		Priority 7.				of the priority of transmission service as directed in the requirement.
EOP-003-1	R1.	After taking all other remedial steps, a Transmission Operator or Balancing Authority operating with insufficient generation or transmission capacity shall shed customer load rather than risk an uncontrolled failure of components or cascading outages of the Interconnection.	N/A	N/A	N/A	The Transmission Operator or Balancing Authority failed to shed customer load.
EOP-003-1	R2.	Each Transmission Operator and Balancing Authority shall establish plans for automatic load shedding for underfrequency or undervoltage conditions.	N/A	N/A	N/A	The responsible entity did not establish plans for automatic load shedding as directed by the requirement.
EOP-003-1	R3.	Each Transmission Operator and Balancing Authority shall coordinate load shedding plans among other interconnected Transmission Operators and Balancing Authorities.	The responsible entity did not coordinate load shedding plans, as directed by the requirement, affecting 5% or less of its required entities.	The responsible entity did not coordinate load shedding plans, as directed by the requirement, affecting more than 5% up to (and including) 10% of its required entities.	The responsible entity did not coordinate load shedding plans, as directed by the requirement, affecting more than 10%, up to (and including) 15% or less, of its required entities.	The responsible entity did not coordinate load shedding plans, as directed by the requirement, affecting more than 15% of its required entities.
EOP-003-1	R4.	A Transmission Operator or Balancing Authority shall consider one or more of these factors in designing an automatic load shedding scheme: frequency, rate of frequency decay, voltage level, rate of voltage decay, or power flow levels.	N/A	N/A	N/A	The applicable entity did not consider one of the five required elements, as directed by the requirement.
EOP-003-1	R5.	A Transmission Operator or Balancing Authority shall implement load shedding in steps established to minimize the risk of further uncontrolled separation, loss of generation, or system shutdown.	N/A	N/A	N/A	The Transmission Operator or Balancing Authority failed to implement load shedding in steps

Standard Number	Requirement Number	Text of Requirement	Lower VSL	Moderate VSL	High VSL	Severe VSL
						established to minimize the risk of further uncontrolled separation, loss of generation, or system shutdown.
EOP-003-1	R6.	After a Transmission Operator or Balancing Authority Area separates from the Interconnection, if there is insufficient generating capacity to restore system frequency following automatic underfrequency load shedding, the Transmission Operator or Balancing Authority shall shed additional load.	N/A	N/A	N/A	The Transmission Operator or Balancing Authority failed to shed additional load after it had separated from the Interconnection when there was insufficient generating capacity to restore system frequency following automatic underfrequency load shedding.
EOP-003-1	R7.	The Transmission Operator and Balancing Authority shall coordinate automatic load shedding throughout their areas with underfrequency isolation of generating units, tripping of shunt capacitors, and other automatic actions that will occur under abnormal frequency, voltage, or power flow conditions.	The applicable entity did not coordinate automatic load shedding, as directed by the requirement, affecting 5% or less of its automatic actions.	The applicable entity did not coordinate automatic load shedding, as directed by the requirement, affecting between 5 - 10% of its automatic actions.	The applicable entity did not coordinate automatic load shedding, as directed by the requirement, affecting 10-15%, inclusive, of its automatic actions.	The applicable entity did not coordinate automatic load shedding, as directed by the requirement, affecting greater than 15% of its automatic actions.
EOP-003-1	R8.	Each Transmission Operator or Balancing Authority shall have plans for operator-controlled manual load shedding to respond to real-time emergencies. The Transmission Operator or Balancing Authority shall be capable of implementing the load shedding in a timeframe adequate for responding to the emergency.	N/A	The responsible entity did not have plans for operator controlled manual load shedding, as directed by the requirement.	The responsible entity has plans for manual load shedding but did not have the capability to implement the load shedding, as directed by the requirement.	The responsible entity did not have plans for operator controlled manual load shedding, as directed by the requirement nor had the capability to implement the load shedding, as directed by the requirement.

PRC-007-0	R3.	The Transmission Owner and Distribution Provider that owns a UFLS program (as required by its Regional Reliability Organization) shall provide its documentation of that UFLS program to its Regional Reliability Organization on request (30 calendar days).	The responsible entity has provided the documentation in more than 30 calendar days but less than or equal to 40 calendar days.	The responsible entity has provided the documentation in more than 40 calendar days but less than or equal to 50 calendar days.	The responsible entity has provided the documentation in more than 50 calendar days but less than or equal to 60 calendar days.	The responsible entity has not provided the documentation for more than 60 calendar days.
PRC-008-0	R1.	The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall have a UFLS equipment maintenance and testing program in place. This UFLS equipment maintenance and testing program shall include UFLS equipment identification, the schedule for UFLS equipment testing, and the schedule for UFLS equipment maintenance.	The UFLS equipment identification, testing schedule or maintenance schedule for the responsible entity's UFLS equipment maintenance and testing program was missing 5% or less of the applicable equipment.	The UFLS equipment identification, testing schedule, or maintenance schedule for the responsible entity's UFLS equipment maintenance and testing program was missing for more than 5% up to (and including) 10% of the applicable equipment.	The UFLS equipment identification, testing schedule, or maintenance schedule for the responsible entity's UFLS equipment maintenance and testing program was missing more than 10% up to (and including) 15% of the applicable equipment.	The responsible entity failed to implement UFLS equipment maintenance and testing program. OR The UFLS equipment identification, testing schedule, or maintenance schedule for the responsible entity's UFLS equipment maintenance and testing program was missing more than 15% of the applicable equipment.
PRC-008-0	R2.	The Transmission Owner and Distribution Provider with a UFLS program (as required by its Regional Reliability Organization) shall implement its UFLS equipment maintenance and testing program and shall provide UFLS maintenance and testing program results to its Regional Reliability Organization and NERC on request (within 30 calendar days).	The responsible entity provided documentation of its UFLS equipment maintenance and testing program more than 30 calendar days following a request from its Regional Reliability Organization and/or NERC.	Evidence UFLS equipment was maintained and tested within the defined intervals was missing for more than 5% up to (and including) 10% of the applicable devices.	Evidence UFLS equipment was maintained and tested within the defined intervals was missing for more than 10% up to (and including) 15% of the applicable devices.	Evidence UFLS equipment was maintained and tested within the defined intervals was missing for more than 15% of the applicable devices.

A. Introduction

1. Title: Cyber Security — Critical Cyber Asset Identification

2. Number: CIP-002-3

3. Purpose: NERC Standards CIP-002-3 through CIP-009-3 provide a cyber security framework for the identification and protection of Critical Cyber Assets to support reliable operation of the Bulk Electric System.

These standards recognize the differing roles of each entity in the operation of the Bulk Electric System, the criticality and vulnerability of the assets needed to manage Bulk Electric System reliability, and the risks to which they are exposed.

Business and operational demands for managing and maintaining a reliable Bulk Electric System increasingly rely on Cyber Assets supporting critical reliability functions and processes to communicate with each other, across functions and organizations, for services and data. This results in increased risks to these Cyber Assets.

Standard CIP-002-3 requires the identification and documentation of the Critical Cyber Assets associated with the Critical Assets that support the reliable operation of the Bulk Electric System. These Critical Assets are to be identified through the application of a risk-based assessment.

4. Applicability:

4.1. Within the text of Standard CIP-002-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-002-3:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required)

B. Requirements

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.1. The Responsible Entity shall maintain documentation describing its risk-based assessment methodology that includes procedures and evaluation criteria.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.1. Control centers and backup control centers performing the functions of the entities listed in the Applicability section of this standard.

R1.2.2. Transmission substations that support the reliable operation of the Bulk Electric System.

R1.2.3. Generation resources that support the reliable operation of the Bulk Electric System.

R1.2.4. Systems and facilities critical to system restoration, including blackstart generators and substations in the electrical path of transmission lines used for initial system restoration.

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

R1.2.6. Special Protection Systems that support the reliable operation of the Bulk Electric System.

R1.2.7. Any additional assets that support the reliable operation of the Bulk Electric System that the Responsible Entity deems appropriate to include in its assessment.

R2. Critical Asset Identification — The Responsible Entity shall develop a list of its identified Critical Assets determined through an annual application of the risk-based assessment methodology required in R1. The Responsible Entity shall review this list at least annually, and update it as necessary.

R3. Critical Cyber Asset Identification — Using the list of Critical Assets developed pursuant to Requirement R2, the Responsible Entity shall develop a list of associated Critical Cyber Assets essential to the operation of the Critical Asset. Examples at control centers and backup control centers include systems and facilities at master and remote sites that provide monitoring and control, automatic generation control, real-time power system modeling, and real-time inter-utility data exchange. The Responsible Entity shall review this list at least annually, and update it as necessary. For the purpose of Standard CIP-002-3, Critical Cyber Assets are further qualified to be those having at least one of the following characteristics:

R3.1. The Cyber Asset uses a routable protocol to communicate outside the Electronic Security Perimeter; or,

R3.2. The Cyber Asset uses a routable protocol within a control center; or,

R3.3. The Cyber Asset is dial-up accessible.

R4. Annual Approval — The senior manager or delegate(s) shall approve annually the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets. Based on Requirements R1, R2, and R3 the Responsible Entity may determine that it has no Critical Assets or Critical Cyber Assets. The Responsible Entity shall keep a signed and dated record of the senior manager or delegate(s)'s approval of the risk-based assessment methodology, the list of Critical Assets and the list of Critical Cyber Assets (even if such lists are null.)

C. Measures

M1. The Responsible Entity shall make available its current risk-based assessment methodology documentation as specified in Requirement R1.

M2. The Responsible Entity shall make available its list of Critical Assets as specified in Requirement R2.

M3. The Responsible Entity shall make available its list of Critical Cyber Assets as specified in Requirement R3.

M4. The Responsible Entity shall make available its approval records of annual approvals as specified in Requirement R4.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep documentation required by Standard CIP-002-3 from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
1	January 16, 2006	R3.2 — Change "Control Center" to "control center"	03/24/06
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Comments

Interpretation 2012-INT-05
CIP-002-3 for OGE

The Interpretation 2012-INT-05 Drafting Team thanks all commenters who submitted comments on the Interpretation of CIP-002-3, Requirement R1, for OGE (Project 2012-INT-05). This interpretation was posted for a 30-day public comment period from June 27, 2012 through July 27, 2012. Stakeholders were asked to provide feedback on the interpretation through a special electronic comment form. There were 30 sets of comments, including comments from approximately 100 different people from approximately 90 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director, Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Index to Questions, Comments, and Responses

1. Do you agree with this interpretation? If not, what, specifically, do you disagree with? Please provide specific suggestions or proposals for any alternative language. 8

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. **Do you agree with this interpretation? If not, what, specifically, do you disagree with? Please provide specific suggestions or proposals for any alternative language.**

Summary Consideration: The Interpretation Drafting Team (IDT) carefully reviewed all comments in response to the posting of a formal comment period that ended July 27, 2012. In the draft interpretation, the IDT clarifies the meaning of CIP-002-3, Requirement R1.2.5 as it relates and applies to new technologies such as Advanced Meter Infrastructure (AMI). Commenters provided several points of constructive feedback for the IDT's consideration in modifying the draft interpretation in preparation for the next formal comment period and parallel initial ballot. Among the issues identified in comments were recommendations that the IDT amend its response and that it add detail to the response and clarify the response with improved wording. The IDT believes that a few of the commenters who disagreed with the interpretation disagreed due to a misunderstanding of the response, and the IDT has adopted several of the recommended wording changes. Several commenters stated that Load shed of 300 MW or greater is not the issue, but rather that the 300 MW is specifically purposed for BES function of automatic UVLS or UFLS. In response, the IDT agrees with the position that it is not the 300 MW threshold that triggers criticality, but rather what the 300 MW UVLS or UFLS functionally defines. There was a comment that the wording relating to "automatic" could be clarified. In response, the IDT considered the comment but determined that it is generally a well-understood term and would need to be incorporated within an entity's risk-based assessment methodology (RBAM) and processes. There were a few comments that stated the reference to annual is an incorrect citation. In response, the IDT has clarified references from Requirement R4 to Requirement R2 and from Requirement R1 to Requirement R1.2.5.

Organization	Yes or No	Question 1 Comment
Western Small Entity Comment Group	No	The AMI remote connect/disconnect feature described by OGE works at the service voltage level. The meters in question are manufactured with relays inside, so that direct metered services may individually be remotely connected or disconnected. The voltages involved are typically 120V to 480V. While it is true that such a system could be configured to disconnect enough services simultaneously to reach an aggregate exceeding 300MW, the limitations of section 215 of the FPA preclude any consideration of these

Organization	Yes or No	Question 1 Comment
		systems for the purposes of mandatory standards. While there may be some confusion regarding where the line between the Bulk Power System and local distribution lies exactly, the comment group believes these service voltage facilities are unquestionably on the local distribution side and cannot be subject to standards regardless of how they are configured. There can be no requirement to annually reconsider these systems as Critical Assets under the limitations provided by Congress.
Response: Thank you for your comment. Within the CIP standards and related security requirements, loss of Load is within the scope of NERC Reliability Standards as specified in the standards. As the interpretation identifies, if a registered entity has not purposed a system such as AMI to "automatically", which means without human operator initiatation, shed 300 MW or greater of Load it does not need to consider that system under their RBAM. If the equipment is placed on the transmission facilities, the purpose must be evaluated for possible inclusion in the RBAM.		
MRO NSRF	No	The NSRF does not agree that the IDT can clearly state that the AMI is not critical under R1.2.5. The IDT should not make the following statement of:"Applying these requirements to the remote connect or disconnect functionality associated with advanced metering infrastructure (AMI), the drafting team concludes in its interpretation that AMI is not a Critical Asset under R1.2.5 so long as the AMI is not designed to or cannot, without human operator intervention, shed a load of 300MW or more". The NSRF disagrees with this interpretation for the following reasons;1. R1.2.5 is written to specifically address "systems and facilities" that are "critical to automatic load shedding under a common control system capable of shedding 300 MW or more". Not that you have a threshold of "automatic load shedding under a common control system capable of shedding 300 MW or more". The use of 300 MW or more is a pseudo threshold. Consideration of "system and facilities" is the intent of the requirement. 2. Each applicable entity's RBAM should consider (R1.2) their "systems and facilities" that are critical to automatic load shedding...300 MW or more.

Organization	Yes or No	Question 1 Comment
		Upon consideration, the entity may or may not elect to identify the "system or facility" as a Critical Asset, based on their RBAM. 3. The NSRF believes CIP-002-3 is clearly written and that the IDT cannot determine if an Entity's AMI is a Critical Asset or not.
Response: Thank you for your response. The IDT agrees that CIP-002-3 is clearly written and that it cannot determine if an entity's AMI is a Critical Asset. The entity would make that determination by using its RBAM. **In response to OGE's question, the IDT is making the point that AMI is one potential method to shed Load and that the entity would need to determine in its RBAM if it had a system that could "automatically" shed Load and whether the system qualified as a Critical Asset under the terms of the standard.** **The IDT has also removed the following sentence to clarify the interpretation: "If it does, pursuant to Requirement R1.2, the Responsible Entity must consider that asset for identification as a Critical Asset under its RBAM required by CIP-002-3, Requirement R1."**		
Southwest Power Pool Regional Entity	No	The explanatory language of the interpretation is confusing and provides little clarification to the requesting entity. It provides misleading guidance regarding the distinction of "critical" to automatic load shed. It also could be misconstrued by a Responsible Entity in its present form to more broadly apply to all Smart Grid systems functionality in general, leading the entity to conclude that Smart Grid is excluded from the CIP standards. A system or facility is "critical" to load shedding when it is the system or facility that actually disconnects the load upon command of a system intended to perform load reduction as one of its functions, whether manual or automated. Automatic load shedding is that action that occurs without operator intervention, although it may be initiated by an operator under certain circumstances as further explained below. The "common control system" is that programmatic application communicating with and directing the actions of the systems or facilities disconnecting the load. The common control system may be "capable" of shedding more than 300 MW of load

Organization	Yes or No	Question 1 Comment
		while in normal practice less than 300 MW is shed at one time. It is the capability and not the normal practice that must be evaluated. The Responsible Entity must take all of these factors into consideration when determining whether a Cyber Asset meets the R1.2.5 criterion. The Responsible Entities generally recognize that protective relays configured to perform automatic under-frequency or under-voltage load shed meet the criterion of "critical to automatic load shedding" and the entities can readily determine if these devices are capable of shedding 300 MW or more either individually or under a common control system. Responsible Entities generally overlook upstream systems and their potential impact if their capabilities are misused. Responsible Entities often view their SCADA/EMS load shed programs as "manual," not "automatic," without evaluating the actual functionality. While an operator may initiate the load shed by entering a target MW, some load shed programs then automatically perform all of the analysis required to shed sufficient load blocks to attain the target reduction. It is automatic in the sense that the operator could manually open up all of the breakers in the load block scheme, one at a time, to achieve the same result. Similarly, while an operator may initiate rotating load shed by entering a target reduction value, some load shed programs perform all of the necessary steps to automatically cycle through the load blocks until instructed to stop. In a similar manner, Smart Grid systems are often capable of multiple functions including demand response (essentially automatic load shed made possible by curtailing selected appliance load) as well as remote customer meter connect/disconnect (clearly a manual operation and the specific issue at hand). If the demand response functionality of the Smart Grid system is capable of reducing load by 300 MW or more, then it must be considered a Critical Cyber Asset even if load shed is not its "primary" function. The AMI Remote Disconnect function is theoretically capable of being misused to shed 300 MW or more, however that would be done one meter at a time given the programmatic capability

Organization	Yes or No	Question 1 Comment
		of the system. AMI Remote Disconnect is considered to be a manual function - one operator action against one meter. AMI Remote Disconnect is not and cannot be construed to be load shed functionality. The interpretation can be improved, clarified, and simplified by eliminating the explanatory discussion and simply responding to the narrowly focused question asked by OG&E. OG&E specifically asks if the AMI Remote Disconnect function is a system or facility critical to automatic load shedding under a common control system capable of shedding 300 MW or more. The similarly focused response should simply state that while other functions of a Smart Grid AMI system may be capable of automatically shedding 300 MW or more of load, the specific AMI Remote Disconnect function is not a system or facility critical to load shed. An AMI system specifically built and configured to only perform the Remote Disconnect function does not meet the criterion found in CIP-002-3, Requirement R1.2.5.
Response: Thank you for your response. The IDT did not answer the specific AMI question because the role of the IDT is to answer questions concerning the interpretation of the standards and not to answer specific technological applications under the standard. Each entity needs to understand their system and evaluate it under their RBAM. The IDT has made several changes to the wording of its response to make it clearer, however, including language specifying that "an AMI system specifically built and configured to perform the Remote Disconnect function that does not automatically shed load without human operator initiation would not meet the criteria found in CIP-002-3, Requirement R1.2.5."		
Public Utility Commission of Texas	No	I essentially agree with the interpretation but checked "No" because I think the last sentence needs more clarity. The last part of the last sentence reads "...so long as the AMI is not designed to or cannot, without human operator intervention, shed a load of 300MW or more."I propose that the sentence in the interpretation be reworded to read: "as long as the AMI is not designed to shed a load of 300MW or more, or at least cannot do so without human operator intervention."
Response: Thank you for your response. The interpretation has been reworded to improve clarity and to specify that it must be		

Organization	Yes or No	Question 1 Comment
both automatically and without human operator intervention. The IDT notes that the language quoted in the comment was from the background information that the IDT provided and is not part of the interpretation itself.		
Ingleside Cogeneration LP	No	Ingleside Cogeneration LP believes that the interpretation developed by the drafting team comes to the correct conclusion - that OGE's Smart Grid AMI function is not likely going to be identified as a BES Critical Asset. However, it puts the onus on the Responsible Entity to assess the service loss caused by an asset which clearly does not serve a BES function. This effectively expands the scope of the RBAM to apply to equipment that has nothing to do with critical BES functions as they are presently understood. Perhaps of more concern, the drafting team has ignored the results of extensive investigation into this issue which took place during the development of CIP Version 4. In CIP-002-4, the corresponding bright-line criterion states the following:"1.13. Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program."This language is unambiguous and fully addresses the concern by OGE that their Smart Grid Advanced Meter Infrastructure (AMI) could be considered a Smart Grid remote meter disconnect function to be a Critical Asset because it can be configured to shed an aggregate load greater than 300 MW. The intent is to identify UVLS and UFLS systems that are a part of a regional reliability program - not delve into remote meter connections. We are aware that NERC Compliance has taken a position that the bright-line criteria cannot replace the RBAM until CIP Version 4 takes effect in 2014. We are puzzled why an superior system which has been vetted by industry and approved by FERC should be out-of-bounds - especially since the stance does not appear to be related to reliability. Furthermore, there are costs to ambiguity - every dollar spent evaluating the AMI system takes away from other reliability needs. In addition, there is a hidden cost that a conservative reading of the interpretation will lead Responsible Entities to conclude that

Organization	Yes or No	Question 1 Comment
		cyber-hardening is necessary for Smart Grid technologies. If this becomes a wide-spread belief, then many will choose to delay or not deploy the capability. There are enormous societal benefits to Smart Grid (e.g.; intelligent energy conservation) that are at stake - so we urge the project team to take a more definitive stance that AMI systems are not part of the BES and do not need to be considered as Critical Assets.
Response: Thank you for your response. The IDT notes that a Responsible Entity's evaluation and application of its RBAM is necessarily driven by facts and circumstances. Furthermore, the IDT is responding to OGE's request within the context of CIP Versions 1 through 3, which include the RBAM, and based on Guidelines for Interpretation Drafting Teams. This interpretation will not apply to Version 4, which does not use the RBAM, and the IDT does not interpret the previous versions with the information that does not appear in the standard.		
Duke Energy	No	While the interpretation arrives at the correct conclusion, the logic in the third paragraph of the response is needlessly complicated and not supported by a reading of the plain language of R4. Suggested rewording of the third paragraph: "During the identification and documentation of the risk-based assessment methodology used to identify Critical Assets required by R1, a Responsible Entity shall consider "Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more" as specified in R1.2.5. R2 then requires the entity to apply this risk-based assessment methodology annually to identify Critical Assets. If a system or facility is not "critical to" automatically shedding load, or the common control system is not "capable of" automatically shedding 300 MW or more, the asset is not required to be considered in the methodology per R1.2.5, and the asset may not be a Critical Asset."Also, in the fifth paragraph of the response, insert the word "automatically" before the word "shedding".
Response: Thank you for your response. The IDT used your language to rewrite its response.		

Organization	Yes or No	Question 1 Comment
Muscatine Power and Water	No	MPW does not agree that the IDT can clearly state that the AMI is not critical under R1.2.5. The IDT should not make the following statement of:"Applying these requirements to the remote connect or disconnect functionality associated with advanced metering infrastructure (AMI), the drafting team concludes in its interpretation that AMI is not a Critical Asset under R1.2.5 so long as the AMI is not designed to or cannot, without human operator intervention, shed a load of 300MW or more". MPW disagrees with this interpretation for the following reasons; 1. R1.2.5 is written to specifically address "systems and facilities" that are "critical to automatic load shedding under a common control system capable of shedding 300 MW or more". Not that you have a threshold of "automatic load shedding under a common control system capable of shedding 300 MW or more". The use of 300 MW or more is a pseudo threshold. Consideration of "system and facilities" is the intent of the requirement. 2. Each applicable entity's RBAM should consider (R1.2) their "systems and facilities" that are critical to automatic load shedding...300 MW or more. Upon consideration, the entity may or may not elect to identify the "system or facility" as a Critical Asset, based on their RBAM. 3. MPW believes CIP-002-3 is clearly written and that the IDT cannot determine if an Entity's AMI is a Critical Asset or not.
Response: Thank you for your response. The IDT agrees that CIP-002-3 is clearly written and that it cannot determine if an entity's AMI is a Critical Asset. The entity would make that determination by using its RBAM. **In response to OGE's question, the IDT is making the point that AMI is potentially one of a number of potential methods to shed Load and that the entity would need to determine via its RBAM if it had a system that could "automatically" shed Load and whether the system qualified as a CA under the terms of the standard.**		

Organization	Yes or No	Question 1 Comment
ACES Power Marketing	No	Conceptually, we agree with the interpretation. We offer a few refinements to further improve the interpretation. 1) The first sentence in the third paragraph should reference CIP-002-3 R2 not CIP-002-3 R4. The annual application of the risk-based assessment (RBAM) is not required in CIP-002-3 R4 as interpretation implies. Rather it is required in CIP-002-3 R2. CIP-002-3 R4 requires the senior manager to approve the RBAM, list of Critical Assts, and list of Critical Cyber Assets. While this approval likely will require some level of review, it will be a management review not the annual RBAM application. Thus, "Each year, during the annual approval required under CIP-002-3, Requirement R4," should become "Each year per CIP-002-3 Requirement R2". 2) The interpretation needs to match the order of the application of the requirements more closely. In the first sentence of the third paragraph, we suggest "a Responsible Entity must reevaluate whether it has systems or facilities, as specified in Requirement R1.2.5" should be changed to a "Responsible Entity must annually apply its RBAM to identify if any system or facilities, as specified in Requirement R1.2.5, are Critical Assets". 3) In the last sentence of the third paragraph, "the asset may not be a Critical Asset" should be changed to "the asset is not required to be considered a potential Critical Asset in its RBAM through CIP-002-3 R1.2.5." Otherwise, it is not perfectly clear that the responsible entity does not have to consider these "systems and facilities" as potential Critical Assets in its RBAM. Otherwise, the responsible entity may be left confused if they are obligated to consider these "systems and

Organization	Yes or No	Question 1 Comment
		facilities". 4) In the third line of the third paragraph, R1.2 should be R1.2.5. 5) The fourth paragraph needs some modifications. "Asset" should be "Critical Asset and CIP-002-3, Requirement R1 should refer to Requirement R2. R1 does not compel identification of any assets of any type. Rather it simply requires that the responsible entity to identify and document an RBAM. 6) A more direct statement is needed to clarify that if the "systems and facilities" are not automatic and require operator (or user) intervention that they are not subject to R1.2.5. The last statement in the Background Information section of the comment form is much clearer than the interpretation and could be adopted. It reads: "Applying these requirements to the remote connect or disconnect functionality associated with advanced metering infrastructure (AMI), the drafting team concludes in its interpretation that AMI is not a Critical Asset under R1.2.5 so long as the AMI is not designed to or cannot, without human operator intervention, shed a load of 300MW or more." This really clarifies what is meant by automatic. "Systems and facilities" could be substituted for AMI to make the statement technology neutral.
Response: Thank you for your response. The IDT took your comments into consideration along with the recommendations made by other commenters and reworded its response. Q1 – Q4: The third paragraph has been reworded. Q5: Your recommended changes have been adopted. Q6: Based on its understanding of Guidelines for Interpretation Drafting Teams, the IDT believes that such a statement is more appropriately included as part of the background information as opposed to part of the interpretation itself. The IDT intends for the interpretation to provide an input to the RBAM consideration process, not to prescribe an outcome. However, based in part on this suggestion, the IDT did further clarify in the interpretation itself that "an AMI system specifically built and configured to perform the Remote Disconnect function that does not automatically shed load		

Organization	Yes or No	Question 1 Comment
without human operator initiation would not meet the criteria found in CIP-002-3, Requirement R1.2.5."		
Bonneville Power Administration	Yes	BPA agrees with this interpretation with the understanding that a System Operator does not have access to the AMI and a one push button cannot achieve 300MW or more.
Response: Thank you for your response. The IDT agrees with your comment and notes that "a one push button" is not automatic.		
Salt River Project	Yes	SRP supports OGE's interpretation that SmartGrid AMI systems are not designed to allow for automatic load shedding.
Response: Thank you for your response and supportive comment.		
FirstEnergy	Yes	We fundamentally agree with the interpretation but offer the following comments and suggested wording: Although the interpretation request is specific to CIP-002-3, the team should consider whether or not their response is within the spirit of CIP-002-4 bright line Attachment 1 criterion 1.13 which reads: "Each system or Facility that performs automatic load shedding, without human operator initiation, of 300 MW or more implementing Under Voltage Load Shedding (UVLS) or Under Frequency Load Shedding (UFLS) as required by the regional load shedding program." The subtle difference between version 3 and version 4 is that version 4 seems to include only those systems associated with UVLS and UFLS and not more generically as in the wording of version 3 and is the reason the requestor indicates that the AMI system is not relied upon for its UVLS and UFLS functionality. Another key clarification the bright line made was in the phrase "without human operator initiation". It sounds like AMIs are intended as a convenience or efficiency gain of dropping load from a central

Organization	Yes or No	Question 1 Comment
		location and would be operator initiated. The risk of a hacker just breaking into some system and dropping load is likely not a BES reliability risk. Additionally, if the hacker would compromise the AMI such that the load can not be shed from a centralized location (assuming operator initiated) still does not impact BES reliability since the transmission operator would have EMS controls as a back-up for shedding load, even if the load shed is for a reliability purpose and not an economic need. The reason the bright line criterion 1.13 landed where it did is that the real risk is that a load shedding scheme performing automatic load shed during a critical frequency or voltage collapse cannot be compromised and must be available to act when automatic controls triggering those systems are met. In light of our comments, we suggest a slight modification to the last paragraph of the interpretation to include the phrase "without human operator initiation shed load for a critical BES reliability purpose" and suggest the following wording for the last paragraph:"Therefore, if a system or facility such as AMI meets the specifications of Requirement 1.2.5 (i.e., is both capable of shedding 300 MW or more and is set up and purposed to automatically, without human operator initiation, shed load for a critical BES reliability purpose), the Responsible Entity should consider the system or facility for identification as a Critical Asset under its RBAM. Otherwise, the Responsible Entity is not required to consider the system or facility for identification as a Critical Asset."
Response: Thank you for your response. The IDT reworded the last paragraph using the main points of your recommendation.		
ISO/RTO Council Standards Review Committee	Yes	In regards to the Response section of the Interpretation, the SRC requests the correction(s) shown below. Response Section, page 2 "Each year, during the annual approval required under CIP-002-3, Requirement R2, a Responsible Entity must reevaluate whether it has systems or facilities, as specified in Requirement R1.2.5, that

Organization	Yes or No	Question 1 Comment
		are “critical to automatic load shedding under a common control system capable of shedding 300 MW or more.” If it does, pursuant to Requirement R1.2, the Responsible Entity must consider that asset for identification as a Critical Asset under its RBAM required by CIP-002-3, Requirement R1. If a system or facility is not “critical to” automatical shedding load, or the common control system is not “capable of” shedding 300 MW or more, the asset may not be a Critical Asset.” Explanation: Requirement R2 is the requirement for the annual application of the risk-based assessment methodology required in R1. Requirement 4 is only for approval and not for update or reevaluation. The change to “automatical” is a grammatical fix. Response Section, page 3 ”Therefore, if a system or facility such as AMI meets the specifications of Requirement 1.2.5 (i.e., is critical to automatic load shedding under a common control system and is capable of shedding 300 MW or more), the Responsible Entity should consider the system or facility for identification as a Critical Asset under its RBAM.” An entity should consider AMI under its RBAM if the equipment/facility has the requisite capability - i.e. capable of shedding 300 MW or more - despite whether the equipment/facilities are in fact purposed to perform that function in practice. The reason that capability, and not actual function, should be the determining factor is because if the equipment can be manipulated to manipulate load, despite its actual practical function, it should be assessed for criticality because it can affect system reliability. Explanation: The SRC requests the interpretation be modified consistent with the above revisions because if an AMI system is capable of shedding load, despite its actual functionality, it has the potential to negatively impact the BES in the event of misuse or security breach.
Response: Thank you for your response. The IDT notes that there is not a need for a grammar fix, as the standard uses the term “automatic,” and the IDT cannot change the standard itself.		

Organization	Yes or No	Question 1 Comment
Southern Company	Yes	Southern Company appreciates the opportunity to provide the following comments regarding the interpretation of CIP-002-3, Requirement 1. As part of the annual approval, the methodology and logic as required by NERC CIP - 002 is used to determined the list of assets critical to the reliability of the Bulk Electric System. Southern Company agrees that each entity should determine its Critical Assets, if any.
Response: Thank you for your response and supportive comments.		
Pepco Holdings Inc.	Yes	PHI supports the interpretation
Response: Thank you for your support of the interpretation.		
ReliabilityFirst	Yes	ReliabilityFirst generally agrees with the drafted interpretation but offers one minor comment for consideration. ReliabilityFirst believes there is an incorrect reference to “an annual approval” per CIP-002-3 R4 in the draft Interpretation. ReliabilityFirst believes the correct reference should be to the “annual application of the RBAM” located in CIP-002-3 R2.
Response: Thank you for your comment. The IDT clarified the references.		
MidAmerican Energy Company	Yes	MidAmerican Energy Company believes CIP-002-3, R1.2.5 is clear as written, but does not disagree with the proposed interpretation response.
Response: Thank you for your response.

Date submitted: 2/24/11

Contact information for person requesting the interpretation:

Name: John Rhea

Organization: OGE Energy Corp.

Telephone: 405-553-3445

E-mail: rheajd@oge.com

Identify the standard that needs clarification:

Standard Number (include version number): CIP-002-3

(example: PRC-001-1)

Standard Title: Cyber Security – Critical Cyber Asset Identification

Identify specifically what requirement needs clarification:

Requirement Number and Text of Requirement:

CIP-002-3 R1.2.5 - Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

Clarification needed: Based on the text above, an auditor could apply this standard to the Smart Grid Advanced Meter Infrastructure (AMI) remote connect/disconnect functionality. While the AMI system is not designed to perform automatic load shedding of 300 MW it could be repurposed to shed an aggregate load of 300 MW or more. However, it is important to note that the AMI remote disconnect function is not used for under-voltage load shedding or under-frequency load shedding as a part of the region's load shedding program.

The primary purpose of the AMI remote connect/disconnect function is to connect and disconnect individual retail electric customers from a central location rather than at the meter itself to enable substantial efficiency gains.

OGE would like NERC to clarify that a company's SmartGrid AMI functionality, which may be able to disconnect 300+ MW of load, is not considered a system or facility critical to automatic load shedding under a common control system capable of shedding 300 mw and therefore it should not be included in the Company's risk based methodology. OGE believes this clarification is appropriate because CIP-002-3 R1.2.5 was written to address under-voltage and under-frequency load shedding systems; SmartGrid AMI disconnect functionality pertains to neither.

Identify the material impact associated with this interpretation:
Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this standard. The AMI Remote Disconnect function has no impact on OGE's ability to participate in SPP's load shedding program. The cost of compliance for OGE alone is in the millions of dollars without any significant benefit to the reliability of the Bulk Electric System.

Project 2012-INT-05: Response to Request for an Interpretation of NERC Standard CIP-002-3 for the OGE Energy Corporation

The following interpretation of NERC Standard CIP-002-3 Cyber Security — Critical Cyber Asset Identification, Requirement R1.2.5, was developed by a project team from the CIP Interpretation Drafting Team.

Requirement Number and Text of Requirement

R1. Critical Asset Identification Method — The Responsible Entity shall identify and document a risk-based assessment methodology to use to identify its Critical Assets.

R1.2. The risk-based assessment shall consider the following assets:

R1.2.5. Systems and facilities critical to automatic load shedding under a common control system capable of shedding 300 MW or more.

Question

OGE Energy Corporation seeks clarification on the meaning of CIP-002-3, Requirement R1.2.5 as it relates to "SmartGrid Advanced Meter Infrastructure (AMI) remote connect/disconnect functionality."

In its response, the Interpretation Drafting Team will answer whether a company's SmartGrid AMI functionality, which may be able to disconnect more than 300 MW of load, is considered a system or facility critical to automatic load shedding under a common control system capable of shedding 300 MW or more under CIP-002-3, Requirement 1.2.5.

Response

In evaluating OGE's request, the Interpretation Drafting Team (IDT) clarifies the meaning of CIP-002-3, Requirement R1.2.5 as it relates and applies to new technologies such as AMI. CIP-002-3, Requirement R1.2.5, along with the context of the standard as a whole, informed development of this interpretation.

CIP-002-3, Requirement R1.2 specifies that the Responsible Entity's risk-based assessment methodology ("RBAM") "shall consider" the assets described in Requirement R1.2.5 ~~for identification as Critical Assets.~~ .

~~Each year, during~~During the ~~annual approval required under CIP-002-3, Requirement R4~~identification and documentation of the RBAM, a Responsible Entity ~~must reevaluate whether it has systems or~~shall consider "Systems and facilities~~, as specified in Requirement R1.2.5, that are "~~ critical to automatic load shedding under a common control system capable of shedding 300 MW or more~~." If it does, pursuant~~" as specified in Requirement R1.2.5. Requirement R2 then requires the entity to apply this RBAM annually to identify Critical Assets. If a system or facility does not meet the specifications of Requirement R1.2.5, the ~~Responsible Entity must~~RBAM is not required to consider that asset.
~~for identification as a~~
~~Critical Asset under its RBAM required by CIP-002-3, Requirement R1. If a system or facility is not "critical to" automatically shedding load, or the common control system is not "capable of" shedding 300 MW or more, the asset may not be a Critical Asset.~~

The Critical Asset identification method under CIP-002-3, Requirement R1 is based on a facts and circumstance-driven analysis and is not dependent exclusively on specific technology or specific types of systems or facilities.~~-~~ For instance, systems or facilities such as AMI may have the potential or capability to be set up to automatically shed load, but having that potential or capability does not necessarily mean that the system or facility performs the function as described in Requirement R1.2.5. Therefore, an AMI system specifically built and configured to perform the Remote Disconnect function that does not automatically shed load without human operator initiation would not meet the criteria found in CIP-002-3, Requirement R1.2.5.

~~Therefore, if a system or facility such as AMI meets the specifications of Requirement 1.2.5 (i.e., is both capable of shedding 300 MW or more and is set up and purposed to automatically shed load), the Responsible Entity should consider the system or facility for identification as a Critical Asset under its RBAM. Otherwise, the Responsible Entity is not required to consider the system or facility for identification as a Critical Asset.~~

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2012-INT-05 Interpretation of CIP-002-3 for OGE

Formal Comment Period Now Open: November 6, 2012 – December 20, 2012
Ballot Pool Forming Now: November 6, 2012 – December 5, 2012

Upcoming
Initial Ballot: December 11 – 20, 2012

Now Available

A formal comment period for the interpretation of **CIP-002-3** – Cyber Security – Critical Cyber Asset Identification is open through 8 p.m. Eastern on **Thursday, December 20, 2012.** A ballot pool is being formed and the ballot pool window is open through 8 a.m. Eastern on **Wednesday, December 5, 2012** (*please note that ballot pools close at 8 a.m. Eastern and mark your calendar accordingly*).

Instructions for Joining Ballot Pool(s)

Registered Ballot Body members must join the ballot pool to be eligible to vote in the balloting of the interpretation of CIP-002-3. Registered Ballot Body members may join the ballot pool at the following page: Join Ballot Pool

During the pre-ballot window, members of the ballot pool may communicate with one another by using the "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list server.)
The ballot pool list server for this ballot pool is: bp-2012-INT-05@nerc.com.

The ballot pool is open **through 8 a.m. Eastern on Thursday, December 20, 2012.**

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Thursday, December 20, 2012.** Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

An initial ballot will be conducted December 11, 2012 through 8 p.m. Thursday, December 20, 2012.

Background

Oklahoma Gas and Electric (OGE) submitted a request for interpretation of CIP-002-3 asking for clarification of Requirement R1.2.5 in relation to SmartGrid AMI functionality. Clarification was requested that a company's SmartGrid AMI functionality, which may be able to disconnect 300+ MW

of load, is not considered a system or facility critical to automatic load shedding under a common control system capable of shedding 300 MW and therefore it should not be included in the company's risk-based methodology.

The drafting team has reviewed all comments submitted in the previous posting of the interpretation, and it has made changes in the interpretation in response to those comments.

To sign up for the plus list for this project to follow along with meetings and work products, please email Wendy Muller.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standards Announcement

Project 2012-INT-06 – Interpretation of CIP-003-3 for Consumers Energy

Formal Comment Period Open: November 9, 2012 – December 10, 2012

Now Available

A formal comment period for the interpretation of CIP-003 for Consumers Energy is open through **8 p.m. Eastern on Monday, December 10, 2012**.

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Monday, December 10, 2012.** Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at Wendy.Muller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team will consider all comments and determine whether to make changes to the interpretation response prior to posting the interpretation for a 45-day comment period and initial ballot.

Background

In May 2011, the Standards Committee appointed a standing CIP Interpretation Drafting Team (IDT) for the development of CIP Interpretations. A project team from the CIP IDT has reviewed Consumers Energy's request for interpretation and developed this interpretation pursuant to the NERC Guidelines for IDTs. Consumers Energy requested clarification on Section 4.1 of CIP-003-3 Requirement R2 as to if a registered entity can assign different CIP Senior Managers for different applicable functions it is registered for.

Additional information is available on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, at Wendy.Muller@nerc.net or at 404-446-2560.

A. Introduction

1. Title: Cyber Security — Security Management Controls

2. Number: CIP-003-3

3. Purpose: Standard CIP-003-3 requires that Responsible Entities have minimum security management controls in place to protect Critical Cyber Assets. Standard CIP-003-3 should be read as part of a group of standards numbered Standards CIP-002-3 through CIP-009-3.

4. Applicability:

4.1. Within the text of Standard CIP-003-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-003-3:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-3, identify that they have no Critical Cyber Assets shall only be required to comply with CIP-003-3 Requirement R2.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Cyber Security Policy — The Responsible Entity shall document and implement a cyber security policy that represents management's commitment and ability to secure its Critical Cyber Assets. The Responsible Entity shall, at minimum, ensure the following:

R1.1. The cyber security policy addresses the requirements in Standards CIP-002-3 through CIP-009-3, including provision for emergency situations.

R1.2. The cyber security policy is readily available to all personnel who have access to, or are responsible for, Critical Cyber Assets.

R1.3. Annual review and approval of the cyber security policy by the senior manager assigned pursuant to R2.

R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-3 through CIP-009-3.

R2.1. The senior manager shall be identified by name, title, and date of designation.

R2.2. Changes to the senior manager must be documented within thirty calendar days of the effective date.

R2.3. Where allowed by Standards CIP-002-3 through CIP-009-3, the senior manager may delegate authority for specific actions to a named delegate or delegates. These delegations shall be documented in the same manner as R2.1 and R2.2, and approved by the senior manager.

R2.4. The senior manager or delegate(s), shall authorize and document any exception from the requirements of the cyber security policy.

R3. Exceptions — Instances where the Responsible Entity cannot conform to its cyber security policy must be documented as exceptions and authorized by the senior manager or delegate(s).

R3.1. Exceptions to the Responsible Entity's cyber security policy must be documented within thirty days of being approved by the senior manager or delegate(s).

R3.2. Documented exceptions to the cyber security policy must include an explanation as to why the exception is necessary and any compensating measures.

R3.3. Authorized exceptions to the cyber security policy must be reviewed and approved annually by the senior manager or delegate(s) to ensure the exceptions are still required and valid. Such review and approval shall be documented.

R4. Information Protection — The Responsible Entity shall implement and document a program to identify, classify, and protect information associated with Critical Cyber Assets.

R4.1. The Critical Cyber Asset information to be protected shall include, at a minimum and regardless of media type, operational procedures, lists as required in Standard CIP-002-3, network topology or similar diagrams, floor plans of computing centers that contain Critical Cyber Assets, equipment layouts of Critical Cyber Assets, disaster recovery plans, incident response plans, and security configuration information.

R4.2. The Responsible Entity shall classify information to be protected under this program based on the sensitivity of the Critical Cyber Asset information.

R4.3. The Responsible Entity shall, at least annually, assess adherence to its Critical Cyber Asset information protection program, document the assessment results, and implement an action plan to remediate deficiencies identified during the assessment.

R5. Access Control — The Responsible Entity shall document and implement a program for managing access to protected Critical Cyber Asset information.

R5.1. The Responsible Entity shall maintain a list of designated personnel who are responsible for authorizing logical or physical access to protected information.

R5.1.1. Personnel shall be identified by name, title, and the information for which they are responsible for authorizing access.

R5.1.2. The list of personnel responsible for authorizing access to protected information shall be verified at least annually.

R5.2. The Responsible Entity shall review at least annually the access privileges to protected information to confirm that access privileges are correct and that they correspond with the Responsible Entity's needs and appropriate personnel roles and responsibilities.

R5.3. The Responsible Entity shall assess and document at least annually the processes for controlling access privileges to protected information.

R6. Change Control and Configuration Management — The Responsible Entity shall establish and document a process of change control and configuration management for adding, modifying, replacing, or removing Critical Cyber Asset hardware or software, and implement supporting configuration management activities to identify, control and document all entity or vendor-related changes to hardware and software components of Critical Cyber Assets pursuant to the change control process.

C. Measures

M1. The Responsible Entity shall make available documentation of its cyber security policy as specified in Requirement R1. Additionally, the Responsible Entity shall demonstrate that the cyber security policy is available as specified in Requirement R1.2.

M2. The Responsible Entity shall make available documentation of the assignment of, and changes to, its leadership as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation of the exceptions, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation of its information protection program as specified in Requirement R4.

