NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Glossary of Terms Used in NERC Reliability Standards

Updated October 19, 2012

Introduction:

This Glossary lists each term that was defined for use in one or more of NERC's continent-wide or Regional Reliability Standards and adopted by the NERC Board of Trustees from February 8, 2005 through October 19, 2012.

This reference is divided into two sections, and each section is organized in alphabetical order. The first section identifies all terms that have been adopted by the NERC Board of Trustees for use in continent-wide standards; the second section identifies all terms that have been adopted by the NERC Board of Trustees for use in regional standards. (WECC, NPCC and Reliability*First* are the only Regions that have definitions approved by the NERC Board of Trustees. If other Regions develop definitions for approved Regional Standards using a NERC-approved standards development process, those definitions will be added to the Regional Definitions section of this glossary.)

Most of the terms identified in this glossary were adopted as part of the development of NERC's initial set of reliability standards, called the "Version 0" standards. Subsequent to the development of Version 0 standards, new definitions have been developed and approved following NERC's Reliability Standards Development Process, and added to this glossary following board adoption, with the "FERC approved" date added following a final Order approving the definition.

Immediately under each term is a link to the archive for the development of that term.

Definitions that have been adopted by the NERC Board of Trustees but have not been approved by FERC, or FERC has not approved but has directed be modified, are shaded in blue. Definitions that have been remanded or retired are shaded in orange.

Any comments regarding this glossary should be reported to the following: sarcomm@nerc.com with "Glossary Comment" in the subject line.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Adequacy [Archive]		2/8/2005	3/16/2007	The ability of the electric system to supply the aggregate electrical demand and energy requirements of the end-use customers at all times, taking into account scheduled and reasonably expected unscheduled outages of system elements.
Adjacent Balancing Authority [Archive]		2/8/2005	3/16/2007	A Balancing Authority Area that is interconnected another Balancing Authority Area either directly or via a multi-party agreement or transmission tariff.
Adverse Reliability Impact [Archive]		2/7/2006	3/16/2007	The impact of an event that results in frequency-related instability; unplanned tripping of load or generation; or uncontrolled separation or cascading outages that affects a widespread area of the Interconnection.
Adverse Reliability Impact [Archive]		8/4/2011		The impact of an event that results in Bulk Electric System instability or Cascading.
After the Fact [Archive]	ATF	10/29/2008	12/17/2009	A time classification assigned to an RFI when the submittal time is greater than one hour after the start time of the RFI.
Agreement [Archive]		2/8/2005	3/16/2007	A contract or arrangement, either written or verbal and sometimes enforceable by law.
Altitude Correction Factor [Archive]		2/7/2006	3/16/2007	A multiplier applied to specify distances, which adjusts the distances to account for the change in relative air density (RAD) due to altitude from the RAD used to determine the specified distance. Altitude correction factors apply to both minimum worker approach distances and to minimum vegetation clearance distances.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Ancillary Service [Archive]		2/8/2005	3/16/2007	Those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Service Provider's transmission system in accordance with good utility practice. (*From FERC order 888-A.*)
Anti-Aliasing Filter [Archive]		2/8/2005	3/16/2007	An analog filter installed at a metering point to remove the high frequency components of the signal over the AGC sample period.
Area Control Error [Archive]	ACE	2/8/2005	3/16/2007	The instantaneous difference between a Balancing Authority's net actual and scheduled interchange, taking into account the effects of Frequency Bias and correction for meter error.
Area Interchange Methodology [Archive]		08/22/2008	11/24/2009	The Area Interchange methodology is characterized by determination of incremental transfer capability via simulation, from which Total Transfer Capability (TTC) can be mathematically derived. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from the TTC, and Postbacks and counterflows are added, to derive Available Transfer Capability. Under the Area Interchange Methodology, TTC results are generally reported on an area to area basis.
Arranged Interchange [Archive]		5/2/2006	3/16/2007	The state where the Interchange Authority has received the Interchange information (initial or revised).
Automatic Generation Control [Archive]	AGC	2/8/2005	3/16/2007	Equipment that automatically adjusts generation in a Balancing Authority Area from a central location to maintain the Balancing Authority's interchange schedule plus Frequency Bias. AGC may also accommodate automatic inadvertent payback and time error correction.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
Available Flowgate Capability [Archive]	AFC	08/22/2008	11/24/2009	A measure of the flow capability remaining on a Flowgate for further commercial activity over and above already committed uses. It is defined as TFC less Existing Transmission Commitments (ETC), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, and plus counterflows.
Available Transfer Capability [Archive]	ATC	2/8/2005	3/16/2007	A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less existing transmission commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin.
Available Transfer Capability [Archive]	ATC	08/22/2008	11/24/2009	A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. It is defined as Total Transfer Capability less Existing Transmission Commitments (including retail customer service), less a Capacity Benefit Margin, less a Transmission Reliability Margin, plus Postbacks, plus counterflows.
Available Transfer Capability Implementation Document [Archive]	ATCID	08/22/2008	11/24/2009	A document that describes the implementation of a methodology for calculating ATC or AFC, and provides information related to a Transmission Service Provider's calculation of ATC or AFC.

Continent-wide Term	Acronym	BOT Approval Date	FERC Approval Date	Definition
ATC Path [Archive]		08/22/2008	Not approved; Modification directed 11/24/09	Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path[1].

[1] See 18 CFR 37.6(b)(1)

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Balancing Authority [Archive]	BA	2/8/2005	3/16/2007	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports Interconnection frequency in real time.
Balancing Authority Area [Archive]		2/8/2005	3/16/2007	The collection of generation, transmission, and loads within the metered boundaries of the Balancing Authority. The Balancing Authority maintains load-resource balance within this area.
Base Load [Archive]		2/8/2005	3/16/2007	The minimum amount of electric power delivered or required over a given period at a constant rate.
Blackstart Capability Plan [Archive]		2/8/2005 Will be retired when EOP-005-2 becomes enforceable on (7/1/13)	3/16/2007	A documented procedure for a generating unit or station to go from a shutdown condition to an operating condition delivering electric power without assistance from the electric system. This procedure is only a portion of an overall system restoration plan.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Blackstart Resource [Archive]		8/5/2009	3/17/11	A generating unit(s) and its associated set of equipment which has the ability to be started without support from the System or is designed to remain energized without connection to the remainder of the System, with the ability to energize a bus, meeting the Transmission Operator's restoration plan needs for real and reactive power capability, frequency and voltage control, and that has been included in the Transmission Operator's restoration plan.
Block Dispatch [Archive]		08/22/2008	11/24/2009	A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, the capacity of a given generator is segmented into loadable "blocks," each of which is grouped and ordered relative to other blocks (based on characteristics including, but not limited to, efficiency, run of river or fuel supply considerations, and/or "must-run" status).
Bulk Electric System [Archive]	BES	2/8/2005	3/16/2007	As defined by the Regional Reliability Organization, the electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not included in this definition.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Burden [Archive]		2/8/2005	3/16/2007	Operation of the Bulk Electric System that violates or is expected to violate a System Operating Limit or Interconnection Reliability Operating Limit in the Interconnection, or that violates any other NERC, Regional Reliability Organization, or local operating reliability standards or criteria.
Business Practices [Archive]		8/22/2008	Not approved; Modification directed 11/24/09	Those business rules contained in the Transmission Service Provider's applicable tariff, rules, or procedures; associated Regional Reliability Organization or regional entity business practices; or NAESB Business Practices.
Bus-tie Breaker [Archive]		8/4/2011		A circuit breaker that is positioned to connect two individual substation bus configurations.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Capacity Benefit Margin [Archive]	CBM	2/8/2005	3/16/2007	The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs), whose loads are located on that Transmission Service Provider's system, to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.
Capacity Benefit Margin Implementation Document [Archive]	CBMID	11/13/2008	11/24/2009	A document that describes the implementation of a Capacity Benefit Margin methodology.
Capacity Emergency [Archive]		2/8/2005	3/16/2007	A capacity emergency exists when a Balancing Authority Area's operating capacity, plus firm purchases from other systems, to the extent available or limited by transfer capability, is inadequate to meet its demand plus its regulating requirements.
Cascading [Archive]		2/8/2005	3/16/2007	The uncontrolled successive loss of system elements triggered by an incident at any location. Cascading results in widespread electric service interruption that cannot be restrained from sequentially spreading beyond an area predetermined by studies.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Cascading Outages [Archive]		11/1/2006 Withdrawn 2/12/2008	FERC Remanded 12/27/2007	~~The uncontrolled successive loss of Bulk Electric System Facilities triggered by an incident (or condition) at any location resulting in the interruption of electric service that cannot be restrained from spreading beyond a pre-determined area.~~
Clock Hour [Archive]		2/8/2005	3/16/2007	The 60-minute period ending at :00. All surveys, measurements, and reports are based on Clock Hour periods unless specifically noted.
Cogeneration [Archive]		2/8/2005	3/16/2007	Production of electricity from steam, heat, or other forms of energy produced as a by-product of another process.
Compliance Monitor [Archive]		2/8/2005	3/16/2007	The entity that monitors, reviews, and ensures compliance of responsible entities with reliability standards.
Confirmed Interchange [Archive]		5/2/2006	3/16/2007	The state where the Interchange Authority has verified the Arranged Interchange.
Congestion Management Report [Archive]		2/8/2005	3/16/2007	A report that the Interchange Distribution Calculator issues when a Reliability Coordinator initiates the Transmission Loading Relief procedure. This report identifies the transactions and native and network load curtailments that must be initiated to achieve the loading relief requested by the initiating Reliability Coordinator.
Consequential Load Loss [Archive]		8/4/2011		All Load that is no longer served by the Transmission system as a result of Transmission Facilities being removed from service by a Protection System operation designed to isolate the fault.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Constrained Facility [Archive]		2/8/2005	3/16/2007	A transmission facility (line, transformer, breaker, etc.) that is approaching, is at, or is beyond its System Operating Limit or Interconnection Reliability Operating Limit.
Contingency [Archive]		2/8/2005	3/16/2007	The unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element.
Contingency Reserve [Archive]		2/8/2005	3/16/2007	The provision of capacity deployed by the Balancing Authority to meet the Disturbance Control Standard (DCS) and other NERC and Regional Reliability Organization contingency requirements.
Contract Path [Archive]		2/8/2005	3/16/2007	An agreed upon electrical path for the continuous flow of electrical power between the parties of an Interchange Transaction.
Control Performance Standard [Archive]	CPS	2/8/2005	3/16/2007	The reliability standard that sets the limits of a Balancing Authority's Area Control Error over a specified time period.
Corrective Action Plan [Archive]		2/7/2006	3/16/2007	A list of actions and an associated timetable for implementation to remedy a specific problem.
Cranking Path [Archive]		5/2/2006	3/16/2007	A portion of the electric system that can be isolated and then energized to deliver electric power from a generation source to enable the startup of one or more other generating units.
Critical Assets [Archive]		5/2/2006	1/18/2008	Facilities, systems, and equipment which, if destroyed, degraded, or otherwise rendered unavailable, would affect the reliability or operability of the Bulk Electric System.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Critical Cyber Assets [Archive]		5/2/2006	1/18/2008	Cyber Assets essential to the reliable operation of Critical Assets.
Curtailment [Archive]		2/8/2005	3/16/2007	A reduction in the scheduled capacity or energy delivery of an Interchange Transaction.
Curtailment Threshold [Archive]		2/8/2005	3/16/2007	The minimum Transfer Distribution Factor which, if exceeded, will subject an Interchange Transaction to curtailment to relieve a transmission facility constraint.
Cyber Assets [Archive]		5/2/2006	1/18/2008	Programmable electronic devices and communication networks including hardware, software, and data.
Cyber Security Incident [Archive]		5/2/2006	1/18/2008	Any malicious act or suspicious event that: • Compromises, or was an attempt to compromise, the Electronic Security Perimeter or Physical Security Perimeter of a Critical Cyber Asset, or, • Disrupts, or was an attempt to disrupt, the operation of a Critical Cyber Asset.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Delayed Fault Clearing [Archive]		11/1/2006	12/27/2007	Fault clearing consistent with correct operation of a breaker failure protection system and its associated breakers, or of a backup protection system with an intentional time delay.
Demand [Archive]		2/8/2005	3/16/2007	1. The rate at which electric energy is delivered to or by a system or part of a system, generally expressed in kilowatts or megawatts, at a given instant or averaged over any designated interval of time. 2. The rate at which energy is being used by the customer.
Demand-Side Management [Archive]	DSM	2/8/2005	3/16/2007	The term for all activities or programs undertaken by Load-Serving Entity or its customers to influence the amount or timing of electricity they use.
Direct Control Load Management [Archive]	DCLM	2/8/2005	3/16/2007	Demand-Side Management that is under the direct control of the system operator. DCLM may control the electric supply to individual appliances or equipment on customer premises. DCLM as defined here does not include Interruptible Demand.
Dispatch Order [Archive]		08/22/2008	11/24/2009	A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, each generator is ranked by priority.
Dispersed Load by Substations [Archive]		2/8/2005	3/16/2007	Substation load information configured to represent a system for power flow or system dynamics modeling purposes, or both.
Distribution Factor [Archive]	DF	2/8/2005	3/16/2007	The portion of an Interchange Transaction, typically expressed in per unit that flows across a transmission facility (Flowgate).

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Distribution Provider [Archive]	DP	2/8/2005	3/16/2007	Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the Distribution function at any voltage.
Disturbance [Archive]		2/8/2005	3/16/2007	1. An unplanned event that produces an abnormal system condition. 2. Any perturbation to the electric system. 3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.
Disturbance Control Standard [Archive]	DCS	2/8/2005	3/16/2007	The reliability standard that sets the time limit following a Disturbance within which a Balancing Authority must return its Area Control Error to within a specified range.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Disturbance Monitoring Equipment [Archive]	DME	8/2/2006	3/16/2007	Devices capable of monitoring and recording system data pertaining to a Disturbance. Such devices include the following categories of recorders[2]: • Sequence of event recorders which record equipment response to the event • Fault recorders, which record actual waveform data replicating the system primary voltages and currents. This may include protective relays. • Dynamic Disturbance Recorders (DDRs), which record incidents that portray power system behavior during dynamic events such as low-frequency (0.1 Hz – 3 Hz) oscillations and abnormal frequency or voltage excursions
Dynamic Interchange Schedule or Dynamic Schedule [Archive]		2/8/2005	3/16/2007	A telemetered reading or value that is updated in real time and used as a schedule in the AGC/ACE equation and the integrated value of which is treated as a schedule for interchange accounting purposes. Commonly used for scheduling jointly owned generation to or from another Balancing Authority Area.
Dynamic Transfer [Archive]		2/8/2005	3/16/2007	The provision of the real-time monitoring, telemetering, computer software, hardware, communications, engineering, energy accounting (including inadvertent interchange), and administration required to electronically move all or a portion of the real energy services associated with a generator or load out of one Balancing Authority Area into another.

[2] Phasor Measurement Units and any other equipment that meets the functional requirements of DMEs may qualify as DMEs.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Economic Dispatch [Archive]		2/8/2005	3/16/2007	The allocation of demand to individual generating units on line to effect the most economical production of electricity.
Electrical Energy [Archive]		2/8/2005	3/16/2007	The generation or use of electric power by a device over a period of time, expressed in kilowatthours (kWh), megawatthours (MWh), or gigawatthours (GWh).
Electronic Security Perimeter [Archive]	ESP	5/2/2006	1/18/2008	The logical border surrounding a network to which Critical Cyber Assets are connected and for which access is controlled.
Element [Archive]		2/8/2005	3/16/2007	Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components.
Emergency or BES Emergency [Archive]		2/8/2005	3/16/2007	Any abnormal system condition that requires automatic or immediate manual action to prevent or limit the failure of transmission facilities or generation supply that could adversely affect the reliability of the Bulk Electric System.
Emergency Rating [Archive]		2/8/2005	3/16/2007	The rating as defined by the equipment owner that specifies the level of electrical loading or output, usually expressed in megawatts (MW) or Mvar or other appropriate units, that a system, facility, or element can support, produce, or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.
Emergency Request for Interchange [Archive]	Emergency RFI	10/29/2008	12/17/2009	Request for Interchange to be initiated for Emergency or Energy Emergency conditions.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Energy Emergency [Archive]		2/8/2005	3/16/2007	A condition when a Load-Serving Entity has exhausted all other options and can no longer provide its customers' expected energy requirements.
Equipment Rating [Archive]		2/7/2006	3/16/2007	The maximum and minimum voltage, current, frequency, real and reactive power flows on individual equipment under steady state, short-circuit and transient conditions, as permitted or assigned by the equipment owner.
Existing Transmission Commitments [Archive]	ETC	08/22/2008	11/24/2009	Committed uses of a Transmission Service Provider's Transmission system considered when determining ATC or AFC.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Facility [Archive]		2/7/2006	3/16/2007	A set of electrical equipment that operates as a single Bulk Electric System Element (e.g., a line, a generator, a shunt compensator, transformer, etc.)
Facility Rating [Archive]		2/8/2005	3/16/2007	The maximum or minimum voltage, current, frequency, or real or reactive power flow through a facility that does not violate the applicable equipment rating of any equipment comprising the facility.
Fault [Archive]		2/8/2005	3/16/2007	An event occurring on an electric system such as a short circuit, a broken wire, or an intermittent connection.
Fire Risk [Archive]		2/7/2006	3/16/2007	The likelihood that a fire will ignite or spread in a particular geographic area.
Firm Demand [Archive]		2/8/2005	3/16/2007	That portion of the Demand that a power supplier is obligated to provide except when system reliability is threatened or during emergency conditions.
Firm Transmission Service [Archive]		2/8/2005	3/16/2007	The highest quality (priority) service offered to customers under a filed rate schedule that anticipates no planned interruption.
Flashover [Archive]		2/7/2006	3/16/2007	An electrical discharge through air around or over the surface of insulation, between objects of different potential, caused by placing a voltage across the air space that results in the ionization of the air space.
Flowgate [Archive]		2/8/2005	3/16/2007	A designated point on the transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Flowgate [Archive]		08/22/2008	11/24/2009	1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System.
Flowgate Methodology [Archive]		08/22/2008	11/24/2009	The Flowgate methodology is characterized by identification of key Facilities as Flowgates. Total Flowgate Capabilities are determined based on Facility Ratings and voltage and stability limits. The impacts of Existing Transmission Commitments (ETCs) are determined by simulation. The impacts of ETC, Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) are subtracted from the Total Flowgate Capability, and Postbacks and counterflows are added, to determine the Available Flowgate Capability (AFC) value for that Flowgate. AFCs can be used to determine Available Transfer Capability (ATC).
Forced Outage [Archive]		2/8/2005	3/16/2007	1. The removal from service availability of a generating unit, transmission line, or other facility for emergency reasons. 2. The condition in which the equipment is unavailable due to unanticipated failure.
Frequency Bias [Archive]		2/8/2005	3/16/2007	A value, usually expressed in megawatts per 0.1 Hertz (MW/0.1 Hz), associated with a Balancing Authority Area that approximates the Balancing Authority Area's response to Interconnection frequency error.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Frequency Bias Setting [Archive]		2/8/2005	3/16/2007	A value, usually expressed in MW/0.1 Hz, set into a Balancing Authority ACE algorithm that allows the Balancing Authority to contribute its frequency response to the Interconnection.
Frequency Deviation [Archive]		2/8/2005	3/16/2007	A change in Interconnection frequency.
Frequency Error [Archive]		2/8/2005	3/16/2007	The difference between the actual and scheduled frequency. ($F_A - F_S$)
Frequency Regulation [Archive]		2/8/2005	3/16/2007	The ability of a Balancing Authority to help the Interconnection maintain Scheduled Frequency. This assistance can include both turbine governor response and Automatic Generation Control.
Frequency Response [Archive]		2/8/2005	3/16/2007	(Equipment) The ability of a system or elements of the system to react or respond to a change in system frequency. (System) The sum of the change in demand, plus the change in generation, divided by the change in frequency, expressed in megawatts per 0.1 Hertz (MW/0.1 Hz).

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Generator Operator [Archive]	GOP	2/8/2005	3/16/2007	The entity that operates generating unit(s) and performs the functions of supplying energy and Interconnected Operations Services.
Generator Owner [Archive]	GO	2/8/2005	3/16/2007	Entity that owns and maintains generating units.
Generator Shift Factor [Archive]	GSF	2/8/2005	3/16/2007	A factor to be applied to a generator's expected change in output to determine the amount of flow contribution that change in output will impose on an identified transmission facility or Flowgate.
Generator-to-Load Distribution Factor [Archive]	GLDF	2/8/2005	3/16/2007	The algebraic sum of a Generator Shift Factor and a Load Shift Factor to determine the total impact of an Interchange Transaction on an identified transmission facility or Flowgate.
Generation Capability Import Requirement [Archive]	GCIR	11/13/2008	11/24/2009	The amount of generation capability from external sources identified by a Load-Serving Entity (LSE) or Resource Planner (RP) to meet its generation reliability or resource adequacy requirements as an alternative to internal resources.
Host Balancing Authority [Archive]		2/8/2005	3/16/2007	1. A Balancing Authority that confirms and implements Interchange Transactions for a Purchasing Selling Entity that operates generation or serves customers directly within the Balancing Authority's metered boundaries. 2. The Balancing Authority within whose metered boundaries a jointly owned unit is physically located.
Hourly Value [Archive]		2/8/2005	3/16/2007	Data measured on a Clock Hour basis.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Implemented Interchange [Archive]		5/2/2006	3/16/2007	The state where the Balancing Authority enters the Confirmed Interchange into its Area Control Error equation.
Inadvertent Interchange [Archive]		2/8/2005	3/16/2007	The difference between the Balancing Authority's Net Actual Interchange and Net Scheduled Interchange. ($I_A - I_S$)
Independent Power Producer [Archive]	IPP	2/8/2005	3/16/2007	Any entity that owns or operates an electricity generating facility that is not included in an electric utility's rate base. This term includes, but is not limited to, cogenerators and small power producers and all other nonutility electricity producers, such as exempt wholesale generators, who sell electricity.
Institute of Electrical and Electronics Engineers, Inc. [Archive]	IEEE	2/7/2006	3/16/2007	
Interchange [Archive]		5/2/2006	3/16/2007	Energy transfers that cross Balancing Authority boundaries.
Interchange Authority [Archive]	IA	5/2/2006	3/16/2007	The responsible entity that authorizes implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communication of Interchange information for reliability assessment purposes.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Interchange Distribution Calculator [Archive]	IDC	2/8/2005	3/16/2007	The mechanism used by Reliability Coordinators in the Eastern Interconnection to calculate the distribution of Interchange Transactions over specific Flowgates. It includes a database of all Interchange Transactions and a matrix of the Distribution Factors for the Eastern Interconnection.
Interchange Schedule [Archive]		2/8/2005	3/16/2007	An agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction.
Interchange Transaction [Archive]		2/8/2005	3/16/2007	An agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority Area boundaries.
Interchange Transaction Tag or Tag [Archive]		2/8/2005	3/16/2007	The details of an Interchange Transaction required for its physical implementation.
Interconnected Operations Service [Archive]		2/8/2005	3/16/2007	A service (exclusive of basic energy and transmission services) that is required to support the reliable operation of interconnected Bulk Electric Systems.
Interconnection [Archive]		2/8/2005	3/16/2007	When capitalized, any one of the three major electric system networks in North America: Eastern, Western, and ERCOT.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Interconnection Reliability Operating Limit [Archive]	IROL	2/8/2005	3/16/2007 Retired 12/27/2007	The value (such as MW, MVar, Amperes, Frequency or Volts) derived from, or a subset of the System Operating Limits, which if exceeded, could expose a widespread area of the Bulk Electric System to instability, uncontrolled separation(s) or cascading outages.
Interconnection Reliability Operating Limit [Archive]	IROL	11/1/2006	12/27/2007	A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages[3] that adversely impact the reliability of the Bulk Electric System.
Interconnection Reliability Operating Limit T_v [Archive]	IROL T_v	11/1/2006	12/27/2007	The maximum time that an Interconnection Reliability Operating Limit can be violated before the risk to the interconnection or other Reliability Coordinator Area(s) becomes greater than acceptable. Each Interconnection Reliability Operating Limit's T_v shall be less than or equal to 30 minutes.
Intermediate Balancing Authority [Archive]		2/8/2005	3/16/2007	A Balancing Authority Area that has connecting facilities in the Scheduling Path between the Sending Balancing Authority Area and Receiving Balancing Authority Area and operating agreements that establish the conditions for the use of such facilities
Interruptible Load or Interruptible Demand [Archive]		11/1/2006	3/16/2007	Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment.

[3] On September 13, 2012, FERC issued an Order approving NERC's request to modify the reference to "Cascading Outages" to "Cascading outages" within the definition of IROL due to the fact that the definition of "Cascading Outages" was previously remanded by FERC.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Joint Control [Archive]		2/8/2005	3/16/2007	Automatic Generation Control of jointly owned units by two or more Balancing Authorities.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Limiting Element [Archive]		2/8/2005	3/16/2007	The element that is 1.)Either operating at its appropriate rating, or 2,) Would be following the limiting contingency. Thus, the Limiting Element establishes a system limit.
Load [Archive]		2/8/2005	3/16/2007	An end-use device or customer that receives power from the electric system.
Load Shift Factor [Archive]	LSF	2/8/2005	3/16/2007	A factor to be applied to a load's expected change in demand to determine the amount of flow contribution that change in demand will impose on an identified transmission facility or monitored Flowgate.
Load-Serving Entity [Archive]	LSE	2/8/2005	3/16/2007	Secures energy and transmission service (and related Interconnected Operations Services) to serve the electrical demand and energy requirements of its end-use customers.
Long-Term Transmission Planning Horizon [Archive]		8/4/2011		Transmission planning period that covers years six through ten or beyond when required to accommodate any known longer lead time projects that may take longer than ten years to complete.
Market Flow [Archive]		11/4/2010	4/21/2011	The total amount of power flowing across a specified Facility or set of Facilities due to a market dispatch of generation internal to the market to serve load internal to the market.
Minimum Vegetation Clearance Distance [Archive]	MVCD	11/3/2011		The calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Misoperation [Archive]		2/7/2006	3/16/2007	• Any failure of a Protection System element to operate within the specified time when a fault or abnormal condition occurs within a zone of protection. • Any operation for a fault not within a zone of protection (other than operation as backup protection for a fault in an adjacent zone that is not cleared within a specified time for the protection for that zone). • Any unintentional Protection System operation when no fault or other abnormal condition has occurred unrelated to on-site maintenance and testing activity.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Native Load [Archive]		2/8/2005	3/16/2007	The end-use customers that the Load-Serving Entity is obligated to serve.
Near-Term Transmission Planning Horizon [Archive]		1/24/2011	11/17/2011	The transmission planning period that covers Year One through five.
Net Actual Interchange [Archive]		2/8/2005	3/16/2007	The algebraic sum of all metered interchange over all interconnections between two physically Adjacent Balancing Authority Areas.
Net Energy for Load [Archive]		2/8/2005	3/16/2007	Net Balancing Authority Area generation, plus energy received from other Balancing Authority Areas, less energy delivered to Balancing Authority Areas through interchange. It includes Balancing Authority Area losses but excludes energy required for storage at energy storage facilities.
Net Interchange Schedule [Archive]		2/8/2005	3/16/2007	The algebraic sum of all Interchange Schedules with each Adjacent Balancing Authority.
Net Scheduled Interchange [Archive]		2/8/2005	3/16/2007	The algebraic sum of all Interchange Schedules across a given path or between Balancing Authorities for a given period or instant in time.
Network Integration Transmission Service [Archive]		2/8/2005	3/16/2007	Service that allows an electric transmission customer to integrate, plan, economically dispatch and regulate its network reserves in a manner comparable to that in which the Transmission Owner serves Native Load customers.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Non-Consequential Load Loss [Archive]		8/4/2011		Non-Interruptible Load loss that does not include: (1) Consequential Load Loss, (2) the response of voltage sensitive Load, or (3) Load that is disconnected from the System by end-user equipment.
Non-Firm Transmission Service [Archive]		2/8/2005	3/16/2007	Transmission service that is reserved on an as-available basis and is subject to curtailment or interruption.
Non-Spinning Reserve [Archive]		2/8/2005	3/16/2007	1. That generating reserve not connected to the system but capable of serving demand within a specified time. 2. Interruptible load that can be removed from the system in a specified time.
Normal Clearing [Archive]		11/1/2006	12/27/2007	A protection system operates as designed and the fault is cleared in the time normally expected with proper functioning of the installed protection systems.
Normal Rating [Archive]		2/8/2005	3/16/2007	The rating as defined by the equipment owner that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or element can support or withstand through the daily demand cycles without loss of equipment life.
Nuclear Plant Generator Operator [Archive]		5/2/2007	10/16/2008	Any Generator Operator or Generator Owner that is a Nuclear Plant Licensee responsible for operation of a nuclear facility licensed to produce commercial power.
Nuclear Plant Off-site Power Supply (Off-site Power) [Archive]		5/2/2007	10/16/2008	The electric power supply provided from the electric system to the nuclear power plant distribution system as required per the nuclear power plant license.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Nuclear Plant Licensing Requirements [Archive]	NPLRs	5/2/2007	10/16/2008	Requirements included in the design basis of the nuclear plant and statutorily mandated for the operation of the plant, including nuclear power plant licensing requirements for: 1) Off-site power supply to enable safe shutdown of the plant during an electric system or plant event; and 2) Avoiding preventable challenges to nuclear safety as a result of an electric system disturbance, transient, or condition.
Nuclear Plant Interface Requirements [Archive]	NPIRs	5/2/2007	10/16/2008	The requirements based on NPLRs and Bulk Electric System requirements that have been mutually agreed to by the Nuclear Plant Generator Operator and the applicable Transmission Entities.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Off-Peak [Archive]		2/8/2005	3/16/2007	Those hours or other periods defined by NAESB business practices, contract, agreements, or guides as periods of lower electrical demand.
On-Peak [Archive]		2/8/2005	3/16/2007	Those hours or other periods defined by NAESB business practices, contract, agreements, or guides as periods of higher electrical demand.
Open Access Same Time Information Service [Archive]	OASIS	2/8/2005	3/16/2007	An electronic posting system that the Transmission Service Provider maintains for transmission access data and that allows all transmission customers to view the data simultaneously.
Open Access Transmission Tariff [Archive]	OATT	2/8/2005	3/16/2007	Electronic transmission tariff accepted by the U.S. Federal Energy Regulatory Commission requiring the Transmission Service Provider to furnish to all shippers with non-discriminating service comparable to that provided by Transmission Owners to themselves.
Operating Plan [Archive]		2/7/2006	3/16/2007	A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Operating Procedure [Archive]		2/7/2006	3/16/2007	A document that identifies specific steps or tasks that should be taken by one or more specific operating positions to achieve specific operating goal(s). The steps in an Operating Procedure should be followed in the order in which they are presented, and should be performed by the position(s) identified. A document that lists the specific steps for a system operator to take in removing a specific transmission line from service is an example of an Operating Procedure.
Operating Process [Archive]		2/7/2006	3/16/2007	A document that identifies general steps for achieving a generic operating goal. An Operating Process includes steps with options that may be selected depending upon Real-time conditions. A guideline for controlling high voltage is an example of an Operating Process.
Operating Reserve [Archive]		2/8/2005	3/16/2007	That capability above firm system demand required to provide for regulation, load forecasting error, equipment forced and scheduled outages and local area protection. It consists of spinning and non-spinning reserve.
Operating Reserve – Spinning [Archive]		2/8/2005	3/16/2007	The portion of Operating Reserve consisting of: • Generation synchronized to the system and fully available to serve load within the Disturbance Recovery Period following the contingency event; or • Load fully removable from the system within the Disturbance Recovery Period following the contingency event.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Operating Reserve – Supplemental [Archive]		2/8/2005	3/16/2007	The portion of Operating Reserve consisting of: • Generation (synchronized or capable of being synchronized to the system) that is fully available to serve load within the Disturbance Recovery Period following the contingency event; or • Load fully removable from the system within the Disturbance Recovery Period following the contingency event.
Operating Voltage [Archive]		2/7/2006	3/16/2007	The voltage level by which an electrical system is designated and to which certain operating characteristics of the system are related; also, the effective (root-mean-square) potential difference between any two conductors or between a conductor and the ground. The actual voltage of the circuit may vary somewhat above or below this value.
Operational Planning Analysis [Archive]		10/17/2008	3/17/2011	An analysis of the expected system conditions for the next day's operation. (That analysis may be performed either a day ahead or as much as 12 months ahead.) Expected system conditions include things such as load forecast(s), generation output levels, and known system constraints (transmission facility outages, generator outages, equipment limitations, etc.).
Outage Transfer Distribution Factor [Archive]	OTDF	8/22/2008	11/24/2009	In the post-contingency configuration of a system under study, the electric Power Transfer Distribution Factor (PTDF) with one or more system Facilities removed from service (outaged).

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Overlap Regulation Service [Archive]		2/8/2005	3/16/2007	A method of providing regulation service in which the Balancing Authority providing the regulation service incorporates another Balancing Authority's actual interchange, frequency response, and schedules into providing Balancing Authority's AGC/ACE equation.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Participation Factors [Archive]		8/22/2008	11/24/2009	A set of dispatch rules such that given a specific amount of load to serve, an approximate generation dispatch can be determined. To accomplish this, generators are assigned a percentage that they will contribute to serve load.
Peak Demand [Archive]		2/8/2005	3/16/2007	1. The highest hourly integrated Net Energy For Load within a Balancing Authority Area occurring within a given period (e.g., day, month, season, or year). 2. The highest instantaneous demand within the Balancing Authority Area.
Performance-Reset Period [Archive]		2/7/2006	3/16/2007	The time period that the entity being assessed must operate without any violations to reset the level of non compliance to zero.
Physical Security Perimeter [Archive]	PSP	5/2/2006	1/18/2008	The physical, completely enclosed ("six-wall") border surrounding computer rooms, telecommunications rooms, operations centers, and other locations in which Critical Cyber Assets are housed and for which access is controlled.
Planning Assessment [Archive]		8/4/2011		Documented evaluation of future Transmission system performance and Corrective Action Plans to remedy identified deficiencies.
Planning Authority [Archive]	PA	2/8/2005	3/16/2007	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.
Planning Coordinator [Archive]	PC	8/22/2008	11/24/2009	See Planning Authority.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Point of Delivery [Archive]	POD	2/8/2005	3/16/2007	A location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction leaves or a Load-Serving Entity receives its energy.
Point of Receipt [Archive]	POR	2/8/2005	3/16/2007	A location that the Transmission Service Provider specifies on its transmission system where an Interchange Transaction enters or a Generator delivers its output.
Point to Point Transmission Service [Archive]	PTP	2/8/2005	3/16/2007	The reservation and transmission of capacity and energy on either a firm or non-firm basis from the Point(s) of Receipt to the Point(s) of Delivery.
Postback [Archive]		08/22/2008	Not approved; Modification directed 11/24/09	Positive adjustments to ATC or AFC as defined in Business Practices. Such Business Practices may include processing of redirects and unscheduled service.
Power Transfer Distribution Factor [Archive]	PTDF	08/22/2008	11/24/2009	In the pre-contingency configuration of a system under study, a measure of the responsiveness or change in electrical loadings on transmission system Facilities due to a change in electric power transfer from one area to another, expressed in percent (up to 100%) of the change in power transfer
Pro Forma Tariff [Archive]		2/8/2005	3/16/2007	Usually refers to the standard OATT and/or associated transmission rights mandated by the U.S. Federal Energy Regulatory Commission Order No. 888.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Protection System [Archive]		2/7/2006	3/17/2007 Will be retired 4/1/2013	Protective relays, associated communication systems, voltage and current sensing devices, station batteries and DC control circuitry.
Protection System[4] [Archive] [Implementation Plan]		11/19/2010	2/3/2012	Protection System – • Protective relays which respond to electrical quantities, • Communications systems necessary for correct operation of protective functions • Voltage and current sensing devices providing inputs to protective relays, • Station dc supply associated with protective functions (including batteries, battery chargers, and non-battery-based dc supply), and • Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.
Pseudo-Tie [Archive]		2/8/2005	3/16/2007	A telemetered reading or value that is updated in real time and used as a "virtual" tie line flow in the AGC/ACE equation but for which no physical tie or energy metering actually exists. The integrated value is used as a metered MWh value for interchange accounting purposes.

[4] This term becomes effective on April 1, 2013.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Purchasing-Selling Entity [Archive]	PSE	2/8/2005	3/16/2007	The entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services. Purchasing-Selling Entities may be affiliated or unaffiliated merchants and may or may not own generating facilities.
Ramp Rate or Ramp [Archive]		2/8/2005	3/16/2007	(Schedule) The rate, expressed in megawatts per minute, at which the interchange schedule is attained during the ramp period. (Generator) The rate, expressed in megawatts per minute, that a generator changes its output.
Rated Electrical Operating Conditions [Archive]		2/7/2006	3/16/2007	The specified or reasonably anticipated conditions under which the electrical system or an individual electrical circuit is intend/designed to operate
Rating [Archive]		2/8/2005	3/16/2007	The operational limits of a transmission system element under a set of specified conditions.
Rated System Path Methodology [Archive]		08/22/2008	11/24/2009	The Rated System Path Methodology is characterized by an initial Total Transfer Capability (TTC), determined via simulation. Capacity Benefit Margin, Transmission Reliability Margin, and Existing Transmission Commitments are subtracted from TTC, and Postbacks and counterflows are added as applicable, to derive Available Transfer Capability. Under the Rated System Path Methodology, TTC results are generally reported as specific transmission path capabilities.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Reactive Power [Archive]		2/8/2005	3/16/2007	The portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive losses on transmission facilities. Reactive power is provided by generators, synchronous condensers, or electrostatic equipment such as capacitors and directly influences electric system voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar).
Real Power [Archive]		2/8/2005	3/16/2007	The portion of electricity that supplies energy to the load.
Reallocation [Archive]		2/8/2005	3/16/2007	The total or partial curtailment of Transactions during TLR Level 3a or 5a to allow Transactions using higher priority to be implemented.
Real-time [Archive]		2/7/2006	3/16/2007	Present time as opposed to future time. (From Interconnection Reliability Operating Limits standard.)
Real-time Assessment [Archive]		10/17/2008	3/17/2011	An examination of existing and expected system conditions, conducted by collecting and reviewing immediately available data
Receiving Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority importing the Interchange.
Regional Reliability Organization [Archive]	RRO	2/8/2005	3/16/2007	1. An entity that ensures that a defined area of the Bulk Electric System is reliable, adequate and secure. 2. A member of the North American Electric Reliability Council. The Regional Reliability Organization can serve as the Compliance Monitor.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Regional Reliability Plan [Archive]		2/8/2005	3/16/2007	The plan that specifies the Reliability Coordinators and Balancing Authorities within the Regional Reliability Organization, and explains how reliability coordination will be accomplished.
Regulating Reserve [Archive]		2/8/2005	3/16/2007	An amount of reserve responsive to Automatic Generation Control, which is sufficient to provide normal regulating margin.
Regulation Service [Archive]		2/8/2005	3/16/2007	The process whereby one Balancing Authority contracts to provide corrective response to all or a portion of the ACE of another Balancing Authority. The Balancing Authority providing the response assumes the obligation of meeting all applicable control criteria as specified by NERC for itself and the Balancing Authority for which it is providing the Regulation Service.
Reliability Adjustment RFI [Archive]		10/29/2008	12/17/2009	Request to modify an Implemented Interchange Schedule for reliability purposes.
Reliability Coordinator [Archive]	RC	2/8/2005	3/16/2007	The entity that is the highest level of authority who is responsible for the reliable operation of the Bulk Electric System, has the Wide Area view of the Bulk Electric System, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The Reliability Coordinator has the purview that is broad enough to enable the calculation of Interconnection Reliability Operating Limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Reliability Coordinator Area [Archive]		2/8/2005	3/16/2007	The collection of generation, transmission, and loads within the boundaries of the Reliability Coordinator. Its boundary coincides with one or more Balancing Authority Areas.
Reliability Coordinator Information System [Archive]	RCIS	2/8/2005	3/16/2007	The system that Reliability Coordinators use to post messages and share operating information in real time.
Reliability Directive [Archive]		8/16/2012		A communication initiated by a Reliability Coordinator, Transmission Operator, or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.
Remedial Action Scheme [Archive]	RAS	2/8/2005	3/16/2007	See "Special Protection System"
Reportable Disturbance [Archive]		2/8/2005	3/16/2007	Any event that causes an ACE change greater than or equal to 80% of a Balancing Authority's or reserve sharing group's most severe contingency. The definition of a reportable disturbance is specified by each Regional Reliability Organization. This definition may not be retroactively adjusted in response to observed performance.
Request for Interchange [Archive]	RFI	5/2/2006	3/16/2007	A collection of data as defined in the NAESB RFI Datasheet, to be submitted to the Interchange Authority for the purpose of implementing bilateral Interchange between a Source and Sink Balancing Authority.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Reserve Sharing Group [Archive]	RSG	2/8/2005	3/16/2007	A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each Balancing Authority's use in recovering from contingencies within the group. Scheduling energy from an Adjacent Balancing Authority to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g., ten minutes). If the transaction is ramped in quicker (e.g., between zero and ten minutes) then, for the purposes of Disturbance Control Performance, the Areas become a Reserve Sharing Group.
Resource Planner [Archive]	RP	2/8/2005	3/16/2007	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a Planning Authority Area.
Response Rate [Archive]		2/8/2005	3/16/2007	The Ramp Rate that a generating unit can achieve under normal operating conditions expressed in megawatts per minute (MW/Min).
Right-of-Way [Archive]	ROW	2/7/2006	3/16/2007	A corridor of land on which electric lines may be located. The Transmission Owner may own the land in fee, own an easement, or have certain franchise, prescription, or license rights to construct and maintain lines.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Right-of-Way [Archive]	ROW	11/3/2011		The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the Transmission Owner's legal rights but may be less based on the aforementioned criteria.
Right-of-Way [Archive]	ROW	5/9/12		The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the applicable Transmission Owner's or applicable Generator Owner's legal rights but may be less based on the aforementioned criteria.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Scenario [Archive]		2/7/2006	3/16/2007	Possible event.
Schedule [Archive]		2/8/2005	3/16/2007	(Verb) To set up a plan or arrangement for an Interchange Transaction. (Noun) An Interchange Schedule.
Scheduled Frequency [Archive]		2/8/2005	3/16/2007	60.0 Hertz, except during a time correction.
Scheduling Entity [Archive]		2/8/2005	3/16/2007	An entity responsible for approving and implementing Interchange Schedules.
Scheduling Path [Archive]		2/8/2005	3/16/2007	The Transmission Service arrangements reserved by the Purchasing-Selling Entity for a Transaction.
Sending Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority exporting the Interchange.
Sink Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority in which the load (sink) is located for an Interchange Transaction. (This will also be a Receiving Balancing Authority for the resulting Interchange Schedule.)
Source Balancing Authority [Archive]		2/8/2005	3/16/2007	The Balancing Authority in which the generation (source) is located for an Interchange Transaction. (This will also be a Sending Balancing Authority for the resulting Interchange Schedule.)

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Special Protection System (Remedial Action Scheme) [Archive]	SPS	2/8/2005	3/16/2007	An automatic protection system designed to detect abnormal or predetermined system conditions, and take corrective actions other than and/or in addition to the isolation of faulted components to maintain system reliability. Such action may include changes in demand, generation (MW and Mvar), or system configuration to maintain system stability, acceptable voltage, or power flows. An SPS does not include (a) underfrequency or undervoltage load shedding or (b) fault conditions that must be isolated or (c) out-of-step relaying (not designed as an integral part of an SPS). Also called Remedial Action Scheme.
Spinning Reserve [Archive]		2/8/2005	3/16/2007	Unloaded generation that is synchronized and ready to serve additional demand.
Stability [Archive]		2/8/2005	3/16/2007	The ability of an electric system to maintain a state of equilibrium during normal and abnormal conditions or disturbances.
Stability Limit [Archive]		2/8/2005	3/16/2007	The maximum power flow possible through some particular point in the system while maintaining stability in the entire system or the part of the system to which the stability limit refers.
Supervisory Control and Data Acquisition [Archive]	SCADA	2/8/2005	3/16/2007	A system of remote control and telemetry used to monitor and control the transmission system.
Supplemental Regulation Service [Archive]		2/8/2005	3/16/2007	A method of providing regulation service in which the Balancing Authority providing the regulation service receives a signal representing all or a portion of the other Balancing Authority's ACE.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Surge [Archive]		2/8/2005	3/16/2007	A transient variation of current, voltage, or power flow in an electric circuit or across an electric system.
Sustained Outage [Archive]		2/7/2006	3/16/2007	The deenergized condition of a transmission line resulting from a fault or disturbance following an unsuccessful automatic reclosing sequence and/or unsuccessful manual reclosing procedure.
System [Archive]		2/8/2005	3/16/2007	A combination of generation, transmission, and distribution components.
System Operating Limit [Archive]	SOL	2/8/2005	3/16/2007	The value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to: • Facility Ratings (Applicable pre- and post-Contingency equipment or facility ratings) • Transient Stability Ratings (Applicable pre- and post-Contingency Stability Limits) • Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) • System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits)
System Operator [Archive]		2/8/2005	3/16/2007	An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Telemetering [Archive]		2/8/2005	3/16/2007	The process by which measurable electrical quantities from substations and generating stations are instantaneously transmitted to the control center, and by which operating commands from the control center are transmitted to the substations and generating stations.
Thermal Rating [Archive]		2/8/2005	3/16/2007	The maximum amount of electrical current that a transmission line or electrical facility can conduct over a specified time period before it sustains permanent damage by overheating or before it sags to the point that it violates public safety requirements.
Tie Line [Archive]		2/8/2005	3/16/2007	A circuit connecting two Balancing Authority Areas.
Tie Line Bias [Archive]		2/8/2005	3/16/2007	A mode of Automatic Generation Control that allows the Balancing Authority to 1.) maintain its Interchange Schedule and 2.) respond to Interconnection frequency error.
Time Error [Archive]		2/8/2005	3/16/2007	The difference between the Interconnection time measured at the Balancing Authority(ies) and the time specified by the National Institute of Standards and Technology. Time error is caused by the accumulation of Frequency Error over a given period.
Time Error Correction [Archive]		2/8/2005	3/16/2007	An offset to the Interconnection's scheduled frequency to return the Interconnection's Time Error to a predetermined value.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
TLR Log [Archive]		2/8/2005	3/16/2007	Report required to be filed after every TLR Level 2 or higher in a specified format. The NERC IDC prepares the report for review by the issuing Reliability Coordinator. After approval by the issuing Reliability Coordinator, the report is electronically filed in a public area of the NERC Web site.
Total Flowgate Capability [Archive]	TFC	08/22/2008	11/24/2009	The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.
Total Transfer Capability [Archive]	TTC	2/8/2005	3/16/2007	The amount of electric power that can be moved or transferred reliably from one area to another area of the interconnected transmission systems by way of all transmission lines (or paths) between those areas under specified system conditions.
Transaction [Archive]		2/8/2005	3/16/2007	See Interchange Transaction.
Transfer Capability [Archive]		2/8/2005	3/16/2007	The measure of the ability of interconnected electric systems to move or transfer power *in a reliable manner* from one area to another over all transmission lines (or paths) between those areas under specified system conditions. The units of transfer capability are in terms of electric power, generally expressed in megawatts (MW). The transfer capability from "Area A" to "Area B" is *not g*enerally equal to the transfer capability from "Area B" to "Area A."

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Transfer Distribution Factor [Archive]		2/8/2005	3/16/2007	See Distribution Factor.
Transmission [Archive]		2/8/2005	3/16/2007	An interconnected group of lines and associated equipment for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems.
Transmission Constraint [Archive]		2/8/2005	3/16/2007	A limitation on one or more transmission elements that may be reached during normal or contingency system operations.
Transmission Customer [Archive]		2/8/2005	3/16/2007	1. Any eligible customer (or its designated agent) that can or does execute a transmission service agreement or can or does receive transmission service. 2. Any of the following responsible entities: Generator Owner, Load-Serving Entity, or Purchasing-Selling Entity.
Transmission Line [Archive]		2/7/2006	3/16/2007	A system of structures, wires, insulators and associated hardware that carry electric energy from one point to another in an electric power system. Lines are operated at relatively high voltages varying from 69 kV up to 765 kV, and are capable of transmitting large quantities of electricity over long distances.
Transmission Operator [Archive]	TOP	2/8/2005	3/16/2007	The entity responsible for the reliability of its "local" transmission system, and that operates or directs the operations of the transmission facilities.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Transmission Operator Area [Archive]		08/22/2008	11/24/2009	The collection of Transmission assets over which the Transmission Operator is responsible for operating.
Transmission Owner [Archive]	TO	2/8/2005	3/16/2007	The entity that owns and maintains transmission facilities.
Transmission Planner [Archive]	TP	2/8/2005	3/16/2007	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the Planning Authority Area.
Transmission Reliability Margin [Archive]	TRM	2/8/2005	3/16/2007	The amount of transmission transfer capability necessary to provide reasonable assurance that the interconnected transmission network will be secure. TRM accounts for the inherent uncertainty in system conditions and the need for operating flexibility to ensure reliable system operation as system conditions change.
Transmission Reliability Margin Implementation Document [Archive]	TRMID	08/22/2008	11/24/2009	A document that describes the implementation of a Transmission Reliability Margin methodology, and provides information related to a Transmission Operator's calculation of TRM.
Transmission Service [Archive]		2/8/2005	3/16/2007	Services provided to the Transmission Customer by the Transmission Service Provider to move energy from a Point of Receipt to a Point of Delivery.
Transmission Service Provider [Archive]	TSP	2/8/2005	3/16/2007	The entity that administers the transmission tariff and provides Transmission Service to Transmission Customers under applicable transmission service agreements.

Continent-wide Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Vegetation [Archive]		2/7/2006	3/16/2007	All plant material, growing or not, living or dead.
Vegetation Inspection [Archive]		2/7/2006	3/16/2007	The systematic examination of a transmission corridor to document vegetation conditions.
Vegetation Inspection [Archive]		11/3/2011		The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the Transmission Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.
Vegetation Inspection [Archive]		5/9/12		The systematic examination of vegetation conditions on a Right-of-Way and those vegetation conditions under the applicable Transmission Owner's or applicable Generator Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection. This may be combined with a general line inspection.
Wide Area [Archive]		2/8/2005	3/16/2007	The entire Reliability Coordinator Area as well as the critical flow and status information from adjacent Reliability Coordinator Areas as determined by detailed system studies to allow the calculation of Interconnected Reliability Operating Limits.
Year One [Archive]		1/24/2011	11/17/2011	The first twelve month period that a Planning Coordinator or a Transmission Planner is responsible for assessing. For an assessment started in a given calendar year, Year One includes the forecasted peak Load period for one of the following two calendar years. For example, if a Planning Assessment was started in 2011, then Year One includes the forecasted peak Load period for either 2012 or 2013.

Reliability*First* Regional Definitions

The following definitions were developed for use in Reliability*First* Regional Standards.

RFC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Resource Adequacy [Archive]		08/05/2009	03/17/2011	The ability of supply-side and demand-side resources to meet the aggregate electrical demand (including losses)
Net Internal Demand [Archive]		08/05/2009	03/17/2011	Total of all end-use customer demand and electric system losses within specified metered boundaries, less Direct Control Management and Interruptible Demand
Peak Period [Archive]		08/05/2009	03/17/2011	A period consisting of two (2) or more calendar months but less than seven (7) calendar months, which includes the period during which the responsible entity's annual peak demand is expected to occur
Wind Generating Station [Archive]		11/03/2011		A collection of wind turbines electrically connected together and injecting energy into the grid at one point, sometimes known as a "Wind Farm."
Year One [Archive]		08/05/2009	03/17/2011	The planning year that begins with the upcoming annual Peak Period

NPCC Regional Definitions

The following definitions were developed for use in NPCC Regional Standards.

NPCC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Current Zero Time [Archive]		11/04/2010	10/20/2011	The time of the final current zero on the last phase to interrupt.
Generating Plant [Archive]		11/04/2010	10/20/2011	One or more generators at a single physical location whereby any single contingency can affect all the generators at that location.

WECC Regional Definitions

The following definitions were developed for use in WECC Regional Standards.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Area Control Error† [Archive]	ACE	3/12/2007	6/8/2007	Means the instantaneous difference between net actual and scheduled interchange, taking into account the effects of Frequency Bias including correction for meter error.
Automatic Generation Control‡ [Archive]	AGC	3/12/2007	6/8/2007	Means equipment that automatically adjusts a Control Area's generation from a central location to maintain its interchange schedule plus Frequency Bias.
Automatic Time Error Correction [Archive]		3/26/2008	5/21/2009	A frequency control automatic action that a Balancing Authority uses to offset its frequency contribution to support the Interconnection's scheduled frequency.
Average Generation‡ [Archive]		3/12/2007	6/8/2007	Means the total MWh generated within the Balancing Authority Operator's Balancing Authority Area during the prior year divided by 8760 hours (8784 hours if the prior year had 366 days).
Business Day‡ [Archive]		3/12/2007	6/8/2007	Means any day other than Saturday, Sunday, or a legal public holiday as designated in section 6103 of title 5, U.S. Code.
Disturbance‡ [Archive]		3/12/2007	6/8/2007	Means (i) any perturbation to the electric system, or (ii) the unexpected change in ACE that is caused by the sudden loss of generation or interruption of load.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Extraordinary Contingency‡ [Archive]		3/12/2007	6/8/2007	Shall have the meaning set out in Excuse of Performance, section B.4.c. language in section B.4.c: *means any act of God, actions by a non-affiliated third party, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, earthquake, explosion, accident to or breakage, failure or malfunction of machinery or equipment, or any other cause beyond the Reliability Entity's reasonable control; provided that prudent industry standards (e.g. maintenance, design, operation) have been employed; and provided further that no act or cause shall be considered an Extraordinary Contingency if such act or cause results in any contingency contemplated in any WECC Reliability Standard (e.g., the "Most Severe Single Contingency" as defined in the WECC Reliability Criteria or any lesser contingency).*
Frequency Bias‡ [Archive]		3/12/2007	6/8/2007	Means a value, usually given in megawatts per 0.1 Hertz, associated with a Control Area that relates the difference between scheduled and actual frequency to the amount of generation required to correct the difference.
Generating Unit Capability‡ [Archive]		3/12/2007	6/8/2007	Means the MVA nameplate rating of a generator.
Non-spinning Reserve‡ [Archive]		3/12/2007	6/8/2007	Means that Operating Reserve not connected to the system but capable of serving demand within a specified time, or interruptible load that can be removed from the system in a specified time.
Normal Path Rating‡		3/12/2007	6/8/2007	Is the maximum path rating in MW that has been demonstrated to WECC through study results or actual operation, whichever

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
[Archive]				is greater. For a path with transfer capability limits that vary seasonally, it is the maximum of all the seasonal values.
Operating Reserve‡ [Archive]		3/12/2007	6/8/2007	Means that capability above firm system demand required to provide for regulation, load-forecasting error, equipment forced and scheduled outages and local area protection. Operating Reserve consists of Spinning Reserve and Nonspinning Reserve.
Operating Transfer Capability Limit‡ [Archive]	OTC	3/12/2007	6/8/2007	Means the maximum value of the most critical system operating parameter(s) which meets: (a) precontingency criteria as determined by equipment loading capability and acceptable voltage conditions, (b) transient criteria as determined by equipment loading capability and acceptable voltage conditions, (c) transient performance criteria, and (d) post-contingency loading and voltage criteria.
Primary Inadvertent Interchange [Archive]		3/26/2008	5/21/2009	The component of area (n) inadvertent interchange caused by the regulating deficiencies of the area (n).
Secondary Inadvertent Interchange [Archive]		3/26/2008	5/21/2009	The component of area (n) inadvertent interchange caused by the regulating deficiencies of area (i).
Spinning Reserve‡ [Archive]		3/12/2007	6/8/2007	Means unloaded generation which is synchronized and ready to serve additional demand. It consists of Regulating reserve and Contingency reserve (as each are described in Sections B.a.i and ii).

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
WECC Table 2[†] [Archive]		3/12/2007	6/8/2007	Means the table maintained by the WECC identifying those transfer paths monitored by the WECC regional Reliability coordinators. As of the date set out therein, the transmission paths identified in Table 2 are as listed in Attachment A to this Standard.
Functionally Equivalent Protection System [Archive]	FEPS	10/29/2008	4/21/2011	A Protection System that provides performance as follows: • Each Protection System can detect the same faults within the zone of protection and provide the clearing times and coordination needed to comply with all Reliability Standards. • Each Protection System may have different components and operating characteristics.
Functionally Equivalent RAS [Archive]	FERAS	10/29/2008	4/21/2011	A Remedial Action Scheme ("RAS") that provides the same performance as follows: • Each RAS can detect the same conditions and provide mitigation to comply with all Reliability Standards. • Each RAS may have different components and operating characteristics.
Security-Based Misoperation [Archive]		10/29/2008	4/21/2011	A Misoperation caused by the incorrect operation of a Protection System or RAS. Security is a component of reliability and is the measure of a device's certainty not to operate falsely.
Dependability-Based Misoperation [Archive]		10/29/2008	4/21/2011	Is the absence of a Protection System or RAS operation when intended. Dependability is a component of reliability and is the measure of a device's certainty to operate when required.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Commercial Operation [Archive]		10/29/2008	4/21/2011	Achievement of this designation indicates that the Generator Operator or Transmission Operator of the synchronous generator or synchronous condenser has received all approvals necessary for operation after completion of initial start-up testing.
Qualified Transfer Path Curtailment Event [Archive]		2/10/2009	3/17/2011	Each hour that a Transmission Operator calls for Step 4 or higher for one or more consecutive hours (See Attachment 1 IRO-006-WECC-1) during which the curtailment tool is functional.
Relief Requirement [Archive]		2/10/2009	3/17/2011	The expected amount of the unscheduled flow reduction on the Qualified Transfer Path that would result by curtailing each Sink Balancing Authority's Contributing Schedules by the percentages listed in the columns of WECC Unscheduled Flow Mitigation Summary of Actions Table in Attachment 1 WECC IRO-006-WECC-1.
Transfer Distribution Factor [Archive]	TDF	2/10/2009	3/17/2011	The percentage of USF that flows across a Qualified Transfer Path when an Interchange Transaction (Contributing Schedule) is implemented. [See the WECC Unscheduled Flow Mitigation Summary of Actions Table (Attachment 1 WECC IRO-006-WECC-1).]
Contributing Schedule [Archive]		2/10/2009	3/17/2011	A Schedule not on the Qualified Transfer Path between a Source Balancing Authority and a Sink Balancing Authority that contributes unscheduled flow across the Qualified Transfer Path.
Qualified Transfer Path [Archive]		2/10/2009	3/17/2011	A transfer path designated by the WECC Operating Committee as being qualified for WECC unscheduled flow mitigation.

WECC Regional Term	Acronym	BOT Approved Date	FERC Approved Date	Definition
Qualified Controllable Device [Archive]		2/10/2009	3/17/2011	A controllable device installed in the Interconnection for controlling energy flow and the WECC Operating Committee has approved using the device for controlling the USF on the Qualified Transfer Paths.

Endnotes

[†] FERC approved the WECC Tier One Reliability Standards in the Order Approving Regional Reliability Standards for the Western Interconnection and Directing Modifications, 119 FERC ¶ 61,260 (June 8, 2007). In that Order, FERC directed WECC to address the inconsistencies between the regional definitions and the NERC Glossary in developing permanent replacement standards. The replacement standards designed to address the shortcomings were filed with FERC in 2009.

Glossary of Terms

Approved by the Reliability Standards Committee

October 26, 2011

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Actual Interchange		Metered electric **power** that flows from one entity to another.	D5
Applicable emergency limits		These limits depend on the duration of the occurrence, and on the policy of the various member systems of NPCC regarding loss of life to equipment, voltage limitations, etc. **Emergency** limits are those which can be utilized for the time required to take corrective action, but in no case less than five minutes. The limiting condition for voltages should recognize that voltages should not drop below that required for suitable system **stability** performance, and should not adversely affect the operation of the **bulk power system**. The limiting condition for equipment loadings should be such that cascading outages will not occur due to operation of protective devices upon the failure of facilities. (Various definitions of equipment **ratings** are found elsewhere in this glossary.)	D1 D7
Area		An **Area** (when capitalized) refers to one of the following: New England, New York, Ontario, Quebec or the Maritimes (New Brunswick, Nova Scotia and Prince Edward Island); or, as the situation requires, area (lower case) may mean a part of a system or more than a single system. Within NPCC, Areas (capitalized) operate as **control areas** as defined by the North American Electric Reliability Council (NERC) (the definition can be found in this glossary).	D1 D7 D8 D12
Area Control Error	**ACE**	The instantaneous difference between a Balancing Authority's net actual and scheduled interchange, taking into account the effects of Frequency Bias and correction for meter error. (Source: NERC Glossary of Terms)	D2 D5 D8

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Automatic Generation Control	**AGC**	Equipment that automatically adjusts generation in a Balancing Authority Area from a central location to maintain the Balancing Authority's interchange schedule plus Frequency Bias. AGC may also accommodate automatic inadvertent payback and time error correction. (Source: NERC Glossary of Terms)	D2 D5 D8
Basic Minimum Power System		Consists of one or more generating stations, transmission lines, and substations operating in the form of an island for the purpose of initiating the restoration process. The Reliability Coordinator and Transmission Operator shall each identify its area's basic minimum power system(s) within its system restoration plan.	D8
Bipolar		Operation of HVdc with two **poles** of opposite polarity with negligible ground current.	D1
Blackstart Capability		The ability of a generating unit or station to go from a shutdown condition to an operating condition and start delivering **power** without assistance from the electric system.	D8
Bulk Power System	**BPS**	The interconnected electrical systems within northeastern North America comprised of system **elements** on which **faults** or **disturbances** can have a **significant adverse impact** outside of the **local area.**	D1 D2 D3 D4 D7 D9 D10
Cable		An underground or underwater circuit.	D4 D5 D7 D8

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Capacity		The rated continuous load-carrying ability, expressed in megawatts (MW) or megavolt-amperes (MVA) of **generation**, transmission, or other electrical equipment.	D1 D2 D5 D8
Commutation Failure		A fault in a thyristor valve group where the current transfer from one valve to the next is interrupted.	D4
Component		Refers to components of equipment or protection systems rather than **elements** of a **power** system. See **Element**.	D1 D3 D7
Contingency		An event, usually involving the loss of one or more **elements**, which affects the power system at least momentarily.	D1 D2 D5 D7
Converter		An operative unit comprised of either a rectifier or inverter bridge connected to an ac system through transformers and switching devices with the associated control equipment.	D4
Converter Transformer		A **power** transformer which transfers the energy from the thyristor valves to the connected ac system and vice-versa.	D4
Critical Components		Equipment required for continued and proper operation of a **key facility** in the event of a total loss of grid supply. Critical components include but are not limited to the following: ▪ blackstart generating units; ▪ substation backup power supplies; ▪ control center and telecommunication center backup power supplies and computer systems;	D8

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		▪ control center and telecommunication center computer room HVAC; ▪ telecommunication facilities backup power supplies.	
Declared Capability (of a generator or generating facility)		The facility ratings submitted by the Generator Owner to the respective Transmission Operator as per NERC Standard FAC-009.	D10
Delayed Fault Clearing		Fault clearing consistent with correct operation of a breaker failure protection system and its associated breakers, or of a backup protection system with an intentional time delay. (Source: NERC Glossary of Terms)	D1
Demand		1. The rate at which electric energy is delivered to or by a system or part of a system, generally expressed in kilowatts or megawatts, at a given instant or averaged over any designated interval of time. 2. The rate at which energy is being used by the customer. (Source: NERC Glossary of Terms)	D1 D5
Disturbance		Severe oscillations or severe step changes of current, voltage and/or frequency usually caused by **faults**.	D1 D2 D4 D5 D7
Disturbance Monitoring Equipment	**DME**	Devices capable of monitoring and recording system data pertaining to a Disturbance. Such devices include the following categories of recorders2 • Sequence of event recorders which record equipment response to the event; • Fault recorders, which record actual waveform data replicating the system primary voltages and currents. This may include protective	D4

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		relays; • Dynamic Disturbance Recorders (DDRs), which record incidents that portray power system behavior during dynamic events such as low-frequency (0.1 Hz – 3 Hz) oscillations and abnormal frequency or voltage excursions (Source: NERC Glossary of Terms)	
Economic Dispatch		The allocation of demand to individual generating units on line to effect the most economical production of electricity. (Source: NERC Glossary of Terms)	D2
Element		Any electrical device with terminals that may be connected to other electrical devices such as a generator, transformer, circuit breaker, bus section, or transmission line. An element may be comprised of one or more components. (Source: NERC Glossary of Terms)	D1 D2 D4 D5 D7 D9 D10
Emergency		Any abnormal system condition that requires automatic or manual action to prevent or limit loss of transmission facilities or **generation** supply that could adversely affect the **reliability** of the electric system. NPCC Specific Definition: **Emergency** — An **Emergency** is considered to exist in an Area if **firm load** may have to be shed.	D1 D2 D4 D5 D7
Emergency Regional Reserve Redispatch		The regional coordination of actions to enhance **reliability** among **Areas** in response to a **Regional Reserve Deficiency.**	D5

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Emergency Regional Reserve Dispatch Energy		Electrical energy that is received and delivered among **Areas** in response to a **Regional Reserve Deficiency** to enhance regional **reliability.**	D5
Emergency Transfer Capability		The amount of **power** transfer allowed between **Areas** or within an **Area** when ope**rating** to meet NPCC **emergency** criteria contingencies [as defined in Directory #1].	D2
Energize		To make a piece of equipment or circuit alive.	D4
Fault		An electrical **short circuit**.	D1 D4 D7
Firm Capacity		Capacity that is as firm as the seller's native **load** unless modified by contract. Associated energy may or may not be taken at option of purchaser. Supporting **reserve** is carried by the seller.	D1
Firm Load		That portion of the Demand that a power supplier is obligated to provide except when system reliability is threatened or during emergency conditions. (Source: Firm Demand defined in NERC Glossary of Terms)	D1 D2
First Contingency Loss		The largest **capacity** outage including any assigned Ten-Minute Reserve which would result from the loss of a single **element.**	D5
Forced Outage		1. The removal from service availability of a generating unit, transmission line, or other facility for emergency reasons. 2. The condition in which the equipment is unavailable due to unanticipated failure. (Source: NERC Glossary of Terms)	D1
Generation (Electricity)		The process of producing electrical energy from other forms of energy;	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		also, the amount of electric energy produced, usually expressed in kilowatthours (kWh) or megawatthours (MWh). Gross Generation — The electrical output at the terminals of the generator, usually expressed in megawatts (MW). Net Generation — Gross generation minus station service or unit service **power** requirements, usually expressed in megawatts (MW).	D2 D4 (Appendix A) D5 D7 (Appendices) D12
Generation Facility		Generating units, which are modeled as a single entity by the Transmission Operator.	D8 D9 D10
Generation Rejection		The process of deliberately removing preselected **generation** from a **power** system, or initiating HVdc power runback, in response to a **contingency** or an abnormal condition in order to maintain the integrity of the system. Synonym: Generator Dropping.	D1 D7
Gross Real Power Capability (of a generator or generating facility)		The maximum megawatt output at the generator terminals, at the normally expected system conditions for that seasonal capability period.	D9
Gross Reactive Power Capability (of a generator or generating facility)		The maximum lagging and leading reactive capability at the generator terminals and at a specified Gross Real Power output for a specific seasonal capability period.	D10
Grounded		Connected to earth or some extended conducting body that serves instead of the earth, whether the connection is intentional or accidental.	D4 D7
Harmonic		A sinusoidal component of a periodic wave or quantity having a frequency that is an integral multiple of the fundamental frequency. Note: For example, a component, the frequency of which is twice the fundamental frequency, is called a second harmonic.	D4
HVdc Link		A high Voltage direct current connection between two **power** systems often	D4

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		used to interconnect two asynchronous **power** systems.	
Inadvertent Interchange		The difference between the Balancing Authority's Net Actual Interchange and Net Scheduled Interchange. (IA – IS) (Source: NERC Glossary of Terms)	D5
Interconnection		When capitalized, any one of the five major electric system networks in North America: Eastern, Western, ERCOT, Québec, and Alaska. When not capitalized, the facilities that connect two systems or **Control Areas**. Additionally, an interconnection refers to the facilities that connect a nonutility generator to a **Control Area** or system.	D1 D2 D5 D8 D12
Interchange		Energy transfers that cross Balancing Authority boundaries. (Source: NERC Glossary of Terms)	D1 (Appendix B) D2 D5
Interchange Schedule		An agreed-upon Interchange Transaction size (megawatts), start and end time, beginning and ending ramp times and rate, and type required for delivery and receipt of power and energy between the Source and Sink Balancing Authorities involved in the transaction. (Source: NERC Glossary of Terms)	D1 D5
Interface		The specific set of transmission **elements** between two areas or between two areas comprising one or more electrical systems.	D1 (Appendices)
Interruptible Load		Demand that the end-use customer makes available to its Load-Serving Entity via contract or agreement for curtailment. (Source: NERC Glossary of Terms)	D1 (Appendix D) D5
Island		A portion of a **power** system or several power systems that is electrically separated from the interconnection due to the disconnection of transmission	D1 D8

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		system **elements.**	D12
Key Facilities		Facilities required to establish a **basic minimum power system** following a system blackout. These facilities are essential to the restoration plan of the **Control Area** and include generating stations having blackstart units and other selected generating stations, transmission **elements** which are part of the **basic minimum power system,** control centers and telecommunication centers and telecommunication facilities which are necessary to support **protection** and control facilities, voice and data between and within control centers and voice and data between control centers and key generating / transmission substations.	D8
Load		An end-use device or customer that receives power from the electric system. (Source: NERC Glossary of Terms)	D1 D2 D3 D4 D5 D7 (Appendices) D8 D9 D10 D12
Load Relief		**Load** reduction accomplished by **voltage reduction** and/or **load shedding**.	D1
Load Shedding		The process of deliberately removing (either manually or automatically) preselected customers' **load** from a power system in response to an abnormal condition to maintain the integrity of the system and minimize overall customer outages.	D2 D3 D4 D12
Local area		An electrically confined or radial portion of the system. The geographic	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		size and number of system elements contained will vary based on system characteristics. A local area may be relatively large geographically with relatively few buses in a sparse system, or be relatively small geographically with a relatively large number of buses in a densely networked system.	D4
Maintenance Outage		The removal of equipment from service **availability** to perform work on specific **elements** that can be deferred, but requires the equipment be removed from service before the next planned outage. Typically, a Maintenance Outage may occur anytime during the year, have a flexible start date, and may or may not have a predetermined duration.	D1
Net Capacity		The maximum capacity (or effective **rating**), modified for ambient limitations, that a generating unit, **power** plant, or electric system can sustain over a specified period, less the capacity used to supply the **demand** of station service or auxiliary needs.	D1
Net Real Power Capability (of a generator or generating facility)		The Gross Real Power Capability, less the auxiliary real power loads necessary to operate the generator at maximum real power output.	D9
Net Reactive Power Capability (of a generator or generating facility)		The **Gross Reactive Power Capability** adjusted for any applicable losses and auxiliary loads incurred up to the point of interconnection and at a specified Gross Real Power output for a specific seasonal capability period.	D10
Normal Fault Clearing		Fault clearing consistent with correct operation of the **protection system** and with the correct operation of all circuit breakers or other automatic switching devices intended to operate in conjunction with that **protection system.**	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Normal (Precontingency) Operating Procedures		Operating procedures that are normally invoked by the **system operator** to alleviate potential facility overloads or other potential system problems in anticipation of a **contingency**.	D1 (Appendix F)
Normal Transfer Capability		The amount of **power** transfer allowed between **Areas** or within an **Area** when operating to meet NPCC normal criteria contingencies [as defined in Directory #1].	D1 D2
Operating Capability		The maximum load carrying ability of generating equipment or other electrical apparatus under specified conditions for a given time interval.	D9
Operating Limit		The maximum value of the most critical system operation parameter(s) which meet(s): (a) pre-**contingency** criteria as determined by equipment loading capability and acceptable voltage conditions; (b) **stability** criteria; (c) post-**contingency** loading and voltage criteria.	D1 (Appendix C) D2 D5
Operating Capacity		The **capacity** claimed for any generating source recognizing any temporary deratings, governor load limits, proven maximum loading rates, starting times and equipment limitations including transmission **operating limits**.	D5
Operating Procedures		A set of policies, practices, or system adjustments that may be automatically or manually implemented by the **system operator** within a specified time frame to maintain the operational integrity of the interconnected electric systems.	D1 D5 D7
Operating Reserve		The sum of **ten-minute** and **thirty-minute reserve**.	D1 D2
Phase Shifting Transformer		A transformer that advances or retards the phase angle relationship of one circuit with respect to another to control **power** flow. Synonyms: Phase angle regulator, phase shifter.	D1 D2 D4
Pilot Protection		A form of line protection that uses a communication channel as a means to compare electrical conditions at the terminals of a line.	D4
Planned Outage		Removing the equipment from service **availability** for inspection and/or general overhaul of one or more major equipment groups. This outage	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		usually is scheduled well in advance.	
Pole (HVdc term)		A rectifier and an inverter, with associated filter banks and control equipment, tied together by a transmission line or bus.	D1
Power		See definitions for Real Power and Reactive Power.	D8
Power Swing		A transient change in the **power** flows on a system, usually of an oscillatory nature.	D1 D4 (Appendix A)
Protected element		The power system **element** protected by the subject **protection system**. Examples: Line, bus, transformer, generator.	D4
Protection		The provisions for detecting power system **faults** or abnormal conditions and taking appropriate automatic corrective action.	D1 D2 D3 D4 D7
Protection group		A fully integrated assembly of **protective relays** and associated equipment that is designed to perform the specified protective functions for a power system **element**, independent of other groups. Notes: (a) Variously identified as Main Protection, Primary Protection, Breaker Failure Protection, Back-Up Protection, Alternate Protection, Secondary Protection, A Protection, B Protection, Group A, Group B, System 1 or System 2. (b) Pilot protection is considered to be one protection group.	D1 D3 D4 D7
Protection System		Element Basis	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		One or more protection groups; including all equipment such as instrument transformers, station wiring, circuit breakers and associated trip/close modules, and communication facilities; installed at all terminals of a power system **element** to provide the complete protection of that **element**. Terminal Basis One or more protection groups, as above, installed at one terminal of a power system **element**, typically a transmission line.	D3 D4 D7
Protective relay		A **relay** that detects a power system **fault** or abnormal condition and initiates appropriate control system action.	D3 D4
Rating		The operational limits of an electric system, facility, or **element** under a set of specified conditions.	D1 D5
Reactive Power		The portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive losses on transmission facilities. Reactive power is provided by generators, **synchronous condensers**, or electrostatic equipment such as capacitors. Reactive power directly influences electric system voltage. It is usually expressed in kilovars (kVAr) or megavars (MVAr).	D1 D2 D10
Real Power		The rate of producing, transferring, or using electrical energy, usually expressed in kilowatts (kW) or megawatts (MW).	D1 D2

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
			D9 D10
Reclosing		Autoreclosing — The automatic closing of a circuit breaker in order to restore an **element** to service following automatic tripping of the circuit breaker. Autoreclosing does not include automatic closing of capacitor or reactor circuit breakers. High-speed autoreclosing — The autoreclosing of a circuit breaker after a necessary time delay (less than one second) to permit **fault** arc deionization with due regard to coordination with all **relay** protective systems. This type of autoreclosing is generally not supervised by voltage magnitude or phase angle. Manual Reclosing — The closing of a circuit breaker by operator action after it has been tripped by **protective relays**. Operator initiated closing commands may originate from local control or from remote (supervisory) control. Either local or remote close commands may be supervised or unsupervised. Supervision — A closing command is said to be supervised if closing is permitted to occur only if certain prerequisite conditions are met (e.g., **synchronism-check**). Synchronism-check — refers to the determination that acceptable voltages exist on the two sides of the breaker and the phase angle between them is within a specified limit for a specified time.	D1
Regional Reserve Deficiency		When two or more **Areas** are deficient in **ten minute reserve** after all **Area** coordinated actions have been deployed, including acquiring emergency energy and/or capacity but excluding the shedding of firm load.	D5
Relay		An electrical device designed to respond to input conditions in a prescribed	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		manner and after specified conditions are met to cause contact operation or similar abrupt change in associated electric control circuits. (Also: see **protective relay**).	D3 D4 D7 D12
Reliability		The degree of performance of the bulk electric system that results in electricity being delivered to customers within accepted standards and in the amount desired. Reliability may be measured by the frequency, duration, and magnitude of adverse effects on the electric supply. Electric system reliability can be addressed by considering two basic and functional aspects of the electric system — Adequacy and **Security.** Adequacy — The ability of the electric system to supply the aggregate electrical **demand** and energy requirements of the customers at all times, taking into account scheduled and reasonably expected unscheduled outages of system **elements**. Security — The ability of the electric system to withstand **disturbances** such as electric **short circuits** or unanticipated loss of system **elements.**	D1 D2 D5 D9 D10
Reportable Events		**System disturbances** involving losses of **load**, **generation** or transmission facilities within NPCC **Control Areas** which equal or exceed the following criteria are reportable events: (1) Actual net **interchange** deviations equal to or greater than 500 MW (Maritime: 300 MW). (2) Loss of **generation** or **load** equal to or greater than 500 MW (Maritime: 300 MW). (3) System frequency deviations equal to or greater than 0.03 Hz (Hydro-Quebec: 0.5 Hz). (System frequency deviations that occur for events outside of the NPCC are reported for analysis of frequency response, but are not included in the reporting for the NERC Disturbance Control Standard.)	D5

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Reserve		In normal usage, reserve is the amount of capacity available in excess of the demand	D1 D2 D5
Reserve on Automatic Generation Control (AGC)		That portion of **synchronized reserve** which is under the command of an automatic controller to respond to **load** without need for manual action.	D5
Reserve Requirement		That capability above firm system demand required to provide for regulation, load forecasting error, equipment forced and scheduled outages, and local area supply adequacy.	D2 D5
Resource		Resource refers to the total contributions provided by supply-side and **demand**-side facilities and/or actions. Supply-side facilities include utility and non-utility **generation** and purchases from neighboring systems. **Demand**-side facilities include measures for reducing **load**, such as conservation, **demand** management, and **interruptible load.**	D1 D2 D5 D8 D9 D10
Scheduled Interchange		The algebraic sum of all Interchange Schedules across a given path or between Balancing Authorities for a given period or instant in time. (Source: Net Scheduled Interchange defined in NERC Glossary of Terms)	D5
Second Contingency Loss		The largest **capacity** outage which would result from the loss of a single **element** after allowing for the First Contingency Loss.	D5
Short Circuit		An abnormal connection (including an arc) of relatively low impedance, whether made accidentally or intentionally, between two points of different potential. *Note:* The term **fault** or short-circuit **fault** is used to describe a short circuit.	D4 D7
Short Time Emergency Rating	**STE**	The maximum loading of electrical equipment which can be sustained for 15 minutes based on nominal ambient conditions and recognizing preloading conditions.	D1 (Appendix C)

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Significant Adverse Impact		With due regard for the maximum operating capability of the affected systems, one or more of the following conditions arising from **faults** or **disturbances**, shall be deemed as having **significant adverse impact**: a. instability; • any instability that cannot be demonstrably contained to a well-defined **local area**. • any loss of synchronism of generators that cannot be demonstrably contained to a well-defined **local area** b. unacceptable system dynamic response; • an oscillatory response to a **contingency** that is not demonstrated to be clearly positively damped within 30 seconds of the initiating event. c. unacceptable equipment tripping • tripping of an un-faulted **bulk power system** element (element that has already been classified as **bulk power system**) under planned system configuration due to operation of a **protection system** in response to a stable **power swing** • operation of a Type I or Type II **Special Protection System** in response to a condition for which its operation is not required d. voltage levels in violation of applicable **emergency** limits; e. loadings on transmission facilities in violation of applicable **emergency** limits.	D1 (Appendix E) D5
Single Contingency		A single event, which may result in the loss of one or more **elements.**	D5
Special Protection System	**SPS**	**Special Protection System (SPS)** – A **protection system** designed to detect abnormal system conditions and take corrective action other than the	D1 D3

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		isolation of faulted **elements**. Such action may include changes in **load**, **generation**, or system configuration to maintain system **stability**, acceptable voltages or **power** flows. However, the following are not considered **SPS's**: - Automatic underfrequency **load shedding;** - Automatic under voltage **load shedding**, and - Manual or automatic locally controlled shunt devices.	D4 (Appendix A) D7
Stability		The ability of an electric system to maintain a state of equilibrium during normal and abnormal conditions or disturbances. (Source: NERC Glossary of Tems)	D1 D4
Static Var Compensator	**SVC**	A combination of controlled shunt reactors and switched capacitor banks, used to affect the **reactive power** flow of the system or to regulate the system voltage.	D1 (Appendix G) D2 D4
Synchronize		The process of connecting two previously separated alternating current apparatuses or systems after matching frequency, voltage, phase angles, etc. (e.g., paralleling a generator to the electric system).	D8

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
Synchronized Reserve		The unused portion of generating capacity which is synchronized to the system and ready to pick up **load** to claimed capacity and capacity which can be made available by curtailing pumping hydro units.	D5
Synchronous Condenser		A synchronous machine which operates without mechanical load to supply or absorb **reactive power** for voltage control purposes.	D2 D10
System Disturbance		An event characterized by one or more of the following phenomena: the loss of **power** system **stability**; cascading outages of circuits; oscillations; abnormal ranges of frequency or voltage or both.	D1 D2 D4 D5 D7
System Operator		An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time. (Source: NERC Glossary of Terms)	D2 D3 D8
Teleprotection		A form of **protection** that uses a communication channel.	D4 D7
Ten-Minute Reserve		The sum of **synchronized** and non-**synchronized reserve** that is fully available in ten minutes.	D1 D5
Thirty-Minute Reserve		The sum of **synchronized** and non-**synchronized reserve** that can be utilized in thirty minutes, excluding capacity assigned to **ten-minute reserve**.	D5
Tie Line		A circuit connecting two Balancing Authority Areas.	D1 D2 (Appendix B) D5
Tie Line Bias		A mode of operation under automatic **generation** control in which the **area control error** is determined by the actual net **interchange** minus the biased	D2

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		scheduled net **interchange.**	
Total Transfer Capability	**TTC**	The amount of electric **power** that can be transferred over the interconnected transmission network in a *reliable* manner based on *all* of the following conditions: 1. For the existing or planned system configuration, and with **normal** (**precontingency**) **operating procedures** in effect, all facility loadings are within normal **ratings** and all voltages are within normal limits. 2. The electric systems are capable of absorbing the dynamic **power swings**, and remaining stable, following a **disturbance** that results in the loss of any single electric system **element**, such as a transmission line, transformer, or generating unit. 3. After the dynamic **power swings** subside following a **disturbance** that results in the loss of any single electric system **element** as described in 2 above, and after the operation of any automatic operating systems, but before any post-**contingency** operator-initiated system adjustments are implemented, all transmission facility loadings are within **emergency ratings** and all voltages are within **emergency** limits 4. With reference to condition 1 above, in the case where precontingency facility loadings reach normal thermal **ratings** at a transfer level below that at which any first **contingency** transfer limits are reached, the transfer capability is defined as that transfer level at which such normal **ratings** are reached. 5. In some cases, individual system, **power pool,** subregional, or Regional planning criteria or guides may require consideration of specified multiple contingencies, such as the outage of transmission circuits using common towers or rights-of-way, in the determination of	D5

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Directories that use this term
		transfer capability limits. If the resulting transfer limits for these multiple **contingencies** are more restrictive than the single contingency considerations described above, the more restrictive **reliability** criteria or guides must be observed.	
Transfer Capability		The measure of the ability of interconnected electric systems to move or transfer power in a reliable manner from one area to another over all transmission lines (or paths) between those areas under specified system conditions. The units of transfer capability are in terms of electric power, generally expressed in megawatts (MW). The transfer capability from "Area A" to "Area B" is not generally equal to the transfer capability from "Area B" to "Area A." (Source: NERC Glossary of Terms)	D1 D2 D5
Transient Stability		The ability of an electric system to maintain synchronism between its parts when subjected to a **disturbance** and to regain a state of equilibrium following that disturbance.	D1
Verified Capability (of a generator or generating facility)		The capability as demonstrated by the methods specified in NPCC Directories and accepted by the Transmission Operator.	D9 D10
Voltage Reduction		A means to reduce the **demand** by lowering the customer's voltage.	D1 D2 (Appendix B) D5 (Appendix 3)
Voltage Regulating Transformer		A transformer that increases or decreases the voltage magnitude relationship of one circuit with respect to another, most often used to control voltage but also to control **reactive power** flow.	D1
With Due Regard To Reclosing		This phrase means that before any manual system adjustments, recognition will be given to the type of **reclosing** (i.e., manual or automatic) and the kind of **protection.**	D1

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
Automatic Operating Systems		**Special protection systems**, remedial action schemes, or other operating systems installed on the electric systems that require *no intervention* on the part of **system operators**.	
Auto-reclosing		The automatic closing of a circuit breaker in order to restore an **element** to service following automatic tripping of the circuit breaker. Auto-reclosing does not include automatic closing of capacitor or reactor circuit breakers.	
Available Transfer Capability	**ATC**	A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses. ATC is defined as the Total Transfer Capability (TTC), less the **Transmission Reliability Margin (TRM)**, less the sum of existing transmission commitments (which includes retail customer service) and the **Capacity Benefit Margin (CBM)**.	
Availability		A measure of time a generating unit, transmission line, or other facility is capable of providing service, whether or not it actually is in service. Typically, this measure is expressed as a percent available for the period under consideration.	
Average Demand		The electric energy delivered over any interval of time as determined by dividing the total energy by the units of time in the interval.	
Base load Capacity		Capacity used to serve an essentially constant level of customer **demand**. Base load generating units typically operate whenever they are available.	
Billing Demand		The demand upon which customer billing is based as specified in a rate schedule or contract. It may be based on the contract year, a contract minimum, or a previous maximum and, therefore, does not necessarily coincide with the actual measured demand of the billing period.	
Bottled Energy/Power/Capacity		Energy/Power/Capacity which is available at the source but which cannot be delivered to the point of use because of restrictions in the transmission	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
		system. Also referred to as Locked-In Energy/Power/Capacity.	
Capacity Benefit Margin	**CBM**	CBM is defined as that amount of transmission transfer capability reserved by **load** serving entities to ensure access to **generation** from interconnected systems to meet **generation reliability** requirements.	
Coincident Demand		The sum of two or more demands that occur in the same demand interval.	
Contingency Reserve Adjustment Factor		A factor used in determining the additional **ten-minute reserve** that each **Area**, not meeting the DCS requirement for a given quarter, must carry. It is calculated using the following formula: $CRA_{quarter} = 2 -$ {the average percentage DCS (expressed as a decimal) for the quarter of measurement}	
Continuous Rating		The rating – as defined by the equipment owner – that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or **element** can support or withstand indefinitely without loss of equipment life. (Normally not used in NPCC)	
Contract Demand		The amount of **capacity** that a supplier agrees to make available for delivery to a particular entity and which the entity agrees to purchase.	
Control Area		An electric system or systems, bounded by interconnection metering and telemetry, capable of controlling **generation** to maintain its net **interchange schedule** with other Control Areas and contributing to frequency regulation of the **Interconnection.**	
Demand Interval		The time period during which electric energy is measured, usually in 15-, 30-, or 60-minute increments.	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
Double Element Contingency		A **contingency** involving the loss of two **elements**.	
Emergency Rating		The rating – as defined by the equipment owner – that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units, that a system, facility, or **element** can support or withstand for a finite period. The rating assumes acceptable loss of equipment life or other physical or safety limitations for the equipment involved.	
Firm Demand		That portion of the Contract Demand that a **power** supplier is obligated to provide except when system **reliability** is threatened or during **emergency** conditions.	
First Contingency Incremental Transfer Capability	**FCITC**	The amount of **power**, incremental above normal base **power** transfers, that can be transferred over the transmission network in a reliable manner based on the following conditions: 1. For the existing or planned system configuration, and with normal (pre-**contingency) operating procedures** in effect, all facility loadings are within normal **ratings** and all voltages are within normal limits. 2. The electric systems are capable of absorbing the dynamic **power swings**, and remaining stable, following a **disturbance** that results in the loss of any single electric **element**, such as a transmission line, transformer, or generating unit. 3. After the dynamic **power swings** subside following a **disturbance** that results in the loss of any single electric system **element** as described in 2 above, and after the operation of automatic operating systems, but before any post-**contingency** operator-initiated system adjustments are implemented, all transmission facility loadings are within **emergency**	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
		ratings and all voltages are within **emergency** limits.	
First Contingency Total Transfer Capability	**FCTTC**	The algebraic sums of the FCITC values and the appropriate total interregional transfers assumed in the base load flow model used for the FCITC calculations.	
Forced Outage Rate		The hours a generating unit, transmission line, or other facility is forced out of service, divided by the sum of the hours it is removed from service, plus the total number of hours the facility was connected to the electricity system expressed as a percent.	
Harmonic Current		A periodic component of current having a frequency that is an integral multiple of that currents fundamental frequency. Harmonic currents are normally measured in amperes or in percent of the fundamental frequency current, generally at specific frequencies, such as second and third harmonics. Harmonic currents can, for example, be generated by HVdc converters, **Static Var Compensators** (SVC) and geomagnetically induced currents (GIC).	
High Speed Fault Clearing		Fault clearing consistent with correct operation of high-speed relays and the associated circuit breakers without intentional time delay. *Notes:* The specified time for high-speed relays in present practice is 50 milliseconds (three cycles on a 60Hz basis) or less. [IEEE C37.100-1981]. For planning purposes, a total clearing time of six cycles or less is considered high speed.	
High-Speed Auto reclosing		The auto reclosing of a circuit breaker after a necessary time delay (less than one second) to permit **fault** arc deionization with due regard to coordination with all **relay** protective systems. This type of auto reclosing is generally not supervised by voltage magnitude or phase angle.	
Integrated Demand		The average of the instantaneous demands over the demand interval.	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
Interchange Scheduling		The actions taken by scheduling entities to arrange transfer of electric **power**. The schedule consists of an agreement on the amount, start and end times, ramp rate, and degree of firmness.	
Instantaneous Demand		The rate of energy delivered at a given instant.	
Limiting Contingency		The **contingency** which establishes the **transfer capability**.	
Load Cycle		The normal pattern of **demand** over a specified time period associated with a device or circuit.	
Long Time Emergency (LTE) Rating		The maximum rating of electrical equipment based on nominal ambient conditions and recognizing the nominal **load cycle** for a long period such as 24 hours.	
Manual Reclosing		The closing of a circuit breaker by operator action after it has been tripped by **protective relays**. Operator initiated closing commands may originate from local control or from remote (supervisory) control. Either local or remote close commands may be supervised or unsupervised.	
Negative Shared Activation Reserve Energy		Energy received by an assisting **Area** from a contingent **Area** for an eligible **resource** loss having a concurrent effective loss of demand that exceeds the loss of energy from the **resource** loss, and is implemented at a zero time ramp rate immediately following allocation notification, maintained until the Contingent **Area** requests a return to normal but not longer than thirty minutes, and ramped out at a ten-minute ramp rate following communications initiated by the Contingent **Area** which have resulted in mutually established **interchange schedules.**	
Non coincident Demand		The sum of two or more demands that occur in different demand intervals.	
Non recallable Available Transfer Capability	**NATC**	Total Transmission Capability less the **Transmission Reliability Margin**, less non recallable reserved transmission service (including the **Capacity Benefit Margin**).	
Non-Synchronized Reserve		That portion of **operating capacity**, which is available for synchronizing to	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
		the network and that capacity which can be made available by applying load management techniques such as curtailing **interruptible loads** or implementing **voltage reductions**.	
Normal Incremental Transfer Capability	**NITC**	The amount of electric **power**, incremental above normal base power transfers, that can be transferred between two areas of the interconnected transmission systems under conditions where pre-**contingency** loadings reach the normal thermal **rating** of a facility prior to any first **contingency** transfer limits being reached. When this occurs, NITC replaces FCITC as the most limiting transfer capability.	
Normal Rating		The rating – as defined by the equipment owner – that specifies the level of electrical loading, usually expressed in megawatts (MW) or other appropriate units that a system, facility, or **element** can support or withstand through the daily **demand** cycles without loss of equipment life.	
NPCC Emergency Criteria Contingencies		The set of contingencies to be observed when operating the **bulk power system** under **emergency** conditions.	
NPCC Normal Criteria Contingencies		The set of contingencies to be observed when operating the **bulk power system** under normal conditions.	
Peak Demand		The highest electric **power** requirement occurring in a given period (e.g., an hour, a day, month, season, or year). For an electric system, it is equal to the sum of the metered net outputs of all generators within a system and the metered line flows into the system, less the metered line flows out of the system.	
Peaking Capacity		Capacity used to serve **peak demand**. Peaking generating units operate a limited number of hours per year, and their capacity factor is normally less than 20%.	
Permanent Fault		A fault which prevents the affected **element** from being returned to service until physical actions are taken to effect repairs or to remove the cause of the fault.	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
Pole (of an ac switching device)		That portion of the device associated exclusively with one electrically separated conducting path of the main circuit of the device.	
Post contingency Operating Procedures		Operating procedures that may be invoked by the **system operator** to mitigate or alleviate system problems after a **contingency** has occurred.	
Power		Apparent Power — The product of the volts and amperes. It comprises both *real* and *reactive* power, usually expressed in kilo volt amperes (kVA) or megavoltamperes (MVA).	
Power Pool		Two or more interconnected electric systems operated and/or planned to supply **power** for their combined **demand** requirements.	
Recallable Available Transmission Capability	**RATC**	Total Transmission Capability less the **Transmission Reliability Margin**, less recallable transmission service, less non-recallable transmission service (including the **Capacity Benefit Margin**).	
Reclosing *This term by itself is not defined in the NPCC glossary.*		*Need to develop this definition.*	
Regional Reserve Sharing		Procedure that allows participating **Areas** to reduce the requirement for **reserve** within its **Area** due to the availability and deliverability of **reserve** from other **Areas.**	
Regional Reserve Sharing Energy		Energy delivered to a contingent **Area** from assisting **Areas** that is converted from delivered **Shared Activation Reserve Energy** after the **Shared Activation Reserve Energy** has been delivered for 30 minutes; maintained until the Contingent **Area** requests a return to normal but not longer than sixty minutes, and ramped out at a ten-minute ramp rate following communications initiated by the Contingent **Area** which have resulted in mutually established **interchange schedules.**	
Shared Activation Reserve Energy		Energy delivered from an assisting **Area** to a contingent **Area** that is implemented at a zero time ramp rate immediately following allocation	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
		notification, maintained until the Contingent **Area** requests a return to normal but not longer than thirty minutes, and ramped out at a ten-minute ramp rate following communications initiated by the Contingent **Area** which have resulted in mutually established **interchange schedules.**	
Single Element Contingency		A **contingency** involving the loss of one **element**.	
Small-Signal Stability		The ability of the electric system to withstand small changes or **disturbances** without the loss of synchronism among the synchronous machines in the system.	
Stability Limit		See NERC definition.	
Supervision		A closing command is said to be supervised if closing is permitted to occur only if certain prerequisite conditions are met (e.g., **synchronism-check**).	
Supervisory Control		A form of remote control comprising an arrangement for the selective control of remotely located facilities by an electrical means over one or more communications media.	
Surge		See NERC definition.	
Synchronism-check		Refers to the determination that acceptable voltages exist on the two sides of the breaker and the phase angle between them is within a specified limit for a specified time.	
Synchronism-check Relay		A verification **relay** whose function is to operate when two input voltages satisfy predetermined operating parameters.	
Transient Fault		A fault which occurs for a short or limited time, or which disappears when the faulted **element** is separated from all electrical sources and which does not require repairs to be made before the **element** can be returned to service either manually or automatically.	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Acronym	Definition	Documents that use this term
Transmission Reliability Margin	**TRM**	TRM is defined as that amount of transmission transfer capability necessary to ensure that the interconnected transmission network is secure under a reasonable range of uncertainties in system conditions.	
Wheeling		The contracted use of electrical facilities of one or more entities to transmit electricity for another entity.	

Note: Terms highlighted in blue are defined differently in the NERC Glossary of Terms

Term	Regional Standard	Acronym	BOT Approved Date	FERC Approved Date	Definition
Current Zero Time (Archive)	PRC-002-NPCC-01	DM	11/04/2010	10/20/2011	The time of the final current zero on the last phase to interrupt. (Source: NERC Glossary of Terms)
Generating Plant (Archive)	PRC-002-NPCC-01	DM	11/04/2010	10/20/2011	One or more generators at a single physical location whereby any single contingency can affect all the generators at that location. (Source: NERC Glossary of Terms)

PSEG
Power LLC

PSEG
80 Park Plaza
Newark, NJ 07101

September 18, 2012

Mr. Guy V. Zito
Assistant Vice President-Standards
Northeast Power Coordinating Council, Inc.
1040 Avenue of the Americas, 10th Floor
New York, NY 10018

Mr. Zito:

I am writing you to inform you of my wishes to nominate a member to the NPCC Regional Standards Committee on behalf of PSEG Power Connecticut LLC, PSEG Power New York LLC, and PSEG New Haven LLC, representing the Generator Owner and Generator Operator sectors.

My colleague's contact information is below:

Christy Koncz
NERC Compliance Specialist
80 Park Plaza, T2B, Newark, NJ 07101
973.430.7576
christina.koncz@pseg.com

I thank you in advance for your consideration of this request. Should you have any questions, please let me know.

Sincerely,

Steven Huber
Manager, NERC Compliance

NPCC, Inc.

1040 Avenue of the Americas - 10th Floor
New York, New York 10018-3703

NPCC Regional Standards Committee
Draft Minutes
Meeting # 12-5

Sept. 5, 2012 10:00 a.m. - 5:00 p.m.
Sept. 6, 2012 8:00 a.m. - 3:00 p.m.

Marriott Springhill Suites Old Montreal
445 St-Jean Baptiste St,
Montreal, Qc Canada H2Y 2Z7
Tel: 514-875-4331

Dress Business Casual

RSC@npcc.org

Call in 719-785-1707, Guest Code 8287#

Note: For reference. Glossary of Terms Used in NERC Reliability Standards dated May 25, 2012, and the NPCC Glossary of Terms dated Oct. 26, 2011 included in the Meeting Materials.

Items in red from the Sept. 5, 2012 session.
Items in green from the Sept. 6, 2012 session.

Guy Zito called the meeting to order at 09:57 a.m.
Greg Campoli called the meeting to order at 08:40 a.m.

Attendees introduced themselves.

	Name	***Organization***	***Sector***
1.	Guy Zito (Sept. 5, 2012)	Northeast Power Coordinating Council	
2.	Lee Pedowicz	Northeast Power Coordinating Council	
3.	Si-Truc Phan	Hydro-Quebec TransEnergie	2
4.	Don Weaver	New Brunswick System Operator	2
5.	David Kiguel	Hydro One Networks Inc.	1
6.	Greg Campoli	New York Independent System Operator	2
7.	Gerry Dunbar	Northeast Power Coordinating Council	
8.	Brian Shanahan (guest)	National Grid	
9.	Brian Robinson	Utility Services	5
10.	Ron Falsetti (guest)	AESI	
11.	Michael Jones	National Grid	3
12.	Kathleen Goodman	ISO - New England	2
13.	Chris de Graffenried	Consolidated Edison Co. of New York, Inc.	1
14.	Howard Gugel (guest)	NERC	
15.	Mike Garton	Dominion Resources Services, Inc.	4
16.	Kal Ayoub (guest)	FERC	
17.	Joe Oates (guest) (Sept. 5, 2012)	Hydro-Quebec TransEnergie	
18.	Chantal Mazza (guest)	Hydro-Quebec TransEnergie	
19.	Sarah Martin (guest)	ISO - New England	

On the Phone

	Name	***Organization***	***Sector***
1.	Michael Lombardi	Northeast Utilities	1
2.	Bruce Metruck	New York Power Authority	5
3.	Ben Wu	Orange and Rockland Utilities	1
4.	Sylvain Clermont (Sept. 6, 2012)	Hydro-Quebec TransEnergie	1

Proxy

	Name		***Organization***	***Sector***
	From	**To**		
1.	Peter Yost to Chris de Graffenried		Consolidated Edison Co. of New York, Inc.	3
2.	Wayne Sipperly to Bruce Metruck		New York Power Authority	4

	Name		***Organization***	***Sector***
	From	**To**		
3.	Randy MacDonald to Don Weaver		New Brunswick Power Transmission	1

1. **Introductions. Antitrust Guidelines, Agenda, Roster**
   a. Attendee introductions.
   b. RSC Roster changes.
   c. Read Antitrust Guidelines.
   d. Review of Agenda--inclusions, deletions.

Item 1b--There were no roster changes to report.
Item 1c--Lee Pedowicz read the Antitrust Guidelines.
Item 1d--David Kiguel discussed the new format for the Agenda. Guy Zito replied that there will only be actionable items on it. The Supplement Agenda will only be used for informational and record items.

2. **Review of Previous RSC Meeting Minutes** (in Meeting Materials Package)
   a. Approval of Minutes of previous RSC Meeting.

Item 2a--Guy Zito covered the minutes from the July 18-19, 2012 RSC Meeting. There were no comments. Mike Garton made a motion to accept the Minutes as read. Kathleen Goodman seconded the motion. All participants were in favor.

3. **Action and Ongoing Items List** (in Meeting Materials Package)

Description	Owner	Due	Status
Coordination with the Compliance Committee to develop Joint Activity Action List	Greg Campoli	RSC Meeting	Outgrowth of RSC/CC joint session April 21, 2010.
New York Adoption of More Stringent/Specific NPCC Criteria	Diane Barney	RSC Meeting	Ongoing

   a. NPCC Members on NERC Drafting Teams.
   b. Review Executive Tracking Summary.

Greg Campoli Action Item is ongoing. Diane Barney's revisiting and refilling of more stringent criteria in Directory documents ongoing.

Item 3a--Mike Jones lead the discussion, and has submitted a revision with updated information. Guy Zito asked the question if there could be more direct involvement by

the RSC. Guy Zito asked that the participants let him know if they knew where additional NPCC representation can be used. Si-Truc Phan will talk to Hydro-Quebec TransEnergie's Simon Chano (currently on TFSP) about applying for a position on Project 2007-17's Drafting Team. NERC is looking for a Canadian representative. Simon Chano will have to fill out a self-nomination form, and get management approval. David Kiguel commented that this will have to get done this week in time for the Standard's Committee Sept. 13, 2012 Meeting.

Item 3b--Michael Lombardi discussed. Guy Zito asked how often with the Executive Tracking Summary be updated? Michael Lombardi agreed to update it every two weeks. It will be posted on the NPCC Website. In general, Michael Lombardi will try to issue by the first and fifteenth of every month.

4. Items Requiring RSC Approval

a.

Item 4a--Nothing to report.

5. FERC

a. Issuances below.

Item	NOPR, Petition, Final Rule, Other	Docket No.	Title	Posted
5.1	**Comments**	RM12-1-000	Comments of the North American Electric Reliability Corporation In Response To Notice Of Proposed Rulemaking	7/20/12
	Summary, Instructions, Dates =>	NERC provides these comments in response to FERC's April 19, 2012 NOPR regarding a proposed remand of TPL-001-2 — Transmission System Planning Performance Requirements. In the NOPR, FERC proposed to remand the standard for not meeting the statutory criteria for approval. On April 19, 2012, FERC also issued Order No. 762 remanding NERC's proposed TPL-002-2b. The TPL-002-2b standard includes a provision (footnote b) that allows for planned load shed in a single contingency provided that the plan is documented and alternatives are considered and vetted in an open and transparent stakeholder process. FERC remanded the proposed footnote as vague, unenforceable, and not responsive FERC directives.		

5.2	**Informational Filing**	RM10-5-000	Informational Filing in Compliance with Order No. 758--Interpretation of Protection System Reliability Standard, Docket No. RM10-5-000	7/30/12
	Summary, Instructions, Dates =>	This informational filing is submitted in compliance with Order No. 758 (in Order No. 758, FERC also accepted NERC's commitments to address the concerns in the Protection System Maintenance and Testing standard within the Reliability Standards development process, and directed NERC to file, by July 30, 2012, either a completed project, or an informational filing providing "a schedule for how NERC will address such issues in the Project 2007-17 reinitiated efforts."). On May 10, 2012, the NERC Standards Committee approved a Standard Authorization Request to revise Reliability Standard PRC-005 to address the maintenance and testing of reclosing relays in NERC Project 2007-17.		
5.3	**Motion for an Extension of Time**	RM06-16-010, RM06-16-011	Quarterly Report of the North American Electric Reliability Corporation On Status of Development of BAL-003	7/31/12
	Summary, Instructions, Dates =>	On March 30, 2012, NERC filed with FERC a motion for an extension of time to submit a revised Resource and Demand Balancing ("BAL") Reliability Standard on Frequency Response and Frequency Bias, BAL-003 ("Motion for an Extension of Time"). On May 4, 2012, FERC issued an order establishing a compliance schedule for NERC to submit a revised BAL-003 consistent with FERC's directives in Order No. 693. FERC established a deadline of May 31, 2013, and directed the submission of informational reports on a quarterly basis describing "the progress NERC is making toward completing its analysis and research as well as the progress it is making in completing work on the other issues and filing a revised BAL-003-0 Reliability Standard by May 31, 2013." The instant filing is submitted in compliance with this directive.		

5.4	**Analysis of NERC Standard Process Results Second Quarter 2012**	RR06-1-000, RR09-7-000	**Analysis of NERC Standard Process Results Second Quarter 2012**	7/31/12
	Summary, Instructions, Dates =>	NERC hereby submits its Analysis of NERC Standards Process Results for the Second Quarter 2012 ("Ballot Results Analysis"). This filing is submitted in response to the FERC January 18, 2007 Order requiring NERC to closely monitor and report the voting results for NERC Reliability Standards each quarter for three years and FERC's subsequent order issued on September 16, 2010, whereby FERC renewed and expanded on its directive for an additional three years.		
5.5	**Notice of Filing**	RM06-16-000	**North American Electric Reliability Corporation; Notice of Filing**	8/1/12
	Summary, Instructions, Dates =>	On March 16, 2012, NERC submitted a filing proposing to amend the NERC Glossary Definition by modifying reference to the defined term "Cascading Outages" to "Cascading outages" within the definition of IROL, approved in FERC's Final Rule issued December 27, 2007 on NERC's Proposed Facilities Design, Connections and Maintenance Reliability Standards.		
5.6	**Petition**	RD12- -000	**PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF AN INTERPRETATION TO RELIABILITY STANDARD CIP-002-4 – CRITICAL CYBER ASSET IDENTIFICATION**	8/1/12
	Summary, Instructions, Dates =>	NERC hereby requests FERC approve, in accordance with Section 215(d)(1) of the Federal Power Act ("FPA") and Section 39.5 of FERC's Regulations, an interpretation of Reliability Standard CIP-002-4-- Critical Cyber Asset Identification, Requirement R3, to become effective concurrent with the date of a FERC Order approving this petition. Upon FERC approval of the interpretation, the standard will be referred to as CIP-002-4a — Critical Cyber Asset Identification.		

5.7	**Petition**	RD12- -000	**PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF AN INTERPRETATION TO RELIABILITY STANDARD CIP-004-4 – PERSONNEL AND TRAINING**	8/1/12
	Summary, Instructions, Dates =>	NERC hereby requests FERC approve, in accordance with Section 215(d)(1) of the Federal Power Act ("FPA") and Section 39.5 of FERC's Regulations, an interpretation of Reliability Standard CIP-004-4a--Personnel and Training, Requirements R2, R3, and R4, to become effective concurrent with the date of a FERC Order approving this petition. Upon FERC approval of the interpretation, the standard will be referred to as CIP-004-4a--Personnel and Training.		
5.8	**Order on Reconsideration**	RM11-18-001	**Order On Reconsideration**	8/3/12
	Summary, Instructions, Dates =>	On April 19, 2012, FERC issued a Final Rule remanding a proposal by NERC to modify a provision in TPL-002-0b that allows for planned load shed after a single contingency provided that the plan is documented and alternatives are considered in an open and transparent stakeholder process. The Final Rule found that the proposed provision was vague, unenforceable and not responsive to the previous FERC directives on this matter. Further, in the Final Rule, FERC directed NERC to utilize its Expedited Standards Development Process to develop timely modifications in response to the remand. NERC requests reconsideration, or alternatively rehearing, of the Final Rule with respect to the requirement that NERC use the Expedited Standards Development Process to develop responsive modifications to footnote 'b' of the Reliability Standard. As discussed below, FERC grants NERC's request for reconsideration.		

5.9	**Petition**	RM12-12-000	**Petition of the North American Electric Reliability Corporation For Approval of Proposed NPCC Regional Reliability Standard PRC-006-NPCC-1 – Automatic Underfrequency Load Shedding**	8/3/12
	Summary, Instructions, Dates =>	On May 4, 2012, NERC filed a Petition for Approval of Proposed Regional Reliability Standard PRC-006-NPCC-1--Automatic Underfrequency Load Shedding. It has come to NERC's attention that the implementation plan for the standard was indicated to be in Exhibit A, but is located in Exhibit B at pg. 195 of the pdf filing. This is in error, and NERC submits this filing to correct the record and provide the implementation plan for ease of reference. NERC includes the corrected **Exhibit A** to this filing which contains Regional Reliability Standard PRC-006-NPCC-1 and the accompanying Implementation Plan for Regional Reliability Standard PRC-006-NPCC-1.		
5.10	**Order**	RM11-11-001	**Order Denying Clarification and Rehearing**	8/3/12
	Summary, Instructions, Dates =>	The National Rural Electric Cooperative Association (NRECA) and the American Public Power Association (APPA) filed a joint request for clarification or, in the alternative, rehearing of Order No. 761, in which FERC approved the "Version 4" Critical Infrastructure Protection (CIP) Reliability Standards, submitted by NERC. NRECA and APPA contend that FERC erred in certifying that, pursuant to the Regulatory Flexibility Act of 1980 (RFA), implementation of the Version 4 CIP Reliability Standards would not have a significant impact on a substantial number of small entities. For the reasons discussed in the body of this order, FERC denies the request for clarification and rehearing.		

5.11	**Compliance Filing**	RM11-20-000	**Compliance Filing Of The North American Electric Reliability Corporation In Response To Order No. 763 On Automatic Underfrequency Load Shedding And Load Shedding Plans Reliability Standards**	8/9/12
	Summary, Instructions, Dates =>	On March 31, 2011, NERC filed a petition pursuant to section 215(d)(1) of the Federal Power Act and section 39.5 of FERC's regulations requesting approval of PRC-006-1 (Automatic Underfrequency Load Shedding) and EOP-003-2 (Load Shedding Plans). On October 20, 2011, FERC issued a NOPR. On May 7, 2012, the Commission issued Order No. 763 approving PRC-006-1 and EOP-003-2, and directing NERC to file revisions to one VSL PRC-006-1, Requirement R8, and one VRF for PRC-006-1, Requirement R5. The order also directed NERC to make revisions to future versions of Requirement R9 of PRC-006 and to submit a compliance filing within 30 days of the effective date of the Final Rule explaining how NERC plans to comply. This filing is submitted in compliance with Order No. 763.		
5.12	**Petition**	RD12-5-000	**Petition of the North American Electric Reliability Corporation for Approval of an Interpretation to Reliability Standard CIP-002-4 – Critical Cyber Asset Identification**	8/20/12
	Summary, Instructions, Dates =>	NERC's petition states that the proposed interpretation applies to all versions of the CIP-002 standard, and makes reference to the phrase "Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange," which is included in Requirement R3 of CIP-002-1, CIP-002-2, and CIP-002-3. However, this phrase was modified in CIP-002-4, and the requirement no longer includes examples.		

		Therefore, with respect to the above phrase, the interpretation of CIP-002 should only apply to CIP-002-1, CIP-002-2, and CIP-002-3, and does not apply to CIP-002-4. NERC submits this filing to correct the record.		
5.13	**Petition**	RD12-	**Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standard Mod-028-2 – Area Interchange Methodology**	8/24/12
	Summary, Instructions, Dates =>	NERC hereby requests FERC to approve, proposed standard MOD-028-2 as approved by the NERC Board of Trustees on February 9, 2012. The proposed Reliability Standard provides clarification to the currently effective MOD-028-1 standard on the timing and frequency of Total Transfer Capability ("TTC") calculations needed for Available Transfer Capability ("ATC") calculations. NERC is requesting approval of the following: 1. approval of the proposed Reliability Standard effective on the first day of the first calendar quarter after applicable regulatory approval or where no regulatory approval is required, on the first day of the first calendar quarter after Board approval 2. approval of the implementation plan for the proposed Reliability Standard 3. approval of the retirement of Reliability Standard, effective midnight immediately prior to the first day of the first calendar quarter after applicable regulatory approval or where no regulatory approval is required, on the first day of the first calendar quarter after Board approval.		
5.14	**Order Granting Clarification**	RM11-20-001	**Order Granting Clarification**	8/30/12
	Summary, Instructions, Dates =>	The Wisconsin Electric Power Company (Wisconsin Electric) filed a request for clarification or, in the alternative, a request for rehearing of Order No. 763. The request is limited to the discussion of coordination of automatic underfrequency load shedding (UFLS) and manual load shedding programs in Order No. 763. The request for clarification was granted.		

5.15	**Compliance Filing**	RM06-16-000	**Second Quarter 2012 Compliance Filing of The North American Electric Reliability Corporation In Response To Paragraph 629 Of Order No. 693**	8/31/12
	Summary, Instructions, Dates =>	In its March 16, 2007 Order, FERC directed NERC to provide a quarterly informational filing regarding the timeframe to restore power to the auxiliary power systems of U.S. nuclear power plants following a blackout as determined during simulations and drills of system restoration plans. This filing includes information for the second quarter of 2012 and is submitted in compliance with that directive.		
5.16	**Comments**	RM12-6-000, RM12-7-000	**COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO NOTICE OF PROPOSED RULEMAKING**	9/4/12
	Summary, Instructions, Dates =>	NERC hereby provides these comments in response to FERC's June 22, 2012, NOPR (July 18-19, 2012 RSC Meeting Item 6N-2) regarding revisions to the ERO Definition of BES and RoP. In the NOPR, FERC proposed to approve a modification to the currently-effective definition of "bulk electric system." The proposed modification to the definition removes language allowing for regional discretion in the currently effective bulk electric system definition. The proposed revised definition also establishes a bright-line threshold so that the "bulk electric system" will include facilities operated at 100 kV or higher, if they are Transmission Elements, or connected at 100 kV or higher, if they are Real Power or Reactive Power resources. The new proposed definition contains specific inclusions and exclusions to provide clarity in the definition that the facilities described in certain configurations are included in or excluded from the BES Definition. By this filing, NERC submits its responses to the NOPR.		

5.17	**Comments**	RM12-6-000, RM12-7-000	**COMMENTS OF FLORIDA RELIABILITY COORDINATING COUNCIL MIDWEST RELIABILITY ORGANIZATION NORTHEAST POWER COORDINATING COUNCIL, INC. RELIABILITYFIRST CORPORATION SOUTHWEST POWER POOL REGIONAL ENTITY SERC RELIABILITY CORPORATION TEXAS RELIABILITY ENTITY, INC., AND WESTERN ELECTRICITY COORDINATING COUNCIL**	9/4/12
	Summary, Instructions, Dates =>	"The Regional Entities appreciate the opportunity to provide comments on the NOPR and encourage Commission approval of the revised BES definition, related additions and conforming changes to the ROP, the Detailed Information Exception Request Form and the implementation plan. The revised BES definition addresses the Commission's directives and technical and policy concerns as set forth in Order No. 743 and Order No. 743-A and is "just, reasonable, not unduly discriminatory or preferential, and in the public interest", as required by the Federal Power Act §215(d)(2). The Regional Entities offer the following general comments."		

Item 5.1--Guy Zito reported that the Drafting Team still has work yet that has to be completed. Comments received at NPCC indicated no consensus.
Item 5.2--Guy Zito discussed.
Item 5.3--Guy Zito discussed.
Item 5.4--Kathleen Goodman asked if the Standards Committee was involved with the results. David Kiguel remarked that the Standards Committee only had it for information. Kathleen Goodman commented that the Standards Committee should get more involved with a standard's development, and information should be made public. Guy Zito asked if the information presented here was all that FERC wanted. David

Kiguel and Guy Zito will express their opinions on what the core issues surrounding the issuance of projects are, and a project's development.
Item 5.5--This was a posting for a change to remove a capital letter.
Item 5.6--Guy Zito discussed. The interpretation was good.
Item 5.7--Guy Zito reported that TFIST was good with it.
Item 5.8--Guy Zito discussed.
Item 5.9--Guy Zito discussed.
Item 5.10--FERC's analysis was being questioned. FERC denied a rehearing.
Item 5.11--Guy Zito discussed.
Item 5.12--This is the same as Item 5.6.
Item 5.13--Guy Zito discussed.
Item 5.14--Guy Zito discussed. Wisconsin Electric Power Co. looking for an explanation of the overlap between manual and automatic load shedding. If UFLS is insufficient, then manual load shedding would be needed.
Item 5.15--Quarterly filing.
Item 5.16--Guy Zito lead the discussion.
Item 5.17--NPCC filing. There was no consideration of Canadian issues in the filing. No one was consulted to see if there were any Canadian issues. Kathleen Goodman remarked that this needs to be discussed at the Board level. David Kiguel reported that both the IESO and Hydro One submitted comments. Guy Zito reported that the Massachusetts Department of Public Utilities filed comments saying that because there was no CEAP, FERC should not accept the BES definition. Cost benefit has to be identified. David Kiguel commented that Canadian filings are done with the Provincial entities when documents are submitted to FERC. David Kiguel reported that that is what is done in Ontario. Don Weaver commented that New Brunswick doesn't do it.

6. Posted NERC Projects (in Meeting Materials Package)

	Project and Supporting Materials	**Current and Pending Ballots**		**Join Ballot Pools**		**Posted for Comment**	
1.	Project 2010-05.1 – Protection Systems: Phase 1 (Misoperations)	Initial Ballot 8/29/12 - 9/7/12	Non-Binding Poll	7/25/12	8/27/12	7/25/12	9/7/12
2.	Adequate Level of Reliability--Revised Definition and Associated Documents					8/15/12	9/13/12
3.	PRC-006-SPP-01 - SPP Automatic Underfrequency Load Shedding					8/15/12	9/28/12
4.	2013-2015 Reliability Standards Development Plan					8/17/12	9/18/12

5.	Project 2007-02 - Operating Personnel Communications Protocols RSAW--comments to be sent to: RSAWfeedback@nerc.net	Successive Ballot 9/11/12 - 9/20/12	Non-Binding Poll			8/22/12	9/20/12
6.	Regional Reliability Standards - MRO Standards Process Manual					8/28/12	10/11/12
7.	Standard Process Manual Revisions to Implement SPIG Recommendations	10/3/12-10/12/12				8/29/12	10/12/12
8.	Project 2009-01 – Disturbance and Sabotage Reporting	Successive Ballot 9/18/12 - 9/27/12	Non-Binding Poll			8/29/12	9/27/12

The goal of the meeting for Item 6 was to put together draft comments for the projects listed.

Item 6-1--The draft responses to the Comment Form were discussed. The possibility of a RSC Member reviewing VRFs and VSLs was discussed. Guy Zito indicated that is recommending a "Yes" vote.

Item 6-2--Discussion centered around resource adequacy. It was felt that the contingencies specified were extreme in nature.

Item 6-3--Guy Zito discussed. RSC has no comments to submit.

Item 6-4--Guy Zito discussed. Typically RSC does not comment unless a member has an issue with an item. Kathleen Goodman commented that Standards EOP-004 and COM-003 are labeled as high priority when they shouldn't be because they do not address a reliability issue.

Item 6-5--The question was raised by the meeting if this Standard was necessary. Should the topic be a guideline?

Item 6-6--Guy Zito discussed. RSC has no comments to submit.

Item 6-7--Guy Zito discussed the slide presentation. As per Section 16.0, the Standards Committee can deviate from the Standards Process Manual. There are safeguards given to provide for justification of those deviations. David Kiguel reported that the Drafting Team decided to stay away from the issue regarding the justification of "No" votes. All "No" votes will be counted. There should be some changes to the balloting software to allow a pull down list that would have choices reflecting what you might not like about a standard. Canadian holidays not considered for conflicts with ballots or comment submission dates.

Item 6-8--Kathleen Goodman commented that EOP-004-2 doesn't help reliability. It is for documentation. If this wasn't done, there would be no effect on reliability.

Regarding Project 2013-02 Paragraph 81, David Kiguel reported that the Drafting Team is looking at the comment responses Friday (Sept. 7, 2012). The Drafting Team is meeting next Wednesday (Sept. 12) and Thursday (Sept. 13).

7. Current NERC Drafting Team Nominations

a.				

8. NERC Meetings (in Meeting Materials Package)

Item 8--Sylvain Clermont reported that Gerry Cauley was disappointed at the length of time it takes to develop a standard. This was discussed at the MRC, BOT, and SOTC meetings. RISC will look at the process, and be careful in not identifying too many items for standards development. In general, all parties are looking to improve the process. Regarding the NERC budget, it is not growing. There is going to be no increase in fees. The question was raised if NERC is doing things beyond its scope. The NERC BOT was receptive to this. NERC activities should be adjusted.

a. Project 2010-17 Definition Of BES (Phase 2)--SDT July 31-August 1, 2012 Meeting.
b. NERC Standards Oversight and Technology Committee August 15, 2012.
c. NERC Board of Trustees approvals--from the August 16, 2012 Meeting, notes.
d. NERC Member Representatives Committee Meeting--August 15, 2012.
e. NERC RSG Sept. 10, 2012 Meeting.
    1. RSG activities to end Oct. 1, 2012.

Item 8a--The MRC wants to shift from a culture of compliance, to a culture of reliability. MRC feels that things are being slowed down because of audit, and compliance fears. The question is how this will be addressed. A group will be formed to review. Kathleen Goodman asked what NERC could curtail. Sylvain Clermont commented that NERC does things to respond to FERC. Should they be doing that? Sylvain Clermont reported that the next MRC Meeting is in November. Greg Campoli asked how fast will this move. Sylvain Clermont doesn't know the timeframe. Greg Campoli commented that the RSC will have to keep track of what's happening. Mike Penstone would welcome any input. Sylvain Clermont will share whatever information he can. Greg Campoli suggested that the RSC have a conference call to go over what's happening. David Kiguel commented that people believe standards development takes too long. It is recognized that standards are complex, and consequently their development takes time. David Kiguel believes the standards process is a success, but can use adjustment. He thinks that there are too many standards. Kathleen Goodman commented that progress could be made if more data was made available to the industry. Sylvain Clermont commented that the root cause has not been identified. Sylvain Clermont also talked about submissions to the BES NOPR. He questioned NPCC's submission of comments. This will be discussed at the next NPCC Board of Directors Meeting. Sylvain Clermont

reported that there was discussion of the BES definition at the MRC Meeting. Pete Heidrich just gave an update.

Greg Campoli asked Chris de Graffenried about Phase 2 of the BES development. Chris de Graffenried reported on the July 31 thru August 1, BESSDT Meeting. Reports were given by groups working on Phase 2 tasks. Voltage thresholds were discussed, such as lowering the voltage from 100kV to 69kV. It was decided to keep 100kV as the threshold. The exception process can always be used. Detailed technical justifications will be needed. A guidance document is being developed. Unfortunately its release date isn't set. It is a work in progress.

9. NERC Compliance Activity (in Meeting Materials Package)

Item 9--Greg Campoli discussed.

a. NERC Compliance Process Bulletin #2012-001--Applicability of PRC-0023-for Generator Owners.

	Draft CANs--Table	**Posted**	**Comments Due**

10. NERC Items of Interest

a. NERC Finance and Audit Committee Meeting--August 15, 2012. NERC 2013 Business Plan and Budget. Page 39 of the redline refers to NPCC and its CEAP.
b. Addressing Zero Defect Concerns in CIP Standards--Industry Webinar Sept. 11, 2012.
c. NERC CEAP.
d. NERC Standards Committee elections. Nominations close Sept. 14, 2012.
e. Notice of Intent to Withdraw Petition for FERC Approval and Retire BAL-004-1.
f. NERC Industry Webinar Version 5 CIP Standards: Successive Ballot Update (2 of 2)--Sept. 21, 2012.
g. 2012 Standards and Compliance Workshops: October 23-25, 2012--Westin Buckhead in Atlanta, Georgia.
h. NERC Realigns Management Team to Better Fit Changing Needs of ERO—August 28, 2012 announcement.
i. NERC Industry Webinar Risk-Based Compliance Monitoring and COM-003-1—Sept. 6, 2012.
j. NERC 2013 Implementation Plan and the Actively Monitored List.
k. Order No. 754 Request for Data or Information effective September 1, 2012.

Item 10--Si-Truc Phan discussed TADS. Will the 100kV bright line have to be implemented next year? Steps will have to be taken to get 100kV facilities included, and this will take time to implement. Is TADS enforceable? A NERC document

published in June, 2012 says that it follows RoP 1600, and is enforceable for the United States entities. Howard Gugel directed the Meeting to the materials posted on the NERC Website. NERC will make a general announcement when the comment period opens. See http://www.nerc.com/page.php?cid=4|62.

Si-Truc described the Hydro-Quebec philosophy of using MOD-029 instead of MOD-028 or MOD-030 for the ATC/TTC calculations. The Standard is being translated into French, and Si-Truc does not want to translate all three Standards if it's not necessary. Kathleen Goodman offered to give Si-Truc the reasons for using each of those three Standards.

Item 10c--David Kiguel remarked that the CEAP Team met last week, and reviewed responses to comments. The document was revised accordingly. The Implementation Plan was worked on. There will be a pilot, and Lessons Learned reviewed. Will be posted again. Approval is needed from the Standards Committee. If necessary, the Standards Committee Executive Committee can approve the posting. Anticipate posting the CEAP in October. Dave Taylor (NERC) says that NERC does not have the staff to do assessments. Because of the confidentiality needed, NERC staff will have to be used. Apparently there is confusion within NERC as to how the CEAP will be handled. Howard Gugel will bring these concerns back to NERC. It has been suggested to use the NPCC to try a pilot.

Item 10d--David Kiguel reported that nominations for the Standards Committee are due September 14, 2012. The openings and composition of the Standards Committee was discussed.

Item 10g--David Kiguel commented that an agenda isn't available. Will be able to attend via Webinar.

Item 10h--Howard Gugel reported on the changes.

Item 10i--Greg Campoli reported.

Howard Gugel reported that NERC is looking to fill two Board of Directors openings. Three Board members are stepping down, only two positions will be filled.

11. NPCC Regional Standards, Directories and Related Items (in Meeting Materials Package)

a. Regional Reliability Reference Directory # 7
Special Protection Systems--revised by TFSP, to be posted in September, 2012.
b. Directory #12 Automatic UFLS alternative IESO Implementation Plan.
c. Update on PRC-006-NPCC-01 Automatic Underfrequency Load Shedding Program.
d. NPCC Fall Standards and Compliance Workshop, Nov. 14-16, 2012 Newport Marriott Hotel.
e. Request for an Interpretation of a Reliability Standard--PRC-002-NPCC-01.
f. Regional Reliability Standards Development Procedure.

g. NPCC Response to a Request for Criteria Interpretation on Regional Reliability Directory# 3 Maintenance Criteria for Bulk Power System Protection.

Item 11--Gerry Dunbar updated the status of the Directories. Task Forces are working on Phase 2. Directories 6, 9, and 10 are completed. Directory #6 was developed under Phase 2. It is anticipated that Directory #5 will be posted for ballot by TFCO during the last quarter of 2012. It is on the agenda for the Sept. 12, 2012 RCC Meeting. TFSS will be approached next week to address the tolerances issue. Tolerances will be included. PRC-006-NPCC-01 has 1% tolerances. Seeking approval to include the tolerances. Directory #12 will be retired when PRC-006-NPCC-01 is approved by all parties. Kathleen Goodman asked that she be notified of all Directory #1 activity. Greg Campoli wants to know who is on the Directory #1 group, and wants to be included in the notifications as well.

Si-Truc Phan questioned whether regional standards are being considered in the Paragraph 81 work. David Kiguel commented that regional standards should be included. Kathleen Goodman reported that two WECC requirements have been included. Si-Truc Phan commented that an eliminated NERC requirement can be adopted in a regional standard.

Greg Campoli commented that Compliance is monitoring Directory developments.

Item 11d--Greg Campoli suggested that a topic to be considered would include NPCC Directories, development, procedures. Kathleen Goodman suggested having classroom sessions to discuss the impact of the BES definition changes.

Item 11e--David Kiguel mentioned that a RSAR had been submitted for PRC-002-NPCC-01, and had been rejected by the RSC. Topic will be on the upcoming RCC Meeting's Agenda. There was a question over the use of BES over BPS in the Standard. Guy Zito commented that a technical justification is needed to accommodate the change in the BES definition. Item 11e--Brian Robinson discussed.

Item 11f--How close do we want to the NPCC Process to mirror NERC? NPCC's process will be needed to revise standards. Item 11f--Lee Pedowicz gave an update.

Item 11g--Gerry Dunbar discussed. Interpretation was done by TFSP.

Greg Campoli lead of a discussion that revolved around how a sub-100kV line in an IROL would be treated with regard to being designated as BES. Does a facility need to go through the inclusion process? Discussed revolved around CIP Standards.

12. <u>Other Items of Interest</u>

a. From the Federal Register, Proposed Rules for the Department of Energy, Reducing Regulatory Burden. Comments due Sept. 7, 2012.

13. Future NPCC Meetings

Ron Falsetti inquired about the RSC 2013 Meeting schedule. Greg Campoli reported that he had discussed with Guy Zito, and that in 2013 there will be two meetings with the Compliance Committee. Before putting together the 2013 RSC Meeting schedule, Guy Zito is waiting for the RCC, and NPCC Board of Director meetings dates.

RSC 2012 Meeting Dates

November 29-30, 2012--Montreal (NPCC General Meeting)

2012 RSC Conference Call Schedule

(call 719-785-1707, Guest Code 8287#)

September 14, 2012	November 16, 2012
September 28, 2012	December 14, 2012
October 12, 2012	December 28, 2012
November 2, 2012	

BOD 2012 Meeting Dates

September 19, 2012--NPCC Offices
October 30, 2012 (Teleconference)
November 28, 2012--Montreal, Quebec

RCC, CC, and Task Force Meeting Dates--2012

RCC	Sept. 12, Nov. 27
CC	9/13-14 (NPCC Offices, NYC), 10/17 (Conference Call), 11/29-30 (Montreal, Joint with RSC)
TFSS	
TFCP	Nov. 7
TFCO	October 17, November 29
TFIST	
TFSP	September 18-19, November 13-14

Meeting adjourned at 16:41.
Meeting adjourned at 10:31.

Respectfully Submitted,

Guy V. Zito, Chair RSC
Assistant Vice President-Standards
Northeast Power Coordinating Council Inc.

Northeast Power Coordinating Council, Inc. (NPCC)

Antitrust Compliance Guidelines

It is NPCC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. The antitrust laws make it important that meeting participants avoid discussion of topics that could result in charges of anti-competitive behavior, including: restraint of trade and conspiracies to monopolize, unfair or deceptive business acts or practices, price discrimination, division of markets, allocation of production, imposition of boycotts, exclusive dealing arrangements, and any other activity that unreasonably restrains competition.

It is the responsibility of every NPCC participant and employee who may in any way affect NPCC's compliance with the antitrust laws to carry out this commitment.

Participants in NPCC activities (including those participating in its committees, task forces and subgroups) should refrain from discussing the following throughout any meeting or during any breaks (including NPCC meetings, conference calls and informal discussions):

- Industry-related topics considered sensitive or market intelligence in nature that are outside of their committee's scope or assignment, or the published agenda for the meeting;
- Their company's prices for products or services, or prices charged by their competitors;
- Costs, discounts, terms of sale, profit margins or anything else that might affect prices;
- The resale prices their customers should charge for products they sell them;
- Allocating markets, customers, territories or products with their competitors;
- Limiting production;
- Whether or not to deal with any company; and
- Any competitively sensitive information concerning their company or a competitor.

Any decisions or actions by NPCC as a result of such meetings will only be taken in the interest of promoting and maintaining the reliability and adequacy of the bulk power system.

Any NPCC meeting participant or employee who is uncertain about the legal ramifications of a particular course of conduct or who has doubts or concerns about whether NPCC's antitrust compliance policy is implicated in any situation should call NPCC's Secretary, Andrianne S. Payson at 212-335-4765.

19	Project 2010-INT-01 Interpretation of TOP-006-2 R1.2 and R3 for FMPP	No	TOP-006-3, R1.2 and R3	NA	Yes - Draft #1 (Thru 7/30/12)	Yes - (Recirculation Thru 9/21/12) Approved 87.5%	9/21/2012	Yes (11/7/12)				Pending Regulatory Approval	x
20	Project 2011-INT-02 - Interpretation of VAR-002 for Constellation	No	VAR-002-2b, R2	x	Yes (Thru 6/27/12)	Yes (Recirculation Thru 7/27/12)	Yes (7/27/12)	Yes (8/16/12)			"Rapid Revision"	Pending Regulatory Approval	
21	Project 2007-17 — Protection System Maintenance & Testing RE-INITIATED	High	PRC-005-2	Yes 1st (Thru 9/28/11)	Yes (Thru 8/27/12)	Yes (Recirculation Thru 10/24/12)	Yes (10/24/12)				The standard will be presented to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities	Under Development	
22	Project 2008-06 — Cyber Security — Order 706 -- CIP Version 5 Standards	High	CIP-002-5 thru CIP-009-5, CIP-010-1 and CIP-011-1	x	Yes (Thru 11/5/12)	Yes (Recirculation Thru 11/5/12)	Yes (11/5/12)				Next Steps: The standards will be presented to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.	Industry Approved	x
23	Project 2009-20 — Interpretation of BAL-003-0 R2 and R5 by Energy Mark, Inc.	No	BAL-003-0.1b	x	x	Yes (Recirc Thru 2/26/10)	Yes (2/26/10)					Under Development	
24	Project 2007-02 — Operating Personnel Communications Protocols	High	COM-003-1 and COM-002-2	Yes 2nd (Thru 5/2/07)	Yes (Thru 12/1312)	Yes (Successive Thru 12/13/12)					Posted with RSAW- see RSAW Tab	Under Development	x
25	Project 2007-06 — System Protection Coordination	High	PRC-027-1 Update	Yes 1st (Thru 7/10/07)	Yes (Thru 12/17/12)	Yes (Successive Thru 12/17/12)						Under Development	x

NERC Reliability Standards Executive Tracking Summary

Revised: **11/19/2012**

Line No.	Project No. / Title	High Priority?	Associated Standard	SAR Posted?	Posted for Comment?	Posted For Ballot?	Industry Approved?	NERC BOT Approved?	Petitioned for FERC Approval?	FERC Approved	Comments	Project Status	
26	Project 2007-09 — Generator Verification	High	MOD-024-2, MOD-025-2, MOD-026-1, MOD-027-1, PRC-019-1 and PRC-024-1	Yes 1st (Thru 5/21/07)	MOD-025-2, MOD-026-1, MOD-027-1, PRC-019-1, PRC-024-1 Yes (Thru 10/29/12)	MOD-026-1 & PRC-024-1 (Successive Thru 11/1/12) MOD-025-2, MOD-026-1, MOD-027-1, PRC-019-1, PRC-024-1 Yes (Successive Thru 10/29/12)						Under Development	
27	Project 2007-12 — Frequency Response	High	BAL-003-1	Yes 3rd (Thru 3/09/07)	Yes 30 day Formal (thru 11/5/12)	Yes (Successive Thru 11/5/12) - Passed					Next Steps: The drafting team will consider all comments received during the formal comment period and successive ballot and, if needed, make revisions to the standards. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.	Under Development	x
28	Project 2009-24 — Interpretation of EOP-005-1 R7 by FMPA	No	EOP-005-1, R7	x	x	Yes 1st (Intitial Thru 1/15/10)					Balloting Deferred per Standards Committee	Under Development	
29	Project 2010-05.1 — Protection Systems: Phase 1 (Misoperations)	High	PRC-004-3	Yes 1st (Informal Thru 7/11/11)	Yes (Draft #2 Thru 9/7/12)	Yes (Initial Thru 9/7/12) - Failed					".1" refers to Phase 1 of the Project		
30	Project 2010-11 — TPL Table 1 Order	No	TPL-001-2a, TPL-001-3, TPL-002-1c	Yes 1st (Thru 5/26/10)	Yes - Formal (Thru 11/19/12)	Yes (Initial Thru 11/19/12)					Draft #7 of TPL-001-2a and Draft #6 of TPL-002-1c posted for combined formal comment period and initial ballot On April 19, 2012 FERC issued Order 762 remanding TPL-002-2b and FERC proposed to remand TPL-001-2. NERC has been directed to revise footnote 'b' in accordance with the directives of Order Nos. 762 and 693.	Under Development	
31	Project 2012-08.1 — Phase 1 of Glossary Updates: Statutory Definitions	No	NERC Glossary Of Terms	For Comment (Thru 8/2/12)	Yes (Thru 8/2/12)	Yes (Intitial Thru 8/2/12)							
32	Project 2012-INT-02 - Interpretation of TPL-003-0a and TPL-004-0 for SPCS	No	TPL-003 and TPL-004	NA	Yes - (Thru 12/5/12)	Yes (Initial Thru 12/5/12)							
33	Project 2012-INT-05 – Interpretation of CIP-002-3 for OGE	No	CIP-002	NA	Yes (Thru 12/20/12)	Yes (Initial Thru 12/20/12)						Under Development	x
34	Project 2013-02 — Paragraph 81	No		Draft for Comment (Thru 9/4/12)	Yes (Thru 12/10/12)	Yes (Initial Thru 12/10/12)					The purpose of the project is to retire or modify FERC-approved Reliability Standard requirements that as FERC noted, "provide little protection to the reliable operations of the BES", are redundant or unnecessary, or to retire or modify a FERC-approved Reliability Standard requirement to increase the efficiency of the ERO's compliance programs.	Under Development	
35	Interpretation 2012-INT-04 CIP-007-3 for ITC	No	CIP-007-3	NA	Yes (Thru 12/10/12)								x
36	Interpretation 2012-INT-06 CIP-003-3 for Consumers Energy	No	CIP-003-3	NA	Yes (Thru 12/10/12)								x
37	Project 2007-11 — Disturbance Monitoring	No	PRC-002-1 and PRC-018-1	Yes 1st (Thru 4/20/07)	Yes 1st (Thru 3/18/09)							Under Development	
38	Project 2008-12 — Coordinate Interchange Standards	No	INT-004-, INT-006-4, INT-009-2, INT-010-2 and INT-011-1	Yes 1st (Thru 7/31/08)	Yes 1st (Thru 12/11/09)							Under Development	
39	Project 2009-02 — Real-time Reliability Monitoring and Analysis Capabilities	No	"New"	Yes 2nd (Thru 2/18/10)	Yes 1st (Informal Thru 4/4/11)						Concept White Paper posted for informal comment period	Under Development	
40	Project 2010-13.2 Phase 2 of Relay Loadability: Generation	No	PRC-025-1	x	Yes 30 day formal (thru 11/5/12)						- ".2" refers to Phase 2 of the Project - 2/15/12 - FERC has granted NERC a one-year extension of time to and including September 30, 2013 to complete the Project pursuant to the Commission's Order No. 733. [Docket No. RM08-13-001]		
41	Project 2010-14.1 — Phase 1 of Balancing Authority Reliability-based Control: Reserves	No	BAL-001-1, BAL-002-2, BAL-012-1, BAL-013-1	NA	Yes - Draft #1 Thru 7/3/12						As of July 28, 2010 this project has merges Project 2007-18 - Reliability-based Controls and is now Project 2010-14 - Balancing Authority Reliability-based Control into a single project	Under Development	
42	Project 2010-16 — Definition of System Operator	No	NERC Glossary Of Terms	Yes 1st (Thru 12/3/10)	Yes 1st (Thru 12/3/10)							Under Development	
43	Project 2010-17 — Definition of Bulk Electric System - Phase 2	High	NERC Glossary Of Terms	For Comment (Thru 2/3/12)	Yes - Informal (Guidance Document Thru 11/5/12)							Under Development	
44	Project 2008-01 — Voltage and Reactive planning and control	No	VAR-001 and VAR-002	Yes 2nd (Thru 3/26/10)								Under Development	
45	Project 2008-02 — Undervoltage Load Shedding	No	PRC-010-0 and PRC-022-1	Yes 1st (Thru 02/19/10)							June 2010 SC meeting - Project deferred until Higher Priority projects are completed	Project Deferred	
46	Project 2009-03 — Emergency Operations	No	EOP-001, EOP-002, EOP-003 and IRO-001	Yes 1st (Thru 1/15/10)								Under Development	
47	Project 2009-05 — Resource Adequacy Assessments	No	"New"	Yes 2nd (Thru 3/30/06)								Under Development	
48	Project 2009-07 — Reliability of Protection Systems	No	"New"	Yes 1st (Thru 2/18/09)							Pending prioritization - may be postponed	Under Development	
49	Project 2010-08 — Functional Model Glossary Revisions	No		Yes 1st (Thru 2/22/10)							June 2010 SC meeting - Project deferred until Higher Priority projects are completed	Project Deferred	
50	Project 2013-01 — Cold Weather Preparedness		"TBD"	Draft for Comment (Thru 10/24/12)									

NERC Reliability Standards Executive Tracking Summary

Revised: **11/19/2012**

Line No.	Project No. / Title	High Priority?	Associated Standard	SAR Posted?	Posted for Comment?	Posted For Ballot?	Industry Approved?	NERC BOT Approved?	Petitioned for FERC Approval?	FERC Approved	Comments	Project Status
51	Project 2009-04 — Phasor Measurement Units	No										Project has not started
52	Project 2010-01 — Support Personnel Training	No									2/15/12 - FERC has granted NERC a two-year extension of time to and including September 30, 2014 to complete the Project pursuant to the Commission's Order No. 742. [Docket No. RM09-25-000]	Project has not started
53	Project 2010-02 — Connecting New Facilities to the Grid	No										Project has not started
54	Project 2010-03 — Modeling Data	No										Project has not started
55	Project 2010-04 — Demand Data	No										Project has not started
56	Project 2010-06 — Results-based Reliability Standards	No	Results-based Reliability Standards Transistion Plan								Transistion Plan posted 7/26/10	
57	Project 2010-INT-02 Interpretation of TOP-003-1 R2 for FMPP	No	TOP-003-1, R2								Requester has been contacted to see if a CAN would satisfy their concerns until the standard is revised - awaiting response	On Hold
58	Project 2010-INT-03 Interpretation of TOP-002-2a R2, R8, and R19 for FMPP	No	TOP-002-2a, R2, R8 and R19								Requester has been contacted to see if a CAN would satisfy their concerns until the standard is revised - awaiting response	On Hold
59	Project 2012-01 Equipment Monitoring and Diagnostic Devices	No	FUTURE									
60	Project 2012-02 Physical Protection	No	FUTURE									
61	Pre-2006 — Operate Within Interconnection Reliability Operating Limits	No	IRO-008-1, IRO-009-1 and IRO-010-1a	Yes 2nd (Thru 9/23/02)	Yes 9th (Thru 4/25/08)	Yes 1st (Recirc Thru 8/21/08)	Yes (8/21/08)	Yes (10/17/08)	Yes (12/31/09)	Yes (3/17/11)	- Order on Rehearing published in Federal Register on July 19, 2011 - Rule published in Federal Register on March 23, 2011	Completed
62	Project 2006-01 — System Personnel Training	No	PER-004-2 and PER-005-1	Yes 2nd (Thru 3/20/06)	Yes 4th (Thru 7/17/08)	Yes 5th (Recirc Thru 12/22/08)	Yes (12/22/08)	Yes (04/01/09)	Yes (9/30/09)	Yes (11/18/10)		Completed
63	Project 2006-03 — System Restoration and Blackstart	No	EOP-001-1, EOP-005-2 and EOP-006-2	Yes 2nd (Thru 3/09/07)	Yes 4 th (Thru 11/18/08)	Yes 5th (Recirc Thru 5/18/09)	Yes (5/18/09)	Yes (8/5/09)	Yes (12/31/09)	Yes (3/17/11)	- Order on Rehearing published in Federal Register on July 19, 2011 (Effective Std EOP-001-2) - Rule published in Federal Register on March 23, 2011	Completed
64	Project 2006-04 — Backup Facilities	No	EOP-008-1	Yes 2nd (Thru 3/16/07)	Yes 5th (Thru 3/8/10)	Yes 7th (Recirc Thru 7/26/10)	Yes (7/26/10)	Yes (8/5/010)	Yes (2/11/11)	Yes (4/21/11)	Posted in Federal Register on 4/28/11	Completed
65	Project 2006-08 — Transmission Loading Relief	No	IRO-006-5 and IRO-006-East-1	Yes (For DT Nomination 1/12/07)	Yes 4th (Thru 11/30/09)	Yes 6th (Recirc Thru 8/30/10)	Yes (8/30/10)	Yes (11/4/10)	Yes (1/13/11)	Yes (4/21/11)		Completed
66	Project 2007-01 — Underfrequency Load Shedding	No	EOP-003-1 and PRC-006-1	Yes 3rd (Thru 3/29/07)	Yes 3rd (Thru 7/16/10)	Yes 6th (Recirc Thru 10/28/10)	Yes (10/28/10)	Yes (11/4/10)	Yes (3/31/11)	Yes (5/7/12)		Completed
67	Project 2007-04 — Certifying System Operators	Normal	PER-003-1	Yes 2nd (Thru 1/31/08)	Yes 1st (Thru 11/20/09)	Yes 3rd (Recirc Thru 12/13/10)	Yes (12/31/10)	Yes (2/17/11)	Yes (4/29/11)	Yes (9/15/11)		Completed
68	Project 2007-05 — Balancing Authority Controls	No	NA	NA	NA	NA	NA	NA	NA	NA	As of July 28, 2010 this project has been merged with Project 2007-18 - Reliability-based Controls and is now Project 2010-14 - Balancing Authority Reliability-based Control	NA
69	Project 2007-17 — Protection System Maintenance & Testing	High	PRC-005-2	Yes 1st (Thru 7/10/07)	Yes 4th (30 day formal Thru 5/12/11)	Yes 8th (Recirculation Thru 6/30/11)	Failed to reach ballot pool aproval	NA	NA	NA	After PRC-005-2 failed to reach ballot pool approval in the recirculation ballot that ended on 6/30/11, the drafting team revised the standard. The Standards Committee authorized re-initiating the project with a posting of the SAR and revised standard for a 45-day comment period, with an initial ballot of the standard conducted during the last 10 days of the comment period.	Re-initiated
70	Project 2007-18 — Reliability-based Control	No	NA	NA	NA	NA	NA	NA	NA	NA	As of July 28, 2010 this project has been merged with Project 2007-18 - Reliability-based Controls and is now Project 2010-14 - Balancing Authority Reliability-based Control	NA
71	Project 2007-23 — Violation Severity Levels	No	Six sets of VSLs for various standards	Yes 2nd "Supp" (Thru 9/16/10)	Yes 6th (Thru 2/18/11)	Yes (Non-Binding Poll Thru 2/18/11	NA - Non Binding Poll Only	Yes (3/10/11)	Yes (3/21/11)	Yes (5/19/11)		Completed
72	Project 2007-24 - Interpretation of TPL-002 and TPL-003	No	TPL-002-0a and TPL-003-0a	x	x	Yes 2nd (Thru 7/7/08)	Yes (7/7/08)	Yes (7/30/08)	Yes (10/24/08)	Yes (4/23/10)		Completed
73	Project 2007-27 — Interpretation of CIP-006 R1.1 by SCE&G	No	CIP-006, R1.1	x	x	Yes (Recirc Thru 12/4/07)	Yes (12/4/07)	Yes (2/12/08)	Yes (12/22/09)	Yes (5/19/11)		Completed
74	Project 2008-06 — Cyber Security — Order 706 (CIP-002-4)	High	CIP-002-4 thru CIP-009-4	x	Yes 1st (Thru 11/3/10)	Yes Recirc Thru 12/30/10) - passed	Yes (12/30/10)	Yes (1/24/11)	Yes (2/10/11)	Yes (4/19/12)		Completed
75	Project 2008-06 — Cyber Security — Order 706 (VRFs and VSLs)	No	CIP VRFs and VSLs	x	Yes 1st (Thru 4/20/09)	Yes (Recirc Thru 11/12/09)	Yes (11/12/09)	Yes (12/16/09)	Yes (12/18/09)	Yes (1/20/11)		Completed
76	Project 2008-07 — Interpretation of EOP-002-2 R6.3 and R7.1 by Brookfield Power	No	EOP-002-2, R6.3 and R7.1	x	x	Yes (Recirc Thru 8/31/09)	Yes (8/31/09)	No (Remanded 2/16/10)	NA	NA	2/16/10 NERC BOT: (1) Remands the proposed interpretation of EOP-002-2, Requirements R6.3 and R7.1, to the Standards Committee because the proposed interpretation adds requirements not in the standard, thereby exceeding the permissible scope of an interpretation, and (2) Directs the Standards Committee to initiate action to revise EOP-002-2 as appropriate	NA
77	Project 2008-08 — EOP VSL Revisions	No	EOP family of standards	Yes 1st (Thru 5/19/08)	Yes 2nd (Thru 12/3/09)	Yes (Non-Binding Poll Thru 2/18/11	NA - Non Binding Poll Only	Yes (3/10/11)	Yes (3/21/11)	Yes (5/19/11)		Completed
78	Project 2008-09 — Interpretation of EOP-001-0 R1 by Regional Entity Compliance Managers	No	EOP-001-0, R1	x	x	Yes 4th (Recirc Thru 10/14/10)	Yes (10/14/10)	Yes (11/4/10)	Yes (9/9/11)	Yes (12/15/11)	The standard will now be referred to as EOP-001-2b	Completed
79	Project 2008-11 — Interpretation of VAR-002a by ICF Consulting	No	VAR-002-1.1b	x	x	Yes (Recirc Thru 1/6/09)	Yes (1/6/09)	Yes (2/10/09)	Yes (3/5/09)	Yes (9/16/10)		Completed
80	Project 2008-15 — Interpretation of CIP-006-1a By US Army Corps of Engineers	No	CIP-006-1a, R4	x	x	Yes (Recirc Thru 2/16/09)	Yes (2/16/09)	Yes (8/5/09)	Yes (12/22/09)	Yes (5/19/11)		Completed
81	Project 2008-18 — Interpretation of TOP-005-1 and IRO-005-1 by Manitoba Hydro	No	TOP-005-1 , R3 and IRO-005-1, R12	x	x	Yes (Recirc Thru 4/27/09)	Yes (4/27/09)	Yes (11/5/09)	Yes (11/24/09)	Yes (4/21/11)	Posted in Federal Register on 4/26/11	Completed

NERC Reliability Standards Executive Tracking Summary

Revised: **11/19/2012**

Line No.	Project No. / Title	High Priority?	Associated Standard	SAR Posted?	Posted for Comment?	Posted For Ballot?	Industry Approved?	NERC BOT Approved?	Petitioned for FERC Approval?	FERC Approved	Comments	Project Status
82	Project 2009-06 — Facility Ratings	Normal	FAC-008-3 (was FAC-008-2)	Yes 2nd (Thru 9/9/09)	Yes 3rd (Formal Thru 5/2/11)	Yes 6th (Recirculation Thru 5/23/11)	Yes (5/23/11)	Yes (5/24/11)	Yes (6/15/11)	Yes (11/17/11)	FAC-008-3 is effective the first day of the first calendar quarter that is twelve months after issuance of the FERC Order. FAC-008-3 combines FAC-008-1 and FAC-009-1 into a single standard.	Completed
83	Project 2009-08 — Nuclear Plant Interface Coordination	No	NUC-001-2	Yes 1st (Thru 3/18/09)	Yes 1st (Thru 3/18/09)	Yes (Recirc Thru 7/20/09)	Yes (7/20/09)	Yes (8/5/09)	Date?	Yes (1/21/10)		Completed
84	Project 2009-09 — Interpretation of CIP-001-1 by Covanta	No	CIP-001-1a	x	x	Yes (Recirc Thru 10/9/09)	Yes (10/09/09)	Yes (2/16/10)	Yes (4/21/10)	Yes (2/2/11)	Approved by Letter Order	Completed
85	Project 2009-10 — Interpretation of PRC-005-1 R1 by Compliance Monitoring Processes Working Group (CMPWG)	No	PRC-005-1, R1	x	x	Yes (Recirc Thru 8/6/09)	Yes (8/6/09)	Yes (11/5/09)	Yes (11/17/09)	Yes (2/3/12)	Posted in Federal Register 2/13/12 - Effective 3/14/12	Completed
86	Project 2009-11 — Interpretation of IRO-010-1 R1.2 and R3 by WECC Reliability Coordination Subcommittee	No	IRO-010-1 R1.2 and R3 --> IRO-010-1a	x	x	Yes (Recirc Thru 6/5/09)	Yes (6/5/09)	Yes (8/5/09)	Yes (12/31/09)	Yes (3/17/11)	NOPR issued 11/18/10, Comments were due 1/24/11	Completed
87	Project 2009-12 — Interpretation of CIP-005-1 by PacifiCorp	No	CIP-005-3a	x	x	Yes (Recirc Thru 10/26/09)	Yes (10/26/09)	Yes (2/16/10)	Yes (4/21/10)	Yes (2/2/11)	Approved by Letter Order	Completed
88	Project 2009-13 — interpretation of CIP-006-1 by PacifiCorp	No	CIP-006-2c	x	x	Yes (Recirc Thru 12/23/09)	Yes (12/23/09)	Yes (2/16/10)	Yes (4/20/10)	Yes (7/15/10)		Completed
89	Project 2009-14 — Interpretation of TPL-002-0 R1.3.10 by PacifiCorp	No	TPL-002-0, R1.3.10	x	x	Yes (Recirc Thru 8/6/09)	Yes (8/6/09)	Yes (11/5/09)	Yes (11/17/09)	Yes (9/15/11)	Posted in Federal Register on 9/22/11 - Effective Date: This rule will become effective October 24, 2011	Completed
90	Project 2009-15 — Interpretation of MOD-001-1 R2 and R8 and MOD-029-1 R5 and R6 by NYISO	No	MOD-001-1, R2 and R8 and MOD-029-1 R5 and R6	x	x	Yes (Recirc Thru 7/17/09)	Yes (7/17/09)	Yes (11/5/09)	Yes (12/2/09)	Yes (9/16/10)		Completed
91	Project 2009-16 — Interpretation - CIP-007-1, R2 — Systems Security Management	No	CIP-007-2a	x	x	Yes (Intitial Thru 9/21/09)	Yes (9/21/09)	Yes (11/5/09)	Yes (11/17/09)	Yes (3/18/10)		Completed
92	Project 2009-17 — Interpretation of PRC-004-1 and PRC-005-1 R2 by Y-W Electric and Tri-State G & T	No	PRC-004-1 and PRC-005-1	x	x	Yes 3rd (Recirc Thru 12/3/10)	Yes (12/3/10)	Yes (2/17/11)	Yes (4/15/11)	Yes (9/26/11)		Completed
93	Project 2009-18 — Withdraw Three Midwest ISO Waivers	No	BAL-006-2 and INT-003-3	x	x	Yes (Intitial Thru 9/8/09)	Yes (9/8/09)	Yes (11/5/09)	Yes (11/20/09)	Yes (1/6/11)		Completed
94	Project 2009-21 — Cyber Security Ninety-day Response — CIP Family of Standards	No	CIP-002 through CIP-009, V3	Yes 1st (Thru 11/12/09)	Yes 1st (Thru 11/12/09)	Yes (Recirc Thru 12/14/09)	Yes (12/14/09)	Yes	Yes (1/19/10)	Yes (3/18/10)		Completed
95	Project 2009-23 — Interpretation of CIP-004-2 R3 by Army Corps of Engineers	No	CIP-004-2	x	x	Yes 2nd (Intitial Thru 4/8/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
96	Project 2009-25 — Interpretation of BAL-001-01 and BAL-002-0 by BPA	No	BAL-001-0.1a and BAL-002-0	x	x	Yes 1st (Intitial Thru 1/15/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
97	Project 2009-27 — Interpretation of TOP-002-2a R10 by FMPP	No	TOP-002-2a, R10	x	x	Yes (Recirc Thru 10/16/10)	Yes (10/16/10)	Yes (11/4/10)	Yes (4/15/11)	Yes (10/20/11)		Completed
98	Project 2009-28 — Interpretation of EOP-001-1 and EOP-001-2 R2.2 by FMPP	No	EOP-001-1 and EOP-001-2	x	x	Yes (Recirc Thru 10/15/10)	Yes (10/15/10)	Yes (11/4/10)	Yes (9/9/11)	Yes (12/15/11)	The standard will now be referred to as EOP-001-2b	Completed
99	Project 2009-29 — Interpretation of TOP-002-2a R6 by FMPP	No	TOP-002-2a, R6	x	x	Yes 1st (Intitial Thru 2/22/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
100	Project 2009-30 — Interpretation of PRC-001-1 R1 by WPSC	No	PRC-001-1	x	x	Yes 1st (Intitial Thru 2/26/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
101	Project 2009-31 — Interpretation of TOP-001-1 R8 by FMPP	No	TOP-001-1, R8	x	x	Yes 1st (Intitial Thru 3/16/10)	Yes (3/16/10)	Yes (5/12/10)	Yes (7/16/10)	Yes (9/15/11)	Posted in Federal Register on 9/20/11 - Effective Date: This rule will become effective November 21, 2011	Completed
102	Project 2009-32 — Interpretation of EOP-003-1 R3 and R5 by FMPP	No	EOP-003-1, R3 and R5	x	x	Yes 2nd (Re-ballot Thru 3/31/10)	NA	NA	NA	NA		Standards Committee curtailed work 04/12/11
103	Project 2010-10 — FAC Order 729	No	FAC-013-2	Yes 1st (Thru 4/29/10)	Yes 3rd (Thru 1/8/11)	Yes 3rd (Recirc Thru 1/23/11)	Yes (1/23/11)	Yes (1/24/11)	Yes (1/28/11)	Yes (11/17/11)	FAC-013-2 is effective the first day of the calendar quarter twelve months after Commission approval.	Completed
104	Project 2010-12 — Order 693 Directives	No	BAL-002-1, EOP-002-3, FAC-002-1, MOD-021-1, PRC-004-2 and VAR-001-2	Yes 1st (Thru 7/13/10)	Yes 1st (Thru 7/13/10)	Yes 2nd (Recirc Thru 7/31/10)	Yes (7/31/10)	Yes (8/5/10)	Yes (9/9/10)	Yes (1/10/11)		Completed

Re: North American Electric Reliability Corporation
Docket No. FA11-21-000
Reply Brief of the North American Electric Reliability Corporation

Dear Ms. Bose:

In accordance with the procedural schedule established in the Commission's "Order on Procedures" issued June 4, 2012 in Docket No. FA11-21-000, the North American Electric Reliability Corporation (NERC) hereby submits the "Reply Brief of the North American Electric Reliability Corporation" in this docket.

