided upon by NERC or the regional entity based upon judgment and the facts of the violation. The rationale for the time horizon used and its impact on the setting of the Base Penalty Amount will be documented by NERC or the regional entity and provided within the Notice of Penalty issued for the violation~~. The rationale for the time horizon used and its impact on the setting of the Base Penalty Amount will be provided within the Notice of Penalty issued for the violation.

~~3.13~~2.8 Extenuating Circumstances

In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the regional entity may significantly reduce or eliminate penalties~~ may be significantly reduced or eliminated~~.

~~3.14~~2.9 Concealment or Intentional Violation

NERC or the regional entity ~~Penalties levied for the violation of a reliability standard~~ shall always consider as an aggravating factor~~take into consideration~~ any attempt by a violator to conceal the violation from NERC or the regional entity, or any intentional violation incurred for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the bulk power system.

~~3.15~~2.10 Economic Choice to Violate

~~Owners, operators, and users of the bulk power system may be presented with situations or circumstances where compliance with the reliability standards preclude or reduce an economic gain that could be realized by violating the standards.~~ Penalties shall be sufficient to assure that entities responsible for complying with reliability standards do not have incentives ~~find it attractive~~ to make economic choices that cause or unduly risk violations of~~to~~ reliability standards, or ~~risk or cause~~ incidents resulting from violations of the reliability standards. Economic choice includes economic gain for, or the avoidance of costs to, the violator. NERC or the regional entity shall treat economic

[4] See Section ~~4 Part 4~~3.1~~1~~ for a discussion of these factors.
[5] See Section ~~4 Part 4~~3.2

choice to violate as an aggravating factor when determining a penalty. ~~Penalties levied to violators who have made such a choice shall reflect this aspect of the violation.~~

~~3.16~~2.11 No Influence by Outcome of Economic Choice to Violate

~~Economic choices to violate are generally made for the violator's own potential gain, but making such a choice does not always result in all potential gains being realized or may result in damage or loss. However, irrespective of~~Whatever the financial outcome to the entity making an economic choice to violate a reliability standard, such decisions present a risk to~~others'~~ reliability and to others, commonly without ~~either~~ their knowledge or consent. Penalties levied to violators making an economic choice to violate shall reflect only that the violator made an economic choice to violate a reliability standard. ~~was made at all; t~~The lack of or reduced magnitude of any actual benefit received, or any damage suffered, by the violator as a consequence of making this choice will have no influence upon the determination of the penalty ~~to be levied~~.

~~3.17~~2.12 Non-Monetary Sanctions ~~or Remedial Actions~~

Enforcement actions taken by NERC or a regional entity are not limited to monetary penalties~~;~~. NERC or the regional entity may apply, at ~~the~~its discretion ~~of NERC or the regional entity~~, non-monetary sanctions ~~or remedial actions may also be applied and can~~ includinge limitations on activities, functions, operations, or placement of the violator's name on ~~other appropriate sanctions, including the establishment of~~ a reliability watch list ~~composed~~ of major violators.

~~3.18~~2.13 Non-Exclusiveness of Monetary Penalties or Non-Monetary Sanctions

NERC or the regional entity may impose a~~A~~ non-monetary sanction ~~may be imposed either~~ in lieu of or in addition to a monetary penalty ~~imposed~~ for the same ~~confirmed~~ violation, and vice versa. Imposition of a monetary penalty or non-monetary sanction for a violation does not preclude the imposition of the other as long as~~, in combination,~~ the aggregate penalty ~~continues to~~ bears a reasonable relation to the seriousness of the violation and other relevant factors.

~~3.19~~2.14 Monetization of the Value of Sanctions

A significant element of NERC's oversight of penalties, sanctions, and remedial action directives determined and levied or required by regional entities is to ensure~~ing~~ acceptable similarity in the degree and type of sanction for violations constituting comparable levels of threat to the reliability of the bulk power system by similarly situated entities. It is also a requirement and a commitment of NERC and the regional entities~~its designees~~ that penalties~~,~~ or sanctions~~, or remedial actions~~ levied ~~or applied~~ for the violation of a reliability standard bear reasonable relation to the seriousness of the violation. ~~Specifically with respect to penalties and sanctions, it is intuitive that i~~It is~~will be~~ easier, more objective, and more transparent to monitor and test for the acceptable similarity of penalties and sanctions if ~~(~~monetary~~)~~ penalties or monetized values of sanctions ~~determined for violations~~ are used as the primary basis of comparison~~, versus comparisons made on the basis of other (non-monetized) considerations~~. Similarly, there will be ~~strong intuitiveness and~~ transparency, particularly to those ~~interested but not strongly~~ familiar with the power industry, that NERC or the regional entity reasonably addressed the seriousness of a violation ~~has been reasonably addressed~~ if the consequences ~~for it to the violator~~ are ~~determined and can be~~ expressed clearly and quantifiably in monetary terms.

Penalties determined and levied by NERC or regional entities will by definition be valued in monetary terms: U.S or Canadian dollars. It ~~will be~~is the preference of NERC that ~~(~~non-monetary~~)~~ sanctions imposed either in lieu of or in addition to a penalty should include disclosure of the monetary value of~~that~~ the sanctions ~~represent to the violator~~. ~~It is intuitive that defensible monetary values for those sanctions will be most easily determined if~~ Generally, NERC or the regional entity will first determine the penalty for the violation ~~pursuant to these guidelines is first determined~~ and may, at their discretion, introduce~~then the~~ sanctions ~~to be levied are introduced and justified~~ as appropriate alternatives to the~~at~~ penalty or as additions to a lesser penalty. However, NERC or the

regional entity may determine the monetary value of sanctions ~~may be determined directly (e.g. without first determining a penalty amount) and monetized~~ using other methods.

~~NERC does not have a preference between penalties and sanctions for violations. The preference expressed here will support ensuring comparability of outcomes regarding application of these guidelines and the promotion of reasonable relationship between the seriousness of a violation and the sanctions, or penalties and sanctions, levied for it.~~

~~3.20Maximum Limitations on Penalties~~

~~Penalties are direct, monetary judgments levied against a violator by NERC or the regional entity for the violation of requirements of the reliability standards. In contrast, sanctions will impose limitations or restrictions of some kind that may result in economic or other impacts to the violator, and remedial actions are directives by NERC or a regional entity to the violator regarding the correction of conditions, practices or any other relevant action or activity underlying the noncompliance(s) involved.~~

2.15 Maximum Limitations on Penalties

~~In the United States, the Federal Power Act allows for the imposition of civil penalties of up to $1,000,000 per day per violation.~~ ~~NERC and the regional entities draw their authority to levy penalties from the Federal Power Act; accordingly this figure is and can be understood as the maximum monetary penalty that NERC or regional entities are authorized to levy. However, as this legislation also requires that "[a]ny penalty imposed … shall; (A) bear a reasonable relation to the seriousness of the violation; and (B) take into consideration the efforts of the user, owner, or operator to remedy the violation in a timely manner[6]"~~ ***~~entities required to comply with the reliability standards must also understand that~~*** ~~In~~ In the United States, the maximum penalty amount that NERC or a regional entity will assess for a violation of a reliability standard requirement is $1,000,000 per day per violation. NERC and the regional entities will ~~be obligated to~~ assess penalties amounts up to and including thise maximum amount for violations where warranted pursuant to these Sanction ~~g~~Guidelines.

In Canadian jurisdictions the maximum monetary penalty ~~potentially assessable~~ for a reliability standard violation is significantly less than $1,000,000 per day per violation. ~~the amount allowed in the United States under the Federal Power Act.~~ ~~Also~~Further, legislation presently governing certain~~some~~ Canadian jurisdictions does not accommodate the levying of such a penalty under certain~~some~~ circumstances, may not accommodate the levying of such a penalty for all violations, or does not accommodate the levying of any monetary penalties.

When NERC or a regional entity levies a penalty ~~may be levied~~, or propose~~s~~d ~~to~~ a penalty to regulatory authorities with jurisdiction to ~~be~~ levy~~ied~~ a penalty, NERC or the regional entity shall~~the~~ follow~~ing~~ these steps ~~will be followed~~:

a. NERC or the regional entity will initially disregard the penalty limitations of the applicable regulatory authorities ~~with jurisdiction~~, and will determine what the penalties or sanctions would be pursuant to these ~~s~~Sanction ~~g~~Guidelines ~~only~~.

b. NERC or the regional entity will review the maximum penalty allowed in the applicable~~by the regulatory authorities with~~ jurisdiction.

c. NERC or the regional entity will set the actual penalty ~~to be levied, or proposed to the regulatory authorities with jurisdiction to be levied,~~ as the lesser of (i) the penalty~~that~~ determined pursuant to these Sanction ~~g~~Guidelines and (ii) the maximum penalty or sanction allowed in~~by~~ the applicable jurisdiction~~regulatory authorities~~.

d. If ~~the lesser penalty is~~ the maximum penalty allowed in the applicable jurisdiction is lower than the penalty determined under the Sanction Guidelines, in addition to the legally permissible

[6] ~~H.R.6, Energy Policy Act of 2005, Section 215, Paragraph e, subparagraph 6.~~

penalty ~~by the regulatory authorities~~, the notice of penalty or similar document issued by NERC or the regional entity regarding the violation will also list the penalty that was determined pursuant to these Sanction ~~g~~Guidelines.

Adhering to the above steps will insure that ~~the result of~~ the determination of any penalty for any violation will produce output that can be directly compared (i.e. without influence of ~~local authorities'~~ any penalty limitations or restrictions applicable in certain jurisdictions) with the penalty determined for any other violation, thus assisting the efforts of NERC and others to ensure that these Sanction ~~g~~Guidelines are uniformly applied and that there is an acceptable level of consistency in their application ~~of these sanction guidelines~~ across North America. Regulatory authorities with jurisdiction may also find such information useful for their determination of the appropriateness of any penalty or sanction proposed to them to be levied against a violator of the reliability standards. ~~Similarly, policy and legislative bodies may find such information of value to the review or development of arrangements addressing such matters.~~

~~3.21~~2.16 Frequency and Duration of Violations

~~Section 316A of the Federal Power Act [16 U.S.C. § 825o-1(b)], as amended by the Energy Policy Act of 2005, provides that "any person who violates any provision of Part II of this title or any provision of any rule or order thereunder shall be subject to a civil penalty of not more than $1,000,000 for each day that such violation continues."~~

~~FERC Order No. 672 interprets this statement as setting a cap on the monetary penalties that the Commission, NERC and regional entities can impose under FPA section 215. FERC has referred to this statutory provision as imposing a maximum $1,000,000 "per day, per violation" penalty and has directed that the ERO must ensure that in the U.S. such a penalty amount ($1,000,000), in such a manner ("per day, per violation"), can be imposed for a violation of the Reliability Standards should the conduct at issue so warrant.~~

As stated in Section 2.15 above, the maximum penalty that will be imposed in the U.S. for violation of a reliability standard is $1,000,000 per day. However, ~~S~~some ~~R~~reliability ~~S~~standards may not support the assessment of penalties on a "per day, per violation" basis, but instead should have penalties calculated based on an alternative penalty frequency or duration. Where NERC or the regional entity deems that a monetary penalty is warranted, or where NERC or the regional entity ~~is~~ monetize~~s~~~~ing~~ (Section 2.14~~3.19~~) the value of a non-monetary sanction, ~~for the violation of such a standard NERC or the regional entity~~they shall determine the penalty or monetized amount consistent with the following:

Multiple Instances of Violation on One Day

The nature of some ~~R~~reliability ~~S~~standards includes the possibility that an entity could violate the same requirement two or more times on the same day. In this instance, NERC and~~or~~ the regional entity are~~is~~ not limited to penalizing the violator a maximum of $1,000,000 per day. ~~As NERC or the regional entity deems appropriate~~ NERC or the regional entity may deem that ~~there have been~~ multiple violations of the same requirement ~~that~~ occurred on the same day, each of which is subject to the maximum potential penalty of $1,000,000 per violation, per day. Also, NERC or the regional entity is not constrained to assessing the same penalty amount for each of the multiple violations, irrespective of their proximity in time.

Cumulative Over Time

Certain requirements of ~~the R~~reliability ~~S~~standards are measured not on the basis of discrete acts, but ~~of~~on cumulative acts over time. Reliability ~~S~~standards that fall into this category ~~are~~ generally ~~those~~ involve~~ing~~ measurements based on averages over a given period. ~~Where a violation of such a standard has occurred the element of averaging performance over a period of time introduces the~~

~~difficulty to NERC or the regional entity of reasonably identifying (i) what date the violation should be deemed to have occurred and (ii) its duration.~~

If a Reliability ~~S~~standard requirement measured by an average over time can only be violated once per applicable period, ~~then~~ there is risk that a disproportionately mild penalty might be levied in a situation where the violation was serious and the effects on the Bulk-Power System were severe. In the future, as individual reliability standards are revised, each ~~R~~reliability ~~S~~standard requirement that is based on an average over time will specify the minimum period in which a violation could occur and how to determine when a violation arises, which may be other than once per applicable period[7]. In the interim until relevant ~~R~~reliability ~~S~~standards are so modified, where assessing a penalty for violation of~~any ambiguity on this point will be construed conservatively, meaning that where an entity has not complied with~~ such a standard, NERC or the regional entity will generally consider that only one violation occurred per measurement period. However, ~~notwithstanding this general principle of one violation per measurement period,~~ if an average must be measured by a span of time greater than a month, each month of that span shall constitute at a minimum one violation.

Periodically Monitored Discrete Violation

Some ~~R~~reliability ~~S~~standards may involve discrete events which are only monitored periodically or which are reported by exception. If a requirement of such a standard states that a discrete event constitutes a violation, then (i) a violation arises when that event occurs and (ii) that violation continues until remedied; and~~furthermore,~~ (iii) the violation ~~is deemed to have~~ occurred at the point that the entity ~~-~~entered into noncompliance with the reliability standard, regardless of the monitoring period for the activity or its date of discovery or reporting. For example, if a task required by a ~~R~~reliability ~~S~~standard requirement was~~has~~ not ~~been~~ done by the required date, it is irrelevant that monitoring for compliance for the requirement occurs only on a yearly or other periodic basis; NERC or the regional entity will deem a violation to have occurred on the first day of noncompliance and each day thereafter until compliance is effectuated. Similarly, if a discrete event occurs and is not remedied on the date of its occurrence, then NERC or the regional entity will deem a violation to have occurred on the day of the first instance of the noncompliance and each day~~, or portion thereof~~ thereafter until the entity is in compliance ~~is effectuated~~.

~~Non-compliance with a standard of this type will subject the violator to the potential maximum monetary penalty of $1,000,000 per violation per day in violation.~~

NERC or the regional entity may, at its discretion, ~~is not constrained to~~ assess~~ing~~ the same penalty amount for each day that the entity was in violation of the r~~R~~eliability s~~S~~tandard requirement in question.

[7] ~~Para. 41; FERC Order on Clarification and Rehearing [Docket No. RR06-1-006]~~

4.3. Determination of Monetary Penalties

~~The following~~This section describes the specific steps that NERC or the regional entity will follow to determine the monetary penalty for a violation[8]. The determination of non-monetary sanctions is discussed in Section ~~5~~4 of this document~~; Section 6 discusses remedial action~~.

Step 1. NERC or the regional entity will set ~~T~~the Base Penalty Amount for the violation ~~will be set~~ as discussed in Sections ~~4~~3.1 and ~~4~~3.2, below.

Step 2. NERC or the regional entity will adjust the~~The~~ Base Penalty Amount set in Step 1 ~~will be reviewed~~ pursuant to Section ~~4~~3.3, below. This will result in the Adjusted Penalty Amount.

Step 3. NERC or the regional entity may review ~~T~~the Adjusted Penalty Amount determined in Step 2 ~~may be reviewed~~ in light of the violator's financial ability to pay the penalty. Also, where applicable, NERC or the regional entity will ~~re~~confirm that the penalty ~~set~~ will disgorge unjust profits or economic benefits associated with an economic choice to violate.[9] ~~.~~ At the conclusion of this review, NERC or the regional entity will set the Final Penalty Amount ~~will be set.~~

Step 4. NERC or the regional entity will take into account any limitations on the maximum permissible penalty in the applicable jurisdiction.

~~Unless NERC or the regional entity deems alternative frequency or duration is warranted penalties shall be assessed on a per violation per day basis.~~ At the discretion of NERC or the regional entity, a penalty may be assessed on a per violation per day basis or with alternative frequency or duration. Where NERC or the regional entity deems that alternative penalty frequency or duration is warranted, the Notice of Penalty associated with the violation will clearly identify this and provide the rationale for it. Where NERC or the regional entity deems that alternative penalty frequency or duration is warranted, penalties shall be determined in accordance with section ~~3.21~~2.16 of these Sanction Guidelines.

4.~~1~~3.1 Initial Value Range of the Base Penalty Amount

NERC or the regional entity will determine an initial value range for the Base Penalty Amount by considering ~~two factors regarding the violation:~~ the Violation Risk Factor ("VRF") of the requirement violated and the Violation Severity Level ("VSL") assessed for the violation. Using the Base Penalty Amount Table provided in Appendix A NERC or the regional entity will look up the initial value range for the Base Penalty Amount by finding the intersection of the violation's VRF and VSL on the table.[10] ~~.~~

4.~~1~~.~~1~~3.1.1 Violation Risk Factor

Each ~~requirement set out within NERC's~~ reliability standard~~s~~ requirement has been assigned a ~~Violation Risk Factor (~~VRF~~)~~ through the NERC reliability standards development process. The VRF~~factor~~s have been defined and approved through the standards development process and are assigned to requirements to provide clear, concise and comparative association between the violation of a requirement and the expected or potential impact of the violation to the reliability of the bulk power system. One of three defined levels of risk is assigned to each standards requirement: Lower VRF~~Risk Factor, or~~; Medium VRF~~Risk Factor,~~; or~~;~~ High VRF~~Risk Factor~~. ~~Definitions of the factors can be found in appropriate standards development process documentation.~~

[8] The text in this section discusses the determination of a single penalty for an individual violation; however, the process laid out is also applicable to determining the individual penalties, or a single aggregate penalty, for multiple violations that are associated with each other as discussed in Section ~~3 Part 3~~2.~~8~~1 of this document.

[9] ~~Reference: Section 3 Parts 3.15 and 3.16.~~

[10] As discussed in Section ~~3 Part 3~~2.~~5~~1 of this document, where there is more than one violation ~~in play~~, but the violations are sufficiently associated, NERC or the regional entity may set a single initial value range that is appropriate in light of the individual VRF/VSL combinations of the violations.

4.1.23.1.2 Violation Severity Level

Violation severity levels (VSLs) are defined measurementslevels of the degree to which a violator violated a requirement of a reliability standard was violated. Whereas VRFsviolation risk factors are determined pre-violation and indicate the relative potential impacts that violations of each standard could pose to the reliability of the bulk power system, VSLs arethe violation severity level is assessed post-violation and areis an indicator of the severity of thehow severely the violator actually violatedviolation of the standard(s) requirement(s) in question.

These Sanction gGuidelines utilize the VSLsviolation severity levels, which that have been established[11] by NERC for requirements of the reliability standards. Up to four levels can be defined for each requirement; the levels have been designated as: Lower, Moderate, High, and Severe.

4.23.2 Setting of the Base Penalty Amount

NERC or the regional entity will set the Base Penalty Amount set for the violation may be set at the highest figure of the initial value range determined pursuant to Section 4.13.1, above. However, NERC or the regional entity may set the Base Penalty Amount at or below the lowest figure of the initial value range in light of two specific circumstances regarding the violation and the violator, specifically:

a. The applicability of the VRFViolation Risk Factor of the violation to the specific circumstances[12] of the violator.

b. Whether this is an inconsequential first violation by the violator of the reliability standard(s) in question.

As noted in Section 3.122.7, NERC or the regional entity will consider the time horizon forinvolved with the violation when setting the Base Penalty Amount for the violation. As also noted in Section 3.12 this consideration will be documented for inclusion in the Notice of Penalty issued for the violation.

The penalty amount resulting from the this review will be the Base Penalty Amount that is used as the basis for further adjustment pursuant to the factors discussed in the next section (3.3) of this document.

4.2.13.2.1 Applicability of the Violation Risk Factor

Violation Risk FactorsVRFs are assigned to standards' requirements as indicators of the expected risk or harm to the bulk power system posed by the violation of a requirement by a typical or median entity that is required to comply. NERC or the regional entity may consider the specific circumstances of the violator to determine if the violation of the requirement in question actually produced the degree of risk or harm anticipated by the VRFViolation Risk Factor. If that expected risk or harm was not or would not have been produced, NERC or the regional entity may set the Base Penalty Amount to a value it (i) deems appropriate and (ii) is within the initial value range set above pursuant to Section 3.1.

4.2.23.2.2 First Violation

If the actual or foreseen impact of the violation is judged to be inconsequential by NERC or the regional entity and the violation is the first incidence of violation of the requirement in question by the violator, NERC or the regional entity may at its discretion: (i) set the Base Penalty Amount to a value it deems appropriate within the initial value range set above

[11] Assignment of these levels will be complete and filed with the Commission by March 1, 2008 in accordance with FERC Order on Compliance Filing dated June 7, 2007 [Docket No. RR06-1-007] .

[12] The circumstances of the violator will include but not be limited to, as appropriate: the violator's aggregate and net load;, and interconnections characteristics such as voltage class and transfer ratings;

pursuant to Section ~~4~~3.1, or (ii) excuse the penalty for the violation (i.e. set the Base Penalty Amount to $0~~$~~).

This relief will generally not be afforded to the violator if NERC or the regional entity determines that the violator has a poor internal compliance program, culture of compliance or compliance record; e.g. the circumstances discussed in Section ~~4~~3.3.1 have been an aggravating factor in one or more previous penalties assessed against~~to~~ the violator.

This relief will not be available for consideration in those instances where the violator ~~has~~ concealed or attempted to conceal the violation, failed or refused to comply with compliance directives from NERC or the regional entity, or intentionally violated for purposes other than a demonstrably good faith effort to avoid a significant and greater threat to the immediate reliability of the bulk power system.

~~4.3~~3.3 Application of Adjustment Factors

Adjustment factors provide an~~the~~ opportunity for~~to~~ NERC or the regional entity to adjust the base penalty to reflect the specific facts and circumstances material to each violation and violator.

These guidelines recognize and require that, as a minimum, NERC or the regional entity consider the following:

a. Repetitive violations and the violator's compliance history

b. Failure of the violator to comply with compliance directives

c. Disclosure of the violation by the violator through ~~S~~self-reporting~~disclosure~~, or as the result of a compliance self-analysis following a bulk power system event, and voluntary mitigating activities~~corrective action~~, by the violator

d. Degree and quality of cooperation by the violator in the violation investigation and in any remedial action directed for the violation, including the violator's cooperation in an event analysis concerning, and the performance of a compliance self-analysis by the violator following, a bulk power system event in which the violation occurred or to which it related.

e. The presence and quality of the violator's compliance program ~~quality~~

f. Settlement

~~f~~g. Any attempt by the violator to conceal the violation

h. Intentional violations

~~h~~i. Extenuating circumstances

~~Two documents issued by United States regulatory agencies will be instructive to NERC and the regional entities when they are determining penalties for violations of the reliability standards: the FERC's Policy Statement on Enforcement issued on October 20, 2005 under Docket No. PL06-00, and; U.S Securities and Exchange Commission (SEC) Release No. 44969 under the Securities and Exchange Act of 1934, issued on October 23 2001, also concurrently issued by the SEC as Release No. 1470 under Accounting and Auditing Enforcement.~~

NERC or the regional entity may also consider other ~~additional~~ factors it deems appropriate under the circumstances, as long as their use is clearly identified and adequately justified. The effect of using these factors must~~will also~~ be fully and clearly disclosed in the Notice of Penalty and supporting documents.

~~4.3.1~~3.3.1 Repetitive Violations and Compliance History

~~A bulleted point under Paragraph 20 of the FERC Policy Statement on Enforcement highlights repeat offenses by a violator.~~ If a violator has had repetitive infractions of the same

or a closely-related reliability standard requirement, particularly within a time frame defined within the standard(s) or deemed appropriate by NERC or the regional entity in the absence of a definition of~~the standard(s) defining the~~ a time frame in the relevant standard, NERC or the regional entity shall consider an~~some~~ increase to the penalty. In evaluating the violator's compliance history, NERC or the regional entity will take into account previous violations by affiliates of the violator, particularly violations of the same or similar reliability standard requirements, and will evaluate whether any such prior violations reflect recurring conduct by affiliates that are operated by the same corporate entity or whose compliance activities are conducted by the same corporate entity.

The ~~term "violation~~ reset ~~time~~ period" or reset time frame of a standards requirement may be defined or implied within a given standard as~~to describe~~ the period of time generally required for a violator to continue operations without ~~incidence of further violation(s) of the~~violating a ~~R~~reliability ~~S~~standard~~s~~, particularly ~~of~~ the initial reliability standard violated or a similar standard ~~violated, in order to avoid~~Expiration of this reset period or reset time frame would serve to negate or minimize consideration of the violator's previous violation history for sanctioning purposes in the event of a subsequent violation(s). NERC or~~and~~ the ~~R~~regional entity~~Entities~~ shall exercise appropriate judgment and discretion in this regard as warranted by the facts and circumstances, particularly where no reset ~~time~~ period or reset time frame is specifically set within the standard violated. Repeat violations within violation reset ~~time~~ periods or reset time frames are aggravating factors in the determination of the penalty or sanction~~ing~~. ~~Accordingly, a~~A violation history of no violations will produce no mitigation of the penalty otherwise determined; a violation history of infrequent minor violations of lesser risk requirements assessed lower VSLs~~violation severity levels~~ may result in small or no increase; and a history of more frequent violations or previous violations of higher risk requirements assessed more severe VSLs~~violation severity levels~~ will generally incur commensurately larger increases.

~~4.3.2~~3.3.2 Failure to Comply with a Remedial Action~~Compliance~~ Directives or with Agreed Corrective or Mitigating Activity

If the violator has violated reliability standard requirements despite~~notwithstanding having~~ receiv~~inged~~ related remedial action ~~compliance~~ directives or despite having agreed to corrective or mitigating activities for prior violations, ~~such as for remedial action from NERC or the regional entity,~~ NERC or the regional entity shall consider increasing~~some increase to~~ the penalty.

~~4.3.3~~3.3.3 Disclosure of the Violation Through Self-Reporting and Voluntary Mitigating Activities by the Violator~~Corrective Action~~

NERC or the regional entity shall consider whether a violator ~~self-~~reported~~disclosed~~ the violation by a self-report, or as the result of a compliance self-analysis conducted by the violator following a bulk power system event, prior to detection or intervention by NERC or the regional entity, and any mitigating activities voluntarily~~action~~ undertaken by the violator to correct the ~~situation~~noncompliance. ~~NERC or the regional entity will be instructed in their consideration of these factors by the text of Paragraphs 24 and 25 of the FERC Policy Statement on Enforcement.~~ As they deem warranted, NERC or the regional entity may reduce the violator's penalty ~~consistent with the cited sections of the FERC policy~~. If a self-report or a self-certification submitted by the violator accurately identifies a violation of a Reliability Standard, an identification of the same violation in a subsequent compliance audit or spot check will not subject the violator to an escalated penalty as a result of the compliance audit process unless the severity of the violation is found to be greater than reported by the violator in the self-report or self-certification.