M5. The Responsible Entity shall make available its access control documentation as specified in Requirement R5.

M6. The Responsible Entity shall make available its change control and configuration management documentation as specified in Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information

1.5.1 None

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. Requirement R2 applies to all Responsible Entities, including Responsible Entities which have no Critical Cyber Assets. Modified the personnel identification information requirements in R5.1.1 to include name, title, and the information for which they are responsible for authorizing access (removed the business phone information). Changed compliance monitor to Compliance Enforcement Authority.	
3		Update version number from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees	Update

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Note: A valid interpretation request is one that requests additional clarity about one or more requirements in approved NERC reliability standards, but does not request approval as to how to comply with one or more requirements.

When completed, email this form to:
laura.hussey@nerc.net
For questions about this form or for assistance in completing the form, call Laura Hussey at 404-446-2579.

Request for an Interpretation of a Reliability Standard	
Date submitted: June 9, 2011	
Contact information for person requesting the interpretation:	
Name: Jeanne M. Kurzynowski	
Organization: Consumers Energy Company	
Telephone: (517)788-1110	E-mail: jmkurzyn@cmsenergy.com
Identify the standard that needs clarification:	
Standard Number (include version number, e.g. PRC-001-1): CIP-003-3	
Standard Title: Cyber Security – Security Management Controls	
Identify specifically what requirement needs clarification:	
Requirement Number and Text of Requirement: R2. Leadership — The Responsible Entity shall assign a single senior manager with overall responsibility and authority for leading and managing the entity's implementation of, and adherence to, Standards CIP-002-3 through CIP-009-3.	
Identify the nature of clarification that is requested: (Check as many as applicable)	
☐ Clarify the required performance ☐ Clarify the conditions under which the performance is required ☒ Clarify which functional entity is responsible for performing an action in a requirement ☐ Clarify the reliability outcome the requirement is intended to produce	
Please explain the clarification needed: Section 4.1 of CIP-003-3, "Applicability" specifies that a "Responsible Entity" shall mean…", and lists several functions. If one substitutes any of these functions for the term "Responsible Entity", it would appear that there could be a different Senior Manager for each function to which that entity is registered. With regard to CIP-003-3, R2 can a Registered Entity assign different CIP Senior Managers for different applicable	

functions for which it is registered? (If so, a Registered Entity could have more than one CIP senior manager, but each Responsible Entity would have a single CIP senior manager.)

Identify the material impact associated with this interpretation:

Identify the material impact to your organization or others, if known, caused by the lack of clarity or an incorrect interpretation of this standard.

An incorrect interpretation of the standard may impact an organization's CIP compliance structure.

Question

Consumers Energy Corporation seeks clarification on the meaning of CIP-003-3, Requirement R3 as it relates to designating a CIP Senior Manager.

In its response, the Interpretation Drafting Team will answer whether a Registered Entity may assign different CIP Senior Managers for different applicable functions for which it is registered.

Response

No, a Registered Entity cannot assign different CIP Senior Managers for different applicable functions for which it is registered.

Organizational Registration is a process defined in the NERC Rules of Procedure undertaken by NERC and Regional Entities to identify which entities are responsible for reliability functions within the Regional Entity's Region. Within the NERC Rules of Procedure a "Registered Entity" means an owner, operator, or user of the Bulk Power System, or the entity registered as its designee for the purpose of compliance, which is included in the NERC Compliance Registry.

The number of CIP Senior Managers depends on how the entity registers and appears in the NERC Compliance Registry. Each Registered Entity, even if registered as performing multiple registration functions, shall assign a single CIP Senior Manager. If the same single company has only one NERC ID, i.e. the entity is registered once for its GO/GOP and TO/TOP collectively, the entity assigns one CIP Senior Manager. If a single company has multiple Registered Entities (i.e. company has registered one business segment as a GO/GOP, and another business segment registered as TO/TOP) it could assign a different CIP Senior Manager to each Registered Entity, but that would not preclude the entity from assigning a single CIP Senior Manager to both Registered Entities.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Note: A valid interpretation request is one that requests additional clarity about one or more requirements in approved NERC reliability standards, but does not request approval as to how to comply with one or more requirements.

When completed, email this form to:
laura.hussey@nerc.net
For questions about this form or for assistance in completing the form, call Laura Hussey at 404-446-2579.

A. Introduction

1. Title: Cyber Security — Systems Security Management

2. Number: CIP-007-3

3. Purpose: Standard CIP-007-3 requires Responsible Entities to define methods, processes, and procedures for securing those systems determined to be Critical Cyber Assets, as well as the other (non-critical) Cyber Assets within the Electronic Security Perimeter(s). Standard CIP-007-3 should be read as part of a group of standards numbered Standards CIP-002-3 through CIP-009-3.

4. Applicability:

4.1. Within the text of Standard CIP-007-3, "Responsible Entity" shall mean:

4.1.1 Reliability Coordinator.

4.1.2 Balancing Authority.

4.1.3 Interchange Authority.

4.1.4 Transmission Service Provider.

4.1.5 Transmission Owner.

4.1.6 Transmission Operator.

4.1.7 Generator Owner.

4.1.8 Generator Operator.

4.1.9 Load Serving Entity.

4.1.10 NERC.

4.1.11 Regional Entity.

4.2. The following are exempt from Standard CIP-007-3:

4.2.1 Facilities regulated by the U.S. Nuclear Regulatory Commission or the Canadian Nuclear Safety Commission.

4.2.2 Cyber Assets associated with communication networks and data communication links between discrete Electronic Security Perimeters.

4.2.3 Responsible Entities that, in compliance with Standard CIP-002-3, identify that they have no Critical Cyber Assets.

5. Effective Date: The first day of the third calendar quarter after applicable regulatory approvals have been received (or the Reliability Standard otherwise becomes effective the first day of the third calendar quarter after BOT adoption in those jurisdictions where regulatory approval is not required).

B. Requirements

R1. Test Procedures — The Responsible Entity shall ensure that new Cyber Assets and significant changes to existing Cyber Assets within the Electronic Security Perimeter do not adversely affect existing cyber security controls. For purposes of Standard CIP-007-3, a significant change shall, at a minimum, include implementation of security patches, cumulative service packs, vendor releases, and version upgrades of operating systems, applications, database platforms, or other third-party software or firmware.

R1.1. The Responsible Entity shall create, implement, and maintain cyber security test procedures in a manner that minimizes adverse effects on the production system or its operation.

R1.2. The Responsible Entity shall document that testing is performed in a manner that reflects the production environment.

R1.3. The Responsible Entity shall document test results.

R2. Ports and Services — The Responsible Entity shall establish, document and implement a process to ensure that only those ports and services required for normal and emergency operations are enabled.

R2.1. The Responsible Entity shall enable only those ports and services required for normal and emergency operations.

R2.2. The Responsible Entity shall disable other ports and services, including those used for testing purposes, prior to production use of all Cyber Assets inside the Electronic Security Perimeter(s).

R2.3. In the case where unused ports and services cannot be disabled due to technical limitations, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R3. Security Patch Management — The Responsible Entity, either separately or as a component of the documented configuration management process specified in CIP-003-3 Requirement R6, shall establish, document and implement a security patch management program for tracking, evaluating, testing, and installing applicable cyber security software patches for all Cyber Assets within the Electronic Security Perimeter(s).

R3.1. The Responsible Entity shall document the assessment of security patches and security upgrades for applicability within thirty calendar days of availability of the patches or upgrades.

R3.2. The Responsible Entity shall document the implementation of security patches. In any case where the patch is not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4. Malicious Software Prevention — The Responsible Entity shall use anti-virus software and other malicious software ("malware") prevention tools, where technically feasible, to detect, prevent, deter, and mitigate the introduction, exposure, and propagation of malware on all Cyber Assets within the Electronic Security Perimeter(s).

R4.1. The Responsible Entity shall document and implement anti-virus and malware prevention tools. In the case where anti-virus software and malware prevention tools are not installed, the Responsible Entity shall document compensating measure(s) applied to mitigate risk exposure.

R4.2. The Responsible Entity shall document and implement a process for the update of anti-virus and malware prevention "signatures." The process must address testing and installing the signatures.

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.1. The Responsible Entity shall ensure that individual and shared system accounts and authorized access permissions are consistent with the concept of "need to know" with respect to work functions performed.

R5.1.1. The Responsible Entity shall ensure that user accounts are implemented as approved by designated personnel. Refer to Standard CIP-003-3 Requirement R5.

R5.1.2. The Responsible Entity shall establish methods, processes, and procedures that generate logs of sufficient detail to create historical audit trails of individual user account access activity for a minimum of ninety days.

R5.1.3. The Responsible Entity shall review, at least annually, user accounts to verify access privileges are in accordance with Standard CIP-003-3 Requirement R5 and Standard CIP-004-3 Requirement R4.

R5.2. The Responsible Entity shall implement a policy to minimize and manage the scope and acceptable use of administrator, shared, and other generic account privileges including factory default accounts.

R5.2.1. The policy shall include the removal, disabling, or renaming of such accounts where possible. For such accounts that must remain enabled, passwords shall be changed prior to putting any system into service.

R5.2.2. The Responsible Entity shall identify those individuals with access to shared accounts.

R5.2.3. Where such accounts must be shared, the Responsible Entity shall have a policy for managing the use of such accounts that limits access to only those with authorization, an audit trail of the account use (automated or manual), and steps for securing the account in the event of personnel changes (for example, change in assignment or termination).

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:

R5.3.1. Each password shall be a minimum of six characters.

R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters.

R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

R6. Security Status Monitoring — The Responsible Entity shall ensure that all Cyber Assets within the Electronic Security Perimeter, as technically feasible, implement automated tools or organizational process controls to monitor system events that are related to cyber security.

R6.1. The Responsible Entity shall implement and document the organizational processes and technical and procedural mechanisms for monitoring for security events on all Cyber Assets within the Electronic Security Perimeter.

R6.2. The security monitoring controls shall issue automated or manual alerts for detected Cyber Security Incidents.

R6.3. The Responsible Entity shall maintain logs of system events related to cyber security, where technically feasible, to support incident response as required in Standard CIP-008-3.

R6.4. The Responsible Entity shall retain all logs specified in Requirement R6 for ninety calendar days.

R6.5. The Responsible Entity shall review logs of system events related to cyber security and maintain records documenting review of logs.

R7. Disposal or Redeployment — The Responsible Entity shall establish and implement formal methods, processes, and procedures for disposal or redeployment of Cyber Assets within the Electronic Security Perimeter(s) as identified and documented in Standard CIP-005-3.

R7.1. Prior to the disposal of such assets, the Responsible Entity shall destroy or erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.2. Prior to redeployment of such assets, the Responsible Entity shall, at a minimum, erase the data storage media to prevent unauthorized retrieval of sensitive cyber security or reliability data.

R7.3. The Responsible Entity shall maintain records that such assets were disposed of or redeployed in accordance with documented procedures.

R8. Cyber Vulnerability Assessment — The Responsible Entity shall perform a cyber vulnerability assessment of all Cyber Assets within the Electronic Security Perimeter at least annually. The vulnerability assessment shall include, at a minimum, the following:

R8.1. A document identifying the vulnerability assessment process;

R8.2. A review to verify that only ports and services required for operation of the Cyber Assets within the Electronic Security Perimeter are enabled;

R8.3. A review of controls for default accounts; and,

R8.4. Documentation of the results of the assessment, the action plan to remediate or mitigate vulnerabilities identified in the assessment, and the execution status of that action plan.

R9. Documentation Review and Maintenance — The Responsible Entity shall review and update the documentation specified in Standard CIP-007-3 at least annually. Changes resulting from modifications to the systems or controls shall be documented within thirty calendar days of the change being completed.

C. Measures

M1. The Responsible Entity shall make available documentation of its security test procedures as specified in Requirement R1.

M2. The Responsible Entity shall make available documentation as specified in Requirement R2.

M3. The Responsible Entity shall make available documentation and records of its security patch management program, as specified in Requirement R3.

M4. The Responsible Entity shall make available documentation and records of its malicious software prevention program as specified in Requirement R4.

M5. The Responsible Entity shall make available documentation and records of its account management program as specified in Requirement R5.

M6. The Responsible Entity shall make available documentation and records of its security status monitoring program as specified in Requirement R6.

M7. The Responsible Entity shall make available documentation and records of its program for the disposal or redeployment of Cyber Assets as specified in Requirement R7.

M8. The Responsible Entity shall make available documentation and records of its annual vulnerability assessment of all Cyber Assets within the Electronic Security Perimeters(s) as specified in Requirement R8.

M9. The Responsible Entity shall make available documentation and records demonstrating the review and update as specified in Requirement R9.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

1.1.1 Regional Entity for Responsible Entities that do not perform delegated tasks for their Regional Entity.

1.1.2 ERO for Regional Entity.

1.1.3 Third-party monitor without vested interest in the outcome for NERC.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Compliance Monitoring and Enforcement Processes

Compliance Audits

Self-Certifications

Spot Checking

Compliance Violation Investigations

Self-Reporting

Complaints

1.4. Data Retention

1.4.1 The Responsible Entity shall keep all documentation and records from the previous full calendar year unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

1.4.2 The Responsible Entity shall retain security–related system event logs for ninety calendar days, unless longer retention is required pursuant to Standard CIP-008-3 Requirement R2.

1.4.3 The Compliance Enforcement Authority in conjunction with the Registered Entity shall keep the last audit records and all requested and submitted subsequent audit records.

1.5. Additional Compliance Information.

2. Violation Severity Levels (To be developed later.)

E. Regional Variances

None identified.

Version History

Version	Date	Action	Change Tracking
2		Modifications to clarify the requirements and to bring the compliance elements into conformance with the latest guidelines for developing compliance elements of standards. Removal of reasonable business judgment and acceptance of risk. Revised the Purpose of this standard to clarify that Standard CIP-007-2 requires Responsible Entities to define methods, processes, and procedures for securing Cyber Assets and other (non-Critical)	

		Assets within an Electronic Security Perimeter. Replaced the RRO with the RE as a responsible entity. Rewording of Effective Date. R9 changed ninety (90) days to thirty (30) days Changed compliance monitor to Compliance Enforcement Authority.	
3		Updated version numbers from -2 to -3	
3	12/16/09	Approved by the NERC Board of Trustees

Note: an Interpretation cannot be used to change a standard.

Request for an Interpretation of a Reliability Standard

Date submitted: 12-28-2011

Contact information for person requesting the interpretation:

Name:	Charles Lewis
Organization:	ITC Transmission
Telephone:	248-946-3182
E-mail:	clewis@itctransco.com

Identify the standard that needs clarification:

Standard Number (include version number): CIP-007-3

(example: PRC-001-1)

Standard Title: Cyber Security – Systems Security Management

Identify specifically what requirement needs clarification:

Requirement Number and Text of Requirement:

R5. Account Management — The Responsible Entity shall establish, implement, and document technical and procedural controls that enforce access authentication of, and accountability for, all user activity, and that minimize the risk of unauthorized system access.

R5.3. At a minimum, the Responsible Entity shall require and use passwords, subject to the following, as technically feasible:
R5.3.1. Each password shall be a minimum of six characters.
R5.3.2. Each password shall consist of a combination of alpha, numeric, and “special” characters.
R5.3.3. Each password shall be changed at least annually, or more frequently based on risk.

Clarification needed:

ITC respectfully requests an interpretation regarding the following:

1. Does each sub-requirement, including R5.3, of R5 require that both "technical and procedural controls" be utilized?

2. Do "technical controls", utilized in the context of R5.3, mean that each individual cyber asset device within an ESP has to automatically enforce each of the three R5.3 sub-requirements? The three bullets below are part of this question; they are examples if this is interpreted to be true.

- R5.3.1. Each password shall be a minimum of six characters. Each individual cyber asset device within an ESP has to automatically reject any password that does not conform to a minimum of six characters.
- R5.3.2. Each password shall consist of a combination of alpha, numeric, and "special" characters. Each individual cyber asset device within an ESP has to automatically reject any password that does not conform to a combination of alpha, numeric and "special" characters.
- R5.3.3. Each password shall be changed at least annually, or more frequently based on risk. Each individual cyber asset device within an ESP has to automatically force passwords to be changed at least annually or at a specified interval based on risk.

Identify the material impact associated with this interpretation:

Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this standard.

If it is interpreted that R5.3 requires "technical controls" that automatically enforce password requirements, then there will be a need for entities to file a significant number of additional TFEs. The majority of devices used in the industry, while allowing passwords that meet all of the R5.3 sub-requirements, are not able to automatically enforce the requirements of R5.3.1, R5.3.2 and R5.3.3. In addition, it is expected the TFEs submitted for this requirement will have to be kept in place for a long period of time until device manufacturers create products that can enforce R5.3.1, R5.3.2 and R5.3.3.

A correct interpretation is needed for entities to determine whether existing cyber assets within ESPs are fully compliant with this requirement to avoid penalties associated with noncompliance.

Question

ITC Transmission seeks clarification on the meaning of CIP-007-3, Requirement R5 as it relates to both technical and procedural controls.

In its response, the Interpretation Drafting Team will answer:

1. Whether each sub-requirement of R5 requires both "technical and procedural controls."
2. Whether technical controls in Requirement R5.3 mean that each individual Cyber Asset within the Electronic Security Perimeter (ESP) has to automatically enforce each of the three R5.3 sub-requirements.

Response

Question 1: Does each sub-requirement of Requirement R5 require use of <u>both</u> "technical and procedural controls"?

No, it is not necessary for both technical and procedural controls to be used in each sub-requirement of Requirement R5. The use of "and" in Requirement R5 indicates that the responsible entity must implement both technical and procedural controls to achieve collectively the sub-requirements within Requirement R5 and the associated sub-requirements. Both are not necessary for each sub-requirement individually. Generally, technical controls are carried out or managed by computer systems. That is distinct from a technical aspect that enables or confirms procedural enforcement. While it is possible to have a technical component, tool, or aspect for each procedural control, mere use of technology to enable or support a procedural control is not necessarily a technical control itself. If a control relies on ongoing human intervention, then it is generally a procedural control. Procedural controls are the actions that people take, and they are the process of developing and ensuring compliance with policy and procedures. The responsible entity must look at what's performing the control to determine whether it's technical or procedural: the control is accomplished either by a human being using technology (procedural) or a computer managing or performing the control (technical). The IDT also notes that regardless of control type (technical or procedural) the entity has the compliance requirement of implementing the control and demonstrating evidence of the control.

Question 2: Does the use of "technical controls" in Requirement R5.3 mean that each individual Cyber Asset within the Electronic Security Perimeter (ESP) has to automatically enforce each of the three R5.3 sub-requirements.

No, the IDT interprets the three sub-requirements within R5.3 no differently than the other sub-requirements of R5, with the exception of the technical feasibility exception (TFE) capability provided under R5.3. As requested under the request for interpretation, the concept of automatically enforcing controls is viewed by the IDT as the need to enforce the combination of the technical and procedural controls that are implemented to achieve strict compliance. The automatic enforcement component would apply to the technical controls that are implemented, however most procedural controls are not automatic. The IDT interprets that the responsible entity would need to demonstrate that controls have been put in place to achieve strict compliance with the three sub-requirements of R5.3. In the case where a specific device is not capable of implementing either a technical or procedural control, the entity would file for TFE treatment.

Standards Announcement

Project 2012-INT-04 – Interpretation of CIP-007-3 for ITC

Formal Comment Period Open: November 9, 2012 – December 10, 2012

Now Available

A formal comment period for the interpretation of **CIP-007-3** for ITC is open through **8 p.m. Eastern on Monday, December 10, 2012**.

Instructions for Commenting

A formal comment period is open through **8 p.m. Eastern on Monday, December 10, 2012.** Please use the electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at Wendy.Muller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

The drafting team will consider all comments and determine whether to make changes to the interpretation response prior to posting the interpretation for a 45-day comment period and initial ballot.

Background

In May 2011, the Standards Committee appointed a standing CIP Interpretation Drafting Team (IDT) for the development of CIP Interpretations. A project team from the CIP IDT has reviewed ITC's request for interpretation and developed this interpretation pursuant to the NERC Guidelines for IDTs. In its first question, ITC asked for clarification on whether each sub-requirement of CIP-007-3, Requirement R5 requires both "technical and procedural controls." In its second question, ITC asked for clarification on whether technical controls in CIP-007-3, Requirement R5.3 mean that each individual Cyber Asset within the Electronic Security Perimeter (ESP) has to automatically enforce each of the three R5.3 sub-parts.

Additional information is available on the project page.

Standards Development Process

The Standards Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, at Wendy.Muller@nerc.net or at 404-446-2560.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2007-02 Operating Personnel Communications Protocols

Formal Comment Period Now Open: **November 14, 2012 – December 13, 2012**

RSAW Posted for Industry Comments: **November 14, 2012 – December 13, 2012**

Upcoming:
Successive Ballot and Non-binding Poll: December 4 – December 13, 2012

Now Available

A formal comment period for **COM-003-1 – Operating Personnel Communication Protocols** is open through **8 p.m. Eastern on Thursday, December 13, 2012.**

A successive ballot of COM-003-1 and a non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) will be conducted **Tuesday, December 4, 2012 through 8 p.m. Eastern on Thursday, December 13, 2012.**

In response to comments received during the last comment period and other input, the drafting team has adopted many of the recommendations of commenters and incorporated them into draft 4 of COM-003-1, as summarized below:

- Combined Requirements R1 and R3, and R2 and R4 to emulate CIP version 5. The language calls for an applicable entity to "implement documented communication protocols in a manner that identifies, assesses and corrects deficiencies……."
- Added additional language to clarify the definition of "Operating Instructions," as commenters expressed concerns over the scope of the term.
- Clarified that R1 and R2 now apply to Operating Instructions between Functional Entities.

This version was drafted in conjunction with the development of the Reliability Standard Audit Worksheet (RSAW). Changes were made to the RSAW to reflect the changes in draft 4 of COM-003-1 and changes suggested by some commenters. The RSAW is posted for an informal comment period along with COM-003-1.

Instructions for Commenting

A formal comment period on the draft standard is open through **8 p.m. Eastern on Thursday, December 13, 2012**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at wendy.muller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

A comment period on the draft RSAW is open through **8 p.m. Eastern on Thursday, December 13, 2012**. The draft RSAW is posted on the NERC Compliance Reliability Standard Audit Worksheet page. Please submit comments on the draft RSAW by using the RSAW feedback form on the project page and sending to: RSAWfeedback@nerc.net.

Next Steps

A second successive ballot of COM-003-1 and a non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Tuesday, December 4, 2012 through 8 p.m. Eastern on Thursday, December 13, 2012**.

Background

The purpose of this project is to require that real-time system operators use standardized communication protocols during normal and emergency operations to enhance the clarity of communications, improve situational awareness, shorten response time and ultimately serve reliability. As requested in the SAR, in the development of this proposed standard, the drafting team reviewed communication protocols in other NERC standards and considered the use of alert level guidelines and three-part communications to achieve consistency across regions. The proposed standard is designed to ensure that reliability-related information is conveyed effectively, accurately, consistently and in a timely manner to ensure mutual understanding by all key parties, both during alerts and emergencies and during the communication of routine operating instructions.

There are two projects that include the modification of the COM family of standards in the scope of their SAR. This project, Project 2007-02 – Operating Personnel Communications Protocols, is concerned with communication protocols for normal and emergency operations. The other project, Project 2006-06 – Reliability Coordination, is concerned with ensuring that the reliability-related requirements applicable to the Reliability Coordinator are clear, measurable, unique, enforceable, and sufficient to maintain reliability of the Bulk Electric System.

The Project 2006-06 Reliability Coordination drafting team (RC SDT) has limited the scope of its modifications to those that address communication during emergency operations. The RC SDT has developed a new term, “Reliability Directive,” to specifically address those communications, and this term has been approved by the ballot pool. The proposed definition of Reliability Directive is “A communication initiated by a Reliability Coordinator, Transmission Operator or Balancing Authority where action by the recipient is necessary to address an Emergency or Adverse Reliability Impact.” The

RC SDT is proposing to require three-part communication for Reliability Directives, with a High Violation Risk Factor for those requirements.

Since Project 2007-02 – Operating Personnel Communications Protocols addresses communication protocols for normal *and* emergency operations, the drafting team has proposed a new term, "Operating Instruction," to define the scope of communications to which the COM-003-1 protocols would apply. The proposed definition of Operating Instruction is:

"*Operating Instruction —A command by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.*"

The two standards complement each other. COM-003 establishes the practice of using communication protocols for all Operating Instructions, and provides for an entity to identify, assess and correct any deficiencies with that practice. COM-002 is focused on communications during emergency situations.

Additional information is available on the project page.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. The Standards Committee (SC) approved the Standard Authorization Request (SAR) for posting on March 1, 2007.
2. The SAR was posted for comment from March 19 through April 17, 2007.
3. The SC sought SAR drafting team nominations April 18 through May 2, 2007.
4. The SAR drafting team posted reply comments to industry comments received on the first posting SAR on June 8, 2007
5. Standard drafting team appointed by SC Executive Committee on June 28, 2007
6. Version 1 draft of Standard posted November 2009 for Informal Comments closed January 15 2010.
7. Version 2 draft of Standard posted May 2012 for Formal Comments, Initial Ballot closed June 20 2012.
8. Version 3 draft of Standard posted August 2012 for Formal Comments, Initial Ballot closed September 20 2012.

~~7.~~

Description of Current Draft:

This is the ~~third~~ fourth draft of a new standard requiring the use of standardized communication protocols during normal and emergency operations to improve situational awareness and shorten response time. The drafting team requests posting for a 30-day concurrent Formal Comment period and Ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
~~1. Drafting team considers comments, makes conforming changes, and requests SC approval to proceed to pre-ballot comment period.~~	~~July 2012~~
~~2. Second Ballot of Standards.~~	~~August 2012~~
~~3. Successive Ballot of Standards~~	~~September 2012~~
1. Second Successive Ballot of Standards	~~October~~ November 2012

~~4.~~2.Recirculation ballot of standards.	January ~~October~~ ~~2012~~ 2013
~~5.~~3.Board adopts standards.	~~November~~ February ~~2012~~ 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

When using terms or phrases contained in the Reliability Standards Glossary of Terms for communications it should be cited as the source. When used in written communications, terms or phrases contained in the Reliability Standards Glossary of Terms are capitalized.

Operating Instruction —A ~~C~~command ~~from~~ by a System Operator of a Reliability Coordinator, or of a Transmission Operator, or of a Balancing Authority, where the recipient of the command is expected to act, to change or preserve the state, status, output, or input of an Element of the Bulk Electric System or Facility of the Bulk Electric System. Discussions of general information and of potential options or alternatives to resolve BES operating concerns are not commands and are not considered Operating Instructions.

A. Introduction

1. **Title:** Operating Personnel Communications Protocols

2. **Number:** COM-003-1

3. **Purpose:** To provide System Operators uniform communications protocols that reduce the possibility of miscommunication that could lead to action or inaction harmful to the reliability of BES.

4. **Applicability:**

   4.1. Functional Entities

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Operator

   4.1.4 Reliability Coordinator

   4.1.5 Transmission Operator

5. **(Proposed) Effective Date:** First day of first calendar quarter, twelve (12) calendar months following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter twelve (12) calendar months from the date of Board of Trustee adoption.

6. **Background:**

The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a ~~sole~~ basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

> Each … shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

~~5.~~

B. Requirements

R1. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, ~~have~~ documented communication protocols for Operating Instructions between ~~f~~Functional ~~e~~Entities ~~that incorporate~~ include the following: [*Violation Risk Factor: Medium ~~Low~~*] [*Time Horizon: Long-term Planning*]

1.1. Use of the English language when issuing or responding to an oral or written Operating Instruction ~~between functional entities~~, unless another language is mandated by law or regulation. ~~Transmission Operators and Balancing Authorities may use an alternate language for internal operations.~~

1.2. Use of the 24-hour clock format when referring to clock times when issuing an oral or written Operating Instruction.

1.3. Use of the time, the time zone where the action will occur and indication of whether the time is daylight saving time or standard time w~~W~~hen issuing an oral or written Operating Instruction that refers to clock times between ~~functional~~ Functional ~~entities~~ Entities in different time zones~~, when referring to clock times include the time, the time zone where the action will occur and indicate whether the time is daylight saving time or standard time~~.

1.4. Use of the name specified by the owner(s) for each Transmission interface Element or Transmission interface Facility w~~W~~hen referring to a Transmission interface Element or a Transmission interface Facility~~(when issuing)~~ in an oral or written Operating Instruction ~~between functional entities, use the name specified by the owner(s) for that Transmission interface Element or Transmission interface Facility~~, unless another name is mutually agreed to by the F~~f~~unctional E~~e~~ntities.

1.5. Use of alpha-numeric clarifiers when issuing an oral Operating Instruction for Facilities and Elements in instances where the nomenclature of Facilities or Elements is in alpha-numeric format (~~e.g.~~ ~~(~~for example~~)~~ if an entity designated a circuit breaker "One two~~(12)~~Bravo" (12B). ~~o~~One two Bravo would need alpha-numeric clarifiers if used in an oral Operating Instruction)

1.6. When issuing an oral two party, person-to-person Operating Instruction, require the issuer to:

- Confirm that the response from the recipient of the Operating Instruction was accurate, or
- Reissue the Operating Instruction to resolve a misunderstanding.

1.7. When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.

1.8. When issuing an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time

period (e.g. (for example) an all call system), verbally or electronically confirm receipt from one or more receiving parties.

1.9. When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. (for example) an all call system), request clarification from the initiator if the communication is not understood.

R2. Each Distribution Provider and Generator Operator shall implement, in a manner that identifies, assesses and corrects deficiencies, have documented communication protocols for Operating Instructions, between fFunctional eEntities ,that incorporate include the following: [*Violation Risk Factor: Low Medium*] [*Time Horizon: Long-term Planning*]

2.1. When receiving an oral two party, person-to-person Operating Instruction, require the recipient to repeat, restate, rephrase, or recapitulate the Operating Instruction.

2.2. When receiving an oral Operating Instruction through a one-way burst messaging system used to communicate a common message to multiple parties in a short time period (e.g. an all call system), request clarification from the initiator if the communication is not understood.

R3. Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1 that: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

3.1. Identifies potential deficiencies,

3.2. Assesses the deficiencies found,

3.3. Corrects the deficiencies, and

3.4. Evaluates the process based on deficiencies found external to Part 3.1 and either

- implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or
- demonstrates that no modification to the process is necessary to address the deficiencies.

R4. Each Distribution Provider and Generator Operator shall implement a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2 that: [*Violation Risk Factor: Medium*] [*Time Horizon: Operations Planning*]

4.1. Identifies potential deficiencies,

4.2. Assesses the deficiencies found,

4.3. Corrects the deficiencies, and

4.4. Evaluates the process based on deficiencies found external to Part 4.1 and either

- ~~implements modifications to the process when the evaluation determines that modification of the process is necessary to address the deficiencies found; or~~
- ~~demonstrates that no modification to the process is necessary to address the deficiencies.~~

C. Measures

M1. Evidence must include each applicable entity's documented communications protocols developed for Requirement R1 and must demonstrat~~ing~~e that the protocols have been implemented in a manner that identifies, assesses and corrects deficiencies. ~~Each Balancing Authority, Reliability Coordinator, and Transmission Operator, shall provide its documented communications protocols developed for Requirement R1~~.

~~**M1.**~~**M2.** Evidence must include each applicable entity's documented communications protocols developed for Requirement R2 and must demonstrate that the protocols have been implemented in a manner that identifies, assesses and corrects deficiencies.

~~**M2.** demonstrating~~ ~~Each Distribution Provider and Generator Operator , shall provide its documented communications protocols developed for Requirement R2.~~

~~**M3.** Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall provide the results of its process developed for Requirement R3.~~

~~**M4.** Each Distribution Provider and Generator Operator shall provide the results of its process developed for Requirement R4.~~

~~**M5.**~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

Each Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement

Authority to retain specific evidence for a longer period of time as part of an investigation:

Each Balancing Authority, Reliability Coordinator, and Transmission Operator shall retain evidence of its manner that identifies, assesses and corrects deficiencies for Requirement ~~R3~~ R1 Measure ~~M3~~ M1 for the most recent 90 days.

Each Distribution Provider and Generator Operator shall retain evidence of its manner that identifies, assesses and corrects deficiencies for~~for~~ Requirement ~~R4~~ R2 Measure ~~M4~~ M2 for the most recent 90 days.

If a Transmission Operator, Balancing Authority, Reliability Coordinator, Generator Operator or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.3. Additional Compliance Information

None

R #	Time Horizon	VRF	Violation Severity Levels

Project 2007-02, COM-003-1 Operating Personnel Communication Protocols Rationale and Technical Justification

Justification for Requirements in Draft 4

Rationale and Technical Justification

The Quality Review team for the draft 2 posting of COM-003-1 highly recommended that the OPCPSDT provide a justification or rationale document to aid reviewers in their examination of this draft of COM-003-1. The OPCPSDT agrees with the QR recommendation and has developed the following to support the standard and to help stakeholders understand the intent and scope of the standard. This version of the standard features a non traditional approach to standards that could alleviate concerns that surfaced in comments in drafts one, two and three.

Requirement R1

Requirement R1 requires entities that can both issue and receive Operating Instructions to implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies. Because Operating Instructions affect Facilities and Elements of the Bulk Electric System, the communication of those Operating Instructions must be understood by all involved parties, especially when those communications occur between functional entities. An EPRI study reviewed nearly 400 switching mishaps by electric utilities and found that roughly 19% of errors (generally classified as loss of load, breach of safety, or equipment damage) were due to communication failures.[1] This was nearly identical to another study of dispatchers from 18 utilities representing nearly 2000 years of operating experience that found that 18% of the operators' errors were due to communication problems. [2]The necessary protocols include the use of the

[1] Beare, A., Taylor, J. *Field Operation Power Switching Safety*, WO2944-10, Electric Power Research Institute.

[2] Bilke, T., *Cause and prevention of human error in electric utility operations*, Colorado State University, 1998.

English language (from COM-001-1.1 R4), time formatting, mutually agreed nomenclature for Transmission interface Elements, alpha-numeric clarifiers, and three part communications.

Requirement R2

Requirement R2 requires entities that only receive Operating Instructions to implement documented communication protocols in a manner that identifies, assesses, and corrects deficiencies .
The two protocols (R2 , Parts 2.1 and 2.2) required are repeat back for three part communication and clarification if an "all call" communication is unclear.

Rationale

The SDT has incorporated within this standard a recognition that these requirements should not focus on individual instances of failure as a basis for violating the standard. In particular, the SDT has incorporated an approach to empower and enable the industry to identify, assess, and correct deficiencies in the implementation of certain requirements. The intent is to change the basis of a violation in those requirements so that they are not focused on whether there is a deficiency, but on identifying, assessing, and correcting deficiencies. It is presented in those requirements by modifying "implement" as follows:

Each … shall implement, in a manner that identifies, assesses, and corrects deficiencies, . . .

The term *documented communication protocols* refers to a set of required protocols specific to the Functional Entity and the Functional Entities they must communicate with. This term does not imply any particular naming or approval structure beyond what is stated in the requirements. An entity should include as much as it believes necessary in their documented protocols, but they must address all of the applicable parts of the Requirement. The documented protocols themselves are not required to include the ". . . identifies, assesses, and corrects deficiencies, . . ." elements described in the preceding paragraph, as those aspects are related to the manner of implementation of the documented protocols and could be accomplished through other controls or compliance management activities.

Project 2007-2 – Operating Personnel Communications Protocol

VRF and VSL Justifications

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in COM 003-1 Operating Personnel Communications Protocols.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

The Operations Personnel Communications Protocol Standard Drafting Team applied the following NERC criteria and FERC Guidelines when proposing VRFs and VSLs for the requirements under this project:

NERC Criteria - Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a

cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

FERC Violation Risk Factor Guidelines

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for COM-003-1:

There are ~~three~~ two requirements in COM-003-1, draft ~~4~~1. Requirements R1~~,~~ and R2 are assigned a "Medium" VRF~~,~~. ~~and R3 were assigned a "Medium" VRF.~~

The elimination of draft 3 R3 and R4 and the language change to R1 and R2 which now reads:"*Each ….. shall implement, in a manner that identifies, assesses and corrects deficiencies, documented communication protocols for Operating Instructions between Functional Entities that include the following:* " ~~may~~ warrants raising the VRF to "Medium" because it makes the requirement more than just administrative as it now features an evaluative process that would have a deeper impact on the reliability of the BES.

NERC Criteria - Violation Severity Levels

Violation Severity Levels (VSLs) define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

Violation severity levels should be based on the guidelines shown in the table below:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC Order on Violation Severity Levels

In its June 19, 2008 Order on Violation Severity Levels, FERC indicated it would use the following four guidelines for determining whether to approve VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior Levels of Non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when Levels of Non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

Guideline 2a: A violation of a "binary" type requirement must be a "Severe" VSL.

Guideline 2b: Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

The drafting team will complete the following table, providing of analysis and justification for each VRF and VSL, for each requirement.

VRF and VSL Justifications – COM 003-1, R1	
Proposed VRF	~~Low~~Medium
NERC VRF Discussion	R1 is a requirement in a planning time frame that, if violated, ~~would not~~could, under ~~the~~ emergency, abnormal, or restorative conditions anticipated by the preparations, ~~be expected to~~ directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The VRF for this requirement is "Medium~~Low~~" which is consistent with NERC guidelines
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** R1 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is "Medium~~Low~~" which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard :** The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement calls for the ~~establishment~~ implementation of documented communication protocols that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.

VRF and VSL Justifications – COM 003-1, R1			
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is " Medium ~~Low~~" which is consistent with NERC guidelines		
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** COM-003-1, Requirement R1 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
The Responsible Entity did not include one (1) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols ~~The responsible entity did not include one (1) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols~~	The Responsible Entity did not include two (2) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols~~The responsible entity did not include two (2) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols~~	The Responsible Entity did not include three (3) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols ~~The responsible entity did not include three (3) of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented~~	The Responsible Entity ~~responsible entity~~ did not include four (4) or more of the nine (9) parts of Requirement R1, Parts 1.1 to 1.9 in their documented communication protocols OR The Responsible Entity ~~responsible entity~~ did not have documented

VRF and VSL Justifications – COM 003-1, R1			
		~~communication protocols~~	communication protocols as required in Requirement R1. OR The Responsible Entity did not implement, in a manner that identifies, assesses and corrects deficiencies, their documented communication protocols as required in Requirement R1

VRF and VSL Justifications – COM 003-1, R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Based on the VSL Guidance, the SDT developed four VSLs based on misapplication or absence of common communication protocols. If no communication protocols are used at all or if the number of required protocols falls below the listed thresholds, then the VSL is Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R1 is not binary. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement

VRF and VSL Justifications – COM 003-1, R1	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – COM 003-1, R2	
Proposed VRF	~~Low~~Medium
NERC VRF Discussion	R2 is a requirement in a planning time frame that, if violated, ~~would not~~could, under ~~the~~ emergency, abnormal, or restorative conditions anticipated by the preparations, ~~be expected to~~directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The VRF for this requirement is "Medium~~Low~~" which is consistent with NERC guidelines
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** R2 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is "Medium~~Low~~" which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard :** The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement calls for the ~~establishment~~ implementation of documented communication protocols that reduce the possibility of miscommunication which could eventually lead to action or inaction harmful to the reliability of BES.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** Failure to utilize communication protocols properly could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Medium~~Low~~" which is consistent with NERC guidelines

VRF and VSL Justifications – COM 003-1, R2			
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** COM-003-1, Requirement R2 contains only one objective which is to specify clear, formal and universally applied communication protocols that reduce the possibility of miscommunication which could lead to action or inaction harmful to the reliability of BES. Since the requirement has only one objective, only one VRF was assigned.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Responsible Entity ~~responsible entity~~ did not include one (1) of the two (2) parts of Requirement R2, Parts 2.1 to 2.2 in their documented communication protocols	The Responsible Entity ~~responsible entity~~ did not include Parts 2.1 to 2.~~3~~ 2 (~~3~~2) of Requirement R2, in their documented communication protocols OR The responsible entity did not have documented communication protocols as required in Requirement R2. OR The Responsible Entity did not implement, in a manner that identifies, assesses and corrects deficiencies, their documented

VRF and VSL Justifications – COM 003-1, R2			
			communication protocols as required in Requirement R1

VRF and VSL Justifications – COM 003-1, R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Based on the VSL Guidance, the SDT developed ~~four~~ two VSLs based on misapplication or absence of common communication protocols. If no communication protocols are used at all or if the number of required protocols falls below the listed thresholds, then the VSL is Severe.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R2 is not binary. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement

VRF and VSL Justifications – COM 003-1, R2	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non CIP

VRF and VSL Justifications – COM-003-1, R3	
Proposed VRF	Medium
NERC VRF Discussion	R3 is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Medium" which is consistent with NERC guidelines
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** R3 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is "Medium" which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard :** The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement calls for use of formal three part communication, among other communication protocols. This requirement is analogous to R2 of COM-002-2, which describes a communication protocol required for operating personnel to use when given a directive. The VRF for this requirement (COM-002-2, R2) is "Medium" which is consistent with COM-003-1 R3 at a "Medium". The SDT considers "Medium" as the proper assignment because it is consistent with NERC and FERC guidelines.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** Failure to utilize formal communication protocols could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Medium" which is consistent with NERC guidelines
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** COM-003-1, Requirement R3 contains only one objective which is to implement a process for identifying

VRF and VSL Justifications – COM-003-1, R3			
	deficiencies with adherence to the documented communication protocols. Since the requirement has only one objective, only one VRF was assigned.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity does not have a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R1; Or The Responsible Entity did not evaluate their process based on deficiencies found external to Part 3.1 to determine whether modification of the process is necessary; Or The Responsible Entity did not implement modifications to the process when the evaluation

VRF and VSL Justifications – COM-003-1, R3			
			determined that modification of the process was necessary to address the deficiencies found; Or The Responsible Entity did not demonstrate that no modification to the process was necessary to address the deficiencies found external to Part 3.1.

~~VRF and VSL Justifications – COM-003-1, R3~~	
~~FERC VSL G1~~ ~~Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance~~	~~Since R3 represents a new approach that does not currently exist, the VSL does not lower the current level of compliance.~~
~~FERC VSL G2~~ ~~Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties~~ ~~Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent~~ ~~Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language~~	~~Guideline 2a:~~ ~~The VSL assignment for R3 is binary and Severe.~~ ~~Guideline 2b:~~ ~~The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.~~
~~FERC VSL G3~~ ~~Violation Severity Level Assignment Should Be Consistent with the~~	~~The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement~~

VRF and VSL Justifications – COM-003-1, R3	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non-CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non-CIP

VRF and VSL Justifications – COM-003-1, R4	
Proposed VRF	Medium
NERC VRF Discussion	R4 is a requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Medium" which is consistent with NERC guidelines
FERC VRF G1 Discussion	**Guideline 1- Consistency w/ Blackout Report:** R4 falls under Recommendation 24 of the Blackout Report. The VRF for this requirement is "Medium" which is consistent with FERC guideline G1.
FERC VRF G2 Discussion	**Guideline 2- Consistency within a Reliability Standard :** The requirement has sub-requirements that are of equal importance and similarly address communication protocols; only one VRF was assigned so there is no conflict.
FERC VRF G3 Discussion	**Guideline 3- Consistency among Reliability Standards:** This requirement calls foruse of formal three part communication, among other communication protocols. This requirement is analogous to R2 of COM-002-2, which describes a communication protocol required for operating personnel to use when given a directive. The VRF for this requirement (COM-002-2, R2) is "Medium" which is consistent with COM-003-1 R4 at a "Medium". The SDT considers "Medium" as the proper assignment because it is consistent with NERC and FERC guidelines.
FERC VRF G4 Discussion	**Guideline 4- Consistency with NERC Definitions of VRFs:** Failure to utilize formal communication protocols could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of the requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. The VRF for this requirement is "Medium" which is consistent with NERC guidelines
FERC VRF G5 Discussion	**Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation:** COM-003-1, Requirement R4 contains only one objective which is to implement a process for identifying

VRF and VSL Justifications – COM-003-1, R4			
	deficiencies with adherence to the documented communication protocols. Since the requirement has only one objective, only one VRF was assigned.		
Proposed VSL			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Responsible Entity does not have a process for identifying deficiencies with adherence to the documented communication protocols specified in Requirement R2; Or The Responsible Entity did not evaluate their process based on deficiencies found external to Part 4.1 to determine whether modification of the process is necessary; Or The Responsible Entity did not implement modifications to the process when the evaluation

VRF and VSL Justifications – COM-003-1, R4			
			determined that modification of the process was necessary to address the deficiencies found; Or The Responsible Entity did not demonstrate that no modification to the process was necessary to address the deficiencies found external to Part 4.1.