This filing consists of: (1) this transmittal letter, and (2) the Reply Brief of NERC, which are submitted in a single electronic file.

Please contact the undersigned if you have any questions concerning this filing.

Respectfully submitted,

/s/ Owen E. MacBride

Appendix A: Status of Agreement on Audit Staff's Recommendations

Pursuant to the Order on Procedures issued June 4, 2012, in this proceeding, *N. Am. Elec. Reliability Corp.*, 139 FERC ¶ 61,179 (2012), the North American Electric Reliability Corporation hereby submits this Reply Brief to the Response Brief of the Office of Enforcement Staff ("OE," "Staff" or "Audit Staff") which was submitted on August 20, 2012.[1]

I. Executive Summary

The disagreements between NERC and the Audit Staff continue to narrow in resolving minor differences, but have hardened with respect to the major differences.[2] NERC's Initial Brief accepted 20 of Audit Staff's 42 recommendations and proposed alternative approaches to many of the remaining recommendations. In response, the OE Brief proposes to accept two of NERC's alternative recommendations without change and 9 of NERC's alternative recommendations with conditions or limited modifications. NERC agrees with 7 of those 9 further modified recommendations, thereby leaving 29 of the 42 recommendations undisputed.[3] Of the remaining 13 recommendations, the text of 12 recommendations is disputed and there is disagreement on how to implement one recommendation.[4] In contrast to this narrowing of what were minor differences, OE did not offer any concessions on the core areas of disagreement that led NERC to contest the audit – Audit's Staff's effort to micromanage the form of compensation

[1] *Response of Office of Enforcement Staff to the Initial Brief of the North American Electric Reliability Corporation*, filed August 20, 2012 ("OE Brief" or "Response Brief"). A joint brief was also filed by the American Public Power Association, the Edison Electric Institute, the Electric Power Supply Association, the Electricity Consumers Resource Council, the Large Public Power Council, the National Rural Electric Cooperative Association and the Transmission Access Policy Study Group (collectively "Trade Associations"), and brief comments were filed by the California Public Utilities Commission ("CPUC"). The joint brief of the Trade Associations supports NERC's position on all issues addressed by the Trade Associations. The CPUC's comments state generally that appropriate recommendations should be adopted but do not set forth specific arguments in support of any recommendations.

[2] Appendix A to this Reply Brief provides the current status of agreement on the 42 recommendations.

[3] Based on the OE Brief, there is disagreement on how to implement one of the recommendations (Recommendation 1) as to which NERC and OE agree on the text of the recommendation.

[4] For Recommendation 37, on which there is a disagreement as to implementation, NERC is proposing in this Reply Brief a change in its originally-proposed implementation, which NERC hopes will meet OE's concerns about implementation. *See* §III.D below.

for the Board of Trustees, impose cumbersome pre-approval restrictions on the expenditure of funds, and impose unnecessary time recording burdens on NERC and its employees. Similarly, with respect to the disputed factual findings, OE also refused to modify any of the findings and, in a break from past practice, argues that the Commission must resolve every factual dispute even if the findings relate to unopposed recommendations.

NERC is disappointed that the disputes with Audit Staff remain so fundamental, but is pleased that the June 4 Order provides fair procedures for resolving them. Both NERC and OE have had an adequate opportunity to brief the issues to the Commission on an open and transparent basis and, importantly, other interested parties have that same opportunity. In this regard, the Joint Brief of the Trade Associations – whose load-serving members are "responsible for payment of their allocated share of the NERC budget" and therefore "have a very strong interest in NERC's activities" (Trade Assoc. Br. at 2) – provides strong support for NERC's positions. Among the key points made by the Trade Associations are the following:

- *Standard for Oversight.* The Trade Associations disagree with Audit Staff's proposal to adopt a "more intrusive form of regulation" with respect to NERC than it does for public utilities under Part II of the FPA (*id.* at 5). The Trade Associations "urge the Commission to step back and carefully review the Audit Report, separating legitimate concerns regarding expenditures and internal controls from the Audit Report's no doubt well-intentioned but nonetheless intrusive *post hoc* review of NERC management decisions," noting that, "[i]n many instances, there is no one right answer to a management issue" and "[i]n such cases, management decisions should be given appropriate deference in the absence of any showing of lack of diligence or inattention to relevant factors" (*id.* at 7).
- *"Redirection" of Funds.* The Trade Associations disagree with Audit Staff's contention that NERC should obtain pre-approval from the Commission for any significant changes

in budget needs within the budget year, stating that "the compromise NERC has offered in this subject matter area is sufficient and should be accepted by the Commission" and that "NERC must retain flexibility during the course of a budget year to redirect funds as management deems necessary to carry out NERC's ongoing functions" (*id.* at 10).

- *Board Compensation.* The Trade Associations disagree with Audit Staff's argument that NERC must consider returning to a more variable method of compensation for the Board of Trustees unless it can justify a change to a fixed annual retainer method, stating "[t]he Trade Associations believe that so long as the overall compensation levels for NERC Trustees are not out-of-line when compared to other not-for-profit organizations with similar specialized, critical infrastructure missions and the need for board members with specialized experience and qualifications, *there is no need for the Commission to make any recommendations in this area*" (*id.* at 6) (emphasis added).
- *Scope of Section 215.* The Trade Associations disagree with Audit Staff's narrow view of Section 215, noting that "NERC's statutory mandate extends beyond bare-bones reliability standards-drafting and compliance/enforcement activities, and the Commission has recognized this on multiple occasions" (*id.* at 8) and, with respect to the process for addressing the issue, they agree with NERC that "the better forum in which to resolve such scope issues is the budget process itself" where "the Commission and interested industry participants would have the opportunity to debate and resolve in advance which proposed NERC activities are (or are not) within the scope of Section 215." *Id.*

NERC agrees with the views of the Trade Associations on these issues. As the Trade Associations note on several occasions in their Joint Brief, NERC's budget processes and policies are more open than they are for any other entity the Commission regulates, giving the Trade Associations (and Commission staff, if it so desires) multiple opportunities for input. In addition, the Commission's formal review of NERC's annual budget provides yet another

opportunity to evaluate those policies and procedures. This audit is therefore not the only opportunity for the Commission to review NERC's policies and procedures, which continue to evolve and strengthen each year.

With respect to the key differences that remain concerning the recommendations, they are essentially the same as described in NERC's Initial Brief. NERC continues to object to the "intrusive form of regulation" (Trade Assoc. Br. at 5) reflected in three groups of Audit Staff's recommendations.

First, OE continues to argue that NERC must receive prior Commission approval for any "significant" change in its budget expenditures, even if the total funding required through assessments remains within the amount approved by the Commission. NERC has previously explained why this proposal is unworkable and would severely hamper NERC's ability to respond to emerging reliability threats and changing priorities. NERC proposed either to file its quarterly budget variance reports with the Commission for informational purposes or to submit the variance reports to Commission budget staff. NERC Initial Brief at 30-31. Further, NERC has now adopted and submitted to the Commission a detailed Working Capital and Operating Reserves Policy that includes specific internal approval requirements, at the management, Board committee and Board levels, for spending funds from Operating Reserves on unbudgeted activities or on budgeted activities needing additional funding.[5] (*See* §III.A below.) Regrettably, however, OE has not offered any concessions, and continues to advocate a recommendation that could result in NERC making potentially multiple budget filings every year – despite the fact that the Commission's own regulations do not require any additional filings unless the total amount of assessment funding required has increased. OE also fails to address the practical problems with its proposal given the time lags associated with preparing budget filings on an open and transparent basis and the time required for the Commission to review and act on filings.

[5] NERC's Initial Brief at 28-30 discussed development of this new Policy.

Worse yet, OE's proposal would place the Commission in the untenable position of having to essentially forbid NERC from addressing any new reliability threats not identified in the budget unless it had completed a cumbersome mid-year budget process to allocate funds to those threats. As the Trade Associations emphasize, "NERC must retain flexibility during the course of a budget year to redirect funds as management deems necessary to carry out NERC's ongoing functions." Trade Assoc. Br. at 10.

Second, OE – although emphasizing that the Audit Report did not find NERC's Board compensation to be excessive[6] – continues to insist on forcing NERC's Board of Trustees to consider adopting a method of Trustee compensation that is tied to the amount of time each Trustee spends on NERC activities. The Commission should decline to adopt this position because it is the essence of micromanagement. Further, the audit criteria cited in the Audit Report (under "Pertinent Guidance" at page 56 of the Audit Report) do not support Audit Staff's recommendations on Board compensation. The Audit Report's recommendations on Trustee compensation do not provide additional "transparency" and are not required by any Commission regulation or requirement. Nor are the recommendations necessary to ensure consistency with NERC's own policies. To the contrary, the Audit Report's recommendations on Board compensation rest solely on the Audit Staff's unwavering belief that the Board of Trustees should be forced to bill hours and should be paid for their services that way. The Commission should reject this position and adopt NERC's alternative recommendation, under which the Board compensation plan will continue to be evaluated each year in the same open and transparent process that is used today.

Third, OE continues to argue that NERC's employees should be forced to record their time on a "project-specific" basis and that all NERC expenses must be accounted for on that

[6] OE Brief at 62. Audit Staff also made it clear that it was not taking issue with the level of Board compensation *Audit Staff Comments to NERC Response to Draft Audit Report*, Docket No. FA11-21-000, May 4, 2012 (Appendix B to the Final Audit Report) at B-12 ("Audit Report Appendix B").

basis. The Commission should decline this recommendation for several reasons. First, OE has still not explained what it means by "project-specific," leaving it entirely unclear whether NERC must create scores or even hundreds of new time and expense account numbers for the myriad activities performed by NERC employees. Second, Audit Staff's recommendation would create more costs than it would save, by imposing a cumbersome and expensive new process that is not necessary for the effective management of NERC. Third, OE cannot identify any audit criteria that would necessitate this level of micromanagement of NERC's operations. The Commission should therefore adopt NERC's proposal to provide greater granularity in its time and expense reporting systems and to evaluate over time whether further granularity would save costs (rather than increase them) on a net basis and support effective management.

Finally, this Reply Brief also addresses the disputes regarding the Audit Report's factual findings. NERC has sought to keep this section brief, however, reflecting the fact that the OE Brief simply recites for the most part statements from the Audit Report, rather than containing detailed rebuttal to NERC's responses in its Initial Brief.

II. The Appropriate Legal Standards and Procedures

A. The Commission's Oversight Role

Recognizing that the ERO's role "is unique and that the Commission has an important oversight responsibility with respect to the ERO," NERC has suggested that the Commission, in resolving the disagreements that have arisen in this case, distinguish between effective oversight and micromanagement in discharging this important responsibility:

> Effective oversight of NERC implicates two primary criteria. First, the Commission should ensure that NERC's Board and management have adopted reasonable *processes* for ensuring that its budgetary expenditures and controls are reasonable. Second, the Commission should ensure that there is adequate *transparency* with respect to those processes and the related expenditures. By contrast, micromanagement would go one step further and involve the Commission in second-guessing the *substantive* decisions of NERC's Board or management in exercising its discretion with respect to its budget controls and processes. (NERC Initial Brief at 15; emphasis in original.)

NERC also supported this recommendation as consistent with longstanding Commission precedent. Managers of public utilities regulated under Part II of the Federal Power Act have "broad discretion" in conducting their business affairs and are entitled to a "presumption of prudence."[7] Similarly, the Commission has declined to micromanage the decisions of not-for-profit independent transmission system operators ("ISOs") and regional transmission organizations ("RTOs"):

> If the RTO or ISO board is well-informed about the needs of customers and various stakeholders, it will set criteria for performance, appropriate goals and targets for the organization and its management and institute measures for achieving those targets. *By focusing our requirements on having a well-informed board, we decline to intrude further into board prerogatives regarding management compensation.*[8]

In response, OE argues for a more invasive oversight role. OE argues that these longstanding precedents should not be followed here because they would "substantially limit the Commission's ability to oversee the ERO." OE Brief at 10. OE argues that these precedents "ignore NERC's unique role as the Commission-certified ERO and the Commission's special responsibility to promote reliability of the bulk-power system through ERO oversight." *Id.* Similarly, OE argues that "the Commission's oversight of ERO operations cannot be compared to its oversight of public utilities or ISOs/RTOs in light of the Commission's special responsibility to ensure the ERO performs its unique statutory functions." *Id.* at 12. To discharge this "special" and "unique" role, OE therefore recommends that "the Commission should independently measure the Audit Report's findings and recommendations based on the reasonableness of their evidentiary support and by their consistency with the Commission's statutory authority to oversee the ERO." *Id.* at 12-13.

---

[7] *New England Power Co.,* 31 FERC ¶ 61,047 at 61,084, *reh'g denied*, 32 FERC ¶ 61,112 (1985), *aff'd sub nom.*, *Violet v. FERC,* 800 F.2d 280 (lst Cir. 1986).

[8] *Wholesale Competition in Regions with Organized Electric Markets*, Order No. 719, 73 Fed. Reg. 64100 at P 561 (Oct. 28, 2008), FERC Stats. and Regs. ¶ 31,281 (2008), *order on reh'g*, Order No. 719-A, 74 Fed. Reg. 37776 (Jul. 29, 2009), FERC Stats. and Regs. ¶ 31,292 (2009), *order on reh'g*, Order No. 719-B, 129 FERC ¶ 61,252 (2009) (emphasis added).

NERC agrees that its role is "unique" (NERC Initial Brief at 15) because there is only one ERO. But the fact that NERC is unique does not mean the Commission should adopt a more invasive form of oversight than has been applied for decades to other regulated entities. The Commission's longstanding precedents that decline to micromanage the decisions of public utilities and ISOs/RTOs are sound. Management and board decisions must be made in real time using the information available at the time and their experience in weighing the various factors that go into those decisions, not *post hoc* by auditors or parties using a litigation record compiled over the course of months.

Moreover, OE is entirely vague on what its proposed alternative standard should be. For example OE argues that the Commission should "independently measure" Audit Staff's findings against the evidence and ensure "consistency with the Commission's statutory authority" (OE Brief at 12-13), but NERC has not suggested anything to the contrary. Moreover, although OE strenuously objects to NERC's proposal that the Commission focus on procedures and transparency, OE actually appears to embrace this standard by repeatedly emphasizing that its main objective was to increase "transparency." *See, e.g.*, OE Brief at 4 (arguing that the purpose of the audit was to "assess and improve NERC's transparency" and that there must be "accurate and granular information" to ensure "[t]rue budget transparency"); *id.* at 5 (the recommendations are intended to "improve the transparency and accuracy of NERC's budget process").

NERC therefore recommends that the Commission adopt its proposal with respect to the appropriate standard for oversight. It is consistent with decades of practice and is supported by a significant group of stakeholders in this proceeding. The Joint Brief of the Trade Associations correctly states that Audit Staff's "more intrusive form of regulation" (*id.* at 5) would "enmesh the Commission in NERC's management decision-making in a manner that would substantially hamper needed flexibility." *Id.* at 3. The Trade Associations also note that this invasive role is not contemplated by Section 215:

> [T]he statute contemplates that the Commission will review NERC's rules for allocating reasonable costs in connection with certification (and potential decertification) of the ERO, and that oversight of its costs is for the purpose of assuring that the ERO is complying with statutory and regulatory criteria. This framework plainly places primary authority for the oversight of NERC's expenditures with its governing board, and suggests a substantial degree of deference to the ERO, absent evidence that the organization is failing to accomplish statutory and regulatory objectives. (*Id*. at 5)

OE's more intrusive form of regulation also ignores the public nature of NERC's entire budget process and the fact that it is more open than for any other regulated entity and therefore cannot possibly support a more invasive standard of oversight. As NERC explained in its Initial Brief, the process by which NERC's develops its budget is open for public review and comment by those who are responsible to pay the expenses:

> NERC's current annual process for developing its business plan and budget and those of the Regional Entities is extremely open and transparent. It includes posting of NERC's goals and objectives and the NERC and Regional Entity common business plan and budget assumptions for stakeholder comment, posting of drafts of the NERC and Regional Entity business plans and budgets for stakeholder comment, and presentation and discussion of the proposed business plans and budgets at open meetings of the Finance and Audit Committee ("FAC") of the NERC Board, the Member Representatives Committee ("MRC"), and the full Board. Stakeholders have the opportunity to listen to and participate in all of these meetings and to attend the Board meetings. NERC holds meetings and conference calls with stakeholders and stakeholder groups during the budget development process to discuss the draft budgets and receive comments. NERC and the Regional Entities also meet with Commission budget staff to review drafts of the business plans and budgets. (NERC Initial Brief at 18-19; footnotes omitted.)

In addition to this open process for budget *preparation*, the Commission has the opportunity every year to review and approve NERC's proposed budgets. The Commission has used this review on multiple occasions to require changes in priorities, including with respect to staffing concerns. For example, in its order on NERC's 2009 Business Plan and Budget, the Commission expressed concern about the adequacy of NERC's budgeted staffing for the Reliability Standards and Reliability Assessment and Performance Analysis programs and for the event analysis and compliance investigation functions within the Compliance program to carry out their respective responsibilities, and directed NERC to address these concerns in a

compliance filing.[9] In response, NERC submitted a compliance filing in which it reported that it was adding staff and/or consulting resources in each of these programs and instituting process changes in the Reliability Assessment and Performance Analysis program to address the Commission's concerns.[10] Therefore, this audit is not the Commission's only opportunity to review NERC's resources, policies and procedures, which further counsels against the intrusive standard of oversight reflected in the Audit Report.

B. Clear and Objective Audit Criteria

Compounding the problems presented by OE's invasive form of oversight is the fact that OE does not even ground its recommendations on clear or objective audit criteria. Unlike the normal compliance audit, there were no specific, Commission-approved criteria to apply in this case.[11] The Audit Report conceded this to a limited degree, stating that, "unlike the more common compliance audit, [the NERC audit was] designed to *assist* the subject in improving its performance and to facilitate decision-making by those charged with the responsibility to oversee

RR08-6-000 and RR07-14-001, at 2-18 and 34-36. The Commission accepted NERC's actions on these issues, as reported in the compliance filing, in an order issued on July 16, 2009. *North American Electric Reliability Corp.*, 128 FERC ¶61,025 (2009) at PP 17-21.

[11] *Revised Policy Statement on Enforcement*, 123 FERC ¶ 61,156 at P 14 (2008) ("[t]he Divisions of Audits within the Office of Enforcement helps ensure compliance with the Commission's statutes, regulations, and orders by conducting a wide array of audits of jurisdictional entities"); 18 C.F.R. § 41.1(a) (audit report under FPA Part II focuses on "findings that the audited person has not complied with a requirement of the Commission"); *Report on Enforcement*, Docket No. AD07-13-000, pp. 26-27 (November 14, 2007) (OE's "audits provide the Commission with *an objective assessment of industry compliance* with various aspects of the Commission's rules, regulations, and statutory requirements") (emphasis supplied); *Rules Concerning Certification of the Elec. Reliability Org.; and Procedures for the Establishment, Approval, and Enforcement of Elec. Reliability Standards*, Order No. 672, 114 FERC ¶ 61,104, FERC Stats. & Regs. ¶ 31,204 at P 773 ("[w]e contemplate that a compliance audit of the ERO would typically involve an examination of the ERO's ongoing compliance with statutory and regulatory criteria for certification and its performance in carrying out its responsibility to oversee the compliance with and enforcement of Reliability Standards"), *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,202, *appeal dismissed sub nom., N.Y. Indep. Sys. Operator v. FERC*, No. 06-1185 (D.C. Cir. Sept. 29, 2006); *see also* 16 U.S.C. § 824o(e)(5) ("[t]he Commission may take such action as is necessary or appropriate against the ERO . . . *to ensure compliance with a reliability standard or any Commission order* affecting the ERO . . . .") (emphasis supplied).

or initiate corrective action."[12] But Audit Staff does not consider its recommendations mere "assistance;" it demanded that NERC accept them or proceed to litigation.

The OE Brief now contends, however, that it applied "clear and objective" criteria to assess NERC's performance. OE argues that "staff evaluated NERC's performance in light of FPA Section 215 and 18 C.F.R. part 39, as well as NERC's own internal policies and procedures." OE Brief at 4. OE also argues that NERC must "be held accountable for operating in accordance with rules approved by the Commission and . . . budget-related policies, procedures and controls." *Id.* at 4-5. Finally, as indicated, OE argues that a central purpose of the audit was to increase "transparency." *Id* at 4.

NERC has no objection to being held accountable to the "criteria" mentioned by OE, but none of them support OE's disputed recommendations. Consider, for example, the disputes over NERC's current method of Board compensation. The only audit criteria cited in the Audit Report for this topic are (1) Section 215(c)(2) of the FPA, which specifies that to be certified, the ERO candidate must have "rules that allocate equitably reasonable dues, fees, and other charges among end users for all activities under this section;" and (2) 18 C.F.R. §39.4(b), which specifies the required contents of NERC's annual budget filings. OE Brief at 56 ("Pertinent Guidance"). Yet OE does not contend that NERC has violated Section 215, and does not contend that NERC has violated 18 C.F.R. §39.4(b) (or any other provision of Part 39), in using its current method of Board compensation. Nor does OE contend that there was insufficient transparency in the adoption of the current method of Board compensation. Rather, OE takes issue with the substantive decision itself, arguing that NERC's decision to adopt a fixed annual retainer method of Trustee compensation was not adequately supported. OE Brief at 62. This is the very type of *post-hoc*, micromanagement that is clearly an inappropriate form of oversight and, even more fundamentally, lacks any clear or objective criteria by which to exercise that oversight. It is

[12] Audit Report Appendix B at B-4 (emphasis added).

subjective not objective. OE's position simply reflects Audit Staff's preference for one method of Trustee compensation over another.

The same problems underlie OE's recommendations regarding the supposed "redirection" of budgeted funds. OE has argued that NERC must receive prior Commission approval of any "significant" deviation from its approved annual budget, thereby creating the possibility of multiple budget filings every year that leave NERC unable to respond effectively to emerging reliability threats or changes in priorities while those filings are processed.[13] OE rejected NERC's alternative recommendation that would require NERC to continue to increase the transparency of its budgets, file quarterly budget variance reports with the Commission and develop enhanced policies and procedures concerning the expenditure of unspent funds budgeted for one activity on another, emerging activity,[14] even though OE's position was unsupported by any clear or objective criteria. Indeed, the *only* Commission-approved criteria that exist make clear that additional filings are not required unless NERC needs to collect an additional assessment from load-serving entities, not for adjusting priorities and expenditures within the approved budget and assessment funding. 18 C.F.R. §39.4(d) ("On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next Electric Reliability Organization fiscal year, the Electric Reliability Organization may file with the Commission for authorization to collect a special assessment").

OE's position is even more troubling when combined with OE's demand that the Commission resolve all disputed findings in its favor – even where they relate to recommendations that are unopposed. This is a clear break from past practice where audited entities can accept Audit Staff's recommendations without being bound by findings with which they disagree. *Sw. Power Pool, Inc.*, 126 FERC ¶ 61,045 at PP 21-22 (2009) (recognizing

[13] In addition, preparing and submitting such filings would be additional administrative costs for NERC.

[14] NERC has in fact developed, adopted and submitted such enhanced policies and procedures, in its new Working Capital and Operating Reserves Policy. *See* §III.A below.

significant disputes over audit staff's findings, but declining to address them because of agreement on recommendations); *Entergy Services, Inc.,* Letter Order of Norman C. Bay, Oct. 29, 2010, at 1 ("Entergy agrees, in whole or in part, with all 32 recommendations of the Audit Report. Although Entergy disagrees with many factual findings, it 'does not believe that it would be productive to litigate them given that Entergy has agreed to adopt all of Audit Staff's recommendations.' I hereby approve the recommended corrective actions."). It is even contrary to the practice in formal investigations, where settlements that require mitigation plans *do not* require the settling party to accept Enforcement Staff's findings. *See, e.g., In re PacifiCorp,* 137 FERC ¶ 61,176 (2011) (adopting stipulation that contrasts "stipulated facts" to which all parties agree with Enforcement Staff's "findings" regarding alleged violations that did not require acquiescence by party subject to the investigation).[15] NERC believes that its position on all the disputed findings is correct and should be adopted by the Commission if it decides to resolve all of them, but we continue to be surprised by OE's overly litigious approach to this case that would require the Commission to resolve findings over myriad issues even where there are no disputes over the associated recommendations.

III. Remaining Disputed Recommendations

The Audit Report contained 42 recommendations. Based on (i) the recommendations accepted by NERC in its Initial Brief, and (ii) the NERC revised versions of recommendations that were accepted by OE, without condition, in the OE Brief, NERC and OE are in agreement on 22 recommendations, although there is one recommendation (Recommendation 1) as to which NERC and OE disagree on how to implement it. There are an additional nine Audit Staff recommendations which were modified by NERC that OE states in its Brief are acceptable to OE

[15] In this regard, NERC calls to the Commission's attention OE's assertion that because NERC has accepted Audit Report Recommendation 37, it must be accepting the validity of the underlying audit findings. OE Brief at 76. OE's characterization is both erroneous and imprudent. The Commission should consider whether it wants to be sending a message to future auditees (under all provisions of Commission authority) that if they accept and agree to implement an audit recommendation, they will be deemed to have agreed with the validity of the underlying audit findings.

either subject to conditions, or with slight modifications. In this Reply Brief, NERC accepts the proposed conditions or modifications as to seven of those nine recommendations.[16] For Recommendation 37, OE does not dispute NERC's text for the recommendation, but OE does not agree with NERC's proposed implementation of the recommendation. In §III.D below, NERC accepts OE's position on implementation of this recommendation. As a result, there are 29 agreed recommendations, 12 recommendations disputed as to their text, and one recommendation disputed as to how it should be implemented. The agreed recommendations include all the recommendations relating to 7 of the 11 topics addressed in the Audit Report:

- NERC Oversight of the Regional Entities' Budgets
- Employee Compensation
- Standard for Determining the Reasonableness of Expenses
- Employee Entertainment
- Retirement Plans
- NERC Critical Infrastructure Protection Program
- NERC as the Electric Sector – Information Sharing and Analysis Sector.

As noted above, for one of the remaining 13 recommendations (Recommendation 1), the text of the recommendation is not disputed but OE does not agree with NERC's proposed implementation of the recommendation. This leaves only 12 of the original 42 recommendations for which the text is disputed (Recommendations 2, 3, 4, 9, 12, 13, 25, 26, 27, 28, 29, 38.) In the subsections below, NERC demonstrates why the Commission should adopt NERC's version of these 12 recommendations with disputed text and NERC's proposed implementation of the one recommendation for which there is disagreement on implementation.

A. NERC Budget Process/ "Redirection" of Funds

Issues remain with respect to four of the five Audit report recommendations on the topic of "NERC Budget Process." OE and NERC agree on the text of Recommendation 1 but disagree as to its implementation. OE and NERC disagree on the text of Recommendations 2, 3 and 4.

[16] *See* §III.E below.

Recommendations 1, 2 and 3 are discussed in this section and Recommendation 4 is discussed in §III.B below.[17] Recommendation 5 is agreed.

Recommendation 1. The remaining dispute concerning this recommendation relates to its implementation, not to its text. In its Initial Brief, NERC stated that it would file a new Working Capital and Operating Reserves Policy that would implement this recommendation as part of NERC's upcoming 2013 Business Plan and Budget filing. NERC Initial Brief at 28-29. OE, however, believes that the new Policy should be filed in a separate compliance filing outside of the business plan and budget process. OE Brief at 31-32.

OE and NERC agree on the text of this recommendation as originally presented in the Audit Report, that NERC should "Establish more robust procedures and controls over NERC's use of working capital reserves." In its Initial Brief, NERC stated that it was developing a new Working Capital and Operating Reserves Policy, which had been posted for stakeholder input, and upon obtaining NERC Board approval of the new Policy, would include it in NERC's 2013 Business Plan and Budget filing due August 24, 2012.[18] In its Response Brief, OE states that NERC should not submit its proposed Working Capital and Operating Reserves Policy as part of its Business Plan and Budget filing, but rather in a separate compliance filing. OE's reasons are that (i) the Commission has only 70 days to review and approve NERC's annual business plan and budget filings, and (ii) stakeholders' opportunity for comment on the new Policy should not be truncated or rushed. (OE Brief at 31-32.)

However, because the new Working Capital and Operating Reserves Policy had been through a stakeholder review process and received the approval of the NERC Board Finance and

[17] Although Recommendation 4 is presented in the Audit Report in the section on NERC Budget Process, it does not relate to the topic of "redirection" of budgeted funds to new activities and controls on the use of reserves that is the subject matter of Recommendations 1, 2 and 3. Rather, Recommendation 4 pertains more directly to NERC's Time Reporting and Accounting Systems, similar to Recommendations 9-15.

[18] As discussed below, the new Working Capital and Operating Reserves Policy also addresses, in part, Recommendations 2 and 4.

Audit Committee ("FAC") and the full NERC Board, NERC included the new Policy as Exhibit C of its 2013 Business Plan and Budget that was filed with the Commission on August 24, 2012 (Docket No. RR12-13-000). NERC also developed its proposed Working Capital and Operating Reserves amounts for 2013, as reflected in the budget filing, based on the new Policy. The new Working Capital and Operating Reserves Policy:

- Defines Working Capital Reserves as the amount NERC needs to meet projected annual cash flow requirements and any cash balance requirements under the terms of any loan, credit or other agreements to which NERC is a party. The amount of Working Capital Reserves needed for these purposes is to be budgeted and justified each year separately from Operating Reserves. Funds needed for contingencies are not considered part of Working Capital Reserves
- Establishes three separate Operating Reserve accounts, for (i) known contingencies for which timing and amount are uncertain, (ii) unknown contingencies, and (iii) excess funds generated by the System Operator Certification Program.
- Specifies that the amounts in the first two Operating Reserves accounts are to be separately budgeted and justified each year; amounts accumulated in the third account are to be used solely for purposes of the System Operator Certification Program. Further, the budget for the known contingencies account must state the specific contingencies for which provision is being made and specify the range of potential expenditures for each contingency.
- Establishes guidelines and authorities (management, Board committee and Board approval requirements) to access funds in each of the Working Capital and Operating Reserves accounts and to use these funds for activities in excess of the amounts budgeted for the activities.
- Establishes authorities (management, Board committee and Board approval requirements) to hire personnel in excess of the total staffing levels in the approved business plan and budget.

NERC believed that it was important to proceed to develop the new, more detailed Policy and to use it in developing its 2013 budget. NERC submits that the Working Capital and Operating Reserves Policy is sufficiently detailed, and sufficiently explained in the 2013 Business Plan and Budget filing, that the Commission will be able to evaluate it in the course of reviewing the Business Plan and Budget filing. The Commission, of course, has the ability, in its order on the 2013 Business Plan and Budget, to direct NERC to provide more explanation or justification for the Policy in a compliance filing in that proceeding.

With respect to opportunity for stakeholder review of and input to the new Working Capital and Operating Reserves Policy, the proposed Policy was included in Draft #2 of the 2013 Business Plan and Budget, which was posted on NERC's Website for stakeholder comment on June 4, 2012, more than 60 days in advance of the NERC Board meeting at which the 2013 Business Plan and Budget, including the new Policy, was presented to the Board for approval.[19] Only one set of stakeholder comments relating to the proposed Policy was submitted. Those comments were submitted by the Ontario Independent Electricity System Operator ("IESO"). Thus, no stakeholders operating under the jurisdiction of the Commission submitted comments concerning the Policy. Further, the IESO comments were not directed to the Working Capital and Operating Reserves Policy itself, but rather only to the amounts that Draft #2 of the Business Plan and Budget specified would be included in certain of the Working Capital and Operating Reserves accounts.[20] Additionally, stakeholders have the opportunity to submit comments to the Commission on NERC's new Working Capital and Operating Reserves Policy during the comment period the Commission has established for the 2013 Business Plan and Budget in Docket No. RR12-13-000.[21]

OE's position on implementation of Recommendation 1 is inconsistent with the focus of the "performance audit" (according to Audit Staff) as a means to identify areas in which the entity's processes and operations can be improved going forward (*see* §II.B above). Audit Staff identified what it perceived to be a weakness in NERC's current operations and made a recommendation for improvement. Audit Staff and NERC agree on the text of the

[19] NERC sent notice that Draft #2 was posted for comment on the NERC Website to a broad distribution list of interested persons and entities, by e-mail.

[20] The text of the IESO comments is provided in Attachment 12 to NERC's 2013 Business Plan and Budget filing in Docket No. RR12-13-000. After considering the IESO comments and other input on this topic, NERC reduced the amounts included in certain of the Working Capital and Operating Reserves accounts in its final filed 2013 Business Plan and Budget from the amounts indicated in Draft #2.

[21] On August 27, 2012, the Commission issued a notice in Docket No. RR12-13-000 setting the public comment period on NERC's 2013 Business Plan and Budget filing to run through September 14, 2012.

recommendation. NERC has expeditiously implemented the recommendation by developing a new Working Capital and Operating Reserves Policy as part of the process of developing its 2013 budget, including providing opportunity for stakeholder input on the proposed Policy and obtaining Board of Trustees approval. NERC incorporated the new Policy into the development of the Working Capital and Operating Reserves amounts in its 2013 budget. The Policy has been included as part of NERC's 2013 Business Plan and Budget that has been filed with the Commission. What could be more responsive? In contrast, under OE's approach, implementation of a new policy on Working Capital Reserves would be delayed until at least after (i) briefing in this docket is completed, (ii) the Commission issues its order in the docket, (iii) NERC makes a compliance filing, which would include its proposed Policy responsive to Recommendation 1, at some date following issuance of the order, and (iv) the Commission issues an order on the compliance filing.

Accordingly, NERC submits that its new Working Capital and Operating Reserves Policy, which addresses agreed Recommendation 1, can be adequately reviewed, and any adjustments the Commission finds necessary can be addressed, in the context of NERC's 2013 Business Plan and Budget filing, and that a separate filing and proceeding to review the new Policy is not needed.

Recommendation 2. Audit Report Recommendation 2 is:

> Develop a transparent process that permits the Commission, the BOT [NERC Board] and stakeholders opportunity to review the expenditure of funds approved for specific statutory activities to be redirected to unbudgeted activities, and develop and obtain Board approval of enhanced guidelines governing such expenditures, including criteria for determining when Board and Commission approval is required.

NERC proposes to revise Recommendation 2 to:

> Continue to make improvements in budget transparency that informs the Commission, the Board and stakeholders concerning the expenditure of funds approved for specific budgeted activities on unbudgeted activities, and develop and obtain Board approval of enhanced guidelines governing such expenditures,

> including criteria for determining when Board approval is required. (NERC Initial Brief at 27.)

The only meaningful difference between the two versions of Recommendation 2 is OE's insistence that in at least some circumstances, NERC should be required to obtain Commission approval before initiating "significant unbudgeted discretionary projects" (OE Brief at 29-30). As NERC has pointed out, the Commission's regulations already specify when NERC must obtain Commission approval for expenditures or activities between annual budget filings: "On a demonstration of unforeseen and extraordinary circumstances requiring additional funds prior to the next Electric Reliability Organization fiscal year," NERC may file a request for authorization to collect a special assessment. 18 C.F.R. §39.4(d). Such filing "shall include supporting materials explaining the proposed collection in sufficient detail to justify the requested funding, including any departure from the approved funding formula or method," and is to be approved, disapproved, remanded or modified by the Commission.

The circumstances specified in §39.4(d), which goes unmentioned in the OE Brief, are the only circumstances in which the Commission has specified that a filing with and approval by the Commission is required in order for NERC to deviate from the spending proposed in its annual business plan and budget. Further, OE has no real answer to NERC's point that having to get separate Commission approval, between budget filings, to spend funds to respond to new needs that arise between budget filings (other than as specified in §39.4(d)) would be unworkable. OE's position also ignores the fact that NERC **annually** must file a new business plan and budget, with detailed descriptions and justifications of its proposed programs and activities and the expenditures within each program, for Commission approval. Thus, NERC could not get very far down the road of spending funds on a new, unbudgeted activity before it must make the next annual business plan and budget filing with the Commission explaining and justifying the expenditures on the activity. Moreover, if the new activity required spending at a level that could not be supported by NERC's approved ERO assessment for the year and

available reserves, a filing with the Commission would be required pursuant to §39.4(d).[22]

Aside from the disagreement over the need to file for and obtain Commission approval before NERC may spend funds on "significant unbudgeted discretionary projects," NERC's new Working Capital and Operating Reserves Policy addresses Audit Staff's concerns underlying Recommendation 2, under either formulation of its text.[23] The Policy specifies:

- Funds may be drawn from Working Capital Reserves only to the extent necessary to satisfy daily cash flow requirements, and only on the authority of NERC's Chief Financial and Administrative Officer, and shall be promptly replenished to the extent possible from future excess cash flows.
- Funds may be expended from the known contingencies Operating Reserve account only up to the amounts specified in the approved budget for each known contingency, and only on the authority of NERC's President and Chief Executive Officer ("CEO").
- Budgeted expenditures of funds in the System Operator Certification Program Operating Reserve account may be made up to the amount specified in the approved budget, and only on the authority of NERC's President and CEO.
- Expenditures of funds in the unforeseen contingencies Operating Reserve account, and unbudgeted expenditures of funds from the System Operator Certification Program Operating Reserve account, may be made only pursuant to the following approvals:
  - Up to $250,000, only on authority of the NERC President and CEO.
  - Greater than $250,000 but less than $500,000, only with approval of the Finance and Audit Committee of the NERC Board.
  - Greater than $500,000, only with approval of the NERC Board after notice to and recommendation by the FAC.

Further, under the Policy, any expenditure of funds in excess of NERC's approved budget, inclusive of budgeted Working Capital and Operating Reserves, requires prior approval of NERC's Board, after notice to and recommendation of the FAC. Additionally, the Policy

[22] NERC reiterates that the Audit Report found no instance in which NERC intentionally spent less on a budgeted activity than the amount specified in its approved business plan and budget, in order to redirect those budgeted funds to a new, unbudgeted activity. In the example cited in the Audit Report and the OE Brief - expenditures on NERC's two office relocations and its data center relocation during 2011- the activity was included in the 2011 Business Plan and Budget and the expenditures above the 2011 budgeted amount were made from available Working Capital Reserves, not by diverting funds from other budgeted activities to the office relocations. *See* NERC Initial Brief at 24-25; OE Brief at 21 (recognizing that the 2011 expenditures on the office relocations in excess of the specific budgeted amounts came from available Working Capital Reserves).

[23] OE indicates it is aware that the new Working Capital and Operating Reserves Policy will govern any "redirection" of budgeted funds to unbudgeted activities. OE Brief at 32.

mandates that any addition of full-time equivalent employees ("FTEs") or headcount, regardless of the source and availability of funding, which are in excess of the total FTEs or total headcount set forth in the approved business plan and budget for the year, requires approval of the NERC Board after review by the FAC and the Board Corporate Governance and Human Resources Committee. Thus, personnel additions beyond the total staffing levels specified in the approved budget require specific Board approval following review by the Board committees responsible for both budgeting and finance and human resources and staffing.[24]

Importantly, the Policy specifies that budgeted funds may be "redirected" to unbudgeted activities only pursuant to the authorization required (as detailed above) to expend funds from the unforeseen contingencies Operating Reserve account:

> During the course of the year, events may unfold such that some approved budget areas may run below budget, making funds available to satisfy other resource needs based on changing priorities. In the event such under runs occur, these excess funds shall be added to the unforeseen contingency operating reserve and the president and chief executive officer shall have the authority to expend such funds, and management shall also be responsible for reporting such expenditures, in the same manner as the expenditure of funds for other unforeseen contingencies set forth above.

While NERC did not have (contrary to OE's characterization) "unlimited discretion to redirect budgeted funds to other activities" (OE Brief at 33) *before* the audit, NERC certainly will not have any such discretion prospectively under the new Working Capital and Operating Reserves Policy. Similarly, while OE says the Audit Report found NERC had no clear approved policies governing how "redirected" funds may be spent and which expenditures warranted informing the NERC Board and stakeholders in advance (OE Brief at 27), the Working Capital and Operating Reserves Policy addresses this concern.

[24] Personnel Expenses typically comprise approximately 60% of NERC's budget, and personnel additions usually also necessitate some increased expenditures in other budget accounts such as Travel, Meetings, Office Rent, Office Costs, and Capital Expenditures for Computers & Software, Furniture & Fixtures, and Equipment. Personnel Expenses plus the related, personnel-driven costs together comprise about 77% of NERC's budget. *See* NERC Initial Brief at 33-34; OE Brief at 44 (noting that employee compensation is 61.4% of NERC's 2012 budget).

Under the Working Capital and Operating Reserves Policy, as described above, expenditures from the unforeseen contingencies Operating Reserve account (which will be the only means of "redirecting" funds to new, unbudgeted activities) of between $250,000 and $500,000 will require prior approval of the NERC Board FAC, and expenditures in excess of $500,000 will require approval of the full NERC Board. Requests to increase total FTE staffing or headcount above the numbers specified in the approved budget will also require Board approval. Any such requests will have to be presented at a regular or special meeting of the FAC or the Board (as applicable), which means that the request will be detailed, with supporting information, in a meeting agenda posted on the NERC Website in advance of the meeting, and the action taken on the request by the FAC or the Board will be memorialized in meeting minutes that will also be posted on the NERC Website. Therefore, stakeholders and Commission representatives will have advance notice of any such requests to the FAC or the Board for approval of significant expenditures from the unforeseen contingencies Operating Reserve account or to add FTE staff or headcount above the levels specified in the approved budget.

OE contends that the provision in NERC's version of Recommendation 2 by which NERC commits to make continued improvements in transparency concerning its budgets and "redirected" funds is too vague to be meaningful. OE Brief at 32-33. However, NERC's Working Capital and Operating Reserves Policy is detailed and specific; and NERC will have to make a compliance filing or filings in this proceeding, on a schedule set by the Commission, in which NERC will have to detail the specific steps it is taking to implement Recommendation 2. Stakeholders and the Commissions will have the opportunity to review NERC's specific proposed actions in the context of the compliance filing(s).

Finally, it has been NERC's practice, and the new Working Capital and Operating Reserves Policy requires, that "[a]ll expenditures of contingency funds . . . shall be separately reported in the budget variance reports prepared by management and included in the quarterly

Finance and Audit Committee agenda materials, which are posted on [NERC's] website."[25] OE Staff apparently believes that a procedure by which budget variances and expenditures of funds from contingency reserves are reported in quarterly variance reports is inadequate because it does not entail Commission pre-approval. However, such disclosure procedures are the hallmark of a wide range of compliance regimes, from the securities laws to state and federal campaign finance laws and many others. NERC's quarterly, publicly-posted variance reports give both stakeholders and Commission staff a window into NERC's expenditures and the extent, if any, to which they deviate from the approved budget.

Recommendation 3. Audit Report Recommendation 3 is that NERC should "[r]equest budgetary funds for activities initiated between budget cycles that were not included in the annual budget filing in a manner similar to section 1108 of the NERC Rules of Procedure (ROP)." NERC deleted this recommendation, because (1) 18 C.F.R. §39.4(d) (which ROP §1108 is intended to implement) already specifies the circumstances under which NERC must request Commission approval for expenditures not specified in the approved annual budget, and (2) requiring NERC to request approval to spend funds on any activities that were not included in the annual budget (which is what Recommendation 3 would literally require) would be unworkable and prevent NERC from addressing emerging reliability issues in a timely manner. NERC Initial Brief at 31-32. In its Response Brief, OE does not attempt to modify Recommendation 3 to something that would be arguably workable, but rather states that deletion of this recommendation is acceptable on condition that the Audit Report version of Recommendation 2 is adopted. OE Brief at 33. NERC does not accept the Audit Report version of Recommendation 2; therefore, NERC does not accept OE's condition regarding deletion of Recommendation 3.

[25] As explained immediately above, there will be advance notice, in the form of posted FAC or Board meeting agendas, of requests for approval of expenditures in excess of $250,000 from the unforeseen contingencies Operating Reserve account.

In its discussion of Recommendations 2 and 3, OE essentially concedes that NERC could not plausibly be required to request Commission approval to expend funds on any "activities initiated between budgetary cycles that were not included in the annual budget filing" and still do its job as the ERO. Instead, OE contends in its Brief that Commission approval should only be required for "significant [undefined] redirections of funds." OE Brief at 33. As noted, Audit Report Recommendation 3 is unworkable and untenable as written, and OE has not provided any modification to Recommendation 3 to attempt to make it workable (including providing any parameters for "significant redirections").

Although OE states that it would accept the deletion of Recommendation 3 if Audit report Recommendation 2 is adopted, OE also states that "Recommendation 3 is unnecessary *if* Recommendation 2 provides for Commission review and approval of guidelines that govern significant redirection of funds and delineate the activities and budget variances that do not require prior review or approval." OE Brief at 33 (emphasis in original). While NERC does not agree with the specific wording of Audit Report Recommendation 2, NERC believes that its new Working Capital and Operating Reserves Policy will satisfy the requirements listed by OE in the immediately preceding sentence. More generally, NERC agrees with OE that Recommendation 2 encompasses the concerns underlying Recommendation 3 and that Recommendation 3 is unnecessary if an appropriate version of Recommendation 2 is adopted. For the reasons given in the discussion of Recommendation 2 above, NERC's version of Recommendation 2 is appropriate, and is sufficient to warrant elimination of Recommendation 3.

B. Time Reporting and Accounting System

The section of the Audit Report on "Time Reporting and Accounting System" presented seven recommendations, nos. 9 through 15. In addition, as noted above, Recommendation 4 is appropriately discussed under this topic. Recommendations 10, 11, 14 and 15 are agreed. Recommendations 4, 9, 12 and 13 remain disputed. The fundamental issues underlying the

disputed recommendations are (1) whether NERC should be required to immediately adopt "project-specific" time reporting, expense reporting, accounting and budgeting systems, (2) what Audit Staff and OE even mean by "project-specific" cost reporting, accounting and budgeting systems, and (3) why it is so important that NERC be mandated to adopt "project-specific" cost reporting, accounting and budgeting systems. The answer to the first question is no. The answer to the questions 2 and 3 is that one cannot tell from reading the Audit Report and the OE Brief.

Recommendation 4. Audit Report Recommendation 4 is that NERC should:

> Increase the granularity of the NERC budget filings by: (1) breaking out significant cost categories in its expenses; (2) identifying proposed budgeted expenditures, at a minimum, on a project specific basis; and (3) separating working capital reserves needed for operations from working capital reserves needed for contingencies and identifying those contingencies.

NERC's proposed version of Recommendation 4 is:

> Increase the granularity of NERC budget filings by: (1) breaking out budgeted expenses, such as budgeted contractors and consultant expenditures, into more detailed cost categories; and (2) separating working capital reserves needed for operations from working capital reserves needed for contingencies to the extent they are known during business planning. (NERC Initial Brief at 28.)

NERC's version of item (1) in this recommendation preserves the Recommendation's key concept that budgeted expenses should be broken out into more detailed cost categories, while providing an example of a major cost category – budgeted contractors and consultant expenditures – for which NERC admittedly has not provided significant detail in previous years' budgets, but will in the future.[26] NERC deleted item (2) from the Audit Report recommendation because a requirement to budget all expenditures on a "project specific basis" is undefined, but would likely be costly and administratively cumbersome for NERC to implement, and would not contribute to the reliability of the bulk power system. Item (2) in the Audit Report's recommendation would require NERC to adopt "project-specific" budgeting and accounting

[26] In fact, in its 2013 Business Plan and Budget filed in Docket No. RR12-13-000, NERC has provided considerably more granularity and detail about the budgeted Consultants & Contracts expenses than it has provided in previous years' budgets.

before a determination has been made that it will provide sufficient additional useful information to management to justify the costs. Item (2) in the NERC version of this recommendation is similar to item (3) in the Audit Report Recommendation, and, NERC submits, both versions are fully addressed by NERC's new Working Capital and Operating Reserves Policy, as described above in the discussion of Recommendation 1.

Although OE states that "NERC's proposed changes are not acceptable" (OE Brief, App. A, at 1), OE primarily takes issue with NERC's deletion of the requirement that NERC must budget its expenditures on a "project-specific basis."[27] (OE Brief at 33-34.) Despite the concern expressed in NERC's Initial Brief over the undefined nature of the Audit Report's phrase "at a minimum, on a project specific basis," OE has not provided any clarity in its Response Brief as to what is intended by "at a minimum, on a project specific basis." Instead, OE offers only the unsubstantiated, conclusory assertion that Staff examined NERC's time recording and expense tracking systems "and believes that NERC would only need to make minor modifications to track time and expenses for individual projects." (OE Brief at 33.) While any "examination" Audit Staff made of NERC's time recording and expense tracking systems during the audit was necessarily cursory, the NERC Finance and Accounting personnel who work with these systems on a daily basis emphatically disagree that all that would be needed would be "minor modifications" to NERC's accounting software. NERC's current accounting system was not designed to track costs on a "project" level and could not be used to do so without significant additional administrative effort and associated costs. (*See* additional discussion under

[27] OE also objects to NERC's purported "deletion" of the requirement in item (1) of the recommendation that NERC "break out significant cost categories in its expenses." (OE Brief at 33.) However, NERC already breaks out its budgeted expenses into significant cost categories, both as to program area (such as Reliability Standards, Compliance Operations, Compliance Enforcement, and Critical Infrastructure) and type of expenditure (*e.g.*, Salary expense, Benefits expense, Retirement expense, Travel expense, Meetings expense, Conference Call expense and Office Rent). The language in NERC's version of this recommendation that it "break[ ] out budgeted expenses . . . into *more detailed* cost categories" (emphasis added) will actually require **greater** granularity in the budget presentation than would the Audit Report's version of item (1) of this recommendation.

Recommendation 13, below).

Further, OE has completely overlooked the bigger problem with its proposed requirement for accounting and budgeting on a "project specific" basis. Audit Report Recommendation 4 does not simply require NERC to develop an accounting and reporting system that would enable it to easily capture all the time and expenses incurred on identifiable major projects. Rather, it would require NERC to revise its accounting, time recording and expense tracking systems to be systems in which all of NERC's activities must be defined as specific "projects" so that every expenditure of employee time and other expenses can be linked to a unique, defined "project;" as opposed to major activities, which is what NERC is proposing as an initial step to gain further experience and provide a basis for a cost-benefit analysis of adopting more detailed project-level time and expense accounting. While some companies structure their accounting, budgeting and financial reporting on the basis of "projects," it is a fundamentally different accounting system from the one NERC has in place (and the Commission has approved[28]). Thus, a requirement to budget and record all expenditures on a "project-specific" basis could require significant modifications to NERC's accounting system.

OE states that NERC has suggested that "more granular project tracking and budgeting would not provide useful information to its management." OE Brief at 34. NERC has not made such a suggestion. To the contrary, NERC stated in its Initial Brief that, although it disagreed with the text of Audit Report Recommendation 4, "NERC does, however, agree that its budgeted expenditures can be presented in more detailed cost categories than is currently the case."[29] What NERC **has** stated, with respect to OE's insistence on "project specific" budgeting and

[28] *Order Conditionally Accepting Compliance Filing*, 123 FERC ¶ 61,282 (2008).

[29] NERC Initial Brief at 33. NERC went on to describe ways in which it would be providing increased granularity in its budgets. *Id* at 33-34. And in fact, OE later acknowledges that "NERC concurs with staff's view that increased granularity of time and expense accounting would improve transparency and accountability and enhance the Commission's ability to carry out its oversight responsibilities." OE Brief at 42.

accounting, is that:

> NERC does not believe, at this time, that for an organization its size, and given the benefits NERC anticipates from utilizing the additional functionality of its recently-installed time accounting system as further described herein, that the costs and administrative complexities of implementing and maintaining this level of "project" time accounting would be justified by the additional benefits it would provide. (NERC Initial Brief at 40-41.)

OE provides no response to this concern. Nor (to get to the crux of the issue over the different formulations of item (1) in Recommendation 4) has OE explained, in either the Audit Report or its Response Brief, *why* it is important for NERC to adopt "project-specific" budgeting and accounting at this time, rather than waiting until after NERC has implemented additional granularity in its time reporting and budgeting to determine whether "project-specific" accounting and budgeting is cost beneficial. NERC agrees that more granular detail in its budgets than provided in previous years is appropriate, and this is what NERC's version of item (1) in Recommendation 4 would require – without prescribing adoption of a particular model of accounting and budgeting.

OE does not identify any specific concerns with item (2) in NERC's version of Recommendation 4 (which corresponds to item (3) in the Audit Report recommendation). In any event, as noted, NERC's new Working Capital and Operating Reserves Policy fully addresses either version. NERC's version of Recommendation 4 should be adopted.

Recommendation 9. OE's proposed version of Recommendation 9, which is a slight modification of this recommendation from the Audit Report, is:

> Continue to implement a time reporting system with the functionality to track employees' time based on the amount of time spent on specific projects or activities and on statutory or non-statutory reliability activities.[30]

NERC's proposed version of Recommendation 9 is:

[30] The slight modification to this recommendation is the addition of "Continue to" at the start of this recommendation, to recognize that NERC has recently purchased and installed a new time reporting system that will enable time to be recorded in more detailed categories than under the predecessor system. OE Brief at 44 note 131 and at Appendix 1, page 2, note 2.

> Continue implementation of a time reporting system with the functionality to track employees' time based on the amount of time spent on functional activities or key specific projects. (NERC Initial Brief at 42.)

The difference between the two versions is the phrase "amount of time spent on *specific projects or activities and on statutory or non-statutory reliability activities*" (OE version) versus the phrase "amount of time spent on *functional activities or key specific projects*" (NERC version).

OE's Brief provides no specific justification for its version of Recommendation 9 (or its versions of disputed Recommendations 12 and 13), but only states that NERC "has provided no credible support for . . . substantively modifying Recommendation 9", and offers the general proposition that "Improving transparency through project specific tracking of employee time and expenses will provide numerous benefits, including enhanced Commission oversight." OE Brief at 44. Once again, as with Recommendation 4, OE provides no reasons why the Commission should mandate that NERC adopt a time recording and expense tracking system that requires all NERC activities to be defined as specific "projects" and requires all time and expenses to be associated with a specific "project."

As described in the Audit Report and in NERC's Initial Brief, NERC has in fact recently procured and implemented a new employee time-tracking system with greater functionality than the predecessor system to provide for more detailed time reporting by employees. Audit Report at 36; NERC Initial Brief at 40. Under its version of Recommendation 9, NERC is proposing a gradual approach to increasing the granularity of time reporting, with evaluation of the costs and benefits at each step, rather than a mandated, comprehensive switch to a project-based accounting and time-keeping system with an unknown cost-benefit trade-off. Implementation of a time-recording system that provides for time to be recorded on the basis of "functional activities," as stated in NERC's version of Recommendation 9, will enable time to be recorded and tracked by major corporate and departmental activities, as well as the program or department the employee spends the time supporting, including cross-department support activities (*e.g.*,

support provided by Critical Infrastructure Department ("CID") staff to Compliance Program audits of compliance with Critical Infrastructure Protection standards, or support provided by Compliance Program or CID staff to Reliability Standards Program standards development projects). Similarly, implementation of a time-recording system that provides for time to be recorded on the basis of "key specific projects," as stated in NERC's version of the recommendation, will enable time to be recorded to significant projects (which are the projects most likely to involve more than one program or department), without requiring a comprehensive revamping of NERC's accounting and time and expense recording processes to identify every NERC activity as a unique "project."

To implement this recommendation, NERC is developing a list of activity codes to be used for purposes of recording employee time. The list under development currently provides for a total of approximately 95 activity codes against which employee time could be recorded. For all cross-organizational support work, time would be charged to the appropriate departmental activity code under the department that has lead accountability for the activity (regardless of the employee's "home" program or department). Implementation of these time-tracking codes would represent a significant increase in the level of detail and granularity at which NERC employees record their time; however, the codes can be implemented at this level of detail relatively simply and without significant incremental cost in terms of set-up, employee training and system maintenance. At the same time, implementation of these activity codes would represent a "first step" of increased granularity, which NERC will evaluate after a reasonable period of use to assess whether additional granularity (*i.e.*, adoption of even more detailed activity codes) would be cost-beneficial in terms of the incremental information provided to management. NERC is planning to implement these more detailed activity codes in January 2013, with training of employees on use of the new activity codes taking place in the fourth quarter of 2012. In addition to monthly and quarterly reviews of this information by

management, after NERC has 6 to 9 months of data, NERC will conduct a more comprehensive review of the use of these codes and assess at that time whether implementation of additional, even more detailed codes would be sufficiently beneficial in terms of management information to justify the additional costs of implementation and maintenance. NERC proposes to file the results of that assessment as a compliance filing with respect to this audit recommendation.

NERC's version of Recommendation 9, and its planned implementation steps as described immediately above, would fully address the concerns expressed in the Audit Report that are the basis for Recommendation 9. The OE Brief describes those concerns as follows:

> [Audit] Staff expressed concerns with NERC's pre-2012 policy of tracking most employees' time for attendance purposes only and recording that time under employees' administratively-assigned operating division instead of tracking actual time spent on specific projects. [Footnote: Audit Report at 35.] The Audit Report noted that this practice was particularly problematic because NERC's operating divisions had shifted over time and NERC evolved into a "matrix" organization structure in which projects often spanned operating divisions. [Footnote: *Id.*] . . . NERC was actually only tracking employee time by the operating division in which a staff member was employed. (OE Brief at 38; emphasis added.)

Under NERC's version of Recommendation 9, and its planned implementation as described above, employee time will be tracked in *considerably* more detail than under the practice that concerned Audit Staff of "tracking most employees' time for attendance purposes only and recording that time under employees' administratively-assigned operating division." Employees will be required to record their time to an activity code that relates the subject matter of the activity (which is not necessarily led by the employee's home department). Thus, all employees working on a common activity (*e.g.*, standards development or Regional Entity compliance program oversight) will record their time for that activity against the same activity code regardless of the department in which the employee is based. Reports can then be run showing the total time devoted to that activity, total time by person and total time by department. Thus, the time-tracking system will recognize and require the recording of time spent on cross-departmental and cross-functional activities. The Audit Report's concerns that NERC's previous

time-recording procedures were not appropriate for the evolving "matrix" nature of the organization will be fully addressed.[31]

Finally, NERC's version of Recommendation 9 deletes the reference to recording time based on "statutory or non-statutory reliability activities," because NERC does not engage in non-statutory activities and does not anticipate doing so.[32] There are no non-statutory activities to develop codes for. NERC acknowledges that it could add an activity code for "non-statutory activities" to the list of activity codes it is developing, but that activity code would not need to be used. While NERC has no plans at present to engage in non-statutory activities, if NERC ever chooses to engage in a non-statutory activity, additional codes can be added to track the time spent on those activities, in addition to NERC putting in place other accounting controls to ensure the proper allocation of costs associated with those activities.

For these reasons, NERC's version of Recommendation 9 should be adopted.

Recommendation 12. NERC proposes deletion of Audit Report Recommendation 12, which states: "Develop project and business and activity codes to allow better project management, including tracking of operating expenses to project-specific levels." Recommendations 4, 9 and 13 adequately cover the subject matter of recording and reporting employee time and expenses in greater detail and with greater granularity, including with more detailed activity codes or (as urged by OE) on a "project specific basis." Recommendation 12

[31] NERC believes that OE and the Audit Report overstate the extent of the "matrix" nature of the NERC organization with regards to its impact on employee time recording. Most NERC employees spend the vast majority of their time working on activities of the program or department to which the employee is assigned. However, NERC recognizes that there are cross-functional and cross-departmental activities (in fact, NERC is striving to increase the amount of cross-functional support provided among various programs). Therefore, NERC agrees that cross-functional and cross-departmental support activities should be captured in the time tracking system, and is planning enhancements, as described above, that will accomplish this.

[32] If the Commission were to determine that any of NERC's current activities are non-statutory activities and required NERC to develop a separate source of funding for the activity, NERC would have to seriously consider ceasing to perform the activity. Receiving financial support from industry sources other than through the statutory assessment mechanism and other, existing sources could raise questions about NERC's independence.

adds nothing to Recommendations 4, 9 and 13. OE has provided no explanation of how Recommendation 12 differs from Recommendations 4, 9, and 13, nor has OE suggested any specific, unique implementation steps that NERC would be expected to implement to address Recommendation 12, that would not otherwise be encompassed by the implementation actions for Recommendations 4, 9 and 13. In fact, OE has not offered any specific justification for Recommendation 12. Recommendation 12 should be deleted.

Recommendation 13. Audit Report Recommendation 13 is:

> To the extent consistent with good business practices, NERC should expeditiously implement functionality in the expense reporting software to allow the tracking of expenses on a project and activity basis.

NERC proposes that Recommendation 13 be revised to state:

> Conduct a cost-benefit analysis in 2013 of implementing a more detailed project level budgeting and accounting system. (NERC Initial Brief at 43.)

While the Audit Report recommendation uses the phrase "to the extent consistent with good business practices," the NERC version states in a more straightforward manner that NERC must "conduct a cost benefit analysis in 2013." Further, for this recommendation as for others under this topic, OE has not provided any explanation of why NERC should be mandated to move ("expeditiously" or otherwise) to a system of tracking expenses on a project-specific basis.

NERC's version of Recommendation 13 ties to its version of Recommendation 9. NERC plans to implement expense reporting at a similar level of detail as it will implement for employee time, as described above in the discussion of Recommendation 9. After utilizing the more detailed time reporting and expense reporting systems for 6 to 9 months, and gaining background and information regarding the costs and benefits of implementation of project-level reporting and accounting systems, NERC will use this information to conduct a cost-benefit analysis of implementing "project level" budgeting and accounting systems compared to the continued use of its current systems. The cost-benefit analysis will analyze the value, in terms of providing useful information for management, of implementing "project level" time reporting

and accounting systems, and the related costs. NERC will report the results of the cost-benefit analysis in an informational filing with the Commission. Stakeholders will be able to see and comment on the cost-benefit analysis and the Commission will be able to specifically review the results. NERC's version of Recommendation 13, and its approach to this topic, will provide for incremental steps of increasing detail in time recording and expense reporting, with an appropriate stopping point to analyze whether introduction of further detail into NERC's time recording and expense reporting systems is justified by the costs – rather than a mandated flash cut to a "project-specific" time and expense reporting system as would be required by Audit Report Recommendation 13 (and related Audit Report Recommendations 4, 9 and 12).

OE contends that NERC can implement "project-specific" tracking of expenses simply by adding an extra column to its accounting software to hold a "project code field," which OE asserts "could be added with minimal cost." OE Brief at 43. NERC's current expense system would permit a project code to be assigned to an expense report, but not to an individual transaction, which would be required to correctly allocate expenses when multiple projects or activities are related to the expenses incurred. Further, even if the software modifications needed to overcome these problems were relatively simple, OE has greatly understated the additional resources that would be required for NERC to adopt "project-specific" cost and time reporting. As noted earlier, NERC's current accounting system was not designed to track costs on a "project-specific" basis and could not be used to do so without significant additional administrative effort and associated costs. NERC does not wish to prejudge the cost-benefit analysis it will conduct under its version of Recommendation 13, but adding an extra column in a software program is barely the start of implementing and maintaining a project-based accounting system. Other activities required for initial implementation and (probably more significantly) ongoing maintenance of such a system would include:

- Creating an initial list of "projects" (and related codes) that capture all of NERC's current activities.

- Training employees in the use of the new coding system for recording time and expenses.
- Identifying new activities when they are initiated and either associating each new activity with an existing "project," or creating a new "project" for the new activity.
- Monitoring for the completion of projects and deletion or deactivation of the "project" from the accounting code system, so that the system does not contain numerous unneeded project codes that an employee might inadvertently use to enter time or expenses.
- Maintaining four separate systems for consistency: general ledger, payroll, timekeeping and travel expense.
- Notifying NERC's employees each time a new project code is created of the existence of the new code and the activities for which time and expenses are to be recorded using the new code.
- Monitoring time and expense submissions into the system on an ongoing basis to catch errors in the coding and submission of information.

In contrast, the tentative activity codes that NERC has developed (as described above in the discussion of Recommendation 9), while they will introduce considerably more detail into NERC's budgeting and accounting system, are not expected to require the level of continuing attention to maintenance and revision that would be needed to maintain the "project-specific" time recording and expense tracking systems that OE advocates.

A fundamental problem with Audit Report Recommendations 9 and 13 is that NERC's current payroll and timekeeping system cannot calculate payroll expenses at the "project" level. NERC's staff is salaried staff, not hourly staff, and although all hours worked are tracked, employees are paid based on the allocation of an assumed 2,080 hours per year (40 hours times 52 weeks) to 24 semi-monthly pay periods, *i.e.*, 86.67 hours per pay period. The timekeeping system may show the employee has worked 100 hours on various activities during the pay period, but the current system cannot allocate the employee's payroll expense at the "project" level because the hours recorded as worked is more than the hours paid. The percentage of time worked on various activities can be calculated, but accounting staff would have to manually create the journal entry to post to the system, instead of using the payroll system to create the journal entry that is posted to the ledger. Additionally, the submission and entry of employee

time sheets necessarily lags the pay period in which the employee did the work and the related pay date.

OE argues that "Project-specific tracking would absorb appreciable amounts of staff time only if each NERC employee worked on dozens of projects each day." OE Brief at 43-44. OE evidently fails to appreciate the point NERC was making. What NERC stated in its Initial Brief was: "The Audit Report does not explain what Audit Staff means by 'project-specific basis.' Presumably this would involve breaking down NERC's activities into scores of 'projects' and requiring NERC's employees, each day, to determine which of the projects they have worked on." NERC Initial Brief at 40. Even if a NERC employee only worked on a small number of "projects" in a day (or in a longer period such as a week or a pay period, since, as in most such systems, the employee would not be expected to enter his or her time into the system on a daily basis), the employee would still have to check the project code list to verify that he or she had identified all the projects he or she had worked on and that the proper codes were used.[33] As in any accounting system, proper and complete entries at the individual level are critical or else the system will not provide the anticipated management information benefits and in fact could provide misleading information. [34]

Accordingly, NERC's version of Recommendation no. 13 should be adopted.

C. Board of Trustees Compensation and Expenses

This topic encompasses Recommendations 25-31. Recommendations 30 and 31 are agreed. Recommendations 25, 26, 27, 28 and 29 remain in dispute. OE has proposed a modification to NERC's version of Recommendation 29 but, as discussed below, it is not

[33] Many NERC employees, particularly management employees, do spend time on multiple activities during the course of a day.

[34] In a rather impressive display of sophistry, the OE Brief, after failing to define or explain what OE contemplates by "project-specific" reporting systems or the level of granularity the Audit Report contemplates, argues that NERC's concerns about the administrative burdens of such a system are "speculative" because NERC does not know what the Audit Report meant by "project-specific" accounting. OE Brief at 44.

acceptable to NERC.[35] Disputed Recommendations 25-28 involve two fundamental issues: (1) has NERC provided sufficient basis to show that its current method of compensating its Trustees is reasonable and within the range of Board discretion, and (2) should NERC be required to track, or conduct detailed studies of, the actual amounts of time its Trustees spend on NERC activities, and base its Trustee compensation on the results of such tracking and studies. The answer to the first question is yes. The answer to the second question is no.

Consideration of the Audit report's recommendations on Board compensation must start with the fact that, as the OE Brief makes clear, the Audit Report did not find NERC's Board compensation to be excessive (OE Brief at 62). Audit Staff also made it clear that it was not taking issue with the level of Board compensation.[36] Therefore, it is difficult to understand why OE and Audit Staff insist on being so prescriptive about the method by which NERC determines Trustee compensation.

Recommendation 25. NERC believes Recommendation 25 should be deleted.

As the OE Brief describes, for the years 2006 through 2010, compensation to the NERC Trustees consisted of a fixed annual payment of $30,000 to $32,000 per year and additional payments based on the numbers of meetings and calls participated in by the Trustee. OE Brief at 61. Although OE contends that under this compensation plan Trustee compensation was "linked in part to time spent on NERC activities" (*id*. at 54), that characterization is inaccurate – the previous compensation method based compensation in part on the numbers of meetings and calls attended, *not* on the amount of time spent on NERC activities. Trustees were compensated based on attendance at a meeting or conference call, regardless of its duration, and regardless of how much time they spent preparing for the meeting or engaged in other NERC activities.

[35] Disputed Recommendations 25-28 relate to Board compensation and disputed Recommendation 29 relates to Board expenses.

[36] Audit Report Appendix B at B-12.

In 2011, NERC moved to a flat annual retainer payment as the method of Trustee compensation. OE states that in doing so, NERC did not follow a 2008 Board Compensation Policy that specified the applicable Board committee was to determine Trustee compensation based on, among other factors, an "evaluat[ion of] the amount of work and level of responsibility the BOT is being asked to undertake" (OE Brief at 54-55 and 61). OE is incorrect. The Trustee compensation plan adopted in 2011 provides for different levels of compensation to each Trustee based on the numbers of committees and the particular committees each Trustee serves on (since some committees require more work), with the Chairman of the Board receiving additional compensation. *See* NERC Initial Brief at 67-68. Thus, the amount of work and level of responsibility each Trustee is being asked to undertake is taken into account.

Nonetheless, Audit Report Recommendation 25 would require NERC to "Consider returning to the performance-based method of compensating BOT members until NERC gains the necessary experience to support a change to a flat-fee compensation model." This recommendation is flawed in several respects, and should be deleted.

First, Recommendation 25 incorrectly refers to NERC's previous compensation method as "performance based." It was not "performance based." It compensated Trustees, in part, based on attendance at meetings and participation in conference calls. The compensation was not based on the quality (or lack thereof) of the Trustees' performance of their responsibilities as Board members. As described at pages 66-67 of NERC's Initial Brief, NERC has other mechanisms in place to evaluate the quality of Trustees' performance of their responsibilities.

Second, Recommendation 25 is based in large part on the Audit Report's criticisms of a consultant report that was prepared in 2010 in connection with consideration of adoption of the annual retainer compensation method, and, more generally, on what OE perceives to be a lack of evidentiary support for the decision to adopt this method at the time it was made in 2011. OE Brief at 60-63. However, consistent with the purpose of a performance audit (as stated by Audit

Staff) to identify opportunities to improve NERC's operations prospectively (*see* §II.B above), the relevant question is whether the annual retainer method is reasonable and appropriate within the range of Board discretion – not whether Audit Staff could find a satisfactory (to Audit Staff) amount of contemporaneous documentation from 2011 on the basis for this compensation method. NERC has provided numerous reasons supporting the use of the annual retainer method of compensation as reasonable and appropriate, as compared to one based on a combination of an annual fee and Trustee attendance at meetings. NERC Initial Brief at 63-68. OE fails to address these reasons head-on, other than arguing that some of them were not cited in the 2011 consultant study. In particular:

- OE does not dispute (and in fact acknowledges) that Trustee compensation based on a fixed annual retainer rather than on the number of meetings called and attended enables NERC to budget this expense item more accurately. OE Brief at 61.[37]
- OE does not dispute that a per-meeting compensation approach creates an incentive to schedule additional meetings.
- OE does not dispute (and in fact acknowledges) that the greater predictability of compensation and the tax planning advantages, from the Trustee perspective, of the fixed annual retainer method is beneficial in Trustee recruitment. OE Brief at 61-62.
- OE does not dispute that having to track the amount of time that each Trustee actually spends on NERC activities would create additional administrative burdens and costs for both NERC and its Trustees.

Despite not disputing these points, OE says that NERC did not provide any evidence that unnecessary meetings were being called, that Trustee candidates were concerned about variable compensation, or that additional administrative costs were being incurred. (OE Brief at 62.) But these are structural issues. Saying that the compensation method does not need to be designed to eliminate incentives for unnecessary meetings until unnecessary meetings have actually occurred

[37] OE asserts that Trustee compensation is no different than other NERC expenses that are "trued up annually." OE Brief at 61. NERC does not understand the point of this comment. While NERC files budget-to-actual cost "true-up" reports with the Commission annually, neither Trustee compensation nor any other expenses are "trued up" in the sense that NERC assesses a year-end additional charge (or refund) to the load-serving entities reflecting any variances from the budgeted amounts used to set the original assessments. OE's comment seems to view NERC's expenses like utility costs that are recovered from customers through an automatic adjustment charge in the utility's tariff, which is certainly not the case for NERC's expenses.

is like saying that federal officeholders and candidates should not be required to file reports of their campaign contributions and expenditures with the Federal Election Commission until they have actually violated the law.

NERC has demonstrated that its current annual retainer method of Trustee compensation is reasonable and appropriate, and certainly within the range of reasonable Board judgment. That should be all that is necessary to resolve this issue, regardless of the quality or extent of contemporaneous documentary justification for adoption of the current method in 2011 that NERC was able to produce.[38]

Third, OE contends that the move to the fixed annual retainer compensation method contravened the 2008 Board Compensation Policy, referred to above, because the move was not supported "with a time study based on actual time spent by the BOT on BOT activities or a representative study of the actual time spent on these activities." OE Brief at 56. But the 2008 Board Compensation Policy did not require that compensation be based on a "time study based on actual time spent by the BOT." Rather, it required that in developing the Trustee compensation plan, the Board's Corporate Governance and Human Resources Committee "evaluate the amount of work and level of responsibility trustees are being asked to undertake" (emphasis added). OE Brief at 54. As explained above, the current Trustee compensation plan takes into account the amount of work and level of responsibility each Trustee is being asked to undertake.

Fourth, implicit in Audit Report Recommendation 25 is a presumption that the previous method that compensated Trustees in part based on attendance at meetings was a preferred or superior method, and that NERC somehow had a burden of proof to justify switching to another

[38] OE notes that the 2010 consultant's report on Board compensation stated that less than 30% of corporate boards used annual fees. OE Brief at 56. OE fails to mention the more recent evidence (contained in the public report of a leading compensation consulting firm that was not commissioned by NERC) that only 37% of boards are paid per-meeting fees, down from 72% in 2001 and 57% in 2006, and just 35% of companies pay fees for board committee meetings. *See* NERC Initial Brief at 66.

Trustee compensation method. However, neither the Audit Report nor the OE Brief explains why the previous method warrants the benefit of such a presumption, or why the previous method is better than the current method. Without such an explanation, there is no basis for complaining that NERC failed to justify adoption of the current method rather than staying with the previous method. Again, NERC explained in its Initial Brief why the annual retainer method of compensation, coupled with its other mechanisms in place to directly evaluate Trustee performance, is superior to a compensation method based on attendance.

Fifth, Recommendation 25 would require NERC to consider returning to its previous Board compensation method, based on attendance, "until NERC gains the necessary [unspecified] experience to support a change to a flat-fee compensation method." However, no "experience" is necessary to support the use of a flat-fee compensation method.

NERC recognizes that Audit Report Recommendation 25 would only require NERC to "consider" returning to the previous compensation method. In this aspect, however, Recommendation 25 is unnecessary because it is duplicative of NERC's version of Recommendation 28, which requires NERC to continue to conduct annual reviews of the Board compensation plan, taking into account Board time and participation on Board activities. In connection with Recommendation 28, NERC has committed that (as provided in the mandate of the Corporate Governance and Human Resources Committee of the NERC Board) it will continue to evaluate the Board compensation plan annually. NERC Initial Brief at 72 and 73-74.

Recommendation 26. Audit Report Recommendation 26 is that NERC should "Establish a method for tracking BOT time and participation on BOT activities to be able to properly evaluate and quantify the performance of each trustee." NERC deleted this recommendation as unnecessary. NERC does record Trustees' attendance at meetings and

conference calls,[39] but does not see a need to track the amount of time spent by Trustees in meetings, conference calls and other NERC activities, in order to be able to "properly evaluate and quantify the performance of each trustee." As noted above and as explained in its Initial Brief (at 66-67), NERC has other mechanisms in place to evaluate Trustee performance (including mechanisms that provide for direct stakeholder input), and does not need to track the hours that each Trustee spends on NERC activities in order to be able to evaluate the quality of the Trustee's performance of his or her responsibilities. Tracking hours would only record time and would not provide a measure of the actual effectiveness of the Trustee in performing his or her responsibilities. Moreover, implementing a time-tracking system would be burdensome to the Trustees and create yet another additional administrative activity for NERC staff. Recommendation 26 should be deleted.

Recommendation 27. Audit Report Recommendation 27 is that NERC should "Implement the planned BOT tracking software to assist in measuring BOT participation and reducing undue administrative burden." NERC deleted this recommendation because, as stated in NERC's Initial Brief, there is no "planned BOT tracking software." NERC explained in its Initial Brief that Audit Staff may have been under the misimpression that NERC's recently-implemented enhanced employee time recording system would be used for Trustees. NERC Initial Brief at 73. Based on the OE Brief, NERC now understands that the Audit Report was referring to a vendor-provided electronic portal and software which NERC was considering acquiring, referred to as "Digital Books for Trustees." OE Brief at 63 note 196. NERC has now acquired and implemented this tool (the product NERC acquired is called "Diligent Boardbooks"). This secure electronic tool enables Board members to access the often voluminous Board and committee meeting materials and other materials relating to NERC

[39] The Trustees attending a Board or Board committee meeting or participating in a Board or Board committee conference call are listed in the minutes of the event.

activities without having to send them bulky paper documents or large e-mail attachments that may prove to be undeliverable due to size. The Diligent Boardbooks tool includes a calendar device Trustees can use, but does not provide time tracking or entry capability for hours spent.

In summary, NERC has no plans to expend funds to acquire software that would track Trustee time. In any event, NERC reiterates that tracking the actual number of hours that each Trustee spends in meetings, conference calls and other NERC related activities is not necessary for an evaluation of the Trustees' performance.[40] As noted, Trustee attendance at Board meetings, committee meetings and conference calls, as well as some other NERC activities, is recorded, and this is sufficient information on the extent of each Trustee's level of effort for purposes of the annual review of the Board compensation plan, along with the other information available on the Trustees' performance in carrying out their responsibilities. Recommendation 27 is unnecessary and should be deleted.

Recommendation 28. Audit Report Recommendation 28 is:

> Conduct an analysis of BOT participation and effort based on a time study using actual time spent during BOT activities, or a representative study of the actual time spent and implement a compensation methodology that pays BOT members reasonably for performance of their duties.

NERC proposes that this Recommendation be revised to the following:

> Continue to conduct annual reviews of the Board compensation plan, taking into account Board time and participation on Board activities and conduct periodic market studies regarding the structure and amount of Board compensation.

The Audit Report version of this recommendation would mandate that NERC conduct a specific study of the amount of time spent by Trustees on Board activities, and then implement a Trustee compensation method based on the results of that study. The directive in Audit Report Recommendation 28 would unequivocally be micromanagement. It would also be a much

[40] On page 65 of its Initial Brief, NERC provided examples of some of the many NERC-related activities in which the Trustees participate, in addition to attending the quarterly Board and Board committee meetings.

deeper dive into management and board decision-making prerogatives than the Commission has previously taken with respect to entities under its jurisdiction.[41] *See* NERC Initial Brief at 13-16.

As noted above, and as reflected in NERC's version of Recommendation 28, the Corporate Governance and Human Resources Committee of the NERC Board is mandated to conduct an annual review of the Board compensation plan. As reflected in NERC's version of this recommendation, the annual reviews "tak[e] into account Board time and participation on Board activities." This is a sufficient requirement that the level of effort expended by, and participation of, Trustees on NERC activities be taken into account in determining how, and how much, Trustees will be compensated – without requiring that specific studies of the amount of time spent by Trustees be conducted or that a Trustee time-tracking tool be used in determining Trustee compensation.[42] The NERC version of Recommendation 28 also specifies that periodic market studies shall be conducted regarding the structure and amount of Board compensation, for use in determining the Board compensation plan. NERC's version of this recommendation provides for annual review of Trustee compensation and specifies that Trustee participation and effort and market data on board compensation will be taken into account. The NERC version provides sufficient guidance for the determination of Board compensation without being

[41] Although OE disclaims that it is attempting to micro-manage NERC's Trustee compensation decisions, OE makes detailed, intrusive suggestions such as that NERC should have increased the fixed retainer component of the Trustees' compensation to compensate them for out-of-meeting activities (OE Brief at 61 note 187) and should have set a "minimum meeting duration" so that Trustees would not be compensated for meetings that were too short. *Id.* at 62.

[42] OE states that NERC "already must track" Trustee time because nonprofits must report to the Internal Revenue Service ("IRS"), on IRS Form 990, the trustee "average hours per week." OE Brief at 62 and 63. However, the IRS form requires the organization to provide an estimate of the average hours per week each person listed in the report devotes to the organization's activities. (*See Instructions for Form 990 Return of Organization Exempt from Income Tax*, at 26 (Instructions for Part VII, Section A, Column B) (available at: http://www.irs.gov/pub/irs-pdf/i990.pdf)). It does not require actual tracking of time. NERC fulfills this reporting requirement by using an estimate provided by each Trustee of his or her average number of hours per week devoted to NERC business during the year. NERC presumes that OE would not accept these Trustee-provided annual estimates as sufficient to satisfy the requirements of Audit Report Recommendations 26-28 for "tracking" of Trustee time and studies of the actual time spent by Trustees on NERC activities.

prescriptive or requiring a specific type of study, and should be adopted as the recommendation on this topic.[43]

Recommendation 29. In its Initial Brief, NERC proposed a modified version of Audit Report Recommendation 29, to read as follows:

> Estimate and include in its annual budgets an amount of funding to cover expenses for Trustees in connection with Board and Board committee meetings and other NERC activities that it deems appropriate and seek approval for such funding. (NERC Initial Brief at 72.)

In its Response Brief, OE indicates states that the NERC version of Recommendation 29 is acceptable to OE if the phrase "for Trustees" is deleted. OE Brief at 64. NERC understands the purpose of OE's proposed further modification to be that all expenses relating to Board and Board committee meetings, not just the costs incurred by Trustees, would be budgeted in a separate account. However, NERC does not accept this further revision. OE's further revision would require, for example, that the travel expenses of NERC management and staff to attend Board meetings would have to be separately budgeted and (when incurred) charged to the "Board meetings" account rather than to the departmental travel expenses accounts in which all other travel costs of department employees are recorded. NERC's version of Recommendation 29 will satisfy the underlying objective of capturing all expenses for Trustees incurred in connection with Board meetings, Board committee meetings and other NERC activities in which one or more Trustees participate.

D. NERC Activities

There are two recommendations in this section of the Audit Report, Recommendations 37 and 38. With respect to Recommendation 37, the disagreement is over the manner in which NERC implements the recommendation. However, as discussed immediately below, NERC proposes a modification to its plan for implementing the recommendation which NERC believes

[43] Moreover, the NERC version of Recommendation 28 is consistent with the 2008 Board Compensation Policy cited by OE. OE Brief at 54-55.

will satisfy OE's concern. With respect to Recommendation 38, NERC and OE do not agree on the text of the recommendation.

Recommendation 37. In its Initial Brief, NERC proposed a revised version of Recommendation 37, reading as follows:

> Establish written criteria for determining whether an activity is a statutory activity and should be funded under section 215 through an open and transparent process initiated by NERC. (NERC Initial Brief at 99.)

NERC also proposed the following process for implementing this recommendation:

> To implement this recommendation, NERC plans to develop the criteria through a stakeholder process that it will initiate in the fourth quarter of 2012 and complete by July 2013, in sufficient time to submit the criteria in, and use the criteria in preparing, NERC's 2014 business plan and budget filing. The Commission would then be able to review and, to the extent it deems necessary, rule on the criteria in the context of reviewing and ruling on NERC's 2014 business plan and budget, which will also take into account stakeholder input regarding the criteria and the scope of NERC's activities. (NERC Initial Brief at 100.)

OE does not state any disagreement with the text of NERC's version of Recommendation 37. However, OE states that "Staff and NERC disagree on implementation of this recommendation" (OE Brief, Appendix A at 6), that "Staff does not accept NERC's proposal to delay its filing of the new criteria and processes to be developed under Recommendation 37" (OE Brief at 78), and that the Commission should reject NERC's proposal to submit the criteria and processes for the first time in NERC's 2014 budget filing,[44] and should require NERC to submit the criteria and processes at an earlier date, in a compliance filing. *Id*. OE also states that it agrees the new criteria and processes should go into effect as part of NERC's 2014 budget. *Id*.

NERC accepts OE's position that the criteria that NERC will develop through a stakeholder process pursuant to Recommendation 37 should be filed with the Commission in a compliance filing in advance of filing the 2014 Business Plan and Budget. NERC commits to completing its process for developing the criteria and to file the criteria with the Commission, in

[44] The 2014 Business Plan and Budget filing will need to be filed at the Commission by August 23, 2013.

a compliance filing, by March 1, 2013. NERC will use the filed criteria in developing its 2014 Business Plan and Budget, with any revisions indicated by the Commission's order on the compliance filing, if that order is issued sufficiently in advance of the filing date (August 23, 2013) for the 2014 Business Plan and Budget to be taken into account in budget development. If the order is not issued in sufficient time to be taken into account in developing the 2014 Business Plan and Budget, then NERC will reflect any revisions to the criteria indicated by the Commission's order in preparing the following year's business plan and budget.

Recommendation 38. In its Initial Brief, NERC proposed a revised version of Recommendation 38, reading as follows:

> In its annual business plan and budget filings, provide an explanation as to why the proposed activities to be undertaken by each program area for the budget year are statutory, including, at a minimum: a description and the purpose of the major activities to be undertaken by each program area and an explanation for why the activity is a statutory activity. (NERC Initial Brief at 99.)

OE's only objection to NERC's proposed text of this recommendation is to NERC's proposal (as described by OE) "to explain why only 'major activities' – rather than *all* activities – are statutory." OE Brief at 78-79 (emphasis in original). NERC submits that OE is taking the term "major activities" in NERC's version out of context. The first sentence of NERC's version would require NERC to provide, in each annual business plan and budget filing, "an explanation as to why the proposed activities to be undertaken for the budget year are statutory." The reference to "major activities" in the subordinate clause recognizes that various activities in a program area can be grouped into categories and the purpose and statutory basis for each such category explained. An example of a "major activity" would be providing stakeholder education regarding standards and compliance, versus identifying and explaining the Section 215 basis for each workshop or seminar that will be held in furtherance of this activity. If providing such stakeholder education is a statutory activity, then all individual education and training sessions

and associated support activities are statutory without the need to describe each of them and their individual connections to Section 215 in the business plan and budget document.

Further, OE's concerns are unwarranted given that this recommendation is enforceable by the Commission on an ongoing basis through its review of NERC's annual business plan and budget filings. If the Commission concludes that a NERC budget filing has not provided a sufficient explanation of why a particular activity included in the business plan and budget is a statutory activity that should be funded pursuant to Section 215, the Commission can order NERC to provide more information in a compliance filing, or can direct that the activity and related costs be removed from the budget. NERC has a strong incentive to provide, in its business plan and budget filings, complete explanations of why all of its proposed activities are statutory, in order to avoid having activities removed from the budget and to avoid having to prepare and submit compliance filings.

E. Other Recommendations - Conditions Proposed by OE / Accepted by NERC

1. Employee Entertainment – Recommendations 22, 23 and 24

In its Initial Brief, NERC proposed the following revised versions of Recommendations 22, 23 and 24 (NERC Initial Brief at 60-61):

> 22. Explicitly budget for employee rewards and recognition and entertainment expenses by including line items of sufficient granularity in the budget filings.
>
> 23. Use miscellaneous expense accounts to track expenses which are for employee rewards and recognition or entertainment separately from other business-related expenses in its accounting system.
>
> 24. Ensure rewards and recognition expenses and entertainment expenses are clearly and transparently presented to the Board, the Commission, and stakeholders in the budget before these costs are incurred.

In its Response Brief, OE states: "NERC's proposed changes to Recommendations 22, 23, and 24 are acceptable on the condition that NERC develop and submit clear policies and procedures that identify the costs to be recorded as employee rewards and recognition, and develop and file policies and procedures for how NERC will provide such rewards and

recognition." OE Brief, Appendix A at 4 note 3; *see* OE Brief at 53-54. NERC accepts this condition. NERC will develop (1) policies and procedures that identify the costs to be recorded as employee rewards and recognition, and (2) policies and procedures for how NERC will provide such rewards and recognition, and will submit these policies and procedures in the compliance filing scheduled by the Commission in this proceeding.

2. NERC as the ES-ISAC – Recommendations 39, 40, 41 and 42

In its Initial Brief, NERC proposed that Audit Report Recommendations 40, 41 and 42 be deleted and that Audit Report Recommendation 39 be replaced with the following text that encompassed all four recommendations:

> Provide additional information in NERC's 2013 Business Plan and Budget regarding NERC's role as the ES-ISAC; and initiate an open and transparent process to provide opportunities for stakeholder input regarding NERC's role as the ES-ISAC, including (1) the impact, if any, on NERC's compliance-related activities of "walling off" certain staff from the ES-ISAC activities; and (2) access of FERC staff to ES-ISAC information for situational awareness and compliance purposes. (NERC Initial Brief at 105-106.)

In its Response Brief, OE states that NERC's proposed changes to Recommendation 39 and the deletion of Recommendations 40, 41 and 42 are acceptable "with the condition that a clarification of the Commission's ES-ISAC oversight responsibilities is clearly laid out as part of this process, and provided the Commission has an opportunity to expressly consider and approve or disapprove ES-ISAC's statutory funding eligibility." OE Brief, Appendix 1 at 7 note 5; *see* OE Brief at 85. NERC agrees with these conditions. With regard to the first condition, the stakeholder process that NERC will conduct pursuant to Recommendation 39 will address clarification of the Commission's ES-ISAC oversight responsibilities. With regard to the second condition, the Commission can consider and approve or disapprove the ES-ISAC's statutory funding eligibility in a future business plan and budget proceeding, or in a separate proceeding established by the Commission. Recommendation 38 (*see* §III.D, above) will require NERC to include in its annual business plan and budget filings a description of the purpose of the ES-

ISAC activity and an explanation of why it should be funded pursuant to §215.

IV. Factual Findings

In this section, NERC responds to assertions in the OE Brief concerning the factual findings in the Audit Report that have not been already addressed in NERC's Initial Brief or in the discussion of a related recommendation in §III above.

A. NERC Budget Process

Although NERC has agreed (and has developed and implemented) a detailed written procedure on the approvals required to use funds from Working Capital and Operating Reserves and to spend funds budgeted for one activity on another activity, NERC disagrees with OE's statement that NERC had limited procedures and controls concerning these matters. (OE Brief at 5, 21, 27.) NERC has in place policies specifying that expenditures of funds in excess of budgeted amounts are required to be approved by the applicable department head, the NERC Chief Financial Officer and, depending on the amount and nature of the expense, by NERC's President and CEO. Further, the availability of funds to be used for the purposes specified in such requests is evaluated in light of NERC's other funding needs.

With respect to the only instance of purportedly "redirected" funds cited in the Audit Report, the expenditures in 2011 from Working Capital Reserves in order to expeditiously complete NERC's office relocations and data center relocation, NERC agrees that it explicitly identified $1,175,000 of specific relocation-related expenditures in its 2011 Business Plan and Budget, but disagrees with OE's contention that NERC was limited to spending no more than that amount in 2011 on the office relocations. OE Brief at 21, 25, 31. NERC clearly stated in its 2011 Business Plan and Budget filing that it would use Working Capital Reserves to fund any additional expenditures on the office relocations in 2011. *See* NERC Initial Brief at 24-25. OE not only gives short shrift to this plan, which was clearly disclosed in the 2011 Business Plan and Budget filing, but also fails to respond to NERC's explanation of why it was prudent to proceed

to complete the office and data center relocations as expeditiously as possible once they were announced.[45] (*See id.* at 25-26.) However, OE does acknowledge that the Audit Report did not address the prudence of any past expenditures. OE Brief at 27. Further, the fact that NERC was relocating its offices, and specifically that the headquarters office would be moved from Princeton to Atlanta, and the reasons for those decisions, were set forth in detail in the 2011 Business Plan and Budget filing. *See* NERC Initial Brief at 24. Presumably OE is not suggesting that the Commission, having approved the relocation decision in the 2011 Business Plan and Budget, should have had the opportunity to revisit that approval in the following two budget cycles. NERC emphasizes again that the additional 2011 expenditures were funded from Working Capital Reserves that were higher than expected at year-end 2010 – not by intentionally spending less than the budgeted amounts on other programs in order to free up funds for the office relocations. NERC Initial Brief at 25.

OE states that NERC officers told Audit Staff that working capital reserves were viewed as contingency funds to be used for unexpected expenditures. OE Brief at 21 note 60. But that is exactly what the Commission stated in one of its early NERC budgeted-related orders: "Working capital reserves provide readily available funds, which are available without a charge for or restriction on their use, to meet unforeseen expenditures." *North American Electric Reliability Corp.*, 129 FERC ¶ 61,040 (2009) at P 24.

Although NERC has agreed to increase the level of detail provided in its budget filings, NERC disagrees with OE's assertion that NERC heretofore has presented only "high level" information in its business plans and budgets. OE Brief at 5. For example, NERC's 2012 Business Plan and Budget document (the last one prepared and filed prior to the audit) was 134

[45] NERC did originally intend to spread the work and related expenditures for the office and data center relocations over 2 to 3 years in order to spread out the expenditures and reduce their impact in terms of causing year-to-year fluctuations in the assessments to load-serving entities. However, after it announced the relocations, NERC realized that they needed to be carried out much more expeditiously, for the reasons explained at NERC Initial Brief at 25-26.

single-spaced pages long, not counting the tables that showed the allocation of the 2012 ERO funding requirement to the Regions and the calculation of assessments to individual load-serving entities. A detailed statement of revenues, operating expenses and capital expenditures was provided for the entire company and for each of the five statutory programs and five administrative departments. These statements showed the budgeted 2012 operating expenses and capital assets expenditures broken out into numerous categories, including Salaries, Payroll Taxes, Benefits, Retirement costs, Meetings expense, Travel expense, Conference Call expense, Consultants & Contracts expense, Office Rent, Office Costs, Furniture and Fixtures capital expenditures, Computer Equipment and Software capital expenditures, Depreciation, and more. The statements also showed the 2011 budgeted amount and projected amount for each line item and the change to the 2012 budgeted amount. The Business Plan and Budget document contained, for each statutory program and administrative department, a description of its activities, a discussion of its principal goals and deliverables/objectives for 2012, and a discussion of the reasons for cost increases or decreases from the 2011 budget for those line items for which significant changes were budgeted. Separately, in Section B of the Business Plan and Budget, detailed tables were included showing detailed budgeted expense changes in each of numerous expense categories, including Personnel Expenses (Salary, Payroll Taxes, Benefits and Retirement costs); Meetings, Travel and Conference Call expenses; Consultants & Contracts expense; Office Rent; and Office Costs, with explanations provided for significant changes from the 2011 budget. Finally, 19 pages of detailed business planning and budgeting assumptions were provided.

Similarly unsupportable is OE's assertion that NERC's annual true-up reports to the Commission have provided only high level information and were not at the same level of granularity as the budgets. OE Brief at 5, 22. The format of the true-up reports has included statements of revenues, expenses and capital asset activity at the same level of detail as those

statements provided in the budget, *i.e.*, for the entire company and for each of the statutory programs and administrative departments, with each statement in the true-up report showing the same line items as in the budget. The true-up report has shown the budgeted amount, actual amount, and variance for each line item. NERC has applied a threshold for providing narrative explanations of the line item variances on the individual statements – generally for variances greater than the larger of 10% of the budgeted amount or $10,000 – and the Commission's orders accepting the true-up filings have not indicated that this variance threshold for providing narrative explanations should be lowered.

NERC has provided the level of detail and information in its business plan and budget filings and in its annual true-up reports that was indicated by the Commission's previous budget-related orders and guidance received from the Commission staff who review NERC's budget filings. NERC does not dispute that it is appropriate for Audit Staff to make recommendations for improvements going forward (in this case, to provide more detail in future business plan and budget filings), but to find that the amount and detail of information NERC provided in its annual business plan and budget filings and true-ups violated any Commission requirements, or were deficient, is unsupportable. The Audit Report's proposed findings under NERC Budget Process should be rejected by the Commission.

B. NERC Oversight of the Regional Entities' Budgets

NERC has agreed to the recommendations in this section of the Audit Report (Recommendations 6, 7, 8), relating to NERC's oversight of the preparation of the Regional Entities' business plans and budgets, and NERC has already implemented actions in response to these recommendations in connection with preparation of the 2013 Regional Entity business plans and budgets, including providing for more substantive reviews and input from NERC program and department heads. However, NERC does not agree with OE's assertion that NERC should have used the budget preparation process to evaluate the composition of the Regional

Entities' CIP audit teams and the skills of audit team members. OE Brief at 35. While ensuring that the Regional Entities perform satisfactory CIP compliance audits is an appropriate activity, NERC does not believe that the review of the composition and skills of the Regional Entity CIP compliance audit teams is an activity that should necessarily be carried out as part of the budget preparation process.

C. Time Reporting and Accounting System

OE states that Audit Staff found "evidence of NERC first-line managers' positive reactions to [sic] when staff suggested increased timekeeping granularity." OE Brief at 42. As previously stated, NERC has installed a new time accounting system and its management team has worked to develop a set of activity codes that will provide additional granularity for use by management and others. Resources are not unlimited, and management and stakeholders (and the Commission) must focus on whether the costs of such enhancements are justified by the benefits they provide. It is doubtful that Audit Staff and NERC's first-line managers discussed the costs as well as the benefits of a "project-level" time accounting system in any detail or with sufficient information to support the conclusion that OE suggests with respect to the implementation of "project-level" time accounting.

D. Employee Compensation

NERC has agreed to all three of the Audit Report's recommendations on this topic (Recommendations 16, 17, 18). The OE Brief contains no new arguments regarding the Audit Report's findings that were not addressed in NERC's Initial Brief. With respect to the Audit Report's criticisms of the Mercer compensation studies, NERC notes that the OE Brief states that "NERC's explanation of the Mercer studies' assumptions, coupled with [NERC's] acceptance of the Audit Report's three recommendations, address staff's concerns." OE Brief at 48.

E. Standard for Determining the Reasonableness of Expenses

NERC has agreed to all three of the Audit Report's recommendations on this topic

(Recommendations 19, 20, 21). The OE Brief contains no new arguments regarding the Audit Report's findings that were not addressed in NERC's Initial Brief. However, NERC does not agree with OE's characterization that expenditures for employee rewards and recognition are not "routine business expenses." OE Brief at 48-49. All manner of businesses and organizations incur expenses to reward or recognize employees for excellent performance or efforts beyond what is normally required, or to boost employee morale or for team-building purposes. These expenditures are considered ordinary and appropriate costs of operating the business. These comments are also relevant to the topic of Entertainment Expenses, below.[46]

F. Employee Entertainment

NERC and OE have reached agreement on the three recommendations on this topic (Recommendations 22, 23, 24), including OE's conditions to acceptance of NERC's versions of these recommendations. *See* §III.E.1 above. The OE Brief contains no new arguments regarding the Audit Report's findings that were not addressed in NERC's Initial Brief. However, see the comments concerning the accounting for employee rewards and recognition expenses under Standard for Determining the Reasonableness of Expenses, above.

G. Board of Trustees Compensation and Expenses

All of the arguments in the Audit Report and the OE Brief concerning the Audit Findings on this topic have been addressed in either or both of NERC's Initial Brief or the discussion of the recommendations on this topic in §III.C above. Although NERC is agreeing to take various actions based on the recommendations, there is no basis for any audit findings that NERC's performance was deficient with regards to Board compensation or expenses.

[46] Additionally, the suggestion that it is improper to record the employee expenses as "routine business expenses" was not made in the Audit Report and is raised for the first time in the OE Brief. Neither the proposed Audit Finding nor the three recommendations on this topic address the accounting for employee expenses.

H. Retirement Plans

NERC and OE have reached agreement on the three recommendations on this topic (Recommendations 32, 33 and 34). However, NERC takes exception to OE's characterization that NERC, in its Initial Brief, attempted to justify its retirement plan provisions by "describing their evolution." OE Brief at 66. OE misses the point of the discussion referred to, at pages 76-77 of NERC's Initial Brief, which was to show that NERC's retirement plan provisions were adopted in an effort to remain competitive with companies and organizations with which NERC competes for employees, including for-profit companies that can offer compensation plan provisions (such as stock options and performance share grants) that NERC cannot offer. NERC therefore decided to offer other compensation and benefit provisions (such as the additional 10% 401(k) contribution) in order to provide a competitive overall compensation and benefits package. Similarly, OE's statement that NERC's retirement plan package was higher than industry average and did not reflect market conditions (OE Brief at 67) reflects an evaluation of an individual component of total remuneration out of context and fails to recognize that NERC competed for employees with for-profit companies that could offer compensation and benefits components that NERC cannot or did not offer.

Finally, OE notes that the Audit Report did not rely on any NERC violations of IRS requirements concerning its retirement plans to reach the Audit Findings on this topic. OE Brief at 67. However, the absence of any violations of IRS requirements should have been relevant to Audit Staff's analysis, because the provisions of 401(k) and other retirement plans are largely driven by the requirements and limitations of the Internal Revenue Code and IRS regulations.

I. NERC Critical Infrastructure Protection Program

NERC and OE are in agreement on the two recommendations under this topic (Recommendations 35 and 36). However, NERC takes issue with a number of assertions in the OE Brief.

First, the number of Regional Entity CIP compliance audits on which the Commission chooses to expend its resources by sending observers (OE Brief at 68) is not a valid or reasonable guide to the number of CIP audits to which NERC should send observers in order to exercise appropriate oversight over the Regional Entities' CIP auditing activities. The NERC CIP Auditors who provide Regional oversight maintain an audit attendance selection process based on location, Regional Entity and available resources. Each calendar year, the NERC Critical Infrastructure Department ("CID") assesses U.S. and Canadian registered entities scheduled for a CIP standards compliance audit using the master audit schedule maintained by the NERC Compliance Operations department. In determining which CIP compliance audits to attend, CID applies the criteria listed at page 85 of NERC's Initial Brief.

Second, attending Regional Entity CIP compliance audits of registered entities is one of many available methods to assess the Regional Entity's performance under the Compliance Monitoring and Enforcement Program. Additional oversight activities may include engagements at the Regional Entities' offices to review processes, tools and process actions. Key Reliability Spot Checks is another method that is used to assess Regional Entity performance. Review of Regional Entity processing and transition of compliance issues from auditing or field staff to the enforcement staff, and review of mitigation plans and enforcement actions, are also oversight activities with respect to the Regional Entities' CIP compliance programs.

Third, OE asserts that by not attending the CIP compliance audits that were attended by Commission representatives, NERC "shifted primary responsibility for overseeing [Regional Entity] CIP compliance audits to FERC." OE Brief at 68. There is no support for this assertion, and NERC disagrees with the implication that every CIP audit conducted by a Regional Entity needs an "overseer." The Regional Entities are, in fact, primarily responsible for carrying out the CIP audit program (as well as the audit program for the operations and planning standards). However, as explained in NERC's Initial Brief, NERC has sought to provide guidance and

oversight to the Regional Entities in their conduct of their CIP compliance audit programs, through such activities as development and refinement of the Reliability Standards Audit Worksheets ("RSAWs") for the CIP Standards, CIP auditor training workshops and seminars, development and issuance of Compliance Application Notices ("CANs") which provide guidance on application of the CIP standards to auditors as well as to industry, and review of the Regional Entities' CIP audit reports. *See* NERC Initial Brief at 82-83. In fact, OE acknowledges that attending the Regional Entities' CIP audits is not the only way to provide oversight to their CIP programs, and disclaims any intention to convey such an impression. OE Brief at 71.

Further, as is well known, compliance auditors are trained to review documentary evidence of compliance, in preference to oral "testimony" from personnel of the registered entity. (Much like Audit Staff here, we note.) Compliance audits are typically scheduled for the registered entity's location where there are a large number of standards requirements scheduled to be audited. Registered entities are generally requested and expected to submit their documentary evidence to the audit team in advance. The documents can be reviewed by NERC staff, as needed, either before or after the actual on-site audit. In short, it is not necessary for NERC personnel to be physically in attendance at the registered entity's location during a compliance audit in order to provide oversight of the audit.

OE states that "Whether [Regional Entity] staff adequately perform their CIP compliance activities is a different question outside this audit's scope." OE Brief at 71. But with no evidence that the Regional Entities are failing to adequately carry out their CIP compliance auditing responsibilities, there is no basis for a finding that NERC's oversight activities were inadequate. OE also asserts that "More active NERC oversight [read: attendance at audits] could have provided additional technical guidance to improve both [Regional Entity] team performance and the performance of audited registered entities" and could have "ensur[ed] greater regional consistency among [Regional Entities]." OE Brief at 72. Compliance audits are

just one of many tools for effecting change in future performance of a registered entity. Other CIP-related activities NERC has engaged in, such as training and educational activities for industry on CIP requirements and cyber security threats (*see* NERC Initial Brief at 81-82) also are directed to improving the performance of registered entities in the cyber security area. In addition, there are other activities such as creation and revision of the RSAWs, CIP auditor training, development and issuance of CANs, review of the CIP audit reports from all Regional Entities, and review of possible CIP violations identified by the Regional Entities, that NERC has used to ensure consistency among the Regional Entities in their enforcement of the CIP standards.

Finally, OE ignores the significance of the evidence that, in fact, the Regional Entity CIP compliance programs have been very active in identifying violations of the CIP standards over the last two years since registered entities became obligated to be in auditable compliance with the CIP standards (NERC Brief at 84), and OE offers no response to the fact that NERC has significantly increased its CIP staffing and budget since 2010 (*id*. at 85-86).

J. NERC Activities

The arguments in the Audit Report and the OE Brief concerning the Audit Findings on this topic have been addressed in either or both of NERC's Initial Brief or the discussion of the recommendations on this topic in §III.D above. Although NERC is agreeing to take various actions based on the recommendations, there is no basis for any audit findings that NERC's performance was deficient in this area. NERC notes that the discussion on this topic in the OE Brief is considerably more restrained than the discussion in the Audit Report (which is turn was more restrained than the discussion in the Draft Audit Report, after Audit Staff received and considered NERC's comments on the Draft Audit Report). The OE Brief emphasizes that "the Audit Report did not suggest that the Commission revisit its acceptance of NERC's six broad program areas as statutory." OE Brief at 77.

K. NERC as the Electric Sector Information Sharing and Analysis Center

All of the arguments in the Audit Report and the OE Brief concerning the Audit Findings on this topic have been addressed in either or both of NERC's Initial Brief or the discussion of the recommendations on this topic in §III.E.2 above. The two points listed in the second full paragraph on page 83 of the OE Brief will be addressed through NERC's compliance with Recommendation 39 and the additional conditions proposed by OE that NERC has agreed to.

V. Conclusion

For the reasons set forth in the Initial Brief and this Reply Brief of the North American Electric Reliability Corporation, NERC respectfully requests that the Commission issue an order adopting the agreed audit recommendations and related conditions (where applicable), and adopting NERC's versions of the recommendations on which there is not agreement.

Respectfully submitted,

APPENDIX A

STATUS OF AGREEMENT ON

AUDIT STAFF'S RECOMMENDATIONS

No.	Audit Staff Recommendation	NERC Recommendation	Status
1	Establish more robust procedures and controls over NERC's use of working capital reserves.	Establish more robust procedures and controls over NERC's use of working capital reserves.	Agreed (no difference) as to Recommendation text; disagree on implementation.
2	Develop a transparent process that permits the Commission, the BOT and stakeholders opportunity to review the expenditure of funds approved for specific statutory activities to be redirected to unbudgeted activities, and develop and obtain Board approval of enhanced guidelines governing such expenditures, including criteria for determining when Board and Commission approval is required.	Continue to make improvements in budget transparency that informs the Commission, the Board and stakeholders concerning the expenditure of funds approved for specific budgeted activities on unbudgeted activities, and develop and obtain Board approval of enhanced guidelines governing such expenditures, including criteria for determining when Board approval is required.	Disputed.
3	Request budgetary funds for activities initiated between budget cycles that were not included in the annual budget filing in a manner similar to section 1108 of the NERC Rules of Procedure (ROP).	NERC deleted this recommendation.	Audit Staff accepts deletion of this Recommendation if Audit Staff Recommendation 2 is adopted; NERC does not accept Audit Staff Recommendation 2.
4	Increase the granularity of the NERC budget filings by: (1) breaking out significant cost categories in its expenses; (2) identifying proposed budgeted expenditures, at a minimum, on a project specific basis; and (3) separating working capital reserves needed for operations from working capital reserves needed for contingencies and identifying those contingencies.	Increase the granularity of the NERC budget filings by: (1) breaking out budgeted expenses, such as budgeted contractors and consultant expenditures, into more detailed cost categories; and (2) separating working capital reserves needed for operations from working capital reserves needed for contingencies to the extent they are known during business planning.	Disputed.
5	Increase the granularity of the NERC true-up filings in line with the budget filings.	Increase the granularity of the NERC true-up filings in line with the budget filings.	Agreed (no difference).

6	Increase the level of NERC review of proposed Regional Entity business plans and budgets, including qualitative and quantitative analyses, with a specific focus on increasing the amount of review provided by NERC's statutory program departments to the business plans and budget of their counterpart Regional Entity functions.	Increase the level of NERC review of proposed Regional Entity business plans and budgets, including qualitative and quantitative analyses, with a specific focus on increasing the amount of review provided by NERC's statutory program departments to the business plans and budget of their counterpart Regional Entity functions.	Agreed (no difference).
7	Establish policies and procedures for using information gained and lessons learned from NERC's oversight of Regional Entity operations in the review process for Regional Entity business plans and budgets.	Establish policies and procedures for using information gained and lessons learned from NERC's oversight of Regional Entity operations in the review process for Regional Entity business plans and budgets.	Agreed (no difference).
8	Provide budget changes and recommendations to the Regional Entities during the early stages of the Regional Entity budget processes so there is sufficient time to incorporate NERC's recommendations prior to final review and approval of such business plans and budgets by the Board.	Provide budget changes and recommendations to the Regional Entities during the early stages of the Regional Entity budget processes so there is sufficient time to incorporate NERC's recommendations prior to final review and approval of such business plans and budgets by the Board.	Agreed (no difference).
9	Continue to implement a time reporting system with the functionality to track employees' time based on the amount of time spent on specific projects or activities and on statutory or non-statutory reliability activities.	Continue implementation of a time reporting system with the functionality to track employees' time based on the amount of time spent on functional activities or key specific projects.	Disputed.
10	Develop and implement more comprehensive policies and procedures governing employee time reporting and tracking.	Develop and implement more comprehensive policies and procedures governing employee time reporting and tracking.	Agreed (no difference).
11	Provide training to NERC employees on the proper use of the new time reporting	Provide training to NERC employees on the proper use of the new time reporting	Agreed (no difference).

	system.	system.	
12	Develop project and business activity codes to allow better project management, including tracking of operating expenses to project-specific levels.	NERC deleted this recommendation.	Disputed.
13	To the extent consistent with good business practices, NERC should expeditiously implement functionality in the expense reporting software to allow the tracking of expenses on a project and activity basis.	Conduct a cost-benefit analysis in 2013 of implementing a more detailed project level budgeting and accounting system.	Disputed.
14	Improve automated controls in its accounting system, such as flags and alerts, to ensure proper accounting classifications, efficiency, and oversight for reporting and analyzing expenses.	Improve automated controls in its accounting system, such as flags and alerts, to ensure proper accounting classifications, efficiency, and oversight for reporting and analyzing expenses.	Agreed (no difference).
15	Establish a comprehensive, single-source accounting manual consisting of comprehensive accounting policies, procedures, controls, guidance, and other materials to ensure costs are properly classified, reviewed, approved, and presented accurately in NERC's accounting system, financial statements, and budget filings.	Establish a comprehensive, single-source accounting manual consisting of comprehensive accounting policies, procedures, controls, guidance, and other materials to ensure costs are properly classified, reviewed, approved, and presented accurately in NERC's accounting system, financial statements, and budget filings.	Agreed (no difference).
16	Continue to conduct on a routine and periodic basis a thorough review of its entire organization to determine the particular skills and competencies that are required to perform the necessary tasks of each organizational position.	Continue to conduct on a routine and periodic basis a thorough review of its entire organization to determine the particular skills and competencies that are required to perform the necessary tasks of each organizational position. 18	Use total compensation and update policies to reflect the use of total compensation as the relevant guideline in assessing salaries, retirement benefits, bonuses and other forms of compensation.	Use total compensation, and update policies to reflect the use of total compensation as the relevant guideline in assessing salaries, retirement benefits, bonuses and other forms of compensation.	Agreed (no difference).
19	Enhance formal policies, procedures, and guidance governing expenses incurred by employees to include the following: (1) developing a well-documented reasonableness standard for employee and Trustee meal, hotel and other travel expenses, including guidance on what constitutes a reasonable cost; (2) detailed steps for reviewing and approving expenses; and (3) other necessary procedures to provide clear guidance to employees.	Enhance formal policies, procedures, and guidance governing expenses incurred by employees to include the following: (1) developing well-documented reasonableness standards for employee and Trustee meal, hotel and other travel expenses, including guidance on what constitutes a reasonable cost; (2) detailed steps for reviewing and approving expenses; and (3) other necessary procedures to provide clear guidance to employees.	Agreed (no difference).
20	In the enhancements under recommendation 19, NERC should evaluate the effectiveness of dividing its process for approving expenses into two steps, leaving managers responsible for approving the purpose and rationale for incurring expenses and designating accounting staff to be responsible for evaluating the reasonableness of expenses.	In the enhancements under recommendation 19, NERC should evaluate the effectiveness of dividing its process for approving expenses into two steps, leaving managers responsible for approving the purpose and rationale for incurring expenses and designating accounting staff to be responsible for evaluating the reasonableness of expenses.	Agreed (no difference).
21	Devise formalized recruitment and hiring policies, procedures, and strategies that address, among other things, controls over the total compensation packages, salary, retention bonuses, benefits, and other accommodations offered to	Devise formalized recruitment and hiring policies, procedures, and strategies that address, among other things, controls over the total compensation packages, salary, retention bonuses, benefits, and other accommodations offered to	Agreed (no difference).

	prospective employees. The policies and procedures should also address the qualifications and experience of prospective employees.	prospective employees. The policies and procedures should also address the qualifications and experience of prospective employees.	
22	Explicitly budget for employee entertainment expenses by including line items of sufficient granularity in the budget filings.	Explicitly budget for employee rewards and recognition and entertainment expenses by including line items of sufficient granularity in the budget filings.	NERC version agreed to with condition that NERC develop and submit clear policies and procedures that identify the nature of the costs to be recorded as employee rewards and recognition, and develop and file policies for how NERC will provide such rewards and recognition.
23	Use miscellaneous expense accounts to track entertainment expenses separately from business-related expenses in its accounting system.	Use miscellaneous expense accounts to track expenses which are for employee rewards and recognition or entertainment separately from other business-related expenses in its accounting system.	NERC version agreed to with condition that NERC develop and submit clear policies and procedures that identify the nature of the costs to be recorded as employee rewards and recognition, and develop and file policies for how NERC will provide such rewards and recognition.
24	Ensure entertainment expenses are clearly and transparently presented to the BOT, Commission, and stakeholders in the budget before these costs are incurred.	Ensure rewards and recognition expenses and entertainment expenses are clearly and transparently presented to the Board, Commission, and stakeholders in the budget before these costs are incurred.	NERC version agreed to with condition that NERC develop and submit clear policies and procedures that identify the nature of the costs to be recorded as employee rewards and recognition, and develop and file policies for how NERC will provide such rewards and recognition.
25	Consider returning to the performance-based method of compensating BOT members until NERC gains the necessary experience to support a change to a flat-fee compensation model.	NERC deleted this recommendation.	Disputed.
26	Establish a method for	NERC deleted this	Disputed.

	tracking BOT time and participation on BOT activities to be able to properly evaluate and quantify the performance of each trustee.	recommendation.	
27	Implement the planned BOT tracking software to assist in measuring BOT participation and reducing undue administrative burden.	NERC deleted this recommendation.	Disputed.
28	Conduct an analysis of BOT participation and effort based on a time study using actual time spent during BOT activities, or a representative study of the actual time spent and implement a compensation methodology that pays BOT members reasonably for performance of their duties.	Continue to conduct annual reviews of the Board compensation plan, taking into account Board time and participation on Board activities and conduct periodic market studies regarding the structure and amount of Board compensation.	Disputed.
29	Estimate and include in its annual budgets an amount of funding to cover expenses in connection with Board and Board committee meetings and other NERC activities that it deems appropriate and seek approval for such funding.	Estimate and include in its annual budgets an amount of funding to cover expenses for Trustees in connection with Board and Board committee meetings and other NERC activities that it deems appropriate and seek approval for such funding.	Disputed. Audit Staff modified version deletes "for Trustees" from NERC version.
30	Track the expenses actually incurred on the BOT to the budgeted amounts for such expenses.	Track the expenses actually incurred on the BOT to the budgeted amounts for such expenses.	Agreed (no difference).
31	Develop appropriate policies for the giving of gifts, funded from NERC's own resources or paid by any NERC officer or employee to a Trustee.	Develop appropriate policies for the giving of gifts, funded from NERC's own resources or paid by any NERC officer or employee to a Trustee.	Agreed (no difference).
32	Determine its retirement obligations using relevant comparability and other data that reflects current market conditions.	Determine its retirement obligations using relevant comparability and other data that reflects current market conditions.	Agreed (no difference).

	compensation, electric power industry practices, and other relevant factors. This policy should include procedures to justify that all retirement plan contribution levels are appropriate and reasonable.	compensation, electric power industry practices, and other relevant factors. This policy should include procedures to justify that all retirement plan contribution levels are appropriate and reasonable.	
34	Develop an alternative mechanism for addressing retirement contributions in excess of the IRS cap that maintains the payment as a retirement benefit and not as additional compensation to the employee.	Continue to use the mechanism that has been adopted and consider additional mechanisms to allow employees to address tax deferred retirement saving of contributions in excess of the IRS cap on 401(k) contributions.	Agreed to NERC version.
35	Conduct an assessment of existing CIP-related staffing to ensure that NERC staff work aligns with section 215 activities, and that there are adequate resources to accomplish CIP work.	Conduct an assessment of existing CIP-related staffing levels to ensure there are adequate resources to accomplish CIP work, particularly with respect to Regional Entity CIP auditing and other Regional Entity CIP-related CMEP activities.	Agreed to NERC version.
36	Devote greater resources to carry out its duties under the CMEP as to the CIP-002 through CIP-009 standards and provide effective oversight of CIP CMEP activities by the Regional Entities.	Devote greater resources to carry out its duties under the CMEP as to the CIP-002 through CIP-009 standards and provide effective oversight of CIP CMEP activities by the Regional Entities.	Agreed (no difference).
37	Establish written criteria for determining whether a reliability activity should be funded under section 215 through coordination and discussion with Commission staff and stakeholders. Submit to audit staff the criteria established from this collaborative process.	Establish written criteria for determining whether an activity is a statutory activity and should be funded under section 215 through an open and transparent process initiated by NERC.	Audit Staff and NERC disagree on how to implement this Recommendation; however, NERC now proposes to implement it via a March 1, 2013 compliance filing with the Commission.
38	Identify all ERO activities funded under section 215, detailing at a minimum: the purpose of the activity, a description, and the justification for using	In its annual business plan and budget filings, provide an explanation as to why the proposed activities to be undertaken by each program area for the budget year are	Disputed.

	section 215 funding. Submit all documentation to audit staff for these reliability activities.	statutory, including, at a minimum: a description and the purpose of the major activities to be undertaken by each program area and an explanation for why the activity is a statutory activity.	
39	Work with Commission staff to define NERC's role as the ES-ISAC, to evaluate NERC's role as the ES-ISAC in connection with NERC's other roles as the ERO, and to clearly lay out the Commission's role in overseeing the ES-ISAC.	Provide additional information in NERC's 2013 Business Plan and Budget regarding NERC's role as the ES-ISAC; and initiate an open and transparent process to provide opportunities for stakeholder input regarding NERC's role as the ES-ISAC, including (1) the impact, if any, on NERC's compliance-related activities of "walling off" certain staff from the ES-ISAC activities; and (2) access of FERC staff to ES-ISAC information for situational awareness and compliance purposes.	Agreed to NERC version with condition that a clarification of the Commission's ES-ISAC oversight responsibilities is clearly laid out as part of this process, and that the Commission has an opportunity to expressly consider and approve or disapprove ES-ISAC's statutory funding eligibility.
40	Evaluate the impact on compliance-related activities of "walling off" certain staff from these activities, and modify NERC's current proposal for redefining the operation of the ES-ISAC to include clear guidance on how the "walled off" sub-division will interact with the ERO.	NERC deleted this recommendation because it is subsumed by NERC's proposed no. 39.	Deletion agreed to with the condition stated in 39 above.
41	Clarify the flow of information between the ES-ISAC and the FERC staff for situational awareness and compliance purposes.	NERC deleted this recommendation because it is subsumed by NERC's proposed no. 39.	Deletion agreed to with the condition stated in 39 above.
42	Determine whether the funding of the ES-ISAC, in whole or in part, should be treated as non-statutory and, if so, how to manage such funding.	NERC deleted this recommendation because it is subsumed by NERC's proposed no. 39 and proposed nos. 37 and 38 in the preceding section on "NERC Activities."	Deletion agreed to with the condition stated in 39 above.

CERTIFICATE OF SERVICE

I hereby certify that I have served a copy of the foregoing document upon all parties listed on the official service list compiled by the Secretary in this proceeding.

Dated at Chicago, Illinois, this 10th day of September, 2012.

OFFICE OF ELECTRIC RELIABILITY

North American Electric Reliability Corporation
Docket No. RM06-16-000

September 13, 2012

North American Electric Reliability Corporation
1325 G Street N.W., Suite 600
Washington, D.C. 20005-3801

Attention: Holly A. Hawkins
Assistant General Counsel for Standards and Critical Infrastructure Protection

Reference: Filing for Approval of Errata Change to NERC Glossary of Terms

Dear Ms. Hawkins:

On March 16, 2012, the North American Electric Reliability Corporation (NERC) submitted a filing that requested that the NERC Glossary of Terms be amended to modify the definition of "Interconnection Reliability Operating Limit (IROL)" by replacing the reference to "Cascading Outages" with "Cascading outages."

NERC notes that the proposed term "Cascading Outages" was remanded in the Commission Order[1] which approved the term "IROL".

Notice of this filing was issued on July 25, 2012, with protests and interventions due on or before August 15, 2012.

Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and Procedure. 18 C.F.R. § 385.214. No protests were filed.

[1] *Facilities Design, Connections and Maintenance Reliability Standards*, 121 FERC ¶ 61,296 (December 27, 2007).

NERC's uncontested filing is approved pursuant to the relevant authority delegated to the Director, Office of Electric Reliability, under 18 C.F.R. § 375.303, as of the date of this order.

This action shall not be construed as accepting any other contingency plan pursuant to 18 C.F.R. § 375.303(a)(1)(i) or any other data or report pursuant to 18 C.F.R. § 375.303(b)(3)(iv). This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such action shall not be deemed as recognition of any claimed right or obligation associated therewith and such action is without prejudice to any findings or orders that have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order pursuant to 18 C.F.R. § 385.713.

Sincerely,

Joseph H. McClelland, Director
Office of Electric Reliability

Docket No. RD12-4-000

September 13, 2012

North American Electric Reliability Corporation
1325 G Street N.W., Suite 600
Washington, D.C. 20005-3801

Attention: Holly A. Hawkins
Assistant General Counsel for Standards and Critical Infrastructure Protection

Reference: Petition for Approval of Errata Changes to Seven Reliability Standards

Dear Ms. Hawkins:

On June 5, 2012, the North American Electric Reliability Corporation (NERC) submitted a filing that requested approval of errata changes to seven Reliability Standards as follows:

- BAL-005-0.1b Automatic Generation Control - replace Appendix 1 with a correct version of a Commission-approved interpretation, and make an internal reference correction in the interpretation;
- EOP-001-0b Emergency Operations Planning - update the title of Attachment 1 and correct internal references thereto, and correct an incorrect internal reference in Appendix 2;
- EOP-001-2b Emergency Operations Planning - update the title of Attachment 1 and correct internal references thereto, and update references in Appendix 1 to the correct standard;
- EOP-002-3 Capacity and Energy Emergencies - update the title of Attachment 1 and correct internal references thereto; remove parenthetical reference to a retired Attachment to another standard;
- IRO-005-3a Reliability Coordination – Current Day Operations - remove outdated internal reference in two Measures;

20120913-3010 FERC PDF (Unofficial) 09/13/2012

• PER-001-0.1 Operating Personnel Responsibility and Authority - correct transposition error of two words in a Measure; and

• TOP-002-2b Normal Operations Planning - remove incorrect language in Effective Date section of Exhibit B; remove two retired sub-requirements and parenthetical reference thereto, and correct Measure to reflect these changes.

Each change above is also accompanied by a revision to the numbering of the Reliability Standard and version history. Each errata change was submitted to NERC's Standards Committee, which found that the proposed corrections do not change the scope or intent of the associated Standards, nor do they have a material impact on the end users of the Standards.

Notice of this filing was issued on June 6, 2012, with protests and interventions due on or before June 26, 2012.

Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and Procedure. 18 C.F.R. § 385.214. No protests were filed.

NERC's uncontested filing is approved pursuant to the relevant authority delegated to the Director, Office of Electric Reliability, under 18 C.F.R. § 375.303, as of the date of this order.

This action shall not be construed as accepting any other contingency plan pursuant to 18 C.F.R. § 375.303(a)(1)(i) or any other data or report pursuant to 18 C.F.R. § 375.303(b)(3)(iv). This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such action shall not be deemed as recognition of any claimed right or obligation associated therewith and such action is without prejudice to any findings or orders that have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order pursuant to 18 C.F.R. § 385.713.

Sincerely,

Joseph H. McClelland, Director
Office of Electric Reliability

Revisions to Electric Reliability	**)**	**Docket Nos. RM12-6-000**
Organization Definition of Bulk Electric System	**)**	**RM12-7-000**
And Rules of Procedure	**)**	

REPLY COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO NOTICE OF PROPOSED RULEMAKING

The North American Electric Reliability Corporation ("NERC")[1] hereby provides these reply comments in response to the comments submitted on September 4, 2012 on the Federal Energy Regulatory Commission's ("FERC" or "Commission") June 22, 2012, Notice of Proposed Rulemaking ("NOPR")[2] regarding revisions to the Electric Reliability Organization ("ERO") Definition of Bulk Electric System ("BES Definition") and Rules of Procedure.

I. BACKGROUND

In the NOPR, the Commission proposed to approve a modification to the currently-effective definition of "bulk electric system."[3] The proposed modification to the definition removes language allowing for regional discretion in the currently-effective bulk electric system definition. The proposed revised definition also establishes a bright-line threshold so that the

---

[1] The Federal Energy Regulatory Commission certified NERC as the electric reliability organization ("ERO") in its order issued on July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corporation*, 116 FERC ¶ 61,062 (2006).

[2] *Revisions to Electric Reliability Organization Definition of Bulk Electric System and Rules of Procedure*, 139 FERC ¶ 61,247 (June 22, 2012) ("NOPR").

[3] NERC proposes the following "core" definition of bulk electric system:

> Unless modified by the [inclusion and exclusion] lists shown below, all Transmission Elements operated at 100 kV or higher and Real Power and Reactive Power resources connected at 100 kV or higher. This does not include facilities used in the local distribution of electric energy.

"bulk electric system" will include facilities operated at 100 kV or higher, if they are Transmission Elements, or connected at 100 kV or higher, if they are Real Power or Reactive Power resources.[4] The new proposed definition contains specific inclusions and exclusions to provide clarity in the definition that the facilities described in certain configurations are included in or excluded from the BES Definition. Comments on the NOPR were due on September 4, 2012, and NERC and a significant number of entities submitted comments. Pursuant to Rule 212, NERC respectfully offers these reply comments in order to clarify several issues raised by other commenters.

II. COMMENTS

NERC offers comments on the following: (1) the extent of the Commission's jurisdiction in connection with the scope of the BES Definition, (2) the exceptions process as set forth in the Rules of Procedure, and (3) the scope of Phase 2 of the BES Definition.[5] In addition, several entities offer revised language to the BES Definition for consideration by the Commission.[6] As the Commission has noted in prior instances, such comments should have been submitted during the standard development process and the Commission should reject such comments.[7]

---

[4] Unless otherwise designated, all capitalized terms shall have the meaning set forth in the Glossary of Terms Used in NERC Reliability Standards, available here: http://www.nerc.com/files/Glossary_of_Terms.pdf.

[5] In response to the request for clarification by Alameda Municipal Power regarding the ability of parties to seek exceptions for proposed facilities, NERC notes that Section 1.1 provides that an entity planning the connection of a new Element for which it believes an Exception would be appropriate may request an Exception prior to commercial operation of the Element. *See Comments of Alameda Municipal Power* at 17 ("AMP seeks clarification that parties may seek exceptions for proposed facilities, and not just for existing facilities. Allowing exceptions to be sought for proposed facilities would provide an opportunity for entities to make reasoned decisions about planned system improvements.").

[6] *See e.g.,Comments of the PSEG Companies* at 2.

[7] See *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672 at P 334, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006)("we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by the Commission.").

A. The BES Definition Accurately Reflects the Extent of the Commission's Jurisdiction

With respect to comments submitted regarding the extent of the Commission's jurisdiction under Section 215 of the Federal Power Act ("FPA"),[8] NERC notes that the exemption of local distribution facilities in the BES Definition and the exclusion of radial systems as described in Exclusion E1, appropriately reflect the Commission's jurisdiction under Section 215.[9] As the Commission acknowledged in Order No. 743, Congress has specifically exempted facilities used in the local distribution of energy from the definition of Bulk-Power System, and such facilities accordingly cannot be included as part of the BES as defined by NERC.[10]

The sole fact that industrial generators are intrastate facilities that only serve load does not mean that they are excluded from the Commission's jurisdiction under Section 215. Section 215 applies to both interstate and intrastate facilities -- whether or not Section 215 applies to industrial generators depends on whether they are users, owners or operators of the bulk-power system and the current criteria for that determination are set forth in NERC's Compliance

---

[8] Several commenters state that because industrial generators are intrastate facilities that only serve the owner's load, they are excluded from the jurisdiction of the Commission. *See Comments of Barrick Goldstrike Mines Inc.*, at 13 ("Accordingly, these intrastate industrial generators are not now subject to FERC jurisdiction and NERC's reliability rules must therefore stay within the limits imposed by the statutory text set forth by Congress."); *Comments of the Industrial Users of Utah* at 3-4 ("Because these industrial generators are intrastate facilities that serve only the owner's load, they are excluded from the jurisdiction of FERC and NERC. ").

[9] FPA Section 215(b)(1), titled "Jurisdiction and Applicability," describes the Commission's reliability jurisdiction as follows:

> The Commission shall have jurisdiction . . . over . . . all users, owners and operators of the bulk-power system, including but not limited to the entities described in section 201(f), for purposes of approving reliability standards established under this section and enforcing compliance with [FPA section 215]. All users, owners and operators of the bulk-power system shall comply with reliability standards that take effect under this section.
>
> 16 U.S.C. § 824o(b)(1).

[10] *See* Order No. 743, 133 FERC ¶ 61,150 at P 37 (2010); *see also* Order No. 743-A, 134 FERC ¶ 61,210 at P 58 ("[W]e reiterate that facilities used for local distribution are excluded from the Bulk-Power System definition under *section 215*, and thus are excluded from the bulk electric system.")(2011).

Registry. NERC respectfully submits that the BES Definition appropriately reflects the exemption of facilities used in local distribution and accurately reflects the Commission's jurisdiction.

B. The Exceptions Process is Sufficiently Robust and Transparent

1. The Limitation on the Right to File an Exception Request is Appropriate

Section 1.1 of Appendix 5C to the NERC Rules of Procedure details who is entitled to file an Exception Request. The exceptions process is based on the NERC Compliance Registry and the NERC Functional Model. The right to file an Exception Request is not limited to the Owner of the Element that is the subject of the Exception Request. Rather, the Regional Entity or a Registered Entity performing reliability functions that would have the Element within its Scope of Responsibility may submit an Exception Request with respect to the Element.

> The Owner of the Element to which the Exception Request applies or, with respect to an Element owned by another Registered Entity, any Regional Entity, Planning Authority ("PA"), Reliability Coordinator ("RC"), Transmission Operator ("TOP"), Transmission Planner ("TP") or Balancing Authority ("BA") that has (or will have upon inclusion of the Elements in the BES) the Elements covered by an Exception Request within its Scope of Responsibility may submit an Exception Request for the Element as provided in this Exception Procedure

Several commenters have raised concerns regarding the role of state commissions[11] and Regional Transmission Organizations/Independent System Operators ("RTOs/ISOs") within the

[11] *See Comments of the New York State Public Service Commission* at 7 ("the NOPR does not include any meaningful opportunities for the participation of states in the exception process for excluding facilities that are not necessary for the reliable operation of the interconnected transmission network. Because the states are appropriate entities that should be working with local Transmission Owners and/or regional reliability councils to identify local distribution facilities, the Commission should expressly provide for state involvement in any such process."); *Comments of the National Association of Regulatory Utility Commissioners* at 7 ("the Commission should direct NERC to amend the Rules of Procedure to ensure the relevant State regulatory authorities receive the same notice and access to information as Planning authorities and other entities and should have the same right to provide comment and input to the Regional Entity as is provided to other stakeholders.").

exceptions process.[12] NERC submits that the limitation on the right to file an Exception Request to the above-listed entities is appropriate. This procedure reflects an effective and efficient way to bring to bear the information required to process Exception Requests. RTOs and ISOs have the ability to file an Exception Request where they are acting in their capacity as Planning Authorities, Reliability Coordinators, Transmission Operators, Transmission Planners or Balancing Authorities. The exceptions process is technical and is based on engineering expertise, and these are the necessary parties with the required information. State commissions have other means and methods at their disposal for working with entities to identify candidates for an Exception Request. For these reasons, the limitation on the right to file an Exception Request is appropriate and administratively efficient.

2. Notice Regarding Exception Requests is Sufficient

Commenters have stated that state regulatory authorities should receive notice and access to information regarding Exception Requests.[13] Attachment 9 of NERC's Petition, (The Development Process and Basis for the RoP Team Recommended Provisions- How Stakeholder Comments were Considered and Addressed), includes a discussion (at p. 6-7) regarding the role of state regulators within the exceptions process.

> The Team specifically provided that (1) detailed notice of any request would be provided to every Registered Entity with reliability oversight obligation for the Element subject to the Request and (2) general information about the request will be publicly posted. The RoP team believes that it has achieved sufficient balance between the protection of CEII and other confidential information and the need to have a process as transparent as possible to ensure consistency. The RoP Team believes that third parties (including state regulatory agencies) will have adequate opportunity to provide comments regarding the request without formally participating in the process

[12] *See e.g., Comments of the Midwest Independent Transmission System Operator, Inc.* at 9-13.

[13] *See infra.* at n.11.

This process provides as much transparency as possible, while maintaining protection and confidentiality of information. As noted above, NERC maintains that it is unnecessary for there to be an explicit role for specific third parties within the exceptions process and asserts that the notice provided with respect to Exception Requests is sufficient.

3. <u>The Requirements for Submitting an Exception Request Must be Consistent</u>

The Midwest Independent Transmission System Operator, Inc. suggests that the Commission should "lower the requirements for RTOs when filing exception requests for exclusion and/or inclusion of facilities within their scope of responsibility."[14] NERC disagrees. This concept is inconsistent with the need to provide a consistent and clear basis for determining the outcome of exception requests. The Rules of Procedure require the submitting entity to include a common set of data and information with each exception request (the "Detailed Information to Support an Exception Request"). The Detailed Information is intended to ensure that a consistent baseline of technical information is provided to the Regional Entity and NERC with all exception requests, in addition to the specific information and arguments submitted by the submitting entity in support of its exception request. For these reasons, NERC asserts that it is appropriate that the information required for an exception request is the same, regardless of the identity of the submitter.

C. Phase 2 of the BES Definition

A number of comments submitted in response to the BES NOPR raise issues that are currently being addressed by Phase 2 of the BES Definition.[15] Project 2010-17, Definition of

---

[14] *Comments of the Midwest Independent Transmission System Operator, Inc*. at 12.

[15] *See e.g*., *Comments of Consumers Energy Company* at 3 ("the scope of Inclusion I4 is unclear"); *Comments of Barrick Goldstrike Mines, Inc.* at 5 ("It is unclear what 'not . . . non-retail generation' means.")*; Comments of the Dow Chemical Company* at 1 ("the requirement that power may only flow into, and not out of, a local network should be clarified to apply only to power that originates outside of, and flows through, a local network."); *Comments of the New England States Committee on Electricity* at 3("NERC's proposal provides no technical

Bulk Electric System was divided into phases in order to meet the Commission's directives in Order Nos. 743 and 743-A, while also addressing the concerns raised by stakeholders in the standard development process. As outlined in the Phase 2 Standards Authorization Request ("SAR"),[16] Phase 2 of the BES Definition will include an analysis of the-following issues which were identified during the development of Phase 1:

- Development of a technical justification to set the appropriate threshold for Real and Reactive Power Resources necessary for the reliable operation of the BES;
- Determination of whether there is a need for the BES Definition to encompass a contiguous BES;
- Determination of whether there is a technical justification to revise the current 100 kV bright-line voltage level;
- Determination of whether there is a technical justification to support allowing power flow out of the local network under certain conditions and if so, what the maximum allowable flow and duration should be.