~~4.3.4~~3.3.4 Degree and Quality of Cooperation ~~in Violation Investigation and Remedial Action~~

NERC or the regional entity shall consider the degree and quality of the violator's cooperation with NERC or the regional entity ~~in the investigation of the violation and any remedial action arising from it~~. ~~NERC or the regional entity will be instructed in making their determination on this by the text of Paragraphs 26 and 27 of the FERC Policy Statement on Enforcement.~~ NERC or the regional entity may adjust the violator's penalty as they deem appropriate, which ~~warranted commensurate with the cited sections of the FERC policy statement. This~~ may result in an increase, a decrease or no change to the penalty. If the violation occurred in connection with a bulk power system event and the violator is cooperative in the event analysis process and performs an appropriate compliance self-analysis following the event, the violator's actions will be considered as mitigating factors in the determination of any penalties or sanctions for violations occurring in connection with the event.

~~4.3.5~~3.3.5 Presence and Quality of Violator's Internal Compliance Program

NERC or the regional entity shall consider the presence and quality of the violator's internal compliance program, if any, and other indicators of the violator's culture of compliance. ~~NERC or the regional entity will be instructed in making their determination on this factor by the text of Paragraphs 22 and 23 of the FERC Policy Statement on Enforcement. As they deem warranted,~~ NERC or the regional entity may reduce the violator's penalty as they deem appropriate. ~~consistent with the cited sections of the FERC policy. Consistent with the FERC policy~~ However, NERC or the regional entity may not increase a violator's penalty ~~specifically~~solely on the grounds that the violator has no internal compliance program or a poor quality program.

3.3.6 Settlement

NERC or the regional entity may consider a reduction in penalty if the violator resolves the violation through settlement, taking into account the speed with which settlement was reached.

~~4.3.6~~3.3.7 Violation Concealment and Non-Responsiveness

~~Two bulleted points under Paragraph 20 of the FERC Policy Statement on Enforcement highlight misrepresentation of material facts and resistance or impediment to inquiry of a violation. When determining a penalty NERC or the regional entity shall consider any concealment or attempt to conceal the violation, or information needed to investigate the violation, on the part of the violator.~~ NERC or the regional entity shall consider a significant increase to the penalty ~~I~~if NERC or the regional entity determines, based on its review of the facts, that the violator concealed or attempted to conceal the violation or information necessary to investigate the violation. The presumption in such circumstances is to double ~~, some significant increase to the penalty shall be considered; doubling of the penalty otherwise determined is suggested. Conduct of this nature on more than one occasion regarding one violation, or with respect to more than one violation, should incur an even larger increase to~~ the penalty otherwise determined. Additionally, NERC or the regional entity shall consider an increase to the penalty if NERC or the regional entity determines, based on its review of the facts, that the violator resisted or impeded the discovery and review of a violation.

~~4.3.7~~3.3.8 Intentional Violation

~~Another bulleted point under Paragraph 20 of the FERC Policy Statement on Enforcement highlights offenses as willful action by a violator.~~ When determining a penalty, NERC or the regional entity shall consider if the violator intentionally violated the reliability standard ~~without just cause; i.e.,~~ for purposes other than a demonstrably good faith effort to

avoid a significant and greater threat to the immediate reliability of the bulk power system. If the violator engaged in such conduct, a~~some~~ significant increase to the penalty shall be considered; the presumption in such cases is to doubl~~eing of~~ the penalty otherwise determined ~~is suggested~~. If conduct of this nature has been detected on more than one occasion, NERC or the regional entity should assess an even larger increase to the penalty ~~otherwise determined~~.

NERC or the regional entity will consider violations attributable to an economic choice to violate as intentional violations. ~~Consistent with the FERC Policy Statement on Enforcement a~~Any penalty issued involving conduct of this manner shall a~~t~~s a minimum disgorge any profits or economic benefits the violator acquired as a consequence of the behavior, whenever and to the extent that they can be determined or reasonably estimated.

~~4.3.8~~3.3.9 Extenuating Circumstances

NERC or the regional entity will consider any~~if there are~~ extenuating circumstances regarding the violation that justify reduction or elimination of the penalty otherwise determined.

~~Consideration of adjusting a penalty for this factor would be inconsistent with NERC or the regional entity increasing a penalty after consideration of any other factor included in this section of these guidelines, such as intentional violation without justifiable cause or concealment or attempt to conceal.~~

~~4.4~~3.4 Setting of the Final Penalty Amount

The Adjusted Penalty Amount determined in Step 2 may be reviewed in light of the violator's financial ability to pay the penalty. ~~Also, i~~If the violation ~~was~~resulted from an economic choice, NERC or the regional entity will ~~re~~confirm that the penalty ~~set~~ will disgorge any unjust profits or economic benefits. At the conclusion of this review, if applicable, NERC or the regional entity will set the Final Penalty Amount ~~will be set~~.

~~4.4.1~~3.4.1 Violator's Financial Ability to Pay[13]

At the written request of the violator, NERC or the regional entity will review the penalty determined in Step 2 in light of relevant, verifiable information that the violator provides regarding its~~their~~ financial ability to pay. At the conclusion of this review NERC or the regional entity may:

1. Reduce the penalty ~~payable~~ to an amount that NERC or the regional entity~~, as applicable,~~ deems that the violator has the financial ability to pay, or;
2. Excuse the penalty amount payable, or;
3. Sustain the penalty amount determined in Step 2.

~~Where the penalty amount has been reduced or excused,~~ If NERC or the regional entity reduces or excuses the penalty, NERC or the regional entity shall consider the assessment of appropriate non-monetary sanction(s) as a substitute or an alternative for the penalty amount otherwise considered appropriate ~~that has been excused or by which the penalty has been reduced~~.

~~4.4.2~~3.4.2 ~~Rec~~Confirmation of Disgorgement of Unjust Profit or Gain

Notwithstanding the application of any other consideration or factor applicable to the determination of a just and reasonable penalty for the violation, if the violation in question involved an economic choice to violate a reliability standard, NERC or the regional entity

[13] NERC anticipates that this will be the primary vehicle for addressing the ability to pay of "not-for-profit" and other similar organizations.

shall ~~re~~confirm that the penalty ~~set~~ meets the requirements set forth in ~~Parts 3.15 and 3.16 of~~ Section~~s~~ ~~3~~2.10 and 2.11 of this document.

~~5.~~4. Determination of Non-Monetary Sanctions

The imposition of sanctions is not limited~~bounded~~ to monetary penalties. Non-~~M~~monetary sanctions ~~applied must~~may be applied with the objective of promoting reliability and compliance with the reliability standards. Non-monetary sanctions may include~~, but not be limited to, the following:~~ limiting activities, functions, or operations, or placing the violator on a reliability watch list of significant violators.

~~a.Limitations on activities, functions, or operations~~

~~a.Placing an entity on a reliability watch list composed of major violators~~

6.Remedial Action

6.1Definition and Anticipated Use

Remedial actions are directives that may be issued to a bulk power system owner, operator, or user to resolve an alleged violation of a reliability standard by addressing conditions, practices, or any other relevant action or activity that is immediately necessary to terminate or correct to protect the reliability of the bulk power system from an imminent threat. A remedial action directive will be issued when NERC or the regional entity identifies an alleged violation of a reliability standard that must be corrected immediately to protect the reliability of the bulk power system from the imminent threat that NERC or the regional entity has identified.

NERC or the regional entity will generally employ remedial action directives where they deem it necessary to clearly specify minimum corrective actions that the subject of the remedial action directive must take; additionally or alternatively a remedial action directive may clearly specify timelines within which the subject must take specified actions, complete specified tasks, or achieve specified outcomes. Also, to the extent NERC or the regional entity is authorized to do so, a remedial action directive may communicate penalties, sanctions, or further remedial actions that may be imposed should the specific remedial action directive not be complied with by those to whom it has been issued. As a rule of thumb, remedial action directives will be of use to NERC or the regional entity whenever any significant combination of specificity, clarity, or time is of the essence to address a threat to the reliability of the bulk power system brought on by lack of or inadequate compliance to the reliability standards.

6.2Compliance Requirements

In the United States, the Commission has concluded that owners, operators, or users of the bulk power system must comply with remedial action directives issued to them by NERC or a regional entity. Noncompliance with a remedial action directive may result in a substantially increased penalty or sanction.

Remedial action directives issued by NERC or the regional entity will include a deadline by which time the owner, operator, or user must complete requirements set out in the order, and by which time the entity must demonstrate compliance to the remedial action directive to NERC or the regional entity that issued it. Failure or refusal to meet the requirements or deadlines set out in a remedial action directive may itself result in further remedial action directives or significantly increased penalties or sanctions by NERC or the regional entity.

6.3No Obligation to Issue

NERC or the regional entity may, but is not obligated, to issue remedial action directives. Lack of being issued a remedial action directive does not relieve a bulk power system owner, operator, or user from any responsibilities they otherwise have to comply or maintain compliance with requirements of the reliability standards. Remedial action directives will be used by NERC or the regional entities only as they deem warranted, when they deem warranted.

6.4Scope of Application

The scope of remedial action directives issued by NERC or the regional entity will be limited to conditions, practices, or any other relevant actions or activities resulting in noncompliance, or that NERC or the regional entity considers at significant risk of becoming noncompliant, to requirements of the reliability standards, and that present an imminent threat to the reliability of the bulk power system. However, beyond merely directing compliance or improved compliance with standards' requirements, where NERC or the regional entity is authorized to do so, the directive may also stipulate how compliance or the improvement to compliance is to be achieved.

~~6.5Availability~~

~~In the United States, the Commission has interpreted the Federal Power Act to authorize the NERC or the regional entity can issue a remedial action directive prior to completion of the confirmation review of a probable violation, or prior to the determination of a penalty or sanction for that violation. The Commission also concluded it is not necessary for NERC or the regional entity to acquire the Commission's or other regulators' approval prior to issuing remedial action directives. Accordingly, NERC or the regional entity may issue remedial action directives to entities in the United States whenever they deem it necessary or otherwise warranted to do so. Also, NERC or the regional entity may issue remedial action directives to entities in the United States regarding a violation that is immediately necessary to terminate or correct to protect the reliability of the bulk power system from an imminent threat, irrespective of whether that violation is ultimately verified or dismissed by NERC or the regional entity's investigation of the violation.~~

~~6.6No Impact on Confirmation of Violation, or Penalties or Sanctions~~

~~Remedial action directives issued regarding a violation, in particular any costs incurred by the violator to comply with any such directive, will not be considered when reviewing whether the aggregate of any penalties and sanctions levied for that violation bear a reasonable relation to the seriousness of the violation. Also, any remedial action directives issued with respect to a violation will not influence the outcome of the confirmation review of that violation nor the determination of penalties or sanctions for that violation; ordering a violator to correct what needs correcting anyway is no grounds for dispelling a violation nor reducing or eliminating a penalty or sanction that would otherwise be determined appropriate for the violator for that violation.~~

~~6.7Types of Remedial Actions~~

~~NERC or the regional entities may issue remedial action directives to correct compliance with NERC or regional reliability standards and reduce or eliminate imminent threats to the reliability of the bulk power system. Examples of remedial actions include:~~

~~a.Specifying operating or planning criteria, limits, or limitations~~

~~b.Requiring specific system studies~~

~~c.Defining operating practices or guidelines~~

~~d.Requiring confirmation of data, practices, or procedures through inspection testing or other methods~~

~~e.Requiring specific training for personnel~~

~~f.Requiring development of specific operating plans~~

Appendix A: Base Penalty Amount Table

The following lists the Base Penalty amounts corresponding to combinations of ~~v~~Violation ~~r~~Risk ~~f~~Factor and ~~v~~Violation Ss~~s~~everity F~~f~~actor.

	Violation Severity Level							
Violation Risk Factor	**Lower**		**Moderate**		**High**		**Severe**	
	Range Limits		**Range Limits**		**Range Limits**		**Range Limits**	
	Low	**High**	**Low**	**High**	**Low**	**High**	**Low**	**High**
Lower	$1,000	$3,000	$2,000	$7,500	$3,000	$15,000	$5,000	$25,000
Medium	$2,000	$30,000	$4,000	$100,000	$6,000	$200,000	$10,000	$335,000
High	$4,000	$125,000	$8,000	$300,000	$12,000	$625,000	$20,000	$1,000,000

NOTE: This table describes the amount of penalty that could be applied for each day that a violation continues, subject to the considerations of Section 3.21 regarding frequency and duration of violations.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PROPOSED REVISIONS 11-7-2011

North American Electric Reliability Corporation

Compliance Monitoring and Enforcement Program

APPENDIX 4C TO THE RULES OF PROCEDURE

Effective: ~~October 7, 2011~~ , 2012

TABLE OF CONTENTS

COMPLIANCE MONITORING AND ENFORCEMENT PROGRAM

1.0 INTRODUCTION

This Compliance Monitoring and Enforcement Program ("Compliance Program") is the program to be used by the North American Electric Reliability Corporation ("NERC") and the Regional Entities to monitor, assess, and enforce compliance with Reliability Standards within the United States. Compliance monitoring and enforcement programs also will be implemented in Canada consistent with Canadian laws and agreements.

1.1 Definitions

Capitalized terms used in this Compliance Program shall have the meanings set forth in Section 200 and Section 1501 of the NERC Rules of Procedure or as set forth below:

1.1.1 Alleged Violation: A Possible Violation for which the Compliance Enforcement Authority has determined, based on an assessment of the facts and circumstances surrounding the Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard.

1.1.2 Annual Audit Plan: A plan developed annually by the Compliance Enforcement Authority that includes the Reliability Standards and Registered Entities to be audited, and the schedule of Compliance Audits, and Compliance Audit Participant requirements for the calendar year.

1.1.3 Applicable Governmental Authority: The Federal Energy Regulatory Commission ("FERC") within the United States and the appropriate governmental authority with subject matter jurisdiction over reliability in Canada and Mexico.

1.1.4 Complaint: An allegation that a Registered Entity violated a Reliability Standard.

1.1.5 Compliance Audit: A systematic, objective review and examination of records and activities to determine whether a Registered Entity meets the requirements of applicable Reliability Standards.

1.1.6 Compliance Audit Participants: Registered Entities scheduled to be audited and the audit team members.

1.1.7 Compliance Enforcement Authority: NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.1.8 Compliance Investigation: A comprehensive investigation, which may include an on-site visit with interviews of the appropriate personnel, to determine if a violation of a Reliability Standard has occurred.

1.1.9 Confirmed Violation: An Alleged Violation for which (1) ~~an~~the Registered ~~e~~Entity has~~: (1)~~ accepted the Notice of Alleged Violation and Proposed Penalty or Sanction or other notification of the Alleged Violation~~finding of the violation by a Regional Entity or NERC and will not seek an appeal~~, or (2) there has been the issuance of a final order finding a violation, penalty or sanction~~completed the hearing and appeals process within NERC,~~ or (3) ~~allowed~~ the period~~time~~ for requesting a hearing or ~~submitting~~ an appeal has ~~to~~ expired and the Registered Entity has not contested the Alleged Violation or penalty in any filing with the Compliance Enforcement Authority, or (4) the Registered Entity has entered into a settlement agreement, regardless of whether or not the Registered Entity has admitted or contested~~to~~ the Alleged ~~v~~Violation ~~in a settlement agreement~~.

1.1.10 End Date: The last date of the period to be covered in a Compliance Audit.

1.1.11 Exception Report~~ing~~: Information provided to the Compliance Enforcement Authority by a Registered Entity indicating that a violation of a Reliability Standard has occurred (e.g., a system operating limit has been exceeded) or enabling the Compliance Enforcement Authority to ascertain the Registered Entity's compliance.

1.1.12 ISO/RTO: A FERC-approved independent system operator or regional transmission organization with exclusive and independent authority under section 205 of the Federal Power Act (16 U.S.C. 824d) to propose rates, terms and conditions of transmission service provided over the facilities it operates.

1.1.1~~2~~3 Mitigation Plan: An action plan~~, required when a Registered Entity violates a Reliability Standard as determined by any means including Compliance Enforcement Authority decision, settlement agreement, or otherwise, that is~~ developed by the Registered Entity to (1) correct a violation of a Reliability Standard and (2) prevent re-occurrence of the violation.

1.1.1~~3~~4 NERC Compliance Registry: A list, maintained by NERC pursuant to Section 500 of the NERC Rules of Procedure and Appendix 5B, the NERC *Statement of Compliance Registry Criteria*, of the owners, operators and users of the Bulk Power System, and the entities registered as their designees, that perform one or more functions in support of reliability of the Bulk Power System and are required to comply with one or more requirements of Reliability Standards.

1.1.1~~4~~5 NERC Compliance Monitoring and Enforcement Program Implementation Plan or NERC Implementation Plan: The annual NERC Compliance Monitoring and Enforcement Program

Implementation Plan that specifies the Reliability Standards that are subject to reporting by Registered Entities to the Compliance Enforcement Authority in order to verify compliance and identifies the appropriate monitoring procedures and reporting schedules for each such Reliability Standard.

1.1.15~~5~~6 Notice of Alleged Violation and Proposed Penalty or Sanction: A notice issued by the Compliance Enforcement Authority to a Registered Entity pursuant to Section 5.3.

1.1.16~~7~~ Notice of Completion of Enforcement Action: A notice issued by the Compliance Enforcement Authority to a Registered Entity, pursuant to Section 5.10, stating than an enforcement action is closed.

1.1.17~~8~~ Notice of Confirmed Violation: A notice issued by the Compliance Enforcement Authority to a Registered Entity confirming the violation of one or more Reliability Standards~~, as a result of (1) the Registered Entity accepting a Notice of Alleged Violation and the proposed penalty or sanction, or (2) the finding of a violation through a hearing and appeal, or (3) the expiration of the period for requesting a hearing or an appeal, or (4) the Registered Entity admitting the violation as part of an executed settlement agreement~~.

1.1.18~~9~~ Notice of Penalty: A notice prepared by NERC and filed with FERC, following approval by NERC of a Notice or other notification of Confirmed Violation or a settlement agreement, stating the penalty or sanction imposed or agreed to for the Confirmed Violation or as part of the settlement.

1.1.~~19~~20 Notice of Possible Violation: A notice issued by the Compliance Enforcement Authority to a Registered Entity that (1) states a Possible Violation has been identified, (2) provides a brief description of the Possible Violation, including the Reliability Standard requirement(s) and the date(s) involved, and (3) instructs the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

1.1.20~~1~~ Periodic Data Submittals: Modeling, studies, analyses, documents, procedures, methodologies, operating data, process information or other information to demonstrate compliance with Reliability Standards and provided by Registered Entities to the Compliance Enforcement Authority on a time frame required by a Reliability Standard or an ad hoc basis.

1.1.21~~2~~ Possible Violation: The identification, by the Compliance Enforcement Authority, ~~using one of the Compliance Monitoring and Enforcement Processes in Section 3.0,~~ of a possible failure by a

Registered Entity to comply with a Reliability Standard that is applicable to the Registered Entity.

1.1.2~~2~~3 Preliminary Screen: An initial evaluation of evidence indicating potential noncompliance with a Reliability Standard has occurred or is occurring, conducted by the Compliance Enforcement Authority for the purpose of determining whether a Possible Violation exists, and consisting of an evaluation of whether (1) the entity allegedly involved in the potential noncompliance is registered, ~~and~~ (2) the Reliability Standard requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered, and (3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation which is currently being processed.

1.1.24 Public Notification List: A list posted on the NERC website, pursuant to Section 5.11 of this Appendix, of the names of Registered Entities that an ISO/RTO contends it has authority to allocate to, pursuant to a proceeding under section 205 of the Federal Power Act, some or all of a monetary penalty imposed on the ISO/RTO for a violation of a Reliability Standard.

1.1.2~~3~~5 Regional Implementation Plan: An annual plan, submitted ~~by~~on or about October ~~November~~ 1 of each year to NERC for approval that, in accordance with NERC Rule of Procedure Section 401.6 and the NERC Compliance Monitoring and Enforcement Program Implementation Plan, identifies (1) all Reliability Standards identified by NERC to be actively monitored during each year, (2) other Reliability Standards proposed for active monitoring by the Regional Entity, (3) the methods to be used by the Regional Entity for reporting, monitoring, evaluation, and assessment of performance criteria with each Reliability Standard, and (4) the Regional Entity's Annual Audit Plan.

1.1.2~~4~~6 Registered Entity: An owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, that is included in the NERC Compliance Registry.

1.1.2~~5~~7 Remedial Action Directive: An action (other than a penalty or sanction) required by a Compliance Enforcement Authority that (1) is to bring a Registered Entity into compliance with a Reliability Standard or to avoid a Reliability Standard violation, and (2) is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat.

1.1.2~~6~~8 Required Date: The date given a Registered Entity in a notice from the Compliance Enforcement Authority by which some action by the Registered Entity is required.

1.1.2~~7~~9 Self-Certification: An attestation by a Registered Entity that it is compliant or non-compliant~~of compliance or non-compliance~~ with a Reliability Standard requirement that is the subject of the Self-Certification, or that it does not own facilities that are subject to the Reliability Standard requirement, or that the Reliability Standard requirement is not applicable to the Registered Entity ~~for which Self-Certification is required by the Compliance Enforcement Authority and that is included for monitoring in the Regional Implementation Plan~~.

1.1.2~~8~~30 Self-Report~~ing~~: A report by a Registered Entity stating ~~(1)~~ that the Registered Entity believes it has, or may have, violated a Reliability Standard~~, and (2) the actions that have been taken or will be taken to resolve the violation~~.

1.1.~~29~~31 Spot Check~~ing~~: A process in which the Compliance Enforcement Authority requests a Registered Entity to provide information (1) to support the Registered Entity's Self-Certification, Self-Report~~ing~~, or Periodic Data Submittal and to assess whether the Registered Entity complies with Reliability Standards, or (2) as a random check, or (3) in response to ~~events, as described in the Reliability Standards or based on~~ operating problems, ~~or~~ system events, or risk-based assessments.

2.0 IDENTIFICATION OF ORGANIZATIONS RESPONSIBLE FOR COMPLYING WITH RELIABILITY STANDARDS

NERC shall register the organizations responsible for complying with Reliability Standards, in accordance with Section 500 of the NERC Rules of Procedure and Appendix 5B, *Statement of Compliance Registry Criteria*. Organizations are responsible to register and to comply with Reliability Standards if they are owners, operators, and users of the Bulk Power System, perform a function listed in the functional types identified in Section II of Appendix 5B, and are material to the reliable operation of the Bulk Power System as defined by the criteria and notes in Appendix 5B. Regional Entities shall (i) develop and provide to NERC information to assist NERC to register organizations responsible for complying with Reliability Standards, and (ii) in the event of a registration appeal to NERC or an Applicable Governmental Authority, provide information requested by NERC concerning how the Registered Entity meets the registration criteria or is otherwise material to the reliability of the Bulk Power System.

NERC shall notify organizations of their inclusion on the NERC Compliance Registry and shall maintain the NERC Compliance Registry on its web site. NERC shall inform each Registered Entity at the time of registration of the Reliability Standards that are applicable to reliability functions for which the Registered Entity is registered. Each Registered Entity shall inform NERC or the applicable Regional Entity promptly of changes to the Registered Entity's registration information including planned or completed changes in ownership of Bulk Power System facilities, registration status, address and other contact information, and name of designated compliance contact. NERC will provide FERC and Applicable Governmental Authorities monthly updates to the NERC Compliance Registry.

NERC and each Regional Entity will designate a contact person(s) and require each Registered Entity to designate a contact person(s) responsible for sending and receiving all necessary information and communications concerning compliance matters. NERC and the applicable Regional Entity will designate where Registered Entities are to send information, data, Mitigation Plans, or any other compliance-related correspondence.

NERC shall maintain on its website a current listing of Reliability Standards that are applicable to all Registered Entities.

As provided for herein, during the course of compliance monitoring and enforcement activities relating to U.S. entities, NERC may obtain information that it will provide to FERC and, if the information pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such provision of information to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure. ~~However, NERC will not provide non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining permission from FERC for such disclosures and subject to such limitations as FERC may place on such disclosures. Similarly, during the course of compliance monitoring and enforcement activities relating to non-U.S. entities, NERC may obtain information that it will provide to the Applicable Governmental Authorities, including FERC, that have jurisdiction over the Registered Entity or the portion of the Bulk Power System to which the information pertains, but subject to any limitations placed on the disclosure of non-public, non-U.S. compliance information by the Applicable Governmental Authority with jurisdiction or by other law of the applicable jurisdiction. In any notice to, and request for permission to disclose compliance information from, FERC or another Applicable Governmental Authority pursuant to any provision of this Compliance Program, NERC will identify each Applicable Governmental Authority to which it proposes to disclose the information and the specific procedures that will be used for protecting from public disclosure any non-public compliance information that will be transferred to the other Applicable Governmental Authority or Authorities. The provisions of this paragraph do not apply to the provision by NERC to an Applicable Governmental Authority of information that is not directly related to a specific Registered Entity's compliance with a requirement of a Reliability Standard.~~

3.0 COMPLIANCE MONITORING ~~AND ENFORCEMENT~~ PROCESSES

The Compliance Enforcement Authority will monitor~~, assess, and enforce~~ Registered Entities' compliance with Reliability Standards using the compliance monitoring processes described in this Section ~~3.0 to collect information in order to make assessments of compliance. These processes are described in Sections 3.1 through 3.8 below~~. Scheduled compliance monitoring processes, such as Compliance Audits, will be conducted in accordance with applicable NERC Annual Implementation Plans and Regional Annual Implementation Plans, and individual entity audit plans. Compliance monitoring processes can also be initiated on an unscheduled basis as needed, in the judgment of NERC or the Compliance Enforcement Authority, based on Bulk Power System occurrences such as major events, disturbances, and trends. Factors that will be considered in determining whether a compliance monitoring process should be initiated on an unscheduled basis, and the type of compliance monitoring process to be initiated, include, but are not limited to, the significance of the occurrence to the reliability of the Bulk Power System, the

compliance record of the Registered Entity for which the compliance monitoring process would be initiated, and the quality of the Registered Entity's internal reliability compliance program.

If a compliance monitoring process described in this Section reveals a potential noncompliance with a Reliability Standard, the Compliance Enforcement Authority will conduct a Preliminary Screen of the potential noncompliance in accordance with Section 3.8. In addition, if the Compliance Enforcement Authority obtains evidence or information of a potential noncompliance with a Reliability Standard through any other means, including but not limited to an Exception Report or other report of noncompliance that a Registered Entity is required to submit in accordance with the terms of a Reliability Standard, the Compliance Enforcement Authority will conduct a Preliminary Screen of the information in accordance with Section 3.8. If the Preliminary Screen results in an affirmative determination with respect to the Preliminary Screen criteria, a Possible Violation exists and the Compliance Enforcement Authority will proceed in accordance with Section 5.0, Enforcement Actions.

~~Enforcement actions taken by the Compliance Enforcement Authority through the Compliance Program may include the imposition of remedial actions, sanctions, and penalties, where applicable, which shall be based on the schedule of penalties and sanctions approved for implementation by FERC and other Applicable Governmental Authorities. The imposition and acceptance of sanctions and penalties shall not be considered an acceptable alternative to any Registered Entity's continuing obligation to comply with the Reliability Standards.~~ Registered Entities found in violation of a Reliability Standard will be required to mitigate the violation regardless of any enforcement actions taken.

The ~~C~~compliance monitoring processes in this Section ~~Program~~ require~~s~~ timely information, reports and data from Registered Entities to effectively monitor compliance with Reliability Standards. The Compliance Enforcement Authority has authority to collect documents, data and information in the manner it deems most appropriate, including removing copies of documents, data and information from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. If documents, data, information or other reports to determine compliance requested from a Registered Entity are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a ~~party~~Registered Entity believes that a request for documents, data or information is unreasonable, the ~~party~~Registered Entity may request a written determination from the NERC General Counsel~~compliance program officer~~.