VRF and VSL Justifications – COM-003-1, R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Since R4 represents a new approach that does not currently exist, the VSL does not lower the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 2a: The VSL assignment for R4 is binary and Severe. Guideline 2b: The proposed VSL does not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the	The proposed VSL uses the same terminology as used in the associated requirement, and is, therefore, consistent with the requirement

VRF and VSL Justifications – COM-003-1, R4	
Corresponding Requirement	
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The VSL is based on a single violation and not cumulative violations
FERC VSL G5 Requirements where a single lapse in protection can compromise computer network security, i.e., the 'weakest link' characteristic, should apply binary VSLs	Non-CIP
FERC VSL G6 VSLs for cyber security requirements containing interdependent tasks of documentation and implementation should account for their interdependence	Non-CIP

Consideration of Comments

Standard Processes Manual Revisions to Implement SPIG Recommendations

The Standard Processes Manual (SPM) Drafting Team thanks all commenters who submitted comments on the SPM revisions. These SPM revisions were posted for a 45-day public comment period from August 29, 2012 through October 12, 2012. Stakeholders were asked to provide feedback on the revisions and associated documents through a special electronic comment form. There were 67 sets of comments, including comments from approximately 160 different people from approximately 122 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Index to Questions, Comments, and Responses

1. In response to stakeholder feedback about changes to the commenting process, the SCPS clarified that all written comments received via informal feedback will be posted and that while drafting teams are not required to provide a written response to each individual comment received, the teams are encouraged to post a summary response that identifies how it used comments submitted by stakeholders (addressed in section 4.5). The SCPS revised sections 4.12 and 4.13 to clarify the requirements to consider and respond to all written comments.....16

2. In the first posted draft of the SPM, the SCPS proposed handling 'no' votes without comments or with unrelated comments in the way that ANSI recommends – by counting those votes toward quorum but not toward the calculation of consensus, with a detailed evaluation for determining whether a comment is relevant. With this proposed change, the SCPS was trying to encourage stakeholders to only submit the kind of constructive comments that help standard drafting teams improve the standard and reach technical consensus. Based on the comments received, the SPM has re-examined this issue and determined that the approach for evaluating the relevance of comments requires additional clarification, so it has eliminated the process for reviewing the relevance of comments from the proposed revisions. However, the SCPS has retained the concept of including 'no' ballots that are not accompanied by comments in the calculation of quorum, but not being counted in the calculation of consensus. Do you support this modified proposal for handling 'no' votes?.....42

3. Many stakeholders supported the SCPS's proposal to move measures from standards into Reliability Standards Audit Worksheets (RSAWs), as in most cases, measures included in standards are little more than a repeat of the requirement (offering little value to registered entities and compliance auditors). Under the proposed new process, measures will indeed be moved from standards to RSAWs, and the standard drafting team and compliance staff will collaborate to develop the RSAW alongside the standard to ensure consistency from early on in the standards project. As proposed in the first posting, the RSAW will then be posted alongside the standard during the final 45-day comment period, and the RSAW will be subject to a non-binding poll and ultimately presented to NERC's BOT for information. This process is already being piloted, and lessons learned during the pilot will be applied if this proposed process continues. Do you support the proposal to move measures to RSAWs and have drafting teams and compliance staff collaborate on RSAW development, as proposed in the first posting and again in the latest posted revisions to the SPM?.....57

4. In the first posted revisions to the SPM, the SCPS proposed eliminating Violation Risk Factors (VRFs) and the Violation Severity Levels (VSLs) to address several issues identified in the SPIG recommendations. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional

clarification. Therefore, the proposed revisions to eliminate the VRFs and VSLs will be removed from the next draft of the SPM. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop concepts in response to the SPIG recommendations to ease the burden on the drafting teams and shorten development time frames associated with standard development projects – including strategies for eliminating VRFs and VSLs while maintaining the ERO's focus on the potential risk to the reliability of the BES. Do you support the continued use of VRFs and VSLs as the SCPS works towards a more effective solution for eliminating them from the standards process?.....45

5. Section 7.0 of the SPM, which concerns interpretations, was revised to ensure that stakeholders have a common understanding of what aspects of a standard may be addressed by an interpretation. Only requirements require technical expertise to interpret, and those kinds of interpretations thus require the traditional utilization of a drafting team. Other less technical questions, like a concern about an effective date, do not require the formation of a drafting team and ballot pool and all the associated processing. The SCPS does want to provide stakeholders the ability to maintain control over how interpretations are developed, but the interpretation process in its entirety can lead to large volumes of work and the delay of processing high-priority standards projects. With the revisions proposed in the posted SPM, the SC aims to increase transparency about the handling of interpretations, with the goal of reducing the number of rejected interpretations and ultimately decreasing the interpretation-related burden on drafting teams and stakeholders. Do you agree that this clarification on the use of interpretations will be useful?.....54

6. In the first posted revisions to the SPM, the SCPS proposed the addition of section 16.0, which introduced a waiver provision to allow the SC some flexibility in administering the standards process to meet reliability needs. In other words, the waiver process allows the SC to modify the standards process in rare cases for good cause. Many stakeholders were concerned about this addition, but the SCPS continues to believe that a waiver provision is essential for giving the SC, and thus the industry, the ability to act expeditiously when necessary for reliability (e.g., in responding to regulatory directives in a timely manner). The waiver provision would not give the SC unilateral power in modifying the process, but would require a presentation to the BOT explaining the need for the use of waiver. It could only be utilized if the BOT supported the explanation for the need of the waiver. With this additional clarification, can you support the addition of the waiver provision in section 16.0?.....107

7. If you have any other comments on these proposed revisions that you haven't already mentioned above, please provide them here.....84

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

Brazos Electric Power Cooperative	Agree	ACES Power Marketing

Summary Consideration:

An initial ballot of Draft 2 of the proposed revisions to the SPM concluded on October 12, 2012 and received a 63% approval. The SC, its subcommittees, and NERC staff continue to be grateful for the industry support and thoughtful comments on the improvements to the standard development process.

The SCPS and Standards Committee have reviewed all of the comments and made the following substantive changes in response to the comments:

- **VRFs, VSLs, Measures, and RSAWs** - The majority of the commenters recognize the burden that the development of VRFs and VSLs has on SDTs and support the development of potential alternatives. Commenters also expressed support for drafting team participation in developing RSAWs. Both of these items will require collaboration between the Standards Committee, NERC Standards staff, and NERC and Regional Compliance programs to develop and implement. Therefore the SCPS is continuing to work toward the elimination of the VRFs and the VSLs through the development of potential alternatives and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. In the same vein, NERC's Compliance program is working with Regions and stakeholders to develop and implement the Reliability Assurance Initiative (RAI), and as this effort evolves the SC and NERC Standards staff will leverage opportunities to align drafting teams and compliance staff to ensure that the intent of drafting teams is captured in approaches to monitoring compliance.

  While these concepts are further developed, Measures, VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll of VRFs and VSLs will continue to be conducted consistent with current process.

- **Treatment of 'No' Votes During a Final Ballot** - Several commenters identified that during a Final ballot, there is no comment period. There is no obligation in the current SPM to accept comments during a recirculation ballot, and the proposed revisions to the SPM are consistent with the current SPM in that there is no comment period associated with a Final Ballot. Therefore, all 'no' votes submitted in a Final Ballot will count toward determination of both the quorum and consensus. Clarifying language and a new Footnote 24 have been inserted in section 4.11, to clarify this important point. Footnote 24 reads: The Final Ballot is used to confirm consensus achieved during the Formal Comment and Ballot stage. Ballot Pool members voting negative on the Final Ballot will be deemed to have commented or supported the comments of other groups during prior Formal Comment periods.

- **Section 16.0 Waiver Provision** - In response to stakeholders concerns regarding transparency, openness and due process protections, the SCPS incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when

the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee.

- **In addition, stakeholders identified a number of minor typographical errors and minor clarifications. These corrections have been made and are shown in the redline.**

1. **In response to stakeholder feedback about changes to the commenting process, the SCPS clarified that all written comments received via informal feedback will be posted and that while drafting teams are not required to provide a written response to each individual comment received, the teams are encouraged to post a summary response that identifies how it used comments submitted by stakeholders (addressed in section 4.5). The SCPS revised sections 4.12 and 4.13 to clarify the requirements to consider and respond to all written comments. These sections now read:**

   4.12 Consideration of Comments A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted.

   However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an additional ballot will be conducted.

   4.13 Additional Ballots If a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last additional ballot prior to conducting a Final Ballot.

   With these revisions, indicated in redline form in the posted SPM, do you support the proposed the new process for addressing comments?

Summary Consideration:

By far, the majority of concerns by comments on Question 1 were related to the perception that ceasing to require the drafting team to respond individually to each and every submitted comment would negatively affect the quality of the effort made by the drafting team to consider all input. The drafting team discussed this topic in great detail. The SPM revision drafting team has concluded that, while there is some validity to the concerns, the expectation is that much greater gains in efficiency in the process and clarity of the consensus development will greatly outweigh any such negative impacts.

The comment process has been streamlined and revised to allow for summary responses to comments and only one formal comment period during which a drafting team is required to respond to comments in writing. In every case where written comments are accepted, the complete record of comments submitted will be posted as part of the development record of the standard.

The process envisions the use of a variety of methods to collect informal stakeholder feedback on preliminary drafts of its documents, including the use of informal comment periods, webinars, industry meetings, workshops, or other mechanisms. As the drafting team uses the various methods, a robust draft will be developed. Once the draft is ready for posting, it should be a high quality product which already addresses industry concerns.

The 30 day informal comment period has been removed to provide more flexibility in the use of informal mechanisms for collecting feedback from stakeholders. This change is consistent with SPIG Recommendations 1 and 5. There is no ANSI requirement to have informal comment periods for 30 days.

If a drafting team determines that significant changes are needed as a result of a comment period, there is no formal obligation for a drafting team to respond to comments in writing. Rather, drafting teams may make any needed changes and communicate these changes via webinar or other informal methods. Drafting teams are mindful that in order to build consensus it is imperative to be responsive to comments, however, responding in writing to every single comment at every stage of standard development is time-intensive and can be inefficient. For this reason, the ability to provide informal feedback to stakeholders regarding how a team is responding to comments allows for necessary flexibility.

The drafting teams will be encouraged to reach out to commenters for explanation of any comments they do not understand. In addition, although the drafting teams are not allowed to receive one-on-one comments from individual commenters, which could be perceived to be biased or unequal access to the process, commenters are free to attend any public meeting of the drafting team and give input at that meeting.

The drafting teams will be encouraged to develop a summary of actions taken to make changes or other disposition of comments received. Although the drafting teams will not be required to develop individual summaries, the background information provided at the beginning of documents posted will explain what is being posted and why. The drafting teams almost certainly will find action summaries to be very useful in developing the document postings.

Following a substantive change, a proposal will again be posted for a 45 day comment period and ballot, accompanied by an explanation of the major changes proposed in the revised proposal. Once a drafting team has responded to comments in writing, a proposal may proceed to the Final Ballot. These changes reflect the minimum ANSI requirements.

Some comments were received in response to this question raising issues which are more appropriately addressed in responses to other questions in the posting. Commenters are encouraged to review all responses to all questions for complete coverage of their comments.

Organization	Yes or No	Question 1 Comment
Western Small Entity Comment Group	No	The comment group objects to summary comment responses. We note that summary comment responses have already been used by some teams, and we find that our comments are not always summarized properly. When the team continues to provide a response, we find they may have not addressed our concerns at all. We fail to see how the summary response will result in an efficiency gain, since more ballots and comment periods will be needed to gather the needed affirmative votes.
Response: The drafting team appreciates your comments. The SDT understands your recommendation and did discuss them. The team continues to support encouraging drafting teams to post a summary response during the informal feedback period that identifies how it used comments submitted by stakeholders, and points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives. Additionally, during the balloting process, should your comment not be addressed or misunderstood, please note standard drafting team meetings are open to observers for discussion of multiple perspectives. Also available is the option to directly contact a drafting team chair or member to further discuss any concerns regarding comments.		
ACES Power Marketing Standards Collaborators	No	(1) We simply do not believe that this proposal will have the intended effect of shortening the standards development process. In fact, we believe it will actually lengthen the standards development process in some cases. (2) While

Organization	Yes or No	Question 1 Comment
		the proposal conceptually sounds like a reasonable approach, we are concerned that the actual implementation will result in comments that are not considered appropriately. We have observed that many drafting team's have provided responses to our comments that have indicated they did not fully understand the comments. This results in issues that are raised repeatedly in the future comment phases. The current requirement that a drafting team has to respond to all comments creates a discipline that each comment is at least considered on a cursory basis. This proposal eliminates that discipline which means that comments will be even less likely to be given full consideration. While we understand that comments for some projects (CIP for example) have been so numerous that this approach is not workable for every project, we believe that responding to every comment in writing in most projects is still very manageable. This is especially true if the work is divided up among drafting team participants. Furthermore, even if the drafting team proposes a significant change that will result in an additional ballot per 4.13, we believe it makes sense to respond in writing to all comments to explain how the significant change addresses the comment. Otherwise, the same comment may be re-submitted to the drafting team during the next ballot. (3) The current standards development process has essentially become a "bring me a rock exercise". The drafting team responds to comments and then posts for formal comment and ballot during the next phase. Commenters then submit additional comments often indicating some intricacy of the same or similar issue that the drafting team has not considered fully. Essentially, they say either you did not understand our comments or the proposed changes don't fully address our comments. For major issues, we believe a better approach would be for the drafting team to reach out to commenters in between postings to ensure that the response to comments will address the issue. While this might slightly increase the time in between postings, it is likely to result in fewer postings which results in greater efficiencies. Because NERC requires the commenter to provide contact information when submitting comments, we cannot see any

Organization	Yes or No	Question 1 Comment
		reason this outreach should not occur for the typical standards development effort.
Response: Thank you for your comments. In response to your first comment, it is recognized that it is your opinion that the process may not be shortened by the proposed SPM changes, however, the SCPS does believe that the changes will result in a shorter process and other process benefits. Specific to your second comment, the discipline to consider all comments is intended to continue. There are other options available should you feel that your comments are not specifically addressed. During the balloting process, should your comment not be addressed or misunderstood, please note standard drafting team meetings are open to observers for discussion of multiple perspectives. Also available is the option to directly contact a drafting team chair or member to further discuss any concerns regarding comments. The team continues to support encouraging drafting teams to post a summary response during the informal feedback period that identifies how it used comments submitted by stakeholders, and points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives. The intent is for the SDT to use many informal sources of input for the creation of their draft consensus document BEFORE they draft the document and post it for comments and ballot. This process should result in a more robust draft that already contains the majority of the industry consensus input. Regarding your third comment to have the drafting team contact a commenter to discuss responses to their comments, this communication is already available and drafting teams have reached out to commenters to clarify their comment or a particular change would address their concern. Drafting teams are encouraged by NERC to contact commenters to gain better clarification of comments when needed. Your suggestion that the SDT should reach out to commenters is a good one and a revision will be made to the SPM draft to include such activities as a form of informal information gathering to be used between postings/ballots.		
National Rural Electric Cooperative Association (NRECA)	No	NRECA strongly urges the SC to rethink the provisions related to SDT comment response processes. NRECA requests that the SPM be revised to require, not only encourage, a SDT to post a summary response that identifies how it used stakeholder comments in informal comment periods. Otherwise commenters will not know whether and how their comments were considered until possibly the end of the process. NRECA also strongly urges the SC to revise the SPM to require individual, not summary, comment responses during the final formal

Organization	Yes or No	Question 1 Comment
		comment period. If these provisions are not addressed carefully, it could limit, or appear to limit, the ability of stakeholders to effectively participate in the standard development process. This could potentially bring about an increased number of appeals submitted to NERC due to stakeholders not believing their comments were properly addressed and responded to.
Response: Thank you for your comments. The SDT understands your recommendation and did discuss them. The team continues to support encouraging drafting teams to post a summary response during the informal feedback period that identifies how it used comments submitted by stakeholders, and points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Trans Bay Cable LLC	No	Since NERC is moving towards NOT COUNTING no votes without comment, then they are stating comments are required. If comments are required, then the drafting teams/NERC should directly respond to the comments. A lot of time, money, energy is spent in developing, reviewing and writing comments to provide feedback to standard drafting teams. If NERC would decide allow NEGATIVE or NO votes without comment I would support the recommendation.If significant changes are going to be made to a standard, then I agree a response is not required, but the entity who submitted the comment should be responded to stating their comment will be addressed in the updated standard. Again, a lot of time, effort and man power is put into reading, reviewing and responding to standards.
Response: The drafting team reminds you that Section 4.12 of the draft SPM provides for the following: "Consideration of Comments A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted."		

Organization	Yes or No	Question 1 Comment
Duke Energy	No	Section 4.5 should require, not just encourage, summary responses to informal comments. This is an important part of the dialogue between the industry (those providing the informal comments) and the standard drafting team. Similarly, the standard drafting team should be required in section 4.12 to respond in writing with a summary of the significant revisions identified in consideration of comments submitted.
Response: Thank you for your comments. The SDT understands your recommendation and did discuss them. The team continues to support encouraging drafting teams to post a summary response during the informal feedback period that identifies how it used comments submitted by stakeholders, and points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Ameren	No	A summary response would be acceptable as long as all responses are easily searchable under the commenting entity's name; otherwise, there would be no easy way to learn of response to individual comments and also to compile responses to entity's comments to disseminate internally to SMEs.
Response: Thank you for your comments. Serious consideration was given to your recommendation; however, because the number of commenters may be voluminous, it may be impractical and administratively burdensome to require the drafting team to include all commenters' names. The direction is not to make changes to the SPM to include this additional requirement.		
Consumers Energy	No	Consumers Energy believes it is best for the drafting team to respond to all comments as a normal course of action, as it is then clear to the commenting entity exactly what was done/not done to address their concerns. Also, an explanation of why the drafting team disagrees with a comment may clear up the reason for the comment so the entity making the comment does not carry it forward.

Organization	Yes or No	Question 1 Comment
Response: The drafting team appreciates your comments. The drafting teams are encouraged to provide responses to the written comments in a summary form where possible. The Drafting teams are also encouraged to post a summary response that identifies how it used comments submitted by stakeholders. The intent is to gather stakeholder feedback on a "working document" before the document reaches the point where it is considered the "final draft". **Additionally, during the balloting process, should your comment not be addressed or misunderstood, please note standard drafting team meetings are open to observers for discussion of multiple perspectives. Also available is the option to directly contact a drafting team chair or member to further discuss any concerns regarding comments.**		
Trans Bay Cable LLC	No	Having reviewed summarized comments posted from other standards, knowing the oritinal comment provided and reading the "summarized" version, the meaning and intent of the original comment was lost. Comments should be posted as they are submitted.
Response: Thank you for your comments. The SDT points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Exelon Corporation and its affiliates	No	Exelon supports the revision to remove the 30 day time frame for informal comment periods. This is useful to give flexibility to the informal process. More frequent use of the informal comment periods to gather constructive input in the early stages allows the drafting team to utilize the iteration process without the burden of formal response to comment. More robust use of the informal stages could have been sufficient to render the revisions made to the response to comments provision unnecessary. No clear justification or reasoning is given for how the changes will expedite the development process. Presumably, the assumption is that if SDT members don't have to spend so much time on responding to comments then they can continue with the drafting work. This may be exchanging a workload concern for potential quality and consensus

Organization	Yes or No	Question 1 Comment
		building concerns. The response to comments serves a few purposes for entities - an acknowledgement of the entity voice, an indication of whether the SDT understood the comments, and as a tool for confirming language understanding. It is the communications process between the SDT and technical experts at the voting entities over the iterative process. Putting all responses at the end of the process is summary form may eliminate the value that the response to comments contributed to language development and getting to yes votes.
Response: Thank you for your comments and appreciates your support of the revisions to comments received during the informal feedback period. In large part, your comments correctly summarize the intent of the revisions to the SPM. However, please review the draft Sections 4.12 and 4.13 to see that all comments must be posted and all summary responses must be posted. **There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.** **If a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to written comments received in the last Additional Ballot prior to conducting a Final Ballot.** **The drafting team agrees that communications is important to make the process successful.**		
Oncor Electric Delivery	No	Process OverviewOncor does not support the new commenting process as proposed. In Section 4.13 it states "If a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such

Organization	Yes or No	Question 1 Comment
		revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot." The proposed process also states that if the Standard Development Team chooses to post the revisions for additional comment and ballot that previous comments do not require a response in writing.Oncor takes the position that when a stakeholder submits a significant revision during the initial formal commenting period which improves the quality, clarity, or enforceability of a Reliability Standard, then, the drafting team would be remiss [“may choose”] not to consider the validity of the comments by providing a written response to stakeholder concerns and by allowing them to participate in an additional ballot.Oncor takes the position that the current language in the ROP should remain as follows.”If a stakeholder or balloter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent initial ballot that will improve the quality, clarity, or enforceability of that Reliability Standard then the drafting team shall make such revisions and post the revised Reliability Standard for another public comment period and ballot.”
Response: Thank you for your comments. The drafting team wishes to clarify that whether to include significant revisions is a decision to be made by the SDT. However, we believe that such revisions which do, in fact, improve the quality, clarity, or enforceability of the Reliability Standard are almost certain to be adopted by the SDT. There may be other decisions or options available which lead the SDT to select a different, equally effective option. In any case, when significant revisions are made, the SDT is not required to spend unnecessary time in responding to all comments. The SDT will notify the commenters that a significant revision will be made and, as a result, an additional posting/ballot will be required. In all cases, prior to the final ballot, the SDT must consider and respond to all remaining comments. The drafting team believes the language included in Sections 4.12 and 4.13 do require what you suggest.		
Kansas City Power & Light	No	
HHWP	No	
MRO NSRF	Yes	Yes, we agree with these changes. We encourage the standard drafting team to

Organization	Yes or No	Question 1 Comment
		post the revised Reliability Standard for another 45 calendar day public comment period and ballot each time a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard.
Response: Thank you for your comments and support. The drafting team wishes to clarify that whether to include significant revisions is a decision to be made by the SDT. However, we believe that such revisions which do, in fact, improve the quality, clarity, or enforceability of the Reliability Standard are almost certain to be adopted by the SDT. There may be other decisions or options available which lead the SDT to select a different, equally effective option. The drafting team believes the new language proposed in Sections 4.12 and 4.13 do require what you suggest.		
SPP Standards Review Group	Yes	While we understand the necessity of streamlining the process by cutting down on the number of responses made to comments, making this change leaves the impression that consideration for all comments received may not be given. We are accustomed to seeing responses to our comments posted in the next draft of a standard. However, the SPM does provide encouragement that all comments will be considered.
Response: Thank you for your comments and support.		
American Electric Power	Yes	The text for 4.12 as provided in the comment form above is shown as 4.12 in the draft, and the text for 4.13 provided in the comment form above is shown as 4.12 in the draft. It would appear that the draft is incorrect and that the format provided in the comment form is correct.
Response: Thank you for your comments and support. We believe that you may have been referencing the June posting of the draft SPM which did have the order of Sections 4.12 and 4.13 reversed.		
Occidental Energy Ventures Corp	Yes	Occidental Energy Ventures Corp (OEVC) agrees that the elimination of a requirement to individually address each stakeholder comment could result in

Organization	Yes or No	Question 1 Comment
		substantial savings in development time. However, we are concerned that if some consideration is not demonstrated, most entities (including us) will likely re-submit the comment during the following review. If this consistently occurs, the result could be extra review cycles - and eliminate the benefit of not developing a response in the first place.
Response: Thank you for your comments and support. We understand your concern and believe it is addressed by the ability of the commenter to either discuss their concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Georgia System Operations Corporation	Yes	This is yes is continguent up additional clarity in providing the response to the comments.
Response: Thank you for your support. Be assured that all comments will be addressed by the drafting teams.		
Oklahoma Gas & Electric	Yes	We understand the need to streamline the stakeholder process; however, the responses to comments can provide valuable information. We are in support of one response for multiple comments that are similar and that the option of not responding to comments be used only when significant changes are needed and additional ballots are conducted.
Response: Thank you for your comments and support.

Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives. The intent is for the SDT to use many informal sources of input for the creation of their draft consensus document BEFORE they draft the		

Organization	Yes or No	Question 1 Comment
document and post it for comments and ballot. This process should result in a more robust draft that already contains the majority of the industry consensus input. Regarding your third comment to have the drafting team contact a commenter to discuss responses to their comments, this communication is already available and drafting teams have reached out to commenters to clarify their comment or a particular change would address their concern. Drafting teams are encouraged by NERC to contact commenters to gain better clarification of comments when needed. Your suggestion that the SDT should reach out to commenters is a good one and a revision will be made to the SPM draft to include such activities as a form of informal information gathering to be used between postings/ballots.		
National Rural Electric Cooperative Association (NRECA)	No	NRECA strongly urges the SC to rethink the provisions related to SDT comment response processes. NRECA requests that the SPM be revised to require, not only encourage, a SDT to post a summary response that identifies how it used stakeholder comments in informal comment periods. Otherwise commenters will not know whether and how their comments were considered until possibly the end of the process. NRECA also strongly urges the SC to revise the SPM to require individual, not summary, comment responses during the final formal comment period. If these provisions are not addressed carefully, it could limit, or appear to limit, the ability of stakeholders to effectively participate in the standard development process. This could potentially bring about an increased number of appeals submitted to NERC due to stakeholders not believing their comments were properly addressed and responded to.
Response: Thank you for your comments. The SDT understands your recommendation and did discuss them. The team continues to support encouraging drafting teams to post a summary response during the informal feedback period that identifies how it used comments submitted by stakeholders, and points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Trans Bay Cable LLC	No	Since NERC is moving towards NOT COUNTING no votes without comment, then they are stating comments are required. If comments are required, then the drafting teams/NERC should directly respond to the comments. A lot of

Organization	Yes or No	Question 1 Comment
		time, money, energy is spent in developing, reviewing and writing comments to provide feedback to standard drafting teams. If NERC would decide allow NEGATIVE or NO votes without comment I would support the recommendation.If significant changes are going to be made to a standard, then I agree a response is not required, but the entity who submitted the comment should be responded to stating their comment will be addressed in the updated standard. Again, a lot of time, effort and man power is put into reading, reviewing and responding to standards.
Response: This one needs input from the "No" vote team. I suggest also including the following: The drafting team reminds you that Section 4.12 of the draft SPM provides for the following: "Consideration of Comments A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted."		
Duke Energy	No	Section 4.5 should require, not just encourage, summary responses to informal comments. This is an important part of the dialogue between the industry (those providing the informal comments) and the standard drafting team. Similarly, the standard drafting team should be required in section 4.12 to respond in writing with a summary of the significant revisions identified in consideration of comments submitted.
Response: Thank you for your comments. The SDT understands your recommendation and did discuss them. The team continues to support encouraging drafting teams to post a summary response during the informal feedback period that identifies how it used comments submitted by stakeholders, and points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Ameren	No	A summary response would be acceptable as long as all responses are easily

Organization	Yes or No	Question 1 Comment
		searchable under the commenting entity's name; otherwise, there would be no easy way to learn of response to individual comments and also to compile responses to entity's comments to disseminate internally to SMEs.
Response: Thank you for your comments. Serious consideration was given to your recommendation; however, because the number of commenters may be voluminous, it may be impractical and administratively burdensome to require the drafting team to include all commenters' names. The direction is not to make changes to the SPM to include this additional requirement.		
Consumers Energy	No	Consumers Energy believes it is best for the drafting team to respond to all comments as a normal course of action, as it is then clear to the commenting entity exactly what was done/not done to address their concerns. Also, an explanation of why the drafting team disagrees with a comment may clear up the reason for the comment so the entity making the comment does not carry it forward.
Response: The drafting team appreciates your comments. The drafting teams are encouraged to provide responses to the written comments in a summary form where possible. The Drafting teams are also encouraged to post a summary response that identifies how it used comments submitted by stakeholders. The intent is to gather stakeholder feedback on a "working document" before the document reaches the point where it is considered the "final draft". **Additionally, during the balloting process, should your comment not be addressed or misunderstood, please note standard drafting team meetings are open to observers for discussion of multiple perspectives. Also available is the option to directly contact a drafting team chair or member to further discuss any concerns regarding comments.**		
Trans Bay Cable LLC	No	Having reviewed summarized comments posted from other standards, knowing the oritinal comment provided and reading the "summarized" version, the meaning and intent of the original comment was lost. Comments should be posted as they are submitted.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. The SDT points to Section 4.12 which requires, in part, that: "All comments received and all responses shall be publicly posted." Additionally, during the balloting process, should you believe your comment was misunderstood or not addressed in the summary of comments, you can either discuss your concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Exelon Corporation and its affiliates	No	Exelon supports the revision to remove the 30 day time frame for informal comment periods. This is useful to give flexibility to the informal process. More frequent use of the informal comment periods to gather constructive input in the early stages allows the drafting team to utilize the iteration process without the burden of formal response to comment. More robust use of the informal stages could have been sufficient to render the revisions made to the response to comments provision unnecessary. No clear justification or reasoning is given for how the changes will expedite the development process. Presumably, the assumption is that if SDT members don't have to spend so much time on responding to comments then they can continue with the drafting work. This may be exchanging a workload concern for potential quality and consensus building concerns. The response to comments serves a few purposes for entities - an acknowledgement of the entity voice, an indication of whether the SDT understood the comments, and as a tool for confirming language understanding. It is the communications process between the SDT and technical experts at the voting entities over the iterative process. Putting all responses at the end of the process is summary form may eliminate the value that the response to comments contributed to language development and getting to yes votes.
Response: Thank you for your comments and appreciates your support of the revisions to comments received during the informal feedback period. In large part, your comments correctly summarize the intent of the revisions to the SPM. However, please review the draft Sections 4.12 and 4.13 to see that all comments must be posted and all summary responses must be posted. **There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any**		

Organization	Yes or No	Question 1 Comment
comments submitted during the Final Ballot. If a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to written comments received in the last Additional Ballot prior to conducting a Final Ballot. The drafting team agrees that communications is important to make the process successful.		
Oncor Electric Delivery	No	Process OverviewOncor does not support the new commenting process as proposed. In Section 4.13 it states "If a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot." The proposed process also states that if the Standard Development Team chooses to post the revisions for additional comment and ballot that previous comments do not require a response in writing.Oncor takes the position that when a stakeholder submits a significant revision during the initial formal commenting period which improves the quality, clarity, or enforceability of a Reliability Standard, then, the drafting team would be remiss [“may choose”] not to consider the validity of the comments by providing a written response to stakeholder concerns and by allowing them to participate in an additional ballot.Oncor takes the position that the current language in the ROP should remain as follows.”If a stakeholder or balloter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent initial ballot that will improve the quality, clarity, or enforceability of that Reliability Standard then the drafting team shall

Organization	Yes or No	Question 1 Comment
		make such revisions and post the revised Reliability Standard for another public comment period and ballot."
Response: Thank you for your comments. The drafting team wishes to clarify that whether to include significant revisions is a decision to be made by the SDT. However, we believe that such revisions which do, in fact, improve the quality, clarity, or enforceability of the Reliability Standard are almost certain to be adopted by the SDT. There may be other decisions or options available which lead the SDT to select a different, equally effective option. In any case, when significant revisions are made, the SDT is not required to spend unnecessary time in responding to all comments. The SDT will notify the commenters that a significant revision will be made and, as a result, an additional posting/ballot will be required. In all cases, prior to the final ballot, the SDT must consider and respond to all remaining comments. The drafting team believes the language included in Sections 4.12 and 4.13 do require what you suggest.		
Kansas City Power & Light	No	
HHWP	No	
MRO NSRF	Yes	Yes, we agree with these changes. We encourage the standard drafting team to post the revised Reliability Standard for another 45 calendar day public comment period and ballot each time a stakeholder or ballotter proposes a significant revision to the Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard.
Response: Thank you for your comments and support. The drafting team wishes to clarify that whether to include significant revisions is a decision to be made by the SDT. However, we believe that such revisions which do, in fact, improve the quality, clarity, or enforceability of the Reliability Standard are almost certain to be adopted by the SDT. There may be other decisions or options available which lead the SDT to select a different, equally effective option. The drafting team believes the new language proposed in Sections 4.12 and 4.13 do require what you suggest.		
SPP Standards Review Group	Yes	While we understand the necessity of streamlining the process by cutting down on the number of responses made to comments, making this change leaves the impression that consideration for all comments received may not be given. We are accustomed to seeing responses to our comments posted in the next draft

Organization	Yes or No	Question 1 Comment
		of a standard. However, the SPM does provide encouragement that all comments will be considered.
Response: Thank you for your comments and support.		
American Electric Power	Yes	The text for 4.12 as provided in the comment form above is shown as 4.12 in the draft, and the text for 4.13 provided in the comment form above is shown as 4.12 in the draft. It would appear that the draft is incorrect and that the format provided in the comment form is correct.
Response: Thank you for your comments and support. We believe that you may have been referencing the June posting of the draft SPM which did have the order of Sections 4.12 and 4.13 reversed.		
Occidental Energy Ventures Corp	Yes	Occidental Energy Ventures Corp (OEVC) agrees that the elimination of a requirement to individually address each stakeholder comment could result in substantial savings in development time. However, we are concerned that if some consideration is not demonstrated, most entities (including us) will likely re-submit the comment during the following review. If this consistently occurs, the result could be extra review cycles - and eliminate the benefit of not developing a response in the first place.
Response: Thank you for your comments and support. We understand your concern and believe it is addressed by the ability of the commenter to either discuss their concerns during an open meeting or directly contact the drafting team to discuss their comments. Please note standard drafting team meetings are open to observers for discussion of multiple perspectives.		
Georgia System Operations Corporation	Yes	This is yes is contingent up additional clarity in providing the response to the comments.
Response: Thank you for your support. Be assured that all comments will be addressed by the drafting teams.		
Oklahoma Gas & Electric	Yes	We understand the need to streamline the stakeholder process; however, the responses to comments can provide valuable information. We are in support of

2. In the first posted draft of the SPM, the SCPS proposed handling 'no' votes without comments or with unrelated comments in the way that ANSI recommends – by counting those votes toward quorum but not toward the calculation of consensus, with a detailed evaluation for determining whether a comment is relevant. With this proposed change, the SCPS was trying to encourage stakeholders to only submit the kind of constructive comments that help standard drafting teams improve the standard and reach technical consensus.

Based on the comments received, the SPM has re-examined this issue and determined that the approach for evaluating the relevance of comments requires additional clarification, so it has eliminated the process for reviewing the relevance of comments from the proposed revisions. However, the SCPS has retained the concept of including 'no' ballots that are not accompanied by comments in the calculation of quorum, but not being counted in the calculation of consensus.

Do you support this modified proposal for handling 'no' votes?

Summary Consideration:

Although a number of commenters expressed concern about discounting negative ballots without comments in the determination or consensus, the SC believes that this is a necessary and reasonable step to provide drafting teams with the information needed to develop a consensus standard. All negative votes with comments, including those votes submitted by balloters that participated in the development of group comments, will count in the determination of both a quorum as well as consensus. Although some commenters identified that this may cause some balloters to submit meaningless comments with their 'no' vote, the SC believes that the opportunity to participate in submitting comments through one of the many industry groups that develop consensus comments provides stakeholders who do not wish to develop their own set of comments with opportunities to inform standard drafting teams of their concerns without resorting to such tactics.

Several commenters identified that during a Final ballot, there is no comment period. There is no obligation in the current SPM to accept comments during a recirculation ballot, and the proposed revisions to the SPM are consistent in that there is no comment period associated with a Final Ballot. Therefore, all 'no' votes submitted in a Final Ballot will count toward determination of both the quorum and consensus. Clarifying language and a new Footnote 24 have been inserted in section 4.11, to clarify this important point. Footnote 24 reads: *The Final Ballot is used to confirm consensus achieved during the Formal Comment and Ballot stage. Ballot Pool members voting negative on the Final Ballot will be deemed to have commented or supported the comments of other groups during prior Formal Comment periods.*

Organization	Yes or No	Question 2 Comment
Detroit Edison	No	On page 6- I disagree with the last part of the statement. the requirement to a add a comment to a negative vote should not be required. - A two-thirds majority of the weighted segmentSegment votes cast shall be affirmative. The number of votes cast is the sum of affirmative and negative votes with related comments or stated objections, excluding abstentions and, non-responses., negative votes without comments, and negative votes with unrelated comments.On page 27 under 4.11- requiring a comment for a negative vote is not acceptable
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. It is not a burden and provides the drafters with the necessary information to know why their ballot did not achieve consensus and what may be done to improve the quality of the standard in an efficient manner. The reference to "related" comment included in the text box will be struck from the SPM.		
ACES Power Marketing Standards Collaborators	No	(1) We believe that comments in response to the last posting indicated little support for discounting 'no' votes for any reason. Given the comments, we believe the drafting team should eliminate any plan to discount negative votes for any reason until evidence and analysis is presented that demonstrates that 'no' votes without supporting comments has delayed the standard development process significantly. (2) We disagree with counting discounted 'no' votes towards quorum. Some 'no' votes appropriately will not provide constructive feedback for how to improve the standard simply because the balloter believes the standard is unnecessary. Such a balloter may simply choose not to provide a comment because it only slows the drafting team down because they have to respond to the comment. It would be totally inappropriate to discount such a 'no' vote and then count it towards quorum.
Response: Thank you for your comment. The NERC SC has given further consideration to the matter and in this latest draft will not dismiss any no vote with a comment associated with it. The industry needs to be encouraged to submit comments that are helpful to the drafting teams writing the standards. Participation in the NERC Ballot Pools comes with responsibility to participate		

Organization	Yes or No	Question 2 Comment
and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. It is not a burden to either the drafting team or the commenter to review or provide a comment and provides the drafters with the necessary information to know why their ballot did not achieve consensus and what may be done to improve the quality of the standard in an efficient manner. Simply counting all the no votes and not knowing why the entities voted negatively provides no information to the drafting teams to consider making a revision to the satisfaction of these stakeholders. Casting a negative Ballot with no comment slows the process down and the drafting teams won't know what the issues are with the posted standards.		
SERC Planning Standards Subcommittee	No	Even if there are no comments included, a "No" vote should count in the calculation of consensus.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. To submit no votes and not provide the drafting teams with a reason why leads to inefficiencies and contributes to poor productivity.		
Arizona Public Service Company	No	As proposed, essentially all "no" votes are subject to not being counted in the calculation of consensus.
Response: Thank you for your comment however, the latest proposal only would dismiss those "no" votes without comment in the calculation of consensus. This attribute will encourage commenters to provide some information on why they voted negatively.		
Trans Bay Cable LLC	No	Per the ANSI standard document, their standards are "guidelines" for industry practice, such as siesmic standards for buildings. It's not a "regulated" or "audited" standard that has possible financial penalties for violations. Also, within this same update, NERC is requesting to not repond to all comments, so not only do they want more comments, they don't want to respond to them either.
Response: Thank you for your comment. The NERC SC recognizes the difference between ANSI standards and NERC Reliability Standards and it is because of these differences that it is vitally important to have the industry fully participate in the Standard		

Organization	Yes or No	Question 2 Comment
development process by providing thoughtful comments that support their balloting position as a Ballot Pool Member. Although the NERC Standards Development Process is an ANSI accredited process, the NERC Reliability Standards are not filed with, nor approved by ANSI. Therefore a comparison between ANSI standards and NERC Reliability Standards is not an appropriate assessment to draw conclusions from on how the NERC Standard Development Process should be managed. There are different classes of comments. The most important of which is the comment causing a "no" vote. The drafting teams needs the information why an entity is voting against the standard and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner. There is a difference between comments that come out during a ballot versus an informal comment period. The proposal is to consider all comments gathered during all comment periods to consider all concerns. However there will be informal comment periods where comments will not be responded to individually, rather, will be grouped by type and the drafting team is encouraged one response given to each type.		
Owensboro Municipal Utilities	No	OMU does not support the provision where negative votes are elimintated as part of the calculation of consensus, if these votes do not contain comments.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner.		
NIPSCO	No	Comments should be related and relevent.
Response: Thank you for your comment. As a first step towards ensuring relevancy of comments related to the proposal, NERC is proposing to accept all comments as qualifiers to count a "no" ballot towards consensus.		
Manitoba Hydro	No	Because the text related to negative votes without comments has been deleted from section 4.11 and not replaced with alternate wording, it is now not clear what will happen when someone submits a negative vote without comments.As a related question, we have several voting representative in our entity, but only submit one commenting form on the entity's behalf. Will this be sufficient?

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment. "No" ballots without comments will not be counted in the calculation of consensus. If an entity references comments made by others, that response will be sufficient to count the "no" ballot.		
CenterPoint Energy Houston Electric L.L.C.	No	CenterPoint Energy does not agree with the modified proposal for handling "no" votes. The Company agrees with an incentive to provide constructive comments with an entity's "no" vote, however CenterPoint Energy strongly believes if a "no" vote is not to be counted in the calculation of consensus, then the vote should not count towards the calculation of quorum. CenterPoint Energy is concerned that this method has the potential to skew a ballot in favor of passage when that may not be the consensus of industry voters. In addition, the Company believes these "hidden" "no" votes should be posted so that an accurate picture of industry support for a project be displayed for all participants to view. CenterPoint Energy recommends if a "no" vote with no comments is not to be counted toward consensus then that vote should not be counted towards quorum.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner. NERC Standards Committee does not believe the burden outweighs the benefit of knowing the opinions of those negative ballot positions and why they voted "no". NERC Standard Committee is not considering this attribute to skew the results of the ballot but rather to encourage comments that provide sufficient guidance to the drafting teams. Since the last draft of the SPM, the relevancy qualifier has been dropped and now "any" comment submitted that accompanies a no ballot will qualify that ballot to be counted. All details of the voting will be provided and a recommendation to identify those votes that did not include comments.		
Lakeland Electric	No	Removal of the comments entry field from the ballot screen causes this proposal to be a problem. My concern is that this will cause a burden on the vote compilers to look in the comment files for comments that are related to the "no" or negative vote. One solution may be to provide some type of link to the comments when a negative

Organization	Yes or No	Question 2 Comment
		vote is entered.
Response: Thank you for your comment. NERC Standards Committee is aware of this situation and NERC has committed the resources necessary to accurately identify negative votes with associated comments.		
Tri-State G & T	No	The SCPS should retain the concept of including 'no' ballots in the calculation of the consensus.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner.		
South Carolina Electric and Gas	No	All votes should be counted in the calculation of consensus.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner.		
SCE&G	No	All votes should be counted in the calculation of consensus.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner.		

Organization	Yes or No	Question 2 Comment
Consumers Energy	No	At this time, NERC's ballot tool does not include a mechanism for direct comments with the ballot. It has been stated that a new tool will be in place by the time these revisions take effect. However, until the tool is in place, there is no way to know for certain that the balloter will be able to directly attach comments to their ballot. Therefore, it is still feasible that a negative ballot would be submitted and that NERC would be unable to locate the related comments, thus rendering the ballot as 'no vote' for purposes of calculating the consensus.
Response: Thank you for your comment. NERC Standards Committee is aware of this situation and NERC has committed the resources necessary to accurately identify negative votes with associated comments.		
Trans Bay Cable LLC	No	If industry isn't empowered to have a right for a "NO" or "Negative" vote to have the same weight as a yes vote, regardless of comments, it's no longer a "vote" and we are simply ceding all the authority to the drafting team and NERC when the intent of the legislation was for industry-approved standards. We realize and understand the guiding standards developed by other organizations adhere and support not counting "NO" votes without comment, but as stated by many the other industry standards are only guidelines and carry no punitive damages. Since NERC standards can and do carry punitive damages all registered voting entities should retain their voting rights to vote for or against any standard or revision without comment.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to actively participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner. The current standards productivity is not meeting the expectations of the regulators and it is important that the drafting teams be given as much information as possible, especially information on why entities voted negatively, to develop standards efficiently and expeditiously. It is burdensome for the drafting teams to continually revise standards to try to gain industry consensus when they don't have all the concerns.		