In addition, Phase 2 will provide clarity to the following:

- The relationship between the BES Definition and the ERO Statement of Compliance Registry Criteria established in Order No. 693;
- The use of the term "non-retail generation;"
- The language for Inclusion I4 on dispersed power resources;
- The appropriate points of demarcation between Transmission, Generation and Distribution.

---

justification for relying on the bright-line approach."); *Comments of the New York State Public Service Commission* at 3 ("The NOPR lacks a technical justification for a 100 kV bright-line definition."); *Comments of Southern Company Services, Inc.* at 5 ("further consideration should be given as to whether inclusion I2 should be made more consistent with the Registry Criteria.").

[16] *See* http://www.nerc.com/filez/standards/Project2010-17_BES.html; *see also*, http://www.nerc.com/docs/standards/sar/BES_Definition_Fact_Sheet_20110920_final.pdf.

Phase 2 may also include other improvements to the BES Definition. NERC encourages commenters to participate in the standard development process and respectfully requests that the Commission continue to allow these issues to be addressed in Phase 2 of the BES Definition.

III. CONCLUSION

For the reasons stated above, NERC respectfully requests that the Commission accept these comments for consideration.

Respectfully submitted,

18 CFR Part 40

[Docket No. RM12-12-000]

Regional Reliability Standard PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding

(Issued September 20, 2012)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of Proposed Rulemaking.

SUMMARY: Under section 215 of the Federal Power Act (FPA),[1] the Federal Energy Regulatory Commission (Commission) proposes to approve regional Reliability Standard PRC-006-NPCC-1 (Automatic Underfrequency Load Shedding). The North American Electric Reliability Corporation (NERC) submitted the proposed regional Reliability Standard to the Commission for approval. The proposed regional Reliability Standard applies to generator owners, planning coordinators, distribution providers, and transmission owners in the Northeast Power Coordinating Council Region and is designed to ensure the development of an effective automatic underfrequency load shedding (UFLS) program to preserve the security and integrity of the Bulk-Power System during declining system frequency events, in coordination with the NERC continent-wide UFLS Reliability Standard PRC-006-1. The Commission also proposes

[1] 16 U.S.C. 824(o) (2006).

to approve the associated violation risk factors and violation severity levels, implementation plan, and effective dates proposed by NERC.

DATES: Comments are due [INSERT DATE 60 days after publication in the **FEDERAL REGISTER**]

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document

140 FERC ¶ 61,203
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Regional Reliability Standard PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding

Docket No. RM12-12-000

NOTICE OF PROPOSED RULEMAKING

(Issued September 20, 2012)

1. Under section 215 of the Federal Power Act (FPA), the Federal Energy Regulatory Commission (Commission) proposes to approve regional Reliability Standard PRC-006-NPCC-1 (Automatic Underfrequency Load Shedding). The North American Electric Reliability Corporation (NERC) submitted the proposed regional Reliability Standard to the Commission for approval. The proposed regional Reliability Standard applies to generator owners, planning coordinators, distribution providers, and transmission owners in the Northeast Power Coordinating Council (NPCC) Region and is designed to ensure the development of an effective automatic underfrequency load shedding (UFLS) program to preserve the security and integrity of the Bulk-Power System during declining system frequency events, in coordination with NERC's continent-wide UFLS Reliability Standard PRC-006-1.

2. The Commission also proposes to approve the associated violation risk factors (VRF) and violation severity levels (VSL), implementation plan, and effective dates proposed by NERC.

I. Background

A. Mandatory Reliability Standards

3. Section 215 of the FPA requires a Commission-certified Electric Reliability Organization (ERO) to develop mandatory and enforceable Reliability Standards that are subject to Commission review and approval. Once approved, the Reliability Standards may be enforced by NERC, subject to Commission oversight, or by the Commission independently.[2]

4. A Regional Entity may develop a Reliability Standard for Commission approval to be effective in that region only.[3] In Order No. 672, the Commission stated that:

> As a general matter, we will accept the following two types of regional differences, provided they are otherwise just, reasonable, not unduly discriminatory or preferential and in the public interest, as required under the statute: (1) a regional difference that is more stringent than the continent-wide Reliability Standard, including a regional difference that addresses matters that the continent-wide Reliability Standard does not; and (2) a regional Reliability Standard that is necessitated by a physical difference in the Bulk-Power System.[4]

[2] *See* 16 U.S.C. § 824o(e) (2006).

[3] 16 U.S.C. § 824o(e)(4). A Regional Entity is an entity approved by the Commission to enforce Reliability Standards under delegated authority from the ERO. *See* 16 U.S.C. § 824o(a)(7) and (e)(4).

[4] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, at P 291, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006)).

5. On April 19, 2007, the Commission accepted delegation agreements between NERC and each of the eight Regional Entities.[5] In the order, the Commission accepted NPCC as a Regional Entity.

6. NERC Reliability Standard PRC-006-1 establishes continent-wide design and documentation requirements for UFLS programs that arrest declining frequency and assist recovery of frequency following system events leading to frequency degradation.

B. Proposed Regional Reliability Standard PRC-006-NPCC-1

7. On May 4, 2012, NERC petitioned the Commission to approve proposed regional Reliability Standard PRC-006-NPCC-1 and the associated VRFs and VSLs, effective dates, and implementation plan.[6] NERC states that the proposed regional Reliability Standard is just, reasonable, not unduly discriminatory or preferential, and in the public interest because it satisfies the factors set forth in Order No. 672, which the Commission applies when reviewing a proposed Reliability Standard.[7] NERC states that PRC-006-NPCC-1 also satisfies the additional criteria required for approval of regional Reliability

[5] *North American Electric Reliability Corp.*, 119 FERC ¶ 61,060, *order on reh'g*, 120 FERC ¶ 61,239 (2007).

[6] Proposed regional Reliability Standard PRC-006-NPCC-1 is available on the Commission's eLibrary document retrieval system in Docket No. RM12-12-000 and on the NERC website, www.nerc.com. On August 3, 2012, NERC filed an errata attaching the proposed implementation plan.

[7] NERC Petition at 9-29 (citing Order No. 672, FERC Stats. & Regs. ¶ 31,204 at PP 323-335, 444).

Standards because it adds specificity not contained in the NERC continent-wide UFLS Reliability Standard PRC-006-1.[8]

8. Proposed regional Reliability Standard PRC-006-NPCC-1 has 23 requirements, each having an associated measure of compliance. The proposed standard also includes Figure 1, which includes a curve that establishes a threshold for setting underfrequency trip protection for generators in the portion of the NPCC Region in the Eastern Interconnection. NERC explains that the proposed regional Reliability Standard is based on the program characteristics defined within NPCC Directory #12 Underfrequency Load Shedding Program Requirements, which contains the criteria that govern the NPCC Automatic UFLS program that have been in place since June 26, 2009.[9] NERC states that the proposed regional Reliability Standard will achieve a coordinated, comprehensive UFLS region-wide consistent program within the NPCC Region and provides the regional requirements necessary to achieve and facilitate the broader program characteristics contained in the requirements of the NERC Reliability Standard PRC-006-1.[10] NERC states that the proposed regional Reliability Standard is designed to work in conjunction with and augment Reliability Standard PRC-006-1 by mitigating the consequences of an underfrequency event, while accommodating differences in system transmission and distribution topology among NPCC planning coordinators due to

[8] NERC Petition at 29-30.

[9] *Id.* at 11.

[10] *Id.* at 29-30.

historical design criteria, makeup of load demands, and generation resources.[11] NERC further states that the proposed regional Reliability Standard also facilitates uniformity, compliance, and clearly delineates what the applicable entities' requirements are within the NPCC Region to achieve a robust, reliable and effective UFLS program.[12]

9. NERC also proposes VRFs and VSLs for each requirement of the proposed regional Reliability Standard and an implementation plan and effective dates. NERC states that these proposals were developed and reviewed for consistency with NERC and Commission guidelines.

10. NERC proposes two effective dates for the proposed regional Reliability Standard. NERC states that Requirements R1 through R7 would become effective on the first day of the first calendar quarter following applicable regulatory approval but no earlier than January 1, 2016. The implementation plan states that the January 1, 2016 effective date for Requirements R1 through R7 is meant to allow for completion of the on-going six-year implementation period for NPCC Directory #12 Underfrequency Load Shedding Program Requirements.[13] The implementation plan provides that the plan for "this

[11] *Id*. at 30.

[12] *Id*.

[13] NPCC Directory #12 Underfrequency Load Shedding Program Requirements contains the pre-existing criteria that govern the NPCC Automatic UFLS program developed by the NPCC Working Group on Inter-Area Dynamic Analysis. NERC Petition at 11. The implementation plan was submitted as an exhibit to the August 3, 2012 NERC errata filing. As found on the Commission's eLibrary system in Docket No. RM12-12-000, the implementation plan is located in Exhibit A (PRC-006-NPCC-1 — Automatic Underfrequency Load Shedding Regional Reliability Standard Proposed and

(continued)

standard is based, in part, on the timelines reflected in the existing and ongoing Implementation Plan for NPCC Directory #12 absent the annual milestones required by Directory #12."[14] With respect to Requirements R8 through R23, NERC proposes that they become effective the first day of the first calendar quarter two years following applicable regulatory approval.

II. Discussion

A. PRC-006-NPCC-1

11. Pursuant to FPA section 215(d)(2), we propose to approve regional Reliability Standard PRC-006-NPCC-1 as just, reasonable, not unduly discriminatory or preferential, and in the public interest. Proposed regional Reliability Standard PRC-006-NPCC-1 is designed to operate in conjunction with the NERC continent-wide UFLS Reliability Standard PRC-006-1 by mitigating the consequences of underfrequency events, while accommodating differences in system transmission and distribution topology among NPCC planning coordinators due to historical design criteria, makeup of load demands, and generation resources.

12. The proposed regional Reliability Standard includes requirements not found in the corresponding NERC continent-wide UFLS Reliability Standard PRC-006-1 that are more stringent than Reliability Standard PRC-006-1 and accommodate differences in

---

Implementation Plan for Approval) of the errata filing beginning at page 29 of the PDF electronic file submitted by NERC.

[14] *Id*.

system transmission and distribution topology among NPCC planning coordinators due to historical design criteria, makeup of load demands, and generation resources.[15]

13. For example, the generator underfrequency trip threshold in PRC-006-NPCC-1, Requirement R13 is more stringent than the threshold specified in the continent-wide Reliability Standard PRC-006-1. Requirement R13 of the proposed regional Reliability Standard requires generator owners to set their generator underfrequency trip relay setting below the generator underfrequency trip protection settings threshold shown in Figure 1, except as otherwise provided in Requirements R16 and R19. This requirement is more stringent than the corresponding requirement in Reliability Standard PRC-006-1, Requirement R4, because the continent-wide Reliability Standard requires a higher generator underfrequency trip setting.[16] In addition, the continent-wide Reliability Standard PRC-006-1 does not require generator owners to have compensatory load shedding provisions if their units trip above the underfrequency tripping threshold requirements specified in PRC-006-1, Attachment 1. By contrast, proposed regional Reliability Standard PRC-006-NPCC-1, Requirement R16.3, requires that each generator owner of existing non-nuclear units "[h]ave compensatory load shedding, as provided by a Distribution Provider or Transmission Owner that is adequate to compensate for the

[15] NERC Petition at 29-30.

[16] Higher underfrequency trip settings result in generators tripping offline sooner than lower underfrequency trip settings.

loss of their generator due to early tripping."[17] The proposed regional Reliability Standard PRC-006-NPCC-1 is therefore more stringent, while also accommodating NPCC's generation resource mix, because it requires compensatory load shedding by existing non-nuclear units, but not existing nuclear units, to make up for the loss of generation due to early tripping of the generators.[18]

14. While we propose to approve regional Reliability Standard PRC-006-NPCC-1, the Commission seeks comment on: (1) the technical basis for the 57.8 Hz maximum tripping limit for existing nuclear units established in Requirement R19; and (2) the time-frames for actions that result in changes to the NPCC UFLS program.

15. First, Requirement R19 of the proposed regional Reliability Standard for existing nuclear generating plants provides that:

> R19 Each Generator Owner of existing nuclear generating plants with units that have underfrequency relay threshold settings above the Eastern Interconnection generator tripping curve in Figure 1, based on their licensing design basis, shall: [Violation Risk Factor: High] [Time Horizon: Long Term Planning]
>
> 19.1 Set the underfrequency protection to operate at as low a frequency as possible in accordance with the plant design licensing limitations but not greater than 57.8Hz.
>
> 19.2 Set the frequency trip setting upper tolerance to no greater than + 0.1

[17] Attachment B to proposed regional Reliability Standard PRC-006-NPCC-1 establishes the compensatory load shedding criteria for the portion of NPCC located in the United States for existing non-nuclear units.

[18] *Compare* proposed regional Reliability Standard PRC-006-NPCC-1, Requirement R16, *with* proposed regional Reliability Standard PRC-006-NPCC-1, Requirement R19.

Hz.

19.3 Transmit the initial frequency trip setting and any changes to the setting and the technical basis for the settings to the Planning Coordinator.

16. The NERC petition does not explain the technical basis for establishing 57.8 Hz as the maximum frequency at which existing nuclear units may trip pursuant to Requirement R19.1. The NERC petition states that the proposed regional Reliability Standard was based on the work of an NPCC working group.[19] However, the NERC petition and its attachments do not provide any information as to how the 57.8 Hz figure was developed. We seek comment from NPCC, NERC, and other interested entities explaining the technical basis for the 57.8 Hz limit established in Requirement R19.1.

17. Second, Requirement R3 of NERC's Reliability Standard PRC-006-1 requires the planning coordinator to set the schedule for the distribution providers and transmission owners to implement the UFLS program. The regional Reliability Standard PRC-006-NPCC-1, Requirements R5, R16.2, and R19.3, require distribution providers, transmission owners, and generator owners to provide, inform, and transmit exceptions to the UFLS program and justifications for the exceptions to the planning coordinator. The requirements, however, do not specify a time-frame for the completion of these actions. Requirements R5, R16.2, and R19.3 address actions that can result in changes to the UFLS program and should occur before the UFLS program is implemented, thus making it necessary for entities to provide the required information to the planning coordinator

[19] NERC Petition at 11.

within a specified period of time. We note there are other requirements in the proposed regional Reliability Standard that also require actions of distribution providers, transmission owners, and generator owners that should occur before the UFLS program is implemented that include specific time-frames.[20] The Commission seeks comment on whether Requirements R5, R16.2, and R19.3 should also specify time-frames for completion of the required actions and, if so, the appropriate time-frames for each.

B. Violation Risk Factors and Violation Severity Levels

18. NERC states that each Requirement of the proposed regional Reliability Standard PRC-006-NPCC-1 includes one VRF and one VSL and that the ranges of penalties for violations will be based on the sanctions table and supporting penalty determination process described in the Commission-approved NERC Sanctions Guideline. The Commission proposes to approve the VRFs and VSLs for regional Reliability Standard PRC-006-NPCC-1 proposed by NERC as consistent with the Commission's established guidelines.[21]

C. Implementation Plan and Effective Dates

19. NERC proposes that Requirements R1 through R7 become effective on the first day of the first calendar quarter following applicable regulatory approval but no earlier than January 1, 2016 while Requirements R8 through R23 become effective the first day of the first calendar quarter two years following applicable regulatory approval. NERC

[20] *See, e.g.*, Requirements R11, R14, and R23 of proposed regional Reliability Standard PRC-006-NPCC-1.

[21] *North American Electric Reliability Corp.*, 135 FERC ¶ 61,166 (2011).

states that the implementation plan provides that "this standard is based, in part, on the timelines reflected in the existing and ongoing Implementation Plan for NPCC Directory #12 absent the annual milestones required by Directory #12."[22] The Commission proposes to accept the implementation plan and effective dates proposed by NERC for regional Reliability Standard PRC-006-NPCC-1.

III. Information Collection Statement

20. The Office of Management and Budget (OMB) regulations require that OMB approve certain reporting and recordkeeping (collections of information) imposed by an agency.[23] Upon approval of a collection(s) of information, OMB will assign an OMB control number and expiration date. Respondents subject to the filing requirements of this rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

21. The Commission is submitting these reporting and recordkeeping requirements to OMB for its review and approval under section 3507(d) of the PRA. Comments are solicited on the Commission's need for this information, whether the information will have practical utility, the accuracy of the provided burden estimate, ways to enhance the quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques.

---

[22] NERC August 3, 2012 Errata at 29 of PDF electronic file.

[23] 5 C.F.R. § 1320.11.

22. This Notice of Proposed Rulemaking proposes to approve regional Reliability Standard PRC-006-NPCC-1. This is the first time NERC has requested Commission approval of the proposed regional Reliability Standard. NERC states in its petition that UFLS requirements have been in place at a continent-wide level and within NPCC for many years prior to implementation of the Commission-approved Reliability Standards in 2007. Because the UFLS requirements have been in place prior to the development of PRC-006-NPCC-1, the proposed regional Reliability Standard is largely associated with requirements that applicable entities are already following.[24] The proposed regional Reliability Standard PRC-006-NPCC-1 is designed to work in conjunction with and augment the NERC continent-wide UFLS Reliability Standard PRC-006-1 by mitigating the consequences of underfrequency events, while accommodating differences in system transmission and distribution topology among NPCC planning coordinators due to historical design criteria, makeup of load demands, and generation resources. The proposed regional Reliability Standard is only applicable to generator owners, planning coordinators, distribution providers, and transmission owners in the NPCC Region. The reporting requirements in proposed regional Reliability Standard PRC-006-NPCC-1 only pertain to entities within the NPCC Region.

[24] *See* 5 C.F.R. § 1320.3(b)(2) ("The time, effort, and financial resources necessary to comply with a collection of information that would be incurred by persons in the normal course of their activities (e.g., in compiling and maintaining business records) will be excluded from the 'burden' if the agency demonstrates that the reporting, recordkeeping, or disclosure activities needed to comply are usual and customary.").

23. Public Reporting Burden: Our estimate below regarding the number of respondents is based on the NERC Compliance Registry as of July 24, 2012. According to the NERC Compliance Registry, there are 2 planning coordinators and 135 generator owners within the United States portion of the NPCC Region. The Commission bases individual burden estimates on the time needed for planning coordinators to incrementally gather data, run studies, and analyze study results to design or update the UFLS programs that are required in the regional Reliability Standard in addition to the requirements of the NERC Reliability Standard PRC-006-1.[25] Additionally, generator owners must set each underfrequency trip relay below the appropriate generator underfrequency trip protection settings threshold curve in PRC-006-NPCC-1, Figure 1 and provide the generator underfrequency trip setting and time delay to its planning coordinator within 45 days of the planning coordinator's request. These burden estimates are consistent with estimates for similar tasks in other Commission-approved Reliability Standards. The following estimates relate to the requirements for this Notice of Proposed Rulemaking in Docket No. RM12-12-000 (For Planning Coordinators) and are in addition to the burden for the continent-wide Reliability Standard PRC-006-1, which was approved in Order No. 763 (approved by OMB Control No.1902-0244 on7/9/2012).

[25] The burden estimates for Reliability Standard PRC-006-1 are included in Order No. 763 and are not repeated here.

PRC-006-NPCC-1 (FERC-725L) (Automatic Underfrequency Load Shedding)[26]	Number of Respondents Annually (1)	Number of Responses per Respondent (2)	Average Burden Hours Per Response (3)	Total Annual Burden Hours (1)x(2)x(3)
PCs*: Design and document Automatic UFLS Program	2	1	8	16
PCs: Update and Maintain UFLS Program Database			16	32
GOs*: Provide Documentation and Data to the Planning Coordinator	135	1	16	2160
GOs: Record Retention			4	540
Total				2748

*PC=planning coordinator; GO=generator owner

Total Annual Hours for Collection: (Compliance/Documentation) = 2,748 hours.

Total Reporting Cost for planning coordinators: = 48 hours @ $120/hour = $5,760.

Total Reporting Cost for generator owners: = 2,160 hours @ $120/hour = $259,200.

Total Record Retention Cost for generator owners: 540 hours @ $28/hour = $15,120.

Total Annual Cost (Reporting + Record Retention)[27]: = $5760 + $259,200 +$15,120 = $280,080.

Title: Mandatory Reliability Standards for the NPCC Region

[26] Proposed regional Reliability Standard PRC-006-NPCC-1 applies to planning coordinators, transmission owners, distribution providers and generator owners. However, the burden associated with the transmission owners and distribution providers is not included within this table because the Commission accounted for it under Commission-approved Reliability Standards PRC-006-1, PRC-007-0 and PRC-009-0.

[27] The Commission bases the hourly reporting cost on the cost of an engineer to implement the requirements of the rule. The record retention cost comes from Commission staff research on record retention requirements.

Action: Proposed Collection FERC-725L.

OMB Control No.: To be determined.

Respondents: Businesses or other for-profit institutions; not-for-profit institutions.

Frequency of Responses: On Occasion.

Necessity of the Information: This proposed rule proposes to approve the regional Reliability Standard pertaining to automatic underfrequency load shedding. The proposed regional Reliability Standard helps ensure the development of an effective UFLS program that preserves the security and integrity of the Bulk-Power System during declining system frequency events in coordination with the continent-wide Reliability Standard PRC-006-1 requirements.

Internal Review: The Commission reviewed the proposed regional Reliability Standard and made a determination that its action is necessary to implement section 215 of the FPA. These requirements, if accepted, should conform to the Commission's expectation for UFLS programs as well as procedures within the NPCC Region.

24. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

25. For submitting comments concerning the collection(s) of information and the associated burden estimate(s), please send your comments to the Commission and to the Office of Management and Budget, Office of Information and Regulatory Affairs, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory

Commission, phone: (202) 395-4638, fax: (202) 395-7285]. For security reasons, comments to OMB should be submitted by e-mail to: oira_submission@omb.eop.gov. Comments submitted to OMB should include FERC-725L and Docket Number RM12-12-000.

IV. Environmental Analysis

26. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[28] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[29] The actions proposed here fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act Certification

27. The Regulatory Flexibility Act of 1980 (RFA)[30] generally requires a description and analysis of any rules that will have significant economic impact on a substantial number of small entities. The RFA mandates consideration of regulatory alternatives that accomplish the stated objectives of a proposed rule and that minimize any significant economic impact on a substantial number of small entities. The Small Business

[28] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, FERC Stats. & Regs., Regulations Preambles 1986-1990 ¶ 30,783 (1987).

[29] 18 C.F.R. § 380.4(a)(2)(ii).

[30] 5 U.S.C. 601-612.

Administration's (SBA) Office of Size Standards develops the numerical definition of a small business.[31] The SBA has established a size standard for electric utilities, stating that a firm is small if, including its affiliates, it is primarily engaged in the transmission, generation and/or distribution of electric energy for sale and its total electric output for the preceding twelve months did not exceed four million megawatt hours.[32]

28. Proposed regional Reliability Standard PRC-006-NPCC-1 proposes to achieve a coordinated, comprehensive UFLS region-wide consistent program within the NPCC Region to achieve and facilitate the broader program characteristics contained in the requirements of the continent-wide Reliability Standard PRC-006-1.[33] It will be applicable to planning coordinators, generator owners, transmission owners and distribution providers. Comparison of the NERC Compliance Registry with data submitted to the Energy Information Administration on Form EIA-861 indicates that 5 small entities are registered as generator owners in the United States portion of the NPCC Region.[34] The Commission estimates that the small generator owners to whom the proposed regional Reliability Standard applies will incur compliance and record keeping costs of $10,160 ($2,032 per generator owner). Accordingly, proposed regional

[31] 13 C.F.R. 121.101.

[32] 13 C.F.R. 121.201, Sector 22, Utilities & n.1.

[33] NERC Petition at 29-30

[34] The two planning coordinators in the United States portion of the NPCC Region are not considered small entities.

Reliability Standard PRC-006-NPCC-1 should not impose a significant operating cost increase or decrease on the affected small entities.

29. Further, NERC explains that the cost for smaller entities to implement regional Reliability Standard PRC-006-NPCC-1 was considered during the development process. NERC states that proposed regional Reliability Standard PRC-006-NPCC-1 provides an opportunity for smaller entities to aggregate their load with other such entities in the same electrical island. This allows each smaller entity's respective planning coordinator to achieve the desired aggregate outcome within that island according to program characteristics.[35]

30. Based on this understanding, the Commission certifies that the regional Reliability Standard will not have a significant economic impact on a substantial number of small entities. Accordingly, no regulatory flexibility analysis is required.

VI. Comment Procedures

31. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [INSERT DATE 60 days after publication in the **FEDERAL REGISTER**]]. Comments must refer to Docket No. RM12-12-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

[35] NERC Petition at 25.

32. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

33. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC 20426.

34. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VII. Document Availability

35. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington DC 20426.

36. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and

Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

37. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

By direction of the Commission.

I. INTRODUCTION

The North American Electric Reliability Corporation ("NERC")[1] submits this filing in support of the response of the SERC Reliability Corporation ("SERC") to the Notice of Proposed Rulemaking, issued on July 19, 2012, proposing to approve regional Reliability Standard PRC-006-SERC-01 - Automatic Underfrequency Load Shedding Requirements ("NOPR").

By this filing, NERC expresses its support for the response of SERC to the NOPR and requests that the Commission approve the standard consistent with this filing.

II. NOTICES AND COMMUNICATIONS

Notices and communications with respect to this filing may be addressed to:

Gerald W. Cauley
President and Chief Executive Officer

[1] The Federal Energy Regulatory Commission ("FERC" or "Commission") certified NERC as the electric reliability organization ("ERO") in its order issued on July 20, 2006 in Docket No. RR06-1-000. *North American Reliability Corporation*, "Order Certifying North American Electric Reliability Corporation as the Electric Reliability Organization and Ordering Compliance Filing," 116 FERC ¶ 61,062 (July 20, 2006).

III. DISCUSSION

On February 1, 2012, NERC submitted a petition seeking approval of regional Reliability Standard PRC-006-SERC-01– Automatic Underfrequency Load Shedding Requirements ("NERC Petition").[2] On July 19, 2012, the Commission issued a NOPR[3] proposing to approve regional Reliability Standard PRC-006-SERC-01, but expressed concerns about a possible inconsistency between PRC-006-SERC-01 and the continent-wide PRC-006-1 — Automatic Underfrequency Load Shedding.[4]

On August 9, 2012, NERC submitted a compliance filing to Order No. 763, which addressed the Commission's concern regarding PRC-006-SERC-01 and PRC-006-1:

> NERC hereby clarifies that the continent-wide standard PRC-006-1 is not replaced by PRC-SERC-006-01. UFLS entities in the SERC Reliability Corporation Region must be compliant with both standards… In any event, UFLS entities must meet the schedule set by the Planning Coordinator to comply with PRC-006-1, Requirement R9, but the timeframe must not exceed 18 months in the SERC Reliability Corporation Region to comply with PRC-SERC-006-01, Requirement R6.

In its NOPR comments, SERC states that it does not oppose the above clarification by NERC, and SERC proposes to revise the rationale for Requirement R6 of PRC-SERC-006-01 as follows:

> The SDT believes it is necessary to put a requirement on how quickly changes to the scheme should be implemented. This requirement specifies that changes must be implemented within 18 months of notification by the PC. The 18 month interval was chosen to give a reasonable amount of time for making changes in the field. All of the SERC Region has existing UFLS schemes which, based on periodic simulations, have provided reliable

[2] Petition of the North American Electric Reliability Corporation for Approval of Regional Reliability Standard PRC-006-SERC-01, Docket No. RM12-9-000 (February 1, 2012).

[3] Notice of Proposed Rulemaking, *Regional Reliability Standard PRC-006-SERC-01 —Automatic Underfrequency Load Shedding Requirements*, 140 FERC ¶ 61,056, (2012).

[4] On May 7, 2012, the Commission issued Order No. 763 approving the continent-wide Reliability Standard PRC-006-1. *See Automatic Underfrequency Load Shedding and Load Shedding Plans Reliability Standards*, 139 FERC ¶ 61,098 (2012).

> protection for years. Events which result in islanding and an activation of the UFLS schemes are extremely rare *in SERC*. Therefore, the SDT does not believe that changes to an existing UFLS scheme will be needed in less than 18 months. However, if a PC determines there is a need for changing the UFLS scheme faster than 18 months, then the PC may require the implementation to be done sooner as allowed by NERC Reliability Standard PRC-006-1.

SERC also does not oppose modifying the VRF assigned to Requirement R6 of PRC-SERC-006-01 from "medium" to "high".

NERC supports the rationale for Requirement R6 of PRC-SERC-006-01, as revised by SERC, and modifying the VRF assignment to Requirement R6 of PRC-SERC-006-01 from "medium" to "high".

IV. CONCLUSION

NERC respectfully requests that the Commission approve the standard as proposed in the NOPR and consistent with this filing, as mandatory and enforceable.

Respectfully submitted,

/s/ Willie L. Phillips

Commissioner John R. Norris Statement
October 18, 2012
Docket Nos. RM12-22-000 and RM12-4-000
Item Nos. E-2 and E-3

Proposed Enhancements to Reliability of Bulk Power System

"These two reliability orders address two distinctly different challenges, and represent two different approaches to maintaining reliability. E-3, concerning Reliability Standard FAC-003-2 on Transmission Vegetation Management (FAC-003), to me is about executing the fundamentals necessary to keep the lights on. We know that, without continuous care of transmission rights of way, vegetation growth will, without question, grow into power lines and impact reliability. This second version of FAC-003 recognizes the inevitability of outages if vegetation management is not in a continual state of maintenance, and also recognizes that this maintenance must be preformed on all transmission facilities that have an impact on reliability. The inclusion of Interconnection Operating Limit (IROL) elements and Major Western Electricity Coordinating Council (WECC) Transfer Path elements is a good step in recognizing that the applicability of FAC-003 should include sub-200 kV facilities that are critical to grid reliability.

"The threat of geomagnetic disturbances (GMD) addressed in the proposed rule in E-2 is a different but equally important reliability challenge. A poster child for a Low Frequency–High Impact threat, GMD involves a judgment call that requires us to assess the likelihood of occurrence, how severe the impact could be, and the options to guard against that impact. Like a cyber attack, the potential size and duration of an outage that could result from a GMD demands that we take the precautions necessary to prevent, limit, or contain the potential impact. While I do not believe there is a reasonable option that will guarantee that GMDs will never impact the grid, there are shorter and longer-term steps that we can take to guard against their potential impacts. Recognizing that taking these steps will come with costs, we have to find a "sweet spot", if you will, where the cost of implementing reasonable reliability measures to guard against GMD impacts is appropriately balanced against the potential costs of a GMD event.

"Given the magnitude of the potential damage, I believe we are taking the right approach in this order by proposing to require that in stage two, there must be more extensive standards developed than just those that address operational and enhanced training procedures (the subject of stage one). The evidence before us today suggests that some or all vulnerable elements of the system will need further hardening to withstand a GMD. I think we appropriately give deference to NERC to make a needs assessment and design the additional measures necessary (through the development of the stage two standards) to meet the reliability needs identified in those assessments. But, as the proposed rule indicates, timing is of the essence. With the prediction of high solar flare activity on the very near time horizon, NERC will need to develop standards and industry to implement them much more rapidly than has previously been required. Again, this is another judgment call where we must decide what is reasonable and what is necessary. I ask NERC and the industry to accept this challenge and work as expeditiously as possible to meet it.

"In summary I think we have approached vegetation management like you would approach changing the oil in your car. You know that, if you do not do it, at some point your car will breakdown. And, preparing for GMDs is like buying insurance for you car. You hope that you will never need it - and in fact, you might not - but, it would be irresponsible to not determine what level of coverage you do need and to make the necessary investment to protect yourself and others from the risk and potential severity of an occurrence."

Updated: October 18, 2012

News Release: October 18, 2012
Docket Nos. RM12-22-000, RM12-4-000
Item Nos. E-2 & E-3

FERC Proposes Enhancements to Reliability of Bulk Power System

The Federal Energy Regulatory Commission (FERC) today took steps to ensure continued reliable operation of the nation's bulk power system by proposing to approve a revised vegetation management standard and to require new standards addressing the impacts of a geomagnetic disturbance (GMD).

GMDs, which result in distortions to the earth's magnetic field, may cause severe problems with grid reliability, including blackouts as well as damage to critical or vulnerable equipment. Although strong disturbances are infrequent, current mandatory reliability standards do not adequately address vulnerabilities.

To address this reliability gap, today's Notice of Proposed Rulemaking (NOPR) proposes to direct the North American Electric Reliability Corporation (NERC), the FERC-approved Electric Reliability Organization, to develop and submit new GMD standards in a two-stage process.

First, within 90 days of the effective date of a final rule in the proceeding, NERC would file one or more standards requiring owners and operators of the bulk power system to develop and implement operational procedures to mitigate GMD effects. That such procedures already are in place in some areas should allow for faster development and implementation of these standards, the NOPR says.

In the second stage, FERC proposes that NERC file, within six months of a final rule, standards that require grid owners and operators to conduct initial and continuing assessments of the potential impacts of GMDs and, based on those assessments, implement strategies to protect the bulk power system, including automatic blocking of geomagnetically induced currents, instituting specification requirements for new equipment, inventory management, or isolating certain equipment that is not cost effective to retrofit. Stage two would be implemented in phases, focusing first on the most critical and vulnerable assets.

The NOPR does not propose specific requirements, but offers guidance regarding the assessments of the grid's vulnerability to GMDs, the mechanisms for protecting critical or vulnerable components and an implementation schedule. FERC seeks comments on all aspects of the proposal.

In a separate NOPR on vegetation management, FERC proposes to approve revisions submitted by NERC that would:

- Expand the applicability of the standard to include lines operated below 200 kilovolts that are part of an Interconnection Reliability Operating Limit or a Major Western Electricity Coordinating Council Transfer Path.
- Set a new minimum annual inspection requirement.
- Incorporate new minimum clearance distances into the text of the standard.

Comments on both proposals are due 60 days after publication in the *Federal Register*.

Commissioner Cheryl A. LaFleur Statement
October 18, 2012
Docket Nos. RM12-22-000 and RM12-4-000
Item Nos. E-2 and E-3

Proposed Enhancements to Reliability of Bulk Power System

"Protecting the reliability of the nation's bulk electric system requires both day-to-day blocking and tackling to make sure that the lights stay on, and preparing for emerging issues including high-impact low-frequency events. Today, we are voting out Notices of Proposed Rulemaking that speak to both these components of reliability.

Vegetation Management Standard

"No issue is more central to reliability than timely and effective tree trimming to keep the transmission system operational. Indeed, a tree contact was a key contributing cause of the 2003 blackout that gave rise to this Commission's jurisdiction over reliability.

"I believe the vegetation management standard (FAC-003-2) that we propose to approve today represents an important step forward in addressing this basic reliability issue. In particular, I note that the new standard includes a requirement to maintain a defined Minimum Vegetation Clearing Distance (MVCD) for all transmission lines above 200 kv and lines below 200 KV that are part of an Interconnection Reliability Operating Limit or WECC Transfer Path, and, for the first time, a requirement to annually inspect 100 percent of the lines subject to the standard. These requirements are both clear and concrete.

"The standard we propose to approve today is one of the first results-based standards put forward by NERC. As I understand the concept of a results-based standard, it includes a clearly defined result – avoidance of outages caused by vegetation within a MVCD—on the basis of which to judge compliance with the standard. Because the standard is judged by results, it proposes to give more flexibility to transmission owners about how to meet those results, as long as they are met. This is an important concept, and the successful implementation of this standard may be a model for further results-based standards.

"I also appreciate the commitment by NERC and the industry, working with EPRI, to fund further empirical research on the proposed MVCD, since that is such a critical element of the proposed standard. I recognize that years of hard work went into this proposed standard, and appreciate the efforts of the NERC standards team as well as everyone here at FERC that worked on the standard.

Geomagnetic Disturbances

"The second Notice of Proposed Rulemaking relates to a very different issue, preventing or mitigating damage to the bulk electric system caused by geomagnetic disturbances resulting from solar storms. Solar storms are an acute example of "High Impact Low Frequency" events, which I believe are among the most difficult, but also the most necessary, to address through standards. Just as our society has over the centuries developed standards to protect elements of our infrastructure from high impact low frequency events like earthquakes and fires, I believe we must begin to address the challenge of making our electric grid resilient to geomagnetic disturbances. This is an issue in which I have taken a strong personal interest. As I have observed, the threat of geomagnetic disturbances damaging the power grid sounds like science fiction, but is in fact based on scientific fact. However, while the fact that geomagnetic disturbances can cause substantial harm to the electric grid is undisputed, the way in which that harm would occur is not without controversy. The technical community has debated whether geomagnetic disturbances caused by solar events would cause the bulk electric system to break apart due to excessive reactive power consumption, cause damage to high-voltage transformers and other key elements of the system due to inductive currents, or some combination of the two. Any of these results is unacceptable, and is exactly the

CONTACT

Email: MediaDL

Telephone: 202-502-8680
Toll Free: 1-866-208-3372

sort of cascading disturbance to the bulk power system that section 215 of the Federal Power Act requires us to address. I believe that, while continuing to explore the technical issues, we can and should adopt “No Regrets” actions to prevent and mitigate grid damage from geomagnetic disturbances. The Notice of Proposed Rulemaking we are voting on today includes two such No Regrets actions, both of which are consistent with NERC’s assessment report on GmD issued earlier this year.

“First, we would require NERC to develop and propose a standard that requires transmission owners to take operational steps, to prepare for geomagnetic disturbances. This is one of the first actions proposed in NERC’s assessment and action plan. Because we are approaching a periodic solar maximum in 2013, increasing the threat of damaging solar storms, we are proposing to seek fast action on an operational standard.

“Second, we would require NERC to develop and propose a standard that would require transmission owners to undertake an assessment of the most vulnerable elements of the bulk electric system, and propose steps to prevent or mitigate damage to those elements from geomagnetic disturbances. As indicated in the Notice of Proposed Rulemaking, those steps could include installation of automatic blocking in certain vulnerable and critical transformers, requirement of withstand capability in transformers, inventory management strategies, operational plans to address critical elements of the system, and/or other steps that the industry and NERC may propose. Importantly, the proposed rule gives industry and NERC considerable flexibility of how to address this issue, but not the flexibility to ignore it.

“As with any other program to address pieces of the electric grid—and I have lived through quite a few—the appropriate action steps would likely vary based on how critical an asset was, where it was located, when it was scheduled to be replaced, whether it could be protected by islanding or operating protocols, or whether it needed to be retrofitted with protective equipment. Our collective understanding of these options would likely grow once we started the process.

“I know that the challenge of preparing our bulk electric system for geomagnetic disturbances is very complicated, and complicated challenges require complicated solutions. In the past, the electric grid has undergone many large-scale efforts to refurbish or replace electrical equipment to improve reliability, safety or environmental performance. Because of the size, diversity and continuous operation of the electric grid, these efforts are inevitably more complicated and take longer than expected. To me, that argues for getting started sooner rather than later.

“Finally, I believe it is appropriate to tackle this challenge now because the US is facing considerable investment in our transmission grid, driven by a change in power supply and replacement of aging infrastructure. We have a big opportunity to make sure the next generation of transmission equipment is built to withstand geomagnetic disturbances.

“I hope we will receive a broad range of comments on both Notice of Proposed Rulemaking. I would like to thank the FERC teams that worked on these proposed rules, and on the technical conference on GmD last spring on this issue. Thank you.”

Statement

Response to FERC's Proposed Rulemaking on Vegetation Management, Geomagnetic Disturbance Standards

Click for Announcement, FERC Announcement
Norris Statement, LaFleur Statement

WASHINGTON, DC -- The Federal Energy Regulatory Commission issued a notice of proposed rulemaking today proposing to approve the North American Electric Reliability Corporation's vegetation management standard (FAC-003-2). In separate action, the FERC proposed to direct NERC to develop standards that address geomagnetic disturbances and their impacts on the grid.

"The proposed approval of the results-based vegetation management standard is an important recognition of NERC's efforts on addressing this issue," said Gerry Cauley, president and chief executive officer at NERC. "The proposed rulemaking on geomagnetic disturbances provides a framework to address the current vulnerability, and to factor in the scientific and engineering analysis necessary to understand this complex issue."

141 FERC ¶ 61,046
UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

Docket No. RM12-4-000

Revisions to Reliability Standard for Transmission Vegetation Management

(Issued October 18, 2012)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of Proposed Rulemaking.

SUMMARY: Pursuant to section 215 of the Federal Power Act, the Commission proposes to approve Reliability Standard FAC-003-2 (Transmission Vegetation Management), submitted by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization. The proposed Reliability Standard would expand the applicability of the standard to include overhead transmission lines that are operated below 200 kV, if they are either an element of an Interconnection Reliability Operating Limit or an element of a Major WECC Transfer Path. In addition, the proposed Reliability Standard incorporates a new minimum annual vegetation inspection requirement, and incorporates new minimum vegetation clearance distances into the text of the standard.

The Commission also proposes to approve the three definitions, the implementation plan and the Violation Severity Levels associated with the proposed Reliability Standard. Finally, the Commission proposes to direct that NERC revise the

Violation Risk Factor for Requirement R2, and approve the remainder of the Violation Risk Factors.

DATES: Comments are due [INSERT DATE 60 days after publication in the **FEDERAL REGISTER**].

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not a scanned format.
- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Revisions to Reliability Standard for Transmission Vegetation Management — Docket No. RM12-4-000

NOTICE OF PROPOSED RULEMAKING

(Issued October 18, 2012)

1. Pursuant to section 215 of the Federal Power Act (FPA),[1] the Commission proposes to approve Reliability Standard FAC-003-2 (Transmission Vegetation Management), submitted by the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO). Proposed Reliability Standard FAC-003-2 modifies the currently effective standard, FAC-003-1 (the "Version 1" standard). The proposed modifications, in part, respond to certain Commission directives in Order No. 693, in which the Commission approved currently-effective Reliability Standard FAC-003-1.[2]

2. Proposed Reliability Standard FAC-003-2 has a number of features that make it an improvement over the Version 1 standard. For example, like Version 1, the proposed

[1] 16 U.S.C. § 824o (2006).

[2] *See Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Reliability Standard would apply to all overhead transmission lines operated at or above 200 kV, but unlike Version 1, it would explicitly apply to any lower voltage overhead transmission line that is either an element of an Interconnection Reliability Operating Limit (IROL) or an element of a Major WECC Transfer Path.[3] This is a new class of transmission lines not previously required to comply with the Standard. The proposed Reliability Standard would also make explicit a transmission owner's obligation to prevent an encroachment into the minimum vegetation clearance distance (MVCD) for a line subject to the standard, regardless of whether that encroachment results in a sustained outage or fault.[4] Also, for the first time, the proposed Reliability Standard would require transmission owners to annually inspect all transmission lines subject to the standard and to complete 100 percent of their annual vegetation work plan. The proposed Reliability Standard also incorporates the MVCDs into the text of the standard, and does not rely on

[3] NERC defines "IROL" as "[a] System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System." NERC defines "System Operating Limit" as "[t]he value (such as MW, MVar, Amperes, Frequency or Volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria." *See* NERC Glossary of Terms Used in Reliability Standards (NERC Glossary) at 26, 48. The Western Electric Coordinating Council maintains a listing of Major WECC Transfer Paths, *available at* http://www.wecc.biz/Standards/Development/WECC-0091/Shared Documents/WECC-0091 Table Major Paths 4-28-08.doc.

[4] *See* Reliability Standard FAC-003-2, Requirements R1 and R2; *see also* Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standard FAC-003-2 – Transmission Vegetation Management at 4, 6 (NERC Petition). NERC proposes to define MVCD as "the calculated minimum distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages." *Id.* at 2.

(continued…)

clearance distances from an outside reference, as is the case with the currently-effective Version 1 standard. We believe these beneficial provisions, and others discussed below, support our proposal to approve FAC-003-2.

3. A recurring cause in many blackouts has been vegetation-related outages. In fact one of the initiating causes of the 2003 Northeast blackout was inadequate vegetation management practices that led to tree contact.[5] Further, NERC has identified a focus on preventing non-random equipment outages such as those caused by vegetation as a top priority that will most likely have a positive impact on Bulk-Power System reliability.[6] We also note that industry has made important strides in reducing the instances of vegetation contact.[7] We believe that the revised FAC-003 standard we propose to approve in this rulemaking, together with a continued focus by industry on best practices for vegetation management, will serve to enhance the reliability of the Bulk-Power System. While we propose to approve NERC's use of the Gallet equation to determine the minimum vegetation clearing distances, we believe it is important that NERC develop

---

[6] *See* Gerry Cauley written remarks for November 29, 2011 Reliability Technical Conference at 1, 4 and 5 (Docket No. AD12-1-000).

[7] *See, e.g.*, NERC's Second Quarter 2012 Vegetation-Related Transmission Outage Report at 6-7, available at http://www.nerc.com/fileUploads/File/Compliance/2Q2012_Vegetation%20Report_FINAL%20DRAFT.pdf.

empirical evidence that either confirms the MVCD values or gives reason to revisit the Reliability Standard. Accordingly, consistent with the activity that NERC has already initiated, the Commission proposes to direct that NERC conduct or commission testing to obtain empirical data and submit a report to the Commission providing the results of the testing.

4. We also propose to approve the three new or revised definitions associated with the proposed Reliability Standard for inclusion in NERC's Glossary. Specifically, we propose to approve the changes in the definition of "Right-of-Way (ROW)" and "Vegetation Inspection," as well as the addition of the term "Minimum Vegetation Clearance Distance (MVCD)" as defined in NERC's petition. We also propose to approve NERC's implementation plan for FAC-003-2.

5. While we believe that the proposed Reliability Standard will enhance reliability by requiring sub-200 kV transmission lines that are elements of an IROL or Major WECC Transfer Path to comply with its requirements, we seek comment on how NERC will ensure that IROLs are properly designated, as discussed in detail below. In addition, while we agree that a number of the proposed modifications clarify and make more explicit the transmission owner's obligations, we seek comment with regard to the enforceability of certain provisions.

6. We do not believe, however, that NERC has adequately supported the assignment of a "medium" Violation Risk Factor to Requirement R2, which pertains to preventing vegetation encroachments into the MVCD of transmission lines operated at 200 kV and above, but which are *not* part of an IROL or a Major WECC Transfer Path. As discussed

later, system events have originated from non-IROL facilities. Accordingly, as discussed below, we propose to direct that NERC submit a modification, within 60 days of the effective date of the Final Rule, assigning a "high" Violation Risk Factor for violations of Requirement R2.

I. Background

A. Section 215 of the FPA

7. Section 215 of the FPA requires the Commission-certified ERO to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval. Once approved, the Reliability Standards may be enforced by the ERO subject to Commission oversight, or by the Commission independently.[8] Pursuant to the requirements of FPA section 215, the Commission established a process to select and certify an ERO[9] and, subsequently, certified NERC as the ERO.[10]

B. Reliability Standard FAC-003-1

8. Currently-effective Reliability Standard FAC-003-1 is applicable to transmission owners. The requirements of the Version 1 standard apply to (1) all transmission lines

[8] *See* 16 U.S.C. § 824o(e)(3).

[9] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards*, Order No. 672, FERC Stats. & Regs. ¶ 31,204, *order on reh'g*, Order No. 672-A, FERC Stats. & Regs. ¶ 31,212 (2006).

[10] *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062, *order on reh'g and compliance*, 117 FERC ¶ 61,126 (2006) (certifying NERC as the ERO responsible for the development and enforcement of mandatory Reliability Standards), *aff'd sub nom. Alcoa Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

operated at 200 kV or above, and (2) lower-voltage lines designated as "critical to the reliability of the electric system" by a Regional Entity.

9. Currently-effective FAC-003-1 contains four requirements. Requirement R1 requires each transmission owner to prepare, and keep current, a transmission vegetation management program (TVMP) that includes, *inter alia*, a Clearance 1 distance to be achieved at the time of vegetation management work, and a Clearance 2 distance to be maintained at all times. The Clearance 2 distance is set by each transmission owner at a level necessary to prevent flashover, but must be no less than the clearance distances established in the Institute of Electric and Electronics Engineers (IEEE) Standard 516-2003 (Guide for Maintenance Methods on Energized Power Lines). The Clearance 1 distances are established by each transmission owner, and the only numerical criterion under the current standard is that the "Clearance 1 distances shall be greater than those defined by Clearance 2."[11] Further, Requirement R1.3 requires that "[a]ll personnel directly involved in the design and implementation of the TVMP shall hold appropriate qualifications and training, as defined by the Transmission Owner, to perform their duties."

10. Requirement R2 of the Version 1 standard requires that each transmission owner develop and implement an "annual plan for vegetation management work," allowing flexibility to adjust to "changing conditions." Pursuant to Requirement R3, transmission

[11] FAC-003-1, R1.2.1.

owners must report quarterly to the relevant Regional Entity "sustained transmission line outages … caused by vegetation." Requirement R4 requires the Regional Entity to report the outage information to NERC.

C. Order No. 693 Discussion Regarding Vegetation Management

11. On March 16, 2007, in Order No. 693, the Commission approved 83 of 107 proposed Reliability Standards pursuant to FPA section 215(d), including currently-effective FAC-003-1.[12] In addition, pursuant to section 215(d)(5) of the FPA, the Commission directed NERC to develop modifications to FAC-003-1 to address certain issues identified by the Commission, discussed below.

12. In the Notice of Proposed Rulemaking (NOPR) that preceded Order No. 693, the Commission proposed two directives requiring modification of NERC's proposed standard pursuant to section 215(d)(5) of the FPA.[13] The first would have directed NERC to develop a minimum vegetation inspection cycle, and the second would have required NERC to remove the standard's general limitation on applicability to transmission lines operated at 200 kV and above.[14] In Order No. 693, the Commission decided not to require either modification at that time, but continued to express its

[12] *See* Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 735.

[13] *Mandatory Reliability Standards for the Bulk Power System,* Notice of Proposed Rulemaking, 71 FR 64,770 (Nov. 3, 2006), FERC Stats. & Regs., Proposed Regulations 2004-2007 ¶ 32,608, at P 387 (2006).

[14] *Id.*

concern about the standard's limited applicability and the lack of a minimum vegetation inspection requirement.

13. The Commission instead required NERC to address a modification to the applicability of the standard through its Standards development process, directing NERC to "modify [FAC-003-1] to apply to Bulk-Power System transmission lines that have an impact on reliability as determined by the ERO."[15] In doing so, the Commission stated that it supported the "suggestions by [certain commenters] to limit applicability to lower voltage lines associated with IROL" and noted that "these suggestions should be part of the input to the Reliability Standards development process."[16] Finally, in response to concerns raised about the cost of compliance with the standard, the Commission explained that the ERO must "develop an acceptable definition that covers facilities that impact reliability but balances extending the applicability of this standard against unreasonably increasing the burden on transmission owners."[17]

14. Similarly, while the Commission decided not to require NERC to submit a modification to FAC-003-1 to incorporate a minimum vegetation inspection cycle as part of Order No. 693, the Commission noted that it "continues to be concerned with leaving

[15] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 706.

[16] *Id.*

[17] *Id.* P 708.

complete discretion to the transmission owners in determining inspection cycles.[18] The Commission also rejected the notion that incorporating such a minimum requirement would lead to a "lowest common denominator" and thereby potentially reduce the frequency of inspections for transmission owners with aggressive inspection cycles.[19] Although the Commission did not require a minimum inspection requirement as part of the standard, it directed NERC "to develop compliance audit procedures to identify appropriate inspection cycles based on local factors."[20]

15. With respect to minimum vegetation clearances distances, the Commission approved FAC-003-1's general approach and "reaffirm[ed] its interpretation that FAC-003-1 requires sufficient clearances to prevent outages due to vegetation management practices under all applicable conditions."[21] However, the Commission directed NERC to "develop a Reliability Standard that defines the minimum clearance needed to avoid sustained vegetation-related outages that would apply to transmission lines crossing both federal and non-federal land"[22] and "decline[d] to endorse the use of IEEE 516 as the only minimum clearance."[23]

---

[18] *Id.* P 721.

[19] *Id.* P 720.

[20] *Id.* P 735.

[21] *Id.* P 729.

[22] *Id.* P 732.

[23] *Id.* P 731.

16. Finally, the Commission directed NERC to address certain commenters' suggestion that, for purposes of the FAC-003 Reliability Standard, rights-of-way should be defined to encompass the required clearance area, and not the entire legal right-of-way, particularly where the legal right-of-way may greatly exceed the area needed for effective vegetation management.[24]

II. NERC Petition and Proposed Reliability Standard FAC-003-2

A. NERC Petition

17. In its petition, NERC maintains that proposed Reliability Standard FAC-003-2 is just and reasonable, as the proposal meets or exceeds each of the criteria the Commission has identified for evaluating a proposed Reliability Standard.[25] NERC asserts that the proposed Reliability Standard "achieves the specific reliability goal of maintaining a reliable electric transmission system by using a defense-in-depth strategy to manage vegetation located on transmission ROW and minimize encroachments from vegetation located adjacent to the ROW, thus preventing the risk of those vegetation-related outages that could lead to Cascading."[26] Moreover, NERC maintains that the proposed Reliability Standard contains a technically sound method to achieve that goal, as it requires transmission owners to prevent vegetation from encroaching into the flashover distances, requires consideration of conductor movement and growth rates (among other

[24] *Id.* P 734.

[25] *See* NERC Petition at 44.

[26] *Id.* at 45.

things), requires annual inspections, and requires completion of annual work needed to prevent encroachments. NERC asserts that FAC-003-2 is clear and unambiguous as to the requirements and penalties, and contains clear and objective measures for compliance.[27]

18. Further, NERC maintains that proposed Reliability Standard FAC-003-2 represents an improvement over the currently-effective standard, as FAC-003-2 enhances reliability, facilitates enforceability, and preserves necessary flexibility for transmission owners to address local vegetation conditions.[28] NERC asserts that the proposed Reliability Standard was developed with the shortcomings of the currently-effective standard, as identified in Order No. 693, in mind, including the directive to develop a standard that defines the minimum clearance needed to avoid sustained vegetation-related outages without relying on IEEE-516 to set these clearances.[29] NERC states that the Standard Drafting Team (SDT) considered four potential methods for deriving flashover distances for various voltages and altitudes, and of those, selected the "Gallet equation" because the "information to support the development of the standard was readily available in an industry recognized reference."[30] NERC asserts that the "distances

[27] *Id.* at 46-48; *see also id.* at 33-40.

[28] *Id.* at 3, 44-52.

[29] *See id.* at 5 (citing Order No. 693, FERC Stats. & Regs. ¶ 31,242 at PP 731-732).

[30] *Id.*, *see also* Ex. I, Appx. 1.

derived using the Gallet Equation result in the probability of flashover in the range of 10^{-6}" (one in a million).[31]

19. NERC states that proposed FAC-003-2 continues to give transmission owners the necessary discretion to determine how to achieve the required clearances,[32] but is more stringent than the currently effective standard because it "explicitly treat[s] any encroachment into the MVCD (without contact, with a flashover, with a momentary

---

[31] NERC Petition at 6. As NERC explained in its response to Question 1 of the Commission's Data Requests:

> The probability of a flashover, given a drop in voltage to 85% of the 'Critical Flashover Voltage (CFO),' is roughly .135% (or approximately 10^{-3}). This value represents the probability of a flashover, assuming the specified CFO is achieved or exceeded.
>
> However, this is not the only event being considered when attempting to model the probability of a vegetation flashover. The probability of achieving a maximum switching overvoltage ("Peak Voltage") in excess of the CFO must also be considered. This is shown on page 40 in equation 6 of the Technical Reference Document, and is specified there as roughly 0.135% (also approximately 10^{-3}).
>
> In other words, the conditional probability of flashover given that the 85% CFO has been exceeded is approximately 10^{-3}. However, the probability of the CFO being exceeded is *also* 10^{-3}. As these can be treated as two independent events, the probability is statistically "joint" (the probability of exceeding the CFO and the probability of a flashover given the exceeding of the CFO are independent events). Accordingly, the two probabilities are to be multiplied, yielding a probability on the order of magnitude of approximately 10^{-6}.

[32] NERC Petition at 6, 19-22.

outage, or with a sustained outage) as a violation of the standard."[33] According to NERC, the proposed Reliability Standard incorporates a new requirement to perform an annual inspection of all applicable lines and is "much more explicit regarding what actions must be taken to support vegetation management and reliability."[34]

20. NERC states that proposed FAC-003-2 was designed to address directives from Order No. 693, including the directives requiring that NERC address proposed modifications to expand the applicability of FAC-003-1, evaluate and consider specific proposals made by parties commenting on FAC-003-1, develop compliance audit procedures to identify appropriate inspection cycles, define the minimum clearances needed to avoid sustained vegetation-related outages applicable to transmission lines crossing both federal and non-federal land, and address suggestions that rights-of-way should be defined to encompass required clearance areas only. NERC also explains that proposed FAC-003-2 is one of the first Reliability Standards developed using NERC's "results-based" approach and, therefore, includes some restructuring of the standard to focus on completing objectives and achieving goals, as well as to ensure that enforcement is undertaken in a consistent and non-preferential manner.[35]

[33] *Id.* at 6.

[34] *Id.*

[35] *Id.* at 7.

21. NERC proposes an implementation plan for FAC-003-2.[36] For individual transmission lines that become subject to the vegetation management standard for the first time following designation as an element of an IROL or Major WECC Transfer Path, NERC asks that the requirements become effective the latter of (1) twelve months after the date of such designation, or (2) January 1 of the planning year when the line is forecast to become an element of an IROL or Major WECC Transfer Path.[37]

22. Accordingly, NERC requests that the Commission approve proposed FAC-003-2 and the associated Violation Risk Factors and Violation Severity Levels. NERC requests as an effective date for the Reliability Standard, "the first day of the first calendar quarter that is twelve months following the effective date of a Final Rule in this docket."[38] NERC further requests: (1) retirement of the Version 1 standard concurrent with the effective date of FAC-003-2; (2) approval of three definitions for inclusion in the NERC Glossary; and (3) approval of the implementation plan for proposed FAC-003-2.

B. Proposed Reliability Standard FAC-003-2 and NERC Explanation of Provisions

23. The proposed Reliability Standard includes seven requirements.

---

[36] *Id.* at Ex. B.

[37] In considering this aspect of the proposed implementation plan, we assume that NERC asks that the proposed standard become effective on the "later" of alternative (1) or (2), rather than the "latter."

[38] *Id.* at 68.

24. **Requirements R1 and R2**: Pursuant to Requirements R1 and R2, transmission owners must "manage vegetation to prevent encroachments into the MVCD of its applicable line(s)," and any encroachment is considered a violation of these requirements regardless of whether it results in a sustained outage.[39] NERC characterizes this as a "zero tolerance" approach to vegetation management.[40] Further, NERC maintains that these requirements represent an improvement over the currently effective Version 1 Standard because the proposed standard makes the requirement to prevent encroachments explicit, and because it incorporates specific clearance distances into the standard itself based on "an established method for calculating the flashover distance for various voltages, altitudes, and atmospheric conditions."[41]

25. NERC has bifurcated the basic requirement to prevent encroachment into the MVCDs. Requirement R1 applies to IROL elements and Major WECC Transfer Path elements and is assigned a high Violation Risk Factor. Requirement R2 sets forth the same substantive requirements but pertains to non-IROL and non-Major WECC Transfer Path elements and is assigned a medium Violation Risk Factor. NERC explains that it

[39] *See* Reliability Standard FAC-003-2, Requirements R1 and R2, subsection 1 (transmission owners must manage vegetation to prevent, *inter alia*, "an encroachment into the MVCD, as shown in FAC-003-Table 2, observed in Real-Time, absent a Sustained Outage").

[40] NERC Petition at 6.

[41] *Id.* at 22.

bifurcated the requirement to "eliminate commingling of higher risk reliability objectives and lesser risk reliability objectives."[42]

26. In addition, NERC has included a footnote describing certain conditions or scenarios, outside the transmission owner's control, where an encroachment would be exempt from Requirements R1 and R2, including natural disasters and certain human or animal activity.[43] As NERC explains, the footnote "does not exempt the Transmission Owner from responsibility for encroachments caused by activities performed by their own employees or contractors, but it does exempt them from responsibility when other human activities, animal activities, or other environmental conditions outside their control lead to an encroachment that otherwise would not have occurred."[44]

27. **Requirement R3:** Requirement R3 requires a transmission owner to have "documented maintenance strategies or procedures or processes or specifications it uses to prevent the encroachment of vegetation into the MVCD of its applicable lines." Requirement R3 requires that these strategies take into account movement of conductors (sag and sway), and the inter-relationship between vegetation growth rates, vegetation control methods, and inspection frequency. While NERC acknowledges that this requirement does not include the currently effective standard's requirement to establish a

[42] *Id.* at 22-23.

[43] *See* proposed Reliability Standard FAC-003-2, n.2.

[44] NERC Petition at 23.

Clearance 1 as part of the required TVMP, NERC notes that Clearance 1 levels are currently left largely to the discretion of the transmission owner and that the only numerical criterion for Clearance 1 is that it "must be some undefined amount larger than the minimum flashover distance [Clearance 2]."[45] NERC maintains that the proposed standard's requirement to avoid encroachments after taking into account conductor movement, vegetation growth rates, etc., "still retains the same obligations defined by 'Clearance 1.'"[46]

28. **Requirement R4:** Requirement R4 requires a transmission owner that has observed a vegetation condition likely to produce a fault to notify, "without any intentional time delay," the appropriate control center with switching authority for that transmission line. NERC states that the proposed requirement is an improvement over the Version 1 standard, in that it makes explicit the obligation to communicate imminent threats, rather than merely establish and document a process for doing so, as is currently required.[47] In addition, NERC explains that the currently-effective Reliability Standard's requirement that the process allow for "immediate" notification was "impractical at best," and was therefore replaced with the phrase "without any intentional time delay," which still requires timely notification.

---

[45] *Id.* at 20.

[46] *Id.*

[47] *See id.* at 25-26 (referencing Requirement R1.5 of FAC-003-1).

29. **Requirement R5:** Requirement R5 requires a transmission owner constrained from performing vegetation management work needed to prevent a vegetation encroachment into the MVCD prior to implementation of the next annual work plan to take corrective action to prevent such encroachments. NERC contends that this proposed requirement represents an improvement over the currently-effective provision, Requirement R1.4, which merely requires the transmission owner to develop mitigation measures to address such circumstances, but does not affirmatively require the transmission owner to take corrective action. The proposed measures for determining compliance associated with proposed Requirement R5 provide examples of the kinds of corrective actions expected, including increased monitoring, line de-ratings, and revised work orders.[48]

30. **Requirement R6**: Pursuant to Requirement R6, each transmission owner shall inspect 100 percent of its applicable lines at least once per year and with no more than 18 months between inspections on the same Right-of-Way. NERC maintains that the new requirement is "an improvement to the standard that reduces risks," and notes that the currently effective standard allows the transmission owner to develop its own schedule for inspections (with no standard minimum time) and contains no explicit requirement that the transmission owner meet its established schedule.[49]

[48] *See id.* at 24-25.

[49] *Id.* at 17-18.

31. **Requirement R7:** Pursuant to Requirement R7, the transmission owner must complete 100 percent of its annual vegetation work plan, allowing for documented changes to the work plan as long as those modifications do not allow encroachment into the MVCD. NERC argues that this requirement represents an improvement over the currently effective standard because the current Requirement (R2) "does not mandate that entities plan to prevent encroachments into the MVCD, but simply that they implement whatever is included in the plan."[50]

32. NERC explains in its petition that certain requirements in the currently-effective Reliability Standard have not been translated into a requirement in the proposed standard. In particular, NERC notes that the Version 1 standard's reporting requirements, R3 and R4, have been moved into the compliance section of proposed standard FAC-003-2.[51] NERC maintains that the reporting requirement remains enforceable under NERC's Rules of Procedure, which gives NERC authority, *inter alia*, to require entities to provide "such information as is necessary to monitor compliance with the reliability standards."[52] NERC further notes that it can take action against any entity that fails to comply with such a reporting requirement (which would amount to a failure to comply with a NERC Rule of Procedure) pursuant to NERC Rule of Procedure Section 100, and that it is

[50] *Id.* at 28.

[51] *Id.* at 29-31.

[52] *Id.* at 31 (quoting NERC Rule of Procedure Section 400.3). This provision actually is located at Section 401.3.

obligated to notify the applicable governmental authorities of the entity's failure to comply.[53]

33. In addition, NERC acknowledges that the proposed standard no longer contains a requirement that personnel involved in the design and implementation of a vegetation management program have appropriate qualifications and training (currently set out in sub-requirement R1.3).[54] According to NERC, this provision of the Version 1 standard is "effectively meaningless," since "appropriate" qualifications and training are undefined and left entirely to the discretion of the transmission owner. Thus, NERC maintains that elimination of this sub-requirement does not impact reliability.

34. NERC is also seeking to revise the definitions of Right-of-Way (ROW) and Vegetation Inspection, and to add a new definition for MVCD.[55] NERC proposes that Right-of-Way be defined as the "corridor of land under a transmission line(s) needed to operate the line(s)," which may not exceed the Transmission Owner's legal rights but may be smaller. NERC proposes to modify "Vegetation Inspection" to allow both maintenance inspections and vegetation inspections to be performed concurrently. Finally, NERC proposes a new definition, "MVCD," to be "[t]he calculated minimum

[53] *See id.* at 31-32.

[54] *Id.* at 23-24.

[55] *See* NERC Petition, Ex. C.

distance stated in feet (meters) to prevent flash-over between conductors and vegetation, for various altitudes and operating voltages."

35. NERC explains in its petition how it will approach enforcement of each Requirement under FAC-003-2, noting that each Requirement has an associated compliance measure that identifies what is required and how the Requirement will be enforced. NERC explains, *inter alia*, that the measures for Requirements R1 and R2 require each transmission owner to have "evidence that it managed vegetation to prevent encroachment into the MVCD," and to be able to produce records "indicating the requirements were not violated."[56] In order to show compliance with Requirement R3, NERC explains that a transmission owner will be "obligated to show documentation, and that documentation must be sufficient to satisfy the auditor that the information contained in that documentation is sufficient that the Transmission Owner can use it to prevent encroachment into the MVCD."[57] Similarly, NERC explains that "entities will not be able to comply with [Requirement R7] without having a documented plan."[58]

36. NERC asserts that it has addressed seven directives in Order No. 693 regarding NERC's vegetation management standard.[59] First, NERC asserts that it has addressed the concerns in applying the vegetation management standard only to transmission lines that

[56] NERC Petition at 34.

[57] *Id.* at 35.

[58] *Id.* at 39.

[59] *See id.* at 40-44.

are 200 kV or above.[60] NERC notes that it has addressed that concern (and related directives) by extending the applicability of the proposed standard to overhead transmission lines that are either 200 kV and above, or less than 200 kV if the line is an element of an IROL or a Major WECC Transfer Path. In addition, NERC explains that it has developed an appropriate implementation plan for any new lines covered by the standard, thereby satisfying the Commission's directive to consider a delayed implementation date if lower-voltage facilities are included.[61] NERC further maintains that it has addressed the Commission's concern about allowing transmission owners full discretion to set inspection schedules by requiring inspections at least once per year, has satisfied the Commission's directive to define minimum clearances for both federal and non-federal lands by adopting MVCDs that apply to lines on both federal and non-federal lands, and has satisfied the Commission's directive to consider whether modifications to the definition of Right-of-Way were necessary through the proposed revision to that definition.[62]

III. PNNL Report and Comments

A. PNNL Report

37. As NERC explains in its petition, the Standard Drafting Team applied the "Gallet equation" to derive the MVCDs set forth in FAC-003-2. NERC describes the Gallet

[60] *Id.* at 40-42.

[61] *Id.* at 42-43.

[62] *Id.* at 43-44.

equation as a "well-known method of computing the required strike distance for proper insulation coordination."[63]

38. The Commission's Office of Electric Reliability retained the Pacific Northwest National Laboratory (PNNL) to undertake an "analysis of the mathematics and documentation of the technical justification behind the application of the Gallet equation and the assumptions used in the technical reference paper [Exh. A of NERC's petition]."[64]

39. PNNL's final *Report on the Applicability of the "Gallet Equation" to the Vegetation Clearances of NERC Reliability Standard FAC-003-2* (PNNL Report) was posted as part of the record in this docket on April 23, 2012, along with a notice inviting comment on the PNNL Report within 30 days.

40. While the PNNL Report points out benefits of the use of the Gallet equation, it raises questions about potential inconsistencies in NERC's filing.[65] The PNNL Report raises concerns about NERC's use of an assumed gap factor of 1.3, asserting that that figure has not been adequately supported for use with vegetation and that there is no

[63] NERC Petition, Ex. I (Technical Reference Document) at 39.

[64] *See* April 23, 2012 Notice Inviting Comments on Report.

[65] PNNL Report at iv-v ("The equation [the Gallet equation] is a good and simple-to-use way to solve a problem made difficult by the nonlinear interactions of the variables. However, in spite of the evident usefulness of the equation, inconsistencies are found in the NERC filing . . . .").

evidence that statistics relating to tower design are usable with vegetation.[66] Instead, the PNNL Report suggests that a "rod-plane gap and tree branch might have about the same gap factor (i.e., k=1),"[67] but does not provide any other indication of an appropriate gap factor for use with vegetation.

41. The PNNL Report further asserts that without NERC's assumption "that the gap between a power line and growing vegetation is stronger (by 30%) than the reference gap used in developing the Gallet equation," the minimum distances calculated would be about 50% larger.[68]

42. The PNNL Report also asserts that "[t]hough there is no obvious way to relate tower clearance to vegetation clearance," the proposed MVCDs in FAC-003-2 are small when compared to transmission tower design clearances:

> The values for tower clearance for a line at 500 kV in the Transmission Line Reference Book range from 8.3 ft. to over 17 ft. The NERC filing requires a gap less than 6 ft for the same voltage, even at high altitude. There is no reason to suppose that a tree could safely be allowed so much closer to a line (less than 6 ft) than a tower.[69]

[66] *See id.* at 11-13, 19.

[67] PNNL Report at 13.

[68] *Id.* at v.

[69] *Id.* at 19.

B. Comments in Response to PNNL Report

43. Nine sets of comments were filed in response to the PNNL Report, with timely submissions made by NERC, the Canadian Electricity Association, American Electric Power (AEP), Duke Energy Corporation (Duke), Oncor Electric Delivery Company LLC (Oncor), Kansas City Power & Light and KCP&L Greater Missouri Operations Company (KCP&L), Arizona Public Service Company (APS), and Salt River Project Agricultural Improvement and Power District (Salt River), as well as a joint submission by the Edison Electric Institute, the American Public Power Association, the National Rural Electric Cooperative Association and the Electric Power Supply Association (collectively, the Trade Associations).

44. In its comments, NERC asserts that the PNNL Report "(a) improperly juxtaposes data included in the FAC-003-2 Reliability Standard; (b) disregards NERC's justification regarding the selection of transient overvoltage calculations; (c) fails to consider joint probability of independent events when analyzing flashover probability; and (d) disagrees with the choice of gap factor for vegetation without providing any empirical evidence, scientific reasoning or expert consensus on what an appropriate gap factor should be."[70]

45. With regard to the assertion in the PNNL Report that there is no evidence that statistics relating to tower design are usable with vegetation, NERC explains the rationale for its use of the Gallet equation in some detail (discussed further in PP 47 - 48 below),

[70] NERC Comments on PNNL Report at 1-2 (NERC Comments).

and notes that the PNNL Report "disagrees with [NERC's] choice of gap factor for vegetation without providing any empirical evidence, scientific reasoning, or expert consensus on what an appropriate gap factor should be."[71] NERC explains that the Standard Drafting Team "relied on the scientific body of available knowledge and the opinions of experts (applied conservatively) currently working in the industry" to support a gap factor of 1.3.[72] By contrast, NERC asserts that "there is no justification for the suggestion that the gap factors for vegetation could be less than unity," and considers the PNNL Report's suggestion of a gap factor of 1.0 to be based "purely on speculation."[73]

46. With regard to PNNL's assertion that "inconsistencies are found in NERC's filing", NERC states that the "inconsistencies" identified by the PNNL Report in NERC's Technical Reference Document result from PNNL erroneously comparing two separate sets of data developed for different purposes. According to NERC, one set of data was developed to demonstrate the consistency between the clearance values set out in the IEEE-516 standard and the values generated using the Gallet equation when using similar assumptions as those used in the IEEE-516 standard. The second set of data was designed to generate appropriate clearance values using the Gallet equation and "a set of assumptions determined by the [SDT] to be consistent with the purposes of the

[71] *Id.* at 2.

[72] *Id.*, Att. A at 8.

[73] *Id.*

standard."[74] NERC responds that PNNL's comparison of the two sets of data is therefore "misleading."[75]

47. With respect to the gap factor, NERC maintains that it relied on a widely known and regarded source for determining the appropriate gap factor, which indicates that an appropriate gap factor for a conductor-to-lateral structure configuration is in the range of 1.25 to 1.40.[76] Specifically, NERC explains that the Standard Drafting Team (SDT) relied on the "widely regarded" *Insulation Coordination for Power Systems,* by Andrew Hileman, to develop the proposed gap factor of 1.3.[77] NERC indicated that there is a range of gap factors that could be used in the Gallet equation, each factor designed to represent the difference in voltage withstand capability[78] between a given object, i.e., the transmission wire or conductor, and a reference case, i.e., the object for which the distance from the wire must be established. The gap factor varies based on the nature of the "gap configuration" of the reference case. In its response to the PNNL Report, NERC

[74] *Id.*, Att. A at 2.

[75] *Id.*

[76] *Id.*, Att. A at 6-7.

[77] *Id.* (citing Andrew Hileman, *Insulation Coordination for Power Systems* 167 (Marcel Dekker, New York, NY 1999)).

[78] The PNNL Report defines "withstand" in this context as "[t]he capability of an insulation system to function as an insulator when a high voltage is applied." PNNL Report at 1.

provided the following table showing the range of gap factors (shown as k_g in the table below) based on the gap configuration:

Typical Value of Gap Factors k_g for Phase-Ground Insulations

Gap Configuration	Range of k_g	Typical value of k_g
Rod-plane	1.00	1.00
Rod-rod (vertical)	1.25 – 1.35	1.30
Rod-rod (horizontal)	1.25 – 1.45	1.35
Conductor-lateral structure	1.25 – 1.40	1.30
Conductor-lower rod	1.40 – 1.60	1.50

48. NERC then states that use of a gap factor of 1.3 is conservative:

> It is worth noting that the gap factors for many shapes that could approximate vegetation are even higher than the 1.3 used in FAC-003-2, with ranges that include values as high as 1.6. Hileman notes that in regards to the substation environment (which includes many objects, conducting and non-conducting, with varying shapes and configurations): "Practically, the lowest gap factor in the substations is 1.3, which normally is conservative."
>
> . . .
>
> [T]he [SDT] did not rely on any specific properties inherent in trees, rather, the [SDT] conservatively assumed that vegetation had the same properties as metal. The [SDT] elected to use the "typical" value for "conductor to lateral structure." Unlike the other examples given, which specify a "typical" value that is equivalent to the midpoint of the range, this value (1.3) is within the conservative third of the range (1.25 – 1.4).[79]

[79] *Id.* at 7.

49. In response to the assertion in the PNNL Report that "[t]here is no reason to suppose that a tree could safely be allowed so much closer to a line . . . than a tower" (see P 42, *supra*), NERC explains in its comments why NERC's proposed MVCDs may not be directly comparable to distances based on tower design:

> [C]are must be taken when making an interpretation of the tabular data, as the original survey participants may have answered the questions in a general context involving multiple structure designs. The final structure design parameters provided in the Red Book include the CFO gap plus other factors (such as insulator geometry, personnel safety and extreme lightning events). Accordingly, they should not be considered the final word with regard to Vegetation Management, as those distances were established to address a number of other issues. FAC-003-2 is not intended to mandate the parameters for all future line designs; it is focused solely on the distances necessary to mitigate the risk of vegetation related outages.

50. In addition to providing a response to the technical issues raised by the PNNL Report, NERC argues that the Commission is obligated under FPA section 215(d)(2) to give due weight to NERC's technical expertise with respect to the content of proposed standards.

51. Trade Associations, Duke, Oncor and other commenters support NERC's technical analysis. AEP and Oncor agree with NERC that the PNNL report contains inappropriate comparisons of data NERC presented in its petition and supporting materials, and that if NERC's Gallet-generated numbers are compared to the distances calculated under IEEE-516, the "clearances determined by the two calculations are in fact

closely aligned."[80] AEP and Oncor further maintain that the PNNL Report does not offer a "better alternative" to the use of the Gallet equation, and that it does not dispute the Standard Drafting Team's rationale for its selection of transmission overvoltages.[81] AEP and Oncor note that the PNNL Report acknowledges "that the Gallet Equation is 'a fair representation of the performance of an air gap of a few meters, a simple-to-use way to solve a problem made difficult by the nonlinear interactions of the variables' and that NERC has used the complete method that includes all the factors that go into the estimate of peak voltage."[82] AEP and Oncor also assert that proposed FAC-003-2, taken as a whole, will serve to improve the reliability of the system. AEP notes that the MVCDs included in Table 2 of the proposed Reliability Standard are merely the first piece of an overall strategy the transmission owner must develop to manage vegetation, and that the transmission owner must have documented strategies to prevent encroachments within all rated operating conditions, after taking into account sag, sway, and vegetative growth.

52. KCP&L comments that the PNNL Report should have "included discussion regarding a correction factor in the clearance calculation using the Gallet Equation due to the difference in the conductive properties of the metal rod compared to vegetation."[83]

---

[80] AEP Comments and Oncor Comments at 2.

[81] *Id.*

[82] *Id.* at 3 (citing PNNL Report at 19).

[83] KCP&L Comments at 2-3.

KCP&L supports use of the Gallet equation as an "improvement over the industry's current means of determining clearance distances."[84]

53. APS questions whether either the Gallet equation or the IEEE standard incorporated in currently-effective FAC-003-1 "provides a demonstrable indicator of the flash-over distance between conductors and ground vegetation . . . ,"[85] and accordingly suggests that the Commission ask the Department of Energy to experimentally verify the distances derived from the IEEE and Gallet methodologies. APS takes the position that, until such data are developed, the Gallet methodology "seems more reasonable" than the IEEE standard as a basis for developing a clearance requirement.[86]

54. Salt River supports the PNNL Report's analysis, noting that it has questioned the applicability of the Gallet equation for vegetation clearances throughout the development of FAC-003-2. Salt River further agrees that there is insufficient evidence to suggest that a tree could safely be allowed much closer to a line than a tower. Finally, Salt River supports the experimental verification of any proposed guidelines regarding required vegetation clearances.

---

[84] *Id.* at 3. KCP&L also points out what it characterizes as a technical error in the PNNL Report related to the impact of multiple gaps on flashover probabilities, maintaining that in the example given by the PNNL Report, the flashover probability with 20 gaps should be 4% rather than 33%. *Id.*

[85] APS Comments at 2.

[86] *Id.*

C. NERC Response to Data Request

55. On May 4, 2012, Commission staff issued data requests to NERC. NERC submitted a timely response to the data requests on May 25, 2012, addressing matters such as the correct understanding and enforceability of certain provisions of the proposed Reliability Standard. Relevant elements of NERC's response to the data requests are discussed further below.

IV. Discussion

56. Pursuant to section 215(d) of the FPA, we propose to approve Reliability Standard FAC-003-2, including the associated new and revised definitions and implementation plan, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. As discussed in Section A below, we believe the proposed Reliability Standard will enhance reliability and satisfies a number of the outstanding directives from Order No. 693. In addition, we seek further comment on certain aspects of the proposed Reliability Standard. Accordingly, we discuss the following matters below: (A) proposal to approve FAC-003-2; (B) applicability of the standard to sub-200 kV transmission lines; (C) clearance distances; (D) appropriate Violation Risk Factor for Requirement R2; (E) enforcement issues; (F) inclusion of reporting obligations as a compliance measure; and (G) proposed definitions.

A. The Commission Proposes to Approve FAC-003-2

57. We believe that proposed standard FAC-003-2 is an improvement over the currently-effective Version 1 standard, will support vegetation management practices that can effectively protect against vegetation-related transmission outages, and satisfies a

number of the outstanding directives from Order No. 693. As discussed earlier, NERC has explained how many of the Requirements improve upon the currently-effective Version 1 standard. In support of our proposal to approve FAC-003-2, we highlight several of these improvements. For example, in accordance with our directives in Order No. 693, as discussed further below, NERC has expanded the applicability of the Reliability Standard so that it now applies not only to all transmission lines above 200 kV, but also to transmission lines operated *below* 200 kV if they are an element of an IROL or an element of a Major WECC Transfer Path.

58. In addition, NERC has incorporated minimum clearance distances into the text of the Reliability Standard, and no longer includes a required clearance distance based on distances set by IEEE-516 which, as indicated in Order No. 693, served a different purpose than vegetation management. Proposed FAC-003-2 requires a transmission owner to prevent an encroachment into the MVCD, even if the encroachment does not result in a flashover or fault. As NERC explains, "FAC-003-2 presents a 'zero-tolerance' approach to vegetation management, explicitly treating any encroachment into the MVCD . . . as a violation . . . ."[87] Finally, encroachments must be prevented under all rated operating conditions, and must take into account sag and sway of the line, as well as vegetative growth rates and frequency of inspection and maintenance.

[87] NERC Petition at 6.

59. While the Commission did not require NERC to adopt a minimum inspection cycle as part of Order No. 693, the Commission did express concern both prior to and as part of Order No. 693 that inspection cycles should not be left entirely to the discretion of the transmission owner. Accordingly, in Order No. 693, the Commission stated that:

> The Commission continues to be concerned with leaving complete discretion to the transmission owners in determining inspection cycles, which limits the effectiveness of the Reliability Standard. Accordingly, the Commission directs the ERO to develop compliance audit procedures . . . which would identify appropriate inspection cycles based on local factors. These inspections cycles are to be used in compliance auditing of FAC-003-1 by the ERO or Regional Entity to ensure such inspection cycles and vegetation management requirements are properly met by the responsible entities.[88]

NERC has addressed this concern by incorporating a *minimum* inspection cycle requirement in the proposed Reliability Standard (at least once per calendar year and no more than 18 months between inspections).[89]

60. Thus, based on the overall benefits of proposed FAC-003-2, we propose to approve Reliability Standard FAC-003-2 and propose to direct a change in the VRF level assigned to Requirement R2, as discussed further below.

61. In considering whether to approve Reliability Standard FAC-003-2, we give due weight to NERC's technical expertise. In light of our proposal to approve the proposed

---

[88] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 721.

[89] *See* NERC Petition at 43.

Reliability Standard, commenters' suggestions that we have failed to give due weight to NERC's technical expertise are moot. Below, however, we will discuss our substantive consideration of the proposed minimum clearance distances derived based on application of the Gallet equation and certain technical points raised by the PNNL Report and commenters.

B. Applicability

62. The currently-effective Reliability Standard, FAC-003-1, is applicable to any transmission line operated at 200 kV and above, and to any line of lesser voltage designated by a Regional Entity[90] as "critical to the reliability of the electric system in the region."[91] As discussed above, the Commission accepted this approach in Order No. 693, but directed NERC to address a modification to the applicability of the standard through its Reliability Standards development process:

> We will not direct NERC to submit a modification to the general limitation on applicability as proposed in the NOPR. However we will require the ERO to address the proposed modification through its Reliability Standards development process. As explained in the NOPR, the Commission is concerned that the bright-line applicability threshold of 200 kV will exclude a significant number of transmission lines that could impact Bulk-Power System reliability . . . . We support the suggestions by Progress Energy, SERC and MISO to limit applicability to lower voltage lines associated

[90] Reliability Standard FAC-003-1 refers to Regional Reliability Organizations (RROs), the precursors to Regional Entities.

[91] To date, no Regional Entity has designated any lower voltage lines as critical to regional reliability and therefore subject to FAC-003-1.

> with IROL and these suggestions should be part of the input to the Reliability Standards development process.
>
> . . . .
>
> [Other commenters] raise concerns about the cost of implementing this Reliability Standard if the applicability is expanded to lower-voltage facilities. We recognize these concerns . . . and we direct the ERO to develop an acceptable definition that covers facilities that impact reliability but balances extending the applicability of this standard against unreasonably increasing the burden on transmission owners.[92]

63. We believe that NERC has satisfied this directive by considering the various concerns raised by the commenters as noted in Order No. 693, and ultimately by revising the Reliability Standard so that it applies to not only to lines that are 200 kV and above, but also to any sub-200 kV transmission line that is an element of an IROL or a Major WECC Transfer Path. We believe that NERC has supported its approach to the expansion in applicability, noting that proposed FAC-003-2 provides specific criteria to determine applicability for sub-200 kV transmission lines. In addition, NERC has used an impact-based approach for determining applicability rather than a bright-line threshold as a means of balancing the potential increased burden on transmission owners under a standard with expanded applicability.[93]

64. While we view the modified applicability as a significant improvement, there are two aspects on which we seek comment. First, section 4.2.2 of proposed FAC-003-2 provides that the standard applies to overhead transmission lines operated below 200 kV

[92] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at PP 706, 708.

[93] NERC Petition at 41-42.

identified as an IROL under NERC Standard FAC-014 by the planning coordinator. However, FAC-014-2 does not explicitly require the planning coordinator to provide information about IROL status to transmission owners. Further, IROLs may change with changing system conditions. Given these factors, we seek a better understanding of how FAC-003-2 will be applied to facilities designated as IROLs. For example, we seek comment on how information regarding IROL status will be transmitted to transmission owners that must comply with FAC-003-2 and how transmission owners can effectively implement vegetation management per FAC-003-2 given that such programs are generally implemented annually and a change in IROL status can take place at any time given changing system conditions.[94]

65. Second, in Order No. 693, the Commission directed that the proposed Reliability Standard apply to "Bulk-Power System transmission lines that have an impact on reliability as determined by the ERO."[95] The Commission noted evidence that some lines below 200 kV can have significant impacts on the Bulk-Power System, including IROLs and System Operating Limits (SOLs).[96] The Commission directed the ERO, however, to balance extending the applicability of the standard against unreasonably increasing the

[94] For example, if a line is designated to be an IROL element by the planning coordinator, how will the transmission owner know to thereafter apply FAC-003-2 to that line? If the designation of an IROL changes with changes in system conditions, how will a transmission owner document management of vegetation over time?

[95] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 706.

[96] *Id.* P 710.

burden on transmission owners.[97] Thus, we seek comment on how the applicability of the proposed Reliability Standard complies with the directive that the standard cover "lines that have an impact on reliability." In addition, since the issuance of Order No. 693, we note that Commission staff and NERC stated in their joint report on the 2011 Southwest outage that failure to properly designate IROLs was a major cause of the outage.[98] Therefore, as part of the broader inquiry into whether the standard covers "lines that have an impact on reliability," we seek comment on how NERC will assure that IROLs are properly designated.

C. Requirements R1 and R2

1. Minimum Clearance Values

66. We find that NERC has relied on a reasonable method for setting the MVCD, and has supported the inputs and assumptions it used to develop those minimum clearance distances, at least until such time that empirical data is developed and is available for use in setting MVCDs. We note that the MVCDs are roughly equivalent to, or slightly larger than, the minimum Clearance 2 distances in the current standard.

67. NERC explains that the MVCD is the result of a conservative gap factor. Further, the MVCD clearances represent only one aspect of proposed FAC-003-2. The MVCD

[97] *Id.* P 708.

[98] *See* FERC and NERC Staff Report, Arizona- Southern California Outages on Sept. 8, 2011: Causes and Recommendations at 6, 97-100 (April 2012).

establishes a "*minimum*[] required to prevent Flash-over."[99] The proposed standard requires transmission operators to manage vegetation to ensure that vegetation does not encroach into that minimum clearance distance, which requires transmission owners to manage vegetation to a distance further than the MVCD. For example, transmission owners are required to have documented compliance strategies, procedures, processes, or specifications under Requirement R3 to prevent encroachments into the MVCDs after taking into account sag and sway of the lines, as well as vegetative growth rates, planned control methods and frequency of inspections. Similarly, under Requirement R7, a transmission owner is required to "complete 100% of its annual vegetation work plan of applicable lines to ensure no vegetation encroachments occur within the MVCD."[100] Indeed, as NERC has explained, the "Transmission Owner is obligated to show detailed documentation that clearly explains their system with regard to the geography and how the Transmission Owner will execute the plan to prevent encroachment."[101] Further, NERC has indicated that a transmission owner's documentation approach will generally contain the following elements:

> 1. the maintenance strategy used (such as minimum vegetation-to-conductor distance or maximum vegetation

[99] NERC Petition, Ex. A (Proposed Reliability Standard FAC-003-2) at 26 (Table 2 – Minimum Vegetation Clearance Distances (MVCD) For Alternating Current Voltages), n. 7 (emphasis added).

[100] Proposed Reliability Standard FAC-003-2 R7.

[101] *See* NERC Response to Data Request Q2.

> height) *to ensure that MVCD clearances are never violated*.
>
> 2. the work methods that the Transmission Owner uses to control vegetation
>
> 3. a stated Vegetation Inspection frequency
>
> 4. an annual work plan[102]

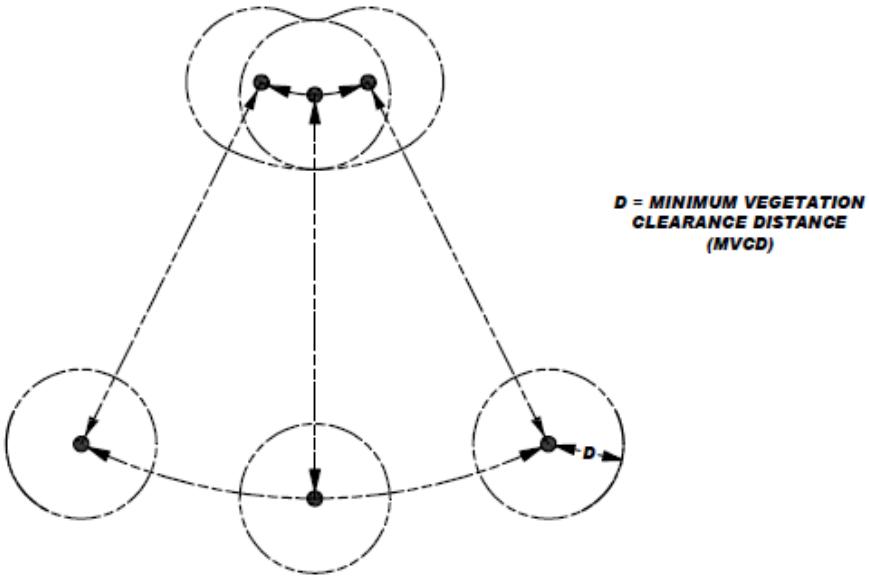
NERC also has indicated in its filing that "prudent vegetation maintenance practices dictate that substantially greater distances [than the applicable MVCD] will be achieved at time of vegetation maintenance."[103]

68. NERC also explains that a conductor's position in space at any point in time continuously changes in reaction to a variety of factors, such as the amount of thermal and physical loading, air temperature, wind velocity and direction, and precipitation. The following diagram is a cross-section view of a single conductor at a given point along the span that illustrates six possible conductor positions due to movement resulting from thermal and mechanical loading:[104]

[102] NERC Response to Data Request Q4 (emphasis added) (citing NERC Petition, Ex. A at 19-20).

[103] NERC Petition, Ex. A (Proposed Reliability Standard FAC-003-2) at 26 (Table 2 – Minimum Vegetation Clearance Distances (MVCD) For Alternating Current Voltages), n. 7.

[104] NERC Petition, Ex. A at 20-21.



NERC indicates that conductor movements must be taken into account under FAC-003-2, and that the transmission owner is required to show that its approach to vegetation management under Requirement R3 will prevent encroachments under all expected line positions.[105] Thus, a transmission owner must manage vegetation to ensure it does not encroach into the MVCD under multiple conditions.

69. Finally, as NERC explains in its Technical Reference Document, transmission owners will have to clear vegetation to levels "well away from" the minimum spark-over zone:

> As the conductor moves through various positions [due to thermal loading and physical loading], a spark-over zone surrounding the conductor moves with it. . . . At the time of making a field observation, however, it is very difficult to precisely know where the conductor is in relation to its wide

[105] *See id.* and Requirement R3 of FAC-003-2; *see also* NERC Petition, Ex. I (Technical Reference Document) at 20-29.

> range of all possible positions. Therefore, Transmission Owners must adopt maintenance approaches that account for this dynamic situation.
>
> . . .
>
> In order to maintain adequate separation between vegetation and transmission line conductors, the Transmission Owner must craft a maintenance strategy that keeps vegetation well away from the spark-over zone mentioned above.[106]

70. Thus, while clearances required at the time of maintenance may vary from one region or area to another, our proposed approval of FAC-003-2 is based on our understanding, which is drawn directly from NERC's statements in its petition, that transmission operators will manage vegetation to distances beyond the MVCD to ensure no encroachment into the MVCD.

71. As discussed above, the PNNL Report identifies specific potential concerns regarding NERC's approach to calculating minimum clearance values, such as the appropriate "gap factor" to apply. In its response to the PNNL Report, NERC explains the Standard Drafting Team's approach to reach a 1.3 gap factor and how it considered the matters raised in the PNNL Report. For example, with regard to the gap factor, NERC indicates that the drafting team relied on an authoritative source and chose a conservative gap factor value.[107] Based on the record in this proceeding, the application of the Gallet equation appears to be one reasonable method to calculate MVCD values.

---

[106] NERC Petition, Ex. I (Technical Reference Document) at 21-24.

[107] NERC Comments on PNNL Report at 6-7.

Further, while questions have been raised regarding certain inputs into the mathematical formula, we believe that NERC has supported use of the MVCD values set forth in FAC-003-2.

72. Notwithstanding our approval of the proposed MVCD, we remain concerned, as indicated in Order No. 693, over the lack of empirical data with regard to actual flashover distances observed through testing or analysis of flashover events.[108] NERC states in its petition that the Electric Power Research Institute (EPRI) is planning to undertake "the first known field tests of energized high voltage conductor flash-over to vegetation" at its Lenox facility, and that EPRI could be ready to commence such testing by the summer of 2013.[109] We seek comment on the status of this project and any other similar testing that is planned or ongoing of which NERC or other commenters are aware.

73. NERC further states that "the results of those [EPRI] tests may be useful to the industry for future reviews of this NERC standard."[110] We agree with NERC. While we accept NERC's approach to determine the MVCDs between conductors and vegetation needed to prevent flashovers, we believe it is important that NERC develop empirical evidence that either confirms the MVCD values or gives reason to revisit the Reliability Standard. Accordingly, consistent with the activity that NERC has already initiated, the

[108] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 735.

[109] NERC Petition at 5, n. 10.

[110] *Id*.

Commission proposes to direct that NERC conduct or commission testing to obtain empirical data and submit a report to the Commission providing the results of the testing. We seek comment on this proposal, as well as the appropriate time frame for completion of the required testing and the submission of a report.

2. Designation of Medium VRF for Requirement R2

74. Requirement R1 of currently-effective Reliability Standard FAC-003-1 requires a transmission owner to maintain a "transmission vegetation management program" pursuant to which a transmission owner must maintain certain clearance distances between applicable transmission lines and vegetation. Requirement R1 of the Version 1 standard is assigned a "high" Violation Risk Factor.

NERC Petition

75. Under FAC-003-2, NERC proposes to bifurcate the assigned Violation Risk Factor levels, depending on the type of transmission line involved. NERC proposes to assign a high Violation Risk Factor to Requirement R1, which requires transmission owners to "manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path." Requirement R2 of the proposed Reliability Standard, which is assigned a medium Violation Risk Factor, provides that "[e]ach Transmission Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path." [Emphasis in original.] Thus, the substantive obligation set forth in Requirements R1

and R2 are identical, but the Violation Risk Factors differ based on whether a transmission line is an element of an IROL or Major WECC Transfer Path.

76. NERC maintains that the assignment of a medium Violation Risk Factor for Requirement R2 is appropriate pursuant to existing Violation Risk Factor definitions and guidelines. NERC maintains that "[l]ines that are not IROLs and are not Major WECC Transfer Paths by definition have less potential for leading to cascading, separation or instability."[111] Thus, NERC asserts that the separation into high risk and medium risk categories "ensure entities properly understand the risk to reliability associated with specific actions."[112]

Commission Proposal

77. Based on the information provided in NERC's Petition, it is not clear that NERC has adequately supported a medium Violation Risk Factor designation for Requirement R2. The Commission-approved definition of a "medium" risk requirement is:

> A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is *unlikely to lead to bulk electric system instability, separation, or cascading failures . . . .* [113]

[111] NERC Petition at 53.

[112] *Id.* at 54.

[113] *See North American Electric Reliability Corp*., 119 FERC ¶ 61,145 at P 9, *order on compliance*, 121 FERC ¶ 61,179, at n.2, Appx. A (2007) (emphasis added).

The definition of a high Violation Risk Factor is:

> A requirement that, if violated, *could directly cause or contribute to* bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures . . . .[114]

NERC's support for the medium designation is that transmission lines that are not IROLs and are not Major WECC Transfer Paths "have less potential for leading to cascading, separation, or instability" than lines that are IROLs or Major WECC Transfer Paths.[115] But NERC does not explain *why* outages on these relatively high voltage lines (200 kV or higher) would not likely lead to cascading, separation, or instability, or provide any indication of the number of transmission lines and transmission line-miles that would now be subject to a reduced (i.e., medium) Violation Risk Factor designation if FAC-003-2 were in effect.

78. Moreover, transmission lines not designated as an IROL element (or the equivalent) have been instrumental in causing major blackouts, including the August 2003 Northeast blackout. In that case, at least three of the four 345 kV lines (Star-S Canton, Harding-Chamberlin, and Hanna-Juniper) that tripped due to tree contact were not monitored as a flowgate, which could be viewed as the technical equivalent of

[114] *Id.* (emphasis added).

[115] NERC Petition at 53.

an IROL at that time.[116] These three lines were the second, third and fourth lines to trip.[117]

79. Likewise, an August 10, 1996 blackout in WECC began with the trip of a 500 kV line (due to a tree contact) that was not identified as part of WECC's relevant path catalog at the time, i.e., the line was not identified as one of the critical paths subject to WECC monitoring and oversight similar to that required for a Major WECC Transfer Path today.[118]

80. Pursuant to proposed Requirements R1 and R2, transmission owners must "manage vegetation to prevent encroachments into the MVCD of its applicable lines," and any encroachment is considered a violation of these requirements regardless of whether it results in a sustained outage. NERC explains that it bifurcated the requirement to eliminate commingling of higher risk reliability objectives and lesser risk reliability objectives. However, analysis of the two aforementioned system disturbances suggests

---

[116] 2003 Blackout Report at 55, 57, 60. The NERC Glossary defines a flowgate as: "1.) A portion of the Transmission system through which the Interchange Distribution Calculator calculates the power flow from Interchange Transactions. 2.) A mathematical construct, comprised of one or more monitored transmission Facilities and optionally one or more contingency Facilities, used to analyze the impact of power flows upon the Bulk Electric System." NERC Glossary at 20.

[117] 2003 Blackout Report at 46 (Fig. 5.1).

[118] The blackout originated with the trip of the Keeler-Allston 500 kV line, *see* NERC 1996 System Disturbances: Review of Selected Electric System Disturbances in North America (August 2002) at 40, 47, and affected 7.5 million people and 28,000 MW of load across fourteen states. 2003 Blackout Report at 106.

that lines that are not designated as an IROL or a Major WECC Transfer Path at a given point in time (i.e., proposed Requirement R2 lines), may still be associated with higher-risk consequences, including outages that can lead to Cascading.

81. Accordingly, pursuant to our Violation Risk Factor guidelines, which require, among other things, consistency within a Reliability Standard (guideline 2) and consistency between requirements that have similar reliability objectives (guideline 3), we propose to modify the Violation Risk Factor assigned to Requirement R2 from medium to high. However, in its comments on this NOPR, NERC is free to provide additional explanation than provided thus far to demonstrate the lines identified in Requirement R2 are properly assigned a medium Violation Risk Factor.

D. Enforceability

NERC Petition

82. In its petition, NERC describes its approach to enforcement with respect to each of the Reliability Standard's requirements, noting that each requirement is associated with a specific measure for evaluating compliance and Violation Severity Level guidance. With respect to Requirements R1 and R2, NERC explains that the associated measure sets out the types of evidence or documentation that will be required to show that vegetation was managed to prevent encroachments.

83. NERC acknowledges that proposed Requirements R1 and R2 include a general footnote (Footnote 1) describing multiple conditions exempting a transmission owner from these requirements so as not to be held accountable for an encroachment (e.g., a natural disaster or a "major storm" as defined either by the transmission owner or an

applicable regulatory body). However, NERC explains that this exception would only apply to situations that are beyond the control of the transmission owner or its duly appointed delegate.[119] Further, any determination by the Commission or any other "applicable regulatory body" as to whether a given event does or does not qualify as a "major storm" would override any such determination by the transmission owner.[120]

84. With respect to the Requirement R3 obligation that a transmission owner document its approach to vegetation management, NERC explains that the transmission owner must not only demonstrate that its program takes into account "the movement of the conductor, as well as growth rate, control method, and inspection frequency," it must also provide "documentation that is sufficient to satisfy the auditor that the information contained in that documentation is sufficient that the Transmission Owner can use it to prevent encroachment into the MVCD."[121] NERC further explains that "[a]uditors will have to use judgment to evaluate the appropriateness of the documentation provided given the particular circumstances of the entity being audited."[122]

85. With respect to the obligation in Requirement R4 to provide notice to the applicable control center of a confirmed vegetation condition likely to cause a fault, NERC again explains that auditors may have to use judgment based on the specific

[119] NERC Petition at 34.

[120] NERC Petition at 34.

[121] *Id.* at 35.

[122] *Id*.

circumstances, "but it is expected that an entity that does not make this reporting a top priority would be in violation of the standard."[123] In addition, NERC explains that the obligation to notify without intentional delay generally "can be understood to include an immediate (within 1 hour of the observation) communication notwithstanding a safety issue to the personnel, other immediate priority maintenance functions to ensure reliability or system stability, or communications equipment failure that precludes immediate communication."[124]

86. With respect to Requirement R5, NERC explains that in the case where a transmission owner is prevented from taking actions needed to prevent an encroachment into the MVCD, the transmission owner must de-energize or de-rate the line to reduce the MVCD as needed to avoid a violation, and must show proof that it has taken that action if needed.[125]

87. With respect to Requirement R7 covering vegetation work plans, NERC notes that the requirement does not explicitly require the creation of such a plan, but states that "entities will not be able to comply with the requirement without having a documented plan."[126] While NERC acknowledges that R7 allows transmission owners to have a

[123] *Id.*

[124] *Id.* at 37.

[125] *Id.*

[126] *Id.* at 39.

"dynamic work plan," it points out that any modifications to the plan must be executed to avoid encroachment of vegetation into the MVCD. Moreover, NERC notes that "[a]ny such encroachment would be a violation of R1 or R2, and any changes to the plan that resulted in such an encroachment would be a violation of R7."[127] Finally, NERC notes that auditors will be able to request and review initial work plans for comparison with completed work plans in order to assess compliance with these requirements.[128]

88. In addition, NERC has identified what it expects a transmission owner's vegetation management program to contain. See P 67, *supra.*

89. The proposed Reliability Standard, as filed, includes a "Guideline and Technical Basis" document that further explains NERC's expectations on how the requirements will be enforced and how compliance can be demonstrated. For example, with respect to Requirement R3, NERC explains in greater detail that the documentation showing the transmission owner's approach to vegetation management must provide "the basis for evaluating the intent, allocation of appropriate resources, and the competency of the Transmission Owner in managing vegetation."[129] While NERC notes that there are many acceptable approaches to vegetation management, the transmission owner must be able to

[127] *Id.*

[128] *Id.* at 40.

[129] *Id.*, Ex. A at 19.

show how it conducts work to maintain the required clearances.[130] In addition, as discussed in paragraphs 67-71 above, transmission owners cannot show compliance with the standard without adopting a vegetation management program that keeps vegetation away from the MVCDs under changing conditions.

Commission Proposal

90. We support NERC's overall efforts to develop explicit, verifiable measures for each requirement in order to allow for consistent, non-preferential enforcement.

91. As noted above, NERC has provided information we believe is useful to an overall understanding of the intent of the standard and how it will be interpreted and enforced, including the information that NERC has provided in its petition, in the Guideline and Technical Basis document that is attached as part of Exhibit A to the petition, and in its May 25, 2012 responses to the Commission staff's data requests. We believe these additional resources, while not setting forth requirements or themselves determining whether compliance has occurred, provide guidance with respect to uniform compliance with the proposed Reliability Standard.[131] We expect that NERC will approach its compliance, auditing and enforcement obligations as described in each of these submitted materials. We seek comment as to whether this material should be consolidated as reference material to complement the proposed compliance measures in order that entities

[130] *Id.* at 20.

[131] Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 253.

that must comply can find these materials in one place and assure implementation of the proposed standard as NERC has supported in its filings.

92. In addition, Requirement R4 requires transmission owners to notify "without intentional time delay" the control center with switching authority for the applicable line when the transmission owner has confirmed the existence of a vegetation condition that is likely to cause an imminent fault. We seek comment on how NERC would or should treat a delay in communication caused by the negligence of the transmission owner or one of its employees, where the delay may be significant and "unintentional."

E. Reporting Requirements

93. Reliability Standard FAC-003-1, Requirements R3 and R4, require quarterly reporting to the Regional Entities of sustained transmission outages caused by vegetation. While the proposed Reliability Standard moves these reporting requirements to the "Additional Compliance Information" section as a Periodic Data Submittal, NERC maintains that the reporting requirements remain enforceable under NERC's Rules of Procedure. Among other things, NERC states that it and Regional Entities can require entities to provide "such information as is necessary to monitor compliance with the reliability standards" under Section 401.3 of NERC's Rules of Procedure.[132] In addition, NERC asserts that it "has certain courses of action it may undertake as necessary to

[132] NERC Rules of Procedure Section 401.3.

ensure the entity complies with the Rules," pursuant to NERC Rule of Procedure Section 100, including notifying the Commission of the entity's failure to comply.[133]

94. We agree that pursuant to section 401.3 of NERC's Rules of Procedure, NERC and the Regional Entities can require transmission owners to make quarterly reports of sustained transmission outages because these reports provide information relating to compliance with the requirements of proposed FAC-003-2. This rule states: "All Bulk Power System owners, operators and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards." Further, a periodic data submittal is a requirement to provide compliance information pursuant to section 3.6 of NERC's Compliance Monitoring and Enforcement Program.[134] However, we seek comment on NERC's statement regarding the "courses of action" that are available to it in order to ensure compliance, other than notifying the Commission of the entity's failure to comply.

F. Definitions

95. We propose to accept the new definition of Minimum Vegetation Clearance Distance and the revised definitions of Vegetation Inspection and Right-of-Way for

---

[133] *See* NERC Petition at 31-32. *See* NERC Rule of Procedure, Section 100 ("[e]ach Bulk Power System owner, operator, and user shall comply with all Rules of Procedure of NERC that are made applicable to such entities . . . . If NERC determines that a Rule of Procedure has been violated, or cannot practically be complied with, NERC shall notify [the Commission] and take such other actions as NERC deems appropriate to address the situation").

[134] NERC Rules of Procedure, Appx. 4C § 3.6.

inclusion in the NERC Glossary of Terms. However, we seek further comment regarding the proposed revision to the definition of Right-of-Way, as discussed below.

Revised Definition of Right-of-Way

96. As noted above, we directed NERC in Order No. 693 to consider FirstEnergy's suggestion that "rights-of-way be defined to encompass the required clearance areas instead of the corresponding legal rights, and that the standards should not require clearing the entire right-of-way when the required clearance for an existing line does not take up the entire right-of-way."[135] In response to this directive, NERC now proposes the following new definition of Right-of-Way (ROW):

> The corridor of land under a transmission line(s) needed to operate the line(s). The width of the corridor is established by engineering or construction standards as documented in either construction documents, pre-2007 vegetation maintenance records, or by the blowout standard in effect when the line was built. The ROW width in no case exceeds the Transmission Owner's legal rights but may be less based on the aforementioned criteria.

97. Under Requirements R1.1 and R2.1 of the proposed Reliability Standard, encroachments into the MVCD observed in real time would be violations of R1 or R2 regardless of whether they cause a sustained outage and regardless of whether the vegetation is within the Right-of-Way as defined under FAC-003-2. However, under proposed Requirements R1.2, R1.3 and R1.4 and the corresponding sub-requirements of R2, fall-ins, blow-ins and grow-ins that cause a sustained outage are violations of the

[135] *See* Order No. 693, FERC Stats. & Regs. ¶ 31,242 at P 734.

proposed standard only if they occur from *inside* this newly-defined Right-of-Way, which could give transmission owners the perverse incentive to "define" a particular Right-of-Way as narrowly as possible in order to limit the likelihood of an R1 or R2 violation.

98. In response to the Commission staff data requests, NERC has provided information suggesting that encroachments from within the legal right-of-way (i.e., the area within the transmission owner's control) would, in most cases, still be violations of FAC-003-2, even if the Right-of-Way is more narrowly defined. In response to Commission staff's question about a transmission owner's obligation to respond when it identifies a vegetation condition that might encroach into the MVCD if the vegetation is located outside of the Right-of-Way (as proposed under the new definition), but within the transmission owner's *legal* right-of-way, NERC provided the following explanation:

> **1. A grow-in from a tree or the tree wall into the ROW.** The definition of ROW provides for "The corridor of land under a transmission line(s) needed to operate the line(s)." Therefore, in order to operate the line consistent with its rating, the ROW includes space for "blowout" of the lines within the context of the MVCD. With respect to the grow in of a tree from outside the ROW as defined but within the legal ROW, the TO will use vegetations [sic] inspections to identify "those vegetation conditions under the Transmission Owner's control that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection." In the event, an inspection shows that a tree has already grown inside the MVCD, the TO would be in violation of R1 item 1 or R2 item 1. Another way to consider this issue is that tree growing into the MVCD from the side is no different from a tree growing into the MVCD from below the line.
>
> **2. A fall-in of danger timber (dead, diseased or dying) from outside of the ROW but within the TO's control.** The definition of inspection covers vegetation "….vegetation conditions on a Right-of-Way and those vegetation conditions

> *under the Transmission Owner's control* that are likely to pose a hazard to the line(s) prior to the next planned maintenance or inspection." Under this requirement, if the TO is regularly identifying its danger trees and has a program for managing the risk of fall-in there would be no violation. Conversely, if an outage occurs and it is confirmed that the TO was not attempting to identify its danger timber risk, the TO would be in violation of R6. . . . Also, if the TO identifies the danger tree but puts no plan into effect to manage the risk of fall-in, the TO would be in violation of R7 . . . .[136]

99. NERC distinguishes these cases from a case where a fall-in occurs from a *green or healthy tree* outside the corridor-based Right-of-Way, but within the right-of-way controlled by the transmission owner. In that case, NERC acknowledges that there would be no violation under the proposed standard, and maintains that the "fact that the Transmission Owner owns additional ROW over and above . . . that needed by the MVCD is insufficient reason to cut healthy green trees. To require the cutting of green, healthy trees that pose no known threat would likely not be environmentally, socially, or politically acceptable."[137]

100. We agree with NERC that in the situation in which a fall-in occurs from a green or healthy tree outside the corridor based Right-of-Way, but within the ROW controlled by the transmission owner, there would be no violation under the revised Reliability Standard. Moreover, we note that the proposed Reliability Standard does not require clear-cutting along the right-of-way, but instead gives the transmission owner the

[136] NERC Data Responses, Responses to Q9 (May 25, 2012).

[137] *Id.*, Response to Q 9 at P 3.

flexibility to adopt an appropriate vegetation management strategy to comply with FAC-003-2 based on the particular circumstances for a given line. As NERC notes in its Technical Reference Document, different vegetation management strategies may be appropriate for different areas, and FAC-003-2 gives transmission owners the option to adopt strategies to comply with FAC-003-2 that encourage active vegetation management and Integrated Vegetation Management rather than clear-cutting.[138] NERC's Technical Reference Document describes ANSI A-300 – Best Management Practices for Tree Care Operations and identifies Integrated Vegetation Management as a best management practice, including incorporation of wire-border zone management techniques and the establishment and maintenance of compatible vegetation.

101. However, we seek further comment on NERC's enforcement approach with respect to a fall-in by "danger timber" (dead, diseased or dying trees or limbs) from within the transmission owner's legally-owned and controlled right-of-way. Specifically, NERC indicates in its data responses (restated in P 98, *supra*) that "if the TO is regularly identifying its danger trees and has a program for managing the risk of fall-in there would be no violation." The Commission's concern is that this statement could be read to mean that, as long as the transmission owner identifies danger trees and has a program to manage the risk of those trees, an encroachment into the MVCD from a location within the transmission owner's control would not be a violation. The Commission would not

[138] *See* NERC Petition, Ex. I (Technical Reference Document) at 24-29.

agree with such a reading. The mere existence of a program to identify danger trees and a program to manage risk should not shield a transmission owner from enforcement if, notwithstanding the existence of the program, an encroachment into the MVCD occurred. The Commission seeks comment on this reading and, based on the comments, will consider whether changes are needed.

102. We also note that the proposed definition of Right-of-Way includes guidance as to how the transmission owner may define its Right-of-Way, requiring that it be based on construction documents, pre-2007 vegetation maintenance records, or as-built blowout standards. We seek comment on how the identified guidance in the new definition will be used: (1) by the transmission owner to establish criteria to determine an appropriate Right-of-Way; and (2) by auditors to establish criteria to determine compliance with the proposed standard.

G. Implementation Plan

103. We propose to approve the Implementation Plan as submitted in Ex. B of NERC's petition.

V. Information Collection Statement

104. The following collection of information contained in the Proposed Rule is subject to review by the Office of Management and Budget (OMB) under section 3507(d) of the Paperwork Reduction Act of 1995 (PRA).[139] OMB's regulations require that OMB

[139] 44 U.S.C. § 3507(d) (2006).

approve certain reporting and recordkeeping requirements (collections of information) imposed by an agency.[140] Upon approval of a collection of information, OMB will assign an OMB control number and expiration date. Respondents subject to the filing requirements of this rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

105. The Commission is proposing to submit these reporting and recordkeeping requirements to OMB for its review and approval under section 3507(d) of the PRA. Comments are solicited on the Commission's need for this information, whether the information will have practical utility, the accuracy of the provided burden estimate, ways to enhance the quality, utility, and clarity of the information to be collected, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques.

106. This Notice of Proposed Rulemaking proposes to approve Reliability Standard FAC-003-2, which includes certain requirements to create and maintain records related to a transmission owner's vegetation management work plan and its performance of inspections. Because transmission owners have vegetation management plans they follow per the existing transmission vegetation management standard (FAC-003-1), and must compile and maintain similar records and provide similar reports under the existing standard, the proposed revisions are expected to have a minor impact on the burden of

[140] 5 C.F.R. § 1320.11 (2012).

record-keeping and reporting. In addition, by allowing greater flexibility compared to the currently-effective Version 1 standard with regard to the materials that must be maintained for a vegetation management plan or strategy, the NERC proposal may prove to reduce the reporting burden for some entities.

107. Public Reporting Burden: Our estimate below regarding the number of respondents is based on the NERC compliance registry as of July 24, 2012. According to the compliance registry, NERC has registered 330 transmission owners within the United States. Transmission owners must report and retain certain data pursuant to the currently effective Version 1 Standard. Thus, the burden estimate below is based on the potential change in the reporting burden imposed by proposed FAC-003-2. As discussed earlier, Requirement R3 of NERC's proposal provides more flexibility for transmission owners in preparing and maintaining a vegetation management program, and the incremental change in the burden may be negligible or even decrease for some portion of transmission owners. The individual burden estimates are based on each transmission owner having to perform a one-time review of the revised Reliability Standard's information collection requirements and to make any required modifications to its existing vegetation management plans and documentation procedures. In addition, the burden estimate takes into account an on-going, albeit very minor increase in the quarterly reporting burden, based on the increased burden to confirm whether or not reportable outages have occurred on lines not previously subject to FAC-003-1's requirements. Further, the burden estimate takes into account the increased recordkeeping burden associated with the proposed standard's annual vegetation inspection requirements, which is estimated to

increase the inspection cycles (and the associated documentation to demonstrate compliance) for about one third of transmission owners (110 transmission owners).

FAC-003-2 (Transmission Vegetation Management)	Number of Transmission Owner Respondents (1)	Number of Responses per Respondent (2)	Average Burden Hours Per Response (3)	Total Annual Burden Hours (1)x(2)x(3)
One time review and modifications to existing documentation, plans and procedures	330	1	16	5,280 (one-time)
Quarterly Reporting	115	4	0.5	330[141]
Annual Vegetation Inspections Documentation	110	1	2	220
Total				5,830

Total Annual Hours for Collection: (Compliance/Documentation) = 5,830 hours.

Quarterly Reporting Cost for Transmission Owners: = 330 hours @ $70/hour[142] = $23,100.

[141] While approval of FAC-003-2 is not expected to increase the number of reports made or the number of reportable outages experienced, some utilities may experience a very slight increase in the amount of time required to confirm whether or not any reportable outages occurred due to the increased applicability of the standard to certain sub-200 kV transmission lines.

[142] This figure is the average of the salary plus benefits for a manager and an engineer. The figures are taken from the Bureau of Labor and Statistics at http://bls.gov/oes/current/naics3_221000.htm.

Annual Vegetation Inspections Documentation: = 220 hours @ $28/hour[143] = $6,160.

Total Annual Cost (Reporting + Record Retention): = $23,100 + $6,160 = $29,260.

One-Time Review and Modification of Plans and Documentation: 5,280 hours @ $52/hour[144] = $274,560.

Title: Mandatory Reliability Standards for the Bulk-Power System

Action: Proposed revisions to collection FERC-725A.

OMB Control No.: 1902-0244.

Respondents: Businesses or other for-profit institutions; not-for-profit institutions.

Frequency of Responses: Annual, quarterly, and one-time.

Necessity of the Information: The proposed revision of NERC standard FAC-003-2 Transmission Vegetation Management is part of the implementation of the Congressional mandate of the Energy Policy Act of 2005 to develop mandatory and enforceable Reliability Standards to better ensure the reliability of the nation's Bulk Power System. Specifically, the proposal would ensure that transmission owners are protecting transmission lines from encroachment of vegetation.

Internal Review: The Commission has reviewed the proposed revision to the current Reliability Standard and made a determination that its action is necessary to implement

[143] Wage figure is based on a Commission staff study of record retention burden.

[144] This figure is the average of the salary plus benefits for an engineer and a forester. The figures are taken from Bureau of Labor and Statistics at http://bls.gov/oes/current/naics3_221000.htm.

section 215 of the FPA. The Commission has assured itself, by means of its internal review, that there is specific, objective support for the burden estimate associated with the information requirements.

108. Interested persons may obtain information on the reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, phone: (202) 502-8663, fax: (202) 273-0873].

109. For submitting comments concerning the collection of information and the associated burden estimate, please send your comments to the Commission and to the Office of Management and Budget, Office of Information and Regulatory Affairs, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission, phone: (202) 395-4638, fax: (202) 395-7285]. For security reasons, comments to OMB should be submitted by e-mail to: oira_submission@omb.eop.gov. Comments submitted to OMB should include Docket Number RM12-04 and OMB Control Number 1902-0244.

VI. Regulatory Flexibility Act Certification

110. The Regulatory Flexibility Act of 1980 (RFA)[145] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities. The RFA mandates consideration of regulatory alternatives that

[145] 5 U.S.C. §§ 601-612 (2006).

accomplish the stated objectives of a proposed rule and that minimize any significant economic impact on a substantial number of small entities. The Small Business Administration's (SBA's) Office of Size Standards develops the numerical definition of a small business.[146] The SBA has established a size standard for electric utilities, stating that a firm is small if, including its affiliates, it is primarily engaged in the transmission, generation and/or distribution of electric energy for sale and its total electric output for the preceding twelve months did not exceed four million megawatt hours.[147]

111. Proposed Reliability Standard FAC-003-2 will be applicable to overhead transmission lines operated at 200 kV or higher, and, for the first time, to transmission lines operated at less than 200 kV if they are elements of an IROL as defined by FAC-014 or elements of a Major WECC Transfer Path. In addition, Proposed Reliability Standard FAC-003-2 will require annual vegetation inspections for all applicable lines, which could result in an increase in annual inspections performed for a subset of transmission owners.

112. Comparison of the NERC Compliance Registry with data submitted to the Energy Information Administration on Form EIA-861 indicates that, of the 330 transmission owners in the United States registered by NERC, 127 of these entities qualify as small businesses. The Commission estimates that the 127 transmission owners that qualify as

[146] 13 C.F.R. § 121.101 (2012).

[147] 13 C.F.R. § 121.201, Sector 22, Utilities & n.1.

small businesses will incur increased costs associated solely with a one-time review of the proposed standard and modification to existing plans and procedures. As described in the information collection section of this NOPR, the estimated cost for the increased data collection and retention is approximately $1,000 per entity.

113. Further, some transmission owners that qualify as small entities will incur costs associated with an increase in frequency of inspections. As indicated above, currently-effective FAC-003-1 requires periodic vegetation management inspections of transmission line rights-of-way at an interval determined by each transmission owner. Requirement R6 of the proposed standard would require each transmission owners to inspect 100 percent of the transmission lines at least once per year. Based on a review of available information, including data provided in response to a 2004 vegetation management study performed by Commission staff,[148] we estimate that approximately one third, i.e., 42, of the transmission owners that qualify as small entities would incur costs associated with more frequent inspection cycles. Assuming that (1) such small entities own approximately 50-200 miles of transmission lines, (2) approximately 15-20 miles of transmission line can be inspected per day and (3) cost of labor is approximately $47 per hour,[149] the estimated increase in inspection cost for these

[148] *See Utility Vegetation Management and Bulk Electric Reliability Report from the Federal Energy Regulatory Commission*, p. 8-10 (Sept. 7, 2004). Available at: http://www.ferc.gov/industries/electric/indus-act/reliability/veg-mgmt-rpt-final.pdf.

[149] The wage figure is taken from the Bureau of Labor and Statistics at http://bls.gov/oes/current/naics3_221000.htm.

42 small entities is in the range of approximately $5,000 to 10,000 per entity. As discussed above, NERC's proposal would modify the applicability of the Reliability Standard to include overhead transmission lines that are operated below 200 kV if they are either an element of an IROL or an element of a Major WECC Transfer Path. Based on a review of the Major WECC Transfer Paths and a sample of sub-200 kV IROLs in the Eastern Interconnect, the Commission believes that most, if not all, of the transmission lines subject to the expanded applicability of proposed FAC-003-2 are owned by large entities. Thus, the increased cost of the new rule to small entities appears to be negligible with respect to the expanded applicability of the Reliability Standard.

114. Based on the above, the Commission does not consider the cost of the NERC proposal to be a significant economic impact for small entities because it should not represent a significant percentage of an affected small entity's operating budget.

115. Based on the above, the Commission certifies that the new or revised requirements set forth in proposed Reliability Standard FAC-003-2 will not have a significant economic impact on a substantial number of small entities. Accordingly, no regulatory flexibility analysis is required.

VII. Environmental Analysis

116. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect

on the human environment.[150] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. The actions proposed here fall within the categorical exclusion in the Commission's regulations for rules that are clarifying, corrective or procedural or that do not substantially change the effect of the regulations being amended.[151] The actions proposed herein fall within this categorical exclusion in the Commission's regulations.

VIII. Comment Procedures

117. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [INSERT DATE 60 days after publication in the **FEDERAL REGISTER**]. Comments must refer to Docket No. RM12-4-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

118. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not

[150] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs., Regulations Preambles 1986-1990 ¶ 30,783 (1987).

[151] 18 C.F.R. § 380.4(a)(2)(ii) (2012).

in a scanned format. Commenters filing electronically do not need to make a paper filing.

119. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

120. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

IX. Document Availability

121. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

122. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

123. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at (202) 502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

Deputy Secretary.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Statement

Response to FERC's Proposed Rulemaking on Vegetation Management, Geomagnetic Disturbance Standards

October 18, 2012

WASHINGTON, DC -- The Federal Energy Regulatory Commission issued a notice of proposed rulemaking today proposing to approve the North American Electric Reliability Corporation's vegetation management standard (FAC-003-2). In separate action, the FERC proposed to direct NERC to develop standards that address geomagnetic disturbances and their impacts on the grid.

"The proposed approval of the results-based vegetation management standard is an important recognition of NERC's efforts on addressing this issue," said Gerry Cauley, president and chief executive officer at NERC. "The proposed rulemaking on geomagnetic disturbances provides a framework to address the current vulnerability, and to factor in the scientific and engineering analysis necessary to understand this complex issue."

The proposed rulemaking on geomagnetic disturbances outlines a two-step process for the industry to, first, develop and implement operational procedures to mitigate effects of solar storms, reflecting many of the recommendations outlined in NERC's 2012 geomagnetic disturbance report and, second, to conduct assessments and implement strategies based on those assessments to protect the bulk power system from geomagnetic disturbances.

NERC has placed a high priority on the vegetation management standard and on identifying effects of geomagnetic disturbances on the bulk power system, and looks forward to working with FERC and the industry to continue our efforts to safeguard the grid.

Procedures for Solar Magnetic Disturbances
Which Affect Electric Power Systems
Table of Contents

**1.0 Introduction ••••••

1.0 Introduction

Solar Magnetic Disturbances (SMD) are events that occur on the sun which can ultimately affect man-made systems on earth, including power systems. Voltage potentials are induced in the earth's crust which in turn cause geomagnetically induced currents (GIC) to flow in transmission lines. The resulting GICs are predominantly direct currents in nature and are typically more prevalent in the more northerly latitudes and in those regions in which the resistivity of the earth's crust is high to a considerable depth. This is notably the case in areas of igneous rock deposits.

Those utilities most affected by solar activity since 1989 have developed procedures which establish a safe operating posture and which are initiated by criteria for their respective systems.

A detailed technical description of SMDs may be found Appendix F.

2.0 Impacts on Power Systems

The flow of GICs in the transmission system may affect the following equipment:

2.1 General Effects

2.1.1 Power Transformers

The presence of GIC produces off-setting dc excitation in a transformer, resulting in some degree of core saturation. This can cause the production of **harmonic currents** which can distort system voltages and cause **protective relay** operation due to the flow of neutral current to ground. Core saturation can also result in internal localized heating of the core and windings, and degradation of winding insulation. Saturated transformers are **reactive power** sinks, using up system reactive capacity, resulting in voltage depression.

2.1.2 HVdc Systems and **Static VAR Compensators**

Operations at or near the minimum or maximum current **rating** of HVdc circuits increases the potential for **commutation failures**, jeopardizing continuity of service.

These systems require a sinusoidal voltage to properly commutate current transmission. Voltage distorted by **harmonics** may be severe enough to cause **commutation failures** and result in shutdown of such systems.

Filter banks, including capacitor banks, associated with these systems will tend to overload due to harmonic current and may result in tripping.

2.1.3 Shunt Capacitor Banks

Shunt capacitor banks will tend to overload due to **harmonic current**, typically the third **harmonic**.

2.1.4 Generators

Automatic voltage regulators (AVR) associated with generators require representative voltage signals to control the dc field current on generators. Distorted ac voltage input to the AVR may result in uncertain translation of the ac signals for control, possibly resulting in a cyclical level of excitation on the generator, and hence real and **reactive power** output may vary in an abnormal manner.

Overheating may occur in large generators due to imbalances in phase currents and **harmonic** distortion in voltages which result from the saturation of power transformers. Turbine mechanical vibration may be excited by the presence of increased **harmonic** rotor current.

2.1.5 Transmission Lines

Harmonic frequencies in the system voltage can increase the magnitude of the voltage required to be switched by circuit breakers. **Harmonics** increase transmission losses and cause interference to communications systems.

2.1.6 Overall System Impact

Transformer saturation results in increased VAR consumption and **harmonic** injection into the system. These **harmonic currents** can result in capacitor bank overloading and their tripping, generator tripping and misoperation of **static VAR compensators**. This could further deplete the system of reactive VAR support and impact the overall system performance and security. The power systems are becoming more vulnerable to GIC effects due to longer transmission lines, decreased reactive margins and greater dependence on **static VAR compensators** and high voltage dc control.

3.0 NPCC Alerts of Solar Magnetic Disturbances

The NPCC **Areas** receive, on a continual twenty-four by seven basis, the status of solar activity and geomagnetic storm alerts from the Solar Terrestrial Dispatch (STD). The primary mechanism for notification to the NPCC **Areas** is the Solar Terrestrial Dispatch's Geomagnetic Storm Mitigation System (GSMS), an active communications software package installed on the operator's console. Upon receipt of a geomagnetic storm alert from Solar Terrestrial Dispatch of level Kp 6 or higher, the GSMS simultaneously displays:

- a flashing dialog box advising the operator of a "Major or Severe Geomagnetic Storm Warning." At the discretion of the **Area**, audible warnings will also accompany the flashing dialog box. Both the flashing indicator and the audible warning (if utilized) will continue until the "Confirm Receipt" button is clicked in the dialog box. This sends a verification to Solar Terrestrial Dispatch that the storm alert was received by the NPCC **Areas**. After acknowledging receipt of the geomagnetic storm alert, the GSMS will immediately prompt the operator to specify any GIC activity that has been observed on the power grid. The operator responds by clicking one of the following four buttons, as applicable:

  "No GIC activity has been observed yet."

  "Weak GIC activity has been observed."

  "Moderately strong GIC activity has been observed."

  "Strong GIC activity has been observed."

- a main screen providing the operator with all information currently known about possible solar activity. The following information is presented:

  - the time of the notification in both Universal Time and the **Area's** local time in twenty-four hour format

  - the history of actual hourly Kp readings for the previous seven hours

  - the Kp prediction, together with the predicted time of its onset, and the predicted peak Kp reading for the next twenty-four, forty-eight and seventy-two hours periods

  - the maximum Kp prediction for both the auroral and sub-auroral zones

- the probability of occurrence of the predicted Kp level
- the probable duration of the geomagnetic storm
- a graphical presentation over time of both current historical Kp observations and projected Kp values
- the status of the receipt of the notification by all NPCC **Areas**.

After reviewing the available data, the operator may choose to enact protective measures. Such protective measures taken are to be promptly reported as soon as possible. This is done by clicking on the "Submit Notifications" tab and filling in the box labeled "Specify new actions being taken." Then click on the red arrow to record the actions that are being taken. This permanently records the action taken on the GSMS display and transmits the action to all NPCC Areas. Upon the halting of a previous action taken, the operator is to similarly report these steps using the same interface.

In the event that an **Area** observes GIC activity absent the notification of a geomagnetic storm alert, the operator is to use the "Submit Notifications" feature of the Geomagnetic Storm Mitigation System to automatically notify the other NPCC **Areas** and the Solar Terrestrial Dispatch of the activity.

All time alerts issued by the Solar Terrestrial Dispatch are disseminated in Universal Time (Greenwich Mean Time), a constant scientific time reference. All references to Universal Time may be converted to the prevailing Eastern Time or Atlantic Time as described in Appendix E.

A summary of the levels of solar activity that are made available to the NPCC **Areas** by the STD are shown in Appendix B. Further details can be obtained through the Web site of Solar Terrestrial Dispatch at:

http://www.spacew.com/

4.0 Recommended Procedures

4.1 Operational Planning

On receiving from the Solar Terrestrial Dispatch a forecast of SMD activity expected to result in Kp levels 7, 8 or 9, operations should be reviewed for vulnerability to such storms. Actions should be considered which include, but are not limited to, those listed in Section 4.2.

4.2 Operator Action With the Onset of an SMD

On receiving from the Solar Terrestrial Dispatch a geomagnetic storm alert predicting at least a 40% probability of activity at levels of Kp 7, Kp 8 or Kp 9, or notification of significant GIC activity, **system operators** may evaluate the situation and consider the following actions where appropriate:

4.2.1 Discontinue maintenance work and restore out of service high voltage transmission lines to service. Avoid taking long lines out of service.

4.2.2 Maintain the system voltage within an acceptable operating range to protect against voltage swings.

4.2.3 Reduce the loading on interconnections, critical transmission facilities, and critical transmission interfaces to 90%, or less, of their agreed limits.

4.2.4 Reduce the loading on generators operating at full load to provide reserve power and reactive capacity.

4.2.5 Consider the impact of tripping large shunt capacitor banks and static VAR compensators.

4.2.6 Dispatch generation to manage system voltage, tie line loading and to distribute operating reserve.

4.2.7 Bring equipment capable of synchronous condenser operation on line to provide reactive power reserve.

5.0 Back-Up Communications

5.1 Communications Failure

Although significant redundancy is incorporated in the dissemination of the solar alerts provided by the Solar Terrestrial Dispatch, in the event that all communication is lost with STD, the NPCC will, in the interim, rely on the solar forecasts and alerts issued by the governmental agencies of the United States and Canada. These are, respectively, the Space Environment Center (SEC) of the National Oceanic and Atmospheric Administration (NOAA), located in Boulder, Colorado, referenced in Appendix C, and the Geological Survey of Canada, Department of Natural Resources Canada (NRCAN), located in Ottawa, Ontario, referenced in Appendix D. These communication paths are summarized in Appendix A.

5.2 Conflicting Data

All actions to be considered in section 4.2 are to be based on the forecasts and alerts disseminated by the STD. This data is tailored for the power system in general, and for the geographic subauroral region in which the NPCC transmission system is located. It is therefore unlikely that the STD would predict less solar activity than either the SEC or the NRCAN. However, should the forecasts or alerts of either the SEC or the NRCAN predict higher solar activity than those of Solar Terrestrial Dispatch, each NPCC **Area** will communicate this discrepancy with the STD through the "Submit Notifications" tab of the GSMS and request clarification.

Prepared by:	Task Force on Coordination of Operation
Review frequency:	3 years

Appendix A

Communication Paths

Primary NPCC Notification:

Primary NPCC Notifications	
On a continual basis, through the Solar Terrestrial Dispatch Geomagnetic Storm Mitigation System (GSMS), solar activity is available to:	all NPCC **Areas** (IESO, ISO-NE, NBSO, NYISO and TE)
Upon the prediction of a geomagnetic storm alert of level Kp 6 or higher, the Solar Terrestrial Dispatch GSMS automatically provides alarms to:	all NPCC **Areas** (IESO, ISO-NE, NBSO, NYISO and TE)
For a prediction of Kp 7 or higher, the Solar Terrestrial Dispatch notifies by telephone:	the NYISO; the NYISO in turn notifies the IESO, the ISO-NE, NBSO, and TE.

Back-up NPCC Notification:

SEC (Boulder, Colorado) Forecasts and Alerts	
SEC-Boulder notifies:	New York ISO
New York ISO notifies:	PJM-ISO New England-IESO-TE-NBSO
New Brunswick System Operator notifies:	Nova Scotia Power Incorporated

NRCAN (Ottawa) Forecasts and Alerts	
NRCAN-Ottawa notifies:	IESO-TE
IESO notifies:	New York ISO
New York ISO notifies:	PJM-ISO New England-NBSO
New Brunswick System Operator notifies:	Nova Scotia Power Incorporated

Note: The North American Electric Reliability Council (NERC) also receives solar alerts from the Space Environment Center and transmits these alerts to the NERC Reliability Coordinators through the Reliability Coordinator Information System (RCIS).

Appendix B

Solar Activity Reporting Form

The predictive measure of solar activity reported by the Solar Terrestrial Dispatch is the Kp index, a scale divided into 27 zones of solar activity. A description of these zones and the relationship between the observed Kp index and typically observed GIC activity follows:

Kp Index	Solar Activity	GIC Activity
0o	Quiet	No GICs
1-		
1o		
1+		
2-	Unsettled	
2o		
2+		
3-	Active	
3o		
3+		
4-		
4o		
4+		
5-	Minor Storm	Low Level GICs
5o		
5+		
6-	Major Storm	
6o		
6+		
7-	Severe Storm	Moderate GICs
7o		
7+		
8-	Very Severe Storm	Strong GICs
8o		
8+		
9-		
9o		

Appendix C

Solar Alerts Issued by the Space Environment Services (SEC–Boulder, Colorado)

The Space Environment Center (SEC) of the National Oceanic and Atmospheric Administration (NOAA) is located in Boulder, Colorado, and provides warnings and alerts of geomagnetic activity to the New York ISO. The NYISO subsequently disseminates this information to the other operating Areas within NPCC.

SEC warnings and alerts are issued in the form of a daily "A" index up to three days in advance. The "A" index is a measure of the expected geomagnetic activity, based on solar observations, for Fredericksburg, Virginia. The classification of Major Storm (A index of 50 and above) is transmitted to the NPCC Areas. The SEC also includes a probability for "Major Storm" conditions to help users assess the confidence level of the forecast.

SEC warnings and alerts are also issued in the form of the Kp index, which is based on the maximum deviation of the horizontal magnetic field components of the earth relative to a quiet day, within a three hour time period. The Boulder Kp index is based on measurements from the Boulder magnetometer, and it is used at the SEC to define the alert thresholds. A warning or alert is issued for a Kp index of Kp 5 or greater. Most electrical power systems, however, are not affected until the Kp index reaches a level of 7 or higher.

The forecasts and warnings that are made available to system control centers follow:

Warnings

The following Warnings are issued by telephone from the SEC to the NYISO. Warnings are predictions for a certain period in the future. That is, warnings come before the specified period.

A Index = 30
A Index = 50
Kp Index = 5
Kp Index = 6
Kp Index = 7 or above

Alerts

The following Alerts are issued by telephone from the SEC to the NYISO. Alerts are observations of activity that has already occurred. Generally, alerts are issued at the end of the specified period.

A Index = 30
A Index = 50
Kp Index = 5
Kp Index = 6
Kp Index = 7
Kp Index = 8

Rapid Alerts

The following Rapid Alerts are issued by telephone from the SEC to the NYISO. Rapid Alerts are observations of activity that has occurred, but they are issued immediately, without waiting for the end of the period.

Kp Index = 7
Kp Index = 8

Note: The SEC in some cases speaks of all of these messages, including warnings, alerts and rapid alerts, as "alerts," and thus all of the messages can carry an alert code.

All time alerts issued by the SEC are disseminated in Universal Time (Greenwich Mean Time), a constant scientific time reference. All references to Universal Time may be converted to the prevailing Eastern Time or Atlantic Time as described in Appendix E

Further information can be obtained at:

http://www.sec.noaa.gov/today.html

Appendix D

Solar Alerts Issued by the Department of Natural Resources Canada (NRCAN– Ottawa, Ontario)

The Geological Survey of Canada, Department of Natural Resources Canada (NRCAN), located in Ottawa, Ontario, Canada, issues forecasts and warnings, based on magnetometer data from 12 observatories using the Canadian Automatic Magnetometer Observatory System (CANMOS) and on solar data received from sources around the world.

GSC forecasts are updated and issued every hour. They are based on hourly range predictions of geomagnetic activity for up to two days in the future for the subauroral zone, the geographic region in which most of the NPCC Areas are located. The classifications which are of concern to the NPCC Areas are "Stormy" (corresponding to an approximate Kp index of 5 or 6), and "Major Storm" (corresponding to an approximate Kp index of 7, 8, or 9). Several key observatories are continually monitored, and, when events are found that meet predefined criteria, a warning and updated forecast are issued. The forecasts and warnings that are made available to system control centers follow:

Warnings

Warnings issued by the NRCAN are based on actual conditions which have occurred and been observed:

WARNINGS-NRCAN (Ottawa)	
Kp Index	Hourly Range in Nanoteslas (nT)
0	0 to 7
1	8 to 14
2	15 to 29
3	30 to 59
4	60 to 104
5	105 to 179
6	180 to 299
7	300 to 499
8	500 to 749
9	750 and above

Forecasts

Forecasts issued by the NRCAN are projections for expected conditions:

FORECASTS-NRCAN (Ottawa)	
Activity Level	Kp Levels
Stormy	5 and 6
Major Storm	7, 8 and 9

NOTE: NRCAN data is measured at Ottawa, Ontario, Canada; forecasts are projections of conditions expected to occur in the subauroral zone in which most of NPCC is physically located.

All time alerts issued by the NRCAN are disseminated in Universal Time (Greenwich Mean Time), a constant scientific time reference. All references to Universal Time may be converted to the prevailing Eastern Time or Atlantic Time as described in Appendix E.

Further information can be obtained at:

forecast@geolab.nrcan.gc.ca
http://www.geolab.nrcan.gc.ca/geomag

Appendix E

Time Conversion Reference Document

The time reference used in the solar alerts disseminated by the Solar Terrestrial Dispatch, as well as the Department of Natural Resources Canada and the Space Environment Services, is the scientifically accepted Universal Time (UT), which is also equivalent to Greenwich Mean Time (GMT). The prevailing Eastern Time lags Universal Time / Greenwich Mean Time by five hours in the autumn and winter. The prevailing Eastern Time lags Universal Time / Greenwich Mean Time by four hours in the spring and summer. The prevailing Atlantic Time lags Universal Time / Greenwich Mean Time by four hours in the autumn and winter. The prevailing Atlantic Time lags Universal Time / Greenwich Mean Time by three hours in the spring and summer. The Universal Time / Greenwich Mean Time is a constant time reference and does not convert to accommodate daylight savings in the spring and summer. Conversion examples for the Eastern and Atlantic time zones follow:

Eastern Standard Time (EST)	Universal Time (GMT)
12:00 hour	17:00 hour

Eastern Daylight Time (EDT)	Universal Time (GMT)
13:00 hour	17:00 hour

Atlantic Standard Time (AST)	Universal Time (GMT)
13:00 hour	17:00 hour

Atlantic Daylight Time (ADT)	Universal Time (GMT)
14:00 hour	17:00 hour

Appendix F

Description of Solar Magnetic Disturbances

Solar Magnetic Disturbances (SMDs) are events that occur on the sun that can ultimately affect man-made systems on Earth, including power systems. The sun emits a stream of charged particles known as the solar wind that continuously moves outward from the sun past the Earth. Solar activity (solar flares, disappearing filaments and coronal holes) affects the intensity of the solar wind, varying from very quiet levels to very active levels during major storms. Extremely fast coronal mass ejection (CME) events associated with unusually energetic solar flares (known as Fast Transit Events [FTEs]) can reach the earth in as little as fourteen hours. However, most CMEs (including disappearing filament eruptions) require approximately two to three days to travel to the Earth. Coronal hole based disturbances typically take two to four days to reach the Earth. The quiet solar wind can take up to six days to reach the Earth.

The Earth has a magnetic field that is generated by a liquid metal core. This magnetic field penetrates the surface of the Earth and expands outward a large distance into space, effectively creating a cocoon or shield around the Earth that protects the Earth from harmful effects of the solar wind. The domain of the Earth's magnetic field is known as the magnetosphere. Pressure from the solar wind shapes the magnetosphere into a comet-like appearance with a “head” surrounding the Earth and a “tail” (known as the magnetotail) that extends a great distance in a direction that is opposite to the Sun (behind the Earth).

Strong magnetic fields on the Sun are dragged out toward the Earth by the solar wind. As these magnetic fields flow past the Earth, they can interact with the Earth's magnetic field. When the magnetic field lines in the solar wind are oriented in a direction that is opposite to the magnetic field lines from the Earth, the magnetic field lines from the Earth can reconnect with the magnetic fields in the solar wind. This opens up a conduit that allows solar wind momentum energy and particles to directly enter and energize the Earth's magnetosphere. The reconnected field lines are then convected across the Earth's polar regions and are dragged by the solar wind into the magnetotail region of the Earth's magnetosphere. The build-up of additional magnetic flux in the magnetotail can eventually trigger powerful magnetic field reconnection events in the Earth's magnetotail that both energize and accelerate particles and plasma from the magnetotail toward the Earth. Beams of energized particles are guided by the Earth's magnetic field into the ionosphere where they collide with atmospheric constituents and fluoresce as aurora (northern lights). The aurora are produced within a ring of activity that encircles the earth's geomagnetic poles, usually over the higher latitudes. This ring is known as the auroral zone.

Within the auroral zone ionosphere, powerful electrical currents (auroral electrojets) are forced to flow to help dissipate the tremendous energy that is released during the magnetotail reconnection events. Currents in the dusk regions flow eastward while currents in the dawn regions flow westward. These current systems converge near local midnight. The region where these currents converge is known as the Harang discontinuity region. Although the intensity of these currents can rapidly change during a geomagnetic storm, the most significant and hazardous changes typically occur near the midnight Harang discontinuity region where eastward-directed currents may suddenly change direction to westward directed currents. Significant changes in the intensity and / or the direction of these current systems can induce ground-based voltage (potential) differentials between locations spaced some distance apart. These ground potential differences can cause currents to flow through the grounded connections of transmission lines if the resistivity of the ground to a respectable depth is higher than the resistivity of the transmission line. This condition occurs more frequently and with greater magnitude in areas that overlie igneous rock.

The flow of these currents into transmission lines is known as geomagnetically induced currents (GICs). They are ostensibly direct currents in nature and are most often located toward the higher latitudes within the auroral zone during quiet to modestly active geomagnetic conditions. However, as geomagnetic storm activity intensifies, the size of the auroral zone expands. This expansion causes the equatorward boundary of the auroral electrojets (the southern-most location of the intense ionospheric electrical current systems) to migrate toward lower latitudes. During extreme events, the auroral electrojets can move at least into the central United States. This equatorward motion and the concurrent intensification of the ionospheric electrical currents during significant geomagnetic storms can therefore expose a considerable portion of the North American power grid to GICs that may be considerably stronger than those observed over the higher latitudes or during quieter geomagnetic intervals.

Commissioner John R. Norris Statement
October 18, 2012
Docket Nos. RM12-22-000 and RM12-4-000
Item Nos. E-2 and E-3

Proposed Enhancements to Reliability of Bulk Power System

"These two reliability orders address two distinctly different challenges, and represent two different approaches to maintaining reliability. E-3, concerning Reliability Standard FAC-003-2 on Transmission Vegetation Management (FAC-003), to me is about executing the fundamentals necessary to keep the lights on. We know that, without continuous care of transmission rights of way, vegetation growth will, without question, grow into power lines and impact reliability. This second version of FAC-003 recognizes the inevitability of outages if vegetation management is not in a continual state of maintenance, and also recognizes that this maintenance must be preformed on all transmission facilities that have an impact on reliability. The inclusion of Interconnection Operating Limit (IROL) elements and Major Western Electricity Coordinating Council (WECC) Transfer Path elements is a good step in recognizing that the applicability of FAC-003 should include sub-200 kV facilities that are critical to grid reliability.

"The threat of geomagnetic disturbances (GMD) addressed in the proposed rule in E-2 is a different but equally important reliability challenge. A poster child for a Low Frequency–High Impact threat, GMD involves a judgment call that requires us to assess the likelihood of occurrence, how severe the impact could be, and the options to guard against that impact. Like a cyber attack, the potential size and duration of an outage that could result from a GMD demands that we take the precautions necessary to prevent, limit, or contain the potential impact. While I do not believe there is a reasonable option that will guarantee that GMDs will never impact the grid, there are shorter and longer-term steps that we can take to guard against their potential impacts. Recognizing that taking these steps will come with costs, we have to find a "sweet spot", if you will, where the cost of implementing reasonable reliability measures to guard against GMD impacts is appropriately balanced against the potential costs of a GMD event.

"Given the magnitude of the potential damage, I believe we are taking the right approach in this order by proposing to require that in stage two, there must be more extensive standards developed than just those that address operational and enhanced training procedures (the subject of stage one). The evidence before us today suggests that some or all vulnerable elements of the system will need further hardening to withstand a GMD. I think we appropriately give deference to NERC to make a needs assessment and design the additional measures necessary (through the development of the stage two standards) to meet the reliability needs identified in those assessments. But, as the proposed rule indicates, timing is of the essence. With the prediction of high solar flare activity on the very near time horizon, NERC will need to develop standards and industry to implement them much more rapidly than has previously been required. Again, this is another judgment call where we must decide what is reasonable and what is necessary. I ask NERC and the industry to accept this challenge and work as expeditiously as possible to meet it.