Any report or other submission of information by a Registered Entity required by the Compliance Program shall be signed by an officer, employee, attorney or other authorized representative of the Registered Entity. Electronic signatures are permitted in accordance with

processes established by NERC and the Regional Entity. NERC or the Compliance Enforcement Authority may require the signer to provide a statement of the basis of his or her authority to sign on behalf of the Registered Entity.

3.1 Compliance Audits

All Registered Entities are subject to audit for compliance with all Reliability Standards applicable to the functions for which the Registered Entity is registered. Compliance Audits are conducted on the Registered Entity's site to the extent required by NERC Rule of Procedure 403.11.2. Compliance Audit processes for Compliance Audits conducted in the United States shall be based on professional auditing standards recognized in the U.S., which may include, for example~~including~~ Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards and standards sanctioned by the Institute of Internal Auditors. Compliance Audit processes for Compliance Audits conducted outside the U.S. may be based on Canadian or other international standards. All Compliance Audits shall be conducted in accordance with audit guides established for the Reliability Standards included in the Compliance Audit, consistent with accepted auditing guidelines as approved by NERC. The audit guides will be posted on NERC's website.

3.1.1 Compliance Audit Process Steps

The process steps for a Compliance Audit are as follows:[1]

- The Compliance Enforcement Authority posts~~distributes~~ the Annual Audit Plan (developed in coordination with NERC) ~~to the Compliance Audit Participants and NERC~~. The Compliance Enforcement Authority provides additional information to the Compliance Audit Participants, including audit materials, coordinating agendas and changes to the audit schedule as required. ~~Prior to the Compliance Audit, the Compliance Enforcement Authority informs the Registered Entity of the Reliability Standards to be evaluated.~~ NERC or the Regional Entity provides the audit schedules to FERC and to any other Applicable Governmental Authority based upon the agreements in place with the other Applicable Governmental Authority.

- At least ~~two (2) months~~ninety (90) days prior to commencement of a regularly scheduled Compliance Audit, the Compliance Enforcement Authority notifies the Registered Entity of the Compliance Audit and the Reliability Standards to be evaluated, identifies the audit team members and their recent employment history, and requests data, including a completed NERC pre-audit questionnaire. If the audit team members change from the time of the original notification, the Compliance Enforcement Authority will promptly notify the Registered Entity of the change and will allow time for the Registered Entity to object to the new audit team member(s) (see Section 3.1.5.4).

- The Registered Entity provides to the Compliance Enforcement Authority the required information in the format and by the Required Date specified in the request.

[1] ~~This process normally completes within sixty (60) days of the completion of the on-site Compliance Audit work at the Registered Entity's site.~~

- The audit team reviews the submitted information for conformance with the requirements of the Reliability Standards~~ prior to performing the Compliance Audit. The audit team follows NERC audit guidelines in the implementation of the Compliance Audit~~.

- The~~is~~ audit team~~shall include~~ conduct~~sing~~ an exit briefing with the Registered Entity, provide~~sing~~ for a review of the audit report with the Registered Entity before it is finalized, and complete~~sissuing~~ an audit report in accordance with Section 3.1.6~~, including an assessment of compliance with the Reliability Standards, to the Compliance Enforcement Authority~~.

- If the audit team identifies evidence of a potential noncompliance with a Reliability Standard requirement by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

- ~~The Compliance Enforcement Authority reviews the report developed by the audit team and completes a Preliminary Screen for any Possible Violations of Reliability Standards, based on the potential noncompliances with Reliability Standards (if any) identified in the report.~~

- ~~If the Compliance Enforcement Authority concludes that there is a Possible Violation of a Reliability Standard, it shall send the Registered Entity a Notice of Possible Violation.~~

- ~~The Compliance Enforcement Authority provides the final audit report to the Registered Entity and to NERC.~~

3.1.2 Compliance Enforcement Authority Annual Audit Plan and Schedule

The Compliance Enforcement Authority shall develop an Annual Audit Plan. The Annual Audit Plan of Regional Entities will be included in the Regional Implementation Plans submitted to NERC for review and approval (see Section 4.2). NERC or the Regional Entity provides the Annual Audit Plans to FERC and to any other Applicable Governmental Authority consistent with the agreements in place with the Applicable Governmental Authority.

Prior to ~~January~~October 1 of the year preceding the year covered by the Annual Audit Plan, the Compliance Enforcement Authority shall notify Registered Entities subject to Compliance Audits during the upcoming year~~,~~ of the audit schedule~~s, methods, and data requirements for the audit~~. The Compliance Enforcement Authority will give due consideration to any schedule changes requested by Registered Entities for reasonable cause~~to avoid unnecessary burdens~~.

Revisions and additions to a Regional Entity Annual Audit Plan shall be communicated to and approved by NERC, and shall be communicated to the Registered Entity~~ shall be notified~~ in a timely manner (normally sixty (60) days in advance) of changes or revisions to scheduled audit dates.

3.1.3 Frequency of Compliance Audits

The Compliance Enforcement Authority will perform comprehensive Compliance Audits as required by the NERC Rules of Procedure and based on criteria established by NERC. In addition to scheduled Compliance Audits, the Compliance Enforcement Authority ~~Additionally,~~ ~~(i)~~ may initiate an unscheduled Compliance Audit of any Registered Entity ~~(i) may be initiated~~ at any time ~~by the Compliance Enforcement Authority~~ if the Compliance Enforcement Authority reasonably determine~~d~~s ~~d~~ it to be necessary to ensure the Registered Entity's compliance with Reliability Standards, and (ii) shall ~~be~~ initiate~~d by the~~ an unscheduled Compliance Audit ~~Enforcement Authority or by NERC~~ if directed by FERC. The Compliance Enforcement Authority shall notify NERC and FERC ~~P~~prior to or on the same date it notifies the Registered Entity that an unscheduled Compliance Audit is being initiated~~, the Compliance Enforcement Authority shall notify NERC and FERC that an unscheduled Compliance Audit is being initiated~~. If NERC initiates the unscheduled Compliance Audit, it shall notify the appropriate Regional Entity or Entities. The ~~Registered Entity~~Compliance Enforcement Authority shall provide~~receive~~ at least ten (10) business days advance notice to the Registered Entity that an unscheduled Compliance Audit is being initiated, which notice shall include identification of the members of the Compliance Audit team. ~~The Registered Entity shall make any objections to the composition of the Compliance Audit team, which shall be based on failure to meet the criteria specified in Section 3.1.5.2, at least five (5) business days prior to the start of on-site audit work for the unscheduled Compliance Audit.~~

3.1.4 Scope of Compliance Audits

3.1.4.1 Reliability Standards

A Compliance Audit shall include those Reliability Standards applicable to the Registered Entity that are identified in the NERC Implementation Plan for the current year, and may include other Reliability Standards applicable to the Registered Entity whether or not they~~that~~ are identified in the Regional Entity's Regional Implementation Plan for the current year. ~~The Compliance Audit may include any other Reliability Standards that are applicable to the Registered Entity.~~

3.1.4.2 Period Covered

The Registered Entity's data and information ~~should~~must show compliance with the Reliability Standards that are the subject of the Compliance Audit for the entire period covered by the Compliance Audit. The Compliance Enforcement Authority will indicate the beginning and End Date of the audit period in its notice of the Compliance Audit. The audit period begin~~sning with~~ the day after the End Date of the prior Compliance ~~a~~Audit by the Compliance Enforcement Authority ~~ended~~ (or the later of June 18, 2007 or the date the Registered Entity~~'s date of registration~~ became subject to compliance with the Reliability Standards if the Registered Entity has not previously been subject to a Compliance Audit)~~, and ending with the End Date for the Compliance Audit. However, if another Compliance Monitoring and Enforcement process has been conducted with respect to the Registered Entity subsequent to the date that would otherwise be the start of the period, the period covered by the Compliance Audit may, in the Regional Entity's discretion, begin with the completion of that Compliance Monitoring and Enforcement process for those Reliability Standards requirements that were the subject of the Compliance Monitoring and Enforcement process~~. The Compliance Enforcement Authority may modify the beginning date of the audit period for any given Reliability Standard requirement based on an intervening compliance monitoring process. The End Date may be a predetermined specific date

or may be stated generally as the last day ~~will be stated in the Compliance Enforcement Authority's notification~~ of the Compliance Audit ~~issued to the Registered Entity pursuant to Section 3.1.1~~.

The Registered Entity will be expected to demonstrate compliance for the entire period described above. ~~However, i~~If a Reliability Standard specifies a document retention period that does not cover the entire period described above, the Registered Entity will not be found in noncompliance solely on the basis of the lack of specific information that has rightfully not been retained based on the retention period specified in the Reliability Standard. However, in such cases, the Compliance Enforcement Authority will require the Registered Entity to demonstrate compliance through other means.

3.1.4.3 Review of Mitigation~~on~~ Activities ~~Plans~~

The Compliance Audit ~~will~~may include a review of any mitigating activities~~Mitigation Plans~~ which the Registered Entity has not yet completed, for the purpose of determining whether the Registered Entity is making adequate progress towards completion of the mitigating activities~~Mitigation Plan~~.

3.1.5 Conduct of Compliance Audits

3.1.5.1 Composition of Compliance Audit Teams

The audit team shall be comprised of ~~staff from~~members whom the Compliance Enforcement Authority has determined have the requisite knowledge, training and skills to conduct the Compliance Audit. ~~and such other persons as are included in the audit team pursuant to Section 3.1.5.3, and~~ The Compliance Audit team may include (i) contractors and industry subject matter experts ~~as determined by the Compliance Enforcement Authority to be appropriate to comprise a sufficient audit team~~, (ii) NERC staff members (which may include contractors to NERC), (iii) compliance staff members of other Regional Entities, and (iv) representatives of FERC and other Applicable Governmental Authorities so long as the Registered Entity is subject to the Applicable Governmental Authority's reliability jurisdiction. The audit team leader shall be a staff member from the Compliance Enforcement Authority and is responsible for the conduct of the Compliance Audit and preparation of the audit report.

3.1.5.2 Requirements for Compliance Audit Team Members

Each audit team member must:

- Be free of conflicts of interests in accordance with Compliance Enforcement Authority policies. ~~For example, e~~Employees or contractors of the Registered Entity being audited shall not be allowed to participate as auditors in the Compliance Audit of the Registered Entity.

- Comply with the NERC Antitrust Compliance Guidelines and shall have either signed appropriate confidentiality agreements or acknowledgments that the confidentiality agreement signed by the Compliance Enforcement Authority is applicable.

- Successfully complete all NERC or NERC-approved Regional Entity auditor training applicable to the Compliance Audit.

- Prior to the Compliance Audit, the Compliance Enforcement Authority shall provide confirmation to the Registered Entity that all audit team members have~~Provide copies of~~ executed confidentiality agreements or acknowledgements~~ to be provided to the Registered Entity prior to the audit~~.

3.1.5.3 Compliance Audit Observers ~~or~~and Other Attendees~~Participants~~

In any Regional Entity Compliance Audit of a Registered Entity, in addition to the audit team members, the following may participate as observers: (i) NERC Staff (which may include contractors to NERC)~~ may participate either as observers or as audit team members~~; (ii) other members of the Regional Entity's Compliance ~~s~~Staff~~, in addition to the audit team, may participate as observers~~; (iii) with the permission of the Regional Entity, compliance staff members of other Regional Entities~~ may participate either as observers or as audit team members~~; and (iv) representatives of FERC and of other Applicable Governmental Authorities ~~may participate either as observers or as audit team members~~ so long as the Registered Entity is subject to the Applicable Governmental Authority's reliability jurisdiction.

In addition, at the request of the Registered Entity being audited, the Regional Entity may allow attendance at the Compliance Audit by: (1) representatives of corporate affiliates of the Registered Entity being audited that are Registered Entities or that provide compliance services, support or oversight to the Registered Entity being audited, and (2) representatives of Registered Entities whose compliance activities are conducted by the Registered Entity being audited or by the same corporate entity that conducts the compliance activities of the Registered Entity being audited (e.g., representatives of other members of a Joint Registration Organization or of participants in a Coordinated Functional Registration pursuant to Section 500 of the Rules of Procedure). Each such additional attendee must execute a confidentiality agreement approved by the Regional Entity.

Compliance audit observers and attendees are not audit team members and do not participate in conducting the Compliance Audit or in making audit findings and determinations.

The Compliance Audit team leader or other staff of the Regional Entity conducting the Compliance Audit will communicate in advance with any observers or other attendees to ensure there are no undue disruptions to the audit, such as space limitations, no conflicts of interest, and no other considerations that in the judgment of the Compliance Audit team leader may be detrimental to the conduct and quality of the audit. If the Compliance Audit team leader identifies any such issues, he/she shall work with the proposed observers or attendees to facilitate observation in a less disruptive manner; or, alternatively, the Regional Entity Compliance staff will work with the proposed observers or attendees to schedule their participation in, observation of, or attendance at a different Compliance Audit in which such issues are not presented.

3.1.5.4 Registered Entity Objections to Compliance Audit Team

A Registered Entity subject to a Compliance Audit may object to any member of the audit team on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties. Any such objections must be provided in writing to the Compliance Enforcement Authority no later than fifteen (15) days prior to the start of on-site audit work. This fifteen (15) day requirement shall not apply ~~(i)~~ where an audit team member has been appointed less than twenty (20) days prior to the start of on-site audit work, in which case the Registered Entity must provide any objections to the Compliance Enforcement Authority within five (5) business days after receiving notice of the appointment of the Compliance Audit team member.~~; and (ii)~~

~~i~~In the case of an unscheduled Compliance Audit pursuant to Section 3.1.3, ~~in which case~~ the Registered Entity must provide any objections to the Compliance Enforcement Authority at least five (5) business days prior to the start of on-site audit work for the unscheduled Compliance Audit.

The Compliance Enforcement Authority will make a final determination on whether the member will participate in the Compliance Audit of the Registered Entity. Nothing in Section 3.1 shall be read to limit the participation of NERC staff in the Compliance Audit or to limit the participation of FERC staff in a Compliance Audit of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction.

3.1.6 Compliance Audit Reports

The audit team shall develop a draft audit report that shall include a description of the objective, scope, and methodology of the Compliance Audit; identify any evidence~~-~~ of potential~~possible~~ noncompliance with Reliability Standards by the Registered Entity found by the audit team; identify any ~~Mitigation Plans or~~ Remedial Action Directives, Mitigation Plans or other mitigating activities which have been completed or pending in the year of the Compliance Audit; and identify if~~the nature of~~ any C~~c~~onfidential I~~i~~nformation has been redacted. The report may also state areas of concern and recommendations identified by the audit team. ~~A separate document may be prepared that contains recommendations of the audit team. Any recommendations contained in that document will be considered non-binding.~~ The draft report will be provided to the Registered Entity for comment.

The audit team ~~will~~ considers corrections based on comments of the Registered Entity, ~~and provide the~~ finalizes the audit report, ~~to the Compliance Enforcement Authority who will review the report and assess compliance with the Reliability Standards~~ and provides the Registered Entity with a copy of the final report on or before the date the final report is provided to NERC. The Compliance Enforcement Authority~~Regional Entities will~~ provides the final report to NERC, which ~~will~~ in turn provides the report to FERC ~~-~~if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which FERC has jurisdiction and/or to another Applicable Governmental Authority if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which the other Applicable Governmental Authority has jurisdiction. The provision of the final report to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure.~~ Provided, that NERC will not disclose non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining

~~permission from FERC for such disclosure and subject to such limitations as FERC may place on such disclosure; and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission for such disclosure from the Applicable Governmental Authority with jurisdiction over the Registered Entity or the portion of the Bulk Power System to which such non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction. The Registered Entity shall receive the final audit report at least five (5) business days prior to the release of the report to the public.~~ Work papers and other documentation associated with the audit shall be maintained by the Compliance Enforcement Authority in accordance with NERC or Regional Entity requirements.

NERC will not publicly post the final audit report for at least five (5) business days following receipt. If~~n the event~~ the audit report identifies any Possible Violations of one or more Reliability Standards, the final audit report, or pertinent part thereof identifying the Possible Violations, shall not be released to the public by NERC~~ or the Compliance Enforcement Authority~~ until (i) the Possible Violation is dismissed prior to becoming a Confirmed Violation, or (ii) NERC submits a Notice of Penalty to FERC or other Applicable Governmental Authority~~,~~ or (iii) the Registered Entity executes~~admits to a violation or enters into~~ a settlement agreement with the Compliance Enforcement Authority pursuant to Section 5.6.

Information deemed by a Compliance Enforcement Authority or the Registered Entity as ~~c~~Critical ~~e~~Energy ~~i~~Infrastructure ~~i~~Information or ~~c~~Confidential ~~i~~Information~~ (as defined in Section 1501 of the NERC Rules of Procedure)~~ shall be redacted from any public reports.

3.2 Self-Certifications

The Compliance Enforcement Authority may require Registered Entities to self-certify their compliance with Reliability Standards.

~~If a Self-Certification accurately identifies a violation of a Reliability Standard, an identification of the same violation in a subsequent Compliance Audit or Spot Check will not subject the Registered Entity to an escalated penalty as a result of the Compliance Audit process unless the severity of the violation is found to be greater than reported by the Registered Entity in the Self-Certification.~~

3.2.1 Self-Certification Process Steps

The process steps for the Self-Certification process are as follows:[2]

- The Compliance Enforcement Authority posts and updates the reporting schedule containing the applicable reporting periods and informs Registered Entities. The Compliance Enforcement Authority and NERC will ensure~~s~~ that the appropriate Reliability Standards, compliance procedures, and required submittal forms for the Reliability Standards being evaluated are maintained and available~~ electronically~~.

[2] ~~If no Possible Violations are found, this process normally completes within sixty (60) days of the Compliance Enforcement Authority's receipt of data.~~

- The Compliance Enforcement Authority requests the Registered Entity to make a Self-Certification within the advance notice period specified by the Reliability Standard. If the Reliability Standard does not specify the advance notice period, this request will be issued in a timely manner (normally thirty (30) days advance notice).

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the form and manner, and by the Required Date, specified by the Compliance Enforcement Authority. The Self-Certification response may state that (i) the Registered Entity is in compliance with the Reliability Standard requirement, (ii) the Registered Entity is not in compliance with the Reliability Standard requirement, (iii) the Registered Entity does not own facilities that are subject to the Reliability Standard requirement, or (iv) the Reliability Standard requirement is not applicable to the Registered Entity.

- At a minimum, ~~T~~the Compliance Enforcement Authority reviews Self-Certifications of noncompliance and Self-Certifications in which the Registered Entity has responded that it does not own facilities that are subject to the Reliability Standard requirement or that the Reliability Standard Requirement is not applicable to the Registered Entity,~~information to determine compliance with the Reliability Standards~~ and the Compliance Enforcement Authority may request additional data and/or information if necessary.

- ~~The Compliance Enforcement Authority completes the assessment of the Registered Entity for compliance with the Reliability Standard (and with the Registered Entity's Mitigation Plan, if applicable). If the Compliance Enforcement Authority concludes, after completing a Preliminary Screen(s), that there is a Possible Violation of a Reliability Standard, it shall send the Registered Entity a Notice of Possible Violation.~~If the Compliance Enforcement Authority's review of the Self-Certification indicates a potential noncompliance with a Reliability Standard by the Registered Entity, the Compliance Enforcement Authority conducts a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

Receipt of a Self-Certification by the Compliance Enforcement Authority shall not be construed as a finding by the Compliance Enforcement Authority that the Registered Entity is compliant with, not compliant with, or not subject to, the Reliability Standard requirement.

3.3 Spot Check~~sing~~

Spot Check~~sing~~ will be conducted by the Compliance Enforcement Authority. Spot Check~~sing~~ may be initiated at the discretion of ~~by~~ the Compliance Enforcement Authority or as directed by NERC, ~~at any time to verify or confirm Self-Certifications, Self-Reporting, and Periodic Data Submittals. Spot Checking may also be random or may be initiated in response~~for reasons including but not limited ~~to events, as described in the Reliability Standards, or~~ to operating problems, ~~or~~ system events, or risk-based assessments based on the Registered Entity's Bulk Power System facilities and operations and their significance to the reliability of the Bulk Power System and the Registered Entity's compliance history and internal compliance program or other indicators of its culture of compliance, or on a random schedule. ~~The Compliance Enforcement Authority then reviews the information submitted to verify the Registered Entity's compliance~~

~~with the Reliability Standard. Compliance auditors may be assigned to the Spot Checking process by the Compliance Enforcement Authority as necessary.~~

3.3.1 Spot Check~~ing~~ Process Steps

The process steps for Spot Check~~sing~~ are as follows~~:~~[3]

- The Compliance Enforcement Authority shall issue a notification letter to ~~notifies~~ the Registered Entity that a Spot Check~~ing~~ will be performed~~,~~ ~~and~~ the reason for the Spot Check~~ing~~, and the scope of the Spot Check including the Reliability Standard requirements that will be covered, in accordance with~~in~~ the advance notice period specified by the Reliability Standard. If the Reliability Standard requirement does not specify an advance notice period, any information submittal request made by the Compliance Enforcement Authority will allow at least twenty (20) days for the Registered Entity to submit the information or make it available for review.

- The Compliance Enforcement Authority, as part of the notification package,~~during the advance notice period, notifies~~ shall provide the Registered Entity with~~of~~ the names and employment histories of the persons who will be conducting the Spot Check~~ing~~. The Compliance Enforcement Authority shall provide confirmation to the Registered Entity that the members of the Spot Check team have executed confidentiality agreements or acknowledgements. The Registered Entity may object to inclusion of any individual on the Spot Check~~ing~~ team on the grounds specified in ~~accordance with~~ Section 3.1.5.4. Any such objections must be submitted to the Compliance Enforcement Authority by the later of (i) five (5) business days before the information ~~being~~ requested by the Compliance Enforcement Authority is submitted and (ii) five (5) business days after the Registered Entity is notified of the persons on the Spot Check~~ing~~ team. Nothing in Section 3.1~~this step~~ shall be read to limit the participation of NERC ~~or FERC~~ staff ~~on the~~in a Spot Check~~ing team~~ or to limit the participation of FERC staff in a Spot Check of a Registered Entity, or involving a portion of the Bulk Power System, over which FERC has jurisdiction.

- The Spot Check~~ing~~ may require submission of data, documentation, and information and ~~or possibly~~ an on-site review.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the date specified in the request.

- The ~~Compliance Enforcement Authority~~Spot Check team conducts a review~~s~~ of the information submitted to determine compliance with the Reliability Standard~~s~~ requirements and may request additional data and/or information if necessary~~ for a complete assessment of compliance~~.

- If the Spot Check team's review of the information submitted indicates a potential noncompliance with a Reliability Standard requirement by the Registered Entity, the

[3] ~~If no Possible Violations are found, this process normally completes within ninety (90) days of the Compliance Enforcement Authority's receipt of data.~~

Compliance Enforcement Authority conducts a Preliminary Screen pursuant to Section 3.8.

- The Spot Check team ~~Compliance Enforcement Authority~~ prepares a draft Spot Check report~~reviews its draft assessment of the Registered Entity's compliance with the Registered Entity~~ and provides the Registered Entity ten (10) business days ~~an opportunity for the Registered Entity~~ to comment on the draft ~~assessment~~report.

- The ~~Compliance Enforcement Authority~~Spot Check team considers any corrections based on the Registered Entity's comments, finalizes ~~completes and documents the assessment of the Registered Entity for compliance with the Reliability Standard and provides a~~the Spot Check report and provides it to the Registered Entity and to NERC ~~indicating the results of the Spot Checking~~.

- If the Compliance Enforcement Authority is a Regional Entity, the Regional Entity provides the final report to NERC. NERC provides the report to FERC if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which FERC has jurisdiction and/or to another Applicable Governmental Authority if the report pertains to a Registered Entity or to a portion of the Bulk Power System over which the other Applicable Governmental Authority has jurisdiction. The provision of the report to FERC or to another Applicable Governmental Authority shall be in accordance with Section 8.0, Reporting and Disclosure.~~Provided, that NERC will not disclose non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining permission from FERC for such disclosure and subject to such limitations as FERC may place on such disclosure; and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission for such disclosure from the Applicable Governmental Authority with jurisdiction over the Registered Entity or the portion of the Bulk Power System to which such non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.~~

- The report will not be publicly posted, or otherwise made publicly available, by the Regional Entity or by NERC.

~~If the Compliance Enforcement Authority concludes, after completing a Preliminary Screen(s), that there is a Possible Violation of a Reliability Standard, it shall send the Registered Entity a Notice of Possible Violation.~~

3.4 Compliance Investigations

A Compliance Investigation may be initiated at any time by the Compliance Enforcement Authority or NERC in response to a system disturbance, Complaint, or any potential noncompliance with~~possible violation of~~ a Reliability Standard identified by any other means.

Compliance Investigations will generally be led by the Regional Entity's staff. NERC reserves the right to assume the leadership of a Compliance Investigation.[4] The Regional Entity shall not be entitled to appeal NERC's decision to lead a Compliance Investigation.

Compliance Investigations are confidential, unless FERC directs that a Compliance Investigation should be public or that certain information obtained in the Compliance Investigation should be publicly disclosed. Confirmed Violations resulting from a Compliance Investigation will be made public.

FERC or another Applicable Governmental Authority may initiate an investigation at any time in response to a system disturbance, Complaint, or potential noncompliance with~~possible violation of~~ a Reliability Standard identified by any other means, or for any other purpose authorized by law. Investigations initiated by FERC or another Applicable Governmental Authority shall be governed by and conducted pursuant to the statutory authority and rules of the Applicable Governmental Authority and not the procedures set forth herein. If an Applicable Governmental Authority other than FERC initiates an investigation of a U.S.-related matter, NERC shall provide notice to FERC of the investigation prior to disclosure of any non-public U.S.-related compliance information regarding the matter to be investigated to the other Applicable Governmental Authority. NERC's notice to FERC shall identify the other Applicable Governmental Authority, shall describe the nature of the proposed disclosures to the other Applicable Governmental Authority, and shall state the procedures NERC will utilize in connection with the Compliance Investigation to ensure compliance with the requirements of 18 C.F.R. §39.7(b)(4) concerning nondisclosure of violations and Alleged Violations.

If FERC initiates an investigation of a non-U.S.-related matter, NERC shall provide notice of the investigation to the Applicable Governmental Authority having jurisdiction over the Registered Entity or the portion of the Bulk Power System that is the subject of the investigation prior to disclosure to FERC of any non-public non-U.S.-related compliance information regarding the matter to be investigated. NERC's notice to the other Applicable Governmental Authority shall describe the nature of the proposed disclosures to FERC and shall state the procedures NERC will utilize in connection with the investigation to ensure compliance with regulations of the other Applicable Governmental Authority or other law of the applicable jurisdiction concerning disclosure of non-public compliance information.

3.4.1 Compliance Investigation Process Steps

The process steps for a Compliance Investigation are as follows:[5]

[4]Examples of situations in which NERC may decide to lead a Compliance Investigation include: (i) to assure consistency in investigative processes, (ii) to coordinate Compliance Investigations into matters that may cross Regional Entity boundaries, (iii) where the potential noncompliance is related to the Regional Entity or one of its affiliates, divisions, committees or subordinate structures, or (iv) where the Regional Entity determines it cannot conduct the Compliance Investigation.