Organization	Yes or No	Question 2 Comment
HHWP	No	This proposed handling of makes a ballot pool member non-response a more powerful negative voice than a "'no' votes without comments". A "'no' vote without comments" supports the development of a quorum and has no value in the majority vote count, whereas a ballot pool member non-response works against adoption through obstructing the development of a quorum.
Response: Thank you for your comment. NERC Standards Committee recognizes this however the proposal is meant to encourage industry submittal of comments that are the issue of determining the "no" ballots. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner. The goal is to provide the Standards Drafting teams with the best opportunity be successful in the development of a standard that supports the reliability objective in the shortest amount of time.		
Oncor Electric Delivery	No	Oncor does not support the proposal for the handling "no" votes. In Section 4.10, it states "Abstentions and, non-responses, and negative votes without comments shall not be counted for the purposes of determining the fractional affirmative vote for a Segment." Section 4.10 also describes that a quorum is established by at least 75% of the members of the ballot pool submitting a response (which includes Negative votes without comment).The rationale used for the elimination of negative votes without comments is consistent with NERC's ANSI accreditation, however, Oncor takes the position that the elimination of Negative votes without comments for the purpose of determining the fractional affirmative vote for a Segment encourages the submission of comments that serve no useful purpose, other than to fulfill the requirement for a comment to accompany a "No" vote. It appears to go against the spirit of fairness and transparency.Oncor takes the position that all votes should be counted for both the quorum and the establishment of the Affirmative vote. Oncor recommends the following language to support that position as prescribed in Section 4.10: "A quorum, which is established by at least 75% of the members of the ballot pool submitting a response with an affirmative vote, a negative vote, or an abstention."Oncor also recommends that the appropriate software to support a more effective process for

Organization	Yes or No	Question 2 Comment
		balloting, commenting and responding be designed and implemented as part of this initiative. The software should simplify the process for correlating "No" votes to comments in a way which supports the SDTs to be able to assemble comments and potential prioritize for review and implementation. Ultimately, streamline the process to ensure constructive input from the industry and be reviewed and potentially implemented to allow for an efficient standards development process.
Response: Thank you for your comment. Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner. NERC Standards Committee is aware of the issues of correlation between "no" votes and comment and NERC has committed the resources necessary to accurately identify negative votes with associated comments.		
Kansas City Power & Light	No	
Western Small Entity Comment Group	Yes	The comment group agrees, but is concerned how no votes without comments are determined. It is no longer possible to submit comments along with a ballot; a separate process must be used. In addition, a balloter may rely on comments submitted by someone else within the same entity, another entity, or comments submitted by a group of entities. The individual name may not be present in the entity comments, or may have altered spelling if listed in group comments. Variations of entity names may also differ from ballot to comments. We expect these issues have or will be addressed.
Response: Thank you for your comment. NERC Standards Committee is aware of the issues of correlation between "no" votes and comment and NERC has committed the resources necessary to accurately identify negative votes with associated comments.		
PPL Corporation NERC Registered Affiliates	Yes	The PPL Companies appreciate the work of the drafting team as it tries to create a process that encourages stakeholder participation in creating Standards that are carefully contemplated and well drafted. While the PPL Companies prefer that all

Organization	Yes or No	Question 2 Comment
		'no' votes be counted, regardless of whether they are accompanied by comments, we can support counting only those 'no' votes that are accompanied by comments, as long as there is not any 'litmus test' regarding the relevance of the comments. We believe that the approach for evaluating the relevance of comments does not require additional clarification (as stated in the question above), as this evaluation is unnecessary and should be removed entirely from the process. The PPL Companies also support the utilization of a tool that would alert submitters to the fact that they are submitting no comments along with their ballot, and to the consequences of such an action.
Response: Thank you for your comments. As a first step, the SPM will not apply a litmus test to ascertain a comment's relevancy or validity and proposes to count all "no" ballots with any comment. The suggestion for "alerting a balloter that comment is not included with a negative ballot and will therefore be dismissed" will be communicated to NERC Staff for possible incorporation to the balloting software.		
Bonneville Power Administration	Yes	BPA agrees that additional work needs to be done towards the approach of evaluating the relevance of the comments.
Response: Thank you for your comments.		
EPSA	Yes	See comprehensive comments in Question 7
Response: Thank you for your comment. However EPSA's submittal to Question 7 has no specifics with respect to the "no" ballot counting.		
Occidental Energy Ventures Corp	Yes	OEVC appreciates the project team's decision to remove the allowance for "No" votes with non-relevant comments to be discarded. As an active member in a Trade Association, OEVC will often refer to comments that they submit - and want to be sure that our input will count against the final tally. In addition, we were concerned that someone would make a value judgment on the applicability of our comments, which we believe is not appropriate.

Organization	Yes or No	Question 2 Comment
Response: Thank you for your comment and support of the proposal. Comments that refer to other's comments will be deemed acceptable.		
Essential Power, LLC	Yes	The SC must ensure that the commenting function is included in the balloting software prior to implementing this change.
Response: Thank you for your comment. NERC Standards Committee is aware and NERC has committed the resources necessary to accurately associate comments with ballots.		
Ameren	Yes	Please consider adding a pop-up window on the web portal to remind the voter that he/she is about to submit a 'no' vote without comments and as such the vote will only be counted in the calculation of quorum, and not in the calculation of consensus".
Response: Thank you for your comment. The suggestion for "alerting a balloter via a "pop-up window" that comment is not included with a negative ballot and will therefore be dismissed" will be communicated to NERC Staff for possible incorporation to the balloting software.		
Liberty Electric Power LLC	Yes	1. There is still language in the section on rationale which discusses the 'relevance' of a comment, this should be deleted.2. Current comment procedure requires the submission of a comment form outside of the voting process. The disqualification of no votes without comment should not occur until there is a process for submitting comments during the vote. Further, comment forms have been quite lengthy at times with dozens of questions. There needs to be a simple method of commenting which assures a commenter will have his no vote counted. Comment forms such as the CIP form, which covers multiple standards, should be disallowed so there is no confusion in this process.
Response: Thank you for your comment.		

Organization	Yes or No	Question 2 Comment
1. Conforming changes will be made to the process manual to be consistent with the latest proposal. 2. The identified shortcomings of the NERC software has been communicated by NERC Standards Committee to NERC staff as suggestions for potential revision to the existing balloting software.		
American Electric Power	Yes	AEP has no objections as currently proposed, however the comment field was removed from balloting earlier this year, and it remains to be seen what approach would be taken to reference and acknowledge comments made using the electronic comment form.
Response: Thank you for your comment. NERC Standards Committee is aware of the commenting issue and NERC has committed the resources necessary to accurately associate comments with ballots. The identified shortcomings of the NERC software has been communicated by NERC Standards Committee to NERC staff as suggestions for potential revision to the existing balloting software.		
Tacoma Power	Yes	Tacoma Power supports the proposed handling of 'no' votes without comments. The process should not be hindered by actions, such as a 'no' vote without comment, that are not productive to building an industry consensus.However, it should be noted that the ability to submit comments with votes has recently been deleted from the process. In addition, there is no current method to link a submitted comment under the commenting process with a vote. Therefore the ability to submit comments with votes must be reinstated.
Response: Thank you for your comment. NERC Standards Committee is aware of the commenting issue and NERC staff has committed the resources necessary to accurately associate comments with ballots. The identified shortcomings of the NERC software has been communicated by NERC Standards Committee to NERC staff as suggestions for potential revision to the existing balloting software.

Independent Electricity System Operator	Yes	
American Public Power Association	Yes	
CPS Energy	Yes	
Dominion	Yes	
ISO/RTO Council's Standards Review Committee		Regarding the No voting without responses, we recommend NERC change their tool such that the submitter gets an error message unless something is included in the comments field. We find it problematic for the tool to accept a No vote without comments and then exclude the No vote in the opposition count without providing notification to the submitter that their vote will not be counted.As currently drafted and without the changes to the tool, there are inconsistencies between Sections 4.10 and 4.11. Section 4.11 removed the reference that allowed a ballot pool member to submit a negative vote without comment. However, Section 4.10 indicates that negative votes without comments can be submitted but they will not be counted in determining the consensus but will be used in determining quorum. The two sections are inconsistent.
Response: Thank you for your comment. The suggestion for "alerting a balloter via a "pop-up window" that comment is not included with a negative ballot and will therefore be dismissed" will be communicated to NERC Staff for possible incorporation to the balloting software.		

Organization	Yes or No	Question 2 Comment
Exelon Corporation and its affiliates		Exelon accepts the move to require comments with negative votes, though the balloting portal must be revised to accommodate this new requirement.
Response: Thank you for your comment. NERC Standards Committee is aware of the commenting issue and NERC staff has committed the resources necessary to accurately associate comments with ballots. The identified shortcomings of the NERC software has been communicated by NERC Standards Committee to NERC staff as suggestions for potential revision to the existing balloting software.		

3. **Many stakeholders supported the SCPS's proposal to move measures from standards into Reliability Standards Audit Worksheets (RSAWs), as in most cases, measures included in standards are little more than a repeat of the requirement (offering little value to registered entities and compliance auditors).**

   Under the proposed new process, measures will indeed be moved from standards to RSAWs, and the standard drafting team and compliance staff will collaborate to develop the RSAW alongside the standard to ensure consistency from early on in the standards project. As proposed in the first posting, the RSAW will then be posted alongside the standard during the final 45-day comment period, and the RSAW will be subject to a non-binding poll and ultimately presented to NERC's BOT for information. This process is already being piloted, and lessons learned during the pilot will be applied if this proposed process continues.

   Do you support the proposal to move measures to RSAWs and have drafting teams and compliance staff collaborate on RSAW development, as proposed in the first posting and again in the latest posted revisions to the SPM?

Summary Consideration:

Individual commenters were provided with the following response:

The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans.

Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.

Based on the majority of the commenters' responses and the initial ballot results, the industry supports the SCPS in continuing the pursuit of the elimination of the Measures from the Reliability Standards and establishing the process for the collaborative (SDT &

Compliance) development of the companion RSAW during the Standard Development Process. As the details of the 'Reliability Assurance Initiative' are finalized, the SC and SCPS will work with the NERC Compliance Organization to continue the collaboration between the SDTs and the Compliance Organization to produce the accompanying Compliance documents that support the Reliability Standards.

Organization	Yes or No	Question 3 Comment
NPCC	No	Comments: It is important for Stakeholders to be able to provide input into the Measures via the Reliability Standards, specifically to ensure there are not additional Requirements inadvertently incorporated into the RSAWs. Because there is no obligation for NERC to include comments from the Stakeholders in the RSAWs, the Measures should not be moved from the Standards development process.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
ISO/RTO Council's Standards Review Committee	No	We believe it is important for Stakeholders to be able to provide input into the Measures via the Reliability Standards, specifically to ensure there are not additional Requirements inadvertently incorporated into the RSAWs. Since, there is no obligation for NERC to include comments from the Stakeholders in the RSAWs, we do

Organization	Yes or No	Question 3 Comment
		not support moving the Measures from the Standards development process.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
PPL Corporation NERC Registered Affiliates	No	The PPL Companies believe it is important for Stakeholders to be able to provide input into the Measures via the Reliability Standards, specifically to ensure there are not additional Requirements inadvertently incorporated into the RSAWs. Since, there is no obligation for NERC to include comments from the Stakeholders in the RSAWs, the PPL Companies do not support moving the Measures from the Standards development process.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans.		

Organization	Yes or No	Question 3 Comment
Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
SERC Planning Standards Subcommittee	No	We continue to feel that the measures should remain with the standards. Since there is a potential for the measures to modify requirements, the measures should remain subject to industry approval.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Southern Company	No	The proposed revisions must provide more clarity on the parallel development of Reliability Standards Audit Worksheets (RSAWs) and Reliability Standards. The Standards Committee Process Subcommittee's consideration of initial comments to the first posting of the revised SPM indicate that RSAWs will be posted for industry review and that the new process will include a non-binding poll during the final 45 day comment/ballot period to gauge industry support. We concur with this approach but it is not clear how the latest draft of the SPM incorporates this concept. We do note that Section 3.10 explains how RSAWs will be developed through collaboration

Organization	Yes or No	Question 3 Comment
		of standards drafting teams and NERC Compliance Staff. Additionally, we note that footnote 20 provides more detail in this regard. The uncertainty over where and how stakeholders will have an opportunity to participate should be codified in the illustration provided in the Process for Developing or Modifying a Reliability Standard (Section 4.0, Figure 1).
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
PacifiCorp	No	PacifiCorp does not support the proposal to move measures to RSAWs as revisions to RSAWs are not subject to the same standards balloting process. The absence of a binding process for the rejection or approval of revisions to the RSAW could create inconsistency between the way a standard is written and the way it is measured in the RSAW. PacifiCorp prefers that the measures remain in the standards template to ensure that changes to a standard and to the way a standard is measured are evaluated concurrently within the same document.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures		

Organization	Yes or No	Question 3 Comment
in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Arizona Public Service Company	No	While we fully support the development and revision of RSAWs by the drafting team at the time of the development/revision, until such time as all Standards are accompanied by RSAWs, the measures within the Standards are a helpful tool for industry to determine auditor focus and intent.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
National Rural Electric Cooperative Association	No	The elimination of Measures from the standards and effectively replacing them with RSAWs creates several issues of concern. With Measures currently a part of the

Organization	Yes or No	Question 3 Comment
(NRECA)		standard there is certainty of these provisions since they cannot be changed outside of the standard development process. RSAWs, on the other hand, are controlled by NERC compliance staff and they can be updated outside of the standard development process. NRECA is concerned that after the proposed SDT role of working collaboratively with NERC compliance on RSAW development, the RSAWs can be revised without the consultation and straw poll provisions of the proposed SPM. There is currently no assurance that NERC compliance will work to avoid revising the RSAWs after the SDT's role is complete. One possible solution if the SDT is no longer in place to perform this task would be to seek SC concurrence with any future RSAW changes. Additionally, it's still unclear what the roles are for NERC staff and the SDTs regarding RSAW development. NRECA requests that further structure be added to the SPM on the respective roles of NERC compliance and the SDTs regarding RSAW development. Without this NRECA is unsure of the role that SDTs will have in this important role.Footnote 7 - The inclusion of the word "technically" potentially creates confusion as it is used here to qualify whether something is part of a standard or not. Something is either part of the standard or not - eliminate the word "technically" from the second line of the footnote. Footnote 33 - In the second line it states that the RSAWs "may" have a non-binding poll. NRECA requests that this be revised to require that a non-binding poll on RSAWs be conducted, similar to how VSLs/VRFs are handled today.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans.		

Organization	Yes or No	Question 3 Comment
Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Duke Energy	No	Measures should be kept in the standard itself due to the fact that the RSAWs can be changed without industry input after the standard has been approved, but measures are currently an element of the reliability standard subject to industry vote, Board of Trustee and FERC approval. Keeping the measures as part of the Reliability Standard itself provides compliance certainty and ensures they are considered during the Quality Review, ultimately resulting in greater consistency and higher quality of the measures and the standard overall. This change would necessitate adding the Measures to section 4.6 Conduct Quality Review.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Georgia System Operations Corporation	No	This would be acceptable if the industry had the right to approve the RSAWs.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the		

Organization	Yes or No	Question 3 Comment
majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Manitoba Hydro	No	If the measures are to be moved into the RSAWs then there should be a binding vote on the RSAWs. There is no obligation by compliance staff and the SDT to make modifications based on comments submitted in non-binding polls. As an example, even though draft CANs are posted for comment, very few comments are ever incorporated into the CANs. A binding poll on measures, whether they are in the standards or RSAWs, will lead to measures that are more acceptable to industry as a whole.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance		

Organization	Yes or No	Question 3 Comment
documents.		
Lakeland Electric	No	I support FMPA comments on this question
Response: Thank you for your comment. However FMPA did not provide comments to this question.		
Ameren	No	(1) Because the RSAW including the measures would be subject only to a non-binding poll, and the SDT is not required to respond to stakeholder comments we provided for the RSAW/Measures. Therefore, we prefer measures to continue as a part of the standard. (2) We also want to guard against additional requirements which may creep into the RSAW/Measures resulting in a scope change of the standard with a non-binding vote.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Tri-State G & T	No	This is only acceptable if the RSAW is available as a part of the standard, otherwise the entity may not have ready and reasonable access to the expected evidence to show compliance.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and		

Organization	Yes or No	Question 3 Comment
the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Oklahoma Gas & Electric	No	After further review, we prefer that measures be included in the Standard instead of the RSAW. We do support the RSAW development during the drafting of the Standard since those two documents should be lock-step.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Oncor Electric Delivery	No	Oncor takes the position that since the RSAW is in itself, not subject to approval by

Organization	Yes or No	Question 3 Comment
		the standards development process, the validity and effectiveness of the measures could be better served by not placing them in the RSAW, but retaining them in the standards and by performing selected improvements to their clarity and their relativeness.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
SPP Standards Review Group	Yes	We very much appreciate the effort to include the drafting teams in the development of the RSAWs in conjunction with NERC compliance and enforcement staff. This will work great on the initial development of the standard and associated RSAW. We do have concerns that down the road there may be changes to the RSAW such that it may no longer be compatible with the standard. The only way to ensure that the content of the RSAW remains consistent with the standard is to involve the drafting team whenever changes are made to the RSAW.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision		

Organization	Yes or No	Question 3 Comment
comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
FirstEnergy	Yes	FirstEnergy (FE) supports the new process that has the SDT and NERC Compliance Staff working collaboratively to develop the RSAW at the same time that the Standard is being developed.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
ACES Power Marketing Standards Collaborators	Yes	We support the proposal as long as the RSAWs provide real guidance on how compliance will be measured. If the RSAWs become like the measures and some of the current RSAWs by simply repeating the requirement, we would not support the proposal. Furthermore, we request that a link to the RSAW be included in the

Organization	Yes or No	Question 3 Comment
		standard for ease of reference.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Bonneville Power Administration	Yes	BPA supports this proposal. BPA emphasizes the need for the SDT to have the authority to develop the standard without interference from the compliance staff. BPA agrees that many benefits can be gained from the compliance staff collaborating with the SDT to create the RSAW. The SDT needs to be the author of the standard and the compliance staff needs to be the author of the RSAW once the standard is developed.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans.		

Organization	Yes or No	Question 3 Comment
Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
EPSA	Yes	See comprehensive comments in Question 7.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Trans Bay Cable LLC	Yes	My team really liked the format of the test RSAW
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans.		

Organization	Yes or No	Question 3 Comment
Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
American Electric Power	Yes	We see the potential benefit of proposing RSAWs during the comment period as it gets the RSAW closer to the original drafting team, however AEP is concerned that industry would now have a very limited say in their content by virtue of the non-binding poll for RSAWs. AEP sees the benefit of having the RSAWs be an attachment of standard itself, thereby serving as a "one stop shop", and affording industry the opportunity to provide comment and vote on the "attached RSAW".
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Occidental Energy Ventures Corp	Yes	OEVC believes that the project team has addressed many of our concerns that we submitted to the original draft of the Standards Development Process Manual. Although we would still like to see a binding vote on the RSAW, it is essential that its coordinated development with the Reliability Standard is essential to consistency in the findings of violations - a high priority outcome from our perspective.

Organization	Yes or No	Question 3 Comment
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. This revision comes at the request of the NERC Compliance Organization to allow sufficient time for the development of the 'Reliability Assurance Initiative' which includes a review of the existing RSAW content, development process and use by the industry and ERO Compliance Organizations. This time also allows the more focused review of the Standards Development Process that was recently discussed at the NERC MRC and BOT meetings in New Orleans. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
City of Jacksonville Beach, FL dba/Beaches Energy Services	Yes	We support the concept; however, what almost causes us to cast a "negative" vote is footnote 7. Currently, the industry has control of the Measures as they are part of the balloted standard, albeit, the industry sometimes does not do a good job developing them. With footnote 7, ERO Staff will have unilateral right to change the Measures (and other Compliance Elements) that the industry as a whole currently controls. We believe this is inappropriate. So, while we agree with the concept, we disagree with the proposed governance of measures and retention at minimum which we believe should not be under the unilateral control of ERO Staff.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. Therefore, the SPM has been revised to eliminate all references to the development of RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		
Liberty Electric Power LLC	Yes	While supportive of this provision, I do note moving the measures from a binding vote to a non-binding poll could cause problems in the future.
Response: Thank you for your comment and support.		
Tacoma Power	Yes	Tacoma Power supports moving the measures to the RSAWs. We believe the measures and the RSAWs should be tools for the industry to understand how the auditors will perform the compliance with the standards. By moving the measures to the RSAWs, we expect to see fewer conflicts between the documents and the quality and clarity of the RSAW can be improved.
Response: Thank you for your comment and support.

Exelon Corporation and its affiliates		Exelon appreciates the move to develop compliance tools/RSAWs for comment along-side the proposed standard language. It is valuable to develop compliance tools such as the RSAW concurrently with the standard development. This improves the likelihood that the intent of the standard language will be reflected in the compliance tool. In addition, it is useful for applicable entities to understand the compliance implications and obligation of the standard prior to building a compliance program. However, a concern remains that replacing Measures (currently part of the approved standard) with the RSAW (not part of the standard and subject to future revision) removes the stability of the compliance instruction. While it may be preferable to remove the Measures from the standard to enable revisions to the measures/RSAWs without embarking on a standard revision project, greater discussion of and commitment to the value of stable, durable RSAWs would be helpful.Whatever the compliance tool utilized with the standard, it should request reasonable information, in a clear and concise manner, to assist in audit-prep for both entities and auditors, it should strictly and accurately reflect the standard language and intent, and it should be stable over time so that entities can incorporate RSAW completion into their compliance programs without multiple iterations of RSAWs.
Response: The SCPS thanks all commenters for their input concerning the removal of Measures from the Reliability Standards and the collaborative development of RSAWs between the Standard Drafting Teams and the NERC Compliance Department. Although the majority of the commenters supported the proposed process, the Standard Process Manual has been revised to retain the Measures in the Reliability Standards and eliminate the language describing SDT involvement in the development of the RSAWs. The collaboration between the SDT and the NERC Compliance Organization will continue through the development of the Measures and any accompanying Compliance documents.		

4. In the first posted revisions to the SPM, the SCPS proposed eliminating Violation Risk Factors (VRFs) and the Violation Severity Levels (VSLs) to address several issues identified in the SPIG recommendations. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification.

Therefore, the proposed revisions to eliminate the VRFs and VSLs will be removed from the next draft of the SPM. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.

The SCPS will continue to develop concepts in response to the SPIG recommendations to ease the burden on the drafting teams and shorten development time frames associated with standard development projects – including strategies for eliminating VRFs and VSLs while maintaining the ERO's focus on the potential risk to the reliability of the BES.

Do you support the continued use of VRFs and VSLs as the SCPS works towards a more effective solution for eliminating them from the standards process?

Summary Consideration:

The majority of the commenters recognize the burden that the development of VRFs and VSLs has on the SDTs and supports the development of potential alternatives to the existing Enforcement processes (i.e., revisions to the Penalty Matrix that utilizes the VRFs and VSLs exclusively for determining the starting point for enforcement actions). Commenters expressed concerns with the 'Sanctions Table' concepts and the SCPS has re-examined the concepts and has concluded that certain aspects of the proposal require additional clarification. Therefore the SCPS is continuing to work toward the elimination of the VRFs and the VSLs through the development of potential alternatives to the existing Enforcement processes and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While these concepts are fully vetted, the VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.

The SPCS recognizes that the development of VRFs and VSLs takes a significant amount of time and potentially extends the duration of standard development projects. The SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition team.

Organization	Yes or No	Question 4 Comment
NPCC	No	Comments: The development of the VRFs and VSLs takes a significant amount of time and effort in the Standards development process. Since the resulting "benefit" does not outweigh the cost of this effort, we suggest these be eliminated.
Response: Thank you for your comment. The NERC SPCS agrees with the commenter in that the development of VRFs and VSLs takes a significant amount of time and potentially extends the life of standard development projects. The SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition team. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts.		
ISO/RTO Council's Standards Review Committee	No	It has been our experience that the development of the VRFs and VSLs takes a significant amount of time and effort in the Standards development process. Since the resulting "benefit" does not outweigh the cost of this effort, we suggest these be eliminated.
Response: Thank you for your comment. The NERC SPCS agrees with the commenter in that the development of VRFs and VSLs takes a significant amount of time and potentially extends the life of standard development projects. The SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition team. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. Organization	Yes or No	Question 4 Comment
and Regional Enforcement staff to establish a consensus on the concepts.		
ACES Power Marketing Standards Collaborators	No	We can find little correlation between actual penalties and VRFs and VSLS. As a result, we cannot support their continued use in the current form. There have been many proposals to modify the process by which VSLs and VRFs are developed. These proposals have ranged from complete elimination to developing pro forma VSLs that would be used for every requirement to developing a spreadsheet tool that outputs VRFs based on a series of questions. We do not understand why one of these proposals cannot be piloted. Industry and drafting teams simply spend an inordinate amount of time developing and commenting on VSLs. The amount time spent is simply not commensurate with the impact on reliability.
Response: Thank you for your comment. The NERC SPCS agrees with the commenter in that the development of VRFs and VSLs takes a significant amount of time and potentially extends the life of standard development projects. The SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS has further developed guidance for the SDTs to assist with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition team. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts.		
Southern Company	No	Southern Company raises the following concerns with Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs):We acknowledge the Standard Committee's challenge to address standards development process efficiencies while incorporating various recommendations from the SCPS and the SPIG. We also note that in drafting SPM revisions, the SCPS suspended an approach to eliminate VRFs and VSLs while incorporating a Sanctions Table. We concur with this approach as it may create opportunities for further review and discussion of specific and comprehensive

Organization	Yes or No	Question 4 Comment
		solutions. Certain portions of the SPM create conflicting messages concerning the manner in which compliance elements such as VRFs/VSLs will be developed and approved. Footnote 4 suggests that NERC staff and the BOT will have an opportunity to revise the stakeholder-approved compliance elements if directed by FERC. Sections 4.4.4, 4.9 and 4.16 provide ample description of how drafting teams and NERC staff will work together to develop, ballot and obtain approval of VRFs and VSLs. The Standards Committee should clarify that a stakeholder's participation in the development process will not be minimized as a result of provisions which allow NERC and the BOT to modify stakeholder-approved compliance elements. We recommend elimination of footnote 4 as a way to mitigate potential conflicts.

Response: Thank you for your comments. The NERC SPCS agrees with the commenter in that the development of VRFs and VSLs takes a significant amount of time and potentially extends the life of standard development projects. The SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts.

Footnote 5 has been revised to address the commenters concern as follows:

[5]It is the responsibility of the ERO staff to develop compliance elements for each standard; however while these elements are not ~~technically~~ part of the standard, they are included in the standard and referenced in this manual because the preferred approach to developing these elements is to use a transparent process that leverages the technical and practical expertise of the drafting team and ballot pool. If directed by FERC, NERC may file revisions to compliance elements following approval of the NERC Board of Trustees.

The SPM has undergone minor revisions in regards to the VRFs and VSLs, to improve the clarity of the process without altering the concepts which dictate the development of, the associated non-binding polls, and the ERO responsibilities to ensure that the VFRs and VSLs meet the criteria established by the ERO and the applicable government agencies.

Organization	Yes or No	Question 4 Comment
PacifiCorp	No	PacifiCorp does not support the continued use of VRFs and VSLs as the SCPS works towards a more effective solution for eliminating them from the standards process. VRFs and VSLs are a faulty process to determine the level of severity for a potential violation. The increase in severity levels and risk factors during updates of existing standards provides little constructive information. The inclusion of the VRFs and VSLs in the balloting process (without binding balloting by the industry) is a drain on industry resources and the balloting process and serves no helpful purpose.
Response: Thank you for your comments. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the alternatives that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
Arizona Public Service Company	No	Until the SCPS has developed a more effective solution, VRF and VSL should be eliminated. It may take a long time before the process is developed and continuing in the meantime is not advised, because the VRFs and VSLs are not being applied consistently and there is no transparency regarding the fines that are issued.
Response: Thank you for your comments. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In

Organization	Yes or No	Question 4 Comment
American Electric Power	No	AEP is disappointed that the SPCS has seemingly abandoned the concept of pursuing the elimination of VRFs and VSLs from the standard template in favor of a Sanction Table Reference. We believe it was an opportunity to encourage SPIG to evaluate the current compliance practice that requires 100% compliance at all times, specifically in regards to requirements that have a very large scope and application. For example, these standards have driven entities to track many thousands of individual due dates which must all be met in order to be fully compliant. To track and meet this volume of distinct parameters is not only extremely challenging, but creates a statistical certitude that violations will occur. We suggest that future standards be developed in such a way that promotes the reliability of the BES in a manner which yields a more reasonable volume of milestones and deliverables to track and meet.AEP liked where the SPCS was going in regards to the Sanction Table Reference, and cannot comment on continuing the use of VRFs and VSLs until a newer methodology is proposed. In the meanwhile, AEP encourages the team to continue working towards an effective solution for eliminating VRFs and VSLs from the standards process. It is our hope that this could be accomplished in the near term, rather than years from now.
Response: Thank you for your comments. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
Georgia System Operations Corporation	No	If the VRFs and VSLs are continued to be used in enforcement they should be part of the standard development process.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your comments. The NERC SPCS believes that the best option is to eliminate the VRFs and VSLs from the Reliability Standards. However, the elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. The NERC SCPS agrees with the commenter in that the development of the VRFs and VSLs should remain in the Standard Development Process. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
NextEra Energy	No	As stated in its original comments NextEra Energy, Inc. (NextEra) does not see the value in the VSLs. NextEra generally favors the approach of eliminating VRFs and VSLs as presented in the original SPIG changes, subject to NextEra's specific comments on the replacement tables.
Response: Thank you for your comments. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
Oncor Electric Delivery	No	In the absence of an alternative path, continuing to utilize VRF's and VSL's is the only option. The industry is nearing the 6th year since the implementation of compliance and enforcement, and it seems the appropriate time to revisit the strategic and programmatic framework of compliance and enforcement policies and practices.

Organization	Yes or No	Question 4 Comment
		With a potential shift in the enforcement practices beginning with Find, Fix and Track (FFT) and the internal controls concept (often referred to as "zero defect language") being introduced into standards/RSAWs during the development process, Oncor recommends that SCPS partner with RISC to identify the appropriate framework including participation for this critical initiative.
Response: Thank you for your comments. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
Kansas City Power & Light	No	
MRO NSRF	Yes	We support the SCPS' efforts to create a more effective solution for eliminating VRFs and VSLs from the standards process.
Response: Thank you for the Comments and support of the concepts presented. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. associated with standard development projects In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
City of Jacksonville Beach, FL dba/Beaches Energy Services	Yes	However, we encourage expedited action to develop alternatives to VSLs and VRFs.
Response: Thank you for the Comments and support of the concepts presented. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
Ameren	Yes	We believe this is a step in the right direction at this time, and we also encourage efforts by the SDT to move towards a more effective solution for eliminating them from the standards process.
Response: Thank you for the Comments and support of the concepts presented. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. Organization	Yes or No	Question 4 Comment
the VRF Definition.		
Tri-State G & T	Yes	An explanation box for Section 3 (p 12) indicates that the VRFs and VSLs are being removed from the standards in this draft. Section 4.4.4 also indicates that the VRFs and VSLs will be developed by the drafting team. Why are VRFs and VSLs removed from the third line of Section 4.8?
Response: Thank you for your comments. The text box (explanation box) on page 10 of the draft SPM will be revised to remove the reference to the elimination of the VRFs and VSLs. Section 4.8 has been revised to include the language specific to VRFs and VSLs. This language was not replaced when the reference to the 'Sanctions Tables' was removed.		
Tacoma Power	Yes	Tacoma Power supports the continued use of the VRFs and VSLs while the SCPS works toward an effective solution for eliminating them.
Response: Thank you for the Comments and support of the concepts presented. The NERC SPCS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination of the VFRs and VSLs requires the development of an alternative to the existing enforcement process. In support of these efforts, the SCPS is further developing alternatives, including, but not limited to, the 'Sanctions Table' concepts originally proposed during the initial formal comment period, and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS is further developing guidance for the SDTs to assist them with the development of the VRFs and VSLs which incorporates the concepts developed by the Pro Forma VSL team and the VRF Definition.		
American Public Power Association	Yes	APPA supports continued use of VRFs and VSLs as inputs to the Sanctions Table but only until such time as consensus can be reached among stakeholders and the regions on the Risk-Based Matrix approach that was proposed by the SCPS. It is essential that NERC identify efficiencies in the standards development process to free up industry, SDT and NERC staff resources to focus on higher value initiatives such as joint development of RSAWS, CEAP and implementation guides and to speed

5. **Section 7.0 of the SPM, which concerns interpretations, was revised to ensure that stakeholders have a common understanding of what aspects of a standard may be addressed by an interpretation. Only requirements require technical expertise to interpret, and those kinds of interpretations thus require the traditional utilization of a drafting team. Other less technical questions, like a concern about an effective date, do not require the formation of a drafting team and ballot pool and all the associated processing.**

   The SCPS does want to provide stakeholders the ability to maintain control over how interpretations are developed, but the interpretation process in its entirety can lead to large volumes of work and the delay of processing high-priority standards projects. With the revisions proposed in the posted SPM, the SC aims to increase transparency about the handling of interpretations, with the goal of reducing the number of rejected interpretations and ultimately decreasing the interpretation-related burden on drafting teams and stakeholders.

   Do you agree that this clarification on the use of interpretations will be useful?

Summary Consideration:

The governing principle of Section 7.0 is laid out in its first paragraph. "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." See Proposed SPM Section 7.0 Revisions at P 1, emphasis added. An Interpretation request is not the appropriate vehicle to identify a gap or perceived weakness in an approved Reliability Standard. Rather, the primary function of an Interpretation request is to provide clarity regarding Requirements. The proper vehicle for the identification of a gap or weakness in a Reliability Standard is a SAR.

Interpretations are balloted in the same manner as Reliability Standards, and through this mechanism, registered entities are very much a part of the interpretation process and are in involved in the approval of the interpretation.

Organization	Yes or No	Question 5 Comment
NPCC	No	Comments: While we agree with clarification on the use of Interpretations, we do not agree that the Interpretations are limited in the cases of "Where an issue can be addressed by an active standard drafting team." or "Where a question has already been addressed in the record." In the first instance, although duplication of effort is

Organization	Yes or No	Question 5 Comment
		not desirable, it is not acceptable that a Responsible Entity may be found in violation and subsequently penalized while awaiting development of a standards development process. In the second instance, if there is a question that has been 'addressed in the record' we believe that this clarity should be incorporated into the Reliability Standard itself.
Response: Thank you for your comments. It is evident that NPCC and NERC share the same objective—that duplication of effort is not desirable. It is this objective that forged the key governing principle regarding interpretations in the SPM: namely that "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." *See* Proposed SPM Section 7.0 Revisions at P 1, *emphasis added*. A SAR has always been and presently remains the best method of clarifying an ambiguity that a Responsible Entity has identified within a reliability standard. Permitting an entity to submit an Interpretation request while the requirement at issue could be addressed by an active standard drafting team would violate this foundational principle, and divert industry attention and resources away from their proper procedural channel. **Regarding #5, "where a question has already been addressed in the record" NPCC states that "if there is a question that has been 'addressed in the record' we believe that this clarity should be incorporated into the Reliability Standard itself." We disagree. If there is a factual question that has been asked and answered in the standard development process or in the record at the Federal Energy Regulatory Commission, an interpretation is inappropriate and would needlessly expend both NERC and industry resources in a duplicative effort.**		
ISO/RTO Council's Standards Review Committee	No	While we agree with clarification on the use of Interpretations, we do not agree that the Interpretations are limited in the cases of "Where an issue can be addressed by an active standard drafting team." or "Where a question has already been addressed in the record." In the first instance, although we understand that duplication of effort is not desirable, it is not acceptable that a Responsible Entity may be found in violation and subsequently penalized while awaiting development of a standards development process. In the second instance, if there is a question that has been 'addressed in the record' we believe that this clarity should be incorporated into the Reliability Standard itself.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comments. It is evident that ISO/RTO and NERC share the same objective—that duplication of effort is not desirable. It is this objective that forged the key governing principle regarding interpretations in the SPM: namely that "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." *See* Proposed SPM Section 7.0 Revisions at P 1, *emphasis added*. A SAR has always been and presently remains the best method of clarifying an ambiguity that a Responsible Entity has identified within a reliability standard. Permitting an entity to submit an Interpretation request while the requirement at issue could be addressed by an active standard drafting team would violate this foundational principle, and divert industry attention and resources away from their proper procedural channel. **Regarding #5, "where a question has already been addressed in the record" ISO/RTO states that "if there is a question that has been 'addressed in the record' we believe that this clarity should be incorporated into the Reliability Standard itself." We disagree. If there is a factual question that has been asked and answered in the standard development process or in the record at the Federal Energy Regulatory Commission, interpretation is inappropriate and would needlessly expend both NERC and industry resources in a duplicative effort.**		
Western Small Entity Comment Group	No	The comment group agrees that non-technical questions do not require the formation of a drafting team, but the revised SPM provides no alternative path to address such questions. The comment group would also like to point out that the Applicability sections of some of the proposed standards are getting very technical, and can see that entities may need clarification on applicability as well as on the requirements.
Response: Thank you for your comments. The Interpretation process is intended to clarify questions regarding specific *requirements*. "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." *See* Proposed SPM Revisions at P 1, *emphasis added*. Any non-technical question would likely refer to another, non-Requirement provision of a reliability standard, and thus violate this core governing principle of SPM Section 7.0. An interpretation request is thus, likely an improper vehicle to submit non-technical questions.		
PPL Corporation NERC Registered Affiliates	No	The PPL Companies support the intent and the majority of the changes to this section, but suggest a change in the last sentence of the first paragraph of Section

Organization	Yes or No	Question 5 Comment
		7.0. Since not all NERC Board of Trustees-approved Standards have a future effective date in the United States, we suggest changing the language to state, "Interpretations will only be provided for Board of Trustees-approved Reliability Standards, and only for the current effective or later versions of the Reliability Standard."Also, while the PPL Companies agree with clarification on the use of Interpretations, we do not agree that the Interpretations are limited in the cases of "Where an issue can be addressed by an active standard drafting team." or "Where a question has already been addressed in the record." In the first instance, although we understand that duplication of effort is not desirable, it is not acceptable that a Responsible Entity may be found in violation and subsequently penalized while awaiting development of a standards development process. In the second instance, if there is a question that has been 'addressed in the record' we believe that this clarity should be incorporated into the Reliability Standard itself. The PPL Companies do not support, as it is currently written, the proposed addition of the paragraph (in Section 7.0) "The NERC Reliability Standards and Legal Staff shall review the final Interpretation to determine whether it has met the requirements for a valid Interpretation. Based on this review, the NERC Reliability Standards and Legal Staff shall make a recommendation to the NERC Board of Trustees regarding adoption." We would support language that made clear "the requirements for a valid interpretation" that the NERC Staff would be using and language that clearly stated that the NERC Staff would only be using such limited requirements in determining its recommendation.

Response: Thank you for your comments. The intent of the language referenced by PPL is to allow Interpretations only for current or future versions of Reliability Standards. Interpretations for no longer effective versions of Reliability Standards should be rejected because they are inconsistent with the purpose of Interpretations- which is to provide clarity and not to provide guidance on compliance. In order to clarify this point, NERC will modify the last sentence of the first paragraph to read "Interpretations will not be provided for versions of reliability standards that are no longer effective."

It is evident that PPL and NERC share the same objective—that duplication of effort is not desirable. It is this objective that forged the key governing principle regarding interpretations in the SPM: namely that "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any*

Organization	Yes or No	Question 5 Comment
		***Requirement*." *See* Proposed SPM Revisions Section 7.0 at P 1, *emphasis added*. A SAR has always been and presently remains the best method of clarifying an ambiguity that a Responsible Entity has identified within a reliability standard. Permitting an entity to submit an Interpretation request while the requirement at issue could be addressed by an active standard drafting team would violate this foundational principle, and divert industry attention and resources away from their proper procedural channel. Interpretations should not be used as a method to shortcut the standard development process.** **If there is a factual question that has been asked and answered in the standard development process, an interpretation is inappropriate and would needlessly expend both NERC and industry resources in a duplicative effort.** **The purpose of the final review of the Interpretation is to ensure that the final product comports with the requirements set forth in the Standard Processes Manual.**
PacifiCorp	No	PacifiCorp understands the concern that the interpretation process may lead to large volumes of work for drafting teams and delay in processing other pending standards projects, but those reasons alone are insufficient to limit an otherwise significant right of registered entities: to request reasonable clarifications or interpretations of approved standards that may otherwise be imprecise as presently drafted. It does not appear reasonable for NERC to focus its efforts on processing "high-priority standards projects" when there is a legitimate and reasonable request by registered entities to seek clarification of current active standards with which entities are already required to comply. To that end, PacifiCorp disagrees with certain of the enumerated example circumstances by which an Interpretation request may be rejected, as they actually appear to target the core reason as to when registered entities may bring legitimate Interpretation requests. For example, rejecting an Interpretation request that "[i]dentifies a gap or perceived weakness in the approved Reliability Standard," fails to align with a common legitimate justification for a request; approved standards or requirements may have an identified gap or weakness that, as written, impact registered entities' ability to have assurance that it may wholly comply. Further, rejecting an Interpretation request "[w]here an issue can be addressed by an active standard drafting team," is insufficient as a general rule to justify a rejection; an active NERC project may not necessarily address the precise issue in the request and there is no telling how long the active drafting team

Organization	Yes or No	Question 5 Comment
		may take with its project, in any event.
Response: Thank you for your comments. The governing principle of Section 7.0 is laid out in its first paragraph. "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." *See* Proposed SPM Section 7.0 Revisions at P 1, *emphasis added*. An Interpretation request is not the appropriate vehicle to identify a gap or perceived weakness in an approved Reliability Standard. Rather, the primary function of an Interpretation request is to provide clarity regarding Requirements. The proper vehicle for the identification of a gap or weakness in a Reliability Standard is a SAR. **Additionally, PacifiCorp cited example #3 of the proposed modifications to Section 7.0 as being insufficient as a general rule to justify a rejection. That example reads "[w]here an issue can be addressed by an active standard drafting team," it may be rejected. PacifiCorp asserted that "an active NERC project may not necessarily address the precise issue in the request and there is no telling how long the active drafting team may take with its project…" We remind PacifiCorp that Interpretations are required to follow the same process as Reliability Standards, and that Interpretations are a Requirement clarification mechanism, not a compliance tool. Going forward, it is intended for RSAWs to be drafted simultaneously with standards, allowing for such issues to be raised during the development process. We refer Pacificorp to the April 2011 Guidelines issued by Standards Committee titled *Guidelines for Interpretation Drafting Teams*. That document lists four explicit prohibitions regarding what an interpretation may not do:** **An interpretation may not:** **• be used to change an approved Reliability Standard or its applicability;** **• address a gap or perceived weakness in the approved Reliability Standard;** **• clarify or interpret sections of an approved Reliability Standard other than the requirements of the standard;** **• provide an opinion on a particular approach to complying with the requirements.** **If there is an issue that can be addressed by a standing drafting team, use of the interpretation process is not appropriate.**		
Trans Bay Cable LLC	No	I would recommend working towards writing more clear standards. They have become more "legal" than industry and thus require more review which leads to

Organization	Yes or No	Question 5 Comment
		more clarifying questions. Make it simple, easy to use.
Response: Thank you for your comment. NERC is continually striving to improve its standard development process by working with all stakeholders to promulgate clear, understandable Reliability Standards. If Trans Bay has any specific comments regarding the proposed modifications to SPM Section 7.0 on Interpretation processes, please make them known so that we may consider such input in drafting the final version of the SPM.		
Georgia System Operations Corporation	No	It could be acceptable if registered entities were involved in the approval of the interpretation.
Response: Thank you for your comment. We remind GSOC that Interpretations are balloted in the same manner as Reliability Standards, and through this mechanism, registered entities are very much a part of the interpretation process and are in involved in the approval of the interpretation.		
NextEra Energy	No	NextEra continues to favor its approach as presented in its original comments that clarifies how interpretations should be addressed.
Response: Thank you for your comment. Please let us know if there are any elements presented in your original comments that are suitable for specific consideration in Section 7.0.		
Ameren	No	The proposal and its intent are good, but without further details (transparency criteria) we cannot support it at this time.
Response: Thank you for your comment. It is unclear to us what Ameren means precisely by" further details (transparency criteria)." The text within the blue box in the upper right-hand corner of the proposed modifications to Section 7.0 defines the scope of this effort: **[c]hanges to Section 7.0 are intended to clarify the basis and process for rejecting an interpretation, consistent with guidance issued by the NERC Board of Trustees in November 2009, and to incorporate some of the elements of the Standards Committee's *Guidelines to Interpretation Drafting Teams*.** **The proposed changes to Section 7.0 are intended to provide additional clarity and transparency to the processing of**		

Organization	Yes or No	Question 5 Comment
Interpretations.		
Kansas City Power & Light	No	
ACES Power Marketing Standards Collaborators	Yes	Overall, we think the section will be helpful but do note a one issue. While we agree that it would be useful for the interpretation drafting team to develop a SAR for a reliability gap that they identified, we disagree with the language in this section that states they must do this. The team members were nominated to fulfill a purpose which is the interpretation of a standard. They were not nominated to write a standard. While many interpretation drafting teams may wish to submit a SAR, team members may decide that it is beyond their commitment and they simply do not have the time. Development of a standard is more time consuming than interpreting a standard.
Response: Thank you for your comment. If ACES's primary concern is that writing a SAR may be too taxing on the time of Interpretation drafting team members, then we are willing to amend the proposed language. Our primary concern is that if a reliability gap is identified by the Interpretation drafting team, it is made known to the Standards Committee without delay. Thus we will not require that a SAR be written, but rather only require that the Standards Committee be notified of the reliability gap.		
Southern Company	Yes	At Section 7.0: Process for Developing an Interpretation, it is not clear why an interpretation request should be rejected when it "identifies a gap or perceived weakness in the approved Reliability Standard." Is this example correct?
Response: We would like to thank Southern for its comments regarding Question #5. Yes, the example provided is correct. **Southern asked for clarification regarding example #2 listed on the first page of the proposed modifications to SPM Section 7.0. These examples illustrate conditions in which an Interpretation Request might be rejected. Specifically, example #2 states that when an Interpretation Request "[i]dentifies a gap or perceived weakness in the approved Reliability Standard" it may be rejected.** **The governing principle of Section 7.0 is laid out in its first paragraph. "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any*****		

Organization	Yes or No	Question 5 Comment
Requirement." ***See*** **Proposed SPM Section 7.0 Revisions at P 1, *emphasis added*. An Interpretation Request is not the appropriate vehicle to identify of a gap or perceived weakness in an approved Reliability Standard. Rather, the primary function of an Interpretation Request is to provide clarity regarding Requirements. The proper vehicle for the identification of a gap or weakness in a Reliability Standard is SAR.** **Additionally, we refer Southern to the April 2011 Guidelines issued by the Standards Committee titled *Guidelines for Interpretation Drafting Teams*. That document lists four explicit prohibitions regarding what an interpretation may not do (please note second item listed):** **An interpretation may not:** **• be used to change an approved Reliability Standard or its applicability;** **• address a gap or perceived weakness in the approved Reliability Standard;** **• clarify or interpret sections of an approved Reliability Standard other than the requirements of the standard;** **• provide an opinion on a particular approach to complying with the requirements.**		
EPSA	Yes	See comprehensive comments in Question 7.
Response: Thank you for your comments. The EPSA comments in Question 7 do not appear to address interpretations.		
Duke Energy	Yes	1) Please expand on the term "plain on its face" in the eighth example of why an Interpretation may be rejected. It is not clear how that will be assessed. 2) As noted in the response to Question 3, Measures should be retained as an element of the reliability standard and should be subject to interpretation as they could require technical expertise to interpret.
Response: We would like to thank Duke for its comments regarding question #5. The term "plain on its face" is meant as it is commonly used to mean something that is clear and unambiguous to a reasonable person. **Duke encouraged NERC to retain Measures as elements of a reliability standard and to permit measures to be subject to Interpretations. However, the governing principle of Section 7.0 is laid out in its first paragraph. "A valid interpretation response**		

Organization	Yes or No	Question 5 Comment
provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." *See* Proposed SPM Section 7.0 Revisions at P 1, *emphasis added*. The primary function of an Interpretation Request is to provide clarity regarding Requirements. **Additionally, we refer Duke to the April 2011 Guidelines issued by the Standards Committee titled *Guidelines for Interpretation Drafting Teams*. That document lists four explicit prohibitions regarding what an interpretation may not do (please note the third item listed):** **An interpretation may not:** **• be used to change an approved Reliability Standard or its applicability;** **• address a gap or perceived weakness in the approved Reliability Standard;** **• clarify or interpret sections of an approved Reliability Standard other than the requirements of the standard;** **• provide an opinion on a particular approach to complying with the requirements.**		
American Electric Power	Yes	In Step 3 of the process flow, it states "If the Standards Committee rejects the Interpretation request, it shall provide a written explanation for rejecting the SAR to the entity...". Should this instead state "shall provide a written explanation for rejecting the Interpretation Request to the entity"?
Response: We would like to thank AEP for its comments regarding Question #5. AEP pointed out a typo in Step 3 of the process flow chart. We thank AEP for identifying this mistake and will fix it.		
Occidental Energy Ventures Corp	Yes	OEVC believes that by instituting a concurrent standard/RSAW review process, the project team has embarked upon a path which will greatly reduce the need for interpretations and Compliance Application Notices. Although never quite perfectly achievable, that is the appropriate goal of the Standards Development process. We have no problem with language that discourages the submission of minor issues into the interpretations process.