"In summary I think we have approached vegetation management like you would approach changing the oil in your car. You know that, if you do not do it, at some point your car will breakdown. And, preparing for GMDs is like buying insurance for you car. You hope that you will never need it - and in fact, you might not - but, it would be irresponsible to not determine what level of coverage you do need and to make the necessary investment to protect yourself and others from the risk and potential severity of an occurrence."

Updated: October 18, 2012

News Release: October 18, 2012
Docket Nos. RM12-22-000, RM12-4-000
Item Nos. E-2 & E-3

FERC Proposes Enhancements to Reliability of Bulk Power System

The Federal Energy Regulatory Commission (FERC) today took steps to ensure continued reliable operation of the nation's bulk power system by proposing to approve a revised vegetation management standard and to require new standards addressing the impacts of a geomagnetic disturbance (GMD).

GMDs, which result in distortions to the earth's magnetic field, may cause severe problems with grid reliability, including blackouts as well as damage to critical or vulnerable equipment. Although strong disturbances are infrequent, current mandatory reliability standards do not adequately address vulnerabilities.

To address this reliability gap, today's Notice of Proposed Rulemaking (NOPR) proposes to direct the North American Electric Reliability Corporation (NERC), the FERC-approved Electric Reliability Organization, to develop and submit new GMD standards in a two-stage process.

First, within 90 days of the effective date of a final rule in the proceeding, NERC would file one or more standards requiring owners and operators of the bulk power system to develop and implement operational procedures to mitigate GMD effects. That such procedures already are in place in some areas should allow for faster development and implementation of these standards, the NOPR says.

In the second stage, FERC proposes that NERC file, within six months of a final rule, standards that require grid owners and operators to conduct initial and continuing assessments of the potential impacts of GMDs and, based on those assessments, implement strategies to protect the bulk power system, including automatic blocking of geomagnetically induced currents, instituting specification requirements for new equipment, inventory management, or isolating certain equipment that is not cost effective to retrofit. Stage two would be implemented in phases, focusing first on the most critical and vulnerable assets.

The NOPR does not propose specific requirements, but offers guidance regarding the assessments of the grid's vulnerability to GMDs, the mechanisms for protecting critical or vulnerable components and an implementation schedule. FERC seeks comments on all aspects of the proposal.

In a separate NOPR on vegetation management, FERC proposes to approve revisions submitted by NERC that would:

- Expand the applicability of the standard to include lines operated below 200 kilovolts that are part of an Interconnection Reliability Operating Limit or a Major Western Electricity Coordinating Council Transfer Path.
- Set a new minimum annual inspection requirement.
- Incorporate new minimum clearance distances into the text of the standard.

Comments on both proposals are due 60 days after publication in the *Federal Register*.

Subject:	FW: NERC: FERC NOPR Issued Proposing to Direct NERC to Develop Geomagnetic Disturbance Reliability Standards
Date:	Friday, October 19, 2012 9:20:51 AM
Attachments:	NOPR_GMD_standards.pdf

To All,

Attached is a FERC NOPR on GMDs. outlining the desire of FERC to direct NERC to develop standards in two phases, the first of which is to, within 90 days of the final rule NERC is to file with the Commission a standard(s) that will require TOs to mitigate the effect of GMDs. Subsequent to this first filing, NERC is to develop a standard(s) requiring TOs to study and identify, on an ongoing basis, the vulnerabilities of their systems to GMD and develop mitigations for those identified risks.

We will have this on the agenda for our November meeting so please be prepared to discussed. Perhaps Sylvain from HQ could arrange for a SME to attend and assist us with discussion since we will be in Montreal. Quebec's 1989 event is referred to in the NOPR as evidence of the significant impact that GMDs may have on the grid. Geomagnetic induced currents can be damaging to transformers and currently there are warning times of between 30 - 60 minutes prior to GMD events currently available. The GMDs do not restrict themselves to just the Grid but also distribution systems and pipelines as well as any electrically conductive surface.

The standard(s) that are developed from this effort could result in very costly mitigations. A different short term approach to this problem could be, given the 30-60 minute warning time, to turn off portions of the grid for the duration of the event and then restore it. There should be sufficient historical data to demonstrate what levels of GMDs the grid effectively "rode through" and perhaps use the highest of these as a threshold. Anything anticipated to be greater than this threshold could trigger public notification and subsequent operator action to "pull the plug" in those areas where the greatest effect from the GMD might be. A peak to the solar cycle is anticipated to be in 2013 and I am concerned with the ability of us to develop standards gain their approval and implemented them to sufficiently harden the grid by this time. I am hopeful all can keep an open mind to solutions and think outside the box for the short term goal. Long term could be a more comprehensive approach to hardening based on the actual risk to the system. Interesting times.

Thanks,

Guy V. Zito

Commissioner Cheryl A. LaFleur Statement
October 18, 2012
Docket Nos. RM12-22-000 and RM12-4-000
Item Nos. E-2 and E-3

Proposed Enhancements to Reliability of Bulk Power System

"Protecting the reliability of the nation's bulk electric system requires both day-to-day blocking and tackling to make sure that the lights stay on, and preparing for emerging issues including high-impact low-frequency events. Today, we are voting out Notices of Proposed Rulemaking that speak to both these components of reliability.

Vegetation Management Standard

"No issue is more central to reliability than timely and effective tree trimming to keep the transmission system operational. Indeed, a tree contact was a key contributing cause of the 2003 blackout that gave rise to this Commission's jurisdiction over reliability.

"I believe the vegetation management standard (FAC-003-2) that we propose to approve today represents an important step forward in addressing this basic reliability issue. In particular, I note that the new standard includes a requirement to maintain a defined Minimum Vegetation Clearing Distance (MVCD) for all transmission lines above 200 kv and lines below 200 KV that are part of an Interconnection Reliability Operating Limit or WECC Transfer Path, and, for the first time, a requirement to annually inspect 100 percent of the lines subject to the standard. These requirements are both clear and concrete.

"The standard we propose to approve today is one of the first results-based standards put forward by NERC. As I understand the concept of a results-based standard, it includes a clearly defined result – avoidance of outages caused by vegetation within a MVCD—on the basis of which to judge compliance with the standard. Because the standard is judged by results, it proposes to give more flexibility to transmission owners about how to meet those results, as long as they are met. This is an important concept, and the successful implementation of this standard may be a model for further results-based standards.

"I also appreciate the commitment by NERC and the industry, working with EPRI, to fund further empirical research on the proposed MVCD, since that is such a critical element of the proposed standard. I recognize that years of hard work went into this proposed standard, and appreciate the efforts of the NERC standards team as well as everyone here at FERC that worked on the standard.

Geomagnetic Disturbances

"The second Notice of Proposed Rulemaking relates to a very different issue, preventing or mitigating damage to the bulk electric system caused by geomagnetic disturbances resulting from solar storms. Solar storms are an acute example of "High Impact Low Frequency" events, which I believe are among the most difficult, but also the most necessary, to address through standards. Just as our society has over the centuries developed standards to protect elements of our infrastructure from high impact low frequency events like earthquakes and fires, I believe we must begin to address the challenge of making our electric grid resilient to geomagnetic disturbances. This is an issue in which I have taken a strong personal interest. As I have observed, the threat of geomagnetic disturbances damaging the power grid sounds like science fiction, but is in fact based on scientific fact. However, while the fact that geomagnetic disturbances can cause substantial harm to the electric grid is undisputed, the way in which that harm would occur is not without controversy. The technical community has debated whether geomagnetic disturbances caused by solar events would cause the bulk electric system to break apart due to excessive reactive power consumption, cause damage to high-voltage transformers and other key elements of the system due to inductive currents, or some combination of the two. Any of these results is unacceptable, and is exactly the

Telephone: 202-502-8680
Toll Free: 1-866-208-3372

sort of cascading disturbance to the bulk power system that section 215 of the Federal Power Act requires us to address. I believe that, while continuing to explore the technical issues, we can and should adopt “No Regrets” actions to prevent and mitigate grid damage from geomagnetic disturbances. The Notice of Proposed Rulemaking we are voting on today includes two such No Regrets actions, both of which are consistent with NERC’s assessment report on GmD issued earlier this year.

“First, we would require NERC to develop and propose a standard that requires transmission owners to take operational steps, to prepare for geomagnetic disturbances. This is one of the first actions proposed in NERC’s assessment and action plan. Because we are approaching a periodic solar maximum in 2013, increasing the threat of damaging solar storms, we are proposing to seek fast action on an operational standard.

“Second, we would require NERC to develop and propose a standard that would require transmission owners to undertake an assessment of the most vulnerable elements of the bulk electric system, and propose steps to prevent or mitigate damage to those elements from geomagnetic disturbances. As indicated in the Notice of Proposed Rulemaking, those steps could include installation of automatic blocking in certain vulnerable and critical transformers, requirement of withstand capability in transformers, inventory management strategies, operational plans to address critical elements of the system, and/or other steps that the industry and NERC may propose. Importantly, the proposed rule gives industry and NERC considerable flexibility of how to address this issue, but not the flexibility to ignore it.

“As with any other program to address pieces of the electric grid—and I have lived through quite a few—the appropriate action steps would likely vary based on how critical an asset was, where it was located, when it was scheduled to be replaced, whether it could be protected by islanding or operating protocols, or whether it needed to be retrofitted with protective equipment. Our collective understanding of these options would likely grow once we started the process.

“I know that the challenge of preparing our bulk electric system for geomagnetic disturbances is very complicated, and complicated challenges require complicated solutions. In the past, the electric grid has undergone many large-scale efforts to refurbish or replace electrical equipment to improve reliability, safety or environmental performance. Because of the size, diversity and continuous operation of the electric grid, these efforts are inevitably more complicated and take longer than expected. To me, that argues for getting started sooner rather than later.

“Finally, I believe it is appropriate to tackle this challenge now because the US is facing considerable investment in our transmission grid, driven by a change in power supply and replacement of aging infrastructure. We have a big opportunity to make sure the next generation of transmission equipment is built to withstand geomagnetic disturbances.

“I hope we will receive a broad range of comments on both Notice of Proposed Rulemaking. I would like to thank the FERC teams that worked on these proposed rules, and on the technical conference on GmD last spring on this issue. Thank you.”

Norris Statement, LaFleur Statement

WASHINGTON, DC -- The Federal Energy Regulatory Commission issued a notice of proposed rulemaking today proposing to approve the North American Electric Reliability Corporation's vegetation management standard (FAC-003-2). In separate action, the FERC proposed to direct NERC to develop standards that address geomagnetic disturbances and their impacts on the grid.

"The proposed approval of the results-based vegetation management standard is an important recognition of NERC's efforts on addressing this issue," said Gerry Cauley, president and chief executive officer at NERC. "The proposed rulemaking on geomagnetic disturbances provides a framework to address the current vulnerability, and to factor in the scientific and engineering analysis necessary to understand this complex issue."

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM12-22-000]

Reliability Standards for Geomagnetic Disturbances

(Issued October 18, 2012)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of Proposed Rulemaking.

SUMMARY: Under section 215 of the Federal Power Act, the Federal Energy Regulatory Commission (Commission) proposes to direct the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization, to submit for approval Reliability Standards that address the impact of geomagnetic disturbances (GMD) on the reliable operation of the Bulk-Power System. The Commission proposes to do this in two stages. In the first stage, the Commission proposes to direct NERC to file, within 90 days of the effective date of a final rule in this proceeding, one or more Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System. In the second stage, the Commission proposes to direct NERC to file, within six months of the effective date of a final rule in this proceeding, one or more Reliability Standards that require owners and operators of the Bulk-Power System to conduct initial and on-going

assessments of the potential impact of GMDs on Bulk-Power System equipment and the Bulk-Power System as a whole. Based on those assessments, the Reliability Standards would require owners and operators to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD. This plan cannot be limited to operational procedures or enhanced training alone, but should, subject to the needs indentified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, or location of specific equipment. These strategies could include automatically blocking geomagnetically induced currents from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, and isolating certain equipment that is not cost effective to retrofit. This second stage would be implemented in phases, focusing first on the most critical Bulk-Power System assets.

DATES: Comments are due **[INSERT DATE 60 days after publication in the FEDERAL REGISTER].**

ADDRESSES: Comments, identified by docket number, may be filed in the following ways:

- Electronic Filing through http://www.ferc.gov. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format.

- Mail/Hand Delivery: Those unable to file electronically may mail or hand-deliver comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington, DC 20426.

Instructions: For detailed instructions on submitting comments and additional information on the rulemaking process, see the Comment Procedures Section of this document.

FEDERAL ENERGY REGULATORY COMMISSION

Reliability Standards for Geomagnetic Disturbances Docket No. RM12-22-000

NOTICE OF PROPOSED RULEMAKING

(Issued October 18, 2012)

1. Pursuant to section 215(d)(5) of the Federal Power Act (FPA),[1] the Federal Energy Regulatory Commission (Commission) proposes to direct the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization (ERO), to file for approval with the Commission Reliability Standards (GMD Reliability Standards) that address the risks posed by geomagnetic disturbances (GMD) to the reliable operation of the Bulk-Power System.[2] The Commission proposes to direct NERC to develop the GMD Reliability Standards in two stages. In the first stage, within 90 days of the effective date of a final rule in this proceeding, NERC would file one or more proposed Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the

[1] 16 U.S.C. 824o(d)(5) (2006).

[2] "A geomagnetic disturbance occurs when the magnetic field embedded in the solar wind is opposite that of the earth. This disturbance, which results in distortions to the earth's magnetic field, can be of varying intensity and has in the past impacted the operation of pipelines, communications systems, and electric power systems." Oak Ridge National Laboratory, *Electric Utility Industry Experience with Geomagnetic Disturbances* at xiii (1991), *available at* http://www.ornl.gov/~webworks/cpr/v823/rpt/51089.pdf.

effects of GMDs consistent with the reliable operation of the Bulk-Power System. In the second stage, within six months of the effective date of a final rule in this proceeding, NERC would file one or more proposed Reliability Standards that require owners and operators of the Bulk-Power System to conduct initial and on-going assessments of the potential impact of GMDs on Bulk-Power System equipment and the Bulk-Power System as a whole. Based on those assessments, the Reliability Standards would require owners and operators to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD.[3] This plan cannot be limited to operational procedures or enhanced training alone, but should, subject to the needs indentified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, or location of specific equipment. These strategies could include automatically blocking geomagnetically induced currents (GICs) from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, and isolating certain equipment that is not cost effective to retrofit.[4] This second stage would be implemented in phases, focusing first on the most critical Bulk-Power System assets.

[3] 16 U.S.C. 824o(a)(4) (2006).

[4] Some examples of automatic blocking include series line capacitors, transformer neutral GIC blocking and/or reduction devices, and selective tripping of vulnerable

(continued…)

2. We take this action based on government-sponsored studies and NERC studies that conclude that GMD events can have an adverse, wide-area impact on the reliable operation of the Bulk-Power System.[5] In a 2010 study prepared for the Commission, Department of Energy, and Department of Homeland Security, the Oak Ridge National Laboratory reported that GMD events can develop quickly over large geographic footprints, having the capability to produce geographically-large outages and significant damage to Bulk-Power System equipment.[6]

3. The seriousness of the risk posed by GMDs to the reliable operation of the Bulk-Power System was expressed at a Technical Conference held on April 30, 2012.[7] At the Technical Conference, several panelists indicated that severe GMD events could potentially compromise the reliable operation of the Bulk-Power System, with some

---

assets. Automatic blocking measures can also include the use of relays that can be set so that they are activated only when needed.

[7] Written statements presented at the Technical Conference, post-Technical Conference comments, and Technical Conference transcript are accessible through the Commission's eLibrary document retrieval system in Docket No. AD12-13-000.

noting as an example the GMD-induced disruption of the Hydro-Québec grid in 1989.[8] At the Technical Conference, panelists stated that the current 11-year solar activity cycle is expected to hit its maximum activity in 2013 and large solar events often occur within four years of such a cycle maximum.[9] While strong GMDs are infrequent events, their potential impact on the reliable operation of the Bulk-Power System (e.g., widespread blackouts) requires Commission action under section 215(d)(5) of the FPA.[10]

[8] *See, e.g.*, Statement of Scott Pugh, U.S. Department of Homeland Security at 2 (citing 1989 Hydro-Québec blackout); Statement of Frank Koza, PJM Interconnection, L.L.C. at 1 ("The combination of half-cycle transformer saturation and increased reactive power consumption can lead to voltage collapse and blackouts if not properly managed."); Statement of John Kappenman at 8 ("The bulk power system is the nation's most important critical infrastructure and unlike other threats, a severe geomagnetic storms [sic] can impose a near simultaneous nationwide crippling threat to this vital infrastructure."); Statement of Gerry Cauley, NERC at 1 ("Previous examples, such as the 1989 event in Hydro Québec demonstrate that severe solar storms represent a serious risk that can challenge the reliability of the bulk power system.").

[9] April 30, 2012 Technical Conference Tr. 84:14-19 (Pugh); 106:9-15, 169:1-19 (Murtagh).

[10] 16 U.S.C. 824o(d)(5); *see also Transmission Relay Loadability Reliability Standard*, 134 FERC ¶ 61,127, at P 25 (2011) (explaining that under section 215(d)(5) "the Commission, and not just the ERO, has the responsibility and authority to identify 'specific matters' that it considers appropriate to carry out section 215. Section 215 establishes a paradigm by which both the Commission and the ERO are responsible for identifying reliability gaps—the ERO through its Reliability Standards development process, where it can independently identify areas of concern and develop Standards to address them; and the Commission through its review of proposed Reliability Standards and authority to direct modifications or new Standards that address specific issues necessary to effectuate the purposes of section 215.").

4. Currently, GMD vulnerabilities are not adequately addressed in the Reliability Standards.[11] This constitutes a reliability gap because, as discussed below, GMD events can cause the Bulk-Power System to collapse suddenly and can potentially damage the Bulk-Power System.

5. GMD events affect the Bulk-Power System by introducing geomagnetically-induced currents[12] that can cause "half-cycle saturation" of certain high-voltage Bulk-Power System transformers.[13] Half-cycle saturation of transformers can lead to increased consumption of reactive power and creation of disruptive harmonics that can cause the sudden collapse of the Bulk-Power System.[14] Further, half-cycle saturation from GICs can potentially damage Bulk-Power System transformers because of overheating.[15]

---

[11] NERC Reliability Standard IRO-005-3a (Reliability Coordination — Current Day Operations), Requirement R3, is the only existing requirement that discusses GMDs. Requirement R3 requires reliability coordinators to make transmission operators and balancing authorities aware of GMD forecast information and assist as needed in the development of response plans, but it does not require steps for mitigating the effects of GMD events.

[12] GIC is an electrical current created by a solar event that appears as direct current to the bulk electric system. North American Electric Reliability Council, *March 13, 1989 Geomagnetic Disturbance* at 36 (1989), *available at* http://www.nerc.com/files/1989-Quebec-Disturbance.pdf. Automatic blocking prevents or reduces GICs flows into protected Bulk-Power System components without operator intervention. *NERC Interim GMD Report* at 73.

[13] NERC Interim GMD Report at iii-iv. Half-cycle saturation is an abnormal operating condition whereby a transformer operates outside nominal voltage design values, saturating the transformer core with magnetic flux and forcing magnetic flux into other parts of the transformer. *Id.* at 25.

[14] *Id.* at 3 ("GMD can have … a wide range of impacts on power apparatus and power system operations. The effects on apparatus range from nuisance events, such as tripping of electrical equipment, radio interference, and control malfunctions, to large-

(continued…)

Permanent damage to large transformers due to GICs can lead to restoration delays for the power grid.[16] For example, the Oak Ridge Study assessed the effects of a "1-in-100 year" geomagnetic storm on the modern Bulk-Power System.[17] The Oak Ridge Study simulation concluded that such an event could put a significant number of Bulk-Power System transformers at risk for failure or permanent damage.[18] The Oak Ridge Study simulation also found that the effects of a GMD event may be substantially larger if it

---

scale events, such as voltage and reactive power fluctuations, local disruption of service, limited equipment failure, and potential voltage instability resulting in uncontrolled cascading of the bulk power system.").

[15] While disagreements exist as to the likely severity of transformer damage from GMDs compared with the likelihood of voltage collapse due to increased reactive power absorption arising from GMDs, there appears to be a consensus that GMDs can cause at least some damage to Bulk-Power System transformers. *See*, *e.g.*, Comments of the North American Electric Reliability Corporation, Docket No. AD12-13-000, at 5 (filed May 21, 2012) ("Though the most likely result is voltage collapse, the GMD Task Force members agreed that, depending on the transformer health, design, geology and geomagnetic latitude, geomagnetic induced current flows can result in transformer loss-of-life, and may ultimately result in the failure of some transformers.").

[16] *Oak Ridge Study 319 Report* at pages 4-1, 4-3 ("The recovery could plausibly extend into months in many parts of the impacted regions … These multi-ton apparatus [transformers] generally cannot be repaired in the field, and if damaged in this manner, they need to be replaced with new units, which have manufacture lead times of 12 months or more in the world market."); NERC Interim GMD Report at iv ("[R]estoration times for system collapse due to voltage instability would be a matter of hours to days, while replacing transformers requires long-lead times (a number of months) to replace or move spares into place, unless they are in a nearby location. Therefore, the failure of a large numbers [sic] of transformers would have considerable impacts on portions of the system.").

[17] *Oak Ridge Study 319 Report* at page 3-22.

[18] *Id*. at page 1-14, Tables 4-1, 4-2, 4-3 (listing numbers of at-risk transformer).

occurred at lower latitudes.[19] Estimates prepared by the National Research Council of the National Academies concluded that these events have the potential to cause wide-spread, long-term losses with economic costs to the United States estimated at $1-2 trillion and a recovery time of four to ten years.[20] The NERC Interim GMD Report concluded, on the other hand, that the worst-case scenario is "voltage instability and subsequent voltage collapse," and cites as an example the 1989 Hydro-Québec blackout.[21] While the conclusions of these reports differ significantly, our proposed action is warranted by even the lesser consequence of a projected widespread blackout without long-term, significant damage to the Bulk-Power System. Taking steps to prevent such blackouts is consistent with maintaining the reliable operation of the Bulk-Power System.[22]

6. Given the potentially severe, wide-spread impact to the reliable operation of the Bulk-Power System from GMD events and the absence of existing Reliability Standards to address it, the Commission proposes to direct the ERO to file with the Commission for

[19] *Id.* at pages 3-25, 3-26.

[20] National Research Council of the National Academies, *Severe Space Weather Events—Understanding Societal and Economic Impacts: A Workshop Report* at 4 (2008) (*NAS Workshop Report*), *available at* http://www.nap.edu/catalog/12507.html.

[21] NERC Interim GMD Report at 69.

[22] 16 U.S.C. 824o(a)(4) ("The term 'reliable operation' means operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.").

approval Reliability Standards that address this reliability gap. In proposing to address the risks posed by GMDs in two stages, the Commission finds that there are Reliability Standards that the ERO can develop and file quickly (i.e., requiring GMD operational procedures) to mitigate the effects of GMDs while it develops other Reliability Standards that require owners and operators of the Bulk-Power System to assess the potential impact of GMDs on Bulk-Power System equipment and the Bulk-Power System as a whole. Based on those assessments, the Reliability Standards would require owners and operators to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD. This plan cannot be limited to operational procedures or enhanced training alone, but should, subject to the needs indentified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, or location of specific equipment. These strategies could include automatically blocking geomagnetically induced currents from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, and isolating certain equipment that is not cost effective to retrofit.[23]

7. We recognize that, depending on the results of the initial and on-going assessments that would be required under this proposed rule, there could be substantial costs associated with some measures to protect against damage to the Bulk-Power System

[23] *See infra* PP 34-36.

from GMDs.[24] In determining that it is appropriate to issue this proposed rule, however, we have compared such costs against the societal harms, including the potential costs of equipment damage or prolonged blackouts, that could result from taking no action.[25]

I. Background

A. Section 215 and Mandatory Reliability Standards

8. Section 215 of the FPA requires the Commission to certify an ERO to develop mandatory and enforceable Reliability Standards, subject to Commission review and approval.[26] Once approved, the Reliability Standards may be enforced in the United States by the ERO, subject to Commission oversight, or by the Commission independently.

---

[24] For example, estimates for installing blocking devices on transformers range from $100,000 to $500,000 for each affected transformer. *See* Foundation for Resilient Societies, Comments on Advance Notice of Proposed Rulemaking (ANPR) of the Nuclear Regulatory Commission Relating to the Prevention and Mitigation of Station Blackout, filed in Docket No. AD12-13-000, at 13 (May 4, 2012) (citing $500,000 installed costs per transformer); MITRE Corp., Impacts of Severe Space Weather on the Electric Grid, at 66 (November 2011) (citing $100,000 cost for neutral-current-blocking-capacitors per transformer), *available at* http://www.fas.org/irp/agency/dod/jason/spaceweather.pdf.

[25] For example the estimated total cost of the August 2003 four-day blackout in the United States is between $4 billion and $10 billion, with the Department of Energy calculating the total cost to be $6 billion. Electricity Consumers Resource Council, The Economic Impacts of the August 2003 Blackout, *available at* http://www.elcon.org/Documents/EconomicImpactsOfAugust2003Blackout.pdf. *See also supra* P 5 (citing estimates by the National Research Council of the National Academies of potentially $1-2 trillion in economic costs from a severe GMD event).

[26] 16 U.S.C. § 824o (2006).

9. Pursuant to section 215(d)(5) of the FPA, the Commission has the authority, upon its own motion or upon complaint, to order the ERO to submit to the Commission a proposed Reliability Standard or a modification to a Reliability Standard that addresses a specific matter if the Commission considers such a new or modified Reliability Standard appropriate to carry out section 215 of the FPA.[27]

B. Studies of GMD Events on the Bulk-Power System

10. The impact of GMDs on the Bulk-Power System has been evaluated in several government-sponsored studies and NERC reports. The EMP Commission issued reports assessing the threat to the United States from Electromagnetic Pulse (EMP) attack in 2004 and 2008, which also addressed the effects of geomagnetic storms on the electric power infrastructure.[28] The NAS Workshop Report addressing the impact of severe space weather events was released in 2008. The Oak Ridge National Laboratory issued the Oak Ridge Study on the effects of electromagnetic pulses on the Bulk-Power System in January 2010. The NERC HILF Report on high-impact, low-frequency risks to the Bulk-Power System was issued in June 2010.[29] In February 2012, NERC issued the NERC Interim GMD Report evaluating the effects of GMDs on the Bulk-Power System.

---

[27] 16 U.S.C. 824o(d)(5); 18 CFR 39.6(f) (2012).

[28] These reports are accessible at the Commission to Assess the Threat to the United States from Electromagnetic Pulse (EMP) Attack website at http://www.empcommission.org/.

[29] The HILF Report was prepared by NERC, Department of Energy, and a steering committee comprised of industry and risk experts and was approved by the NERC Board of Trustees on May 17, 2010. *HILF Report* at 2.

11. The Commission conducted a staff-led Technical Conference on April 30, 2012 to discuss the effects of GMDs on the reliable operation of the Bulk-Power System. NERC, government agencies, industry stakeholders, and other interested entities attended the Technical Conference and submitted post-Technical Conference comments.

C. Effects of GMD Events on the Bulk-Power System

12. The interaction of the Earth's magnetic field and solar events can cause low frequency GICs to flow along the surface of the Earth and in the oceans. Reliability issues arise when GICs enter the Bulk-Power System from the Earth. Since many Bulk-Power System transformers are grounded, the GIC appears as electrical current to the Bulk-Power System and flows through the ground connection and conductors, such as transformers and transmission lines.[30]

13. GICs can cause transformer cores to become "saturated," resulting in loss of reactive power (VARs), the introduction of harmonic distortions, and possible physical damage to the transformer.[31] GICs enter the Bulk-Power System through the grounded neutrals of transformers and are responsible for forcing their metal cores into saturation.[32]

---

[31] *HILF Report* 70-71. Harmonics are currents or voltages with frequencies that are integer multiples of the fundamental power frequency (i.e., 60 Hz in the United States). *See* Northeast Power Coordinating Council, Inc. Glossary of Terms, *available at* https://www.npcc.org/Standards/Directories/Glossary%20of%20Terms.pdf. They can cause overcurrent relays to automatically trip components (e.g., capacitor banks and static VAR compensators) from service. *HILF Report* at 71. Automatic removal of such components can further exacerbate system voltages already reduced by the GIC-related

(continued…)

A primary effect of saturation is the potential for transformer damage through the overheating of internal components.[33] Saturation is also responsible for secondary effects, such as the production of harmonics that are not present during normal Bulk-Power System operation and for substantially increasing the transformer's absorption of reactive power from the system, thus requiring significant amounts of additional voltage support to compensate for reactive power absorption. Harmonic production and reactive power absorption may interfere with normal system operations creating secondary effects on other Bulk-Power System facilities. These primary and secondary effects can occur almost simultaneously over a large geographic area, resulting in a multiple contingency outage that has the potential to cascade across the Bulk-Power System.[34]

14. The Oak Ridge Study identified factors that determine the severity of GMD events, including: (1) location and strength of the underlying solar event; (2) ground conductivity in the affected locations (i.e., the geology of the location); (3) orientation of

---

absorption of reactive power.

[32] *Oak Ridge Study 322 Report* at pages 1-1, 7-11.

[33] *HILF Report* at 70 ("Transformers experience excessive levels of internal heating brought on by stray flux when GICs cause the transformer's magnetic core to saturate and spill flux outside the normal core steel magnetic circuit. Previous well-documented cases have noted heating failures that caused melting and burn-through of large-amperage copper windings and leads in these transformers (Figure 9)."); *Oak Ridge Study 319 Report* at page 2-29 ("Also of note from this particular [March 1989] storm is strong evidence that GIC-induced half-cycle saturation of transformers can indeed produce enough heat to severely damage or even destroy exposed large power transformers.").

[34] *HILF Report* at 71-72.

the transmission lines; (4) length of transmission lines; and (5) grid construction.[35] A solar disturbance can cause near-simultaneous, multi-point failures that can trigger collapse of the Bulk-Power System.[36]

II. Discussion

15. As discussed below, the Commission finds that there is a gap in the Reliability Standards regarding GMDs. Therefore, in order to carry out section 215 of the FPA, the Commission proposes to direct the ERO to develop and file for approval Reliability Standards that address the potentially severe, wide-spread impact of GMD events on the reliable operation of the Bulk-Power System.

16. We propose that the ERO develop and file the GMD Reliability Standards in two stages. In the first stage, within 90 days of the effective date of a final rule in this proceeding, the Commission proposes to direct NERC to file one or more Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System. In the second stage, the Commission proposes to direct NERC to file one or more Reliability Standards, within six months of the effective date of a final rule in this proceeding, that require owners and operators of the Bulk-Power System to assess the impact of GMDs on Bulk-Power System equipment

[35] *Oak Ridge Study 319 Report* at page 2-5.

[36] *Id.* at pages 4-1, 4-2. One example cited in the Oak Ridge Study is the March 13, 1989 solar disturbance that triggered the collapse of the Hydro-Québec power grid, which went from normal to a situation where it sustained seven contingencies in an elapsed time of 57 seconds. *Id.*

and the Bulk-Power System as a whole. Based on those assessments, the Reliability Standards would require owners and operators to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD. This plan cannot be limited to operational procedures or enhanced training alone, but should, subject to the needs indentified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, or location of specific equipment. These strategies could include automatically blocking geomagnetically induced currents from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, and isolating certain equipment that is not cost effective to retrofit.[37]

17. In proposing to direct the ERO to submit Reliability Standards that address the impact of GMD events on the reliable operation of the Bulk-Power System, we are not proposing specific requirements or otherwise pre-judging what the ERO may eventually submit. Instead, we identify concerns that we believe should be addressed in any GMD Reliability Standards. We expect the ERO to support its proposed Reliability Standards and explain how they address the Commission's concerns.

[37] The second stage Reliability Standards would not require owners and operators of the Bulk-Power System to protect the Bulk-Power System beyond what is found to be required based on the initial and ongoing assessments.

A. Reliability Standards Requiring Operational Procedures

18. Requiring operational procedures, while not a complete solution, constitutes a first step to addressing the GMD reliability gap because they can be implemented relatively quickly.[38] The Commission does not propose to require the ERO or owners and operators of the Bulk-Power System to adopt any particular operational procedures. Owners and operators of the Bulk-Power System are the most familiar with the equipment and system configurations. Accordingly, we propose that the ERO file one or more Reliability Standards requiring owners and operators of the Bulk-Power System to develop and implement operational procedures to mitigate the effects of GMDs consistent with the reliable operation of the Bulk-Power System based on the following guidance.

19. Operational procedures may help alleviate abnormal system conditions due to transformer absorption of reactive power during GMD events, helping to stabilize system voltage swings, and may potentially isolate some equipment from being damaged or misoperated. The NERC Interim GMD Report identifies examples of operational procedures to mitigate GMD events (i.e., the effects of GICs), including: reduction of equipment loading (e.g., by starting off-line generation), unloading the reactive load of operating generation, reductions of system voltage, and system and/or equipment

[38] NERC Interim GMD Report at 79 ("Operating procedures are the quickest way to put in place actions that can mitigate the adverse effects of GIC on system reliability … Both system operating and transmission owner organizations need to have appropriate procedures and training in place.").

isolation through reconfiguration of the transmission system.[39] Some entities already have operational procedures to mitigate the effect of GICs on the Bulk-Power System utilizing system resources.[40] The Commission expects that the ERO and owners and operators of the Bulk-Power System will draw on industry's experience in developing and implementing existing operational procedures. Given that experience, we propose to direct NERC to file, within 90 days of the effective date of a final rule in this proceeding, proposed Reliability Standards that require the development and implementation of operational procedures. While this deadline is aggressive, mandatory and enforceable Reliability Standards requiring owners and operators to implement operational procedures should be established quickly to afford some level of uniform protection to the Bulk-Power System against GMD events. As discussed above, the impact of GMDs on the Bulk-Power System has been studied extensively for many years, laying the foundation for the prompt development of these first stage Reliability Standards. Moreover, the fact that operational procedures are already in place in some areas should allow for faster development and implementation of these Reliability Standards.

20. While the proposed Reliability Standards should not necessarily specify what operational procedures must be adopted, the ERO should give owners and operators of

[39] NERC Interim GMD Report at 80-81.

[40] *See*, *e.g.*, PJM Interconnection, L.L.C., Manual 13: Emergency Operations at 47, *available at* http://www.pjm.com/~/media/documents/manuals/m13.ashx; Northeast Power Coordinating Council, Inc., Procedures for Solar Magnetic Disturbances Which Affect Electric Power Systems, *available at* https://www.npcc.org/Standards/Procedures/c-15.pdf.

the Bulk-Power System guidance as to what procedures have been or are expected to be effective in mitigating the effects of GMDs consistent with the reliable operation of the Bulk-Power System. Moreover, the proposed Reliability Standards should address the coordination of operational procedures among responsible entities across regions.[41] Since there could be potential equipment damage resulting from a GMD event, the proposed Reliability Standards should also address operational procedures for restoring GMD-impacted portions of the Bulk-Power System that take into account the potential for equipment that is damaged or out-of-service for an extended period of time.

21. We do not propose to direct a specific implementation schedule for the proposed Reliability Standards, but the Commission encourages the ERO to require owners and operators of the Bulk-Power System to implement the required operational procedures 90 days after Commission approval of the Reliability Standards. Following implementation, the Commission proposes to require NERC to provide periodic reports assessing the effectiveness of the operational procedures in mitigating the effects of GMD events. In addition, NERC should periodically review the required operational procedures and recommend to owners and operators that they incorporate lessons-learned and new research findings.

22. In addition to developing Reliability Standards that require operational procedures during the first stage, the Commission also proposes to accept aspects of the "Initial

[41] NERC Interim GMD Report at 79 ("The [operating] procedures of these organizations need to be coordinated with each other and with their neighboring organizations.").

Actions" proposal set forth in NERC's May 21, 2012 post-Technical Conference comments. Specifically, NERC proposed to "identify facilities most at-risk from severe geomagnetic disturbance" and to "conduct wide-area geomagnetic disturbance vulnerability assessment."[42] As noted in NERC's comments regarding the vulnerability assessments, special attention would be given to evaluating critical transformers (e.g., step-up transformers at large generating facilities). We agree with NERC that critical Bulk-Power System facilities should be evaluated for GMD vulnerability as an initial action. In addition, as part of the initial action, special attention should be given to those Bulk-Power System facilities that provide service to critical and priority loads.[43] The Commission, therefore, proposes to direct NERC to conduct this "initial action" simultaneously with the development and implementation of the first stage GMD Reliability Standards. The Commission seeks comment from NERC and other interested entities on all aspects of this proposal.

[42] NERC Comments at 8-9 ("As the first step in identifying the risk of geomagnetic disturbance to the bulk power system, NERC intends to complete a system-wide vulnerability assessment … special attention will be given to the evaluation of critical transformers, such as generator step-up units at large generating facilities … a high level review will be conducted to identify and classify the at-risk population based on existing peer-reviewed research. This assessment will be based on a high level screening approach that will include transformer design, condition, geology and geomagnetic location.").

[43] The NERC Severe Impact Resilience Task Force identified critical and priority loads in a report. *See* Severe Impact Resilience: Considerations and Recommendations at 26 (Accepted by NERC Board of Trustees on May 9, 2012), *available at* http://www.nerc.com/docs/oc/sirtf/SIRTF_Final_May_9_2012-Board_Accepted.pdf.

B. Second Stage Reliability Standards

23. To address GMDs comprehensively, the Commission proposes to direct NERC to develop, in a second stage, Reliability Standards that require owners and operators of the Bulk-Power System to conduct initial and on-going assessments of the potential impact of GMDs on Bulk-Power System equipment and on the Bulk-Power System as a whole. Based on those assessments, the Reliability Standards would require owners and operators to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD. This plan cannot be limited to operational procedures or enhanced training alone, but should, subject to the needs indentified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, or location of specific equipment. These strategies could include automatically blocking geomagnetically induced currents from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, and isolating certain equipment that is not cost effective to retrofit. While the Commission proposes to direct the ERO to submit the proposed second stage Reliability Standards within six months of the effective date of a final rule in this proceeding, the Commission seeks comment on the feasibility of a six-month deadline.

24. We propose to direct the filing of these second stage GMD Reliability Standards because of two concerns with relying on operational procedures alone: (1) owners and operators of the Bulk-Power System may not have enough time to initiate effective

operating procedures after being warned of a GMD event; and (2) operational procedures may not prevent permanent damage to Bulk-Power System equipment.[44] Current GMD forecasting methods provide limited time for operators to react once a GMD warning is issued.[45] Even with enough time to react, the Oak Ridge Study found that, given a large enough GMD event, operational procedures are unlikely to provide the substantial levels of GIC reduction needed to limit the potential for permanent damage to transformers.[46] The Oak Ridge Study and the HILF Report also found that widespread damage to Bulk-Power System transformers could result in prolonged outages.[47]

---

[44] NERC Interim GMD Report at 10 ("These warning can be received as short as 30 minutes before the onset of an impending geomagnetic storm."). At the April 30, 2012 Technical Conference, Mr. Murtagh, Program Coordinator at the National Oceanic and Atmospheric Administration's Space Weather Prediction Center, stated that a warning is issued when a GMD event reaches the NASA Advanced Composition Explorer (ACE) satellite and at that point, in some cases, it could be 20 or 30 minutes before the event reaches the Earth's magnetic field. April 30, 2012 Technical Conference Tr. 170:5-22 (Murtagh).

[45] Mr. Pugh, from the U.S. Department of Homeland Security's Interagency Programs Office Science & Technology Directorate, stated that the operators in the 1989 Hydro-Québec blackout only had 90 seconds to react, which was insufficient to "prevent a massive blackout and significant equipment damage." April 30, 2012 Technical Conference Tr. 12:4-7 (Pugh).

[46] *Oak Ridge Study 322 Report* at pages ix and 1-1.

[47] *HILF Report* at 12 ("The physical damage of certain system components (e.g. extra-high-voltage transformers) on a large scale, as could be effected by any of these threats, could result in prolonged outages as procurement cycles for these components range from months to years."); *Oak Ridge Study 319 Report* at pages 2-33, 2-34 ("An especially large storm or GIC event could plausibly create the potential for widespread failure of many exposed transformers and hamper rapid restoration capabilities. In extreme cases, where replacements may take months, a situation may exist where the demand for electric service can only be partially supplied, raising the prospect of rationing and rotating blackouts to regions that are unable to be fully served.").

25. We recognize that the NERC Interim GMD Report concludes that a prolonged blackout due to extensive damage to Bulk-Power System transformers is less likely than voltage instability due to increased reactive power consumption and loss of reactive power support, which can lead to blackouts like the 1989 Hydro-Québec event.[48] The Commission's proposed two-stage approach recognizes this difference by focusing first on the development of Reliability Standards requiring operational procedures in a relatively short time frame. The Commission proposes to give NERC and owners and operators of the Bulk-Power System more time to perform, in the second stage, initial and on-going assessments. Based on those assessments, the Reliability Standards would require owners and operators to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD. This plan cannot be limited to operational procedures or enhanced training alone, but should, subject to the needs indentified in the assessments, contain strategies for protecting against the potential impact of GMDs based on factors such as the age, condition, technical specifications, or location of specific equipment. These strategies could include automatically blocking geomagnetically induced currents from entering the Bulk-Power System, instituting specification requirements for new equipment, inventory management, and isolating certain equipment that is not cost effective to retrofit. Moreover, although the NOPR proposes that the second stage

[48] NERC Interim GMD Report at vi.

Reliability Standards be filed within six months of the effective date of the final rule, we seek comment on the feasibility of that deadline.

26. Below, we offer guidance on the assessments of Bulk-Power System vulnerability to GMDs and potential measures for automatically protecting critical or vulnerable components. In addition, recognizing the potential for substantial investments of time and resources to implement these Reliability Standards, we offer guidance on an implementation schedule, which will likely consist of an extended, multi-phase process. The Commission seeks comment from NERC and other interested entities on all aspects of this proposal.

1. GMD Vulnerability Assessments of the Bulk-Power System

27. The Commission proposes to direct the ERO to develop Reliability Standards that require owners and operators of the Bulk-Power System to conduct vulnerability assessments to determine how critical or vulnerable Bulk-Power System components react to simulated GICs of varying intensities.[49] The Commission proposes to direct the ERO to consider the following parameters as it develops the Reliability Standards.[50]

[49] To accurately simulate the impact of GMDs on the Bulk-Power System, the assessments should consider the impact of GICs that may enter the system through transformers that are not treated as part of the bulk electric system and any impact that the non-bulk electric system transformers may have on the reliability of the Bulk-Power System. We do not propose, however, that equipment falling outside of our jurisdiction would be required to be protected under the proposed Reliability Standard.

[50] The vulnerability assessments in the second phase Reliability Standards are distinct from the "initial action" evaluations, discussed above, which NERC proposed to do and we propose to have NERC conduct simultaneous with the development and implementation of the first phase Reliability Standards. We expect, however, that the

(continued…)

28. First, the Reliability Standards should contain uniform evaluation criteria for owners and operators to follow when conducting their assessments. As the Commission noted with respect to other reliability assessments, uniformity increases the accuracy of transmission system reliability assessments and consequently enhances overall reliability.[51]

29. Second, the assessments should, through studies and simulations, evaluate the primary and secondary effects of GICs on Bulk-Power System transformers, including the effects of GICs originating from and passing to other regions.

30. Third, the assessments should evaluate the effects of GICs on other Bulk-Power System equipment, system operations, and system stability, including the anticipated loss of critical or vulnerable devices or elements resulting from GIC-related issues.[52]

31. Fourth, in conjunction with assessments by owners and operators of their own Bulk-Power System components, wide-area or Regional assessments of GIC impacts should be performed. A severe GMD event can cause simultaneous stresses at multiple

---

analyses performed in the "initial action" evaluations will be used to quickly identify and protect the most critical and vulnerable Bulk-Power System components once the second stage Reliability Standards become effective.

[51] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, at P 1298, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[52] The Oak Ridge Study assessment included GMD modeling, simulation and review of storm impacts, power grid GIC flows and reactive power demands, transformer heating and risk of potential damage to transformers. *See generally Oak Ridge Study 319 Report*.

locations on the Bulk-Power System, potentially resulting in a multiple-outage event.[53] In predicting GIC flows, it is necessary to take into consideration the network topology as an integrated whole (i.e., on a wide-area basis).[54]

32. Fifth, the assessments should be periodically updated, taking into account new facilities, modifications to existing facilities, and new information, including new research on GMDs, to determine whether there are resulting changes in GMD impacts that require modifications to Bulk-Power System mitigation schemes.

33. The Commission seeks comments from NERC and other interested entities on all aspects of this proposal.

2. Automatic GIC Blocking for Critical or Vulnerable Bulk-Power System Components

34. While we do not propose to require a particular solution in the second stage Reliability Standards to address GMDs, we expect that some assessments will demonstrate that automatic blocking is necessary in some instances. The Commission, above, proposes to direct the ERO to develop Reliability Standards that require owners and operators of the Bulk-Power System to develop and implement a plan so that instability, uncontrolled separation, or cascading failures of the Bulk-Power System, caused by damage to critical or vulnerable Bulk-Power System equipment, or otherwise, will not occur as a result of a GMD. Automatic blocking measures address the major concerns with relying exclusively on operational procedures to mitigate GMDs (i.e., the

[53] *Oak Ridge Study 319 Report* at pages A1-1, A1-2.

[54] *Id.* at page 1-17.

short period of time to react to a GMD event and the potential consequences of not reacting fast enough). Blocking can prevent the flow of GICs through power transformers and the Bulk-Power System.[55] Eliminating GICs in transformers prevents transformer core saturation and, thus, mitigates or prevents the effects of GMDs on the Bulk-Power System (i.e., transformer overheating, reactive power absorption, and harmonic generation).

35. The Commission does not propose to direct the ERO to require a particular automatic blocking technology, where blocking is necessary. Instead, the Commission proposes to direct the ERO to identify in the proposed Reliability Standards what would constitute appropriate automatic blocking measures. In defining what is an appropriate blocking measure, the ERO should address: (1) its feasibility and effectiveness; and (2) its ability to operate without adversely impacting the reliable operation of the Bulk-Power System. The Commission proposes that the Reliability Standards should include a means by which the ERO can verify that selected blocking measures are appropriate.

36. The use of automatic blocking devices, such as transmission line series capacitors and transformer neutral blocking, are possible measures.[56] These devices block or reduce the flow of GIC in a power grid.[57] Although not a means for blocking GICs, another possible option is to improve the "withstand" capability of Bulk-Power System

[55] NERC Interim GMD Report at 73.

[56] *Oak Ridge Study 322 Report* at ix-x.

[57] *Id.*

components. The "withstand" capability, in this context, refers to a component's ability to withstand stresses imposed by GICs before suffering damage, but it does not prevent GICs from affecting the rest of the Bulk-Power System (e.g., it does not prevent the secondary effects of harmonics or increased reactive power consumption).[58] The ERO should consider whether the reliability goals of the proposed Reliability Standards can be achieved by a combination of automatic protection measures, including, for example, some combination of automatic blocking and improved "withstand" capability. In any event, the measures must be adequate to protect the reliability of the Bulk-Power System against the risks identified in the assessments.

37. The Commission seeks comments from NERC and other interested entities on all aspects of this proposal.

3. Implementation Schedule

38. The second stage Reliability Standards will likely require an extended, multi-phase implementation period given the time needed to conduct the required assessments and the time and cost of installing any required automatic protection measures. Although the Commission does not propose to direct the ERO to develop a specific implementation plan, we believe it would be appropriate for the proposed Reliability Standard to include an implementation schedule that requires owners and operators of the Bulk-Power System to prioritize implementation so that components considered vital to the reliable

[58] NERC Interim GMD Report at 67.

operation of the Bulk-Power System are provided with any necessary automatic protection measures in the earliest phase of the plan.[59]

39. The Commission seeks comments from NERC and other interested entities on an implementation plan.

III. Information Collection Statement

40. The Office of Management and Budget (OMB) regulations require approval of certain information collection requirements imposed by agency rules. Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of an agency rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number. The Paperwork Reduction Act (PRA) requires each federal agency to seek and obtain OMB approval before undertaking a collection of information directed to ten or more persons, or contained in a rule of general applicability.

41. The Commission is submitting these reporting requirements to OMB for its review and approval under section 3507(d) of the PRA. Comments are solicited on the Commission's need for this information, whether the information will have practical utility, ways to enhance the quality, utility, and clarity of the information to be collected,

[59] For example, critical Bulk-Power System equipment identified by NERC in the first stage "initial actions" assessments, discussed previously, should be protected in the earliest phase of the implementation plan.

and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques.

42. The Public Reporting Burden and cost related to the proposed rule in Docket No. RM12-22-000 are covered by, and already included in, the existing FERC-725, Certification of Electric Reliability Organization; Procedures for Electric Reliability (OMB Control No. 1902-0225). FERC-725 includes the ERO's overall responsibility for developing Reliability Standards, such as the Reliability Standards for Geomagnetic Disturbances.

43. Internal review: The Commission has reviewed the proposed changes and has determined that the changes are necessary to ensure the reliability and integrity of the Nation's Bulk-Power System.

44. Interested persons may obtain information on the reporting requirements by contacting: Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, Phone: (202) 502-8663, fax: (202) 273-0873]. Comments on the requirements of this rule may also be sent to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission]. For security reasons, comments should be sent by e-mail to OMB at oira_submission@omb.eop.gov. Please reference OMB Control No. 1902-0225, FERC-725 and the docket number of this proposed rulemaking in your submission.

IV. Environmental Analysis

45. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[60] The Commission has categorically excluded certain actions from this requirement as not having a significant effect on the human environment. Included in the exclusion are rules that are clarifying, corrective, or procedural or that do not substantially change the effect of the regulations being amended.[61] The actions proposed here fall within this categorical exclusion in the Commission's regulations.

V. Regulatory Flexibility Act

46. The Regulatory Flexibility Act of 1980 (RFA)[62] generally requires a description and analysis of proposed rules that will have significant economic impact on a substantial number of small entities.

47. By only proposing to direct NERC, the Commission-certified ERO, to develop GMD Reliability Standards, this Notice of Proposed Rulemaking will not have a significant or substantial impact on entities other than NERC. The ERO develops and files with the Commission for approval Reliability Standards affecting the Bulk-Power System, which represents: (a) a total electricity demand of 830 gigawatts (830,000

---

[60] *Regulations Implementing the National Environmental Policy Act of 1969*, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs., Regulations Preambles 1986-1990 ¶ 30,783 (1987).

[61] 18 CFR 380.4(a)(2)(ii).

[62] 5 U.S.C. 601-612.

megawatts) and (b) more than $1 trillion worth of assets. Therefore, the Commission certifies that this Notice of Proposed Rulemaking will not have a significant economic impact on a substantial number of small entities.

48. Any Reliability Standards proposed by NERC in compliance with this rulemaking will be considered by the Commission in future proceedings. As part of any future proceedings, the Commission will make determinations pertaining to the Regulatory Flexibility Act based on the content of the Reliability Standards proposed by NERC.

VI. Comment Procedures

49. The Commission invites interested persons to submit comments on the matters and issues proposed in this notice to be adopted, including any related matters or alternative proposals that commenters may wish to discuss. Comments are due [**INSERT DATE 60 days after publication in the FEDERAL REGISTER**]. Comments must refer to Docket No. RM12-22-000, and must include the commenter's name, the organization they represent, if applicable, and their address in their comments.

50. The Commission encourages comments to be filed electronically via the eFiling link on the Commission's web site at http://www.ferc.gov. The Commission accepts most standard word processing formats. Documents created electronically using word processing software should be filed in native applications or print-to-PDF format and not in a scanned format. Commenters filing electronically do not need to make a paper filing.

51. Commenters that are not able to file comments electronically must send an original of their comments to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street NE, Washington, DC 20426.

52. All comments will be placed in the Commission's public files and may be viewed, printed, or downloaded remotely as described in the Document Availability section below. Commenters on this proposal are not required to serve copies of their comments on other commenters.

VII. Document Availability

53. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

54. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

55. User assistance is available for eLibrary and the Commission's website during normal business hours from the Commission's Online Support at 202-502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference

Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

By direction of the Commission.

Kimberly D. Bose,
Secretary.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Statement

Response to FERC's Proposed Rulemaking on Vegetation Management, Geomagnetic Disturbance Standards

October 18, 2012

WASHINGTON, DC -- The Federal Energy Regulatory Commission issued a notice of proposed rulemaking today proposing to approve the North American Electric Reliability Corporation's vegetation management standard (FAC-003-2). In separate action, the FERC proposed to direct NERC to develop standards that address geomagnetic disturbances and their impacts on the grid.

"The proposed approval of the results-based vegetation management standard is an important recognition of NERC's efforts on addressing this issue," said Gerry Cauley, president and chief executive officer at NERC. "The proposed rulemaking on geomagnetic disturbances provides a framework to address the current vulnerability, and to factor in the scientific and engineering analysis necessary to understand this complex issue."

The proposed rulemaking on geomagnetic disturbances outlines a two-step process for the industry to, first, develop and implement operational procedures to mitigate effects of solar storms, reflecting many of the recommendations outlined in NERC's 2012 geomagnetic disturbance report and, second, to conduct assessments and implement strategies based on those assessments to protect the bulk power system from geomagnetic disturbances.

NERC has placed a high priority on the vegetation management standard and on identifying effects of geomagnetic disturbances on the bulk power system, and looks forward to working with FERC and the industry to continue our efforts to safeguard the grid.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION	**)** **)**	**Docket No. RM09-13-____**

NOTICE OF WITHDRAWAL OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION OF BAL-004-1 – TIME ERROR CORRECTION

Pursuant to Rule 216 of the Federal Energy Regulatory Commission's ("FERC" or the "Commission") Rules of Practice and Procedure, 18 C.F.R. § 385.216 (2012), the North American Electric Reliability Corporation ("NERC") hereby submits this Notice of Withdrawal of its NERC's March 11, 2009, Petition for Approval of the BAL-004-1 Time Error Correction Reliability Standard ("Petition"). BAL-004-0 is currently effective and is unaltered by the submission of this Notice.

I. BACKGROUND

A. Time Error Correction Generally

As the Commission has noted, Time Error occurs when a synchronous Interconnection operates at a frequency that is different from the Interconnection's Scheduled Frequency.[1] Interconnections control to 60 Hz (60 cycles per second); however, the control is imperfect and over time will result in the average frequency being either above 60 Hz or below 60 Hz. This discrepancy between actual frequency and Scheduled Frequency results from an imbalance between generation and interchange and load and losses, which also results in Inadvertent Interchange.[2] Time Error Correction is

---

[1] *Time Error Correction Reliability Standar*d, 130 FERC ¶ 61,201 (2010).

[2] Inadvertent Interchange occurs when unplanned energy transfers cross Balancing Authority boundaries, typically where a Balancing Authority experiences an operational problem that prevents its net

the procedure Reliability Coordinators and Balancing Authorities follow to reduce Time Error and regulate the average frequency closer to 60 Hz. The Time Error Correction Reliability Standard, BAL-004-0, sets forth the process that Reliability Coordinators and Balancing Authorities follow to offset their Scheduled Frequency to reliably correct for the accumulated Time Error. The efficiency of Time Error Corrections is determined by the participation of all Balancing Authorities within the Interconnection. Coordination and oversight by all Balancing Authorities and Reliability Coordinators is necessary to ensure that Time Error Corrections are performed reliably.

B. Proposed Reliability Standard BAL-004-1

BAL-004-0, Requirement R1 currently states that only a Reliability Coordinator is eligible to serve as an Interconnection Time Monitor, and that the NERC Operating Committee shall designate a single Reliability Coordinator in each Interconnection to serve as Interconnection Time Monitor. The proposed changes in BAL-004-1 would remove the requirement that the NERC Operating Committee designate Interconnection Time Monitors. The proposed change would vest authority for designating Interconnection Time Monitors with the NERC Board of Trustees, based on NERC Operating Committee review and recommendation. As NERC noted in its Petition (at p. 10), BAL-004-1 was intended to maintain the *status quo* by allowing a Reliability Coordinator to continue to be available to serve in the voluntary role of Interconnection Time Monitor. As explained below, NERC has determined that these proposed changes to BAL-004-1 are unnecessary and therefore, NERC is providing notice of its withdrawal of the Petition for approval of BAL-004-1.

---

actual interchange of energy from matching its net scheduled interchange with other Balancing Authorities within the Interconnection.

C. Procedural History

The Commission approved the current Time Error Correction Reliability Standard, BAL-004-0, on March 16, 2007, as part of Order No. 693.[3] The NERC Operating Committee submitted a Standard Authorization Request ("SAR") to the NERC Standards Committee on July 11, 2007, proposing changes to BAL-004-0. The Operating Committee requested that the Standards Committee use the "Urgent Action" process in addressing the proposed revisions. At its September 11, 2007 meeting, the Standards Committee determined to post the SAR and proposed standard changes using the Urgent Action process, stating that the potential loss of a willing Reliability Coordinator to serve as the Interconnection Time Monitor justified use of the Urgent Access process. The BAL-004-1 standard passed with 97.45 percent of the 157 ballot pool participants voting, resulting in a weighted segment approval of 94.10 percent. The NERC Board of Trustees approved the revised Reliability Standard on March 26, 2008.

On March 11, 2009, NERC filed a request for Commission approval of the proposed BAL-004-1 Reliability Standard. In response, the Commission issued a Notice of Proposed Rulemaking ("NOPR") on March 18, 2010, that proposed to remand the standard and direct NERC to make specific changes to address Commission concerns.[4] Specifically, the Commission proposed to direct NERC, on remand, to modify its proposed changes to Requirement R2 to (1) indicate that the Time Monitor, designated according to a process described in a Commission-approved document, is responsible for initiating or termination a Time Error Correction in a reliable manner; and (2) explain the

---

[3] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[4] *Time Error Correction Reliability Standar*d, 130 FERC ¶ 61,201 (2010).

circumstances under which the Time Monitor should start or end a Time Error Correction.[5]

NERC and several other entities submitted comments to the Commission regarding the NOPR. General support for the Commission's NOPR proposal seemed lacking, as reflected in comments from NERC, the Edison Electric Institute, the Midwest Independent Transmission System Operator, Inc., and the ISO/RTO Council. No entity submitted comments in direct support of the NOPR's proposal to remand BAL-004-1.

On August 20, 2010, NERC submitted a Motion to Defer Action on the BAL-004-1 Petition. In the motion, NERC noted that ongoing testing and analysis of Time Error Correction might lead to NERC's withdrawal of the request for approval of BAL-004-1 and the retirement of BAL-004-0, and that issuing a final rule would be premature at this stage in the process. NERC requested that the Commission defer action until August 20, 2011. NERC also stated that it would submit a status report six months from the date of the motion. On February 22, 2011, NERC filed an informational status report, fulfilling that commitment.

On August 11, 2011, NERC filed a Motion to Further Defer Action on NERC's Petition for Approval of BAL-004-1. On August 16, 2012, the NERC Board of Trustees rescinded its approval of BAL-004-1 and directed NERC Staff to withdraw the petition submitted to the Commission requesting approval of BAL-004-1. BAL-004-0 remains in effect and is unaffected by the submission of this Notice.

III. SUPPORT FOR NOTICE OF WITHDRAWAL OF BAL-004-1

NERC and its stakeholders performed significant outreach to entities both inside and outside the electric utility industry to determine if Manual Time Error Correction could be eliminated with minimal harm. While it was clear that eliminating Time Error Corrections is unlikely to have a negative impact on reliability that was insurmountable, it also became clear that the potential for other problems was largely undefined and not well understood. Following extensive discussion and debate over several months, it was ultimately determined by the NERC Operating Committee at its March 6-7, 2012, meeting that NERC should discontinue its effort to eliminate Manual Time Error Corrections.

[6] Persons to be included on the Commission's service list are indicated with an asterisk. NERC requests waiver of 18 C.F.R. § 385.203(b) to permit the inclusion of more than two people on the service list.

When considering the original reasons enumerated above for creating BAL-004-1, NERC has learned that those concerns may no longer be as acute as originally envisioned.

- To date, no Interconnection Time Monitor has incurred a violation of BAL-004-0. The need to modify the standard to address this concern would appear to be less severe than originally envisioned.
- Upon further review, because the NERC Operating Committee is not a registered entity, there is no potential for compliance actions against the Operating Committee. As such, the statement regarding the role of the Operating Committee in selecting the Interconnection Time Monitor should be considered for informational purposes only. There is no need to change the standard to address this concern, other than for purposes of clarification.
- The Commission's prior approval of the BAL-004-0 standard indicates that there is not a conflict in requiring that entities adhere to the NAESB business practices associated with Time Error Correction, as is provided in Requirement R2. In the proceedings under FERC Docket RM06-16-000 (Order No. 693), no entities expressed an objection to Requirement R2. While elimination of the reference to NAESB business practices may still be considered on a going-forward basis, this alone is insufficient justification to pursue a change to the standard at this time.

Additionally:

- BAL-004-0 remains in effect, and has been in effect since 2007.
- Manual Time Error Correction is no longer expected to be eliminated.

- The Reliability Standards Development Plan already includes a project to address modifications of BAL-004. Based on the prioritization established during the development of the 2012-2014 Reliability Standards Development Plan, Project 2010-14.2 Phase 2 of Balancing Authority Reliability-based Controls: Time Error, AGC, and Inadvertent, is expected to begin in 2013.

For these reasons, NERC hereby submits this Notice of Withdrawal of NERC's March 11, 2009, Petition for Approval of the BAL-004-1. As noted above, BAL-004-0 remains in effect and is unaltered by the submission of this Notice.

IV. CONCLUSION

NERC respectfully requests that the Commission withdraw NERC's petition for approval of BAL-004-1.

Respectfully submitted,

/s/ Stacey Tyrewala

Attention: Owen E. MacBride
Attorney for North American Electric Reliability Corporation

Reference: Amendments to Delegation Agreement with Reliability*First* Corporation

Dear Mr. MacBride:

On July 30, 2012, the North American Electric Reliability Corporation (NERC) submitted a filing that seeks approval of proposed amendments to NERC's Delegation Agreement with Reliability*First* Corporation (RFC), including approval of amendments to RFC's Bylaws and Reliability Standards Development Procedure.

Notice of this filing was issued on July 31, 2012, with protests and interventions due on or before August 20, 2012.

Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and Procedure. 18 C.F.R. § 385.214. No protests were filed.

NERC's uncontested filing is accepted pursuant to the relevant authority delegated to the Director, Office of Energy Market Regulation, under 18 C.F.R. § 375.307 as of the date of this order.

This action shall not be construed as approving any other application, including proposed revisions of Electric Reliability Organization or Regional Entity rules or procedures pursuant to 18 C.F.R. § 375.307(a)(2)(vi). This action does not constitute approval of any service, rate, charge, classification, or any rule, regulation, contract, or practice affecting such rate or service provided for in the filed documents. Such action shall not be deemed as recognition of any claimed right or obligation associated therewith

and such action is without prejudice to any findings or orders that have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Electric Reliability Organization or any Regional Entity.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order pursuant to 18 C.F.R. § 385.713.

Sincerely,

Penny S. Murrell, Director
Division of Electric Power Regulation-Central

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION	**)** **)**	**Docket No. RM11-11-000**

QUARTERLY REPORT OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION ON STATUS OF DEVEOPMENT OF VERSION 5 CRITICAL INFRASTRUCTURE PROTECTION RELIABILITY STANDARDS

On February 10, 2011, the North American Electric Reliability Corporation ("NERC") filed a petition seeking Federal Energy Regulatory Commission ("FERC" or the "Commission") approval of the "Version 4" Critical Infrastructure Protection ("CIP") Reliability Standards, CIP-002-4 through CIP-009-4. The Version 4 CIP Reliability Standards provide a cybersecurity framework for the identification and protection of "Critical Cyber Assets" that are associated with "Critical Assets" to support the reliable operation of the Bulk-Power System.

On April 19, 2012, the Commission issued an order approving the Version 4 CIP Reliability Standards[1] and imposing a March 31, 2013, deadline by which time NERC must file CIP Reliability Standards that are fully compliant with Order No. 706.[2] The Commission also required the submission of reports at the "beginning of each quarter" explaining whether NERC is "on track to meet the deadline and describe the status of its CIP standard development efforts."[3] The instant filing is submitted in compliance with this directive.[4]

III. Status of CIP Version 5 Standard Development Efforts

In the third quarter of 2012 (*i.e.*, July 1 to September 30, 2012), there was a posting for a parallel formal comment and successive ballot period, two drafting team meetings, and several conference calls as described in further detail below.

A parallel formal comment and 12 successive ballot windows for the "Version 5" CIP standards (CIP-002-5 Cyber Security –BES Cyber System Identification; CIP-003-5 Cyber

---

[4] In response to the first quarterly report submitted on July 2, 2012, the Commission granted NERC's request to file such reports 30-days after the end of each calendar quarter. *See Notice of Extension of Time*, Docket No. RM11-11-000 (July 24, 2012).

[5] Persons to be included on FERC's service list are indicated with an asterisk. NERC requests waiver of 18 C.F.R. § 385.203(b) to permit the inclusion of more than two people on the service list.

Security – Security Management Controls; CIP-004-5 Cyber Security – Personnel and Training; CIP-005-5 Cyber Security – Electronic Security Perimeter(s); CIP-006-5 Cyber Security – Physical Security; CIP-007-5 Cyber Security – Systems Security Management; CIP-008-5 Cyber Security – Incident Reporting and Response Planning; CIP-009-5 Cyber Security – Recovery Plans for BES Cyber Assets and Systems; CIP-010-1 Cyber Security – Configuration Change Management; CIP-011-1 Cyber Security – Information Protection), one ballot for the associated implementation plan, and one ballot for a set of new and revised NERC Glossary definitions, began on September 11, 2012, and ended October 10, 2012. All 12 successive ballots achieved at least two-thirds approval. *See* **Attachment A**.

The Project 2008-06 – Cyber Security Order 706 – V5 standard drafting team met from July 10-12, 2012, and from August 14-16, 2012. Specific information regarding the issues discussed at this meeting is included herein at **Attachment B** and is posted on the NERC website.[6] In addition, conference calls were held by the drafting team on July 2, 2012, July 19, 2012, July 27, 2012, August 2, 2012, August 6, 2012, September 5, 2012, and September 6, 2012. The drafting team also conducted informational industry webinars on September 11, 2012, ("Industry Webinar (1 of 2) for Version 5 CIP Standards: A Focus on "Correcting Deficiencies"), and September 21, 2012, ("Industry Webinar (2 of 2) for Version 5 CIP Standards: Successive Ballot Update").[7] A drafting team teleconference was held on October 12, 2012, and a drafting team meeting is scheduled for October 23-25, 2012, in Sacramento, CA.

With respect to whether the Version 5 standard drafting team is on schedule to meet the March 31, 2013, deadline, a project schedule is maintained on the NERC website and is publicly

available.[8] *See* **Attachment C**. The current schedule projects that NERC will meet the Commission's March 31, 2013, deadline.

IV. Conclusion

NERC respectfully requests that the Commission (i) accept this Compliance Filing in accordance with the Commission's directive in Order No. 761, and (ii) find that the proposal to submit future quarterly reports based on the Commission's electric quarterly report schedule is reasonable and satisfies the directive in Order No. 761.

Respectfully submitted,

/s/ Willie L. Phillips

Standards Announcement

Project 2008-06 Cyber Security Order 706 (CIP Version 5)

Successive Ballot Results

Now Available

Twelve successive ballot windows for the following ten CIP standards, one ballot for the associated implementation plan, and one ballot for a set of new and revised NERC Glossary definitions, closed on Wednesday, October 10, 2012. The drafting team thanks stakeholders for the careful consideration of such a large volume of documents, and for the substantive and constructive feedback received.

Voting statistics for each ballot are listed below, and the Ballot Results webpage provides a link to the detailed results.

Ballot	Results
CIP-002-5 Cyber Security — BES Cyber System Identification	Quorum: 80.58% Approval: 74.85%
CIP-003-5 Cyber Security — Security Management Controls	Quorum: 80.37% Approval: 89.50%
CIP-004-5 Cyber Security — Personnel and Training	Quorum: 80.58% Approval: 85.58%
CIP-005-5 Cyber Security — Electronic Security Perimeter(s)	Quorum: 80.58% Approval: 89.46%
CIP-006-5 Cyber Security — Physical Security	Quorum: 80.58% Approval: 92.11%
CIP-007-5 Cyber Security — Systems Security Management	Quorum: 80.58% Approval: 87.73%
CIP-008-5 Cyber Security — Incident Reporting and Response Planning	Quorum: 80.58% Approval: 91.74%
CIP-009-5 Cyber Security — Recovery Plans for BES Cyber Assets and Systems	Quorum: 80.58% Approval: 91.73%
CIP-010-1 Cyber Security — Configuration Change Management	Quorum: 80.58% Approval: 84.60%
CIP-011-1 Cyber Security — Information Protection	Quorum: 80.58% Approval: 92.90%
CIP V5 Implementation Plan	Quorum: 78.93% Approval: 94.00%
CIP V5 Definitions	Quorum: 79.13% Approval: 91.59%

Next Steps

The drafting team will consider all comments submitted, and based on the comments will determine whether to make additional changes. If the drafting team determines that no substantive changes are required to address the comments, recirculation ballots will be conducted.

Background

In 2008, FERC Order No. 706 directed the ERO to develop modifications to Version 1 of the NERC CIP Cyber Security Standards to address a range of concerns in various areas of the Version 1 standards.

Version 5 of the NERC CIP Cyber Security Standards is intended to address all remaining standards related issues of FERC Order No. 706.

The SDT believes the NERC Version 5 CIP Cyber Security Standards provide a cyber security framework for the categorization and protection of BES Cyber Systems to support the reliable operation of the Bulk Electric System. These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the cyber systems needed to support Bulk Electric System reliability, and the risks to which they are exposed. Additional information about the project is available on the project page.

Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Meeting Agenda
Project 2008-06 Cyber Security Order 706 Standard Drafting Team

July 10-12, 2012 | 8:00 a.m. – 6:00 p.m. CT

Great River Energy
12300 Elm Creek Boulevard
Maple Grove, MN 55369
(763) 445-5500

Dial-in: 1-866-740-1260 | Access Code: 7149593 | Security Code: 997870

Administrative

1. **Introductions**
2. **Determination of Quorum**

   The rule for NERC Standard Drafting Team (SDT) states that a quorum requires two-thirds of the voting members of the SDT to be present.
3. **NERC Antitrust Compliance Guidelines and Public Announcement**

   It is NERC's policy and practice to obey the antitrust laws and to avoid all conduct that unreasonably restrains competition. This policy requires the avoidance of any conduct that violates, or that might appear to violate, the antitrust laws. Among other things, the antitrust laws forbid any agreement between or among competitors regarding prices, availability of service, product design, terms of sale, division of markets, allocation of customers or any other activity that unreasonably restrains competition. It is the responsibility of every NERC participant and employee who may in any way affect NERC's compliance with the antitrust laws to carry out this commitment.
4. **Review Current Team Roster**

5. **Review Meeting Agenda and Objectives**
    a. Continue review/response to industry comments and modify standards in response.
    b. Finalize approach to previously identified significant unresolved issues.

Agenda

1. **Approval of Notes from Previous Meetings**
2. **Update on Successive Ballot Timeline**
3. **Finalize Approaches to Significant Issues**
    a. Program-based requirement approach (non-zero-defect).
    b. Addressing guidance in Order 761.
    c. CIP-002-5 BES Cyber System Identification.
    d. Immediate revocation of access.
    e. Physical Security Perimeter monitoring and alerting.
4. **Finalize Response to Comments (Review Additional Modifications to Each Standard)**
5. **Prepare Standards for Quality Review as Available**
6. **Action Items and Next Steps**
7. **Planning for Webinars, Full Team Calls, etc.**
8. **Future Meeting Schedules and Venues**
    a. August 14-16, 2012, Columbus, OH (AEP)
    b. September 11-13, 2012 (to be determined)
9. **Adjourn**

Meeting Notes

Project 2008-06 Cyber Security Order 706 Standard Drafting Team

July 10-12, 2012
Maple Grove, MN

Administrative

1. **Introductions and Chair's Remarks**

The acting chair brought the meeting to order at 8:00 a.m. CT on Tuesday, July 10, 2012 at Great River Energy (GRE) Headquarters facilities. Meeting participants were:

Members		
Rob Antonishen, Ontario Power	Rene Bourassa, Hydro Quebec (via teleconference)	Sharon Edwards, Duke Energy
Jerry Freese, AEP	Christine Hasha, ERCOT	Philip Huff, Vice Chair, AECC
Doug Johnson, ComEd	Richard Kinas, OUCI	Robert Lloyd, SCE
Scott Mix, NERC	Steven Noess, NERC Advisor	Kevin Sherlin, SMUD
David Revill, GA Transmission	Thomas Stevenson, Constellation	John Varnell, Tenaska Power Services
William Winters, APS		

Observers		
Tom Alrich, Honeywell	Joe Bucciero, EnerNex	Richard Burt, MRO
David Dockery, AECI	James Fletcher, AEP	Annette Johnston, MidAmerican
Michael Keene, FERC	Collin Martin, Oncor	Jeremy Morgan, Progress Energy
Sharon Koller, Alliant Energy	Dan McAuley, Southern Company	Brian Newell, AEP
Eduardo Santiago, Southern Compnay	Cade Simmons, MidAmerican	Josh Smith, Southern Company
Jennifer White, Alliant Energy		

2. **Determination of Quorum**

   The rule for NERC Standard Drafting Team (the team or SDT) states that a quorum requires two-thirds of the voting members of the SDT. Quorum was achieved as 15 of 16 total members were present.

3. **NERC Antitrust Compliance Guidelines and Public Announcement**

   The NERC Antitrust Compliance Guidelines and public announcement were delivered.

4. **Review Team Roster**

   The Standards Committee approved the removal of one member from the drafting team on May 24, 2012, as the member changed roles and is no longer able to participate actively in the drafting team's activities. An updated team roster has been posted to the team's project page.

5. **Review Meeting Agenda and Objectives**

   No changes were made to the meeting agenda or objectives. The meeting objectives were to continue review of industry comments, finalize approach to significant unresolved issues, and prepare changes to the standards in response.

Agenda Items

1. **Approval of Notes from Previous Meetings**

2. **Update on Ballot Results and Process Toward Successive Ballot**

   The team reviewed the plan to prepare another draft for successive ballot, to be posted in August or September 2012. The team re-acknowledged that it will need to complete a successive ballot and recirculation ballot before the end of 2012 in order to meet the deadline for filing Version 5 imposed by FERC Order No. 761. Furthermore, the team sought from the Standards Committee deferral of Violation Severity Levels (VSLs) for non-binding poll, and the Standards Committee approved deferral of posting VSLs for non-binding poll until the recirculation ballot. The SDT also reviewed progress in finalizing comment response summaries for each of the set of questions submitted during the formal comment period that ended in May 2012. Each member assigned to a question indicated that he or she was on track to finish the comment responses before the beginning of the August 2012 face-to-face SDT meeting.

3. **Major Issues and Actions**

   The focus of the meeting was to continue improving and modifying the standards in response to industry input from formal comments. The SDT made several changes at its June 2012 in direct response to comments, and this meeting focused on several remaining issues, many of which applied broadly across more than one standard. The team met in plenary session for the duration of the meeting, and it focused on those standards that had less focus during June's meeting.

Namely, CIP-003-5, CIP-008-5, CIP-009-5, CIP-010-1, and CIP-011-1. Among several issues identified or resolved during these meetings include, but are not limited to:

a. The SDT discussed with NERC's director of compliance operations the direction NERC is moving with respect to compliance monitoring. The discussion included presentation of the broader ERO directions to incorporate risk-informed approaches.

b. In addition to the compliance monitoring discussion, the SDT discussed incorporating a self-correcting component within several requirements. As part of its obligation under FERC Order No. 706, the SDT has an obligation to consider applicable features of the NIST Risk Management Framework. Thus, Version 5 has incorporated the "Assess" and "Monitor" processes of the NIST Risk Management Framework in the development of the requirements and enabled these processes through additional language for identifying, assessing, and correcting deficiencies in controls. The SDT has incorporated within CIP Version 5 a recognition that certain requirements should not focus on individual instances of failure as a sole basis for determining a violation of the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on *whether* there is a deficiency, but on identifying, assessing, and correcting deficiencies. Note that, where used, the addition of language modifies "implement"; it does not itself require or specify internal controls, though it certainly enables their use for those entities that have adopted an internal controls approach. Where used, the requirements incorporate the forward-looking language into the main requirement, which ties in with CIP Version 5's use of accompanying tables. It is presented in those requirements as follows: "Each Responsible Entity shall implement**, in a manner that identifies, assesses, and corrects deficiencies,** one or more documented processes (or program, etc., as specified by the requirement) that collectively include each of the applicable items in [the referenced table]."

c. The team continued to review generally Order No. 761 guidance and its implications on the drafting team's work.

d. As part of the movement to incorporate a self-correcting aspect into the requirements, the SDT also discussed the importance of synchronizing those concepts within other supporting documents, such as Reliability Standard Audit Worksheets (RSAWs) and the VSLs. The SDT will work with NERC to provide input into the RSAWs so that an example RSAW can be posted for comment alongside the next posting of the standards.

e. The SDT reviewed the decisions for global changes, which are included in the June 2012 meeting summary, and reviewed and confirmed those changes in the standards.

f. Synchronize all measures to reflect the approach that measures are non-exhaustive lists of examples. To accomplish this, the SDT added the "Examples of" concept to precede "evidence includes, but is not limited to, . . ."

g. In CIP-004-5, the SDT discussed some questions regarding the PRA process. Specifically, some commenters were concerned that a PRA would be required for a change in role, and the SDT clarified that its intent is for the entity's process to determine what is appropriate and that the standard should be clear that a PRA should not be any older than 7 years, not that it must be conducted for each new role. To provide clarity, the SDT does not distinguish between a first time or renewal PRA, and as written, a PRA that is no older than 7 years is a condition for access. As a condition of access, it must have been conducted either prior to granting such access or prior to renewing such access.

h. The SDT also clarified the identity verification requirement by specifying that the entity should have a process to verify identity, but the SDT does not prescribe how.

i. The SDT discussed but did not make a final determination on the MW threshold for Balancing Authorities (BAs). An observer in attendance provided the SDT with information and a summary of the 22 commenters that discussed this issue in the comments for draft 2. The SDT discussed the topic and seemed to agree that, in general, even if a BA goes down, there would still be voltage at the actual generators.

j. The SDT also finalized several other changes for clarity, style, and grammar.

4. **Action Items and Next Steps**

   a. Team members were reminded of responsibility for completing summaries for individual questions from the comment forms. Summaries must be completed before the end of July 2012.

   b. Participate in all topic-specific SDT interim calls.

5. **Future Meeting(s)**

   a. August 14-16, 2012 (AEP in Columbus, OH).

   b. September 11-13, 2012 (to be determined).

6. **Adjourn**

   The meeting was adjourned at 4:00 p.m. CT on July 12, 2012. The chair thanked GRE for use of its facilities and thanked the members for a productive session.

Meeting Notes

Project 2008-06 Cyber Security Order 706 Standard Drafting Team

August 14-16, 2012
Columbus, OH

Administrative

1. **Introductions and Chair's Remarks**

The chair brought the meeting to order at 8:02 a.m. ET on Tuesday, August 14, 2012 at AEP Headquarters. Meeting participants were:

Members		
Rene Bourassa, Hydro Quebec	Jay Cribb, Southern Company	Sharon Edwards, Duke Energy
Christine Hasha, ERCOT (via conference call)	Philip Huff, Vice Chair, AECC	Jerry Freese, AEP
Doug Johnson, Exelon	John Lim, Chair, Consolidated Edison	Scott Mix, NERC
Steven Noess, NERC Advisor	Robert Preston Lloyd, Southern California Edison	David Revill, GA Transmission
Kevin Sherlin, SMUD (via conference call)	Thomas Stevenson, Constellation	John Varnell, Tenaska Power Services (via conference call)
William Winters, APS (via conference call)		

Observers		
Michael Bailey, FirstEnergy	Peter Buerling, FirstEnergy	Randy Calhoun, AEP
Bryan Carr, PacifiCorp	Trey Cross, ACES Power Marketing	David Dockery, AECI
James Fletcher, AEP	John Fridye, Ventyx	Doug Hohlbaugh, FirstEnergy
Annette Johnston, MidAmerican Energy Company	Michael Keane, FERC	Sharon Koller, Alliant Energy

Observers		
Collin Martin, ONCOR	Dan McAveley, Progress Energy	Don Miller, FirstEnergy
Nathan Mitchell, APPA	Jeremy Morgan, Progress Energy Carolinas	Brian Newell, AEP
James Rappach, AEP	Troy Rhoades, FirstEnergy	Carlo Santarelli, AEP
Tim Sheerer, FirstEnergy	Josh Smith, Southern Company Services	Ryan Stewart, NERC
Jennifer White, Alliant Energy	Spencer Young, PacifiCorp	

2. **Determination of Quorum**

   The rule for NERC Standard Drafting Team (the team or SDT) states that a quorum requires two-thirds of the voting members of the SDT. Quorum was achieved as 14 of 16 total members were present.

3. **NERC Antitrust Compliance Guidelines and Public Announcement**

   The NERC Antitrust Compliance Guidelines and public announcement were delivered.

Agenda Items

1. The SDT reviewed the upcoming timeline as there are a few time sensitive areas the SDT needs to address. The timeline discussed and agreed to is:

   - 30-day comment period from approximately September 12 – October 12, 2012.
   - 10-day ballot period during the last ten days of the 30-day comment period.
   - SDT conference calls September 5-6, 2012 to discuss and finalize quality review (QR) consideration.
   - SDT face to face meeting to address comments prior to recirculation ballot.
   - Recirculation ballot shortly after the face to face meeting.
   - Board of Trustee (BOT) approval at its November 2012 meeting if recirculation complete or in December 2012.
   - Filing with FERC shortly after BOT approval to meet deadline in Order No. 761.

2. **Major Issues and Actions**

   The focus of the meeting was to discuss the proposed self-correcting language for the applicable Requirements, discuss CIP-002-5 through CIP-011-1 regarding changes from the second draft to the current state of the standards for concensus and approval for submission to QR, and discuss the CIP Version 5 Definitions document.

In summary, Tuesday focused on the zero defect approach to the applicable Requirements within the CIP standards, the review of CIP-002-5, CIP-003-5 and CIP-005-5. Wednesday focused on the draft CIP-006-5 Reliability Standard Audit Worksheet (RSAW) and the continued review of CIP-005-5 and CIP-007-5. Thursday focused mainly on the development of the Implementation Plan as well as the review of CIP-004-5 and CIP-006-5. Among several issues identified during these meetings for continued team discussion include, but are not limited to:

a. Standards approach moving from *whether* deficiencies occur to *correcting* deficiencies. The SDT took a straw poll to determine if the SDT is comfortable with including language at all on this issue. The proposal is whether the SDT is in support of including language in the applicable Requirements to support the concept of identify, assess and correct. The straw poll reflected team concensus. The SDT is in support of using the language.

b. Stemming from the discussion above, the team reviewed different proposals from industry stakeholders regarding the self-correcting language. Many of the proposals included detail language indicating what *is not* a violation, and other proposals modified "process" instead of "implement." The team agreed with the concept of many of the proposals, but they agreed that many of the concepts in the proposed alternative language would be more appropriate in other compliance monitoring documents, such as an RSAW. The SDT is moving forward with the current proposal of the language (#1). The SDT will provide outreach to stakeholder groups on this language to solicit feedback and comments to guage the industry's reaction.

c. The SDT discussed slides on the CIP Version 5 approach for correcting deficiencies. The approach shifts focus from *whether* defiencies occur to *correcting defiencies*. As mentioned above, a number of prosposals to incorporate the identify, assess, and correct deficiencies language were provided prior to the meeting, and the team returned to the language of "implement, in a manner that identifies, assesses, and corrects deficiencies…" It is important to note that the language does not *require* an entity to have internal controls but provides flexibility to an entity if it is using an internal controls or compliance management approach.

d. The SDT discussed whether the self-correcting language should be in all Requirements or only certain Requirements. The SDT determined that it is only appropriate in certain requirements, such as highly recurrent or documentation-type requirements, and that other requirements are more binary in nature with respect to meeting the required performance. Furthermore, using it selectively further supports a risk-informed approach that recognizes that some requirements should be performed without flaw. As such, the approach will only be included for approximately half of the Requirements.

e. The SDT reviewed the draft RSAW for CIP-006-5, which was modeled after the COM-003-1 RSAW. The SDT expects that the other nine RSAWs will be developed with continued industry

and SDT input following approval of the CIP Version 5 standards. NERC plans to post this draft RSAW as an informational document concurrent with draft 3's posting for successive ballot.

f. The SDT reviewed the implementation plan. There was discussion regarding the effective dates and how Version 4 of the CIP standards will impact Version 5. NERC is working on a smooth transition for each Version. In the implementation plan for the CIP Version 5 standards, the SDT had previously proposed to extend Version 3 until the effective date of Version 5. In doing so, the effective date proposes that Version 4 will be superseded by Version 5 and not go into effect. Even though Version 4 has been approved by order, the SDT always contemplated such approval during the development of the implementation plan language. That order does not change the SDT's proposal. The expectation of the order is why the SDT included language implementation plan's effective date to specify that the extension of Version 3 until Version 5, and that Version 4 would not go into effect, would occur "notwithstanding any order to the contrary." There is no change in the SDT's intent and proposal to extend Version 3 until Version 5, and for Version 5 to supersede Version 4, notwithstanding the recent order approving Version 4. The SDT also understands, as is the case for any standards proposal by the industry, that the proposal is subject to approval by appropriate regulatory authorities.

g. Within the individual standards for CIP Version 5, the effective dates have been modified so that they are specific to the particular standard. In doing so, the reference to extending Version 3 and superseding Version 4 has been removed, as the Implementation Plan is the appropriate place for that language (where it remains, as described above). Thus, while there is no change to the SDT's proposal, you will notice that the individual, standard-by-standard effective dates have been modified to the correct style and form.

h. There was a general discussion with regards to what the questions will be during the next posting. Since this is the third posting, the SDT has reviewed thousands of pages of perspectives, and it is not looking for the volume of comments previously submitted. It believes that the set of standards being prepared for posting reflect careful consideration of the varied formal and informal inputs into the process that reflect a consensus position. As such the SDT agreed that to keep the number and amount of questions to a minimum.

3. **Action Items and Next Steps**

a. NERC has already announced the September 11, 2012 webinar, and it will send an announcement for September 21, 2012 webinar, along with reminders for both of the webinars as the date approaches.

b. A subteam of the SDT and Observer collaborators is working on VSLs and will provide them to the SDT within two weeks of the meeting.

c. The SDT Chair will finalize the consideration of directives and will provide that to the SDT for submittal to QR.

d. An SDT member will provide language in the background section for the protected cyber asset concepts.

e. Several other members had small areas for clarity they will provide for inclusion in the background and guidelines sections of the standards.

4. **Planning for Webinars, Full Team Calls, etc.**

   a. September 11, 2:00 – 4:00 p.m. ET.

   b. September 21, 1:00 – 3:00 p.m. ET.

5. **Future Meeting Schedules and Venues**

   a. September 5-6, 2012, via Teleconference (11:00 a.m. – 5:00 p.m. ET each day).

   b. October 23-25, 2012, Sacramento, CA (SMUD Hosting).

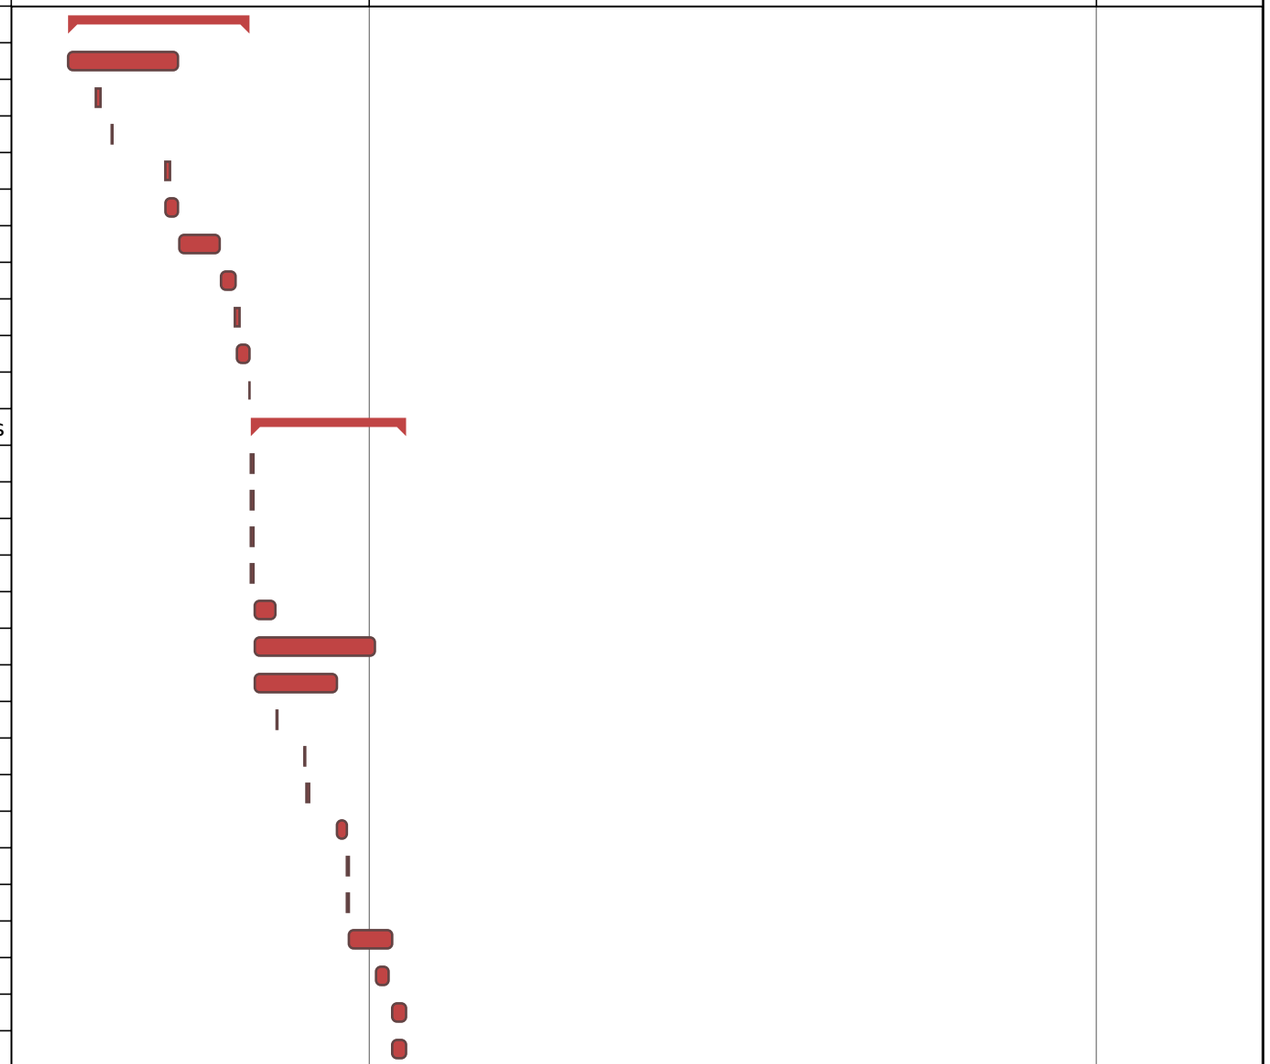
6. **Adjourn**

   The meeting was adjourned at 4:01 p.m. ET on August 16, 2012.

Attachment C

Project 2008-06 – Cyber Security Order 706 – V5 Project Schedule

#	Name	Duration
1	**B - DRAFT STANDARD**	528 hrs
2	Write Draft Standard	40 days
3	SDT Meets (Atlanta, GA) to Solicit Industry Feedback	3 days
4	Sponsor Industry Webinar on Version 5 CIP Standards	1 days
5	SDT Meets (Westminster CA) to Finalize Documentation for QR	3 days
6	Send Posting Package to SPM for Quality Review	5 days
7	Perform Quality Review of Posting Package	15 days
8	Edit Posting Package based on QR and Send to SPM	6 days
9	SDT meets (Baltimore MD) to finalize CIP v5 Documentaiton for	3 days
10	Final Pre-Posting Review of Posting Package	5 days
11	Drafting Complete	0 days
12	**E - INITIAL BALLOT**	451.23 hrs
13	Write Draft Standard Posting and Ballot Pool Announcement	2 days
14	Post Draft Standard and Update Web Page	2 days
15	Post Draft Standard Posting and Ballot Pool Announcement	2 days
16	Distribute Draft Standard Posting and Ballot Pool Announcement	2 days
17	SDT Prepares for industry Webinar on CIP v5 Stadnards	7 days
18	Comment Period	60.44
19	Refresh Ballot Pool over 30 days	41.32
20	Webinar to the Industry (CIP-002, Defintions, and	1 days
21	Webinar to the Industry (CIP-003 thru -011)	1 days
22	SDT meets (via Conference Call) to review Webnar Questions	2 days
23	Write Initial Ballot Announcement	24 hrs
24	Post Initial Ballot Announcement	1 days
25	Distribute Initial Ballot Announcement	1 days
26	Conduct Initial Ballot over 10 days	21.81
27	Assemble Comments on Draft Standard and Send to Project	5 days
28	Assemble Ballot Comments on Draft Standard and Send to	5 days
29	Assemble Ballot Results and Update Web Page	5 days



Project: Project 2008-06 Cyber Security Order 706
Planned Start: 8/2/11
Projected Start: 8/2/11
Planned Completion: 2/25/13
Projected Completion: 3/29/13
Printed On: 10/22/12

The second phase (Phase 2) of Project 2008-06 Cyber Security Order 706 will require the SDT to propose modifications not included in Phase 1 of the project to bring the following standards into conformance with the ERO Rules of Procedure and to address the directives from FERC Order 706:
CIP-002-2 Critical Cyber Asset Identification

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, D.C. 20426

OFFICE OF ELECTRIC RELIABILITY

North American Electric Reliability Corporation
Docket No. RM11-20-002

November 9, 2012

North American Electric Reliability Corporation
1325 G Street N.W., Suite 600
Washington, D.C. 20005-3801

Attention: Holly A. Hawkins, Attorney

Reference: Filing for Approval of Compliance Filing In Response to Order No. 763 on Automatic Underfrequency Load Shedding Reliability Standards

Dear Ms. Hawkins:

On May 7, 2012, the Commission issued Order No. 763 approving two Reliability Standards, PRC-006-1 and EOP-003-2, that address underfrequency load shedding plans.[1] Order No. 763 directed modifications to Reliability Standard PRC-006-1, Requirement R9, and to a Violation Risk Factor and Violation Severity Level associated with PRC-006-1. Order No. 763 directed NERC to make a compliance filing.

On August 9, 2012, NERC submitted a compliance filing modifying the Violation Risk Factor and Violation Severity Level in compliance with Order No. 763. Additionally, NERC proposes in the compliance filing to modify PRC-006-1, Requirement R9 in accordance with Order No. 763, when a standard development project is next initiated for modifying PRC-006-1.

Notice of this filing was issued on August 27, 2012, with comments, protests or motions to intervene due on or before September 10, 2012.

Notices of intervention and unopposed timely filed motions to intervene are granted pursuant to the operation of Rule 214 of the Commission's Rules of Practice and

[1] *Automatic Underfrequency Load Shedding and Load Shedding Plans Reliability Standards*, Order No. 763, 139 FERC ¶ 61,098 (2012).

20121109-4001 FERC PDF (Unofficial) 11/09/2012

Procedure. 18 C.F.R. § 385.214. No protests were filed specific to NERC's compliance with Order No. 763.[2]

NERC's uncontested filing is accepted pursuant to the authority delegated to the Director, Office of Electric Reliability, under 18 C.F.R. § 375.303.

This action shall not be construed as accepting any other contingency plan pursuant to 18 C.F.R. § 375.303(a)(1)(i) or any other data or report pursuant to C.F.R. § 375.303(b)(3)(iv). This action shall not be construed as approving any other application including Electric Reliability Organization or Regional Entity Rules or procedures pursuant to 18 C.F.R. § 375.303(a)(2)(i). Such acceptance or approval shall not be deemed as recognition of any claimed right or obligation associated therewith; and such acceptance or approval is without prejudice to any findings or orders which have been or which may hereafter be made by the Commission in any proceeding now or pending or hereafter instituted by or against NERC.

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order, pursuant to 18 C.F.R. § 385.713.

Sincerely,

Michael Bardee, Director
Office of Electric Reliability

[2] On September 7, 2012, Dominion Resource Services, Inc. filed a motion to intervene and comments. The comments did not contest NERC's compliance with Order No. 763 and instead requested changes to proposed regional Reliability Standard PRC-006-SERC-01, which is the subject of pending Docket No. RM12-9-000.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Regional Reliability Standard PRC-006-NPCC-1	**)**	**Docket No. RM12-12-000**
Automatic Underfrequency Load Shedding	**)**	

COMMENTS OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION IN RESPONSE TO NOTICE OF PROPOSED RULEMAKING

The North American Electric Reliability Corporation ("NERC")[1] hereby provides these comments in response to the Federal Energy Regulatory Commission's ("FERC" or the "Commission") September 20, 2012, Notice of Proposed Rulemaking ("NOPR")[2] regarding the proposed regional Reliability Standard PRC-006-NPCC-1 (Automatic Underfrequency Load Shedding). The proposed regional Reliability Standard applies to generator owners, planning coordinators, distribution providers, and transmission owners in the Northeast Power Coordinating Council Region and is designed to ensure the development of an effective automatic underfrequency load shedding ("UFLS") program to preserve the security and integrity of the Bulk-Power System during declining system frequency events, in coordination with the NERC continent-wide UFLS Reliability Standard PRC-006-1.

I. BACKGROUND

In the NOPR, the Commission proposes to approve the proposed regional Reliability Standard PRC-006-NPCC-1, the associated violation risk factors ("VRFs") and violation severity levels ("VSLs"), implementation plan, and effective dates proposed by NERC. Proposed

---

[1] The Federal Energy Regulatory Commission certified NERC as the electric reliability organization ("ERO") in its order issued on July 20, 2006 in Docket No. RR06-1-000. *North American Electric Reliability Corporation*, 116 FERC ¶ 61,062 (2006).

[2] *Regional Reliability Standard PRC-006-NPCC-1—Automatic Underfrequency Load Shedding*, 140 FERC ¶ 61,203 (September 20, 2012) ("NOPR").

regional Reliability Standard PRC-006-NPCC-1 has 23 requirements, each having an associated measure of compliance. The proposed regional Reliability Standard is designed to work in conjunction with and augment Reliability Standard PRC-006-1 by mitigating the consequences of an underfrequency event, while accommodating differences in system transmission and distribution topology among Northeast Power Coordinating Council, Inc. ("NPCC") planning coordinators due to historical design criteria, makeup of load demands, and generation resources.

II. COMMENTS

The Commission seeks comment on: (1) the technical basis for the 57.8 Hz maximum tripping limit for existing nuclear units established in Requirement R19; and (2) the time-frames for actions that result in changes to the NPC UFLS program.

A. NERC Supports the Comments of the Northeast Power Coordinating Council

NERC supports the comments submitted by NPCC in this proceeding on the two issues addressed in the NOPR. NERC and NPCC assert that a region-wide and fully coordinated single set of UFLS requirements is of benefit to achieving an effective and efficient UFLS program. The requirements in the PRC-006-NPCC-1 standard are consistent with the PRC-006-1 NERC standard and support reliability.

NERC respectfully requests that the Commission approve PRC-006-NPCC-1 and the associated violation risk factors, violation severity levels and effective dates.

III. CONCLUSION

For the reasons stated above, NERC respectfully requests that the Commission accept these comments for consideration.

Respectfully submitted,

/s/ Stacey Tyrewala

From: Guy V. Zito
To: rsc
Subject: NERC Approval of the CEAP
Date: Wednesday, October 10, 2012 12:58:22 PM

RSC et al,

Today the NERC Standards Committee unanimously approved the NERC Cost Effectiveness Analysis Process CEAP. An associated implementation plan was also approved which I will be discussing at the next RSC meeting.

Thanks,

Guy V. Zito

CEAP Phase 1 Cost Impact Analysis (CIA) Report 16

CEAP Phase 2 Cost Effectiveness Analysis (CEA) Report 17

1. Introduction

Cost considerations are inherent in the development of Reliability Standards. One of the objectives of the NERC Cost Effective Analysis Process ("CEAP" or "Process") is to make such considerations transparent and to ensure that where decisions on Reliability Standards are made regarding cost effectiveness, these decisions are made in an open manner and are part of the standard development record.

While the reliability benefit of any one particular Reliability Standard may be small, taken together, the full battery of standards form a coherent and interdependent whole that helps ensure the reliability of the North American Bulk Power System ("BPS").Understanding the implementation costs and continuing costs of meeting compliance obligations for standards is vital to the development of these standards. Additionally, it is beneficial to industry stakeholders to identify and utilize the most cost effective methods of achieving the standards reliability objective and to afford the same industry stakeholders the ability to propose alternative methods of achieving the reliability objectives.

Regulatory authorities, federal, state and provincial, as well as the NERC Board of Trustees, Regional Entities and electric industry stakeholders have all expressed interest in a process to determine effectiveness and implementation costs of proposed or revised standards to improve reliability of facilities, resources and activities subject to NERC standards. The CEAP will also contribute to the record of standard development and become an integral part of filings with regulatory authorities providing additional needed information and justifications for the standards. Inclusion of implementation costs will also provide a sound basis to assist regulators in satisfying requirements for data that must accompany, and appear in, rulemakings (e.g. the Regulatory Flexiblity Act and Office Management and Budget requirments).

The foundation for this document was the Northeast Power Coordinating Council (NPCC) CEAP which was developed to address the NPCC Board of Director's concerns about implementation costs. The NPCC CEAP was effectively piloted and proved beneficial and has served to provide the concepts found in this NERC CEAP Guideline.

2. Purpose

The CEAP and associated implementation plan represent an initial effort towards addressing concerns regarding cost impacts (*e.g.,* implementation, maintenance, and ongoing compliance resource

requirements) associated with achieving reliability objectives for facilities, resources and activities subject to NERC standards.

The purpose of the CEAP is to establish guidelines for the solicitation of input and high level data from the industry, as part of and during the standards development process, to identify more cost effective ways to achieve the same or better reliability outcomes at equal or lower costs. The CEAP is intended to allow the industry the opportunity during the drafting process to identify alternative requirements or methods for meeting a standard's reliability objective that may be (i) less costly or (ii) equally or more effective, or (iii) more efficient. The CEAP, conducted in parallel with the drafting process, should not significantly delay the development of the standard and will add supporting information and background for the NERC stakeholders, the NERC Board of Trustees, and Federal, Provincial and State Regulatory Agencies to be utilized for decision-making.

The CEAP is not intended to provide a comprehensive cost impact or benefit analysis. The CEAP is a guideline to be used for informational gathering purposes only and is intended to collect beneficial data, not previously available during standards development. The CEAP is intended to augment and contribute to the efficiency and effectiveness of reliability standards and not delay or obstruct their development.

3. Process Overview

The CEAP will be conducted in two phases. Phase 1, Cost Impact Analysis ("CIA"), and Phase 2, Cost Effectiveness Analysis ("CEA"). Each phase of the CEAP will consist of a set of surveys with questions to be responded to by the industry.

The CEAP Final Report will consist of the (1) CEAP Phase 1 CIA Report and, (2) all combined CEAP Phase 2 CEA Reports.

The CEAP process will result in the production and publication of a CEAP Report, to be archived on the NERC website with the documentation related to the development of the standard.

3.1 Phase 1 Cost Impact Analysis (CIA)

Phase 1 will typically be conducted in conjunction with the Standards Authorization Request ("SAR") stage of a standard's development. The CIA is intended to collect estimated industry wide cost impacts (implementation, maintenance, and ongoing compliance resource requirements) and will evaluate potential reliability benefits of a proposed draft reliability standard. The CIA proposes an analysis of potential areas for coordination and efficiency gains in the development of proposed standards. The CIA will provide a high level "snapshot" of estimated cost impacts and mitigated reliability risks of the proposed reliability standard by soliciting input from stakeholders.

Questions posed during the Phase 1 CIA will focus on potential cost impacts and reliability risks to determine if the standard, in the view of stakeholders, would achieve or possibly exceed an Adequate Level of Reliability ("ALR"). Cost information collected in this phase should be "order of magnitude costs" to determine if a proposed standard will have excessive costs associated with it.

3.2 Phase 2 Cost Effectiveness Analysis (CEA)

The purpose of the CEA is to provide information about cost impacts (*e.g.*, implementation, maintenance, and ongoing compliance resource requirements) of draft reliability standards and their relative effectiveness, which will allow the industry to evaluate and propose alternative approaches for achieving the reliability objectives of the standard. Phase 2 will typically be conducted at the time of the first combined Formal Comment period and Ballot.

The CEA will involve two sets of survey questions which will be asked concurrently. The first set relates to technical feasibility and effectiveness of the proposed requirements as well as soliciting possible more cost effective alternatives to achieve the reliability objectives. The second set of questions will solicit cost impacts (*e.g.*, implementation, maintenance, and ongoing compliance resource requirements) and any related implementation information.

3.3 Cost Effective Analysis Process (CEAP) Report

All information provided during the CIA and CEA phases of the CEAP will be consolidated and evaluated to produce a CEAP report. The CEAP report will be provided to the NERC Standards Committee ("SC") and to the Standard Drafting Team ("SDT") for informational purposes.

All available resources will be utilized effectively and efficiently to produce a CEAP report in a timely manner that does not create unnecessary delays to the standards development process. It must be emphasized that the purpose of the CEAP is not to provide impediments to the NERC standard development process, but rather to inform stakeholders and decision makers of proposed industry cost impact and provide an opportunity for suggestions of alternate methods to achieve equally effective reliability goals and objectives that may result in less costly implementation. The final report is not intended to be analytical in nature but to promote better judgment and decision-making.

4. Confidentiality

All of the cost impact information submitted by entities will be reviewed and compiled prior to being made public, or presented to the SC and the SDT. The collection, review and compilation of information will be performed in conformance to all applicable requirements of Section 1500 of the NERC Rules of Procedure. Market sensitive issues of individual stakeholders may exist or be provided through the

responses to the CEAP questions. All necessary confidentiality will be maintained, and no market sensitive information or Critical Energy Infrastructure Information ("CEII") will be included in the final public report. Responders should identify confidential CEII or market sensitive information in their responses.

5. Process Details

5.1 NERC CEAP Process (See Figure 1: CEAP Process Flowchart)

1) When a draft SAR is posted for a thirty (30) day comment period, a set of CIA questions (Phase 1 of the CEAP) based on the sample questions in Appendix B, (as amended on a case-specific basis to reflect the contents of the SAR), will be posted for stakeholder review and response.

2) The responses will be evaluated and consolidated into the CIA report and submitted to the SC and to the SDT for informational purposes. The CIA report will be posted as part of a standard's development record.

3) The SDT in conjunction with the NERC Standards Development Advisor will initiate the CEA phase (Phase 2 of the CEAP). The CEA phase will typically be conducted during the first combined formal comment period and ballot.

4) The NERC Standards Development Advisor, will complete the CEAP Process Control Document (see Appendix A for template) outlining the expectations for the development of the final CEAP report. The NERC Standards Development Advisor will use the CEAP Process Control document to provide oversight of the CEA.

5) Under the guidance of the NERC Standards Development Advisor and the CEAP Process Control document the SDT will develop a set of survey questions using the template in Appendix B (as amended on a case-specific basis) and adding any other questions that may be necessary to identify the impact (*i.e.*, operational, implementation costs, resources, maintenance costs, ongoing compliance costs, etc.) of the proposed standard's requirements on a requirement by requirement basis. The surveys should be designed such that its results provide:

    i. An indication of what cost impact would be associated with the individual requirements in the standard, if approved.
    ii. An indication of the entities' estimates of what resources and timeframes might be needed to comply with a standard's requirements and provide information on the time the entities might need to implement the requirements of the standard, and develop documentation regarding compliance. This input would consider not only technical but

budgetary concerns. The timeframe would provide further input to the SDT's Implementation Plan.

iii. The identification of potential alternative reliability requirements that could more cost effectively achieve the same reliability objective, and provide justifications, as well as any potential adverse impacts or unintended consequences, if any, that may result directly, or indirectly.

iv. The identification of any market or regulatory issues that may exist and how they could affect the standard's requirements or applicability.

6) The CEA survey questions, along with all pertinent information, will be posted (i) concurrently with the first formal comment period and ballot and (ii) on an as-needed basis to reflect modifications to the proposed reliability standard.

7) Survey results will be evaluated and consolidated into the CEA report with due consideration of any market sensitive information.

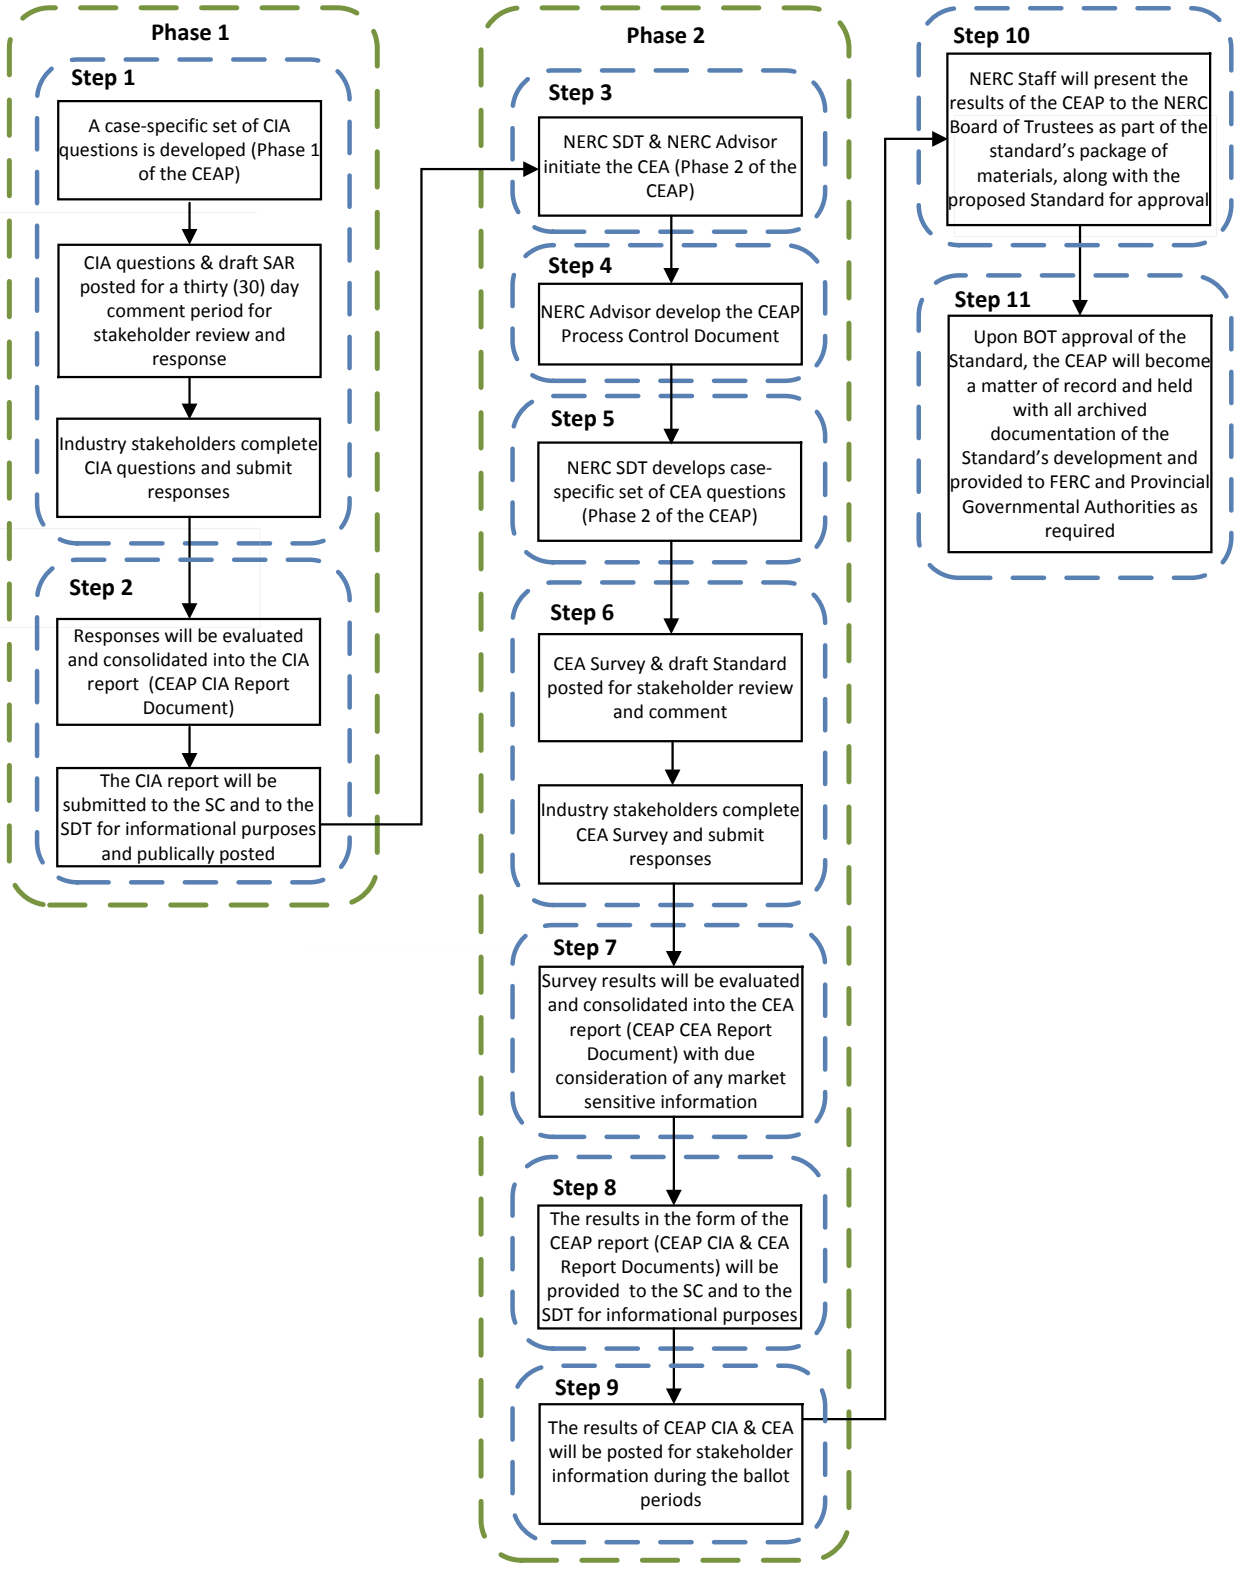
8) Upon completion of the CEA, the results in the form of the CEAP report will be provided to the SC and the SDT for informational purposes. If insufficient responses are received, this will be noted in the CEAP report. The format for the report is set forth in Appendix C of this document.

9) The SC will authorize posting of the CEAP report prior to or concurrent with the successive or recirculation ballot.

10) NERC Staff will present the final CEAP report to the NERC Board of Trustees ("BOT") as part of a standard's package of materials, along with the proposed standard for approval.

11) Upon BOT approval of the standard, the CEAP will become a matter of record and will be held with all archived information in the standard's development record and provided to the FERC and applicable Governmental Authorities as required. The CEAP is informational and is not in itself approved by FERC or the applicable Governmental Authorities.

5.2 Figure 1: CEAP Process Flowchart



5.3 Considerations for the CEAP Report

In developing the reports for Phase 1 of the CEAP ("CIA") and Phase 2 ("CEA") the Standards Committee Process Subcommittee ("SCPS") or other SC designee(s), will utilize any and all available and approved data and tools which may be necessary to extrapolate from incomplete responses, or leverage historical and "snapshot" data and available information to produce an informative report. The CEAP should focus on data related to facilities and other resources and activities subject to the NERC standards.

Items that may be used when developing the report and Staff recommendation may consist of, but not be limited to the following:

i. Adequate Level of Reliability (ALR) Metrics
ii. Transmission Availability Data System (TADS), Generating Availability Data System (GADS) and Demand Response Availability Data System (DADS) databases Filings of the Energy Information Administration EIA411 Form Data which includes information regarding quantities of resources and transmission miles by voltage class
iii. Event, condition, and performance driven indices being developed
iv. Historical Compliance or Event Analysis information
v. Published "Lessons Learned"
vi. Standards Issues Database

Examples of how some of the above may be used, include, but are not limited to, the following;

i. Use of "averaging" when insufficient data may have been submitted by stakeholders. In some instances it may be sufficient to provide a "typical" cost impact for a Transmission Owner with "X" number of miles of transmission, or a Generator capable of "X" MW. Ranges instead of discrete cost impacts such as Transmission Owners' costs ranged between $X and $Y dollars per miles of transmission may be used. Regional characteristics will be taken into consideration to ensure that "averaging" does not produce a misleading perception of results.
ii. Extrapolating when insufficient data may have been submitted by stakeholders by determining total Generation or Transmission circuit miles by voltage class and estimating from the responses given total potential industry cost impact. Energy Information Administration EIA411 Data that NERC currently compiles could provide this "total" data and submitted data could be extrapolated to arrive at approximate industry cost impact.
iii. If the evaluation required extrapolation, estimation or averaging of data to provide useful information, the methods will be documented in the CEAP report for reference.

Data characteristics could include:

- Transmission Owner/Transmission Operator – Approximate miles of transmission lines. (Number of interconnections?) (Number of Stations?)
- Generator Owner/Generator Operator – Aggregate gross capacity of generation resources (MVA).
- Load Serving Entity/Distribution Provider – Peak loading (MW).
- Reliability Coordinator/Balancing Authority/Planning Authority – Approximate miles of transmission lines & aggregate gross capacity of generation resources (MVA).

Appendix B

Sample CIA and CEA Questions

Sample CIA Questions (Additional questions may be included as appropriate):

(Respondents should identify their responses they believe to be CEII, market sensitive, or otherwise confidential.)

1) What approximate incremental one-time and ongoing estimated potential cost impacts are associated with the following: (Please be as specific as possible)

   (a) Implementation costs

   (b) Maintenance costs

   (c) Ongoing Compliance Resource Requirements

2) Are there alternative method(s) or existing reliability standard requirement(s) not identified in the SAR that may achieve the reliability objective? Please explain.

3) Would a technical guideline or "best practices" whitepaper or a training program be effective in achieving a desired outcome to meet the reliability need, as opposed to a "continent-wide" standard? If so, please explain why.

4) What level of reliability related risk exposure of the interconnected transmission network is being addressed by the standard (*i.e.*, High, Medium, or Low)?

Sample CEA Technical Survey Questions (Additional questions may be included as appropriate):

(Respondents should identify their responses they believe to be CEII, market sensitive, or otherwise confidential.)

T-1) Do the requirements in the proposed Reliability Standard collectively achieve the reliability objective of the standard and if not, why?

T-2) Are there alternative method(s) or existing reliability standard requirement(s) not identified in the draft standard which may achieve the draft standard's reliability objective? If so, what alternatives are there and which requirements would they replace?

T-3) On a requirement by requirement basis, does each of the draft requirements, by itself, achieve or contribute to a level of reliability that is "adequate," i.e. acceptable? If so, how? If not, why not?

T-4) Are there additional "efficiencies" that could be realized for any requirement(s)? If so, which requirements, what "efficiencies," and how might they be realized?

T-5) Is there any adverse impact to reliability or any other existing NERC standard, Regional standard, Regional criteria, or in-process project draft standard(s), of which your organization is aware?

T-6) What level of reliability related risk exposure of the interconnected transmission network is being addressed by this standard? (i.e. High, Medium, or Low)

Sample CEA Cost and Implementation Questions (SDT may include additional questions as appropriate):

(Respondents should identify their responses they believe to be CEII, market sensitive, or otherwise confidential.)

CI-1) Describe the size of your organization in broad general terms, e.g. GO-Total installed MWs, TOs circuit miles by kV and total load served, etc.

CI-2) Please answer the following regarding the estimated costs and benefits of each of the proposed requirements:

CI-2a) What are the initial one time, ongoing, implementation, and maintenance costs of complying with the requirements?

CI-2b) What is the on-going long term cost impact (after implementation) of complying with the requirements in terms of equivalent full time employees (EFTE)?

CI-2c) What are the resource benefits (labor, materials, administrative) of implementing these requirements?

CI-2d) What are the reliability benefits of implementing these requirements?

CI-3) Are there alternative method(s) or existing reliability standard requirement(s) not identified in the draft standard which may achieve the reliability objective of the standard that may result in less cost impact (implementation, maintenance, and ongoing compliance resource requirements)? If so what? Please provide as much additional supporting evidence as possible.

CI-4) How long would it take your organization to implement full compliance to the standard as written? What would affect the implementation (i.e. outage scheduling, availability of materials, human resources, etc.)?

CI-5) Would a technical guideline or “best practices” whitepaper or a training program be effective in achieving a desired outcome to meet the reliability need, as opposed to a “continent-wide” standard or variance?

Appendix C

CEAP Report Document Format

The final CEAP Report should be provided in consideration of the following:

i. The total of number of respondents, their cost impacts and their capacities(relative sizes) with due consideration given to market sensitivities.
ii. Ranges or discrete cost impact per MW or circuit mile of transmission or some other factor that industry can utilize to determine an approximation for their cost impact.
iii. Total industry wide potential implementation cost impact for entities.
iv. Effectiveness of the requirements to meet the reliability objective of the standard.
v. Basis for need of the standard as identified in the CIA Phase One of the project based on probabilities of occurrence, potential severity of impact to the BES and reliability need (event, condition or performance driven).
vi. List of any alternatives considered that may have been proposed by stakeholders and not accepted by the SDT along with reasons.
vii. List any assumptions or extrapolations that may have been presented in the report which may affect the results.

If the industry responses were insufficient to provide the SC and SDT with meaningful guidance, efforts will be made to extrapolate without drawing conclusions, clearly identifying where this extrapolation may have been done in the final report.

The approach described poses questions and provides aggregated results in the form of a report to the industry for informational purposes during balloting. The report will take into consideration market sensitivities and the confidentiality of the individual responses and the respondents.

In addition, information in the final posted report will be based on the total number of respondents with due regard to geographic and topological reliability impacts. Upon authorization, the report will be posted along with the NERC standard during balloting**.**

CEAP Phase 2 Cost Effectiveness Analysis (CEA) Report 17

1. Introduction

Cost considerations are inherent in the development of Reliability Standards. One of the objectives of the NERC Cost Effective Analysis Process ("CEAP" or "Process") is to make such considerations transparent and to ensure that where decisions on Reliability Standards are made regarding cost effectiveness, these decisions are made in an open manner and are part of the standard development record.

While the reliability benefit of any one particular Reliability Standard may be small, taken together, the full battery of standards form a coherent and interdependent whole that helps ensure the reliability of the North American Bulk Power System ("BPS").Understanding the implementation costs and continuing costs of meeting compliance obligations for standards is vital to the development of these standards. Additionally, it is beneficial to industry stakeholders to identify and utilize the most cost effective methods of achieving the standards reliability objective and to afford the same industry stakeholders the ability to propose alternative methods of achieving the reliability objectives.

Regulatory authorities, federal, state and provincial, as well as the NERC Board of Trustees, Regional Entities and electric industry stakeholders have all expressed interest in a process to determine effectiveness and implementation costs of proposed or revised standards to improve reliability of facilities, resources and activities subject to NERC standards. The CEAP will also contribute to the record of standard development and become an integral part of filings with regulatory authorities providing additional needed information and justifications for the standards. Inclusion of implementation costs will also provide a sound basis to assist regulators in satisfying requirements for data that must accompany, and appear in, rulemakings (e.g. the Regulatory Flexiblity Act and Office Management and Budget requirments).

The foundation for this document was the Northeast Power Coordinating Council (NPCC) CEAP which was developed to address the NPCC Board of Director's concerns about implementation costs. The NPCC CEAP was effectively piloted and proved beneficial and has served to provide the concepts found in this NERC CEAP Guideline.

2. Purpose

The CEAP and associated implementation plan represent an initial effort towards addressing concerns regarding cost impacts (*e.g.,* implementation, maintenance, and ongoing compliance resource requirements) associated with achieving reliability objectives for facilities, resources and activities subject to NERC standards.

The purpose of the CEAP is to establish guidelines for the solicitation of input and high level data from the industry, as part of and during the standards development process, to identify more cost effective ways to achieve the same or better reliability outcomes at equal or lower costs. The CEAP is intended to allow the industry the opportunity during the drafting process to identify alternative requirements or methods for meeting a standard's reliability objective that may be (i) less costly or (ii) equally or more effective, or (iii) more efficient. The CEAP, conducted in parallel with the drafting process, should not significantly delay the development of the standard and will add supporting information and background for the NERC stakeholders, the NERC Board of Trustees, and Federal, Provincial and State Regulatory Agencies to be utilized for decision-making.

The CEAP is not intended to provide a comprehensive cost impact or benefit analysis. The CEAP is a guideline to be used for information gathering purposes only and is intended to collect beneficial data, not previously available during standards development. The CEAP is intended to augment and contribute to the efficiency and effectiveness of reliability standards and not delay or obstruct their development.

3. Process Overview

The CEAP will be conducted in two phases. Phase 1, Cost Impact Analysis ("CIA"), and Phase 2, Cost Effectiveness Analysis ("CEA"). Each phase of the CEAP will consist of a set of surveys with questions to be responded to by the industry.

The CEAP Final Report will consist of the (1) CEAP Phase 1 CIA Report and, (2) all combined CEAP Phase 2 CEA Reports.

The CEAP process will result in the production and publication of a CEAP Report, to be archived on the NERC website with the documentation related to the development of the standard.

3.1 Phase 1 Cost Impact Analysis (CIA)

Phase 1 will typically be conducted in conjunction with the Standards Authorization Request ("SAR") stage of a standard's development. The CIA is intended to collect estimated industry wide cost impacts (implementation, maintenance, and ongoing compliance resource requirements) and will evaluate potential reliability benefits of a proposed draft reliability standard. The CIA proposes an analysis of potential areas for coordination and efficiency gains in the development of proposed standards. The CIA will provide a high level "snapshot" of estimated cost impacts and mitigated reliability risks of the proposed reliability standard by soliciting input from stakeholders.

Questions posed during the Phase 1 CIA will focus on potential cost impacts and reliability risks to determine if the standard, in the view of stakeholders, would achieve or possibly exceed an Adequate Level of Reliability ("ALR"). Cost information collected in this phase should be "order of magnitude costs" to determine if a proposed standard will have excessive costs associated with it.

3.2 Phase 2 Cost Effectiveness Analysis (CEA)

The purpose of the CEA is to provide information about cost impacts (*e.g.*, implementation, maintenance, and ongoing compliance resource requirements) of draft reliability standards and their relative effectiveness, which will allow the industry to evaluate and propose alternative approaches for achieving the reliability objectives of the standard. Phase 2 will typically be conducted at the time of the first combined Formal Comment period and Ballot.

The CEA will involve two sets of survey questions which will be asked concurrently. The first set relates to technical feasibility and effectiveness of the proposed requirements as well as soliciting possible more cost effective alternatives to achieve the reliability objectives. The second set of questions will solicit cost impacts (*e.g.*, implementation, maintenance, and ongoing compliance resource requirements) and any related implementation information.

3.3 Cost Effective Analysis Process (CEAP) Report

All information provided during the CIA and CEA phases of the CEAP will be consolidated and evaluated to produce a CEAP report. The CEAP report will be provided to the NERC Standards Committee ("SC") and to the Standard Drafting Team ("SDT") for informational purposes.

All available resources will be utilized effectively and efficiently to produce a CEAP report in a timely manner that does not create unnecessary delays to the standards development process. It must be emphasized that the purpose of the CEAP is not to provide impediments to the NERC standard development process, but rather to inform stakeholders and decision makers of proposed industry cost impact and provide an opportunity for suggestions of alternate methods to achieve equally effective

reliability goals and objectives that may result in less costly implementation. The final report is not intended to be analytical in nature but to promote better judgment and decision-making.

4. Confidentiality

All of the cost impact information submitted by entities will be reviewed and compiled prior to being made public, or presented to the SC and the SDT. The collection, review and compilation of information will be performed in conformance to all applicable requirements of Section 1500 of the NERC Rules of Procedure. Market sensitive issues of individual stakeholders may exist or be provided through the responses to the CEAP questions. All necessary confidentiality will be maintained, and no market sensitive information or Critical Energy Infrastructure Information ("CEII") will be included in the final public report. Responders should identify confidential CEII or market sensitive information in their responses.

5. Process Details

5.1 NERC CEAP Process (See Figure 1: CEAP Process Flowchart)

1) When a draft SAR is posted for a thirty (30) day comment period, a set of CIA questions (Phase 1 of the CEAP) based on the sample questions in Appendix B, (as amended on a case-specific basis to reflect the contents of the SAR), will be posted for stakeholder review and response.

2) The responses will be evaluated and consolidated into the CIA report and submitted to the SC and to the SDT for informational purposes. The CIA report will be posted as part of a standard's development record.

3) The SDT in conjunction with the NERC Standards Development Advisor will initiate the CEA phase (Phase 2 of the CEAP). The CEA phase will typically be conducted during the first combined formal comment period and ballot.

4) The NERC Standards Development Advisor, will complete the CEAP Process Control Document (see Appendix A for template) outlining the expectations for the development of the final CEAP report. The NERC Standards Development Advisor will use the CEAP Process Control document to provide oversight of the CEA.

5) Under the guidance of the NERC Standards Development Advisor and the CEAP Process Control document the SDT will develop a set of survey questions using the template in Appendix B (as amended on a case-specific basis) and adding any other questions that may be necessary to

identify the impact (*i.e.*, operational, implementation costs, resources, maintenance costs, ongoing compliance costs, etc.) of the proposed standard's requirements on a requirement by requirement basis. The surveys should be designed such that its results provide:

i. An indication of what cost impact would be associated with the individual requirements in the standard, if approved.
ii. An indication of the entities' estimates of what resources and timeframes might be needed to comply with a standard's requirements and provide information on the time the entities might need to implement the requirements of the standard, and develop documentation regarding compliance. This input would consider not only technical but budgetary concerns. The timeframe would provide further input to the SDT's Implementation Plan.
iii. The identification of potential alternative reliability requirements that could more cost effectively achieve the same reliability objective, and provide justifications, as well as any potential adverse impacts or unintended consequences, if any, that may result directly, or indirectly.
iv. The identification of any market or regulatory issues that may exist and how they could affect the standard's requirements or applicability.

6) The CEA survey questions, along with all pertinent information, will be posted (i) concurrently with the first formal comment period and ballot and (ii) on an as-needed basis to reflect modifications to the proposed reliability standard.

7) Survey results will be evaluated and consolidated into the CEA report with due consideration of any market sensitive information.

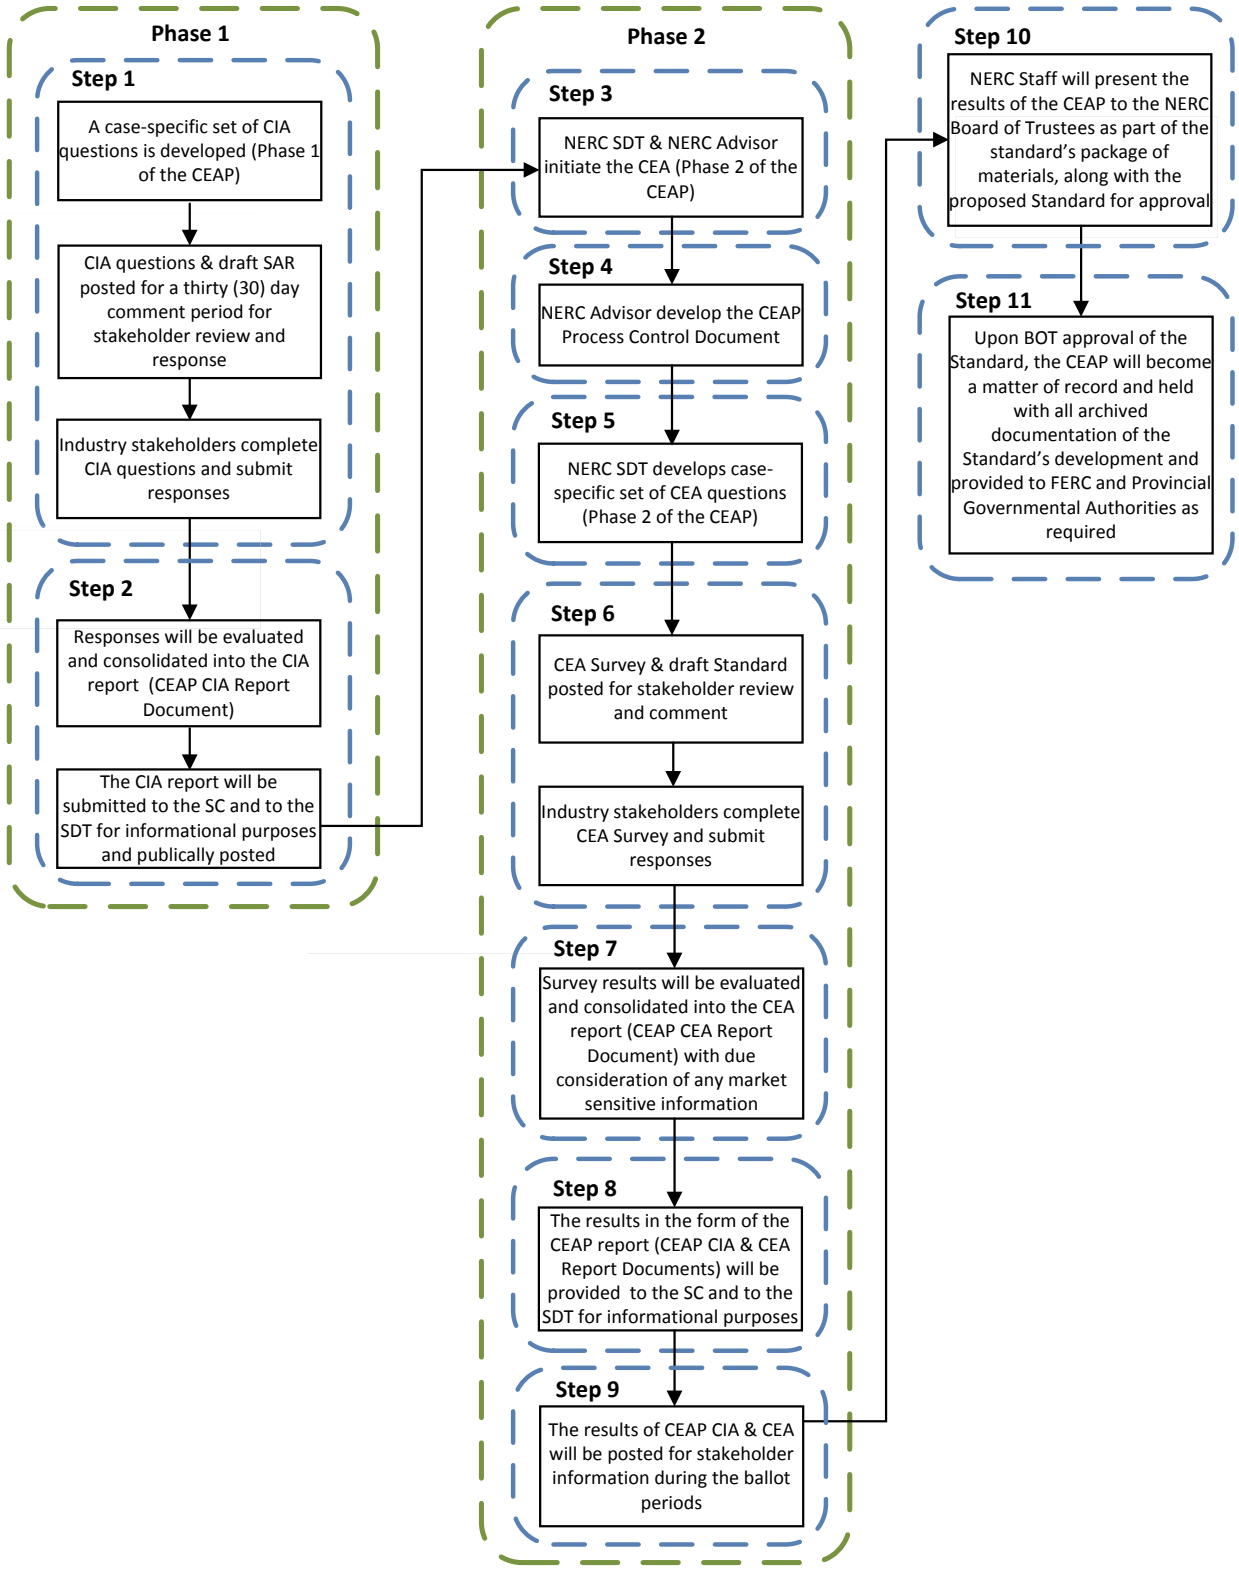
8) Upon completion of the CEA, the results in the form of the CEAP report will be provided to the SC and the SDT for informational purposes. If insufficient responses are received, this will be noted in the CEAP report. The format for the report is set forth in Appendix C of this document.

9) The SC will authorize posting of the CEAP report prior to or concurrent with the successive or recirculation ballot.

10) NERC Staff will present the final CEAP report to the NERC Board of Trustees ("BOT") as part of a standard's package of materials, along with the proposed standard for approval.

11) Upon BOT approval of the standard, the CEAP will become a matter of record and will be held with all archived information in the standard's development record and provided to the FERC and applicable Governmental Authorities as required. The CEAP is informational and is not in itself approved by FERC or the applicable Governmental Authorities.

5.2 *Figure 1: CEAP Process Flowchart*



5.3 Considerations for the CEAP Report

In developing the reports for Phase 1 of the CEAP ("CIA") and Phase 2 ("CEA") the Standards Committee Process Subcommittee ("SCPS") or other SC designee(s), will utilize any and all available and approved data and tools which may be necessary to extrapolate from incomplete responses, or leverage historical and "snapshot" data and available information to produce an informative report. The CEAP should focus on data related to facilities and other resources and activities subject to the NERC standards.

Items that may be used when developing the report and Staff recommendation may consist of, but not be limited to the following:

i. Adequate Level of Reliability (ALR) Metrics
ii. Transmission Availability Data System (TADS), Generating Availability Data System (GADS) and Demand Response Availability Data System (DADS) databases Filings of the Energy Information Administration EIA411 Form Data which includes information regarding quantities of resources and transmission miles by voltage class
iii. Event, condition, and performance driven indices being developed
iv. Historical Compliance or Event Analysis information
v. Published "Lessons Learned"
vi. Standards Issues Database

Examples of how some of the above may be used, include, but are not limited to, the following;

i. Use of "averaging" when insufficient data may have been submitted by stakeholders. In some instances it may be sufficient to provide a "typical" cost impact for a Transmission Owner with "X" number of miles of transmission, or a Generator capable of "X" MW. Ranges instead of discrete cost impacts such as Transmission Owners' costs ranged between $X and $Y dollars per miles of transmission may be used. Regional characteristics will be taken into consideration to ensure that "averaging" does not produce a misleading perception of results.
ii. Extrapolating when insufficient data may have been submitted by stakeholders by determining total Generation or Transmission circuit miles by voltage class and estimating from the responses given total potential industry cost impact. Energy Information Administration EIA411 Data that NERC currently compiles could provide this "total" data and submitted data could be extrapolated to arrive at approximate industry cost impact.
iii. If the evaluation required extrapolation, estimation or averaging of data to provide useful information, the methods will be documented in the CEAP report for reference.

Data characteristics could include:

- Transmission Owner/Transmission Operator – Approximate miles of transmission lines. (Number of interconnections?) (Number of Stations?)

NOTE: The cost difference for overhead vs. underground might require a divided classification of cost, e.g., $X per overhead mile of transmission operated at 200kV and above.

- Generator Owner/Generator Operator – Aggregate gross capacity of generation resources (MVA).

NOTE: Standards may impact different technologies differently. Costs might have to be classified by generation type, e.g., Nuclear $Y per MW, GT's $Z per MW.

- Load Serving Entity/Distribution Provider – Peak loading (MW).
- Reliability Coordinator/Balancing Authority/Planning Authority – Approximate miles of transmission lines & aggregate gross capacity of generation resources (MVA).

Sample CIA and CEA Questions

Sample CIA Questions (Additional questions may be included as appropriate):

(Respondents should identify their responses they believe to be CEII, market sensitive, or otherwise confidential.)

1) What approximate incremental one-time and ongoing estimated potential cost impacts are associated with the following: (Please be as specific as possible)

   (a) Implementation costs

   (b) Maintenance costs

   (c) Ongoing Compliance Resource Requirements

2) Are there alternative method(s) or existing reliability standard requirement(s) not identified in the SAR that may achieve the reliability objective? Please explain.

3) Would a technical guideline or "best practices" whitepaper or a training program be effective in achieving a desired outcome to meet the reliability need, as opposed to a "continent-wide" standard? If so, please explain why.

4) What level of reliability related risk exposure of the interconnected transmission network is being addressed by the standard (*i.e.*, High, Medium, or Low)?

Sample CEA Technical Survey Questions (Additional questions may be included as appropriate):

(Respondents should identify their responses they believe to be CEII, market sensitive, or otherwise confidential.)

T-1) Do the requirements in the proposed Reliability Standard collectively achieve the reliability objective of the standard and if not, why?

T-2) Are there alternative method(s) or existing reliability standard requirement(s) not identified in the draft standard which may achieve the draft standard's reliability objective? If so, what alternatives are there and which requirements would they replace?

T-3) On a requirement by requirement basis, does each of the draft requirements, by itself, achieve or contribute to a level of reliability that is "adequate," i.e. acceptable? If so, how? If not, why not?

T-4) Are there additional "efficiencies" that could be realized for any requirement(s)? If so, which requirements, what "efficiencies," and how might they be realized?

T-5) Is there any adverse impact to reliability or any other existing NERC standard, Regional standard, Regional criteria, or in-process project draft standard(s), of which your organization is aware?

T-6) What level of reliability related risk exposure of the interconnected transmission network is being addressed by this standard? (i.e. High, Medium, or Low)

Sample CEA Cost and Implementation Questions (SDT may include additional questions as appropriate):

(Respondents should identify their responses they believe to be CEII, market sensitive, or otherwise confidential.)

CI-1) Describe the size of your organization in broad general terms, e.g. GO-Total installed MWs, TOs circuit miles by kV and total load served, etc.

CI-2) Please answer the following regarding the estimated costs and benefits of each of the proposed requirements:

CI-2a) What are the initial one time, ongoing, implementation, and maintenance costs of complying with the requirements?

CI-2b) What is the on-going long term cost impact (after implementation) of complying with the requirements in terms of equivalent full time employees (EFTE)?

CI-2c) What are the resource benefits (labor, materials, administrative) of implementing these requirements?

CI-2d) What are the reliability benefits of implementing these requirements?

CI-3) Are there alternative method(s) or existing reliability standard requirement(s) not identified in the draft standard which may achieve the reliability objective of the standard that may result in less cost impact (implementation, maintenance, and ongoing compliance resource requirements)? If so what? Please provide as much additional supporting evidence as possible.

CI-4) How long would it take your organization to implement full compliance to the standard as written? What would affect the implementation (i.e. outage scheduling, availability of materials, human resources, etc.)?

CI-5) Would a technical guideline or "best practices" whitepaper or a training program be effective in achieving a desired outcome to meet the reliability need, as opposed to a "continent-wide" standard or variance?

Appendix C

CEAP Report Document Format

The final CEAP Report should be provided in consideration of the following:

i. The total of number of respondents, their cost impacts and their capacities(relative sizes) with due consideration given to market sensitivities.
ii. Ranges or discrete cost impact per MW or circuit mile of transmission or some other factor that industry can utilize to determine an approximation for their cost impact.
iii. Total industry wide potential implementation cost impact for entities.
iv. Effectiveness of the requirements to meet the reliability objective of the standard.
v. Basis for need of the standard as identified in the CIA Phase One of the project based on probabilities of occurrence, potential severity of impact to the BES and reliability need (event, condition or performance driven).
vi. List of any alternatives considered that may have been proposed by stakeholders and not accepted by the SDT along with reasons.
vii. List any assumptions or extrapolations that may have been presented in the report which may affect the results.

If the industry responses were insufficient to provide the SC and SDT with meaningful guidance, efforts will be made to extrapolate without drawing conclusions, clearly identifying where this extrapolation may have been done in the final report.

The approach described poses questions and provides aggregated results in the form of a report to the industry for informational purposes during balloting. The report will take into consideration market sensitivities and the confidentiality of the individual responses and the respondents.

In addition, information in the final posted report will be developed by a team with the required subject matter knowledge to be able to analyze and present the data in a useful form. The report will include the total number of respondents with due regard and identification of geographic and topological reliability impacts. Upon authorization, the report will be posted along with the NERC standard during balloting**.**

CEAP Phase 1 Cost Impact Analysis (CIA) Report

I. Draft Standard Title/Project Number

II. Executive Summary

III. Standard Type (i.e. Planning- TPL, Protection-PRC, etc.)

IV. Functional Entity Applicability

V. Survey Participants

- a. Analysis of Participants
  - i. Functional Entities (quantity of each type of entity)
  - ii. Relative Sizes (e.g., miles of transmission by class, etc.)
  - iii. Geographic Locations (e.g., region, interconnections, countries, etc.)
- b. Graphical Depiction of Results

VI. CEAP Phase 1 CIA

- a. Reliability Benefit Analysis
  - i. Reliability Related Survey Questions
    1. Assumptions
    2. Data Analysis
  - ii. Results
- b. Cost Impact Analysis
  - i. Cost Related Survey Questions
    1. Assumptions
    2. Data Analysis
  - ii. Graphical Depictions of Results

VII. Conclusions for Phase 1 CIA

CEAP Phase 2 Cost Effectiveness Analysis (CEA) Report

I. Draft Standard Title/Project Number

II. Executive Summary

III. Standard Type (i.e. Planning- TPL, Protection-PRC, etc.)

IV. Functional Entity Applicability

V. Survey Participants

- a. Analysis of Participants
  - i. Functional Entities (quantity of each type of entity)
  - ii. Relative Sizes (e.g., miles of transmission by class, etc.)
  - iii. Geographic Locations (e.g., region, interconnections, countries, etc.)
- b. Graphical Depiction of Results

VI. CEAP Phase 2 CEA

- a. Standard/Requirement Technical Analysis
  - i. Technical Survey Questions
    1. Assumptions
    2. Data Analysis
  - ii. Results
- b. Cost and Implementation Analysis
  - i. Cost and Implementation Survey Questions
    1. Assumptions
    2. Data Analysis
  - ii. Graphical Depictions of Results

VII. Conclusions for Phase 2 CEA

Subject:	Revised NERC CEAP Document and Implementation Plan Whitepaper
Date:	Thursday, September 27, 2012 10:56:19 AM
Attachments:	NERC CEAP DRAFT 09 27 2012.docx Whitepaper on Implementation of CEAP-09.19.2012.docx
Importance:	High

CEAP Team et al,

Attached is the revised draft of the CEAP(minus the cover page due to size restrictions on recipient emails) incorporating points from our meeting with the FERC, your suggestions, and reflective of stakeholders comments received during the posting period. I would like you to send me any further suggested revisions by Friday of this week, Sept. 29th. I would like to gain the NERC SC's approval/endorsement of this and have it available for use by the RISC and the SC if they so choose to implement it. In addition, please also find attached, a revised "scaled down" implementation plan that hopefully will be well received and allow this project to move forward more expeditiously to a field test. Comments on the implementation document are welcome as well by this Friday. I will forward everything to Laura Hussey for inclusion in the SC October meeting material package on Monday and provide the "responses to comments" document for posting on the project page at that time as well.