[5]~~If no Possible Violation(s) are found, this process normally completes within sixty (60) days following the decision to initiate a Compliance Investigation.~~

- The Compliance Enforcement Authority ~~is notified or~~ becomes aware of circumstances indicating a Reliability Standard may have been or is being violated and determines whether a Compliance Investigation is warranted. Within three (3)~~two (2)~~ business days of the decision to initiate a Compliance Investigation, the Compliance Enforcement Authority: (i) notifies the Registered Entity of the initiation and initial scope of the Compliance Investigation, (ii) instructs the Registered Entity~~the requirements~~ to preserve all records and information relevant to the Compliance Investigation~~ and, where appropriate, the reasons for the Compliance Investigation~~, and (iii) provides a copy of the notice to~~notifies~~ NERC~~ of the initiation of and the reasons for the Compliance Investigation~~. The~~While the Compliance Enforcement Authority may, at its discretion, notify the Registered Entity of the reasons for its~~ Compliance Investigation may be expanded beyond the initial scope based on information obtained by the Compliance Enforcement Authority after initiation of~~,~~ the Compliance Investigation~~, as it unfolds, need not be limited to this scope~~.

- NERC assigns a NERC staff member to the Compliance Investigation as an observer or team member and to serve as a single point of contact for communications with NERC. Within three (3)~~two (2)~~ business days after NERC receives~~is~~ ~~notified~~notice of the decision to initiate a Compliance Investigation, NERC will notify FERC and each other Applicable Governmental Authority having jurisdiction over a Registered Entity or a portion of the Bulk Power System to which the Compliance Investigation relates. Any such notice to FERC or to another Applicable Governmental Authority will be provided in accordance with Section 8.0, Reporting and Disclosure. ~~Provided, that NERC will not disclose non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to an Applicable Governmental Authority other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure, and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.~~

- The Compliance Enforcement Authority requests data or documentation and provides a list of individuals on the Compliance Investigation team and their recent employment history. ~~The Registered Entity may object to any individual on the Compliance Investigation team in accordance with Section 3.1.5.4; however, the Registered Entity may not object to participation by NERC, by FERC staff or by staff of another Applicable Governmental Authority on the Compliance Investigation team. If the Reliability Standard does not specify the advance notice period, a request is normally issued with no less than twenty (20) days advance notice.~~

~~-~~Within ten (10) business days of receiving the notification of a Compliance Investigation, a Registered Entity subject to a Compliance Investigation may object to any member of the Compliance Investigation team on grounds of a conflict of interest or the existence of other circumstances that could interfere with the team member's impartial performance of his or her duties; however, the Registered Entity may not object to participation by NERC, by

FERC staff or by staff of another Applicable Governmental Authority having reliability jurisdiction over the Registered Entity in the Compliance Investigation. Such objections must be provided in writing to the Compliance Enforcement Authority within such ten (10) business day period. The Compliance Enforcement Authority will make a final determination as to whether the individual will participate in the Compliance Investigation of the Registered Entity.

- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date ~~as~~ specified in the request. If information is not received in the time and format requested, the Compliance Enforcement Authority may initiate the steps in **Process for Non-Submittal of Requested Data** in **Attachment 1**.

- If necessary, the Compliance Investigation may include ~~an~~ on-site visits with interviews of the appropriate personnel and review of data.

- ~~In conducting the Compliance Investigation, t~~The Compliance Enforcement Authority may require the Registered Entity to (i) provide a verification under oath by an officer, employee, attorney or other authorized representative of the Registered Entity attesting to the accuracy, completeness and truth of the Registered Entity's responses to the Compliance Enforcement Authority's requests for information; and (ii) produce one or more officers, employees or other authorized representatives of the Registered Entity who are familiar with the matter(s) that are the subject of the Compliance Investigation, to be interviewed or to provide testimony under oath concerning such matters. The Compliance Enforcement Authority shall determine in each case (i) whether representatives of the Registered Entity shall be allowed to be present when an interview is taking place or testimony is being taken, and (ii) whether, and by what method, the interview or testimony shall be recorded; provided, that counsel for the person being interviewed or giving testimony may be present when the interview is being conducted or testimony is being taken (regardless of whether such counsel also represents the Registered Entity).

- The Compliance Enforcement Authority reviews information to determine compliance with the Reliability Standards. The Compliance Enforcement Authority may request additional data and/or information, if necessary ~~for a complete assessment or to demonstrate compliance~~.

- The Compliance Enforcement Authority completes the assessment of compliance with the Reliability Standard, ~~and/or approval of the applicable~~ which may include review of a Mitigation Plan or mitigating activities, ~~writes~~ and provides a~~distributes the~~ report of the Compliance Investigation to NERC, and ~~notifies~~ the Registered Entity.

- If the Compliance Enforcement Authority ~~concludes~~, at any time during the Compliance Investigation, identifies a potential noncompliance with a Reliability Standard requirement by a Registered Entity, the Compliance Enforcement Authority shall conduct a Preliminary Screen of the potential noncompliance in accordance with Section 3.8 ~~and~~

~~after completing a Preliminary Screen(s), that there is a Possible Violation of a Reliability Standard, it shall send the Registered Entity a Notice of Possible Violation~~.

- If the Compliance Enforcement Authority determines that no violation occurred, it shall send the Registered Entity and NERC a notice that the Compliance Investigation has been completed. NERC will in turn notify FERC and, if the Compliance Investigation pertained to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, will also notify such other Applicable Governmental Authority. Any such notice to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.~~Provided, however, that NERC will not disclose non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure, and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.~~

3.5 Self-Report~~sing~~

Self-Report~~sing is~~ are encouraged at the time a Registered Entity becomes aware (i) that it has ~~of a~~ violat~~edion of~~ a Reliability Standard, or (ii) ~~a change in~~ the violation severity level of a previously reported violation has changed. Self-Report~~sing~~ of a violation of a Reliability Standard ~~is~~are encouraged regardless of whether the Reliability Standard requires reporting on a pre-defined schedule in the Compliance Program ~~and~~or whether the violation is determined outside the pre-defined reporting schedule. If possible, and without delaying the Self-Report, a Self-Report may include the actions that have been taken or will be taken to resolve the violation.

3.5.1 Self-Report~~ing~~ Process Steps

The process steps for Self-Report~~sing~~ are as follows:[6]

- The Compliance Enforcement Authority posts the Self-Report~~ing~~ submittal forms and ensures they are maintained and available ~~on its Web site~~.

- The Registered Entity provides the Self-Report~~ing~~ information to the Compliance Enforcement Authority.

- The Compliance Enforcement Authority reviews the information to evaluate~~determine~~ compliance with the Reliability Standards and may request that the Registered Entity ~~to~~ provide clarification or additional data and/or information.

[6] ~~This process normally completes within sixty (60) days following the Compliance Enforcement Authority's receipt of data.~~

~~□The Compliance Enforcement Authority completes the assessment of the Registered Entity for compliance with the Reliability Standards and any Mitigation Plan, if applicable, and notifies the Registered Entity.~~

- ~~If t~~The Compliance Enforcement Authority ~~concludes, after~~ conduct~~sing~~ a Preliminary Screen~~(s),~~ of the Self-Report information in accordance with Section 3.8~~that there is a Possible Violation of a Reliability Standard, it shall send the Registered Entity a Notice of Possible Violation.~~

3.6 Periodic Data Submittals

The Compliance Enforcement Authority requires Periodic Data Submittals in accordance with the schedule stated in the applicable Reliability Standard, or as established by the Compliance Enforcement Authority, or on an as-needed basis. ~~Requests for data submittals will be issued by t~~The Compliance Enforcement Authority shall issue requests for Periodic Data Submittals to Registered Entities within at least the minimum advance notice period specified by the applicable Reliability Standard. If the Reliability Standard does not specify an advance notice period, the Compliance Enforcement Authority will normally issue this request ~~will normally be issued~~ with no less than twenty (20) days advance notice.

3.6.1 Periodic Data Submittals Process Steps

The process steps for Periodic Data Submittal are as follows:[7]

- The Compliance Enforcement Authority posts the current data reporting schedule on its web site and informs~~keeps~~ Registered Entities ~~informed~~ of changes and/or updates. The Compliance Enforcement Authority ensures that the ~~appropriate Reliability Standard compliance procedures and the~~ required submittal forms for the Reliability Standards being evaluated are maintained and available ~~via its web site~~.
- The Compliance Enforcement Authority makes a request for a Periodic Data Submittal.
- The Registered Entity provides the required information to the Compliance Enforcement Authority in the format and by the Required Date~~as~~ specified in the request.
- The Compliance Enforcement Authority reviews the data submittal to determine compliance with the Reliability Standards and may request additional data and/or information if necessary ~~for a complete assessment or to demonstrate compliance~~.
- If the Compliance Enforcement Authority's review of the data submittal indicates a potential noncompliance with a Reliability Standard requirement by the Registered Entity, the Compliance Enforcement Authority performs a Preliminary Screen of the potential noncompliance in accordance with Section 3.8.

[7] ~~If no Possible Violation(s) are found, this process generally completes within ten (10) business days of the Compliance Enforcement Authority's receipt of data.~~

- ~~If the Compliance Enforcement Authority's assessment of the Registered Entity's compliance indicates there may be a Possible Violation, the Compliance Enforcement Authority provides an opportunity for the Registered Entity to comment on the assessment before it is finalized.~~

- ~~If the Compliance Enforcement Authority concludes, after conducting a Preliminary Screen(s), that there is a Possible Violation of a Reliability Standard, it shall send the Registered Entity a Notice of Possible Violation.~~

Receipt of a Periodic Data Submittal by the Compliance Enforcement Authority shall not be construed as a finding by the Compliance Enforcement Authority that the Registered Entity is compliant with, not compliant with, or not subject to, the Reliability Standard requirement.

~~3.7Exception Reporting~~

~~Some Reliability Standards require reporting of exceptions to compliance with the Reliability Standard as a form of compliance monitoring. The Compliance Enforcement Authority shall require Registered Entities to provide reports identifying any exceptions to the extent required by any Reliability Standard.~~

~~The Compliance Enforcement Authority shall also require Registered Entities to confirm the number of exceptions that have occurred in a given time period identified by NERC, even if the number of exceptions is zero.~~

~~3.8~~3.7 Complaints

Either NERC or Regional Entities may receive Complaints alleging violations of a Reliability Standard. ~~A Regional Entity~~ The Compliance Enforcement Authority will conduct a review of each Complaint it receives to determine if the Complaint provides sufficient basis for initiating another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process, except that NERC will review any Complaint ~~(1) that is related to a Regional Entity or its affiliates, divisions, committees or subordinate structures, (2)~~ where the Compliance Enforcement Authority~~Regional Entity~~ determines it cannot conduct the review, or ~~(3)~~ if the complainant wishes to remain anonymous or specifically requests NERC to conduct the review of the Complaint.

If the Complaint is submitted to NERC, NERC will forward the information to the Regional Entity, as appropriate.

All anonymous Complaints will be reviewed and any resulting ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement processes conducted by NERC will be conducted in accordance with Section ~~3.8.2~~3.7.2 to prevent disclosure of the identity of the complainant.

The Compliance Enforcement Authority conducting the review will determine if the Complaint may be closed as a result of the initial review and assessment ~~of the Complaint to determine~~or if it provides sufficient basis for initiating another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process. The ~~Regional Entity~~Compliance Enforcement Authority will report the results of its review of the Complaint to NERC. If, as a result of the initial review of the Complaint, the Compliance Enforcement Authority determines that initiating another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process is warranted, the Compliance

Enforcement Authority shall conduct that ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process ~~will be conducted~~ in accordance with the applicable provisions of Section 3.0.

~~3.8.1~~3.7.1 Complaint Process Steps

The detailed process steps for the Complaint process are as follows:[8]

- The complainant notifies NERC or a Regional Entity using the NERC compliance hotline, submitting a NERC Complaint reporting form, or by other means. NERC and the Regional Entity shall post ~~A~~a link to the Complaint reporting form ~~will be posted~~ on their respective ~~the NERC and Regional Entity~~ Web sites. The Complaint should include sufficient information to enable NERC or the Regional Entity to make an assessment regarding~~of~~ whether the initiation of another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process is warranted. NERC or the Regional Entity may not act on a Complaint if the Complaint is incomplete and does not include sufficient information.

- If the Compliance Enforcement Authority determines that initiation of another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process is warranted, it initiates the ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process in accordance with the applicable provisions of Section 3.0 or Section 5.0; otherwise it takes no further action. The Compliance Enforcement Authority notifies the complainant, the Registered Entity, and NERC of the initiation of the ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process. If the Compliance Enforcement Authority determines that initiation of another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process is not warranted, it will notify the complainant, NERC, and the Registered Entity that no further action will be taken.

- The Compliance Enforcement Authority fully documents the Complaint and the Complaint review, and whether another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process is warranted~~initiated or not~~.

~~3.8.2~~3.7.2 Anonymous Complainant Notification Procedure

A~~n anonymous~~ complainant who believes, or has information indicating, there has been a violation of a Reliability Standard, and wishes to remain anonymous, can report the information and request that the complainant's identity not be disclosed.[9] All Complaints lodged by a person or entity requesting that the complainant's identity not be disclosed shall be investigated by NERC following the procedural steps described in Section ~~3.8.1~~3.7.1. Anonymous Complaints received by a Regional Entity will either be directed to NERC or the Regional Entity will collect and forward the information to NERC, at the Regional Entity's discretion. Neither NERC nor the Regional Entity shall disclose the identity of any person or entity reporting information indicating violations of Reliability Standards to NERC or to a Regional Entity that

[8] ~~If no Possible Violations are found, this process normally completes within sixty (60) days following receipt of the Complaint.~~

[9] NERC has established a Compliance Hotline that may be used for the submission of Complaints by persons or entities that ~~to~~ do not want his/her/its identity disclosed (see www.nerc.com for additional information).

requests that his/her/its identity not be revealed. The identity of the complainant will only be known by NERC and in the case where a Regional Entity collects the information, by NERC and the Regional Entity. If the Compliance Enforcement Authority determines that initiation of another ~~C~~compliance ~~M~~monitoring ~~and~~ or ~~E~~enforcement process is not warranted, it will notify the complainant, NERC, and the Registered Entity that no further action will be taken.

3.8 Preliminary Screen

If the Compliance Enforcement Authority obtains information, through one of the compliance monitoring processes described in this Section 3.0 or by any other means, that indicates a potential noncompliance with a Reliability Standard requirement, the Compliance Enforcement Authority shall conduct a Preliminary Screen of the potential noncompliance. The Preliminary Screen shall be conducted within five (5) business days after the Compliance Enforcement Authority identifies the potential noncompliance, except that (i) if the Compliance Enforcement Authority identifies the potential noncompliance during a Compliance Audit, the Preliminary Screen shall be conducted immediately following the exit briefing of the Registered Entity, and (ii) if the Compliance Enforcement Authority identifies the potential noncompliance during a Compliance Investigation, the Preliminary Screen shall be conducted immediately after the Registered Entity is first notified of the potential noncompliance identified by the Compliance Investigation.

A Preliminary Screen shall be limited to determining whether:

(1) the entity allegedly involved in the potential noncompliance is a Registered Entity;

(2) the Reliability Standard requirement to which the evidence of potential noncompliance relates is applicable to the entity, has been approved by the Applicable Governmental Authority, and is in effect at the time of the potential noncompliance; and

(3) if known, the potential noncompliance is not a duplicate of a Possible Violation or Alleged Violation that is currently being processed.

If the Preliminary Screen results in an affirmative determination with respect to the above criteria, a Possible Violation exists and the Compliance Enforcement Authority shall proceed in accordance with Section 5.0.

The Compliance Enforcement authority shall maintain records of all Preliminary Screens.

4.0 ANNUAL IMPLEMENTATION PLANS

4.1 NERC Compliance Monitoring and Enforcement Program Implementation Plan

NERC will maintain and update the NERC Implementation Plan, to be carried out by Compliance Enforcement Authorities in the performance of their responsibilities and duties in implementing the NERC Compliance Monitoring and Enforcement Program. The NERC

Implementation Plan will be provided to the Regional Entities on or about Septemberby October 1 of each year and will specify the Reliability Standards requiring reporting by Registered Entities to the Compliance Enforcement Authority to provide verification of compliance through one of the monitoring methods described in this Compliance Programplan document. The NERC Implementation Plan will be posted on the NERC web site. NERC may update and revise the NERC Implementation Plan during the course of the year as necessary. Regional Entities have discretion to make modifications to the NERC Implementation Plan with respect to individual Registered Entities, based on a determination concerning the Registered Entity's past and current compliance performance. As these changes to the NERC Implementation Plan occur, Registered Entities that have previously been notified concerning the schedule and scope of Compliance Audits and other compliance monitoring processes may be required to make adjustments in response to these changes.

4.2 Regional Entity Implementation Plan

By on or about OctoberNovember 1 of each year, each Regional EntityEntities will submit a Regional Implementation Plan for the following calendar year to NERC for review and approval. The Regional Implementation Plan and the Regional Entity's other relevant Compliance Program documents shall be posted on the Regional Entity's Web site. The Regional Entity may update and revise the Regional Entity Implementation Plan during the course of the year as necessary, with NERC approval, or as required by NERC. Regional Entities have discretion to make modifications to the Regional Entity Implementation Plan with respect to individual Registered Entities, based on a determination concerning the Registered Entity's past and current compliance performance. As these changes to the Regional Entity Implementation Plan occur, Registered Entities that have previously been notified concerning the schedule and scope of Compliance Audits and other compliance monitoring processes may be required to make adjustments in response to these changes.

5.0 ENFORCEMENT ACTIONS

The Compliance Enforcement Authority shall determine (i) whether there have been violations of Reliability Standards by Registered Entities within the Compliance Enforcement Authority's area of responsibility, and (ii) if so, the appropriate remedial actionsmitigating activities, and penalties and sanctions, as prescribed in the NERC *Sanction Guidelines* (Appendix 4B to the NERC Rules of Procedure). NERC will work to achieve consistency in the application of the *Sanction Guidelines* by Regional Entities by direct oversight and review of penalties and sanctions, and each Regional Entity shall provide to NERC such information as is requested by NERC concerning any penalty, sanction, or remedial actionsmitigating activities imposed by the Regional Entity.

The imposition and acceptance of penalties and sanctions shall not be considered an acceptable alternative to any Registered Entity's continuing obligation to comply with the Reliability Standards.

The Compliance Enforcement Authority has authority to collect documents, data and information in the manner it deems most appropriate, including removing copies of documents, data and information from the Registered Entity's location in accordance with appropriate security

procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC General Counsel. If documents, data or information requested from a Registered Entity in connection with an enforcement process are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

The following enforcement process is undertaken by the Compliance Enforcement Authority following identification~~, through one of the Compliance Monitoring and Enforcement processes set forth in Section 3.0,~~ of a Possible Violation ~~evidence~~ of ~~noncompliance with~~ a Reliability Standard requirement by a Registered Entity. However, under the circumstances presented by some Possible Violations, Alleged Violations or Confirmed Violations, absolute adherence to the following enforcement process, to the exclusion of other approaches, may not be the most appropriate, efficient or desirable means by which to achieve the overall objectives of the Compliance Program for NERC, the Compliance Enforcement Authority and the Registered Entity. In such circumstances, other approaches may be considered and employed.

~~**5.1Preliminary Screen**~~

~~If the Compliance Enforcement Authority identifies or obtains evidence of potential noncompliance with a Reliability Standard, the Compliance Enforcement Authority shall perform a Preliminary Screen to determine whether there is a Possible Violation. A Preliminary Screen shall be limited to determining whether:~~

~~(i)the entity allegedly involved in the potential noncompliance is a Registered Entity; and~~

~~(ii) the Reliability Standard requirement to which the evidence of potential noncompliance relates is applicable to a reliability function for which the entity is registered.~~

~~The Compliance Enforcement Authority shall complete the Preliminary Screen within five (5) business days after identifying or obtaining evidence of potential noncompliance with a Reliability Standard.~~

~~The Compliance Enforcement Authority shall maintain records of all Preliminary Screens.~~

5.1 Notice of Possible Violation

If a Preliminary Screen conducted in accordance with Section 3.8 results in an affirmative determination with respect to the Preliminary Screen~~above~~ criteria, a Possible Violation exists.

The Compliance Enforcement Authority shall issue a Notice of Possible Violation to the Registered Entity. The Notice of Possible Violation shall:

(i) state that a Possible Violation by the Registered Entity has been identified;

(ii) provide a brief description of the Possible Violation, including the Reliability Standard requirement(s) and, if known, the date(s) involved; and

(iii) instruct the Registered Entity to retain and preserve all data and records relating to the Possible Violation.

Upon issuing a Notice of Possible Violation, the Compliance Enforcement Authority reports the Possible Violation to~~enters the Possible Violation into the~~ NERC ~~compliance reporting and tracking system~~. NERC reports the Possible Violation to the NERC Board of Trustees Compliance Committee and submits a Notice of Possible Violation, on a confidential basis, to FERC and to other Applicable Governmental Authorities, as applicable. Any such notice to FERC or to other Applicable Governmental Authorities shall be provided in accordance with Section 8.0, Reporting and Disclosure.

~~5.2~~5.2 Assessment of Possible Violation

After issuing a Notice of Possible Violation, the Compliance Enforcement Authority shall conduct an assessment of the facts and circumstances surrounding the Possible Violation to determine whether evidence exists to indicate the Registered Entity has violated the Reliability Standard requirement(s) identified in the Notice of Possible Violation, or whether the Possible Violation should be dismissed. The Compliance Enforcement Authority may consider any additional information to demonstrate that the Possible Violation should be dismissed or modified.

~~5.3~~5.3 Notification to Registered Entity of Alleged Violation

If the Compliance Enforcement Authority determines, based on an assessment of the facts and circumstances surrounding a Possible Violation, that evidence exists to indicate a Registered Entity has violated a Reliability Standard, ~~and the Compliance Enforcement Authority and the Registered Entity have not entered into settlement negotiations pursuant to Section 5.6,~~ the Compliance Enforcement Authority shall notify the Registered Entity of the determination of the Alleged Violation, ~~and shall notify NERC of the Alleged Violation,~~ through issuance of ~~issue~~ a Notice of Alleged Violation and Proposed Penalty or Sanction or similar notification, and shall report the Alleged Violation to NERC ~~(signed by an officer or designee of the Compliance Enforcement Authority) to the Registered Entity (CEO or equivalent and compliance contact) and shall enter the Alleged Violation into the NERC compliance reporting and tracking system~~. The notification of Alleged Violation shall be transmitted by the Compliance Enforcement Authority to the Registered Entity by electronic mail and shall be effective as of the date of the electronic mail message from the Compliance Enforcement Authority transmitting the notification. The notification~~Notice~~ of Alleged Violation shall include~~state~~, at a minimum:

(i) the Reliability Standard and requirement(s) thereof the Registered Entity has allegedly violated,

(ii) the date and time the Alleged Violation occurred (or is occurring),

(iii) the facts the Compliance Enforcement Authority believes demonstrate or constitute the Alleged Violation,

(iv) the proposed penalty or sanction, if any, determined by the Compliance Enforcement Authority to be applicable to the Alleged Violation in accordance with the NERC *Sanction Guidelines*, including an explanation of the basis on which the particular penalty or sanction was determined to be applicable,

(v) notice that the Registered Entity shall, within thirty (30) days, elect one of the following options or the Compliance Enforcement Authority will deem the Registered Entity to have accepted the determination of violation and proposed penalty or sanction:

1. agree with the Alleged Violation and proposed penalty or sanction, and agree to submit and implement a Mitigation Plan or other mitigating activities to correct the violation and its underlying causes, and may provide a response in accordance with Section 5.4, or

2. agree with the Alleged Violation and agree to submit and implement a Mitigation Plan or other mitigating activities to eliminate the violation and its underlying causes, but contest the proposed penalty or sanction, and may provide a response in accordance with Section 5.4, or

3. contest both the Alleged Violation and proposed penalty or sanction,

(vi) notice that the Registered Entity may elect to submit a Mitigation Plan while contesting the Alleged Violation and/or the proposed penalty or sanction, and that submission of a Mitigation Plan will not waive the Registered Entity's right to contest the Alleged Violation and/or the proposed penalty or sanction;

(vii) notice that if the Registered Entity elects to contest the Alleged Violation and/or the proposed penalty or sanction, the Registered Entity may elect to have a hearing conducted pursuant to either (i) the short-form procedure in Section 1.3.4~~1.3.2~~, or (ii) the ~~full~~general hearing procedure, in **Attachment 2, Hearing Procedures**, and

(viii) required procedures to submit the Registered Entity's Mitigation Plan.

NERC shall ~~forward a copy of the Notice of Alleged Violation to~~notify FERC of the Alleged Violation and, if the Alleged Violation pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, ~~to~~shall notify such other Applicable Governmental Authority of the Alleged Violation, within two (2) business days of receipt from the Compliance Enforcement Authority~~, provided, that NERC will not disclose non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure, and~~

~~NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction~~. Any such notice to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.

~~Upon acceptance by the Registered Entity of the Alleged Violation and proposed penalty or sanction, the Notice of Confirmed Violation or other enforcement action will then be processed and issued to the Registered Entity.~~

~~5.4~~5.4 Registered Entity Response

If the Registered Entity agrees with, does not contest, or does not respond to the ~~Notice~~notification of Alleged Violation within thirty (30) days following the date of the notification of Alleged Violation by electronic mail, it shall be deemed to have accepted the Compliance Enforcement Authority's determination of violation and penalty or sanction, ~~in which case~~and the Compliance Enforcement Authority shall issue a Notice of Confirmed Violation or similar notification to the Registered Entity and shall ~~enter the Confirmed Violation into the~~ report the Confirmed Violation to NERC ~~compliance reporting and tracking system~~. At the time of notifying the Registered Entity~~issuing the Notice~~ of the Confirmed Violation ~~to the Registered Entity~~, the Compliance Enforcement Authority~~Regional Entity~~ shall also provide notice to the Registered Entity that it may provide a written explanatory statement to accompany the filing with FERC and public posting ~~Notice~~ of the Confirmed Violation. The Registered Entity's statement must include the name, title, and signature of an officer, employee, attorney or other authorized representative of the Registered Entity.

If the Registered Entity contests the Alleged Violation or the proposed penalty or sanction, the Registered Entity shall submit to the Compliance Enforcement Authority, within thirty (30) days following the date of the notification of the Alleged Violation, a response explaining its position, signed by an officer, employee, attorney or other authorized representative together with any supporting information and documents. The Compliance Enforcement Authority shall schedule a conference with the Registered Entity within ten (10) business days after receipt of the response. If the Compliance Enforcement Authority and the Registered Entity are unable to resolve all issues within forty (40) days after the Registered Entity's response, the Registered Entity may request a hearing. The Compliance Enforcement Authority and the Registered Entity may agree in writing to extend the forty (40) day period. If no hearing request is made prior to the end of the forty (40) day period, the violation will be become a Confirmed Violation~~, in which case the Compliance Enforcement Authority shall issue a Notice of Confirmed Violation to the Registered Entity and to NERC.~~.

If a hearing is requested the Compliance Enforcement Authority shall initiate the hearing process in accordance with **Attachment 2, Hearing Procedures**~~by convening a hearing body and~~

~~issuing a written notice of hearing to the Registered Entity and the hearing body and identifying the Compliance Enforcement Authority's designated hearing representative~~.[10]

~~5.5~~5.5 Hearing Process for Compliance Hearings

The Compliance Enforcement Authority hearing process is set forth in **Attachment 2**.