Organization	Yes or No	Question 5 Comment
Response: We would like to thank Occidental for its comments regarding Question #5. We are pleased to have its support behind the proposed modifications to SPM Section 7.0.

National Rural Electric Cooperative Association (NRECA)		NRECA is not clear on why an interpretation can't be done for the reason listed in item 2. Please support this provision or delete it. Also, in item 8, NRECA requests that clarification be added to the SPM on who determines whether the meaning of a Reliability Standard is plain on its face. In the second to last paragraph of Section 7.0, in the second line after "Based on this review," add "and after passing industry ballot" to clarify this language.

Response: Thank you for your comments. NRECA inquired as to why an Interpretation could not be offered for an Interpretation request that "identifies a gap or perceived weakness in the approved Reliability Standard" as specified in Example #2 on the first page of the proposed modifications to SPM Section 7.0. The governing principle of Section 7.0 is laid out in its first paragraph. "A valid interpretation response provides additional clarity about one or more Requirements, *but does not expand on any Requirement and does not explain how to comply with any Requirement*." *See* Proposed SPM Section 7.0 Revisions at P 1, *emphasis added*. An Interpretation Request is not the appropriate vehicle to identify of a gap or perceived weakness in an approved Reliability Standard. Rather, the primary function of an Interpretation Request is to provide clarity regarding Requirements. The proper vehicle for the identification of a gap or weakness in a Reliability Standard is a SAR.

Additionally, we refer NRECA to the April 2011 Guidelines issued by the Standards Committee titled *Guidelines for Interpretation Drafting Teams*. That document lists four explicit prohibitions regarding what an interpretation may not do (please note the second item listed):

An interpretation may not:

- **be used to change an approved Reliability Standard or its applicability;**
- **address a gap or perceived weakness in the approved Reliability Standard;**
- **clarify or interpret sections of an approved Reliability Standard other than the requirements of the standard;**
- **provide an opinion on a particular approach to complying with the requirements.**

NRECA also requested that clarification be added to the SPM regarding who will determine whether the meaning of a Reliability

Organization	Yes or No	Question 5 Comment
Standard is "plain on its face," as specified in Example #8 of Section 7.0. We direct NRECA to the paragraph immediately preceding the list of examples, which identifies NERC Reliability Standards and Legal Staff as the bodies that will make such a determination, and present their determination to the Standards Committee. **Lastly, NRECA asked us to modify the second to last paragraph of Section 7.0, which reads:** **The NERC Reliability Standards and Legal Staffs shall review the final interpretation to determine whether it has met the requirements for a valid interpretation. Based on this review, the NERC Standards and Legal Staffs shall make a recommendation to the NERC Board of Trustees regarding adoption.** **NRECA requested that in the second sentence, after the phrase "[b]ased on this review," we insert the phrase "and after passing industry ballot." We do not believe that this addition is necessary. Interpretations are balloted in the same manner as Reliability Standards.**		
Exelon Corporation and its affiliates		Additional clarification language should be added to the Section 7.0 Interpretations: o The language should acknowledge that when a project to address an issue raised in an interpretation request changes from an Interpretation project (subject to Section 7.0 provisions) to a standard revision project, it adopts the process for modifying a Reliability Standard (subject to Section 4.0 provisions). o In addition, the development record should accurately reflect the Standards Committee decision to change an Interpretation to a Standard revision including clear discussion of any objections to the decision.Typo: "Staffs" should be singular.
Response: Thank you for your comments. We thank Exelon for its comments regarding Question #5. Exelon requested additional language that would "acknowledge that when a project to address an issue raised in an Interpretation request changes from an Interpretation project (subject to Section 7.0 provisions) to a standard revision project, it adopts the process for modifying a Reliability Standard (subject to Section 4.0 provisions). We will not add this language as we believe this is self-explanatory within the SPM. **Exelon also suggested that the development record accurately reflect the Standards Committee decision to change an Interpretation to a Standard revision, including clear discussion of any objections to the decision. We agree that this information should be reflected in the development record, but we maintain the position that the specific details of what should be included in the development record of a Reliability Standard should not be set forth in the SPM at such a granular level.**		

6. **In the first posted revisions to the SPM, the SCPS proposed the addition of section 16.0, which introduced a waiver provision to allow the SC some flexibility in administering the standards process to meet reliability needs. In other words, the waiver process allows the SC to modify the standards process in rare cases for good cause.**

   Many stakeholders were concerned about this addition, but the SCPS continues to believe that a waiver provision is essential for giving the SC, and thus the industry, the ability to act expeditiously when necessary for reliability (e.g., in responding to regulatory directives in a timely manner). The waiver provision would not give the SC unilateral power in modifying the process, but would require a presentation to the BOT explaining the need for the use of waiver. It could only be utilized if the BOT supported the explanation for the need of the waiver.

   With this additional clarification, can you support the addition of the waiver provision in section 16.0?

Summary Consideration:

Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.

The waiver provision would not violate ANSI. The currently-effective Standard Process Manual already provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety.

In the currently-effective Standard Process Manual, the section on Processes for Developing a Reliability Standard Related to a Confidential Issue states: "When faced with a national security emergency situation, NERC may use one of the following special processes to develop a Reliability Standard that addresses an issue that is confidential. Reliability Standards developed using one of the following processes shall be called, "special Reliability Standards" *and shall not be filed with ANSI for approval as ANSI standards*." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation.

The waiver provision is intended as a tool to allow the Standards Committee to manage the standards development process. The Standards Committee is tasked with protecting the "credibility and integrity of the standards development process." See Standards Committee Charter, available here: http://www.nerc.com/files/SC_Charter_clean_for_BOT_approval_20110417.pdf

In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee of the NERC Board of Trustees.

Organization	Yes or No	Question 6 Comment
NPCC	No	Comments: The SC already has, and has previously, exercised the 'authority' to 'deviate' from the process. However, the current requirement is that the SC must report these 'deviations' to the CCC and Board. With this blanket waiver, the industry would lose the information that may be critical to understanding when and where the process may be broken and, therefore needs to be deviated from.
Response: Thank you for your comments. Section 16.0 specifically provides that the use of the waiver provision will be reported to the Board of Trustees: "The Standards Committee shall report the exercise of this waiver provision to the Board of Trustees prior to adoption of the related Reliability Standard, Interpretation, definition or Variance." **In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee of the NERC Board of Trustees.** **Therefore, no information regarding the standard development process is lost.**		
MRO NSRF	No	We discourage the use of a waiver process. We do not believe that taking action on reliability directives and standards in a faster fashion will increase the reliability of the grid, but following the standards process that has received consensus from the industry will better lead to a more reliable grid.
Response: Thank you for your comments. The waiver provision is intended to be used under a very limited set of circumstances, for example, where it is necessary to address an urgent reliability issue. The currently-effective Standard Process Manual provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that		

Organization	Yes or No	Question 6 Comment
there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety. The need for the ability to address urgent reliability issues has been reflected in FERC's orders certifying NERC as the ERO. See for example P 253 of *North American Electric Reliability Corp*., 116 FERC ¶ 61,062 (2006) "in rare instances, the urgent action process may not be sufficiently expedited, such as if necessary to address an imminent threat to national security. We require NERC to address whether the urgent action process, or some other process, can accommodate any such rare circumstances. " **There is a direct relationship between reliability of the grid and the need for the ability to take action on Reliability Standards in a timely manner.**		
ISO/RTO Council's Standards Review Committee	No	We believe the SC already has, and has previously exercised, the 'authority' to 'deviate' from the process. However, the current requirement is that the SC must report these 'deviations' to the CCC and Board. With this blanket waiver, the industry would lose the information that may be critical to understanding when and where the process may be broken and, therefore, needs to be deviated from.
Response: Thank you for your comments. Section 16.0 specifically provides that the use of the waiver provision will be reported to the Board of Trustees: "The Standards Committee shall report the exercise of this waiver provision to the Board of Trustees prior to adoption of the related Reliability Standard, Interpretation, definition or Variance." **In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee of the NERC Board of Trustees.** **Therefore, no information regarding the standard development process is lost.**		
PPL Corporation NERC Registered Affiliates	No	The PPL Companies believe the Standards Committee already has, and has previously exercised, the authority to deviate from the process. However, the current requirement is that the SC must report these deviations to the CCC and Board. We

Organization	Yes or No	Question 6 Comment
		would support language in this section that more clearly stated the current process, while leaving in place the current requirements for reporting to the CCC and Board.
Response: Response: Thank you for your comments. Section 16.0 specifically provides that the use of the waiver provision will be reported to the Board of Trustees: "The Standards Committee shall report the exercise of this waiver provision to the Board of Trustees prior to adoption of the related Reliability Standard, Interpretation, definition or Variance." **In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. In addition, Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.**		
ACES Power Marketing Standards Collaborators	No	We cannot support the waiver section in its current form. It is simply too broad. First, the third bullet causes us particular concern. The Standards Committee (SC) and many drafting teams have misinterpreted industry support for modifications of a standard, definition, etc. many times in the past. Thus, based on history, we are not convinced that the SC could accurately determine that a modification has been fully vetted or that the change is so insubstantial on behalf of industry without a ballot. If the purpose of a waiver for an insubstantial change is to streamline errata changes, we suggest this bullet should be modified to state this directly. Second, contrary to the explanation associated with this question, the waiver section simply does not reflect that the Standards Committee (SC) will only utilize the waiver if the BOT supports the use of the waiver. It only requires the SC to report the use of the waiver to the BOT. Furthermore, waiting for approval from the NERC BOT would only slow down the process anyway which defeats the purpose of the waiver. Third, we do not

Organization	Yes or No	Question 6 Comment
		understand what is driving the need for the waiver section. We are not aware of any regulatory deadline for development of a standard that NERC has failed to meet under the existing process.

Response: Thank you for your comments.

With respect to your comment on the third bullet, the intent is to allow drafting teams the flexibility to make limited additional substantive changes for an abbreviated industry comment period, to for example, adopt language proposed by commenters. Such changes would not qualify as errata.

With respect to your suggestion that the BOT approve use of the waiver, in response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.

With respect to your broader concerns about the need for the waiver section, we suggest that in order for the ERO model to be successful, NERC must have the ability to meet regulatory deadlines. Pursuant to section 215(d)(5) of the FPA, the Commission may direct the ERO to submit to the Commission a new or modified Reliability Standard that addresses a specific matter if the Commission considers such a new or modified Standard appropriate to carry out section 215. As the ERO, NERC must be able to comply with a Commission directive pursuant to section 215(d)(5) of the FPA. The Commission has expressed concern that the standard development process can be misused to "delay or block NERC's ability to report to a Commission directive" See North American Electric Reliability Corp., 130 FERC ¶ 61,203 at P 23 (2010).

NERC has failed to meet several Commission-imposed regulatory deadlines and has repeatedly sought extensions from the Commission.

The Commission has continuously expressed concern regarding the amount of time it takes to develop a Reliability Standard.

- ***See North American Electric Reliability Corp.*, 118 FERC ¶ 61,030 at P 31 (2007)("Both in Order No. 672 and in the *Certification Order* we expressed concern with the length of time the ERO process takes to develop a Reliability Standard. The ERO has never, to our knowledge, developed a Reliability Standard under its normal process in four months or**

Organization	Yes or No	Question 6 Comment
		developed an urgent action Reliability Standard in 60 days."). • *North American Electric Reliability Corp. Reliability Standards Development et al.*, 132 FERC ¶ 61,217 (2010)("In its application for certification as the ERO, NERC indicated that under its usual ANSI-accredited process in effect at the time, a Reliability Standard may be developed in as little as four months, or up to 12 to 15 months for a more complex Standard. However, the NERC analysis submitted in this docket indicates that, in practice, it has taken considerably longer, an average processing time of 21.7 months, to develop Reliability Standards. The average processing time is even longer if 'urgent action' Standards are not considered. Given this analysis, the Commission continues to have some concerns regarding NERC's ability to timely develop Reliability Standards.")(internal citations omitted). NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner. Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. In addition, Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure. The Standards Committee is tasked with protecting the "credibility and integrity of the standards development process." *See* Standards Committee Charter, available here: http://www.nerc.com/files/SC_Charter_clean_for_BOT_approval_20110417.pdf.
SERC Planning Standards Subcommittee	No	We do not agree with the latitude granted by this provision. We feel that some industry input, even if abbreviated and burdensome, is preferred over the currently proposed approach.
Response: Thank you for your comments. The waiver provision is intended as a tool to allow the Standards Committee to manage the standards development process. The Standards Committee is tasked with protecting the "credibility and integrity of the standards development process." See Standards Committee Charter, available here:		

Organization	Yes or No	Question 6 Comment
http://www.nerc.com/files/SC_Charter_clean_for_BOT_approval_20110417.pdf. **The Standards Committee is comprised of industry members from each segment. By definition, there is industry input into the consideration by the Standards Committee of the use of the waiver provision under Section 16.0.** **In order to address your concern regarding notice to stakeholders, the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee has been incorporated. We have clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.**		
PacifiCorp	No	PacifiCorp purports that the exercise of a waiver provision will result in a violation of NERC's ANSI-approved standards development process. Additionally, reporting the exercise of a waiver to the Board of Trustees (BOT) prior to adopting a standard is unacceptable. The exercise of the waiver and BOT approval may be separated by years of work by both the Standards Committee (SC) and the Standards Drafting Team (SDT). Each exercise of an SC waiver should have BOT finality so that the BOT will not be pressured to approve any waiver, regardless of the facts, to preserve the substantial body of work that has followed the exercise of waiver by the SC. At a minimum, waivers to the SPM should be preceded by the following: a. The posting of an SC document to the Registered Ballot Body (RBB) that describes the reason for the requested waiver, including the threat to reliability, and what processes would be affected by the waiver. b. A short (10 day) period for accepting RBB comments. c. After comments are received, the SC may either withdraw the waiver or request its expedited approval by the BOT, ensuring that the board is supplied with the comments received. The entire process proposed above could be completed within 30-45 days, causing a minor delay for the (hopefully) rare exercise by the SC of waiving an SPM provision.
Response: The waiver provision would not violate ANSI. The currently-effective Standard Process Manual already provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that		

Organization	Yes or No	Question 6 Comment
		there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety. **In the currently-effective Standard Process Manual, the section on Processes for Developing a Reliability Standard Related to a Confidential Issue states: "When faced with a national security emergency situation, NERC may use one of the following special processes to develop a Reliability Standard that addresses an issue that is confidential. Reliability Standards developed using one of the following processes shall be called, "special Reliability Standards" and shall not be filed with ANSI for approval as ANSI standards." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation.** **In order to address your concern regarding the potential lag in reporting to the Board of Trustees, additional language has been added to require reporting of the use of the waiver provision to the Standards Oversight & Technology Committee.** **In order to address your concern regarding notice to stakeholders, the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee has been incorporated. We have clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.** **NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.** **Adding an additional 30-45 days to the standard development process in order to utilize a waiver as proposed would defeat the very purpose of the waiver provision- which is to add flexibility to the process.**
National Rural Electric Cooperative Association	No	NRECA presumes that the elimination of expedited standards development process is being done in conjunction with the addition of Section 16 that provides for waiver authority. While the expedited process has its complications, NRECA believes it would

Organization	Yes or No	Question 6 Comment
(NRECA)		troublesome to eliminate this section from an optics point of view. NRECA requests that the expedited process be revised to address the existing problems and eliminate, or significantly limit the provision of the proposed overly broad waiver section. Having a formal expedited process shows FERC and Congress we are prepared to move very quickly if needed and that we have a formal process to that clearly demonstrates how such work can be completed.NRECA continues to have significant concerns with the proposed overly broad waiver section. If the expedited process section is maintained (and improved upon to address current problems) then this overly broad waiver provision should not be needed. There has been no other demonstration of need for such a broad waiver provision. NRECA requests the waiver provision be deleted or revised to significantly limit the situations when it can be used.

Response: Thank you for your comments. NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.

The waiver provision is intended as a tool to allow the Standards Committee to manage the standards development process. The Standards Committee is tasked with protecting the "credibility and integrity of the standards development process." See Standards Committee Charter, available here: http://www.nerc.com/files/SC_Charter_clean_for_BOT_approval_20110417.pdf.

Section 16.0 is not a "full waiver provision" and is not overly broad. The waiver provision is intended to be used under a very limited set of circumstances, for example, where it is necessary to address an urgent reliability issue. As you note, the currently-effective Standard Process Manual provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety. The need for the ability to address urgent reliability issues has been reflected in FERC's orders certifying NERC as the ERO. See for example P 253 of *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062 (2006) "in rare instances, the urgent action process may not be sufficiently expedited, such as if necessary to

Organization	Yes or No	Question 6 Comment
address an imminent threat to national security. We require NERC to address whether the urgent action process, or some other process, can accommodate any such rare circumstances. " **NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.**		
Trans Bay Cable LLC	No	There was not enough information on how/when this could/would be used. I see this being used for standards such as CIP V5 that do not pass the voting process and are "pushed through" to meet FERC deadlines. More information on when this would be used and what controls would be in place are needed.
Response: Thank you for your comments. Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure. **In order to address your concern regarding what controls are in place, additional language has been added to require reporting of the use of the waiver provision to the Standards Oversight & Technology Committee.** **In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. Duke Energy	No	The circumstances listed in Section 16 for invoking the waiver provision do not constitute reliability needs. The provisions that can be waived should be more limited and the circumstances for which they can be waived should be based on clearly articulated reliability needs. The industry expertise of the Members Representative Committee (MRC) should be used to evaluate the provisions being waived and the circumstances they are being waived in.
Response: Thank you for your comments. NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.		

Organization	Yes or No	Question 6 Comment
Respectfully, we suggest that in order for the ERO model to be successful, NERC must have the ability to meet regulatory deadlines. Pursuant to section 215(d)(5) of the FPA, the Commission may direct the ERO to submit to the Commission a new or modified Reliability Standard that addresses a specific matter if the Commission considers such a new or modified Standard appropriate to carry out section 215. As the ERO, NERC must be able to comply with a Commission directive pursuant to section 215(d)(5) of the FPA. **The need for the ability to address urgent reliability issues has been reflected in FERC's orders certifying NERC as the ERO. See for example P 253 of *North American Electric Reliability Corp*., 116 FERC ¶ 61,062 (2006) "in rare instances, the urgent action process may not be sufficiently expedited, such as if necessary to address an imminent threat to national security. We require NERC to address whether the urgent action process, or some other process, can accommodate any such rare circumstances. "** **There is a direct relationship between reliability of the grid and the need for the ability to take action on Reliability Standards in a timely manner.** **In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.**		
American Electric Power	No	Though AEP would not object outright to such a waiver process, our concerns would be in regards to what level of perceived urgency might drive such a waiver, as well as how often such a waiver might be invoked. Such a waiver should only be used for the most extreme and rare circumstances, and the circumstances as currently listed are not restrictive enough. For example, "where necessary to meet regulatory deadlines" is entirely subjective and could conceivably be used for almost any circumstance. Rather than being so open-ended, AEP recommends adding language stating that invoking such a waiver could *only* be done in response to circumstances involving a known and immediate impact to the reliability of the BES. In addition, and perhaps more importantly, it would appear that any such waiver process would be in direct violation of ANSI standards. NERC seems to acknowledge this at least in part by

Organization	Yes or No	Question 6 Comment
		stating in the SPM that "Reliability Standards developed as a result of a waiver of any provision of the Standard Processes Manual shall not be filed with ANSI for approval as American National Standards." AEP is greatly concerned by any process which would circumvent ANSI for any reason, even for expediency's sake, and seeks clarification on what ANSI accreditation implications there might for NERC as a result of the proposed process.

Response: Thank you for your comments. The waiver provision would not violate ANSI. The currently-effective Standard Process Manual already provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety.

In the currently-effective Standard Process Manual, the section on Processes for Developing a Reliability Standard Related to a Confidential Issue states: "When faced with a national security emergency situation, NERC may use one of the following special processes to develop a Reliability Standard that addresses an issue that is confidential. Reliability Standards developed using one of the following processes shall be called, "special Reliability Standards" and shall not be filed with ANSI for approval as ANSI standards." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation.

NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.

Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.

Organization	Yes or No	Question 6 Comment
The United Illuminating Company	No	: UI does not believe the propose waiver process will function. Without ballot body support to waive the ANSI process any attempt to utilize the waiver process will result in a negative vote. The proposed process will not expedite a standard but delay it.The proposed process informs the BOT at the time a standard is submitted for BOT approval that it was developed via a Waiver process which can lead to the inefficiency of the BOT remanding the Standard to go through the ANSI process. This would be more inefficient then just going with the ANSI process. UI proposes the inclusion of a 15 day ballot where the SC provides notice a Standard will be drafted with a waiver on certain sections of the ANSI process. The Ballot body could then approve the waiver and development could proceed.

Response: Thank you for your comments. NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.

Adding an additional ballot period to the standard development process in order to utilize a waiver as proposed would defeat the very purpose of the waiver provision, which is to add flexibility to the process. In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.

Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a

standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure. **The waiver provision would not violate ANSI. The currently-effective Standard Process Manual already provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety.** **In the currently-effective Standard Process Manual, the section on Processes for Developing a Reliability Standard Related to a Confidential Issue states: "When faced with a national security emergency situation, NERC may use one of the following special processes to develop a Reliability Standard that addresses an issue that is confidential. Reliability Standards developed using one of the following processes shall be called, "special Reliability Standards" and shall not be filed with ANSI for approval as ANSI standards." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation.**		
Occidental Energy Ventures Corp	No	The issue is not whether the SC applies the wavier - its whether NERC and FERC can dispense with industry-acceptance when they believe the need is urgent. OEVC understands that they may have the legal authority to do so (as defined in the FPA), but does not agree that this allows the ENTIRE process to be ANSI accredited. The ANSI process is intended to demonstrate sincere cooperative efforts between organizations that have different goals - and result in a body of standards which is accepted by all stakeholders. Simply declaring that one group is ANSI certified while the other group is not, is not acceptable to OEVC. Therefore, OEVC cannot support this recommendation.
Response: Thank you for your comment. The waiver provision does not allow the Standards Committee to dispense with industry-acceptance and in fact expressly forbids this. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. Manitoba Hydro	No	Section 16.0 proposes to allow NERC's Standards Committee to "waive" any provisions in the manual for good cause shown under certain circumstances: (1. to meet NERC BOT deadlines; 2. to meet regulatory deadlines; 3. for "insubstantial" modifications to standards). Our first concern is that the concept of a "waiver" is inappropriate in this context. In legal terms, a party can only waive its own rights, not its obligations or the rights of others. The NERC membership, not the Standards Committee, has the right to insist that all standards be developed in accordance with the NERC Rules of Procedure (as part of the membership agreement), including the SPM which forms part of the ROP. Accordingly, only the NERC membership as a whole can waive this right. The Standards Committee cannot "waive" its obligation to follow the SPM.Furthermore, the Standards Development Process is a core principle of NERC that ensures that industry has sufficient input into the development of a standard. This core principle served as the primary foundation for various Canadian Governmental Authorities granting authority to NERC. Eliminating or shortening comment periods through a generic waiver provision can significantly erode industry involvement, especially considering the volume of standards development projects which compete for attention. This can cause Canadian Governmental Authorities to reconsider NERC's authority in the various provinces. In Manitoba, only NERC Rules of Procedure that are incorporated into regulation will be effective in Manitoba. It is to be noted that the provisions of Section 321 of the NERC ROP governing responding to regulatory directives also attempted to make deviations from the standards development process and was intensely debated by industry, including the Canadian Electricity Association. The proposed waiver criterion regarding "meeting NERC BOT deadlines" allows considerable discretion to the board which could trigger the waiver

Organization	Yes or No	Question 6 Comment
		provisions, and provides too much uncertainty.
Response: Thank you for your comments. **If the waiver provision is incorporated into the Standard Processes Manual then the exercise of the waiver provision would be consistent with the Standard Processes Manual, therefore, there would be no applicable waiver of any party's rights or obligations.** **NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. and Canadian regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.** **The waiver provision is intended as a tool to allow the Standards Committee to manage the standards development process. CenterPoint Energy Houston Electric L.L.C.	No	CenterPoint Energy does not believe such a waiver is necessary. The circumstances listed do not rise to this level of urgency. FERC and the NERC BOT are well aware of the minimum time needed to develop and ballot a new or revised Standard. The Company does not believe there are actual reliability issues that would be so critical as to require such an expedited process. If one did arise, there are other means available to address such a concern such as the NERC Alert process.

Organization	Yes or No	Question 6 Comment
Response: Thank you for your comments. Beginning in Order No. 672 (at P 269), the Commission has expressed concern regarding the amount of time it takes to develop an ANSI standard. "We are concerned about the time it may take to develop a Reliability Standard under the ANSI-certified process. The ERO applicant should address in its application the timetable for developing a proposed Reliability Standard under an ANSI-certified or other process, including the timetable for developing a proposed Reliability Standard that is urgently needed. Moreover, the ERO applicant should also propose a process for modifying or replacing a Reliability Standard (even if interim in nature) in the event that the Commission orders the ERO to modify a Reliability Standard." **The Commission has continuously directed NERC to modify its Standard Development Process to ensure that the ERO is able to respond to urgent reliability issues. See for example P 253 of *North American Electric Reliability Corp*., 116 FERC ¶ 61,062 (2006) "in rare instances, the urgent action process may not be sufficiently expedited, such as if necessary to address an imminent threat to national security. We require NERC to address whether the urgent action process, or some other process, can accommodate any such rare circumstances. "** **There is a direct relationship between reliability of the grid and the need for the ability to take action on Reliability Standards in a timely manner.**		
Ameren	No	The waiver provision is not necessary because the NERC Rules of Procedure already has a process for this scenario. (2) It seems to us that the revision now have the BOT and stakeholders' involvement at the end of the process rather than at the beginning. We believe that the approval for the use of the waiver process for a specific reason should get necessary approval (buy-in) from stakeholders and BOT before SC starts using the process to revise or develop a new standard. (3) Has the SDT confirmed that the waiver proposal would be within the ANSI process?
Response: Thank you for your comments. **The waiver provision would not violate ANSI. of the following processes shall be called, "special Reliability Standards" and shall not be filed with ANSI for approval as ANSI standards." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation. **Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. In addition, Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.**		
Oklahoma Gas & Electric	No	We do not support Section 16.0 which provides a waiver to allow for a revision of a Standard, definition, Variance, or implementation plan to meet an urgent reliability issue. The circumstances in which this waiver would be allowed are outlined as (1) meet regulatory deadlines, (2) meet deadlines imposed by the NERC BOT, or (3) SC determine the modification has already been vetted. These circumstances do not seem to meet the initial statement of "to meet an urgent reliability issue". We do not consider regulatory deadlines to be urgent reliability issues.
Response: Thank you for your comments. Respectfully, we suggest that in order for the ERO model to be successful, NERC must have the ability to meet regulatory deadlines. **Pursuant to section 215(d)(5) of the FPA, the Commission may direct the ERO to submit to the Commission a new or modified Reliability Standard that addresses a specific matter if the Commission considers such a new or modified Standard appropriate to carry out section 215. As the ERO, NERC must be able to comply with a Commission directive pursuant to section 215(d)(5) of the FPA. The Commission has expressed concern that the standard development process can be misused to "delay or block NERC's ability to report to a Commission directive" *See North American Electric Reliability Corp.*, 130 FERC ¶ 61,203 at P 23 (2010).** **Section 16.0 is intended to provide clarity to the Standards Committee's authority to waive provisions of the Standard Processes Manual and limits the circumstances under which the Standards Committee can take such actions. In addition, Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.**		

Organization	Yes or No	Question 6 Comment
Independent Electricity System Operator	No	We do support the addition of the Waiver section, recognizing that this particular section proposes a provision to cover only urgent reliability standard revisions, and not emergency situations requiring immediate action. We believe clear distinction and separation, possibly supported by separate processes, should be made between an urgent situation requiring an urgent standard development and an emergency situation requiring an immediate action. An emergency reliability standard revision procedural step would give the NERC Board the authority to act on its own motion to address an issue on an interim basis immediately, with a follow-on process to then review and address the issue on a more regular timetable.However, all standard /definition/variance/implementation plans approved under such a fast track process must be subjected to peer review and balloting for it to become an enduring part of the NERC standards/definitions/etc.

Response: Thank you for your comments. NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. and Canadian regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner.

The currently-effective Standard Process Manual provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety. The need for the ability to address urgent reliability issues has been reflected in FERC's orders certifying NERC as the ERO. See for example P 253 of *North American Electric Reliability Corp*., 116 FERC ¶ 61,062 (2006) "in rare instances, the urgent action process may not be sufficiently expedited, such as if necessary to address an imminent threat to national security. We require NERC to address whether the urgent action process, or some other process, can accommodate any such rare circumstances. "

There is a direct relationship between reliability of the grid and the need for the ability to take action on Reliability Standards in a timely manner.

Organization	Yes or No	Question 6 Comment
South Carolina Electric and Gas	No	The current expedited standards development process should be retained. The use of waivers is not consistent with the ANSI process and should be rejected. The use of a waiver will result is a violation of the NERC's American National Standards Institute (ANSI)-approved standards development process. Reporting the use of a waiver prior to the Board of Trustees (BOT) adopting a standard is unacceptable. The exercise of the waiver and BOT approval may be separated by years of work by the both the Standards Committee (SC) and the standards drafting team (SDT). Each exercise of an SC waiver should have BOT finality so that the BOT will not be pressured to approve any waiver, regardless of the facts, in order to not reject the substantial body of work that has followed the exercise of the waiver by the SC. At a minimum, waivers to the SPM should be preceded by the following: a. The posting of an SC document to the RBB that describes the reason for the requested waiver, including the threat to reliability, and what processes would be affected by the waiver. b. A short (10 day) period for accepting RBB comments. c. After comments are received, the SC may either withdraw the waiver or request its expedited approval by the NERC board, ensuring that the board is supplied with the comments received. This entire process proposed above could be completed within 30-45 days, causing a minor delay for the hopefully rare exercise by the SC of waiving an SPM provision.The present SPM has an "expedited standards development process" that was stricken. However, the ROP section 300 (Reliability Standards Development) requires that process. The SPM should retain that; without it in the SPM, NERC cannot respond to a request from a governmental authority for expedited development of a standard. The SPM therefore needs to retain that procedure, unless the SPM procedure is waived, which is the next topic. If this provision were reinstated, the use of a waiver process would be minimized since the expedited process would be a provision of the SPM.
Response: Thank you for your comments. The waiver provision would not violate ANSI. As you note, the currently-effective Standard Process Manual already provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety. The need for the ability to address urgent reliability issues has		

Organization	Yes or No	Question 6 Comment
		been reflected in FERC's orders certifying NERC as the ERO. See for example P 253 of *North American Electric Reliability Corp.*, 116 FERC ¶ 61,062 (2006) "in rare instances, the urgent action process may not be sufficiently expedited, such as if necessary to address an imminent threat to national security. We require NERC to address whether the urgent action process, or some other process, can accommodate any such rare circumstances. " In the currently-effective Standard Process Manual, the section on Processes for Developing a Reliability Standard Related to a Confidential Issue states: "When faced with a national security emergency situation, NERC may use one of the following special processes to develop a Reliability Standard that addresses an issue that is confidential. Reliability Standards developed using one of the following processes shall be called, "special Reliability Standards" and shall not be filed with ANSI for approval as ANSI standards." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation. A Standard developed using the Expedited Reliability Standard Development Process is approved only on a conditional basis and it must *again* go through the standard development process in order to be made permanent. The Expedited Reliability Standard Development Process provides: If a new or modified Reliability Standard is developed, approved by its ballot pool, and subsequently adopted by the NERC Board of Trustees through this expedited process, one of the following three actions shall occur [fn27]: • If the Reliability Standard is to be made permanent without additional substantive changes, then a SAR and a proposed Reliability Standard shall be submitted to the Reliability Standards staff immediately after the ballot. The project shall be added to the list of approved projects and shall proceed through the regular standard development process, including balloting by stakeholders, without any intentional delay. • If the Reliability Standard is to be substantively revised or replaced by a new Reliability Standard, then a project for the new or revised Reliability Standard shall be added to the list of projects to be added to the Reliability Standard Development Plan. The project shall be initiated as soon as practical after the ballot and the project shall proceed through the regular Reliability Standard development process, including balloting by stakeholders, as soon as practical but within two years of the date the Reliability Standard was approved by stakeholders using the expedited process. • The Reliability Standard shall be withdrawn through a ballot of the stakeholders within two years of the date the Reliability Standard was approved by stakeholders using the expedited process. Rather than repeating the standard development process, Section 16.0 would allow a Reliability Standard to become "permanent"

Trans Bay Cable LLC	No	There is not enough checks and balances in the current proposed changes to ensure that the SC will not abuse this ability.
Response: Thank you for your comments. The Standards Committee is tasked with protecting the "credibility and integrity of the standards development process." *See* Standards Committee Charter, available here: http://www.nerc.com/files/SC_Charter_clean_for_BOT_approval_20110417.pdf. **As an additional check on the authority of the Standards Committee, a provision has been added to report the use of the waiver provision to the Standards Oversight and Technology Committee.**		
HHWP	No	I agree with the comments and the alternative waiver proposal made by PSEG.
Response: Thank you for your comments. Please see response to comments of PSEG.		
Tacoma Power	No	Tacoma Power cannot support the addition of the waiver provision in Section 16.0 with the additional clarification. Tacoma Power believes the waiver provisions of

Organization	Yes or No	Question 6 Comment
		Section 16.0 are overly broad and opaque. Section 16.0 provides the Standards Committee an option to bypass the standard development process. Tacoma Power is concerned that the waiver provision would be too easy to resort to under pressure from various deadlines. Such a waiver option should be, at minimum, mitigated with counteracting safeguards and procedural steps and only available in situations recognized as necessary to prevent an imminent threat to reliability to guard against potential misuse. The comment form's explanation implies that the BOT review will provide an overview and gate-keeping safeguard to waivers. However, Section 16.0 only states that the SC will report the exercise of the waiver provision to the BOT prior to adoption. What the BOT's review process will be, the considerations it will use, and what detail is required in the report to the BOT is not specified. At minimum, Tacoma Power believes there should be a more formal process established for waiver approval (such as by the BOT). A public posting for a short period could be required to receive comments before waiver. The posting could describe the reason and identify the specific processes that will be changed by the waiver. Therefore, Tacoma Power believes Section 16.0 should be removed until an open and sufficient waiver process can be developed.
Response: Thank you for your comments. In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.		
Oncor Electric Delivery	No	Oncor is not in agreement with proposed Waiver as prescribed in Section 16. The current Rule of Procedure (Section 309.3) requires an "expedited standards development process" for the Standard Process Manual. The proposed changes to the SPM strike this provision (Section 9, 10 - Redline Version). Without this provision, NERC cannot respond to a request from a governmental authority for expedited

Organization	Yes or No	Question 6 Comment
		development of a standard. Furthermore, the proposed Waiver has no appeals process, thus granting the Standards Committee the power to authorize change to NERC Reliability Standards – unchecked. Oncor takes the position that the existing "expedited standards development process" for the Standard Process Manual is adequate and sufficient and that the proposed Waiver as prescribed in section 16.0 be removed

Response: Thank you for your comments. As you note, Section 16.0 is very similar to the currently –effective Standard Processes Manual section of the Expedited Reliability Standard Development Process. However, a Standard developed using the Expedited Reliability Standard Development Process is approved only on a conditional basis and it must *again* go through the standard development process in order to be made permanent. The Expedited Reliability Standard Development Process provides:

If a new or modified Reliability Standard is developed, approved by its ballot pool, and subsequently adopted by the NERC Board of Trustees through this expedited process, one of the following three actions shall occur [fn27]:

• If the Reliability Standard is to be made permanent without additional substantive changes, then a SAR and a proposed Reliability Standard shall be submitted to the Reliability Standards staff immediately after the ballot. The project shall be added to the list of approved projects and shall proceed through the regular standard development process, including balloting by stakeholders, without any intentional delay.

• If the Reliability Standard is to be substantively revised or replaced by a new Reliability Standard, then a project for the new or revised Reliability Standard shall be added to the list of projects to be added to the Reliability Standard Development Plan. The project shall be initiated as soon as practical after the ballot and the project shall proceed through the regular Reliability Standard development process, including balloting by stakeholders, as soon as practical but within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.

• The Reliability Standard shall be withdrawn through a ballot of the stakeholders within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.

This is clearly redundant and a waste of resources for NERC, the industry and the drafting team. Rather than repeating the standard development process, Section 16.0 would allow a Reliability Standard to become "permanent" upon stakeholder approval.

In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the

Organization	Yes or No	Question 6 Comment
concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.		
CPS Energy	No	
Kansas City Power & Light	No	
FirstEnergy	Yes	FE supports the addition of Section 16.0, however, the phrase in the third bullet that begins with "or is so insubstantial" is confusing. Is this referring to an errata change only? Or is it referring to a 'rapid fix'? this should be more clearly defined.
Response: Thank you for your comments. The third bullet is intended to refer to circumstances where the process should be waived to provide flexibility. For example, a commenter may propose alternative language in a requirement that is superior to the drafting team's proposal. An abbreviated comment period may be sufficient to reach consensus on this substantive change.		
JEA	Yes	JEA is supporting the waiver provision with the understanding that the balloting, quorum and approval requirements in the manual cannot be waived. Further, JEA suggests the language related to the waiver be changed to more clearly reflect this. For example, the second paragraph of 16.0 could be changed to say "...may waive any of the provisions in this manual except the balloting and the quorum provisions..."
Response: Thank you for your comments and for your support. You are correct that approval still requires a 75% quorum, a two-thirds segment weighted supermajority approval, and responses to all comments raised, plus a final/recirculation ballot. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.		
Bonneville Power	Yes	BPA appreciates the opportunity to comment on the Standards Process Manual. BPA

Organization	Yes or No	Question 6 Comment
Administration		would like to acknowledge the Standards Committee willingness to work with the industry on revising the Standards Process Manual (SPM) and appreciates that most of BPA's previous comments have been addressed in the latest draft. While BPA is voting yes on the current SPM version, BPA strongly encourages the SC to consider modification of the current section 16 to address industry concerns. By modifying section 16 to address industry concerns BPA believes the gesture will increase industry confidence in the SC and will ease the transition of the implementation of the new SPM.Section 16 "Waiver" of the Standards Process Manual:BPA has concerns about Section 16, BPA understands the need to have the flexibility of a waiver. BPA is unaware of any specific examples for the need of such a broad waiver. BPA would like to recommend one of two options:1. Revise the Waiver section to increase industry awareness and knowledge of the proposed waiver to include:a. A short posting (10 days) of the need for the waiverb. a short (10 days) opportunity for the industry to comment. If the majority of industry stakeholders express a concern, then the final decision should be evaluated to the BOTc. a single concise response from the SC on the decision to continue with the proposed waiver or to withdraw2. Revising the current expedited process section to address current issues the SPIG, the NERC SC and NERC staff.

Response: Thank you for your comments and for your support. Modifications have been made to Section 16 to address industry concerns. Specifically, in response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.

Revising the expedited process section of the Standard Processes Manual is ineffective because the Expedited Process requires that as soon as the standard is adopted by the Board NERC must either announce that the standard will expire after two years or repeat the entire standards process again to develop and approve the same standard or a modified standard. This is clearly redundant and a waste of resources for NERC, the industry and the drafting team.

Organization	Yes or No	Question 6 Comment
Southern Company	Yes	Southern Company raises the following concerns with deletion of the Expedited Standards Development Process and inclusion of a Waiver Provision:The proposed SPM revisions do not recognize a threshold distinction between 'elimination of a provision' and 'modification of a provision.' The currently effective SPM includes a provision for an expedited process which essentially gives the Standards Committee the authority to adjust (modify) the timeframes of certain steps within the regular standards development process. The proposed revisions (Section 16) allow the Standards Committee to waive (eliminate) any provision within the SPM for good cause shown and within certain limited circumstances. The waiver provision could be broadly interpreted to mean that the Standards Committee could not only shorten a timeframe within a step, but it could completely ignore any step or other action as a means to achieve certain objectives. As a threshold matter, the Standards Committee should restore the explicit provisions under the current expedited process. Where the Standards Committee seeks broader authority to address any other provision within the SPM, it should specify which provisions it would reasonably anticipate as requiring some type of modification and then codify how it would exercise its authority in that regard. The draft SPM expands the Standards Committee's authority. Rules of Procedure Section 321, Special Rule to Address Certain Regulatory Directives, establish which actions the BOT may take to develop standards where the rule applies. The rule does not give explicit authority to the Standards Committee to waive or eliminate steps as explained in the draft waiver provision. For the most part, the rule establishes the BOT authority for certain circumstances and describes how the BOT can be assisted by the Standards Committee, NERC Staff, stakeholders and the public at large.The draft SPM waiver section describes how the Standards Committee shall report its use of the waiver provision to the BOT prior to adoption of a Reliability Standard, Interpretation, definition or Variance. This is a key aspect which demonstrates that procedures and controls are in place to ensure some level of transparency. However, it is not clear that the Standards Committee does not need or require explicit instruction from the BOT before proceeding with a waiver. The basis

Organization	Yes or No	Question 6 Comment
		for this requirement may be rooted in whether or not the Standards Committee is deriving its waiver authority from rule 321. If the authority is rooted in rule 321, then according to the rule, at each instance where a ballot fails to address a regulatory directive and the BOT decides to exercise its authority, prior to remanding a proposed Reliability Standard to the Standards Committee with instructions, the BOT must either (1) be presented with a proposed Reliability Standard that fails to address a directive or (2) the BOT itself must make a written finding that a ballot pool has failed to address a directive. This suggests that at some point prior to the Standards Committee taking some action (i.e. an action described within the waiver provision) based on the BOT's instructions, there must be some correspondence memorializing why the Standards Committee will take the action in the first instance. If the above argument holds, wouldn't the Standards Committee be obliged to wait for explicit instructions from the BOT prior to invoking waiver provisions in those instances where rule 321 is being invoked? If the answer is yes then the waiver provision should clarify this obligation as a procedural matter.