Thank you all for you participation in this project and as the implementation plan shows, I propose we have some future role in assisting with this important endeavor. Special thanks to Pete Heidrich who provided significant help to me during the past two weeks to bring this closer to the finish line.

Regards,

Guy V. Zito

Subject: FERC Chairman Jon Wellinghoff on Right of First Refusal (ROFR) Orders

CEAP Team,

On Sept. 19th The FERC released statements on two denials for rehearings which were filed in response to complaints against PJM and whether a regional planning process has the "right of first refusal" for a project. The proceedings may be found at :

http://elibrary.FERC.gov/idmws/file_list.asp?accession_num=20120719-4006

In FERC's deteminination, as outlined in Order 1000 and to paraphrase; The commissions reaffirms it is unjust and unreasonable to grant incumbent transmission providers a federal right of first refusal with respect to certain transmission projects because doing so may result in the failure to consider more efficient or **cost-effective** solutions to regional needs and, in turn, result in the inclusion of higher-cost solutions in the regional plan.

Cost Effectiveness is being further emphasized and is playing a larger role in Commission rulings and activities and I think this is yet another example of the importance to continue to move the NERC CEAP forward towards implementation, even if in a reduced form.

Thanks,

Guy V. Zito

Subject: Resend, NERC CEAP Team Meeting - ERCOT Austin - August 29-30, 2012
Importance: High

CEAP Team,

Please respond to me if you are planning on attending next week's meeting in Austin. I am resending the attached meeting logistics and a draft agenda for the subject meeting. Those that are proposing any further changes from Kate and my draft sent out two weeks ago, please bring the proposed revisions to the meeting. I also want to go over the CEAP draft implementation plan and how to move forward with piloting this.

Thanks,

Guy V. Zito

July 19, 2012Chairman Jon Wellinghoff

STATEMENT

FEDERAL ENERGY REGULATORY COMMISSION

Docket Nos.: ER10-253-001, EL10-14-001, EL10-52-001, ER12-69-000, & ER12-24-000

Item Nos.: E-11, E-12, E-13 & E-14

Statement of Chairman Jon Wellinghoff on Right of First Refusal (ROFR) Orders

"Today's agenda includes several cases related to whether a regional planning process has a right of first refusal, and its impact on transmission development projects.

In E-11 and E-12, the Commission denies requests for rehearing in the complaints filed by Primary Power and Central Transmission, respectively, against PJM. In those cases, we find that PJM's Transmission Owners Agreement does not establish a ROFR as to economic projects and that non-incumbent providers can seek cost recovery under PJM's tariff for those projects.

In contrast, in E-14, *Pioneer v. NIPSCO*, and E-15, *Xcel v. American Transmission Company*, the Commission finds that MISO's Transmission Owners Agreement currently includes a ROFR, and that a proposed transmission line that connects the facilities of two transmission owners will be shared equally by those owners under MISO's TO Agreement, regardless of who initially proposed the line. Although the complainants argued that application of a ROFR in MISO's planning process would be inconsistent with the Commission's findings in Order No. 1000 that it is not just and reasonable, we note that Order No. 1000 applies prospectively, upon acceptance of the parties' compliance filings, which are due in October of this year.

Additionally, in E-13, we deny a complaint brought by Primary Power against PJM for selecting competing projects proposed by incumbent transmission providers. In that case, PJM selected the proposals to construct static var compensators in existing substations by incumbent transmission providers, due to the lower cost.

These orders highlight the very situation that Order No. 1000 is designed to remedy. In Order No. 1000, the Commission stated that it is unjust and unreasonable to grant incumbent transmission providers a federal right of first refusal with respect to certain transmission projects because doing so may result in the failure to consider more efficient or cost-effective solutions to regional needs and, in turn, result in the inclusion of higher-cost solutions in the regional plan. In Order No. 1000-A, the Commission further stated that "expanding the universe of transmission developers offering potential solutions can lead to the identification and evaluation of potential solutions to regional needs that are more efficient or cost-effective." The Commission therefore directed elimination of provisions that establish a federal right of first refusal for an incumbent transmission provider with respect to transmission facilities selected in a regional transmission plan for purposes of cost allocation.

The Commission also provided further guidance in the development of regional transmission planning processes. We note that in Order No. 1000, the Commission required each public utility transmission provider to revise its open access transmission tariff to identify the information that must be submitted by a prospective transmission developer in support of a transmission project that it proposes in the regional transmission planning process. The public utility transmission provider must also provide the date by which such information must be submitted to be considered in a given planning cycle. Each region may determine for itself what deadline is appropriate, including rolling or flexible dates to reflect the iterative nature of its transmission planning process.

The Commission also provided flexibility to regions by stating in Order No. 1000 that the public utility transmission providers may, but are not required to, use competitive solicitation to solicit project or project developers to meet

regional needs. The Commission declined to adopt suggestions to mandate a competitive bidding process. The Commission explained that while it agrees that a competitive process can provide benefits to consumers, it continues to allow public utility transmission providers within each region to determine for themselves, in consultation with stakeholders, what mechanisms are most appropriate to evaluate and select potential transmission solutions to regional needs.

Order No. 1000 further requires public utility transmission providers to implement a planning process that evaluates competing projects in a way that is sufficiently detailed for stakeholders to understand why a particular transmission project was selected or not selected in the regional transmission plan for purposes of cost allocation. By requiring an open and transparent transmission planning process that produces a regional transmission plan, "Order No. 1000 will provide the Commission and interested parties with a record that we believe will be able to highlight whether public utility transmission providers are engaging in undue discrimination against others."

The deadline for filing Order No. 1000 compliance filings is October 11, 2012. We will scrutinize those and related implementation to ensure that Commission-jurisdictional tariffs and agreements are just and reasonable and not unduly discriminatory."

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Whitepaper - Implementation Plan of NERC Cost Effective Analysis Process, "CEAP"

Background

The Cost Effective Analysis Process ("CEAP") was developed in response to requests by NERC registered entities as well as regulators, to address compliance costs and the efficiency and reliability impact of the draft NERC Reliability Standards. The NERC Standards Process Input Group ("SPIG"), under the direction of the NERC Member Representatives Committee ("MRC"), identified cost effectiveness as part of a set of recommendations for improving the NERC standard development process. Upon approval of the SPIG recommendations by the NERC Board of Trustees ("BOT"), an assignment was made to the NERC Standards Committee ("SC") to address SPIG recommendations where appropriate. This *Whitepaper* describes the CEAP and includes a proposed Implementation Plan developed by an industry team working under the auspices of the NERC Standards Committee Process Subcommittee ("SCPS"). The CEAP estimates the implementation costs of a draft Reliability Standard and the effectiveness of the proposed standard if approved and implemented in support of the respective reliability objective.

Executive Summary

Cost considerations are inherent in the development of Reliability Standards. One of the objectives of the CEAP is to make such considerations transparent by ensuring where decisions are made regarding cost effectiveness, these decisions are made in an open manner and are part of the standard development record.

The CEAP affords stakeholders an opportunity to share projected cost information regarding implementation of draft standards and provides the opportunity to offer alternatives that would be equally, or more efficient at achieving the reliability objective of the draft standard while also taking into consideration implementation costs.

The CEAP currently proposes a two-phase process for identifying projected implementation costs. The first phase of the CEAP, identified as the Cost Impact Analysis ("CIA") is conducted during the Standard Authorization Request ("SAR") stage of the standard's development and would provide an opportunity to identify approximate implementation costs that may be associated with a proposed standard prior to its development. Information related to the proposed standard's mission and forecasted implementation costs would typically be collected from the industry during the initial SAR comment period. Information collected would be shared with the NERC Standards Committee ("SC"), Standard Drafting Teams ("SDT"), and will be posted on the NERC website.

The second phase of the CEAP, identified as the Cost Effective Analysis ("CEA"), is typically conducted later in the standards development process after the draft standard is developed by the SDT and is ready for the first combined formal comment period and ballot. In this phase, the industry would again be solicited to provide forecasted implementation costs of the proposed requirements and would be provided the opportunity to propose alternative methods to achieve the standard's reliability objective more efficiently. Any alternative proposals provided by the industry during this phase should contain sufficient technical justification, and if possible, cost comparison data for consideration.

This information will be aggregated, shared with the SDT and made available in the form of a "CEAP Final Report" during successive or recirculation ballots for industry consideration. The CEAP Final Report will then be provided for informational purposes to the NERC Board of Trustees ("BOT") with all other standard background information. Upon approval by the NERC BOT, the standard and the CEAP Final Report will be provided for informational purposes in the filings to applicable regulatory authorities.

The recommended implementation plan for CEAP ideally will include pilot projects for practical experience before a more expansive CEAP implementation. Ultimately, the success of the CEAP depends on the voluntary participation of industry stakeholders.

Recommended CEAP Implementation Plan

The following "Interim Step(s)" will be performed upon SC endorsement of this draft Implementation Plan:

Initial Pilot (Fall 2012/Winter 2013):

1. Immediately upon endorsement of the Implementation Plan, the CEAP Team will review all existing standard projects that are approaching a formal comment and initial ballot and will provide a list of candidates to the SC for potential piloting of the CEAP.
2. The CEAP Team with support from the SDT, when necessary, will develop a limited number of questions that will be added to the "Formal Comment" template for two standards selected for pilot by the SC. Typical questions will focus on:
    i. Identification of forecasted implementation costs of the draft standard.
    ii. More explicit solicitation from the industry to provide alternate ways to equally meet the reliability objective of the draft standard from a long-term implementation perspective, considering implementation costs.
3. Reponses to CEAP survey questions will be collected by NERC Staff and will only be provided to the CEAP Team for evaluation and consolidation. Confidentiality and market sensitive information will be respected and maintained throughout the process.

4. Aggregated information on survey responses related to costs of implementation and alternate methods on addressing this standard (including those alternative costs forecasts) will be made available to the SC and SDTs.
5. The SC and SDT will consider the information collected and take appropriate action which could include revision of the standard or posting of the aggregated summary of information received, with the recirculation ballot. If the SDT decides to revise the standard, then the forecasted costs will be collected again upon successive ballot to create a final record of implementation costs to be posted in conjunction with the recirculation ballot. The question on whether alternative methods of achieving the reliability objective of the Standard will not be solicited at the time of recirculation ballot.

The CEAP Team will develop and propose to the SC a full field test of the CEAP based on the results of the initial pilot and in consideration of any future modifications of the CEAP and the prospective cost effective related responsibilities of the Reliability Issues Steering Committee (RISC). The RISC may assume the responsibilities associated with the CEAP, partially or in its entirety, to address the NERC BOT approved 'SPIG' recommendations regarding the cost of implementation of Reliability Standards.

Proposed Uses of the CEAP

- All new standards development projects - (CIA Phase 1 and CEA Phase 2)
- Revised standards projects
- Standards being revised to meet FERC Directives - Phase 2
- Rapid Revisions - Phase 2 (subject to SC determination)

CEAP will not be applied to the following:

- Errata Changes
- Interpretations and Compliance Application Notices ("CANs")

Subject: FW: NERC: Standards Announcement - Standard Process Manual Revisions to Implement SPIG Recommendations - Initial Ballot Results
Date: Tuesday, October 16, 2012 9:38:26 AM

RSC Members,

Initial ballot of the revised Standards Process Manual failed by a small margin. I am currently drafting the responses on behalf of NERC to some of the concerns expressed in the comment period conducted with this ballot. David Kiguel and I will also report at the next RSC meeting on the proceedings at the NERC Standards Committee meeting last week where Gerry Cauley described his vision for standards and how he proposed we achieve that. Also in the coming weeks, Mr. Mark Lauby, who took over for Herb Schrayshuen as Vice President and Director of Standards, will be developing a strategic plan for moving forward with standards development. Initial discussions indicate a very ambitious undertaking of standards development, but retention of the core process. More information to come.

Subject: NERC: Standards Announcement - Standard Process Manual Revisions to Implement SPIG Recommendations - Initial Ballot Results

Standards Announcement

Standard Process Manual Revisions to Implement SPIG Recommendations

Initial Ballot Results

Available Now

An initial ballot for the Standards Processes Manual Revisions concluded on Friday, October 12, 2012.

Voting statistics are listed below, and the Ballots Results page provides a link to the detailed results.

Approval
Quorum: 87.23%
Approval: 63.17%

Next Steps

The Standards Committee Process Subcommittee sub-teams will meet in October to review all comments received and determine what revisions are necessary to finalize the SPM. If no significant changes are made, the SPM will be posted for a recirculation ballot and, if approved by the stakeholder body, presented to the NERC Board of Trustees for approval.

Background

At its February 9, 2012 meeting, the NERC Board of Trustees (BOT) requested the assistance of the NERC Member Representatives Committee (MRC) to provide policy input, and a proposed framework, for specific improvements to the standards development process. The MRC Chair and Vice Chair invited several members of the MRC, two NERC BOT members, the NERC CEO, and the Standards Committee (SC) Chair – the group collectively known as the Standard Process Input Group (SPIG) – to join with them as participants in developing recommendations to improve the standards development process.

To help ensure that the SPIG focused its efforts on the most important areas for improvement, the group began its work by gathering input from subject matter experts, including the regions, the MRC, standard drafting team leaders, NERC staff, and other stakeholders. This input was collected through a series of interviews, supplemented by a formal survey. Based on that input, the SPIG produced a document with five recommendations to modify the way NERC develops Reliability Standards and other solutions intended to improve the priority, product, and process of standards development:

1. **American National Standards Institute (ANSI):** NERC should continue to meet the minimum requirements of the ANSI process to preserve ANSI accreditation.
2. **Reliability Issues Steering Committee (RISC):** The NERC BOT is encouraged to form a RISC to conduct front-end, high-level reviews of nominated reliability issues and direct the initiation of standards projects or other solutions that will address the reliability issues. (Note that the RISC was formed during the August 16 BOT meeting.)
3. **Interface with Regulatory and Governmental Authorities:** The NERC BOT is encouraged to task NERC management, working with a broad array of Electric Reliability Organization resources (e.g., the MRC, technical committees, Regional Entities, trade associations, etc.) to develop a strategy for improving the communication and awareness of effective reliability risk controls to increase input and alignment with state, federal, and provincial authorities.
4. **Standards Product Issues:** The NERC BOT is encouraged to require that the standards development process address the use of results-based standards; cost effectiveness of standards and standards development; alignment of standards requirements/measures with Reliability Standards Audit Worksheets (RSAWs); and the retirement of standards no longer needed to meet an adequate level of reliability.
5. **Standards Development Process and Resource Issues:** The NERC BOT is encouraged to require the standards development process to be revised to improve timely, stakeholder consensus in support of new or revised reliability standards. The BOT is also encouraged to require standard development resources to achieve and address formal and consistent project management and efficient formation and composition of standard drafting teams.

The recommendations also aim to strengthen consensus building, first on the need for a standard, and then on the requirements themselves. Further detail is available in the posted SPIG report.

These recommendations were presented to the BOT and approved on May 9, 2012. The SC was specifically charged with addressing SPIG Recommendations 1, 4, and 5. The SC has organized this effort by leveraging each of its subcommittees, the Process Subcommittee (SCPS) and the Communications and Planning Subcommittee (SCCPS), to work in parallel on developing proposed revisions and conducting outreach to industry stakeholders to ensure that all interested stakeholders have an opportunity to provide their input.

On June 20, 2012, the first draft of SPM revisions was posted for a 30-day stakeholder comment period. The SCPS, supported by NERC staff, has spent the last several weeks reviewing this feedback, revising the proposed SPM as necessary, and responding to stakeholder comments. The proposed revisions to the SPM are included in the posted redline version of the document, and can be summarized as follows:

- Clarification of the requirements for responding to stakeholder comments during informal and formal comment periods
- Retention of the concept of including 'no' ballots that are not accompanied by comments in the calculation of quorum, but not being counted in the calculation of consensus; elimination of the evaluation of comments submitted alongside a 'no' vote to determine relevance
- Clarification of the proposal to move measures from standards to RSAWs
- Removal of the proposal to eliminate VRFs and VSLs from standards
- Clarification of the handling and purpose of interpretations
- Clarification of the intent of the waiver provision in section 16.0

The SC, its subcommittees, and NERC staff are grateful for the industry participation on this project to date, and encourages stakeholders to continue to offer feedback on the proposed SPM revisions so that the SC can deliver a significantly improved process in a timely fashion.

Additional documentation is available on the project page.

Subject: NERC: Standards Announcement - Standard Process Manual Revisions to Implement SPIG Recommendations - Initial Ballot Results
Date: Tuesday, October 16, 2012 9:47:59 AM

Standards Announcement

Standard Process Manual Revisions to Implement SPIG Recommendations

Initial Ballot Results

Available Now

An initial ballot for the Standards Processes Manual Revisions concluded on Friday, October 12, 2012.

Voting statistics are listed below, and the Ballots Results page provides a link to the detailed results.

Approval
Quorum: 87.23%
Approval: 63.17%

Next Steps

The Standards Committee Process Subcommittee sub-teams will meet in October to review all comments received and determine what revisions are necessary to finalize the SPM. If no significant changes are made, the SPM will be posted for a recirculation ballot and, if approved by the stakeholder body, presented to the NERC Board of Trustees for approval.

Background

At its February 9, 2012 meeting, the NERC Board of Trustees (BOT) requested the assistance of the NERC Member Representatives Committee (MRC) to provide policy input, and a proposed framework, for specific improvements to the standards development process. The MRC Chair and Vice Chair invited several members of the MRC, two NERC BOT members, the NERC CEO, and the Standards Committee (SC) Chair – the group collectively known as the Standard Process Input Group (SPIG) – to join with them as participants in developing recommendations to improve the standards development process.

To help ensure that the SPIG focused its efforts on the most important areas for improvement, the group began its work by gathering input from subject matter experts, including the regions, the MRC, standard drafting team leaders, NERC staff, and other stakeholders. This input was collected through a series of interviews, supplemented by a formal survey. Based on that input, the SPIG produced a document with five recommendations to modify the way NERC develops Reliability Standards and other solutions intended to improve the priority, product, and process of standards development:

1. **American National Standards Institute (ANSI):** NERC should continue to meet the minimum requirements of the ANSI process to preserve ANSI accreditation.
2. **Reliability Issues Steering Committee (RISC):** The NERC BOT is encouraged to form a RISC to conduct front-end, high-level reviews of nominated reliability issues and direct the initiation of standards projects or other solutions that will address the reliability issues. (Note that the RISC was formed during the August 16 BOT meeting.)
3. **Interface with Regulatory and Governmental Authorities:** The NERC BOT is encouraged to task NERC management, working with a broad array of Electric Reliability Organization resources (e.g., the MRC, technical committees, Regional Entities, trade associations, etc.) to develop a strategy for improving the communication and awareness of effective reliability risk controls to increase input and alignment with state, federal, and provincial authorities.
4. **Standards Product Issues:** The NERC BOT is encouraged to require that the standards development process address the use of results-based standards; cost effectiveness of standards and standards development; alignment of standards requirements/measures with Reliability Standards Audit Worksheets (RSAWs); and the retirement of standards no longer needed to meet an adequate level of reliability.
5. **Standards Development Process and Resource Issues:** The NERC BOT is encouraged to require the standards development process to be revised to improve timely, stakeholder consensus in support of new or revised reliability standards. The BOT is also encouraged to require standard development resources to achieve and address formal and consistent project management and efficient formation and composition of standard drafting teams.

The recommendations also aim to strengthen consensus building, first on the need for a standard, and then on the requirements themselves. Further detail is available in the posted SPIG report.

These recommendations were presented to the BOT and approved on May 9, 2012. The SC was specifically charged with addressing SPIG Recommendations 1, 4, and 5. The SC has organized this effort by leveraging each of its subcommittees, the Process Subcommittee (SCPS) and the Communications and Planning Subcommittee (SCCPS), to work in parallel on developing proposed revisions and conducting outreach to industry stakeholders to ensure that all interested stakeholders have an opportunity to provide their input.

On June 20, 2012, the first draft of SPM revisions was posted for a 30-day stakeholder comment period. The SCPS, supported by NERC staff, has spent the last several weeks reviewing this feedback, revising the proposed SPM as necessary, and responding to stakeholder comments. The proposed revisions to the SPM are included in the posted redline version of the document, and can be summarized as follows:

- Clarification of the requirements for responding to stakeholder comments during informal and formal comment periods
- Retention of the concept of including 'no' ballots that are not accompanied by comments in the calculation of quorum, but not being counted in the calculation of consensus; elimination of the evaluation of comments submitted alongside a 'no' vote to determine relevance
- Clarification of the proposal to move measures from standards to RSAWs

- Removal of the proposal to eliminate VRFs and VSLs from standards
- Clarification of the handling and purpose of interpretations
- Clarification of the intent of the waiver provision in section 16.0

The SC, its subcommittees, and NERC staff are grateful for the industry participation on this project to date, and encourages stakeholders to continue to offer feedback on the proposed SPM revisions so that the SC can deliver a significantly improved process in a timely fashion.

Additional documentation is available on the project page.

Statement

Response to Passage of Critical Infrastructure Protection Version 5 Standards

Click here for Statement

ATLANTA – The electricity industry passed Version 5 of the North American Electric Reliability Corporation's critical infrastructure protection standards with an overwhelming consensus earlier this week. "The industry is to be commended for supporting the CIP Version 5 standards with high approval rates," said Gerry Cauley, president and chief executive officer of the North American Electric Reliability Corporation (NERC). "This effort represents significant prioritization from the industry focused on the importance of cybersecurity."

Statement

Response to Passage of Critical Infrastructure Protection Version 5 Standards

November 7, 2012

ATLANTA – The electricity industry passed Version 5 of the North American Electric Reliability Corporation's critical infrastructure protection standards with an overwhelming consensus earlier this week.

"The industry is to be commended for supporting the CIP Version 5 standards with high approval rates," said Gerry Cauley, president and chief executive officer of the North American Electric Reliability Corporation (NERC). "This effort represents significant prioritization from the industry focused on the importance of cybersecurity."

The Version 5 standards leverage lessons learned from previous CIP versions, providing for categorization of BES Cyber Systems commensurate with the adverse impact that loss, compromise, or misuse of those BES Cyber Systems could have on the reliable operation of the bulk electric system. The standards provide increased flexibility in implementing risk mitigation and security to individual entity operations based on function, connectivity, risk and impact.

NERC will submit Version 5 to the Board of Trustees for approval, after which the standards will be filed with the Federal Energy Regulatory Commission for final approval.

Standards Announcement

To: Members of the NERC Registered Ballot Body

Re: NERC Server Maintenance

NERC is conducting server maintenance on Saturday, December 1st, and our balloting and commenting systems will be unavailable for a portion of time that day. We are providing this information so that people are able to plan to cast their ballots so that the open ballots and comment periods can close on time, since drafting teams have meetings already planned based on the scheduled closing dates.

The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standards Announcement

Project 2012-INT-02 - Interpretation of TPL-003 and TPL-004 for System Protection and Control Subcommittee

Formal Comment Period Open: October 22 – December 5, 2012

Join Ballot Pool: October 22 – November 20, 2012

Upcoming
Initial Ballot: November 26 – December 5, 2012

Now Available

A formal comment period for the interpretation of **TPL-003-0a** – System Performance Following Loss of Two or More Bulk Electric System Elements (Category C) and **TPL-004-0** – System Performance Following Extreme Events Results in the Loss of Two or More Bulk Electric System Elements (Category D) is open through 8 p.m. Eastern on **Wednesday, December 5, 2012.**

Instructions for Joining Ballot Pool(s)

A ballot pool is being formed. Registered Ballot Body members must join the ballot pool to be eligible to vote in the balloting of the interpretations for TPL-003-0a and TPL-004-0. Registered Ballot Body members may join the ballot pool by 8 a.m. ET on November 20, 2012 at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using the "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list server.) The ballot pool list server for this ballot pool is:

bp-2012-INT-02_TPL3_4_in@nerc.com

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Wednesday, December 5, 2012.** Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Please read carefully: All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit

comments through the electronic comment form. During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter the comments through the electronic comment form. Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.

Next Steps

An initial ballot will be conducted November 26 through 8 p.m. Friday, December 5, 2012

Background

Order No. 754, issued September 15, 2011, was the Final Rule approving the Interpretation of TPL-002-0a for PacifiCorp (Project 2009-14) regarding requirement R1.3.10. In addition to the approval, the Commission expressed a concern (Para 19 and 20) about single point of failure of protection systems and issued NERC a directive for further investigation. This request for interpretation submitted by the System Protection and Control Subcommittee (SPCS) is one of three approaches aimed to address the concern. The SPCS is seeking clarification in two areas in TPL-003-0a (Category C) and TPL-004-0 (Category D). The first regarding the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "(stuck breaker or protection system failure)." Second, to what extent does the description in the standards' Table 1, footnote (e) require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system.

Additional information is available on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

Response for Interpretation of TPL-003 and TPL-004 for SPCS

When completed, email this form to:
laura.hussey@nerc.net
For questions about this form or for assistance in completing the form, call Laura Hussey at 404-446-2579.

Note: A valid interpretation request is one that requests additional clarity about one or more requirements in approved NERC reliability standards, but does not request approval as to how to comply with one or more requirements.

Request for an Interpretation of a Reliability Standard			
Date submitted:	December 12, 2011		
Contact information for person requesting the interpretation.			
Name:	Jonathan Sykes (PG&E), Chairman SPCS		
Organization:	NERC System Protection & Control Subcommittee		
Telephone:	(510) 874-2691	**E-mail:**	jfst@pge.com

Identify the Standard (include version number, e.g., PRC-001-1) that needs clarification and its associated title.	
Standard	Title
TPL-003-0a	System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
TPL-004-0	System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)

Identify specifically what Requirement needs clarification.	
Standard	Requirement (and text)
TPL-003-0a	**R1.3.1** Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system

	results shall be available as supporting information.
TPL-003-0a	**R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-003-0a	**R1.5.** Consider all contingencies applicable to Category C.
TPL-004-0	**R1.3.1.** Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-004-0	**R1.3.7.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-004-0	**R1.4.** Consider all contingencies applicable to Category D.

Identify the nature of clarification that is requested (Check as many as applicable).

- ☒ Clarify the required performance
- ☐ Clarify the conditions under which the performance is required
- ☐ Clarify which functional entity is responsible for performing an action in a requirement
- ☐ Clarify the reliability outcome the requirement is intended to produce

Please explain the clarification needed.

This interpretation request has been developed to address Commission concerns related to the term "Single Point of Failure" and how it relates to system performance and contingency planning clarification regarding the following questions about the listed standards, requirements and terms. More specifically, clarification is needed about the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "protection system failure" and specifically the impact of failed components (i.e., "Single Point of Failure"). It is not entirely clear whether a valid assessment of a protection system failure includes evaluation of shared or non-redundant protection system components. Protection systems that have a shared protection system component are not two independent protection systems, because both protection systems will be mutually impacted for a failure of a single shared component. A protection system component evaluation would include the evaluation of the consequences on system performance for the failure of any protection system component that is integral to the operation of the protection system being evaluated and to the operation of another protection system.

On March 30, 2009, NERC issued an Industry Advisory — Protection System Single Point of Failure[1] (i.e., NERC Alert) for three significant events. One of which, the Westwing outage (June 14, 2004) was caused by failure of a single auxiliary relay that initiated both breaker tripping and the breaker failure protection. Since breaker tripping and breaker failure protection both shared the same auxiliary relay, there was no independence between breaker tripping and breaker failure protection systems, therefore causing both protection systems to not operate for the single component failure of the auxiliary relay. The failure of this auxiliary relay is known as a "single point of failure." It is not clear whether this situation is comprehensively addressed by the applicable entities when making a valid assessment of system performance for both Category C and D contingencies.

Question 1: For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects[2] of either "stuck breaker" or "protection system failure" contingency[3], or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

There is a lack of clarity whether R1.3.1[4] requires an entity to assess which contingency causes the most severe system results or impacts (R1.3.1) and this ambiguity could result in a potential reliability gap. Whether the simulation of a stuck breaker or protection system failure will produce the worst result depends on the protection system design. For example when a protection system is fully redundant, a protection system failure will not affect fault clearing; therefore, a stuck breaker would result in more severe system results or impacts. However, when a protection system failure affects fault clearing, the fault clearing time may be longer than the breaker failure protection clearing time for a stuck breaker contingency and may result in tripping of additional system elements, resulting in a more severe system response.

Question 2: For the phrase "Delayed Clearing[5]" used in Category C[6] contingencies 6-9 and Category D[7] contingencies 1-4, to what extent does the description in Table 1, footnote (e)[8] require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on

[1] NERC Website: (http://www.nerc.com/fileUploads/File/Events%20Analysis/A-2009-03-30-01.pdf)

[2] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

[3] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

[4] "*Be performed and evaluated only for those Category (TPL-003-0a Category C and TPL-004-0 Category D) contingencies that would produce the more severe system results or impacts*."

[5] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

[6] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

[7] As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

[8] Footnote (e) Delayed Clearing: "failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,"

the as-built design of that protection system?

There is a lack of clarity whether footnote (e) in Table 1 requires the study and/or simulation of a failure of a protection system component (i.e., single point of failure) that may prevent correct operation of the protection system(s) impacted by the component failure. Protection systems that share a protection system component are fully dependent upon the correct operation of that single shared component and do not perform as two independent protection systems. This lack of clarity may result in a potential reliability gap.

Clarity is necessary as to whether (1) a valid assessment should include evaluation of delayed clearing due to failure of the protection system component (i.e., single point of failure), such as the failure of a shared protection system component, that produces the more severe system results or impacts; and (2) the study and/or simulation of the fault clearing sequence and protection system(s) operation should be based on the protection system(s) as-built design.

The lack of clarity is compounded by the similarity between the phrase "Delayed Clearing" used in TPL-003-0a and TPL-004-0, footnote (e), and the NERC glossary term "Delayed Fault Clearing." While TPL-003-0a and TPL-004-0 do not use the glossary term, the similarity may lead to confusion and inconsistency in how entities apply footnote (e) to "stuck breaker" or "protection system failure" contingency assessments.

Identify the material impact to your organization or others, if known, caused by the lack of clarity or an incorrect interpretation of this standard.

There is a material impact to the entities required to perform transmission planning assessments and to the entities that may rely on these assessments. The lack of clarity in defining the required studies impacts entities by:

- Potential non-compliance if the correct contingencies are not studied
- Inefficient use of resources if contingencies are studied that are not required and mitigation plans are implemented that are not required
- Potential negative impact to grid reliability if the correct contingencies are not assessed

Interpretation 2012-INT-02: Response to Request for Interpretation of TPL-003-0a, Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, Requirements R1.3.1, R1.3.7 and R1.4 for the System Protection and Control Subcommittee
The following interpretations of TPL-003-0a, System Performance Following Loss of Two or More Bulk Electric System Elements (Category C), Requirements R1.3.1, R1.3.10 and R1.5 and TPL-004-0, System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D), Requirements R1.3.1, R1.37 and R1.4 were developed by members of the Assess Transmission Future Needs Standard Drafting Team (ATFNSTD), Protection System Misoperations Standard Development Team (PSMSDT), and Protection System Maintenance and Testing Standard Drafting Team (PSMTSDT).

Standard	Requirement (and text)
TPL-003-0a	**R1.3.1** Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-003-0a	**R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-003-0a	**R1.5.** Consider all contingencies applicable to Category C.
TPL-004-0	**R1.3.1.** Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-004-0	**R1.3.7.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-004-0	**R1.4.** Consider all contingencies applicable to Category D.

Question 1
For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of

evaluating the effects[9] of either "stuck breaker" or "protection system failure" contingency[10], or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

Response 1

The interpretation drafting team concludes that the Planning Authority and Transmission Planner must consider the situation that produces the more severe system results or impacts (i.e., TPL-003-0a, R1.3.1 and TPL-004-0, R1.3.1) due to a delayed clearing condition regardless of whether the condition resulted from a stuck breaker or protection system failure. The Reliability Standards TPL-003-0a (Table I, Category C contingencies 6-9) and TPL-004-0 (Table I, ~~TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (~~Category D contingencies 1-4) involve an assessment of the effects of either a stuck breaker or a protection system failure. Evaluation of a single line ground (SLG) (TPL-003-0a, Table I, Category C) Fault and 3~~Three~~-phase (3ø) (TPL-004-0, Table I, Category D) Fault with delayed clearing is required and further defined by footnote (e) and the parenthetical phrase "(~~"~~stuck breaker or protection system failure)."~~."~~ Footnote (e) explains that "Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay." The parenthetical further emphasizes that the failure may be a "stuck breaker or protection system failure" that causes the delayed clearing of the fault. The ordered reading of the text in Table 1 in either standard explains that delayed clearing caused by a failure of a protection system or circuit breaker must be evaluated to examine its impact on BES performance. ~~Therefore, the transmission planner must consider the situation that produces the more severe system results or impacts due to a delayed clearing condition regardless whether the condition resulted from either a stuck breaker or protection system failure.~~

Standard	Requirement (and text)
TPL-003-0a	**R1.3.1** Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-003-0a	**R1.3.10.** Include the effects of existing and planned protection systems, including

[9] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

[10] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

	any backup or redundant systems.
TPL-003-0a	**R1.5.** Consider all contingencies applicable to Category C.
TPL-004-0	**R1.3.1.** Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-004-0	**R1.3.7.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-004-0	**R1.4.** Consider all contingencies applicable to Category D.

Question 2

For the phrase "Delayed Clearing[11]" used in Category C[12] contingencies 6-9 and Category D[13] contingencies 1-4, to what extent does the description in Table 1, footnote (e)[14] require an entity to model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

Response 2

The term "Delayed Clearing" that is described in Table I~~1~~, footnote (e) refers to fault clearing that results from a failure to achieve the protection system's normally expected clearing time. The Planning Authority and Transmission Planner is permitted engineering judgment in its Category C or D contingencies to select the~~Any failure of a~~ protection system component failures for evaluation that would produce the more severe system results or impact (R1.3.1) and this would include addressing all protection systems affected by the selected component.

A protection system component failure that impacts ~~increases clearing times of~~ one or more protection systems and increases the total fault clearing time requires the Planning Authority and Transmission Planner ~~and Planning Authority~~ to simulate the full impact (clearing time and facilities removed) on the Bulk Electric System performance.

[11] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

[12] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

[13] As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

[14] Footnote (e) Delayed Clearing: "failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,"

The interpretation drafting team bases this conclusion on the footnote (e) example "…any protection system component such as, relay, circuit breaker, or current transformer…" because the component "circuit breaker" is not addressed in the current or previously defined NERC glossary term. The interpretation drafting team initially believed the lowercase usage of "protection system" inferred the NERC glossary term and the components described therein; however, based on the interpretation drafting team's further assessment of footnote (e), it concludes that the existing TPL standards (TPL-003-0a and TPL-004-0) do not implicitly use the NERC glossary term. Without an explicit reference to the NERC glossary term, "Protection System," the two standards do not prescribe the specific protection system components that must be addressed by the Planning Authority and Transmission Planner in performing the studies required in TPL-003-0a and TPL-004-0.

Revision History (To be removed upon Final)

Version	Date	Description
1.0	5/9/2012	Draft 1 of the response to the request for interpretation.
2.0	10/16/2012	Draft 2 of the response to the request for interpretation.

Identify the Standard (include version number, e.g., PRC-001-1) that needs clarification and its associated title.	
Standard	**Title**
TPL-003-0a	System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)
TPL-004-0	System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)

Identify specifically what Requirement needs clarification.	
Standard	**Requirement (and text)**
TPL-003-0a	**R1.3.1** Be performed and evaluated only for those Category C contingencies that

	would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-003-0a	**R1.3.10.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-003-0a	**R1.5.** Consider all contingencies applicable to Category C.
TPL-004-0	**R1.3.1.** Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.
TPL-004-0	**R1.3.7.** Include the effects of existing and planned protection systems, including any backup or redundant systems.
TPL-004-0	**R1.4.** Consider all contingencies applicable to Category D.

Identify the nature of clarification that is requested (Check as many as applicable).

- ☒ Clarify the required performance
- ☐ Clarify the conditions under which the performance is required
- ☐ Clarify which functional entity is responsible for performing an action in a requirement
- ☐ Clarify the reliability outcome the requirement is intended to produce

Please explain the clarification needed.

This interpretation request has been developed to address Commission concerns related to the term "Single Point of Failure" and how it relates to system performance and contingency planning clarification regarding the following questions about the listed standards, requirements and terms. More specifically, clarification is needed about the comprehensive study of system performance relating to Table 1's, Category C and D contingency of a "protection system failure" and specifically the impact of failed components (i.e., "Single Point of Failure"). It is not entirely clear whether a valid assessment of a protection system failure includes evaluation of shared or non-redundant protection system components. Protection systems that have a shared protection system component are not two independent protection systems, because both protection systems will be mutually impacted for a failure of a single shared component. A protection system component evaluation would include the

evaluation of the consequences on system performance for the failure of any protection system component that is integral to the operation of the protection system being evaluated and to the operation of another protection system.

On March 30, 2009, NERC issued an Industry Advisory — Protection System Single Point of Failure[1] (i.e., NERC Alert) for three significant events. One of which, the Westwing outage (June 14, 2004) was caused by failure of a single auxiliary relay that initiated both breaker tripping and the breaker failure protection. Since breaker tripping and breaker failure protection both shared the same auxiliary relay, there was no independence between breaker tripping and breaker failure protection systems, therefore causing both protection systems to not operate for the single component failure of the auxiliary relay. The failure of this auxiliary relay is known as a "single point of failure." It is not clear whether this situation is comprehensively addressed by the applicable entities when making a valid assessment of system performance for both Category C and D contingencies.

Question 1: For the parenthetical "(stuck breaker or protection system failure)" in TPL-003-0a (Category C contingencies 6-9) and TPL-004-0 (Category D contingencies 1-4), does an entity have the option of evaluating the effects[2] of either "stuck breaker" or "protection system failure" contingency[3], or does an applicable entity have to evaluate the contingency that produces the more severe system results or impacts as identified in R1.3.1 of both standards?

There is a lack of clarity whether R1.3.1[4] requires an entity to assess which contingency causes the most severe system results or impacts (R1.3.1) and this ambiguity could result in a potential reliability gap. Whether the simulation of a stuck breaker or protection system failure will produce the worst result depends on the protection system design. For example when a protection system is fully redundant, a protection system failure will not affect fault clearing; therefore, a stuck breaker would result in more severe system results or impacts. However, when a protection system failure affects fault clearing, the fault clearing time may be longer than the breaker failure protection clearing time for a stuck breaker contingency and may result in tripping of additional system elements, resulting in a more severe system response.

Question 2: For the phrase "Delayed Clearing[5]" used in Category C[6] contingencies 6-9 and Category D[7] contingencies 1-4, to what extent does the description in Table 1, footnote (e)[8] require an entity to

[1] NERC Website: (http://www.nerc.com/fileUploads/File/Events%20Analysis/A-2009-03-30-01.pdf)

[2] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.3.10. and/or TPL-004-0, Requirement R1.3.7.

[3] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

[4] "*Be performed and evaluated only for those Category (TPL-003-0a Category C and TPL-004-0 Category D) contingencies that would produce the more severe system results or impacts*."

[5] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5. and/or TPL-004-0, Requirement R1.4.

[6] As required by NERC Reliability Standard TPL-003-0a, Requirement R1.5.

[7] As required by NERC Reliability Standard TPL-004-0, Requirement R1.4.

model a single point of failure of a protection system component that may prevent correct operation of a protection system, including other protection systems impacted by that failed component based on the as-built design of that protection system?

There is a lack of clarity whether footnote (e) in Table 1 requires the study and/or simulation of a failure of a protection system component (i.e., single point of failure) that may prevent correct operation of the protection system(s) impacted by the component failure. Protection systems that share a protection system component are fully dependent upon the correct operation of that single shared component and do not perform as two independent protection systems. This lack of clarity may result in a potential reliability gap.

Clarity is necessary as to whether (1) a valid assessment should include evaluation of delayed clearing due to failure of the protection system component (i.e., single point of failure), such as the failure of a shared protection system component, that produces the more severe system results or impacts; and (2) the study and/or simulation of the fault clearing sequence and protection system(s) operation should be based on the protection system(s) as-built design.

The lack of clarity is compounded by the similarity between the phrase "Delayed Clearing" used in TPL-003-0a and TPL-004-0, footnote (e), and the NERC glossary term "Delayed Fault Clearing." While TPL-003-0a and TPL-004-0 do not use the glossary term, the similarity may lead to confusion and inconsistency in how entities apply footnote (e) to "stuck breaker" or "protection system failure" contingency assessments.

Identify the material impact to your organization or others, if known, caused by the lack of clarity or an incorrect interpretation of this standard.

There is a material impact to the entities required to perform transmission planning assessments and to the entities that may rely on these assessments. The lack of clarity in defining the required studies impacts entities by:

- Potential non-compliance if the correct contingencies are not studied
- Inefficient use of resources if contingencies are studied that are not required and mitigation plans are implemented that are not required
- Potential negative impact to grid reliability if the correct contingencies are not assessed

[8] Footnote (e) Delayed Clearing: "failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay,"

A. Introduction

1. **Title:** **System Performance Following Loss of Two or More Bulk Electric System Elements (Category C)**

2. **Number:** TPL-003-0a

3. **Purpose:** System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.

4. **Applicability:**

   4.1. Planning Authority

   4.2. Transmission Planner

5. **Effective Date:** April 23, 2010

B. Requirements

R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission systems is planned such that the network can be operated to supply projected customer demands and projected Firm (non-recallable reserved) Transmission Services, at all demand Levels over the range of forecast system demands, under the contingency conditions as defined in Category C of Table I (attached). The controlled interruption of customer Demand, the planned removal of generators, or the Curtailment of firm (non-recallable reserved) power transfers may be necessary to meet this standard. To be valid, the Planning Authority and Transmission Planner assessments shall:

R1.1. Be made annually.

R1.2. Be conducted for near-term (years one through five) and longer-term (years six through ten) planning horizons.

R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.1. Be performed and evaluated only for those Category C contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.

R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

R1.3.4. Be conducted beyond the five-year horizon only as needed to address identified marginal conditions that may have longer lead-time solutions.

R1.3.5. Have all projected firm transfers modeled.

R1.3.6. Be performed and evaluated for selected demand levels over the range of forecast system demands.

R1.3.7. Demonstrate that System performance meets Table 1 for Category C contingencies.

R1.3.8. Include existing and planned facilities.

R1.3.9. Include Reactive Power resources to ensure that adequate reactive resources are available to meet System performance.

R1.3.10. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.11. Include the effects of existing and planned control devices.

R1.3.12. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those Demand levels for which planned (including maintenance) outages are performed.

R1.4. Address any planned upgrades needed to meet the performance requirements of Category C.

R1.5. Consider all contingencies applicable to Category C.

R2. When system simulations indicate an inability of the systems to respond as prescribed in Reliability Standard TPL-003-0_R1, the Planning Authority and Transmission Planner shall each:

R2.1. Provide a written summary of its plans to achieve the required system performance as described above throughout the planning horizon:

R2.1.1. Including a schedule for implementation.

R2.1.2. Including a discussion of expected required in-service dates of facilities.

R2.1.3. Consider lead times necessary to implement plans.

R2.2. Review, in subsequent annual assessments, (where sufficient lead time exists), the continuing need for identified system facilities. Detailed implementation plans are not needed.

R3. The Planning Authority and Transmission Planner shall each document the results of these Reliability Assessments and corrective plans and shall annually provide these to its respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-003-0_R1 and TPL-003-0_R2.

M2. The Planning Authority and Transmission Planner shall have evidence it reported documentation of results of its reliability assessments and corrective plans per Reliability Standard TPL-003-0_R3.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: A valid assessment and corrective plan for the longer-term planning horizon is not available.

2.3. Level 3: Not applicable.

2.4. Level 4: A valid assessment and corrective plan for the near-term planning horizon is not available.

E. Regional Differences

1. None identified.

Table I. Transmission System Standards – Normal and Emergency Conditions

Category	Contingencies	System Limits or Impacts		
	Initiating Event(s) and Contingency Element(s)	System Stable and both Thermal and Voltage Limits within Applicable Rating [a]	Loss of Demand or Curtailed Firm Transfers	Cascading [c] Outages
A No Contingencies	All Facilities in Service	Yes	No	No
B Event resulting in the loss of a single element.	Single Line Ground (SLG) or 3-Phase (3Ø) Fault, with Normal Clearing: 1. Generator 2. Transmission Circuit 3. Transformer Loss of an Element without a Fault.	Yes Yes Yes Yes	No [b] No [b] No [b] No [b]	No No No No
	Single Pole Block, Normal Clearing[e]: 4. Single Pole (dc) Line	Yes	No[b]	No
C Event(s) resulting in the loss of two or more (multiple) elements.	SLG Fault, with Normal Clearing[e]: 1. Bus Section 2. Breaker (failure or internal Fault)	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG or 3Ø Fault, with Normal Clearing[e], Manual System Adjustments, followed by another SLG or 3Ø Fault, with Normal Clearing[e]: 3. Category B (B1, B2, B3, or B4) contingency, manual system adjustments, followed by another Category B (B1, B2, B3, or B4) contingency	Yes	Planned/ Controlled[c]	No
	Bipolar Block, with Normal Clearing[e]: 4. Bipolar (dc) Line Fault (non 3Ø), with Normal Clearing[e]: 5. Any two circuits of a multiple circuit towerline[f]	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 6. Generator 7. Transformer 8. Transmission Circuit 9. Bus Section	Yes Yes Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c]	No No No No

D [d] Extreme event resulting in two or more (multiple) elements removed or Cascading out of service	3Ø Fault, with Delayed Clearing [e] (stuck breaker or protection system failure): 1. Generator 2. Transmission Circuit 3. Transformer 4. Bus Section 3Ø Fault, with Normal Clearing[e]: 5. Breaker (failure or internal Fault) 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.	Evaluate for risks and consequences. ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.

a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or system voltage limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.

b) Planned or controlled interruption of electric supply to radial customers or some local Network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.

c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.

e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.

f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Appendix 1

Interpretation of TPL-002-0 Requirements R1.3.2 and R1.3.12 and TPL-003-0 Requirements R1.3.2 and R1.3.12 for Ameren and MISO

NERC received two requests for interpretation of identical requirements (Requirements R1.3.2 and R1.3.12) in TPL-002-0 and TPL-003-0 from the Midwest ISO and Ameren. These requirements state:

TPL-002-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category B of Table 1 (single contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

TPL-003-0:

[To be valid, the Planning Authority and Transmission Planner assessments shall:]

R1.3 Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category C of Table 1 (multiple contingencies). The specific elements selected (from each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.2 Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.12 Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

Requirement R1.3.2

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from Ameren on July 25, 2007:

Ameren specifically requests clarification on the phrase, 'critical system conditions' in R1.3.2. Ameren asks if compliance with R1.3.2 requires multiple contingent generating unit Outages as part of possible generation dispatch scenarios describing critical system conditions for which the system shall be planned and modeled in accordance with the contingency definitions included in Table 1.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 Received from MISO on August 9, 2007:

MISO asks if the TPL standards require that any specific dispatch be applied, other than one that is representative of supply of firm demand and transmission service commitments, in the modeling of system contingencies specified in Table 1 in the TPL standards.

MISO then asks if a variety of possible dispatch patterns should be included in planning analyses including a probabilistically based dispatch that is representative of generation deficiency scenarios, would it be an appropriate application of the TPL standard to apply the transmission contingency conditions in Category B of Table 1 to these possible dispatch pattern.

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.2 was developed by the NERC Planning Committee on March 13, 2008:

The selection of a credible generation dispatch for the modeling of critical system conditions is within the discretion of the Planning Authority. The Planning Authority was renamed "Planning Coordinator" (PC) in the Functional Model dated February 13, 2007. (TPL -002 and -003 use the former "Planning Authority" name, and the Functional Model terminology was a change in name only and did not affect responsibilities.)

– Under the Functional Model, the Planning Coordinator "Provides and informs Resource Planners, Transmission Planners, and adjacent Planning Coordinators of the methodologies and tools for the simulation of the transmission system" while the Transmission Planner "Receives from the Planning Coordinator methodologies and tools for the analysis and development of transmission expansion plans." A PC's selection of "critical system conditions" and its associated generation dispatch falls within the purview of "methodology."

Furthermore, consistent with this interpretation, a Planning Coordinator would formulate critical system conditions that may involve a range of critical generator unit outages as part of the possible generator dispatch scenarios.

Both TPL-002-0 and TPL-003-0 have a similar measure M1:

> **M1.** The Planning Authority and Transmission Planner shall have a valid assessment and corrective plans as specified in Reliability Standard TPL-002-0_R1 [or TPL-003-0_R1] and TPL-002-0_R2 [or TPL-003-0_R2]."

The Regional Reliability Organization (RRO) is named as the Compliance Monitor in both standards. Pursuant to Federal Energy Regulatory Commission (FERC) Order 693, FERC eliminated the RRO as the appropriate Compliance Monitor for standards and replaced it with the Regional Entity (RE). See paragraph 157 of Order 693. Although the referenced TPL standards still include the reference to the RRO, to be consistent with Order 693, the RRO is replaced by the RE as the Compliance Monitor for this interpretation. As the Compliance Monitor, the RE determines what a "valid assessment" means when evaluating studies based upon specific sub-requirements in R1.3 selected by the Planning Coordinator and the Transmission Planner. If a PC has Transmission Planners in more than one region, the REs must coordinate among themselves on compliance matters.

Requirement R1.3.12

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from Ameren on July 25, 2007:

Ameren also asks how the inclusion of planned outages should be interpreted with respect to the contingency definitions specified in Table 1 for Categories B and C. Specifically, Ameren asks if R1.3.12 requires that the system be planned to be operated during those conditions associated with planned outages consistent with the performance requirements described in Table 1 plus any unidentified outage.

Request for Interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 Received from MISO on August 9, 2007:

MISO asks if the term "planned outages" means only already known/scheduled planned outages that may continue into the planning horizon, or does it include potential planned outages not yet scheduled that may occur at those demand levels for which planned (including maintenance) outages are performed?

If the requirement does include not yet scheduled but potential planned outages that could occur in the planning horizon, is the following a proper interpretation of this provision?

The system is adequately planned and in accordance with the standard if, in order for a system operator to potentially schedule such a planned outage on the future planned system, planning studies show that a system adjustment (load shed, re-dispatch of generating units in the interconnection, or system reconfiguration) would be required concurrent with taking such a planned outage in order to prepare for a Category B contingency (single element forced out of service)? In other words, should the system in effect be planned to be operated as for a Category C3 n-2 event, even though the first event is a planned base condition?

If the requirement is intended to mean only known and scheduled planned outages that will occur or may continue into the planning horizon, is this interpretation consistent with the original interpretation by NERC of the standard as provided by NERC in response to industry questions in the Phase I development of this standard1?

The following interpretation of TPL-002-0 and TPL-003-0 Requirement R1.3.12 was developed by the NERC Planning Committee on March 13, 2008:

This provision was not previously interpreted by NERC since its approval by FERC and other regulatory authorities. TPL-002-0 and TPL-003-0 explicitly provide that the inclusion of planned (including maintenance) outages of any bulk electric equipment at demand levels for which the planned outages are required. For studies that include planned outages, compliance with the contingency assessment for TPL-002-0 and TPL-003-0 as outlined in Table 1 would include any necessary system adjustments which might be required to accommodate planned outages since a planned outage is not a "contingency" as defined in the *NERC Glossary of Terms Used in Standards.*

A. Introduction

1. Title: System Performance Following Extreme Events Resulting in the Loss of Two or More Bulk Electric System Elements (Category D)

2. Number: TPL-004-0

3. Purpose: System simulations and associated assessments are needed periodically to ensure that reliable systems are developed that meet specified performance requirements, with sufficient lead time and continue to be modified or upgraded as necessary to meet present and future System needs.

4. Applicability:

4.1. Planning Authority

4.2. Transmission Planner

5. Effective Date: April 1, 2005

B. Requirements

R1. The Planning Authority and Transmission Planner shall each demonstrate through a valid assessment that its portion of the interconnected transmission system is evaluated for the risks and consequences of a number of each of the extreme contingencies that are listed under Category D of Table I. To be valid, the Planning Authority's and Transmission Planner's assessment shall:

R1.1. Be made annually.

R1.2. Be conducted for near-term (years one through five).

R1.3. Be supported by a current or past study and/or system simulation testing that addresses each of the following categories, showing system performance following Category D contingencies of Table I. The specific elements selected (from within each of the following categories) for inclusion in these studies and simulations shall be acceptable to the associated Regional Reliability Organization(s).

R1.3.1. Be performed and evaluated only for those Category D contingencies that would produce the more severe system results or impacts. The rationale for the contingencies selected for evaluation shall be available as supporting information. An explanation of why the remaining simulations would produce less severe system results shall be available as supporting information.

R1.3.2. Cover critical system conditions and study years as deemed appropriate by the responsible entity.

R1.3.3. Be conducted annually unless changes to system conditions do not warrant such analyses.

R1.3.4. Have all projected firm transfers modeled.

R1.3.5. Include existing and planned facilities.

R1.3.6. Include Reactive Power resources to ensure that adequate reactive resources are available to meet system performance.

R1.3.7. Include the effects of existing and planned protection systems, including any backup or redundant systems.

R1.3.8. Include the effects of existing and planned control devices.

R1.3.9. Include the planned (including maintenance) outage of any bulk electric equipment (including protection systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

R1.4. Consider all contingencies applicable to Category D.

R2. The Planning Authority and Transmission Planner shall each document the results of its reliability assessments and shall annually provide the results to its entities' respective NERC Regional Reliability Organization(s), as required by the Regional Reliability Organization.

C. Measures

M1. The Planning Authority and Transmission Planner shall have a valid assessment for its system responses as specified in Reliability Standard TPL-004-0_R1.

M2. The Planning Authority and Transmission Planner shall provide evidence to its Compliance Monitor that it reported documentation of results of its reliability assessments per Reliability Standard TPL-004-0_R1.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organization.

Each Compliance Monitor shall report compliance and violations to NERC via the NERC Compliance Reporting Process.

1.2. Compliance Monitoring Period and Reset Timeframe

Annually.

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: A valid assessment, as defined above, for the near-term planning horizon is not available.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: Not applicable.

B. Regional Differences

1. None identified.

	SLG or 3Ø Fault, with Normal Clearing[e], Manual System Adjustments, followed by another SLG or 3Ø Fault, with Normal Clearing[e]: 3. Category B (B1, B2, B3, or B4) contingency, manual system adjustments, followed by another Category B (B1, B2, B3, or B4) contingency	Yes	Planned/ Controlled[c]	No
	Bipolar Block, with Normal Clearing[e]: 4. Bipolar (dc) Line Fault (non 3Ø), with Normal Clearing[e]: 5. Any two circuits of a multiple circuit towerline[f]	Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c]	No No
	SLG Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 6. Generator 7. Transformer 8. Transmission Circuit 9. Bus Section	Yes Yes Yes Yes	Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c] Planned/ Controlled[c]	No No No No

D [d] Extreme event resulting in two or more (multiple) elements removed or Cascading out of service	3Ø Fault, with Delayed Clearing[e] (stuck breaker or protection system failure): 1. Generator 2. Transmission Circuit 3. Transformer 4. Bus Section 3Ø Fault, with Normal Clearing[e]: 5. Breaker (failure or internal Fault) 6. Loss of towerline with three or more circuits 7. All transmission lines on a common right-of way 8. Loss of a substation (one voltage level plus transformers) 9. Loss of a switching station (one voltage level plus transformers) 10. Loss of all generating units at a station 11. Loss of a large Load or major Load center 12. Failure of a fully redundant Special Protection System (or remedial action scheme) to operate when required 13. Operation, partial operation, or misoperation of a fully redundant Special Protection System (or Remedial Action Scheme) in response to an event or abnormal system condition for which it was not intended to operate 14. Impact of severe power swings or oscillations from Disturbances in another Regional Reliability Organization.	Evaluate for risks and consequences. ▪ May involve substantial loss of customer Demand and generation in a widespread area or areas. ▪ Portions or all of the interconnected systems may or may not achieve a new, stable operating point. ▪ Evaluation of these events may require joint studies with neighboring systems.

a) Applicable rating refers to the applicable Normal and Emergency facility thermal Rating or System Voltage Limit as determined and consistently applied by the system or facility owner. Applicable Ratings may include Emergency Ratings applicable for short durations as required to permit operating steps necessary to maintain system control. All Ratings must be established consistent with applicable NERC Reliability Standards addressing Facility Ratings.

b) Planned or controlled interruption of electric supply to radial customers or some local network customers, connected to or supplied by the Faulted element or by the affected area, may occur in certain areas without impacting the overall reliability of the interconnected transmission systems. To prepare for the next contingency, system adjustments are permitted, including curtailments of contracted Firm (non-recallable reserved) electric power Transfers.

c) Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers may be necessary to maintain the overall reliability of the interconnected transmission systems.

d) A number of extreme contingencies that are listed under Category D and judged to be critical by the transmission planning entity(ies) will be selected for evaluation. It is not expected that all possible facility outages under each listed contingency of Category D will be evaluated.

e) Normal clearing is when the protection system operates as designed and the Fault is cleared in the time normally expected with proper functioning of the installed protection systems. Delayed clearing of a Fault is due to failure of any protection system component such as a relay, circuit breaker, or current transformer, and not because of an intentional design delay.

f) System assessments may exclude these events where multiple circuit towers are used over short distances (e.g., station entrance, river crossings) in accordance with Regional exemption criteria.

Standards Announcement

Project 2013-02 Paragraph 81

Formal Comment Period Now Open: October 25 – December 10, 2012
Ballot Pool Forming Now: October 25 – November 23, 2012

Upcoming
Initial Ballot: November 30 – December 10, 2012

Now Available

The Paragraph 81 (P81) standard drafting team (SDT) has posted a single PDF containing redlined versions of 27 standards showing 38 requirements proposed to be retired, and an implementation plan for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Monday, December 10, 2012. A ballot pool is being formed and the ballot pool window is open through 8 a.m. Eastern on **Friday, November 23, 2012** (*please note that ballot pools close at 8 a.m. Eastern and mark your calendar accordingly*).

The following documents are posted on the project page for review and balloting:

- **Redline of Standards with Proposed Retirements** – A PDF document containing a redline of each of the affected standards, indicating the requirements and associated elements proposed to be retired with a "(Retired)" and with the version number remaining the same. When these Requirements are retired, the version numbers of the standards will NOT be incremented. After evaluating the options and consulting with the Standards Committee and Standards Committee Process Subcommittee, the P81 drafting team determined that this was the most practical approach. Incrementing the version numbers of each standard is impractical because, in some cases, a subsequent version has already been developed. In addition, incrementing the version would require renumbering Requirements where a retired Requirement created a gap in numbering, and this creates an undesirable administrative burden for entities using certain systems to manage their compliance programs.
- **Implementation Plan** – The implementation plan for retiring the Phase I requirements.

The following documents are posted on the project page as Supporting Materials to assist stakeholders in their review:

- **Final SAR (clean and redline)** – The final SAR incorporates revisions to the draft SAR by the P81 SDT in response to comments received from the industry.
- **Technical White Paper** – The technical white paper includes the technical justification developed by the P81 SDT to support the retirement of the proposed requirements in Phase I.

- **Redline of VSL Matrix** – This identifies the VSLs (and parts of VSLs) that will be retired when the requirements in Phase I are retired. The matrix may be useful in providing a complete view of the VSLs and parts of VSLs that will be retired when a particular Requirement is retired, since some of the early standards have not had the FERC-approved VSLs incorporated in the standard.
- **Spreadsheet with Proposed Retirements** – This spreadsheet includes a list of the requirements proposed in the draft SAR and their status in the final SAR (kept in final SAR for retirement, kept in final SAR for information only, deferred to subsequent phase). Additionally, the spreadsheet includes requirements that were added to the Phase I list as a result of industry comments on the draft SAR, which are identified as 'added to final SAR for retirement.'
- **Unofficial Comment Form (Word)** – A Word version of the comment form for the development of internal draft responses only (the final must be submitted electronically).

Instructions for Joining Ballot Pool(s)

Registered Ballot Body members must join the ballot pool to be eligible to vote in balloting of the requirements being proposed for retirement. A single ballot pool is being formed, and all of the standards with Requirements being proposed for retirement will be balloted as a group. Registered Ballot Body members may join the ballot pool at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using the "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list server.) The ballot pool list server for this ballot pool is: bp-2013-02_P81_in@nerc.com.

The ballot pool is open **through 8 a.m. Eastern on Friday, November 23, 2012.**

Instructions for Commenting

A formal comment period is open through 8 p.m. Eastern on **Monday, December 10, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

A single ballot for all of the standards with Requirements being proposed for retirements will be conducted Friday, November 30, 2012 through 8 p.m. Monday December 10, 2012.

Background

On March 15, 2012, the Federal Energy Regulatory Commission (FERC) issued an order on NERC's Find, Fix and Track process that stated the following in P81:

> "The Commission notes that NERC's FFT initiative is predicated on the view that many violations of requirements currently included in Reliability Standards pose lesser risk to the Bulk-Power System. If so, some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant. The Commission is interested in obtaining views on whether such requirements could be removed from the Reliability Standards with little effect on reliability and an increase in efficiency of the ERO compliance program. If NERC believes that specific Reliability Standards or specific requirements within certain Standards should be revised or removed, we invite NERC to make specific proposals to the Commission identifying the Standards or requirements and setting forth in detail the technical basis for its belief. In addition, or in the alternative, we invite NERC, the Regional Entities and other interested entities to propose appropriate mechanisms to identify and remove from the Commission-approved Reliability Standards unnecessary or redundant requirements. We will not impose a deadline on when these comments should be submitted, but ask that to the extent such comments are submitted NERC, the Regional Entities, and interested entities coordinate to submit their respective comments concurrently."

The purpose of the project is to retire or modify FERC-approved Reliability Standard requirements that as FERC noted, "provide little protection to the reliable operations of the BES," are redundant or unnecessary, or to retire or modify a FERC-approved Reliability Standard requirement to increase the efficiency of the ERO's compliance programs.

The draft SAR, which included criteria for retiring or modifying requirements, defined phases for the project, and a suggested list of requirements put together by NERC, the regions, and the trades and their member companies for consideration in Phase I, was posted for an informal comment period. In September, the P81 SDT met to respond to the comments received and finalize the SAR. The revisions resulted in a list of 38 requirements in 23 Reliability Standard versions being proposed for retirement and an additional 13 requirements included for informational purposes only. The P81 SDT also developed a Technical White Paper which includes the justification for retiring the proposed requirements.

To sign up for the plus list for this project to follow along with meetings and work products, please email Kristin Iwanechko.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Consideration of Comments

Project 2013-02 Paragraph 81

The Paragraph 81 Drafting Team thanks all commenters who submitted comments on the Project 2013-02 Paragraph 81 - Retirement of Reliability Standard Requirements. The complete set of standards with proposed retirements for Phase 1 were posted for a 30-day public comment period from August 3, 2012 through September 4, 2012. Stakeholders were asked to provide feedback on the set of standards through a special electronic comment form. There were 43 sets of comments, including comments from approximately 98 different people from approximately 65 companies representing all of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Index to Questions, Comments, and Responses

1. Do you agree with the criteria listed in the SAR to identify Reliability Standard requirements for retirement? If not, please explain in the comment area. 8
2. The Initial Phase of the P81 project is designed to identify all FERC-approved Reliability Standard requirements that easily satisfy the criteria. Do you agree that the suggested list of Reliability Standard requirements included in the draft SAR easily satisfy the criteria listed in the draft SAR? If you disagree, please provide a statement supporting what Reliability Standard requirements you would add or subtract from the Initial Phase, including a citation to at least one element of Criterion B, as applicable. 24
3. The subsequent phases of the P81 project are designed to identify all FERC-approved Reliability Standard requirements that could not be included in the Initial Phase due to the need for additional analysis or an editing of language. Please list any Reliability Standard requirements that you believe should be revised or retired in a subsequent phase, and include a brief supporting statement and citation to at least one element of Criterion B for each requirement listed. 67
4. If you have any other comments or suggestions on the draft SAR that you have not already provided in response to the previous questions, please provide them here. 94

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. **Do you agree with the criteria listed in the SAR to identify Reliability Standard requirements for retirement? If not, please explain in the comment area.**

Summary Consideration:[2]

The majority of commenters supported the Criteria A, B and C included in the draft SAR, with a few commenters suggesting changes.

A. Comments on Criterion A

The P81 standards drafting team (P81 SDT), in conjunction with NERC's technical staff review, believes it is appropriate to rephrase Criterion A to be similar to Criterion B 9, which comports with the FFT Order, and, at the same time, to eliminate Criterion B 8 and Criterion B 9 to avoid any confusion between Criterion A and Criterion B. The P81 SDT believes the following provides a more suitable overarching Criterion A:

"The Reliability Standard requirement requires responsible entities to conduct an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES."

Comments

The Western Electricity Coordinating Council (WECC) and Northeast Power Coordinating Council (NPCC) requested clarification or alternative wording of Criterion A, while Independent Electricity System Operator and NPCC also saw Criterion A and Criterion B 9 as redundant or duplicative. Manitoba Hydro also believed there was a need to clarify Criterion B 9 and Occidental Energy Ventures Corp. desires that Criterion A implicate Section 215 of the Federal Power Act, while Occidental, like others, also believes Criterion B 8 and Criterion B 9 need clarification.

Response

The P81 SDT believes the above revision of Criterion A and elimination of Criterion B 8 and Criterion B 9 addresses the commenters' concerns, while still including the Section 215 term reliable operation.

B. Comments on Criterion B

[2] Although responses to informal comments are not required in the detail found in the P81 SDT responsive comments, the P81 SDT believed it was appropriate to provide more detail given the level of interest in this Standards Development Project. The format and detail of these responses are not precedent setting with respect to how other SDTs respond to an informal comment period.

Comment

WECC states it only agrees with Criterion B 1 if each administrative requirement meets all the sub-requirements listed (administrative in nature, does not support reliability and needlessly burdensome). In addition, ACES Power Marketing Standards Collaborators states that in Criterion B 1 it would be best to strike "and is needlessly burdensome."

Response

The list of requirements was meant to apply to each candidate and uses the term "and" not "or" to ensure all three are required. The wording of Criterion B 1 was carefully considered in the collaborative process, and it was believed that the current wording, which tends to match with WECC's understanding, is appropriate. Thus, the P81 SDT believes that no changes to Criterion B 1 are necessary.

Comment

WECC disagrees with Criteria B 3, B 4 and B 5 unless it may be demonstrated that there is no benefit to reliability at all.

Response

WECC's comment seems misaligned with FERC's intention which the P81 SDT believes was for NERC and stakeholders to investigate what requirements provide little protection to the BES, are unnecessary or redundant. WECC's approach seems much stricter and seems to suggest that if any plausible argument can be made, the requirement cannot be retired. Such an argument is not in line with the rest of the commenters and, therefore, will not be adopted. In addition, as the project proceeds through the standard drafting process, sufficient technical justifications will be put forward for industry review for each proposed requirement for retirement. The industry will have further opportunity to evaluate the technical justifications as the P81 project moves forward.

Comment

SRC believes that the SAR captures the right categories, but states that Criteria B 2 through B 5 could be sub-items of B1. In a similar light, NERC staff states there is significant overlap between Criterion B 3 (Purely Documentation) and Criterion B 5 (Periodic Updates) and these criteria could be combined. Independent Electricity System Operator and SRC also disagree with Criterion B 5.

Response

While annual reviews may be necessary, there may be other ways to ensure periodic reviews are done. Criterion B 5 was contemplated by the P81 SDT more in the context of future phases which would allow for the modification of requirements, not an easily identified retirement. Thus, while to some extent we share the concerns of SRC, NERC staff and Independent Electricity System Operator, we believe that the use of Criterion B 5 may be useful in facilitating review of further requirements by the stakeholders.

Comment

WECC disagrees with the use of Criterion B 2 because data and evidence collection is necessary to demonstrate compliance.

Response

The P81 SDT believes that this concern appears to miss the essential aspect of the P81 project in its initial phase which is to retire requirements that do little to protect BES reliability. Thus, hardwiring in data retention mandatory requirements does not seem aligned with generally accepted methods of auditing or promoting an effective and efficient ERO. It is incumbent on the entities to maintain sufficient evidence to support compliance with requirements, and the P81 SDT believes that any requirements that strictly support compliance assessments without a benefit to reliability should be evaluated for revision or retirement.

Comment

WECC disagrees with Criterion B 7 because it would allow other regulators to enforce a requirement.

Response

The P81 SDT agrees with WECC's overarching concern; however, that situation exists today. If there is a requirement that is already part of a regulatory order or under the purview of another governmental authority and is consistently understood and applied across North America, then the P81 SDT believes it should remain a candidate for retirement to remove this potential for double jeopardy. It is important to note, however, that it must be consistently covered across the whole continent and mandatory so as to ensure no "gaps" exist.

Comment

Independent Electricity System Operator suggests that another word be used other then "Technical" to describe Criterion B.

Response

Based on this concern, the P81 SDT changed "Technical" to "Identifying."

C. <u>Comments of Criterion C</u>

Comment

WECC believes Criterion C 1, C 2, C 4, C 6 and C 7 all need to be made more specific or improved.

Response

The concern seems predicated on Criterion C determining whether or not to retire a requirement, which is not the intent. Instead, these criteria will be used to ensure additional pertinent information and considerations are used to assist in the determination of whether a Reliability Standard requirement satisfies both Criterion A and Criterion B. The P81 SDT shall consider these data and

reference points to make a more informed decision. Also, note that these criteria are conceptual only and were developed to assist the industry and the P81 SDT with their analysis. The P81 SDT thanks WECC for their thorough review; however, it will retain the criteria as written.

Comment

Independent Electricity System Operator states it is confusing as to how the section C, "Additional Data and Reference Points" will be used by the drafting team to determine retirement of Reliability Standards even though they have satisfied Criterion A and Criterion B.

Response

The P81 SDT believes that a review of the technical white paper, which will be issued and will contain the initial list of requirements to be retired, will promote an understanding on how Criterion C was used. Criterion C is only meant to provide additional considerations to provide further justifications that the proposed retirements do not have any other underlying reliability related need.

D. Miscellaneous Comments on Phase I vs. Subsequent Phases

Comment

ACES Power Marketing Standards Collaborators suggest that the scope of the SAR should be changed to include current standards under development.

Response

At this time it appears that including requirements from current standards under development would overly complicate the P81 project and intrude on other standard drafting teams. With that said, the P81 SDT does intend to work with and coordinate with other standard drafting teams to help ensure that new requirements are not being drafted that appear to meet the P81 criteria. Also, the P81 SDT will be working with the Standards Committee to draft guidelines to help standard drafting teams draft requirements that are more results-based, and not requirements that would meet the P81 criteria.

Comment

ERCOT indicates that the criteria used for future phases should remain flexible.

Response

The initial list should not preclude the use of additional criteria for future phases where additional criteria support the elimination of requirements in those efforts. Given the amount of commenters who requested numerous requirements be considered in future phases, it appears reasonable that P81 project should remain flexible to meet the needs of stakeholders. Thus, the P81 SDT has revised the SAR to apply to Phase I only.

Comment

SRC urges the SAR simply suggest that the proposed requirements be considered and evaluated by the SDT as opposed to making a presumption (and hence setting a high expectation for the industry) that the proposed list will be retired.

Response

The P81 SDT did not intend for the list of requirements proposed in the draft SAR to come across as a list without flexibility.

Comment

ACES Power Marketing Standards Collaborators suggests that requirements that are assigned to the wrong functional entities should be added as a criterion for revision or retirement.

Response

The P81 SDT believes that ACES's suggestion should be considered during the development of a Phase 2 SAR. In many instances, applicability can be a complex undertaking and there may be large diversity, irrespective of an entity having some common high-level responsibilities as listed in the NERC Registry and Functional Model.

Comment

NERC staff suggests that any technical justifications that rely on Criterion B 6 should address how NAESB, etc. would handle the requirement.

Response

As a general matter, many commenters suggest that the P81 project develop thorough justifications and remain in line with the suggested Criteria. NERC staff's concern of reliance on Criterion B 6 will also be considered when developing the justifications. The P81 SDT removed references to NAESB, but notes that when relying on B 6, sufficient reference will be made to other mandatory requirements which effectively ensure there will be no gap on a continent-wide basis and in addition, what will ensure that on an ongoing basis, this gap will remain addressed by something other than a NERC standard requirement. The technical white paper will consider these concerns. In addition, the P81 SDT believes that ongoing training for drafting teams will ensure that these types of requirements are no longer developed.

Organization	Yes or No	Question 1 Comment

Organization	Yes or No	Question 1 Comment
Western Electricity Coordinating Council	No	WECC offers the following related to the criteria listed in the SAR.WECC beleives the OVERARCHING CRITERIA listed under "A" needs clarification and that as currently identified is too vague. The Overarching Criterion statement is too broad and is contrary to the FPA Section 215. "Impact" is an ambiguous term. There is no measure as to how to quantify a Requirement's "impact" and to distinguish between "little" impacts as opposed to some other metric of "impact." More importantly, however, a Requirement that has any impact on the reliable operation of the BES cannot be dismissed as inconsequential, even if it is determined to have "little" impact. The "impact" must be weighed against the "burden" of the standard and potential for efforts to demonstrate compliance hindering or preventing other more "impactful" reqiurements. Further, the Standard Requirements work in concert with one another. For many Standard Requirements, it is impossible to reasonably assess the "impact" of a single Standard Requirement. For example, the "purpose" statement for CIP Standard Requirements reads that "[CIP Standard Requirements] should be read as part of a group of standards numbered Standards CIP-002 through CIP-009." To examine the "impact" of a single Standard Requirement, therefore, contradicts the intent and purpose of many Standard Requirements that are crafted to operate in concerns with one another.WECC believes the B1 Administrative Technical Criteria needs claificaiton and is vague as currently written. The term "administrative" is ambiguous and could cover a broad range of activities. Further, "administrative requirements" often require evidence of program or procedure creation. However, WECC does agree with this criteria, but only in the case where all three criteria listed (administrative, does not support reliability, and needlessly burdensome) are met.WECC disagrees witht he B2 Technical Criteria Data Collection/Data Retention. Data Collection/Data Retention is often the only means by which a Responsible Entity can objectively demonstrate compliance. As to mandatory data retention

Organization	Yes or No	Question 1 Comment
		periods, an explicit mandate to retain data may be required to meet compliance obligations unique to a particular Standard Requirement. However, if treated correctly, a requirement for the data collection/retention for compliance purposes could be removed from the Requirmeetns and made part of the Measures or RSAWs.WECC Disagrees with the B3 criteria Purley Documentation unless it can be clearly demonstrated that the dcoumentation does not protect the reliabiltity of the BES in any way. In some cases Plans/Policies/Procedures are necessary for employees to have a guide for not only protection but maintaining and restoring BES assets (i.e. Restoration Plans). Documentation of plans, policies and procedures, is key in defining the parameters of compliance. Further, plans/policies and procedures are often the only means by which Compliance and Enforcement can assess a responsible entity's compliance with a Standard Requirement.WECC Disagrees with the B4 criteria Purely Reporting unless no purpose for the reporting can be identified. Reporting helps overarching organizations (ex. ES ISAC) detect potential issues earlier, by giving them more information and from multiple entities. These issues may seem small or insignificant when viewed by a singular entity but may have a more a drastic impact when viewed from the perspective of the entire BES. WECC Disagrees with the B5 criteria Periodic Updates unless it can be clearly demonstrated that the reproting has no operational benefit to reliability. Without these requirements there is nothing in place to ensure entityies are maintaining, and periodically verifying the accuracy of these documents. With the criteria established as it is, there is no real way of measuring the effect of "operational benefit to reliability". Is it measured by the size of impact (MW), by time (something that will take over a 1hr), or by Time Horizon (Same-Day operations vs. Real Time Operations). It is recommended to establish a more accurate means to measure these criteria. If proberly handled, these reporting requirements that that demonstrate the entities are maintaining certain necessary

Organization	Yes or No	Question 1 Comment
		documents could be moved from the Requirements to the Measures or RSAWs.WECC agrees with the B6 criteria of Business Practices.B7 criteria Redundant: Although WECC agrees requirements should not be redundant with each other, if compliance is left to other regulators (Open Access Transmission Tariff, NAESB, etc.) compliance may not be held up to NERC expectations or interpretations. In identifying redundant standards, only NERC Reliability Standards should be considered.WECC agrees with B* criteria,WECC believes the B9 criteria needs clarification and as written is vague. How will the determination that teh Requirements do little, if anything, to promote the protection of the BES be determined?WECC disagrees with C1. The FFT determination is not predicated on any particular Standard Requirement. The FFT determination is fact specific. Even a requirement that is critical to the BES may have an FFT'd violation if the manner in which the requirement was violated was minor.WECC beleives C2 is vague and needs clarification. Not certan what it means if the requirement is being revieweed in an on-going Standards Development Project. Is this the same as B7 Redundant?WECC agrees C3 is a factor that should be considered.WECC agrees with C4 but beleives information on how the tiers will be viewed should be included.WECC agrees with C5.WECC believes C6 and C7 are vague as written and believes that these last two reference points are intended to indicate that if the answer is yes, then the requirement or standard would NOT be eligable for retirement. This should be clarified.
Independent Electricity System Operator	No	(1) The IESO supports this proposed effort and agrees with most of the criteria, with some exceptions (except #5): "The Reliability Standard requirement requires responsible entities to periodically update (e.g., annually) documentation, such as a plan, procedure or policy without an operational benefit to reliability."Take for example the system restoration plan. An annual review is necessary to ensure that the plan recognizes BES facility changes that occurred since the last review/update. Another

Organization	Yes or No	Question 1 Comment
		example is the exceptions to the cyber security policy that needs to be reviewed and approved by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Applying this criterion in a broad brush manner without looking at each requirement may result in removing requirements that are still needed for reliability.(2) Generally, the nine criteria listed in the SAR are simple and sufficient to be used to determine retirement of reliability standard requirements. It is recommended that the word "Technical" in the heading of the B section "Technical Criteria" be erased as the criteria aren't based on technical data. Also, it is unclear and confusing as to how the section C "Additional Data and Reference Points" will be used by the drafting team to determine retirement of reliability standards even though they have satisfied Criteria A and B. Criterion B.9 can potentially be deleted as its purpose seems to be the duplication of Criterion A.(3) The SAR narrative for TOP-001-1a R3 states the requirement is redundant with IRO-001-1a R8. IRO-001-1a does not exist; we believe, it should be IRO-001-1.1 R8 instead.
NERC Technical Staff Review	No	(1) Revise Criteria A to focus on the content of the Reliability Standards. NERC Staff suggests the following language for Criteria A: "The Reliability Standard requirement requires responsible entities to conduct an activity or task that does little, if anything, to protect reliable operation of the BES." This language is currently included as Criteria B9. NERC notes that both Criterion B8 (hinders the protection or reliable operation of the BES) and B9 (little, if any value as a reliability requirement) are duplicative with Criterion A and should be eliminated. Since any requirement that meets Criterion B8 or B9 would necessarily meet Criterion A, this creates an unintended consequence by undermining the objective that requirements for consideration must satisfy both the overarching Criterion A and a separate technical criteria. For these reasons, NERC Staff supports the elimination of both Criteria B8 and B9 and the re-phrasing of Criteria A. (2) There is significant overlap between Criteria B3 (Purely Documentation) and B5

Organization	Yes or No	Question 1 Comment
		(Periodic Updates) and these criteria could be combined. Criteria B3 addresses requirements for entities to develop a document that is not necessary and Criteria B5 addresses the requirement for entities to periodically update such documentation. NERC Staff suggests renaming Criteria B3 "Documentation" and suggests the following language: "The Reliability Standard requirement requires responsible entities to develop and/or periodically update a document (e.g., plan, policy or procedure) which is not necessary to protect BES reliability." (3) The explanation of Criterion B6 (Commercial or Business Practice) states that the Reliability Standard requirement "is a commercial or business practice, e.g., better served as a NAESB standard or as part of NAESB Electric Industry Registry (EIR)." However, the technical justifications provided for the application of the B6 criteria do not state that the standard/requirement should be addressed in another manner, e.g., with a NAESB standard. Please clarify or otherwise modify this criterion appropriately. Further, the technical justification should address the fact that such business practices may not be applicable to the same entities and may not be mandatory or enforceable.
Northeast Power Coordinating Council	Yes	NPCC participating members support the P81 initiative and agree with the criteria listed in the SAR to identify Reliability Standard requirements for retirement. The criteria are also consistent with FERC's guidance in Paragraph 81 of the FFT Order. With respect to the words in Criterion A wording, it could be interpreted as an indication that the original reliability standard requirement was a mistake. Suggest the SDT consider alternative wording to indicate that the experience with the requirement, over time, has proven not to be useful to accomplish its initially intended reliability objective, or has not produced clear results for the initially intended reliability objective.Criterion A, and Technical Criteria B9 "Little, if any, value as a reliability requirement" are redundant.

Organization	Yes or No	Question 1 Comment
ACES Power Marketing Standards Collaborators	Yes	In general, we agree with the criteria. However, we do offer two suggestions. First, in criterion B.1, we suggest striking "and is needlessly burdensome". If the activity does not support reliability the burden is irrelevant. Second, we suggest if there are current standards under development that are already proposing to retire requirements that those requirements should be considered for inclusion in this project. In order to include those requirements, the proposed reason for retirement should align with one of the criteria in this project. This would accelerate the retirement of unnecessary requirements. Third, we suggest requirements that are assigned to the wrong functional entities should be added as a criterion for revision/retirement.
The Edison Electric Institute (EEI), the National Rural Electric Cooperative Association (NRECA), the Electric Power Supply Association (EPSA), the Transmission Access Policy Study Group (TAPS), Electricity Consumers Resource Council (ELCON), the American Public Power Association (APPA), the Large Public Power Council (LPPC) and, the Canadian Electricity Association (CEA) (collectively, the Trade Associations).	Yes	The Trade Associations agree with the criteria listed in the SAR to identify Reliability Standard requirements for retirement. As noted above, the criteria were the product of intense discussions among numerous stakeholders, including the Trade Associations, NERC, and the Regional Entities. The criteria are also consistent with FERC's guidance in paragraph 81 of the FFT Order.
SPP Standards Review Group	Yes	We concur that the proposed criteria are a good starting point for the evaluation of requirements to be retired.
Salt River Project	Yes	We like the criteria and methodology.

Organization	Yes or No	Question 1 Comment
SRC	Yes	The criteria listed in the SAR capture the right categories; however, consider restructuring B1. B2 through B5 are examples of administrative requirements and should possibly be sub-items of B1. While we generally support this proposed effort and agrees with most of the criteria, the exception is B5: “The Reliability Standard requirement requires responsible entities to periodically update (e.g., annually) documentation, such as a plan, procedure or policy without an operational benefit to reliability.”Take for example the system restoration plan. An annual review is necessary to ensure that the plan recognizes BES facility changes that occurred since the last review/update. Another example is the exceptions to the cyber security policy that needs to be reviewed and approved by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Applying this criterion in a broad brush manner without looking at each requirement may result in removing requirements that are still needed for reliability. In addition, the acid test for retirement of a requirement is when the standard drafting team reviews the overall reliability impact of removing a particular requirement from a standard, and how it may affect other related standards. In brief, it may be a bit premature to pass on this judgment at the SAR stage. We urge the SAR proponent to simply suggest that the proposed requirements be considered and evaluated by the SDT as opposed to making a presumption (and hence setting a high expectation for the industry) that the proposed list will be retired. And, in order to meet the requirements for regulatory approval, we suggest the SDT to provide strong technical basis to justify each retirement.
Manitoba Hydro	Yes	The technical criteria B.9, "Little if any, value as a reliability requirement", is very subjective and should be redefined or clarified.
Georgia System Operations Corporation	Yes	Georgia System Operations agrees with the criteria listed in the SAR to identify Reliability Standard requirements for either modification or

Organization	Yes or No	Question 1 Comment
		withdrawal.
seattle city light	Yes	Seattle City Light supports the consolidated comments of the industry Trade Organizations.
NV Energy	Yes	We agree with the Overarching Criterion and the specific Technical Criteria, and believe that the types of requirements specified in the Technical Criteria can be eliminated without any impact to reliable operation of the interconnected transmission system.
Occidental Energy Ventures Corp.	Yes	Occidental Energy Ventures Corp. ("OEVC") fully supports the efforts taken by the Trades, NERC, and the Regional Entity Management Group to develop the criteria to identify requirements that may be eligible for retirement and modification. The overarching criterion is extremely important in our view, as it serves to remind us all that FERC's original purpose as defined by Section 215(a)(4) of the Federal Power Act is to oversee wide-area reliability of the bulk power system. In recent years, the Commission's authority has expanded into distribution systems and localized load shedding - important issues, but already regulated by the PUCs. In our view, this is duplicative work that increases costs without serving improved reliability.OEVC also believes that the technical criteria are appropriate and complete for now. However, in our view, Item #8 "Hinders the protection or reliable operation of the BES" and Item #9 "Little, if any, value as a reliability requirement" will need further refinement in future phases of this project. Both are quite subjective, and FERC in our opinion will only respond to fact-based quantitative data that shows that BPS reliability is not improved by a given reliability requirement. A painful reminder may be the requirement for secondary Facility Ratings (FAC-008-3) which FERC clearly perceives to be a reliability imperative despite overwhelming industry rejection of the concept. It is unlikely that this view will change unless tangible cost/benefit evidence to the contrary

Organization	Yes or No	Question 1 Comment
		is provided to the Commission.
South Carolina Electric and Gas	Yes	I support removing redundancy and any items that are not related to reliability impacts.
Georgia Transmission Corporation	Yes	Georgia Transmission Corporation agrees with the criteria listed in the SAR to identify Reliability Standard requirements for either modification or withdrawal.
Electric Reliability Council of Texas, Inc.	Yes	ERCOT agrees with the ISO/RTO SRC comments. However, in addition for SRC comments, ERCOT offers the following: ERCOT agrees with the criteria listed in the SAR to identify Reliability Standard requirements for retirement in Phase 1. However, the criteria used for future phases should remain flexible. The initial list should not preclude the use of additional criteria for future phases where additional criteria support the elimination of requirements in those efforts.

2. The Initial Phase of the P81 project is designed to identify all FERC-approved Reliability Standard requirements that easily satisfy the criteria. Do you agree that the suggested list of Reliability Standard requirements included in the draft SAR easily satisfy the criteria listed in the draft SAR? If you disagree, please provide a statement supporting what Reliability Standard requirements you would add or subtract from the Initial Phase, including a citation to at least one element of Criterion B, as applicable.

Summary Consideration:

A. Support for Initial List

The majority of commenters support the initial list of requirements suggested for retirement in the draft SAR. Supporters include SPP Standards Review Group, The Edison Electric Institute (EEI), the National Rural Electric Cooperative Association (NRECA), the Electric Power Supply Association (EPSA), the Transmission Access Policy Study Group (TAPS), Electricity Consumers Resource Council (ELCON), the American Public Power Association (APPA), the Large Public Power Council (LPPC), the Canadian Electricity Association (CEA) (collectively, the Trade Associations), Salt River Project, SRC, Georgia System Operations Corporation, Seattle City Light, Duke Energy, NV Energy, Occidental Energy Ventures Corp., South Carolina Electric and Gas, Ameren, Electric Reliability Council of Texas, Inc., SERC EC Planning Standards Subcommittee, Dominion, Pepco Holdings Inc & Affiliates, PPL Corporation NERC Registered Affiliates, Tampa Electric Company, Manitoba Hydro, City of Garland, Entergy Services, Inc., Wolverine Power Supply Cooperative, Inc., Central Hudson Gas & Electric Corporation, Tucson Electric Power, CPS Energy, Edison Mission Marketing & Trading, Illinois Municipal Electric Agency, Idaho Power Company, City of Austin dba Austin Energy, Transmission Agency of Northern California, and Kansas City Power & Light. Also, the following entities appear to generally support the current list, while requesting additional requirements to be added: Georgia Transmission Corporation, Occidental Power Services, Inc., American Electric Power, and ACES Power Marketing Standards Collaborators. This level of support appears to be a testament to the hard work of the collaborative process and provides significant context in which to consider the merits of those stakeholders who requested that certain requirements be added or removed from the initial list.

B. Concerns with requirements included in the initial list

Comment

Northeast Power Coordinating Council (NPCC), Southwest Power Pool Regional Entity (SPP RE), Western Electricity Coordinating Council (WECC), NERC staff technical review (NERC staff) presented concerns with retiring requirements related to PRC-008-0 and PRC-009-0.

Response

As SRC points out, PRC-009-0 is already scheduled to be retired. More specifically, in Order No. 763 at Paragraph 103[3] the Commission accepted the retirement of PRC-009-0 as appropriately replaced with PRC-006-1. Consistent with Order No. 763, PRC-009-0 will become inactive on September 30, 2013 and will be replaced by PRC-006-1. Similarly, under Standards Development Project 2007-17 Protection System Maintenance, which recently passed stakeholders vote on August 27, 2012, PRC-008-0 is scheduled to be retired and replaced with PRC-005-2. PRC-005-2 will likely be presented to the NERC Board of Trustees in November for approval. To avoid confusion and promote regulatory efficiency, the P81 SDT intends to present PRC-008-0 and PRC-009-0 in the final SAR for informational purposes only. Accordingly, PRC-008-0 and PRC-009-0 will not be included in the P81 project for purposes of comment and ballot.

Comment

NPCC is concerned that it may only receive information related to UVLS program assessment and performance after an event if PRC-010-0 R2 and PRC-022-1 R2 are retired.

Response

The P81 SDT believes it is appropriate to retire PRC-010-0 R2 and PRC-022-1 R2 because the Regional Entities' current compliance and monitoring processes provide for the review of UVLS program assessment and performance during a spot check, compliance audit, etc., which makes PRC-010-0 R2 and PRC-022-1 R2 unnecessary. Thus, the P81 SDT believes that PRC-010-0 R2 and PRC-022-1 R2 should remain within the scope of P81 for purposes of comment and ballot.

Comment

WECC and SPP RE requested that CIP-007-3 R7.3 not be retired, based on concerns related to demonstrating compliance with other requirements.

Response

These concerns appear to miss the essential aspect of the P81 project which is to retire requirements that do little to protect BES reliability. The P81 SDT believes that data retention in and of itself has little to do with protecting BES reliability, particularly when the Regions have authority to request data to show compliance with any mandatory Reliability Standard. Thus, hardwiring in data retention into mandatory Reliability Standard requirements does not seem aligned with generally accepted methods of auditing or promoting an effective and efficient ERO compliance program. In other words, it seems to adopt the position of WECC and SPP RE on this matter could essentially be an endorsement that every Reliability Standard requirement should be accompanied with a mandatory data retention requirement, which would seem counterintuitive given the processes set for in the Compliance Monitoring and Enforcement Program. Thus, the P81 SDT believes that CIP-007-3 R7.3 should remain within the scope of P81 for purposes of comment and ballot.

[3] *Automatic Underfrequency Load Shedding and Load Shedding Plans Reliability Standards*, 139 F.E.R.C. ¶ 61,098 (2012).

Comment

WECC also disagrees with the inclusion of IRO-016-1 R2 with a concern that Reliability Coordinators must be required to document their actions for compliance and enforcement purposes.

Response

Reliability Coordinator actions are conducted over recorded lines or via written directives, and, thus, the documentation is already available for a Regional Entity to inspect. Further, during a spot check or compliance audit a Regional Entity has the authority to request information, as well as the entity has the burden to prove compliance – if the entity chooses to prove compliance via recorded phone lines or logs is not necessarily an appropriate subject for a mandatory Reliability Standard. Thus, the P81 SDT believes that IRO-016-1 R2 should remain within the scope of P81 for purposes of comment and ballot.

Comment

WECC and NERC staff express concerns with including MOD-004-1. Specifically, WECC states:

MOD-004 is not redundant to TOP-002 even though the CBM itself may be a tariff issue and rarely used. The reliability piece is that if the CBM is used by a TSP then the details of it must be available for use in system studies. Without the awareness of a transmission holdback for CBM when it exists, a network study could be run and show no issues but if at some time the CBM were implemented an overload could result. This might not always be the case but unless the CBM parameters are known and modeled it could impact reliability.

NERC staff suggests that MOD-004-1 may be more appropriate for a subsequent phase unless a solid technical justification can be developed for MOD-004-1 that addresses relevant FERC's ruling.

Response

One of the tenants of the initial phase of P81 is that the requirement does not need significant technical justifications or editing. Notwithstanding the apparent support for MOD-004-1 to be part of the P81 project, it is also apparent to the P81 SDT that at this time MOD-004-1 needs additional review and consideration prior to any decision to retire all or part of its requirements. It is also noteworthy that there are a large number of requests to consider other MOD standards in subsequent phases, and it is likely appropriate to consider the MOD Standards as a whole so that MOD-004-1 can be more thoroughly analyzed. For example, CBM is referenced in a number of MOD Standards, such as MOD-001-1a, MOD-008-1 and MOD-028-1. Thus, the P81 SDT has removed MOD-004-1 from the list of requirements proposed for the initial phase and MOD-004-1 will be considered in a subsequent phase of the P81 project.

Comment

WECC, Public Service Enterprise Group and Essential Power, LLC state that CIP-002-1a R4 should not be retired. WECC makes several points, including:

"An entity has many enforcement agencies to contact without the FBI listed in the operating instructions they could easily be overlooked. . . . . Retiring R4 will remove the incentive of having a working relationship with the FBI, especially among the smaller entities. Retiring R4 may effectively delay or prevent the FBI from rapidly locating those responsible for sabotage."

Also, Public Service Enterprise Group and Essential Power, LLC state:

"If the entity owns or operates a BES asset, there is a clear reliability benefit to have appropriate law enforcement contacts and procedures to address sabotage or other security incidents. Similarly, the federal agencies feel that this is a good idea. In a coordinated attack environment, sabotage reporting to these Law enforcement agencies from the BES operators and owners would improve the ability of a coordinated response."

Response

The P81 SDT believes that the practices and procedures discussed by WECC, Public Service Enterprise Group and Essential Power, LLC are accomplished via R1 through R3 of CIP-002-1a, not R4. For example, consistent with R2,[4] it is common practice to contact local law enforcement authorities when there is any suspicion that sabotage has occurred at a BES facility. The entity's corporate security and site personnel will consult with local law enforcement to assess the situation and facts to determine whether a suspected or actual act of sabotage has occurred. If they find a suspected or actual act of sabotage has occurred, reliability entities as well as the Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP), as appropriate, will be contacted in accordance with R2. Thus, pursuant to R1 through R3, when there is an instance of sabotage that warrants contacting the FBI or RCMP or any other federal or national governmental authority, entities will contact them. Conversely, the requirement in R4 to establish communication contacts with the FBI or RCMP, as applicable, is purely an administrative, documentation and data collection task requirement – there is no operational or results-based aspect of R4, like there is with R1 through R3. Accordingly, in CIP-001-2a R1 through R3 serve the results-based reliability function, while R4 is a static, administrative requirement that has no direct or clear nexus to protecting BES reliability. For these reasons, the P81 SDT believes that CIP-001-2a R4 should remain within the scope of P81 for purposes of comment and ballot.

Comment

Bonneville Power Administration, WECC and NERC staff do not support the proposed retirement of TOP-001-1a R3.

[4] "**R2.** Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection."

Response

Bonneville Power Administration, WECC and NERC staff all make valid points. Although there is redundancy between TOP-001-1a R3 and IRO-001-1a R8 related to Reliability Coordinators, this redundancy was addressed in Standards Development Project 2007-03 (Real-time Operations). Specifically, Project 2007-03 eliminated the redundancy in the current version of TOP-001-2 R1 that replaces TOP-001-1a R3 and reads as follows:

Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Reliability Directive issued and identified as such by its Transmission Operator(s), unless such action would violate safety, equipment, regulatory, or statutory requirements.

TOP-001-2 has been approved by the NERC Board of Trustees and will be filed with the Commission for approval; therefore, the P81 SDT intends to present TOP-001-1a R3 in the final SAR for informational purposes only. Accordingly, TOP-001-1a R3 will not be included in the P81 project for purposes of comment and ballot.

Comment

SRC and NERC staff state that VAR-002-WECC-1 R2 and VAR-501-WECC-1 R2 should not be included in the P81 project until they have first been processed for retirement via the WECC regional standards process.

Response

SRC and NERC staff make a valid point that regional standards proposed for retirement need to first proceed through their region prior to being considered for retirement via a NERC standards development project. For these procedural concerns, VAR-002-WECC-1 R2 and VAR-501-WECC-1 R2 have been removed from the P81 project; however, the P81 SDT encourages WECC to consider the deliberations of the collaborative process and act on retiring VAR-002-WECC-1 R2 and VAR-501-WECC-1 R2, as appropriate.

Comment

Central Hudson Gas & Electric Corporation, Public Service Enterprise Group, and American Electric Power and Essential Power, LLC express concern with the inclusion of CIP-003-3 R4 and its sub-requirements in the P81 project. AEP states:

“AEP recommends instead that CIP-003 R1 be removed in which case CIP-003 R3 (and CIP-003 R2.4) can also be removed. However, if the drafting team does not agree with this recommendation, CIP-003 R3 must be retained in order for entities to take targeted exception(s) where applicable (for example, in circumstances where an entity’s program is more stringent than the CIP requirements).”

Public Service Enterprise Group and Essential Power, LLC indicate that “[t]he exceptions language in R3, though rarely used, allows for those instances where an entity is unable to conform with it's cyber security policy.”

Response

The reason for retiring CIP-003-3, -4 R3 and its sub-requirements is directly applicable to the concerns expressed. In other words, although the CIP exception requirements have never been available for use to exempt an entity from compliance with any requirement of any NERC Reliability Standard, entities apparently are reading the CIP exception requirements out of context. These requirements only apply to exceptions to internal corporate policy, and only in cases where the policy exceeds a NERC Reliability Standard requirement or addresses an issue that is not covered in a NERC Reliability Standard. For example, if an internal corporate policy statement requires that all passwords be a minimum of eight characters in length, and be changed every 30 days, this provision could be used for internal governance purposes to lessen the corporate requirement back to the password requirements in CIP-007 R5.3, or in conjunction with a Technical Feasibility Exception (TFE) to something else. Therefore, removal of this requirement has no effect on the TFE process or compliance with any other CIP requirement. Also, the retirement of the CIP exception requirements would not impact an entity's ability to maintain such a process within their corporate policy governance procedures. Consequently, the CIP exception requirements provide little protection for BES reliability and are an internal administrative and documentation requirement that is outside the scope of the other CIP requirements. Thus, the P81 SDT believes that CIP-003-3, -4 R3 and its sub-requirements should remain within the scope of P81 for purposes of comment and ballot.

Comment

Public Service Enterprise Group and Essential Power, LLC also request the P81 project not include EOP-004-1 R1 because it will soon be replaced by EOP-004-2.

Response

The P81 SDT notes that the past ballot of EOP-004-2 did not pass and it is currently in the balloting stage. The P81 SDT has coordinated its efforts with the chair of Project 2009-01 and both agree there is no conflict between retiring EOP-004-1 R1 and the direction of Project 2009-01. At such time that the EOP-004-2 project does obtain stakeholder approval and is scheduled for NERC Board of Trustees review, P81 SDT will reconsider the need to include EOP-004-1 R1. Thus, at this time, the P81 SDT believes that EOP-004-1 R1 should remain within the scope of P81 for purposes of comment and ballot.

Comment

Public Service Enterprise Group and Essential Power, LLC further request that FAC-002-1 R2 be removed from the P81 project based on the concern that the three year study retention requirement could be increased to six years via compliance and monitoring data retention.

Response

The concern of Public Service Enterprise Group and Essential Power, LLC, however, appears to miss the essential aspect of the P81 project in its initial phase which is to retire requirements that do little to protect BES reliability. Thus, hardwiring in data retention

mandatory requirements does not seem aligned with generally accepted methods of auditing or promoting an effective and efficient ERO compliance program. Accordingly, the P81 SDT believes that FAC-002-1 R2 should remain within the scope of P81 for purposes of comment and ballot.

Comment

NERC staff questioned the inclusion of FAC-008-1 R2, FAC-008-1 R3, FAC-008-3 R4, FAC-008-3 R5 and FAC-013-2 R3 in the P81 project. Specifically, NERC staff states:

"These requirements, combined with others, provide checks and balances on the Facility Rating Methodology and Transfer Capability methodology established by the responsible entities. This provides a reliability benefit by requiring the responsible entity to consider areas in which their methodology may not be sufficient to support reliable operation of the interconnected transmission system. There may be better ways of assuring that entities have sufficient methodologies and alternatives should be considered during Phase II. NERC Staff suggests that the SDT reconsider whether discussing the methodology (and not the numerical rating of a facility) has commercial or market related implications. With respect to FAC-013-2 R3, NERC Staff suggests that the SDT reconsider whether the requirement relates to "a back and forward on transfer capability" as noted in the draft SAR, as the requirement pertains only to the methodology for determining transfer capability."

Response

The P81 SDT notes that Page 5 of NERC's Standards Process Manual states:

"A Reliability Standard includes a set of Requirements that define specific obligations of owners, operators, and users of the North American Bulk Power Systems. The Requirements shall be material to reliability and measurable."

It appears difficult to read into the plain language of FAC-008-1 R2, FAC-008-1 R3, FAC-008-3 R4, FAC-008-3 R5 and FAC-013-2 R3 specific obligations that are material to reliability and measurable or provide more than a little amount of protection to BES reliability. For instance, in practice, while the owners of ratings and transmission capability methodologies have made these documents available for comment during the duration of the mandatory Reliability Standard regime, experience shows that little, if any, technical comments have not been submitted on these documents. In the regional processes, entities are on a variety of committees and have professional relationships, and, therefore, if they have a concern with a methodology, they have ample opportunity to seek out professional technical critique as a best practice. FAC-008-1 R2, FAC-008-1 R3, FAC-008-3 R4, FAC-008-3 R5 and FAC-013-2 R3 seem toonly formalize a vehicle for professional technical critique without an exacting nexus between it and reliability. Given that entities that develop these methodologies must comply with rigorous requirements in FAC-008 and FAC-013, the P81 SDT believes that the addition of a mandatory best practice technical critique process does not seem necessary, material or measurable. It is also noteworthy that there is no obligation for any entity to request a methodology nor is there any obligation on the owner of the methodology to respond to any

comments with any level or burden of technical thoroughness. Thus, the P81 SDT believes that FAC-008-1 R2, FAC-008-1 R3, FAC-008-3 R4, FAC-008-3 R5 and FAC-013-2 R3 should remain within the scope of P81 for purposes of comment and ballot.

C. Suggested additions to the initial list

Comment

NPCC suggests adding FAC-003-1 R3, FAC-003-1 R4, CIP-005-3 R4, and CIP-007-3 R8.

Response

While the P81 SDT believes there appears to be merit in considering the FAC-003 and CIP requirements suggested by NPCC, these requirements were discussed in the collaborative process and it was generally agreed that these requirements need additional technical review prior to any consideration of retirement. Thus, these requirements will be considered in a subsequent phase of the P81 project.

Comment

NPCC and SRC suggest adding IRO-014-2 R2 and it sub-requirements. According to NPCC, these requirements are administrative requirements only and do not enhance reliability, while SRC states that these requirements satisfy Criterion B1 and Criterion B5.

Response

While IRO-014-2 R2 seems like a valid candidate for P81, it is not a FERC-approved Reliability Standard. At this time, it has been adopted by the NERC Board of Trustees and has yet to be filed with FERC for approval. As the P81 project matures or a more formalized approach to P81 is adopted by NERC in its Rules of Procedures or processes, the consideration of Reliability Standards not yet approved may be practical. However, at this time, the scope of the P81 project remains FERC-approved Reliability Standards. The exception to this is if a FERC-approved requirement being proposed for retirement is duplicated in a standard that has only been adopted by the NERC Board of Trustees. Thus, at this time, IRO-014-2 R2 is not ripe for consideration in P81.

Comment

ACES Power Marketing Standards Collaborators suggests adding FAC-010-2.1 R5 and FAC-011-2 R5 in the initial phase for the following reasons:

"FAC-010-2.1 R5 is an administrative requirement for the Planning Authority to respond to comments on its SOL methodology. Failure to provide a written response to technical comments does not impact reliability. The PC is already required to distribute its methodology in R4. Any functional entity that would have provided technical comments will see any adjustments. This requirement meets Criteria B.1 and B.9.(7) FAC-011-2 R5 is an administrative requirement for the Reliability Coordinator to respond to comments on its SOL methodology. Failure to provide a written response to technical comments does not impact reliability. The RC is already required to distribute its methodology in R4."

Response

ACES Power Marketing Standards Collaborators' position is similar to the reasons that FAC-008-1 R2, FAC-008-1 R3, FAC-008-3 R4, FAC-008-3 R5 and FAC-013-2 R3 were included in the draft SAR as satisfying the criteria and appropriate for retirement. Further, the language in all of these Reliability Standard requirements is very similar. Thus, the P81 SDT has added FAC-010-2.1 R5 and FAC-011-2 R5 to the initial phase of P81.

Comment

ACES Power Marketing Standards Collaborators suggests that IRO-005-3 R11 is redundant with MOD-028-1 R6.1, MOD-029-1a R3, and MOD-030-2 R2.4 and that the MOD standards already require the Transmission Service Provider to consider IROLs and SOLs when determining Available Transfer Capability/Available Flowgate Capability and Total Transfer Capability. Specifically, IRO-005-3 R11 reads:

"The Transmission Service Provider shall respect SOLs and IROLs in accordance with filed tariffs and regional Total Transfer Calculation and Available Transfer Calculation processes."

Response

It appears that while IRO-005-3 R11 may be redundant for the reasons stated by ACES Power Marketing Standards Collaborators; however, this requirement has been retired in IRO-005-4, which was approved by the Board of Trustees and is pending a filing at FERC. Thus, recognizing that that Project 2006-06 Reliability Coordination has already received many of the necessary approvals to retire IRO-005-3 R11, it does not seem to serve regulatory efficiency to include IRO-005-3 R11 in the P81 project as well. Thus, the P81 SDT did not add IRO-005-3 R11 to the initial phase of P81.

Comment

ACES Power Marketing Standards Collaborators suggests COM-001-1.1 should be retired because English is the dominant language used.

Response

To retire such a requirement would possibly need coordination with the Canadian authorities in French speaking provinces and those in areas of the United States were Spanish is a first language. Such coordination would seem to complicate the retirement of COM-001-1.1, and, thus, the P81 SDT believes it is more appropriately considered in a subsequent phase.

Comment

With regard to VAR-001-2 R5, ACES Power Marketing Standards Collaborators states that it:

". . . is redundant with FERC's pro forma tariff and was originally included in the NERC policies to align them with said tariff. The requirement compels the PSE and LSE to arrange for reactive resources to satisfy the reactive requirements of the Transmission Service

Provider. PSEs and LSEs cannot purchase transmission service without purchasing reactive service or demonstrating to the transmission provider that they have arranged for reactive resources. From a practical perspective, this means they always purchase reactive service from the Transmission Provider. Furthermore, it is the Transmission Operator that actually ensures reactive resources are dispatched per VAR-001-2 R2."

Response

The P81 SDT notes that when approving VAR-001, in Order No. 693 at Paragraph 1858,[5] the Commission recognized:

". . . that all transmission customers of public utilities are required to purchase Ancillary Service No. 2 under the OATT or self-supply, but the OATT does not require them to provide information to transmission operators needed to accurately study reactive power needs. The Commission directs the ERO to address the reactive power requirements for LSEs on a comparable basis with purchasing-selling entities."

ACES Power Marketing Standards Collaborators states VAR-001-2 R5 appears to be redundant with Ancillary Service No. 2 under the OATT. Moreover, VAR-001-2 R5 is very limited to this OATT obligation and regional process, and, therefore, does not speak to the Commission's concern related to providing information to Transmission Operators for accurate reactive power studies. Therefore, it appears that VAR-001-2 R5 satisfies the P81 criteria by doing little to protect BES reliability and being redundant with the OATT. Thus, the P81 SDT has added VAR-001-2 R5 to the initial phase of P81.

Comment

ACES Power Marketing Standards Collaborators also suggests adding BAL-002 R1, BAL-002 R3, BAL-005-0.1b R1 and its sub-requirements, INT-004-2 R1, and TOP-005-2a R3.

Response

The P81 SDT notes that during the collaborative process the linkage between the BAL and INT standards was discussed and there seems to be merit considering whether some BAL and INT standards could be combined. The Trade Associations, among others, suggested this be conducted in a subsequent phase of P81. Given the complexity related to the linkage between the BAL and INT standards, along with TOP-005-2a R3, the P81 SDT believes that additional review should be conducted in a subsequent phase of P81 prior to retiring the suggested BAL and INT standards.

Comment

[5] VAR-001-2 was approved via a Letter Order issued on January 10, 2011.

ACES Power Marketing Standards Collaborators also suggests including PRC-011-0 R2, PRC-015-0 R3, PRC-016-0.1 R3, PRC-017-0.1 R2, PRC-021-0.1 R2, PRC-023-1 R2, and PRC-023-2 R3. American Electric Power suggests the following additions: PRC-021-1 R2; PRC-018-1 R5; PRC-016-0.1 R3; PRC-015-0 R3; PRC-011-0 R2; PRC-007-0 R3; CIP-006 R1.5; CIP-004-3 R4; CIP-007 R5.1.1; CIP-007 R5.1.3; CIP-007 R6.3; CIP-007 R6.4; CIP-003-3, CIP-003-4 R1; CIP-003-3, CIP-003-4 R1.2; CIP-003-3, CIP-003-4 R1.3; CIP-003-3, CIP-003-4 R2.4; CIP-003-3, CIP-003-4 R3. Tampa Electric recommends that the P81 SDT ensure that the CIP requirements proposed for removal via P81 are also removed from v5 of the NERC CIP standards. Tampa Electric also supports the consideration of the following for NERC CIP standards: (1) Removal of data collection requirements (CIP-005-3a,-4a R5.3, CIP-006-3c,-4c R7 and R8.3, CIP-007-3,-4 R5.1.2, R6.4and R7.3, CIP-008-3,-4 R2); and (2) Removal of annual review requirements (CIP-002-3,-4 R4, CIP-003-3,-4 R1.3, R4.3, R5.1.2, and R5.3, CIP-006-3c,-4c R1.8, CIP-007-3,-4 R9, and CIP-009-3,-4 R1).

Response

There was much discussion around the PRC and CIP standards during the collaborative process. There are several issues that impact the retirement of these requirements including not creating a reporting gap by retiring PRC standards and the coordination of CIP standards with the Version 5 SDT. Given these complications, the P81 SDT believes it is best to consider these CIP and PRC Standards as part of a subsequent phase of the P81 project. To address Tampa Electric's other concern, the P81 SDT has been coordinating its activities with the CIP Version 5 SDT, and will continue to do so, so that the agreed upon retirements do not reemerge in CIP Version 5.

Comment

Occidental Power Services, Inc. requests the removal of the PSE function from the applicable sections of the following: INT-001-3 R1, INT-004-2 R2, IRO-001-1.1 R3, IRO-001-1.1 R8, IRO-005-3 R10, TOP-005-2 R3, and VAR-001 R5. ACES Power Marketing Standards Collaborators also suggests removing PSE and LSE the applicable sections of IRO-005-3 R10.

Response

The removal of applicable from the requirements is an interesting suggestion that would take some more technical review and modification of the requirements. Thus, the P81 SDT believes this suggestion is more appropriate for consideration in a subsequent phase of P81.

Comment

Georgia Transmission Corporation suggests the following additions: MOD-016-1.1 R1, MOD-016-1.1 R1.1, MOD-016-1.1 R3, MOD-017-0.1 R1, MOD-017-0.1 R1.1, MOD-017-0.1 R1.2, MOD-017-0.1 R1.3, MOD-017-0.1 R1.4, MOD-018-0 R1, MOD-018-0 R1.2, MOD-018-0 R1.3, MOD-018-0 R2, MOD-019-0.1 R1, MOD-020-0 R1, MOD-021-1 R1, MOD-021-1 R2, MOD-021-1 R3, PRC-005-1b R2, PRC-005-1b R2.1, PRC-005-1b R2.2, PRC-006-1 R7, PRC-006-1 R8, PRC-006-1 R14, PRC-007-0 R2, PRC-007-0 R3, PRC-011-0 R2, PRC-015-0 R3, PRC-017-0 R2, PRC-018-1 R5, PRC-021-1 R2, PRC-023-1 R3.3, and TOP-001-1a R4.

Response

Georgia Transmission Corporation points out many of the same requirements that the trade associations suggest for subsequent phases of the P81 project. As mentioned above, for example, we are deferring the consideration of MOD-004-1 to a subsequent phase so it may be considered in the context of other MOD Standards. The P81 SDT believes it is more appropriate to consider Georgia Transmission Corporation's suggestions in a subsequent phase.

Comment

South Carolina Electric and Gas asked if the measures associated with requirements being proposed for retirement would be modified or removed as well.

Response

The relevant measures and other associated elements will be marked as retired in the standard. These will be identified in the redlines of the standards that will be posted with the requirements during the next comment period.

Comment

ERCOT states that the justification statement for BAL-005-0.1b R2 could benefit from additional clarification regarding how it is redundant with BAL-001 R1 and R2 and the justification for EOP-009-2 R2 should also be enhanced.

Response

The P81 SDT notes that additional clarification for BAL-005-0.1b R2, EOP-009-0 R2 and other requirements will be included in the technical white paper being developed by the P81 SDT.

In summary, of the initial list in the draft SAR, MOD-004-1, VAR-002-WECC-1 R2 and VAR-501-WECC-1 R2 have been deferred to a subsequent phase. Of the suggested additions, it appears that only VAR-001-2 R5, FAC-010-2.1 R5 and FAC-011-2 R5 satisfy the P81 criteria without significant technical review, and, thus, are appropriate to be added to the final SAR for the initial phase. As a general note, any requirements suggested for the initial phase, but not adopted, shall be considered by the P81 SDT in a subsequent phase of the project, and, therefore, the entities do not need to resubmit the requirements.

Organization	Yes or No	Question 2 Comment
Northeast Power Coordinating Council	No	From page 25 of the SAR, "Since PRC-008-0 R1; PRC-008-0 R2; PRC-009-0 R1; PRC-009-0 R1.1; PRC-009-0 R1.2; PRC-009-0 R1.3; PRC-009-0 R1.4; PRC-009-0 R2; PRC-010-0 R2; PRC-022-1 R2 provides little protection to the BES and better handled under event analysis and lessons learned papers, it should be removed." is not valid due to that fact that as of this posting the Event Analysis Program (EAP) has not become part of the RoP and is therefore a voluntary program. The requirements that are covered by these standards are mandatory cannot be replaced by a voluntary program. Refer to the following:Additionally, the EAP process is an after-the-fact Analysis of an event or events. These standard requirements (PRC-008-0 R1; PRC-008-0 R2; PRC-009-0 R1; PRC-009-0 R1.1; PRC-009-0 R1.2; PRC-009-0 R1.3; PRC-009-0 R1.4; PRC-009-0 R2; PRC-010-0 R2; PRC-022-1 R2) address different needs which can be determined only if such an event occurs. For example, from PRC-008-0--"R1. The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall have a UFLS equipment maintenance and testing program in place. This UFLS equipment maintenance and testing program shall include UFLS equipment identification, the schedule for UFLS equipment testing, and the schedule for UFLS equipment maintenance." This requirement addresses the need to have an equipment maintenance and testing program in place prior to an event. Discovering that an entity did not have this as a result of an event analysis would, in this case, be after the damage is done and would not serve reliability. Analyzing why the UFSL program did not operate properly would come under the purview of the EAP but that is different from the Standard's intent. PRC-008-0--"R2. The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall implement its UFLS equipment maintenance and testing program and shall provide UFLS maintenance and testing program results to its Regional Reliability Organization and NERC on request (within 30 calendar days)." If the EAP was relied upon to meet this requirement the receipt or confirmation of this program would only occur after an event. PRC-009-0--"R1. The Transmission Owner, Transmission Operator, Load-Serving Entity and Distribution Provider that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall

Organization	Yes or No	Question 2 Comment
		analyze and document its UFLS program performance in accordance with its Regional Reliability Organization's UFLS program. The analysis shall address the performance of UFLS equipment and program effectiveness following system events resulting in system frequency excursions below the initializing set points of the UFLS program. The analysis shall include, but not be limited to:R1.1 A description of the event including initiating conditions.R1.2 A review of the UFLS set points and tripping times.R1.3 A simulation of the event.R1.4 A summary of the findings."Although this Standard appears that it could be covered under EAP, it is a highly detailed technical study and needs to be carried out on its own accord. Event Analysis will focus primarily what caused the event that triggered the UFLS program but not necessarily the program itself. Because of the importance of the UFLS program to the reliability of the system, its performance should not be analyzed only on a voluntary basis and not only by those entities that actually shed load as a result of the event, but against the whole regional program.PRC-009-0--"R2. The Transmission Owner, Transmission Operator, Load-Serving Entity, and Distribution Provider that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall provide documentation of the analysis of the UFLS program to its Regional Reliability Organization and NERC on request 90 calendar days after the system event."This is administrative, refer to the response for R1 preceding. PRC-010-0--"R2. The Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall provide documentation of its current UVLS program assessment to its Regional Reliability Organization and NERC on request (30 calendar days)." This should not triggered only after an event, see preceding response for R1 preceding. PRC-022-1--"R2. Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall provide documentation of its analysis of UVLS program performance to its Regional Reliability Organization within 90 calendar days of a request."This is the same situation as for the UFLS program. Refer to the responses preceding. IRO-014-2 --The following requirements in Standard IRO-014-2 are administrative requirements only and do not enhance reliability, and should be considered for removal in the Initial

Organization	Yes or No	Question 2 Comment
		Phase. "R2. Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: [Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Operations Planning]2.1. Review and update annually with no more that 15 months between reviews. 2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.2.3. Distribute to all Reliability Coordinators that are required to take the indicated action(s) within 30 days of an update."FAC-003-1 Requirements R3, and R4 (shown below) and their sub-requirements are administrative (reporting) requirements only and do not enhance reliability, and should be considered for removal in the Initial Phase. R3. The Transmission Owner shall report quarterly to its RRO, or the RRO's designee, sustained transmission line outages determined by the Transmission Owner to have been caused by vegetation.R4. The RRO shall report the outage information provided to it by Transmission Owner's, as required by Requirement 3, quarterly to NERC, as well as any actions taken by the RRO as a result of any of the reported outages.In addition, as shown below, CIP-005-3 R4 and CIP-007-3 R8 are essentially the same. Suggest to eliminate CIP-005-3 R4 and include assessment of access points in CIP-007-3 R8.CIP-005-3 R4:"R4. Cyber Vulnerability Assessment - The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following: R4.1. A document identifying the vulnerability assessment process; R4.2. A review to verify that only ports and services required for operations at these access points are enabled; R4.3. The discovery of all access points to the Electronic Security Perimeter; R4.4. A review of controls for default accounts, passwords, and network management community strings; R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan." CIP-007-3 R8:"R8. Cyber Vulnerability Assessment - The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the

Organization	Yes or No	Question 2 Comment
		following: R8.1 A document identifying the vulnerability assessment process; R8.2 A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled; R8.3 A review of controls for default accounts; and, R8.4 Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan."
Southwest Power Pool Regional Entity	No	SPP RE does not agree that PRC-008 R1 and R2 should be retired or that they provide "little protection to the BES and [are] better handled under event analysis and lessons learned papers". UFLS equipment maintenance and testing programs ARE important to BES reliability, in a preventative mode, and are NOT covered under the Event Analysis process. Preventative maintenance is very important to reliability; without it, events are more likely. Industry should not wait for an event to happen to collect information and consider maintenance and testing. UFLS is the last line of "defense in depth protection of the BES" (Criteria C6). SPP RE's comment follows the discussion around removing PRC-005 and its relationship to BES reliability.SPP RE does not agree that CIP-007-3 R7.3 should be retired. R7.3 requires the Responsible Entity to maintain records of how data storage media was erased or destroyed prior to disposal or redeployment of the Cyber Asset (which could be simply the media previously removed from the Cyber Asset). In the absence of such records, the Responsible Entity cannot demonstrate compliance with CIP-007-3 R7.1 and CIP-007-3 R7.2, rendering those requirements not auditable. Elimination of this requirement could also result in a loss of visibility of Cyber Assets that have been disposed of or redeployed, also hampering the ability of the Responsible Entity to demonstrate compliance and the Compliance Enforcement Authority to audit compliance with the remaining requirements.
Bonneville Power Administration	No	BPA does not support the proposed retirement of TOP-001-1a R3. BPA does not agree that TOP-001-1a R3 is redundant with IRO-001-1a R8 because IRO-001-1a R8 only addresses RC directives, whereas TOP-001-1a R3 addresses both RC directives and TOP directives. BPA believes that retiring TOP-001-1a R3 before TOP-001-2 R1 is

Organization	Yes or No	Question 2 Comment
		effective would create a gap because no requirement would address TOP directives. BPA supports the additional proposed retirements and thanks the drafting team for their efforts.
ACES Power Marketing Standards Collaborators	No	(1) We believe there are other requirements that easily meet the criteria. (2) VAR-001-2 R5 is redundant with FERC's pro forma tariff and was originally included in the NERC policies to align them with said tariff. The requirement compels the PSE and LSE to arrange for reactive resources to satisfy the reactive requirements of the Transmission Service Provider. PSEs and LSEs cannot purchase transmission service without purchasing reactive service or demonstrating to the transmission provider that they have arranged for reactive resources. From a practical perspective, this means they always purchase reactive service from the Transmission Provider. Furthermore, it is the Transmission Operator that actually ensures reactive resources are dispatched per VAR-001-2 R2. Thus, VAR-001-2 R5 satisfies criteria B.1, B.6, B.7, and B.9.(3) BAL-002 R1 and R3 are redundant. R1 compels the BA to have access to and operate Contingency Reserve to respond to disturbances. R3 requires the BA to activate sufficient Contingency Reserve to comply with DCS. We suggest removing R1 because it is redundant (Criterion B.7). This applies to both versions 0 and 1 of the standard.(4) BAL-005-0.1b R1 and its sub-requirements are not necessary. All generation, transmission and load is currently contained within the metered boundaries of a BA. It is impossible to add new generation, transmission and load and not be within the metered boundaries of a BA. To do so, would require the equipment owner to carve out an area from the BA. For example, if a TO added a new transmission line, it would have to put a meter on both ends to carve it out of any BA footprint. In the process, they, in effect, create a new BA. The only way these requirements can't be met would be if BAs started removing metering equipment en masse. Given removing metering equipment has significant financial consequences due to inaccurate energy accounting; it is not going to happen. Thus, it meets Criterion B.9. Furthermore, TOs are already required to identify metering requirements in FAC-001-0 R2.1.6 as part of its facility connection requirements. It also meets Criterion B.7.(5) COM-001-1.1 is unnecessary and the audit of it has

Organization	Yes or No	Question 2 Comment
		largely become a demonstration that it is an administrative requirement. English is the primary language across the vast majority of the Interconnections under NERC's purview and it is the primary language in all of the areas under FERC's jurisdiction. For the few companies in areas where English is not predominant, those companies will be unable to meet other requirements if they use a different language to speak with companies from predominantly speaking English languages. Furthermore, audits have regulated this to predominantly an administrative requirement. The auditors largely look for statement that the English language is required despite the fact that all evidence has been provided in English, observations of control center conversations have shown English is used, and the audit has been conducted in English. If there is a need for this requirement, it should be relegated to a regional requirement for those regions that include areas that do not speak predominantly English. Thus, this requirement meets Criteria B.1 and B.9.(6) FAC-010-2.1 R5 is an administrative requirement for the Planning Authority to respond to comments on its SOL methodology. Failure to provide a written response to technical comments does not impact reliability. The PC is already required to distribute its methodology in R4. Any functional entity that would have provided technical comments will see any adjustments. This requirement meets Criteria B.1 and B.9.(7) FAC-011-2 R5 is an administrative requirement for the Reliability Coordinator to respond to comments on its SOL methodology. Failure to provide a written response to technical comments does not impact reliability. The RC is already required to distribute its methodology in R4. Any functional entity that would have provided technical comments will see any adjustments when they receive the methodology. This requirement meets criteria B.1 and B.9.(8) INT-004-2 R1 has nothing to do with reliability and should be included in the list of retirements. Failing to reload an Interchange Transaction that was curtailed for a reliability event has no reliability impact. It is a remnant from the NERC Policies that was added at the request of market participants because once transactions were cut, reliability entities did not always allow the transaction to resume once the reliability issue had been addressed. This is strictly a commercial issue. Thus, this requirement meets Criterion B.9.(9)

Organization	Yes or No	Question 2 Comment
		IRO-005-3 R10 should be modified to reflect the functional model. In cases where there are differences in derived limits, PSEs and LSE cannot operate to the most limiting parameters. They are not in a position to even have information on the parameters such as facility ratings. Rather, their role is to follow directives. Thus, inclusion of PSE and LSE in the requirement does not support reliability. Thus, this requirement meets Criterion B.9. (10) IRO-005-3 R11 is redundant with MOD-028-1 R6.1, MOD-029-1a R3, and MOD-030-2 R2.4. The MOD standards already require the TSP to consider IROLs and SOLs when determining Available Transfer Capability/Available Flowgate Capability and Total Transfer Capability. This requirement meets Criterion B.7. (11) PRC-011-0 R2 should be retired. A requirement is not needed to compel the TO and DP to provide data on its UVLS equipment maintenance program to the Regional Entity. The Regional Entity's CMEP and NERC's Rules of Procedure compel the TO and DP to provide information regarding enforceable requirements per the Regional Entity's request. This requirement meets Criteria B.1, B.4, and B.9.(12) PRC-015-0 R3 should be retired. A requirement is not needed to compel the TO, GO and DP to provide data on their Special Protection Systems (SPS) to the Regional Entity. The Regional Entity's CMEP and NERC's Rules of Procedure compel the TO, GO and DP to provide information regarding enforceable requirements per the Regional Entity's request. This requirement meets Criteria B.1, B.4, and B.9.(13) PRC-016-0.1 R3 should be retired. A requirement is not needed to compel the TO, GO and DP to provide data on their SPS Misoperations analyses and corrective action plans to the Regional Entity. The Regional Entity's CMEP and NERC's Rules of Procedure compel the TO, GO and DP to provide information regarding enforceable requirements per the Regional Entity's request. This requirement meets Criteria B.1, B.4, and B.9.(14) PRC-017-0.1 R2 should be retired. A requirement is not needed to compel the TO, GO and DP to provide documentation of the SPS maintenance and testing program to the Regional Entity. The Regional Entities CMEP and NERC's Rules of Procedure compel the TO, GO and DP to provide information regarding enforceable requirements per the Regional Entity's request. This requirement meets Criteria B.1, B.4, and B.9.(15) PRC-

Organization	Yes or No	Question 2 Comment
		021-0.1 R2 should be retired. A requirement is not needed to compel the TO and DP to provide UVLS program data to the Regional Entity. The Regional Entities CMEP and NERC's Rules of Procedure compel the TO and DP to provide information regarding enforceable requirements per the Regional Entity's request. This requirement meets Criteria B.1, B.4, and B.9.(16) PRC-023-1 R2 and PRC-023-2 R3 are redundant with FAC-008-1 R1.2.1 and FAC-008-3 Part 2.4.1. FAC-008-1 R1.2.1 and FAC-008-3 Part 2.4.1 already require the GO and TO to consider relay protective devices when determining facility ratings. The DP cannot limit the Facility Rating because a DP does not have Transmission Facilities. They only have relays that impact Facility Ratings that must ultimately be considered by the TO. This requirement meets Criterion B.7(17) TOP-005-2a R3 is redundant with the INT standards and should be retired. In the NERC Functional Model, the only role for the PSE is to facilitate Arranged Interchange. The INT standards already govern Arranged Interchange and contain the necessary information that the PSE must provide. Furthermore, Project 2007-03 Real-Time Operations has proposed retirement of this requirement as it is redundant with NAESB e-Tag specifications. Beyond the E-tag data there is no additional information that a PSE or LSE could provide for the BA or TOP to conduct operational assessments. This requirement meets Criteria B.6, B.7 and B.9.(18) PRC-006-1 R7 should be retired. Failure by a Planning Coordinator to provide data to another Planning Coordinator within 30 days is not a reliability issue because Planning Assessments have long time lines to complete the studies. Furthermore, any failure to provide data within 30 calendar days is most likely a simple oversight. If a Planning Coordinator refuses to provide data, the requesting Planning Coordinator may get involved and which will compel them to provide the data. This can be done without the need for this requirement. This requirement meets criterion B.4.
Western Electricity Coordinating Council	No	WECC supports the majority of the Standards Requirements identified, but notes concerns with the following. WECC recommends eliminating CIP-003 R1 in its entirety.WECC disagrees with the inclustion of CIP-007, R7.3. This requirement is necessary for entity's to demonstrate compliance with the other sub-requirements of CIP 007 R7. However, this requirement could be moved to a Measure or RSAW to

Organization	Yes or No	Question 2 Comment
		demonstrate compliance with the other sub-requirements of CIP-007, R7.WECC disagrees with the includsion of IRO-016-1, R2. Required documentation of the RC's actions to remedy an event is necessary for quality and efficient root cause analysis, including insight into the RC's wide view of actions during an event or disagreement. The language in the SAR statement for IRO-016-1 R2 points to this information being monitored through Spot Checks or other compliance monitoring methods. If this standard is removed yet the information is to be included in future compliance monitoring there must be some sort of methodology that requires the entity to retain the associated data to be kept for the duration of the required cycle for monitoring (i.e. audit cycle if monitored through audits). It is important that entities document the actions taken that analyze the effect on the system as well as the BES for either an even or/and for the disagreement on the problem. Therefore, it is important that this information is part of the overall compliance monitoring program.MOD-004 is not redundant to TOP-002 even though the CBM itself may be a tariff issue and rarely used. The reliability piece is that if the CBM is used by a TSP then the details of it must be available for use in system studies. Without the awareness of a transmission holdback for CBM when it exists, a network study could be run and show no issues but if at some time the CBM were implemented an overload could result. This might not always be the case but unless the CBM parameters are known and modeled it could impact reliability.WECC disagrees with the recommendations with PRC-008-0 R1 and PRC-008-0 R2. Unless these standards are being superseded, WECC does not agree that they provide "little protection to the BES." They are not administrative in nature like the other standards in this group. They insure that maintenance and testing program is established and implemented for an entity's UFLS protection systems. Without these standards, there is reduced assurance that UFLS protection systems will operate correctly when called upon for an under-frequency event. UFLS has a vital role in its effectiveness for preserving system stability and elimination of these standards may reduce its effectiveness. This standard is about making sure the equipment is maintained not about collecting data. If and when PRC-005-2 is adopted, and if it were to include the UFLS devices, then this standard should be

Organization	Yes or No	Question 2 Comment
		considered for removal.WECC believes the statements associated with TOP-001-1a, R3 are incorrect. Removing TOP-001-1a would result in no NERC requirement for parties to follow TOP directives. The current TOP-001-1a R3 requires BOTH TOP and RC directives to be followed. The proposed IRO-001-3 R2 requires ONLY RC directives to be followed. In addition, the SAR statement is incorrect. TOP-001-1a R3 applies to directives issued by the TOP (and also the RC). IRO-001-1a applies only to directives from the RC. If the intent, as they state, is to replace TOP-001-1a R3 with IRO-001-3, that leaves a void for an entity to comply with a directive from the TOP. Only the part about following an RC directive is redundant. Requirement should be modified to eliminate the redundancy, but not retired. WECC disagrees witht he inclusion of CIP-001, R4. An entity has many enforcement agencies to contact without the FBI listed in the operating instructions they could easily be overlooked. This Requirement has encouraged entities to establish a current communication line with the FBI. In fact, several other larger entities are members of InfraGardÂ®, which is a partnership between the FBI and the private sector. Retiring R4 will remove the incentive of having a working relationship with the FBI, especially among the smaller entities. Retiring R4 may effectively delay or prevent the FBI from rapidly locating those responsible for sabotage. The requirement is not “needlessly burdensome”, which is a criteria for deletion.WECC believes the requirements VAR-002-WECC-1, R2, and VAR-502-WECC-1, R2, are probably the best way of demonstrating compliance with the accociated R1 requirments. The two VAR R2 requirements do not say the entity has to submit the information to WECC (Regional Entity), only that it shall have the documentation to prove exclusion for the sub requirements in R1. We’ve had cases where entities don’t meet the 98% availability and if the entity was claiming exclusion time, WECC would want to review the documentation that proves the exclusion. It is in the entity’s best interest to keep exclusion documentation in case its units don’t make the 98%, but this is beter suited for a Measure or RSAW.
Independent Electricity System Operator	No	(1) We generally agree that most of the identified standards/requirements would meet the proposed criteria. However, as indicated under Q1, we believe that the “annual review” criterion is too broad which could result in retiring some

Organization	Yes or No	Question 2 Comment
		requirements that are still needed for reliability. In addition, the acid test for retirement a requirement is when the standard drafting team reviews the overall reliability impact of removing a particular requirement from a standard, and how it may affect other related standards. In brief, it is premature to pass on this judgment at the SAR stage. We urge the SAR proponent to simply suggest that the proposed requirements be considered and evaluated by the SDT as opposed to making a presumption (and hence setting a high expectation for the industry) that the proposed list will be retired. And, in order to meet the requirements for regulatory approval, we suggest the SDT to provide strong technical basis to justify each retirement.
American Electric Power	No	AEP does not disagree with a majority of the requirements proposed by the drafting team, though we recommend the team reconsider the inclusion of CIP-003 R3 and associated sub-requirements. AEP recommends instead that CIP-003 R1 be removed in which case CIP-003 R3 (and CIP-003 R2.4) can also be removed. However, if the drafting team does not agree with this recommendation, CIP-003 R3 must be retained in order for entities to take targeted exception(s) where applicable (for example, in circumstances where an entity's program is more stringent than the CIP requirements).AEP would like the team to consider the following additional Reliability Standard requirements as candidates for retirement on this initial, or subsequent, request for comment. Standard: PRC-021-1Requirement: R2Requirement Text: Each Transmission Operator and Distribution Provider that owns a UVLS program shall provide its UVLS program data to the Regional Reliability Organization within 30 calendar days of a request.Criterion: B4,9Standard: PRC-018-1Requirement: R5Requirement Text: The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years.Criterion: B2Standard: PRC-016-0.1Requirement: R3Requirement Text: The Transmission Owner, Generator Owner, and Distribution Provider that owns an SPS shall provide documentation of the misoperation analyses and the corrective action plans to its Regional Reliability Organization and NERC on request (within 90 calendar days).Criterion: B4Standard: PRC-015-0Requirement:

Organization	Yes or No	Question 2 Comment
		R3Requirement Text: The Transmission Owner, Generator Owner, and Distribution Provider that owns an SPS shall provide documentation of SPS data and the results of Studies that show compliance of new or functionally modified SPSs with NERC Reliability Standards and Regional Reliability Organization criteria to affected Regional Reliability Organizations and NERC on request (within 30 calendar days).Criterion: B4Standard: PRC-011-0Requirement: R2Requirement Text: The Transmission Owner and Distribution Provider that owns a UVLS system shall provide documentation of its UVLS equipment maintenance and testing program and the implementation of that UVLS equipment maintenance and testing program to its Regional Reliability Organization and NERC on request (within 30 calendar days).Criterion: B4Standard: PRC-007-0Requirement: R3Requirement Text: The Transmission Owner and Distribution Provider that owns a UFLS program (as required by its Regional Reliability Organization) shall provide its documentation of that UFLS program to its Regional Reliability Organization on request (30 calendar days).Criterion: B4Standard: CIP-006Requirement: R1.5Requirement Text: Review of access authorization requests and revocation of access authorization, in accordance with CIP-004-3 Requirement R4.Criterion: B7Standard: CIP-007Requirement: R5.1.1Requirement Text: The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-3 Requirement R5.Criterion: B7Standard: CIP-007Requirement: R5.1.3Requirement Text: The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.Criterion: B7Standard: CIP-007Requirement: R6.3Requirement Text: The Responsible Entity shall maintain logs of system events related to cyber security, where technically Feasible, to support incident response as required in Standard CIP-008-3.Criterion: B7Standard: CIP-007Requirement: R6.4Requirement Text: The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.Criterion: B1, B3Standard: CIP-003-3, CIP-003-4Requirement: R1Requirement Text: Cyber Security Policy - The Responsible Entity shall document and implement a cyber security policy that represents

Organization	Yes or No	Question 2 Comment
		management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:Criterion: B1, B3, B7, B9Standard: CIP-003-3, CIP-003-4Requirement: R1.2Requirement Text: The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets. Criterion: B1, B3, B7, B9Standard: CIP-003-3, CIP-003-4Requirement: R1.3Requirement Text: Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2. Criterion: B5Standard: CIP-003-3, CIP-003-4Requirement: R2.4Requirement Text: The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy. Criterion: B7Comment: Although AEP does not necessarily agree with removal of this requirement (see R3 comment below), R2.4 is redundant with R3.3 (which is being removed) and should probably be removed along with R3.Standard: CIP-003-3, CIP-003-4Requirement: R3 (R3.1, R3.2, R3.3)Requirement Text: Exceptions - Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s). Criterion: Comment: If R1 is not removed, R3 (or some exception process) is necessary. For example, if the Cyber Security Policy goes above and beyond the standards, then an exception may be needed even though the standards are met.
Public Service Enterprise Group	No	For these requirements, KEEP:CIP-001-2a R4. If the entity owns or operates a BES asset, there is a clear reliability benefit to have appropriate law enforcement contacts and procedures to address sabotage or other security incidents. Similarly, the federal agencies feel that this is a good idea. In a coordinated attack environment, sabotage reporting to these Law enforcement agencies from the BES operators and owners would improve the ability of a coordinated response. Thus we feel that this requirement should be kept within the standards.CIP-003-3 R3. The exceptions language in R3, though rarely used, allows for those instances where an entity is unable to conform with it's cyber security policy. In addition, the requirement has been approved by the industry and FERC more than once. It's removal may have a negative impact on the industry. CIP-003-4 R3. The exceptions language in R3, though

Organization	Yes or No	Question 2 Comment
		rarely used, allows for those instances where an entity is unable to conform with it's cyber security policy. In addition, the requirement has been approved by the industry and FERC more than once. It's removal may have a negative impact on the industry. TOP-005-2a R1. "TOP-003-2 requires operating entities such as GOs and TOs to provide operating data to BAs ands TOPs. In TOP-005-2a, R2 and R3 requires BAs and TOPs to exchange this data with other BAs and TOPs . R1 requires BA and TOP recipients of such data to execute a confidentiality agreement so that its confidentiality is protected. This requirement ultimately protects the confidentiality of data provided by entities under TOP-003-2.For these requirements, KEEP BUT MODIFY:FAC-002-1 R2. We believe the three year limitation on documentation sets a limit; otherwise six years may be required (the period between audits. We do suggest removing the language " and shall provide the documentation to the Regional Reliability Organization(s) and NERC on request (within 30 calendar days)." because we see no reliability benefit.For these rerquirements, KEEP UNTIL REPLACED:EOP-004-1 R1. NERC's Event Analysis Process was approved by NERC's BOT on February 9, 2012. This process has already been adopted as RFC's process under EOP-004-1, R1. Draft standard EOP-004-2 will replace Regional reporting requirements in R1 with consistent NERC-wide requirements; however, while the draft does not presently require the use of the NERC Event Analysis Process, that process is embedded in proposed NERC ROP changes filed with FERC on May 7, 2012. Keep until these NERC ROP changes are approved by FERC and become effective.PRC-008-0 R1. This is required for reliability. Such a testing program has been incorporated into draft PRC-005-2 When this is adopted, PRC-008-0 can be retired.PRC-009-0 R1. The NERC Event Analysis Process is embedded in proposed NERC ROP changes filed with FERC on May 7, 2012. Keep until these NERC ROP changes are approved by FERC and become effective.PRC-009-0 R1.1. See R1 above.PRC-009-0 R1.2. See R1 above.PRC-009-0 R1.3. See R1 above.PRC-009-0 R1.4. See R1 above.
Essential Power, LLC	No	CIP-001-2a, R4. This requirement should be removed from the Paragraph 81 project. If an entity owns or operates a BES asset, there is a clear reliability benefit to have

Organization	Yes or No	Question 2 Comment
		appropriate law enforcement contacts and procedures to address sabotage or other security incidents. Similarly, the federal agencies feel that this is a good idea. In a coordinated attack environment, sabotage reporting to these law enforcement agencies from the BES operators and owners would improve the ability of a coordinated response. Thus we feel that this requirement should be kept within the standards.CIP-003-3, R3. This requirement should be removed from the Paragraph 81 project. The exceptions language in R3, though rarely used, allows for those instances where an entity is unable to conform to its cyber security policy. In addition, the requirement has been approved by the industry and FERC more than once. Its removal may have a negative impact on the industry.CIP-003-4, R3. This requirement should be removed from the Paragraph 81 project. The exceptions language in R3, though rarely used, allows for those instances where an entity is unable to conform to its cyber security policy. In addition, the requirement has been approved by the industry and FERC more than once. Its removal may have a negative impact on the industry.EOP-004-1, R1. This requirement should be removed from Phase 1 of the Paragraph 81 project, until replaced by EOP-004-2. NERC's Event Analysis Process was approved by NERC's BOT on February 9, 2012. This process has already been adopted as RFC's process under EOP-004-1, R1. Draft standard EOP-004-2 will replace Regional reporting requirements in R1 with consistent NERC-wide requirements; however, while the draft does not presently require the use of the NERC Event Analysis Process, which is embedded in proposed NERC ROP changes filed with FERC on May 7, 2012. This requirement should be kept until these NERC ROP changes are approved by FERC.FAC-002-1, R2. This requirement should be removed from the Paragraph 81 project, and modified instead. We believe the three year limitation on documentation sets a limit; otherwise six years may be required (the period between audits). We do suggest removing the language “and shall provide the documentation to the Regional Reliability Organization(s) and NERC on request (within 30 calendar days)." because we see no reliability benefit to this element of the requirement.
Occidental Power Services,	No	OPSI recommends the following additions for Phase 1 implementation: 1. INT-001-3, R1. The Load Serving, Purchasing-Selling Entity shall ensure that Arranged

Organization	Yes or No	Question 2 Comment
Inc.		Interchange is submitted to the Interchange Authority for all Dynamic Schedules at the expected average MW profile for each hour.Criteria: B6, B9Statement: This requirement is at best a business practice of markets (protocol). These schedules can be rejected if not correctly submitted, can be cut if not executed correctly, and the PSE can be penalized if there are offenses.Recommendation: Remove PSE from R1 and from the Applicability section.2. INT-004-2, R2. The Purchasing-Selling Entity responsible for tagging a Dynamic Interchange Schedule shall ensure the tag is updated for the next available scheduling hour and future hours when any one of the following occurs:o R2.1 The average energy profile in an hour is greater than 250 MW and in that hour the actual hourly integrated energy deviates from the hourly average energy profile indicated on the tag by more than Â±10%o R2.2 The average energy profile in an hour is less than or equal to 250 MW and in that hour the actual hourly integrated energy deviates from the hourly average energy profile indicated on the tag by more than Â±25 megawatt-hourso R2.3 A Reliability coordinator or Transmission Operator determines the deviation, regardless of magnitude, to be a reliability concern and notifies the Purchasing-Selling Entity of that determination and the reasons. Criteria: B6,B9Statement: This requirement is at best a business practice of markets (protocol). These schedules can be rejected if not correctly submitted, can be cut if not executed correctly, and the PSE can be penalized if there are offenses.Recommendation: Remove PSE from R2 and from the Applicability section.3. IRO-001-1.1, R3 and R8.R3. The Reliability Coordinator shall have clear decision-making authority to act and to direct actions to be taken by Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing- Selling Entities within its Reliability Coordinator Area to preserve the integrity and reliability of the Bulk Electric System. These actions shall be taken without delay, but no longer than 30 minutes.R8. Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the

Organization	Yes or No	Question 2 Comment
		Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions.Criteria: B9Statement: PSEs do not generally receive Reliability Directives from RCsRecommendation: Remove PSE from R3 and R8 and from the Applicability section.4. IRO-005-3, R10. In instances where there is a difference in derived limits, the Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall always operate the Bulk Electric System to the most limiting parameter.Criteria: B9Statement: PSEs do not generally derive limits for the transmission of power over the BES.Recommendation: Remove PSE from R10 and from the Applicability section.5. TOP-005-2, R3. Each Purchasing-Selling Entity shall provide information as requested by its Host Balancing Authorities and Transmission Operators to enable them to conduct operational reliability assessments and coordinate reliable operations.Criteria: B6,B9Statement: PSEs have to supply this information as a requirement for participating in market functions.Recommendation: Remove PSE from R3 and from the Applicability section.6. VAR-001, R5. Each Purchasing-Selling Entity shall arrange for (self-provide or purchase) reactive resources to satisfy its reactive requirements identified by its Transmission Service Provider.Criteria: B6,B9Statement: This is a requirement to participate in competitive markets (generally, it is included in the transmission rate) or is required by tariffs in non-competitive markets. The PSE has no option but to purchase the reactive power in order to make the transaction.Recommendation: Remove PSE from R5 and from the Applicability section.
Georgia Transmission Corporation	No	GTC agrees that the suggested list easily satisfies the criteria in the draft SAR, but GTC also believes this is an incomplete list for Phase I. GTC also believes the following Reliability Standard requirements easily satisfy the criteria listed in the draft SAR and recommends reconsidering and adding to the list in the initial Phase I.MOD-016-1.1;R1:The Planning Authority and Regional Reliability Organization shall have

Organization	Yes or No	Question 2 Comment
		documentation identifying the scope and details of the actual and forecast (a) Demand data, (b) Net Energy for Load data, and (c) controllable DSM data to be reported for system modeling and reliability analyses. [Meets Criteria A, B1, B2, B3, B9]MOD-016-1.1 R1.1 The aggregated and dispersed data submittal requirements shall ensure that consistent data is supplied for Reliability Standards TPL-005, TPL-006, MOD-010, MOD-011, MOD-012, MOD-013, MOD-014, MOD-015, MOD-016, MOD-017, MOD-018, MOD-019, MOD-020, and MOD-021. The data submittal requirements shall stipulate that each Load-Serving Entity count its customer Demand once and only once, on an aggregated and dispersed basis, in developing its actual and forecast customer Demand values. Meets Criteria A, B1, B3, B4, B9MOD-016-1.1 R3 The Planning Authority shall distribute its documentation required in R1 for reporting customer data and any changes to that documentation, to its Transmission Planners and Load-Serving Entities that work within its Planning Authority Area. Meets Criteria A, B1, B3, B9MOD-016-1.1 R3.1 The Planning Authority shall make this distribution within 30 calendar days of approval. Meets Criteria A, B1, B3, B9MOD-017-0.1 R1 The Load-Serving Entity, Planning Authority and Resource Planner shall each provide the following information annually on an aggregated Regional, subregional, Power Pool, individual system, or Load-Serving Entity basis to NERC, the Regional Reliability Organizations, and any other entities specified by the documentation in Standard MOD-016-1_R1. Meets Criteria A, B1, B4, B9MOD-017-0.1 R1.1 Integrated hourly demands in megawatts (MW) for the prior year. Meets Criteria A, B1, B4, B9MOD-017-0.1 R1.2 Monthly and annual peak hour actual demands in MW and Net Energy for Load in gigawatthours (GWh) for the prior year. Meets Criteria A, B1, B4, B9MOD-017-0.1 R1.3 Monthly peak hour forecast demands in MW and Net Energy for Load in GWh for the next two years. Meets Criteria A, B1, B4, B9MOD-017-0.1 R1.4 Annual Peak hour forecast demands (summer and winter) in MW and annual Net Energy for load in GWh for at least five years and up to ten years into the future, as requested. Meets Criteria A, B1, B4, B9MOD-018-0 R1 The Load-Serving Entity, Planning Authority, Transmission Planner and Resource Planner's report of actual and forecast demand data (reported on either an aggregated or

Organization	Yes or No	Question 2 Comment
		dispersed basis) shall: Meets Criteria A, B1, B3, B9MOD-018-0 R1.1 Indicate whether the demand data of nonmember entities within an area or Regional Reliability Organization are included, and Meets Criteria A, B1, B3, B9MOD-018-0 R1.2 Address assumptions, methods, and the manner in which uncertainties are treated in the forecasts of aggregated peak demands and Net Energy for Load. Meets Criteria A, B1, B3, B9MOD-018-0 R1.3 Items (MOD-018-0_R 1.1) and (MOD-018-0_R 1.2) shall be addressed as described in the reporting procedures developed for Standard MOD-016-1_R 1. Meets Criteria A, B1, B3, B9MOD-018-0 R2. The Load-Serving Entity, Planning Authority, Transmission Planner, and Resource Planner shall each report data associated with Reliability Standard MOD-018-0_R1 to NERC, the Regional Reliability Organization, Load-Serving Entity, Planning Authority, and Resource Planner on request (within 30 calendar days). Meets Criteria A, B1, B4, B9MOD-019-0.1 R1. The Load-Serving Entity, Planning Authority, Transmission Planner, and Resource Planner shall each provide annually its forecasts of interruptible demands and Direct Control Load Management (DCLM) data for at least five years and up to ten years into the future, as requested, for summer and winter peak system conditions to NERC, the Regional Reliability Organizations, and other entities (Load-Serving Entities, Planning Authorities, and Resource Planners) as specified by the documentation in Reliability Standard MOD-016-1_R 1. Meets Criteria A, B1, B4, B9MOD-020-0 R1. The Load-Serving Entity, Transmission Planner, and Resource Planner shall each make known its amount of interruptible demands and Direct Control Load Management (DCLM) to Transmission Operators, Balancing Authorities, and Reliability Coordinators on request within 30 calendar days. Meets Criteria A, B1, B4, B9MOD-021-1 R1. The Load-Serving Entity, Transmission Planner and Resource Planner's forecasts shall each clearly document how the Demand and energy effects of DSM programs (such as conservation, time-of-use rates, interruptible Demands, and Direct Control Load Management) are addressed. Meets Criteria A, B1, B3, B9MOD-021-1 R2. The Load-Serving Entity, Transmission Planner and Resource Planner shall each include information detailing how Demand-Side Management measures are addressed in the forecasts of its Peak Demand and annual Net Energy

Organization	Yes or No	Question 2 Comment
		for Load in the data reporting procedures of Standard MOD-016-0_R1. Meets Criteria A, B1, B3, B9MOD-021-1 R3. The Load-Serving Entity, Transmission Planner and Resource Planner shall each make documentation on the treatment of its DSM programs available to NERC on request (within 30 calendar days). Meets Criteria A, B1, B3, B9PRC-005-1b R2. Each Transmission Owner and any Distribution Provider that owns a transmission Protection System and each Generator Owner that owns a generation Protection System shall provide documentation of its Protection System maintenance and testing program and the implementation of that program to its Regional Reliability Organization on request (within 30 calendar days). The documentation of the program implementation shall include: Meets Criteria A, B1, B3, B9PRC-005-1b R2.1. Evidence Protection System devices were maintained and tested within the defined intervals. Meets Criteria A, B1, B3, B9PRC-005-1b R2.2. Date each Protection System device was last tested/maintained. Meets Criteria A, B1, B3, B9PRC-006-1 R7. Each Planning Coordinator shall provide its UFLS database containing data necessary to model its UFLS program to other Planning Coordinators within its Interconnection within 30 calendar days of a request. Meets Criteria A, B1, B4, B9PRC-006-1 R8. Each UFLS entity shall provide data to its Planning Coordinator(s) according to the format and schedule specified by the Planning Coordinator(s) to support maintenance of each Planning Coordinator's UFLS database. Meets Criteria A, B1, B4, B9PRC-006-1 R14. Each Planning Coordinator shall respond to written comments submitted by UFLS entities and Transmission Owners within its Planning Coordinator area following a comment period and before finalizing its UFLS program, indicating in the written response to comments whether changes will be made or reasons why changes will not be made to the following:14.1. UFLS program, including a schedule for implementation 14.2. UFLS design assessment 14.3. Format and schedule of UFLS data submittal Meets Criteria A, B1, B3, B9PRC-007-0 R2. The Transmission Owner, Transmission Operator, Distribution Provider, and Load-Serving Entity that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall provide, and annually update, its underfrequency data as necessary for its Regional Reliability Organization to maintain and update a

Organization	Yes or No	Question 2 Comment
		UFLSprogram database. Meets Criteria A, B1, B4, B9PRC-007-0 R3. The Transmission Owner and Distribution Provider that owns a UFLS program (as required by its Regional Reliability Organization) shall provide its documentation of that UFLS program to its Regional Reliability Organization on request (30 calendar days). Meets Criteria A, B1, B3, B4, B9PRC-011-0 R2. The Transmission Owner and Distribution Provider that owns a UVLS system shall provide documentation of its UVLS equipment maintenance and testing program and the implementation of that UVLS equipment maintenance and testing program to its Regional Reliability Organization and NERC on request (within 30 calendar days). Meets Criteria A, B1, B3, B4, B9PRC-015-0 R3. The Transmission Owner, Generator Owner, and Distribution Provider that owns an SPS shall provide documentation of SPS data and the results of studies that show compliance of new or functionally modified SPSs with NERC Reliability Standards and Regional Reliability Organization criteria to affected Regional Reliability Organizations and NERC on request (within 30 calendar days). Meets Criteria A, B1, B4, B9PRC-017-0 R2. The Transmission Owner, Generator Owner, and Distribution Provider that owns an SPS shall provide documentation of the program and its implementation to the appropriate Regional Reliability Organizations and NERC on request (within 30 calendar days). Meets Criteria A, B1, B3, B4, B9PRC-018-1 R5. The Transmission Owner and Generator Owner shall each archive all data recorded by DMEs for Regional Reliability Organization-identified events for at least three years. Meets Criteria A, B1, B2, B3, B9PRC-021-1 R2. Each Transmission Owner and Distribution Provider that owns a UVLS program shall provide its UVLS program data to the Regional Reliability Organization within 30 calendar days of a request. Meets Criteria A, B1, B4, B9PRC-023-1 R3.3. The Planning Coordinator shall provide a list of facilities to its Reliability Coordinators, Transmission Owners, Generator Owners, and Distribution Providers within 30 days of the establishment of the initial list and within 30 days of any changes to the list. Meets Criteria A, B1, B4, B9TOP-001-1a R4. Each Distribution Provider and Load-Serving Entity shall comply with all reliability directives issued by the Transmission Operator, including shedding firm load, unless such actions would violate safety, equipment, regulatory or statutory

Organization	Yes or No	Question 2 Comment
		requirements. Under these circumstances, the Distribution Provider or Load-Serving Entity shall immediately inform the Transmission Operator of the inability to perform the directive so that the Transmission Operator can implement alternate remedial actions. Same requirement as R3 which made the Phase I list, only difference is applicability.
NERC Staff Technical Review	No	After further review, NERC Staff recommends that the SDT review the following standard requirements and consider moving them from Phase I to Phase II. If the SDT determines the following standard requirements still fall into Phase I, a more robust technical justification would be needed.(1) FAC-008-1 R2, R3, FAC-008-3 R4, R5 and FAC-013-2 R3: These requirements, combined with others, provide checks and balances on the Facility Rating Methodology and Transfer Capability methodology established by the responsible entities. This provides a reliability benefit by requiring the responsible entity to consider areas in which their methodology may not be sufficient to support reliable operation of the interconnected transmission system. There may be better ways of assuring that entities have sufficient methodologies and alternatives should be considered during Phase II. NERC Staff suggests that the SDT reconsider whether discussing the methodology (and not the numerical rating of a facility) has commercial or market related implications. With respect to FAC-013-2 R3, NERC Staff suggests that the SDT reconsider whether the requirement relates to "a back and forward on transfer capability" as noted in the draft SAR, as the requirement pertains only to the methodology for determining transfer capability.(2) PRC-008-0 R2: Maintenance and testing of underfrequency load shedding (UFLS) relays is necessary to assure reliable operation of a UFLS program and this requirement is included in PRC-005-2 as part of Project 2007-17, Protection System Maintenance and Testing. NERC Staff recommends that the language in R2 relating to implementing its UFLS equipment maintenance and testing program remain to avoid a reliability gap prior to the effective date of PRC-005-2. NERC Staff recognizes that the second part of R2 does meet the criteria in the SAR and recommends that the SDT consider revising the requirement in a future phase to remove the language that requires an entity to "provide UFLS maintenance and testing program results to

Organization	Yes or No	Question 2 Comment
		its Regional Reliability Organization and NERC on request (within 30 calendar days)." (3) TOP-001-1a R3: The technical justification states that this requirement is redundant with IRO-001-1a R8. NERC Staff notes that the requirement is only partially redundant until IRO-001-3 is approved by FERC and therefore, it is premature to consider it for Phase I; it should be considered for Phase II.(4) MOD-004-1: NERC Staff notes that there are a number of Commission directives associated with MOD-004-1 and the technical justification provided for the elimination of this standard should directly address these directives. If a solid technical justification cannot be made, NERC Staff suggests that the requirements should not be included in Phase I. In addition to the above, NERC Staff recommends that the SDT consider removing the following standard requirements from the scope of the P81 project:(1) PRC-008-0 R1: The requirement to have a maintenance and testing program for UFLS is necessary to assure reliable operation of a UFLS program and this requirement is included in PRC-005-2 as part of Project 2007-17, Protection System Maintenance and Testing. NERC Staff recommends retaining R1 to avoid a reliability gap prior to the effective date of PRC-005-2.(2) PRC-009-0 R1: Analysis to assess the performance of UFLS equipment and program effectiveness following system events provides a reliability benefit by identifying whether the UFLS program is effective and whether modifications are necessary. A requirement similar to R1 is included in FERC-approved standard PRC-006-1 and NERC Staff recommends retaining R1 to avoid a reliability gap prior to the effective date of PRC-006-1. If the SDT believes this requirement is not necessary, the justification for removing R1 should discuss Commission comments in Order No. 763 pertaining to Requirement R11 in PRC-006-1.(3) VAR-002-WECC-1 and VAR-501-WECC-1: NERC Staff notes that the regional standards should be removed from the scope of the P81 project because they must first be eliminated via the regional standards development process prior to being processed through the NERC standard development process.
MidAmerican Energy Company	No	FERC Order 706 clearly states that an exception forms alternative obligations for the responsible entity to meet the requirements; an exception is not an exemption from the requirements. We believe a Responsible Entity should still be allowed to have

Organization	Yes or No	Question 2 Comment
		exceptions to its cyber security policy. MidAmerican Energy Company agrees with the proposed removal of CIP-003-3 (CIP-003-4) R3, R3.1, R3.2, R3.3, as long as CIP-003-3 (CIP-003-4) R2.4 remains and allows for possible exceptions to a Responsible Entities' cyber security policy. R2.4 states "The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy." When removing requirements eligible for TFEs, revisions to the Rules of Procedure Appendix 4D - Procedures for Requesting and Receiving Technical Feasibility Exceptions to NERC Critical Infrastructure Protection Standards will be necessary. For example, CIP-005-3, R2.6 should be deleted from the list of requirements with TFEs in the Scope section on page 1 if the requirement is removed as part of this process.
SPP Standards Review Group	Yes	From our review of the list we feel that this is again, a good starting point, but would hope that the drafting team could add or subtract requirements as needed as Phase 1 of the project develops.
The Edison Electric Institute (EEI), the National Rural Electric Cooperative Association (NRECA), the Electric Power Supply Association (EPSA), the Transmission Access Policy Study Group (TAPS), Electricity Consumers Resource Council (ELCON), the American Public Power Association (APPA), the Large Public Power Council (LPPC) and, the Canadian Electricity Association (CEA) (collectively, the Trade Associations).	Yes	The Trade Associations agree with the suggested list of Reliability Standard requirements contained in the SAR for the Initial Phase of P81.