~~5.6~~5.6 Settlement Process

The Registered Entity can request settlement negotiations at any time, including prior to the issuance of notification of an ~~Notice of~~ Alleged Violation; however, the Compliance Enforcement Authority may decline to engage in or to continue settlement negotiations after a Possible Violation or Alleged Violation becomes a Confirmed Violation in accordance with Section 5.4. The Registered Entity or the Compliance Enforcement Authority may terminate settlement negotiations at any time. The time for the Registered Entity to respond to the notification of Alleged Violation pursuant to Section 5.4 is suspended during settlement negotiations. NERC shall be notified of all settlement negotiations and may participate in any settlement negotiations. All settlement negotiations will be confidential until such time as the settlement is approved by NERC. For all settlement discussions, the Compliance Enforcement Authority shall require the Registered Entity to designate an individual(s) authorized to negotiate on its behalf.

The Compliance Enforcement Authority may consider all relevant facts in settlement negotiations. A settlement agreement must ensure that the reliability of the Bulk Power System will not be compromised by the settlement and that a violation of a Reliability Standard will not occur as a result of the settlement. All settlement agreements must provide, if the settlement is approved, for waiver of the Registered Entity's right to further hearings and appeal.

The Compliance Enforcement Authority and the Registered Entity will execute a settlement agreement~~issue a letter~~ setting forth the final settlement terms including all penalties, sanctions and mitigation requirements provided for in the final settlement.

The ~~Regional Entity~~Compliance Enforcement Authority shall report the terms of all settlements of compliance matters to NERC. NERC will review the settlement for the purpose of evaluating its consistency with other settlements entered into for similar violations or under other, similar circumstances. The Registered Entity may submit an explanatory statement, conforming to the requirements of Section 5.4, to be included in the settlement agreement and which shall be subject to consent of the Compliance Enforcement Authority as part of the settlement agreement. The settlement agreement may state that the Registered Entity (i) admits the Alleged Violation, or (ii) does not contest the Alleged Violation, or (iii) neither admits nor denies the Alleged Violation, but may not state that the Registered Entity denies the Alleged Violation. Based on this review, NERC will either approve the settlement or reject the settlement and notify the Compliance Enforcement Authority~~Regional Entity and the Registered Entity~~ of any changes to

[10] ~~If the dispute involves a proposed Mitigation Plan, which has not been accepted by the Compliance Enforcement Authority, the Registered Entity may file a request for hearing with the Compliance Enforcement Authority.~~

the settlement that would result in approval, and within five (5) business days the Compliance Enforcement Authority will in turn notify the Registered Entity. If NERC rejects the settlement, the ~~Regional Entity~~Compliance Enforcement Authority will attempt to negotiate a revised settlement agreement with the Registered Entity including any changes to the settlement specified by NERC.

NERC will report the approved settlement of the violation to FERC and, if the settlement relates to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such report to FERC or to another Applicable Governmental Authority shall be provided in accordance with Section 8.0, Reporting and Disclosure.~~, provided, that NERC will not disclose non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure, and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.~~ NERC will also publicly post the violation settled (regardless of whether the settlement includes or does not include an admission of a violation) and the resulting penalty or sanction provided for in the settlement. This posting shall include a copy of the settlement or a description of the terms of the settlement, and a copy of any Mitigation Plan that is agreed to as part of the settlement, with any Critical Energy Infrastructure Information and Confidential Information redacted. The Compliance Enforcement Authority will issue a letter setting forth the final settlement terms including all penalties, sanctions and mitigation requirements provided for in the final settlement. Postings of Notices of Confirmed Violations are addressed in Section 8.0.

~~5.7~~5.7 NERC Appeal Process

~~The~~A Registered Entity or the Compliance Enforcement Authority may appeal the decision of a Regional Entity hearing body~~'s decision~~ to NERC, as provided for in NERC Rules of Procedure, Section 409.[11]

On appeal, NERC shall either affirm the ~~Regional Entity~~ decision or remand to the ~~Regional Entity~~Compliance Enforcement Authority with reasons for its remand, which may include a direction to the ~~Regional Entity~~Compliance Enforcement Authority to revise the decision. If NERC affirms the ~~Regional Entity~~ decision, the ~~Regional Entity~~Compliance Enforcement Authority shall issue a Notice of Confirmed Violation to the Registered Entity. If NERC directs the Compliance Enforcement Authority~~Regional Entity~~ to revise ~~its~~the decision, ~~the~~a Registered Entity that was the subject of the decision or the Compliance Enforcement Authority~~Staff of the Regional Entity whose interests are adversely affected by the directed revision~~ may reopen the proceeding on any issue whose resolution is affected by NERC's directive, irrespective of whether the issue was previously litigated, settled or unopposed.

~~[11]This process generally completes within ninety (90) days of NERC's receipt of request for appeal.~~

~~5.8~~5.8 ~~Approval of a Notice~~Notification of Confirmed Violation

A Notice or other notification of Confirmed Violation issued to a Registered Entity pursuant to Sections 5.4 or 5.7 shall include a detailed record of the enforcement action, including the facts and circumstances analyzed and the information on which the Compliance Enforcement Authority relied in proposing a penalty or sanction.

After NERC receives~~receiving~~ a ~~Notice~~notification of Confirmed Violation ~~through the NERC compliance reporting and tracking system~~from the Compliance Enforcement Authority, NERC shall review the ~~Notice~~notification of Confirmed Violation and utilize the information therein to prepare a Notice of Penalty. NERC shall advise the Compliance Enforcement Authority~~Regional Entity~~ of any additional detail or further development of the factual findings that NERC deems necessary before the Notice of Penalty can be issued.

NERC may direct the Compliance Enforcement Authority~~Regional Entity~~ to revise a penalty determination, in which case the Registered Entity subject to the penalty, or the Compliance Enforcement Authority, as applicable~~Staff of the Regional Entity~~, may reopen the proceedings on any issue on which the penalty was based, irrespective of whether the issue was previously litigated, settled or unopposed.

5.9 Notice of Penalty

If (i) the Registered Entity accepts~~does not dispute~~ the Notice of Alleged Violation and Proposed Penalty or Sanction or other notification of enforcement action from the Compliance Enforcement Authority ~~and the proposed penalty or sanction~~, or (ii) a decision has been entered affirming an ~~finding a~~Alleged ~~v~~Violation and all appeals have been concluded, or (iii) a settlement agreement has been reached addressing the Possible Violation or Alleged Violation~~(s)~~, NERC shall submit~~prepare~~ a ~~draft~~ Notice of Penalty to the Applicable Governmental Authority and provide a copy to the ~~Regional Entity~~Compliance Enforcement Authority. The Regional Entity shall inform the Registered Entity that a Notice of Penalty is pending public filing, at least five (5) business days prior to the public filing and posting. NERC will file the Notice of Penalty with FERC and any other Applicable Governmental Authority~~, as provided in the next paragraph,~~ no sooner than five (5) business days after NERC approves the ~~Notice of~~ Confirmed Violation or settlement agreement.

NERC shall file the Notice of Penalty with FERC and, if the Possible Violation or Alleged Violation pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority. Any such filing with FERC or with another Applicable Governmental Authority shall be made in accordance with Section 8.0, Reporting and Disclosure.~~; provided, that NERC will not disclose any non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to Applicable Governmental Authorities other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure, and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority~~

~~or by other law of the applicable jurisdiction.~~ NERC will include with the Notice of Penalty any statement provided by the Registered Entity as set forth in Sections 5.4 or ~~5.7~~5.6.

The penalty or sanction will be effective upon expiration of the thirty (30) day period following filing with FERC of the Notice of Penalty (or such longer period as ordered by FERC) or, if FERC decides to review the penalty or sanction, upon final determination by FERC.

5.10 ~~Closure~~Completion of Enforcement Action

Following FERC approval of, or expiration of the period for action by FERC on, a Notice of Penalty filed by NERC, the Compliance Enforcement Authority shall issue a payment due notice and invoice to the Registered Entity. The payment due notice and invoice shall state the payment due date which shall be thirty (30) days from the date of the payment due notice and invoice. Upon payment of all monetary penalties by the Registered Entity, the Compliance Enforcement Authority shall issue a notice confirming payment to the Registered Entity, and provide a copy of the notice confirming payment to NERC. Following the completion by the Registered Entity of all requirements set forth in the Notice of Penalty and any settlement agreement, the Compliance Enforcement Authority shall issue the Registered Entity a Notice of Completion of Enforcement Action.

If the Compliance Enforcement Authority dismisses or disposes of a Possible Violation or Alleged Violation that does not become a Confirmed Violation, the Compliance Enforcement Authority shall issue a Notice of Completion of Enforcement Action to the Registered Entity.

A copy of the Notice of Completion of Enforcement Action shall also be provided to NERC by the Compliance Enforcement Authority.

The Notice of Completion of Enforcement Action shall include a release of any data retention directives that were previously issued to the Registered Entity in connection with the matter. Upon issuance of a Notice of Completion of Enforcement Action, tracking of the violation is completed, and the enforcement action shall be closed.

5.11 Special Procedures for an Enforcement Action Against an ISO/RTO Where the Monetary Penalty May be Allocated by the ISO/RTO to Other Registered Entities

A Registered Entity that is an ISO/RTO may have authority to allocate, pursuant to a proceeding under section 205 of the Federal Power Act, some or all of a monetary penalty imposed on the ISO/RTO for violation of a Reliability Standard, to another Registered Entity(ies) that the Compliance Enforcement Authority, NERC or FERC determines was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation of the Reliability Standard. In such circumstances, the ISO/RTO may request the Compliance Enforcement Authority to make a determination, during the enforcement process for a Notice of Possible Violation issued to the ISO/RTO, that a specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. This Section sets forth the procedures to be followed when an ISO/RTO that has received a Notice of Possible Violation requests a determination by the Compliance Enforcement Authority that another Registered Entity(ies) was

responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation.

The procedures in this section apply only where an ISO/RTO requests a determination that a specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in a Notice of Possible Violation issued to the ISO/RTO, and shall not apply where the ISO/RTO anticipates or is entitled to allocate or assign a monetary penalty among all, or an identified segment of, its members, customers or users, pursuant to general cost recovery provisions in the ISO/RTO's tariffs, agreements or governance documents and regardless of actual fault or responsibility of the entities to whom the monetary penalty is issued for the violation for which the penalty is imposed.

5.11.1 Public Notification List

NERC shall maintain on its website a Public Notification List for each ISO/RTO. The Public Notification Lists shall be based solely on information provided to NERC by each ISO/RTO, and NERC shall have no responsibility to correct errors and omissions on a Public Notification List or in information provided by the ISO/RTO to NERC for inclusion in the Public Notification List. Inclusion of a Registered Entity on the Public Notification List shall not constitute or be construed as a determination by NERC that the ISO/RTO has the authority to allocate to the Registered Entity all or a part of any monetary penalty that may be imposed on the ISO/RTO for violation of a Reliability Standard. The Public Notification List for an ISO/RTO shall be developed and maintained in accordance with the following steps:

(1) The ISO/RTO shall provide to NERC a list of the Registered Entities to which the ISO/RTO contends it has authority to allocate all or a part of any monetary penalty that is imposed on the ISO/RTO for violation of a Reliability Standard, and the NERC registration identification number for each Registered Entity on the list.

(2) The ISO/RTO shall provide revisions to the information for the Public Notification List to NERC from time to time as changes occur, and shall notify NERC of any errors, omissions, corrections or additions needed to the Public Notification List.

(3) NERC shall post and maintain the Public Notification List based on the information provided to NERC by the ISO/RTO. The posted Public Notification List shall consist of the names and NERC registration identification numbers of the Registered Entities and the date each Registered Entity was placed on the Public Notification List.

(4) Each ISO/RTO shall also provide on its website a link to the ISO/RTO's Public Notification List on the NERC website.

5.11.2 ISO/RTO's Request for Determination and Notice to Other Registered Entity or Registered Entities

In order to request the Compliance Enforcement Authority to make a determination in an enforcement action that a specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation (if confirmed) of a Reliability Standard for which the ISO/RTO has received a Notice of Possible Violation, the ISO/RTO shall, no later than five (5) business days after receiving the Notice of Possible Violation (i) submit a written request to the Compliance Enforcement Authority and (ii) issue a notice to the specified other Regional Entity(ies), each conforming to the requirements of the following two paragraphs of this Section.

The ISO/RTO's written request to the Compliance Enforcement Authority shall contain:

(1) the Compliance Enforcement Authority's identification number for the Notice of Possible Violation;

(2) a statement that the ISO/RTO is requesting that the Compliance Enforcement Authority make a determination that a specified other Registered Entity(ies) was responsible, in whole or in part, for actions and omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation;

(3) the name(s) of, and contact information for, the specified other Registered Entity(ies), including name(s) and address(es) of the Registered Entity(ies) and name(s), telephone number(s) and e-mail address(es) of the contact person(s) for the other Registered Entity(ies);

(4) a statement of the basis for the ISO/RTO's authority to allocate some or all of the monetary penalty to the specified other Registered Entity(ies), including copies of any supporting tariffs, agreements, orders, or governance documents;

(5) a brief statement of the factual basis on which the ISO/RTO contends in good faith that the specified other Registered Entity(ies) was responsible for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. As the enforcement action proceeds, the ISO/RTO shall not be limited by the statement in its written request of the factual basis on which it contends the specified other Registered Entity(ies) was responsible for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation, but rather may supplement, expand or modify this explanation as additional information becomes available during the course of the enforcement action; and

(6) If the specified other Registered Entity(ies) was not listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation, a statement demonstrating that there are extraordinary circumstances warranting that the Compliance Enforcement Authority make the requested determination with respect to the specified other Registered Entity despite the specified other Registered Entity's absence from the Public Notification List.

The ISO/RTO's notice to the specified other Registered Entity(ies) shall contain the following information:

(1) The name of the Registered Entity, and the name, telephone number and e-mail address of the Registered Entity's contact person (person to whom the notice is being sent);

(2) A statement that the ISO/RTO has received a Notice of Possible Violation from the Compliance Enforcement Authority, the Compliance Enforcement Authority's identification number for the Notice of Possible Violation, and contact information for the Compliance Enforcement Authority;

(3) A statement that the ISO/RTO has requested the Compliance Enforcement Authority to make a determination that the Registered Entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, and that the ISO/RTO intends to seek to allocate to the Registered Entity all or a portion of any monetary penalty that is imposed on the ISO/RTO for the violation (if confirmed), if the Compliance Enforcement Authority determines the Registered Entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation.

(4) A statement that the Registered Entity should contact the Compliance Enforcement Authority as soon as possible for further information and to request to participate in the enforcement action relating to the Notice of Possible Violation.

The ISO/RTO shall cause its notice to the specified other Registered Entity(ies) to be delivered to the other Registered Entity(ies) by next-business-day delivery using a delivery service that provides verification of delivery. The ISO/RTO shall provide the Compliance Enforcement Authority with (i) a copy of the notice sent to each specified other Registered Entity, and (ii) a copy of the delivery service's verification of delivery of the notice to each specified other Registered Entity.

5.11.3 Responses of the Compliance Enforcement Authority and the Specified Other Registered Entity or Registered Entities to ISO/RTO's Request for Determination and Notice

Upon (i) verifying that the specified other Registered Entity(ies) was listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation, or, if the specified other Registered Entity(ies) was not listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation, determining that there are nonetheless extraordinary circumstances that warrant making the requested determination with respect to the specified other Registered Entity(ies), (ii) verifying, based on the written request from the ISO/RTO, that the ISO/RTO has authority to allocate to the specified other Registered Entity(ies) all or a portion of any monetary penalty imposed on the ISO/RTO for the violation (if confirmed)

identified in the Notice of Possible Violation, and (iii) receiving the copy of the notice and of the verification of delivery to the specified other Registered Entity(ies) showing timely delivery of the notice to the specified other Registered Entity(ies) in accordance with Section 5.11.2, the Compliance Enforcement Authority shall provide the other Registered Entity(ies) with a copy of a non-disclosure agreement (which shall include the Registered Entity's agreement to comply with the confidentiality requirements of the Compliance Program and of Section 1500 of the NERC Rules of Procedure) that must be executed to obtain a copy of the Notice of Possible Violation and a copy of the ISO/RTO's written request to the Compliance Enforcement Authority for a determination that the specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation (if confirmed) identified in the Notice of Possible Violation. In addition to transmitting the non-disclosure agreement, the Compliance Enforcement Authority shall advise the specified other Registered Entity(ies) that: (i) the specified other Registered Entity(ies) may elect not to participate in the enforcement action, and may submit a written statement to the Compliance Enforcement Authority stating why the specified other Registered Entity is not participating and providing any facts or information the Registered Entity wishes to provide concerning the occurrence(s) that are the subject of the Notice of Possible Violation, and (ii) whether or not the specified other Registered Entity elects to participate in the enforcement action, the Compliance Enforcement Authority may make a determination that the specified other Registered Entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation.

If the Compliance Enforcement Authority has (i) verified that the specified other Registered Entity(ies) was listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation or, if the specified other Registered Entity(ies) was not listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation, determined that there are nonetheless extraordinary circumstances that warrant making the requested determination with respect to the specified other Registered Entity(ies), and (ii) verified that the ISO/RTO has authority to allocate to the specified other Registered Entity(ies) all or a portion of any monetary penalty imposed on the ISO/RTO for the violation (if confirmed) identified in the Notice of Possible Violation, then a specified other Registered Entity that has received a timely notice from the ISO/RTO as described in Section 5.11.2 shall be permitted to participate in the enforcement action concerning the Notice of Possible Violation if the Registered Entity submits a written request to participate to the Compliance Enforcement Authority and executes a non-disclosure agreement in the form provided by the Compliance Enforcement Authority as described above. The specified other Registered Entity must submit its written request to participate prior to, as applicable (i) the date of execution of a settlement agreement between the Compliance Enforcement Authority and the ISO/RTO, or (ii) the date that the Compliance Enforcement Authority issues a Notice of Confirmed Violation to the ISO/RTO. The Compliance Enforcement Authority is not required to suspend or delay the enforcement process pending receipt of a request to participate from the specified other Registered Entity(ies), nor to revisit or redo any aspect of the enforcement process that has already occurred prior to receipt of the specified other Registered Entity(ies)'s written request to participate; however, upon receipt of a written request to participate and executed nondisclosure agreement from the specified other Registered Entity(ies), the Compliance Enforcement Authority shall suspend activity in the enforcement action until it has acted on the request to participate.

Upon receiving the specified other Registered Entity's written request to participate in the enforcement action and the Registered Entity's executed nondisclosure agreement, the Compliance Enforcement Authority shall issue a notice to the ISO/RTO and to the specified other Registered Entity stating that the specified other Registered Entity is allowed to participate in the enforcement action. The Compliance Enforcement Authority's notice that the specified other Registered Entity is allowed to participate in the enforcement action shall include a copy of the Notice of Possible Violation originally issued to the ISO/RTO and, if a Notice of Alleged Violation and Proposed Penalty or Sanction or similar notification has been issued to the ISO/RTO, a copy of the latter Notice or notification.

If the Compliance Enforcement Authority determines (i) that the specified other Registered Entity(ies) was not listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation and that there are not extraordinary circumstances that warrant making the requested determination with respect to the specified other Registered Entity, or (ii) that the ISO/RTO does not have authority to allocate to the specified other Registered Entity(ies) all or a portion of any monetary penalty imposed on the ISO/RTO for the violation (if confirmed) identified in the Notice of Possible Violation, or (ii) that the ISO/RTO did not provide a timely notice to the specified other Registered Entity in accordance with Section 5.11.1, the Compliance Enforcement Authority shall issue a notice to the ISO/RTO and to the specified other Registered Entity stating that the Compliance Enforcement Authority will not make the determination requested by the ISO/RTO and that the specified other Registered Entity will not be allowed to participate in the enforcement action relating to the Notice of Possible Violation.

5.11.4 Compliance Enforcement Authority's Notices to NERC

(a) Within five (5) business days after receiving an ISO/RTO's written request for a determination that a specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to a violation identified in the Notice of Possible Violation issued to the ISO/RTO, the Compliance Enforcement Authority shall provide to NERC (i) a copy of the ISO/RTO's written request for a determination that a specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, and (ii) the ISO/RTO's notice to the specified other Registered Entity(ies).

(b) On the same day that the Compliance Enforcement Authority issues a notice pursuant to Section 5.11.3 stating, as applicable, that (i) it will or will not make the determination requested by the ISO/RTO or (ii) the specified other Registered Entity(ies) are or are not allowed to participate in the enforcement action, the Compliance Enforcement Authority shall provide a copy of the notice to NERC and shall send a copy of the notice to any other entities that have been allowed to participate in the enforcement action.

5.11.5 Participation by the Specified Other Registered Entity or Registered Entities in the Enforcement Action Against the ISO/RTO

Upon receiving notice from the Compliance Enforcement Authority that it is allowed to participate in the enforcement action, the specified other Registered Entity may participate in the

same manner as the ISO/RTO and shall be subject to all applicable requirements and deadlines specified in the NERC Compliance Program.

5.11.6 Compliance Enforcement Authority's Determination

If the Compliance Enforcement Authority has (i) verified that the specified other Registered Entity was listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation, or, if the specified other Registered Entity(ies) was not listed on the Public Notification List as of the date of issuance of the Notice of Possible Violation, determined that there are nonetheless extraordinary circumstances that warrant making the requested determination with respect to the specified other Registered Entity(ies), (ii) verified that the ISO/RTO has authority to allocate to the specified other Registered Entity(ies) all or a portion of any monetary penalty imposed on the ISO/RTO for the violation (if confirmed) identified in the Notice of Possible Violation, and (iii) verified that the specified other Registered Entity(ies) received a timely notice(s) from the ISO/RTO as described in Section 5.11.2, then, if the enforcement action is not resolved by a settlement agreement stating whether or not the specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation, the Compliance Enforcement Authority shall make, and include in its proposed Notice of Penalty, its determination of whether or not the specified other Registered Entity(ies) were responsible, in whole or in part, for actions or omissions that caused or contributed to the violation. The Compliance Enforcement Authority's determination shall only address whether or not the specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, and shall not address whether all or a part of any monetary penalty imposed on the ISO/RTO for the violation should be allocated or assigned to the specified other Registered Entity(ies).

If the specified other Registered Entity(ies) has requested permission, and been allowed, to participate in the enforcement action, any settlement agreement specifying that the specified other Registered Entity(ies) was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation identified in the Notice of Possible Violation must be agreed to by the specified other Registered Entity(ies).

5.11.7 Procedure Where ISO/RTO Members Are Allowed to Directly Assign Monetary Penalties for Violations of Reliability Standards to the ISO/RTO

If an ISO/RTO's tariffs, agreement or other relevant governance documents establish procedures, that have been approved by FERC, that allow members of the ISO/RTO to directly assign to the ISO/RTO monetary penalties imposed on the ISO/RTO member(s) for violations of Reliability Standards, then the ISO/RTO members may follow the same requirements of Sections 5.11.2, 511.3 and 511.5 as are applicable to an ISO/RTO under those sections, and the ISO/RTO shall be afforded the same rights to participate in the enforcement action as a specified other Registered Entity under Sections 5.11.2, 5.11.3, 5.11.5 and 5.11.6, subject to the same requirements and conditions specified in those sections. In such circumstances, the ISO/RTO shall be deemed to be a "specified other Registered Entity" for purposes of this Section.

5.11.8 Obligation to Pay Monetary Penalty

(a) The ISO/RTO shall be obligated and responsible to pay any monetary penalty imposed by the Compliance Enforcement Authority on the ISO/RTO for violation of a Reliability Standard, in accordance with Section 5.10 of this Appendix, (i) regardless of whether the Compliance Enforcement Authority has made a determination that a specified other Registered Entity was responsible, in whole or in part, for actions or omissions that caused or contributed to the violation, (ii) without regard to the timing of any separate proceeding(s) in which the ISO/RTO seeks to allocate some or all of the monetary penalty to a specified other Registered Entity(ies), and (iii) without regard to whether or when the ISO/RTO receives payment from the specified other Registered Entity(ies).

(b) In an enforcement action subject to Section 5.11.7, the ISO/RTO member(s) shall be obligated and responsible to pay any monetary penalty imposed by the Compliance Enforcement Authority on the ISO/RTO member(s) for violation of a Reliability Standard, regardless of whether or when the ISO/RTO members receive payment or reimbursement from the ISO/RTO.

6.0 MITIGATION OF VIOLATIONS OF RELIABILITY STANDARDS

The Compliance Enforcement Authority has authority to collect documents, data and information in the manner it deems most appropriate, including removing copies of documents, data and information from the Registered Entity's location in accordance with appropriate security procedures conforming to Section 1500 of the Rules of Procedure and other safeguards as appropriate in the circumstances to maintain the confidential or other protected status of the documents, data and information, such as information held by a governmental entity that is subject to an exemption from disclosure under the United States Freedom of Information Act, or a comparable state or provincial law, that would be lost of the information were placed into the public domain. Parties engaged in the process described in this section should consult with each other on the data and information that would be appropriate for effectively addressing this section's process requirements. If a Registered Entity believes that a request for documents, data or information is unreasonable, the Registered Entity may request a written determination from the NERC ~~director of enforcement~~General Counsel. If documents, data, information or other reports requested from a Registered Entity in connection with development of a Mitigation Plan or other mitigating activities are not received by the Required Date, the Compliance Enforcement Authority may execute the steps described in **Attachment 1, Process for Non-submittal of Requested Data.**

6.1 Requirement for Submission of Mitigation Plans

A Registered Entity found to be in violation of a Reliability Standard shall file with the Compliance Enforcement Authority (i) a proposed Mitigation Plan to correct the violation, or (ii) a description of how the violation has been mitigated, and any requests for extensions of Mitigation Plans or a report of completed mitigation. A Registered Entity may also submit a proposed Mitigation Plan at any other time, including with a Self-Report, or, without admitting it has committed a violation, in response to a Notice of Possible Violation or ~~Notice~~notification of Alleged Violation.

6.2 Contents of Mitigation Plans

A Mitigation Plan shall include the following information:

- The Registered Entity's point of contact for the Mitigation Plan, who shall be a person (i) responsible for filing the Mitigation Plan, (ii) technically knowledgeable regarding the Mitigation Plan, and (iii) authorized and competent to respond to questions regarding the status of the Mitigation Plan. This person may be the Registered Entity's point of contact described in Section 2.0.

- The Possible, Alleged or Confirmed Violation(s) of Reliability Standard(s) the Mitigation Plan will correct.

- The cause of the Possible, Alleged or Confirmed Violation(s).

- The Registered Entity's action plan to correct the Possible, Alleged or Confirmed Violation(s).

- The Registered Entity's action plan to correct the cause of the Possible, Alleged or Confirmed Violation.

- The Registered Entity's action plan to prevent recurrence of the Possible, Alleged or Confirmed Violation(s).

- The anticipated impact of the Mitigation Plan on the Bulk Power System reliability and an action plan to mitigate any increased risk to the reliability of the Bulk Power System while the Mitigation Plan is being implemented.

- A timetable for completion of the Mitigation Plan including the completion date by which the Mitigation Plan will be fully implemented and the Possible, Alleged or Confirmed Violation(s) corrected.

- Implementation milestones no more than three (3) months apart for Mitigation Plans with expected completion dates more than three (3) months from the date of submission. Additional violations could be determined for not completing work associated with accepted milestones.

- Any other information deemed necessary or appropriate

The Mitigation Plan shall be signed by an officer, employee, attorney or other authorized representative of the Registered Entity~~, which if applicable, shall be the person that signed the Self-Certification or Self-Reporting submittals~~.