Response: Thank you for your comments. In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.

The authority for the waiver provision is not rooted in Rule 321 of the NERC Rules of Procedure. Section 16.0 states that the waiver provision cannot be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. NERC is firmly committed to the consensus-based stakeholder standards development process that is set out in NERC's Rules of Procedure.

Revising the expedited process section of the Standard Processes Manual is ineffective because the Expedited Process requires that as soon as the standard is adopted by the Board NERC must either announce that the standard will expire after two years or repeat the entire standards process again to develop and approve the same standard or a modified standard. This is clearly

Organization	Yes or No	Question 6 Comment
redundant and a waste of resources for NERC, the industry and the drafting team. The waiver provision is intended as a tool to allow the Standards Committee to manage the standards development process. The Standards Committee is tasked with protecting the "credibility and integrity of the standards development process." *See* Standards Committee Charter, available here: http://www.nerc.com/files/SC_Charter_clean_for_BOT_approval_20110417.pdf. The record of the decision on the waiver request will be documented by NERC staff and maintained on the relevant project page on the NERC website.		
Liberty Electric Power LLC	Yes	There are concerns with the inclusion of the "to meet a timeline set by the NERC BOT" as a waiver condition. The potential remains for the BOT to set deadlines without a compelling need (see COM-003).
Response: Thank you for your comments and for your support. The ERO must be able to meet the deadlines set by its Board of Trustees in order to be successful. NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner. The ability of the ERO to meet deadlines established by the NERC Board of Trustees is essential and the waiver provision will allow the Standards Committee to meet its obligations to the NERC Board.		
American Public Power Association	Yes	APPA submits the following comments in support of the proposed waiver provision and responding to comments by PSEG that object to proposed Section 16.0 Waiver and support retention of the existing Expedited Standard Development Process. For ease of reference, here are links to the two provisions that PSEG and I are referring to:Proposed Standard Processes Manual, Section 16.0 "Waiver," at page 49: http://www.nerc.com/docs/standards/sar/Appendix_3A_StandardsProcessesManual_clean_2012_08_27.pdf Expedited Standard Development Process of the current Standard Processes Manual, at page 34:

Organization	Yes or No	Question 6 Comment
		http://www.nerc.com/fileUploads/File/Appendix_3A_StandardsProcessesManual_20120131.pdfMy specific reasons for supporting for the Waiver Provision and my responses to PSEG's concerns are set out below:First, the current "Expedited Standard Development Process" really isn't a separate standards process at all. It's just a waiver provision by another name with a prescriptive list of actions that can be taken. However, the Expedited Process has a poison pill: as soon as the standard is adopted by the Board through the "expedited" process, NERC must either announce that the standard will expire after two years or repeat the entire standards process again to develop and approve the same standard or a modified standard. This is clearly redundant and a waste of resources for NERC, the industry and the drafting team. I know of no standards project since the Urgent Action 1200 cyber project where a sunset provision was deemed appropriate.Second, the first two bases for the Standards Committee to approve a Waiver (where necessary to meet a regulatory deadline or a deadline imposed by the Board of Trustees) are fundamentally the same as under the current Expedited Process (specific time constraints such as a regulatory directive or to meet an urgent reliability issue). However, the current SPM is ambiguous on who decides whether the reliability issue is in fact urgent and how urgent it is. Is it NERC staff? The Standards Committee? The drafting team? This type of prioritization decision should in fact be authorized by the Board. But it is the Standards Committee's responsibility to work with staff and the SDT to figure out how to meet such deadlines.Third, the other basis under which the SC is authorized to grant a waiver for any part of the SPM, in the absence of a regulatory or Board deadline, is limited only to where the proposed modification of the standard "has already been vetted by the industry through the standards development process or is so insubstantial that developing the modification through the processes contained in this manual will add significant time delay." To approve a waiver, the Standards Committee will be required to make a judgment about whether a specific issue has been fully vetted or is so insubstantial that it is a waste of industry and NERC time and resources to follow all of the normal steps in the standards process. The need for this part of the waiver provision should be self-evident in the fact that the current SPM led

Organization	Yes or No	Question 6 Comment
		to a substantial debate as to whether the SC was required to terminate work on the PRC-005-2 project and start over with a new SAR and drafting team after the ballot failed on a recirculation ballot in summer 2011. The SPM shouldn't drive NERC and the industry to do dumb things. Rather, we need to use the process to get to consensus in support of technically excellent standards. The SPM is a means to an end, not the end in and of itself.Fourth, any action by the SC to waive an element of the SPM will be done in public and will be fully noticed to the industry as a whole. The action will be taken by approval of a motion by the Standards Committee, not by NERC staff. The basis for the waiver will appear in the agenda package and minutes of the SC. Notice of the waiver will be included on the standard Project Page, the announcement of comment and ballot periods, as well as the development history of the project. There is no need to have a specific SPM text provision to require notice to take place. The NERC ROP already has an appeal procedure, so no entity need wait to appeal an SC waiver decision until it is presented to the Board at some later date. And if good cause for the waiver is not shown, the SC will be reversed by the Board. Fifth, PSEG recommends that the SPM be modified to require a public comment period on the SC's waiver decision and that the NERC Board approve the waiver before it goes into effect. This process not only adds a minimum of 45 days to the process and would likely entail scheduling of a special Board meeting to consider each waiver approved by the SC, more importantly it confuses roles and responsibilities. The registered ballot body elects the SC to represent the best interests of the industry and reliability. The SC also reports to and is responsible to the Board to accomplish duties set forth in its charter, which include working with NERC staff to manage the standards process. It makes no sense to require the Board to ratify process management decisions that have been delegated to the SC unless one or more entities disagree with the decision - and we have an appeals process for that purpose, to ensure timely due process. Sixth, even if the waiver provisions are utilized, I think the development history of the resulting standard is likely to comply with ANSI's fundamental tenets - but the SC can't guarantee that in advance, because it entails a waiver of the approved SPM. To date, NERC has not submitted any standards to ANSI for approval. Rather, NERC's practice

Organization	Yes or No	Question 6 Comment
		has been to submit the SPM to ANSI to gain approval as an accredited standards development organization (SDO). ANSI does not require an SDO to use the accredited process for all of its standards work, but if and when we depart from the ANSI approved process we shouldn't submit such standards to ANSI for approval.Seventh, industry consensus is still fully required. The new waiver provision does not change the voting rules, so approval still requires a 75% quorum, a two-thirds segment weighted supermajority approval, and responses to all comments raised, plus a final/recirculation ballot. Just like today. The waiver provision merely allows the SC to meet external deadlines and to avoid wasting industry and NERC resources, which is front and center what the Board directed us to do when it adopted the SPIG's recommendation that we take steps to improve the efficiency of the standards process. If the industry does not agree that the waiver is appropriate, the ballot pool will vote it down.Finally, the waiver provision is designed to enhance the ability of the SC to accomplish the SPIG's recommendation #5, to ensure timely development of reliability standards and make efficient use of industry and NERC resources, while adhering with ANSI principles:Recommendation 5: Standards Development Process and Resources The Board is encouraged to require the standards development process be revised to improve timely, stakeholder consensus in support of new or revised reliability standards. The Board is also encouraged to require standard development resources to achieve and address: o Formal and consistent project management o Efficient formation and composition of SDTsThanks for your consideration of these comments.
Response: Thank you for your comments and for your support. Your comments illustrate the need for the waiver provision.		
NextEra Energy	Yes	NextEra generally supports the clarification, but suggests that an additional option for a waiver be added: "In response to a national emergency declared by the United States or Canadian government that involves the reliability of the BES or cyber attack on the BES." NextEra also recommends that the following be added as a lead in to ensure that stakeholders have adequate notice of a possible waiver: "With the exception of a waiver addressing a national emergency, all potential waivers must be

Organization	Yes or No	Question 6 Comment
		noticed to stakeholders 5 business days in advance of any consideration by the Standards Committee."
Response: Thank you for your comments and for your support. The concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee has been incorporated.

Response:		
Exelon Corporation and its affiliates		Exelon believes there remains ambiguity in the waiver process and there need to be additional details added, such as: o There should be a further explanation of why and under what circumstances a waiver would be used for a modification to a proposed standard or requirement, etc. as articulated in the third bullet under the provisions for a waiver. As there is a limitation that a waiver cannot be used to modify the voting requirements for a proposed standard, it is not clear under what circumstances an issue that has been "vetted by the industry through the standards development process" would be subject to a waiver. o Who can request a waiver or is the waiver limited to the Standards Committee members? o How will record of the decision to use the waiver process be documented and made known to stakeholders other than the BOT?
Response: Thank you for your comments. Section 16.0 does not specify the identity of parties that may request a waiver because consistent with the openness and transparency of the standard development process, a waiver may be requested by anyone. Additional language has been added to address this concern which clarifies this point. **The record of the decision on the waiver request will be documented by NERC staff and maintained on the relevant project page on the NERC website. In response to stakeholders concerns regarding transparency, openness and due process protections, we have incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee. Finally, we have added a footnote indicating that any entity may appeal a waiver decision or any other procedural decision by the Standards Committee pursuant to Section 8.0 of the NERC Standard Processes Manual.**		

7. If you have any other comments on these proposed revisions that you haven't already mentioned above, please provide them here.

Summary Consideration: Stakeholders made a variety of suggestions and the drafting team considered each of the suggestions. Please refer to the individual responses below. Two issues that were identified by multiple stakeholders were related to the handling of SARs and consideration of Canadian federal holidays.

With respect to criteria for accepting or rejecting SARs and for retirement of a standards development project:

The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM.

With respect to consideration of Canadian federal holidays:

Regarding Section 4.9, the reference to federally-recognized United States Holidays is intended to acknowledge that NERC's offices that accept and process ballot submissions, which are located in the United States, are not open on these dates. While the Standards Committee and NERC staff make every consideration possible to posting conflicts, the Standards Committee did not feel it was necessary to codify this in the SPM. Since there are several representatives on the Standards Committee from Canadian entities, they can help ensure the other members are aware of Canadian-specific conflicts of any nature. No change made.

Organization	Yes or No	Question 7 Comment
ACES Power Marketing Standards Collaborators		(1) In section 1.4 on page 3, we suggest documenting that not only does Section 304 of the NERC Rules of Procedure compel an open and transparent standards development process but the Energy Policy Act of 2005 compels the same. Specifically, the statute requires "reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards". (2) While section 3.4 clarifies that the Standards Committee (SC) has the authority to remand, reject, or accept the work of the drafting team, we suggest that

Organization	Yes or No	Question 7 Comment
		the SC develop guidelines or criteria for why they do so. This will avoid conflicts of interest in which SC members may not like the outcome of a perfectly valid standard.(3) We suggest the SC develop criteria and guidelines for why a standard will be developed. Just because a SAR is presented does not mean it is wise to develop a standard. The bar for submitting a SAR is not very high. There are many reliability issues that can be addressed outside the standards development process in a more expeditious fashion. For example, NERC alerts, lessons learned, partnering with the North American Transmission Forum and North American Generation Forum among other outreach initiatives can be used to address reliability issues rapidly. We have heard some say that a standard needs to be developed for key issues because "industry won't do it without a standard". If a standard always compelled the exact reliability behavior that FERC and NERC desire, there would be no standard violations. We obviously know that is not the case. Sometimes, industry (despite wanting to do the right thing) simply does not understand what is expected which further supports the need for other types of outreach besides developing a standard. The bottom line is that the criteria can't be that a standard is the only way we can compel the desired reliability outcome because numerous violations clearly indicate that standards often do not work. (4) Section 3.6 clarifies that the SC shall appoint industry experts to standards drafting team and NERC "shall appoint drafting teams that develop Interpretations." We suggest that the language regarding NERC appointing interpretation drafting teams to be made clear that NERC is appointing industry experts as well. (5) Several of the rationale boxes were truncated. We were not able to deduce the full rationale of the changes proposed by the SC as a result. (6) The language that a SAR can be rejected "for good cause" in Section 4.1 needs to be expanded. We suggest the SC develop criteria for what constitutes good cause. These criteria should be included in this standards process document or it should be referenced. (7) Sections 4.2 and 4.3 need to be further expanded to clarify that SC will only use another process besides public nomination for selecting a drafting team in extraordinary circumstances. The public nomination process should be used for nearly all standards development efforts. Furthermore, we suggest that the SC

Organization	Yes or No	Question 7 Comment
		should develop criteria or a process for identifying when the public nomination process may not be used. For example, the only times we can fathom that another process would be used would be for a confidential issue related to national security that would require necessary security clearances or to address an aggressive regulatory deadline that is likely related to an imminent threat to reliability and time does not allow for the use of public nomination. (8) Section 4.2 clarifies that the drafting team will determine if there is support for a SAR. Without a ballot, how can the drafting team possibly gauge support? There have been many draft standards that receive little support despite the belief by the standards drafting team that they have developed a standard that is supported by industry. They only discovered the lack of support during the ballot because comments can be submitted by more than just the registered ballot body and can simply be misinterpreted(9) Section 4.6 states that the detailed results of the quality review shall be provided to the Standards Committee. We do not believe that is actual practice. We believe the quality review is only provided to the standards drafting team. If this is correct, we suggest modifying the section accordingly. (10) Section 4.15 should clarify under what circumstances a SC will decide to continue working on a standard that has failed the Final Ballot. There should be a high bar such as satisfying a regulatory deadline for the SC to do this. If the Registered Ballot Body has determined a proposed standard is not satisfactory by voting the standard down, continuing to develop a standard does not reflect their authority in the process. This authority should only be overridden by a higher body such as FERC through a regulatory deadline. After all, this is supposed to be a final ballot. It is not truly a final ballot, if more actions will be directed by the SC.

Response: (1) Regarding Section 1.4, thank you for your suggestion. We agree that NERC Rule of Procedure Rule (ROP) 304 is consistent with the requirements of EPA 2005. Because there are many instances where the SPM, the NERC ROP and other NERC documents align with the statute, it would be cumbersome to reference the statute repeatedly. The suggested edit is unnecessary.

(2), (3), (6) and (10) The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or

Organization	Yes or No	Question 7 Comment
		other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee. (4) Section 7.0, Process for Developing an Interpretation provides: "If the Standards Committee accepts the Interpretation request, the NERC Standards Staff shall form a ballot pool and assemble an Interpretation drafting team with the relevant expertise to address the interpretation." Therefore, it is unnecessary to include additional language regarding interpretation drafting teams in Section 3.6. (5) The SCPS is unable to reproduce the described problem with the rationale boxes. We apologize for any inconvenience. You may contact your segment representative on the SC for more detailed information regarding the rationale of the proposed changes. (7) Thank you for the comment. However, the Standards Committee feels that flexibility is needed in this area, and spending time developing more process will not benefit the overall process improvements at this time. (8) Thank you for your comment. Voting on SARs was removed in a previous version of the SPM that was approved by the industry, as a means to expedite the process. The Standards Committee is currently exploring whether there should be an additional process(es), further guidelines for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee. (9) This language was a carryover from a former practice that included a review by the Standards Committee. We agree it is no longer in practice and modifications have been made.
ISO/RTO Council's Standards Review Committee		1. The footer in the main page is erroneous, given the recent relocation of the NERC offices to Atlanta.2. We believe there should be an obligation on NERC to file a Board-approved Standard with appropriate regulatory bodies within 30 to 60 days.3. We believe that there should be a limit on the number of Additional Ballots that are required/can be performed, so that the Industry has an opportunity to appropriately affect the outcome of a Standards project through a reballot.4. We believe the VRFs and VSLs should be eliminated from the Standards Development Process.5. We

Organization	Yes or No	Question 7 Comment
		believe that the revision should include the changes to incorporate the formation of the Reliability Issues Steering Committee (RISC).6. The annual solicitation of projects by NERC Staff is no longer needed and should be eliminated, we have a backlog of Standards Projects in the plan and there is no need to ask for more work in this area; if there is an identified reliability need, a SAR should be submitted.7. The proposed elimination of the ability to appeal from the SPM is not acceptable.8. We do not support addition of section 4.18 which appears to give the Board additional authority outside of Process; any withdrawals should go through the industry for balloting.However, if the decision is to move forward with the section there is a significant issue which can result from the process as written. The process does not consider the impact if another governmental entity, such as a Canadian entity, has approved the standards. This impact should be considered.9. We do not support the proposed addition of the paragraph (in Section 7.0) which reads "The NERC Reliability Standards and Legal Staff shall review the final Interpretation to determine whether it has met the requirements for a valid Interpretation. Based on this review, the NERC Reliability Standards and Legal Staff shall make a recommendation to the NERC Board of Trustees regarding adoption." We believe this is the responsibility of the SC.10. Section 7.0 - The statement "[i]f the Standards Committee accepts the Interpretation request, the NERC Standards staff shall form a ballot pool and assemble an Interpretation drafting team with the relevant expertise to address the interpretation." As written it could be assumed that the ballot pool is formed at the same time as the drafting team is assembled which is not the case according to Figure 2 Process for Developing an Interpretation. 11. Section 7.0 - It is unclear why the textual description of the processes for conducting the Quality Review and the Standards Committee approval were deleted from this section and replaced with "Interpretations will be balloted in the same manner as Reliability Standards." By deleting these steps, which occur prior to the balloting process, it could be implied that Quality Reviews will no longer be done and the Standards Committee will no longer approve Interpretations for posting.12. We do not support the proposed addition of the paragraph (in Section 10.0) which reads "NERC Board of Trustees may

Organization	Yes or No	Question 7 Comment
		direct the development of a new or revised Reliability Standard to address a national security situation that involves confidential issues...." We believe this resides within the authority of FERC.13. Sections 10.1 through 10.7 - Response to Imminent, Confidential Issue - This process has become a black box. There is not interface with the Standards Committee except at the Chair and Vice Chair level. It is unclear as to how people will be notified as to when they can register for the ballot pool, what are the processes to determine when the standards should be available for formal stakeholder comments, etc. It is unclear why there is no opportunity for an Additional Ballot if the drafting team makes considerable changes to the standards.14. Sections 10.8 through 10.4 - Response to Non-imminent, Confidential Issue - Figure 4: Developing a Standard Responsive to a Non-imminent, Confidential Issue indicates the Standards Committee approves to post for Comment and Ballot (the first step 3). However, there is no mention in the textual description of the process that the Standards Committee will approve for posting. It is unclear why the Comment Period and Ballot may be abbreviated if the issue being address is not imminent (the second step 3).15. Section 13.0 - We do not support the five-year review modification to ten-years. We believe that the five-year review, had it been enforced, we would be in a position that the Paragraph 81 initiative would not be a necessity.However, if the decision is to move forward with limiting the 5 year review to ANSI approved Standards, the Standards Process Manual should be updated to include a process that specifies how/when a BOT approved standard will be submitted to ANSI for approval. As noted in the rationale there are no standards submitted to ANSI. Without having a process in place identify standards for submittal to ANSI, by default all standards will move to a ten year review.16. There appears to be contradictory language regarding establishing a quorum. These are both confusing and we suggest clarifying this language and making it consistent.17. Section 1.4 - Under Balance bullet it indicates "[t]he Registered Ballot Body serves as the consensus body voting to approve each new or proposed Reliability Standard, definition, Variance, and Interpretation." Suggest this be changed to "approve or reject". Also suggest adding a statement that they approve or reject retirement of a

Organization	Yes or No	Question 7 Comment
		Reliability Standard, definition, Variance, and Interpretation.18. Section 1.4 - Under the new Metrics bullet it indicates that the standards apply in portions of Mexico. Section 1.3 indicates that the standards are applicable in the United States and through applicable authorities in Canada. There is no other mention of Mexico in the SPM other than the new section. If the standards are applicable in Mexico, we suggest additional conforming changes be made to the SPM where appropriate such as Section 3.7 Governmental Authorities, and Section 10 Process for Developing a Reliability Standard Related to a Confidential Issue.19. Section 2.5 - The following statement was added. "The Components of a Reliability Standard may include the following." This statement would imply that none of the elements such as Title, Number, Purpose, Applicability, Effective Date, or even Requirement are required in a Reliability Standard. Though there are some items that may be included in a Reliability Standard such as Application Guidelines and Procedures there are some items that should always be required. The SPM should delineate between what is always required and what is optional rather than indicating everything is optional.20. Footnote 5 - More information on where the Sanctions Guidelines of the North American Electric Reliability Corporation document is posted (such as the web page) would be helpful other than to indicate it is posted somewhere on the NERC Web Site. Also, we do not think it is appropriate to have footnotes embedded in footnotes. Footnote 6 is included in footnote 5.21. Section 3.1 - We suggest that under the Board of Trustees the scope be expanded to include approval of retirements as well as withdrawals of Reliability Standards, definitions, Variances, or Interpretations to be consistent with other sections of the document.22. Section 3.4 - New language was added to allow the Standards Committee to disband a drafting team. However, the SPM does not provide the next steps. It would be beneficial to outline the options available to the Standards Committee once they disband a drafting team, such as terminate the project, create a new team, place the project on hold, etc.23. Section 3.6 (Drafting Team) indicates the drafting team may consist of technical, legal and compliance experts, while section 4.3 (Form Drafting Team) makes references to regulatory rather than legal. It would be appropriate to use

Organization	Yes or No	Question 7 Comment
		consistent terminology. Also in section 4.3 there is no reference to including compliance experts. This seems inconsistent.24. Section 4.1 through 4.3 - Appointing drafting team during the SAR process - It is unclear in reading these sections as to what conditions determine if a drafting team is/is not created to assist in developing the SAR. Additional clarification would be helpful. 25. Section 4.5 - The revisions remove the minimum duration of 30 days for informal comments. We recognized that there are situations such as webinar's, meetings, etc. where comments could be gathered in less than 30 days. However, we would recommend if the standard is posted for informal comments that a minimum guideline be included in the SPM for soliciting the informal comments. We believe in these situations, 30 days is a reasonable timeframe for soliciting informal written comments.26. Section 4.6 - Indicates the quality review will be done in accordance with the Standards Committee's approved procedures for conducting Quality Reviews. We could not find where these procedures posted? On the Reliability Standards Resources web page we found the Draft Template for Quality Review of a NERC Reliability Standard but no procedures. We would also recommend that there be a set time limit from when the NERC Reliability Standards Staff receives a request to conduct a Quality Review to when the Quality Review is completed.27. Sections 4.9 through 4.15 -- By removing the Initial Ballot reference in the SPM and then adding capitalized terms for Additional Ballot and Final Ballot has added confusion to the SPM. We would suggest: a) adding the Initial Ballot process back into the type of Ballots so there are no gaps in types of ballots; b) additional clarity be added to specify whether there can be one and only one Final Ballot: and c) additional clarity be provided by what is meant by not having to respond to comments in a previous ballot.28. Section 5.1 - states the "[i]f the SAR identifies a term that is used in a Reliability Standard already under revision by a drafting team, the Standards Committee may direct the drafting team to add the term to scope of the existing project." In this situation it is unclear as to what happens with the SAR. Additional clarity on what happens to a SAR that is incorporated into an existing project would be beneficial.29. Section 6.1 - What is meant by "the Standards Committee may direct the team to withdraw the SAR until

Organization	Yes or No	Question 7 Comment
		the data has been collected and analyzed"? By withdrawing the SAR: a) is it rejected and a new SAR will need to be submitted; b) does it place the SAR in a hold status until the field test has been completed or; c) are their multiple options for what may happen when the SAR is withdrawn. Additional clarity on the available options to the Standards Committee would be helpful.30. Section 9.1 Interconnection-Wide Variances makes an invalid assumption in that an interconnection-wide variance would be applicable to one Regional Entity and that the standards should be developed through that Regional Entity's NERC-approved Regional Reliability Standards development procedure. If there is a variance that is applicable to the Eastern Interconnection which Regional Reliability Standards development procedure should be used?31. Advisor or Coordinator - in some instances the term advisor is used in one instance the term coordinator is used. Are these the same? If so, we suggest consistently using the same term.32. References to NERC staff should be consistent. Sometimes the term NERC Reliability Standards Staff is used an in some instances NERC Standards Staff is used. For example, see Section 7.0 third paragraph.33. We recommend a thorough review of Reliability Standards Resources web page document references be conducted. We have found: o There are numerous references to documents found on the Reliability Standards Resources web page where the documents referenced in the SPM do not match the document names on the web page or the name in the document. For example, "market interface principles" is used in the SPM (section 2.3 and footnote 2). The document posted is Market Principles. o The SPM should also consistently use the same name when referencing a document. For example, the SPM sometimes uses "Ten Benchmarks of an Excellent Reliability Standards." Other sections reference "NERC's Benchmarks for Excellent Standards." o If a document is identified as being on the Reliability Standards Resources web page verify it is currently on the web page. For example footnote 23 indicates the NERC NAESB Template for Joint Standards Development and Coordination is posted on the Reliability Standards Resources web page. The same is applicable for footnote 24 which references the Process for Approving Data Collection and Analysis and Field Test Associated with a Reliability

Organization	Yes or No	Question 7 Comment
		Standard. We could not find these documents posted on the web page.

Response:

1. **The suggested edit is accepted. The footnote on the cover page will be changed to reflect the current NERC address in Atlanta.**
2. **In the recent 2 years, NERC staff has greatly improved the processes and timing for getting items filed timely with FERC. The items that are held longer than typical are done so deliberately and thoughtfully. The Standards Committee believes that flexibility is needed in this area, and will continue to monitor NERC's performance.**
3. **Regarding the comment to limit the number of ballots, an intentional decision was made not to put an arbitrary limitation in place. While it might be clear in some cases after one or two ballots whether a standard is going to be successful, in other cases it may take much longer for consensus to arise. We believe this issue is better handled by the authority the SC has to terminate a project if it does not believe consensus can be achieved. An arbitrary limit could require a project to be restarted just as consensus is about to be reached.**
4. **The NERC SCPS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination requires the development of a replacement to the existing Penalty Matrix, which supports and incorporates the risk based concepts into the enforcement process. In support of these efforts, the SCPS is continuing to work toward the elimination of the VRFs and the VSLs through further development of the 'Sanctions Table' concepts originally proposed during the initial formal comment period and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts.**

   While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS has further developed guidance for the SDTs to assist with the development of the VRFs and VSLs.
5. **It is still unclear what role the RISC will play, in regards to the front end of Standards Development. Until that is understood, no changes will be made to the SPM.**
6. **We agree this area should be reconsidered. However, this matter is not ripe for inclusion in the current revision. Thank you for your support of the proposed changes to the SPM.**
7. **No change to the appeals process was made. References to the process in some sections were eliminated, but section 8 makes**

Organization	Yes or No	Question 7 Comment
		clear that "any procedural action or inaction related to the development, approval, revision, reaffirmation, retirement or withdrawal of a Reliability Standard" may be appealed. No substantive changes were made to this section. 8. We agree that a withdrawal should go through an industry ballot. Modifications to the SPM have been made. 9. The purpose of the final review of the Interpretation is to ensure that the final product comports with the requirements set forth in the Standard Processes Manual. This step fulfills the obligations of NERC Staff to their corporate board and provides accountability. 10. We believe the text and the figure are consistent, regarding NERC staff actions after the SC accepts an interpretation request. Additional clarification to demonstrate that these activities are not done at the same time would not contribute to the overall improvement of the SPM. No change was made. 11. Details regarding Quality Reviews and Standards Committee approval are in Section 4 (and its subsections). Instead of reiterating those steps in Section 7.0, the language was removed and a reference to the standards development process was added. These steps are still required, as you can see in the flow chart. No changes were made. 12. With respect to the ability of NERC to direct the development of a new or revised standard to address a national security situation that involves confidential issues is not new to this revision. No substantive changes to this provision are proposed in this revision. Also NERC's authority in this area is concurrent with that of FERC, not exclusive. No change made. 13. With respect to comment 13, no substantive changes to this provision are proposed in this revision. Although there is some reduction in transparency necessary to protect the confidential issues involved, the provisions balance the need for confidentiality with the needs of the Ballot Pool for relevant information. No change made. 14. With respect to comment 14, we have made changes to the process flow chart to correct the issues you identified. Thank you for identifying these issues. 15. With respect to comment 15, the move to a ten year review period was deemed appropriate to enable the limited industry resources available to be put to their most effective use. While we certainly understand the advantages of a more frequent review, including those you noted, we believe there is a consensus in the industry for the increased flexibility this change provides. No change made. 16. Although different phrasing is used in two different sections, we do not see an actual conflict. However, modifications have been made. Recommend the following modification in parts 1.4 and 4.10. (Rejecting the change to 4.10) "A quorum, which is established by at least 75% of the members of the ballot pool submitting an affirmative vote, a negative vote, or an

Organization	Yes or No	Question 7 Comment
abstention” 17. Thank you for your comment. We will take this clarification under consideration for the next revision. 18. The SPM was reviewed for all places where Canada was mentioned, to see if it was appropriate to also add Mexico. Since NERC does not have a MOU with Mexico or any part of Mexico, we felt it was not appropriate to treat it the same way in the SPM. (Note: WECC enforces some standards in Baja.) No changes were made. 19. FERC has held that only the Requirements and Applicability components of a standard are enforceable. While not required, the other components of a Reliability Standard listed in Section 2.5 are important for a complete understanding of the standard. To make clear that all of the listed components should be included in a draft standard without suggesting that they are all "required", Section 2.5 will be edited to remove the word "may". The phrase will read as follows: "The Components of a Reliability Standard include the following. . ." 20. Regarding the content of footnote 5, more information regarding exactly where the Sanctions Guidelines are located on the NERC web-page will not be included at this time because the NERC web-page is subject to change more frequently than the SPM. The issue with the placement of footnote 6 appears to be a typographical formatting error that resulted when tracked changes were accepted in the document. The formatting will be corrected to ensure that footnote 6 is independent of footnote 5. 21. Thank you for your comment. We will take this clarification under consideration for the next revision. 22. The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee. 23. Agreed. Modifications have been made. 24. The decision to provide the SC discretion in creating a drafting team to assist with SAR development was intentional. The proposed language gives the SC the flexibility needed to create such a team only in scenarios where it believes a team would be helpful and would justify the associated resources. No change made. 25. A crucial aspect of the SPM revisions is to provide flexibility to make the standards development process as efficient as		

Organization	Yes or No	Question 7 Comment
		possible. While we agree that 30 days is a reasonable time frame in many situations, the choice was made not to bind the industry to a specific period in this informal feedback gathering stage. No change made.
		26. The procedures for conducting a quality review are currently being revised by the SCPS. Your recommendation for a time limit between receiving a request and completing the review will be taken into consideration as those procedures are developed.
		27. With respect to comment 27, a) Initial Ballot was replaced by Ballot. Section 4.7 is where the first Ballot is conducted. The sections that follow are sequential in their references to an Additional Ballot or Final Ballot. No change made. b) As states in Section 4.15, there is no limit to the number of ballots that may be conducted. This includes Final Ballots. No change made. c) Section 4.31 is clear that a formal response to all comments is required prior to conducting a Final Ballot. We believe the language you are referring to clearly communicates that if an Additional Ballot will be conducted, no formal response to comments from previous ballots is required. No change made.
		28. The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.
		29. The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.
		30. Thank you for your comment. However, this suggestion is out of scope for this revision and would not contribute to an overall improvement of the SPM. We will retain this issue for a future revision.
		31. Regarding the issue of advisor versus coordinator, each word is only in the text one time, and in both cases it is used in a general use of the word (dictionary), rather than as a job title. We believe it is appropriate to leave the text as is.
		32. Thank you for your comment. The issue raised does not present a substantive problem that requires correction at this time.

Organization	Yes or No	Question 7 Comment
33. A reconciliation of the Resources webpage will be conducted. However, modifications may have to be made in a future revision to the SPM.		
American Public Power Association		A special note of thanks to the SCPS, SCCPS and NERC staff, and to all industry stakeholders that have contributed to revision of the NERC Standard Processes Manual. A phenomenal amount of very high quality development work and systematic outreach to industry was completed over a period of just five months, to move the broadly outlined recommendations of the SPIG from concept to industry ballot. You are to be commended for that effort.
Response: Thank you for your comment.		
Canadian Electricity Association		CEA wishes to raise one issue, which was briefly addressed by the SDT and the SCPS in the consideration of comments from the first comment period.The SPM revisions include new language in Section 4.9, which reads as follows: "If the last day of the ballot window falls on a Saturday, Sunday or federally-recognized United States holiday, the period does not end until the next business day." In response, a CEA member requested that equal consideration be given to statutory holidays in Canada.In its official consideration of comments, the SCPS said that adding more holidays to the calendar of days when a ballot or other action cannot close would be "counter to the SPIG recommendations which are calling for improvements to shorten the process."As the national representative of NERC members and registered entities in Canada, CEA calls on the SDT and SCPS to re-consider. CEA acknowledges that this issue may appear to be a minor one; however, we believe that it is a matter of principle for an international organization like NERC, which is accountable to members and governmental authorities in both the United States and Canada. NERC should seek to afford equal consideration to the interests, concerns and - in scenarios such as this - customs of its stakeholders on either side of the border. CEA finds the SCPS' argument to be unpersuasive and unreasonable. We request that the language

Organization	Yes or No	Question 7 Comment
		in Section 4.9 be modified, as follows: "If the last day of the ballot window falls on a Saturday, Sunday, federally-recognized United States holiday, or holiday in the majority of Canadian jurisdictions, the period does not end until the next business day."
Response: Regarding Section 4.9, the reference to federally-recognized United States Holidays is intended to acknowledge that NERC's offices that accept and process ballot submissions, which are located in the United States, are not open on these dates. While the Standards Committee and NERC staff makes every consideration possible to posting conflicts, the Standards Committee did not feel it was necessary to codify this in the SPM. Since there are several representatives on the Standards Committee from Canadian entities, they can help ensure the other members are aware of Canadian-specific conflicts of any nature. No change made.		
HHWP		-Comment A- Can the SPIG please check the Rational provided for Section 2.5. It does not appear relevant. Rationale: Section 2.5 has been updated to reflect the SPIG recommendation that redundant elements of a standard be eliminated, as well as a recomm
Response: The Rationale statements are a communication tool intended to provide commenters with background on the proposed changes and guide comments. The Rationale statements will be removed when the final changes are approved, and are not part of the SPM. Part of the rational statement that was originally posted related to the proposal to replace VRFs and VSLs, but the proposal did not have sufficient industry support in the first round of comments. The VSL/VRF language was added back into this version of Section 2.5, and the related language in the rationale statement was removed accordingly. What remains of the rationale statement in this posting explains the other, minor changes to Section 2.5 that were made prior to the last posting that more clearly articulate the components of a reliability standard and how they related to the Requirements of a Reliability Standard.		
NPCC		Comments: The following additional comments: o The footer in the main page is erroneous, given the recent relocation of the NERC offices to Atlanta. o There should be an obligation on NERC to file a Board-approved Standard with appropriate regulatory bodies within 30 to 60 days. o There should be a limit on the number of recirculation ballots that are required/can be performed, so that the Industry has an

Organization	Yes or No	Question 7 Comment
		opportunity to appropriately affect the outcome of a Standards project through a re-ballot. o The VRFs and VSLs should be eliminated from the Standards Development Process. o The revision should include the changes to incorporate the formation of the Reliability Issues Steering Committee (RISC). o The annual solicitation of projects by NERC Staff is no longer needed and should be eliminated. There is a backlog of Standards Projects in the plan and there is no need to ask for more work in this area. If there is an identified reliability need, a SAR should be submitted. o The proposed elimination of the ability to appeal from the SPM is not acceptable. o We do not support addition of section 4.18 which appears to give the Board additional authority outside of Process. Any withdrawals should go through the industry for balloting. o We do not support the proposed addition of the paragraph (in Section 7.0) which reads "The NERC Reliability Standards and Legal Staff shall review the final Interpretation to determine whether it has met the requirements for a valid Interpretation. Based on this review, the NERC Reliability Standards and Legal Staff shall make a recommendation to the NERC Board of Trustees regarding adoption." This is the responsibility of the SC. o We do not support the proposed addition of the paragraph (in Section 7.0) which reads "NERC Board of Trustees may direct the development of a new or revised Reliability Standard to address a national security situation that involves confidential issues...." This resides within the authority of FERC. o We do not support the five year review modification to ten years. The enforcement of the five year review would have made the Paragraph 81 initiative unnecessary. o Regarding the No voting without responses, NERC should change their tool such that the submitter gets an error message unless something is included in the comments field. This would appropriately resolve the issue. o The present SPM has an "expedited standards development process" that was stricken. However, the RoP section 300 (Reliability Standards Development) requires that process. Section 309.3 references it. The SPM should retain that. Without it in the SPM, NERC cannot respond to a request from a governmental authority for expedited development of a standard. The SPM therefore needs to retain that procedure, and if this provision were reinstated, the use of a waiver process would be minimized since

Organization	Yes or No	Question 7 Comment
		the expedited process would be a provision of the SPM. o The proposed version of Section 16.0: Waiver of the SPM (from the clean version, p. 49) allows the Standards Committee wide latitude to waive any SPM provision. From the document: "The Standards Committee may waive any of the provisions contained in this manual for good cause shown, but limited to the following circumstances: o Where necessary to meet regulatory deadlines; o Where necessary to meet deadlines imposed by the NERC Board of Trustees; or o Where the Standards Committee determines that a modification to a proposed Reliability Standard or its Requirement(s), a modification to a defined term, a modification to an interpretation, or a modification to a variance has already been vetted by the industry through the standards development process or is so insubstantial that developing the modification through the processes contained in this manual will add significant time delay.In no circumstances shall this provision be used to modify the requirements for achieving quorum or the voting requirements for approval of a standard. The Standards Committee shall report the exercise of this waiver provision to the Board of Trustees prior to adoption of the related Reliability Standard, Interpretation, definition or Variance.Reliability Standards developed as a result of a waiver of any provision of the Standard Processes Manual shall not be filed with ANSI for approval as American National Standards."The use of a waiver will result is a violation of the NERC's American National Standards Institute (ANSI) approved standards development process. Otherwise, the last highlighted sentence above would not be needed. Reporting the use of a waiver prior to the Board of Trustees (BOT) adopting a standard is unacceptable (refer to "The Standards Committee shall report the exercise of this waiver provision to the Board of Trustees prior to adoption of the related Reliability Standard, Interpretation, definition or Variance."). The exercise of the waiver and BOT approval may be separated by years of work by the both the Standards Committee (SC) and the standards drafting team (SDT). Each exercise of a SC waiver should have BOT finality so that the BOT will not be pressured to approve any waiver in order to not reject the substantial body of work that has followed the exercise of the waiver by the SC. At a minimum, waivers to the SPM should be preceded by the

Organization	Yes or No	Question 7 Comment
		following:a. The posting of an SC document to the Registered Ballot Body that describes the reason for the requested waiver, including the threat to reliability, and what processes would be affected by the waiver.b. A short (10 day) period for accepting Registered Ballot Body comments.c. After comments are received, the SC may either withdraw the waiver or request its expedited approval by the NERC board, ensuring that the Board is supplied with the comments received. The entire process proposed above could be completed within 30-45 days, causing a minor delay for the hopefully rare exercise by the SC of waiving a SPM provision. o The extension of the ballot window when the last day falls on a Saturday, Sunday or federally-recognized United States holiday, should be modified to include Canadian holidays. It must be recognized that the document applies continent-wide.

Response: 1) The suggested edit is accepted. The footnote on the cover page will be changed to reflect the current NERC address in Atlanta.

2) In the recent 2 years, NERC staff has greatly improved the processes and timing for getting items filed timely with FERC. The items that are held longer than typical are done so deliberately and thoughtfully. The Standards Committee believes that flexibility is needed in this area, and will continue to monitor NERC's performance.

3) Regarding the comment to limit the number of ballots, an intentional decision was made not to put an arbitrary limitation in place. While it might be clear in some cases after one or two ballots whether a standard is going to be successful, in other cases it may take much longer for consensus to arise. We believe this issue is better handled by the authority the SC has to terminate a project if it does not believe consensus can be achieved. An arbitrary limit could require a project to be restarted just as consensus is about to be reached.

4) The NERC SCPS agrees with the commenter in that the ultimate goal is to eliminate the VRFs and VSLs from the Reliability Standards. The elimination requires the development of a replacement to the existing Penalty Matrix, which supports and incorporates the risk based concepts into the enforcement process. In support of these efforts, the SCPS is continuing to work toward the elimination of the VRFs and the VSLs through further development of the 'Sanctions Table' concepts originally proposed during the initial formal comment period and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts.

While the concepts that support the elimination of the VRFs and VSLs are vetted, the SCPS is actively developing concepts in

Organization	Yes or No	Question 7 Comment
		response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. In support of these efforts the SCPS has further developed guidance for the SDTs to assist with the development of the VRFs and VSLs. 5) It is still unclear what role the RISC will play, in regards to the front end of Standards Development. Until that is understood, no changes will be made to the SPM. 6) We agree this area should be reconsidered. However, this matter is not ripe for inclusion in the current revision. Thank you for your support of the proposed changes to the SPM. 7) With respect to the comment regarding the appeals process, no change to the appeals process was made. References to the process in some sections were eliminated, but the appeals process itself still remains in section 8.0. 8) Agree that a withdrawal should go through an industry ballot. Modifications to Section 4.18 of the SPM have been made. 9) The purpose of the final review of the Interpretation is to ensure that the final product comports with the requirements set forth in the Standard Processes Manual. This step fulfills the obligations of NERC Staff to their corporate board and provides accountability. 10) With respect to the ability of NERC to direct the development of a new or revised standard to address a national security situation that involves confidential issues is not new to this revision. No substantive changes to this provision are proposed in this revision. Furthermore, NERC's authority in this area is concurrent with that of FERC, not exclusive. No change made. 11) With respect to the comment regarding the change to the 5 year review process, the move to a ten year review period was deemed appropriate to enable the limited industry resources available to be put to their most effective use. While we certainly understand the advantages of a more frequent review, including those you noted, we believe there is a consensus in the industry for the increased flexibility this change provides. No change made. 12) The suggestion for "change [the] tool such that the submitter gets an error message unless something is included in the comments field." will be communicated to NERC Staff for possible incorporation to the balloting software. 13) With respect to the comment regarding an expedited review process, we believe that Section 16 of the SPM which provides the SC the authority to waive various provisions of the standards development process in specified situations is more than adequate to meet the requirement for an expedited process found in the ROP section 309.3. Note that Section 16 of the SPM specifically lists the need to meet a regulatory deadline as a justification for a waiver. The waiver section also provides more

Organization	Yes or No	Question 7 Comment
		flexibility to the SC than a specified procedure would. No change made. 14) The waiver provision would not violate ANSI. The currently-effective Standard Process Manual already provides a process for the expedited development of Reliability Standards where necessary "to meet an urgent reliability issue such that there isn't time to follow all the steps in the normal Reliability Standards development process." The waiver provision replaces this section in its entirety. In the currently-effective Standard Process Manual, the section on Processes for Developing a Reliability Standard Related to a Confidential Issue states: "When faced with a national security emergency situation, NERC may use one of the following special processes to develop a Reliability Standard that addresses an issue that is confidential. Reliability Standards developed using one of the following processes shall be called, "special Reliability Standards" and shall not be filed with ANSI for approval as ANSI standards." (emphasis added). The concept that certain Reliability Standards will not be filed with ANSI is not a new one to the Standard Processes Manual nor does it jeopardize NERC's accreditation. In order to address your concern regarding the potential lag in reporting to the Board of Trustees, additional language has been added to require reporting of the use of the waiver provision to the Standards Oversight & Technology Committee. In order to address your concern regarding notice to stakeholders, the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee has been incorporated. NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner. Adding an additional 30-45 days to the standard development process in order to utilize a waiver as proposed would defeat the very purpose of the waiver provision- which is to add flexibility to the process. 15) Regarding Section 4.9, the reference to federally-recognized United States Holidays is intended to acknowledge that NERC's offices that accept and process ballot submissions, which are located in the United States, are not open on these dates. While the Standards Committee and NERC staff make every consideration possible to posting conflicts, the Standards Committee did not feel it was necessary to codify this in the SPM. Since there are several representatives on the Standards Committee from Canadian

Organization	Yes or No	Question 7 Comment
entities, they can help ensure the other members are aware of Canadian-specific conflicts of any nature. No change made.		
Consumers Energy		Consumers Energy believes that where substantive changes are made, quality review should still be performed. Though this is a time consuming process, we believe it is better than a standard which does not meet all the necessary criteria being approved, presented to FERC, then returned for additional work.
Response: The goal of quality review is to ensure that a standard presented for FERC approval meets the necessary criteria for approval. As is stated in the "rationale" box attached to Section 4.6, the changes to the language in this section are intended to ensure that quality review occurs in parallel with the development of a Reliability Standard. Section 4.6, fn 30 also states that quality review will be conducted in accordance with an approved procedure. The Standard Committee's Standards Process Subcommittee is working on improvements to the quality review procedure that will ensure quality review will occur as necessary "in parallel with the development of a Reliability Standard" to best facilitate FERC approval. While in some cases it might be advisable to conduct an additional Quality Review after substantial changes have been made to a standard there are other cases where a change, although substantive, is not substantial enough to justify the delay and resources that would be involved. For this reason we do not believe it is advisable to require an additional Quality Review after every substantive change.		
EPSA		EPSA answers:EPSA generally supports the efforts of the Standards Committee (SC) and NERC staff regarding the proposed revisions to the Standards Process Manual and votes yes on while expressing the value of improvements and concerns about the proposed revisions. It is important to incorporate the changes of the Standards Process Input Group (SPIG) and make changes that will promote continual improvement of the standards process. Several revisions should improve the standards process: - Development of RSAWs in the standards process will better align RSAWs with the intent of the standard and motivate registered entities to use RSAW provisions in compliance programs; - the revised language includes the inclusion of technical writers, legal, compliance and facilitation support personnel which will provide for appropriate professional personnel making the standards process more efficient; - removal of the 30 day time frame for informal comment periods is useful

Organization	Yes or No	Question 7 Comment
		to give flexibility to the informal process;- enabling quality reviews to occur throughout the process rather than at the end is a positive changes which should add flexibility; and, - Standard Authorization Request (SAR) remand revisions process improvement that now allow the SC to remand a SAR to either Staff or the requestor should increase efficiency.EPSA does have some concerns about the proposed changes that should be noted:- A key point raised through the SPIG evaluation process and in the comments was the need for better front end analysis. This point went in two directions - one became a Reliability Issues Steering Committee (RISC) task to consider whether an issue should be handled with a standard. The RISC is now in place and will address this issue. The second issue dealt with whether to deploy more robust input in creating the project details (scope, foundational analysis, etc.) that would better focus the standard project. In EPSA's view the second issue still needs to be addressed. Should the SPIG continue its work EPSA recommends that this issue should be the starting point for their continued work. - Another SPIG recommendation was for better utilization of the technical committees in the standards development process. The current revisions do not include effective changes regarding the role of the technical committees.- The revisions tie the SPM closely to the Reliability Standards Development Plan (RSDP). It's not clear that the plan development process is sufficient to support this strong of a tie. The RSDP process may need notable revision to be effective. Moreover, it may need coordination with the RISC efforts.- Removal of Measures from the standard language means removal of approved language that has provided registered entities with stability and provides informal guidance. The replacement of Measures with RSAWs needs to demonstrate measurable benefits, and if not, the change should be revisited.- Regarding changes associated with Response to Comments - EPSA infers that the benefit of the change is that SDT members don't have to spend as much time on responding to comments and can focus on drafting work. However, the response to comments is important - its serves as an acknowledgement, as well as whether the SDT understood the comments, and as a tool for confirming language understanding. Such clarification can inform understanding in the compliance

Organization	Yes or No	Question 7 Comment
		process. In addition, putting all responses at the end of the process in summary form may eliminate the value that the response to comments contributed to language development and getting to yes votes.- The waiver justification is that it will improve efficiency and expedite the standards process in place of the Expedited Process. EPSA believes that installing a broad waiver may not be as efficient as fixing the problems with the Expedited Process. The inclusion of the waiver creates a lot of latitude for the SC to potentially step aside the process that relies on stakeholder expertise for decision making. Therefore it is not assured that time will be saved through use of the waiver.