Organization	Yes or No	Question 2 Comment
Salt River Project	Yes	Yes
SRC	Yes	o PRC-009-0 R1 - R2 are in the process of being retired by PRC-006-1 as such these requirements will eventually go away. o VAR-002-WECC-1 R2 - Regional standards/requirements for retirement should go through the regional standards process not the NERC continent wide process. o VAR-501-WECC-1 R2 - Regional standards/requirements for retirement should go through the regional standards process not the NERC continent wide process. o Consider adding IRO-014-2 R2 requirements: R2 Each Reliability Coordinator shall maintain its Operating Procedures, Operating Processes, or Operating Plans identified in Requirement R1 as follows: [Violation Risk Factor: Lower] [Time Horizon: Same Day Operations and Operations Planning]2.1. Review and update annually with no more that 15 months between reviews. 2.2. Obtain written agreement from all of the Reliability Coordinators required to take the indicated action(s) for each update.These meet criteria B1 and B5.
Georgia System Operations Corporation	Yes	Georgia System Operations agrees with the suggested list of Reliability Standard requirements contained in the SAR for the Initial Phase of P81.
seattle city light	Yes	Seattle City Light supports the consolidated comments of the industry Trade Organizations.
Duke Energy	Yes	The initial phase of the P81 project should contain only requirements that can quickly gain industry and regulatory support and that there is adequate time to prepare a strong technical justification for. Duke Energy asks the P81 Standards Drafting Team to ensure these parameters are taken into consideration as the list is finalized, and move to a subsequent phase any requirements that could take additional time to develop a strong technical justification and consensus for.

Organization	Yes or No	Question 2 Comment
NV Energy	Yes	Our review of the rationale for each of the suggested requirements of the draft SAR supports the conclusion that these requirements should be subject to retirement.
Occidental Energy Ventures Corp.	Yes	OEVC believes that the phased approach proposed in the SAR is prudent and likely the most effective. Only the most obvious candidates for retirement or modification should be presented at this early date. If the industry moves too-far, too-fast, the result may be a blanket rejection of every proposal. Once FERC is comfortable that the industry is in-tune to their sense of risk - which includes public perception of their oversight effectiveness - we believe they will be prepared to deal with requirements that seem important on the surface, but whose contribution to reliability is illusory.
South Carolina Electric and Gas	Yes	Will the measures associated with requirements that are up for retirement be modified or removed?Eg. Removing R2 of a standard but not removing the text in M1 which refers to R2 of that same standard.
Ameren	Yes	We appreciate the excellent work done by the P81 Project team in developing the criteria and agree with the list of suggested standards/requirements that easily satisfy the criteria in this initial phase.
Electric Reliability Council of Texas, Inc.	Yes	ERCOT agrees with the ISO/RTO SCR comments. However, in addition to the SRC comments, ERCOT offers the following:ERCOT agrees that all the requirements included in the SAR warrant retirement based on the relevant criteria, as supported by the corresponding justification statements. ERCOT offers the following additional comments related to the justification statements for the SDT's consideration:BAL-005-0.1b R2 - The justification statement could benefit from additional clarification regarding the reason why this requirement is redundant, because it isn't readily apparent why this is redundant with BAL-001 R1 and R2. Maintaining CPS requires the use of regulation. Therefore, it is implicit that the relevant functional entities have regulation to comply with BAL-001 R1 and 2. Also, the justification should clarify the point of the discussion related to equating compliance based on

Organization	Yes or No	Question 2 Comment
		compliance of BAL-001 R 1 and 2 and how that argument justifies retirement. CIP-001-2a R4 - The justification statement should clarify that this requirement is redundant to the communications obligations in R1-3.CIP-003-3, 4 R1.2 - In addition to the justifications presented in the SAR, the term "readily available" is ambiguous and creates the opportunity for the use of CEA subjective judgment during compliance assessments. This is problematic for compliance risk generally, but is especially problematic when the requirement is administrative in nature. Entities should not be subject to unnecessary compliance risk based on ambiguity that can result in subjective compliance determinations based on the opinion of CEA personnel, as opposed to the four corners of the requirements, especially when the underlying requirement provides no reliability value. Further evidence that this requirement serves no purpose is the fact that it is not included in CIP v5. CIP-003-3 R3, 3.1, 3.2 and 3.3 - In addition to the justifications presented in the SAR, this issue is already fully addressed in the TFE process in Appendix 4D of the ROP, which is not only adequate, but is the appropriate place for this type of administrative function related to documentation. There are a specific set of defined requirements that allow an exception, and those exceptions have be to be filed according to the TFE process. Thus, the requirements proposed for retirement are redundant to that process. CIP-003-3, -4 R4.2 - In addition to the justification presented in the SAR, the phrase "based on sensitivity", is ambiguous and creates the opportunity to insert subjective judgment into compliance assessments. This is problematic for compliance risk generally, but especially when the requirement is administrative in nature AND redundant. Entities should not be subject to unnecessary compliance risk based on ambiguity resulting in subjective compliance determinations, as opposed to the four corners of the requirements, especially when the underlying requirement provides no operational reliability value. Further evidence that this requirement serves no purpose is the fact that it is not included in CIP v5. CIP-005-3a, -4a R2.6 - The justification statement could benefit from additional clarification as to why the banner is not useful. An appropriate use banner has not been useful over time, because people who intend to use sites inappropriately will simply ignore the

Organization	Yes or No	Question 2 Comment
		banner. Banners are generally considered to be a legal protection and not a security protection. Further evidence that this requirement serves no purpose is the fact that it has been removed from CIP v5 because the use of banners does not meet a reliability objective.CIP-007-3, -4 R7.3 - In addition to the justification presented in the SAR, it should be noted that to demonstrate that an entity performed the data destruction under R7.1 and R7.2, the entity needs to collect evidence. Having a separate requirement for evidence is redundant and not needed. COM-001-1.1 R6 - In addition to the justification presented in the SAR, the justification statement could note that this policy should be documented in the ROP for information within NERCNet that is considered sensitive or impacting to the BES. It should be a voluntary best practice or business practice for other information so that entities may use it, or use some other policy that better fits its circumstances. The justification should state that the NERCNet policy should be a voluntary best practice type of issue for information that is not considered sensitive or impacting to the BES. EOP-009-0 R2 - This is a reporting obligation and a documentation issue. The justification statement should also note that both documentation and reporting on this does not rise to the level of a reliability standard. The statement could note that this may be a best practices issue, but just for documentation. Reporting test results to REs isn't a best practice. Additionally, the justification should not state that the relevant information is better considered / obtained during an audit. If it's not relevant to the mandatory requirements, then it has no place in CMEP proceedings.FAC-002-1 R2 - The justification should not include that the relevant information is better considered / obtained during an audit. If it's not relevant to the mandatory requirements, then it has no place in CMEP proceedings.FAC-008-1 R1.3.5 - In addition to the justification presented in the SAR, the justification statement could note that the term "other assumptions" is ambiguous and introduces the potential for inefficient/ineffective administration of the CMEP due to introduction of subjectivity and opinions into compliance assessments. This is problematic for compliance risk generally, but especially when the requirement is administrative in nature AND redundant. Entities should not be subject to unnecessary compliance risk based on ambiguity resulting in

Organization	Yes or No	Question 2 Comment
		subjective compliance determinations, as opposed to the four corners of the requirements, especially when the underlying requirement provides no operational reliability value.FAC-008-1 R2; FAC-008-1 R3; FAC-008-3 R4; FAC-008-3 R5 - In addition to the justification presented in the SAR, the justification statement could note that it is inappropriate for entities other than the owners of equipment to establish facility ratings. The owners don't have to change their ratings, but the scheme is far more effective if the respective functional roles are distinct and not blurred by the review process contemplated in the requirements proposed for retirement. The owners should set the ratings and the RCs receive them and perform their functions in accordance with those ratings. The RC should not be involved with the TO/GO business-management of their equipment. Also, by keeping the roles distinct, it mitigates any liability risk of the third party if the owner uses its input and then the equipment breaks because of the new rating;FAC-013-2 R3 - Same comment as above.MOD-004-1 R1; MOD-004-1 R1.1; MOD-004-1 R1.2; MOD-004-1 R1.3; MOD-004-1 R2; MOD-004-1 R3; MOD-004-1 R3.1; MOD-004-1 R3.2; MOD-004-1 R4; MOD-004-1 R4.1; MOD-004-1 R4.2; MOD-004-1 R5; MOD-004-1 R5.1; MOD-004-1 R5.2; MOD-004-1 R6; MOD-004-1 R6.1; MOD-004-1 R6.2; MOD-004-1 R7; MOD-004-1 R8; MOD-004-1 R9; MOD-004-1 R9.1; MOD-004-1 R9.2; MOD-004-1 R10; MOD-004-1 R11; MOD-004-1 R12; MOD-004-1 R12.1; MOD-004-1 R12.2; MOD-004-1 R12.3 - ERCOT agrees with the comments/justifications.PRC-008-0 R1; PRC-008-0 R2; PRC-009-0 R1; PRC-009-0 R1.1; PRC-009-0 R1.2; PRC-009-0 R1.3; PRC-009-0 R1.4; PRC-009-0 R2; PRC-010-0 R2; PRC-022-1 R2 - In addition to the justification presented in the SAR, the justification statement could note that the tasks required in these standards are administrative/documentation/reporting in nature and they don't affect reliability from a standards perspective. These could either be best practices or evidentiary in RSAWs - e.g. provide UFLS/UVLS program documentation - which could be relative to requirements that have actionable UVLS/UFLS requirements;TOP-001-1a R3 - ERCOT agrees with the justification with regard to the RC function, but the TOP standard also requires BAs/GOPs to follow the directives of the TOP, so the two relevant requirements are not apples to apples. Modification to one or the other

Organization	Yes or No	Question 2 Comment
		may be needed to ensure appropriate authority and corresponding obligation to follow that authority is reflected in one or the other standard, or both, but eliminate overlaps.TOP-005-2a R1 - ERCOT agrees with the justification. This should either be in the ROP or just via the ISN access process/agreement.VAR-002-WECC-1 R2; VAR-501-WECC-1 R2 - ERCOT agrees with the justification, but if the documentation/reporting are not relevant for the requirement, then the SAR should not suggest the REs should seek the info in CMEP proceedings, which should solely focus on compliance with the substance of the standards.

3. The subsequent phases of the P81 project are designed to identify all FERC-approved Reliability Standard requirements that could not be included in the Initial Phase due to the need for additional analysis or an editing of language. Please list any Reliability Standard requirements that you believe should be revised or retired in a subsequent phase, and include a brief supporting statement and citation to at least one element of Criterion B for each requirement listed.

Summary Consideration:

The P81 SDT is very appreciative of the time and effort the commenters spent developing their responses to Question 3. The commenters proposed numerous requirements for consideration in a subsequent phase, including requirements in BAL, CIP, INT, FAC, MOD, and PRC Reliability Standards, among others. As a general observation, the commenters suggested several ways to handle Reliability Standard requirements in the subsequent phases, including (i) retiring a requirement; (ii) modifying the requirement; (iii) changing the functional applicability of a requirement; and (iv) combining requirements or standards. Also, several commenters, such as ERCOT, Independent Electricity System Operator and SPP Standards Review Group requested the ability to raise additional Reliability Standard requirements during the subsequent phases. Given the level of interest in the subsequent phases of the P81 project, it is appropriate for the P81 SDT to carefully consider how best to propose a process for the subsequent phases. To some extent, ERCOT said it well:

"The SDT should establish a prospective process that provides adequate time and opportunity for entities to perform a meaningful review of remaining requirements to determine which additional requirements warrant retirement and to develop appropriate criteria, if relevant, that may be incremental to the ones proposed in this SAR, and to develop appropriate retirement justifications based on the relevant retirement criteria."

Consequently, while all the requests for consideration of Reliability Standard requirements in subsequent phases will receive consideration (including those requirements suggested for Phase I, but deferred to a subsequent phase), the process by which that consideration will be undertaken needs to be developed in light of the requirements suggested for subsequent phases. Accordingly, based on the comments, the P81 SDT intends to develop and suggest options to the Standards Committee in the near future on how to move forward with the subsequent phases.

Organization	Yes or No	Question 3 Comment
ACES Power Marketing		(1) EOP-002-3 R6 and R7 and their sub-requirements are redundant with BAL-001-

Organization	Yes or No	Question 3 Comment
Standards Collaborators		0.1a R1 and R2 and BAL-002 R4. BAL-001-0.1a R1 compels a BA to meet CPS1. BAL-001-0.1a R2 compels a BA to meet CPS2. BAL-002 R4 compels a BA to respond meet the DCS for all reportable events less than MSSC. EOP-002-3 R6 and R7 do not make the BA any more or less responsible to meet these requirements but rather creates an opportunity for double jeopardy. Furthermore, EOP-002-3 R6 and R7 do not make any sense in context with the CPS1 and CPS2 calculations. They are averages over a long term and would never require the emergency actions listed in the sub-requirements to comply with them. These requirements have already proven to incent behavior that is contrary to reliability (criterion B.8). At the August NERC BOT meeting, the NERC OC Chair explained that a BA shed load to meet the DCS criterion even though there were no other concerns (i.e. voltage, frequency, IROL or SOL violations) on the transmission system at the time. These requirements meet criterion B.7. (2) EOP-004-1 R2 should be considered for future retirement. The approval of the Event Analysis Procedure obviates the need for a standard requirement to analyze Bulk Electric System disturbances. This would be especially true if the procedure is added to the Rules of Procedure as NERC has planned. This requirement meets criterion B.7.(3) Retirement of FAC-001-0 R3 should be considered in the next phase. There is an implied obligation for the TO to update its Facility connection requirements when they change. Additionally, a requirement to make them available to the Regional Entity and users of the transmission system is unnecessary. First, the Regional Entity could request them through the compliance monitoring process. Second, the TO will provide the Facility connection requirements to those with genuine interconnection requests because the TO will want its connection standards met. This requirement meets criterion B.4, B.7 and B.9. (4) FAC-002-1 R1 should be revised to reflect the NERC Functional Model because it assigns the requirements to the wrong functional entities. The Transmission Planner and Planning Coordinator are responsible for conducting the assessments for new Facilities. The requirement appears to be an attempt to require the GO, TO, DP, and LSE to coordinate with the TP and PC. However, the requirement actually defines what is required in the TP and PC assessments which unfortunately place these

Organization	Yes or No	Question 3 Comment
		responsibilities on the GO, TO, DP and LSE. None of these functional entities have the capability to meet requirements such as performing dynamics studies. This requirement meets criterion B.8. (5) VAR-001-2 R2 and TOP-006-2 R2 are duplicate requirements. VAR-001-2 R2 compels the TOP to acquire sufficient reactive resources. TOP-006-2 R2 requires the RC, TOP and BA to monitor reactive resources. Since VAR-001-2 R2 applies all the time, a TOP cannot know they have acquired and maintained reactive resources unless they are monitoring them. Furthermore, TOP-006-2 R2 incorrectly applies to the BA. According to the NERC Functional Model, the BA cannot monitor reactive resources that are not generators and have no role in ensuring system voltages. Thus, TOP-006-2 R2 meets criterion B.7 because it is redundant, and it meets criteria B.8 and B.9 because it assigns responsibility to a functional entity (BA) that cannot meet it. This distracts the BA from its reliability mission.
Independent Electricity System Operator		(1) IRO-004-2 R1 could be retired if the wording in IRO-001-1.1 R8 was changed to cover all operating timeframes (Criterion B7). (2) We do not have any other particular standards/requirements in mind at this time. However, we will review and propose additional candidates for future phases as this project gets into the mid or end of Phase I. We believe the industry should focus on the Phase I effort at this time to gauge the regulator's and industry's reaction before marching too far down the path.
Western Electricity Coordinating Council		CIP 002 R2/R3/R4: Redundant and require revision. Each of these requirements requires an annual review of the Critical Asset list and Critical Cyber Asset list. WECC agrees these protections are required, however, the standard should be revised so either CIP 002-3 R4 is removed and CIP 002-3 R1-R3 are revised to require annual review and approval of the appropriate documentation, or CIP 002-3 R2 and R3 are revised to no longer require an annual review.CIP 005 R1.5/006 R3: These are redundant and should be removed/revised. CIP 006-3 R3 is redundant with CIP 005-3 R1.5. Either CIP 005-3 R1.5 should be revised to no longer require the protections of CIP 006-3 R3, or CIP 006-3 R3 should be removed and the content of CIP 006 R3 moved to CIP 005 R1.5.CIP 005 R1.5/006 R2.2: Redundant. Should be revised. Devices

Organization	Yes or No	Question 3 Comment
		applicable to these requirements may be redundant if they are classified as CCA (thus duplicated with CIP 002 - CIP 009) or reside within an ESP (thus duplicated with CIP 007). The requirements should be revised to take into account the situation where a device resides within an ESP or is classified as CCA, and is a device used in the EACM/PACM of ESPs/PSPs. Note: It appears this is being addressed in V.5 of CIP.CIP-005, R5: Should be removed and the protections highlighted in this requirement moved to appropriate requirements it references. This will cause less confusion with entities, and be more precise with exactly what documentation is required to be reviewed and approved.CIP 005 R5.1/R5.2: Redundant. Should revise CIP 005 R1.6 to include the wording of CIP 005 R5.1, and remove CIP 005 R5.1. This will cause less confusion with entities, and be better aligned with the CIP 005 R1.6 requirement.CIP 005 R5.3: Redundant. Should revise CIP 005 R3 to include the wording of this sub-requirement, and CIP 005 R5.3 should be removed. This change will create a better fit in the appropriate requirement, and be less confusing for entities.CIP 007 R9: Should be removed and the protections highlighted in this requirement moved to appropriate requirements it references. Thus CIP 007 requirements that require documentation should include the need to review and update the documentation. This will cause less confusion with entities, and be more precise with what documentation is required to be reviewed and approved.EOP-004-1 R3.2: Little, if any, value as a reliability requirement. This requirement points to attachments that could be addressed in the main part of the R3 standard. This requirement does nothing to promote the protection of the BES.VAR-001-2 R10: Redundant. The reliability purpose for R10 is to make sure that operators don't think that exceeding an SOL or IROL due to voltage issues is acceptable. There are multiple standards requiring operators not exceed and maintain an SOL or IROL with 30 minutes, regardless of the cause of the exceedance. These standards are TOP-001-2 R7, R11; TOP-004-2 R1; TOP-007-0 R2; TOP-008-1 R1.
Entergy Services, Inc.		CIP-006 R5 - A revision to the language in CIP-006 R5 is needed in order to require the review and handling of incidents of unauthorized access (when a door, gate or window has been opened without authorization), as opposed to what is more

Organization	Yes or No	Question 3 Comment
		accurately characterized as "unsuccessful" access attempts (e.g. invalid access card swipes). There currently is no definition of "unauthorized access attempts". The methods to be used for monitoring that are listed in the requirement, however do list: "Alarm Systems that alarm to indicate a door, gate or window has been opened without authorization". This method does not indicate that the alarm system must alarm on card swipes that do not result in the door opening, and be characterized as "Unauthorized Access attempts". Unsuccessful card swipes at a PSP access point, for example, do not suggest an unauthorized access attempt. A card swipe can be unsuccessful for a number of reasons, all of which are recorded by the key card system, such as the use of a deactivated card, an invalid card format, and a card not in the card file. An unsuccessful card swipe itself is not an indication that a PSP access point was “opened within authorization” because it does not indicate that the door has been opened in any manner. However, in the FAQ guidance for the CIP Reliability Standards, NERC acknowledged that Responsible Entities can consider single failed access attempts such as a single failed log-in not to be suspicious events requiring a response A single failed card swipe should be treated in the same way. The rewording of this requirement would address Criteria B-8 - "Hinders the protection or reliable operation of the BES." Investigating and documenting each unsuccessful card swipe would take a tremendous amount of time and produce a significant amount of paperwork without providing any additional physical security.CIP-005 R3 and CIP-006 R5 - Revisions to the wording around the timing of monitoring both physical and electronic access are needed. CIP-005 R3 - Monitoring Electronic Access states that "The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week." and CIP-006 R5 -Monitoring Physical Access stats that "The Responsible Entity shall document and implement the technical and procedural controls for monitoring physical access at all access points to the Physical Security Perimeter(s) twenty-four hours a day, seven days a week. Unauthorized access attempts shall be reviewed immediately and handled in accordance with the procedures specified in

Organization	Yes or No	Question 3 Comment
		Requirement CIP-008-3.The "twenty-four hours a day, seven days a week" portion of these requirements provides an unachievable requirement for 100% uptime for all systems used to monitor such access. The requirement should allow for a resonable amount of downtime. Either the "twenty-four hours a day, seven days a week" wording in these requirements could be removed altogether, or alternative langauge, such as requiring "High Availability" (for example 99.9% uptime) or some other wording that allowed for very small amounts of downtime that might be required for system reboots or minor maintenance.
SRC		Consider including the following standards for review in Phase II:BAL-004-0 - Time Error CorrectionMOD-030-2 - Flowgate MethodologyPRC-006-1 R8 (provision of data)PRC-006-1 R14 (administrative - response to written comments)
MidAmerican Energy Company		Consider the list provided by EEI.
Georgia System Operations Corporation		EOP-002-3, R1PER-001-0.1, R1Criteria B7, 9Statement: reference to BA or RC responsibilities and authority are within the criteria of NERC's Functional Model and so this is redundant. In addition, it is understood that these functions are substantial if not paramount for an entity to become certified as such. FAC-001-0 (all requirements)Criteria B 1, 3 and 6Statement: The requirement in FAC-001-0 to document and publish facility connection requirements has no impact on reliability. It is purely a document that those considering to interconnect with a transmission entity may review as a reference. All INT standardsCriteria B 1, 3 and 6Statement: Many of the INT Reliability Standard requirements are very close to duplicative of similar requirements in the BAL Reliability Standards or address commercial matters. As drafted, the INT Reliability Standards include tasks or activities that do little, if anything, to promote the protection the Bulk Electric System. Note: INT-007-1 R1.2 is part of Initial Phase. All data collection requirementsCIP-005-3a, 4a R5.3CIP-006c, -4c R7, R8.3CIP-007-3, -4 R5.1.2; R6.4; R7.3CIP-008-3, -4 R2PRC-018-1, R5Criteria B1,2 and 9Statement: These requirements are for data retention and although the need is

Organization	Yes or No	Question 3 Comment
		substancial, i.e. as a sort of forensic tool, they serve no function to reliability from an immediate time perspective.Standards currently requiring reporting.Criteria 1, 4 and 9EOP-002-3 R9.2EOP-004-1 R3 and its subrequirements; R4 and R5FAC-003-1 R3; FAC-003-1 R3.1: FAC-003-1 R3.2: FAC-003-1 R3.3: FAC-003-1 R3.4: FAC-003-1 R3.4.1: FAC-003-1 R3.4.2: FAC-003-1 R3.4.3: FAC-003-1 R4FAC-010-2.1 R5FAC-011-2 R5FAC-013-2 R6MOD-012-0 R2MOD-020-0 R1MOD-021-1 R3PRC-004-1a R3: PRC-004-2a R3: PRC-004-WECC-1 R.3.PRC-007-0 R2; PRC-007-0 R3; PRC-009-0 R2 PRC-011-0 R2; PRC-015-0 R3; PRC-016-0.1 R3; PRC-017-0 R2; PRC-021-1 R2TPL-001-0.1 R3; TPL-002-0b R3; TPL-003-0a R3; TPL-004-0 R2.Statement: These are all reporting requirements; they do not aid reliability from an immediate time perspective. If the Regional Entity desires to review information for purposes of monitoring reliability or assessing risk, the information should be collected via vehicles other than the Reliability Standards.Requirements applied to annual reviewsCriteria B1, 2,3 7 and 9CIP-002-2, -4 R4CIP-003-3, -4 R1.3; CIP-003-3, -4 R4.3; CIP-003-3, - 4 R5.1.2; CIP-003-3, - 4 R5.3CIP-006-3c, -4 R1.8CIP-007-3, -4 R9CIP-009-3, -4 R1EOP-005-1 R1; EOP-005-2 R3.1EOP-008-0 R1.7EOP-008-1 R5IRO-014-1 R4.3Statement: These requirements do not closely relate to operations of the Bulk Electric System. They would be better served as processes expected of entities to manage their compliance programs and processes. PRC-005-1b, R2Criteria B4, 9Statement: This requirement needs to be revised such that language is elminated as it refers to the entity providing to its RE within 30 days. MOD-016-1.1 and MOD-021-1 (all requirements) Criteria B 9Statement: MOD-016 through MOD-021 are all about long term load forecasting and reporting of actual loads. Most of this can be eliminated from the standards and replaced with a data collection process (e.g., DADS). Loads to be used in modeling should be incorporated in the data requirements of MOD-010 and MOD-012 and not a separate standard.
Electric Reliability Council of Texas, Inc.		ERCOT agrees with the ISO/RTO SCR comments. However, in addition to the SRC comments, ERCOT offers the following:ERCOT supports future phases of the P81 project to eliminate/retire reliability standards that do not facilitate BES reliability. ERCOT is reviewing all standards to that end, however, developing a list of additional

Organization	Yes or No	Question 3 Comment
		requirements for retirement will require additional time. The SDT should establish a prospective process that provides adequate time and opportunity for entities to perform a meaningful review of remaining requirements to determine which additional requirements warrant retirement and to develop appropriate criteria, if relevant, that may be incremental to the ones proposed in this SAR, and to develop appropriate retirement justifications based on the relevant retirement criteria.
City of Austin dba Austin Energy		FAC-001-0 (all requirements)Criteria B 1, 3 and 6Statement: The requirement in FAC-001-0 to document and publish facility connection requirements has no impact on reliability. It is purely a document that those considering to interconnect with a transmission entity may review as a reference. Once an interconnection request is actually made with a transmission owner, the transmission owner performs the FAC-002-1 steady-state, short-circuit, and dynamics studies to determine the new interconnection's impact on reliability. During the negotiation of an interconnection agreement the FAC-001-0 referenced material is agreed on and reduced to writing for purposes of constructing, maintaining and operating the interconnection facilities. Also, during the entire interconnection process, as FAC-002-1 provides for, the parties must coordinate and cooperate during the assessment of the reliability impact of the new interconnection facilities. Thus, FAC-001-0, at best, is a best practice or helpful initial guide to an entity considering interconnecting, but provides little, if any, meaningful value to reliability, especially when compared to the actual benefits to reliability via the FAC-002-1 studies, the execution of a negotiated agreement and the coordination of activities during constriction and operation of the new facilities. Accordingly, FAC-001-0 should be retired, and, if necessary, any requirements that protect reliability should be transferred to FAC-002-1. All INT Standards Criteria B 6, 7 and 9Statement: Many of the INT Reliability Standard requirements are very close to duplicative of similar requirements in the BAL Standards or address commercial matters. As drafted, the INT Reliability Standards include tasks or activities that do little, if anything, to promote the protection the Bulk Electric System. Thus, we recommend that the Standards Drafting Team retire the INT Reliability Standards and, as necessary, transfer any requirement that protect

Organization	Yes or No	Question 3 Comment
		reliability to the BAL Reliability Standards. All data collection requirements not included in the Initial Phase, more specifically:CIP-005-3a, -4a R5.3CIP-006c, -4c R7, R8.3CIP-007-3, -4 R5.1.2; R6.4CIP-008-3, -4 R2PRC-018-1 R5Criteria B 1, 2 and 9Statement: These requirements are purely data retention requirements with no functional nexus to reliability and, therefore, best handled via compliance monitoring, RSAW or as a data request during an audit. All reporting out requirements not included in the Initial Phase, more specifically:EOP-002-3 R9.2EOP-004-1 R3 and its subrequirements; R4 and R5FAC-003-1 R3; FAC-003-1 R3.1: FAC-003-1 R3.2: FAC-003-1 R3.3: FAC-003-1 R3.4: FAC-003-1 R3.4.1: FAC-003-1 R3.4.2: FAC-003-1 R3.4.3: FAC-003-1 R4FAC-010-2.1 R5FAC-011-2 R5FAC-013-2 R6MOD-012-0 R2MOD-020-0 R1MOD-021-1 R3PRC-004-1a R3: PRC-004-2a R3: PRC-004-WECC-1 R.3.PRC-007-0 R2; PRC-007-0 R3; PRC-009-0 R2 PRC-011-0 R2; PRC-015-0 R3; PRC-016-0.1 R3; PRC-017-0 R2; PRC-021-1 R2TPL-001-0.1 R3; TPL-002-0b R3; TPL-003-0a R3; TPL-004-0 R2.Criteria B 1, 4 and 9Statement: There is no direct connection between reporting out of information to an entity or Regional Entity and protecting reliability. If the Regional Entity desires to review information for purposes of monitoring reliability or assessing risk, the information should be collected via vehicles other than the Reliability Standards.Annual reviewsCIP-002-3, R3; CIP-002 -4 R3CIP-003-3, -4 R1.3; CIP-003-3, -4 R4.3; CIP-003-3, - 4 R5.1.2; CIP-003-3, - 4 R5.3CIP-006-3c, -4 R1.8CIP-007-3, -4 R9CIP-009-3, -4 R1EOP-005-1 R1; EOP-005-2 R3.1EOP-008-0 R1.7EOP-008-1 R5IRO-014-1 R4.3Criteria B 1, 2, 3, 7 and 9Statement: The annual review and update requirements are arbitrary, administrative and not aligned with the operation and protection of the Bulk Electric System. These requirements should be retired or modified to align with how the Bulk Electric System is operated and protected. Other requirementsCIP-007-3, -4 R7 Criteria B 1, 2, 3 and 7Statement: The essential elements of the process of disposing or redeploying of Cyber Assets and the associated cyber security are set forth in R7.2 and R7.3. To require “formal methods, processes and procedures” appears to require formal documentation for the sake of documentation, rather than allowing the responsible entity to implement a process that achieves the actions required in R7.2 and R7.3,

Organization	Yes or No	Question 3 Comment
		which may or may not include formal procedures, for example. EOP-004-1 R2Criteria B 7 Statement: The analysis of the BES for system disturbances is covered in PRC-004-2.1a R1. The PRC Requirement R1 calls for the analysis of its transmission Protection System Misoperations. We believe that BES analysis is covered inherently through this PRC standard making EOP-004 R1 redundant to the PRC standard.Another factor is the Version 2 of the EOP-004-2 where the requirement to analyze the BES disturbance is noticeably absent. The focus on the EOP-004 is for the reporting of applicable events that are identified in the PRC-004 standard. There is an event analysis reporting process referenced in the NERC Rules of Procedures (ROPs) that handles this requirement. Therefore, this is a redundant requirement. In February of 2012, NERC deployed its Events Analysis Process - incorporating the learnings from two field trials held over the previous year and a half. It includes all the necessary steps that affected operators must take to analyze and report on events that may impair the reliability of the BES. Most Regional Entities have already updated their reporting procedures to match NERC's. Furthermore, NERC and the Regional Entities already have sufficient authority to order analyses and corrective action plans outside of the Reliability Standards. These are important steps for the development of Lessons Learned and trending analyses, but do not contribute to reliable operations. In fact, the demand for near term reporting - some within one hour of the initiation of the event - interferes with the efforts of front-line personnel to mitigate the issue at handBAL-001-0.1a (all requirements), BAL-004-0 (all requirements), BAL-005-0.1b R11; BAL-006-2 (all requirements)Criteria B 6 and 9Statement: BAL-001 requires a 12 month rolling average of ACE and does not impact reliability and should be eliminated (in favor of BAL-002). Consider augmenting NAESB standard WEQ-005.BAL-004 requirement for time error correction is not important for reliability and should be eliminated. It also duplicates NAESB std WEQ-006.In BAL-005 R11, Balancing Authorities shall include the effect of ramp rates, which shall be identical and agreed to between affected Balancing Authorities, in the Scheduled Interchange values to calculate ACE, is not needed for reliability. Ramp rates have minimal impact on ACE calculations, and are already included in the

Organization	Yes or No	Question 3 Comment
		definition of Interchange Schedule in the NERC Glossary as used in R9. The requirement to use agreed upon ramp rates is commercial in nature and is already covered by NAESB standard WEQ-004-17.BAL-006-2 is an after-the-fact accounting of inadvertent interchange and does not impact reliability and should be eliminated. Consider augmenting NAESB standard WEQ-007.CIP-003-3, -4 R2 and its subrequirementsCriteria B 1 and 9Statement: Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether there is an employee called a CIP senior manager oversees the plan. CIP-004-3, -4 R2.3 Criteria B 9Statement: Whether the entity has a robust up-to-date, trained-on CIP compliance plan may impact reliability, but not whether there is annual training. CIP-004-3, -4 R3.2Criteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether there is a seven year update to the PRA. CIP-004-3, -4 R4.1Criteria B 1, 9Statement: Whether the entity has a robust up-to-date on CIP compliance plan may impact reliability, but not whether it reviews lists every seven days. CIP-004-3, -4 R4.2Criteria B 1, 9Statement: Whether the entity has a robust up-to-date on CIP compliance plan may impact reliability, but not whether it revokes access within 24 hours or 7 days. CIP-005-3a, -4a R2.5 and its subrequirementsCriteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan to protect the ESP may impact reliability, but not whether specific information is documented. CIP-007-3, -4 R3.1, R3.2Criteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan to protect the PSP may impact reliability, but not whether specific information is documented within 30 days. Also, whether the entity has a robust up-to-date on CIP compliance plan to protect the PSP may impact reliability, but not whether specific information is documented. CIP-008-3 R1.4Criteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether specific information is documented within 30 days or a change. EOP-001-1b, -2bCriteria B 7Statement: Duplicative with the other EOP Standards (e.g., Capacity and Energy emergency of EOP-002, Load Shedding of EOP-003, and System Restoration of EOP-005).EOP-002-3 R1Criteria B 7Statement: Duplicates other

Organization	Yes or No	Question 3 Comment
		requirements such as IRO-001-1 R8 and should be retired or modified to reduce redundancy. EOP-002-3 R9 Criteria B 7Statement: When a Transmission Service Provider expects to elevate the transmission service priority of an Interchange Transaction from Priority 6 (Network Integration Transmission Service from Non-designated Resources) to Priority 7 (Network Integration Transmission Service from designated Network Resources). It duplicates NAESB standard WEQ-008 and should be eliminated.EOP-005-2 R1.2.A description of how all Agreements or mutually agreed upon procedures or protocols for off-site power requirements of nuclear power plants, including priority of restoration, will be fulfilled during System restoration. Criteria B 1, 3 and 7 Statement: With the implementation of NUC-001-2 R2, there is no longer a need for EOP-005-2 R1.2. Specifically, NUC-001-2 R2 requires Nuclear Plant Interface Requirements (NPIRs) to be included in the agreements for operation and maintenance (including restoration process) for off-site nuclear power:R2. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements1 that include mutually agreed to NPIRs and document how the Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs.Given the off-site power requirements of NUC-001-2 which require comprehensive operational interface protocols (including restoration) between nuclear plants and responsible entities as part of the NPIRs, there is no longer a need for the administrative, documentation-only requirement in EOP-005-2 related to the same subject matter.IRO-002-2 (all requirements)Criteria B 7Statement: Redundant with COM-002-2, R1 COM-001-1.1, R1 and IRO-002-2, R2 and R3IRO-005-3a R10Criteria B 9Statement: Confusing requirement. It was intended to address rare cases where entities were told to operate to different SOLs and IROLs. However, because only the TOP and the RC can see these parameters, the only thing a GOP can do is follow a directive.IRO-014-1 R4Criteria B 9Statement: Requirement 4 (including sub-parts) should be rolled up into R1. and eliminated. Requirement 1 should be modified to require "current operating procedures, processes or plans with all adjacent RCs.IRO-015-1 R2.1Criteria B1 and 9Statement: Whether the procedure, process and plan is

Organization	Yes or No	Question 3 Comment
		robust and up-to-date may impact reliability, not whether there are weekly calls.MOD-001-1 and MOD-008-1 (all requirements)Criteria 6 and 9Statement: Do the ATC / TTC standards belong in NERC or NAESB (i.e., MOD-001, MOD-004, MOD-008, MOD-028 thru 030, and TOP-002-2 R12)? I think NERC should be focused on managing SOLs and IROLs, whereas NAESB on TTC, ATC, etc., and I think these can/should be moved to the NAESB standards.Criteria B 6 and 9Statement: This could be handled as a data request from an RE or other Registered Entities and, therefore, would not need a requirement, as there are too many requirements that warrant an attestation that no request was made.MOD-016-1.1 and MOD-021-1 (all requirements) Criteria B 9Statement: MOD-016 through MOD-021 are all about long term load forecasting and reporting of actual loads. Most of this can be eliminated from the standards and replaced with a data collection process (e.g., DADS). Loads to be used in modeling should be incorporated in the data requirements of MOD-010 and MOD-012 and not a separate standard.MOD-028-1 (all requirements); MOD-029-1a (all requirements); MOD-030-2 (all requirements)Criteria B 6 and 9Statements: ATC / TTC standards should belong NAESB (i.e., MOD-001, MOD-004, MOD-008, MOD-028 thru 030, and TOP-002-2 R12)? NERC should focus on managing SOLs and IROLs, whereas NAESB on TTC, ATC, etc.PRC-022-1 R1, R1.1, R1.2, R1.3, R1.4, and R1.5Criteria B 7Statement: Whether the responsible entity has robust UVLS misoperation and correction action is redundant with PRC-004-1a, -2a. TOP-001-1a R3 and R7 (and its subrequirements)Criteria B 9Statement: For R3, there are three projects in progress addressing the issuance of directives by the RC, BA and TOP. Also, for R7, all outages information should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-002-2b R8 and R 9Criteria B 6, 7 and 9Statement: “Each Balancing Authority shall plan to meet voltage and/or reactive limits, including the deliverability/capability for any single contingency”, duplicates VAR-001 and should be eliminated. “Each Balancing Authority shall plan to meet Interchange Schedules and ramps” duplicates the BAL standards and the NEASB standards and should be eliminated.TOP-002-2b R12Criteria B 6 and 9Statement: ATC / TTC standards should belong to NAESB (i.e., MOD-001, MOD-004, MOD-008,

Organization	Yes or No	Question 3 Comment
		MOD-028 thru 030, and TOP-002-2 R12). NERC should focus on managing SOLs and IROLs, whereas NAESB on TTC, ATC, etc., These can/should be moved to the NAESB standard.TOP-002-2b R14 and R14.1Criteria B 9Statement: All derating information should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-002-2b R15Criteria B 9Statement: Each Balancing Authority and Transmission Operator shall maintain accurate computer models utilized for analyzing and planning system operations is a "how" requirement that is needed to meet other requirements in the standard. It is also not measureable, and the requirement should be eliminated. All weekly forecasts should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-003-1 R1 and its subrequirements; R2 and R3Criteria B 9Statement: All planned outage information should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-005-2a R3Criteria B 9Statement: PSEs are not best positioned to provide reliability information.BAL-005-0.1b R1Criteria B7Statement: Introductory statement; redundant with subrequirements MOD-010-0 R2Criteria B 1, 4 and 9Statement: MOD-012-0 R2 was included in the Joint Trade Associations list of suggested requirements for retirement or modification. MOD-010-0 R2 is nearly identical to MOD-012-0 R2 and should also be considered.PER-001-0.1 R1Criteria B7Statement: The TOP portion of this requirement is redundant with TOP-001-1a R1PRC-018-1 R3 (and all sub requirements)Criteria B2 and 4Statement: This requirement involves data collecting and reporting that does not impact the reliability of the BES; could be part of a data request if necessary
Georgia Transmission Corporation		FAC-001-0 (all requirements)Criteria B 1, 3 and 6Statement: The requirement in FAC-001-0 to document and publish facility connection requirements has no impact on reliability. It is purely a document that those considering to interconnect with a transmission entity may review as a reference. MOD-016-1.1 and MOD-021-1 (all requirements) Criteria Meets Criteria A and a combination of either or all of B1, B2, B3, B4, B 9Statement: MOD-016 through MOD-021 are about long term load forecasting and reporting of actual and forecast loads. Requirements could be eliminated from the standards and replaced with a data collection process (e.g.,

Organization	Yes or No	Question 3 Comment
		TADS/DADS, etc.). Loads to be used in modeling could be incorporated in the data requirements of MOD-010 and MOD-012 and not a separate standard. Additionally, MODs-016 through 021 have yet to be classified as Tier 1, 2, or 3; nor have they yet to be identified on NERC's Actively Monitored List.PRC-006-1 (R7, R8, and R14) Criteria: Meets Criteria A and a combination of either or all of B1, B3, B4, B9Statement: Recommend these requirements to be eliminated from the standards and replaced with a data collection and or reporting process (e.g., TADS/DADS, etc.). PRC-023-1 (R3.3) Criteria: Meets Criteria A and a combination of either or all of B1, B4, B9Statement: Recommend these requirements to be eliminated from the standards and replaced with a data reporting process.TOP-001-1a (R4) Criteria: Meets Criteria A and B1Statement: Same requirement as TOP-001-1a (R3) which made the Phase I list, only difference is applicability.
Occidental Power Services, Inc.		If the changes listed in Question 2 are not considered in Phase 1, then they should be considered in subsequent phases of the project.
Illinois Municipal Electric Agency		IRO-010-1a R3
Idaho Power Company		MOD-017-0.1 R1.1, R1.2 Criterion B2MOD-018-0 R1 Criterion B7 (Should be covered by MOD-016)MOD-021-1 R1, R2 Criterion B7 (Should be covered by MOD-016)MOD-021-1 R3 Criterion B4
CPS Energy		No additional comments.
Salt River Project		No additions at this time.
Occidental Energy Ventures Corp.		OEVC agrees with the process that the Trades are using to approach this question, but do not agree with some of their priorities. OEVC has only addressed the Requirements where OEVC has additional comments to what the Trades have provided.In addition, OEVC believes the following requirements can also be

Organization	Yes or No	Question 3 Comment
		removed:a) BAL-005, R1.1 - BA metering is financial in nature. Telemetry is already required for reliability.b) TOP-002, R13 - Generator validations are driven by the regions already.FAC-001-0 (all requirements)Criteria B 1, 3 and 6Statement: OEVC agrees with the Trade's analysis, but will also point out that once connection requirements are in place, they will rarely change. We believe this would mean a lower priority is in order. All INT Standards Criteria B 6, 7 and 9 Statement: Again, OEVC agrees with the Trades on this. It may even be time to suggest that the functional designation of the PSE go away. They serve a marketing purpose and are blind to reliability indicators. All data collection requirements not included in the Initial PhaseCIP-005-3a, -4a R5.3CIP-006c, -4c R7, R8.3CIP-007-3, -4 R5.1.2; R6.4; R7.3CIP-008-3, -4 R2PRC-018-1 R5Criteria B 1, 2 and 9 Statement: OEVC agrees with the Trades. Most of these are captured in Phase I. These fit in the same category. All reporting out requirements not included in the Initial PhaseCIP-001-2a R3 should be modified to eliminate the word "reporting" (added by OEVC)EOP-002-3 R9.2EOP-004-1 R3 and its sub requirements; R4 and R5 FAC-003-1 R3; FAC-003-1 R3.1: FAC-003-1 R3.2: FAC-003-1 R3.3: FAC-003-1 R3.4: FAC-003-1 R3.4.1: FAC-003-1 R3.4.2: FAC-003-1 R3.4.3: FAC-003-1 R4FAC-010-2.1 R5FAC-011-2 R5FAC-013-2 R6MOD-010-0 R2 Similar to MOD-012-0 (added by OEVC)MOD-012-0 R2MOD-020-0 R1MOD-021-1 R3PRC-004-1a R3: PRC-004-2a R3: PRC-004-WECC-1 R.3.PRC-007-0 R2; PRC-007-0 R3; PRC-009-0 R2 PRC-011-0 R2; PRC-015-0 R3; PRC-016-0.1 R3; PRC-017-0 R2; PRC-021-1 R2TPL-001-0.1 R3; TPL-002-0b R3; TPL-003-0a R3; TPL-004-0 R2.Criteria B 1, 4 and 9 Statement: In addition to the Trade's comments, OEVC believes that NERC has an Events Analysis process, RAPA process, and Section 1600 Data Request process that they can invoke to get this information.Annual reviewsCIP-002-2, -4 R4CIP-003-3, -4 R1.3; CIP-003-3, -4 R4.3; CIP-003-3, - 4 R5.1.2; CIP-003-3, - 4 R5.3CIP-006-3c, -4 R1.8CIP-007-3, -4 R9CIP-009-3, -4 R1EOP-005-1 R1; EOP-005-2 R3.1EOP-008-0 R1.7EOP-008-1 R5IRO-014-1 R4.3Criteria B 1, 2, 3, 7 and 9 Statement: OEVC agrees with the Trades and add that Compliance teams spend far too much time trying to confirm that a RBAM was reviewed and signed off-on. This serves only to add time and expense - especially when conditions have not changed in the preceding year.

Organization	Yes or No	Question 3 Comment
		Other requirements EOP-004-1 R2 Criteria B 7 Statement: OEVC agrees with the Trades. Again, NERC has an Events Analysis process and RAPA process that they can invoke to require analyses. FAC-002-1 R1OEVC agrees that this requirement and five sub-requirements are unnecessary. First of all, the PUC, the BA, and the TOP are highly involved in the interconnection process. It is not clear what extra value is provided by overlapping oversight from the RE and/or NERC. Second, other standards - the TPLs in particular - are directly referenced in the requirement. Those are enforceable already, there is no need to duplicate them here.FAC-008-1 R1.3.5This requirement is already addressed in Phase I.IRO-001-1.1 R8 OEVC believes the intent is to consolidate RC directives in IRO-001 with TOP directives in TOP-001. Since Phase I addresses TOP-001, this seems to have been already accomplished.IRO-005-3a R10Criteria B 9Statement: OEVC agrees with the Trades. This is one that we propose should be a much higher priority. Since the GOP is already told to follow a directive, this requirement makes no sense. MOD-017-0.1 R1.1 and MOD-018-0 (all requirements) ; MOD-020-1 R1OEVC believes that this is redundant with IRO-010 and the new version of TOP-003 when it takes effect.MOD-019-0.1 R1OEVC believes that this is redundant with IRO-010 and the new version of TOP-003 when it takes effect. TOP-002-2b R2; R15OEVC believes that TOP-002 R15 will be resolved by the release of the new TOP standards.TOP-002-2b R14 and R14.1Criteria B 9Statement: OEVC believes that TOP-002 R14 and R14.1 will be resolved by the release of the new TOP standards.TOP-003-1 R1 and its sub requirements; R2 and R3Criteria B 9Statement: OEVC believes that these items will be resolved by the release of the new TOP standards.TOP-005-2a R3Criteria B 9Statement: OEVC agrees with the Trades on this one. Again, it may even be time to suggest that the functional designation of the PSE go away. TOP-006-2 R1.1, R4, R5, R6; TOP-008-1 R2, R4 OEVC believes that that TOP-006 R1.1 will be resolved by the release of the new TOP standards.
NERC Staff Technical Review		Please see NERC Staff's response to question 2 for Phase I requirements that NERC Staff recommends be reviewed for inclusion in a future phase. NERC Staff may propose additional requirements for a future phase of the P81 project at a later date.

Organization	Yes or No	Question 3 Comment
American Electric Power		Please see the response to Question #2 for additional Reliability Standard requirements that AEP would like to be considered as candidates for retirement on this initial, or subsequent, request for comment.
seattle city light		Seattle City Light supports the consolidated comments of the industry Trade Organizations.
Tampa Electric Company		Tampa Electric suggests that the P81 Drafting Team consider the adoption of concepts from the CIP version 5 criteria for consideration under CIP version 3 and 4. In particular Tampa Electric proposes that draft language for CIP-007 patching will reduce administrative burden for compliance with patching process TFEs under current versions (CIP-007 V3 and V4). The version 5 draft Guidelines and Technical Basis for CIP-007 V5 states: R2.1 A patch source is not required for Cyber Assets that have no updateable software or firmware (there is no user accessible way to update the internal software or firmware executing on the Cyber Asset), or those Cyber Assets that have no existing source of patches such as vendors that no longer exist. R2.2 Determination that a security related patch, hotfix, and/or update poses too great a risk to install on a system or is not applicable due to the system configuration should not require a TFE.
Manitoba Hydro		The following statement should be removed from the standard as it does not support reliability of the BES [B8]:FAC-013-2 R5. 'However, if a functional entity that has a reliability related need for the results of the annual assessment of the Transfer Capabilities makes a written request for such an assessment after the completion of the assessment, the Planning Coordinator shall make the documented Transfer Capability assessment results available to that entity within 45 calendar days of receipt of the request'The following statement should be removed from the standard as it does not support reliability or provide any protection to the BES. [B8]:FAC-013-2 R6. 'If a recipient of a documented Transfer Capability assessment requests data to support the assessment results, the Planning Coordinator shall provide such data to

Organization	Yes or No	Question 3 Comment
		that entity within 45 calendar days of receipt of the request. The provision of such data shall be subject to the legal and regulatory obligations of the Planning Coordinator's area regarding the disclosure of confidential and/or sensitive information'.
The Edison Electric Institute (EEI), the National Rural Electric Cooperative Association (NRECA), the Electric Power Supply Association (EPSA), the Transmission Access Policy Study Group (TAPS), Electricity Consumers Resource Council (ELCON), the American Public Power Association (APPA), the Large Public Power Council (LPPC) and, the Canadian Electricity Association (CEA) (collectively, the Trade Associations).		The Trade Associations support the following list of Reliability Standard requirements to be retired or modified in a subsequent phase of the P81 project. To assist the Standards Drafting Team decide what should be considered in phase 2, phase 3 etc., the Trade Associations have listed the requirements in the order of importance - with those at the top of the list candidates for phase 2. The Trade Associations understand, however, that the decision on how best to proceed with phase 2, phase 3 will be weighed by the Standards Drafting Team, and, therefore, have not indicated any bright line on what should or should not be included in phase 2 versus phase 3, etc. The Trade Associations further note that the list of requirements listed below may be supplemented with additional requirements as the phase 2/phase 3 discussions evolve. Additionally, the Trade Associations believe that additional criteria for elimination may be proposed as part of the phase 2/phase 3 process.FAC-001-0 (all requirements)Criteria B 1, 3 and 6Statement: The requirement in FAC-001-0 to document and publish facility connection requirements has no impact on reliability. It is purely a document that those considering to interconnect with a transmission entity may review as a reference. Once an interconnection request is actually submitted to a transmission owner, the transmission owner performs the FAC-002-1 steady-state, short-circuit, and dynamics studies to determine the new interconnection's impact on reliability. During the negotiation of an interconnection agreement the FAC-001-0 reference material is agreed on and reduced to writing for purposes of constructing, maintaining and operating the interconnection facilities. Also, FAC-002-1 imposes an obligation on the parties to coordinate and cooperate during the assessment of the reliability impact of the new interconnection facilities. Thus, FAC-001-0, at best, is a best practice or helpful initial guide to an entity considering interconnecting, but provides little, if any, meaningful value to reliability, especially when compared to the actual benefits to reliability via the FAC-002-1

Organization	Yes or No	Question 3 Comment
		studies, the execution of a negotiated agreement and the coordination of activities during construction and operation of the new facilities. Accordingly, FAC-001-0 should be retired, and, if necessary, the transfer of any requirements that protect reliability to FAC-002-1. All INT Standards (With the exception of INT-007-1 R1.2 which is part of and should remain in the Initial Phase.)Criteria B 6, 7 and 9 Statement: Many of the INT Reliability Standard requirements are very close to duplicative of similar requirements in the BAL Reliability Standards or address commercial matters. As drafted, the INT Reliability Standards include tasks or activities that do little, if anything, to promote the protection the Bulk Electric System. Thus, it is recommended that the Standards Drafting Team retire the INT Reliability Standards, and, as necessary, transfer any requirement that protect reliability to the BAL Reliability Standards. ALL DATA COLLECTION REQUIREMENTS NOT INCLUDED IN THE INITIAL PHASECIP-005-3a, -4a R5.3CIP-006-3c, -4c R7, R8.3CIP-007-3, -4 R5.1.2; R6.4CIP-008-3, -4 R2PRC-018-1 R5Criteria B 1, 2 and 9Statement: These requirements are purely a data retention requirement with no functional nexus to reliability, and, therefore, are best handled via compliance monitoring, RSAWs or as a data request during an audit.ALL REPORTING OUT REQUIREMENTS NOT INCLUDED IN THE INITIAL PHASEEOP-002-3 R9.2EOP-004-1 R3 and its subrequirements; R4 and R5FAC-003-1 R3; FAC-003-1 R3.1: FAC-003-1 R3.2: FAC-003-1 R3.3: FAC-003-1 R3.4: FAC-003-1 R3.4.1: FAC-003-1 R3.4.2: FAC-003-1 R3.4.3: FAC-003-1 R4FAC-010-2.1 R5FAC-011-2 R5FAC-013-2 R6MOD-012-0 R2MOD-020-0 R1MOD-021-1 R3PRC-004-1a R3: PRC-004-2a R3: PRC-004-WECC-1 R.3.PRC-007-0 R2; PRC-007-0 R3; PRC-009-0 R2; PRC-011-0 R2; PRC-015-0 R3; PRC-016-0.1 R3; PRC-017-0 R2; PRC-021-1 R2TPL-001-0.1 R3; TPL-002-0b R3; TPL-003-0a R3; TPL-004-0 R2.Criteria B 1, 4 and 9Statement: There is no direct nexus between reporting out of information to an entity or Regional Entity and protecting reliability. If the Regional Entity desires to review information for purposes of monitoring reliability or assessing risk, the information should be collected via vehicles other than the Reliability Standards.Annual reviewsCIP-002-3, R3; CIP-002 -4 R3CIP-003-3, -4 R1.3; CIP-003-3, -4 R4.3; CIP-003-3, - 4 R5.1.2; CIP-003-3, - 4 R5.3CIP-006-3c, -4 R1.8CIP-007-3, -4

Organization	Yes or No	Question 3 Comment
		R9CIP-009-3, -4 R1EOP-005-1 R1; EOP-005-2 R3.1EOP-008-0 R1.7EOP-008-1 R5IRO-014-1 R4.3Criteria B 1, 2, 3, 7 and 9Statement: The annual review and update requirements are arbitrary, administrative and not aligned with the operation and protection of the Bulk Electric System. These requirements should be retired or modified to align with how the Bulk Electric System is operated and protected. OTHER REQUIREMENTSCIP-007-3, -4 R7 Criteria B 1, 2, 3 and 7Statement: The essential elements of the process of disposing or redeploying of Cyber Assets and the associated cyber security are set forth in R7.2 and R7.3. To require "formal methods, processes and procedures" appears to require formal documentation for the sake of documentation, rather than allowing the responsible entity to implement a process that achieves the actions required in R7.2 and R7.3, which may or may not include formal procedures, for example. EOP-004-1 R2Criteria B 7 Statement: The analysis of the BES for system disturbances is covered in the PRC-004-2.1a R1. The PRC Requirement R1 calls for the analysis of its transmission Protection System Misoperations. We believe that BES analysis is covered inherently through this PRC standard, making EOP-004 R1 redundant to the PRC standard. Another factor that was considered is the notable absence of any requirement in EOP-004-2 to analyze the BES disturbance. The focus of EOP-004 is on the reporting of applicable events that are identified in the PRC-004 standard. There is an event analysis reporting process referenced in the NERC Rules of Procedures (ROP) that addresses this requirement. Therefore, this is a redundant requirement. In February of 2012, NERC deployed its Events Analysis Process - incorporating the learnings from two field trials held over the previous year and a half. It includes all the necessary steps that affected operators must take to analyze and report on events that may impair the reliability of the BES. Most Regional Entities have already updated their reporting procedures to match NERC's. Furthermore, NERC and the Regional Entities already have sufficient authority to order analyses and corrective action plans outside of the Reliability Standards. These are important steps for the development of Lessons Learned and trending analyses, but do not contribute to reliable operations. In fact, it is arguable that the demand for near term reporting - some within one hour of the

Organization	Yes or No	Question 3 Comment
		initiation of the event - interferes with the efforts of front-line personnel to mitigate the issue at hand BAL-004-0 (all requirements), BAL-005-0.1b R11; BAL-006-2 (all requirements)Criteria B 6 and 9Statement: BAL-004 requirement for time error correction is not important for reliability and should be eliminated. BAL-004 also duplicates NAESB standard WEQ-006.BAL-005 R11 states that Balancing Authorities shall include the effect of ramp rates, which shall be identical and agreed to between affected Balancing Authorities, in the Scheduled Interchange values to calculate ACE. This requirement is not needed for reliability. Ramp rates have minimal impact on ACE calculations, and are already included in the definition of Interchange Schedule in the NERC Glossary as used in R9. The requirement to use agreed upon ramp rates is commercial in nature and is already covered by NAESB standard WEQ-004-17.BAL-006-2 is an after the fact accounting of inadvertent interchange and does not impact reliability and should be eliminated. Consider augmenting NAESB standard WEQ-007. CIP-003-3, -4 R2 and its subrequirementsCriteria B 1 and 9Statement: Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether there is an employee called a CIP senior manager that oversees the plan. CIP-004-3, -4 R2.3 Criteria B 9Statement: Whether the entity has a robust up-to-date, trained-on CIP compliance plan may impact reliability, but not whether there is annual training. CIP-004-3, -4 R3.2Criteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether there is a seven year update to the personnel risk assessment(PRA). CIP-004-3, -4 R4.1Criteria B 1, 9Statement: Whether the entity has a robust up-to-date on CIP compliance plan may impact reliability, but not whether it reviews lists every seven days. CIP-005-3a, -4a R2.5 and its subrequirementsCriteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan to protect the ESP may impact reliability, but not whether specific information is documented. CIP-007-3, -4 R3.1, R3.2Criteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan to protect the PSP may impact reliability, but not whether specific information is documented within 30 days. Also, whether the entity has a robust up-to-date CIP compliance plan to protect the PSP may impact reliability, but

Organization	Yes or No	Question 3 Comment
		not whether specific information is documented. CIP-008-3 R1.4Criteria B 1, 9Statement: Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether specific information is documented within 30 days or a change. EOP-001-1b, -2bCriteria B 7Statement: Duplicative with the other EOP Standards (e.g., Capacity and Energy emergency of EOP-002, Load Shedding of EOP-003, and System Restoration of EOP-005).EOP-002-3 R1Criteria B 7Statement: Duplicative of other requirements such as IRO-001-1 R8, and should be retired or modified to reduce redundancy. EOP-002-3 R9 Criteria B 7Statement: When a Transmission Service Provider expects to elevate the transmission service priority of an Interchange Transaction from Priority 6 (Network Integration Transmission Service from Non-designated Resources) to Priority 7 (Network Integration Transmission Service from designated Network Resources). It is duplicative of NAESB standard WEQ-008 and should be eliminated.EOP-005-2 R1.2.A description of how all Agreements or mutually agreed upon procedures or protocols for off-site power requirements of nuclear power plants, including priority of restoration, will be fulfilled during System restoration. Criteria B 1, 3 and 7 Statement: With the implementation of NUC-001-2 R2, there is no longer a need for EOP-005-2 R1.2. Specifically, NUC-001-2 R2 requires Nuclear Plant Interface Requirements (NPIRs) to be included in the agreements for operation and maintenance (including restoration process) for off-site nuclear power:Ref: NUC-001-2 R2. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements1 that include mutually agreed to NPIRs and document how the Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs.Given the off-site power requirements of NUC-001-2 which require comprehensive operational interface protocols (including restoration) between nuclear plants and responsible entities as part of the NPIRs, there is no longer a need for the administrative, documentation-only requirement in EOP-005-2 related to the same subject matter.FAC-013-1 (all requirements)Criteria B 6Statement: It is really a commercial planning practice suitable for Order 1000 under Section 205/206 as opposed to Section 215.IRO-002-2 (all requirements)Criteria B

Organization	Yes or No	Question 3 Comment
		7Statement: Redundant with COM-002-2, R1 COM-001-1.1, R1 and IRO-002-2, R2 and R3IRO-005-3a R10Criteria B 9Statement: Confusing requirement. It was intended to address rare cases where entities were told to operate to different SOLs and IROLs. However, since only the TOP and the RC can see these parameters, the only thing a GOP can do is follow a directive.IRO-014-1 R4Criteria B 9Statement: Requirement 4 (including sub-parts) should be rolled up into R1 and eliminated. Requirement 1 should be modified to require "current operating procedures, processes or plans with all adjacent RCs.IRO-015-1 R2.1Criteria B1 and 9Statement: Whether the procedure, process and plan is robust and up-to-date may impact reliability, not whether there are weekly calls. MOD-001-1 and MOD-008-1 (all requirements)Criteria B 6 and 9Statement: NERC should be focused on modeling the BES and managing SOLs and IROLs, the methodologies for the determination of CBM, TTC and ATC are commercial matters associated with the reservation and allocation of rights to transfer capability among transmission customers. While transfer capability calculations should be based on models of the BES, the NAESB WEQ should address the issues raised in MOD-001, MOD-004, MOD-008, MOD-028 thru 030, and TOP-002-2 R12.Criteria B 6 and 9Statement: This could be handled as a data request from an RE or other Registered Entities, and therefore would not need a requirement, as there are too many requirements that warrant an attestation that no request was made.MOD-016-1.1 and MOD-021-1 (all requirements) Criteria B 9Statement: MOD-016 through MOD-021 are all about long term load forecasting and reporting of actual loads. Most of this can be eliminated from the standards and replaced with a data collection process (e.g., DADS). Loads to be used in modeling should be incorporated in the data requirements of MOD-010 and MOD-012 and not a separate standard.MOD-019-0.1 R1Criteria B 1, 2, and 9Statement: MOD-019-0.1 covers “Reporting of Interruptible Demands and Direct Control Load Management,” which requires reporting of a forecast of interruptible demand and direct control load management data. This reporting is administrative in nature, and the information is not important for reliability. The data is best gathered through DADS and not through a standard.MOD-028-1 (all requirements); MOD-029-1a (all requirements);

Organization	Yes or No	Question 3 Comment
		MOD-030-2 (all requirements)Criteria B 6 and 9Statement: Do the ATC / TTC standards belong in NERC or NAESB (i.e., MOD-001, MOD-004, MOD-008, MOD-028 thru 030, and TOP-002-2 R12)? I think NERC should be focused on managing SOLs and IROLs, whereas NAESB on TTC, ATC, etc., and I think these can/should be moved to the NAESB standards. PRC-011-0 R1 Criteria B 4 and 9Statement: Requirements for maintenance of under-frequency load shedding systems ("UFLS") and under-voltage load shedding systems ("UVLS") are not needed to meet an adequate level of BES reliability. UFLS and UVLS installations are widely distributed. Distribution circuit outages, distribution field switching, and varying load profiles, such as peak and off-peak, could impact the amount of load that would be automatically shed by UFLS and UVLS. Therefore, entities must include adequate margins above their obligation to be able to meet the obligated load shed at all times as required by Reliability Standards, such as PRC-006 and PRC-007, that are performance-based, or results-based. While UFLS and UVLS are, of course, important safety-net systems, PRC-011-0 R 1 maintenance requirement is not needed to provide a "defense-in-depth" approach due to the margins required to meet performance-based requirements. Thus, Like PRC-008-0 R1 included in Phase I, Reliability Standard PRC-011-0 R1 which involves maintenance of UVLS, is not needed. In fact, it is typically the same relays and associated equipment that provides both the UFLS and the UVLS functions. PRC-022-1 R1, R1.1, R1.2, R1.3, R1.4, and R1.5Criteria B 7Statement: Whether the responsible entity has robust UVLS misoperation and correction action is redundant with PRC-004-1a, -2a. TOP-001-1a R7 (and its subrequirements)Criteria B 9Statement: For R3, there are three projects in progress addressing the issuance of directives by the RC, BA, and TOP. This includes COM-003-1's requirements for the issuances of "not quite directives" Also, for R7 All outages information should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-002-2b R8 and R 9Criteria B 6, 7 and 9Statement: "Each Balancing Authority shall plan to meet voltage and/or reactive limits, including the deliverability/capability for any single contingency", is duplicative of VAR-001 (and incorrect) and should be eliminated. "Each Balancing Authority shall plan to meet Interchange Schedules and ramps", is duplicative of the

Organization	Yes or No	Question 3 Comment
		BAL standards and the NAESB standards and should be eliminated.TOP-002-2b R12Criteria B 6 and 9Statement: The ATC / TTC standards may belong in NAESB (i.e., MOD-001, MOD-004, MOD-008, MOD-028 thru 030, and TOP-002-2 R12)? NERC standards should be focused on managing SOLs and IROLs, whereas NAESB on TTC, ATC, etc.TOP-002-2b R14 and R14.1Criteria B 9Statement: All derating information should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-002-2b R15Criteria B 9Statement: Each Balancing Authority and Transmission Operator shall maintain accurate computer models utilized for analyzing and planning system operations is a "how" requirement that is needed to meet other requirements in the standard. It is also not measureable, and the requirement should be eliminated. All weekly forecasts should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-003-1 R1 and its subrequirements; R2 and R3Criteria B 9Statement: All planned outage information should be submitted to the TOP and/or BA in accordance with their data requirements.TOP-005-2a R3Criteria B 9Statement: PSEs are not best positioned to provide reliability information.
SPP Standards Review Group		VAR-002 R3 Status changes on AVRs - Quite often status changes to AVRs may be made for only a matter of seconds. These changes do not impact the reliability of the BES but still require a call be made for notification of the change. Perhaps the requirement could be changed such that only status changes which impact the BES need to be reported. This hits on Items 4, 5, 8 and 9 in Criterion B.FAC-003-1 R1.3 - Specific training is required for personnel involved with vegetation management programs. This requirement is purely administrative (Criterion B.1) and does not, in and of itself, benefit the reliability of the BES. (Although this requirement has been removed in subsequent versions of this standard (FAC-003-2 and FAC-003-3), it remains in effect today. It needs to be retired.)While we don't have an extensive list at this time, we would hope that the drafting team will ask for potential candidates which fit this category at some point in the future prior to the start of work on the latter phases of the project.

Organization	Yes or No	Question 3 Comment
Ameren		We support and agree with Trade Association's comments and their suggested list of Reliability Standard requirements to be retired or modified in the subsequent phase of the P81 Project. In addition, we suggest that IRO-005-3, R10 should be modify to eliminate its applicability to LSE and PSE in addition to GOP. While the IRO-005-3_1a, R10 is necessary for the reliable operation of the BES, its applicability to LSE and PSE also is questionable as these entities do not "operate" the BES. We believe that it is redundant (criteria B7) with other requirements where these entities (GOP, LSE, and PSE) have to follow the RC and/or TOP directives.
Wolverine Power Supply Cooperative, Inc.		Wolverine agrees with the list of requirements that the trade associations are submitting. We are a member of NRECA and agree with their comments.

4. If you have any other comments or suggestions on the draft SAR that you have not already provided in response to the previous questions, please provide them here.

Summary Consideration:

Comment

NERC staff requests that the scope of the SAR include currently-pending versions of related Reliability Standards to address requirements proposed in Phase I that are also included in a subsequent version of the standard that has been adopted by the NERC Board of Trustees, but not yet approved by FERC. Manitoba Hydro has a similar concern. NERC staff also requests that technical justifications only rely on Commission-approved Reliability Standards and how removal of a requirement will "increase in efficiency of the ERO compliance program" consistent with the language of P81.

Response

The P81 SDT added a footnote to the SAR to address how pending versions of related Reliability Standards (i.e., NERC BOT adopted) are considered so that eliminated requirements carry through to any new NERC BOT adopted versions. In addition, the P81 SDT is developing a technical white paper that it believes will provide a sound, technical basis for removal of each NERC Reliability Standard requirement proposed in Phase I. As appropriate, the technical basis will only reference or rely on Commission-approved Reliability Standards. The technical white paper being developed by the P81 SDT will generally address the issue of efficiency gains in the ERO compliance program with a blanket statement, on a requirement basis, or a combination of both.

Comment

Kansas City Power & Light states that the retirement of the requirements should not have a ripple impact in other standards or requirements.

Response

Although it is unclear to the P81 SDT what is meant by the term "ripple impact," it is believed to be similar to Criterion C's defense in depth concept. In the future, it would be helpful to provide some examples where the removal of a NERC Reliability Standard requirement may have a ripple impact in other standards. At this time, the P81 SDT believes the consideration of Criterion C (specifically, the consideration of whether retiring a requirement will have any negative impact on the defense-in-depth protection of the BES) ensures that other standards and requirements are not negatively impacted.

Comment

Entergy Services, Inc. states that during future phases industry input should be gathered in a more formal process. PPL Corporation NERC Registered Affiliates had a similar suggestion to increase stakeholder involvement.

Response

The P81 SDT is using the approved Standard Process Manual (SPM) for Phase I, and, at this point, plans to use the SPM in effect at the time for future phases of this project as well. The SDT acknowledges that stakeholder input may need to be gathered in a manner differently in subsequent phases than that used for Phase I, as subsequent phases may be more involved than simply removing requirements in their entirety and will likely require combining and/or re-wording of existing requirements.

Comment

Dominion observed some highlighting and number issues in the draft documents and appears to suggest we add IRO-001-1a R8.

Response

Requirement 8 of NERC Reliability Standard IRO-001-1a, while redundant to TOP-001-1a R3 with regard to Reliability Coordinators, will need to remain to ensure that a NERC Reliability Standard exists that addresses the need for entities to comply with a Reliability Coordinator's Reliability Directives.

Typographical errors will be addressed by the SDT.

The spreadsheet with proposed retirements on the NERC website will be manually sorted to ensure appropriate ordering of requirements on future revisions.

Comment

South Carolina Electric and Gas states that instead of retiring R2 of EOP-009-0 could the whole standard can be replaced by the new EOP-005?

Response

Yes, it is the SDT's understanding that NERC Reliability Standard EOP-009-0 will be retired when Standard EOP-005-2 becomes enforceable (July 1, 2013).

Comment

Idaho Power Company, among other things, suggests the combing of MOD standards 016 through 021.

Response

The suggested combining of NERC Reliability Standards MOD-016 through MOD-021 has been referred to the Question 3 sub-team for consideration for Phase II.

Comment

ACES Power Marketing Standards Collaborators and Electric Reliability Council of Texas, Inc. state that NERC needs to develop guidance that includes these criteria for drafting teams to avoid developing requirements that offer little reliability value in the future.

Response

The P81 SDT agrees that NERC-developed guidance is needed for standard drafting teams to ensure that new requirements consider the criteria established by the P81 SDT. The P81 SDT will address this issue with the NERC Standards Committee.

Comment

Georgia System Operations Corporation and Georgia Transmission Corporation suggest the consideration of requirements for retirement that supports NERC programs other than the mandatory Reliability Standards.

Response

The SDT appreciates the comments. The SDT believes that the criteria, as drafted, should capture those requirements that Georgia System Operations Corporation and Georgia Transmission Corporation are concerned about.

Organization	Yes or No	Question 4 Comment
NERC Staff Technical Review		(1) NERC Staff notes that the scope of the SAR should be expanded to include currently-pending versions of related Reliability Standards to address requirements proposed in Phase I that are also included in a subsequent version of the standard that has been adopted by the NERC Board of Trustees, but not yet approved by FERC. NERC Staff suggests that footnotes could be included to capture these situations.(2) NERC Staff submits that the technical justification for removal of particular requirements should not be a restatement of the Criteria (see e.g., INT-007-1 R1.2). Nor should the technical justifications reference and/or rely upon for support any Reliability Standards unless those Reliability Standards are Commission-approved. (3) NERC Staff suggests that the technical justifications for the satisfaction of the Criteria

Organization	Yes or No	Question 4 Comment
		should include an explanation of how removal of the requirement will result in an "increase in efficiency of the ERO compliance program" consistent with the language of P81.
Duke Energy		Duke Energy generally supports the comments submitted by The Edison Electric Institute (EEI) and the process being used to respond to the Commission's invitation in the FFT Order.
Kansas City Power & Light		Efforts need to be made to make sure that the retirement of the requirements listed in "Proposed Requirements for Retirement in Phase 1 of Project 2013-02: Paragraph 81" don't have a ripple impact in other standards or requirements.
Entergy Services, Inc.		For future phases, indutry input should be gathered in a more formal process to allow for suggestions for re-wording or suggesting additional requirements for removal.
Tucson Electric Power		I appreciate the fact that there is a review of the NERC Standards as well as a review of the absolute need for various Standards and/or requirements. I also appreciate that the regulatory bodies are agreeable to such changes and improvements to the compliance process.
Illinois Municipal Electric Agency		Illinois Municipal Electric Agency fully supports this initiative by the collaboration group which suppports NERC's application of a risk-based focus to it's programs, and which is consistent with SPIG Recommendation 4.
Dominion		In the Complete Set of Standards with Proposed Retirements for Phase 1 pdf; Need to add IRO-001-1a R8 and MOD-004-1 R8 needs to be completely highlighted. In the Spreadsheet with Proposed Retirements; Suggest the MOD-004-1 Requirements be put in numeric order. Need to add IRO-001-1a R8; it is not listed on the spreadsheet.
South Carolina Electric and Gas		Instead of retiring R2 of EOP-009-0 could the whole standard can be replaced by the new EOP-005?

Organization	Yes or No	Question 4 Comment
Manitoba Hydro		It is not clear what will happen in instances where this project proposes to remove a requirement from a FERC approved Reliability Standard when the NERC BOT has already approved a newer version of that same standard. Will the newer BOT approved version also be modified if it includes one of the requirements in question? What if industry has already resolved one of these issues in the next version of a standard? Shouldn't we just implement the newer version?
MidAmerican Energy Company		MidAmerican Energy Company supports the draft SAR as a positive step to allow Responsible Entities, Regional Entities, NERC and FERC to focus their combined efforts on protecting the Bulk Electric System.
Idaho Power Company		MOD standards 016 through 021 should be combined into a single standard, removing duplication and retiring requirements which are "reporting-only" and/or have little discernable reliability benefit.We agree with the stated Purpose or Goal of the proposed standard of setting forth specific Reliability Standard requirement evaluation criteria and establishing a multi-phased process for addressing these Reliability Standard requirements. We agree with and support this Reliability Standard requirement evaluation and proposed multi-phased process based on the following:We believe there is value in differentiation of violations based on risk. We believe that not all violations pose the same risk to reliability, so they should not all be treated the same. Focusing on the greatest risks to reliability will allow for more efficient use of resources while improving the reliability of the BES through an application of structured risk management.
ACES Power Marketing Standards Collaborators		NERC needs to develop guidance that includes these criteria for drafting teams to avoid developing requirements that offer little reliability value in the future. There are many standards currently being developed that include similar kinds of requirements that will make a future exercise like this necessary. NERC should expend every effort to avoid such a future situation. Some examples can be found in Project 2007-09 Generator Verification. Proposed MOD-027-1 R3 through R5 largely

Transmission Agency of Northern California		TANC commends FERC for soliciting input on ways to eliminate requirements that are redundant or provide little protection for the bulk power system. TANC believes that NERC has proposed an appropriate response to this opportunity and looks forward to further initiatives that prioritize reliability ahead of compliance.
SERC EC Planning Standards Subcommittee		The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
SPP Standards Review Group		The following are typos we found in the SAR:Either delete the 'an' or make 'processes' singular in Technical Criteria B.2.(b).Either delete the 'that' in the 5th line or the 'to' in the 6th line of the Statement paragraph under CIP-001-2a R4. This is the 3rd sentence in the paragraph.Insert an 'a' between 'require' and 'new' in the last sentence of the Statement paragraph under CIP-003-3, -4 R4.2.
City of Austin dba Austin Energy		The P81 project should be considered a high priority Standards development project for the following reasons:(1) Responsive to P81 of FERC's March 15, 2012 order and SPIG Recommendation No. 4(2) Will increase efficiency of the ERO compliance programs(3) Requirements submitted for the initial phase appear to be clear candidates on their face and should not require extensive technical research(4) The collaborative nature of the project is an example for future work, because it advances the project while reducing the impact on stakeholders and NERC staff(5) The proposed pace of the project sets an example for future work (6) Furthers the focus on results, performance based Reliability Standards (7) May provide a roadmap of what should or should not be a requirement in future Reliability Standards(8) The draft P81 SAR criteria is designed to be sufficiently broad to capture all FERC approved reliability Standards that are unnecessary, redundant or do little to protect reliability (9) To eliminate Reliability Standards requirements that deter from our

Organization	Yes or No	Question 4 Comment
		focus on reliability Based on these benefits, we support the Standards Drafting Team and NERC staff working together to file the initial list of Reliability Standards for retirement with the Federal Energy Regulatory Commission prior to the end of the year and that the Standards Drafting Team also make significant progress on the scope of the phase two P81 Reliability Standards list by the end of the year.
PPL Corporation NERC Registered Affiliates		The PPL Companies generally support the concept and process being recommended, but are concerned that the stakeholder involvement in the process may be lacking. During the webinar on August 21, 2012 the drafting team members stated that the Standards Development Process will be utilized for all Phases of the project. However, the SAR does not indicate that the SDP is mandated. The Companies recommend that the entire SAR specifically state the the Standards Development Process will be used where the SDT must respond to comments and a stakeholder vote for approval. Additionally, the process should allow for individual (or groups) of stakeholders to request a standard's removal or modification that is not designated by the SDT for removal.
The Edison Electric Institute (EEI), the National Rural Electric Cooperative Association (NRECA), the Electric Power Supply Association (EPSA), the Transmission Access Policy Study Group (TAPS), Electricity Consumers Resource Council (ELCON), the American Public Power Association (APPA), the Large Public Power Council (LPPC) and, the Canadian Electricity Association (CEA) (collectively, the Trade		The Trade Associations believe that the P81 project should be considered a high priority Standards development project for the following reasons: o Responsive to P81 of FERC's March 15, 2012 order and SPIG Recommendation No. 4 o Will increase efficiency of the ERO compliance programs o Requirements submitted for the initial phase appear to be clear candidates on their face and should not require extensive technical research o The collaborative nature of the project is an example for future work, because it advances the project while reducing the impact on stakeholders and NERC staff o The proposed pace of the project sets an example for future work o Furthers the focus on results, performance based Reliability Standards o May provide a roadmap of what should or should not be a requirement in future Reliability Standards o The draft P81 SAR criteria are designed to be sufficiently broad to capture all FERC approved reliability Standards that are unnecessary, redundant or do little to protect reliability o Eliminating Reliability Standards requirements that are unnecessary, redundant or do little to protect reliability will

Associations).		eliminate distractions from our focus on reliability Based on these benefits, the Trade Associations strongly support the Standards Drafting Team and NERC staff working together to file the initial list of Reliability Standards for retirement with the Federal Energy Regulatory Commission prior to the end of the year, and that the Standards Drafting Team also make significant progress on the scope of the phase two P81 Reliability Standards list by the end of the year.
City of Garland		This is a good start on removing requirements that are either redundant or provide little / no protection for Bulk-Power System reliability.
Electric Reliability Council of Texas, Inc.		This SAR offers significant potential value by retiring requirements that provide no BES reliability value, but nonetheless require commitment of time and resources for both regulated entities and regulators to effect and oversee compliance, respectively, and also pose liability risk for no reason, given that they provide no reliability value. However, the substance of the requirements (e.g. administrative processes, etc.) may have non-essential value unrelated to system reliability. To the extent the SDT/industry/NERC believe there may be some non-mandatory use for this information outside of the reliability standards, the information could be considered for guidance in another format, such as guidelines, best practice documentation or lessons learned. If such an effort is deemed worthwhile, it should be established in a separate process/effort, and should not distract from moving this and future phases of this SAR forward in the most efficient and effective manner to achieve the significant benefits that may result from this SAR. In addition, the standards process going forward should include consideration of whether a proposed standard addresses a reliability requirement, is cost effective and meets the reliability-based standards criteria of “what” needs to be met and not “how” an entity will meet the standard which is better address through guidelines, best practices and/or lessons learned.
Central Husdon Gas & Electric		We agree with the criteria as listed, however, we believe that another criterion must be added. This criterion is that the retirement of a requirement must not create a

Organization	Yes or No	Question 4 Comment
Corporation		compliance gap for Entities. Several of the NERC requirements have been crafted to afford Entities a means to display compliance. Retirement of these requirements can place an Entity's compliance efforts in jeopardy. A salient example of this is identified below:Central Hudson Gas & Electric Corporation strongly disagrees with the inclusion of CIP-003-3, -4 Requirements R3, R3.1, R3.2, R3.3 as candidates for retirement. The reasons stated in the SAR in favor of inclusion are that these requirements are administrative in nature and are purely examples of a documentation process. Further it is stated in the SAR that they, ".... have been subject to misinterpretation, including responsible entities believing they can exempt themselves from compliance with the CIP requirements." This last statement is precisely the reason why the aforementioned requirements were included in the standard. These requirements allow Registered Entities to, on rare occasions, take an exception to one or several of the CIP requirements (for a limited period of time) if they (1) have valid cause (major emergency, Force Majeure, etc.), (2) document the occurrence and (3) are reviewed and approved by the CIP Senior Manager. This process supports the Registered Entity's compliance effort and acknowledges the need for special protocols to address emergency circumstances. Without such a process, the only recourse for the Registered Entity is to self-report a violation which is not within its control. In other words, retirement of these requirements would force the Registered Entity to be in full compliance with ALL CIP Standards ALL the time regardless of circumstance. The concept of 'realistic expectation' was undoubtedly the reason these requirements were crafted and included in the standard. Further, with regard to the Registered Entity's decision to claim an exception, a system of checks and balances already exists. At the time of a compliance audit of the standard's requirements, the Regional Entity reviews and makes a determination as to whether the actions taken by the Registered Entity were warranted.
NV Energy		We commend NERC and the Drafting Team on their efforts thus far in this important initiative. This process will serve to better focus the industry's limited resources on

Organization	Yes or No	Question 4 Comment
		activities that are necessary for reliability.
SRC		We support the P81 team's efforts and appreciate the effort to pull together this initial list of criteria and requirements. The SRC is looking forward to seeing a concrete timeline for the project.
Western Electricity Coordinating Council		WECC recognizes and appreciates the large amount of work done in a short time on this project and appreciates the opportunity to proved our comments.
American Electric Power		While AEP supports the efforts of this drafting team, it might have been advantageous to first agree on the criteria as a first phase, and then once determined, enter a second phase where requirements were proposed based upon the agreed-upon criteria. This might enable the fast-tracking of the criteria to be used by other concurrent projects and project teams.

P81 Project Technical White Paper

October 23, 2012

I. Introduction

On March 15, 2012, the Federal Energy Regulatory Commission ("FERC" or Commission") issued an order[1] on the North American Electric Reliability Corporation's ("NERC") Find, Fix and Track ("FFT") process that stated in paragraph 81 ("P81"):

> The Commission notes that NERC's FFT initiative is predicated on the view that many violations of requirements currently included in Reliability Standards pose lesser risk to the Bulk-Power System. If so, some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant. The Commission is interested in obtaining views on whether such requirements could be removed from the Reliability Standards with little effect on reliability and an increase in efficiency of the [Electric Reliability Organization] ERO compliance program. If NERC believes that specific Reliability Standards or specific requirements within certain Standards should be revised or removed, we invite NERC to make specific proposals to the Commission identifying the Standards or requirements and setting forth in detail the technical basis for its belief. In addition, or in the alternative, we invite NERC, the Regional Entities and other interested entities to propose appropriate mechanisms to identify and remove from the Commission-approved Reliability Standards unnecessary or redundant requirements. We will not impose a deadline on when these comments should be submitted, but ask that to the extent such comments are submitted NERC, the Regional Entities, and interested entities coordinate to submit their respective comments concurrently.

A. Consensus Process

In response to P81 and the Commission's request for comments to be coordinated,[2] during June and July 2012, various industry stakeholders, Trade Associations,[3] staff from NERC and staff from the NERC Regions jointly discussed consensus criteria and an initial list of Reliability Standard requirements that appeared to easily satisfy the criteria, and, thus, could be retired. Specifically, the three parties (industry stakeholders/Trade Associations, staff from NERC, and staff from the NERC Regions) used the following

[1] *North American Electric Reliability Corporation,* 138 FERC ¶ 61,193 at P 81 (2012).

[2] In addition to addressing P81, the consensus effort was also consistent with recommendation #4 set forth in *NERC's Recommendations to Improve The Standards Development Process* at page 12 (April 2012), which states:

Recommendation 4: Standards Product Issues — The NERC board is encouraged to require that the standards development process address: . . . The retirement of standards no longer needed to meet an adequate level of reliability.

[3] Edison Electric Institute, American Public Power Association, National Rural Electric Cooperative Association, Large Public Power Council, Electricity Consumers Resource Council, The Electric Power Supply Association, and Transmission Access Policy Study Group.

conservative discipline to arrive at the proposed list of requirements to be retired: (i) the development of criteria to determine whether a Reliability Standard requirement should be retired and (ii) the application of this criteria with consultation from Subject Matter Experts ("SME"), with the understanding that if any of the three parties objected to including a requirement it would not be included in the initial phase of the P81 Project. As a result of this process, a draft Standards Authorization Request ("SAR"), including an initial suggested list of requirements for retirement, was drafted and presented to the NERC Standards Committee. Also, the SMEs consulted in this process provided the technical justifications that appear in this technical white paper.

B. Standards Committee

On July 11, 2012, the Standards Committee authorized the draft SAR to be posted for industry comment and formed an interim P81 Standards Drafting Team ("SDT") to review and respond to comments as well as finalize the SAR. The draft SAR was posted on August 3, 2012 with stakeholder comments due on or before September 4, 2012. Based on the stakeholder comments received, the SDT finalized the SAR, including the criteria and the initial list of Reliability Standard requirements proposed for retirement. On September 28, 2012, the Standards Committee Executive Committee authorized: (a) waiving the 30 day initial comment period and (b) posting the SAR and list of requirements proposed for retirement in the initial phase for a 45-day formal comment period with the formation of a ballot pool during the first 30 days and an initial ballot during the last 10 days of that 45-day comment period.[4]

The purpose of this technical white paper is to set forth the background and technical justification for each of the Reliability Standard requirements proposed for retirement. Stakeholders are requested to review this technical white paper and provide the SDT any: (1) supplemental, additional technical justifications for a requirement(s) and/or (2) concerns with the technical justifications for a requirement(s).

[4] The following requirements that were presented in the draft SAR were already scheduled to be retired or subsumed via another Standards Development Project that has been approved by stakeholders and the NERC Board of Trustees (or due to be before the Board in November), and, thus, are presented in this technical white paper in Section V for informational purposes only: COM-001-1.1 R6; EOP-009-0 R2; FAC-008-1 R1.3.5; PRC-008-0 R1; PRC-008-0 R2; PRC-009-0 R1; PRC-009-0 R1.1; PRC-009-0 R1.2; PRC-009-0 R1.3; PRC-009-0 R1.4; PRC-009-0 R2; TOP-001-1a R3; and TOP-005-2a R1. For regulatory efficiency, these requirements will not be presented for comment and vote, and, therefore, will not be presented to the Board of Trustees for retirement or filed with the Commission or Canadian governmental authorities as part of the P81 Project. Those requirements that were not part of the draft SAR, but were added based on stakeholder comments are denoted by a "**" throughout this technical white paper. More detail on each of these requirements is provided below.

II. Executive Summary

The SDT developed a set of three criteria and used them to identify requirements that could be eligible for retirement. A summary of the criteria are as follows:

A. Criterion A (Overarching Criterion): little, if any, benefit or protection to the reliable operation of the BES

B. Criteria B (Identifying Criteria)
   - B1. Administrative
   - B2. Data Collection/Data Retention
   - B3. Documentation
   - B4. Reporting
   - B5. Periodic Updates
   - B6. Commercial or Business Practice
   - B7. Redundant

C. Criteria C (Additional data and reference points)
   - C1. Part of a FFT filing
   - C2. Being reviewed in an ongoing Standards Development Project
   - C3. Violation Risk Factor ("VRF") of the requirement
   - C4. Tier in the 2013 Actively Monitored List ("AML")
   - C5. Negative impact on NERC's reliability principles
   - C6. Negative impact on the defense in depth protection of the BES
   - C7. Promotion of results or performance based Reliability Standards

Specifically, for a requirement to be proposed for retirement, it must satisfy both, Criterion A and at least one of the Criteria B. Criteria C were considered as additional information to make a more informed decision.

Based on the criteria above, the SDT proposes to retire the following 38 requirements in 23 Reliability Standard versions:

- BAL-005-0.2b R2
- CIP-001-2a R4
- CIP-003-3 R1.2
- CIP-003-3 R3
- CIP-003-3 R3.1
- CIP-003-3 R3.2
- CIP-003-3 R3.3
- CIP-003-3 R4.2
- CIP-003-4 R1.2
- CIP-003-4 R3
- CIP-003-4 R3.1
- CIP-003-4 R3.2

- CIP-003-4 R3.3
- CIP-003-4 R4.2
- CIP-005-3a R2.6
- CIP-005-4a R2.6
- CIP-007-3 R7.3
- CIP-007-4 R7.3
- EOP-004-1 R1
- EOP-005-2 R3.1
- FAC-002-1 R2
- FAC-008-1 R2
- FAC-008-1 R3
- FAC-008-3 R4
- FAC-008-3 R5
- FAC-010-2.1 R5**
- FAC-011-2 R5**
- FAC-013-2 R3
- INT-007-1 R1.2
- IRO-016-1 R2
- NUC-001-2 R9.1
- NUC-001-2 R9.1.1
- NUC-001-2 R9.1.2
- NUC-001-2 R9.1.3
- NUC-001-2 R9.1.4
- PRC-010-0 R2
- PRC-022-1 R2
- VAR-001-2 R5**

A table is included in Appendix A with the Reliability Standard requirements proposed for retirement and a cross-reference to the associated criteria.

III. Criteria

The P81 Project focuses on identifying FERC-approved Reliability Standard requirements that satisfy the criteria set forth below.[5] Specifically, for a Reliability Standard requirement to be proposed for retirement it must satisfy **both**: (i) Criterion A (the overarching criterion) and (ii) at least one of the Criteria B listed below (identifying criteria). The purpose of having these two levels of criteria was to confine the review and consideration of requirements to only those requirements that clearly need not be included in the mandatory Reliability Standards. Also, Criteria A and B were designed

[5] The scope of future phases of the P81 Project has not yet been determined. When the scope is considered, the criteria set forth herein may be a useful guide to appropriate criteria for those phases.

so there would be no rewriting or consolidation of requirements, and the technical merits of retiring the requirements did not require significant research and vetting. In addition, for each Reliability Standard requirement proposed for retirement, the data and reference points set forth below in Criteria C were considered to make a more informed decision on whether to proceed with retirement. Lastly, for each requirement proposed for retirement, any increase to the efficiency of the ERO compliance program is addressed.

Criterion A (Overarching Criterion)
The Reliability Standard requirement requires responsible entities to conduct an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES.

Section 215(a) (4) of the United States Federal Power Act defines "reliable operation" as: "… operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements."

Criteria B (Identifying Criteria)
B1. Administrative
The Reliability Standard requirement requires responsible entities ("entities") to perform a function that is administrative in nature, does not support reliability and is needlessly burdensome.

This criterion is designed to identify requirements that can be removed with little effect on reliability and whose removal will result in an increase in the efficiency of the ERO compliance program. Administrative functions may include a task that is or is not related to developing procedures or plans, such as establishing communication contacts. Thus, for certain requirements, Criterion B1 is closely related to Criteria B2, B3 and B4. Strictly administrative functions do not inherently negatively impact reliability directly and, where possible, should be eliminated for purposes of efficiency and to allow the ERO and entities to appropriately allocate resources.

B2. Data Collection/Data Retention
These are requirements that obligate responsible entities to produce and retain data which document prior events or activities, and should be collected via some other method under NERC's rules and processes.

This criterion is designed to identify requirements that can be removed with little effect on reliability. The collection and/or retention of data do not necessarily have a reliability benefit and yet are often required to demonstrate compliance. Where data collection and/or data retention is unnecessary for reliability purposes, such requirements should be eliminated in order to increase the efficiency of the ERO compliance program.

B3. Documentation
The Reliability Standard requirement requires responsible entities to develop a document (*e.g.*, plan, policy or procedure) which is not necessary to protect BES reliability.

This criterion is designed to identify requirements that require the development of a document that is unrelated to reliability or has no performance or results-based function. In other words, the document is required, but no execution of a reliability activity or task is associated with or required by the document.

B4. Reporting
The Reliability Standard requirement obligates responsible entities to report to a Regional Entity, NERC or another party or entity. These are requirements that obligate responsible entities to report to a Regional Entity on activities which have no discernible impact on promoting the reliable operation of the BES and if the entity failed to meet this requirement there would be little reliability impact.

B5. Periodic Updates
The Reliability Standard requirement requires responsible entities to periodically update (*e.g.*, annually) documentation, such as a plan, procedure or policy without an operational benefit to reliability.

This criterion is designed to identify requirements that impose an updating requirement that is out of sync with the actual operations of the BES, unnecessary or duplicative.

B6. Commercial or Business Practice
The Reliability Standard requirement is a commercial or business practice, or implicates commercial rather than reliability issues.

This criterion is designed to identify those requirements that require: (i) implementing a best or outdated business practice or (ii) implicating the exchange of or debate on commercially sensitive information while doing little, if anything, to promote the reliable operation of the BES.

B7. Redundant
The Reliability Standard requirement is redundant with (i) another FERC-approved Reliability Standard requirement(s); (ii) the ERO compliance and monitoring program or (iii) a governmental regulation (*e.g.*, Open Access Transmission Tariff, North American Energy Standards Board ("NAESB"), etc.).

This criterion is designed to identify requirements that are redundant with other requirements and are, therefore, unnecessary. Unlike the other criteria listed in Criterion B, in the case of redundancy, the task or activity itself may contribute to a reliable BES, but it is not necessary to have two duplicative requirements on the same or similar task or activity. Such requirements can be removed with little or no effect on reliability and removal will result in an increase in efficiency of the ERO compliance program.

Criteria C (Additional data and reference points)
In those instances where there is a need for additional information to assist in the determination of whether a Reliability Standard requirement satisfies both Criteria A and B, the following data and reference points shall be considered to make a more informed decision:

C1. Was the Reliability Standard requirement part of a FFT filing?

The application of this criterion involves determining whether the requirement was included in a FFT filing.

C2. Is the Reliability Standard requirement being reviewed in an on-going Standards Development Project?

The application of this criterion involves determining whether the requirement proposed for retirement is part of an active on-going Standards Development Project, with a consideration of the point in the process that Project is at. If the requirement has been passed by the stakeholders and is scheduled to be presented to the NERC Board of Trustees, in most cases it will not be included in the P81 project to promote regulatory efficiency. The exception would be a requirement, such as the Critical Information Protection ("CIP") requirements for Version 3 and 4, that is not due to be retired for an extended period of time; or, other requirements that based on the specific facts and circumstances of that requirement indicate it should be retired via the P81 Project first rather than waiting for another Standards Development Project to retire it, particularly as a way to increase the efficiencies of the ERO compliance program. Also, for informational purposes, whether the requirement is included in a future or pending Standards Development Project will be identified and discussed.

C3. What is the VRF of the Reliability Standard requirement?

The application of this criterion involves identifying the VRF of the requirement proposed for retirement, with particular consideration of any requirement that has been assigned as having a Medium or High VRF. Also, the fact that a requirement has a Lower VRF is not dispositive that it qualifies for retirement. In this regard, Criterion C3 is considered in light of Criterion C5 (Reliability Principles) and C6 (Defense in Depth) to ensure that no reliability gap would be created by the retirement of the Lower VRF requirement. For example, no requirement, including a Lower VRF requirement, should be retired if its retirement harms the effectiveness of a larger scheme of requirements that are purposely designed to protect the reliable operation of the BES.

C4. In which tier of the 2013 AML does the Reliability Standard requirement fall?

The application of this criterion involves identifying whether the requirement proposed for retirement is on the 2013 AML, with particular consideration for any requirement in the first tier of the 2013 AML.

C5. Is there a possible negative impact on NERC's published and posted reliability principles?

The application of this criterion involves consideration of the eight following reliability principles published on the NERC webpage.

> **Reliability Principles**
> NERC Reliability Standards are based on certain reliability principles that define the foundation of reliability for North American bulk power systems. Each reliability standard shall enable or support one or more of the reliability principles, thereby ensuring that each standard serves a purpose in support of reliability of the North American bulk power systems. Each reliability standard shall also be consistent with all of the reliability principles, thereby ensuring that no standard undermines reliability through an unintended consequence.
>
> Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
>
> Principle 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
>
> Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
>
> Principle 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

Principle 5. Facilities for communication, monitoring, and control shall be provided, used, and maintained for the reliability of interconnected bulk power systems.

Principle 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

Principle 7. The reliability of the interconnected bulk power systems shall be assessed, monitored, and maintained on a wide-area basis.

Principle 8. Bulk power systems shall be protected from malicious physical or cyber attacks. (footnote omitted).

C6. Is there any negative impact on the defense in depth protection of the BES?

The application of this criterion considers whether the requirement proposed for retirement is part of a defense in depth protection strategy. In order words, the assessment is to verify whether other requirements rely on the requirement proposed for retirement to protect the BES.

C7. Does the retirement promote results or performance based Reliability Standards?

The application of this criterion considers whether the requirement, if retired, will promote the initiative to implement results- and/or performance-based Reliability Standards.

IV. The Initial Phase Reliability Standards Requirements Proposed for Retirement

The following lists the requirements proposed for retirement with details of the assessment resulting from the applicability of the criteria above.

BAL-005-0.2b R2 – Automatic Generation Control

R2. Each Balancing Authority shall maintain Regulating Reserve that can be controlled by AGC to meet the Control Performance Standard.

Background/Commission Directives

BAL-005-0 was filed for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[6] Also, the Commission accepted an errata filing to BAL-005-0.1b, which replaced Appendix 1 with a corrected version of a Commission-approved interpretation, and made an internal reference correction in the interpretation, thus resulting in BAL-005-0.2b.[7]

In Order No. 693 at paragraph 387, the Commission stated that:

> The goal of this Reliability Standard is to maintain Interconnection frequency by requiring that all generation, transmission, and customer load be within the metered boundaries of a balancing authority area, and establishing the functional requirements for the balancing authority's regulation service, including its calculation of ACE.

At paragraph 396, the Commission stated:

> On this issue, the Commission directs the ERO to modify BAL-005-0 through the Reliability Standards development process to develop a process to calculate the minimum regulating reserve for a balancing authority, taking into account expected load and generation variation and transactions being ramped into or out of the balancing authority.

This Commission directive is unaffected by the proposed retirement of BAL-005-0.2b R2.

Additionally, when adjusting the VRF for the previous version, BAL-005-0.1b R2, from Lower to High, the Commission stated that:[8]

> While theoretically, CPS can be met without the use of AGC, for example, when the AGC system is malfunctioning, the Commission believes, in practice, that AGC is the most dependable and effective means for multiple balancing authorities in an Interconnection to collectively meet CPS requirements in tandem while minimizing assistance from each other in this regard. Human reaction is neither fast enough nor dependable enough in this repetitive task to provide the immediate and continuous support to correct for Interconnection frequency drift. Further, the failure to use AGC presents a higher risk that immediate load shedding will need to be implemented after the sudden loss of generation or an unforeseen

[6] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

[7] Letter Order, Petition of the North American Electric Reliability Corporation for Approval of Errata Changes to Seven Reliability Standards, Docket No. RD12-4-000 (September 13, 2012).

[8] *North American Electric Reliability Corporation*, 121 FERC ¶ 61,179 at P 50 (2007).

> significant load increase and, thus, the failure to use AGC subjects the Bulk-Power System to a higher risk of instability.

However, the fact that the VRF for BAL-005-0.2b R2 is High is not indicative of its actual impact on the BES as explained in further detail below. Also, no Commission directive is impacted by BAL-005-0.2b R2.

Technical Justification

The stated reliability purpose of BAL-005-0.2b is to establish requirements for Balancing Authority Automatic Generation Control ("AGC") necessary to calculate Area Control Error ("ACE") and to routinely deploy the Regulating Reserve. The standard also ensures that all facilities and load electrically synchronized to the Interconnection are included within the metered boundary of a Balancing Area so that balancing of resources and demand can be achieved. The reliability purpose and objectives of BAL-005-0.2b are unaffected by the proposed retirement of R2.

A Balancing Authority must use AGC to control its Regulating Reserves to meet the Control Performance Standards ("CPS") as set forth in BAL-001-0.1a R1 and R2. Although for a short period of time (as the Commission stated during an AGC malfunction) a Balancing Authority may be able to meet its CPS obligations without AGC, it cannot do so for any extended period of time, and, therefore, Balancing Authorities must use AGC to control its Regulating Reserves to satisfy its obligations under BAL-001-0.1a R1 and R2. Given this fact, it is redundant to also have BAL-005-0.2b R2 set forth the following statement: "Each Balancing Authority shall maintain Regulating Reserve that can be controlled by AGC to meet the Control Performance Standard." (Criterion B7). It is the duplicative nature of having two requirements requiring the same activity that does little, if anything, to benefit or protect reliable operation of the BES. (Criterion A). In other words, without the existence of BAL-005-0.2b R2, Balancing Authorities must still have Regulating Reserves that can be controlled by AGC to satisfy the CPS in BAL-001-0.1a R1 and R2.

Also, the retirement of BAL-005-0.2b R2 would increase the efficiency of the ERO compliance program because NERC and the Regional Entities would be able to focus their time and resources on monitoring compliance on BAL-001-0.1a R1 and R2, which are results-based requirements, versus monitoring compliance with both BAL-001-0.1a R1 and R2 as well as the static statement in BAL-005-0.2b R2. Therefore, retiring BAL-005-0.2b R2 will provide for increased efficiencies in the ERO compliance program.

Criterion A

Without the existence of BAL-005-0.2b R2, Balancing Authorities must still have Regulating Reserves that can be controlled by AGC to satisfy the CPS in BAL-001-0.1a R1 and R2. Having two requirements requiring a Balancing Authority to conduct the same activity or task does little, if anything, to benefit or protect the reliable operation of the BES because it is duplicative.

Criteria B

- Criterion B7 (Redundant)

Criteria C

1. BAL-005-0.2b R2 has not been part of a FFT filing.

2. BAL-005-0.2b R2 is currently scheduled to be included in Standards Development Project 2010-14.2, which is Phase II of Balancing Authority Reliability-based Controls: Time Error, AGC, and Inadvertent. Given that Project 2010-14.2 is currently not an active Standards Development Project, it remains appropriate to retire BAL-005-0.2b R2 via the P81 Project.

3. The VRF for BAL-005-0.2b R2 is High. Given the redundant nature of BAL-005-0.2b R2, the High VRF is not dispositive of whether or not it should be retired since BAL-001-0.1a R1 and R2 accomplishes the important reliability requirement of Balancing Authorities maintaining Regulating Reserves that can be controlled by AGC to satisfy CPS.

4. BAL-005-0.2b R2 is not part of the 2013 AML.

5. The redundant nature of BAL-005-0.2b R2 with BAL-001-0.1a R1 and R2 also indicates that the retirement of BAL-005-0.2b R2 does not pose a negative impact to NERC's published and posted reliability principles. The two reliability principles applicable to BAL-005-0.2b R2 are the following:

    Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

    Principle 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

6. Retirement of BAL-005-0.2b R2 does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability. As discussed above, given that BAL-001-0.1a R1 and R2 already require that AGC be used to control Regulating Reserves, there is no risk or gap to reliability resulting from the retirement of BAL-005-0.2b R2.

7. Retirement of BAL-005-0.2b R2 promotes a results-based approach, because it is retiring a static requirement while BAL-001.1a R1 and R2, which are more dynamic and results-based requirements, will remain in effect.

Accordingly, for the above reasons, it is appropriate to retire BAL-005-0.2b R2.

CIP-001-2a R4 Sabotage Reporting

R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances.

Background/Commission Directives

CIP-001-1 was filed for Commission approval on November 15, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[9] CIP-001-1a was filed for Commission approval on April 21, 2010 in Docket No. RD10-11-000, and was approved by an unpublished letter order on February 2, 2011.[10]

CIP-001-2a was filed for Commission approval as a Regional Variance for the ERCOT Region, containing an interpretation of CIP-001-1, on June 21, 2011 in Docket No. RD11-6-000 and was approved by unpublished letter order on August 2, 2011.[11]

In Order No. 693 at paragraph 460, the Commission stated:

> For these reasons, the Commission remains concerned that a wider application of CIP-001-1 may be appropriate for Bulk-Power System reliability. Balancing these concerns with our earlier discussion of the applicability of Reliability Standards to smaller entities, we will not direct the ERO to make any specific modification to CIP-001-1 to address applicability. However, we direct the ERO, as part of its Work Plan, to consider in the Reliability Standards development process, possible revisions to CIP-001-1 that address our concerns regarding the need for wider application of the Reliability Standard. Further, when addressing such applicability issues, the ERO should consider whether separate, less burdensome requirements for smaller entities may be appropriate to address these concerns.

In Order No. 693 at paragraphs 445 and 467 through 470, the Commission stated that:

> The goal of CIP-001-1 is to ensure that operating entities recognize sabotage events and inform appropriate authorities and each other to

[9] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[10] Letter Order, Petition of the North American Electric Reliability Corporation for Approval of Interpretation to Reliability Standard CIP-001-1 —Cyber Security— Sabotage Reporting, Requirement R2, Docket No. RD10-11-000 (February 2, 2011).
[11] Letter Order, Petition of the North American Electric Reliability Corporation for Approval of the Reliability Standard CIP-001-2a – Sabotage Reporting with a Regional Variance for Texas Reliability Entity, Docket No. RD11-6-000 (August 2, 2011).

properly respond to the sabotage to minimize the impact on the Bulk-Power System. The Reliability Standard requires that each reliability coordinator, balancing authority, transmission operator, generation operator and LSE have procedures for recognizing and for making operating personnel aware of sabotage events, and communicating information concerning sabotage events to appropriate "parties" in the Interconnection.

* * *

CIP-001-1, Requirement R4, requires that each applicable entity establish communications contacts, as applicable, with the local FBI or Royal Canadian Mounted Police officials and develop reporting procedures as appropriate to its circumstances. The Commission in the NOPR expressed concern that the Reliability Standard does not require an applicable entity to actually contact the appropriate governmental or regulatory body in the event of sabotage. Therefore, the Commission proposed that NERC modify the Reliability Standard to require an applicable entity to "contact appropriate federal authorities, such as the Department of Homeland Security, in the event of sabotage within a specified period of time."

As mentioned above, NERC and others object to the wording of the proposed directive as overly prescriptive and note that the reference to "appropriate federal authorities" fails to recognize the international application of the Reliability Standard. The example of the Department of Homeland Security as an "appropriate federal authority" was not intended to be an exclusive designation. Nonetheless, the Commission agrees that a reference to "federal authorities" could create confusion. Accordingly, we modify the direction in the NOPR and now direct the ERO to address our underlying concern regarding mandatory reporting of a sabotage event. The ERO's Reliability Standards development process should develop the language to implement this directive.

* * *

Thus, the Commission directs the ERO to modify CIP-001-1 to require an applicable entity to contact appropriate governmental authorities in the event of sabotage within a specified period of time, even if it is a preliminary report. The ERO, through its Reliability Standards development process, is directed to determine the proper reporting period. In doing so, the ERO should consider suggestions raised by commenters such as FirstEnergy and Xcel to define the specified period for reporting an incident beginning from when an event is discovered or suspected to be sabotage, and APPA's concerns regarding events at unstaffed or remote

> facilities, and triggering events occurring outside staffed hours at small entities. (Footnotes omitted).

The Commission's suggestion to modify CIP-001-1 to require an applicable entity to contact appropriate federal authorities, such as the Department of Homeland Security, is being considered in Standards Development Project 2009-01 (EOP-004-2). CIP-001-2a R4 is proposed for retirement because it does not require an action when sabotage is suspected or actually occurs, rather that action is addressed via CIP-001-2a R2.

Technical Justification

The practices and procedures set forth in CIP-001-2a R2 provides the results-based foundation for contacting communication of information concerning sabotage events to appropriate parties in the Interconnection, including when necessary, the FBI or RCMP, when there is an event of suspected or actual sabotage, while the task in R4 does little, if anything, to benefit or protect the reliable operation of the BES. (Criterion A). Consistent with CIP-001-2a R1 (identification of sabotage), R2 (communication of sabotage) and R3 (reporting of sabotage),[12] a responsible entity generally contacts local law enforcement authorities when there is any suspicion that sabotage has occurred at a BES facility. The entity's corporate security and site personnel will consult with local law enforcement to assess the situation and facts to determine whether a suspected or actual act of sabotage has occurred. If they find a suspected or actual act of sabotage has occurred, the FBI or RCMP, as appropriate, will be contacted in accordance with R2.[13] Thus, pursuant to the different steps and actions in R1 through R3, when there is an instance of sabotage that warrants contacting the FBI or RCMP or any other federal/national governmental authority, the responsible entities will contact them. Conversely, CIP-001-2a R4 does not require that the FBI or RCMP be contacted when an act of suspected or actual sabotage has occurred; instead, R4 only requires that the entity establish communication contacts with these agencies, as appropriate, and "develop reporting procedures. . . ." While the development of reporting procedures in R4 is generic, the procedures and processes associated with R1, R2, and R3 are specific to the steps of identifying, communicating and reporting issues related to sabotage. This view was confirmed in the interpretation of R2 that states:

> . . . the phrase "appropriate parties in the Interconnection" to refer collectively to entities with whom the reporting party has responsibilities and/or obligations for the communication of physical or cyber security event information.

[12] "**R2.** Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection."

[13] In addition, the requirement, as written, does not reflect current reporting and investigation procedures in some of the Canadian Provinces as protocol for sabotage reporting and investigation varies in each Canadian Province. For example, in the Provinces of Ontario and Quebec, the reports are given to local police (municipal/provincial) and not to the RCMP as the standard specifies. The fact is that the RCMP does not perform Provincial level law enforcement in the Provinces of Ontario and Quebec.

Consequently, the R4 requirement to establish communication contacts and develop reporting procedures does not support reliability, and, instead, is an administrative, documentation and data collection task requirement (Criteria B1, B2 and B3). Also, in the overall context of CIP-001-2a R1 through R3, which already require sabotage related procedures and guidelines, the tasks in R4 are unnecessary and needlessly burdensome. Furthermore, corporate security departments that are involved in the investigation of sabotage related events are well aware of how to contact the FBI and RCMP, as applicable, and, in fact, some corporate security employees to have a law enforcement background, including past positions in federal agencies such as the Secret Service. To have these security professionals establish contacts with agencies they are readily familiar with and to generic develop reporting procedures that do not require action is unnecessarily burdensome. The administrative aspect of R4 is further illuminated when compared to the more results-based activities in CIP-001-2a R1 through R3, which are the requirements that serve reliability by requiring action when suspected or actual sabotage occurs. Accordingly, CIP-001-2a R1 through R3 serve the results-based reliability function, while R4 is a static, administrative requirement that has no direct or clear nexus to protecting BES reliability.

Also, the retirement of CIP-001-2a R4 should increase the efficiencies of the ERO compliance program, because ERO and Regional Entity time and resources would be able to focus more attention, if needed, on monitoring compliance with CIP-001-2a R1 through R3.

Criterion A
CIP-001-2a R2 provides the results-based foundation for contacting communication of information concerning sabotage events to appropriate parties in the Interconnection, including when necessary, the FBI or RCMP, when there is an event of suspected or actual sabotage, while the task in R4 does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B
- Criterion B1 (Administrative)
- Criterion B2 (Data Collection/Data Retention)
- Criterion B3 (Documentation)

Criteria C
1. CIP-001-2a R4 has been part of a FFT filing.[14]

[14] NERC FFT Informational Filing, Docket No. RC12-15-000 (August 31, 2012); NERC FFT Informational Filing, Docket No. RC12-13-000 (June 29, 2012); NERC FFT Informational Filing, Docket No. RC12-11-000 (April 30, 2012); NERC FFT Informational Filing, Docket No. RC12-6-000 (December 30, 2011); NERC FFT Informational Filing, Docket No. RC12-2-000 (November 30, 2011); NERC FFT Informational Filing, Docket No. RC12-1-000 (October 31, 2011); NERC FFT Informational Filing, Docket No. RC11-6-000 (September 30, 2011).

2. CIP-001-2a R4 is part of an on-going Standards Development Project 2009-01 (EOP 004-2). At this time, EOP-004-2 has not been approved by stakeholders and the NERC Board of Trustees, and, therefore, it is appropriate to retain CIP-001-2a R4 within the scope of P81. However, if EOP-004-2 does receive stakeholder approval and is adopted by the NERC Board of Trustees, the SDT will reconsider retirement via the P81 Project and may include CIP-001-2a R4 for informational purposes only.

3. CIP-001-2a R4 has a Medium VRF. All of CIP-001-2a has a Medium VRF, thus the fact that R4 is a Medium VRF is not dispositive of whether it should be retired.

4. CIP-001-2a R4 is in the second tier of the AML. Similar to the VRF, having CIP-001-2a R4 in the second tier of the AML is not dispositive of whether it should be retired, particularly when considered with the fact that R2 and R3, the more results-based requirements, are in the first tier.

5. Given its lack of requiring a reliability based action, the retirement of CIP-001-2a R4 does not negatively impact NERC's published and posted reliability principles. The only principles applicable to CIP-001-2a R4 appear to be the following:

   Principle 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

   Principle 8. Bulk power systems shall be protected from malicious physical or cyber attacks.

6. The retirement of CIP-001-2a R4 does not impact a defense in depth strategy between multiple requirements. CIP-001-2a R1 through R3 provide the foundation for the identification, communication and reporting of suspected and actual sabotage, while R4 is an administrative task of establishing contacts and developing generic reporting procedures. Therefore, there is no reliability risk or gap that will result from the retirement of CIP-001-2a R4.

7. As mentioned above, CIP-001-2a R4 is not a results-based requirement.

Accordingly, for the above reasons, it is appropriate to retire CIP-001-2a R4.

CIP-003-3, -4 R1.2 – Cyber Security – Security Management Controls

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

Background/Commission Directives

CIP-003-1 was filed for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on January 18, 2008 in Order No. 706.[15] CIP-003-2 was filed for Commission approval on May 22, 2009 in Docket Nos. RM06-22-000 and RD09-7-000 and was approved on September 30, 2009.[16] CIP-003-3 was filed for Commission approval on December 29, 2009 in Docket No. RD09-7-002 and was approved on March 31, 2010.[17] CIP-003-4 was submitted for Commission approval on February 10, 2011 in Docket No. RM11-11-000 and was approved on April 19, 2012.[18]

In Order No. 706 at paragraph 342 the Commission stated that:

> Reliability Standard CIP-003-1 seeks to ensure that each responsible entity has minimum security management controls in place to protect the critical cyber assets identified pursuant to CIP-002-1. To achieve this goal, a responsible entity must develop a cyber security policy that represents management's commitment and ability to secure its critical cyber assets. It also must designate a senior manager to direct the cyber security program and to approve any exception to the policy.

All outstanding directives in Order No. 706 will be addressed in Version 5 of the CIP Standards and the retirement of CIP-003-3, -4 R1.2 does not impact a Commission directive.

Technical Justification

The importance of the cyber security policy as representing management's commitment and ability to secure critical cyber assets is overshadowed by the rigorous and specific training, procedural and process related requirements of the CIP Standards. These trainings, procedures and processes render having the cyber security policy readily available an unnecessary requirement. In other words, whether CIP personnel are completing a typical CIP requirement cyber security task or responding to an immediate situation, they will act via their specific training, processes and procedures and not the overarching cyber security policy. Consequently, the cyber security policy's generalized guidance on compliance with the CIP requirements is not a document that adds value to personnel protecting the BES from a cyber attack on a day-to-day basis.

---

[15] *Mandatory Reliability Standards for Critical Infrastructure Protection*, 122 FERC ¶ 61,040 (2008) ("Order No. 706"), *order on reh'g*, Order No. 706-A, 123 FERC ¶ 61,174 (2008), *order on clarification*, Order No. 706-B, 126 FERC ¶ 61,229, order on clarification, Order No. 706-C, 127 FERC ¶ 61,273 (2009).

[16] *Order Approving Revised Reliability Standard for Critical Infrastructure Protection and Requiring Compliance Filing*, 128 FERC ¶ 61,291 (2009), *order denying reh'g and granting clarification*, 129 FERC ¶ 61,236 (2009) (approving Version 2 of the CIP Reliability Standards)).

[17] *Order on Compliance* 130 FERC ¶ 61,271 (2010).

[18] *Version 4 Critical Infrastructure Protection Reliability Standards*, 139 FERC ¶ 61,058 (2012).

Furthermore, to implement CIP-003-3, -4 R1.2 entities have undertaken a variety of administrative solutions including kiosks dedicated to computers with the cyber security policy, posting the policy on the company intranet, having copies available in work stations, at common area desks in generating stations and substations, etc. Therefore, although the cyber security policy is readily available for all personnel who have access to, or are responsible for, Critical Cyber Assets, these personnel are specifically and appropriately focused on implementing the procedures and processes required by CIP Reliability Standards such as CIP-007-3 R1, which states as follows:

> Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-3, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

Generally the cyber security policy will cite CIP-007-3 R1 as a requirement, and may refer to procedures related to CIP-007-3 R1, but will not have, nor is it required to have, the detail necessary to implement CIP-007-3 R1. In some larger companies, it is also common to have specific procedures on how to accomplish requirements such as CIP-007-3 R1 in a control center versus a generating plant or substation, and it may be different CIP personnel implementing these procedures in locations many hundreds of miles, states or Interconnections away from each other. The value of a more general cyber security policy to these individuals is minimal, at best, and, therefore, does not support reliability. Also, making it readily available at all office locations is an unnecessarily burdensome administrative task.

Moreover, to place every procedure and process to comply with CIP in the cyber security policy is also not practical or effective, because such a large policy will only distract from CIP personnel being able to specifically focus on the task before them. As already stated, there are likely some differences between implementing a requirement like CIP-007-1 R1 in a control center that may be located in one state and for generators located several states and hundreds of miles away. Thus, making the cyber security policy readily available is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES (Criteria A and B1).

In this context, also consider the inefficiencies CIP-003-3, -4 R1.2 may be causing the ERO compliance program. In companies with hundreds of personnel who have access to, or are responsible for, Critical Cyber Assets in multiple states and Interconnections, the ERO may expend a significant amount of time and resources to monitor compliance with CIP-003-3, -4 R1.2 via a review of kiosks, intranet sites, office cubicles, desks, etc in

multiple locations. Accordingly, considerable efficiency gains will be obtained for the ERO's compliance program if CIP-003-3, -4 R1.2 is retired.

Criterion A
Making the cyber security policy readily available is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B

- Criterion B1 (Administrative)

Criteria C

1. CIP-003-3, -4 R1.2 has been part of a FFT filing.[19]

2. As is the case with all the CIP requirements (other than CIP-001-2a R4) proposed for retirement in this technical paper, CIP-003-3, -4 R1.2 is part of an on-going Standards Development Project 2008-06 (Cyber Security) ("CIP V5"). The P81 SDT has coordinated its efforts with the chair of Project 2008-06. There is no conflict between CIP requirements proposed in this technical white paper for retirement and the direction of Project 2008-06. The CIP V5 requirements are not Board of Trustee or Commission approved, and, even if they were, the effective date of CIP V5 is unknown and likely at least a year, maybe more, into the future. Thus, unlike the other requirements presented here for informational purposes, it is appropriate to maintain all the CIP requirements discussed in this technical paper within the scope of the P81 Project to secure the efficiency gains resulting to the ERO compliance program from their retirement.

3. CIP-003-3, -4 R4.2 has a Lower VRF. As explained above, CIP-003-3, -4 R4.2 is not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

4. CIP-003-3,-4 R1.2 is in the second tier of the AML. As explained above, CIP-003-3, -4 R4.2 is not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

5. Given its administrative nature, CIP-003-3, -4 R1.2 does not negatively impact NERC's published and posted reliability principles. The two reliability principles that appear applicable to CIP-003-3, -4 R1.2 are the following:

   Principle 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.

[19] NERC FFT Informational Filing, Docket No. RC12-1-000 (October 31, 2011).

Principle 8. Bulk power systems shall be protected from malicious physical or cyber attacks.

As stated above, other CIP requirements are replete with the requirements that CIP personnel implement to protect the BES from cyber attacks.

6. Retiring CIP-003-3, -4 R1.2 does not negatively impact defense in depth because no other requirement depends on the cyber security policy being readily available. Therefore, the removal of CIP-003,-3,-4 R1.2 cannot have a negative impact on defense in depth.

7. Retirement of CIP-003-3, -4 R1.2 promotes a results-based approach because the requirement is mechanistic and administrative, and does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire CIP-003-3, -4 R1.2.

CIP-003-3, -4 R3, R3.1, R3.2, R3.3 – Cyber Security – Security Management Controls

R3. Exceptions – Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

Background/Commission Directives

CIP-003-1 was filed for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on January 18, 2008 in Order No. 706.[20] CIP-003-2 was filed for Commission approval on May 22, 2009 in Docket Nos. RM06-22-000 and RD09-7-

[20] *Mandatory Reliability Standards for Critical Infrastructure Protection*, 122 FERC ¶ 61,040 (2008) ("Order No. 706"), *order on reh'g*, Order No. 706-A, 123 FERC ¶ 61,174 (2008), *order on clarification*, Order No. 706-B, 126 FERC ¶ 61,229, order on clarification, Order No. 706-C, 127 FERC ¶ 61,273 (2009).

000 and was approved on September 30, 2009.[21] CIP-003-3 was filed for Commission approval on December 29, 2009 in Docket No. RD09-7-002 and was approved on March 31, 2010.[22] CIP-003-4 was submitted for Commission approval on February 10, 2011 in Docket No. RM11-11-000 and was approved on April 19, 2012.[23]

In Order No. 706 at paragraphs 373 and 376 the Commission stated that:

> Requirement R3 provides that a responsible entity must document exceptions to its policy with documentation and senior management approval. The Commission is concerned that, if exceptions mount, there would come a point where the exceptions rather than the rule prevail. In such a situation, it is questionable whether the responsible entity is actually implementing a security policy. We therefore believe that the Regional Entities should perform an oversight role in providing accountability of a responsible entity that excepts itself from compliance with the provisions of its cyber security policy. Further, we believe that such oversight would impose a limited additional burden on a responsible entity because Requirement R3 currently requires documentation of exceptions.
>
> Further, the Commission adopts its CIP NOPR proposal and directs the ERO to clarify that the exceptions mentioned in Requirements R2.3 and R3 of CIP-003-1 do not except responsible entities from the Requirements of the CIP Reliability Standards. In response to EEI, we believe that this clarification is needed because, for example, it is important that a responsible entity understand that exceptions that individually may be acceptable must not lead cumulatively to results that undermine compliance with the Requirements themselves.

All outstanding directives in Order No. 706 will be addressed in Version 5 of the CIP Standards and the retirement of CIP-003-3, -4 R3, R3.1, R3.2, and R3.3 do not impact a Commission directive.

Technical Justification

CIP-003-3, -4 R3, R3.1, R3.2, and R3.3 (CIP exception requirements) have proven not to be useful and have been subject to misinterpretation. For instance, although the CIP exception requirements have not been available for use to exempt an entity from compliance with any requirement of any Reliability Standard, based on questions received by NERC CIP Staff, entities may be interpreting the CIP exception requirements to allow for such an exemption. The CIP exception requirements only apply to

[21] *Order Approving Revised Reliability Standard for Critical Infrastructure Protection and Requiring Compliance Filing*, 128 FERC ¶ 61,291 (2009), *order denying reh'g and granting clarification*, 129 FERC ¶ 61,236 (2009) (approving Version 2 of the CIP Reliability Standards)).

[22] *Order on Compliance* 130 FERC ¶ 61,271 (2010).

[23] *Version 4 Critical Infrastructure Protection Reliability Standards*, 139 FERC ¶ 61,058 (2012).

exceptions to internal corporate policy, and only in cases where the policy exceeds a Reliability Standard requirement or addresses an issue that is not covered in a Reliability Standard. For example, if an internal corporate policy statement requires that all passwords be a minimum of eight characters in length, and be changed every 30 days, which is over and above what is required in CIP-007-3 R5.3, the CIP exception requirements could be invoked for internal governance purposes to lessen the corporate requirement back to the password requirements in CIP-007-3 R5.3, but under no circumstances do the CIP exception requirements authorize the implementation of security measures less than what is required in CIP-007-3 R5.3.

The retirement of the CIP exception requirements would not impact an entity's ability to maintain such an exception process within their corporate policy governance procedures, if it so desired. Consequently, the CIP exception requirements were always an internal administrative and documentation requirement that is outside the scope of the other CIP requirements (Criteria B1 and B3). In this context, the CIP exception requirements do not support the level of reliability set forth in the Reliability Standards, and are unnecessarily burdensome because they have resulted in entities implementing practices due to a misinterpretation of the requirement that has caused them to allocate time and resources to tasks that are misaligned with the requirements themselves. Unfortunately, this misunderstanding has also impacted the efficiency of the ERO compliance program because of the amount of time and resources needed to clear up the misunderstanding and coach entities on the meaning of the CIP exception requirements. These inefficiencies would be eliminated with the retirement of the CIP exception requirements. Accordingly, as explained, the CIP exception requirements are an administrative tool for internal corporate governance procedures, and, therefore, are not requirements that are necessary or directly protect the BES from a cyber attack, the tasks associated with these requirements do little, if anything, to benefit or protect the reliable operation of the BES. (Criterion A).

Criterion A
The CIP exception requirements are a tool for internal corporate governance procedures and is not a requirement directly protecting the BES from a cyber attack, and, therefore, the tasks associated with these requirements do little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B

- Criterion B1 (Administrative)
- Criterion B3 (Documentation)

Criteria C

1. The CIP exception requirements have been part of a FFT filing.[24]

[24] NERC FFT Informational Filing, Docket No. RC12-7-000 (January 31, 2012); NERC FFT Informational Filing, Docket No. RC12-6-000 (December 30, 2011).

2. The CIP exception requirements are part of an on-going Standards Development Project 2008-06 (Cyber Security). As detailed in the discussion of CIP-003-3, -4 R1.2, the P81 SDT has coordinated its efforts with the chair of Project 2008-06 and there is no conflict between the CIP exception requirements proposed in this technical white paper for retirement and the direction of Project 2008-06.

3. The CIP exception requirements each have a Lower VRF. As explained above, they are not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

4. The CIP exception requirements are on the third tier of the AML. As explained above, they are not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

5. Given the administrative and unnecessary nature of the CIP exception requirements in relation to protecting the BES from cyber attacks, retirement does not pose any negative impact to NERC's published and posted reliability principles, of which only Principle 8 appears to apply: "Bulk power systems shall be protected from malicious physical or cyber attacks."

6. Retiring the CIP exception requirements does not negatively impact any defense in depth strategy because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. Retirement of the CIP exception requirements promotes a results-based approach because the CIP exception requirements are approaches that entities may voluntarily take to handle internal corporate governance procedures, and, therefore, do not provide the foundation for performing a required reliability task.

Accordingly, for the above reasons, it is appropriate to retire the following CIP exception requirements: CIP-003-3, -4 R3, R3.1, R3.2, and R3.3.

CIP-003-3, -4 R4.2 - Cyber Security – Security Management Controls

> **R4.2.** The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

Background/Commission Directives

CIP-003-1 was filed for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on January 18, 2008 in Order No. 706.[25] CIP-003-2 was filed for Commission approval on May 22, 2009 in Docket Nos. RM06-22-000 and RD09-7-

[25] *Mandatory Reliability Standards for Critical Infrastructure Protection*, 122 FERC ¶ 61,040 (2008) ("Order No. 706").

000 and was approved on September 30, 2009.[26] CIP-003-3 was filed for Commission approval on December 29, 2009 in Docket No. RD09-7-002 and was approved on March 31, 2010.[27] CIP-003-4 was submitted for Commission approval on February 10, 2011 in Docket No. RM11-11-000 and was approved on April 19, 2012.[28] In Order No. 706, the Commission did not specifically address CIP-003-3, -4 R4.2.

All outstanding directives in Order No. 706 will be addressed in Version 5 of the CIP Standards and the retirement of CIP-003-3, -4 R4.2 does not impact a Commission directive.

Technical Justification

The task of classifying Critical Cyber Information "based on the sensitivity" does little, if anything, to benefit or protect the reliable operation of the BES, and is an unnecessarily administrative and a documentation task that is redundant with CIP-003-3, -4 R4 (Criteria A, B1, B3 and B7). Specifically, CIP-003-3, -4 R4[29] already requires the classification of information associated with Critical Cyber Assets. The only difference between R4 and R4.2 is that the subjective term "based on the sensitivity" has been added, thus, making it essentially redundant. Further, CIP-003-3, -4 R4 since requires the entity to develop classifications based on a subjective understanding of sensitivity (*i.e.*, no clear connection to serving reliability), the requirement does not support reliability. In this context, classifying based on sensitivity becomes an administrative that becomes necessarily burdensome, because of all the possible ramifications "based on sensitivity" can produce, and, therefore, require SMEs to decide on and reduce to writing in a documented program. This is time and effort that could be better spent on other CIP activities that provide value to cyber security and actively protect the BES. For similar reasons, retiring CIP-003-3, -4 R4.2 and the term "based on sensitivity" would increase the efficiencies of the ERO compliance program on several levels. The ERO would not spend time and resources on reviewing whether an entity's documentation contained classifications "based on sensitivity," and, instead would be able to focus its time and resources monitoring compliance with the entity's program to identify, classify, and protect information associated with Critical Cyber Assets (R4), without any distraction on monitoring the subjective implementation of classifications based on sensitivity (R4.2).

Criterion A

The task of classifying Critical Cyber Information "based on the sensitivity" does little, if anything, to benefit or protect the reliable operation of the BES, and is an administrative and a documentation task that is redundant with CIP-003-3, -4 R4.

[26] *Order Approving Revised Reliability Standard for Critical Infrastructure Protection and Requiring Compliance Filing*, 128 FERC ¶ 61,291 (2009), *order denying reh'g and granting clarification*, 129 FERC ¶ 61,236 (2009) (approving Version 2 of the CIP Reliability Standards)).
[27] *Order on Compliance* 130 FERC ¶ 61,271 (2010).
[28] *Version 4 Critical Infrastructure Protection Reliability Standards*, 139 FERC ¶ 61,058, (2012).
[29] "**R4**. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets."

Criteria B

- Criterion B1 (Administrative)
- Criterion B3 (Documentation)
- Criterion B7 (Redundant)

Criteria C

1. CIP-003-3, -4 R4.2 has been part of a FFT filing.[30]

2. CIP-003-3, -4 R4.2 is part of an on-going Standards Development Project 2008-06 (Cyber Security). As detailed in the discussion of CIP-003-3, -4 R1.2, the P81 SDT has coordinated its efforts with the chair of Project 2008-06 and there is no conflict between retirement of CIP-003-3, -4 R4.2 and the direction of Project 2008-06.

3. CIP-003-3, -4 R4.2 has a Lower VRF. As explained above, CIP-003-3, -4 R4.2 is not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

4. CIP-003-3, -4 R4.2 is on the third tier of the AML. As explained above, CIP-003-3, -4 R4.2 is not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

5. Given the unnecessary and redundant nature of this requirement, retirement does not pose any negative impact to NERC's published and posted reliability principle No. 8 which appears to apply: "Bulk power systems shall be protected from malicious physical or cyber attacks."

6. Retirement of CIP-003-3, -4 R4.2 does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. Retirement of CIP-003-3, -4 R4.2 promotes a results-based approach because retiring CIP-003-3, -4 R4.2 moves away from prescriptive, checklist of documentation approach to Reliability Standard requirements.

Accordingly, for the above reasons, it is appropriate to retire CIP-003-3, -4 R4.2.

CIP-005-3a, -4a R2.6 – Cyber Security – Electronic Security Perimeter(s)

R2.6. Appropriate Use Banner -- Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen

[30] NERC FFT Informational Filing, Docket No. RC12-7-000 (January 31, 2012); NERC FFT Informational Filing, Docket No. RC12-1-000 (October 31, 2011).

upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.

Background/Commission Directives

CIP-005-1 was filed for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on January 18, 2008 in Order No. 706.[31] CIP-005-2 was filed for Commission approval on May 22, 2009 in Docket Nos. RD09-7-000 and RM06-22-000 and was approved on September 30, 2009.[32] CIP-005-2a was filed for Commission approval on April 21, 2010 in Docket No. RD10-12-000 and was approved by unpublished letter order on February 2, 2011.[33] CIP-005-3 was filed for Commission approval on December 29, 2009 in Docket No. RD09-7-002 and was approved on March 31, 2010.[34] CIP-005-3a was filed for Commission approval on April 21, 2010 in Docket No. RD10-12-000 and was approved by an unpublished letter order on February 2, 2011.[35] CIP-005-4 was filed for Commission approval on February 10, 2011 in Docket No. RM11-11-000 and was approved on April 19, 2012 in Order No. 761.[36] CIP-005-4a was filed for Commission approval as errata to the CIP Version 4 Petition on April 12, 2011 in Docket No. RM11-11-000 and was approved on April 19, 2012 in Order No 761, the Final Rule on the CIP Version 4 standards.[37]

In Order 706 at paragraph 505 the Commission noted that:

> Requirement R2 of CIP-005-1 requires a responsible entity to implement organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the electronic security perimeter.

All outstanding directives in Order No. 706 will be addressed in Version 5 of the CIP Standards and the retirement of CIP-005-3, -4 R2.6 does not impact a Commission directive.

[31] *Mandatory Reliability Standards for Critical Infrastructure Protection*, 122 FERC ¶ 61,040 (2008) ("Order No. 706").
[32] *Order Approving Revised Reliability Standard for Critical Infrastructure Protection and Requiring Compliance Filing*, 128 FERC ¶ 61,291 (2009), *order denying reh'g and granting clarification*, 129 FERC ¶ 61,236 (2009) (approving Version 2 of the CIP Reliability Standards)).
[33] Letter Order, Petition of the North American Electric Reliability Corporation for Approval of Interpretation to Reliability Standard CIP-005-1, Cyber Security, Electronic Security Perimeter(s), Section 4.2.2 and Requirement R1.3., Docket RD10-12-000, (February 2, 2011).
[34] *Order on Compliance* 130 FERC ¶ 61,271 (2010).
[35] Letter Order, Petition of the North American Electric Reliability Corporation for Approval of Interpretation to Reliability Standard CIP-005-1, Cyber Security, Electronic Security Perimeter(s), Section 4.2.2 and Requirement R1.3., Docket RD10-12-000, (February 2, 2011).
[36] *Version 4 Critical Infrastructure Protection Reliability Standards*, 139 FERC ¶ 61,058 (2012).
[37] *Id.*

Technical Justification

The implementation of an appropriate use banner ("banner") on a user's screen for all interactive access attempts into the Electronic Security Perimeter ("ESP") is an activity or task that does little, if anything, to benefit or protect the reliable operation of the BES. Specifically, the banner does not support reliability because people who intend to inappropriately use sites will simply ignore the banner. (Criterion A). The banner is also is an administrative task since it simply requires a message be displayed on an access screen. Furthermore, the implementation and administration of a non-beneficial tool, such as the banner, therefore creates a needlessly burdensome task. As mentioned, above, the ineffectiveness of the banner also indicates that it does not support reliability. (Criteria B1 and B3). In addition, banners of this type are generally considered to be a form of legal protection or mitigation of liability, rather than security protection. Furthermore, the banner does not ensure a proper or secure access point configuration which is generally the purpose of CIP-005-3a, -4a. Further, this requirement has also been the subject of numerous TFEs for devices that cannot support such a banner, and hence has diverted resources from more productive efforts. Thus, the ERO's compliance program would become more efficient if CIP-005-3a, -4a R2.6 was retired, because ERO time and resources could be reallocated to monitor compliance with the remainder of CIP-005-3a, -4a, which provides for more effective controls of electronic access at all electronic access points into the ESP.

Criterion A

The implementation of an appropriate use banner on a user's screen for all interactive access attempts into the ESP is an activity or task that does little, if anything, to benefit or protect reliable operation of the BES, because it is administrative and a static electronic message that is not an effective deterrent or control against unauthorized access.