6.3 Timetable for Completion of Mitigation Plans

The Mitigation Plan shall be completed in accordance with its terms.~~time to have a reasonable potential to correct all of the violation(s) prior to the next applicable compliance reporting/assessment period after occurrence of the violation for which the Mitigation Plan is~~

~~submitted. In all cases the Mitigation Plan should be completed without delay, and should encompass actions necessary to prevent a recurring violation of the Reliability Standard requirements underlying the Possible, Alleged or Confirmed Violation(s). The Compliance Enforcement Authority will expect full compliance with the Reliability Standard to which the Mitigation Plan is applicable at the next report or assessment of the Registered Entity.~~ At the Compliance Enforcement Authority's discretion, the completion deadline may be extended for good cause including, but not limited to: (i) operational issues such as the inability to schedule an outage to complete mitigating activities~~short assessment periods (i.e., event driven or monthly assessments)~~, and (ii) construction requirements in the Mitigation Plan that require longer to complete than originally anticipated~~extend beyond the next assessment period or other extenuating circumstances~~. If the Mitigation Plan extends beyond the next applicable reporting/assessment period, sanctions for any violation of the applicable Reliability Standard(s) occurring during the implementation period will be held in abeyance and will be waived if the Mitigation Plan is satisfactorily completed.

Any violations assessed during the period of time the accepted Mitigation Plan is being implemented will be recorded by the Compliance Enforcement Authority with associated sanctions or penalties. Regional Entities will report any findings of violations recorded during this time period to NERC with the notation that the Registered Entity is working under an accepted Mitigation Plan with an extended completion date with penalties and sanctions held in abeyance until completion of the Mitigation Plan. Upon completion of the accepted Mitigation Plan in accordance with Section 6.6, the Compliance Enforcement Authority will notify the Registered Entity that any findings of violations of the applicable Reliability Standard during the period that the accepted Mitigation Plan was being implemented have been waived and no penalties or sanctions will apply. Regional Entities will also notify NERC of any such waivers of violations of Reliability Standards.

A request for an extension of any milestone or the completion date of the accepted Mitigation Plan by a Registered Entity must be received by the Compliance Enforcement Authority at least five (5) business days before the original milestone or completion date. The Compliance Enforcement Authority may accept a request for an extension or modification of a Mitigation Plan if the Compliance Enforcement Authority determines the request is justified, and shall notify NERC of the extension or modification within five (5) business days.

If a Mitigation Plan submitted by a Registered Entity is rejected by the Regional Entity acting as Compliance Enforcement Authority or the hearing body in accordance with Section 6.5, the Registered Entity shall be subject to any findings of violation of the applicable Reliability Standards during the period the Mitigation Plan was under consideration and to imposition of any penalties or sanctions imposed for such violations.

6.4 Submission of Mitigation Plans

A Mitigation Plan may be submitted at any time but shall have been submitted by the Registered Entity within thirty (30) days after being served the notification~~Notice~~ of Alleged Violation, if the Registered Entity does not contest the Alleged Violation and penalty or sanction, or shall be reflected in a settlement agreement or Notice of Penalty. If the Registered Entity disputes the ~~Notice of~~ Alleged Violation or the penalty or sanction, the Registered Entity shall submit its Mitigation Plan within ten (10) business days following issuance of the written decision of the

hearing body, unless the Registered Entity elects to appeal the hearing body's determination to NERC. The Registered Entity may choose to submit a Mitigation Plan while it contests an Alleged Violation or penalty or sanction or in response to a Notice of Possible Violation; such submission shall not be deemed an admission of a violation or the appropriateness of a penalty or sanction. If the Registered Entity has not yet submitted a Mitigation Plan, or the Registered Entity submits a Mitigation Plan but it is rejected by the Regional Entity acting as Compliance Enforcement Authority or the hearing body in accordance with Section 6.5, any subsequent violations of the Reliability Standard identified by the Compliance Enforcement Authority before the hearing body renders its decision will not be held in abeyance and will be considered as repeat violations of the Reliability Standard.

6.5 Review and Acceptance or Rejection of Proposed Mitigation Plans

Unless the time period is extended by the Compliance Enforcement Authority, it will complete its review of the Mitigation Plan, and will issue a written statement accepting or rejecting the Mitigation Plan, within thirty (30) days of receipt; otherwise the Mitigation Plan will be deemed accepted. In order to extend the initial or an extended period for review of the Mitigation Plan, the Compliance Enforcement Authority shall, within the initial or extended review period, notify the Registered Entity (and NERC if NERC is not the Compliance Enforcement Authority) that the review period is being extended and identify the date by which the Compliance Enforcement Authority will complete its review of the Mitigation Plan. The Compliance Enforcement Authority's extension notice shall also state that if the Compliance Enforcement Authority has not issued a notice by the end of the extended review period either stating that the Compliance Enforcement Authority accepts or rejects the proposed Mitigation Plan or further extending the Compliance Enforcement Authority's period for review of the Mitigation Plan, the Mitigation Plan will be deemed accepted.

If the Compliance Enforcement Authority rejects a Mitigation Plan, the Compliance Enforcement Authority will provide the Registered Entity with a written statement describing the reasons for the rejection, and will require the Registered Entity to submit a revised Mitigation Plan by the Required Date. The Compliance Enforcement Authority will notify the Registered Entity within ten (10) business days after receipt of a revised Mitigation Plan whether the Compliance Enforcement Authority will accept or reject the revised Mitigation Plan and provide a written statement describing the reasons for rejection and the Required Date for the second revised Mitigation Plan. If the second review results in rejection of the Mitigation Plan, the Registered Entity may request a hearing in accordance with the Hearing Procedures, by submitting to the Compliance Enforcement Authority a written request for hearing including an explanation of why the Mitigation Plan should be accepted. After the hearing is completed, the Compliance Enforcement Authority will issue a written statement accepting a Mitigation Plan it deems as appropriate.

Within five (5) business days after a Regional Entity accepts a Mitigation Plan, the Regional Entity (i) will notify NERC and the Registered Entity of the acceptance of the Mitigation Plan and (ii) will provide the accepted Mitigation Plan to NERC. NERC will review the accepted Mitigation Plan and, within thirty (30) days following its receipt of the Mitigation Plan from the Regional Entity, will notify the Regional Entity and the Registered Entity, on a contemporaneous basis, as to whether the Mitigation Plan is approved or disapproved by NERC. If NERC disapproves a Mitigation Plan that was accepted by the Regional Entity, NERC shall state its

reasons for the rejection, and may state the changes to the Mitigation Plan that would result in approval by NERC. The Registered Entity shall not be subject to findings of violations of the specific requirements of Reliability Standards that are the subject of the Mitigation Plan or to imposition of penalties or sanctions for such violations with respect to the period of time the Mitigation Plan was under consideration by NERC and for a reasonable period following NERC's disapproval of the Mitigation Plan, so long as the Registered Entity promptly submits a modified Mitigation Plan that addresses the concerns identified by NERC.

If a Registered Entity submits a Mitigation Plan prior to issuance of a ~~Notice~~notification of Confirmed Violation or entry into a settlement, such as with a Self-Report or in response to a Notice of Possible Violation, the Regional Entity may provisionally accept the proposed Mitigation Plan. If the Regional Entity subsequently determines, upon completing its assessment of the Possible Violation, that the facts and circumstances are different than those on which the accepted Mitigation Plan was based, the Regional Entity may, by notice to the Registered Entity and to NERC, require the Registered Entity to submit a revised Mitigation Plan that fully addresses the facts and circumstances of the violation. The Regional Entity's notice shall state the additional or different facts and circumstances that need to be addressed in the revised Mitigation Plan. The Registered Entity shall submit a revised Mitigation Plan in response to the notice within thirty (30) days following the date of the notice, unless the Regional Entity specifies or allows a longer time period. The Registered Entity's revised Mitigation Plan shall be subject to review and acceptance or rejection by the Regional Entity and by NERC in accordance with this Section 6.5. If the Regional Entity issues a ~~Notice~~notification of Confirmed Violation or enters into a settlement with the Registered Entity and does not identify a need to request modifications to the provisionally-accepted Mitigation Plan based on additional or different facts and circumstances, the Regional Entity shall issue a notice to the Registered Entity, with a copy to NERC, stating that the "provisional" nature of the acceptance is terminated and the acceptance is final. The Regional Entity shall issue such notice within five (5) business days of issuance of the Notice of Confirmed Violation or entry into the settlement.

NERC will submit to FERC, as non-public information, an approved Mitigation Plan relating to violations of Reliability Standards within seven (7) business days after NERC approves the Mitigation Plan. NERC shall publicly post the approved Mitigation Plan as part of the public posting of the related Notice of Penalty in accordance with Section 8.0 or settlement in accordance with Section 5.6.

6.6 Completion/Confirmation of Implementation of Mitigation Plans

The Registered Entity shall provide updates at least quarterly to the Compliance Enforcement Authority on the progress of the Mitigation Plan. The Compliance Enforcement Authority will track the Mitigation Plan to completion and may conduct on-site visits and review status during audits to monitor Mitigation Plan implementation.

Upon completion of the Mitigation Plan, the Registered Entity shall provide to the Compliance Enforcement Authority certification, signed by an officer, employee, attorney or other authorized representative of the Registered Entity, that all required actions described in the Mitigation Plan have been completed and shall include data or information sufficient for the Compliance Enforcement Authority to verify completion. The Compliance Enforcement Authority shall request such data or information and conduct follow-up assessments, on-site or other Spot

Checksing, or Compliance Audits as it deems necessary to verify that all required actions in the Mitigation Plan have been completed ~~and the Registered Entity is in compliance with the subject Reliability Standard requirement(s)~~.

In the event all required actions in the Mitigation Plan are not completed within the applicable deadline including any extensions of the original deadline granted under Section 6.3, any violation(s) of a Reliability Standard subject to the Mitigation Plan that occurred during the originally scheduled time period for completion will be enforced immediately and a new Mitigation Plan must be submitted for acceptance by the Compliance Enforcement Authority. In addition, the Compliance Enforcement Authority may conduct a Compliance Audit of, or issue a Remedial Action Directive to, the Registered Entity.

Upon request by NERC, the Regional Entity~~ies~~ will provide to NERC the quarterly status reports and such other information as NERC requests~~.~~, ~~and~~ The Regional Entity will notify NERC when each Mitigation Plan is verified to have been completed.

6.7 Recordkeeping

The Compliance Enforcement Authority will maintain a record containing the following information for each Mitigation Plan:

- Name of Registered Entity.
- The date of the violation.
- Monitoring method by which the violation was detected, i.e., Self-Certification, Self-Report~~ing~~, Compliance Audit, Compliance Investigation, Complaint, etc.
- Date(s) of Notice of Possible Violation and ~~Notice~~notification of Alleged Violation (if applicable).
- Expected and actual completion date of the Mitigation Plan and major milestones.
- Expected and actual completion date for each required action.
- Accepted changes to milestones, completion dates, or scope of Mitigation Plan.
- Registered Entity's completion notice and data submitted as evidence of completion.

7.0 REMEDIAL ACTION DIRECTIVES

The Compliance Enforcement Authority may issue a Remedial Action Directive when such action is immediately necessary to protect the reliability of the Bulk Power System from an imminent or actual threat. A Remedial Action Directive may include, but is not limited to, any of the following: specifying operating or planning criteria, limits, or limitations; requiring specific system studies; defining operating practices or guidelines; requiring confirmation of data, practices, or procedures through inspection testing or other methods; requiring specific

training for personnel; requiring development of specific operating plans; directing a Registered Entity to develop and comply with a plan to remediate a violation; imposing increased auditing or additional training requirements; and requiring a Registered Entity to cease an activity that may constitute a violation of a Reliability Standard.

A Remedial Action Directive may be issued to a Registered Entity at any time, including during any procedures relating to a Possible Violation or an Alleged Violation of a Reliability Standard. The Compliance Enforcement Authority will specify ~~if~~whether a Remedial Action Directive obviates the need for a Mitigation Plan.

Prior to issuing a Remedial Action Directive, the ~~Regional Entity~~Compliance Enforcement Authority shall consult the Reliability Coordinator for the Registered Entity~~, if applicable, to ensure that the Remedial Action Directive is not in conflict with directives issued by the Reliability Coordinator~~.

Any Remedial Action Directive must be provided in a notice to the Registered Entity and shall include: (i) a list of the Possible Violation(s) or Alleged Violation(s) of Reliability Standards that are the basis for issuance of the Remedial Action Directive; (ii) a discussion of the factual basis for the Remedial Action Directive; (iii) the requirements the Compliance Enforcement Authority is imposing to remove the imminent or current threat to the reliability of the Bulk Power System; (iv) a deadline for compliance and a schedule for specific periodic updates to the Compliance Enforcement Authority; (~~i~~v) a statement that the Registered Entity is in a state of noncompliance with the Reliability Standards listed in (i) until the requirements listed in the Remedial Action Directive are completed and certified completed by an officer of the Registered Entity; and (vi) notice to the Registered Entity that failure to comply with the directive by the Required Date may result in further Remedial Action Directives or significantly increased sanctions.

The Compliance Enforcement Authority will cause the notice of the Remedial Action Directive to be delivered to the Registered Entity by (i) electronic mail~~means~~ to the Registered Entity's CEO or equivalent and copied to the Registered Entity's designated contact person for reliability matters and (ii) by a recognized express courier service that provides tracking and verification of delivery to the recipient. The notice will be deemed received on the earlier of the actual date of receipt of the electronic submission or receipt of the express courier~~date of~~ delivery as specified by the express courier service's verification of delivery~~ shall be the date of actual receipt of the Remedial Action Directive~~. The Compliance Enforcement Authority will monitor implementation of Remedial Action Directives as necessary to verify compliance.

The ~~Regional Entity~~Compliance Enforcement Authority will notify NERC within two (2) business days after issuing a Remedial Action Directive and will copy NERC on all correspondence sent to the Registered Entity.

Once the Compliance Enforcement Authority has given the Registered Entity notice of the Remedial Action Directive, the Registered Entity may contest the Remedial Action Directive by giving written notice to the Compliance Enforcement Authority within two (2) business days following the date of actual receipt of notice of the Remedial Action Directive. Due to the urgency of resolving any objections to a Remedial Action Directive, the hearing shall be conducted under the expedited hearing process set forth in Section 1.9 of **Attachment 2, Hearing Procedures**. Notice to contest the Remedial Action Directive and participation in the

hearing process set forth in Section 1.9 of **Attachment 2, Hearing Procedures** shall constitute the Registered Entity's right to appeal the Remedial Action Directive. The Registered Entity may elect not to implement the Remedial Action Directive until the hearing process is completed, or may proceed with implementing the Remedial Action Directive even if it is contesting the Remedial Action Directive.

8.0 REPORTING AND DISCLOSURE

8.1 Information to be Reported

Regional Entities shall promptly~~prepare and~~ submit to NERC electronic ~~all required~~ reports~~,~~ containing current information concerning the information listed below. NERC will work with Regional Entities to specify form, content, timing, and method of submitting reports and notices.

(1) The status of the review and assessment of ~~Registered Entity compliance with Reliability Standards, (2)~~ all Possible Violations, Alleged Violations and Confirmed Violations of Reliability Standards by Registered Entities~~, (3) the status of Possible Violations and Alleged Violations~~,

(2) The potential impact of any Alleged Violation or Confirmed Violation on the reliability of the Bulk Power System,

(4~~3~~) ~~s~~Sanctions and penalties,

(~~5~~4) Remedial Action Directives imposed, ~~and~~

(~~6~~5) Mitigation Plan(s~~) accepted including dates for all required actions and for completion.~~, and

(6) The name of a Regional Entity staff person knowledgeable about the information to serve as a point of contact.

8.2 Reporting to Applicable Governmental Authorities and Public Disclosure

~~Regional Entities shall report all Possible Violations, Alleged Violations and Confirmed Violations to NERC by promptly entering the Possible Violation, Alleged Violation or Confirmed Violation into the NERC compliance reporting and tracking system.~~ Within two (2) business days of receiving a report from a Regional Entity of a Possible Violation, Alleged Violation or Confirmed Violation, NERC shall notify FERC of the Possible Violation, Alleged Violation or Confirmed Violation.~~and,~~

~~w~~Where the report pertains to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, NERC shall ~~also~~ notify such other Applicable Governmental Authority, within two (2) business days of receiving a report of a Possible Violation, Alleged Violation or Confirmed Violation from the Regional Entity; provided, that NERC will not disclose any non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to an Applicable Governmental Authority other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations

placed by FERC on such disclosure~~;~~. ~~and~~ Likewise, NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.

In any notice to, and request for permission to disclose compliance information from, FERC or another Applicable Governmental Authority pursuant to any provision of this Compliance Program, NERC will identify each Applicable Governmental Authority to which it proposes to disclose the information and the specific procedures that will be used for protecting from public disclosure any non-public compliance information that will be transferred to the other Applicable Governmental Authority or Authorities. The provisions of this paragraph do not apply to the provision by NERC to an Applicable Governmental Authority of information that is not directly related to a specific Registered Entity's compliance with a requirement of a Reliability Standard. ~~Such reports shall include information regarding the nature of the Possible Violation, Alleged Violation or Confirmed Violation, the name of the Registered Entity involved, the status of any ongoing review and assessment of the Possible Violation, Alleged Violation, or Confirmed Violation, the name of a Regional Entity staff person knowledgeable about the information to serve as a point of contact, as required by 18 C.F.R. §39.7(b), and, in the case of an Alleged Violation or Confirmed Violation, its potential impact on the reliability of the Bulk Power System.~~

~~Regional Entities shall report to NERC, through the NERC compliance reporting and tracking system, the status of Possible Violations and Alleged Violations, regardless of significance, that have not yet resulted in a Notice of Confirmed Violation or have not completed the hearing process, or for which mitigation activities (including activities being carried out pursuant to a settlement agreement) have not been completed. Regional Entities will ensure the information is current when these reports are provided.~~

~~Regional Entities shall report a Confirmed Violation to NERC at the same time the Notice of Confirmed Violation is issued to the Registered Entity.~~ NERC will publicly post on its Web site each Notice of Penalty, with any Critical Energy Infrastructure Information or other Confidential Information redacted, ~~with the identify of the violator,~~ together with any statement submitted by the Registered Entity, when NERC files the Notice of Penalty with FERC pursuant to Section 5.9.

NERC will provide reports quarterly to FERC and, where a report contains information pertaining to a Registered Entity or to a portion of the Bulk Power System over which another Applicable Governmental Authority has jurisdiction, to such other Applicable Governmental Authority, on the status of all Possible, Alleged and Confirmed Violations for which mitigation activities have not been completed. All such reports to FERC and to other Applicable Governmental Authorities shall be provided in accordance with this Section.~~; provided, that NERC will not disclose any non-public U.S. compliance information that is subject to 18 C.F.R. §39.7(b)(4) to an Applicable Governmental Authority other than FERC without first obtaining permission from FERC for such disclosure and subject to any limitations placed by FERC on such disclosure, and NERC will not disclose non-public non-U.S. compliance information to an Applicable Governmental Authority (including FERC) without first obtaining permission from~~

~~the Applicable Governmental Authority that has jurisdiction over the Registered Entity or portion of the Bulk Power System to which the non-public information pertains and subject to any limitations placed on such disclosure by such Applicable Governmental Authority or by other law of the applicable jurisdiction.~~

9.0 DATA RETENTION AND CONFIDENTIALITY

9.1 Records Management

The Compliance Enforcement Authority records management policy shall provide for a routine and orderly process for the retention and disposal of electronic and paper records related to the Compliance Program, ensure verification of compliance with appropriate business, regulatory, and legal requirements and at a minimum conform to the data retention requirements of the Reliability Standards. The policy shall allow for the maintenance of records as required to implement the Compliance Program.

9.2 Retention Requirements

The Compliance Enforcement Authority records management policy will require that information and data generated or received pursuant to Compliance Program activities, including Compliance Audits, Self-Certifications, Spot Checks~~sing~~, Compliance Investigations, Self-Reports~~sing~~, Periodic Data Submittals, Exception Reporting, and Complaints, as well as a hearing process, will be retained for the longer of (i) five (5) years or (ii) any retention period specified in a Reliability Standard or by FERC or another Applicable Governmental Authority. The obligation to retain information and data commences upon the initiation of the Compliance Program activity that produces the data or information. If the information or data is material to the resolution of a controversy, the retention period for such data shall not commence until after the controversy is resolved.

Upon request from NERC, Regional Entities will provide to NERC copies of such information and data. NERC will retain the information and data in order to maintain a record of activity under the Compliance Program. In providing the information and data to NERC, the Regional Entity shall preserve any mark of confidentiality.

9.3 Confidentiality and Critical Energy Infrastructure Information

9.3.1 Definitions

Information or data generated or received pursuant to Compliance Program activities, including a hearing process, shall be treated in a confidential manner pursuant to the provisions of Section 1500 of the NERC Rules of Procedure. The terms "~~c~~Confidential ~~i~~Information," "~~c~~Confidential ~~b~~Business and ~~m~~Market ~~i~~Information," "~~c~~Critical ~~e~~Energy ~~i~~Infrastructure ~~i~~Information," and "~~c~~Critical ~~i~~Infrastructure" shall have the meanings stated in Section 1501 of the NERC Rules of Procedure.

9.3.2 Protection of Confidential Information

The Compliance Enforcement Authority personnel (including any contractors, consultants and industry subject matter experts) and committee members, and participants in Compliance Program activities shall be informed of, and agree to comply with, Section 1500 of the NERC Rules of Procedure concerning ~~c~~Confidential ~~i~~Information.

9.3.3 Critical Energy Infrastructure Information

The Compliance Enforcement Authority will keep confidential all ~~c~~Critical ~~e~~Energy ~~i~~Infrastructure ~~i~~Information in accordance with Section 1500 of the NERC Rules of Procedure~~s~~. Information deemed to be C~~c~~ritical ~~e~~Energy ~~i~~Infrastructure ~~i~~Information shall be redacted, in accordance with Section 1500 of the NERC Rules of Procedure, and shall not be released publicly.

ATTACHMENT 1

PROCESS FOR NON-SUBMITTAL OF REQUESTED DATA

~~If data, information, or other reports (including Mitigation Plans) requested from a Registered Entity are not received by the Required Date, the Compliance Enforcement Authority may sequentially execute the following steps for each Reliability Standard for which the Compliance Enforcement Authority has requested data, information, or other reports. The Compliance Enforcement Authority however will afford the Registered Entity reasonable opportunity to resolve a difficulty submitting data due to time or format issues.~~

~~Step 1:~~	~~The Compliance Enforcement Authority will issue a follow-up notification to the Registered Entity's designated contact.~~
~~Step 2:~~	~~The Compliance Enforcement Authority will issues a follow-up notification to the Registered Entity's vice president or equivalent responsible for compliance (with a copy to NERC and the Registered Entity's designated contact).~~
~~Step 3:~~	~~The Compliance Enforcement Authority will issue a follow-up notification to the Registered Entity's chief executive officer or equivalent (with a copy to NERC, the Registered Entity's vice president or equivalent responsible for compliance and the Registered Entity's designated contact).~~ ~~A full Compliance Audit may be scheduled at this step.~~
~~Step 4:~~	~~Thirty (30) days after the Required Date, a Reliability Standard violation may be applied at the Severe Violation Severity Level.~~ ~~Step 4 does not apply to Compliance Audits and Mitigation Plan tracking requests.~~

FERC's regulations at 18 C.F.R §39.2(c) provide that each user, owner or operator of the Bulk Power System within the United States (other than Alaska and Hawaii) shall provide FERC, the ERO and the applicable Regional Entity such information as is necessary to implement section 215 of the Federal Power Act as determined by FERC and set out in the rules of the ERO and each Regional Entity. In order to enforce this requirement, NERC or a Regional Entity may take the steps described in this section where a Registered Entity in the United States fails to provide, in a timely manner and in the form requested, information requested by NERC or a Regional Entity in connection with a compliance monitoring or enforcement process.

If NERC or a Regional Entity has requested data, information or reports from a Registered Entity in connection with a compliance monitoring or enforcement process, and the data, information or report is not received by the Required Date, NERC or the Regional Entity shall sequentially execute the following steps; provided, however, that upon seasonable request from the Registered Entity stating in reasonable detail the basis for the Registered Entity's need for additional time, NERC or the Regional Entity may afford the Registered Entity reasonable additional time to submit the data, information or report due to the scope or difficulty of the request or requirement for data, information or reports, the amount of the data, information or reports requested or required, or the form in which the data, information, or other reports has been requested or is required to be provided.

1. Step 1: NERC or the Registered Entity will issue a notification to the Registered Entity's designated contact for reliability matters, identifying the data, information or report that were requested or required and the Required Date and stating that the Required Date has passed and the Registered Entity should, within five (5) business days, either provide the data, information or report, or contact NERC or the Regional Entity with a proposed date by which the Registered Entity will provide the data, information or report. If NERC or the Regional Entity agrees with the Registered Entity on a revised date by which the Registered Entity will provide the data, information or report, the agreed revised date shall become the revised Required Date.

2. Step 2: If the Registered Entity does not provide a response to the notification in, and in accordance with, Step 1 within five (5) business days, or by a revised date as agreed to in Step 1, NERC or the Regional Entity will issue a notification to the Registered Entity's designated contact for reliability matters, with a copy to the Registered Entity's chief executive officer or equivalent, stating that if the data, information or report is not received within ten (10) business days, NERC or the Regional Entity may (i) implement a compliance monitoring process directed to the Registered Entity, or (ii) apply a Reliability Standard violation at the severe violation severity level against the Registered Entity for the Reliability Standard requirement to which the requested or required data, information or report relates.

3. Step 3: If the Registered Entity fails to produce the requested or required data, information or report in response to the notification in Step 2 within the ten (10) business day cure period set forth in the Step 2 notification, NERC or the Regional Entity may take any action of which the Registered Entity was notified in the Step 2 notification.

ATTACHMENT 2 - HEARING PROCEDURES

TABLE OF CONTENTS

ATTACHMENT 2 - HEARING PROCEDURES

1.1 Applicability, Definitions and Interpretation

1.1.1 Procedure Governed

(a) The provisions set forth in this **Attachment 2** ("Hearing Procedures") shall apply to and govern practice and procedure before the Compliance Enforcement Authority in hearings in the United States conducted into:

(~~i~~1) whether Registered Entities within the Compliance Enforcement Authority's area of responsibility have violated Reliability Standards, and

(~~ii~~2) if so, to determine the appropriate Mitigation Plans as well as any remedial actions, penalties and/or sanctions in accordance with the NERC *Sanction Guidelines* and other applicable penalty guidelines approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2).

(b) Any hearing conducted pursuant to these Hearing Procedures shall be conducted before a Hearing Officer and a ~~[HEARING BODY]~~Hearing Body established by the Compliance Enforcement Authority. Where the Hearing Body is comprised, in whole or in part, of industry stakeholders, ~~T~~the composition of the ~~[HEARING BODY]~~Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision by the ~~[HEARING BODY]~~Hearing Body on any matter brought before it for decision. Where the Hearing Body is comprised solely of independent members and an independent Hearing Officer, decisions shall require a majority vote.

(c) The standard of proof in any proceeding under these Hearing Procedures shall be by a preponderance of the evidence. The burden of persuasion on the merits of the proceedings shall rest upon the Compliance Staff alleging noncompliance with a Reliability Standard, proposing a penalty, opposing a Registered Entity's Mitigation Plan, or requiring compliance with a Remedial Action Directive.

(d) If a final order has been entered by the Hearing Body, or the Hearing Body has issued a ruling determining that there are no issues to be decided regarding the Alleged Violation, proposed Penalty amount, proposed Mitigation Plan or proposed Remedial Action Directive, or the Registered Entity and the Compliance Enforcement Authority have entered into a settlement agreement resolving the matters that are the subject of the hearing, the hearing shall be terminated by the Hearing Body and no further proceedings shall be conducted before the Hearing Body.