Response: Thank you for your comments of support. Regarding your particular areas of concern:

1) It is still unclear what role the RISC will play, in regards to the front end of Standards Development. Until that is understood, no changes will be made to the SPM.

2) The SPM currently contemplates utilization of the technical committees in various steps. No additional changes in this version are planned. However, a change in how the SPM is utilized is where further improvements will be seen.

3) Since the RSDP process is where modifications would need to occur, no changes have been made to the SPM. This feedback will be retained for consideration in modification of the RSDP process.

4) With regard to the comment regarding removal of measures, their exclusion in standards would occur going forward only. All existing approved measures will be retained until the next revision of the standard.

5) It is envisioned that the collaboration between Standards and Compliance will continue throughout the life of the Reliability Standard and the associated RSAW and that future revisions to either the Reliability Standard or the RSAW will maintain this relationship.

While we agree that the well crafted measures provide a level of certainty in regards to compliance obligations, we also recognize that the current format within the Standard does not lend itself to allow the SDT to clearly articulate the intent of the requirements. Eliminating the Measures from the Standard and incorporating them in to the RSAWs provides the SDT with the opportunity to provide a complete explanation of the intent of the requirements while providing guidance on how to achieve the acceptable level of compliance.

6) As you note, Section 16.0 is very similar to the currently –effective Standard Processes Manual section of the Expedited

Organization	Yes or No	Question 7 Comment
Reliability Standard Development Process. However, a Standard developed using the Expedited Reliability Standard Development Process is approved only on a conditional basis and it must *again* go through the standard development process in order to be made permanent. The Expedited Reliability Standard Development Process provides: **If a new or modified Reliability Standard is developed, approved by its ballot pool, and subsequently adopted by the NERC Board of Trustees through this expedited process, one of the following three actions shall occur [fn27]:** **• If the Reliability Standard is to be made permanent without additional substantive changes, then a SAR and a proposed Reliability Standard shall be submitted to the Reliability Standards staff immediately after the ballot. The project shall be added to the list of approved projects and shall proceed through the regular standard development process, including balloting by stakeholders, without any intentional delay.** **• If the Reliability Standard is to be substantively revised or replaced by a new Reliability Standard, then a project for the new or revised Reliability Standard shall be added to the list of projects to be added to the Reliability Standard Development Plan. The project shall be initiated as soon as practical after the ballot and the project shall proceed through the regular Reliability Standard development process, including balloting by stakeholders, as soon as practical but within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.** **• The Reliability Standard shall be withdrawn through a ballot of the stakeholders within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.** **This is clearly redundant and a waste of resources for NERC, the industry and the drafting team. Rather than repeating the standard development process, Section 16.0 would allow a Reliability Standard to become "permanent" upon stakeholder approval.**		
National Rural Electric Cooperative Association (NRECA)		General Comments:NRECA continues to have significant concerns with the new provisions in the proposed SPM. We are voting "negative" on this current ballot for several reasons. While we support moving the process forward to make improvements to the SPM, we believe there are too many unfocused and uncoordinated efforts underway today creating confusion and uncertainly on ultimately where standard development process changes are going. NRECA believes a more focused and collaborative effort, possibly through the SPIG, will lend itself to

Organization	Yes or No	Question 7 Comment
		a comprehensive, and not staggered or piecemeal, effort to improve the SPM. NRECA requests that consideration be given to making further revisions to the SPM as identified in our comments below in a future ballot period that is based on such a comprehensive effort. NRECA remains convinced that there is a need for a thorough analysis of the current SPM and standards development activities to clearly identify the areas that require changes to ensure standards are developed in the most efficient and effective manner. This work should be completed as soon as possible regardless of how the SPM work progresses.If the provisions in the current proposed SPM are approved by the industry, the BOT and ultimately FERC, NRECA encourages the SC and SDTs to carefully implement new provisions of the SPM. It is critically important to successful standard development that stakeholder comments are properly considered and clearly responded to, and that the new waiver provisions is utilized in very few and special cases. Specific Comments:Section 3.4 - third paragraph - The reasons that the SC can disband a SDT are quite subjective and if ever used could create unnecessary tension between the SC and stakeholders. There may be relevant reasons why a SDT may not be able to achieve industry consensus or fully address a regulatory directive. NRECA requests that items b and d be deleted.Section 3.6 - first paragraph - While this does not appear to be a proposed revision the current SPM, NRECA does not understand why NERC, and not the SC, selects interpretation drafting team members. NRECA requests that unless there are specific and necessary reasons provided for NERC to have this role, that the SPM be revised to provide this responsibility to the SC. Section 4.1 - several places throughout section - References to “retirement of a Reliability Standard” should also clearly recognize that there could be retirement of one or more requirements of a reliability standard, not always the whole standard. Wherever “Reliability Standard” is mentioned regarding a SAR, the SPM should also recognize that it may not always be a standard, but that it could be a definition.Section 4.1 - seventh paragraph that lists the SC options for decision on a SAR - In the second bullet, if the SC remands a SAR, NRECA believes it should be required to provide a written explanation similar to what is listed in the third bullet. This should be revised in the SPM. Regarding the

Organization	Yes or No	Question 7 Comment
		third bullet, allowing the SC to reject a SAR for "good cause" seems to provide unnecessary flexibility for the SC. NRECA requests that basic high level criteria be developed for the SC to use for rejecting a SAR.Section 4.14 - first paragraph - Towards the end of the paragraph, the word "substantive" is used, but it appears that word should be "significant" in order to work with the language earlier in the paragraph.Section 4.19 - second paragraph - In the second line NRECA is concerned that only the SC or NERC staff is permitted to identify the need to retire a standard. This should be able to be done by anyone - the SC, NERC, REs and stakeholders - that can submit a SAR. Also, there should be recognition that only a requirement of a standard, not only the whole standard, may be requested for retirement. Lastly, the reference to the Bulk Power System should be changed to Bulk Electric System.

Response:

Thank you for your comments of support. Regarding your particular areas of concern:

1) With respect to the comment on section 3.4, although the reasons listed are to some extent subjective, it is important that the SC have flexibility in making this decision. Although as you commented there may be relevant reasons for a SDT not to be able to reach consensus or to fully address a regulatory directive, the inability of the SDT to achieve those critical objectives might still be a sufficient reason for the SC to disband a drafting team. Note that the language is permissive not mandatory, so the SC can use its judgment in such cases to determine whether disbanding a team is the best alternative available. No change made.

2) The selection of an interpretation drafting team was not revised in this version of the SPM. While this comment is not in scope for consideration in this version, the issue will be retained for future consideration. [Stacey is researching this to find out the background on why NERC selects Interpretation teams, and not the SC. I know this was a deliberate decision…]

3) With regard to the comment regarding the retirement of a requirement as opposed to an entire Standard. We believe that retiring a requirement is clearly a modification of a standard which is already directly addressed by the SPM. Similarly, this same process would also be applicable to retire an individual requirement. No change made.

3) The suggestion to recognize definitions, along with standards, is appreciated. The SPM will be edited to acknowledge both Standards and definitions where appropriate.

4) We agree with the suggestion to require a written explanation if the SC remands a SAR in Section 4.1. The second bullet point

Organization	Yes or No	Question 7 Comment
will be revised to read: "Remand the SAR back to the requestor or to NERC Reliability Standards Staff for additional work. If the SAR is remanded, the Standards Committee will include a written explanation of what additional work is requested. 5) With respect to the comment regarding Section 4.1 and criteria for rejecting a SAR, we believe that in light of the fact that a written explanation of the rejection, coupled with the right to appeal in Section 8, there is a sufficient check on any inappropriate use of this authority. No change made. 6) We agree that the term "substantive" in the first paragraph of Section 4.14 seems inconsistent with the usage of the terms "significant" and "insignificant" in the preceding text. However, the word "substantive" appears to be appropriate. Instead, Section 4.14 will be edited to replace the words "significant" and "insignificant" with the words "substantive" and "non-substantive". 7) The commenter is correct that anyone is permitted to propose retirement of a standard. The suggested edit is accepted. The words "by the Standards Committee or NERC Staff" will be deleted from Section 4.19. 8) With respect to the comment advocating the use of BES in place of BPS, the use of BPS was derived from its use in the statutory authority under which the ERO operates. No change made.		
Arizona Public Service Company		In spite of SPIG recommendation to address cost effectiveness in the standard development process (Recommendation 4, bullet item 2), the proposed process does not address this recommendation. This should be one of the prime considerations and should be addressed.
Response: The SPIG recommendation to address cost effectiveness in the standard development process is being addressed outside of the revisions to the SPM in two ways: 1) In the short term, two standard questions regarding potential costs of a proposed standard are being added to the SAR comment form; 2) in the longer term, the Standards Committee's Standards Process Subcommittee has developed a "Cost Effectiveness Analysis Procedure" or "CEAP" that has been posted for, and received industry comment. The CEAP is a guideline intended to supplement the standards development process by gathering and reporting high-level cost effectiveness feedback from the industry during standard development without adding significant delay to the development process. The CEAP process will be piloted in the near future on an experimental basis to determine whether it adds value and ensure it does not create undue delay in standards development. It is premature to add the CEAP to the SPM at this time, but the Standards Committee will evaluate the CEAP Pilot and may in the future consider changes to the SPM related to		

Organization	Yes or No	Question 7 Comment
the CEAP.		
Kansas City Power & Light		Kansas City Power & Light endorses the comments made by EEI on this subject.
Response: Thank you for your comment.		
Edison Electric Institute		On behalf of our member companies, the Edison Electric Institute (EEI) appreciates the opportunity to provide the following brief comments on the process changes being considered in conjunction with recommendations made by the Standards Process Input Group (SPIG). EEI looks forward to significant process efficiency gains as a result of the full implementation of the SPIG recommendations.Section 16: Waiver ProvisionThis is unnecessary. Full implementation of SPIG recommendations will eliminate need for waiver of any standards development process steps. As a general matter and to correctly align various responsibilities, EEI supports full ownership of the technical content of standards development projects by the various drafting teams and stakeholders through comments and balloting, and process oversight by NERC management. In comments to SPIG, EEI asked that the confusion over process oversight be resolved once and for all. NERC has the responsibility to deliver proposed standards to FERC and should have the tools to ensure timely responses.If problems develop that challenge timely project completion, drafting teams and NERC management need to efficiently resolve the matters. In addition, EEI envisions much stronger and more disciplined process oversight than has been practiced in some projects in the past, which should eliminate the problem. Instead of anticipating such a problem, EEI challenges NERC and all stakeholders to make strong commitments to develop and execute plans that define specific milestones and deadlines that ensure timely development. Waiving process steps for 'insubstantial' matters is a slippery slope that NERC should avoid. Moreover, there is case precedent that NERC has filed with FERC various 'minor modifications' that were not returned to the standards development process for balloting. The boundary for determining 'insubstantial' should be carefully considered and clarified from legal and regulatory perspectives before a final decision is made.Operations Sanctions

Organization	Yes or No	Question 7 Comment
		TableAs part of its April 2012 report, SPIG recommended that “redundancies” such as VSLs be eliminated. In response to this recommendation, as part of the Standards Committee Process Subcommittee (SCPS) white paper issued in June, the SCPS agreed with the elimination of VSLs but also suggested the elimination of VRFs from standards in favor of a “sanctions table”. The SCPS proposed that this sanctions table would replace the existing base sanctions table contained in the Compliance Monitoring and Enforcement Program (CMEP) manual.EEI understands that the proposal framed in the NERC process subcommittee ‘white paper’ and the proposed draft process manual to be that VRFs and VSLs would no longer be defined as ‘essential elements’ of a standard, but would remain part of the standard development project. Under the proposed Standards Process Manual, it appears that the drafting team will work with NERC staff in developing a set of VRFs and VSLs that will be subject to a non-binding poll. Ultimately, the VRFs and VSLs will be presented to the Board of Trustees for adoption. On the surface, the draft proposed Standards Process Manual would appear to agree with the underlying process efficiency objective. However, the proposal is confusing for several reasons. First, contrary to the SPIG recommendation to remove only VSLs as redundant and the SCPS recommendation to eliminate both VRFs and VSLs, the proposed Standards Process Manual states that VSLs and VRFs will still be developed, but will be developed in parallel with the drafting team project scope. Thus, this proposal does not appear to create more efficiency. Further, we do not see a clear alternative process proposal for the development of VSLs and VRFs, and it is important to have an understanding of where and how these variables will be defined.Second, SPIG did not recommend the development of a sanctions table. The purpose of these proposed changes is to address SPIGs recommendations, not to confuse and complicate the process by retaining both VSLs and VRFs and adding the new SCPS-proposed sanction table. While we understand that there have been informal discussions on developing such a table, the addition of this material to the SPIG project does not fit with our sense of ‘eliminating redundancies.’ In addition, the white paper seems to conflate the VSL/VRF process issue with the development of the sanctions table. Certainly, SPIG

Organization	Yes or No	Question 7 Comment
		did not recommend the development of a sanctions table. Therefore, because the proposed Standards Process Manual fails to clearly address SPIG's concerns regarding VSLs, there is a lack of clarity regarding how VSLs and VRFs will be developed and there is uncertainty regarding the sanctions table, EEI recommends that the sanction table not be adopted and the VSLs remain in place until further clarification can be provided by SPIG as to how to address this issue.Handling 'No' VotesThe handling of 'no' votes is a matter that has attracted significant attention. SPIG recommended that the ballot process should use all votes to establish quorum, and provide options for 'no' votes, including changes to the balloting and commenting process that would help useful comments. For example, many comments will briefly state a broad negative comment without showing the specific language of concern, or offering a constructive alternative that the commenter could support.The proposed process change is to disallow simple 'no' votes without comments for purposes of determining final ballot counts. EEI does not understand the logic that moves from the SPIG recommendations to the process proposal to disallow simple 'no' votes, and cannot support the proposal.We understand that SPIG seeks to move the process in the direction of having the balloting and commenting process to provide as much substantive feedback as possible. Irrelevant comments or negative votes unaccompanied by comments do not offer helpful feedback, however, it should be a relatively simple matter to address such comments very quickly. EEI recommends that appropriate software changes be designed and implemented as soon as possible that will help gather more focused comments. A simple 'no' vote should be allowed to count both for determining quorum and final ballot count. Finally, somehow we need to find a way to work around the apparent timing issues for making necessary software changes. This should not be a binding constraint on making these important process changes.

Response:

Thank you for your comments.

1) Respectfully, we suggest that in order for the ERO model to be successful, NERC must have the ability to meet regulatory

Organization	Yes or No	Question 7 Comment
		deadlines. Pursuant to section 215(d)(5) of the FPA, the Commission may direct the ERO to submit to the Commission a new or modified Reliability Standard that addresses a specific matter if the Commission considers such a new or modified Standard appropriate to carry out section 215. As the ERO, NERC must be able to comply with a Commission directive pursuant to section 215(d)(5) of the FPA. The Commission has expressed concern that the standard development process can be misused to "delay or block NERC's ability to report to a Commission directive" *See North American Electric Reliability Corp.*, 130 FERC ¶ 61,203 at P 23 (2010). The Commission has continuously expressed concern regarding the amount of time it takes to develop a Reliability Standard. • *See North American Electric Reliability Corp.*, 118 FERC ¶ 61,030 at P 31 (2007)("Both in Order No. 672 and in the *Certification Order* we expressed concern with the length of time the ERO process takes to develop a Reliability Standard. The ERO has never, to our knowledge, developed a Reliability Standard under its normal process in four months or developed an urgent action Reliability Standard in 60 days."). • *North American Electric Reliability Corp. Reliability Standards Development et al.*, 132 FERC ¶ 61,217 (2010)("In its application for certification as the ERO, NERC indicated that under its usual ANSI-accredited process in effect at the time, a Reliability Standard may be developed in as little as four months, or up to 12 to 15 months for a more complex Standard. However, the NERC analysis submitted in this docket indicates that, in practice, it has taken considerably longer, an average processing time of 21.7 months, to develop Reliability Standards. The average processing time is even longer if 'urgent action' Standards are not considered. Given this analysis, the Commission continues to have some concerns regarding NERC's ability to timely develop Reliability Standards.")(internal citations omitted). NERC, the Regional Entities and industry stakeholders have a significant mutual investment in developing a sustainable Reliability Standards program that will maintain the reliability of the bulk power system in North America. The success of the unique Electric Reliability Organization (ERO) model requires NERC to develop and maintain a body of high-quality, effective Reliability Standards. The current trajectory is unsustainable and, without considering significant course correction, the ERO and industry finds itself nearing a critical juncture where alternate methods to accomplish the development of mandatory Reliability Standards has become necessary. NERC is at risk of losing the confidence of U.S. and Canadian regulatory authorities and industry executives in its ability to produce standards in a timely and efficient manner. 2) The Sanctions Table concept was developed as a replacement to the Penalty Matrix which utilizes the VRFs and VSLs. The SCPS recognized that elimination of the VRFs and VSLs required that a viable alternative be developed to replace the Penalty Matrix.

Organization	Yes or No	Question 7 Comment
Based on the majority of the comments received to the initial posting of the draft process document, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. **The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects, and will consider suggestions provided in the comments below as part of that consideration. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.** **3) Participation in the NERC Ballot Pools comes with responsibility to actively participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams need this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner. The current standards productivity is not meeting the expectations of the regulators and it is important that the drafting teams be given as much information as possible, especially information on why entities voted negatively, to develop standards efficiently and expeditiously. It is burdensome for the drafting teams to continually revise standards to try to gain industry consensus when they don't have all the concerns. The identified shortcomings of the NERC software has been communicated by NERC Standards Committee to NERC staff as suggestions for potential revision to the existing balloting software.**		
Detroit Edison		On page 7- definition of a Reliability Standard- change the wording of the beginning of the first sentence to read- a document containing one or more requirements to provide for the Reliable Operation of the Bulk Power System. REMOVE the following- including without limiting the foregoing, requirements for the operation of existing Bulk Power System Facilities, including cyber security protection, and including the design of planned additions or modifications to such Facilities to the extent necessary for Reliable Operation of the Bulk Power System, but the term does not include any

Organization	Yes or No	Question 7 Comment
		requirement to enlarge Bulk Power System Facilities or to construct new transmission capacity or generation capacity. Leave the last sentence about FERC approval.
Response: The definition of "Reliability Standard" as worded in Section 2.1 is the approved definition that appears in Appendix 2 to the NERC Rules of Procedure, Definitions Used in the Rules of Procedure, which is based on the statutory definition of the term in Section 215 of the Federal Power Act. Accepting the proposed revision to the SPM would create a discrepancy with the approved definition for use in the Rules of Procedure, and will not be adopted. If you believe a change to the defined term is required, please submit a request to change the definition in Appendix 2 of the NERC Rules of Procedure.		
NextEra Energy		One part of the Standards Development process that needs significant improvement is the options available to the Standards Committee when reviewing a proposed SAR. Currently, the rules related to a SAR, even with the new SPIG language, state that the Standards Committee essentially has only the choice to accept or reject, with some ability to delay for further justification or work. NextEra believes that the Standards Committee should consider a SAR in light of existing or pending Standards Development projects, stakeholder support for the SAR and the new RISC triage group. To implement these options, NextEra requests that pertinent portions of Sections 4.1 and 4.2 be revised to read as follows: Section 4.1 proposed changes:"The NERC Reliability Standards Staff shall review each SAR and work with the submitter to verify that all required information has been provided. All properly completed SARs shall be submitted to the Standards Committee for action at the next regularly scheduled Standards Committee meeting. When presented with a SAR, the Standards Committee shall determine if the SAR is sufficiently complete to guide Reliability Standard development and whether the SAR is consistent with this manual. The Standards Committee shall take one of the following actions: o Accept the SAR. o Accept the SAR with the condition that it be combined with an existing or pending Standards Development project. This action may require that the Standards Committee also authorize increasing the scope of the existing or pending Standards Development project. o Remand the SAR back to the requestor or to NERC Reliability

Organization	Yes or No	Question 7 Comment
		Standards Staff for additional work. o Reject the SAR. The Standards Committee may reject a SAR for good cause. If the Standards Committee rejects a SAR, it shall provide a written explanation for rejection to the sponsor within ten days of the rejection decision. o Delay action on the SAR pending one of the following: (i) development of a technical justification for the proposed project; or (ii) consultation with RISC, the Planning Committee or Operations Committee to determine if there is another approach to addressing the issue raised in the SAR, such as via lessons learned, best practices technical white paper, etc."Section 4.2 proposed changes:"If stakeholders indicate support for the project proposed with the SAR, the drafting team shall present its work to the Standards Committee with a request that the Standards Committee authorize development of the associated Reliability Standard. When considering this request, the Standards Committee may take any of the appropriate actions listed in Section 4.1. If stakeholders do not support the project proposed with the SAR, the drafting team shall present its work to the Standards Committee. If the Standards Committee agrees that stakeholder support is lacking, the SAR shall be rejected and the proposed project closed. When there is a question of stakeholder support for a SAR (either from NERC staff or a Standards Committee member), the Standards Committee shall review the record and make a determination. If the determination is that there is no stakeholder support for the SAR, the SAR shall be considered rejected and the proposed project closed."New language to by-pass SAR process at the end of Section 4.1:"Upon receipt of a rapid revision request, the Standards Committee may authorizing by-passing of the SAR process, provided that the rapid revision request includes specific language to change a Reliability Standard to improve its clarity or a possible incorrect interpretation, and the change shall be supported with legal or technical rationale. If the Standards Committee does not agree that a rapid revision request is appropriately supported by technical or legal rationale, it shall reject the rapid revision request and inform the requester in writing."
Response: The SPSC agrees that SARs should be considered in light of existing or pending projects. The suggested edits to Section		

Organization	Yes or No	Question 7 Comment
4.1 and 4.2 are accepted to add clarity to the process. **Regarding the proposed changes to Section 4.2, the Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.** **With respect to the comment advocating new language to by-pass the SAR process for rapid revision requests, the Standards Committee Process Subcommittee has considered this issue. At this time, we feel that a SAR is necessary to establish the framework of the project and to ensure "scope creep" does not occur.**		
Manitoba Hydro		Overall, it is still not clear to us that these revisions have addressed SPIG recommendations #4 and #5. Section 2.5: Requires revision if it is to apply to jurisdictions outside of the United States. The reference to the term "Compliance Enforcement Authority" should be revised to refer to the entity that is responsible for monitoring performance and/or determining if an entity is compliant with the associated Reliability Standard. A similar revision needs to be made to the next sentence (by changing "and" to "and/or") as neither NERC nor Regional Entities determine compliance in Canadian jurisdictions.Section 3.7: "Canadian National Energy Board" should be renamed "National Energy Board of Canada".Section 4.9: Given that NERC is an international organization, this section should refer to both U.S. and Canadian holidays in considering the ballot window.Section 4.19: The reference to "FERC" in the first sentence should be replaced with "Applicable Governmental Authorities".The term "applicable governmental authority/ies" should be capitalized throughout, as it is a defined term.
Response: Regarding Section 2.5, the term "Compliance Enforcement Authority" in this section of the SPM aligns with the defined term that appears in Appendix 2 to the NERC Rules of Procedure, Definitions Used in the Rules of Procedure. Accepting the proposed revision to the SPM would create a discrepancy with the approved definition for use in the Rules of Procedure, and will not be adopted. If you believe a change to the defined term is required, please submit a request to change the definition in		

Organization	Yes or No	Question 7 Comment
Appendix 2 of the NERC Rules of Procedure. **Regarding Section 3.7, the proposed edit is accepted. The language will be changed to "National Energy Board of Canada."** **Regarding Section 4.9, the reference to federally-recognized United States Holidays is intended to acknowledge that NERC's offices that accept and process ballot submissions, which are located in the United States, are not open on these dates. While the Standards Committee and NERC staff make every consideration possible to posting conflicts, the Standards Committee did not feel it was necessary to codify this in the SPM. Since there are several representatives on the Standards Committee from Canadian entities, they can help ensure the other members are aware of Canadian-specific conflicts of any nature. No change made.** **Regarding Section 4.19, the proposed edits are accepted. "FERC" will be replaced with "Applicable Governmental Authorities". The term "Applicable Governmental Authorities" will be capitalized throughout the document as a defined term.**		
PacifiCorp		PacifiCorp believes that further contracting the limited time that the industry already has to review, evaluate, and comment on new or revised reliability standards does not adequately address the challenges associated with reaching timely stakeholder consensus. Rather than focusing on the small window of opportunity that the industry has to provide input into the process, attempts should be made to curtail the amount of time it takes for standards to be processed by the drafting committees.
Response: Thank you for your comment. The NERC Standards department has recently undergone reorganization with the intent to shift a substantial amount of their focus from process to product. One of their primary goals is to facilitate more work in between drafting team meetings, thereby increasing the team's pace and output.		
Pepco Holdings Inc		PHI supports the proposed draft of the SPM.
Response: Thank you for your comment.		
FirstEnergy		Recommendation #5 states that in part "Formal and consistent project management".FE agrees that this is the key to an efficient process and the NERC Staff will improve. but it is not clear in the SPM as to how this will be accomplished? WIll there be specific projct management tools provide to NERC Staff?FE believes that in Section 2.5 Elements of a Reliability Standard should include as on one the

Organization	Yes or No	Question 7 Comment
		components the Version History of a Standard. This would be useful information for determining the changes/revision between versions of a standard.
Response: NERC has announced several steps to improve its project management capabilities including a reorganization of that area. Changes in the guidelines for SDTs have also been made to better define the roles of the chair and NERC staff in the process. The SCPS believes that inclusion of such detailed information in the SPM is inadvisable because it would limit the flexibility of NERC, the Standards Committee and the industry in continuing to tune the process to improve its efficiency and flexibility. No change made. **The recommended edit to Section 2.5 is accepted. In practice, all standards currently include the version history, thus it is useful to indicate in the SPM that version history is a component of a standard.**		
Southern Company		Southern Company supports the Standards Process Input Group (SPIG) Recommendations and the Standards Committee's efforts to incorporate into the SPM various revisions proposed by the SPIG and the Standards Committee Process Subcommittee (SCPS). We have reviewed two versions of SPM Revisions and noted where the Standards Committee has given careful consideration to formal comments from industry. We are however concerned that there are several key and significant changes poised for implementation and that at this juncture, incremental steps are necessary to ensure that NERC and stakeholders achieve the desired results. Our comments cover several proposed changes to the SPM and are indicative of the fact that it is critical that all stakeholders understand what effect the revisions will have on the processes throughout the ERO enterprise and not just to those described within the Manual. We appreciate your consideration of our comments.The currently effective SPM (and the proposed draft SPM) does not demonstrate how, if invoked, Rule 321 would be implemented. The draft SPM only mentions Rule 321 in the context of a Reliability Standard's ability to be enforced for compliance purposes (see draft Section 4.17: Compliance). We raise this concern - that the Standards Committee should address how this rarely used, but nonetheless important rule would be implemented - as a matter which is separate and apart from the concerns expressed with the new waiver or deletion of the expedited process. The draft SPM

Organization	Yes or No	Question 7 Comment
		(including the waiver provision) does not maintain certain key aspects of the expedited process. More specifically, the current SPM explains how an "expedited" standard could either be made permanent, or routed through the regular process, or withdrawn. This explanation was spelled out in the now-deleted 'Expedited' process section and should be restored.The Standards Committee should clarify its procedures for disbanding a drafting team and which subsequent activities the Committee will take to efficiently advance the work effort into the next developmental phase. The proposed revisions do not demonstrate that adequate procedures will be in place to ensure that appropriate checks and balances are applied to both the Standards Committee and any subsequent committee or team that may be tasked with the work effort. More specifically, the revised SPM does not explain if it must provide any notice to the Board of Trustees prior to taking such action or after it has already disbanded the drafting team. Also, the SPM does not indicate if the reason for disbanding the team correlates to invocation of a specific rule (e.g. Rule 321). Finally, the SPM does not discuss what level of review will be undertaken to assess whether or not the subject work effort should proceed. In other words, it is not clear if the Standards Committee will conduct a threshold assessment of whether or not the disbanded team and work effort is still required to address an outstanding reliability issue.At the Introduction Section (and at Section 4.10), the draft SPM should be clarified to avoid any confusion over the summation of the number of votes cast for approval of a proposed Reliability Standard, definition, Variance, or Interpretation. The draft language is silent with respect to affirmative votes without comments. The draft language is as follows: "A two-thirds majority of the weighted Segment votes cast shall be affirmative. The number of votes cast is the sum of affirmative and negative votes with comments, excluding abstentions, non-responses, and negative votes without comments." Either of the following revisions may alleviate the concern. Option A - "A two-thirds majority of the weighted Segment votes cast shall be affirmative. The number of votes cast is the sum of all affirmative votes and all negative votes with comments, excluding abstentions, non-responses, and negative votes without comments." Option B - "A two-thirds majority

Organization	Yes or No	Question 7 Comment
		of the weighted Segment votes cast shall be affirmative. The number of votes cast is the sum of negative votes with comments, affirmative votes with or without comments, excluding abstentions, non-responses, and negative votes without comments." At Section 2.1: Definition of a Reliability Standard, the following phrase provides key reference information about the definition's placement in the Rules of Procedure but the reference should be incorporated as a footnote. "See Appendix 2 to the NERC Rules of Procedure, Definitions Used in the Rules of Procedure."At Section 2.5: Elements of a Reliability Standard, the phrase below creates ambiguity over what are (or are not) components of a Reliability Standard. "The components of a Reliability Standard may include the following:..." It seems more appropriate to use more definitive language such as "...shall include..." These modifications clarify the elements of a Reliability Standard. Other comments to this revision suggest that footnote 4 be deleted as a means to mitigate misunderstanding over the stakeholder's role in development of VRFs and VSLs.The Standards Committee should revisit certain section and subsection titles. The main section title and subsection title should not be identical (refer to Section 2.0 and Subsection 2.5).Certain modifications at Section 3.6: Drafting Teams will clarify the flexibility allowed in the formation of drafting teams constituted for the various purposes described in the first paragraph of this section. More specifically, the addition of the phrase "as deemed appropriate" throughout the paragraph will establish flexibility for the Standards Committee and NERC Reliability Standards Staff. It may be necessary to make corresponding modifications to Section 4.3 of the SPM and to the Drafting Team Guidelines mentioned in footnote 12.At Section 4, Figure 1, Quality Review was removed from Step 4 and added to Step 3. This implies that the only opportunity for a Quality Review is at the initial posting prior to collecting informal feedback. Is this correct? Also, the revised illustration consolidates comment period and ballot "iterations" where the steps may be repeated multiple times (as required). We note that the consolidated steps do not include a Quality Review. We are not certain if the exclusion is a simple oversight in the drafting process. At Section 4.1: Posting and Collecting Information on SARs, Paragraph 3, it is not clear what constitutes

Organization	Yes or No	Question 7 Comment
		"substantially revised" Reliability Standards. This should be clarified or addressed in some manner.The third paragraph at Section 4.3: Form Drafting Team, should be made consistent with section ## in that both are consistent with respect to the availability and inclusion of legal and compliance resources. Also, prior comments at Section 3.6 suggest that modifications are helpful for ensuring consistency and flexibility in constituting drafting teams.See prior comments at the Introduction section for modifications which address summation of the consensus vote.

Response: Thank you for your comments of support. Regarding your particular areas of concern:

1) We feel that the inclusion in the SPM of how Rule 321 may be invoked is out of scope at this time. Furthermore, we do not believe that such clarification would contribute to the overall improvement of the SPM, nor addresses a SPIG recommendation. No change made.

2) Certain aspects of the former expedited process were not ANSI requirements and were intentionally removed. In particular, the requirement to revisit a standard developed under the expedited process was creating additional work for the industry, when those resources could instead be dedicated to other efforts.

3) To clarify, under the SPM as proposed, the Board would not have to be notified prior to disbanding a drafting team. The SC is responsible for managing drafting teams. The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.

4) The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.

5) We agree with your comment regarding necessary modifications in the Introduction Section and Section 4.10 to better clarify

Organization	Yes or No	Question 7 Comment
		what votes are counted to determine approval. Clarifying changes have been made. 6) Regarding Section 2.1, thank you for your editorial comment; however, the SCPS does not believe it is necessary to move the reference to the Rules of Procedure to a footnote at this time. 7) FERC has held that only the Requirements and Applicability components of a standard are enforceable. While not required, the other components of a Reliability Standard listed in Section 2.5 are important for a complete understanding of the standard. To make clear that all of the listed components should be included in a draft standard without suggesting that they are all "required", Section 2.5 will be edited to remove the word "may". The phrase will read as follows: "The Components of a Reliability Standard include the following. . ." 8) Footnote 5 (Previously Footnote 4) has been revised to address the commenters concern as follows: [5]It is the responsibility of the ERO staff to develop compliance elements for each standard; these elements are not ~~technically~~ part of the standard but are included in the standard and referenced in this manual because the preferred approach to developing these elements is to use a transparent process that leverages the technical and practical expertise of the drafting team and ballot pool. If directed by FERC, NERC may file revisions to compliance elements following approval of the NERC Board of Trustees. 9) Thank you for your editorial comment; however, the SCPS does not believe it is necessary to alter the section and subsection headings at this time. The section and subsection numbers provide adequate clarity. 10) With respect to your comment on section 3.6, we feel the language is adequate. Additional softening of the language, as suggested, might lead to a perception that appointing a drafting team is entirely optional. No change made. 11) The intent of the proposed changes to Section 4.6 of the SPM was to expand the ability to conduct quality review in parallel with the standards development process and to allow flexibility to conduct quality review multiple times as the standard continues to develop. This may not be accurately reflected in Section 4's Figure 1. Figure 1 will be modified to make clear that quality review may begin at stage three, but may continue as needed during the remainder of the project. 12) With respect to your comment on the subjectivity of the addition of the words “or substantially revised” to describe SARs for which technical justification is required, we agree that the term is subjective; however, we don’t feel that it is possible at this time to adequately define hard criteria to define modifications to standards that are substantial enough to require technical justification. At this point in time we believe the best course is to provide the SC with the flexibility to make that decision, subject of course to the appeals process provided in Section 8. The following clarifying modifications have been made to the 3rd paragraph: a) added “or substantially revised” after “new” in the second paragraph, and b) clarified that the SC makes the

Organization	Yes or No	Question 7 Comment
determination. **13) The suggested edit to Section 4.3 is accepted. A sentence indicating that the team will also be supplemented with legal and compliance resources will be added.**		
Tacoma Power		Tacoma Power does not have any additional comments at this time. We thank you for the opportunity to provide comments and your consideration of our comments.
Response: Thank you for your comment.		
Exelon Corporation and its affiliates		Thank you for the opportunity to comment on the SPM revisions. Exelon voted affirmatively in the ballot, though as indicated by the comments, concerns remain over the revisions. Exelon's affirmative position comes from a strong desire to support the efforts of the Standards Committee and to support the pursuit of improvement to the standards development process. Exelon recognizes that some of the proposed revisions are positive: o Professional personnel - The revised language states the inclusion of technical writers, legal, compliance and facilitation support personnel. While this change in practice may have been available without the language revision, it did not occur in practice and the formal commitment to is a positive step. o Quality Review - Enabling quality reviews to occur throughout the process rather than at the end is a worthwhile flexibility so long as the SC procedure is not overly cumbersome and that other requirements for in process QR do not get in the way of standard development progress. o SAR Remand - The revisions make a process improvement to allow the SC to remand a SAR to either Staff or the requestor. These are good housekeeping improvements. However, Exelon has concerns in addition to those noted in the other questions above: o Better front end analysis - A key point raised through the SPIG evaluation process and in the comments was the need for better front end analysis. Deploying more robust input in creating the project details (scope, problem statement, foundational analysis, etc.) on which a standard project should begin could pre-empt confusion about the project objectives and avoid mission creep. A clear mission at the start saves time on

Organization	Yes or No	Question 7 Comment
		development. There is no change made to improve front end quality of the standard project foundations. o Role of Technical Committees - Another recommendation was for better utilization of the technical committees in the standards development process. The Standards Committee is limited to non-technical evaluations of technically dense standards projects. The revisions include no effective change for the role of technical committees. o Role of the RSDP - The revisions tie the SPM closely to the Reliability Standards Development Plan (RSDP). It's not clear that the plan development process is sufficient to support this strong of a tie. The RSDP process may need notable revision to be effective. As well, the RSDP may need coordination with the RISC efforts.The critical, overarching concern is that multiple efforts are underway related to standards development process improvements. This piecemeal approach risks creating more problems than improvements. In addition to the proposed SPM revisions the following other activities are underway: o The RISC is just beginning to formulate its functions both overall and in relation to standards development and the Standards Committee. o In August, the BOT tasked the SPIG to perform a phase 2 project on standards development. o In late August, NERC reconstituted the Standards and Compliance department staff with a fresh slate of employees new to NERC standards development. o At the October SC meeting, the SC added to its work development of a Standard Committee Strategic Plan and a work plan.SPM revisions are only one component of the many changes around standards development under consideration. It is more efficient to coordinate all the efforts into a single, comprehensive revision to be implemented once.In addition, while the amount of time it takes to develop a standard is cited as the primary aspect in need of improvement this approach fails to recognize that not all standards projects are the same (some will and should take more time than others) and quality should never be sacrificed for timeliness. Finally, by focusing on changing the SPM process, the SC misses the opportunity to recognize that it's not necessarily the process that is problematic, but how the projects are managed (and in ways mismanaged). There are many different ways to develop a standard under the same process. No doubt there is room for improvement in the process, in particular if

Organization	Yes or No	Question 7 Comment
		impediments exist that prevent efficiencies. However, in evaluating and revising the process without considering the implementation of the process, the improvement results may be limited. You may find that the revisions do not achieve the desired goal because they do not go to the root cause for the delays.While Exelon voted affirmatively in the ballot, the strong preference is that the SC work with the SPIG to consider SPM revisions as a piece of the other potential standards development revisions under consideration.

Response:

Thank you for your comments of support. Regarding your particular areas of concern:

1) Regarding your comment on better front end analysis - Many of the proposed modifications to the SPM were made to encourage more front end analysis and consensus building. (Such as more informal commenting, technical support, etc.) However, we agree more improvements should be made. The Standards Committee is currently exploring additional enhancements in this area. This may be addressed in either a process document that supports, but is not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.

2) The SPM currently contemplates utilization of the technical committees in various steps. No additional changes in this version are planned. However, a change in how the SPM is utilized is where further improvements will be seen.

3) Regarding the role of the RSDP, we feel that the current RSDP process is sufficient. However, the extent to which the Standards Committee utilizes this process should be re-evaluated. No changes to the SPM are being made at this time, but this issue will be considered by the Process Subcommittee.

4) With respect to your comment regarding multiple efforts we agree that coordination of efforts is important to the success of the process and the SCPS is very supportive of improved coordination of the various initiatives you mentioned. However, at the same time we are obligated to respond to the clear and unambiguous direction of the SC and the NERC Board to move forward with the proposed revisions as quickly and efficiently as possible. Note that additional revisions will likely be made and that in all cases the SCPS is committed to coordinating with all affected groups.