Criteria B

- Criterion B1 (Administrative)
- Criterion B3 (Documentation)

Criteria C

1. CIP-005-3a, -4a R2.6 has been part of a FFT filing.[38]

2. CIP-005-3a, -4a R2.6 is part of an on-going Standards Development Project 2008-06 (Cyber Security). As detailed in the discussion of CIP-003-3, -4 R1.2, the P81 SDT has coordinated its efforts with the chair of Project 2008-06 and there is no conflict between retirement of CIP-005-3a, -4a R2.6 and the direction of Project 2008-06.

[38] NERC FFT Informational Filing, Docket No. RC12-13-000 (June 29, 2012); NERC FFT Informational Filing, Docket No. RC12-7-000 (January 31, 2012).

3. The VRF for CIP-005-3a, -4a R2.6 is Lower. As explained above, CIP-005-3a, -4a R2.6 is not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

4. CIP-005-3a, -4a R2.6 is on the first tier of the AML; however, given its clear ineffective nature the placement on the first tier is not dispositive of whether it should be retired.

5. Reliability principle No. 8 – "Bulk power systems shall be protected from malicious physical or cyber attacks" – is not implicated or negatively impacted by the retirement of CIP-005-3a, -4a R2.6, because it is not an effective deterrent or control to unauthorized access into an ESP.

6. The retirement of this requirement does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability. Furthermore, the remainder of CIP-005-3a, -4a provides for actual controls of electronic access at all electronic access points which addresses the reliability risk associated with unauthorized access into an ESP.

7. Its retirement also promotes a results-based approach because CIP-005-3a, -4a R2.6 is an ineffective administrative task, and, therefore, does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire CIP-005-3a, -4a R2.6.

CIP-007-3, -4 R7.3 – Cyber Security – Systems Security Management

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

Background/Commission Directives

CIP-007-1 was filed for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on January 18, 2008 in Order No. 706.[39] CIP-007-2 was filed for Commission approval on May 22, 2009 in Docket Nos. RM06-22-000 and RD09-7-000 and was approved on September 30, 2009.[40] CIP-007-2a was filed for Commission approval on November 17, 2009 in Docket No. RD10-3-000 and was approved on March 18, 2010.[41] CIP-007-3 was filed for Commission approval on December 29, 2009 in Docket No. RD09-7-002 and was approved on March 31, 2010.[42] CIP-007-4 was filed

[39] *Mandatory Reliability Standards for Critical Infrastructure Protection*, 122 FERC ¶ 61,040 (2008) ("Order No. 706").
[40] *Order Approving Revised Reliability Standard for Critical Infrastructure Protection and Requiring Compliance Filing*, 128 FERC ¶ 61,291 (2009), *order denying reh'g and granting clarification*, 129 FERC ¶ 61,236 (2009) (approving Version 2 of the CIP Reliability Standards)).
[41] Order Approving Reliability Standard Interpretation, 130 FERC ¶ 61,184 (2010).
[42] *Order on Compliance* 130 FERC ¶ 61,271 (2010).

for Commission approval on February 10, 2011 in Docket No. RM11-11-000 and was approved on April 19, 2012.[43]

In Order No. 706 at paragraph 631 the Commission stated that:

> Requirement R7 of CIP-007-1 requires the responsible entity to establish formal methods, processes and procedures for disposal or redeployment of cyber assets. In the CIP NOPR, the Commission addressed the concern that solely to "erase the data," as stated several times in Requirement R7, may not be adequate because technology exists that allows retrieval of "erased" data from storage devices, and that effective protection requires discarded or redeployed assets to undergo high quality degaussing. We noted that erasure is as much a method as it is a goal, and that the requirement ultimately needs to assure that there is no opportunity for unauthorized retrieval of data from a cyber asset prior to discarding it or redeploying it. Degaussing is not the sole means for achieving this goal. The Commission therefore proposed to direct the ERO to modify Requirement R7 to clarify this point. (Footnote omitted)

This Commission directive is unaffected by the retirement of CIP-007-3,-4 R7.3 as explained below.

Technical Justification

Outside the context of a Reliability Standard, under Section 400 of the NERC Rules of Procedure, NERC and the Regional Entities have the authority to require an entity to submit data and information for purposes of monitoring compliance. [44] CIP-007-3, -4 R7.3 requires the maintaining of records for the purpose of demonstrating compliance with disposing of or redeploying of Cyber Assets in accordance with documented procedures. NERC and the Regions Entities, however, under Section 400 already have the ability to require the production of records to demonstrate compliance, thus it is unnecessary to also state the same in CIP-007-3, -4 R7.3. The maintaining of records is an administrative task, not a task directly related to the protection of the BES from a cyber attack. The maintaining of records is not a task that by itself, or in conjunction with other requirements, supports reliability. Also, the maintaining of the records becomes unnecessarily burdensome in that it requires all records be maintained, which

[43] *Version 4 Critical Infrastructure Protection Reliability Standards*, 139 FERC ¶ 61,058 (2012).

[44] Section 401 of NERC's Rules of Procedure provide for collection of data and information necessary to monitor compliance outside the context of Reliability Standards:

> **Data Access** — All Bulk Power System owners, operators, and users shall provide to NERC and the applicable Regional Entity such information as is necessary to monitor compliance with the Reliability Standards. NERC and the applicable Regional Entity will define the data retention and reporting requirements in the Reliability Standards *and compliance reporting procedures.* (emphasis added).

may or may not be necessary to demonstrate compliance via the production of information under Section 400. (Criteria B1 and B2). As mentioned, CIP-007-3, -4 R7.3 does not promote reliability because it does not protect the BES from a cyber attack, instead it is a record retention activity. Therefore, CIP-007-3, -4 R7.3 requires an activity or task that in and of itself, does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A).

In contrast, the remaining substantive requirements in R7 read as follows:

> R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-3.
>
> R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.
>
> R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

An entity's following of these requirements may help to protect BES reliability, but the retention of evidence associated with these requirements does not. Hypothetically, an entity could perform R7, R7.1 and R7.2 flawlessly and protect the BES, but not have any record of it. While this situation may impact a demonstration of compliance, the lack of records does not necessarily directly impact the reliability of the BES or protect it from a cyber attack.

Also, there are some inherent inefficiencies resulting from a small number of Reliability Standard requirements mandating the collection of data, evidence and records, while most data and information is collected for ERO compliance monitoring purposes outside the context of Reliability Standards. In this regard, for the ERO, Regional Entities and the entities, arguably Reliability Standards are more difficult to understand because of this inconsistent approach (typically only implicitly requiring documentation as a part of an obligation to prove compliance, but occasionally explicitly requiring it with no discernible pattern or rationale).

Criterion A

CIP-007-3, -4 R7.3 does promote reliability because it does not protect the BES from a cyber attack, instead it is a record retention activity. Therefore, CIP-007-3, -4 R7.3 requires an activity or task that in and of itself, does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B

- Criterion B1 (Administrative)
- Criterion B2 (Data Collection/Data Retention)

Criteria C

1. CIP-007-3, -4 R7.3 has not been part of a FFT filing.

2. CIP-007-3, -4 R7.3 is part of an on-going Standards Development Project 2008-06 (Cyber Security). As detailed in the discussion of CIP-003-3, -4 R1.2, the P81 SDT has coordinated its efforts with the chair of Project 2008-06 and there is no conflict between retirement of CIP-007-3, -4 R7.3 and the direction of Project 2008-06.

3. The VRF for CIP-007-3, -4 R7.3 is Lower. As explained above, CIP-007-3, -4 R7.3 is not an important part of a scheme of CIP requirements, and, therefore, it is appropriate to propose it for retirement.

4. CIP-007-3, -4 R7.3 is on the first tier of the AML; however, given that it is simply requiring the retention of records the fact that is on the first tier is not dispositive of whether it should be retired.

5. Given the administrative, data collection nature of this requirement, retirement does not pose any negative impact to NERC's published and posted reliability principle No. 8: "Bulk power systems shall be protected from malicious physical or cyber attacks."

6. The retirement does not negatively impact defense in depth because data retention in-and-of-itself is not an activity that other requirements depend on to help cover a reliability gap or risk to reliability.

7. Its retirement promotes a results-based approach because the data collection/retention does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire CIP-007-3, -4 R7.3.

EOP-004-1 R1 – Disturbance Reporting

R1. Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports.

Background/Commission Directives

EOP-004-1 was submitted to the Commission for approval on November 15, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[45] Although the Commission did not address EOP-004-1 R1 directly, in Order No. 693 at paragraph 617 it stated that EOP-004-1:

> . . . serves an important purpose in establishing requirements for reporting and analysis of system disturbances. Accordingly, the Commission approves Reliability Standard EOP-004-1 as mandatory and enforceable. In addition, pursuant to section 215(d)(5) of the FPA and § 39.5(f) of our regulations, the Commission directs the ERO to develop a modification to EOP-004-1 through the Reliability Standards development process that includes any Requirements necessary for users, owners and operators of the Bulk-Power System to provide data that will assist NERC in the investigation of a blackout or disturbance.

The directive to provide data that will assist NERC in the investigation of a blackout or disturbance is not affected by the EOP-004-1 R1, because that is accomplished via other requirements in EOP-004-1 and is also under consideration for enhancement in the development of EOP-004-2.

Technical Justification

The reliability purpose of EOP-004-1 is to ensure that disturbances or unusual occurrences that jeopardize the operation of the BES, or result in system equipment damage or customer interruptions, are studied and understood in order to minimize the likelihood of similar events in the future. The reliability purpose of EOP-004-1 is unaffected by the proposed retirement of R1.

EOP-004-1 R1 is an anomaly in the Reliability Standards, given that it requires the Regional Reliability Organization to develop a reporting procedure. Although the development of such a reporting procedure may be helpful guidance to responsible entities on reporting of disturbances to Regional Entities, in and of itself is an administrative and documentation task that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1 and B3). It is worth noting that EOP-004-1 R1, like CIP-001-2a R4, is administrative in that it only requires the development of procedures, it does not require that they be followed. More importantly, the mandatory processes for reporting preliminary and final disturbance reports are set forth in EOP-004-1 R3 and its sub-requirements which read as follows:

> R3. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity experiencing a reportable incident shall provide a preliminary written report to its Regional Reliability Organization and NERC.

[45] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

> R3.1. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall submit within 24 hours of the disturbance or unusual occurrence either a copy of the report submitted to DOE, or, if no DOE report is required, a copy of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report form. Events that are not identified until some time after they occur shall be reported within 24 hours of being recognized.
>
> R3.2. Applicable reporting forms are provided in Attachments 1-EOP-004 and 2- EOP-004.
>
> R3.3. Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by a disturbance and issue a written Interconnection Reliability Operating Limit and Preliminary Disturbance Report within 24 hours. In such cases, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall promptly notify its Regional Reliability Organization(s) and NERC, and verbally provide as much information as is available at that time. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall then provide timely, periodic verbal updates until adequate information is available to issue a written Preliminary Disturbance Report.
>
> R3.4. If, in the judgment of the Regional Reliability Organization, after consultation with the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity in which a disturbance occurred, a final report is required, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall prepare this report within 60 days. As a minimum, the final report shall have a discussion of the events and its cause, the conclusions reached, and recommendations to prevent recurrence of this type of event. The report shall be subject to Regional Reliability Organization approval.

There is no reliability gap created by the passive retirement of EOP-004-1 R1, because EOP-004-1 R3 and its sub-requirements require considerable action to report on disturbances.[46] Also, consider that the EOP-004-1 R1 regional procedures may take the lead from NERC, and, therefore, the regional procedures become a reiteration or a hybrid of mandatory (EOP-004-1 R3 and its sub-requirements) and voluntary rules (NERC

[46] While not dispositive, the NERC voluntary event analysis process is also being used to report and analyze events. A link to NERC's event analysis process is http://www.nerc.com/page.php?cid=5|365.

Event Analysis Process).[47] It is an unnecessarily burdensome task to require such reiterations of NERC reporting requirements on a regional level. Also, if there was a need for particular regional procedures such procedures could exist as guidance even without the existence of EOP-004-1 R1. Thus, the value of EOP-004-1 R1 as a Reliability Standard requirement to support reliability is diminutive.

Furthermore, the retirement of EOP-004-1 R1 will increase the efficiency of the ERO compliance program in that the time and resources spent monitoring EOP-004-1 and checking off whether or not a Regional Entity has the specified procedure, and can be utilized to focus attention on an entity's compliance with EOP-004-1 R3 and its sub-requirements, which produce the information related to disturbances.

Criterion A
A requirement that Regional Entities develop a reporting procedure in and of itself is an administrative and documentation task that does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B
- Criterion B1 (Administrative)
- Criterion B3 (Documentation)

Criteria C
1. EOP-004-1 R1 has not been part of a FFT filing.

2. EOP-004-1 R1 is part of an on-going Standards Development Project 2009-01 (EOP-004-2) and is being proposed for retirement as unnecessary. At this time, EOP-004-2 has not been approved by stakeholders and the NERC Board of Trustees, and, therefore, it is appropriate to retain EOP-004-1 R1 within the scope of the P81 Project. However, if EOP-004-2 does receive stakeholder approval and is adopted by the NERC Board of Trustees, the SDT will reconsider retirement via the P81 Project and may include EOP-004-1 R1 for informational purposes only.

3. The VRF for EOP-004-1 R1 is Lower.

4. EOP-004-1 R1 is in the third tier of the AML.

5. The retirement of EOP-004-1 R1 does not pose any negative impact to NERC's published and posted reliability principles, as none of the principles are directly implicated.

[47] *See, e.g.*, FRCC Disturbance Reporting Procedure, FRCC – RE – OP – 001-0 Effective Date – February 10, 2012.

6. The retirement does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of EOP-004-1 R1 promotes a results-based approach because the requirement is an administrative task of developing a procedure with no associated actionable performance of a task that impacts reliability.

Accordingly, for the above reasons, it is appropriate to retire EOP-004-1 R1.

EOP-005-2 R3.1– System Restoration from Blackstart Resources

R3.1. If there are no changes to the previously submitted restoration plan, the Transmission Operator shall confirm annually on a predetermined schedule to its Reliability Coordinator that it has reviewed its restoration plan and no changes were necessary.

Background/Commission Directives

EOP-005-1 was submitted for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[48] EOP-005-2 was submitted for Commission approval on December 31, 2009 in Docket No. RM10-16-000 and was approved on March 17, 2011 in Order No. 749.[49] Although the Commission did not address EOP-005-2 R3 directly in Order No. 749, it stated at paragraph 17 the following:

> EOP-005-2 and EOP-006-2 clarify the responsibilities of the reliability coordinator and transmission operator in the restoration process and restoration planning and address the Commission's directives in Order No. 693 related to the EOP Standards. By enhancing the rigor of the restoration planning process, the Reliability Standards represent an improvement from the current Standards and will improve the reliability of the Bulk-Power System. The Commission is not directing any modifications to the three new Reliability Standards. Nevertheless, as discussed below, commenters raised several issues for consideration, at the time these standards are next revisited, which we believe could improve these new Reliability Standards

There are no outstanding Commission directives that are affected by the proposed retirement of EOP-005-2 R3.1.

[48] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, FERC Stats. & Regs. ¶ 31,242 (2007).
[49] *System Restoration Reliability Standards*, 134 FERC ¶ 61,215, (March 17, 2011) ("Order No. 749"), *order on clarification*, 136 FERC ¶ 61,030 ("Order No. 749-A") (2011).

Technical Justification

The reliability purpose of EOP-005-2 is to ensure that plans, Facilities, and personnel are prepared to enable System restoration from Blackstart Resources to assure that reliability is maintained during restoration and priority is placed on restoring the Interconnection. This reliability purpose is unaffected by the proposed retirement of R3.1.

A review of EOP-005-2 R3.1 indicates that this requirement is redundant with EOP-005-2 R3 and a duplicative administrative update that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1, B5 and B7). The primary reason EOP-005-2 R3.1 is unnecessary is that EOP-005-2 R3 already requires the Transmission Operator to submit its restoration plan to its Reliability Coordinator whether or not the plan includes changes. EOP-005-2 R3 reads:

> Each Transmission Operator shall review its restoration plan and submit it to its Reliability Coordinator annually on a mutually agreed predetermined schedule.

Consequently, since R3 requires the Transmission Operator to submit its restoration plan to the Reliability Coordinator whether or not there has been a change, R3.1 only adds a separate, duplicative administrative burden for the entity to also confirm that there were no changes based upon another pre-determined schedule. While R3.1 may have attempted to capture the likelihood that unless there have been significant changes to the entity's BES, there would be no change to the restoration plan, this is an insufficient reason to impose a needlessly burdensome, duplicative administrative requirement relative to the language in R3. EOP-005-2 R3.1 is also clearly needlessly burdensome if one considers that the time and resources of Transmission Operators is better spent reliably operating the BES, rather than submitting paperwork to a Reliability Coordinator on possibly two different pre-determined schedules – one for changes and one for no changes. For these reasons, there is no reliability gap resulting from the retirement of EOP-005-2 R3.1 because Transmission Operators already have an obligation to review and provide its restoration plan annually on a mutually agreed predetermined schedule to its Reliability Coordinator. It could also be argued that a reason for both R3 and R3.1 is for the Reliability Coordinator to organize the Transmission Operator submittals into changes versus no changes. However, with the requirement to annually review restoration plans comes the need to demonstrate and track annual reviews via the revision history index, for example, which quickly shows the Reliability Coordinator when changes have and have not occurred.

The retirement of EOP-005-2 R3.1 would also increase the efficiencies of the ERO compliance program because the ERO would be able to focus its time and resources on R3 which already captures R3.1 and not be concerned with tracking the submission of restoration plans on multiple pre-determined schedules, some with changes and some without changes. Instead, the focus of the ERO compliance program would be on whether the Transmission Operators annually submitted its restoration plan to its

Reliability Coordinator on one pre-determined schedule. Thus, the retirement of EOP-005-2 R3.1 appears to benefit the ERO compliance program.

Criterion A
EOP-005-2 R3.1 is redundant and a duplicative administrative update that does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B
- Criterion B1 (Administrative)
- Criterion B5 (Periodic Updates)
- Criterion B7 (Redundant)

Criteria C
1. EOP-005-2 R3.1 has not been part of a FFT filing.

2. EOP-005-2 R3.1 is not part of an on-going Standards Development Project.

3. EOP-005-2 R3.1 does not yet have a FERC-approved VRF.

4. EOP-005-2 R3.1 is on the second tier of the AML; however, the duplicative nature of R3 and R3.1 discounts any indication that R3.1 being in the second tier is a reason not to proceed with its retirement.

5. Since EOP-005-2 R3 already requires the Transmission Operator to submit its restoration plan to its Reliability Coordinator whether or not the plan includes changes, retirement of EOP-005-2 R3.1 does not pose any negative impact to the following of NERC's published and posted reliability principles that appear to apply:

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

   Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

   Principle 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained, and implemented.

6. Retirement of EOP-005-2 R3.1 does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of EOP-005-2 R3.1 promotes a results-based approach because the requirement is administrative and unnecessary, and, therefore, does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire EOP-005-2 R3.1.

FAC-002-1 R2 – Coordination of Plans for New Facilities

R2. The Planning Authority, Transmission Planner, Generator Owner, Transmission Owner, Load-Serving Entity, and Distribution Provider shall each retain its documentation (of its evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission systems) for three years and shall provide the documentation to the Regional Reliability Organization(s) and NERC on request (within 30 calendar days).

Background/Commission Directives

FAC-002-0 was submitted to the Commission for approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[50] FAC-002-1 was submitted for Commission approval on September 9, 2010 in Docket No. RD10-15-000 and was approved on January 10, 2011.[51] When approving FAC-002-0 in Order No. 693 at paragraphs 692 and 693, and FAC-002-1 in a subsequent order,[52] the Commission did not directly address R2.

There are no outstanding Commission directives that are affected by the proposed retirement of FAC-002-1 R2.

Technical Justification

Outside the context of a Reliability Standard, under Section 400 of the NERC Rules of Procedure, NERC and the Regional Entities have the authority to require an entity to submit data and information for purposes of monitoring compliance. Thus, without the existence of FAC-002-1 R2, a Regional Entity or NERC has the ability to request and receive "documentation (of its evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission systems)." This generally would occur during a spot check or compliance audit where entities have the obligation to provide documentation sufficient to demonstrate compliance. In this regard, entities already have the obligation to produce the same information required in R2 to demonstrate compliance to R1 and its sub-requirements, thus making R2 unnecessary. To have a Reliability Standard requirement that is setting forth a data retention requirement and a requirement for the entity to deliver, upon request, that data to NERC

[50] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[51] NERC Petition for Approval of Proposed Modifications to Reliability Standards BAL-002-1; EOP-002-3; FAC-002-1; MOD-021-2; PRC-004-2; and VAR-001-2 RD10-15-000 (January 10, 2011).
[52] *North American Electric Reliability Corporation*, 134 FERC ¶ 61,015 (2011).

or a Regional Entity is unnecessary and also repetitive with the NERC Rules of Procedure. Accordingly, retiring FAC-002-1 R2 presents no gap to reliability or to the information NERC and the Regional Entity need to monitor compliance. Thus, FAC-002-1 R2 is not necessary to support reliability. Consequently, a review of R2 indicates that it is an administrative and data collection requirement that that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1 and B2). The compilation of three years of data is a burdensome task, particularly when one considers the resources and time spent on stockpiling this information is better spent coordinating the studies, executing an interconnection agreement and ensuring that interconnections are safely and reliably energized, maintained and operated. Also, there are some inherent inefficiencies that result from a small number of requirements, such as CIP-007-3, -4 R7.3 and FAC-002-1 R2 being data, evidence and record retention requirements, while there are other and more appropriate established methods to collect and review the data than a Reliability Standard via Rules of Procedure Section 401. In this regard, for the ERO, Regional Entities and the entities, arguably Reliability Standards are more difficult to understand because of this inconsistent approach (typically only implicitly requiring documentation as a part of an obligation to prove compliance, but occasionally explicitly requiring it with no discernible pattern or rationale).

Criterion A

A review of FAC-002-1 R2 indicates that it is an administrative and data collection requirement that does little, if anything, to benefit or protect reliable operation of the BES.

Criteria B

- Criterion B1 (Administrative)
- Criterion B2 (Data Collection/Data Retention)

Criteria C

1. FAC-002-1 R2 has not been part of a FFT filing.

2. FAC-002-1 R2 is subject to a future Project 2010-02 Connecting New Facilities to the Grid (a review of FAC-001 and FAC-002) that is scheduled to begin in the second quarter of 2015. It seems appropriate to retire FAC-002-1 R2 at this time as it may also make the review of FAC-001 and FAC-002 more effective and efficient.

3. FAC-002-1 R2 has a Lower VRF.

4. FAC-002-1 R2 is in the third tier of the AML.

5. The retirement of FAC-002-1 R2 does not pose any negative impact to NERC's published and posted reliability principles, since there are no directly applicable reliability principles.

6. The retirement does not negatively impact defense in depth because the compilation of studies for three years has no operational or planning relationship with any other requirement.

7. The retirement of FAC-002-1 R2 promotes a results-based approach since the requirement is administrative and data collection, and, therefore, does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire FAC-002-1 R2.

FAC-008-1 R2; FAC-008-1 R3;[53] - Facility Ratings Methodology

R2. The Transmission Owner and Generator Owner shall each make its Facility Ratings Methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners, and Planning Authorities that have responsibility for the area in which the associated Facilities are located, within 15 business days of receipt of a request.

R3. If a Reliability Coordinator, Transmission Operator, Transmission Planner, or Planning Authority provides written comments on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings Methodology, the Transmission Owner or Generator Owner shall provide a written response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings Methodology and, if no change will be made to that Facility Ratings Methodology, the reason why.

Background/Commission Directives
FAC-008-1 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[54]

There are no outstanding Commission directives that are affected by the proposed retirement of FAC-008-1 R2 and R3.

[53] Unlike the other requirements presented for informational purposes only, FAC-008-1 R2 and FAC-008-1 R3 have been maintained within the scope of P81 given that they are essentially identical to FAC-008-3 R4; FAC-008-3 R5 which are due be effective on January 1, 2013. Inclusion would also appear to be consistent with increasing ERO compliance program efficiencies, given that retirement would exempt these requirements from being included in spot checks or compliance audits that are backward looking via FAC-008-1 R2 and R3.

[54] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Technical Justification

FAC-008-1 R2 and R3 require that a Transmission Owner and Generator Owner must make its facilities ratings methodology available for inspection and technical review by Reliability Coordinators, Transmission Operators, Transmission Planners, and Planning Authorities that have responsibility for the area in which the associated facilities are located and also require them to respond to any comments received including whether a change will be made to the facility ratings methodology. The retirement of FAC-008-1 R2 and R3 does not create a reliability gap, because Transmission Owners and Generator Owners must comply with the substantive requirements of FAC-008-1 regarding their facility rating methodologies whether or not the exchange envisioned by FAC-008-1 R2 and R3 occurs. Furthermore, neither FAC-008-1 R2 and R3 require that the Transmission Owner and Generator Owner change its methodology, rather FAC-008-1 R2 and R3 are designed as an exchange of comments that may be an avenue to advance commercial interests.

For example, if a Generator Owner's methodology provides for derating its generator step up ("GSU") transformers below the nameplate in an effort to extend the life of its GSUs, that is a commercial decision it has made, and should not be subject to review by a Reliability Coordinator, Transmission Operator, Transmission Planner, and Planning Authority, some of which may have affiliated parts of their company that could benefit from the Generator Owner changing its methodology and operating its GSUs at nameplate. In contrast, the reliability objective that facility ratings produced by the methodologies of the Transmission Owner or Generator Owner shall equal the most limiting applicable equipment rating, and consider, for example, emergency and normal conditions, operating conditions, nameplate ratings, etc. is not significantly or substantively advanced by FAC-008-1 R2 (available for inspection) and R3 (comment and responsive comments). Furthermore, the reliability objective that facility ratings produced by the methodologies of the Transmission Owner or Generator Owner are provided to the reliability entities for the establishment of System Operating Limits ("SOLs"), Interconnection Reliability Operating Limits ("IROLs"), calculations for MOD requirements and compliance with the TPL Standards is accomplished without FAC-008-1 R2 (available for inspection) and R3 (comment and responsive comments).[55] Accordingly, the requirements in FAC-008-1 R2 and FAC-008-1 R3 to make the facility ratings methodology available for comment (and if comments are received to respond to those comments) is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues. (Criteria A, B1, B4 and B6). In this context, it would seem unnecessarily burdensome to engage in the exchange of comments, given there is no nexus between the exchange of comments and compliance with the substantive

[55] See MOD-001-1a R9, MOD-028-1 R2.3; MOD-029-1a R2.1; MOD-030-02 R3.1, PRC-023-2, Attachment A 2.7; TPL-001-0.1 Footnote a; TPL-002-1b, footnotes a and b; TPL-003-0a, footnote a and TPL-004-0, footnote a. Also, via FAC-011-2 the System Operating Limits methodology of Reliability Coordinator may also use facility ratings as a key element.

requirements of FAC-008-1. Instead of spending time and resources on FAC-008-1 R2 and R3, Generator Owners' and Transmission Owners' time and resources would be better spent complying with the substantive requirements of FAC-008-1. For these same reasons, the ERO compliance program would gain efficiencies by no longer having to track whether requests for technical review had occurred, comments provided and reallocate time and resources to monitoring the Transmission Owner's or Generator Owner's adherence to substantive requirements of FAC-008-1.

Criterion A

The requirements in FAC-008-1 R2 and R3 to make the facility ratings methodology available for comment (and if comments are received to respond to those comments) is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues.

Criteria B

- Criterion B1 (Administrative)
- Criterion B4 (Reporting)
- Criterion B6 (Commercial or Business Practice)

Criteria C

1. FAC-008-1 R2 and R3 have not been part of a FFT filing.

2. FAC-008-1 R2 and R3 are not subject to an on-going Standards Development Project.

3. FAC-008-1 R2 and R3 have a Lower VRF.

4. FAC-008-1 R2 and R3 are in the third tier of the AML.

5. The retirement of FAC-008-1 R2 and R3 does not pose any negative impact to the following applicable NERC's published and posted reliability principles:

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

   Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

   It is the adherence to the substantive requirements of FAC-008-1 that promotes these posted reliability principles, and not receiving comments on the facility

ratings methodology from outside entities and then responding to those comments.

6. Retirement of FAC-008-1 R2 and R3, does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability. These requirements may invite entities to engage in an exchange or debate over commercially sensitive information.

7. The retirement of FAC-008-1 R2 and R3 promotes a results-based approach because the requirements do not require the performance of a reliability task.

Accordingly, for the above reasons, it is appropriate to retire FAC-008-1 R2 and R3.

FAC-008-3 R4; FAC-008-3 R5 – Facility Ratings

R4. Each Transmission Owner shall make its Facility Ratings methodology and each Generator Owner shall each make its documentation for determining its Facility Ratings and its Facility Ratings methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners and Planning Coordinators that have responsibility for the area in which the associated Facilities are located, within 21 calendar days of receipt of a request.

R5. If a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner's Facility Ratings methodology or Generator Owner's documentation for determining its Facility Ratings and its Facility Rating methodology, the Transmission Owner or Generator Owner shall provide a response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings methodology and, if no change will be made to that Facility Ratings methodology, the reason why.

Background/Commission Directives

FAC-008-1 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[56] "On May 12, 2010, the NERC Board of Trustees approved the proposed FAC-008-2 Reliability Standard that addressed the first two of the FERC directives in Order No. 693. NERC's proposed FAC-008-2 Reliability Standard was not filed with FERC for approval, but instead was revisited by the standard drafting team so that the third Order

[56] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

No. 693 directive could be addressed in response to FERC's March 18, 2010 Order…"[57] FAC-008-3 was submitted for Commission approval on June 15, 2011 in Docket No. RD11-10-000 and was approved on November 17, 2011.[58]

There are no outstanding Commission directives that are affected by the proposed retirement of FAC-008-3 R4 and R5.

Technical Justification

FAC-008-3 R4 and R5 require that a Transmission Owner and Generator Owner must make its facilities ratings methodology available for inspection and technical review by Reliability Coordinators, Transmission Operators, Transmission Planners, and Planning Authorities that have responsibility for the area in which the associated facilities are located and also require them to respond to any comments received including whether a change will be made to the facility ratings methodology. The retirement of FAC-008-3 R4 and R5 does not create a reliability gap, because Transmission Owners and Generator Owners must comply with the substantive requirements of FAC-008-3 regarding their facility rating methodologies whether or not the exchange envisioned by FAC-008-3 R4 and R5 occurs. Further, neither FAC-008-3 R4 nor R5 require that the Transmission Owner and Generator Owner change its methodology, rather FAC-008-3 R4 and R5 are designed as an exchange of comments that may be an avenue to advance commercial interests.

For example, if a Generator Owner's methodology provides for derating its GSU transformers below the nameplate in an effort to extend the life of its GSUs, that is a commercial decision it has made, and should not be subject to review by a Reliability Coordinator, Transmission Operator, Transmission Planner, and Planning Authority, some of which may have affiliated parts of their company that could benefit from the Generator Owner changing its methodology and operating its GSUs at nameplate. In contrast, the reliability objective that facility ratings produced by the methodologies of the Transmission Owner or Generator Owner shall equal the most limiting applicable equipment rating, and consider, for example, emergency and normal conditions, historical performance, nameplate ratings, etc. is not significantly or substantively advanced by FAC-008-3 R4 (available for inspection) and R5 (comment and responsive comments). Furthermore, the reliability objective that facility ratings produced by the methodologies of the Transmission Owner or Generator Owner are provided to the reliability entities for the establishment of SOLs, IROLs, calculations for MOD requirements and compliance with the TPL Standards is accomplished without FAC-008-3 R4 (available for inspection) and R5 (comment and responsive comments).[59] Accordingly, the

[57] Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standard FAC-008-3 — Facility Ratings, Docket No. RD11-10-000, (June 15, 2011).
[58] *Order Approving Reliability Standard*, 137 FERC ¶ 61,123 (2011).
[59] See MOD-001-1a R9, MOD-028-1 R2.3; MOD-029-1a R2.1; MOD-030-2 R3.1, PRC-023-2, Attachment A 2.7; TPL-001-0.1 Footnote a; TPL-002-1b, footnotes a and b; TPL-003-0a, footnote a and TPL-004-0, footnote a. Also, via FAC-011-2 the System Operating Limits methodology of Reliability Coordinator may

requirements in FAC-008-3 R4 and R5 to make the facility ratings methodology available for comment (and if comments are received to respond to those comments) is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues. (Criteria A, B1, B4 and B6). In this context, it would seem unnecessarily burdensome to engage in the exchange of comments, given there is no nexus between the exchange and compliance with the substantive requirements of FAC-008-3. Instead of spending time and resources on FAC-008-3 R4 and R5, Generator Owners' and Transmission Owners' time and resources would be better spent complying with the substantive requirements of FAC-008-3. For these same reasons, the ERO compliance program would gain efficiencies by no longer having to track whether requests for technical review had occurred, comments provided and reallocate time and resources to monitoring the Transmission Owner's or Generator Owner's adherence to substantive requirements of FAC-008-3.

Criterion A

The requirements in FAC-008-3 R4 and R5 to make the facility ratings methodology available for comment (and if comments are received to respond to those comments) is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues.

Criteria B

- Criterion B1 (Administrative)
- Criterion B4 (Reporting)
- Criterion B6 (Commercial or Business Practice)

Criteria C

1. FAC-008-3 R4 and R5 have not been part of a FFT filing.

2. FAC-008-3 R4 and R5 are not subject to an on-going Standards Development Project.

3. FAC-008-3 R4 and R5 have a Lower VRF.

4. FAC-008-3 R4 and R5 are in the third tier of the AML.

5. The retirement of FAC-008-3 R4 and R5 does not pose any negative impact to the following applicable NERC's published and posted reliability principles:

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under

---

also use facility ratings as a key element. Also, FAC-008-3 R7 and R8 require the transmission of facility ratings to reliability entities.

normal and abnormal conditions as defined in the NERC Standards.

Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

It is the adherence to the substantive requirements of FAC-008-3 that promotes these posted reliability principles, and not receiving comments on the facility ratings methodology from outside entities and then responding to those comments.

6. Retirement of FAC-008-3 R4 and R5, does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability. These may invite entities to engage in an exchange or debate over commercially sensitive information.

7. The retirement of FAC-008-3 R4 and R5 promotes a results-based approach because the requirements do not require the performance of a reliability task.

Accordingly, for the above reasons, it is appropriate to retire FAC-008-3 R4 and R5.

****FAC-010-2.1 R5 – System Operating Limits Methodology for the Planning Horizon**

R5. If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why.

Background/Commission Directives

FAC-010-1 was filed for Commission approval on November 15, 2006 in Docket Nos. RM06-16-000 and RM07-3-000 and was approved on December 27, 2007 in Order No. 705.[60] FAC-010-2 was filed for Commission approval on June 30, 2008 in Docket No. RM08-11-000 and was approved on March 20, 2009 in Order No. 722.[61] FAC-010-2.1 was filed for Commission approval on November 20, 2009 in Docket No. RD10-9-000

[60] *Facilities Design, Connections and Maintenance Reliability Standards,* 121 FERC ¶ 61,296 (December 27, 2007) (Order No. 705).

[61] *Version Two Facilities Design, Connections and Maintenance Reliability Standards,* 126 FERC ¶ 61,255 (March 20, 2009) (Order No. 722).

and was approved on April 19, 2010.[62] In Order No. 722,[63] the Commission approved FAC-010-2.1 R5 without specifically addressing R5.

There are no outstanding Commission directives with respect to this R5.

Technical Justification

The reliability purpose of FAC-010-2.1, to ensure that System Operating Limits used in the reliable planning of the BES are determined based on an established methodology, is unaffected by the proposed retirement of R5. FAC-010-2.1 R5 requires that when a Planning Authority receives comments on its SOL methodology, it must respond and indicate whether it has changed its methodology. The retirement of FAC-010-2.1 R5 does not create a reliability gap, because the Planning Authority must comply with the substantive requirements of FAC-010-2.1 whether or not the exchange envisioned by FAC-010-2.1 R5 occurs. FAC-010-2.1 R5 may support an avenue to advance commercial interests.

For example, if a Transmission Operator or Transmission Planner is also a Transmission Owner it may have a commercial interest in lowering SOLs on its transmission lines in an effort to extend the life of its equipment and, therefore, challenge the Planning Authority's methodology to reduce its SOLs. The Transmission Owner's interests are better considered in the context of its development of a facility ratings methodology under FAC-008-1, -3 than the Planning Authority's methodology. FAC-010-2.1 R5, however, is an invitation to advance commercial interests not through established means, but by challenging the Planning Authority's SOL methodology. Accordingly, FAC-010-2.1 R5 sets forth an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues. (Criteria A, B1, B4 and B6). In this context, it would seem unnecessarily burdensome to engage in the exchange of comments, given there is no nexus between the exchange and compliance with the substantive requirements of FAC-010-2.1. Instead of spending time and resources on FAC-010-2.1, a Planning Authority's time and resources would be better spent complying with the substantive requirements of FAC-010-2.1. For these same reasons, the ERO compliance program would gain efficiencies by no longer having to track whether requests for technical review had occurred, comments provided and reallocate time and resources to monitoring the Planning Authority's adherence to substantive requirements of FAC-010-2.1.

Criterion A

The requirement in FAC-010-2.1 R5 to respond to comments on the SOL methodology is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES.

[62] Letter Order, Electric Reliability Organization Errata Petition Updating Accepted Transmission Operations Reliability Standards, Docket No. RD10-9-000 (April 19, 2010).

[63] *Version Two Facilities Design, Connections and Maintenance Reliability Standards* 125 FERC ¶ 61,040 (2009).

Criteria B

- Criterion B1 (Administrative)
- Criterion B4 (Reporting)
- Criterion B6 (Commercial or Business Practice)

Criteria C

1. FAC-010-2.1 R5 has not been part of a FFT filing.

2. FAC-010-2.1 R5 is subject to future Standards Development Project 2012-11 FAC Review, which is a placeholder for the five year review of FAC-010 and FAC-011. Thus, it is appropriate to process the retirement of this requirement as part of the P81 Project.

3. FAC-010-2.1 R5 has a Lower VRF.

4. FAC-010-2.1 R5 is not on the AML.

5. The retirement of this requirement does not pose any negative impact to NERC's published and posted reliability principles No. 1 or No. 3.

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

   Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

   It is the adherence to the substantive requirements of FAC-010-2.1 that promotes these posted reliability principles, and not receiving comments on the facility ratings methodology from outside entities and then responding to those comments.

6. The retirement of this requirement does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of FAC-010-2.1 R5 also promotes a results-based approach because the requirements have no direct nexus to the performance of a reliability task.

Accordingly, for the above reasons, it is appropriate to retire FAC-010-2.1 R5.

****FAC-011-2 R5– System Operating Limits Methodology for the Operations Horizon**

R5. If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Reliability Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why.

Background/Commission Directives

FAC-011-1 was filed for Commission approval on November 15, 2006 in Docket Nos. RM06-16-000 and RM07-3-000 and was approved on December 27, 2007 in Order No. 705.[64] FAC-011-2 was filed for Commission approval on June 30, 2008 in Docket No. RM08-11-000 and was approved on March 20, 2009 in Order No. 722.[65] In Order No. 722, the Commission approved FAC-011-2 R5 without specifically addressing R5.

There are no outstanding Commission directives with respect to this R5.

Technical Justification

FAC-011-2 R5 requires that when a Reliability Coordinator receives comments on its SOL methodology that it must respond and indicate whether it has changed its methodology. The retirement of FAC-011-2 R5 does not create a reliability gap, because the Reliability Coordinator must comply with the substantive requirements of FAC-011-2 R5 whether or not the exchange envisioned by FAC-011-2 R5 occurs. FAC-011-2 R5 may support an avenue to advance commercial interests.

For example, similar to FAC-010-2.1 R5, if a Transmission Operator or Transmission Planner also is a Transmission Owner it may have a commercial interest in lowering SOLs on its transmission lines in an effort to extend the life of its equipment and, therefore, challenge the Reliability Coordinator's methodology to reduce its SOLs. The Transmission Owner's interests are better considered in the context of the development of its facility ratings methodology under FAC-008-1, -3 than the Reliability Coordinator's methodology. FAC-011-2 R5, however, is an invitation to advance commercial interests not through established means, but by challenging the Reliability Coordinator's SOL methodology. Accordingly, FAC-011-2 R5 sets forth an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues. (Criteria A, B1, B4 and B6). In

[64] *Facilities Design, Connections and Maintenance Reliability Standards,* 121 FERC ¶ 61,296 (December 27, 2007) (Order No. 705).

[65] *Version Two Facilities Design, Connections and Maintenance Reliability Standards,* 126 FERC ¶ 61,255 (March 20, 2009) (Order No. 722).

this context, it would seem unnecessarily burdensome to engage in the exchange of comments, given there is no nexus between the exchange and compliance with the substantive requirements of FAC-011-2. Instead of spending time and resources on FAC-011-2 R5 a Reliability Coordinator's time and resources would be better spent complying with the substantive requirements of FAC-011-2 R5. For these same reasons, the ERO compliance program would gain efficiencies by no longer having to track whether requests for technical review had occurred, comments provided and reallocate time and resources to monitoring the Reliability Coordinator's adherence to substantive requirements of FAC-011-2 R5.

Criterion A
The requirement in FAC-011-2 R5 to respond to comments on the SOL methodology is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues.

Criteria B
- Criterion B1 (Administrative)
- Criterion B4 (Reporting)
- Criterion B6 (Commercial or Business Practice)

Criteria C
1. FAC-011-2 R5 has not been part of a FFT filing.

2. FAC-011-2 R5 is subject to future Standards Development Project 2012-11 FAC Review, which is a placeholder for the five year review of FAC-010 and FAC-011which is not currently scheduled and thus it is appropriate to process the retirement of this requirement as part of the P81 Project.

3. FAC-011-2 R5 has a Lower VRF.

4. FAC-011-2 R5 is not on the AML.

5. The retirement of this requirement does not pose any negative impact to NERC's published and posted reliability principles No. 1 or No. 3.

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

   Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

> It is the adherence to the substantive requirements of FAC-011-2 that promotes these posted reliability principles, and not receiving comments on the facility ratings methodology from outside entities and then responding to those comments.

6. The retirement of this requirement does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of FAC-011-2 R5 also promotes a results-based approach because the requirements have no direct nexus to the performance of a reliability task.

Accordingly, for the above reasons, it is appropriate to retire FAC-011-2 R5.

FAC-013-2 R3 – Assessment of Transfer Capability for the Near-term Transmission Planning Horizon

> **R3.** If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why.

Background/Commission Directives

FAC-013-1 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[66] FAC-013-2 was submitted for Commission approval on January 28, 2011 in Docket No. RD11-3-000 and was approved on November 17, 2011.[67]

In Order No. 729, the Commission denied NERC's request to withdraw FAC-012-1 and retire FAC-013-1, and directed as follows at paragraph 291:

> 291. The Commission hereby adopts its NOPR proposal to deny NERC's request to withdraw FAC-012-1 and retire FAC-013-1. Instead, pursuant to section 215(d)(5) of the FPA and section 39.5(f) of our regulations, the Commission directs the ERO to develop modifications to FAC-012-1 and FAC-013-1 to comply with the relevant directives of Order No. 693 and, as otherwise necessary, to make the requirements of those Reliability Standards consistent with those of the MOD Reliability Standards approved herein as well as this Final Rule. These

[66] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[67] *Order Approving Reliability Standard*, 137 FERC ¶ 61,131 (2011).

> modifications should also remove redundant provisions for the calculation of transfer capability addressed elsewhere in the MOD Reliability Standards. In making these revisions, the ERO should consider the development of a methodology for calculation of inter-regional and intra-regional transfer capabilities. The Commission accepts the ERO's request for additional time to prepare the modifications and so directs the ERO to submit the modifications to FAC-012-1 and FAC-013-1 no later than 60 days before the MOD Reliability Standards become effective.

Although the Commission did not directly address the merits of FAC-013-2 R3 when approving FAC-013-2,[68] similar to FAC-008-3, the developer of the Transfer Capability methodology and data must follow specific technical requirements and provide the data to reliability entities for use in their models. There are no outstanding Commission directives with respect to this R3.

Technical Justification

A review of FAC-013-2 R3 indicates that it is a needlessly burdensome administrative task that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1 and B4). Specifically, FAC-013-2 R1 and its sub-requirements set forth the information that each Planning Authority must include when developing its Transfer Capability methodology. FAC-013-2 R3 sets forth a requirement that if an entity comments on this methodology, the Planning Authority must respond and indicate whether or not it will make a change to its Transfer Capability methodology. Thus, while R1 sets forth substantive requirements, R3 sets forth more of an administrative task of the Planning Authority responding to comments on its methodology.

The following NERC glossary definition of Transfer Capability states:

> The measure of the ability of interconnected electric systems to move or transfer power *in a reliable manner* from one area to another over all transmission lines (or paths) between those areas under specified system conditions. The units of transfer capability are in terms of electric power, generally expressed in megawatts (MW). The transfer capability from "Area A" to "Area B" is *not g*enerally equal to the transfer capability from "Area B" to "Area A."

In the context of a Planning Authority engaging in an exchange with an entity over the Transfer Capability there is a possibility of a scenario that a group of generators[69] try to get the Planning Authority to revise its Transfer Capability methodology to advance commercial interests via changes to the methodology that would increase or decrease transfer capability from Area A to Area B. (Criterion B6). Such issues should be raised

[68] *Id.* (approval of FAC-013-2).

[69] Generators that receive the Transfer Capability methodology via an association with one of the entities in the R2 sub-requirements.

in the context of receipt of transmission services, not the Reliability Standards. Moreover, even without the possible commercial motivation of certain entities to get the Planning Authority to revise its Transfer Capability methodology, implementing an exchange between entities and the Planning Authority seems much better suited via regional planning committees, than mandatory Reliability Standards.

In this context, it would seem unnecessarily burdensome to engage in the exchange of comments, given there is no nexus between the exchange and compliance with the substantive requirements of FAC-013-2. Instead of spending time and resources on FAC-013-2 R3, time and resources would be better spent complying with the substantive requirements of FAC-013-2. For these same reasons, the ERO compliance program would gain efficiencies by no longer having to track whether requests for technical review had occurred, comments provided and reallocate time and resources to monitoring the Reliability Coordinator's adherence to substantive requirements of FAC-013-2.

Criterion A
The requirement in FAC-013-2 R3 to respond to comments on the Transfer Capability methodology is an administrative task that does little, if anything, to benefit or protect the reliable operation of the BES, and has the potential to implicate commercially sensitive issues.

Criteria B
- Criterion B1 (Administrative)
- Criterion B4 (Reporting)
- Criterion B6 (Commercial or Business Practice)

Criteria C
1. FAC-013-2 R3 has not been part of a FFT filing.

2. FAC-013-2 R3 is not subject to an on-going Standards Development Project.

3. FAC-013-2 R3 has a Lower VRF.

4. FAC-013-2 R3 is not on the AML.

5. The retirement of FAC-013-2 R3 does not pose any negative impact to NERC's published and posted reliability principles No. 1 or No. 3.

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

It is the adherence to the substantive requirements of FAC-013-2 that promotes these posted reliability principles, and not receiving comments on the facility ratings methodology from outside entities and then responding to those comments.

6. The retirement of FAC-013-2 R3 does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of FAC-013-2 R3 promotes a results-based approach because the requirements do not require the performance of a reliability task.

Accordingly, for the above reasons, it is appropriate to retire FAC-013-2 R3.

INT-007-1 R1.2 – Interchange Confirmation

R1.2. All reliability entities involved in the Arranged Interchange are currently in the NERC registry.

Background/Commission Directives
INT-007-1 was submitted for Commission approval on August 28, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[70] The Commission did not directly address INT-007-1 R1.2 when it approved the Reliability Standard in Order No. 693 at paragraph 867.

There are no outstanding Commission directives with respect to R1.2.

Technical Justification
The reliability purpose of INT-007-1 is to ensure that each Arranged Interchange is checked for reliability before it is implemented. The reliability purpose of INT-007-1 is unaffected by the proposed retirement of R1.2.

INT-007-1 R1.2 is a needlessly burdensome administrative task that does not support reliability because it is now outdated. (Criterion B1). At one time the identification number came from the NERC TSIN system, by now it is handled via NAESB Electric

[70] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Industry Registry.[71] Also, under the E-Tag protocols, no entity may engage in an Interchange transaction without first registering with the E-Tag system and receiving an identification number. Further, the entity desiring the transaction enters this identification number in the E-Tag system to pre-qualify and engage in an Arranged Interchange. Accordingly, the task set forth in INT-007-1 R1.2 is an outdated activity that is no longer necessary, and thus, does little, if anything, to benefit or protect the reliable operation of the BES. (Criterion A). The ERO compliance program would benefit and be more efficient if it was not monitoring an outdated requirement.

Criterion A
The task set forth in INT-007-1 R1.2 is an outdated activity that is no longer necessary, and thus, does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B

- Criterion B1 (Administrative)

Criteria C

1. INT-007-1 R1.2 has not been part of a FFT filing.

2. INT-007-1 R1.2 is part of a pending Standards Development Project – Project 2008-12 Coordinate Interchange Standards, which is estimated to start in the second quarter of 2013. Given this timeline, it is appropriate to move forward with the retirement of INT-007-1 R1.2. Such a retirement may also help to streamline Project 2008-12 once it is active and progressing.

3. INT-007-1 R1.2 has a Lower VRF.

4. INT-007-1 R1.2 is not on the AML.

5. The retirement of INT-007-1 R1.2 does not pose any negative impact to NERC's published and posted reliability principles No. 1 or No. 3.

    Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

    Principle 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.

[71] *See, North American Energy Standards Board Webregistry Technical Guide v1.4* (Proprietary) (July 2012). The new NAESB system has updated and implemented more automation to the process.

It is the adherence to the substantive requirements of INT-007-1 that promotes these posted reliability principles, not R1.2.

6. The retirement of INT-007-1 R1.2 does not impact any defense in depth strategies because the task is no longer necessary.

7. The retirement of INT-007-1 R1.2 promotes a results-based approach because the requirement does not require the performance of a reliability task.

Accordingly, for the above reasons, it is appropriate to retire INT-007-1 R1.2.

IRO-016-1 R2 – Coordination of Real-time Activities Between Reliability Coordinators

R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.

Background/Commission Directives
IRO-016-1 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693. The Commission did not directly address R2 when approving IRO-016-1 in Order No. 693 at paragraphs 1004 and 1005. There are no outstanding Commission directives with respect to R2.

Technical Justification
The reliability purpose of IRO-016-1 is to ensure that each Reliability Coordinator's operations are coordinated such that they will not have an adverse reliability impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations. To implement the purpose, IRO-016-1 R1 and its sub-requirements state:

> **R1.** The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.
>
> **R1.1.** If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken.

> **R1.2.** If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.).
>
> **R1.2.1.** If time permits, this re-evaluation shall be done before taking corrective actions.
>
> **R1.2.2.** If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved.

These requirements are specific actions and decision points among Reliability Coordinators that promote the reliable operation of the BES. In contrast, a review of R2 indicates that it is a needlessly burdensome administrative and data collection requirement that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1 and B2). Therefore, the reliability purpose of IRO-016-1 is unaffected by the proposed retirement of R2.

Furthermore, outside the context of a Reliability Standard, under Section 400 of the NERC Rules of Procedure, NERC and the Regional Entities have the authority to require an entity to submit data and information for purposes of monitoring compliance. Thus, the retirement of IRO-016-1 R2 does not affect the ability for NERC and the Regional Entities to require Reliability Coordinators to produce documentation to demonstrate compliance with IRO-016-1 R1 and its sub-requirements. Accordingly, retiring IRO-016-1 R2 presents no gap to reliability or to the information NERC and the Regional Entities need to monitor compliance. Thus, IRO-016-1 R1 does not support reliability. Consequently, R2 is an administrative and data collection requirement that that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1 and B2). Also, there are some inherent inefficiencies that result by a small number of requirements, such as IRO-016-1 R2 being a data, evidence and record retention requirement, while there are other and more appropriate established methods to collect and review the data than a Reliability Standard via Rules of Procedure Section 401. In this regard, for the ERO, Regional Entities and the entities, arguably Reliability Standards are more difficult to understand because of this inconsistent approach (typically only implicitly requiring documentation as a part of an obligation to prove compliance, but occasionally explicitly requiring it with no discernible pattern or rationale).

Criterion A
A review of R2 indicates that it is a needlessly burdensome administrative and data collection requirement that does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B

- Criterion B1 (Administrative)

- Criterion B2 (Data Collection/Data Retention)

Criteria C

1. IRO-016-1 R2 has not been part of a FFT filing

2. IRO-016-1 R2 is not subject to an on-going Standards Development project.

3. IRO-016-1 R2 has a Lower VRF.

4. IRO-016-1 R2 is not on the AML.

5. The retirement of IRO-016-1 R2 does not pose any negative impact to NERC's published and posted reliability principles, since none of the principles appear to apply to a data retention requirement.

6. IRO-016-1 R2 does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of IRO-016-1 R2 promotes a results-based approach because the requirement is administrative and data collection, and, therefore, does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire IRO-016-1 R2.

NUC-001-2 R9.1; NUC-001-2 R9.1.1; NUC-001-2 R9.1.2; NUC-001-2 R9.1.3; NUC-001-2 R9.1.4 – Nuclear Plant Interface Coordination

R9.1. Administrative elements:

R9.1.1. Definitions of key terms used in the agreement.

R9.1.2. Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs.

R9.1.3. A requirement to review the agreement(s) at least every three years.

R9.1.4. A dispute resolution mechanism.

Background/Commission Directives

NUC-001-1 was submitted for Commission approval on November 19, 2007 in Docket No. RM08-3-000 and was approved on October 16, 2008.[72] NUC-001-2 was submitted

[72] *Mandatory Reliability Standard for Nuclear Plant Interface Coordination*, 125 FERC ¶ 61,065 (2008) ("Order No. 716"), *order on reh'g*, Order No. 716-A, 126 FERC ¶ 61,122 (2009).

for Commission approval on August 14, 2009 in Docket No. RD09-10-000 and was approved on January 21, 2010.[73]

Although in Order No. 716 the merits of R9.1 and its sub-requirements were not directly addressed, the Commission did state the following in the context of the VRFs for all of R9:[74]

> Consistent with the NOPR, the Commission directs the ERO to revise the violation risk factor assignment for Requirement R9 from lower to medium. The Commission disagrees with commenters that a lower violation risk factor is appropriate because Requirement R9 is an administrative requirement to include the specified provisions. While the Commission recognized in the NOPR that many of the requirements of the proposed Reliability Standard are administrative in nature, these same requirements provide for the development of procedures to ensure the safe and reliable operation of the grid, and responses to potential emergency conditions.

There are no outstanding Commission directives with respect to these requirements.

Technical Justification

The reliability purpose of NUC-001-2 is to ensure the coordination between Nuclear Plant Generator Operators and Transmission Entities for nuclear plant safe operation and shutdown. The reliability purpose of NUC-001-2 is unaffected by the proposed retirement of requirements 9.1, 9.1.1, 9.1.2, 9.1.3 and 9.1.4. Requirement 9.1 and its sub-requirements specify certain administrative elements that must be included in the agreement (required by R2) between the Nuclear Plant Generator Operator and the applicable Transmission Entities. These are a mix of technical, communication, training and administrative requirements. Of those that may be classified as administrative, R9.1 and its sub-requirements clearly stand out as unnecessarily burdensome administrative tasks that do little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A and B1). R9.1 and its sub-requirements are a check list of certain non-technical boilerplate provisions generally included in modern agreements. These provisions do not directly relate to protecting BES reliability. Further, requiring via a mandatory Reliability Standard the inclusion of boilerplate provisions is an unnecessarily burdensome relative to the other significant requirements in NUC-001-2 that pertain to performance based reliability coordination and protocols between Transmission Entities and Nuclear Plant Generator Operators. Therefore, the retirement of NUC-001-2 R9.1 and all its sub-requirements creates no reliability gap and are the type of provisions that would likely be in a modern agreement anyway.

---

[73] *Order Approving Reliability Standard*, 130 FERC ¶ 61,051 (2010).

[74] NUC-001-1 was approved in Order No. 716, while NUC-001-2 was approved without discussion of R9.1 and its sub-requirements in a subsequent order. *Mandatory Reliability Standard for Nuclear Plant Interface Coordination*, 125 FERC ¶ 61,065 (2008); 130 FERC ¶ 61,051 (2010).

For these same reasons, the ERO compliance program efficiency will increase with the retirement of NUC-001-2 R9.1 and its sub-requirements because compliance monitoring time and resources will not be spent conducting a checklist of whether an agreement includes boilerplate provisions, and instead, the time and resources may be spent reviewing adherence with the technical, substantive coordination and protocol provisions of NUC-001-2.

Criterion A
R9.1 and its sub-requirements are unnecessarily burdensome administrative tasks that do little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B
- Criterion B1 (Administrative)

Criteria C
1. NUC-001-2 R9.1 and its sub-requirements have not been part of a FFT filing.

2. NUC-001-2 R9.1 and its sub-requirements are not part of an on-going Standards Development Project, but NUC-001-2 is part of Project 2012-13, which is a placeholder for a five year review. Given the as yet undetermined start date for Project 2012-13, it is appropriate to move forward with the retirement of NUC-001-2 R9.1 and its sub-requirements.

3. Individual VRFs are not assigned to the sub-requirements of NUC-001-2 R9.

4. NUC-001-2 R9.1 and its sub-requirements are in the third tier of the AML.

5. The retirement of NUC-001-2 R9.1 and its sub-requirements do not pose any negative impact to NERC's published and posted reliability principles, since none of them seem to apply to the inclusion of boilerplate contractual provisions.

6. There is no impact on a defense in depth strategy because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of NUC-001-2 R9.1 and its sub-requirements promote a results-based approach by eliminating administrative check-list requirements.

Accordingly, for the above reasons, it is appropriate to retire NUC-001-2 R9.1 and its sub-requirements.

PRC-010-0 R2 – Assessment of the Design and Effectiveness of UVLS Program;

R2. The Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall provide

> documentation of its current UVLS program assessment to its Regional Reliability Organization and NERC on request (30 calendar days).

Background/Commission Directives

PRC-010-0 was filed for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[75] Although not specifically addressing PRC-010-0 R2, in Order No. 693 at paragraph 1506 and 1507 the Commission stated that:

> With regard to ISO-NE's disagreement on integration of various system protections "because such integration cannot be technologically accomplished", we note that the evidence collected in the Blackout Report indicates that "the relay protection settings for the transmission lines, generators and underfrequency load shedding in the northeast may not be entirely appropriate and are certainly not coordinated and integrated to reduce the likelihood and consequence of a cascade – nor were they intended to do so." In addition, the Blackout Report stated that one of the common causes of major outages in North America is a lack of coordination on system protection. The Commission agrees with the protection experts who participated in the investigation, formulated Blackout Recommendation No. 21 and recommended that UVLS programs have an integrated approach.
>
> Regarding FirstEnergy's question of whether universal coordination among UVLS programs that address local system problems makes sense, we believe that PRC-010-0's objective in requiring an integrated and coordinated approach is to address the possible adverse interactions of these protection systems among themselves and to determine whether they could aggravate or accelerate cascading events. We do not believe this Reliability Standard is aimed at universal coordination among UVLS programs that address local system problems. (Footnote omitted).

The retirement of PRC-010-0 R2 does not affect a Commission directive.

Technical Justification

Outside the context of a Reliability Standard, under Section 400 of the NERC Rules of Procedure, NERC and the Regional Entities have the authority to require an entity to submit documentation of its current UVLS program assessment for purposes of monitoring compliance. Thus, the retirement of PRC-010-0 R2 does not affect the ability of NERC and the Regional Entities to require Reliability Coordinators to produce documentation to monitor compliance with PRC-010-0 R1 and its sub-requirements.

[75] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

Furthermore, PRC-010-0 R1 requires that the entity document an assessment of the effectiveness of its UVLS program:

> The Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall periodically (at least every five years or as required by changes in system conditions) conduct and document an assessment of the effectiveness of the UVLS program.

Accordingly, retiring PRC-010-0 R2 presents no gap to reliability or to the information NERC and the Regional Entity need to monitor compliance. A review of R2 indicates that it is a needlessly burdensome administrative and data collection/retention requirement that does little, if anything, to benefit or protect the reliable operation of the BES. (Criteria A, B1 and B2). Also, there are some inherent inefficiencies that result by a small number of requirements, such as PRC-010-0 R2 being a data production requirement, while there are other and more appropriate established methods to collect and review the data than a Reliability Standard via Rules of Procedure Section 401.

Criterion A
R2 is an administrative and data collection requirement that does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B
- Criterion B1(Administrative)
- Criterion B2 (Data Collection/Data Retention)

Criteria C
1. PRC-010-0 R2 has not been part of a FFT filing.

2. PRC-010-0 R2 is subject to Standards Development Project 2008-02 Undervoltage Load Shedding, which is not currently active and is only estimated to be completed until the second quarter of 2014. Since the purpose of Project 2008-02 does not necessarily include a review of R2 and its 2014 completion date is well into the future, it is appropriate to include PRC-010-0 R2 in the P81 Project.

3. This requirement has a Lower VRF.

4. This requirement is not part of the AML.

5. The retirement of PRC-010-0 R2 does not pose any negative impact to NERC's published and posted reliability principles, particularly since submission of a program assessment or documentation of its analysis of UVLS program performance to a Regional Entity does not seem to implicate any of the principles.

6. For similar reasons, there is no negative impact on a defense in depth strategy because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of PRC-010-0 R2 promotes a results-based approach because it is a data collection requirement, and, therefore, does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire PRC-010-0 R2.

PRC-022-1 R2 – Under-Voltage Load Shedding Program Performance

> **R2.** Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall provide documentation of its analysis of UVLS program performance to its Regional Reliability Organization within 90 calendar days of a request.

Background/Commission Directives
PRC-022-1 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[76] In Order No. 693 at paragraph 1565 the Commission approved PRC-022-1 without a discussion of R2. There are no outstanding Commission directives with respect to R2.

Technical Justification
Outside the context of a Reliability Standard, under Section 400 of the NERC Rules of Procedure, NERC and the Regional Entities have the authority to require an entity to submit documentation of its analysis of UVLS program performance for purposes of monitoring compliance. Thus, the retirement of PRC-022-1 R2 does not affect the ability for NERC and the Regional Entities to require Reliability Coordinators to produce documentation to monitor compliance with PRC-022-1 R1 and its sub-requirements. Furthermore, PRC-022-1 R1 already requires that the entity document UVLS performance:

> Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program to mitigate the risk of voltage collapse or voltage instability in the BES shall analyze and document all UVLS operations and Misoperations.

Accordingly, retiring PRC-022-1 R2 presents no gap to reliability or to the information NERC and the Regional Entities need to monitor compliance. In this context, a review of R2 indicates that it is a needlessly burdensome administrative and data collection requirement that that does little, if anything, to benefit or protect the reliable operation of

[76] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

the BES. (Criteria A, B1 and B2). Also, similar to the retention of records requirements in CIP-007-3, -4 R7.3, FAC-002-1 R2 and PRC-010-0 R2, the ERO compliance program efficiency will increase since it will no longer need to track a static requirement of whether a UVLS program assessment was submitted within 30 days of a request by NERC or the Regional Entity, and instead, compliance monitoring may focus on the more substantive requirements of PRC-022-1.

Criterion A
R2 is an administrative and data collection requirement that does little, if anything, to benefit or protect the reliable operation of the BES.

Criteria B
- Criterion B1(Administrative)
- Criterion B2 (Data Collection/Data Retention)

Criteria C
1. PRC-022-1 R2 has not been part of a FFT filing.

2. PRC-022-1 R2 is subject to Standards Development Project 2008-02 Undervoltage Load Shedding, which is not currently active and is only estimated to be completed until the second quarter of 2014. Since the purpose of Project 2008-02 does not necessarily include a review of R2 and its 2014 completion date is well into the future, it is appropriate to include PRC-022-1 R2 in the P81 Project.

3. PRC-022-1 R2 has a Lower VRF.

4. This requirement is not part of the AML.

5. The retirement of PRC-022-1 R2 does not pose any negative impact to NERC's published and posted reliability principles, particularly since submission of a program assessment or documentation of its analysis of UVLS program performance to a Regional Entity does not seem to implicate any of the principles.

6. For similar reasons, there is no negative impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of PRC-022-1 R2 promotes a results-based approach because it is a data collection requirement, and, therefore, does not provide the foundation for performing a reliability task.

Accordingly, for the above reasons, it is appropriate to retire PRC-022-1 R2.

****VAR-001-2 R5 – Voltage and Reactive Control**

R5. Each Purchasing-Selling Entity and Load Serving Entity shall arrange for (self-provide or purchase) reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, and controllable load– to satisfy its reactive requirements identified by its Transmission Service Provider.

Background/Commission Directives

VAR-001-1 was submitted for Commission approval on April 4, 2006, in Docket No. RM06-16-000. When approving VAR-001-1, in Order No. 693 at paragraph 1858,[77] the Commission recognized:

> . . . that all transmission customers of public utilities are required to purchase Ancillary Service No. 2 under the OATT or self-supply, but the OATT does not require them to provide information to transmission operators needed to accurately study reactive power needs. The Commission directs the ERO to address the reactive power requirements for LSEs on a comparable basis with purchasing-selling entities.

On September 9, 2010, NERC submitted VAR-001-2, which included revisions to Requirement R5 to satisfy Commission directives in Order No. 693, including the directive in paragraph 1858. This directive was addressed by adding "Load Serving Entities" to the standard as applicable entities and making them subject to the same requirements as Purchasing Selling Entities. These modifications to VAR-001-2 were accepted by the Commission on January 10, 2011.[78]

Technical Justification

VAR-001-2 R5 does little, if anything, to benefit or protect the reliable operation of the BES because it is redundant with FERC's *pro forma* open access transmission tariff ("OATT"). (Criteria A and B7). To elaborate, VAR-001-2 R5 provides for the PSE and LSE (transmission customers) to arrange for or self provide reactive resources the same as required under Schedule 2 of the OATT. Specifically, as a general matter Schedule 2 of the OATT states:

> **Schedule 2 Reactive Supply and Voltage Control from Generation or Other**
>
> In order to maintain transmission voltages on the Transmission Provider's transmission facilities within acceptable limits, generation facilities and non-generation resources capable of providing this service that are under the control of the control area operator) are operated to produce (or absorb) reactive power. Thus, Reactive Supply and Voltage Control from

[77] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[78] *North American Electric Reliability Corp.*, 134 FERC ¶ 61,015 (2011).

> Generation or Other Sources Service must be provided for each transaction on the Transmission Provider's transmission facilities. The amount of Reactive Supply and Voltage Control from Generation or Other Sources Service that must be supplied with respect to the Transmission Customer's transaction will be determined based on the reactive power support necessary to maintain transmission voltages within limits that are generally accepted in the region and consistently adhered to by the Transmission Provider.
>
> Reactive Supply and Voltage Control from Generation or Other Sources Service is to be provided directly by the Transmission Provider (if the Transmission Provider is the Control Area operator) or indirectly by the Transmission Provider making arrangements with the Control Area operator that performs this service for the Transmission Provider's Transmission System. The Transmission Customer must purchase this service from the Transmission Provider or the Control Area operator. A Transmission Customer may satisfy all or part of its obligation through self provision or purchases provided that the self-provided or purchased reactive power reduces the Transmission Provider's reactive power requirements and is from generating facilities under the control of the Transmission Provider or Control Area operator. The Transmission Customer's Service Agreement shall specify any such reactive supply arrangements. To the extent the Control Area operator performs this service for the Transmission Provider, charges to the Transmission Customer are to reflect only a pass-through of the costs charged to the Transmission Provider by the Control Area operator. The Transmission Provider's rates for Reactive Supply and Voltage Control from Generation Sources Services shall be set out in Appendix A to this Schedule.

Given the importance of the procurement or self providing of reactive power, even in a market setting a form of Schedule 2 is found in the tariffs of MISO and PJM, for example. While NERC complied with the Commission's directive to add LSEs to VAR-001-2 R5, a review of this requirement in light of Schedule 2 indicates that the reliability objective of ensuring that PSEs as well as LSEs either acquire or self provide reactive power resources associated with its transmission service requests is accomplished via Schedule 2, and, therefore, there is no need to reiterate it in VAR-001-2 R5. The repetitive nature of VAR-001-2 R5 is also apparent in the context of how a PSE or LSE generally demonstrates compliance – via screenshots from Open Access Same-Time Information System ("OASIS") reservations that show the mandatory acquiring or self providing of reactive power resources per Schedule 2.

The reliability objective of VAR-001-2 is also accomplished in VAR-001-2 R2 (that is not proposed for retirement) which reads:

> Each Transmission Operator shall acquire sufficient reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, [sic] and controllable load – within its area to protect the voltage levels under normal and Contingency conditions. This includes the Transmission Operator's share of the reactive requirements of interconnecting transmission circuits.

The Transmission Operator's adherence to R2 is a double check for the obligations under Schedule 2 to ensure there are sufficient reactive power resources to protect the voltage levels under normal and Contingency conditions.

In addition, in the Electric Reliability Council of Texas (ERCOT) region, where there is no FERC approved OATT, reactive power is handled via Section 3.15 of the ERCOT Nodal Protocols that describes how ERCOT establishes a Voltage Profile for the grid, and then in detail explains the responsibilities of the Generators, Distribution Providers and Texas Transmission Service Providers (not to be confused with a NERC TSP), to meet the Voltage Profile and ensure that those entities have sufficient reactive support to do so. There is further Operating Guide detail on the responsibilities for entities to deploy reactive resources approximately, within performance criteria in the Operating Guide Section 3. Thus, as in non-ERCOT regions, ERCOT has protocols that are duplicative of VAR-001-2 R5.

Given the redundant nature of VAR-001-2 R5 it would also assist the ERO compliance program to retire it, so that time and resources can be reallocated to focus on adherence to other Reliability Standard requirements.

Criterion A
VAR-001-2 R5 does little, if anything, to benefit or protect the reliable operation of the BES because it is redundant with FERC's *pro forma* OATT.

Criteria B

- Criterion B7 (Redundant)

Criteria C

1. VAR-001-2 R5 has not been part of a FFT filing.

2. VAR-001-2 R5 is subject to Standards Development Project 2008-01 Voltage and Reactive Planning Control. Given that Project 2008-01 is not currently active and is only estimated to be completed until the second quarter of 2014 and the purpose of this project does not necessarily include a review of R5, it is appropriate to include VAR-001-2 R5 in the P81 Project. Also, retiring this requirement via P81 Project may facilitate the efficiency of Project 2008-01.

3. This requirement has a High VRF. However, the reliability objective of VAR-001-2 R5 will be accomplished via Schedule 2 of the OATT, ERCOT protocols

and R2 of VAR-001-2. Thus, the High VRF is not dispositive, and VAR-001-2 R5 remains appropriate for retirement.

4. VAR-001-2 R5 is in the third tier of the AML.

5. Because VAR-001-2 R5 is redundant with the *pro forma* OATT and ERCOT protocols, (as well as the reliability objective of VAR-001-2 R5 is accomplished via Schedule 2 of the OATT, ERCOT protocols and R2 of VAR-001-2), the retirement of VAR-001-2 R5 does not pose any negative impact to the following NERC published and posted reliability principles:

   Principle 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

   Principle 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.

6. Retirement does not negatively impact defense in depth because no other requirement depends on it to help cover a reliability gap or risk to reliability.

7. The retirement of VAR-001-2 R5 is neutral regarding whether it promotes a results-based approach because the requirement is results-based, but already covered in the *pro forma* OATT, Schedule 2 and ERCOT protocols.

Accordingly, for the above reasons, it is appropriate to retire VAR-001-2 R5.

V. The Initial Phase Reliability Standards Provided for Informational Purposes

The following requirements are already scheduled to be retired or subsumed via another Standards Development Project that has been approved by stakeholders and the NERC Board of Trustees (or due to be before the NERC Board of Trustees in November), and, thus, are presented here for informational purposes only. For regulatory efficiency, these requirements will not be presented for comment and vote, and, therefore, will not be presented to the NERC Board of Trustees for approval or filed with the Commission or Canadian governmental authorities as part of the P81 Project.

COM-001-1.1 R6- Telecommunications

Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001-0, "NERCNet Security Policy."

Background
COM-001-1 was submitted for Commission approval on November 15, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[79] COM-001-1.1 was submitted for Commission approval on February 6, 2009 in Docket No. RD09-2-000 as errata and was approved by unpublished letter order on May 13, 2009.[80]

As part of COM-001-2, on September 17, 2012, stakeholders approved the retirement of COM-001-1.1 R6 in Project 2006-06 (Reliability Coordination). This project is due to be presented to the NERC Board of Trustees in November. Thus, COM-001-1 R6 is presented here for informational purposes only.

EOP-009-0 R2 – Documentation of Blackstart Generating Unit Test Results

R2. The Generator Owner or Generator Operator shall provide documentation of the test results of the startup and operation of each blackstart generating unit to the Regional Reliability Organizations and upon request to NERC.

Background
EOP-009-0 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[81] In Order No. 749, the Commission approved the retirement of EOP-009-0 as of July 1, 2013, based on the approval of EOP-005-2, which did not carry forward R2 of EOP-009-0. Thus, EOP-009-0 R2 is presented here for informational purposes only.

FAC-008-1 R1.3.5 – Facility Ratings Methodology

R1.3.5. Other assumptions.

Background
FAC-008-1 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[82]

"On May 12, 2010, the NERC Board of Trustees approved the proposed FAC-008-2 Reliability Standard that addressed the first two of the FERC directives in Order No. 693. NERC's proposed FAC-008-2 Reliability Standard was not filed with FERC for approval, but instead was revisited by the standard drafting team so that the third Order

[79] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[80] Letter Order, Electric Reliability Organization Errata Petition Updating Accepted Reliability Coordination and Transmission Operations Reliability Standards, Docket No. RD09-2-000 (May 13, 2009).
[81] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[82] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

No. 693 directive could be addressed in response to FERC's March 18, 2010 Order…"[83]

FAC-008-3 was submitted for Commission approval on June 15, 2011 in Docket No. RD11-10-000 and was approved on November 17, 2011.[84]

FAC-008-3 (which combined FAC-008 and FAC-009) has been approved by the Commission without the "other assumptions" language.[85] Since FAC-008-3 will become effective on January 1, 2013, FAC-008-1 R1.3.5 is presented here for informational purposes only.

PRC-008-0 R1; PRC-008-0 R2 – Underfrequency Load Shedding Equipment Maintenance Programs

R1. The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall have a UFLS equipment maintenance and testing program in place. This UFLS equipment maintenance and testing program shall include UFLS equipment identification, the schedule for UFLS equipment testing, and the schedule for UFLS equipment maintenance.

R2. The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall implement its UFLS equipment maintenance and testing program and shall provide UFLS maintenance and testing program results to its Regional Reliability Organization and NERC on request (within 30 calendar days).

Background
PRC-008-0 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[86]

Under Standards Development Project 2007-17 Protection System Maintenance, which recently passed on August 27, 2012, PRC-008-0 is scheduled to be retired, subsumed and replaced with PRC-005-2. PRC-005-2 will likely be presented to the NERC Board of Trustees in November for approval, and, thus, PRC-008-0 is only presented here for informational purposes.

PRC-009-0 R1; PRC-009-0 R1.1; PRC-009-0 R1.2; PRC-009-0 R1.3; PRC-009-0 R1.4; PRC-009-0 R2 – UFLS Performance Following an Underfrequency Event

[83] Petition of the North American Electric Reliability Corporation for Approval of Proposed Reliability Standard FAC-008-3 — Facility Ratings, Docket No. RD11-10-000, (June 15, 2011).
[84] *Order Approving Reliability Standard*, 137 FERC ¶ 61,123 (2011).
[85] *Id.*

[86] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

R1. The Transmission Owner, Transmission Operator, Load-Serving Entity and Distribution Provider that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall analyze and document its UFLS program performance in accordance with its Regional Reliability Organization's UFLS program. The analysis shall address the performance of UFLS equipment and program effectiveness following system events resulting in system frequency excursions below the initializing set points of the UFLS program. The analysis shall include, but not be limited to:

R1.1. A description of the event including initiating conditions.

R1.2. A review of the UFLS set points and tripping times.

R1.3. A simulation of the event.

R1.4. A summary of the findings.

R2. The Transmission Owner, Transmission Operator, Load-Serving Entity, and Distribution Provider that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall provide documentation of the analysis of the UFLS program to its Regional Reliability Organization and NERC on request 90 calendar days after the system event.

Background

PRC-009-0 was submitted for Commission approval on April 4, 2006 in Docket No. RM06-16-000 and was approved on March 16, 2007 in Order No. 693.[87] In Order No. 763 at paragraph 103[88] the Commission accepted the retirement of PRC-009-0 as appropriately replaced with PRC-006-1. Consistent with Order No. 763, PRC-009-0 will become inactive on September 30, 2013 and will be replaced by PRC-006-1. Thus, PRC-009-0 is presented here for informational purposes only.

TOP-001-1a R3 – Reliability Responsibilities and Authorities

R3. Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority, or

[87] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[88] *Automatic Underfrequency Load Shedding and Load Shedding Plans Re-liability Standards*, 139 FERC ¶ 61,098 (2012).

> Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions.

Background

TOP-001-1 was submitted for Commission approval on November 15, 2006 in Docket No. RM06-16-000 and was approved by the Commission on March 16, 2007 in Order No. 693.[89] TOP-001-1a was submitted for approval on July 16, 2010 in Docket No. RM10-29-000 and was approved on September 15, 2011 in Order No. 753.[90]

IRO-001-1a R8 reads:

> Transmission Operators, Balancing Authorities, Generator Operators, Transmission Service Providers, Load-Serving Entities, and Purchasing-Selling Entities shall comply with Reliability Coordinator directives unless such actions would violate safety, equipment, or regulatory or statutory requirements. Under these circumstances, the Transmission Operator, Balancing Authority, Generator Operator, Transmission Service Provider, Load-Serving Entity, or Purchasing-Selling Entity shall immediately inform the Reliability Coordinator of the inability to perform the directive so that the Reliability Coordinator may implement alternate remedial actions.

Although there is redundancy between TOP-001-1a R3 and IRO-001-1a R8 as related to Reliability Coordinators, this redundancy was addressed in Standards Development Project 2007-03 (Real-time Operations). Specifically, Project 2007-03 eliminated the redundancy in the current version of TOP-001-2 R1 that replaces TOP-001-1a R3 and reads:

> Each Balancing Authority, Generator Operator, Distribution Provider, and Load-Serving Entity shall comply with each Reliability Directive issued and identified as such by its Transmission Operator(s), unless such action would violate safety, equipment, regulatory, or statutory requirements.

TOP-001-2 has been approved by the NERC Board of Trustees and will be filed with the Commission for approval; therefore, TOP-001-1a R3 is presented for informational purposes only.

TOP-005-2a R1 – Operational Reliability Information

[89] *Mandatory Reliability Standards for the Bulk-Power System*, 72 FR 16416 (Apr. 4, 2007), FERC Stats. & Regs. ¶ 31,242 (2007). ("Order No. 693"), *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).
[90] *Electric Reliability Organization Interpretation of Transmission Operations Reliability Standard*, 136 FERC ¶ 61,176, (September 15, 2011) (Order No. 753).

R1. As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for "Electric System Reliability Data."

Background

Without directly addressing R1 of TOP-005-1 or TOP-005-2a the Commission approved both versions of TOP-005. [91] A review of the Standards Development Project 2007-03 Real-time Transmission Operations indicates it proposes R1 of TOP-005-1 to be retired. The reasoning provided by the SDT was the following:

> Confidentiality is not a reliability issue, but a market or business issue. Since this is not a reliability issue, it does not belong in the Reliability Standards and can be deleted.[92]

As stated above, in the context of Project 2007-03, TOP-001-1a was approved by the NERC Board of Trustees and will be filed with the Commission for approval; therefore, TOP-005-2a R1 is presented for informational purposes only.

[91] Order No. 693 at paragraphs 1648 through 1652 (approval of TOP-005-1); *Mandatory Reliability Standards for Interconnection Reliability Operating Limits,* 134 F.E.R.C. ¶ 61,213 (2011) (approval of TOP-005-2a).

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Authorization Request Form

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard:	Retirement of Reliability Standard Requirements		
Date Submitted:	September 12~~June 29~~, 2012		
SAR Requester Information			
Name:	Brian J. Murphy on behalf of the following:		
Organization:	P81 Interim Standards Drafting Team, as originally supported by Edison Electric Institute, American Public Power Association, National Rural Electric Cooperative Association, Large Public Power Council, Electricity Consumers Resource Council, The Electric Power Supply Association, Transmission Access Policy Study Group, the North American Electric Reliability Corporation, and the Regional Entity Management Group		
Telephone:	305-442-5132		
SAR Type (Check as many as applicable)			
☐ New Standard		☒ Withdrawal of existing Standard	
☒ Revision to existing Standard		☐ Urgent Action	

SAR Information
Industry Need (What is the industry problem this request is trying to solve?):
On March 15, 2012, the Federal Energy Regulatory Commission (FERC) issued an order on NERC's Find, Fix and Track process that stated: "The Commission notes that NERC's FFT initiative is predicated on the view that many violations of requirements currently included in Reliability Standards pose lesser

SAR Information

risk to the Bulk-Power System. If so, some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant. The Commission is interested in obtaining views on whether such requirements could be removed from the Reliability Standards with little effect on reliability and an increase in efficiency of the ERO compliance program. If NERC believes that specific Reliability Standards or specific requirements within certain Standards should be revised or removed, we invite NERC to make specific proposals to the Commission identifying the Standards or requirements and setting forth in detail the technical basis for its belief. In addition, or in the alternative, we invite NERC, the Regional Entities and other interested entities to propose appropriate mechanisms to identify and remove from the Commission-approved Reliability Standards unnecessary or redundant requirements. We will not impose a deadline on when these comments should be submitted, but ask that to the extent such comments are submitted NERC, the Regional Entities, and interested entities coordinate to submit their respective comments concurrently."

North American Electric Reliability Corporation, 138 FERC ¶ 61,193 at p 81 (March 15, 2012) ("P81").

Consistent with P81, the problem this SAR is resolving is to identify Reliability Standards requirements that either: (a) provide little protection to the BPS;[1] (b) are unnecessary or (c) are redundant; and, thereafter, to have NERC file the identified Reliability Standard requirements with FERC to have them removed from the FERC-approved list of Reliability Standards.

In addition to addressing P81, this SAR is also consistent with Recommendation #4 set forth in *NERC's Recommendations to Improve The Standards Development Process* at page 12 (April 2012), which states:

> **Recommendation 4: Standards Product Issues** — The NERC board is encouraged to require that the standards development process address: . . . The retirement of standards no longer needed to meet an adequate level of reliability.

[1] Given NERC's Reliability Standards are based on the definition of a Bulk Electric System (BES), the remainder of this SAR will use the term BES rather than Bulk Power System or BPS.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
Purpose or Goal (How does this request propose to address the problem described above?):
The SAR addresses the problem identified above by: (1) Setting forth the initial phase-specific criteria (below) to evaluate whether a Reliability Standard requirement provides little protection to BES reliability or is unnecessary or redundant. (2) Establishing a multi-phased process for addressing these Reliability Standard requirements. During the initial phase~~Initial Phase~~, the standard drafting team~~Standards Drafting Team~~ will identify those Reliability Standard requirements that ~~easily~~ satisfy the criteria, set forth below, without the need for extensive technical justification or a modification to the requirement, and ~~either~~ recommend~~: (a)~~ the retirement of the requirement.[2] During subsequent[3] ~~or (b) a modification to the requirement,~~[4] ~~while future~~ phases, the standard drafting team may build upon the initial phase criteria, as applicable, to that phase that will identify the remaining appropriate Reliability Standard requirements that ~~satisfy the criteria, but~~ could not be included in the initial phase~~Initial Phase~~ due to the need for additional analysis or a modification of language. This multi-phased approach is also proposed to address FERC's interest in increasing the efficiency of the ERO compliance program, so that the first set of identified Reliability Standard requirements may be filed with FERC on an expedited basis, and, therefore, start increasing ERO efficiencies as soon as practical. (3) At this time,~~To facilitate~~ the standard drafting team has identified~~Initial Phase of the Standard Drafting Team's process,~~ a list of Reliability Standard requirements to be included in the initial phase that ~~appear to easily~~ satisfy the criteria ~~are~~ set forth below.

[2] The Standards Drafting Team will work with NERC staff to determine the manner to eliminate the identified Reliability Standard requirements.

[3] ~~The Standards Drafting Team will work with NERC staff to determine the manner to eliminate the identified Reliability Standards requirements.~~

[4] ~~Given the expedited nature of the Initial Phase, it is unlikely there will be a large number of modifications considered, and the Standards Drafting Team may decide to defer all requested modifications to subsequent phases.~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
(4) During each phase, as a list of Reliability Standard requirements is identified, the standard drafting team ~~and passes through the Standards Development Process, the Standards Drafting Team~~[5] will also assist NERC staff to file these requirements with FERC so the requirements are removed from the FERC-approved list, including providing additional technical justification, as needed.
Identify the Objectives of the proposed standard's requirements (What specific reliability deliverables are required to achieve the goal?):
The objectives of this SAR for all phases of this project are to retire or modify FERC-approved Reliability Standard requirements that provide little protection to the reliable operations of the BES, are redundant or unnecessary, or to retire or modify a FERC-approved Reliability Standard requirement to increase the efficiency of the ERO's compliance programs.
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The scope of this SAR is all FERC-approved Reliability Standards.[6]
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The standard drafting team~~Standard Drafting Team~~ shall implement a phased process. The Initial Phase shall identify all FERC- approved Reliability Standard requirements that ~~easily satisfy the criteria set forth below, while future phases shall identify FERC-approved Reliability Standard requirements that satisfy the criteria set forth below, but could not be included in the Initial Phase due to the need for additional analysis or an editing of language. During each phase the Standards Drafting Team shall~~

~~[5] While this SAR applies to all phases of the P81 project, it is understood that the composition of the Standard Drafting Team may need to change or be supplemented in subsequent phases depending on the technical expertise required.~~

[6] The scope of this SAR with regard to those requirements that are proposed for retirement includes any currently pending versions of the listed Reliability Standards and any additional version of these Reliability Standards that may be submitted. In other words, the intent is to carry forward these retirements based on substance which is not dependent on the exact numbering or placement within a Reliability Standard.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

~~identify Reliability Standard requirements that~~ satisfy **both**: (i) Criteria A ~~(~~) ~~the~~ overarching criteria) and (ii~~B~~) at least one of the Criteria B listed below (identifying~~technical~~ criteria). ~~.~~ In addition, for all phases, the standard drafting team~~Standards Drafting Team~~ shall also consider the data and reference points set forth below in Criterion C when deciding whether a Reliability Standard requirement should be retired or modified.

A. Overarching Criterion:

The~~In the event no responsible entity performed the FERC-approved~~ Reliability Standard requirement requires responsible entities to conduct an activity or task that does~~, there would be~~ little, if anything, ~~or no impact~~ to benefit~~the protection~~ or protect the reliable operation of the BES.

Formatted: Right: 0.5"

Section 215(a)(4) of the Federal Power Act defines "reliable operation" as: "… operating the elements of the bulk-power system within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements."

B. Identifying~~Technical~~ Criteria:

1. Administrative

The Reliability Standard requirement requires responsible entities to perform a function that is administrative in nature, does not support reliability and is needlessly burdensome.

2. Data Collection/Data Retention

~~The Reliability Standard requirement requires responsible entities to collect or retain data and does not contribute to: (a) the reliable operation of the BES or (b) an effective compliance enforcement processes.~~ These are requirements that obligate responsible entities to produce and retain data which document prior events or activities, and should be collected via some other method under NERC's rules and processes ~~or addressed in the data retention sections of Reliability Standards~~.

3. ~~Purely~~ Documentation

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
The Reliability Standard requirement requires responsible entities to develop a document (*e.g.,* plan, policy or procedure) which is not necessary to protect BES reliability.

4. ~~Purely~~ Reporting

The Reliability Standard requirement obligates responsible entities to report ~~out~~ to a Regional Entity, NERC or another party or entity. These are requirements that obligate responsible entities to report to a Regional Entity on activities which have no discernible ~~discernable~~ impact on promoting the reliable operation of the BES and if the entity failed to meet this requirement there ~~it~~ would be ~~have~~ little reliability impact ~~on the reliable operation of the BES~~.

5. Periodic Updates

The Reliability Standard requirement requires responsible entities to periodically update (*e.g.,* annually) documentation, such as a plan, procedure or policy without an operational benefit to reliability.

6. Commercial or Business Practice

The Reliability Standard requirement is a commercial or business practice, or implicates commercial rather than reliability issues. ~~*e.g.,* better served as a NAESB standard or as part of NAESB Electric Industry Registry (EIR).~~

7. Redundant

The Reliability Standard requirement is redundant with (i) ~~either~~ another FERC-approved Reliability Standard requirement; (ii) the ERO compliance and monitoring program; or (iii) a ~~or~~ governmental regulation (*e.g.,* Open Access Transmission Tariff, North American Energy Standards Board ("NAESB"), ~~,~~ etc.).

~~**8. Hinders the protection or reliable operation of the BES**~~

~~The Reliability Standard requirement requires responsible entities to conduct an activity or task that hinders, distracts or is counterproductive to the protection or reliable operation of the BES.~~

~~**9. Little, if any, value as a reliability requirement**~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

~~The tasks or activities in the Reliability Standard requirement do little, if anything, to promote the protection the BES.~~

C. Additional data and reference points

In those instances where~~when~~ there is a~~the~~ need for additional information to assist in the determination of whether a Reliability Standard requirement satisfies both Criteria A and B, the standard drafting team~~Standards Drafting Team~~ shall consider the following data and reference points to make a more informed decision:

1. Was the Reliability Standard requirement part of a Find, Fix and Track filing?

2. Is the Reliability Standard requirement being reviewed in an on-going Standards Development Project?

3. What is the Violation Risk Factor of the Reliability Standard requirement?

4. In which tier of the 2013 Actively Monitored List~~Standards~~ does the Reliability Standard requirement fall?

5. Is there a possible~~Any~~ negative impact on NERC's published and posted reliability principles?

6. Is there any~~Any~~ negative impact on the defense-in-depth protection of the BES?

7. Does the retirement ~~or modification~~ promote results- or performance-based Reliability Standards?

To facilitate the standard drafting team's~~Standard Drafting Team's~~ consideration of the above questions, NERC staff will provide the team with relevant known data and statistics.

Formatted: Font: Bold

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

List of Initial Phase~~To facilitate the Standard Drafting Team's Initial Phase, below is a list of Reliability Standard requirements that appear to satisfy both Criteria A and B, with consideration of Criterion C. To assist the Team's review of these requirements, Criterion B coding is provided, along with a brief statement explaining why the requirement provides little protection to the BES, is unnecessary or is redundant.~~

~~List of Phase One~~ Reliability Standard requirements that satisfy both Criteria A and B, with consideration of Criterion C

To be retired:[7]

BAL-005-0.2b~~1b~~ R2

Each Balancing Authority shall maintain Regulating Reserve that can be controlled by AGC to meet the Control Performance Standard.

Criterion B 7.

Statement:[8] BAL-005-0.2b~~1b~~ is redundant with the Control Performance Standard defined in BAL-001-0.1a R1 and R2. This is also redundant in that it is measured by whether or not BAL-001-0.1a R1 and R2

[7] The following requirements that were originally presented in the draft SAR, and now in this final SAR are denoted with a "*" are so denoted because research shows that they are already scheduled to be retired via another Standards Development Project that has been approved by stakeholders and the NERC Board of Trustees (or due to be before the Board in November – *i.e.*, PRC-005-2), and, thus, are presented here for informational purposes only: COM-001-1.1 R6, EOP-009-0 R2; FAC-008-1 R1.3.5; PRC-008-0 R1; PRC-008-0 R2; PRC-009-0 R1; PRC-009-0 R1.1; PRC-009-0 R1.2; PRC-009-0 R1.3; PRC-009-0 R1.4; PRC-009-0 R2; TOP-001-1a R3 and TOP-005-2a R1. These requirements are generally scheduled to be retired within the next year, and, therefore, to subject them to additional stakeholder vote, comment and Board of Trustees approval does not seem warranted or efficient. Consequently, these requirements will not be presented to stakeholders for comment and vote.

Formatted: Font: Not Bold

Formatted: Left

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

are met.

Conclusion: This is redundant with the Control Performance Standard defined in BAL-001-0.1a R1 and R2. This is also redundant in that it is measured by whether or not BAL-001-0.1a R1 and R2 are met. This may be double jeopardy in that failure to achieve compliance with BAL-001-0.1a R1 and R2 could imply failure of this standard as well. This is misleading in requiring entities to maintain Regulating Reserve, but providing no way to measurably comply, apart from achieving compliance with BAL-001-0.1a R1 and R2.

CIP-001-2a -R4.

Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances.

Criterion B 1, 2~~, 3, 8~~ and 3~~9~~.

Statement: CIP-001-2a is administrative, documentation and data collection in nature, because the establishment of communication contacts, in and of itself, with the FBI and RCMP has little or no impact on protection or the reliable operation of the BES. Instead, compliance with R1 through ~~-~~R3 of CIP-001-2a provides the actions that responsible entities take to protect the BES in the event of sabotage. Specifically, R1 through R3 require that the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity ~~to~~ have procedures for the recognition of sabotage, reporting of sabotage and communication of sabotage events to appropriate parties in the Interconnection, which may include local law enforcement, the FBI, etc. Thus, ~~in~~ CIP-001-2a~~,~~ R1 through R3 serve a reliability function, while R4 is a static, administrative requirement that has no clear results-based nexus to protecting the BES.~~Bulk Electric System (BES).~~

[8] The "Statement" and "Conclusion" sections are brief statements that provide context. The technical justification for each Reliability Standards requirement is contained in a separate Technical White Paper that will also be posted for comment.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
Conclusion: Since this requirement provides little protection to the BES and is administrative in nature, Requirement 4 should be removed from Reliability Standard CIP-001-2a. **CIP-003-3, -4 R1.2** The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets. Criterion B 1. **Statement:** Whether there is a robust CIP compliance plan on which employees are trained -may impact reliability, not whether the cyber security policy is readily available. Employees that are responsible for executing the cyber security policy are required to undergo a variety of training and, follow multiple processes and procedures that are already required by the CIP requirements. Simply requiring that the policy be readily available is an administrative task that provides little, if any, benefit to reliability of the BES. **Conclusion:** Since this requirement provides little protection to the BES and is purely administrative in nature, Requirement 1.2 should be removed from Reliability Standards CIP-003-3 and CIP-003-4. **CIP-003-3, -4 R3, R3.1, R3.2, R3.3** R3 Exceptions – Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s). R3.1 Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s). R3.2 Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures. R3.3 Authorized exceptions to the cyber security policy must be reviewed and approved

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented. Criterion B 1~~, 3~~ and 3~~8~~. **Statement:** Over time, these exception requirements have proven to not be useful and have been subject to misinterpretation, including responsible entities believing they can exempt themselves from compliance with the CIP requirements. **Conclusion:** For regulatory efficiency, since these requirements provide little protection to the BES and are open to misinterpretation, in addition to being entirely documentation, Requirement 3 and its sub-requirements~~subrequirements~~ should be removed from Reliability Standards~~Standard~~ CIP-003-3 and CIP-003-4. **CIP-003-3, -4 R4.2.** The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information. Criterion B 1, 3 and 7. **Statement:** CIP-003-3, -4 R4 already requires the classification of information associated with Critical Cyber Assets, which makes R4.2 redundant. The only difference in R4.2 is the term, "based on the sensitivity" has been added. The addition of this term can be viewed as overly managing the responsible entities' process of classification or simply not adding sufficient value to reliability to require a new requirement over and above R4. **Conclusion:** Since this requirement is~~these requirements are~~ redundant and provides~~provide~~ little protection to the BES, Requirement 4.2 should be removed from both Reliability Standards CIP-003-3 and CIP-003-4.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
CIP-005-3a, -4a R2.6. Appropriate Use Banner -- Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner. ~~devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.~~ Criterion B 1~~, 3, 8~~ and 3~~9~~. **Statement:** Over time, the banner requirement (or no trespass sign) has not been shown to be useful or consistent with a results-based approach to implementing a cyber security program. Additionally, it is administrative in nature. **Conclusion:** Since this requirement provides little protection to the BES and is purely administrative in nature, Requirement R2 should be removed from Reliability Standards CIP-005-3a and CIP-005-4. **CIP-007-3, -4 R7.3** The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures. Criterion B 1 and 2. **Statement:** CIP-007-3, -4 R7.3 is evidence collection and possible for inclusion in an RSAW. **Conclusion:** Since this requirement provides little protection to the BES and is data collection in nature, it should be removed from CIP-007-3, -4. ***COM-001-1.1 R6.**

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001-0, "NERCNet Security Policy." Criterion B 6 and 7. **Statement:** ~~Whether the entity has a robust up-to-date CIP compliance plan may impact reliability, but not whether it employs a specific business practice such as the NERCNet. NOTE:~~ This requirement has been approved by stakeholders~~is proposed~~ for removal per Project 2006-06 (Reliability Coordination) and will ~~with the rationale: "The RC SDT is recommending that R6~~ be presented to the NERC Board of Trustees for approval~~retired. This is an ERO procedural issue and should not be~~ in November. Thus,~~a reliability standard. It should be included in the ERO Rules of Procedure."~~ ~~**Conclusion:** Since this requirement provides little protection to the BES and is more appropriate as a Commercial and Business Practice, Requirement 6 should be removed from Reliability Standard~~ COM-001-1.1 R6 is presented here for informational purposes only. **EOP-004-1 R1.** Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports. Criterion B 1~~, 3~~ and 3~~4~~. **Statement:** Whether or not there is a Regional Entity procedure to report disturbances has no impact on reliability. In other words, while a procedure for the collection of reports on disturbances may be useful information for purposes of Regional Entities to stay informed during events, is not an activity that protects the reliability of BES. The collection of such information should be established outside mandatory Reliability Standards. **Conclusion:** Since this requirement provides little protection to the BES and is purely documentation, Requirement 1 should be removed from Reliability Standard EOP-004-1.

Formatted: Highlight

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

EOP-005-2 R3.1.

If there are no changes to the previously submitted restoration plan, the Transmission Operator shall confirm annually on a predetermined schedule to its Reliability Coordinator that it has reviewed its restoration plan and no changes were necessary.

Criterion B 1, 5~~,~~ ~~7~~ and 7~~9~~.

Statement: EOP-005-2 R3 reads: "Each Transmission Operator shall review its restoration plan and submit it to its Reliability Coordinator annually on a mutually agreed predetermined schedule." This requirement requires the Transmission Operator to submit its restoration plan to the Reliability Coordinator whether or not there have been changes. Therefore, R3.1 only adds a duplicative administrative burden for the entity to also confirm that there were no changes based upon another possible pre-determined schedule. Whether or not there was a change from year to year in the restoration plan will be documented in the revision history of the restoration plan, and thus the Reliability Coordinator will be able to ascertain whether or not there were changes based on R3. Thus, EOP-005-2 R3.1 provides little, if any, value to promoting the protection of the BES.

Conclusion: For regulatory efficiency, and since this requirement appears redundant to R3, Requirement 3.1 should be removed from Reliability Standard EOP-005-2.

***EOP-009-0 R2.**

The Generator Owner or Generator Operator shall provide documentation of the test results of the startup and operation of each blackstart generating unit to the Regional Reliability Organizations and upon request to NERC.

Criterion B 4.

Statement: In Order No. 749, the Commission approved the retirement of EOP-009-0 R2 as of July 1, 2013, and, thus, it is presented here for informational purposes only.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

~~**Statement:** The requirement to report blackstart test results to the Regional Entity and NERC has no impact on reliability. If the Regional Entity desires to review or track this information, a better vehicle to obtain it is via a Compliance Audit or Spot-Check, or some other compliance monitoring procedure.~~

~~**Conclusion:** For regulatory efficiency and since this requirement is purely a reporting activity, Requirement 2 should be removed from Reliability Standard EOP-009-0.~~

FAC-002-1 R2.

The Planning Authority, Transmission Planner, Generator Owner, Transmission Owner, Load-Serving Entity, and Distribution Provider shall each retain its documentation (of its evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission systems) for three years and shall provide the documentation to the Regional Reliability Organization(s) and NERC on request (within 30 calendar days).

Criterion B 1~~2, 3~~ and 2~~4~~.

Statement: Requiring the retention of studies for three years has no impact on protecting or the reliable operation of the BES, and is merely a data retention requirement that is better suited to be considered during an audit or in the context of compliance monitoring.

Conclusion: Since this requirement provides little protection to the BES and is purely data collection/retention, Requirement 2 should be removed from Reliability Standard FAC-002-1.

***FAC-008-1 R1.3.5.**

Other assumptions.

Criterion B 1~~8~~.

Statement: The term “other assumptions" has already been removed via FAC-008-3, which will be

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

effective on January 1, 2013, and, thus, it is presented here for informational purposes only~~in the context of facility ratings is very close to meaningless from a technical standpoint, generic and, therefore, yields no protection of the BES~~.

~~**Conclusion:** Since this requirement provides little or no protection to the BES and is unnecessary, Requirement 1.3.5 should be removed from Reliability Standard FAC-008-1.~~

FAC-008-1 R2; FAC-008-1 R3; FAC-008-3 R4; FAC-008-3 R5

FAC-008-1 R2 The Transmission Owner and Generator Owner shall each make its Facility Ratings Methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners, and Planning Authorities that have responsibility for the area in which the associated Facilities are located, within 15 business days of receipt of a request.

FAC-008-1 R3 If a Reliability Coordinator, Transmission Operator, Transmission Planner, or Planning Authority provides written comments on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings Methodology, the Transmission Owner or Generator Owner shall provide a written response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings Methodology and, if no change will be made to that Facility Ratings Methodology, the reason why.

FAC-008-3 R4 Each Transmission Owner shall make its Facility Ratings methodology and each Generator Owner shall each make its documentation for determining its Facility Ratings and its Facility Ratings methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners and Planning Coordinators that have responsibility for the area in which the associated Facilities are located, within 21 calendar days of receipt of a request.

FAC-008-3 R5 If a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner's Facility Ratings methodology or Generator Owner's documentation for determining its Facility Ratings and its Facility Rating methodology, the Transmission Owner or Generator Owner shall provide a response to that commenting entity within 45 calendar days of receipt of those comments. The response shall

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

indicate whether a change will be made to the Facility Ratings methodology and, if no change will be made to that Facility Ratings methodology, the reason why.

Criterion B 1, ~~2,~~ 4 and 6.

Statement: For purposes of reliability, facility ratings are transmitted and used via the FAC (System Operating Limits), MOD and TPL Standards,[9] and posting the rating methodology for comment and responding to comments in and of itself has no reliability benefit. Furthermore, these requirements do not appear appropriate given the possible commercial or market related implications of sharing and debating with a competitor the facility ratings methodology of a facility.

Conclusion: For regulatory efficiency and possible commercial or market implications in sharing the facility ratings, and since these requirements are purely administrative in nature along with reporting activities, Requirements R2 and R3 of Reliability Standard FAC-008-1 and Requirements 4 and 5 of Reliability Standard FAC-008-3 should be removed from the Standards.

FAC-010-2.1 R5; FAC-011-2 R5

FAC-010-2.1 R5 If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why.

FAC-011-2 R5 If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Reliability Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason

Formatted: Tab stops: 0.5", Left

[9] MOD-001-1a R9, MOD-028-1 R2.3; MOD-029-1a R2.1; MOD-030-02 R3.1, PRC-023-2, Attachment A 2.7; TPL-001-0.1 Footnote a; TPL-002-1b, footnotes a and b; TPL-003-0a, footnote a and TPL-004-0, footnote a. Also, via FAC-011-2 the System Operating Limits methodology of Reliability Coordinator may also use facility ratings as a key element. Also, FAC-008-3 R7 and R8 require the transmission of facility ratings to reliability entities.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

why.

Criterion B 1, 4 and 6.

Statement: A review of FAC-010-2.1 R5 and FAC-011-2 R5 indicate they are administrative requirements for the Planning Authority and Reliability Coordinator to respond to comments on its SOL methodology. Thus, similar to FAC-008-3 R4 and R5, there is no or little protection for BES reliability for a Planning Coordinator or Reliability Coordinator to enter into a give and take with the recipient on its SOL methodology.

Conclusion: Since these requirements are purely administrative, FAC-010-2.1 R5 and FAC-011-2 R5 should be removed from the Standards.

FAC-013-2 R3

If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why.

Criterion B 1, ~~2,~~ 4 and 6.

Statement: Similar to the concerns with FAC-008, the FAC-013-2 requirement to reply to comments on a transfer capability methodology has no reliability benefit, and, moreover, a back and forward on transfer capability could have commercial or market implications.

Conclusion: For regulatory efficiency and possible commercial or market implications in sharing transfer capability methodology, and since these requirements are purely administrative in nature along with reporting activities, Requirement R3 of Reliability Standard FAC-013-2 should be removed from the Standards.

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

INT-007-1 R1.2

All reliability entities involved in the Arranged Interchange are currently in the NERC registry.

Criterion B 1.

Statement: INT-007-1, R1.2 is administrative in nature, and adds little to reliability.

Conclusion: Since INT-007-1 R1.2 provides little protection to the BES, it should be removed.

IRO-016-1 R2

The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.

Criterion B 1 and 2.

Statement:

IRO-016-1 R2 is an evidence requirement and is a candidate. Candidate to go into an RSAW.

Conclusion: Since IRO-016-1 R2 provides little protection to the BES and is data collection in nature, it should be removed.

MOD-004-1 R1; MOD-004-1 R1.1; MOD-004-1 R1.2; MOD-004-1 R1.3; MOD-004-1 R2; MOD-004-1 R3; MOD-004-1 R3.1; MOD-004-1 R3.2; MOD-004-1 R4; MOD-004-1 R4.1; MOD-004-1 R4.2; MOD-004-1 R5; MOD-004-1 R5.1; MOD-004-1 R5.2; MOD-004-1 R6; MOD-004-1 R6.1; MOD-004-1 R6.2; MOD-004-1 R7; MOD-004-1 R8; MOD-004-1 R9; MOD-004-1 R9.1; MOD-004-1 R9.2; MOD-004-1 R10; MOD-004-1 R11; MOD-004-1 R12; MOD-004-1 R12.1; MOD-004-1 R12.2; MOD-004-1 R12.3.

R1 The Transmission Service Provider that maintains CBM shall prepare and keep current a "Capacity

Formatted: Tab stops: Not at 1.5"

SAR Information
~~Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information: [Time Horizon: Operations Planning, Long-term Planning]~~ ~~R1.1. The process through which a Load-Serving Entity within a Balancing Authority Area associated with the Transmission Service Provider, or the Resource Planner associated with that Balancing Authority Area, may ensure that its need for Transmission capacity to be set aside as CBM will be reviewed and accommodated by the Transmission Service Provider to the extent Transmission capacity is available.~~ ~~R1.2. The procedure and assumptions for establishing CBM for each Available Transfer Capability (ATC) Path or Flowgate.~~ ~~R1.3. The procedure for a Load-Serving Entity or Balancing Authority to use Transmission capacity set aside as CBM, including the manner in which the Transmission Service Provider will manage situations where the requested use of CBM exceeds the amount of CBM available.~~ ~~R2. The Transmission Service Provider that maintains CBM shall make available its current CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, Resource Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area, and to the Load Serving Entities and Balancing Authorities within the Transmission Service Provider's area, and notify those entities of any changes to the CBMID prior to the effective date of the change. [Time Horizon: Operations Planning]~~ ~~R3. Each Load-Serving Entity determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by: [Time Horizon: Operations Planning]~~ ~~R3.1. Using one or more of the following to determine the GCIR:~~ ~~Loss of Load Expectation (LOLE) studies~~ ~~Loss of Load Probability (LOLP) studies~~ ~~Deterministic risk-analysis studies~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
~~Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities~~ ~~R3.2. Identifying expected import path(s) or source region(s).~~ ~~R4. Each Resource Planner determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by: [Time Horizon: Operations Planning]~~ ~~R4.1. Using one or more of the following to determine the GCIR:~~ ~~Loss of Load Expectation (LOLE) studies~~ ~~Loss of Load Probability (LOLP) studies~~ ~~Deterministic risk-analysis studies~~ ~~Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities~~ ~~R4.2. Identifying expected import path(s) or source region(s).~~ ~~R5. At least every 13 months, the Transmission Service Provider that maintains CBM shall establish a CBM value for each ATC Path or Flowgate to be used for ATC or Available Flowgate Capability (AFC) calculations during the 13 full calendar months (months 2-14) following the current month (the month in which the Transmission Service Provider is establishing the CBM values). This value shall: [Time Horizon: Operations Planning]~~ ~~R5.1. Reflect consideration of each of the following if available:~~ ~~Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Service Provider's area~~ ~~Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
~~Service Provider's area~~ ~~Any reserve margin or resource adequacy requirements for loads within the Transmission Service Provider's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities~~ ~~R5.2 Be allocated as follows:~~ ~~For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners~~ ~~For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Service Provider~~ ~~R6 At least every 13 months, the Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used in planning during each of the full calendar years two through ten following the current year (the year in which the Transmission Planner is establishing the CBM values). This value shall: [Time Horizon: Long-term Planning]~~ ~~R6.1 Reflect consideration of each of the following if available:~~ ~~Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Planner's area~~ ~~Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner's area~~ ~~Any reserve margin or resource adequacy requirements for loads within the Transmission Planner's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities~~ ~~R6.2 Be allocated as follows:~~ ~~For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

~~For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner.~~

~~R7. Less than 31 calendar days after the establishment of CBM, the Transmission Service Provider that maintains CBM shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the Transmission Service Provider's system of the amount of CBM set aside. [Time Horizon: Operations Planning]~~

~~R8. Less than 31 calendar days after the establishment of CBM, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the system being planned by the Transmission Planner of the amount of CBM set aside. [Time Horizon: Operations Planning]~~

~~R9. The Transmission Service Provider that maintains CBM and the Transmission Planner shall each provide (subject to confidentiality and security requirements) copies of the applicable supporting data, including any models, used for determining CBM or allocating CBM over each ATC Path or Flowgate to the following: [Time Horizon: Operations Planning, Long-term Planning]~~

~~R9.1. Each of its associated Transmission Operators within 30 calendar days of their making a request for the data.~~

~~R9.2. To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, Resource Planner, or Planning Coordinator within 30 calendar days of their making a request for the data.~~

~~R10. The Load-Serving Entity or Balancing Authority shall request to import energy over firm Transfer Capability set aside as CBM only when experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher. [Time Horizon: Same-day Operations]~~

~~R11. When reviewing an Arranged Interchange using CBM, all Balancing Authorities and Transmission Service Providers shall waive, within the bounds of reliable operation, any Real-time timing and ramping~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

~~requirements. [Time Horizon: Same-day Operations]~~

~~R12. The Transmission Service Provider that maintains CBM shall approve, within the bounds of reliable operation, any Arranged Interchange using CBM that is submitted by an "energy deficient entity" under an EEA 2 if: [Time Horizon: Same-day Operations]~~

~~R12.1. The CBM is available~~

~~R12.2. The EEA 2 is declared within the Balancing Authority Area of the "energy deficient entity," and~~

~~R12.3. The Load of the "energy deficient entity" is located within the Transmission Service Provider's area.~~

~~Criterion B 6.~~

~~**Statement:** Capacity Benefit Margin (CBM) is better integrated in marketing functions and is not a reliability function. In the NERC TOP-002 Operations Planning Standard, Requirement R1 specifies that the Transmission Operator shall have an Operating Planning Analysis that represents projected System conditions to assess planned operation for the next day that do not exceed Facility Ratings or Stability Limits for anticipated normal and contingency events. Further, the CBM standard is redundant to the TOP-002 R1 where the marketer would schedule their transmission reserve within the limits established by the Transmission Operator. The Transmission Operator ensures that the established reserve along with other identified schedules are modeled to anticipate next-day conditions and remain within established operating limits.~~

~~In addition, this Standard is not necessary for the support of BES reliability as evidenced by the fact that of the entities that once used CBM, many dropped it when it became effective due to the unnecessary burdens it placed on the entities.~~

~~**Conclusion:** The requirements above relate to commercial and market issues regulated under OATT.~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information
~~Furthermore, they provide little protection to the BES and unnecessary as part of NERC Reliability Standards. Requirements 1 through 12 and associated subrequirements should be removed from Reliability Standard MOD-004-1.~~ **NUC-001-2 R9.1; NUC-001-2 R9.1.1; NUC-001-2 R9.1.2; NUC-001-2 R9.1.3; NUC-001-2 R9.1.4** R9.1 Administrative elements: R9.1.1 Definitions of key terms used in the agreement. R9.1.2 Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs. R9.1.3 A requirement to review the agreement(s) at least every three years. R9.1.4 A dispute resolution mechanism. Criterion B 1~~, 3, 5, 6~~. **Statement:** These requirements of NUC-001-2 do not address reliability, rather they address administrative and commercial terms of an agreement. Given there is no clear nexus between these requirements and reliability, they should be retired. **Conclusion:** Since these requirements are purely administrative in nature, provide for a periodic update and commercial terms of the agreement, they provide little protection to the BES. Requirement 9.1 and associated sub-requirements~~subrequirements~~ should be removed from Reliability Standard NUC-001-2. ***PRC-008-0 R1; *PRC-008-0 R2; *PRC-009-0 R1; *PRC-009-0 R1.1; *PRC-009-0 R1.2; *PRC-009-0 R1.3; *PRC-009-0 R1.4; *PRC-009-0 R2; PRC-010-0 R2; PRC-022-1 R2.**

Formatted: Right: 0", Adjust space between Latin and Asian text, Adjust space between Asian text and numbers, Tab stops: 0.5", Left

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

~~*The next proposed version of IRO-001 for this requirement also reads the same. As is apparent from a comparison of the two requirements, there is no need for TOP-001-1a R3 which is duplicative of IRO-001-1a R8. Also, in the next proposed version of TOP-001, Reliability Coordinator has been deleted from this requirement.~~

~~**Conclusion:** Requirement 3 is redundant to Reliability Standard IRO-001-1a R8 and should be removed from Reliability Standard TOP-001-1a.~~

TOP-005-2a R1

As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for "Electric System Reliability Data."

Criterion B 3.

Statement:

TOP-005-2a R1 is better suited for ROP than reliability requirement. A review of Standards Development Project 2007-03 Real-time Transmission Operations indicates it proposes R1 of TOP-005-1 to be retired. As stated above in the context of TOP-001, this project was approved by the NERC Board of Trustees and will be filed with the Commission for approval; therefore, TOP-005-2a R1 is presented for informational purposes only.

Conclusion: Since TOP-005-2a R1 provides little protection to the BES and is purely documentation in nature, it should be removed.

VAR-001-2 R5

Each Purchasing-Selling Entity and Load Serving Entity shall arrange for (self-provide or purchase) reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching; and controllable load– to satisfy its reactive requirements identified by its Transmission Service Provider.

Formatted: Font: Bold

SAR Information

Criterion B 7.

Statement: VAR-001-2 R5 is redundant with FERC's pro forma open access transmission tariff (OATT) Specifically, the requirement provides for the PSE and LSE to arrange for reactive resources to satisfy the reactive requirements of the Transmission Service Provider, which is already required under Schedule No. 2 of the OATT.

Conclusion: Since VAR-001-2 R5 is redundant with requirements already under FERC's OATT, and, thus, it should be removed.

~~**VAR-002-WECC-1 R2; VAR-501-WECC-1 R2**~~

~~VAR-002-WECC-1 R2 Generator Operators and Transmission Operators shall have documentation identifying the number of hours excluded for each requirement R1.1 through R1.10.~~

~~VAR-501-WECC-1 R2 Generator Operators shall have documentation identifying the number of hours excluded for each requirement in R1.1 through R1.12.~~

~~Criterion B 3 and 4.~~

~~**Statement:** Communication of the status of AVR and PSS with the Transmission Operator may impact reliability, but not documenting or reporting out of this information to a Regional Entity. If the Regional Entity desires to review or track the AVR and PSS hours, such information should be collected via vehicles other than the Reliability Standards, such as Compliance Audits, Spot Checks and other compliance monitoring procedures.~~

~~**Conclusion:** For regulatory efficiency and since the requirements are purely documentation and reporting activities, Requirement 2 in Regional Reliability Standards VAR-002-WECC-1 and VAR-501-WECC-1 should be removed from the Standards.~~

Formatted: Font: (Default) Calibri, Font color: Black

SAR Information

Reliability Functions		
The Standard will Apply to the Following Functions (Check each one that applies.)		
☒	Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of responsible entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☒	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☒	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☒	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☒	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.

Formatted: Font: (Default) Calibri, Font color: Black

Reliability Functions		
☒	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and reactive power.
☒	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☒	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles		
Applicable Reliability Principles (Check all that apply).		
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.	
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.	
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.	
☒	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.	
☒	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.	
☒	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.	
☒	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.	
☒	8. Bulk power systems shall be protected from malicious physical or cyber attacks.	
Does the proposed Standard comply with all of the following Market Interface Principles?		Enter (yes/no)
	1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes

Formatted: Font: (Default) Calibri, Font color: Black

Reliability and Market Interface Principles	
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Subject:	FW: Standards Committee Executive Committee Approved P81 Posting
Date:	Friday, September 28, 2012 4:57:04 PM

To All,

During the Standards Committee Executive Committee teleconference today David Kiguel reported their following activity:

Authorize (a) waiving the 30 day initial comment period and (b) posting the SAR and list of requirements proposed for retirement in phase 1 for a 45-day formal comment period with the formation of a ballot pool during the first 30 days and an initial ballot during the last 10 days of that 45-day comment period. The balloting will be conducted as ONE single ballot for all 38 requirements.

I am trying to obtain further information regarding formalization of a Standards Drafting Team and whether this constitutes a variance in process.

Thanks,

Guy

Note that when these Requirements are retired, the version numbers of the standards will NOT be incremented, but the retired Requirements and associated elements will be clearly marked as retired. After evaluating the options and consulting with the Standards Committee and Standards Committee Process Subcommittee, the P81 drafting team determined that this was the most practical approach. Incrementing the version numbers of each standard is impractical because, in some cases, a subsequent version has already been developed. In addition, incrementing the version would require renumbering Requirements where a retired Requirement created a gap in numbering, and this creates an undesirable administrative burden for entities using certain systems to manage their compliance programs.

Prerequisite Approvals

Revisions to Defined Terms in the NERC Glossary

- None

Background

On September 30, 2011, the North American Electric Reliability Corporation (NERC) filed a petition with the Federal Energy Regulatory Commission (FERC) requesting approval of its proposal to make informational filings in a "Find, Fix, Track and Report" (FFT) spreadsheet of lesser-risk, remediated possible violations of Reliability Standards. On March 15, 2012, the FERC issued an order conditionally accepting NERC's FFT proposal. In paragraph 81 (P81) of that order, the FERC stated:

> The Commission notes that NERC's FFT initiative is predicated on the view that many violations of requirements currently included in Reliability Standards pose lesser risk to the Bulk-Power System. If so, some current requirements likely provide little protection for Bulk-Power System reliability or may be redundant. The Commission is interested in obtaining views on whether such requirements could be removed from the Reliability Standards with little effect on reliability and an increase in efficiency of the ERO compliance program. If NERC believes that specific Reliability Standards or specific requirements within certain Standards should be revised or removed, we invite NERC to make specific proposals to the Commission identifying the Standards or requirements and setting forth in detail the technical basis for its belief. In addition, or in the alternative, we invite NERC, the Regional Entities and other interested entities to propose appropriate mechanisms to identify and remove from the Commission-approved Reliability Standards unnecessary or redundant requirements. We will not impose a deadline on when these comments should be submitted, but ask that to the extent such comments are submitted NERC, the Regional Entities, and interested entities coordinate to submit their respective comments concurrently. North American Electric Reliability Corporation, 138 FERC ¶ 61,193 at p 81 (March 15, 2012) ("P81").

Consistent with P81, a draft Standards Authorization Request (SAR) was drafted to set forth criteria and a process to identify Reliability Standard requirements that either: (a) provide little protection to the Bulk Electric System; (b) are unnecessary or (c) are redundant; and, thereafter, to have NERC file the identified Reliability Standard requirements with FERC to have them removed from the FERC-approved list of Reliability Standards.

Standards Process Input Group (SPIG)

In addition to addressing P81, the draft SAR was drafted consistent with what the SPIG developed as Recommendation No. 4, as set forth in NERC's Recommendations to Improve The Standards Development Process on page 12 (April 2012), which states:

> Recommendation 4: Standards Product Issues — The NERC board is encouraged to require that the standards development process address: . . . The retirement of standards no longer needed to meet an adequate level of reliability.

Collaborative Process

The draft SAR and a suggested list of Reliability Standard requirements embedded in the SAR for consideration in the Initial Phase was the product of collaborative discussions among the following entities and their members: Edison Electric Institute, American Public Power Association, National Rural Electric Cooperative Association, Large Public Power Council, Electricity Consumers Resource Council, The Electric Power Supply Association, Transmission Access Policy Study Group, the North American Electric Reliability Corporation, and the Regional Entity Management Group. The draft SAR was posted for comment, which were due September 4, 2012. The P81 Standards Drafting Team reviewed the comments and finalized the SAR and the proposed list of Reliability Standard requirements for retirement.

Applicable Entities

- Balancing Authority
- Distribution Provider
- Generator Operator
- Generator Owner
- Interchange Authority
- Load Serving Entity
- NERC
- Planning Authority
- Planning Coordinator
- Purchasing-Selling Entity
- Regional Entity
- Regional Reliability Organization
- Reliability Coordinator
- Transmission Service Provider
- Transmission Operator
- Transmission Owner
- Transmission Planner

Effective Date of Retirements

All of the Requirements will be retired on the day of approval by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the first day of the first calendar quarter approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

Note that no complete standard is being proposed for retirement and all of the other Requirements in each of the affected standards will remain in continuous effect until such time that the entire standard may be retired.

Standard Version	Requirement Name	Status	Requirement Text
BAL-005-0.2b	R2.	Kept in Final SAR for Retirement	Each Balancing Authority shall maintain Regulating Reserve that can be controlled by AGC to meet the Control Performance Standard.
CIP-001-2a	R4.	Kept in Final SAR for Retirement	Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances.
CIP-003-3	R1.2.	Kept in Final SAR for Retirement	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.
CIP-003-3	R3.	Kept in Final SAR for Retirement	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).
CIP-003-3	R3.1.	Kept in Final SAR for Retirement	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).
CIP-003-3	R3.2.	Kept in Final SAR for Retirement	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.
CIP-003-3	R3.3.	Kept in Final SAR for Retirement	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.
CIP-003-3	R4.2.	Kept in Final SAR for Retirement	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.
CIP-003-4	R1.2.	Kept in Final SAR for Retirement	The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.
CIP-003-4	R3.	Kept in Final SAR for Retirement	Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).
CIP-003-4	R3.1.	Kept in Final SAR for Retirement	Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).
CIP-003-4	R3.2.	Kept in Final SAR for Retirement	Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.
CIP-003-4	R3.3.	Kept in Final SAR for Retirement	Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.
CIP-003-4	R4.2.	Kept in Final SAR for Retirement	The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

Standard Version	Requirement Name	Status	Requirement Text
CIP-005-3a	R2.6.	Kept in Final SAR for Retirement	Appropriate Use Banner —Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.
CIP-005-4a	R2.6.	Kept in Final SAR for Retirement	Appropriate Use Banner —Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner.
CIP-007-3	R7.3.	Kept in Final SAR for Retirement	The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.
CIP-007-4	R7.3.	Kept in Final SAR for Retirement	The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.
COM-001-1.1	R6.	Kept in Final SAR for Information Only	Each NERCNet User Organization shall adhere to the requirements in Attachment 1-COM-001, "NERCNet Security Policy."
EOP-004-1	R1.	Kept in Final SAR for Retirement	Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports.
EOP-005-2	R3.1.	Kept in Final SAR for Retirement	If there are no changes to the previously submitted restoration plan, the Transmission Operator shall confirm annually on a predetermined schedule to its Reliability Coordinator that it has reviewed its restoration plan and no changes were necessary.
EOP-009-0	R2.	Kept in Final SAR for Information Only	The Generator Owner or Generator Operator shall provide documentation of the test results of the startup and operation of each blackstart generating unit to the Regional Reliability Organizations and upon request to NERC.
FAC-002-1	R2.	Kept in Final SAR for Retirement	The Planning Authority, Transmission Planner, Generator Owner, Transmission Owner, Load-Serving Entity, and Distribution Provider shall each retain its documentation (of its evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission systems) for three years and shall provide the documentation to the Regional Reliability Organization(s) and NERC on request (within 30 calendar days).
FAC-008-1	R1.3.5.	Kept in Final SAR for Information Only	Other assumptions.
FAC-008-1	R2.	Kept in Final SAR for Retirement	The Transmission Owner and Generator Owner shall each make its Facility Ratings Methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners, and Planning Authorities that have responsibility for the area in which the associated Facilities are located, within 15 business days of receipt of a request.

Standard Version	Requirement Name	Status	Requirement Text
FAC-008-1	R3.	Kept in Final SAR for Retirement	If a Reliability Coordinator, Transmission Operator, Transmission Planner, or Planning Authority provides written comments on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings Methodology, the Transmission Owner or Generator Owner shall provide a written response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings Methodology and, if no change will be made to that Facility Ratings Methodology, the reason why.
FAC-008-3	R4.	Kept in Final SAR for Retirement	Each Transmission Owner shall make its Facility Ratings methodology and each Generator Owner shall each make its documentation for determining its Facility Ratings and its Facility Ratings methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners and Planning Coordinators that have responsibility for the area in which the associated Facilities are located, within 21 calendar days of receipt of a request.
FAC-008-3	R5.	Kept in Final SAR for Retirement	If a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner's Facility Ratings methodology or Generator Owner's documentation for determining its Facility Ratings and its Facility Rating methodology, the Transmission Owner or Generator Owner shall provide a response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings methodology and, if no change will be made to that Facility Ratings methodology, the reason why.
FAC-010-2.1	R5.	Added to Final SAR for Retirement	If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why.
FAC-011-2	R5.	Added to Final SAR for Retirement	If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Reliability Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why.

Standard Version	Requirement Name	Status	Requirement Text
FAC-013-2	R3.	Kept in Final SAR for Retirement	If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why.
INT-007-1	R1.2.	Kept in Final SAR for Retirement	All reliability entities involved in the Arranged Interchange are currently in the NERC registry.
IRO-016-1	R2.	Kept in Final SAR for Retirement	The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both.
MOD-004-1	R1.	Deferred to Subsequent Phase	The Transmission Service Provider that maintains CBM shall prepare and keep current a "Capacity Benefit Margin Implementation Document" (CBMID) that includes, at a minimum, the following information:
MOD-004-1	R1.1.	Deferred to Subsequent Phase	The process through which a Load-Serving Entity within a Balancing Authority Area associated with the Transmission Service Provider, or the Resource Planner associated with that Balancing Authority Area, may ensure that its need for Transmission capacity to be set aside as CBM will be reviewed and accommodated by the Transmission Service Provider to the extent Transmission capacity is available.
MOD-004-1	R1.2.	Deferred to Subsequent Phase	The procedure and assumptions for establishing CBM for each Available Transfer Capability (ATC) Path or Flowgate.
MOD-004-1	R1.3.	Deferred to Subsequent Phase	The procedure for a Load-Serving Entity or Balancing Authority to use Transmission capacity set aside as CBM, including the manner in which the Transmission Service Provider will manage situations where the requested use of CBM exceeds the amount of CBM available.
MOD-004-1	R2.	Deferred to Subsequent Phase	The Transmission Service Provider that maintains CBM shall make available its current CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, Resource Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider's area, and to the Load Serving Entities and Balancing Authorities within the Transmission Service Provider's area, and notify those entities of any changes to the CBMID prior to the effective date of the change.
MOD-004-1	R3.	Deferred to Subsequent Phase	Each Load-Serving Entity determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by:

Standard Version	Requirement Name	Status	Requirement Text
MOD-004-1	R3.1.	Deferred to Subsequent Phase	Using one or more of the following to determine the GCIR: Loss of Load Expectation (LOLE) studies; Loss of Load Probability (LOLP) studies; Deterministic risk-analysis studies; Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities
MOD-004-1	R3.2.	Deferred to Subsequent Phase	Identifying expected import path(s) or source region(s).
MOD-004-1	R4.	Deferred to Subsequent Phase	Each Resource Planner determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by:
MOD-004-1	R4.1.	Deferred to Subsequent Phase	Using one or more of the following to determine the GCIR: Loss of Load Expectation (LOLE) studies; Loss of Load Probability (LOLP) studies; Deterministic risk-analysis studies; Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities
MOD-004-1	R4.2.	Deferred to Subsequent Phase	Identifying expected import path(s) or source region(s).
MOD-004-1	R5.	Deferred to Subsequent Phase	At least every 13 months, the Transmission Service Provider that maintains CBM shall establish a CBM value for each ATC Path or Flowgate to be used for ATC or Available Flowgate Capability (AFC) calculations during the 13 full calendar months (months 2-14) following the current month (the month in which the Transmission Service Provider is establishing the CBM values). This value shall:
MOD-004-1	R5.1.	Deferred to Subsequent Phase	Reflect consideration of each of the following if available: Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Service Provider's area; Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Service Provider’s area; Any reserve margin or resource adequacy requirements for loads within the Transmission Service Provider’s area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities
MOD-004-1	R5.2.	Deferred to Subsequent Phase	Be allocated as follows: For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners; For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Service Provider

Standard Version	Requirement Name	Status	Requirement Text
MOD-004-1	R6.	Deferred to Subsequent Phase	At least every 13 months, the Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used in planning during each of the full calendar years two through ten following the current year (the year in which the Transmission Planner is establishing the CBM values). This value shall:
MOD-004-1	R6.1.	Deferred to Subsequent Phase	Reflect consideration of each of the following if available: Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Planner's area; Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner's area; Any reserve margin or resource adequacy requirements for loads within the Transmission Planner's area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities
MOD-004-1	R6.2.	Deferred to Subsequent Phase	Be allocated as follows: For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners; For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner.
MOD-004-1	R7.	Deferred to Subsequent Phase	Less than 31 calendar days after the establishment of CBM, the Transmission Service Provider that maintains CBM shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the Transmission Service Provider's system of the amount of CBM set aside.
MOD-004-1	R8.	Deferred to Subsequent Phase	Less than 31 calendar days after the establishment of CBM, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the system being planned by the Transmission Planner of the amount of CBM set aside.
MOD-004-1	R9.	Deferred to Subsequent Phase	The Transmission Service Provider that maintains CBM and the Transmission Planner shall each provide (subject to confidentiality and security requirements) copies of the applicable supporting data, including any models, used for determining CBM or allocating CBM over each ATC Path or Flowgate to the following:
MOD-004-1	R10.	Deferred to Subsequent Phase	The Load-Serving Entity or Balancing Authority shall request to import energy over firm Transfer Capability set aside as CBM only when experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher.
MOD-004-1	R11.	Deferred to Subsequent Phase	When reviewing an Arranged Interchange using CBM, all Balancing Authorities and Transmission Service Providers shall waive, within the bounds of reliable operation, any Real-time timing and ramping requirements.

Standard Version	Requirement Name	Status	Requirement Text
MOD-004-1	R12.	Deferred to Subsequent Phase	The Transmission Service Provider that maintains CBM shall approve, within the bounds of reliable operation, any Arranged Interchange using CBM that is submitted by an "energy deficient entity" under an EEA 2 if:
MOD-004-1	R12.1.	Deferred to Subsequent Phase	The CBM is available
MOD-004-1	R12.2.	Deferred to Subsequent Phase	The EEA 2 is declared within the Balancing Authority Area of the "energy deficient entity," and
MOD-004-1	R12.3.	Deferred to Subsequent Phase	The Load of the "energy deficient entity" is located within the Transmission Service Provider's area.
MOD-004-1	R9.1.	Deferred to Subsequent Phase	Each of its associated Transmission Operators within 30 calendar days of their making a request for the data.
MOD-004-1	R9.2.	Deferred to Subsequent Phase	To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, Resource Planner, or Planning Coordinator within 30 calendar days of their making a request for the data.
NUC-001-2	R9.1.	Kept in Final SAR for Retirement	Administrative elements:
NUC-001-2	R9.1.1.	Kept in Final SAR for Retirement	Definitions of key terms used in the agreement.
NUC-001-2	R9.1.2.	Kept in Final SAR for Retirement	Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs.
NUC-001-2	R9.1.3.	Kept in Final SAR for Retirement	A requirement to review the agreement(s) at least every three years.
NUC-001-2	R9.1.4.	Kept in Final SAR for Retirement	A dispute resolution mechanism.
PRC-008-0	R1.	Kept in Final SAR for Information Only	The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall have a UFLS equipment maintenance and testing program in place. This UFLS equipment maintenance and testing program shall include UFLS equipment identification, the schedule for UFLS equipment testing, and the schedule for UFLS equipment maintenance.
PRC-008-0	R2.	Kept in Final SAR for Information Only	The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall implement its UFLS equipment maintenance and testing program and shall provide UFLS maintenance and testing program results to its Regional Reliability Organization and NERC on request (within 30 calendar days).
PRC-009-0	R1.	Kept in Final SAR for Information Only	The Transmission Owner, Transmission Operator, Load-Serving Entity and Distribution Provider that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall analyze and document its UFLS program performance in accordance with its Regional Reliability Organization's UFLS program. The analysis shall address the performance of UFLS equipment and program effectiveness following system events resulting in system frequency excursions below the initializing set points of the UFLS program. The analysis shall include, but not be limited to:

Standard Version	Requirement Name	Status	Requirement Text
PRC-009-0	R1.1.	Kept in Final SAR for Information Only	A description of the event including initiating conditions.
PRC-009-0	R1.2.	Kept in Final SAR for Information Only	A review of the UFLS set points and tripping times.
PRC-009-0	R1.3.	Kept in Final SAR for Information Only	A simulation of the event.
PRC-009-0	R1.4.	Kept in Final SAR for Information Only	A summary of the findings.
PRC-009-0	R2.	Kept in Final SAR for Information Only	The Transmission Owner, Transmission Operator, Load-Serving Entity, and Distribution Provider that owns or operates a UFLS program (as required by its Regional Reliability Organization) shall provide documentation of the analysis of the UFLS program to its Regional Reliability Organization and NERC on request 90 calendar days after the system event.
PRC-010-0	R2.	Kept in Final SAR for Retirement	The Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall provide documentation of its current UVLS program assessment to its Regional Reliability Organization and NERC on request (30 calendar days).
PRC-022-1	R2.	Kept in Final SAR for Retirement	Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall provide documentation of its analysis of UVLS program performance to its Regional Reliability Organization within 90 calendar days of a request.
TOP-001-1a	R3.	Kept in Final SAR for Information Only	Each Transmission Operator, Balancing Authority, and Generator Operator shall comply with reliability directives issued by the Reliability Coordinator, and each Balancing Authority and Generator Operator shall comply with reliability directives issued by the Transmission Operator, unless such actions would violate safety, equipment, regulatory or statutory requirements. Under these circumstances the Transmission Operator, Balancing Authority or Generator Operator shall immediately inform the Reliability Coordinator or Transmission Operator of the inability to perform the directive so that the Reliability Coordinator or Transmission Operator can implement alternate remedial actions.
TOP-005-2a	R1.	Kept in Final SAR for Information Only	As a condition of receiving data from the Interregional Security Network (ISN), each ISN data recipient shall sign the NERC Confidentiality Agreement for “Electric System Reliability Data.”

Standard Version	Requirement Name	Status	Requirement Text
VAR-001-2	R5.	Added to Final SAR for Retirement	Each Purchasing-Selling Entity and Load Serving Entity shall arrange for (self-provide or purchase) reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, and controllable load– to satisfy its reactive requirements identified by its Transmission Service Provider.
VAR-002-WECC-1	R2.	Deferred to Subsequent Phase	Generator Operators and Transmission Operators shall have documentation identifying the number of hours excluded for each requirement in R1.1 through R1.10.
VAR-501-WECC-1	R2.	Deferred to Subsequent Phase	Generator Operators shall have documentation identifying the number of hours excluded for each requirement in R1.1 through R1.12.

A. Introduction

1. **Title:** **Automatic Generation Control**

2. **Number:** BAL-005-0.2b

3. **Purpose:** This standard establishes requirements for Balancing Authority Automatic Generation Control (AGC) necessary to calculate Area Control Error (ACE) and to routinely deploy the Regulating Reserve. The standard also ensures that all facilities and load electrically synchronized to the Interconnection are included within the metered boundary of a Balancing Area so that balancing of resources and demand can be achieved.

4. **Applicability:**

   4.1. Balancing Authorities

   4.2. Generator Operators

   4.3. Transmission Operators

   4.4. Load Serving Entities

5. **Effective Date:** May 13, 2009

B. Requirements

R1. All generation, transmission, and load operating within an Interconnection must be included within the metered boundaries of a Balancing Authority Area.

R1.1. Each Generator Operator with generation facilities operating in an Interconnection shall ensure that those generation facilities are included within the metered boundaries of a Balancing Authority Area.

R1.2. Each Transmission Operator with transmission facilities operating in an Interconnection shall ensure that those transmission facilities are included within the metered boundaries of a Balancing Authority Area.

R1.3. Each Load-Serving Entity with load operating in an Interconnection shall ensure that those loads are included within the metered boundaries of a Balancing Authority Area.

R2. Each Balancing Authority shall maintain Regulating Reserve that can be controlled by AGC to meet the Control Performance Standard. (Retired)

R3. A Balancing Authority providing Regulation Service shall ensure that adequate metering, communications, and control equipment are employed to prevent such service from becoming a Burden on the Interconnection or other Balancing Authority Areas.

R4. A Balancing Authority providing Regulation Service shall notify the Host Balancing Authority for whom it is controlling if it is unable to provide the service, as well as any Intermediate Balancing Authorities.

R5. A Balancing Authority receiving Regulation Service shall ensure that backup plans are in place to provide replacement Regulation Service should the supplying Balancing Authority no longer be able to provide this service.

R6. The Balancing Authority's AGC shall compare total Net Actual Interchange to total Net Scheduled Interchange plus Frequency Bias obligation to determine the Balancing Authority's ACE. Single Balancing Authorities operating asynchronously may employ alternative ACE calculations such as (but not limited to) flat frequency control. If a Balancing Authority is unable to calculate ACE for more than 30 minutes it shall notify its Reliability Coordinator.

R7. The Balancing Authority shall operate AGC continuously unless such operation adversely impacts the reliability of the Interconnection. If AGC has become inoperative, the Balancing Authority shall use manual control to adjust generation to maintain the Net Scheduled Interchange.

R8. The Balancing Authority shall ensure that data acquisition for and calculation of ACE occur at least every six seconds.

R8.1. Each Balancing Authority shall provide redundant and independent frequency metering equipment that shall automatically activate upon detection of failure of the primary source. This overall installation shall provide a minimum availability of 99.95%.

R9. The Balancing Authority shall include all Interchange Schedules with Adjacent Balancing Authorities in the calculation of Net Scheduled Interchange for the ACE equation.

R9.1. Balancing Authorities with a high voltage direct current (HVDC) link to another Balancing Authority connected asynchronously to their Interconnection may choose to omit the Interchange Schedule related to the HVDC link from the ACE equation if it is modeled as internal generation or load.

R10. The Balancing Authority shall include all Dynamic Schedules in the calculation of Net Scheduled Interchange for the ACE equation.

R11. Balancing Authorities shall include the effect of ramp rates, which shall be identical and agreed to between affected Balancing Authorities, in the Scheduled Interchange values to calculate ACE.

R12. Each Balancing Authority shall include all Tie Line flows with Adjacent Balancing Authority Areas in the ACE calculation.

R12.1. Balancing Authorities that share a tie shall ensure Tie Line MW metering is telemetered to both control centers, and emanates from a common, agreed-upon source using common primary metering equipment. Balancing Authorities shall ensure that megawatt-hour data is telemetered or reported at the end of each hour.

R12.2. Balancing Authorities shall ensure the power flow and ACE signals that are utilized for calculating Balancing Authority performance or that are transmitted for Regulation Service are not filtered prior to transmission, except for the Anti-aliasing Filters of Tie Lines.

R12.3. Balancing Authorities shall install common metering equipment where Dynamic Schedules or Pseudo-Ties are implemented between two or more Balancing Authorities to deliver the output of Jointly Owned Units or to serve remote load.

R13. Each Balancing Authority shall perform hourly error checks using Tie Line megawatt-hour meters with common time synchronization to determine the accuracy of its control equipment. The Balancing Authority shall adjust the component (e.g., Tie Line meter) of ACE that is in error (if known) or use the interchange meter error (I_{ME}) term of the ACE equation to compensate for any equipment error until repairs can be made.

R14. The Balancing Authority shall provide its operating personnel with sufficient instrumentation and data recording equipment to facilitate monitoring of control performance, generation response, and after-the-fact analysis of area performance. As a minimum, the Balancing Authority shall provide its operating personnel with real-time values for ACE, Interconnection frequency and Net Actual Interchange with each Adjacent Balancing Authority Area.

R15. The Balancing Authority shall provide adequate and reliable backup power supplies and shall periodically test these supplies at the Balancing Authority's control center and other critical

locations to ensure continuous operation of AGC and vital data recording equipment during loss of the normal power supply.

R16. The Balancing Authority shall sample data at least at the same periodicity with which ACE is calculated. The Balancing Authority shall flag missing or bad data for operator display and archival purposes. The Balancing Authority shall collect coincident data to the greatest practical extent, i.e., ACE, Interconnection frequency, Net Actual Interchange, and other data shall all be sampled at the same time.

R17. Each Balancing Authority shall at least annually check and calibrate its time error and frequency devices against a common reference. The Balancing Authority shall adhere to the minimum values for measuring devices as listed below:

Device	Accuracy
Digital frequency transducer	≤ 0.001 Hz
MW, MVAR, and voltage transducer	≤ 0.25 % of full scale
Remote terminal unit	≤ 0.25 % of full scale
Potential transformer	≤ 0.30 % of full scale
Current transformer	≤ 0.50 % of full scale

C. Measures

Not specified.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Balancing Authorities shall be prepared to supply data to NERC in the format defined below:

1.1.1. Within one week upon request, Balancing Authorities shall provide NERC or the Regional Reliability Organization CPS source data in daily CSV files with time stamped one minute averages of: 1) ACE and 2) Frequency Error.

1.1.2. Within one week upon request, Balancing Authorities shall provide NERC or the Regional Reliability Organization DCS source data in CSV files with time stamped scan rate values for: 1) ACE and 2) Frequency Error for a time period of two minutes prior to thirty minutes after the identified Disturbance.

1.2. Compliance Monitoring Period and Reset Timeframe

Not specified.

1.3. Data Retention

1.3.1. Each Balancing Authority shall retain its ACE, actual frequency, Scheduled Frequency, Net Actual Interchange, Net Scheduled Interchange, Tie Line meter error correction and Frequency Bias Setting data in digital format at the same scan rate at which the data is collected for at least one year.

1.3.2. Each Balancing Authority or Reserve Sharing Group shall retain documentation of the magnitude of each Reportable Disturbance as well as the ACE charts and/or samples used to calculate Balancing Authority or

Reserve Sharing Group disturbance recovery values. The data shall be retained for one year following the reporting quarter for which the data was recorded.

1.4. Additional Compliance Information

Not specified.

2. Levels of Non-Compliance

Not specified.

E. Regional Differences

None identified.

F. Associated Documents

1. Appendix 1 — Interpretation of Requirement R17 (February 12, 2008).

Version History

Version	Date	Action	Change Tracking
0	February 8, 2005	Adopted by NERC Board of Trustees	New
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
0a	December 19, 2007	Added Appendix 1 – Interpretation of R17 approved by BOT on May 2, 2007	Addition
0a	January 16, 2008	Section F: added "1."; changed hyphen to "en dash." Changed font style for "Appendix 1" to Arial	Errata
0b	February 12, 2008	Replaced Appendix 1 – Interpretation of R17 approved by BOT on February 12, 2008 (BOT approved retirement of Interpretation included in BAL-005-0a)	Replacement
0.1b	October 29, 2008	BOT approved errata changes; updated version number to "0.1b"	Errata
0.1b	May 13, 2009	FERC approved – Updated Effective Date	Addition
0.2b	March 8, 2012	Errata adopted by Standards Committee; (replaced Appendix 1 with the FERC-approved revised interpretation of R17 and corrected standard version referenced in Interpretation by changing from "BAL-005-1" to "BAL-005-0)	Errata
0.2b	September 13, 2012	FERC approved – Updated Effective Date	Addition
0.2b	TBD	R2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

Appendix 1

Effective Date: August 27, 2008 (U.S.)

Interpretation of BAL-005-0 Automatic Generation Control, R17

Request for Clarification received from PGE on July 31, 2007

PGE requests clarification regarding the measuring devices for which the requirement applies, specifically clarification if the requirement applies to the following measuring devices:

- *Only equipment within the operations control room*
- *Only equipment that provides values used to calculate AGC ACE*
- *Only equipment that provides values to its SCADA system*
- *Only equipment owned or operated by the BA*
- *Only to new or replacement equipment*
- *To all equipment that a BA owns or operates*

BAL-005-0

R17. Each Balancing Authority shall at least annually check and calibrate its time error and frequency devices against a common reference. The Balancing Authority shall adhere to the minimum values for measuring devices as listed below:

Device	Accuracy
Digital frequency transducer	≤ 0.001 Hz
MW, MVAR, and voltage transducer	≤ 0.25% of full scale
Remote terminal unit	≤ 0.25% of full scale
Potential transformer	≤ 0.30% of full scale
Current transformer	≤ 0.50% of full scale

Existing Interpretation Approved by Board of Trustees May 2, 2007

BAL-005-0, Requirement 17 requires that the Balancing Authority check and calibrate its control room time error and frequency devices against a common reference at least annually. The requirement to "annually check and calibrate" does not address any devices outside of the operations control room.

The table represents the design accuracy of the listed devices. There is no requirement within the standard to "annually check and calibrate" the devices listed in the table, unless they are included in the control center time error and frequency devices.

Interpretation provided by NERC Frequency Task Force on September 7, 2007 and Revised on November 16, 2007

As noted in the existing interpretation, BAL-005-0 Requirement 17 applies only to the time error and frequency devices that provide, or in the case of back-up equipment may provide, input into the reporting or compliance ACE equation or provide real-time time error or frequency information to the system

operator. Frequency inputs from other sources that are for reference only are excluded. The time error and frequency measurement devices may not necessarily be located in the system operations control room or owned by the Balancing Authority; however the Balancing Authority has the responsibility for the accuracy of the frequency and time error measurement devices. No other devices are included in R 17. The other devices listed in the table at the end of R17 are for reference only and do not have any mandatory calibration or accuracy requirements.

New or replacement equipment that provides the same functions noted above requires the same calibrations. Some devices used for time error and frequency measurement cannot be calibrated as such. In this case, these devices should be cross-checked against other properly calibrated equipment and replaced if the devices do not meet the required level of accuracy.

A. Introduction

1. **Title:** **Sabotage Reporting**

2. **Number:** CIP-001-2a

3. **Purpose:** Disturbances or unusual occurrences, suspected or determined to be caused by sabotage, shall be reported to the appropriate systems, governmental agencies, and regulatory bodies.

4. **Applicability**

   4.1. Reliability Coordinators.

   4.2. Balancing Authorities.

   4.3. Transmission Operators.

   4.4. Generator Operators.

   4.5. Load Serving Entities.

   4.6. Transmission Owners (only in ERCOT Region).

   4.7. Generator Owners (only in ERCOT Region).

5. **Effective Date:** ERCOT Regional Variance will be effective the first day of the first calendar quarter after applicable regulatory approval.

B. Requirements

R1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection.

R2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection.