1.1.2 Deviation

To the extent permitted by law, any provision in these Hearing Procedures may be waived, suspended or modified by the Hearing Officer~~, as defined in Paragraph 1.1.5,~~ or the ~~[HEARING BODY]~~Hearing Body, for good cause shown, either upon the Hearing Officer's or the ~~[HEARING BODY]~~Hearing Body's own motion or upon the motion of any Participant.

1.1.3 Standards for Discretion

The Compliance Enforcement Authority's discretion under these Hearing Procedures shall be exercised to accomplish the following goals:

(a) Integrity of the Fact-Finding Process - The principal goal of the hearing process is to assemble a complete factual record to serve as a basis for a correct and legally sustainable ruling, decision or order.

(b) Fairness - Persons appearing in Compliance Enforcement Authority proceedings should be treated fairly. To this end, Participants should be given fair notice and opportunity to present explanations, factual information, documentation and legal argument. Action shall be taken as necessary to eliminate any disadvantage or prejudice to a Participant that would otherwise result from another Participant's failure to act diligently and in good faith.

(c) Independence - The hearing process should be tailored to protect against undue influence from any Person, Participant or interest group.

(d) Balanced Decision-Making - Decisions should be based solely on the facts and arguments of record in a proceeding and by individuals who satisfy the Compliance Enforcement Authority's conflict of interest policy.

(e) Impartiality - Persons appearing before the ~~[HEARING BODY]~~Hearing Body should not be subject to discriminatory or preferential treatment. Registered Entities should be treated consistently unless a reasonable basis is shown in any particular proceeding to depart from prior rulings, decisions or orders.

(f) Expedition - Proceedings shall be brought to a conclusion as swiftly as is possible in keeping with the other goals of the hearing process.

1.1.4 Interpretation

(a) These Hearing Procedures shall be interpreted in such a manner as will aid in effectuating the Standards for Discretion set forth in ~~Paragraph~~Section 1.1.3, and so as to require that all practices in connection with the hearings shall be just and reasonable.

(b) Any ruling, order or decision of the Hearing Officer referenced in these Hearing Procedures shall be made by the Hearing Body where the composition of the Hearing Body consists of independent members and an independent Hearing Officer.

(~~b~~c) Unless the context otherwise requires, the singular of a term used herein shall include the plural and the plural of a term shall include the singular.

(~~c~~d) To the extent that the text of a rule is inconsistent with its caption, the text of the rule shall control.

1.1.5 Definitions

Unless otherwise defined, as used in these Hearing Procedures (i) definitions in Section 1.1 of the NERC Compliance Monitoring and Enforcement Program shall apply, and (ii) the following terms shall have the following meanings:

"Clerk," shall mean the personas designated by the Compliance Enforcement Authority to perform administrative tasks relating to the conduct of hearings as described in these Hearing Procedures.

"Compliance Enforcement Authority's area of responsibility" means the Compliance Enforcement Authority's corporate region. If a Regional Entity is the Compliance Enforcement Authority, the Compliance Enforcement Authority's area of responsibility is shown in Exhibit A to the delegation agreement between the Regional Entity and NERC.

"Critical Energy Infrastructure Information" means specific engineering, vulnerability, or detailed design information about proposed or existing critical infrastructure that: (i) relates details about the production, generation, transportation, transmission, or distribution of energy; (ii) could be useful to a person in planning an attack on critical infrastructure; and (iii) does not simply give the location of the critical infrastructure.

"Critical infrastructure" means existing and proposed systems and assets, whether physical or virtual, the incapacity or destruction of which would negatively affect security, economic security, public health or safety, or any combination of those matters.

"Cybersecurity Incident" means a malicious act or suspicious event that disrupts, or was an attempt to disrupt, the operation of those programmable electronic devices and communications networks including hardware, software and data that are essential to the Reliable Operation of the Bulk-Power System.

"Director of Compliance" means the Director of Compliance of the Compliance Enforcement Authority or other individual designated by the Compliance Enforcement Authority, who is responsible for the management and supervision of Compliance Staff.

"Document" means, in addition to the commonly understood meaning of the term as information written or printed on paper, any electronically stored information, including writings, drawings, graphs, charts, photographs, sound recordings, images and other data or data compilations stored in any medium from which information can be obtained, and shall be translated by the producing party into reasonably usable form.

"ERO" means the Electric Reliability Organization, currently the North American Electric Reliability Corporation, or any successor organization, certified by FERC pursuant to 18 C.F.R. Section 39.3.

"Evidentiary Hearing" means a hearing at which one or more Participants submits evidence for the record. A Testimonial Hearing is an Evidentiary Hearing, but an Evidentiary Hearing does not necessarily include the presentation of testimony by witnesses in person.

"FERC" means the Federal Energy Regulatory Commission.

"Hearing Body" means the body established or designated by the Compliance Enforcement Authority to conduct hearings and issue final orders concerning disputed compliance matters in accordance with these Hearing Procedures.

"Hearing Officer" means an individual employed or contracted by the Compliance Enforcement Authority and designated by the Compliance Enforcement Authority to preside over hearings conducted pursuant to these Hearing Procedures.

"Participant" means a Respondent and any other Person who is allowed or required by the Hearing Body or by FERC to participate as an intervenor in a proceeding conducted pursuant to these Hearing Procedures, and as used herein shall include the members of the Compliance Staff of the Compliance Enforcement Authority that participate in a proceeding.

"Penalty" as used herein includes all penalties and sanctions, including but not limited to a monetary or non-monetary penalty; a limitation on an activity, function, operation or other appropriate sanction; or the addition of the Registered Entity to a reliability watch list composed of major violators. Penalties must be within the range set forth in the NERC *Sanction Guidelines* approved by FERC pursuant to 18 C.F.R. Section 39.7(g)(2), and shall bear a reasonable relation to the seriousness of a Registered Entity's violation and take into consideration any timely efforts made by the Registered Entity to remedy the violation.

"Person" means any individual, partnership, corporation, limited liability company, governmental body, association, joint stock company, public trust, organized group of persons, whether incorporated or not, or any other legal entity.

"Respondent" means the Registered Entity who is the subject of the Notice of Alleged Violation, contested Mitigation Plan or contested Remedial Action Directive that is the basis for the proceeding, whichever is applicable.

"Staff" or "Compliance Staff" means individuals employed or contracted by the Compliance Enforcement Authority who have the authority to make initial determinations of compliance or violation with Reliability Standards by Registered Entities and associated Penalties and Mitigation Plans.

"Technical Advisor" means any Staff member, third-party contractor, or industry stakeholder who satisfies the Compliance Enforcement Authority's conflict of interest policy and is selected to assist in a proceeding by providing technical advice to the Hearing Officer and/or the ~~[HEARING BODY]~~Hearing Body.

"Testimonial Hearing" means an Evidentiary Hearing at which the witness or witnesses on behalf of one or more Participants appears in person to present testimony and be subject to cross-examination.

1.2 General Provisions including Filing, Service, Transcription and Participation

1.2.1 Contents of Filings

All filings made with ~~[HEARING BODY]~~Hearing Body must contain:

(a) A caption that sets forth the title of the proceeding and the designated docket number or, if the filing initiates a proceeding, a space for the docket number;

(b) A heading that describes the filing and the Participant on whose behalf the filing is made;

(c) The full name, address, telephone number and email address of the Participant or the representative of the Participant making the filing;

(d) A plain and concise statement of any facts upon which the filing is based, which facts shall be supported by citations to the record of the hearing, if available, or other evidence~~documents~~; and

(e) The specific relief sought, which may be in the alternative, and the authority that provides for or otherwise allows the relief sought.

1.2.2 Form of Filings

(a) All filings shall be typewritten, printed, reproduced or prepared using a computer or other word or data processing equipment on white paper 8½ inches by 11 inches with inside text margins of not less than one inch. Page numbers shall be centered and have a bottom margin of not less than ½ inch. Line numbers, if any, shall have a left-hand margin of not less than ½ inch. The impression shall be on one side of the paper only and shall be double spaced; footnotes may be single spaced and quotations may be single spaced and indented.

(b) All pleadings shall be composed in either Arial or Times New Roman font, black type on white background. The text of pleadings or documents shall be at least 12-point. Footnotes shall be at least 10-point. Other material not in the body of the text, such as schedules, attachments and exhibits, shall be at least 8-point.

(c) Reproductions may be by any process provided that all copies are clear and permanently legible.

(d) Testimony prepared for the purpose of being entered into evidence shall include line numbers on the left-hand side of each page of text. Line numbers shall be continuous.

(e) Filings may include schedules, attachments or exhibits of a numerical or documentary nature which shall, whenever practical, conform to these requirements; however, any log, graph, map, drawing, chart or other such document will be accepted on paper larger than prescribed in subparagraph (a) if it cannot be provided legibly on letter size paper.

1.2.3 Submission of Documents

(a) Where to File

Filings shall be made with the Clerk of the Compliance Enforcement Authority located at its principal office. The office will be open during the Compliance Enforcement Authority's regular business hours~~from [*Compliance Enforcement Authority business hours*] local time~~ each day except Saturday, Sunday, legal holidays and any other day declared by the Compliance Enforcement Authority.

(b) When to File

Filings shall be made within the time limits set forth in these Hearing Procedures or as otherwise directed by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body. Filings will be considered made when they are date stamped received by the Clerk. To be timely, filings must be received no later than 5:00 P.M. ~~[*Compliance Enforcement Authority close of business*]~~ local time on the date specified.

(c) How to File

Filings may be made by personal delivery, mailing documents that are properly addressed with first class postage prepaid, or depositing properly addressed documents with a private express courier service with charges prepaid or payment arrangements made. Alternatively, filing by electronic means will be acceptable upon implementation of a suitable and secure system by the Compliance Enforcement Authority.

(d) Number of Copies to File

One original and five exact copies of any document shall be filed. The Clerk will provide each member of the ~~[HEARING BODY]~~Hearing Body with a copy of each filing.

(e) Signature

The original of every filing shall be signed by the Participant on whose behalf the filing is made, either by an attorney of the Participant or, by the individual if the Participant is an individual, by an officer of the Participant if the Participant is not an individual, or if the Participant is Staff, by a designee authorized to act on behalf of Staff. ~~The signature on a filing constitutes a certificate that the signer has read the filing and knows its contents, and that the contents are true to the best of the signer's knowledge and belief.~~

(f) Verification

The facts alleged in a filing need not be verified unless required by these Hearing Procedures, the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body. If verification is required, it must be under oath by a person having knowledge of the matters set forth in the filing. If any verification is made by an individual other than the signer, a statement must be included in or attached to the verification explaining why a person other than the signer is providing verification.

(g) Certificate of Service

Filings shall be accompanied by a certificate of service stating the name of the individuals served, the Participants whose interests the served individuals represent, the date on which

service is made, the method of service and the addresses to which service is made. The certificate shall be executed by the individual who caused the service to be made.

1.2.4 Service

(a) Service List

For each proceeding, the Clerk shall prepare and maintain a list showing the name, address, telephone number, and facsimile number and email address, if available, of each individual designated for service. The Hearing Officer, Director of Compliance and the Registered Entity's compliance contact~~designated agent for service [~~ as registered with the Compliance Enforcement Authority~~],~~ shall automatically be included on the service list. Participants shall identify all other individuals whom they would like to designate for service in a particular proceeding in their appearances or other filings. Participants may change the individuals designated for service in any proceeding by filing a notice of change in service list in the proceeding. Participants are required to update their service lists to ensure accurate service throughout the course of the proceeding. Copies of the service list may be obtained from the Clerk.

(b) By Participants

Subject to the provisions of Section 1.5.10, ~~A~~any Participant filing a document in a proceeding must serve a copy of the document on each individual whose name is on the service list for the proceeding. Unless otherwise provided, service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made.

(c) By the Clerk

The Clerk shall serve all issuances of the Hearing Officer and ~~[HEARING BODY]~~Hearing Body upon the members of the ~~[HEARING BODY]~~Hearing Body and each individual whose name is on the service list for the proceeding. Service may be made by personal delivery, email, deposit in the United States mail properly addressed with first class postage prepaid, registered mail properly addressed with postage prepaid or deposit with a private express courier service properly addressed with charges prepaid or payment arrangements made. The Clerk shall transmit a copy of the record of a proceeding to the ERO at the time ~~it serves~~the Compliance Enforcement Authority transmits to the ERO ~~with~~ either (1) a Notice of Penalty, or (2) a ~~[HEARING BODY]~~Hearing Body final order that includes a Notice of Penalty.

(d) Effective Date of Service

Service by personal delivery or email is effective immediately. Service by mail or registered mail is effective upon mailing; service by a private express courier service is effective upon delivery to the private express courier service. Unless otherwise provided, whenever a Participant has the right or is required to do some act within a prescribed period after the service of a document upon the Participant, four (4) days shall be added to the prescribed period when the document is served upon the Participant by mail or registered mail.

1.2.5 Computation of Time

The time in which any action is required to be done shall be computed by excluding the day of the act or event from which the time period begins to run, and by including the last day of the time period, unless the last day is a Saturday, Sunday, legal holiday or any other day upon which the office of the Compliance Enforcement Authority is closed, in which event it also shall be excluded and the date upon which the action is required shall be the first succeeding day that is not a Saturday, Sunday, legal holiday, or day upon which the office of the Compliance Enforcement Authority is closed.

1.2.6 Extensions of Time

Except as otherwise provided by law, the time by which a Participant is required or allowed to act may be extended by the Hearing Officer or ~~[HEARING BODY]~~Hearing Body for good cause upon a motion made before the expiration of the period prescribed. If any motion for extension of time is made after the expiration of the period prescribed, the Hearing Officer or ~~[HEARING BODY]~~Hearing Body may permit performance of the act if the movant shows circumstances sufficient to justify the failure to act in a timely manner.

1.2.7 Amendments

Amendments to any documents filed in a proceeding may be allowed by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body upon motion made at any time on such terms and conditions as are deemed to be just and reasonable.

1.2.8 Transcripts

(a) A full and complete record of all hearings, including any oral argument, shall be transcribed verbatim by a certified court reporter, except that the Hearing Officer may allow off-the-record discussion of any matter provided the Hearing Officer states the ruling on any such matter, and the Participants state their positions or agreement in relation thereto, on the record. The court reporter shall file a copy of each transcript with the Clerk. Upon receipt of a transcript from the court reporter, the Clerk shall send notice to the Participants stating that a transcript has been filed by the court reporter, the date or dates of the hearing that the transcript records, and the date the transcript was filed with the Clerk.

(b) Unless otherwise prescribed by the Hearing Officer, a Participant may file and serve suggested corrections to any portion of a~~the~~ transcript within fourteen (14)~~thirty-five (35)~~ days from the date of the Clerk's notice that the transcript has been filed with the Clerk ~~on which the relevant portion of the transcript was taken~~, and any responses shall be filed within ten (10) days after service of the suggested corrections. The Hearing Officer shall determine what changes, if any, shall be made, and shall only allow changes that conform the transcript to the ~~truth~~statements being transcribed and ensure the accuracy of the record.

(c) The Compliance Enforcement Authority will pay for transcription services, for a copy of the transcript for the record and for a copy of the transcript for Staff. Any other

Participant shall pay for its own copy of the transcript if it chooses to obtain one and, should any Participant seek to obtain a copy of the transcript on an expedited basis, it shall pay for the expedited transcription services.

1.2.9 Rulings, Notices, Orders and Other Issuances

Any action taken by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body shall be recorded in a ruling, notice, order or other applicable issuance, or stated on the record for recordation in the transcript, and is effective upon the date of issuance unless otherwise specified by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body. All notices of hearings shall set forth the date, time and place of hearing.

1.2.10 Location of Hearings and Conferences

All hearings and oral arguments shall be held at the principal office of the Compliance Enforcement Authority unless the Hearing Officer or ~~[HEARING BODY]~~Hearing Body designates a different location.

1.2.11 Participant Participation

Participants may appear at any hearing via teleconference subject to the approval of the Hearing Officer and, in the event of oral argument, the ~~[HEARING BODY]~~Hearing Body, except as~~that witnesses shall personally appear at the evidentiary hearing if~~ required by ~~Paragraph~~Section 1.6.6. Staff may participate and be represented by counsel in hearings, and shall have the rights and duties of any Participant.

1.2.12 Interventions ~~Are Not Permitted~~

(a) The Respondent(s) and Staff shall be Participants to the proceeding. Unless otherwise authorized by the Hearing Body or by FERC, no other Persons shall be permitted to intervene or otherwise become a Participant to the proceeding.

(b) The Hearing Body may allow a Person to intervene only if the Hearing Body determines that the Person seeking intervention has a direct and substantial interest in the outcome of the Alleged Violation, proposed penalty or sanction, Mitigation Plan, or Remedial Action Directive that is the subject of the proceeding. Examples of a direct and substantial interest in the outcome shall include

(1) that the Person seeking intervention has received a Notice of Alleged Violation or a Remedial Action Directive involving the same Reliability Standard requirement(s) and arising out of the same event or occurrence as the existing Respondent(s) that is the subject of the proceeding, or

(2) that the Person seeking intervention will or may be contractually or legally liable to the original Respondent(s) for payment of all or a portion of the proposed penalty or sanction that is the subject of the proceeding, provided, that after the Person seeking intervention sufficiently demonstrates it will or may be contractually or legally liable for payment of all or a portion of the proposed penalty or sanction to be granted intervention, the Person granted intervention and

the existing Respondents will not be allowed to litigate in the proceeding whether the Person granted intervention is contractually or legally liable for payment of all or a portion of the proposed penalty or sanction or the amount of the proposed Penalty or Sanction for which the Person granted intervention is or may be liable.

That the Person seeking intervention has received a Notice of Alleged Violation for the same Reliability Standard requirement(s) as the original Respondent(s) but arising out of a different event or occurrence; or seeks to intervene to advocate an interpretation of the Reliability Standard requirement(s) or provision(s) of the *Sanction Guidelines*, that are at issue in the proceeding, without more, shall not constitute a direct and substantial interest in the outcome and shall not be grounds on which the Hearing Body may allow the Person to intervene.

(c) A Person seeking intervention shall do so by filing a motion to intervene with the Clerk. The motion shall state the Person's interest in sufficient factual detail to demonstrate that the Person should be allowed to intervene pursuant to Section 1.2.12(b). The motion to intervene shall also state the Person's agreement to maintain the confidential and non-public nature of the hearing, including all pleadings and other documents filed or exchanged in connection with the request for intervention. Any facts alleged in, or offers of proof made in, the motion to intervene shall be supported by affidavit or verification.

(d) The Clerk shall promptly provide copies of the motion to intervene to the Hearing Officer and the Participants. The Hearing Officer shall promptly set a time period, not to exceed seven (7) days, within which the Participants may file responses to the motion to intervene. Within seven (7) days following the end of the response period, the Hearing Officer shall issue a recommendation to the Hearing Body as to whether or not the motion to intervene should be granted.

(e) The Hearing Body may, within seven (7) days following the date of the Hearing Officer's recommendation, issue a decision granting or denying the motion to intervene. If the Hearing Body does not issue a decision granting or denying the motion to intervene within seven (7) days following the date of the Hearing Officer's recommendation, the Hearing Officer's recommendation shall become the decision of the Hearing Body and the motion to intervene shall be deemed granted or denied by the Hearing Body in accordance with the Hearing Officer's recommendation.

(f) The Hearing Officer, on motion of a Participant or on his or her own motion, or the Hearing Body, on recommendation by the Hearing Officer or its own motion, may stay or suspend the proceeding while a request to intervene, including a request to intervene filed directly with FERC, and including any appeal of the grant or denial of the request to intervene, is being resolved.

(g) A Person allowed to intervene and become a Participant to a proceeding shall be designated as a Respondent and deemed to be aligned with the existing Respondent(s), unless the Hearing Body, in the decision granting intervention, states that the Person allowed to intervene shall be deemed to be aligned with another Participant to the proceeding.

(h) A Person allowed to intervene and become a Participant to a proceeding is required to take the record and the procedural status of the proceeding as it stands on the date the Person's motion to intervene is granted by the Hearing Body.

(i) A Person may appeal a decision of the Hearing Body denying the Person's motion to intervene, and the Compliance Staff, the Respondent or any other Participant may appeal a decision granting or denying a motion to intervene, in accordance with Section 414 of the NERC Rules of Procedure. A notice of appeal shall be filed with the NERC director of enforcement no later than seven (7) days following the date of the decision of the Hearing Body granting or denying the motion to intervene.

1.2.13 Proceedings Closed to the Public

No hearing, oral argument or meeting of the ~~[HEARING BODY]~~Hearing Body shall be open to the public, and no notice, ruling, order or any other issuance of the Hearing Officer or ~~[HEARING BODY]~~Hearing Body, or any transcript, made in any proceeding shall be publicly released unless the ERO (within the U.S., in accordance with the authorization previously granted by FERC to release information about a non-public proceeding) or FERC (in the case of U.S.-related information) or another Applicable Governmental Authority (in the case of non-U.S.-related information) determines that public release is appropriate. Only the members of the ~~[HEARING BODY]~~Hearing Body, the Participants, the Hearing Officer and the Technical Advisors, if any, shall be allowed to participate in or obtain information relating to a proceeding.

1.2.14 Docketing System

The Clerk shall maintain a system for docketing proceedings. A docketed proceeding shall be created upon the filing of a request for a hearing~~issuance of a Notice of Alleged Violation~~. Unless NERC provides a different docketing system that will be used uniformly by the Compliance Enforcement Authorities, docket numbers shall be assigned sequentially beginning with a two digit number that relates to the last two digits of the year in which the docket is initiated, followed by a dash ("-"), followed by the letters "[RE]", followed by a dash ("-"), followed by a four digit number that will be "0001" on January 1 of each calendar year and ascend sequentially until December 31 of the same calendar year.

1.2.15 Representations Deemed to be Made in All Pleadings

A Participant presenting any pleading to the Hearing Officer or Hearing Body shall be deemed to certify that to the best of the Participant's knowledge, information and belief, formed after and based on an inquiry that is reasonable under the circumstances:

(a) the factual allegations set forth in the pleading have or will have support in the evidence or the Participant believes they will have support in the evidence after reasonable opportunity for further investigation or discovery;

(b) the denials in the pleading of factual allegations made by another Participant are warranted by or will be warranted by the evidence or, if specifically so identified, are reasonably based on belief or on a lack of information;

(c) the claims, defenses and other contentions set forth in the pleading are warranted based on the applicable Reliability Standard requirement(s) or Rules of Procedure provisions; and

(d) the pleading is not being presented for any improper purpose, such as to harass, cause unnecessary delay, or needlessly increase the cost of the hearing or the cost incurred by any Participant.

1.2.~~15~~16 Hold Harmless

A condition of a Participant invoking these Hearing Procedures and participating in a hearing is that the Participant agrees that the Compliance Enforcement Authority, including without limitation its members, board of directors or trustees, compliance committee, any other committees or subcommittees, Staff, contracted employees, ~~[HEARING BODY]~~Hearing Body members, Hearing Officers and Technical Advisors, shall not be liable, and shall be held harmless against the consequences of, or any action or inaction arising out of, the hearing process, or of any agreement reached in resolution of a dispute or any failure to reach agreement as a result of a proceeding. This "hold harmless" provision does not extend to matters constituting gross negligence, intentional misconduct or breach of confidentiality.

1.3 Initiation of the Hearing Process

1.3.1 Registered Entity's Option to Request a Hearing

(a) Except when contesting a Remedial Action Directive pursuant to ~~s~~Section 1.9 of these Hearing Procedures, a Registered Entity may file a statement, in accordance with Section 1.3.1(e), with the Compliance Enforcement Authority requesting a hearing if either:

(1~~a~~) The Registered Entity files a response to a Notice of Alleged Violation that contests either the Alleged Violation, the proposed Penalty, or both; or

(2~~b~~) The Compliance Staff submits to the Registered Entity a statement rejecting the Registered Entity's proposed revised Mitigation Plan submitted after Compliance Staff rejected the Registered Entity's initial proposed Mitigation Plan.

(b) A Registered Entity must file its hearing request within forty (40) days after

(~~i~~1) the Registered Entity files its response to the Notice of Alleged Violation; or

(~~ii~~2) the Compliance Staff submits to the Registered Entity its statement identifying a disagreement with the Registered Entity's proposed Mitigation Plan, whichever is applicable.

(c) If the Registered Entity does not file a hearing request within the time period set forth in this ~~Paragraph~~Section, then the Registered Entity will be deemed to have agreed and waived any objection to the proposed Penalty, the Alleged Violation or the Compliance Staff's rejection of the revised Mitigation Plan, whichever is applicable.

(d) In accordance with Section 5.3 of the Compliance Program, ~~Either~~ a Notice of Alleged Violation issued to a Registered Entity or a Staff statement setting forth its rejection of a Registered Entity's proposed revised Mitigation Plan shall clearly state that the Registered Entity has the option to contest the Alleged Violation, proposed Penalty, or both, or the Compliance Staff's rejection of the proposed revised Mitigation Plan, using either the shortened hearing procedure pursuant to Section 1.3.4~~Paragraph 1.3.2~~ or the general~~full~~ hearing procedure described in Sections 1.4 to 1.7. ~~If the Registered Entity files a hearing request within the requisite time period, it shall state within its hearing request whether it requests the shortened hearing procedure pursuant to Paragraph 1.3.2 or the full hearing procedure described in Sections 1.4 to 1.7. If the Registered Entity (or any Respondent if there are more than one Respondent) requests the full hearing procedure, the full hearing procedure shall apply. If the Registered Entity (or all Respondents if there are more than one Respondent) requests the shortened hearing procedure, Compliance Staff and any other Participant shall submit a filing within five (5) days of the Registered Entity's hearing request that states whether Staff or such other Participant agrees to use the shortened hearing procedure. If Staff or another Participant makes a filing requesting the full hearing procedure, then the full hearing procedure shall apply; otherwise the shortened hearing procedure requested by the Registered Entity or Entities shall be used. Once either the full or shortened hearing procedure has been selected, the Participants shall not be allowed to revert to the non-selected hearing procedure unless the Participants mutually agree.~~

(e) The Registered Entity's statement requesting a hearing shall:

(1) contain a plain and concise statement of the facts and arguments supporting the Registered Entity's position, as applicable, that it did not violate the Reliability Standard requirement(s) set forth in the Notice of Alleged Violation, that the proposed penalty or sanction is too high and should be reduced, or that the Registered Entity's proposed Mitigation Plan should be approved;

(2) state the relief that the Registered Entity requests the Hearing Body to grant; and

(3) state whether the Registered Entity requests the shortened hearing procedure or the general hearing procedure.

The Registered Entity's statement may set forth two or more alternative grounds on which the Registered Entity bases its position, as applicable, that it did not violate the Reliability Standard requirement(s) set forth in the Notice of Alleged Violation, that the proposed penalty or sanction is too high and should be reduced, or that the Registered Entity's proposed Mitigation Plan should be approved.

(f) If the Registered Entity (or any Respondent if there are more than one Respondent) requests the general hearing procedure, the general hearing procedure shall apply. If the Registered Entity (or all Respondents if there are more than one Respondent) requests the shortened hearing procedure, Compliance Staff and any other Participants shall submit a filing within five (5) days of the Registered Entity's hearing request that states whether Staff or such other Participant agrees to use the shortened hearing procedure. If Staff or another Participant makes a filing requesting the general hearing procedure, then the general hearing procedure shall apply; otherwise the shortened hearing procedure requested by the Registered Entity or Entities shall be used. Once either the general or shortened hearing procedure has been selected, the

Participants shall not be allowed to revert to the non-selected hearing procedure unless the Participants mutually agree.

(g) A Registered Entity shall attach to a request for hearing whichever of the following are applicable:

(1a) The Registered Entity's Self-Report~~ing~~ of a violation;

(2b) The Notice of Alleged Violation and the Registered Entity's response thereto; and/or

(~~c~~3) The Registered Entity's proposed revised Mitigation Plan and the Compliance Staff's statement rejecting the proposed revised Mitigation Plan.

1.3.2 Compliance Staff's Response to Request for Hearing

(a) If the Registered Entity's request for hearing requests that the shortened hearing procedure be used, the Compliance Staff shall file a response stating whether it agrees to the use of the shortened hearing procedure.

(b) If the Registered Entity's request for hearing requests that the Registered Entity's proposed revised Mitigation Plan should be approved, the Compliance Staff shall file a response stating the Compliance Staff's position as to why the Registered Entity's proposed revised Mitigation Plan should not be approved and setting forth any additional terms that the Compliance Staff believes should be included in the Mitigation Plan.

(c) If the Registered Entity's request for hearing does not request that the shortened hearing procedure be used and does not request that the Registered Entity's proposed revised Mitigation Plan should be approved, the Compliance Staff may, but is not required to, file a response stating, as applicable, the basis for the Compliance Staff's position that the Registered Entity violated the Reliability Standard requirement(s) specified in the Notice of Alleged Violation or that the proposed penalty or sanction is appropriate under the *Sanction Guidelines* and should not be reduced.

(d) Any response by the Compliance Staff required or permitted by this Section shall be filed within fifteen (15) days after the date the request for hearing was filed, unless the Hearing Officer or Hearing Body allows a longer time to file the response.

1.3.3 Notice of Hearing

(a) The Clerk shall issue a notice of hearing not less than sixteen (16) days, and not more than twenty-one (21) days, after the Registered Entity files its request for hearing.

(b) The notice of hearing shall state whether the shortened hearing procedure or the general hearing procedure will be used.

(c) The notice of hearing shall identify the Hearing Officer and the date, time and place for the initial prehearing conference.

(1) If the shortened hearing procedure is to be used, the initial prehearing conference shall be set for a date within seven (7) days following the date of the notice of hearing.

(2) If the general hearing procedure is to be used, the initial prehearing conference shall be set for a date within fourteen (14) days following the date of the notice of hearing.

1.3.~~2~~4 Shortened Hearing Procedure

The shortened hearing procedure shall be as set forth in this ~~Paragraph~~Section. The rules applicable to the general~~full~~ hearing procedure shall apply to the shortened hearing procedure unless the context of such a rule is inconsistent with the procedure set forth in this Section~~Paragraph~~ or otherwise renders it inapplicable to the shortened hearing procedure. The rules concerning ex parte communications in Section~~Paragraph~~ 1.4.7 are hereby expressly made applicable to the shortened hearing procedure under this Section~~Paragraph~~.

The ~~[HEARING BODY]~~Hearing Body shall~~may~~ utilize a Hearing Officer to preside over the shortened hearing procedure in accordance with Section~~Paragraph~~ 1.4.2. But, no Testimonial~~evidentiary~~ ~~h~~Hearing will be held in the shortened hearing procedure and the Participants will not present witness testimony or file briefs, except that briefs on exceptions and briefs in reply to exceptions may be allowed pursuant to ~~Subparagraph~~subsection (g). Instead, the following events shall take place within the following periods:

(a) The initial prehearing conference shall be held within seven (7) days after the date on which the notice of hearing is issued. In addition to any other matters set forth in ~~Paragraph~~Section 1.5.2 that may apply, the initial prehearing conference will be used to develop a schedule for the preparation and submission of comments in accordance with ~~Subparagraphs~~subsections (c) through (e).

(b) Within ~~five (5)~~ten (10) days after the date on which the notice of hearing is issued, Staff shall make documents available to the Registered Entity for inspection and copying pursuant to Section~~Paragraph~~ 1.5.7.

(c) Within twenty-one (21) days after the initial prehearing conference, the Staff shall file:

(1) initial comments stating Staff's position on all issues and the rationale in support of its position, including all factual and legal argument;

(2) all documents that Staff seeks to introduce in support of its position that have not already been submitted in the proceeding; and

(3) a verification attesting to the truthfulness of the facts alleged in the filing.

(d) Within fourteen (14) days of Staff's initial comment filing pursuant to ~~Subparagraph~~subsection (c), the Registered Entity shall file:

(1) responsive comments stating the Registered Entity's position on all issues and the rationale in support of its position, including all factual and legal argument, which comment also may respond to Staff's initial comments;

(2) all documents that the Registered Entity seeks to introduce in support of its position that have not already been submitted in the proceeding; and

(3) a verification attesting to the truthfulness of the facts alleged in the filing.

(e) Within seven (7) days after the Registered Entity's responsive comment filing pursuant to ~~Subparagraph~~subsection (d), Staff shall file reply comments that shall be limited in scope to responding to the Registered Entity's responsive comments and be supported by a verification attesting to the truthfulness of the facts alleged in the filing. Staff shall not submit any additional documents in support of its position as part of this filing except upon motion and good cause shown. If Staff is allowed to file additional documents in support of its position based upon such a motion, the Registered Entity shall have the right to file additional documents in support of its position that are responsive to the additional documents that Staff is allowed to file provided that any additional Registered Entity filing also shall be verified.

(f) The Hearing Officer shall issue an initial opinion within twenty-one (21) days after the Staff's reply comments filing or any additional filing by the Registered Entity pursuant to ~~Subparagraph~~subsection (e).

(g) If either Participant requests, the Hearing Officer shall allow each Participant to file, within seven (7) days after the Hearing Officer's initial opinion, exceptions to the Hearing Officer's initial opinion in a brief designated "brief on exceptions" in accordance with Section~~Paragraph~~ 1.7.5 and within seven (7) days thereafter, a reply brief designated "Brief in Reply to Exceptions."

(h) The ~~[HEARING BODY]~~Hearing Body shall strive, but is not required, to issue a final order within ~~ninety (90)~~one hundred twenty (120) days of the notice of hearing.

The Hearing Officer or ~~[HEARING BODY]~~Hearing Body may modify any time period set forth within this Paragraph as warranted by the circumstances but it will be the objective of the ~~[HEARING BODY]~~Hearing Body to issue the final order within ~~ninety (90)~~one hundred twenty (120) days of the notice of hearing.

1.4 General Hearing Procedure

1.4.1 ~~Notice of Hearing~~[Intentionally Left Blank]

~~Within seven (7) days of a Registered Entity requesting a hearing pursuant to Paragraph 1.3, the Clerk shall issue a notice of hearing in the docket. The notice of hearing shall identify the Hearing Officer, if designated at that time, and the date, time, and place for the prehearing~~

~~conference, which should occur no later than fourteen (14) days after the notice of hearing is issued.~~ [Blank.]

1.4.2 Hearing Officer

(a) The Compliance Enforcement Authority ~~may~~shall utilize a Hearing Officer to preside over each hearing conducted pursuant to these Hearing Procedures, provided that the Hearing Officer's actions shall be subject to the authority of the ~~[HEARING BODY]~~Hearing Body as set forth in ~~Paragraph~~Section 1.4.3. Members of the ~~[HEARING BODY]~~Hearing Body may attend any aspect of the hearing.

(b) The ~~[HEARING BODY] may delegate to the~~ Hearing Officer is responsible for~~authority over~~ the conduct of the hearing, including administering the hearing from the initial prehearing conference through the issuance of the Hearing Officer's initial opinion, ~~and~~ any administrative hearing functions thereafter, and ~~the responsibility for~~ submission of the matter to the ~~[HEARING BODY]~~Hearing Body for final decision through the presentation to the ~~[HEARING BODY]~~Hearing Body of an initial opinion. The Hearing Officer shall have those duties and powers necessary to those ends, consistent with and as further enumerated in these Hearing Procedures, including the following:

(1) To administer oaths and affirmations;

(2) To schedule and otherwise regulate the course of the hearing, including the ability to call to recess, reconvene, postpone or adjourn a hearing;

(3) Consistent with any timing or deadline requirements imposed by these Hearing Procedures or by applicable law, to separate any issue or group of issues from other issues in a proceeding and treat such issue(s) as a separate phase of the proceeding;

(4) Consistent with any timing or deadline requirements imposed by these Hearing Procedures or by applicable law, to modify any time period, if such modification is in the interest of justice and will result in no undue prejudice to any other Participant;

(5) To supervise and issue orders concerning discovery;

(6) To conduct prehearing conferences, status hearings and E~~e~~videntiary ~~h~~Hearings;

(7) To hear argument on all objections, motions and other requests, and to rule upon all objections, motions and other requests that do not result in the final determination of the proceeding;

(8) To rule on and receive evidence;

(9) To call upon a Participant to produce further evidence that is material and relevant to any issue;

(10) To issue protective orders pursuant to Section~~Paragraph~~ 1.5.10;

(11) To issue initial opinions; and

(12) To ensure that hearings are conducted in a full, fair and impartial manner, that order is maintained and that unnecessary delay is avoided in the disposition of the proceedings.

(c) ~~If the [HEARING BODY] uses a Hearing Officer to preside over a hearing, the [HEARING BODY]~~The Compliance Enforcement Authority shall disclose the~~ identity,~~ employment history and professional affiliations of the Hearing Officer within two (2) days of the Hearing Officer's assignment to the proceeding, and Participants to the hearing may raise objections to the Hearing Officer's participation in accordance with Section~~Paragraph~~ 1.4.5.

1.4.3 ~~[HEARING BODY]~~Hearing Body

(a) The composition of the Hearing Body, after any recusals or disqualifications, shall be such that no two industry segments may control, and no single industry segment may veto, any decision of the Hearing Body on any matter brought before it for decision.

(b) The ~~[HEARING BODY]~~Hearing Body is vested with the authority to issue a final order resolving the issue(s) in all cases. To that end:

(1) Upon receiving a filing by a Participant, ~~T~~the Clerk shall promptly send a notice to the members of the ~~[HEARING BODY]~~Hearing Body identifying the date of the filing and the Participant making the filing and briefly describing the nature of the filing. Any member of the Hearing Body may request of, and shall receive from, the Clerk, a copy of any filing by a Participant. ~~shall receive all filings in a hearing, including but not limited to all issuances of the Hearing Officer, all motions and responses thereto, and all written comments, testimony and evidence.~~ The Hearing Body shall not receive documents made available by Staff for inspection and copying by the Respondent, or other responses to discovery between the Participants, unless such documents are placed into the record pursuant to ~~Paragraph~~Section 1.6.7.

(2) The Clerk shall send all issuances of the Hearing Officer to the members of the Hearing Body.

(~~2~~3) The ~~[HEARING BODY]~~Hearing Body or any individual member thereof may, but is not required to, attend any prehearing conference, status hearing or E~~e~~videntiary ~~h~~Hearing, and/or to submit questions to the Hearing Officer to submit to a Participant or any witness at any ~~such~~ hearing. At any prehearing conference or hearing attended by a member of the Hearing Body, any member of the Hearing Body may ask questions directly of any Participant or witness.

(4~~3~~) The ~~[HEARING BODY]~~Hearing Body shall have the same authority as the Hearing Officer, as set forth in these Hearing Procedures, to require the Participants or any individual Participant to: (i) address a specific issue in testimony, evidence or briefs; (ii) present oral argument on an issue; (iii) file pre-~~e~~Evidentiary ~~h~~Hearing memorandums; or (iv) produce further evidence that is

material and relevant to any issue. To this end, the ~~[HEARING BODY]~~Hearing Body shall be entitled to issue questions or requests for information to any Participant or any witness at any time until the issuance of a final order.

(5~~4~~) To the extent that the ~~[HEARING BODY]~~Hearing Body disagrees with any issuance or ruling of the Hearing Officer, it may, on its own motion or upon petition for interlocutory review meeting the requirements of Section~~Paragraph~~ 1.4.4, reverse or modify the issuance or ruling in whole or in part, or take any other action as may be appropriate.

(6~~5~~) The ~~[HEARING BODY]~~Hearing Body shall resolve the issue(s) in every hearing through the issuance of a final order. In issuing a final order, the ~~[HEARING BODY]~~Hearing Body shall consider the Hearing Officer's initial opinion but shall have the authority to reject, modify or approve the initial opinion in whole or in part.

1.4.4 Interlocutory Review

(a) A Participant shall be allowed to seek interlocutory review by the ~~[HEARING BODY]~~Hearing Body of any ruling of the Hearing Officer where the ruling for which interlocutory review is sought presents an extraordinary circumstance which makes prompt review necessary to prevent prejudice to a Participant's ability to present its position in the proceeding. Failure to seek such review shall not operate as a waiver of any objection to such ruling.

(b) Unless good cause is shown or unless otherwise ordered by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body, the Participant seeking review shall file a petition for interlocutory review within fourteen (14) days after the date of the action that is the subject of the petition. The petition shall contain, in a separately identified section, a demonstration that the ruling for which interlocutory review is sought presents an extraordinary circumstance which makes prompt review necessary to prevent prejudice to the Participant's ability to present its position in the proceeding. The petition shall be filed with any offer of proof and supported by references to the record, or by affidavit if based on facts that do not appear ~~of~~in the record. Responses to petitions for interlocutory review shall be filed within seven (7) days after service of the petition. No replies to responses ~~are~~shall be allowed.

(c) The Hearing Officer shall file a report to the ~~[HEARING BODY]~~Hearing Body within fourteen (14) days from the filing of the petition. The Hearing Officer's report shall set forth the relevant facts and other background information relating to the ruling on which interlocutory review is sought, the basis for the Hearing Officer's ruling, a summary of the Participants' arguments on the petition for interlocutory review, and the recommendation of the Hearing Officer for the disposition of the petition by the ~~[HEARING BODY]~~Hearing Body.

(d) On review of a Hearing Officer's ruling, the ~~[HEARING BODY]~~Hearing Body may affirm or reverse the ruling in whole or in part, and may take any other just and reasonable action with respect to the ruling, such as declining to act on an interlocutory basis. The ~~[HEARING BODY]~~Hearing Body may reject the petition for interlocutory review on the grounds that the ruling for which review is sought does not present an extraordinary circumstance which makes

prompt review necessary to prevent prejudice to a Participant's ability to present its position in the proceeding, without considering or ruling on the substance of the petitioner's arguments.

(e) Issuance of a ruling on a petition for interlocutory review shall require (i) a quorum (as defined in Section~~Paragraph~~ 1.7.8) of the ~~[HEARING BODY]~~Hearing Body, and (ii) majority vote of the members of the ~~[HEARING BODY]~~Hearing Body voting on the final order (which number of members voting shall not be less than a quorum). Petitions to rehear or reconsider the ~~[HEARING BODY'S]~~Hearing Body's action taken on interlocutory review shall not be allowed. Filing and disposition of a petition for interlocutory review of a ruling of the Hearing Officer shall not suspend or otherwise delay a hearing or any other scheduled dates in the proceeding except as authorized by the Hearing Officer or the ~~[HEARING BODY]~~Hearing Body based on a finding of exceptional circumstances.

(f) A non-Participant that has been ordered by the Hearing Officer pursuant to Section~~paragraph~~ 1.5.8 to produce or provide documents, information or testimony, and has failed to obtain the relief sought from the Hearing Officer through filing objections to or a motion to quash the order, shall also be entitled to seek interlocutory review by the ~~[HEARING BODY]~~Hearing Body of the Hearing Officer's order, with respect to (i) whether the non-Participant is within the class of Persons subject to such orders pursuant to Section~~paragraph~~ 1.5.8, and (ii) the reasonableness of the Hearing Officer's order to produce or provide document, information or testimony.

1.4.5 Disqualification

(a) A Hearing Officer, Technical Advisor or member of the ~~[HEARING BODY]~~Hearing Body shall recuse himself or herself from a proceeding if participation would violate the Compliance Enforcement Authority's applicable conflict of interest policy.

(b) Any Participant may file a motion to disqualify or for recusal of a Hearing Officer, Technical Advisor or member of the ~~[HEARING BODY]~~Hearing Body from a proceeding on grounds of a conflict of interest, an ex parte communication prohibited by ~~s~~Section 1.4.7, or the existence of other circumstances that could interfere with the impartial performance of his or her duties. The Participant shall set forth and support its alleged grounds for disqualification by affidavit. A motion for disqualification shall be filed within fifteen (15) days after the later of: (1) the time when the Participant learns of the facts believed to constitute the basis for disqualification; or (2) the time when the Participant is notified of the assignment of the Hearing Officer or Technical Advisor.

(c) The Hearing Officer shall issue a proposed ruling for the ~~[HEARING BODY]~~Hearing Body's consideration upon the filing of a motion for disqualification unless the Hearing Officer is the subject of the motion. The ~~[HEARING BODY]~~Hearing Body, without the participation of any member who is the subject of the motion, shall issue a final ruling on the motion. If the Hearing Officer ~~is recused~~recuses himself or herself or is disqualified, the ~~[HEARING BODY]~~Hearing Body will appoint a replacement Hearing Officer. To ensure fairness to the Participants and expedite completion of the proceeding when a replacement Hearing Officer is appointed after a hearing has commenced, the replacement Hearing Officer may recall any witness or may take other steps necessary to ensure~~certify~~ familiarity with any part or all of the record.

(d) If a quorum (as defined in Section~~Paragraph~~ 1.7.8) of the ~~[HEARING BODY]~~Hearing Body does not remain after any recusals and rulings on motions for disqualification, then the Compliance Enforcement Authority shall appoint at least the number of ~~a~~ new member~~(s)~~ to the ~~[HEARING BODY]~~Hearing Body necessary to create a quorum~~.~~. ~~which~~The new member(s) shall serve on the ~~[HEARING BODY]~~Hearing Body through the conclusion of the proceeding but not thereafter. ~~The Compliance Enforcement Authority shall only appoint the number of new members as are necessary to create a quorum.~~ Any new member of the ~~[HEARING BODY]~~Hearing Body shall be subject to the provisions applicable herein to all ~~[HEARING BODY]~~Hearing Body members.

1.4.6 Technical Advisor

(a) The Hearing Officer and/or the ~~[HEARING BODY]~~Hearing Body may elect to use one or more Technical Advisors to assist in any proceeding. Such an election may be made at any time during the course of a proceeding. Any Staff member who serves as a Technical Advisor shall not have been involved in or consulted at any time in regard to any Compliance Staff investigation, determination of a Possible Violation, Alleged Violation or Penalty, or assessment of a Registered Entity's proposed Mitigation Plan that resulted in the proceeding in which technical advice would be rendered, and shall not be a member of Staff participating in the proceeding on which such technical advice would be rendered.

(b) If the Hearing Officer or ~~[HEARING BODY]~~Hearing Body uses a Technical Advisor to assist in any hearing, the Hearing Officer or ~~[HEARING BODY]~~Hearing Body shall disclose the identity, employment history and professional affiliations of the Technical Advisor within two (2) days of the Technical Advisor's assignment to the proceeding, and Participants to the hearing may raise objections to the Technical Advisor's participation in accordance with Section~~Paragraph~~ 1.4.5.

1.4.7 No Ex Parte Communications

(a) Once a Registered Entity requests a hearing pursuant to ~~Paragraph~~Section 1.3.1:

(1) neither the ~~[HEARING BODY]~~Hearing Body, the Hearing Officer, nor the Technical Advisor(s), if any, may communicate either directly or indirectly with any Person concerning any issue in the proceeding outside of the hearing process; except that

(2) the ~~[HEARING BODY]~~Hearing Body, the Hearing Officer, and the Technical Advisor(s), if any, may communicate outside of the hearing process either directly or indirectly with a Participant or a Participant's representative:

(A) in writing if the writing is simultaneously provided to all Participants; or

(B) orally if a representative for every Participant is present in person or by telephone;

(C) subject to the requirement that the substance of any ruling on any issue discussed shall be memorialized on the record or by the issuance of a

notice or ruling, and that any Participant objecting to the ruling shall have the opportunity to state its objection on the record.

(b) Exceptions

(1) The proscription in ~~Subparagraph~~subsection (a)(1) does not prohibit members of the Compliance Staff from communicating with the Registered Entity, and representatives, agents or employees thereof on any topic, provided that any member of the Compliance Staff involved in any such communication relating to the subject matter of the proceeding may not be, and may not subsequently serve as, a Technical Advisor.

~~c~~(2) The proscription in ~~Subparagraph~~subsection (a)(1) ~~also~~ does not prohibit communications between or among members of the ~~[HEARING BODY]~~Hearing Body, the Hearing Officer and any Technical Advisor.

(3) The proscription in subsection (a)(1) does not prohibit communications between the Hearing Officer or members of the Hearing Body to the Clerk for the purpose of transmitting documents, giving instructions to the Clerk, or discussing scheduling and other procedural matters relating to the proceeding.

(4) The proscription in subsection (a)(1) does not prohibit communications between or among the Clerk, the Hearing Body and representatives of the Compliance Enforcement Authority for purposes of establishing the hearing forum.

(~~d~~c) Any member of the ~~[HEARING BODY]~~Hearing Body, the Hearing Officer or any Technical Advisor who receives or who makes or knowingly allows~~causes to be made~~ a communication prohibited by this Section~~Paragraph~~ shall, within seven (7) days of the communication, file and serve on the Participants in the proceeding a notice of ex parte communication setting forth the date, time and place of communication, a summary of the substance and nature of the communication and all responses thereto, and a list of each Person who made or received the communication and, if the communication or any response thereto was in writing, a copy of the written communication shall be attached.

1.4.8 Appearances

(a) Participants shall file written appearances within seven (7) days after the notice of hearing is issued. A Participant's written appearance shall identify the name(s) of each individual authorized to represent the Participant in the proceeding exclusive of witnesses. An individual may appear on his or her own behalf. A corporation, limited liability company, association, partnership or governmental body may appear by any bona fide officer or designee who has the authority to act on behalf of the Participant. A Participant also may appear by an attorney.

(b) A Participant's written appearance shall state, with respect to each individual that the Participant identifies for service, the individual's name, address, telephone number, and facsimile number and email address, if available, where service shall be made.

A Participant may withdraw any individual from the Participant's representation or otherwise change the identity of individuals authorized to represent the Participant in a proceeding by filing a notice of a change in service list.

(c) Any attorney appearing on behalf of a Participant shall be licensed to practice law and in good standing before the Supreme Court of the United States or the highest court of any State, territory of the United States or the District of Columbia. All representatives appearing before the Hearing Body or Hearing Officer shall conform to the standards of ethical conduct required of practitioners before the courts of the United States.

(d) Individuals representing Participants in any hearing also shall enter their appearances at the beginning of the hearing by stating their names, addresses, telephone numbers and email addresses orally on the record.

1.4.9 Failure to Appear or Exercise Diligence

The failure of any Participant to appear during any hearing without good cause and without notification may be grounds for dismissal or deciding against the interests of such Participant.

1.4.10 Consolidation of Proceedings

(a) In the event that more than one Registered Entity receives a Notice of Alleged Violation for the same event or occurrence~~transaction~~, and each Registered Entity selects the general~~full~~ hearing procedure described in Sections 1.4 to 1.7, the Hearing Body on its own motion or on motion of a Participant may exercise its discretion to examine the actions of all such Registered Entities in a single proceeding as long as an initial opinion has not been rendered by the Hearing Officer pursuant to Section 1.7.4 in any proceeding to be consolidated.

(b) A Participant may file a motion ~~pursuant to Paragraph 1.5.5~~ to consolidate into a single proceeding Allegations of Violations of different Reliability Standards against a single Respondent, and related contests of Penalties or Mitigation Plans, arising out of the same event or occurrence~~transaction~~. Such consolidation may be allowed in the discretion of the Hearing Officer or ~~[HEARING BODY]~~Hearing Body, as applicable.

1.5 Prehearing Procedure

1.5.1 [Intentionally left blank]

1.5.2 Prehearing Conferences

(a) The Hearing Officer shall hold at least one ~~The purpose of the~~ prehearing conference, which may be the initial prehearing conference or a subsequently scheduled prehearing conference, for the following purposes ~~shall be to~~:

(1) Preliminarily identify the issues and discuss the anticipated format of the hearing;

(2) Discuss a schedule for any discovery to be conducted and address any discovery issues that are raised at that time;

(3) Explore the possibility of obtaining admissions of fact and of the authenticity~~genuineness~~ of documents that would avoid unnecessary proof;

(4) Develop a schedule for the preparation and submission of evidence and witness testimony, including the disclosures of witnesses and exhibits and whether the use of pre-filed testimony may not be appropriate, in advance of the E~~e~~videntiary ~~h~~Hearing;

(5) Develop a schedule or schedules for any anticipated motions

(6~~5~~) Schedule a date(s) for the E~~e~~videntiary H~~h~~earing, which shall be within ninety (90) days of the prehearing conference described in this subsection, unless a different date or dates is specified by the Hearing Officer or the Hearing Body with the consent of all Participants or for good cause shown; and

(7~~6~~) Address such other matters as may aid in the simplification of the evidence and disposition of the proceeding.

(b) The Hearing Officer shall also hold a final prehearing conference prior to the Evidentiary Hearing, for the purpose of discussing:

(1) the anticipated duration of the hearing;

(2) the scheduling of witnesses' appearances to testify;

(3) the issues anticipated to be presented at the hearing;

(4) whether prehearing memoranda should be filed and if so, the schedule; and

(5) any other matters identified by the Hearing Officer for the management of the Evidentiary Hearing.

Participants may submit to the Hearing Officer, at least ten (10) days prior to the scheduled date of the final prehearing conference, a proposed list or lists of matters to be discussed at the final prehearing conference.

1.5.3 Summary Disposition

(a) Availability

A Hearing Officer, on the Hearing Officer's own motion or on the motion of a Participant, may issue an initial opinion granting, in whole or in part, summary disposition if it appears that there are no issues of material fact and a Participant is entitled to issuance of a final order in its favor. ~~If the Hearing Officer is considering summary disposition in the absence of a Participant motion, the Hearing Officer shall request the Participants to identify in writing any issues of material fact and to comment on the proposed disposition. Factual information in the Participants' comments shall be supported by affidavit. Following review of the Participants' comments, if it still appears to the Hearing Officer that there are no genuine issues of material fact, the Hearing~~

~~Officer may proceed without an evidentiary hearing. The Hearing Officer shall, however, allow the Participants the opportunity to file briefs.~~

(b) Motion for Summary Disposition and Responses

(1) A Participant moving for summary disposition must clearly identify the material facts that are not in dispute, demonstrate that there are no other material facts in dispute, and demonstrate that on the basis of the undisputed material facts, the Participant is entitled to issuance of a final order in its favor.

(2) A Participant opposing a motion for summary disposition must clearly identify in its response to the motion the material facts that the Participant contends remain in dispute, and/or explain why the moving Participant is not entitled to issuance of a final order in its favor even though there are no disputed issues of material fact.

(c) Summary Disposition on the Hearing Officer's Own Motion

If the Hearing Officer is considering summary disposition in the absence of a Participant motion, the Hearing Officer shall request the Participants to identify in writing any issues of material fact and to comment on the proposed disposition. Factual information in the Participants' comments shall be supported by affidavit. Following review of the Participants' comments, if it still appears to the Hearing Officer that there are no genuine issues of material fact, the Hearing Officer may proceed without an Evidentiary Hearing. The Hearing Officer shall, however, allow the Participants the opportunity to file briefs.

(d) Hearing Officer's Initial Opinion Granting Summary Disposition

When the Hearing Officer issues an initial opinion granting ~~a motion for~~ summary disposition in whole or in part, the ruling shall set forth the rationale for the grant. An initial opinion of the Hearing Officer granting summary disposition shall be confirmed, rejected or modified in a final order issued by the ~~[HEARING BODY]~~Hearing Body.

1.5.4 Status Hearings