R3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall provide its operating personnel with sabotage response guidelines, including personnel to contact, for reporting disturbances due to sabotage events.

R4. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall establish communications contacts, as applicable, with local Federal Bureau of Investigation (FBI) or Royal Canadian Mounted Police (RCMP) officials and develop reporting procedures as appropriate to their circumstances. (Retired)

C. Measures

M1. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement 1

M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements 2 and 3.

M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited to procedures, policies, a letter of understanding, communication records, or other equivalent evidence that will be used to confirm that it has established communications contacts with the applicable, local FBI or RCMP officials to communicate sabotage events (Requirement 4). (Retired)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organizations shall be responsible for compliance monitoring.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to verify compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Reliability Coordinator, Transmission Operator, Generator Operator, Distribution Provider, and Load Serving Entity shall have current, in-force documents available as evidence of compliance as specified in each of the Measures.

If an entity is found non-compliant the entity shall keep information related to the non-compliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance:

2.1. Level 1: There shall be a separate Level 1 non-compliance, for every one of the following requirements that is in violation:

2.1.1 Does not have procedures for the recognition of and for making its operating personnel aware of sabotage events (R1).

2.1.2 Does not have procedures or guidelines for the communication of information concerning sabotage events to appropriate parties in the Interconnection (R2).

2.1.3 Has not established communications contacts, as specified in R4. (Retired)

2.2. Level 2: Not applicable.

2.3. Level 3: Has not provided its operating personnel with sabotage response procedures or guidelines (R3).

2.4. Level 4:.Not applicable.

E. ERCOT Interconnection-wide Regional Variance

Requirements

EA.1. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall have procedures for the recognition of and for making their operating personnel aware of sabotage events on its facilities and multi-site sabotage affecting larger portions of the Interconnection.

EA.2. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection.

EA.3. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall provide its operating personnel with sabotage response guidelines, including personnel to contact, for reporting disturbances due to sabotage events.

EA.4. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall establish communications contacts with local Federal Bureau of Investigation (FBI) officials and develop reporting procedures as appropriate to their circumstances. (Retired)

Measures

M.A.1. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall have and provide upon request a procedure (either electronic or hard copy) as defined in Requirement EA1.

M.A.2. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall have and provide upon request the procedures or guidelines that will be used to confirm that it meets Requirements EA2 and EA3.

M.A.3. Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall have and provide upon request evidence that could include, but is not limited to, procedures, policies, a letter of understanding, communication records,

or other equivalent evidence that will be used to confirm that it has established communications contacts with the local FBI officials to communicate sabotage events (Requirement EA4). (Retired)

Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity shall be responsible for compliance monitoring.

1.2. Data Retention

Each Reliability Coordinator, Balancing Authority, Transmission Owner, Transmission Operator, Generator Owner, Generator Operator, and Load Serving Entity shall have current, in-force documents available as evidence of compliance as specified in each of the Measures.

If an entity is found non-compliant the entity shall keep information related to the non-compliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed “Proposed” from Effective Date	Errata

Appendix 1

Requirement Number and Text of Requirement
CIP-001-1: **R2**. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load Serving Entity shall have procedures for the communication of information concerning sabotage events to appropriate parties in the Interconnection.
Question
Please clarify what is meant by the term, "appropriate parties." Moreover, who within the Interconnection hierarchy deems parties to be appropriate?
Response
The drafting team interprets the phrase "appropriate parties in the Interconnection" to refer collectively to entities with whom the reporting party has responsibilities and/or obligations for the communication of physical or cyber security event information. For example, reporting responsibilities result from NERC standards IRO-001 Reliability Coordination — Responsibilities and Authorities, COM-002-2 Communication and Coordination, and TOP-001 Reliability Responsibilities and Authorities, among others. Obligations to report could also result from agreements, processes, or procedures with other parties, such as may be found in operating agreements and interconnection agreements. The drafting team asserts that those entities to which communicating sabotage events is appropriate would be identified by the reporting entity and documented within the procedure required in CIP-001-1 Requirement R2. Regarding "who within the Interconnection hierarchy deems parties to be appropriate," the drafting team knows of no interconnection authority that has such a role.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-3

3. Purpose: Standard CIP-003-3 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-3 should be read as part of a group of standards numbered Standards CIP-002-3 through CIP-009-3.

4. Applicability:

4.1. Within the text of Standard CIP-003-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-3:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-3, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-3 Requirement R2.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-3 through CIP-009-3, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets. (Retired)

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-3 through CIP-009-3.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-3 through CIP-009-3, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s). (Retired)

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s). (Retired)

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures. (Retired)

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented. (Retired)

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-3, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information. (Retired)

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2. (R1.2 retired)

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3. (Retired)

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Requirement R2 applies to all Responsible Entities, including Responsible Entities which have no Critical Cyber Assets. Modified the personnel identification information requirements in R5.1.1 to include name, title, and the information for which they are responsible for authorizing access (removed the business phone information). Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update

	3	TBD	R1.2, R3, R3.1, R3.2, R3.3, and R4.2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-4

3. Purpose: Standard CIP-003-4 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-003-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-4 Requirement R2.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets. (Retired)

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-4 through CIP-009-4, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s). (Retired)

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s). (Retired)

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures. (Retired)

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented. (Retired)

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-4, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information. (Retired)

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2. (R1.2 retired)

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3. (Retired)

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	MEDIUM	N/A	N/A	The Responsible Entity has documented but not implemented a cyber security policy.	The Responsible Entity has not documented nor implemented a cyber security policy.
R1.1.	LOWER	N/A	N/A	N/A	The Responsible Entity's cyber security policy does not address all the requirements in Standards CIP-002-4 through CIP-009-4, including provision for emergency situations.
R1.2. (Retired)	LOWER	N/A	N/A	N/A	The Responsible Entity's cyber security policy is not readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.
R1.3	LOWER	N/A	N/A	The Responsible Entity's senior manager, assigned pursuant to R2, annually reviewed but did not annually approve its cyber security policy.	The Responsible Entity's senior manager, assigned pursuant to R2, did not annually review nor approve its cyber security policy.
R2.	LOWER	N/A	N/A	N/A	The Responsible Entity has not assigned a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-4 through CIP-009-4.
R2.1.	LOWER	N/A	N/A	N/A	The senior manager is not identified by name, title, and date of designation.
R2.2.	LOWER	Changes to the senior manager were documented in greater than 30 but less than 60 days of the effective date.	Changes to the senior manager were documented in 60 or more but less than 90 days of the effective date.	Changes to the senior manager were documented in 90 or more but less than 120 days of the effective date.	Changes to the senior manager were documented in 120 or more days of the effective date.
R2.3.	LOWER	N/A	N/A	The identification of a senior manager's delegate does not include at least one of the following; name, title, or date of the designation, OR The document is not approved by the senior manager, OR Changes to the delegated authority are not documented	A senior manager's delegate is not identified by name, title, and date of designation; the document delegating the authority does not identify the authority being delegated; the document delegating the authority is not approved by the senior manager; AND changes to the delegated authority are not documented within thirty calendar days of the effective date.

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
				within thirty calendar days of the effective date.	
R2.4	LOWER	N/A	N/A	N/A	The senior manager or delegate(s) did not authorize and document any exceptions from the requirements of the cyber security policy as required.
R3. (Retired)	LOWER	N/A	N/A	In Instances where the Responsible Entity cannot conform to its cyber security policy (pertaining to CIP 002 through CIP 009), exceptions were documented, but were not authorized by the senior manager or delegate(s).	In Instances where the Responsible Entity cannot conform to its cyber security policy (pertaining to CIP 002 through CIP 009), exceptions were not documented, and were not authorized by the senior manager or delegate(s).
R3.1. (Retired)	LOWER	Exceptions to the Responsible Entity's cyber security policy were documented in more than 30 but less than 60 days of being approved by the senior manager or delegate(s).	Exceptions to the Responsible Entity's cyber security policy were documented in 60 or more but less than 90 days of being approved by the senior manager or delegate(s).	Exceptions to the Responsible Entity's cyber security policy were documented in 90 or more but less than 120 days of being approved by the senior manager or delegate(s).	Exceptions to the Responsible Entity's cyber security policy were documented in 120 or more days of being approved by the senior manager or delegate(s).
R3.2. (Retired)	LOWER	N/A	N/A	The Responsible Entity has a documented exception to the cyber security policy (pertaining to CIP 002-4 through CIP 009-4) but did not include either: 1) an explanation as to why the exception is necessary, or 2) any compensating measures.	The Responsible Entity has a documented exception to the cyber security policy (pertaining to CIP 002-4 through CIP 009-4) but did not include both: 1) an explanation as to why the exception is necessary, and 2) any compensating measures.
R3.3. (Retired)	LOWER	N/A	N/A	Exceptions to the cyber security policy (pertaining to CIP 002-4 through CIP 009-4) were reviewed but not approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid.	Exceptions to the cyber security policy (pertaining to CIP 002-4 through CIP 009-4) were not reviewed nor approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid.
R4.	MEDIUM	N/A	The Responsible Entity implemented but did not document a program to identify, classify, and protect information associated with Critical Cyber Assets.	The Responsible Entity documented but did not implement a program to identify, classify, and protect information associated with Critical Cyber Assets.	The Responsible Entity did not implement nor document a program to identify, classify, and protect information associated with Critical Cyber Assets.
R4.1.	MEDIUM	N/A	N/A	The information protection program does not include one of the minimum information types to be protected as detailed in R4.1.	The information protection program does not include two or more of the minimum information types to be protected as detailed in R4.1.

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R4.2. (Retired)	LOWER	N/A	N/A	N/A	The Responsible Entity did not classify the information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.
R4.3.	LOWER	N/A	The Responsible Entity annually assessed adherence to its Critical Cyber Asset information protection program, documented the assessment results, which included deficiencies identified during the assessment but did not implement a remediation plan.	The Responsible Entity annually assessed adherence to its Critical Cyber Asset information protection program, did not document the assessment results, and did not implement a remediation plan.	The Responsible Entity did not annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, nor implement an action plan to remediate deficiencies identified during the assessment.
R5.	LOWER	N/A	The Responsible Entity implemented but did not document a program for managing access to protected Critical Cyber Asset information.	The Responsible Entity documented but did not implement a program for managing access to protected Critical Cyber Asset information.	The Responsible Entity did not implement nor document a program for managing access to protected Critical Cyber Asset information.
R5.1.	LOWER	N/A	N/A	The Responsible Entity maintained a list of designated personnel for authorizing either logical or physical access but not both.	The Responsible Entity did not maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.
R5.1.1.	LOWER	N/A	N/A	The Responsible Entity did identify the personnel by name and title but did not identify the information for which they are responsible for authorizing access.	The Responsible Entity did not identify the personnel by name and title nor the information for which they are responsible for authorizing access.
R5.1.2.	LOWER	N/A	N/A	N/A	The Responsible Entity did not verify at least annually the list of personnel responsible for authorizing access to protected information.
R5.2.	LOWER	N/A	N/A	N/A	The Responsible Entity did not review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.
R5.3.	LOWER	N/A	N/A	N/A	The Responsible Entity did not assess and document at least annually the processes for controlling access privileges to protected information.
R6.	LOWER	The Responsible Entity has established but not documented a change	The Responsible Entity has established but not documented both a change control process and configuration management	The Responsible Entity has not established and documented a change control process OR	The Responsible Entity has not established and documented a change control process AND

		control process OR The Responsible Entity has established but not documented a configuration management process.	process.	The Responsible Entity has not established and documented a configuration management process.	The Responsible Entity has not established and documented a configuration management process.

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Requirement R2 applies to all Responsible Entities, including Responsible Entities which have no Critical Cyber Assets. Modified the personnel identification information requirements in R5.1.1 to include name, title, and the information for which they are responsible for authorizing access (removed the business phone information). Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)
4	4/19/12	FERC Order issued approving CIP-003-4 (approval becomes effective June 25, 2012) Added approved VRF/VSL table to section D.2.	
3, 4	TBD	R1.2, R3, R3.1, R3.2, R3.3, and R4.2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-3a

3. Purpose: Standard CIP-005-3 requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005-3 should be read as part of a group of standards numbered Standards CIP-002-3 through CIP-009-3.

4. Applicability

4.1. Within the text of Standard CIP-005-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-005-3:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-3, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-3.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-3; Standard CIP-004-3 Requirement R3; Standard CIP-005-3 Requirements R2 and R3; Standard CIP-006-3 Requirement R3; Standard CIP-007-3 Requirements R1 and R3 through R9; Standard CIP-008-3; and Standard CIP-009-3.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-3 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner. (Retired)

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings;

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-3.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005-3 reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-3 at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-3.

C. Measures

M1. The Responsible Entity shall make available documentation about the Electronic Security Perimeter as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its annual vulnerability assessment as specified in Requirement R4.

M5. The Responsible Entity shall make available access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless: a) longer retention is required pursuant to Standard CIP-008-3, Requirement R2; b) directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005-3 from the previous full calendar year.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change “Critical Assets,” to “Critical Cyber Assets” as intended.	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Revised the wording of the Electronic Access Controls requirement stated in R2.3 to clarify that the Responsible Entity	

		shall “implement and maintain” a procedure for securing dial-up access to the Electronic Security Perimeter(s). Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update
3a	02/16/10	Added Appendix 1 – Interpretation of R1.3 approved by BOT on February 16, 2010	Interpretation

3a	TBD	R2.6 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

Appendix 1

Requirement Number and Text of Requirement
Section 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. **Requirement R1.3** Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).
Question 1 (Section 4.2.2)
What kind of cyber assets are referenced in 4.2.2 as "associated"? What else could be meant except the devices forming the communication link?
Response to Question 1
In the context of applicability, associated Cyber Assets refer to any communications devices external to the Electronic Security Perimeter, i.e., beyond the point at which access to the Electronic Security Perimeter is controlled. Devices controlling access into the Electronic Security Perimeter are not exempt.
Question 2 (Section 4.2.2)
Is the communication link physical or logical? Where does it begin and terminate?
Response to Question 2
The drafting team interprets the data communication link to be physical or logical, and its termination points depend upon the design and architecture of the communication link.
Question 3 (Requirement R1.3)
Please clarify what is meant by an “endpoint”? Is it physical termination? Logical termination of OSI layer 2, layer 3, or above?
Response to Question 3
The drafting team interprets the endpoint to mean the device at which a physical or logical communication link terminates. The endpoint is the Electronic Security Perimeter access point if access into the Electronic Security Perimeter is controlled at the endpoint, irrespective of which Open Systems Interconnection (OSI) layer is managing the communication.
Question 4 (Requirement R1.3)
If “endpoint” is defined as logical and refers to layer 3 and above, please clarify if the termination points of an encrypted tunnel (layer 3) must be treated as an “access point? If two control centers are owned and managed by the same entity, connected via an encrypted link by properly applied Federal

Information Processing Standards, with tunnel termination points that are within the control center ESPs and PSPs and do not terminate on the firewall but on a separate internal device, and the encrypted traffic already passes through a firewall access point at each ESP boundary where port/protocol restrictions are applied, must these encrypted communication tunnel termination points be treated as "access points" in addition to the firewalls through which the encrypted traffic has already passed?
Response to Question 4
In the case where the “endpoint” is defined as logical and is >= layer 3, the termination points of an encrypted tunnel must be treated as an “access point.” The encrypted communication tunnel termination points referred to above are “access points.”

A. Introduction

1. Title: Cyber Security — Electronic Security Perimeter(s)

2. Number: CIP-005-4a

3. Purpose: Standard CIP-005-4a requires the identification and protection of the Electronic Security Perimeter(s) inside which all Critical Cyber Assets reside, as well as all access points on the perimeter. Standard CIP-005-4a should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability

4.1. Within the text of Standard CIP-005-4a, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity

4.2. The following are exempt from Standard CIP-005-4a:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

4.2.4 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Electronic Security Perimeter — The Responsible Entity shall ensure that every Critical Cyber Asset resides within an Electronic Security Perimeter. The Responsible Entity shall identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s).

R1.1. Access points to the Electronic Security Perimeter(s) shall include any externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).

R1.2. For a dial-up accessible Critical Cyber Asset that uses a non-routable protocol, the Responsible Entity shall define an Electronic Security Perimeter for that single access point at the dial-up device.

R1.3. Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).

R1.4. Any non-critical Cyber Asset within a defined Electronic Security Perimeter shall be identified and protected pursuant to the requirements of Standard CIP-005-4a.

R1.5. Cyber Assets used in the access control and/or monitoring of the Electronic Security Perimeter(s) shall be afforded the protective measures as a specified in Standard CIP-003-4; Standard CIP-004-4 Requirement R3; Standard CIP-005-4a Requirements R2 and R3; Standard CIP-006-4c Requirement R3; Standard CIP-007-4 Requirements R1 and R3 through R9; Standard CIP-008-4; and Standard CIP-009-4.

R1.6. The Responsible Entity shall maintain documentation of Electronic Security Perimeter(s), all interconnected Critical and non-critical Cyber Assets within the Electronic Security Perimeter(s), all electronic access points to the Electronic Security Perimeter(s) and the Cyber Assets deployed for the access control and monitoring of these access points.

R2. Electronic Access Controls — The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for control of electronic access at all electronic access points to the Electronic Security Perimeter(s).

R2.1. These processes and mechanisms shall use an access control model that denies access by default, such that explicit access permissions must be specified.

R2.2. At all access points to the Electronic Security Perimeter(s), the Responsible Entity shall enable only ports and services required for operations and for monitoring Cyber Assets within the Electronic Security Perimeter, and shall document, individually or by specified grouping, the configuration of those ports and services.

R2.3. The Responsible Entity shall implement and maintain a procedure for securing dial-up access to the Electronic Security Perimeter(s).

R2.4. Where external interactive access into the Electronic Security Perimeter has been enabled, the Responsible Entity shall implement strong procedural or technical controls at the access points to ensure authenticity of the accessing party, where technically feasible.

R2.5. The required documentation shall, at least, identify and describe:

R2.5.1. The processes for access request and authorization.

R2.5.2. The authentication methods.

R2.5.3. The review process for authorization rights, in accordance with Standard CIP-004-4 Requirement R4.

R2.5.4. The controls used to secure dial-up accessible connections.

R2.6. Appropriate Use Banner — Where technically feasible, electronic access control devices shall display an appropriate use banner on the user screen upon all interactive access attempts. The Responsible Entity shall maintain a document identifying the content of the banner. (Retired)

R3. Monitoring Electronic Access — The Responsible Entity shall implement and document an electronic or manual process(es) for monitoring and logging access at access points to the Electronic Security Perimeter(s) twenty-four hours a day, seven days a week.

R3.1. For dial-up accessible Critical Cyber Assets that use non-routable protocols, the Responsible Entity shall implement and document monitoring process(es) at each access point to the dial-up device, where technically feasible.

R3.2. Where technically feasible, the security monitoring process(es) shall detect and alert for attempts at or actual unauthorized accesses. These alerts shall provide for appropriate notification to designated response personnel. Where alerting is not technically feasible, the Responsible Entity shall review or otherwise assess access logs for attempts at or actual unauthorized accesses at least every ninety calendar days.

R4. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of the electronic access points to the Electronic Security Perimeter(s) at least annually. The vulnerability assessment shall include, at a minimum, the following:

R4.1. A document identifying the vulnerability assessment process;

R4.2. A review to verify that only ports and services required for operations at these access points are enabled;

R4.3. The discovery of all access points to the Electronic Security Perimeter;

R4.4. A review of controls for default accounts, passwords, and network management community strings;

R4.5. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R5. Documentation Review and Maintenance — The Responsible Entity shall review, update, and maintain all documentation to support compliance with the requirements of Standard CIP-005-4a.

R5.1. The Responsible Entity shall ensure that all documentation required by Standard CIP-005-4a reflect current configurations and processes and shall review the documents and procedures referenced in Standard CIP-005-4a at least annually.

R5.2. The Responsible Entity shall update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.

R5.3. The Responsible Entity shall retain electronic access logs for at least ninety calendar days. Logs related to reportable incidents shall be kept in accordance with the requirements of Standard CIP-008-4.

C. Measures

M1. The Responsible Entity shall make available documentation about the Electronic Security Perimeter as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation of the electronic access controls to the Electronic Security Perimeter(s), as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of controls implemented to log and monitor access to the Electronic Security Perimeter(s) as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its annual vulnerability assessment as specified in Requirement R4.

M5. The Responsible Entity shall make available access logs and documentation of review, changes, and log retention as specified in Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.1 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.1 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.2 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep logs for a minimum of ninety calendar days, unless: a) longer retention is required pursuant to Standard CIP-008-4, Requirement R2; b) directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall keep other documents and records required by Standard CIP-005-4a from the previous full calendar year.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

2. Violation Severity Levels

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	MEDIUM	The Responsible Entity did not document one or more access points to the Electronic Security Perimeter(s).	The Responsible Entity identified but did not document one or more Electronic Security Perimeter(s).	The Responsible Entity did not ensure that one or more of the Critical Cyber Assets resides within an Electronic Security Perimeter. OR The Responsible Entity did not identify nor document one or more Electronic Security Perimeter(s).	The Responsible Entity did not ensure that one or more Critical Cyber Assets resides within an Electronic Security Perimeter, and the Responsible Entity did not identify and document the Electronic Security Perimeter(s) and all access points to the perimeter(s) for all Critical Cyber Assets.
R1.1.	MEDIUM	N/A	N/A	N/A	Access points to the Electronic Security Perimeter(s) do not include all externally connected communication end point (for example, dial-up modems) terminating at any device within the Electronic Security Perimeter(s).
R1.2.	MEDIUM	N/A	N/A	N/A	For one or more dial-up accessible Critical Cyber Assets that use a non-routable protocol, the Responsible Entity did not define an Electronic Security Perimeter for that single access point at the dial-up device.
R1.3.	MEDIUM	N/A	N/A	N/A	At least one end point of a communication link within the Electronic Security Perimeter(s) connecting discrete Electronic Security Perimeters was not considered an access point to the Electronic Security Perimeter.
R1.4.	MEDIUM	N/A	One or more non-critical Cyber Asset within a defined Electronic Security Perimeter is not identified but is protected pursuant to the requirements of Standard CIP-005.	One or more non-critical Cyber Asset within a defined Electronic Security Perimeter is identified but not protected pursuant to the requirements of Standard CIP-005.	One or more non-critical Cyber Asset within a defined Electronic Security Perimeter is not identified and is not protected pursuant to the requirements of Standard CIP-005.

R5.1.	LOWER	N/A	The Responsible Entity did not provide evidence of an annual review of the documents and procedures referenced in Standard CIP-005-4.	The Responsible Entity did not document current configurations and processes referenced in Standard CIP-005-4.	The Responsible Entity did not document current configurations and processes and did not review the documents and procedures referenced in Standard CIP-005-4 at least annually.
R5.2.	LOWER	For less than 5% of the applicable changes, the Responsible Entity did not update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	For 5% or more but less than 10% of the applicable changes, the Responsible Entity did not update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	For 10% or more but less than 15% of the applicable changes, the Responsible Entity did not update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.	For 15% or more of the applicable changes, the Responsible Entity did not update the documentation to reflect the modification of the network or controls within ninety calendar days of the change.
R5.3.	LOWER	The Responsible Entity retained electronic access logs for 75 or more calendar days, but for less than 90 calendar days.	The Responsible Entity retained electronic access logs for 60 or more calendar days, but for less than 75 calendar days.	The Responsible Entity retained electronic access logs for 45 or more calendar days , but for less than 60 calendar days.	The Responsible Entity retained electronic access logs for less than 45 calendar days.

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	01/16/06	D.2.3.1 — Change "Critical Assets," to "Critical Cyber Assets" as intended.	03/24/06
2	Approved by NERC Board of Trustees 5/6/09	Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Revised the wording of the Electronic Access Controls requirement stated in R2.3 to clarify that the Responsible Entity shall "implement and maintain" a procedure for securing dial-up access to the Electronic Security Perimeter(s). Changed compliance monitor to Compliance Enforcement Authority.	Revised.
3	12/16/09	Changed CIP-005-2 to CIP-005-3. Changed all references to CIP Version "2" standards to CIP Version "3" standards. For Violation Severity Levels, changed, "To be developed later" to "Developed separately."	Conforming revisions for FERC Order on CIP V2 Standards (9/30/2009)
2a	02/16/10	Added Appendix 1 — Interpretation of R1.3 approved by BOT on February 16, 2010	Addition
4a	01/24/11	Adopted by the NERC Board of Trustees	Update to conform to changes to CIP-002-4 (Project 2008-06) Update version number from "3" to "4a"
4a	4/19/12	FERC Order issued approving CIP-005-4a (approval becomes effective June 25, 2012) Added approved VRF/VSL table to section D.2.	
3a, 4a	TBD	R2.6 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

Appendix 1

Requirement Number and Text of Requirement
Section 4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters. **Requirement R1.3** Communication links connecting discrete Electronic Security Perimeters shall not be considered part of the Electronic Security Perimeter. However, end points of these communication links within the Electronic Security Perimeter(s) shall be considered access points to the Electronic Security Perimeter(s).
Question 1 (Section 4.2.2)
What kind of cyber assets are referenced in 4.2.2 as "associated"? What else could be meant except the devices forming the communication link?
Response to Question 1
In the context of applicability, associated Cyber Assets refer to any communications devices external to the Electronic Security Perimeter, i.e., beyond the point at which access to the Electronic Security Perimeter is controlled. Devices controlling access into the Electronic Security Perimeter are not exempt.
Question 2 (Section 4.2.2)
Is the communication link physical or logical? Where does it begin and terminate?
Response to Question 2
The drafting team interprets the data communication link to be physical or logical, and its termination points depend upon the design and architecture of the communication link.
Question 3 (Requirement R1.3)
Please clarify what is meant by an “endpoint”? Is it physical termination? Logical termination of OSI layer 2, layer 3, or above?
Response to Question 3
The drafting team interprets the endpoint to mean the device at which a physical or logical communication link terminates. The endpoint is the Electronic Security Perimeter access point if access into the Electronic Security Perimeter is controlled at the endpoint, irrespective of which Open Systems Interconnection (OSI) layer is managing the communication.
Question 4 (Requirement R1.3)
If “endpoint” is defined as logical and refers to layer 3 and above, please clarify if the termination points of an encrypted tunnel (layer 3) must be treated as an “access point? If two control centers are

owned and managed by the same entity, connected via an encrypted link by properly applied Federal Information Processing Standards, with tunnel termination points that are within the control center ESPs and PSPs and do not terminate on the firewall but on a separate internal device, and the encrypted traffic already passes through a firewall access point at each ESP boundary where port/protocol restrictions are applied, must these encrypted communication tunnel termination points be treated as "access points" in addition to the firewalls through which the encrypted traffic has already passed?
Response to Question 4
In the case where the “endpoint” is defined as logical and is >= layer 3, the termination points of an encrypted tunnel must be treated as an “access point.” The encrypted communication tunnel termination points referred to above are “access points.”

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-3

3. Purpose: Standard CIP-007-3 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-3 should be read as part of a group of standards numbered Standards CIP-002-3 through CIP-009-3.

4. Applicability:

4.1. Within the text of Standard CIP-007-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-3:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-3, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-3, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-3 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-3 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-3.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-3.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures. (Retired)

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-3 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-3 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment and acceptance of risk. Revised the Purpose of this standard to clarify that Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing Cyber Assets and other (non-Critical)	

		Assets within an Electronic Security Perimeter. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. R9 changed ninety (90) days to thirty (30) days Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	
3	TBD	R7.3 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-4

3. Purpose: Standard CIP-007-4 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-4 should be read as part of a group of standards numbered Standards CIP-002-4 through CIP-009-4.

4. Applicability:

4.1. Within the text of Standard CIP-007-4, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-4:

4.2.1 Facilities regulated by the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 In nuclear plants, the systems, structures, and components that are regulated by the Nuclear Regulatory Commission under a cyber security plan pursuant to 10 C.F. R. Section 73.54

4.2.4 Responsible Entities that, in compliance with Standard CIP-002-4, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the eighth calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the ninth calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-4, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-4 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures. (Retired)

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-4 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.2. The RE shall serve as the CEA with the following exceptions:

1.2.1 For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

1.2.2 For Reliability Coordinators and other functional entities that work for their Regional Entity, the ERO shall serve as the Compliance Enforcement Authority.

1.2.3 For Responsible Entities that are also Regional Entities, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.

1.2.4 For the ERO, a third-party monitor without vested interest in the outcome for the ERO shall serve as the Compliance Enforcement Authority.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-4 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

2. Violation Severity Levels

Requirement	VRF	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	MEDIUM	N/A	The Responsible Entity did create, implement and maintain the test procedures as required in R1.1, **but did not document** that testing is performed as required in R1.2. R3.	LOWER	The Responsible Entity established (implemented) and documented, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, a security patch management program **but** did not include one or more of the following: tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	The Responsible Entity established (implemented) but did not document, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	The Responsible Entity documented but did not establish (implement), either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).	The Responsible Entity did not establish (implement) nor document, either separately or as a component of the documented configuration management process specified in CIP-003-4 Requirement R6, a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).
R3.1.	LOWER	The Responsible Entity documented the assessment of security patches and security upgrades for applicability as required in Requirement R3 in more than 30 but less than 60 calendar days after the availability of the patches and upgrades.	The Responsible Entity documented the assessment of security patches and security upgrades for applicability as required in Requirement R3 in 60 or more but less than 90 calendar days after the availability of the patches and upgrades.	The Responsible Entity documented the assessment of security patches and security upgrades for applicability as required in Requirement R3 in 90 or more but less than 120 calendar days after the availability of the patches and upgrades.	The Responsible Entity documented the assessment of security patches and security upgrades for applicability as required in Requirement R3 in 120 calendar days or more after the availability of the patches and upgrades.

R3.2.	LOWER	N/A	N/A	N/A	The Responsible Entity did not document the implementation of applicable security patches as required in R3. OR Where an applicable patch was not installed, the Responsible Entity did not document the compensating measure(s) applied to mitigate risk exposure.
R4.	MEDIUM	The Responsible Entity, as technically feasible, did not use anti-virus software and other malicious software ("malware") prevention tools, nor implemented compensating measures, on at least one but less than 5% of Cyber Assets within the Electronic Security Perimeter(s).	The Responsible Entity, as technically feasible, did not use anti-virus software and other malicious software ("malware") prevention tools, nor implemented compensating measures, on at least 5% but less than 10% of Cyber Assets within the Electronic Security Perimeter(s).	The Responsible Entity, as technically feasible, did not use anti-virus software and other malicious software ("malware") prevention tools, nor implemented compensating measures, on at least 10% but less than 15% of Cyber Assets within the Electronic Security Perimeter(s).	The Responsible Entity, as technically feasible, did not use anti-virus software and other malicious software ("malware") prevention tools, nor implemented compensating measures, on 15% or more Cyber Assets within the Electronic Security Perimeter(s).
R4.1.	MEDIUM	N/A	N/A	N/A	The Responsible Entity did not document the implementation of antivirus and malware prevention tools for cyber assets within the electronic security perimeter. OR The Responsible Entity did not document the implementation of compensating measure(s) applied to mitigate risk exposure where antivirus and malware prevention tools are not installed.
R4.2.	MEDIUM	The Responsible Entity, as technically feasible, documented and implemented a process for the update of anti-virus and malware prevention "signatures.", but the process did not address testing and installation of the signatures.	The Responsible Entity, as technically feasible, did not document but implemented a process, including addressing testing and installing the signatures, for the update of anti-virus and malware prevention "signatures."	The Responsible Entity, as technically feasible, documented but did not implement a process, including addressing testing and installing the signatures, for the update of anti-virus and malware prevention "signatures."	The Responsible Entity, as technically feasible, did not document nor implement a process including addressing testing and installing the signatures for the update of anti-virus and malware prevention "signatures."
R5.	LOWER	N/A	The Responsible Entity implemented but did not document technical and procedural controls that enforce access authentication of, and accountability for, all user activity.	The Responsible Entity documented but did not implement technical and procedural controls that enforce access authentication of, and accountability for, all user activity.	The Responsible Entity did not document nor implement technical and procedural controls that enforce access authentication of, and accountability for, all user activity.

R5.1.	MEDIUM	N/A	N/A	N/A	The Responsible Entity did not ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.
R5.1.1.	LOWER	At least one user account but less than 1% of user accounts implemented by the Responsible Entity, were not approved by designated personnel.	One (1) % or more of user accounts but less than 3% of user accounts implemented by the Responsible Entity were not approved by designated personnel.	Three (3) % or more of user accounts but less than 5% of user accounts implemented by the Responsible Entity were not approved by designated personnel.	Five (5) % or more of user accounts implemented by the Responsible Entity were not approved by designated personnel.
R5.1.2.	LOWER	N/A	The Responsible Entity generated logs with sufficient detail to create historical audit trails of individual user account access activity, however the logs do not contain activity for a minimum of 90 days.	The Responsible Entity generated logs with insufficient detail to create historical audit trails of individual user account access activity.	The Responsible Entity did not generate logs of individual user account access activity.
R5.1.3.	MEDIUM	N/A	N/A	N/A	The Responsible Entity did not review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.
R5.2.	LOWER	N/A	N/A	N/A	The Responsible Entity did not implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.
R5.2.1.	MEDIUM	N/A	N/A	The Responsible Entity's policy did not include the removal, disabling, or renaming of such accounts where possible, however for accounts that must remain enabled, passwords were changed prior to putting any system into service.	For accounts that must remain enabled, the Responsible Entity did not change passwords prior to putting any system into service.
R5.2.2.	LOWER	N/A	N/A	N/A	The Responsible Entity did not identify all individuals with access to shared accounts.
R5.2.3.	MEDIUM	N/A	Where such accounts must be shared, the Responsible Entity has a policy for managing the use of such accounts, but is missing 1 of the following 3 items: a) limits access to only those with authorization, b) has an audit trail of the account use (automated or	Where such accounts must be shared, the Responsible Entity has a policy for managing the use of such accounts, but is missing 2 of the following 3 items: a) limits access to only those with authorization, b) has an audit trail of the account use (automated or manual), c) has specified steps for securing the account in the event of personnel changes (for example, change in assignment or termination).	Where such accounts must be shared, the Responsible Entity does not have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

			manual), c) has specified steps for securing the account in the event of personnel changes (for example, change in assignment or termination).		
R5.3.	LOWER	The Responsible Entity requires and uses passwords as technically feasible, but only addresses 2 of the requirements in R5.3.1, R5.3.2., R5.3.3.	The Responsible Entity requires and uses passwords as technically feasible but only addresses 1 of the requirements in R5.3.1, R5.3.2., R5.3.3.	The Responsible Entity requires but does not use passwords as required in R5.3.1, R5.3.2., R5.3.3 and did not demonstrate why it is not technically feasible.	The Responsible Entity does not require nor use passwords as required in R5.3.1, R5.3.2., R5.3.3 and did not demonstrate why it is not technically feasible.
R5.3.1.	LOWER	N/A	N/A	N/A	N/A
R5.3.2.	LOWER	N/A	N/A	N/A	N/A
R5.3.3.	MEDIUM	N/A	N/A	N/A	N/A
R6.	LOWER	The Responsible Entity, as technically feasible, did not implement automated tools or organizational process controls to monitor system events that are related to cyber security for at least one but less than 5% of Cyber Assets inside the Electronic Security Perimeter(s).	The Responsible Entity, as technically feasible, did not implement automated tools or organizational process controls to monitor system events that are related to cyber security for 5% or more but less than 10% of Cyber Assets inside the Electronic Security Perimeter(s).	The Responsible Entity did not implement automated tools or organizational process controls, as technically feasible, to monitor system events that are related to cyber security for 10% or more but less than 15% of Cyber Assets inside the Electronic Security Perimeter(s).	The Responsible Entity did not implement automated tools or organizational process controls, as technically feasible, to monitor system events that are related to cyber security for 15% or more of Cyber Assets inside the Electronic Security Perimeter(s).
R6.1.	MEDIUM	N/A	The Responsible Entity implemented but did not document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	The Responsible Entity documented but did not implement the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	The Responsible Entity did not implement nor document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2.	MEDIUM	N/A	N/A	N/A	The Responsible entity's security monitoring controls do not issue automated or manual alerts for detected Cyber Security Incidents.
R6.3.	MEDIUM	N/A	N/A	N/A	The Responsible Entity did not maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-4.
R6.4.	LOWER	The Responsible Entity retained the logs specified in Requirement R6, for at least 60 days, but less than 90 days.	The Responsible Entity retained the logs specified in Requirement R6, for at least 30 days, but less than 60 days.	The Responsible Entity retained the logs specified in Requirement R6, for at least one day, but less than 30 days.	The Responsible Entity did not retain any logs specified in Requirement R6.
R6.5.	LOWER	N/A	N/A	N/A	The Responsible Entity did not review logs of system events related to cyber security nor maintain records documenting review of logs.
R7.	LOWER	The Responsible Entity established and implemented formal methods, processes, and procedures for disposal and redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP- 005-4 **but** did not maintain records as specified in R7.3. (Retired)	The Responsible Entity established and implemented formal methods, processes, and procedures for disposal of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-4 **but** did not address redeployment as specified in R7.2. Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment and acceptance of risk. Revised the Purpose of this standard to clarify that Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing Cyber Assets and other (non-Critical) Assets within an Electronic Security Perimeter. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. R9 changed ninety (90) days to thirty (30) days Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	
4	Board approved 01/24/2011	Update version number from “3” to “4”	Update to conform to changes to CIP-002-4 (Project 2008-06)
4	4/19/12	FERC Order issued approving CIP-007-4 (approval becomes effective June 25, 2012) Added approved VRF/VSL table to section D.2.	
3, 4	TBD	R7.3 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: **Disturbance Reporting**

2. Number: EOP-004-1

3. Purpose: Disturbances or unusual occurrences that jeopardize the operation of the Bulk Electric System, or result in system equipment damage or customer interruptions, need to be studied and understood to minimize the likelihood of similar events in the future.

4. Applicability

4.1. Reliability Coordinators.

4.2. Balancing Authorities.

4.3. Transmission Operators.

4.4. Generator Operators.

4.5. Load Serving Entities.

4.6. Regional Reliability Organizations.

5. Effective Date: January 1, 2007

B. Requirements

R1. Each Regional Reliability Organization shall establish and maintain a Regional reporting procedure to facilitate preparation of preliminary and final disturbance reports. (Retired)

R2. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall promptly analyze Bulk Electric System disturbances on its system or facilities.

R3. A Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity experiencing a reportable incident shall provide a preliminary written report to its Regional Reliability Organization and NERC.

R3.1. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity shall submit within 24 hours of the disturbance or unusual occurrence either a copy of the report submitted to DOE, or, if no DOE report is required, a copy of the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report form. Events that are not identified until some time after they occur shall be reported within 24 hours of being recognized.

R3.2. Applicable reporting forms are provided in Attachments 1-EOP-004 and 2-EOP-004.

R3.3. Under certain adverse conditions, e.g., severe weather, it may not be possible to assess the damage caused by a disturbance and issue a written Interconnection Reliability Operating Limit and Preliminary Disturbance Report within 24 hours. In such cases, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall promptly notify its Regional Reliability Organization(s) and NERC, and verbally provide as much information as is available at that

time. The affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall then provide timely, periodic verbal updates until adequate information is available to issue a written Preliminary Disturbance Report.

R3.4. If, in the judgment of the Regional Reliability Organization, after consultation with the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity in which a disturbance occurred, a final report is required, the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity shall prepare this report within 60 days. As a minimum, the final report shall have a discussion of the events and its cause, the conclusions reached, and recommendations to prevent recurrence of this type of event. The report shall be subject to Regional Reliability Organization approval.

R4. When a Bulk Electric System disturbance occurs, the Regional Reliability Organization shall make its representatives on the NERC Operating Committee and Disturbance Analysis Working Group available to the affected Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, or Load Serving Entity immediately affected by the disturbance for the purpose of providing any needed assistance in the investigation and to assist in the preparation of a final report.

R5. The Regional Reliability Organization shall track and review the status of all final report recommendations at least twice each year to ensure they are being acted upon in a timely manner. If any recommendation has not been acted on within two years, or if Regional Reliability Organization tracking and review indicates at any time that any recommendation is not being acted on with sufficient diligence, the Regional Reliability Organization shall notify the NERC Planning Committee and Operating Committee of the status of the recommendation(s) and the steps the Regional Reliability Organization has taken to accelerate implementation.

C. Measures

M1. The Regional Reliability Organization shall have and provide upon request as evidence, its current regional reporting procedure that is used to facilitate preparation of preliminary and final disturbance reports. (Requirement 1) (Retired)

M2. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load-Serving Entity that has a reportable incident shall have and provide upon request evidence that could include, but is not limited to, the preliminary report, computer printouts, operator logs, or other equivalent evidence that will be used to confirm that it prepared and delivered the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports to NERC within 24 hours of its recognition as specified in Requirement 3.1.

M3. Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and/or Load Serving Entity that has a reportable incident shall have and provide upon request evidence that could include, but is not limited to, operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence that will be used to confirm that it provided information verbally as time permitted, when system conditions precluded the preparation of a report in 24 hours. (Requirement 3.3)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

NERC shall be responsible for compliance monitoring of the Regional Reliability Organizations.

Regional Reliability Organizations shall be responsible for compliance monitoring of Reliability Coordinators, Balancing Authorities, Transmission Operators, Generator Operators, and Load-serving Entities.

1.2. Compliance Monitoring and Reset Time Frame

One or more of the following methods will be used to assess compliance:

- Self-certification (Conducted annually with submission according to schedule.)
- Spot Check Audits (Conducted anytime with up to 30 days notice given to prepare.)
- Periodic Audit (Conducted once every three years according to schedule.)
- Triggered Investigations (Notification of an investigation must be made within 60 days of an event or complaint of noncompliance. The entity will have up to 30 days to prepare for the investigation. An entity may request an extension of the preparation period and the extension will be considered by the Compliance Monitor on a case-by-case basis.)

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

Each Regional Reliability Organization shall have its current, in-force, regional reporting procedure as evidence of compliance. (Measure 1) (Retired)

Each Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and/or Load Serving Entity that is either involved in a Bulk Electric System disturbance or has a reportable incident shall keep data related to the incident for a year from the event or for the duration of any regional investigation, whichever is longer. (Measures 2 through 4)

If an entity is found non-compliant the entity shall keep information related to the noncompliance until found compliant or for two years plus the current year, whichever is longer.

Evidence used as part of a triggered investigation shall be retained by the entity being investigated for one year from the date that the investigation is closed, as determined by the Compliance Monitor,

The Compliance Monitor shall keep the last periodic audit report and all requested and submitted subsequent compliance records.

1.4. Additional Compliance Information

See Attachments:

- EOP-004 Disturbance Reporting Form
- Table 1 EOP-004

2. Levels of Non-Compliance for a Regional Reliability Organization

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: No current procedure to facilitate preparation of preliminary and final disturbance reports as specified in R1. (Retired)

3. Levels of Non-Compliance for a Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator, and Load- Serving Entity:

3.1. Level 1: There shall be a level one non-compliance if any of the following conditions exist:

3.1.1 Failed to prepare and deliver the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports to NERC within 24 hours of its recognition as specified in Requirement 3.1

3.1.2 Failed to provide disturbance information verbally as time permitted, when system conditions precluded the preparation of a report in 24 hours as specified in R3.3

3.1.3 Failed to prepare a final report within 60 days as specified in R3.4

3.2. Level 2: Not applicable.

3.3. Level 3: Not applicable

3.4. Level 4: Not applicable.

E. Regional Differences

None identified.

Attachment 1-EOP-004
NERC Disturbance Report Form

Introduction

These disturbance reporting requirements apply to all Reliability Coordinators, Balancing Authorities, Transmission Operators, Generator Operators, and Load Serving Entities, and provide a common basis for all NERC disturbance reporting. The entity on whose system a reportable disturbance occurs shall notify NERC and its Regional Reliability Organization of the disturbance using the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report forms. Reports can be sent to NERC via email (esisac@nerc.com) by facsimile (609-452-9550) using the NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report forms. If a disturbance is to be reported to the U.S. Department of Energy also, the responding entity may use the DOE reporting form when reporting to NERC. Note: All Emergency Incident and Disturbance Reports (Schedules 1 and 2) sent to DOE shall be simultaneously sent to NERC, preferably electronically at esisac@nerc.com.

The NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Reports are to be made for any of the following events:

1. The loss of a bulk power transmission component that significantly affects the integrity of interconnected system operations. Generally, a disturbance report will be required if the event results in actions such as:
   a. Modification of operating procedures.
   b. Modification of equipment (e.g. control systems or special protection systems) to prevent reoccurrence of the event.
   c. Identification of valuable lessons learned.
   d. Identification of non-compliance with NERC standards or policies.
   e. Identification of a disturbance that is beyond recognized criteria, i.e. three-phase fault with breaker failure, etc.
   f. Frequency or voltage going below the under-frequency or under-voltage load shed points.
2. The occurrence of an interconnected system separation or system islanding or both.
3. Loss of generation by a Generator Operator, Balancing Authority, or Load-Serving Entity — 2,000 MW or more in the Eastern Interconnection or Western Interconnection and 1,000 MW or more in the ERCOT Interconnection.
4. Equipment failures/system operational actions which result in the loss of firm system demands for more than 15 minutes, as described below:
   a. Entities with a previous year recorded peak demand of more than 3,000 MW are required to report all such losses of firm demands totaling more than 300 MW.
   b. All other entities are required to report all such losses of firm demands totaling more than 200 MW or 50% of the total customers being supplied immediately prior to the incident, whichever is less.
5. Firm load shedding of 100 MW or more to maintain the continuity of the bulk electric system.

6. Any action taken by a Generator Operator, Transmission Operator, Balancing Authority, or Load-Serving Entity that results in:
   a. Sustained voltage excursions equal to or greater than ±10%, or
   b. Major damage to power system components, or
   c. Failure, degradation, or misoperation of system protection, special protection schemes, remedial action schemes, or other operating systems that do not require operator intervention, which did result in, or could have resulted in, a system disturbance as defined by steps 1 through 5 above.
7. An Interconnection Reliability Operating Limit (IROL) violation as required in reliability standard TOP-007.
8. Any event that the Operating Committee requests to be submitted to Disturbance Analysis Working Group (DAWG) for review because of the nature of the disturbance and the insight and lessons the electricity supply and delivery industry could learn.

NERC Interconnection Reliability Operating Limit and Preliminary Disturbance Report

☐ Check here if this is an Interconnection Reliability Operating Limit (IROL) violation report.

1.	Organization filing report.		
2.	Name of person filing report.		
3.	Telephone number.		
4.	Date and time of disturbance. Date:(mm/dd/yy) Time/Zone:		
5.	Did the disturbance originate in your system?	Yes ☐ No ☐	
6.	Describe disturbance including: cause, equipment damage, critical services interrupted, system separation, key scheduled and actual flows prior to disturbance and in the case of a disturbance involving a special protection or remedial action scheme, what action is being taken to prevent recurrence.		
7.	Generation tripped. MW Total List generation tripped		
8.	Frequency. Just prior to disturbance (Hz): Immediately after disturbance (Hz max.): Immediately after disturbance (Hz min.):		
9.	List transmission lines tripped (specify voltage level of each line).		
10.		FIRM	INTERRUPTIBLE
	Demand tripped (MW):		
	Number of affected Customers:		

	Demand lost (MW-Minutes):		
11.	Restoration time.	INITIAL	FINAL

Attachment 2-EOP-004
U.S. Department of Energy Disturbance Reporting Requirements

Introduction

The U.S. Department of Energy (DOE), under its relevant authorities, has established mandatory reporting requirements for electric emergency incidents and disturbances in the United States. DOE collects this information from the electric power industry on Form EIA-417 to meet its overall national security and Federal Energy Management Agency's Federal Response Plan (FRP) responsibilities. DOE will use the data from this form to obtain current information regarding emergency situations on U.S. electric energy supply systems. DOE's Energy Information Administration (EIA) will use the data for reporting on electric power emergency incidents and disturbances in monthly EIA reports. In addition, the data may be used to develop legislative recommendations, reports to the Congress and as a basis for DOE investigations following severe, prolonged, or repeated electric power reliability problems.

Every Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity must use this form to submit mandatory reports of electric power system incidents or disturbances to the DOE Operations Center, which operates on a 24-hour basis, seven days a week. All other entities operating electric systems have filing responsibilities to provide information to the Reliability Coordinator, Balancing Authority, Transmission Operator, Generator Operator or Load Serving Entity when necessary for their reporting obligations and to file form EIA-417 in cases where these entities will not be involved. EIA requests that it be notified of those that plan to file jointly and of those electric entities that want to file separately.

Special reporting provisions exist for those electric utilities located within the United States, but for whom Reliability Coordinator oversight responsibilities are handled by electrical systems located across an international border. A foreign utility handling U.S. Balancing Authority responsibilities, may wish to file this information voluntarily to the DOE. Any U.S.-based utility in this international situation needs to inform DOE that these filings will come from a foreign-based electric system or file the required reports themselves.

Form EIA-417 must be submitted to the DOE Operations Center if any one of the following applies (see Table 1-EOP-004-0 — Summary of NERC and DOE Reporting Requirements for Major Electric System Emergencies):

1. Uncontrolled loss of 300 MW or more of firm system load for more than 15 minutes from a single incident.
2. Load shedding of 100 MW or more implemented under emergency operational policy.
3. System-wide voltage reductions of 3 percent or more.
4. Public appeal to reduce the use of electricity for purposes of maintaining the continuity of the electric power system.
5. Actual or suspected physical attacks that could impact electric power system adequacy or reliability; or vandalism, which target components of any security system. Actual or suspected cyber or communications attacks that could impact electric power system adequacy or vulnerability.

6. Actual or suspected cyber or communications attacks that could impact electric power system adequacy or vulnerability.
7. Fuel supply emergencies that could impact electric power system adequacy or reliability.
8. Loss of electric service to more than 50,000 customers for one hour or more.
9. Complete operational failure or shut-down of the transmission and/or distribution electrical system.

The initial DOE Emergency Incident and Disturbance Report (form EIA-417 – Schedule 1) shall be submitted to the DOE Operations Center within 60 minutes of the time of the system disruption. Complete information may not be available at the time of the disruption. However, provide as much information as is known or suspected at the time of the initial filing. If the incident is having a critical impact on operations, a telephone notification to the DOE Operations Center (202-586-8100) is acceptable, pending submission of the completed form EIA-417. Electronic submission via an on-line web-based form is the preferred method of notification. However, electronic submission by facsimile or email is acceptable.

An updated form EIA-417 (Schedule 1 and 2) is due within 48 hours of the event to provide complete disruption information. Electronic submission via facsimile or email is the preferred method of notification. Detailed DOE Incident and Disturbance reporting requirements can be found at: ftp://ftp.eia.doe.gov/pub/electricity/eiafor417.doc.

Table 1-EOP-004-0 Summary of NERC and DOE Reporting Requirements for Major Electric System Emergencies				
Incident No.	**Incident**	**Threshold**	**Report Required**	**Time**
1	Uncontrolled loss of Firm System Load	≥ 300 MW – 15 minutes or more	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
2	Load Shedding	≥ 100 MW under emergency operational policy	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
3	Voltage Reductions	3% or more – applied system-wide	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
4	Public Appeals	Emergency conditions to reduce demand	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
5	Physical sabotage, terrorism or vandalism	On physical security systems – suspected or real	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
6	Cyber sabotage, terrorism or vandalism	If the attempt is believed to have or did happen	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
7	Fuel supply emergencies	Fuel inventory or hydro storage levels ≤ 50% of normal	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
8	Loss of electric service	≥ 50,000 for 1 hour or more	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
9	Complete operation failure of electrical system	If isolated or interconnected electrical systems suffer total electrical system collapse	EIA – Sch-1 EIA – Sch-2	1 hour 48 hour
All DOE EIA-417 Schedule 1 reports are to be filed within 60-minutes after the start of an incident or disturbance All DOE EIA-417 Schedule 2 reports are to be filed within 48-hours after the start of an incident or disturbance				

All entities required to file a DOE EIA-417 report (Schedule 1 & 2) shall send a copy of these reports to NERC simultaneously, but no later than 24 hours after the start of the incident or disturbance.				
Incident No.	**Incident**	**Threshold**	**Report Required**	**Time**
1	Loss of major system component	Significantly affects integrity of interconnected system operations	NERC Prelim Final report	24 hour 60 day
2	Interconnected system separation or system islanding	Total system shutdown Partial shutdown, separation, or islanding	NERC Prelim Final report	24 hour 60 day
3	Loss of generation	≥ 2,000 – Eastern Interconnection ≥ 2,000 – Western Interconnection ≥ 1,000 – ERCOT Interconnection	NERC Prelim Final report	24 hour 60 day
4	Loss of firm load ≥15-minutes	Entities with peak demand ≥3,000: loss ≥300 MW All others ≥200MW or 50% of total demand	NERC Prelim Final report	24 hour 60 day
5	Firm load shedding	≥100 MW to maintain continuity of bulk system	NERC Prelim Final report	24 hour 60 day
6	System operation or operation actions resulting in:	• Voltage excursions ≥10% • Major damage to system components • Failure, degradation, or misoperation of SPS	NERC Prelim Final report	24 hour 60 day
7	IROL violation	Reliability standard TOP-007.	NERC Prelim Final report	72 hour 60 day
8	As requested by ORS Chairman	Due to nature of disturbance & usefulness to industry (lessons learned)	NERC Prelim Final report	24 hour 60 day
All NERC Operating Security Limit and Preliminary Disturbance reports will be filed within 24 hours after the start of the incident. If an entity must file a DOE EIA-417 report on an incident, which requires a NERC Preliminary report, the Entity may use the DOE EIA-417 form for both DOE and NERC reports.				
Any entity reporting a DOE or NERC incident or disturbance has the responsibility to also notify its Regional Reliability Organization.				

A. Introduction

1. Title: **System Restoration from Blackstart Resources**

2. Number: EOP-005-2

3. Purpose: Ensure plans, Facilities, and personnel are prepared to enable System restoration from Blackstart Resources to assure reliability is maintained during restoration and priority is placed on restoring the Interconnection.

4. Applicability:

4.1. Transmission Operators.

4.2. Generator Operators.

4.3. Transmission Owners identified in the Transmission Operators restoration plan.

4.4. Distribution Providers identified in the Transmission Operators restoration plan.

5. Proposed Effective Date: Twenty-four months after the first day of the first calendar quarter following applicable regulatory approval. In those jurisdictions where no regulatory approval is required, all requirements go into effect twenty-four months after Board of Trustees adoption.

B. Requirements

R1. Each Transmission Operator shall have a restoration plan approved by its Reliability Coordinator. The restoration plan shall allow for restoring the Transmission Operator's System following a Disturbance in which one or more areas of the Bulk Electric System (BES) shuts down and the use of Blackstart Resources is required to restore the shut down area to service, to a state whereby the choice of the next Load to be restored is not driven by the need to control frequency or voltage regardless of whether the Blackstart Resource is located within the Transmission Operator's System. The restoration plan shall include: *[Time Horizon = Operations Planning]*

R1.1. Strategies for system restoration that are coordinated with the Reliability Coordinator's high level strategy for restoring the Interconnection.

R1.2. A description of how all Agreements or mutually agreed upon procedures or protocols for off-site power requirements of nuclear power plants, including priority of restoration, will be fulfilled during System restoration.

R1.3. Procedures for restoring interconnections with other Transmission Operators under the direction of the Reliability Coordinator.

R1.4. Identification of each Blackstart Resource and its characteristics including but not limited to the following: the name of the Blackstart Resource, location, megawatt and megavar capacity, and type of unit.

R1.5. Identification of Cranking Paths and initial switching requirements between each Blackstart Resource and the unit(s) to be started.

R1.6. Identification of acceptable operating voltage and frequency limits during restoration.

R1.7. Operating Processes to reestablish connections within the Transmission Operator's System for areas that have been restored and are prepared for reconnection.

R1.8. Operating Processes to restore Loads required to restore the System, such as station service for substations, units to be restarted or stabilized, the Load needed to stabilize generation and frequency, and provide voltage control.

R1.9. Operating Processes for transferring authority back to the Balancing Authority in accordance with the Reliability Coordinator's criteria.

R2. Each Transmission Operator shall provide the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan. *[Time Horizon = Operations Planning]*

R3. Each Transmission Operator shall review its restoration plan and submit it to its Reliability Coordinator annually on a mutually agreed predetermined schedule. *[Time Horizon = Operations Planning]*

R3.1. If there are no changes to the previously submitted restoration plan, the Transmission Operator shall confirm annually on a predetermined schedule to its Reliability Coordinator that it has reviewed its restoration plan and no changes were necessary. (Retired)

R4. Each Transmission Operator shall update its restoration plan within 90 calendar days after identifying any unplanned permanent System modifications, or prior to implementing a planned BES modification, that would change the implementation of its restoration plan. *[Time Horizon = Operations Planning]*

R4.1. Each Transmission Operator shall submit its revised restoration plan to its Reliability Coordinator for approval within the same 90 calendar day period.

R5. Each Transmission Operator shall have a copy of its latest Reliability Coordinator approved restoration plan within its primary and backup control rooms so that it is available to all of its System Operators prior to its implementation date. *[Time Horizon = Operations Planning]*

R6. Each Transmission Operator shall verify through analysis of actual events, steady state and dynamic simulations, or testing that its restoration plan accomplishes its intended function. This shall be completed every five years at a minimum. Such analysis, simulations or testing shall verify: *[Time Horizon = Long-term Planning]*

R6.1. The capability of Blackstart Resources to meet the Real and Reactive Power requirements of the Cranking Paths and the dynamic capability to supply initial Loads.

R6.2. The location and magnitude of Loads required to control voltages and frequency within acceptable operating limits.

R6.3. The capability of generating resources required to control voltages and frequency within acceptable operating limits.

R7. Following a Disturbance in which one or more areas of the BES shuts down and the use of Blackstart Resources is required to restore the shut down area to service, each

affected Transmission Operator shall implement its restoration plan. If the restoration plan cannot be executed as expected the Transmission Operator shall utilize its restoration strategies to facilitate restoration. *[Time Horizon = Real-time Operations]*

R8. Following a Disturbance in which one or more areas of the BES shuts down and the use of Blackstart Resources is required to restore the shut down area to service, the Transmission Operator shall resynchronize area(s) with neighboring Transmission Operator area(s) only with the authorization of the Reliability Coordinator or in accordance with the established procedures of the Reliability Coordinator. *[Time Horizon = Real-time Operations]*

R9. Each Transmission Operator shall have Blackstart Resource testing requirements to verify that each Blackstart Resource is capable of meeting the requirements of its restoration plan. These Blackstart Resource testing requirements shall include: *[Time Horizon = Operations Planning]*

R9.1. The frequency of testing such that each Blackstart Resource is tested at least once every three calendar years.

R9.2. A list of required tests including:

R9.2.1. The ability to start the unit when isolated with no support from the BES or when designed to remain energized without connection to the remainder of the System.

R9.2.2. The ability to energize a bus. If it is not possible to energize a bus during the test, the testing entity must affirm that the unit has the capability to energize a bus such as verifying that the breaker close coil relay can be energized with the voltage and frequency monitor controls disconnected from the synchronizing circuits.

R9.3. The minimum duration of each of the required tests.

R10. Each Transmission Operator shall include within its operations training program, annual System restoration training for its System Operators to assure the proper execution of its restoration plan. This training program shall include training on the following: *[Time Horizon = Operations Planning]*

R10.1. System restoration plan including coordination with the Reliability Coordinator and Generator Operators included in the restoration plan.

R10.2. Restoration priorities.

R10.3. Building of cranking paths.

R10.4. Synchronizing (re-energized sections of the System).

R11. Each Transmission Operator, each applicable Transmission Owner, and each applicable Distribution Provider shall provide a minimum of two hours of System restoration training every two calendar years to their field switching personnel identified as performing unique tasks associated with the Transmission Operator's restoration plan that are outside of their normal tasks. *[Time Horizon = Operations Planning]*

R12. Each Transmission Operator shall participate in its Reliability Coordinator's restoration drills, exercises, or simulations as requested by its Reliability Coordinator. *[Time Horizon = Operations Planning]*

R13. Each Transmission Operator and each Generator Operator with a Blackstart Resource shall have written Blackstart Resource Agreements or mutually agreed upon procedures or protocols, specifying the terms and conditions of their arrangement. Such Agreements shall include references to the Blackstart Resource testing requirements. *[Time Horizon = Operations Planning]*

R14. Each Generator Operator with a Blackstart Resource shall have documented procedures for starting each Blackstart Resource and energizing a bus. *[Time Horizon = Operations Planning]*

R15. Each Generator Operator with a Blackstart Resource shall notify its Transmission Operator of any known changes to the capabilities of that Blackstart Resource affecting the ability to meet the Transmission Operator's restoration plan within 24 hours following such change. *[Time Horizon = Operations Planning]*

R16. Each Generator Operator with a Blackstart Resource shall perform Blackstart Resource tests, and maintain records of such testing, in accordance with the testing requirements set by the Transmission Operator to verify that the Blackstart Resource can perform as specified in the restoration plan. *[Time Horizon = Operations Planning]*

R16.1. Testing records shall include at a minimum: name of the Blackstart Resource, unit tested, date of the test, duration of the test, time required to start the unit, an indication of any testing requirements not met under Requirement R9.

R16.2. Each Generator Operator shall provide the blackstart test results within 30 calendar days following a request from its Reliability Coordinator or Transmission Operator.

R17. Each Generator Operator with a Blackstart Resource shall provide a minimum of two hours of training every two calendar years to each of its operating personnel responsible for the startup of its Blackstart Resource generation units and energizing a bus. The training program shall include training on the following: *[Time Horizon = Operations Planning]*

R17.1. System restoration plan including coordination with the Transmission Operator.

R17.2. The procedures documented in Requirement R14.

R18. Each Generator Operator shall participate in the Reliability Coordinator's restoration drills, exercises, or simulations as requested by the Reliability Coordinator. *[Time Horizon = Operations Planning]*

C. Measures

M1. Each Transmission Operator shall have a dated, documented System restoration plan developed in accordance with Requirement R1 that has been approved by its Reliability Coordinator as shown with the documented approval from its Reliability Coordinator.

M2. Each Transmission Operator shall have evidence such as e-mails with receipts or registered mail receipts that it provided the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan in accordance with Requirement R2.

M3. Each Transmission Operator shall have documentation such as a dated review signature sheet, revision histories, e-mails with receipts, or registered mail receipts, that it has annually reviewed and submitted the Transmission Operator's restoration plan to its Reliability Coordinator in accordance with Requirement R3.

M4. Each Transmission Operator shall have documentation such as dated review signature sheets, revision histories, e-mails with receipts, or registered mail receipts, that it has updated its restoration plan and submitted it to its Reliability Coordinator in accordance with Requirement R4.

M5. Each Transmission Operator shall have documentation that it has made the latest Reliability Coordinator approved copy of its restoration plan available in its primary and backup control rooms and its System Operators prior to its implementation date in accordance with Requirement R5.

M6. Each Transmission Operator shall have documentation such as power flow outputs, that it has verified that its latest restoration plan will accomplish its intended function in accordance with Requirement R6.

M7. If there has been a Disturbance in which Blackstart Resources have been utilized in restoring the shut down area of the BES to service, each Transmission Operator involved shall have evidence such as voice recordings, e-mail, dated computer printouts, or operator logs, that it implemented its restoration plan or restoration plan strategies in accordance with Requirement R7.

M8. If there has been a Disturbance in which Blackstart Resources have been utilized in restoring the shut down area of the BES to service, each Transmission Operator involved in such an event shall have evidence, such as voice recordings, e-mail, dated computer printouts, or operator logs, that it resynchronized shut down areas in accordance with Requirement R8.

M9. Each Transmission Operator shall have documented Blackstart Resource testing requirements in accordance with Requirement R9.

M10. Each Transmission Operator shall have an electronic or hard copy of the training program material provided for its System Operators for System restoration training in accordance with Requirement R10.

M11. Each Transmission Operator, each applicable Transmission Owner, and each applicable Distribution Provider shall have an electronic or hard copy of the training program material provided to their field switching personnel for System restoration training and the corresponding training records including training dates and duration in accordance with Requirement R11.

M12. Each Transmission Operator shall have evidence, such as training records, that it participated in the Reliability Coordinator's restoration drills, exercises, or simulations as requested in accordance with Requirement R12.

M13. Each Transmission Operator and Generator Operator with a Blackstart Resource shall have the dated Blackstart Resource Agreements or mutually agreed upon procedures or protocols in accordance with Requirement R13.

M14. Each Generator Operator with a Blackstart Resource shall have dated documented procedures on file for starting each unit and energizing a bus in accordance with Requirement R14.

M15. Each Generator Operator with a Blackstart Resource shall provide evidence, such as e-mails with receipts or registered mail receipts, showing that it notified its Transmission Operator of any known changes to its Blackstart Resource capabilities within twenty-four hours of such changes in accordance with Requirement R15.

M16. Each Generator Operator with a Blackstart Resource shall maintain dated documentation of its Blackstart Resource test results and shall have evidence such as e-mails with receipts or registered mail receipts, that it provided these records to its Reliability Coordinator and Transmission Operator when requested in accordance with Requirement R16.

M17. Each Generator Operator with a Blackstart Resource shall have an electronic or hard copy of the training program material provided to its operating personnel responsible for the startup and synchronization of its Blackstart Resource generation units and a copy of its dated training records including training dates and durations showing that it has provided training in accordance with Requirement R17.

M18. Each Generator Operator shall have evidence, such as dated training records, that it participated in the Reliability Coordinator's restoration drills, exercises, or simulations if requested to do so in accordance with Requirement R18.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Approved restoration plan and any restoration plans in force since the last compliance audit for Requirement R1, Measure M1.
- Provided the entities identified in its approved restoration plan with a description of any changes to their roles and specific tasks prior to the implementation date of the plan for the current calendar year and three prior calendar years for Requirement R2, Measure M2.
- Submission of the Transmission Operator's annually reviewed restoration plan to its Reliability Coordinator for the current calendar year and three prior calendar years for Requirement R3, Measure M3.
- Submission of an updated restoration plan to its Reliability Coordinator for all versions for the current calendar year and the prior three years for Requirement R4, Measure M4.
- The current, restoration plan approved by the Reliability Coordinator and any restoration plans for the last three calendar years that was made available in its control rooms for Requirement R5, Measure M5.
- The verification results for the current, approved restoration plan and the previous approved restoration plan for Requirement R6, Measure M6.
- Implementation of its restoration plan or restoration plan strategies on any occasion for three calendar years if there has been a Disturbance in which Blackstart Resources have been utilized in restoring the shut down area of the BES to service for Requirement R7, Measure M7.
- Resynchronization of shut down areas on any occasion over three calendar years if there has been a Disturbance in which Blackstart Resources have been utilized in restoring the shut down area of the BES to service for Requirement R8, Measure M8.
- The verification process and results for the current Blackstart Resource testing requirements and the last previous Blackstart Resource testing requirements for Requirement R9, Measure M9.
- Actual training program materials or descriptions for three calendar years for Requirement R10, Measure M10.
- Records of participation in all requested Reliability Coordinator restoration drills, exercises, or simulations since its last compliance audit as well as one previous compliance audit period for Requirement R12, Measure M12.

If a Transmission Operator is found non-compliant for any requirement, it shall keep information related to the non-compliance until found compliant.

The Transmission Operator, applicable Transmission Owner, and applicable Distribution provider shall keep data or evidence to show compliance as identified

below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Actual training program materials or descriptions and actual training records for three calendar years for Requirement R11, Measure M11.

If a Transmission Operator, applicable Transmission owner, or applicable Distribution Provider is found non-compliant for any requirement, it shall keep information related to the non-compliance until found compliant.

The Transmission Operator and Generator Operator with a Blackstart Resource shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Current Blackstart Resource Agreements and any Blackstart Resource Agreements or mutually agreed upon procedures or protocols in force since its last compliance audit for Requirement R13, Measure M13.

The Generator Operator with a Blackstart Resource shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Current documentation and any documentation in force since its last compliance audit on procedures to start each Blackstart Resources and for energizing a bus for Requirement R14, Measure M14.
- Notification to its Transmission Operator of any known changes to its Blackstart Resource capabilities over the last three calendar years for Requirement R15, Measure M15.
- The verification test results for the current set of requirements and one previous set for its Blackstart Resources for Requirement R16, Measure M16.
- Actual training program materials and actual training records for three calendar years for Requirement R17, Measure M17.

If a Generation Operator with a Blackstart Resource is found non-compliant for any requirement, it shall keep information related to the non-compliance until found compliant.

The Generator Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- Records of participation in all requested Reliability Coordinator restoration drills, exercises, or simulations since its last compliance audit for Requirement R18, Measure M18.

If a Generation Operator is found non-compliant for any requirement, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

E. Regional Variances

None.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	August 8, 2005	Removed "Proposed" from Effective Date	Errata
1	May 2, 2007	Approved by Board of Trustees	Revised
2	TBD	Revisions pursuant to Project 2006-03	Updated testing requirements Incorporated Attachment 1 into the requirements Updated Measures and Compliance to match new Requirements
2	August 5, 2009	Adopted by Board of Trustees	Revised
2	March 17, 2011	Order issued by FERC approving EOP-005-2 (approval effective 5/23/11)	
2	TBD	R3.1 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: Coordination of Plans For New Generation, Transmission, and End-User Facilities

2. Number: FAC-002-1

3. Purpose: To avoid adverse impacts on reliability, Generator Owners and Transmission Owners and electricity end-users must meet facility connection and performance requirements.

4. Applicability:

4.1. Generator Owner

4.2. Transmission Owner

4.3. Distribution Provider

4.4. Load-Serving Entity

4.5. Transmission Planner

4.6. Planning Authority

5. (Proposed) Effective Date: The first day of the first calendar quarter six months after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter six months after Board of Trustees' adoption.

B. Requirements

R1. The Generator Owner, Transmission Owner, Distribution Provider, and Load-Serving Entity seeking to integrate generation facilities, transmission facilities, and electricity end-user facilities shall each coordinate and cooperate on its assessments with its Transmission Planner and Planning Authority. The assessment shall include:

1.1. Evaluation of the reliability impact of the new facilities and their connections on the interconnected transmission systems.

1.2. Ensurance of compliance with NERC Reliability Standards and applicable Regional, subregional, Power Pool, and individual system planning criteria and facility connection requirements.

1.3. Evidence that the parties involved in the assessment have coordinated and cooperated on the assessment of the reliability impacts of new facilities on the interconnected transmission systems. While these studies may be performed independently, the results shall be jointly evaluated and coordinated by the entities involved.

1.4. Evidence that the assessment included steady-state, short-circuit, and dynamics studies as necessary to evaluate system performance under both normal and contingency conditions in accordance with Reliability Standards TPL-001-0, TPL-002-0, and TPL-003-0.

1.5. Documentation that the assessment included study assumptions, system performance, alternatives considered, and jointly coordinated recommendations.

R2. The Planning Authority, Transmission Planner, Generator Owner, Transmission Owner, Load-Serving Entity, and Distribution Provider shall each retain its documentation (of its evaluation of the reliability impact of the new facilities and their connections on the interconnected

transmission systems) for three years and shall provide the documentation to the Regional Reliability Organization(s) and NERC on request (within 30 calendar days). (Retired)

C. Measures

M1. The Planning Authority, Transmission Planner, Generator Owner, Transmission Owner, Load-Serving Entity, and Distribution Provider's documentation of its assessment of the reliability impacts of new facilities shall address all items in Reliability Standard FAC-002-0_R1.

M2. The Planning Authority, Transmission Planner, Generator Owner, Transmission Owner, Load-Serving Entity, and Distribution Provider shall each have evidence of its assessment of the reliability impacts of new facilities and their connections on the interconnected transmission systems is retained and provided to other entities in accordance with Reliability Standard FAC-002-0_R2. (Retired)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity.

1.2. Compliance Monitoring Period and Reset Timeframe

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits
Self-Certifications
Spot Checking
Compliance Violation Investigations
Self-Reporting

Complaints

1.4. Data Retention

Evidence of the assessment of the reliability impacts of new facilities and their connections on the interconnected transmission systems: Three years.

1.5. Additional Compliance Information

None

2. Violation Severity Levels (no changes)

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New
0	January 13, 2006	Removed duplication of "Regional Reliability Organizations(s).	Errata
1	TBD	Modified to address Order No. 693 Directives contained in paragraph 693.	Revised.

1	TBD	R2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: **Facility Ratings Methodology**

2. Number: FAC-008-1

3. Purpose: To ensure that Facility Ratings used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.

4. Applicability

4.1. Transmission Owner

4.2. Generator Owner

5. Effective Date: August 7, 2006

B. Requirements

R1. The Transmission Owner and Generator Owner shall each document its current methodology used for developing Facility Ratings (Facility Ratings Methodology) of its solely and jointly owned Facilities. The methodology shall include all of the following:

R1.1. A statement that a Facility Rating shall equal the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

R1.2. The method by which the Rating (of major BES equipment that comprises a Facility) is determined.

R1.2.1. The scope of equipment addressed shall include, but not be limited to, generators, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

R1.2.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

R1.3. Consideration of the following:

R1.3.1. Ratings provided by equipment manufacturers.

R1.3.2. Design criteria (e.g., including applicable references to industry Rating practices such as manufacturer's warranty, IEEE, ANSI or other standards).

R1.3.3. Ambient conditions.

R1.3.4. Operating limitations.

R1.3.5. Other assumptions.

R2. The Transmission Owner and Generator Owner shall each make its Facility Ratings Methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners, and Planning Authorities that have responsibility for the area in which the associated Facilities are located, within 15 business days of receipt of a request. (Retired)

R3. If a Reliability Coordinator, Transmission Operator, Transmission Planner, or Planning Authority provides written comments on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings Methodology, the Transmission Owner or Generator Owner shall provide a written response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the

Facility Ratings Methodology and, if no change will be made to that Facility Ratings Methodology, the reason why. (Retired)

C. Measures

M1. The Transmission Owner and Generator Owner shall each have a documented Facility Ratings Methodology that includes all of the items identified in FAC-008 Requirement 1.1 through FAC-008 Requirement 1.3.5.

M2. The Transmission Owner and Generator Owner shall each have evidence it made its Facility Ratings Methodology available for inspection within 15 business days of a request as follows: (Retired)

M2.1 The Reliability Coordinator shall have access to the Facility Ratings Methodologies used for Rating Facilities in its Reliability Coordinator Area. (Retired)

M2.2 The Transmission Operator shall have access to the Facility Ratings Methodologies used for Rating Facilities in its portion of the Reliability Coordinator Area. (Retired)

M2.3 The Transmission Planner shall have access to the Facility Ratings Methodologies used for Rating Facilities in its Transmission Planning Area. (Retired)

M2.4 The Planning Authority shall have access to the Facility Ratings Methodologies used for Rating Facilities in its Planning Authority Area. (Retired)

M3. If the Reliability Coordinator, Transmission Operator, Transmission Planner, or Planning Authority provides documented comments on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings Methodology, the Transmission Owner or Generator Owner shall have evidence that it provided a written response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings Methodology and, if no change will be made to that Facility Ratings Methodology, the reason why. (Retired)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

Each Transmission Owner and Generator Owner shall self-certify its compliance to the Compliance Monitor at least once every three years. New Transmission Owners and Generator Owners shall each demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be 12 months from the last finding of non-compliance.

1.3. Data Retention

The Transmission Owner and Generator Owner shall each keep all superseded portions of its Facility Ratings Methodology for 12 months beyond the date of the change in that methodology and shall keep all documented comments on the Facility Ratings Methodology and associated responses for three years. In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant.

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

1.4. Additional Compliance Information

The Transmission Owner and Generator Owner shall each make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

1.4.1 Facility Ratings Methodology

1.4.2 Superseded portions of its Facility Ratings Methodology that had been replaced, changed or revised within the past 12 months

1.4.3 Documented comments provided by a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Authority on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings methodology, and the associated responses

2. Levels of Non-Compliance

2.1. Level 1: There shall be a level one non-compliance if any of the following conditions exists:

2.1.1 The Facility Ratings Methodology does not contain a statement that a Facility Rating shall equal the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

2.1.2 The Facility Ratings Methodology does not address one of the required equipment types identified in FAC-008 R1.2.1.

2.1.3 No evidence of responses to a Reliability Coordinator's, Transmission Operator, Transmission Planner, or Planning Authority's comments on the Facility Ratings Methodology. (Retired)

2.2. Level 2: The Facility Ratings Methodology is missing the assumptions used to determine Facility Ratings or does not address two of the required equipment types identified in FAC-008 R1.2.1.

2.3. Level 3: The Facility Ratings Methodology does not address three of the required equipment types identified in FAC-008-1 R1.2.1.

2.4. Level 4: The Facility Ratings Methodology does not address both Normal and Emergency Ratings ~~or the Facility Ratings Methodology was not made available for inspection within 15 business days of receipt of a request~~. (Deleted text retired)

Formatted: Strikethrough

E. **Regional Differences**

Version History

Version	Date	Action	Change Tracking
1	01/01/05	1. Lower cased the word "draft" and "drafting team" where appropriate. 2. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 3. Changed "Timeframe" to "Time	01/20/05

		Frame" and "twelve" to "12" in item D, 1.2.	
1	TBD	R2 and R3 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. **Title:** **Facility Ratings**

2. **Number:** FAC-008-3

3. **Purpose:** To ensure that Facility Ratings used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on technically sound principles. A Facility Rating is essential for the determination of System Operating Limits.

4. **Applicability**

   4.1. Transmission Owner.

   4.2. Generator Owner.

5. **Effective Date:** The first day of the first calendar quarter that is twelve months beyond the date approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the first day of the first calendar quarter twelve months following BOT adoption.

B. Requirements

R1. Each Generator Owner shall have documentation for determining the Facility Ratings of its solely and jointly owned generator Facility(ies) up to the low side terminals of the main step up transformer if the Generator Owner does not own the main step up transformer and the high side terminals of the main step up transformer if the Generator Owner owns the main step up transformer. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The documentation shall contain assumptions used to rate the generator and at least one of the following:

- Design or construction information such as design criteria, ratings provided by equipment manufacturers, equipment drawings and/or specifications, engineering analyses, method(s) consistent with industry standards (e.g. ANSI and IEEE), or an established engineering practice that has been verified by testing or engineering analysis.
- Operational information such as commissioning test results, performance testing or historical performance records, any of which may be supplemented by engineering analyses.

1.2. The documentation shall be consistent with the principle that the Facility Ratings do not exceed the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

R2. Each Generator Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned equipment connected between the location specified in R1 and the point of interconnection with the Transmission Owner that contains all of the following. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. The methodology used to establish the Ratings of the equipment that comprises the Facility(ies) shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

- One or more industry standards developed through an open process such as Institute of Electrical and Electronic Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).
- A practice that has been verified by testing, performance history or engineering analysis.

2.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R2, Part 2.1 including identification of how each of the following were considered:

2.2.1. Equipment Rating standard(s) used in development of this methodology.

2.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

2.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

2.2.4. Operating limitations.[1]

2.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

2.4. The process by which the Rating of equipment that comprises a Facility is determined.

2.4.1. The scope of equipment addressed shall include, but not be limited to, conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

2.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

R3. Each Transmission Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned Facilities (except for those generating unit Facilities addressed in R1 and R2) that contains all of the following: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. The methodology used to establish the Ratings of the equipment that comprises the Facility shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.
- One or more industry standards developed through an open process such as Institute of Electrical and Electronics Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).
- A practice that has been verified by testing, performance history or engineering analysis.

3.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R3, Part 3.1 including identification of how each of the following were considered:

3.2.1. Equipment Rating standard(s) used in development of this methodology.

[1] Such as temporary de-ratings of impaired equipment in accordance with good utility practice.

3.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

3.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

3.2.4. Operating limitations.[2]

3.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

3.4. The process by which the Rating of equipment that comprises a Facility is determined.

3.4.1. The scope of equipment addressed shall include, but not be limited to, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

3.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

R4. Each Transmission Owner shall make its Facility Ratings methodology and each Generator Owner shall each make its documentation for determining its Facility Ratings and its Facility Ratings methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners and Planning Coordinators that have responsibility for the area in which the associated Facilities are located, within 21 calendar days of receipt of a request. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]* (Retired)

R5. If a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner's Facility Ratings methodology or Generator Owner's documentation for determining its Facility Ratings and its Facility Rating methodology, the Transmission Owner or Generator Owner shall provide a response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings methodology and, if no change will be made to that Facility Ratings methodology, the reason why. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]* (Retired)

R6. Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R7. Each Generator Owner shall provide Facility Ratings (for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) as scheduled by such requesting entities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

R8. Each Transmission Owner (and each Generator Owner subject to Requirement R2) shall provide requested information as specified below (for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s): *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

[2] Such as temporary de-ratings of impaired equipment in accordance with good utility practice.

8.1. As scheduled by the requesting entities:

8.1.1. Facility Ratings

8.1.2. Identity of the most limiting equipment of the Facilities

8.2. Within 30 calendar days (or a later date if specified by the requester), for any requested Facility with a Thermal Rating that limits the use of Facilities under the requester's authority by causing any of the following: 1) An Interconnection Reliability Operating Limit, 2) A limitation of Total Transfer Capability, 3) An impediment to generator deliverability, or 4) An impediment to service to a major load center:

8.2.1. Identity of the existing next most limiting equipment of the Facility

8.2.2. The Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1.

C. Measures

M1. Each Generator Owner shall have documentation that shows how its Facility Ratings were determined as identified in Requirement 1.

M2. Each Generator Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 2, Parts 2.1 through 2.4.

M3. Each Transmission Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 3, Parts 3.1 through 3.4.

M4. Each Transmission Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it made its Facility Ratings methodology available for inspection within 21 calendar days of a request in accordance with Requirement 4. The Generator Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it made its documentation for determining its Facility Ratings or its Facility Ratings methodology available for inspection within 21 calendar days of a request in accordance with Requirement R4. (Retired)

M5. If the Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner's or Generator Owner's Facility Ratings methodology or a Generator Owner's documentation for determining its Facility Ratings, the Transmission Owner or Generator Owner shall have evidence, (such as a copy of a dated electronic or hard copy note, or other comparable evidence from the Transmission Owner or Generator Owner addressed to the commenter that includes the response to the comment,) that it provided a response to that commenting entity in accordance with Requirement R5. (Retired)

M6. Each Transmission Owner and Generator Owner shall have evidence to show that its Facility Ratings are consistent with the documentation for determining its Facility Ratings as specified in Requirement R1 or consistent with its Facility Ratings methodology as specified in Requirements R2 and R3 (Requirement R6).

M7. Each Generator Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it provided its Facility Ratings to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) in accordance with Requirement R7.

M8. Each Transmission Owner (and Generator Owner subject to Requirement R2) shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it provided its Facility Ratings and identity of limiting equipment to its associated Reliability

Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) in accordance with Requirement R8.

D. Compliance

1. Compliance Monitoring Process

1.1. **Compliance Enforcement Authority**

Regional Entity

1.2. **Compliance Monitoring and Enforcement Processes:**

- Self-Certifications
- Spot Checking
- Compliance Audits
- Self-Reporting
- Compliance Violation Investigations
- Complaints

1.3. **Data Retention**

The Generator Owner shall keep its current documentation (for R1) and any modifications to the documentation that were in force since last compliance audit period for Measure M1 and Measure M6.

The Generator Owner shall keep its current, in force Facility Ratings methodology (for R2) and any modifications to the methodology that were in force since last compliance audit period for Measure M2 and Measure M6.

The Transmission Owner shall keep its current, in force Facility Ratings methodology (for R3) and any modifications to the methodology that were in force since the last compliance audit for Measure M3 and Measure M6.

The Transmission Owner and Generator Owner shall keep its current, in force Facility Ratings and any changes to those ratings for three calendar years for Measure M6.

The Generator Owner and Transmission Owner shall each keep evidence for Measure M4, and Measure M5, for three calendar years. (Retired)

The Generator Owner shall keep evidence for Measure M7 for three calendar years.

The Transmission Owner (and Generator Owner that is subject to Requirement R2) shall keep evidence for Measure M8 for three calendar years.

If a Generator Owner or Transmission Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit and all subsequent compliance records.

1.4. **Additional Compliance Information**

None

Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	• The Generator Owner's Facility Rating documentation did not address Requirement R1, Part 1.1.	The Generator Owner's Facility Rating documentation did not address Requirement R1, Part 1.2.	The Generator Owner failed to provide documentation for determining its Facility Ratings.

Standard FAC-010-2.1 — System Operating Limits Methodology for the Planning Horizon

A. Introduction

1. Title: **System Operating Limits Methodology for the Planning Horizon**

2. Number: FAC-010-2.1

3. Purpose: To ensure that System Operating Limits (SOLs) used in the reliable planning of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.

4. Applicability

4.1. Planning Authority

5. Effective Date: April 19, 2010

B. Requirements

R1. The Planning Authority shall have a documented SOL Methodology for use in developing SOLs within its Planning Authority Area. This SOL Methodology shall:

R1.1. Be applicable for developing SOLs used in the planning horizon.

R1.2. State that SOLs shall not exceed associated Facility Ratings.

R1.3. Include a description of how to identify the subset of SOLs that qualify as IROLs.

R2. The Planning Authority's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:

R2.1. In the pre-contingency state and with all Facilities in service, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect expected system conditions and shall reflect changes to system topology such as Facility outages.

R2.2. Following the single Contingencies[1] identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

R2.2.1. Single line to ground or three-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.

R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault.

R2.2.3. Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

R2.3. Starting with all Facilities in service, the system's response to a single Contingency, may include any of the following:

R2.3.1. Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.

[1] The Contingencies identified in R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

R2.3.2. System reconfiguration through manual or automatic control or protection actions.

R2.4. To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.

R2.5. Starting with all Facilities in service and following any of the multiple Contingencies identified in Reliability Standard TPL-003 the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

R2.6. In determining the system's response to any of the multiple Contingencies, identified in Reliability Standard TPL-003, in addition to the actions identified in R2.3.1 and R2.3.2, the following shall be acceptable:

R2.6.1. Planned or controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers.

R3. The Planning Authority's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:

R3.1. Study model (must include at least the entire Planning Authority Area as well as the critical modeling details from other Planning Authority Areas that would impact the Facility or Facilities under study).

R3.2. Selection of applicable Contingencies.

R3.3. Level of detail of system models used to determine SOLs.

R3.4. Allowed uses of Special Protection Systems or Remedial Action Plans.

R3.5. Anticipated transmission system configuration, generation dispatch and Load level.

R3.6. Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL T_v.

R4. The Planning Authority shall issue its SOL Methodology, and any change to that methodology, to all of the following prior to the effectiveness of the change:

R4.1. Each adjacent Planning Authority and each Planning Authority that indicated it has a reliability-related need for the methodology.

R4.2. Each Reliability Coordinator and Transmission Operator that operates any portion of the Planning Authority's Planning Authority Area.

R4.3. Each Transmission Planner that works in the Planning Authority's Planning Authority Area.

R5. If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retired)

C. Measures

M1. The Planning Authority's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.

M2. The Planning Authority shall have evidence it issued its SOL Methodology and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.

M3. If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Planning Authority that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5. (Retired)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

Each Planning Authority shall self-certify its compliance to the Compliance Monitor at least once every three years. New Planning Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

1.3. Data Retention

The Planning Authority shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years~~. In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired)

Formatted: Strikethrough

Formatted: Font color: Red

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

1.4. Additional Compliance Information

The Planning Authority shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

1.4.1 SOL Methodology.

1.4.2 Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses. (Retired)

1.4.3 Superseded portions of its SOL Methodology that had been made within the past 12 months.

1.4.4 Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.

2. Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exists:

2.1.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.

2.1.2 No evidence of responses to a recipient's comments on the SOL Methodology. (Retired)

2.2. Level 2: The SOL Methodology did not include a requirement to address all of the elements in R2.1 through R2.3 and E1.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions exists:

2.3.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.

2.3.2 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.

2.3.3 The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.

2.4. Level 4: The SOL Methodology was not issued to all required entities in accordance with R4

3. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	Not applicable.	The Planning Authority has a documented SOL Methodology for use in developing SOLs within its Planning Authority Area, but it does not address R1.2	The Planning Authority has a documented SOL Methodology for use in developing SOLs within its Planning Authority Area, but it does not address R1.3.	The Planning Authority has a documented SOL Methodology for use in developing SOLs within its Planning Authority Area, but it does not address R1.1. OR The Planning Authority has no documented SOL Methodology for use in developing SOLs within its Planning Authority Area.
R2	The Planning Authority's SOL Methodology requires that SOLs are set to meet BES performance following single and multiple contingencies, but does not address the pre-contingency state (R2.1)	The Planning Authority's SOL Methodology requires that SOLs are set to meet BES performance in the pre-contingency state and following single contingencies, but does not address multiple contingencies. (R2.5-R2.6)	The Planning Authority's SOL Methodology requires that SOLs are set to meet BES performance in the pre-contingency state and following multiple contingencies, but does not meet the performance for response to single contingencies. (R2.2 –R2.4)	The Planning Authority's SOL Methodology requires that SOLs are set to meet BES performance in the pre-contingency state but does not require that SOLs be set to meet the BES performance specified for response to single contingencies (R2.2-R2.4) and does not require that SOLs be set to meet the BES performance specified for response to multiple contingencies. (R2.5-R2.6)
R3	The Planning Authority has a methodology for determining SOLs that includes a description for all but one of the following: R3.1 through R3.6.	The Planning Authority has a methodology for determining SOLs that includes a description for all but two of the following: R3.1 through R3.6.	The Planning Authority has a methodology for determining SOLs that includes a description for all but three of the following: R3.1 through R3.6.	The Planning Authority has a methodology for determining SOLs that is missing a description of four or more of the following: R3.1 through R3.6.
R4	One or both of the following: The Planning Authority issued its SOL Methodology and changes	One of the following: The Planning Authority issued its SOL Methodology and changes	One of the following: The Planning Authority issued its SOL Methodology and changes	One of the following: The Planning Authority failed to issue its SOL Methodology and

Requirement	Lower	Moderate	High	Severe
	to that methodology to all but one of the required entities. For a change in methodology, the changed methodology was provided up to 30 calendar days after the effectiveness of the change.	to that methodology to all but one of the required entities AND for a change in methodology, the changed methodology was provided 30 calendar days or more, but less than 60 calendar days after the effectiveness of the change. OR The Planning Authority issued its SOL Methodology and changes to that methodology to all but two of the required entities AND for a change in methodology, the changed methodology was provided up to 30 calendar days after the effectiveness of the change.	to that methodology to all but one of the required entities AND for a change in methodology, the changed methodology was provided 60 calendar days or more, but less than 90 calendar days after the effectiveness of the change. OR The Planning Authority issued its SOL Methodology and changes to that methodology to all but two of the required entities AND for a change in methodology, the changed methodology was provided 30 calendar days or more, but less than 60 calendar days after the effectiveness of the change. OR The Planning Authority issued its SOL Methodology and changes to that methodology to all but three of the required entities AND for a change in methodology, the changed methodology was provided up to 30 calendar days after the effectiveness of the change.	changes to that methodology to more than three of the required entities. The Planning Authority issued its SOL Methodology and changes to that methodology to all but one of the required entities AND for a change in methodology, the changed methodology was provided 90 calendar days or more after the effectiveness of the change. OR The Planning Authority issued its SOL Methodology and changes to that methodology to all but two of the required entities AND for a change in methodology, the changed methodology was provided 60 calendar days or more, but less than 90 calendar days after the effectiveness of the change. OR The Planning Authority issued its SOL Methodology and changes to that methodology to all but three of the required entities AND for a change in methodology, the changed methodology was provided 30 calendar days or more, but less than 60 calendar days after the effectiveness of the change. The Planning Authority issued its SOL Methodology and changes to that methodology to all but

Requirement	Lower	Moderate	High	Severe
				four of the required entities AND for a change in methodology, the changed methodology was provided up to 30 calendar days after the effectiveness of the change.
R5 (Retired)	The Planning Authority received documented technical comments on its SOL Methodology and provided a complete response in a time period that was longer than 45 calendar days but less than 60 calendar days.	The Planning Authority received documented technical comments on its SOL Methodology and provided a complete response in a time period that was 60 calendar days or longer but less than 75 calendar days.	The Planning Authority received documented technical comments on its SOL Methodology and provided a complete response in a time period that was 75 calendar days or longer but less than 90 calendar days. OR The Planning Authority's response to documented technical comments on its SOL Methodology indicated that a change will not be made, but did not include an explanation of why the change will not be made.	The Planning Authority received documented technical comments on its SOL Methodology and provided a complete response in a time period that was 90 calendar days or longer. OR The Planning Authority's response to documented technical comments on its SOL Methodology did not indicate whether a change will be made to the SOL Methodology.

E. **Regional Differences**

1. The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:

1.1. As governed by the requirements of R2.5 and R2.6, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:

1.1.1 Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.

1.1.2 A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7

1.1.3 Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.

1.1.4 The failure of a circuit breaker associated with a Special Protection System to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.

1.1.5 A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.

1.1.6 A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-010.

1.1.7 The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.

1.2. SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:

1.2.1 All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.

1.2.2 Cascading does not occur.

1.2.3 Uncontrolled separation of the system does not occur.

1.2.4 The system demonstrates transient, dynamic and voltage stability.

1.2.5 Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.

1.2.6 Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

1.2.7 To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.

1.3. SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:

1.3.1 Cascading does not occur.

1.4. The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

Version History

Version	Date	Action	Change Tracking
1	November 1, 2006	Adopted by Board of Trustees	New
1	November 1, 2006	Fixed typo. Removed the word "each" from the 1st sentence of section D.1.3, Data Retention.	01/11/07
2	June 24, 2008	Adopted by Board of Trustees; FERC Order 705	Revised

A. Introduction

1. Title: **System Operating Limits Methodology for the Operations Horizon**

2. Number: FAC-011-2

3. Purpose: To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.

4. Applicability

4.1. Reliability Coordinator

5. Effective Date: April 29, 2009

B. Requirements

R1. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall:

R1.1. Be applicable for developing SOLs used in the operations horizon.

R1.2. State that SOLs shall not exceed associated Facility Ratings.

R1.3. Include a description of how to identify the subset of SOLs that qualify as IROLs.

R2. The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:

R2.1. In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.

R2.2. Following the single Contingencies[1] identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

R2.2.1. Single line to ground or 3-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.

R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault.

R2.2.3. Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

R2.3. In determining the system's response to a single Contingency, the following shall be acceptable:

R2.3.1. Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.

[1] The Contingencies identified in FAC-011 R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

R2.3.2. Interruption of other network customers, (a) only if the system has already been adjusted, or is being adjusted, following at least one prior outage, or (b) if the real-time operating conditions are more adverse than anticipated in the corresponding studies

R2.3.3. System reconfiguration through manual or automatic control or protection actions.

R2.4. To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.

R3. The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:

R3.1. Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)

R3.2. Selection of applicable Contingencies

R3.3. A process for determining which of the stability limits associated with the list of multiple contingencies (provided by the Planning Authority in accordance with FAC-014 Requirement 6) are applicable for use in the operating horizon given the actual or expected system conditions.

R3.3.1. This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies.

R3.4. Level of detail of system models used to determine SOLs.

R3.5. Allowed uses of Special Protection Systems or Remedial Action Plans.

R3.6. Anticipated transmission system configuration, generation dispatch and Load level

R3.7. Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL T_V.

R4. The Reliability Coordinator shall issue its SOL Methodology and any changes to that methodology, prior to the effectiveness of the Methodology or of a change to the Methodology, to all of the following:

R4.1. Each adjacent Reliability Coordinator and each Reliability Coordinator that indicated it has a reliability-related need for the methodology.

R4.2. Each Planning Authority and Transmission Planner that models any portion of the Reliability Coordinator's Reliability Coordinator Area.

R4.3. Each Transmission Operator that operates in the Reliability Coordinator Area.

R5. If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Reliability Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retired)

C. **Measures**

M1. The Reliability Coordinator's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.

M2. The Reliability Coordinator shall have evidence it issued its SOL Methodology, and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.

M3. If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Reliability Coordinator that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5 (Retired)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

Each Reliability Coordinator shall self-certify its compliance to the Compliance Monitor at least once every three years. New Reliability Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

1.3. Data Retention

The Reliability Coordinator shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years~~. In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired)

Formatted: Strikethrough

Formatted: Font color: Red

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

1.4. Additional Compliance Information

The Reliability Coordinator shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

1.4.1 SOL Methodology.

1.4.2 Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses. (Retired)

1.4.3 Superseded portions of its SOL Methodology that had been made within the past 12 months.

1.4.4 Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.

2. Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exists:

2.1.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.

2.1.2 No evidence of responses to a recipient's comments on the SOL Methodology (Retired)

2.2. Level 2: The SOL Methodology did not include a requirement to address all of the elements in R3.1, R3.2, R3.4 through R3.7 and E1.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions exists:

2.3.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.

2.3.2 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.

2.3.3 The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.1, R3.2, R3.4 through R3.7.

2.4. Level 4: The SOL Methodology was not issued to all required entities in accordance with R4.

3. Violation Severity Levels:

Requirement	Lower	Moderate	High	Severe
R1	Not applicable.	The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.2	The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.3.	The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.1. OR The Reliability Coordinator has no documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area.
R2	The Reliability Coordinator's SOL Methodology requires that SOLs are set to meet BES performance following single contingencies, but does not require that SOLs are set to meet BES performance in the pre-contingency state. (R2.1)	Not applicable.	The Reliability Coordinator's SOL Methodology requires that SOLs are set to meet BES performance in the pre-contingency state, but does not require that SOLs are set to meet BES performance following single contingencies. (R2.2 – R2.4)	The Reliability Coordinator's SOL Methodology does not require that SOLs are set to meet BES performance in the pre-contingency state and does not require that SOLs are set to meet BES performance following single contingencies. (R2.1 through R2.4)
R3	The Reliability Coordinator has a methodology for determining SOLs that includes a description for all but one of the following: R3.1 through R3.7.	The Reliability Coordinator has a methodology for determining SOLs that includes a description for all but two of the following: R3.1 through R3.7.	The Reliability Coordinator has a methodology for determining SOLs that includes a description for all but three of the following: R3.1 through R3.7.	The Reliability Coordinator has a methodology for determining SOLs that is missing a description of three or more of the following: R3.1 through R3.7.
R4	One or both of the following: The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but one of the required entities. For a change in methodology, the changed methodology was	One of the following: The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but one of the required entities AND for a change in methodology, the changed methodology was provided 30	One of the following: The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but one of the required entities AND for a change in methodology, the changed methodology was provided 60	One of the following: The Reliability Coordinator failed to issue its SOL Methodology and changes to that methodology to more than three of the required entities. The Reliability Coordinator issued its SOL Methodology and

Requirement	Lower	Moderate	High	Severe
	provided up to 30 calendar days after the effectiveness of the change.	calendar days or more, but less than 60 calendar days after the effectiveness of the change. OR The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but two of the required entities AND for a change in methodology, the changed methodology was provided up to 30 calendar days after the effectiveness of the change.	calendar days or more, but less than 90 calendar days after the effectiveness of the change. OR The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but two of the required entities AND for a change in methodology, the changed methodology was provided 30 calendar days or more, but less than 60 calendar days after the effectiveness of the change. OR The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but three of the required entities AND for a change in methodology, the changed methodology was provided up to 30 calendar days after the effectiveness of the change.	changes to that methodology to all but one of the required entities AND for a change in methodology, the changed methodology was provided 90 calendar days or more after the effectiveness of the change. OR The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but two of the required entities AND for a change in methodology, the changed methodology was provided 60 calendar days or more, but less than 90 calendar days after the effectiveness of the change. OR The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but three of the required entities AND for a change in methodology, the changed methodology was provided 30 calendar days or more, but less than 60 calendar days after the effectiveness of the change. OR The Reliability Coordinator issued its SOL Methodology and changes to that methodology to all but four of the required entities AND for a change in methodology, the changed methodology was provided up to

Requirement	Lower	Moderate	High	Severe
				30 calendar days after the effectiveness of the change.
R5 (Retired)	The Reliability Coordinator received documented technical comments on its SOL Methodology and provided a complete response in a time period that was longer than 45 calendar days but less than 60 calendar days.	The Reliability Coordinator received documented technical comments on its SOL Methodology and provided a complete response in a time period that was 60 calendar days or longer but less than 75 calendar days.	The Reliability Coordinator received documented technical comments on its SOL Methodology and provided a complete response in a time period that was 75 calendar days or longer but less than 90 calendar days. OR The Reliability Coordinator's response to documented technical comments on its SOL Methodology indicated that a change will not be made, but did not include an explanation of why the change will not be made.	The Reliability Coordinator received documented technical comments on its SOL Methodology and provided a complete response in a time period that was 90 calendar days or longer. OR The Reliability Coordinator's response to documented technical comments on its SOL Methodology did not indicate whether a change will be made to the SOL Methodology.

Regional Differences

1. The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:

1.1. As governed by the requirements of R3.3, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:

1.1.1 Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.

1.1.2 A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7

1.1.3 Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.

1.1.4 The failure of a circuit breaker associated with a Special Protection System to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.

1.1.5 A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.

1.1.6 A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-011.

1.1.7 The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.

1.2. SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:

1.2.1 All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.

1.2.2 Cascading does not occur.

1.2.3 Uncontrolled separation of the system does not occur.

1.2.4 The system demonstrates transient, dynamic and voltage stability.

1.2.5 Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.

1.2.6 Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

1.2.7 To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.

1.3. SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:

1.3.1 Cascading does not occur.

1.4. The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

Version History

Version	Date	Action	Change Tracking
1	November 1, 2006	Adopted by Board of Trustees	New

2	TBD	R5 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon

2. Number: FAC-013-2

3. Purpose: To ensure that Planning Coordinators have a methodology for, and perform an annual assessment to identify potential future Transmission System weaknesses and limiting Facilities that could impact the Bulk Electric System's (BES) ability to reliably transfer energy in the Near-Term Transmission Planning Horizon.

4. Applicability:

4.1. Planning Coordinators

5. Effective Date:

In those jurisdictions where regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after applicable regulatory approval or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-2 are effective.

In those jurisdictions where no regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after Board of Trustees adoption or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-2 are effective.

B. Requirements

R1. Each Planning Coordinator shall have a documented methodology it uses to perform an annual assessment of Transfer Capability in the Near-Term Transmission Planning Horizon (Transfer Capability methodology). The Transfer Capability methodology shall include, at a minimum, the following information: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Criteria for the selection of the transfers to be assessed.

1.2. A statement that the assessment shall respect known System Operating Limits (SOLs).

1.3. A statement that the assumptions and criteria used to perform the assessment are consistent with the Planning Coordinator's planning practices.

1.4. A description of how each of the following assumptions and criteria used in performing the assessment are addressed:

1.4.1. Generation dispatch, including but not limited to long term planned outages, additions and retirements.

1.4.2. Transmission system topology, including but not limited to long term planned Transmission outages, additions, and retirements.

1.4.3. System demand.

1.4.4. Current approved and projected Transmission uses.

1.4.5. Parallel path (loop flow) adjustments.

1.4.6. Contingencies

1.4.7. Monitored Facilities.

1.5. A description of how simulations of transfers are performed through the adjustment of generation, Load or both.

R2. Each Planning Coordinator shall issue its Transfer Capability methodology, and any revisions to the Transfer Capability methodology, to the following entities subject to the following: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

2.1. Distribute to the following prior to the effectiveness of such revisions:

2.1.1. Each Planning Coordinator adjacent to the Planning Coordinator's Planning Coordinator area or overlapping the Planning Coordinator's area.

2.1.2. Each Transmission Planner within the Planning Coordinator's Planning Coordinator area.

2.2. Distribute to each functional entity that has a reliability-related need for the Transfer Capability methodology and submits a request for that methodology within 30 calendar days of receiving that written request.

R3. If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why. *[Violation Risk Factor: Lower][Time Horizon: Long-term Planning]* (Retired)

R4. During each calendar year, each Planning Coordinator shall conduct simulations and document an assessment based on those simulations in accordance with its Transfer Capability methodology for at least one year in the Near-Term Transmission Planning Horizon. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

R5. Each Planning Coordinator shall make the documented Transfer Capability assessment results available within 45 calendar days of the completion of the assessment to the recipients of its Transfer Capability methodology pursuant to Requirement R2, Parts 2.1 and Part 2.2. However, if a functional entity that has a reliability related need for the results of the annual assessment of the Transfer Capabilities makes a written request for such an assessment after the completion of the assessment, the Planning Coordinator shall make the documented Transfer Capability assessment results available to that entity within 45 calendar days of receipt of the request *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

R6. If a recipient of a documented Transfer Capability assessment requests data to support the assessment results, the Planning Coordinator shall provide such data to that entity within 45 calendar days of receipt of the request. The provision of such data shall be subject to the legal and regulatory obligations of the Planning Coordinator's area regarding the disclosure of confidential and/or sensitive information. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

C. Measures

M1. Each Planning Coordinator shall have a Transfer Capability methodology that includes the information specified in Requirement R1.

M2. Each Planning Coordinator shall have evidence such as dated e-mail or dated transmittal letters that it provided the new or revised Transfer Capability methodology in accordance with Requirement R2

M3. Each Planning Coordinator shall have evidence, such as dated e-mail or dated transmittal letters, that the Planning Coordinator provided a written response to that commenter in accordance with Requirement R3. (Retired)

M4. Each Planning Coordinator shall have evidence such as dated assessment results, that it conducted and documented a Transfer Capability assessment in accordance with Requirement R4.

M5. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment available to the entities in accordance with Requirement R5.

M6. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment data available in accordance with Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Data Retention

The Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Planning Coordinator shall have its current Transfer Capability methodology and any prior versions of the Transfer Capability methodology that were in force since the last compliance audit to show compliance with Requirement R1.
- The Planning Coordinator shall retain evidence since its last compliance audit to show compliance with Requirement R2.
- The Planning Coordinator shall retain evidence to show compliance with Requirements R3, R4, R5 and R6 for the most recent assessment. (R3 retired)
- If a Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time periods specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Planning Coordinator has a Transfer Capability methodology but failed to address one or two of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate one of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address three of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate two of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address four of the items listed in Requirement R1, Part 1.4.	The Planning Coordinator did not have a Transfer Capability methodology. OR The Planning Coordinator has a Transfer Capability methodology, but failed to incorporate three or more of the following Parts of Requirement R1 into that methodology: • Part 1.1 • Part 1.2 • Part 1.3 • Part 1.5 OR The Planning Coordinator has a Transfer Capability methodology but failed to address more than four of the items listed in Requirement R1, Part 1.4.

Formatted Table

Formatted Table

R2	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology after its implementation, but not more than 30 calendar days after its implementation. OR The Planning Coordinator provided the transfer Capability methodology more than 30 calendar days but not more than 60 calendar days after the receipt of a request.	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 30 calendar days after its implementation, but not more than 60 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 60 calendar days but not more than 90 calendar days after receipt of a request	The Planning Coordinator notified one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 60 calendar days, but not more than 90 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 90 calendar days but not more than 120 calendar days after receipt of a request.	The Planning Coordinator failed to notify one or more of the parties specified in Requirement R2 of a new or revised Transfer Capability methodology more than 90 calendar days after its implementation. OR The Planning Coordinator provided the Transfer Capability methodology more than 120 calendar days after receipt of a request.
R3 **(Retired)**	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 45 calendar days, but not more than 60 calendar days after receipt of the concern.	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 60 calendar days, but not more than 75 calendar days after receipt of the concern.	The Planning Coordinator provided a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 more than 75 calendar days, but not more than 90 calendar days after receipt of the concern.	The Planning Coordinator failed to provide a documented response to a documented concern with its Transfer Capability methodology as required in Requirement R3 by more than 90 calendar days after receipt of the concern. OR The Planning Coordinator failed to respond to a documented concern with its Transfer Capability methodology.

R4.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, but not by more than 30 calendar days.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, by more than 30 calendar days, but not by more than 60 calendar days.	The Planning Coordinator conducted a Transfer Capability assessment outside the calendar year, by more than 60 calendar days, but not by more than 90 calendar days.	The Planning Coordinator failed to conduct a Transfer Capability assessment outside the calendar year by more than 90 calendar days. OR The Planning Coordinator failed to conduct a Transfer Capability assessment.

Formatted Table

R5	The Planning Coordinator made its documented Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 45 calendar days after the requirements of R5,, but not more than 60 calendar days after completion of the assessment.	The Planning Coordinator made its Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 60 calendar days after the requirements of R5, but not more than 75 calendar days after completion of the assessment.	The Planning Coordinator made its Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 75 calendar days after the requirements of R5, but not more than 90 days after completion of the assessment.	The Planning Coordinator failed to make its documented Transfer Capability assessment available to one or more of the recipients of its Transfer Capability methodology more than 90 days after the requirements of R5. OR The Planning Coordinator failed to make its documented Transfer Capability assessment available to any of the recipients of its Transfer Capability methodology under the requirements of R5.
R6	The Planning Coordinator provided the requested data as required in Requirement R6 more than 45 calendar days after receipt of the request for data, but not more than 60 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 60 calendar days after receipt of the request for data, but not more than 75 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 75 calendar days after receipt of the request for data, but not more than 90 calendar days after the receipt of the request for data.	The Planning Coordinator provided the requested data as required in Requirement R6 more than 90 after the receipt of the request for data. OR The Planning Coordinator failed to provide the requested data as required in Requirement R6.

A. Introduction

1. Title: **Interchange Confirmation**

2. Number: **INT-007-1**

3. Purpose: To ensure that each Arranged Interchange is checked for reliability before it is implemented.

4. Applicability

4.1. Interchange Authority.

5. Effective Date: January 1, 2007

B. Requirements

R1. The Interchange Authority shall verify that Arranged Interchange is balanced and valid prior to transitioning Arranged Interchange to Confirmed Interchange by verifying the following:

R1.1. Source Balancing Authority megawatts equal sink Balancing Authority megawatts (adjusted for losses, if appropriate).

R1.2. All reliability entities involved in the Arranged Interchange are currently in the NERC registry. (Retired)

R1.3. The following are defined:

R1.3.1. Generation source and load sink.

R1.3.2. Megawatt profile.

R1.3.3. Ramp start and stop times.

R1.3.4. Interchange duration.

R1.4. Each Balancing Authority and Transmission Service Provider that received the Arranged Interchange information from the Interchange Authority for reliability assessment has provided approval.

C. Measures

M1. For each Arranged Interchange, the Interchange Authority shall show evidence that it has verified the Arranged Interchange information prior to the dissemination of the Confirmed Interchange.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

The Performance-Reset Period shall be twelve months from the last noncompliance to Requirement 1.

1.3. Data Retention

The Interchange Authority shall keep 90 days of historical data. The Compliance Monitor shall keep audit records for a minimum of three calendar years.

1.4. Additional Compliance Information

Each Interchange Authority shall demonstrate compliance to the Compliance Monitor within the first year that this standard becomes effective or the first year the entity commences operation by self-certification to the Compliance Monitor.

Subsequent to the initial compliance review, compliance may be:

1.4.1 Verified by audit at least once every three years.

1.4.2 Verified by spot checks in years between audits.

1.4.3 Verified by annual audits of noncompliant Interchange Authorities, until compliance is demonstrated.

1.4.4 Verified at any time as the result of a complaint. Complaints must be lodged within 60 days of the incident. Complaints will be evaluated by the Compliance Monitor.

Each Interchange Authority shall make the following available for inspection by the Compliance Monitor upon request:

1.4.5 For compliance audits and spot checks, relevant data and system log records for the audit period which indicate an Interchange Authority's verification that all Arranged Interchange was balanced and valid as defined in R1. The Compliance Monitor may request up to a three-month period of historical data ending with the date the request is received by the Interchange Authority.

1.4.6 For specific complaints, only those data and system log records associated with the specific Interchange event contained in the complaint which indicate an Interchange Authority's verification that an Arranged Interchange was balanced and valid as defined in R1 for that specific Interchange

2. Levels of Non-Compliance

2.1. Level 1: One occurrence[1] where Interchange-related data was not verified as defined in R1.

2.2. Level 2: Two occurrences where Interchange-related data was not verified as defined in R1.

2.3. Level 3: Three occurrences where Interchange-related data was not verified as defined in R1.

2.4. Level 4: Four or more occurrences where Interchange-related data was not verified as defined in R1.

E. Regional Differences

None

[1] This does not include instances of not verifying due to extenuating circumstances approved by the Compliance Monitor.

Version History

Version	Date	Action	Change Tracking
1	TBD	R1.2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: **Coordination of Real-time Activities Between Reliability Coordinators**

2. Number: **IRO-016-1**

3. Purpose: To ensure that each Reliability Coordinator's operations are coordinated such that they will not have an Adverse Reliability Impact on other Reliability Coordinator Areas and to preserve the reliability benefits of interconnected operations.

4. Applicability

4.1. Reliability Coordinator

5. Effective Date: November 1, 2006

B. Requirements

R1. The Reliability Coordinator that identifies a potential, expected, or actual problem that requires the actions of one or more other Reliability Coordinators shall contact the other Reliability Coordinator(s) to confirm that there is a problem and then discuss options and decide upon a solution to prevent or resolve the identified problem.

R1.1. If the involved Reliability Coordinators agree on the problem and the actions to take to prevent or mitigate the system condition, each involved Reliability Coordinator shall implement the agreed-upon solution, and notify the involved Reliability Coordinators of the action(s) taken.

R1.2. If the involved Reliability Coordinators cannot agree on the problem(s) each Reliability Coordinator shall re-evaluate the causes of the disagreement (bad data, status, study results, tools, etc.).

R1.2.1. If time permits, this re-evaluation shall be done before taking corrective actions.

R1.2.2. If time does not permit, then each Reliability Coordinator shall operate as though the problem(s) exist(s) until the conflicting system status is resolved.

R1.3. If the involved Reliability Coordinators cannot agree on the solution, the more conservative solution shall be implemented.

R2. The Reliability Coordinator shall document (via operator logs or other data sources) its actions taken for either the event or for the disagreement on the problem(s) or for both. (Retired)

C. Measures

M1. For each event that requires Reliability Coordinator-to-Reliability Coordinator coordination, each involved Reliability Coordinator shall have evidence (operator logs or other data sources) of the actions taken for either the event or for the disagreement on the problem or for both.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

The performance reset period shall be one calendar year.

1.3. Data Retention

The Reliability Coordinator shall keep auditable evidence for a rolling 12 months. In addition, entities found non-compliant shall keep information related to the non-compliance until it has been found compliant. The Compliance Monitor shall keep compliance data for a minimum of three years or until the Reliability Coordinator has achieved full compliance, whichever is longer.

1.4. Additional Compliance Information

The Reliability Coordinator shall demonstrate compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor shall use a scheduled on-site review at least once every three years. The Compliance Monitor shall conduct an investigation upon a complaint that is received within 30 days of an alleged infraction's discovery date. The Compliance Monitor shall complete the investigation and report back to all involved Reliability Coordinators (the Reliability Coordinator that complained as well as the Reliability Coordinator that was investigated) within 45 days after the start of the investigation. As part of an audit or investigation, the Compliance Monitor shall interview other Reliability Coordinators within the Interconnection and verify that the Reliability Coordinator being audited or investigated has been coordinating actions to prevent or resolve potential, expected, or actual problems that adversely impact the Interconnection.

The Reliability Coordinator shall have the following available for its Compliance Monitor to inspect during a scheduled, on-site review or within five working days of a request as part of an investigation upon complaint:

1.4.1 Evidence (operator log or other data source) to show coordination with other Reliability Coordinators.

2. Levels of Non-Compliance

2.1. Level 1: For potential, actual or expected events which required Reliability Coordinator-to-Reliability Coordinator coordination, the Reliability Coordinator did coordinate, but did not have evidence that it coordinated with other Reliability Coordinators.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: For potential, actual or expected events which required Reliability Coordinator-to-Reliability Coordinator coordination, the Reliability Coordinator did not coordinate with other Reliability Coordinators.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
Version 1	August 10, 2005	1. Changed incorrect use of certain hyphens (-) to "en dash (–)." 2. Hyphenated "30-day" and "Reliability Coordinator-to-Reliability Coordinator" when used as adjective.	01/20/06

		3. Changed standard header to be consistent with standard "Title." 4. Added "periods" to items where appropriate. 5. Initial capped heading "Definitions of Terms Used in Standard." 6. Changed "Timeframe" to "Time Frame" in item D, 1.2. 7. Lower cased all words that are not "defined" terms — drafting team, and self-certification. 8. Changed apostrophes to "smart" symbols. 9. Removed comma after word "condition" in item R.1.1. 10. Added comma after word "expected" in item 1.4, last sentence. 11. Removed extra spaces between words where appropriate.	
1	TBD	R2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: **Nuclear Plant Interface Coordination**

2. Number: NUC-001-2

3. Purpose: This standard requires coordination between Nuclear Plant Generator Operators and Transmission Entities for the purpose of ensuring nuclear plant safe operation and shutdown.

4. Applicability:

4.1. Nuclear Plant Generator Operator.

4.2. Transmission Entities shall mean all entities that are responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs). Such entities may include one or more of the following:

4.2.1 Transmission Operators.

4.2.2 Transmission Owners.

4.2.3 Transmission Planners.

4.2.4 Transmission Service Providers.

4.2.5 Balancing Authorities.

4.2.6 Reliability Coordinators.

4.2.7 Planning Coordinators.

4.2.8 Distribution Providers.

4.2.9 Load-serving Entities.

4.2.10 Generator Owners.

4.2.11 Generator Operators.

5. Effective Date: April 1, 2010

B. Requirements

R1. The Nuclear Plant Generator Operator shall provide the proposed NPIRs in writing to the applicable Transmission Entities and shall verify receipt [*Risk Factor: Lower*]

R2. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall have in effect one or more Agreements[1] that include mutually agreed to NPIRs and document how the Nuclear Plant Generator Operator and the applicable Transmission Entities shall address and implement these NPIRs. [*Risk Factor: Medium*]

R3. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall incorporate the NPIRs into their planning analyses of the electric system and shall communicate the results of these analyses to the Nuclear Plant Generator Operator. [*Risk Factor: Medium*]

R4. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall: [*Risk Factor: High*]

1. Agreements may include mutually agreed upon procedures or protocols in effect between entities or between departments of a vertically integrated system.

R4.1. Incorporate the NPIRs into their operating analyses of the electric system.

R4.2. Operate the electric system to meet the NPIRs.

R4.3. Inform the Nuclear Plant Generator Operator when the ability to assess the operation of the electric system affecting NPIRs is lost.

R5. The Nuclear Plant Generator Operator shall operate per the Agreements developed in accordance with this standard. [*Risk Factor: High*]

R6. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities and the Nuclear Plant Generator Operator shall coordinate outages and maintenance activities which affect the NPIRs. [*Risk Factor: Medium*]

R7. Per the Agreements developed in accordance with this standard, the Nuclear Plant Generator Operator shall inform the applicable Transmission Entities of actual or proposed changes to nuclear plant design, configuration, operations, limits, protection systems, or capabilities that may impact the ability of the electric system to meet the NPIRs. [*Risk Factor: High*]

R8. Per the Agreements developed in accordance with this standard, the applicable Transmission Entities shall inform the Nuclear Plant Generator Operator of actual or proposed changes to electric system design, configuration, operations, limits, protection systems, or capabilities that may impact the ability of the electric system to meet the NPIRs. [*Risk Factor: High*]

R9. The Nuclear Plant Generator Operator and the applicable Transmission Entities shall include, as a minimum, the following elements within the agreement(s) identified in R2: [*Risk Factor: Medium*]

R9.1. Administrative elements: (Retired)

R9.1.1. Definitions of key terms used in the agreement. (Retired)

R9.1.2. Names of the responsible entities, organizational relationships, and responsibilities related to the NPIRs. (Retired)

R9.1.3. A requirement to review the agreement(s) at least every three years. (Retired)

R9.1.4. A dispute resolution mechanism. (Retired)

R9.2. Technical requirements and analysis:

R9.2.1. Identification of parameters, limits, configurations, and operating scenarios included in the NPIRs and, as applicable, procedures for providing any specific data not provided within the agreement.

R9.2.2. Identification of facilities, components, and configuration restrictions that are essential for meeting the NPIRs.

R9.2.3. Types of planning and operational analyses performed specifically to support the NPIRs, including the frequency of studies and types of Contingencies and scenarios required.

R9.3. Operations and maintenance coordination:

R9.3.1. Designation of ownership of electrical facilities at the interface between the electric system and the nuclear plant and responsibilities for operational control coordination and maintenance of these facilities.

R9.3.2. Identification of any maintenance requirements for equipment not owned or controlled by the Nuclear Plant Generator Operator that are necessary to meet the NPIRs.

R9.3.3. Coordination of testing, calibration and maintenance of on-site and off-site power supply systems and related components.

R9.3.4. Provisions to address mitigating actions needed to avoid violating NPIRs and to address periods when responsible Transmission Entity loses the ability to assess the capability of the electric system to meet the NPIRs. These provisions shall include responsibility to notify the Nuclear Plant Generator Operator within a specified time frame.

R9.3.5. Provision for considering, within the restoration process, the requirements and urgency of a nuclear plant that has lost all off-site and on-site AC power. .

R9.3.6. Coordination of physical and cyber security protection of the Bulk Electric System at the nuclear plant interface to ensure each asset is covered under at least one entity's plan.

R9.3.7. Coordination of the NPIRs with transmission system Special Protection Systems and underfrequency and undervoltage load shedding programs.

R9.4. Communications and training:

R9.4.1. Provisions for communications between the Nuclear Plant Generator Operator and Transmission Entities, including communications protocols, notification time requirements, and definitions of terms.

R9.4.2. Provisions for coordination during an off-normal or emergency event affecting the NPIRs, including the need to provide timely information explaining the event, an estimate of when the system will be returned to a normal state, and the actual time the system is returned to normal.

R9.4.3. Provisions for coordinating investigations of causes of unplanned events affecting the NPIRs and developing solutions to minimize future risk of such events.

R9.4.4. Provisions for supplying information necessary to report to government agencies, as related to NPIRs.

R9.4.5. Provisions for personnel training, as related to NPIRs.

C. Measures

M1. The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide a copy of the transmittal and receipt of transmittal of the proposed NPIRs to the responsible Transmission Entities. (Requirement 1)

M2. The Nuclear Plant Generator Operator and each Transmission Entity shall each have a copy of the Agreement(s) addressing the elements in Requirement 9 available for inspection upon request of the Compliance Enforcement Authority. (Requirement 2 and 9)

M3. Each Transmission Entity responsible for planning analyses in accordance with the Agreement shall, upon request of the Compliance Enforcement Authority, provide a copy of the planning analyses results transmitted to the Nuclear Plant Generator Operator, showing incorporation of the NPIRs. The Compliance Enforcement Authority shall refer to the Agreements developed in accordance with this standard for specific requirements. (Requirement 3)

M4. Each Transmission Entity responsible for operating the electric system in accordance with the Agreement shall demonstrate or provide evidence of the following, upon request of the Compliance Enforcement Authority:

M4.1 The NPIRs have been incorporated into the current operating analysis of the electric system. (Requirement 4.1)

M4.2 The electric system was operated to meet the NPIRs. (Requirement 4.2)

M4.3 The Transmission Entity informed the Nuclear Plant Generator Operator when it became aware it lost the capability to assess the operation of the electric system affecting the NPIRs. (Requirement 4.3)

M5. The Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, demonstrate or provide evidence that the Nuclear Power Plant is being operated consistent with the Agreements developed in accordance with this standard. (Requirement 5)

M6. The Transmission Entities and Nuclear Plant Generator Operator shall, upon request of the Compliance Enforcement Authority, provide evidence of the coordination between the Transmission Entities and the Nuclear Plant Generator Operator regarding outages and maintenance activities which affect the NPIRs. (Requirement 6)

M7. The Nuclear Plant Generator Operator shall provide evidence that it informed the applicable Transmission Entities of changes to nuclear plant design, configuration, operations, limits, protection systems, or capabilities that would impact the ability of the Transmission Entities to meet the NPIRs. (Requirement 7)

M8. The Transmission Entities shall each provide evidence that it informed the Nuclear Plant Generator Operator of changes to electric system design, configuration, operations, limits, protection systems, or capabilities that would impact the ability of the Nuclear Plant Generator Operator to meet the NPIRs. (Requirement 8)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Responsible Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- For Measure 1, the Nuclear Plant Generator Operator shall keep its latest transmittals and receipts.
- For Measure 2, the Nuclear Plant Generator Operator and each Transmission Entity shall have its current, in-force agreement.
- For Measure 3, the Transmission Entity shall have the latest planning analysis results.
- For Measures 4.3, 6 and 8, the Transmission Entity shall keep evidence for two years plus current.
- For Measures 5, 6 and 7, the Nuclear Plant Generator Operator shall keep evidence for two years plus current.

If a Responsible Entity is found non-compliant it shall keep information related to the noncompliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

None.

2. Violation Severity Levels

2.1. Lower: Agreement(s) exist per this standard and NPIRs were identified and implemented, but documentation described in M1-M8 was not provided.

2.2. Moderate: Agreement(s) exist per R2 and NPIRs were identified and implemented, but one or more elements of the Agreement in R9 were not met.

2.3. High: One or more requirements of R3 through R8 were not met.

2.4. Severe: No proposed NPIRs were submitted per R1, no Agreement exists per this standard, or the Agreements were not implemented.

E. Regional Differences

The design basis for Canadian (CANDU) NPPs does not result in the same licensing requirements as U.S. NPPs. NRC design criteria specifies that in addition to emergency on-site electrical power, electrical power from the electric network also be provided to permit safe shutdown. This requirement is specified in such NRC Regulations as 10 CFR 50 Appendix A — General Design Criterion 17 and 10 CFR 50.63 Loss of all alternating current power. There are no equivalent Canadian Regulatory requirements for Station Blackout (SBO) or coping times as they do not form part of the licensing basis for CANDU NPPs.
Therefore the definition of NPLR for Canadian CANDU units will be as follows:

Nuclear Plant Licensing Requirements (NPLR) are requirements included in the design basis of the nuclear plant and are statutorily mandated for the operation of the plant; when used in this standard, NPLR shall mean nuclear power plant licensing requirements for avoiding preventable challenges to nuclear safety as a result of an electric system disturbance, transient, or condition.

2	January 22, 2010	Approved by FERC on January 21, 2010 Added Effective Date	Update
2	TBD	R9.1, R9.1.1, R9.1.2, R9.1.3, and R9.1.4 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. Title: **Technical Assessment of the Design and Effectiveness of Undervoltage Load Shedding Program.**

2. Number: PRC-010-0

3. Purpose: Provide System preservation measures in an attempt to prevent system voltage collapse or voltage instability by implementing an Undervoltage Load Shedding (UVLS) program.

4. Applicability:

4.1. Load-Serving Entity that operates a UVLS program

4.2. Transmission Owner that owns a UVLS program

4.3. Transmission Operator that operates a UVLS program

4.4. Distribution Provider that owns or operates a UVLS program

5. Effective Date: April 1, 2005

B. Requirements

R1. The Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall periodically (at least every five years or as required by changes in system conditions) conduct and document an assessment of the effectiveness of the UVLS program. This assessment shall be conducted with the associated Transmission Planner(s) and Planning Authority(ies).

R1.1. This assessment shall include, but is not limited to:

R1.1.1. Coordination of the UVLS programs with other protection and control systems in the Region and with other Regional Reliability Organizations, as appropriate.

R1.1.2. Simulations that demonstrate that the UVLS programs performance is consistent with Reliability Standards TPL-001-0, TPL-002-0, TPL-003-0 and TPL-004-0.

R1.1.3. A review of the voltage set points and timing.

R2. The Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall provide documentation of its current UVLS program assessment to its Regional Reliability Organization and NERC on request (30 calendar days). (Retired)

C. Measures

M1. Each Transmission Owner's and Distribution Provider's UVLS program shall include the elements identified in Reliability Standard PRC-010-0_R1.

M2. Each Load-Serving Entity, Transmission Owner, Transmission Operator, and Distribution Provider that owns or operates a UVLS program shall have evidence it provided documentation of its current UVLS program assessment to its Regional Reliability Organization and NERC as specified in Reliability Standard PRC-010-0_R2. (Retired)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Compliance Monitor: Regional Reliability Organizations. Each Regional Reliability Organization shall report compliance and violations to NERC via the NERC Compliance Reporting process.

1.2. Compliance Monitoring Period and Reset Timeframe

Assessments every five years or as required by System changes.

Current assessment on request (30 calendar days.)

1.3. Data Retention

None specified.

1.4. Additional Compliance Information

None.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: Not applicable.

2.3. Level 3: Not applicable.

2.4. Level 4: An assessment of the UVLS program did not address one of the three requirements listed in Reliability Standard PRC-010-0_R1.1 or an assessment of the UVLS program was not provided.

E. Regional Differences

1. None identified.

Version History

Version	Date	Action	Change Tracking

Standard PRC-022-1 — Under-Voltage Load Shedding Program Performance

A. Introduction

1. **Title:** **Under-Voltage Load Shedding Program Performance**

2. **Number:** **PRC-022-1**

3. **Purpose:** Ensure that Under Voltage Load Shedding (UVLS) programs perform as intended to mitigate the risk of voltage collapse or voltage instability in the Bulk Electric System (BES).

4. **Applicability**

   4.1. Transmission Operator that operates a UVLS program.

   4.2. Distribution Provider that operates a UVLS program.

   4.3. Load-Serving Entity that operates a UVLS program.

5. **Effective Date:** May 1, 2006

B. Requirements

R1. Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program to mitigate the risk of voltage collapse or voltage instability in the BES shall analyze and document all UVLS operations and Misoperations. The analysis shall include:

R1.1. A description of the event including initiating conditions.

R1.2. A review of the UVLS set points and tripping times.

R1.3. A simulation of the event, if deemed appropriate by the Regional Reliability Organization. For most events, analysis of sequence of events may be sufficient and dynamic simulations may not be needed.

R1.4. A summary of the findings.

R1.5. For any Misoperation, a Corrective Action Plan to avoid future Misoperations of a similar nature.

R2. Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall provide documentation of its analysis of UVLS program performance to its Regional Reliability Organization within 90 calendar days of a request. (Retired)

C. Measures

M1. Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall have documentation of its analysis of UVLS operations and Misoperations in accordance with Requirement 1.1 through 1.5.

M2. Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall have evidence that it provided documentation of its analysis of UVLS program performance within 90 calendar days of a request by the Regional Reliability Organization. (Retired)

D. Compliance

1. Compliance Monitoring Process

   1.1. Compliance Monitoring Responsibility

   Regional Reliability Organization.

   1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

Each Transmission Operator, Load-Serving Entity, and Distribution Provider that operates a UVLS program shall retain documentation of its analyses of UVLS operations and Misoperations for two years. The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

Transmission Operator, Load-Serving Entity, and Distribution Provider shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance

2.1. Level 1: Not applicable.

2.2. Level 2: Documentation of the analysis of UVLS performance was provided but did not include one of the five requirements in R1.

2.3. Level 3: Documentation of the analysis of UVLS performance was provided but did not include two or more of the five requirements in R1.

2.4. Level 4: Documentation of the analysis of UVLS performance was not provided.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
1	December 1, 2005	1. Removed comma after 2004 in "Development Steps Completed," #1. 2. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 3. Lower cased the word "region," "board," and "regional" throughout document where appropriate. 4. Added or removed "periods" where appropriate. 5. Changed "Timeframe" to "Time Frame" in item D, 1.2.	January 20, 2006
1	TBD	R2 and associated elements retired as part of the Paragraph 81 project (Project 2013-02)	

A. Introduction

1. **Title:** **Voltage and Reactive Control**

2. **Number:** VAR-001-2

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in real time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**

   4.1. Transmission Operators.

   4.2. Purchasing-Selling Entities.

   4.3. Load Serving Entities.

5. **(Proposed) Effective Date:** The first day of the first calendar quarter six months after applicable regulatory approval; or in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter six months after Board of Trustees' adoption.

B. Requirements

R1. Each Transmission Operator, individually and jointly with other Transmission Operators, shall ensure that formal policies and procedures are developed, maintained, and implemented for monitoring and controlling voltage levels and Mvar flows within their individual areas and with the areas of neighboring Transmission Operators.

R2. Each Transmission Operator shall acquire sufficient reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, and controllable load – within its area to protect the voltage levels under normal and Contingency conditions. This includes the Transmission Operator's share of the reactive requirements of interconnecting transmission circuits.

R3. The Transmission Operator shall specify criteria that exempts generators from compliance with the requirements defined in Requirement 4, and Requirement 6.1.

R3.1. Each Transmission Operator shall maintain a list of generators in its area that are exempt from following a voltage or Reactive Power schedule.

R3.2. For each generator that is on this exemption list, the Transmission Operator shall notify the associated Generator Owner.

R4. Each Transmission Operator shall specify a voltage or Reactive Power schedule [1] at the interconnection between the generator facility and the Transmission Owner's facilities to be maintained by each generator. The Transmission Operator shall provide the voltage or Reactive Power schedule to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (AVR in service and controlling voltage).

R5. Each Purchasing-Selling Entity and Load Serving Entity shall arrange for (self-provide or purchase) reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, and controllable load– to satisfy its reactive requirements identified by its Transmission Service Provider. (Retired)

[1] The voltage schedule is a target voltage to be maintained within a tolerance band during a specified period.

R6. The Transmission Operator shall know the status of all transmission Reactive Power resources, including the status of voltage regulators and power system stabilizers.

R6.1. When notified of the loss of an automatic voltage regulator control, the Transmission Operator shall direct the Generator Operator to maintain or change either its voltage schedule or its Reactive Power schedule.

R7. The Transmission Operator shall be able to operate or direct the operation of devices necessary to regulate transmission voltage and reactive flow.

R8. Each Transmission Operator shall operate or direct the operation of capacitive and inductive reactive resources within its area – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching; controllable load; and, if necessary, load shedding – to maintain system and Interconnection voltages within established limits.

R9. Each Transmission Operator shall maintain reactive resources – which may include, but is not limited to, reactive generation scheduling; transmission line and reactive resource switching;, and controllable load– to support its voltage under first Contingency conditions.

R9.1. Each Transmission Operator shall disperse and locate the reactive resources so that the resources can be applied effectively and quickly when Contingencies occur.

R10. Each Transmission Operator shall correct IROL or SOL violations resulting from reactive resource deficiencies (IROL violations must be corrected within 30 minutes) and complete the required IROL or SOL violation reporting.

R11. After consultation with the Generator Owner regarding necessary step-up transformer tap changes, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes.

R12. The Transmission Operator shall direct corrective action, including load reduction, necessary to prevent voltage collapse when reactive resources are insufficient.

C. Measures

M1. The Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule as specified in Requirement 4 to each Generator Operator it requires to follow such a schedule.

M2. The Transmission Operator shall have evidence to show that, for each generating unit in its area that is exempt from following a voltage or Reactive Power schedule, the associated Generator Owner was notified of this exemption in accordance with Requirement 3.2.

M3. The Transmission Operator shall have evidence to show that it issued directives as specified in Requirement 6.1 when notified by a Generator Operator of the loss of an automatic voltage regulator control.

M4. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit's step-up transformer tap in accordance with Requirement 11.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Compliance Monitoring and Enforcement Processes:

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

The Transmission Operator shall retain evidence for Measures 1 through 4 for 12 months.

The Compliance Monitor shall retain any audit data for three years.

1.5. Additional Compliance Information

The Transmission Operator shall demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Violation Severity Levels (no changes)

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
0	April 1, 2005	Effective Date	New

Complete Violation Severity Levels Matrix

Encompassing All Commission-Approved Reliability Standards

September 21, 2012

Change History Table is located at the end of the document

Complete Violation Severity Level Matrix (BAL)
Encompassing All Commission-Approved Reliability Standards

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
BAL-001-0.1a	R1.	Each Balancing Authority shall operate such that, on a rolling 12-month basis, the average of the clock-minute averages of the Balancing Authority's Area Control Error (ACE) divided by 10B (B is the clock-minute average of the Balancing Authority Area's Frequency Bias) times the corresponding clock-minute averages of the Interconnection's Frequency Error is less than a specific limit. This limit is a constant derived from a targeted frequency bound (separately calculated for each Interconnection) that is reviewed and set as necessary by the NERC Operating Committee. ***See Standard for Formula.***	The Balancing Authority Area's value of CPS1 is less than 100% but greater than or equal to 95%.	The Balancing Authority Area's value of CPS1 is less than 95% but greater than or equal to 90%.	The Balancing Authority Area's value of CPS1 is less than 90% but greater than or equal to 85%.	The Balancing Authority Area's value of CPS1 is less than 85%.
BAL-001-0.1a	R2.	Each Balancing Authority shall operate such that its average ACE for at least 90% of clock-ten-minute periods (6 non-overlapping periods per hour) during a calendar month is within a specific limit, referred to as L_{10}. ***See Standard for Formula.***	The Balancing Authority Area's value of CPS2 is less than 90% but greater than or equal to 85%.	The Balancing Authority Area's value of CPS2 is less than 85% but greater than or equal to 80%.	The Balancing Authority Area's value of CPS2 is less than 80% but greater than or equal to 75%.	The Balancing Authority Area's value of CPS2 is less than 75%.
BAL-001-0.1a	R3.	Each Balancing Authority providing Overlap Regulation Service shall evaluate Requirement R1 (i.e., Control Performance Standard 1 or CPS1) and Requirement R2 (i.e., Control Performance Standard 2 or CPS2) using the characteristics of the combined ACE and combined Frequency Bias Settings.	N/A	N/A	N/A	The Balancing Authority providing Overlap Regulation Service failed to use a combined ACE and frequency bias.
BAL-001-0.1a	R4.	Any Balancing Authority receiving Overlap Regulation Service shall not	N/A	N/A	N/A	The Balancing Authority receiving

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		have its control performance evaluated (i.e. from a control performance perspective, the Balancing Authority has shifted all control requirements to the Balancing Authority providing Overlap Regulation Service).				Overlap Regulation Service failed to ensure that control performance was being evaluated in a manner consistent with the calculation methodology as described in BAL-001-01 R3.
BAL-002-1	R1.	Each Balancing Authority shall have access to and/or operate Contingency Reserve to respond to Disturbances. Contingency Reserve may be supplied from generation, controllable load resources, or coordinated adjustments to Interchange Schedules.	N/A	N/A	N/A	The Balancing Authority does not have access to and/or operate Contingency Reserve to respond to Disturbances.
BAL-002-1	R1.1.	A Balancing Authority may elect to fulfill its Contingency Reserve obligations by participating as a member of a Reserve Sharing Group. In such cases, the Reserve Sharing Group shall have the same responsibilities and obligations as each Balancing Authority with respect to monitoring and meeting the requirements of Standard BAL-002.	N/A	N/A	N/A	The Balancing Authority has elected to fulfill its Contingency Reserve obligations by participating as a member of a Reserve Sharing Group and the Reserve Sharing Group has not provided the same responsibilities and obligations as required of the responsible entity with respect to monitoring and meeting the requirements of Standard BAL-002.
BAL-002-1	R2.	Each Regional Reliability Organization, sub-Regional Reliability	The Regional Reliability	The Regional Reliability	The Regional Reliability	The Regional Reliability

						Spinning and Operating Reserve – Supplemental that may be included in Contingency Reserve.
BAL-002-1	R2.4.	The procedure for applying Contingency Reserve in practice.	N/A	N/A	N/A	The Regional Reliability Organization, sub-Regional Reliability Organization, or Reserve Sharing Group has failed to provide the procedure for applying Contingency Reserve in practice.
BAL-002-1	R2.5.	The limitations, if any, upon the amount of interruptible load that may be included.	N/A	N/A	N/A	The Regional Reliability Organization, sub-Regional Reliability Organization, or Reserve Sharing Group has failed to specify the limitations, if any, upon the amount of interruptible load that may be included.
BAL-002-1	R2.6.	The same portion of resource capacity (e.g. reserves from jointly owned generation) shall not be counted more than once as Contingency Reserve by multiple Balancing Authorities.	N/A	N/A	N/A	The Regional Reliability Organization, sub-Regional Reliability Organization, or Reserve Sharing Group has allowed the same portion of resource capacity (e.g., reserves from jointly owned generation) to be

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						counted more than once as Contingency Reserve by multiple Balancing Authorities.
BAL-002-1	R3.	Each Balancing Authority or Reserve Sharing Group shall activate sufficient Contingency Reserve to comply with the DCS.	The Balancing Authority or Reserve Sharing Group's Average Percent Recovery per the NERC DCS quarterly report was less than 100% but greater than or equal to 95%.	The Balancing Authority or Reserve Sharing Group's Average Percent Recovery per the NERC DCS quarterly report was less than 95% but greater than or equal to 90%.	The Balancing Authority or Reserve Sharing Group's Average Percent Recovery per the NERC DCS quarterly report was less than 90% but greater than or equal to 85%.	The Balancing Authority or Reserve Sharing Group's Average Percent Recovery per the NERC DCS quarterly report was less than 85%.
BAL-002-1	R3.1.	As a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency. All Balancing Authorities and Reserve Sharing Groups shall review, no less frequently than annually, their probable contingencies to determine their prospective most severe single contingencies.	The Balancing Authority or Reserve Sharing Group failed to review their probable contingencies to determine their prospective most severe single contingencies annually.	N/A	N/A	The Balancing Authority or Reserve Sharing Group failed to carry at least enough Contingency Reserve to cover the most severe single contingency.
BAL-002-1	R4.	A Balancing Authority or Reserve Sharing Group shall meet the Disturbance Recovery Criterion within the Disturbance Recovery Period for 100% of Reportable Disturbances. The Disturbance Recovery Criterion is:	The Balancing Authority or Reserve Sharing Group met the Disturbance Recovery Criterion within the Disturbance Recovery Period for more than 90% and less than 100% of Reportable Disturbances.	The Balancing Authority or Reserve Sharing Group met the Disturbance Recovery Criterion within the Disturbance Recovery Period for more than 80% and less than or equal to 90% of Reportable Disturbances.	The Balancing Authority or Reserve Sharing Group met the Disturbance Recovery Criterion within the Disturbance Recovery Period for more than 70% and less than or equal to 80% of Reportable Disturbances.	The Balancing Authority or Reserve Sharing Group met the Disturbance Recovery Criterion within the Disturbance Recovery Period for more than 0% and less than or equal to 70% of Reportable Disturbances.

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
CIP-003-3	R5.1.	The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.	N/A	N/A	The Responsible Entity maintained a list of designated personnel for authorizing either logical or physical access but not both.	The Responsible Entity did not maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.
CIP-003-3	R5.1.1.	Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.	N/A	N/A	The Responsible Entity did identify the personnel by name, title, and the information for which they are responsible for authorizing access, but the business phone is missing.	Personnel are not identified by name, title, or the information for which they are responsible for authorizing access.
CIP-003-3	R5.1.2.	The list of personnel responsible for authorizing access to protected information shall be verified at least annually.	N/A	N/A	N/A	The Responsible Entity did not verify at least annually the list of personnel responsible for authorizing access to protected information.
CIP-003-3	R5.2.	The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.	N/A	N/A	N/A	The Responsible Entity did not review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's

						needs and appropriate personnel roles and responsibilities.
CIP-003-3	R5.3.	The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.	N/A	N/A	N/A	The Responsible Entity did not assess and document at least annually the processes for controlling access privileges to protected information.
CIP-003-3	R6.	Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.	N/A	N/A	N/A	The Responsible Entity has not established or documented a change control process for the activities required in R6, OR The Responsible Entity has not established or documented a configuration management process for the activities required in R6.
CIP-003-4	R1.	Cyber Security Policy —The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:	N/A	N/A	The Responsible Entity has documented but not implemented a cyber security policy.	The Responsible Entity has not documented nor implemented a cyber security policy.

						OR Where an applicable patch was not installed, the Responsible Entity did not document the compensating measure(s) applied to mitigate risk.
CIP-007-3	R4.	Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).	N/A	N/A	N/A	The Responsible Entity, where technically feasible, did not use anti-virus software or other malicious software ("malware") prevention tools, on one or more Cyber Assets within the Electronic Security Perimeter(s).
CIP-007-3	R4.1.	The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.	N/A	N/A	N/A	The Responsible Entity did not document the implementation of antivirus and malware prevention tools for cyber assets within the electronic security perimeter. OR The Responsible Entity did not document the implementation of

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						compensating measure(s) applied to mitigate risk exposure where antivirus and malware prevention tools are not installed.
CIP-007-3	R4.2.	The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.	N/A	N/A	N/A	The Responsible Entity did not document or did not implement a process including addressing testing and installing the signatures for the update of anti-virus and malware prevention "signatures."
CIP-007-3	R5.	Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.	N/A	N/A	N/A	The Responsible Entity did not document or did not implement technical and procedural controls that enforce access authentication of, and accountability for, all user activity.
CIP-007-3	R5.1.	The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.	N/A	N/A	N/A	The Responsible Entity did not ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to

						know" with respect to work functions performed.
CIP-007-3	R5.1.1.	The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-3 Requirement R5.	N/A	N/A	N/A	One or more user accounts implemented by the Responsible Entity were not implemented as approved by designated personnel.
CIP-007-3	R5.1.2.	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	N/A	The Responsible Entity generated logs with sufficient detail to create historical audit trails of individual user account access activity, however the logs do not contain activity for a minimum of 90 days.	The Responsible Entity generated logs with insufficient detail to create historical audit trails of individual user account access activity.	The Responsible Entity did not generate logs of individual user account access activity.
CIP-007-3	R5.1.3.	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.	N/A	N/A	N/A	The Responsible Entity did not review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.
CIP-007-3	R5.2.	The Responsible Entity shall implement a policy to minimize and manage the	N/A	N/A	N/A	The Responsible Entity did not

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
		scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.				implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.
CIP-007-3	R5.2.1.	The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.	N/A	N/A	The Responsible Entity's policy did not include the removal, disabling, or renaming of such accounts where possible, however for accounts that must remain enabled, passwords were changed prior to putting any system into service.	For accounts that must remain enabled, the Responsible Entity did not change passwords prior to putting any system into service.
CIP-007-3	R5.2.2.	The Responsible Entity shall identify those individuals with access to shared accounts.	N/A	N/A	N/A	The Responsible Entity did not identify all individuals with access to shared accounts.
CIP-007-3	R5.2.3.	Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).	N/A	N/A	N/A	Where such accounts must be shared, the Responsible Entity has not implemented (one or more components of) a policy for managing the use of such accounts that limits

			implemented by the Responsible Entity, were not approved by designated personnel.	by the Responsible Entity were not approved by designated personnel.	implemented by the Responsible Entity were not approved by designated personnel.	were not approved by designated personnel.
CIP-007-4	R5.1.2.	The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.	N/A	The Responsible Entity generated logs with sufficient detail to create historical audit trails of individual user account access activity, however the logs do not contain activity for a minimum of 90 days.	The Responsible Entity generated logs with insufficient detail to create historical audit trails of individual user account access activity.	The Responsible Entity did not generate logs of individual user account access activity.
CIP-007-4	R5.1.3.	The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.	N/A	N/A	N/A	The Responsible Entity did not review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-4 Requirement R5 and Standard CIP-004-4 Requirement R4.
CIP-007-4	R5.2.	The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.	N/A	N/A	N/A	The Responsible Entity did not implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic

		risk.				
CIP-007-4	R6.	Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.	The Responsible Entity, as technically feasible, did not implement automated tools or organizational process controls to monitor system events that are related to cyber security for at least one but less than 5% of Cyber Assets inside the Electronic Security Perimeter(s).	The Responsible Entity, as technically feasible, did not implement automated tools or organizational process controls to monitor system events that are related to cyber security for 5% or more but less than 10% of Cyber Assets inside the Electronic Security Perimeter(s).	The Responsible Entity did not implement automated tools or organizational process controls, as technically feasible, to monitor system events that are related to cyber security for 10% or more but less than 15% of Cyber Assets inside the Electronic Security Perimeter(s).	The Responsible Entity did not implement automated tools or organizational process controls, as technically feasible, to monitor system events that are related to cyber security for 15% or more of Cyber Assets inside the Electronic Security Perimeter(s).
CIP-007-4	R6.1.	The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	N/A	The Responsible Entity implemented but did not document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	The Responsible Entity documented but did not implement the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.	The Responsible Entity did not implement nor document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.