5) With respect to your comment that the focus should not be on changing the SPM process, please note that the proposed revisions are only one aspect of the changes being made. NERC staff are separately pursuing improvements to project

Organization	Yes or No	Question 7 Comment
management. In addition, the Standards Committee and the Process Subcommittee are currently exploring new or modifications to existing "implementing" processes and procedures to find better ways to manage the projects and teams. Your comment is noted and will be considered during the ongoing work of the Standards Committee and Process Subcommittee. **6) With respect to your comment that the SC should work with the SPIG to consider SPM revisions as a piece of the other potential standards development revisions under consideration, we can confirm that this is already being done. Note as an example, the CEAP cost effectiveness initiative that is being undertaken outside of the SPM.**		
The United Illuminating Company		The discrepancy between the ROP Section 309 requirement for an expedited action procedures and the SPM removal of the Expedited Standard Development Process section should be resolved or explained prior to approving the SPM. The ROP and the history of the SPM make clear that an Expedited Standard Development Process was required at the time of SPM drafting. Section 309 is titled Directives to Develop Reliability Standards under Extraordinary Circumstances; it is not just a Directive to develop a Standard but a Directive issued under extraordinary circumstance. A process to waive portions of the normal standard development process is not the same thing as establishing a process to expedite standards during extraordinary circumstance. Either the ROP requires modification to remove the use of an expedited standards development process, or the section titled waivers needs to incorporate explicitly a reference to an expedited standards development process, or the expedited section not deleted. UI suggests that the Expedited Section not be deleted but that it is repurposed to meet its true intent of Extraordinary Circumstances where the BOT approves development of a Standard to be effective until a=the ANSI process can be completed. In this manner the ROP does not require modification, the proposed section 16 can be established to improve efficiencies, and the extraordinary circumstance can be retained.
Response: Thank you for your comments. As you note, Section 16.0 is very similar to the currently –effective Standard Processes Manual section of the Expedited Reliability Standard Development Process. However, a Standard developed using the Expedited Reliability Standard Development Process is approved only on a conditional basis and it must *again* go through the standard		

Organization	Yes or No	Question 7 Comment
development process in order to be made permanent. The Expedited Reliability Standard Development Process provides: **If a new or modified Reliability Standard is developed, approved by its ballot pool, and subsequently adopted by the NERC Board of Trustees through this expedited process, one of the following three actions shall occur [fn27]:** **• If the Reliability Standard is to be made permanent without additional substantive changes, then a SAR and a proposed Reliability Standard shall be submitted to the Reliability Standards staff immediately after the ballot. The project shall be added to the list of approved projects and shall proceed through the regular standard development process, including balloting by stakeholders, without any intentional delay.** **• If the Reliability Standard is to be substantively revised or replaced by a new Reliability Standard, then a project for the new or revised Reliability Standard shall be added to the list of projects to be added to the Reliability Standard Development Plan. The project shall be initiated as soon as practical after the ballot and the project shall proceed through the regular Reliability Standard development process, including balloting by stakeholders, as soon as practical but within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.** **• The Reliability Standard shall be withdrawn through a ballot of the stakeholders within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.** **This is clearly redundant and a waste of resources for NERC, the industry and the drafting team. Rather than repeating the standard development process, Section 16.0 would allow a Reliability Standard to become "permanent" upon stakeholder approval.**		
WECC		the latest redline includes the deletion of the last paragraph in section 4.11. It appears that the last paragraph in section 4.11should be retained.
Response: Section 4.11 was changed and limited to Voting Positions, and as such this paragraph deletion was intentional. The parts intended to remain were moved to Section 4.10. No change made.		
PPL Corporation NERC Registered Affiliates		The PPL Companies believe that there should be a limit on the number of Additional Ballots that are required/can be performed, so that the Industry has an opportunity to appropriately affect the outcome of a Standards project through a reballot. Alternatively, there could be a procedural mechanism that would allow the industry to 'finalize' its rejection of a Standard or the need for a Standard. Section 1.4 - Under

Organization	Yes or No	Question 7 Comment
		Balance bullet it indicates "[t]he Registered Ballot Body serves as the consensus body voting to approve each new or proposed Reliability Standard, definition, Variance, and Interpretation." Suggest this be changed to "approve or reject". Also suggest adding a statement that they approve or reject retirement of a Reliability Standard, definition, Variance, and Interpretation. The PPL Companies support the changes the drafting team is making and believes that the changes will help the Standards drafting process. The drafting team has made excellent progress in refining the drafting process based upon the SPIG recommendations. In fact, the PPL Companies are committed to voting Affirmative to proposed changes that include the suggestions we have made in these comments.
Response: Thank you for your support. **Regarding the comment to limit the number of ballots, an intentional decision was made not to put an arbitrary limitation in place. While it might be clear in some cases after one or two ballots whether a standard is going to be successful, in other cases it may take much longer for consensus to arise. We believe this issue is better handled by the authority the SC has to terminate a project if it does not believe consensus can be achieved. An arbitrary limit could require a project to be restarted just as consensus is about to be reached.** **The Standards Committee is currently exploring whether there should be additional process(es), further guidelines and/or criteria for various Standards Committee decision points within the SPM such as acceptance rejection of a SAR or other drafting team output, when and how to terminate a standards development project, etc. This may be addressed a process documents or guidelines that support, but are not part of the SPM, or may be addressed in future revisions to the SPM. This matter is not ripe for inclusion in the current revision of the SPM; however, your comment is noted and will be considered during the ongoing work of the Standards Committee.**		
SERC Planning Standards Subcommittee		The present SPM has an "expedited standards development process" that was stricken. However, the ROP section 300 (Reliability Standards Development) requires that process. The SPM should retain that; without it in the SPM, NERC cannot respond to a request from a governmental authority for expedited development of a standard. The SPM therefore needs to retain that procedure, unless the SPM procedure is waived. If this provision were reinstated, the use of a waiver process

Organization	Yes or No	Question 7 Comment
		would be minimized since the expedited process would be a provision of the SPM.The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: Thank you for your comments. As you note, Section 16.0 is very similar to the currently –effective Standard Processes Manual section of the Expedited Reliability Standard Development Process. However, a Standard developed using the Expedited Reliability Standard Development Process is approved only on a conditional basis and it must *again* go through the standard development process in order to be made permanent. The Expedited Reliability Standard Development Process provides: **If a new or modified Reliability Standard is developed, approved by its ballot pool, and subsequently adopted by the NERC Board of Trustees through this expedited process, one of the following three actions shall occur [fn27]:** **• If the Reliability Standard is to be made permanent without additional substantive changes, then a SAR and a proposed Reliability Standard shall be submitted to the Reliability Standards staff immediately after the ballot. The project shall be added to the list of approved projects and shall proceed through the regular standard development process, including balloting by stakeholders, without any intentional delay.** **• If the Reliability Standard is to be substantively revised or replaced by a new Reliability Standard, then a project for the new or revised Reliability Standard shall be added to the list of projects to be added to the Reliability Standard Development Plan. The project shall be initiated as soon as practical after the ballot and the project shall proceed through the regular Reliability Standard development process, including balloting by stakeholders, as soon as practical but within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.** **• The Reliability Standard shall be withdrawn through a ballot of the stakeholders within two years of the date the Reliability Standard was approved by stakeholders using the expedited process.** **This is clearly redundant and a waste of resources for NERC, the industry and the drafting team. Rather than repeating the standard development process, Section 16.0 would allow a Reliability Standard to become "permanent" upon stakeholder approval.**		
Georgia System Operations Corporation		The Quality Review processes are not well defined.There is still confusion with respect to the VRFs and VSLs in the document and if they are or are not applicable.There is still confusion on how the RSAWs are a component of the SPDM

Organization	Yes or No	Question 7 Comment
		and whether or not due process is applicable to the RSAWs.The Waivers portion of the SPDM does not seem to be open, transparent nor provide an opportunity for public comment nor due process in developing a Reliability Standard.The SPDM does not give a clear explanation of when and how registered entities comments are consistently addressed when submitted.The timing aspects of Additional Balloting are unclear.The Interpretations language of the SPDM has undergone significant changes and industry participation is not clearly defined and seems to be limited affecting due process.Eliminating Measures is not good unless they can be moved to the RSAWs and then the industry has the right to approve the Measures.The unofficial comment form does not adequately represent the language in the SPDM. It is paraphrased in certain cases and does not adequately represent the language in the SPDM.Some of the concepts in the proposed SPDM are good but NERC needs to have a workshop on this exercise and produce a quality document for such an important component of the ERO responsibilities.

Response: Thank you for your comments.

1) Based on the majority of the comments received to the previous posting, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.

The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.

2) The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process

Organization	Yes or No	Question 7 Comment
		will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan, and the RSAW. **While the SCPS recognizes that the measures provide a level of certainty in regards to compliance obligations we do not agree that the industry is required to have the decision making authority on content of the measures. The measures are not enforceable and are therefore are not required to reside within the Reliability Standard. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)(*"The Commission disagrees with commenters that a Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements."*)** **3) In order to address your concern regarding notice to stakeholders for use of the Section 16.0 waiver, the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee has been incorporated.** **4) The changes to the Interpretations process have been implemented in order to clarify the basis and process for rejecting an interpretation, consistent with guidance issued by the NERC Board of Trustees in November 2009. Interpretations are balloted in the same manner as Reliability Standards, and through this mechanism registered entities are very much a part of the interpretation process.** **5) To the extent the changes are paraphrased in the comment form, the exact changes to the SPM are posted and available to all commenters. The Standards Committee's Communications and Planning Subcommittee will likely hold workshops and distribute information regarding implementation of changes to the SMP after the final version is approved.**
Tri-State G & T		There is inconsistency on who the drafting team works with to develop the RSAW. Section 3.6 states that the drafting team "(w)orks collaboratively with NERC Compliance Staff to develop Reliability Standard Audit Worksheets ("RSAWs") at the same time Reliability Standards are developed." But section 3.10 states that "Compliance Monitoring and Enforcement Staff are responsible for the development

Organization	Yes or No	Question 7 Comment
		of RSAWs." While this may indicate the same NERC staff, we believe that the language should be consistent.If voting "Negative without comment" is not possible (Section 4.11), then that exclusion from calculation of the consensus should be removed.
Response: The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan, and the RSAW. **The SPM will be revised to eliminate the inconsistencies associated with NERC Compliance staff involvement with the development of RSAWs.** **Participation in the NERC Ballot Pools comes with responsibility to participate and be helpful to the process. The value of any comment during the process cannot be underestimated and it is imperative to the NERC Standard Drafting Teams that they know why the entities voted negatively. The drafting teams needs this information and the industry needs to be encouraged to provide constructive comments in order to move the standards forward in an efficient manner.**		
Duke Energy		There needs to be clarity on what is actually being balloted and adopted by the Board of Trustees. Section 2.5 Elements of a Reliability Standard or section 4.9 Conduct Ballot and Non-binding Poll of VRFs and VSLs would seem to be logical places for this clarity. Are the Compliance Elements subject to ballot and adoption? Would they need to be balloted and adopted again if changed? As stated previously, Measures should be retained and should be balloted and adopted.
Response: While the SCPS recognizes that the measures provide a level of certainty in regards to compliance obligations we do not agree that the industry is required to have the decision making authority on content of the measures. The measures are not enforceable and are therefore are not required to reside within the Reliability Standard. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)("*The Commission disagrees with commenters that a*		

Organization	Yes or No	Question 7 Comment
Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements." **)**		
Independent Electricity System Operator		Typo: In section 5.2 in the redline SPM version, somewhere in the middle of the first sentence should read "... and a quality review..."
Response: There does not appear to be a typo, as multiple quality reviews may occur.		
Ameren		We are ok with having a legal review up front to develop a clear and unambiguous standard. However, we are not sure if the proposal implies one lawyer for each SDT as a member of the team or is this referring to one or two lawyers to be available to all the SDTs working in parallel and provide a review when the draft standard is approaching the final quality review of a standard.
Response: The proposed revision to Section 3.6 states that each drafting team "may" consist of a group of technical, legal, and compliance experts that work cooperatively with the support of the NERC Reliability Staff". There is no requirement for a specific number of attorneys. This language gives the Standards Committee flexibility to staff each standards development team with a mix of members that is appropriate to the particular project, including lawyers. The language indicates that the team will work cooperatively; this would include any lawyers who were appointed as members of the team. The Standard Committee's Standards Process Subcommittee is developing a guidance document for quality review that may better define the quality review process that will occur in parallel with the standards development process.

Consideration of Comments

Revisions to NERC Standard Processes Manual to Implement SPIG Recommendations

The Standards Committee Process Subcommittee thanks all commenters who submitted comments on the proposed revisions to the NERC Standard Processes Manual (SPM). The revisions to the SPM were posted for a 30-day public comment period from June 20, 2012 through July 19, 2012. Stakeholders were asked to provide feedback on the revisions to the NERC Standard Processes Manual to implement SPIG recommendations through a special electronic comment form. There were 48 sets of comments, including comments from approximately 128 different people from approximately 100 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page:

http://www.nerc.com/filez/standards/Standards_Processes_Manual_revisions_SPIG_2012.html

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President of Standards and Training, Herb Schrayshuen, at 404-446-2560 or at herb.schrayshuen@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Index to Questions, Comments, and Responses

1. In Recommendation 1, the SPIG recommended that NERC continue to meet the minimum requirements of the American National Standards Institute (ANSI) process to preserve ANSI accreditation. In Recommendation 5, the SPIG encouraged NERC to address standards process and resource issues by revising the standard development process to improve timely stakeholder consensus in support of new or revised reliability standards. This recommendation included suggestions that comment responses be bundled, and that the SDT post the draft standard for an informal comment period of 30 days but not be required to respond to comments. 10
2. As noted in Question 1, SPIG Recommendation 1 states that NERC should continue to meet the minimum requirements of the American National Standards Institute (ANSI) process to preserve ANSI accreditation. Currently, the NERC standards development process exceeds the minimum ANSI requirements in two areas that involve the treatment of Negative (No) ballots (ballots "rejecting" a standard or standards-related item, both with and without comments): 41
3. As part of Recommendation 4, the SPIG encouraged NERC to require the alignment of standard requirements/measures with Reliability Standard Audit Worksheets (RSAWs). The SPIG also recommended that NERC revise the Essential Elements of the Standards Template to eliminate redundancies. 78
4. As stated in Question 3, as part of Recommendation 4, the SPIG encouraged NERC to revise the Essential Elements of the Standards Template to eliminate redundancies, using Violation Severity Levels (VSLs) as an example. 99
5. As part of Recommendation 4, the SPIG encouraged NERC to ensure the cost effectiveness of standards through documentation of alternatives analysis. 139
6. If you have any other comments on these proposed revisions that you haven't already mentioned above, please provide them here: 162

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. **In Recommendation 1, the SPIG recommended that NERC continue to meet the minimum requirements of the American National Standards Institute (ANSI) process to preserve ANSI accreditation. In Recommendation 5, the SPIG encouraged NERC to address standards process and resource issues by revising the standard development process to improve timely stakeholder consensus in support of new or revised reliability standards. This recommendation included suggestions that comment responses be bundled, and that the SDT post the draft standard for an informal comment period of 30 days but not be required to respond to comments.**

   NERC has confirmed with ANSI that only one formal comment period is required under ANSI's process. To fulfill Recommendation 5 while remaining in accordance with Recommendation 1, the revised standard process requires only one formal comment period. The drafting team is required to respond to comments in writing prior to a Final Ballot being conducted, although the team may respond in summary form. The drafting team may offer individual responses if deemed necessary or useful for developing additional consensus. Informal comment periods and other means of gathering informal input may be employed at any time to collect stakeholder feedback, but the drafting team is not required to respond in writing to comments obtained in these forums (though they may do so if they wish).

   Do these proposed revisions adequately address the SPIG Recommendations? If not, please explain why and offer an alternative solution for improving the timely development of standards while maintaining ANSI accreditation.

Summary Consideration:

By far, the dominant concern expressed in comments to Question 1 related to the commenting process, with particular concern to the treatment of comments and information gathered through the allowed multiple informal methods to collect stakeholder feedback on preliminary drafts and ideas early in the drafting process. The SPM drafting team responded to clarify that Section 4.5 (informal feedback) provides that all written comments received (whether for formal or informal postings) will be posted and that, while drafting teams are not required to provide a written response to each individual comment received, drafting teams are encouraged, where possible, to post a summary response that identifies how it used comments submitted by stakeholders. Also, the SPM drafting team points out that a draft standard will be improved incrementally as informal input is gathered and it is expected that the draft that will be posted for the formal posting and commenting/ballot will be a more robust draft that will reflect the input that has been obtained from the industry through the multiple informal forums.

Sections 4.12 and 4.13 have been revised to clarify the requirements to consider and respond to all written comments. The proposed new Sections 4.12 and 4.13 are as follows:

4.12 Consideration of Comments

If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.

4.13 Additional Ballots

A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted.

However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.

Also, some of the comments under Question 1 reflected concern about the new waiver section 16.0, which is addressed by responses to comments received under question 6.

Other less frequent comments address the following concerns: (1) uncertainty of the CEAP as it relates to uncertainty of the role of the RISC and its relation to the SC; (2) concern that the revisions may shorten the time allowed for developing consensus but not necessarily foster consensus; (3) treatment of “no” votes, (4) automation of comment processing, and (5) rigorous project management. These topics are primarily addressed within the responses to other questions within this report.

Organization	Yes or No	Question 1 Comment
Northeast Power Coordinating Council	No	Due to the uncertainty of the CEAP and not knowing the responsibilities of the RISC at the time of this posting, it is premature to agree that the

Organization	Yes or No	Question 1 Comment
		revisions adequately address the SPIG recommendations.
Response: Thank you for your comments. Please see the responses to comments for the CEAP, which was posted for a separate comment period which ended on July 6, 2012, for your concerns about the content of the CEAP. Also, the Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC.		
IRC-SRC	No	While we agree improvements can be made to the commenting process, some safeguards are needed. For informal commenting periods, the drafting team should be obliged to post a summary of the comments received and the changes made based on the posting. For formal commenting, drafting teams need to provide a response to each unique comment during a formal comment period. Comments received during the formal commenting period need to be posted. It's not clear why this language was stricken.
Response: Thank you for your comments. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted. Additionally, information gathered during the informal comment periods will be reflected in the posted draft at the time of the formal posting. Additionally, per Section 4.5, the drafting teams are encouraged, where possible, to post a summary response, following each informal stakeholder feedback session, that identifies how it used comments submitted by stakeholders. To address concerns regarding comments received during formal commenting periods and other stakeholder's comments regarding bundling of comments and providing responses back, Sections 4.12 and 4.13 have been revised as follows: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must		

Organization	Yes or No	Question 1 Comment
communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.		
Hydro One	No	Due to the uncertainty of the CEAP and not knowing the responsibilities of the RISC at the time of this posting, it is premature to agree that the revisions adequately address the SPIG recommendations. The RISC scope must be developed and communicated so that there is a clear differentiation with respect to the roles and responsibilities that the Standards Committee currently has.
Response: Thank you for your comments. Please refer to the responses to Question 5 of the SPM comment form which is specific to the CEAP. Additional information regarding the proposed CEAP process was included in a separate comment posting from May 7, 2012 through July 6, 2012. Additionally, the Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC.		

Organization	Yes or No	Question 1 Comment
National Grid and Niagara Mohawk (A National Grid Company)	No	National Grid supports the goal of SPIG recommendation 5 to revise the standard development process to improve timely stakeholder consensus. However, the steps taken to streamline the average duration of the standard development process must be balanced with the need to allow adequate time and opportunity for stakeholder review and input. National Grid agrees that requiring only one formal comment period is an adequate way to gain process efficiency; however, this reduction in formal comment periods should be balanced with a requirement for at least one method for informal stakeholder feedback prior to the formal comment period. Because informal feedback is optional in the current draft SPM, the proposed revisions to Sections 4.5 and 4.7 permit a standard to be developed with only one formal comment period and no other opportunity for the industry to provide feedback and guidance. National Grid is concerned that this process may inadvertently result in more process delays. With the possibility of only one chance to submit feedback, the formal comments will might be overloaded and burdensome to process with information that could have been gathered informally and the need for more successive ballots may result in order to address issues raised in formal comments. National Grid understands that informal feedback is encouraged, but without a requirement, the need and pressure for faster and faster processing of standard development could easily result in a trend of abandonment of informal feedback with the result of a unintended longer process on the back end of a project. Making informal feedback a required step will guard against possibly unnecessary delay while achieving process efficiency in conjunction with the elimination of the second formal comment period. In place of the eliminated additional formal comment period, the drafting team should be required, not encouraged, to use at least one of the methods for informal stakeholder feedback that is set forth in Section 4.5. By retaining the flexibility to use a variety of informal feedback methods,

Organization	Yes or No	Question 1 Comment
		and by retaining the flexibility for the drafting team to set the deadline for informal comment periods (i.e. not requiring 30-days for informal feedback), sufficient time-savings can be achieved in the overall process, but the industry will be guaranteed at least two opportunities to weigh in. This is the most effective and fair way to meet SPIG recommendation 5. Accordingly, National Grid recommends the following edit to the first sentence of proposed draft of Section 4.5 (changes appear in italicized text): Prior to the formal comment period, drafting teams must use at least one of the following methods to collect informal stakeholder feedback on preliminary drafts of its documents: o Informal comment period(s) of duration at the discretion of the drafting team o Webinar(s) o Industry meeting(s) o Workshop(s) o Other mechanism(s) that solicit informal industry feedback in an open and transparent way. [The remainder of the draft text of Section 4.5 could remain as drafted]. With regard to permitting responses to formal comments in summary form, National Grid supports this change as a reasonable method to achieve process efficiency because the language of the draft Section 4.13 makes clear that "the drafting team must respond in writing to every stakeholder comment" and "all comments and objections must be responded to by the drafting team." As long as this language remains, National Grid supports responses in summary form. National Grid notes that drafting teams should strive to ensure that summary responses clearly correspond to comments to which they respond.

Organization	Yes or No	Question 1 Comment
Response: Thank you for your comments. The proposed changes to the informal comment period as discussed in Section 4.5 of the draft SPM continue to adhere to the ANSI accreditation requirements. Removal of the 30-day informal comment period allows the drafting team to use multiple informal information gathering forums, which does not preclude an informal comment period as determined by the drafting team, is intended to result in a draft that is more reflective of an industry consensus considering all stakeholder input. This process change would be coupled with a more rigorous project management of the drafting process, resulting in more timely completion of the standard. The decision to eliminate a required informal comment period was based on NERC streamlining the standard development process while still maintaining stakeholder input throughout the process. The SPM drafting team determined that providing the various informal gathering forums was a benefit to the industry but because each standard development project is unique, wants to preserve flexibility both in how informal feedback is solicited as well as whether a particular project calls for it. The SPM drafting team recognizes this is a change. Bundling like comments is included as a recommendation in the SPIG report to assist in streamlining the process for response of all comments by the SDT.		
Florida Municipal Power Agency	No	The reason we checked the "no" box is that FMPA believes that some level of response to comments before ballots in addition to the Final Ballot is necessary to meet the SPIG Recommendation 5 "to improve timely, stakeholder consensus" and believes the SPM ought to require the SDTs to develop summary responses to comments, bundling comments of a similar nature, for ballots prior to the Final Ballot. By not responding in summary form to bundled comments, FMPA believes that the number of ballots (which is a driver to delays in the current process) will not be reduced because entities will be left to guess at how their concerns were addressed (or not addressed) from previously submitted comments; which will likely result in negative voting. FMPA believes that the SDT ought to be required to develop summary responses to bundles of the most important comments (e.g., something less than every comment, but, comments determined to be more important in some way, such as volume of similar comments received) received in ballots other than the final ballot (Section 4.13 might be a good place for this).In addition, through deletion of a large portion of section 4.9, publicly posting of comments received from stakeholders seems to have been eliminated. FMPA believes publicly posting these comments received

Organization	Yes or No	Question 1 Comment
		important to achieving timely consensus and suggests adding words to that effect in Sections 4.7 and 4.9

Response: Thank you for your comments. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted.

Based on the stakeholder comments regarding bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM:

4.12: Consideration of Comments

If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.

4.13: Additional Ballots

A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted.

However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.

National Rural Electric Cooperative Association (NRECA)	No	Any changes made to the commenting (and balloting which will be discussed in Q2) process must be done carefully so as not to limit, or appear to limit, the ability of industry stakeholders to effectively participate in the standard

Organization	Yes or No	Question 1 Comment
		development process. This will also need to be done with caution in order to prevent and limit the number of appeals that may be submitted due to stakeholders believing their comments were not properly addressed. NRECA understands the desire to modify the Standards Process Manual (SPM) in such ways that will help to shorten the time it takes to develop a standard, definition or interpretation, etc. However, we do have concerns about some of the changes that have been proposed. The use of summary comments instead of individual responses to each stakeholder comment is a significant formal change to the SPM. While this is permitted in the current SPM for informal ballots, permitting summary comments as the only comment response required in the one and only formal comment period is new and could be problematic. First, a stakeholder may not receive a response from a SDT until the final formal comment period even after possibly submitting multiple rounds of comments. Second, a stakeholder may not have any indication how their comments were treated or responded to by the SDT since no comment responses are required until the final comment period. Third, the response they may receive may not be a direct response to their comment as it could be generically responded to in a summary comment. NRECA believes summary comments are adequate for the informal comment periods, but that individual responses to comments should be required in the final formal comment period.

Response: Thank you for your comments. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted.

The purpose of allowing SDT teams to solicit informal feedback (Section 4.5) through multiple forums is to allow for flexibility in the standard development process that enables the SDT to develop a more robust draft from one step to the next with a near final draft when a formal posting is made. As a result, the consensus developed using the information gathered during the informal feedback forums will be posted at the time of the formal posting.

The proposed changes to the informal comment period as discussed in Section 4.5 of the draft SPM will continue to adhere to the ANSI accreditation requirements. Removal of the 30-day informal comment period allows the drafting team to use multiple

Organization	Yes or No	Question 1 Comment

informal information gathering forums, which does not preclude an informal comment period as determined by the drafting team, and is intended to result in an industry consensus draft that is more reflective of all stakeholder input. This process change would be coupled with more rigorous project management of the drafting team, resulting in more timely completion of the process.

The decision to eliminate a required informal comment period was based on NERC streamlining the standard development process while still maintaining stakeholder input throughout the process. The SPM drafting team determined that providing the various informal gathering forums was a benefit to the industry but because each standard development project is unique, wants to preserve flexibility both in how informal feedback is solicited as well as whether a particular project calls for it.

Additionally, based on the stakeholder comments regarding bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM:

4.12: Consideration of Comments

If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.

4.13: Additional Ballots

A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted.

However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that

Organization	Yes or No	Question 1 Comment
significant changes are needed and an Additional Ballot will be conducted. Every comment will be responded to by the drafting team. The drafting team has the ability to bundle responses if the comments from different stakeholders address the same issues. This process is included in the proposed new version of Section 4.12 of the SPM.		
Manitoba Hydro	No	It is not clear that the proposal will "improve timely stakeholder consensus" as per Recommendation 5. The proposal will shorten the time period during which consensus must be reached, but not necessarily foster consensus.
Response: Thank you for your comments. The proposed changes will continue to adhere to the ANSI accreditation requirements. Allowing the drafting team to use multiple informal information gathering forums is intended to result in a draft that is more reflective of industry consensus with all stakeholder input. This process change would be coupled with more rigorous project management of the drafting team, resulting in more timely completion of the process.		
Pepco Holdings Inc.	No	Not in agreement with to eliminate providing summary responses to comments for each formal comment period. For the stakeholders to understand the direction and thought process of the SDT, the feedback is needed after each formal comment period.
Response: Thank you for your comments. Based on the stakeholder comments regarding bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team		

Organization	Yes or No	Question 1 Comment
		has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted. The SPM drafting team recognizes this is a change. Bundling like comments is included as a recommendation included in the SPIG report to assist in streamlining the process for responding to all comments by the SDT.
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency (IMEA) supports comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comments. Based on the stakeholder comments regarding bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team		

Organization	Yes or No	Question 1 Comment
		has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted.
Ameren	No	(1) We believe that accelerating the schedule for draft standards review at NERC's end of the process will not help stakeholder to keep up with necessary review and commenting on draft standards. While we applaud the decision to maintain the ANSI accreditation, it can be viewed that it defines a minimal set of requirements. rather than more steps in the process which may be necessary for development of the NERC Standards. Developing a quality standards in many cases just takes time and effort that may not be subject to streamlining.(2) There seems to be a conflict between the revisions in the SPM and the recommendation report from SPIG for the informal 30-day comment period. The SPIG states (Page 14, Proposed Details 2nd Bullet, ii) to post draft standard for informal 30-day comment period but the SDT does not have to respond; however, the SPM states (Page 19 section 4.5: Rationale) that drafting teams are not required to have a 30-day informal comment period. In addition to the one formal comment period, which presumably comes at the end of the standards development process just prior to balloting we request that the SDT have additional

Organization	Yes or No	Question 1 Comment
		informal comment periods earlier in the process as currently is done. (3) We have the following concerns/comments about the proposed "summary" response:a. We currently search SDT responses to comments by individual name and/or company name. If a summary reply is made, how then will we be able to find the responses to our specific comments within the "summary" response?b. What criteria the SDT will use to choose which comments not to respond to? We believe that the criteria for this activity need to be provided upfront. Also, what would happen to the submitted comments which the SDT determines not to respond to? Would those comments be published?

Response:

Thank you for your comments. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted.

The purpose of allowing SDT teams to solicit informal feedback (Section 4.5) through multiple forums is to allow for flexibility in the standard development process that enables the SDT to develop a more robust draft from one step to the next with a near final draft when a formal posting is made. As a result, the consensus developed using the information gathered during the informal feedback forums will be reflected in the posted draft at the formal posting.

The proposed changes to the informal comment period as discussed in Section 4.5 of the draft SPM continue to adhere to the ANSI accreditation. Removal of the 30-day informal comment period allows the drafting team to use multiple informal information gathering forums, which does not preclude an informal comment period as determined by the drafting team, and is intended to result in an industry consensus draft that is more reflective of all stakeholder input. This process change would be coupled with more rigorous project management of the drafting team, resulting in more timely completion of the process.

The decision to eliminate a required informal comment period was based on NERC streamlining the standard development process while still maintaining stakeholder input throughout the process. The SPM drafting team determined that providing the various informal gathering forums was a benefit to the industry but because each standard development project is unique, wants to preserve flexibility both in how informal feedback is solicited as well as whether a particular project calls for it.

The changes in the entire standard development process were developed to provide a number of improvements including the ability of the drafting team to have the flexibility to build consensus early in the process via various forums. The SPM changes have

Organization	Yes or No	Question 1 Comment
preserved the ability of the standard drafting team to use informal comment periods as needed. To further address your comments, as well as other stakeholder comments regarding summary or bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.		
Indiana Municipal Power Agency	No	Indiana Municipal Power Agency supports the comments submitted by Florida Municipal Power Agency.
Response:		

Organization	Yes or No	Question 1 Comment
Thank you for your comments. Please see the response to FMPA's comments.		
American Transmission Company	No	The SPM, as proposed, does not address all the SPIG Recommendation #5 items:Ballot process shall: o Provide options for voting "No" with guiding choices for the answer with a comment section on the ballotThis item was a major discussion point for SPIG and it is not addressed in the proposed SPM. We remind the group modifying the SPM, that the reason for the recommendation is to insure that every "no" vote would have a comment, which eliminates the need for determine if vote should be counted. Because the modification did not incorporate this recommendation completely the team has both rehashed the discussion that took place under SPIG and had to include unnecessary language about appealing "no" votes with comments. The SPIG solution must be incorporated into the SPM SPIG Recommendations modify the comment process as follows: o The SDT will post draft standard for informal comment period of 30-days, but not be required to respond to comments. o The SPIG did not recommend removal of the 30-Day comment period for informal comments, only that the SDT would not be required to respond to those comments. o Promote an automated system for managing comments.Although this modification does not belong specifically in the SPM, ATC believes that the response to this item needs to be addressed in the modifications. In addition to the above items there are a number of Recommendation 5 items that are not being addressed. The team needs to address these items in some manner as an indication that they are not being ignored. o Rigorous Project Management o SDT Model
Response: Thank you for your comments. The proposed changes to the informal comment period as discussed in Section 4.5 of the draft SPM continue to adhere to the ANSI accreditation requirements. Removal of the 30-day informal comment period allows the drafting team to use multiple informal information gathering forums, which does not preclude an informal comment period as determined		

Organization	Yes or No	Question 1 Comment
by the drafting team, and is intended to result in an industry consensus draft that is more reflective of all stakeholder input. This process change would be coupled with more rigorous project management of the drafting team, resulting in more timely completion of the process. The decision to eliminate a required informal comment period was based on NERC streamlining the standard development process while still maintaining stakeholder input throughout the process. The SPM drafting team determined that providing the various informal gathering forums was a benefit to the industry but because each standard development project is unique, wants to preserve flexibility both in how informal feedback is solicited as well as whether a particular project calls for it. The topic of 'no' votes is not included in the scope of Question #1. Please refer to Question #2 for response to comments on 'no' ballots. **Section 4.3 (Form Drafting Team)** of the proposed SPM changes includes a reference to project management expertise. The automated system, the use of rigorous project management and the SDT model do not require SPM changes in order to implement these changes. NERC staff is currently addressing these recommendations.		
ISO New England Inc.	No	While we agree improvements can be made to the commenting process, some safeguards are needed. For informal commenting periods, the drafting team should be obliged to post a summary of the comments received and the changes made based on the posting. For formal commenting, drafting teams need to provide a response to each unique comment during a formal comment period. Comments received during the formal commenting period need to be posted. It's not clear why this language was stricken.
Response: Thank you for your comments. To address your comments, as well as other stakeholder comments regarding posting and bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team		

Organization	Yes or No	Question 1 Comment
may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted. Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted.		
AECI and the G&T members Central Electric Power Cooperative, KAMO Power Cooperative, M&A Electric Power Cooperative, Northeast Electric Power Cooperative, NW Electric Power Cooperative, and ShoMe Power Electric Cooperative	Yes	However, the process should ensure that the last comment period before balloting will be a formal comment period, and each and every comment will be responded to. This could be in summary of many if similar or individually.
Response: Thank you for your comments and support. To address your comments, the following response which includes both informal and formal comment periods is provided.		

Organization	Yes or No	Question 1 Comment
Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted. The purpose of allowing SDT teams to solicit informal feedback (Section 4.5) through multiple forums is to allow for flexibility in the standard development process that enables the SDT to develop a more robust draft from one step to the next with a near final draft when a formal posting is made. As a result, the consensus developed using the information gathered during the informal feedback forums will be reflected in the version posted at the formal posting. The SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.Section 4.7 of the draft SPM requires a 45-day formal comment period with a ballot period being included in this 45-day period. This requirement meets ANSI accreditation requirements.		

Organization	Yes or No	Question 1 Comment
Western Electricity Coordinating Council	Yes	WECC supports this revision provided that the drating teams are still required to review and consider all comments received. Section 4.5 of the proposed revisions to the SPM explains that drafting teams are not required to provide responses to feedback from informal comment periods and we support this. However, WECC suggests that clarification be added that indicates the drafting teams must consider the feedback. Without the requirement to consider the feedback, there is no reason for even seeking the feedback.

Response:

Thank you for your comments and support. All comments and feedback received by the drafting team are considered and a response is provided. It is the collective decision of the team to determine what specific stakeholder input is then incorporated into the draft standard.

Section 4.5 of the proposed SPM revisions provides that information gathered from informal comment periods will be posted.

However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an additional ballot will be conducted.

Comments are responded to per the proposed new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM:

> **4.12: Consideration of Comments**
>
> If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

Organization	Yes or No	Question 1 Comment
There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13: Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.		
MRO NSRF	Yes	The NSRF does not believe the proposed revisions to the SPM addressed the SPIG Recommendations as spelled out in the SPIG Report below: Modify the comment process to: o Have the SDT post draft standard for informal comment period of 30-days, but not be required to respond to comments. o Promote an automated system for managing comments. Ballot process shall: o Provide options for voting "No" with guiding choices for the answer with a comment section on the ballot.
Response: Thank you for your comments and support. The proposed changes to the informal comment period as discussed in Section 4.5 of the draft SPM continue to adhere to the ANSI accreditation. Removal of the 30-day informal comment period allows the drafting team to use multiple informal information gathering forums, which does not preclude an informal comment period as determined by the drafting team, and is intended to result in an industry consensus draft that is more reflective of all stakeholder input. This process change would be coupled with more rigorous project management of the drafting team, resulting in more timely completion of the process. The decision to eliminate a required informal comment period was based on NERC streamlining the standard development process while still maintaining stakeholder input throughout the process. The SPM drafting team determined that providing the various informal gathering forums was a benefit to the industry but because each standard development project is unique, wants to preserve flexibility both in how informal feedback is solicited as well as whether a particular project calls for it.		

Organization	Yes or No	Question 1 Comment
The topic of 'no' votes is not included in the scope of Question #1. Please refer to Question #2 for response to comments on 'no' ballots. **Section 4.3 (Form Drafting Team)** of the proposed SPM changes includes a reference to project management expertise. The automated system, the use of rigorous project management and the SDT model do not require SPM changes in order to implement these changes. NERC staff is currently addressing these recommendations.		
Dominion	Yes	Dominion notes that the SPIG recommendations are draft at this point, so any responses to this comment form may or may not remain valid once the SPIG recommendations are finalized. Additionally, it is difficult to determine whether Question #1 is referring to SPIG Recommendation 1 and 5 or all the SPIG recommendations. Dominion assumes, for the sake of providing comments, that Question #1 is addressing SPIG Recommendations 1 & 5.
Response: Thank you for your comments and support. While the posted SPIG recommendations are identified as draft, the BOT approved the recommendations at their May 9, 2012 meeting. Yes, a subteam was assigned the task of addressing SPIG Recommendation 1 and part of Recommendation 5 which pertain to maintaining ANSI accreditation requirements and to streamlining of commenting and balloting processes. Question #1 is intended to cover the proposed revisions to the SPM that address those parts of the Recommendations 1 and 5.		
Bonneville Power Administration	Yes	BPA supports one formal comment period, BPA sees significant value in the drafting team responding individually rather than in summary form, understanding that like comments or similar comments can be grouped together. BPA believes that these changes need to be clearly communicated to the industry.
Response: Thank you for your comments and support. In agreement with your comments, the summary responses to comments must address each comment, although the format of doing so may allow the bundling of similar comments so that one response can be given to address the issues raised. The summary must be robust enough to ensure that each individual comment is		

Organization	Yes or No	Question 1 Comment
addressed.		
SERC Planning Standards Subcommittee	Yes	However, the process should ensure that the last comment period before balloting will be a formal comment period, with individual written responses to each comment submitted.
Response: Thank you for your comments and support. Section 4.7 of the draft SPM requires a 45-day *formal* comment period with a ballot period being included in this 45-day period. The drafting team must address each comment, although the format of doing so may allow the bundling of similar comments so that one response can be given to address the issues raised. If the drafting team responds in summary form, the summary must be robust enough to ensure that each individual comment is addressed.		
Occidental Energy Ventures Corp. (OEVC) and Electricity Consumers Resource Council (ELCON) together called Industrial Consumers	Yes	Occidental Energy Ventures Corp. (OEVC) and the Electricity Consumers Resource Council (ELCON) (herein: Industrial Consumers), the Sector 8 representatives of large end-use electricity consumers on the MRC, believe it essential that NERC's Standards Development process continue to meet at least the minimum ANSI requirements.However, we have two concerns which we believe are an improper translation from the intention of the SPIG recommendations to the updated Standards Process Manual. First, a vehicle must exist for the industry to request additional formal comment periods during the development of complex and/or controversial modifications to Reliability Standards. Without this provision, it is possible that project teams will make major modifications between multiple successive 10 day ballot periods - in our view, a misuse of the intent. For example, we cannot imagine that the CIP Version 5 Standards could be effectively vetted in a single formal review.Second, the legal memorandum posted concurrently with the proposed modifications essentially allows NERC to bypass the ANSI process if they deem it necessary without any threat of loss of accreditation. Although we understand that regulatory standards have inherent differences from voluntary industry-developed Standards, it goes against the partnership principals that NERC and FERC expound. Actions have consequences and it is unseemly to portray a process as communal when it

Organization	Yes or No	Question 1 Comment
		is clearly not.
Response: Thank you for your comments and support. The entire construct of the commenting and balloting process within the standard development process is designed to provide the industry a vehicle to express its concerns and to determine, through ballot, when consensus is reached. If a stakeholder does not feel consensus has been reached, they can appeal any action or inaction at any step in the process pursuant to Section 8.0 of the Standard Processes Manual. The legal memorandum posted is simply a comparison of the NERC Standards Processes with ANSI requirements and was provided solely for informational purposes. Regardless of what is stated in the memorandum the changes to the SPM were drafted with the intent of complying with the SPIG recommendation of preserving ANSI accreditation of the standards development process. The proposed modifications do not allow for NERC to bypass the ANSI process or otherwise provide NERC any authority whatsoever. As noted in the introduction, the memorandum takes no position on whether any particular changes should be made, nor does it express an opinion as to the acceptability of any particular change to the broader stakeholder community.		
Salt River Project	Yes	SRP supports the modifications to the SPM as recommended by the SPIG
Response: Thank you for your comment and support.		
Liberty Electric Power	Yes	Agree with this provision, but the Process Manual should be revised to require comments be immediately posted publicly so all entities can be informed of the views of their peers. This is especially vital considering the intent to modify the criteria for counting negative votes.
Response: Thank you for your comments and support. NERC is considering software modifications that would allow immediate posting of comments as they are received, and this could be implemented without a process change.		
Kansas City Power & Light	Yes	It is important for the Standard Drafting Team (SDT) to understand major industry concerns with a proposed standard. The suggestions in recommendation 1 to improve the process are likely to improve the process. To further strengthen the process, suggest the comments process include a method for the industry to identify “deal breakers” in a proposed standard, explain why it is a “deal breaker”, and suggest a viable alternative. Where a

Organization	Yes or No	Question 1 Comment
		"deal breaker" represents if the proposed standard is not modified, the entity cannot support the standard. This will aid the SDT to focus on the matters of most importance, consider meaningful alternatives and come to an effective and swifter resolution.
Response: Thank you for your comments and support. The entire construct of the commenting and balloting process within the standard development process is designed to provide the industry a vehicle to express its concerns and to determine through ballot when consensus is reached. Identifying "deal breakers" can certainly be helpful to the SDT and commenters are encouraged to be as specific as possible in identifying their concerns and the resolution to those concerns. The SCPS believes this can be accomplished through the established commenting process and does not believe this level of detail should be required in the SPM.		
Texas Reliability Entity	Yes	We support these revisions. However, if a commenter makes a comment or objection in an early comment period, and fails to repeat it in the formal comment period, will the comment or objection be deemed to be waived or abandoned? In Part 4.7, relating to "Formal Comment Period," we suggest adding the following provision: "To ensure full and individual consideration of a comment or objection and to preserve an issue for appeal, an entity should submit its comment or objection in the final formal comment period, even if it previously made the comment in a prior comment period (formal or informal) and the concern was not resolved."
Response: Thank you for your comments and support. The entire construct of the commenting and balloting process within the standard development process is designed to provide the industry a vehicle to express its concerns and to determine through ballot when consensus is reached.		
Independent Electricity System Operator	Yes	As long as voting remains a strong lever for adoption/rejection of a standard, we find these proposed changes acceptable.
Response: Thank you for your comment and support. Yes, voting continues to be a principal part of the process.		

Organization	Yes or No	Question 1 Comment
NextEra Energy Inc	Yes	NextEra Energy, Inc. (NextEra) agrees with streamlining the balloting and comment periods, while maintaining ANSI accreditation.
Response: Thank you for your comment and support.		
Georgia System Operations	Yes	While we encourage efficient use of resources and have no objection to responses being written in summary form, we believe it is imperative that the SPM require that every issue raised in a comment be responded to. The permission to respond in summary form cannot be used as permission not to respond to a difficult issue simply because only a single commenter raised it.

Response: Thank you for your comments and support. To address your comments, as well as other stakeholder comments regarding posting and summary or bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM:

4.12: Consideration of Comments

If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.

4.13: Additional Ballots

A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to

Organization	Yes or No	Question 1 Comment
conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted.		
Duke Energy	Yes	The change to reply to comments in summary form adequately addresses the SPIG recommendation. Duke Energy does not support the SPIG recommendation to not require responses to the comments submitted in the informal 30-day comment period, as this will make it difficult for entities to determine how or if the Standard Drafting Team used the entity's comments. The response to comments is an important tool for developing industry consensus, and providing that response in summary format should enhance the efficiency of the SDT.
Response: Thank you for your comments and support. Allowing the drafting team to use multiple informal information gathering forums, which does not preclude an informal comment period as determined by the drafting team, is intended to result in an industry consensus draft that is more reflective of all stakeholder input.		
Exelon Corporation	Yes	Exelon supports the dual goal of maintaining ANSI accreditation and streamlining the development process. Informal comment periods are useful and should be effectively utilized to gather technical and practical input at the front end of the standard development. Figure 1 implies that informal comment periods will only be used for the SAR. Section 4.5 enables SDTs to conduct informal input gathering including informal comment periods. While the specified 30-day time period has been removed, Figure 1 will be more clear if it notes the option for informal input gathering.In streamlining the process, the Standards Committee must not lose focus on how the iterative process leads to a successful final standard. The iterative process refines the standard language addressing problematic aspects over

Organization	Yes or No	Question 1 Comment
		revisions. The requirements are dynamic - a change to resolve one problem is only successful if it does not create another problem. Shortening the process is only achieved with affirmative votes. Affirmative votes depend on standard language being technically accurate for all covered functional entities, clearly understood and realistically achievable. While responding to individual's comments presents a notable workload for drafting teams, the information learned in that process is essential. The individual response makes it clear to the commenter that the SDT heard their issue and it illustrates how the SDT understood the comment. Given the diversity of system designs within the electric delivery grid, summaries run the risk of losing or diluting the technical issues raised by the industry. If summary responses are the only form of response, they must work hard to clearly respond to all points raised by commenters and do so in time for voters to digest the responses. Furthermore, comments that focus on issues prompting a negative vote are critical to the SDT effort. Commenters seek to improve the standard language at all degrees and should be encouraged to do so whether in correcting typos or raising flawed technical assumptions. It may be worthwhile to include an option for SDTs to respond individually and/or some other means to more clearly identify the objections among stakeholders that motivate a negative vote.

Response: Thank you for your comments and support. Figure 1, Step 3 (Develop Draft of Standard and Implementation Plan), includes "Collect Informal Feedback," this language is intended to apply to the entire step in the process, i.e., the development of a draft standard and implementation plan. The Standards Committee understands the iterative nature of the process and the proposed SPM changes would allow drafting teams to use multiple informal methods to iteratively improve a standard prior to posting for the initial formal comment period. This is intended to ensure that the draft that is posted is technically accurate and well-supported.

Every comment will be responded to by the drafting team. The drafting team has the ability to bundle responses if the comments from different stakeholders address the same issues. This process is included in the proposed revision to Section 4.12 of the SPM below. Standard drafting teams also have the option to respond individually to objections pursuant to the new Section 4.12

Organization	Yes or No	Question 1 Comment
included below which is replacing the previous Section 4.12 of the draft SPM: **4.12: Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.		
PPL Corporation NERC Registered Affiliated		The PPL Companies appreciates the Standards Committee's efforts to revise and streamline the Standard Development process. PPL Companies are in agreement that the proposed recommendations do adequately address the SPIG recommendations, but have the following concerns with the proposal.The proposal will reduce the opportunity that Stakeholders currently have to review and comment on standard revisions. The PPL Companies would like the Standards Committee to consider that eliminating the 30-day informal comment period doesn't provide Stakeholders with the same level of involvement in the standards process as they enjoy today. Given the often technical nature of standards and differences by region and/or company structure, the use of the informal comment period and the 30-day formal comment period has proven effective. The PPL Companies recommend that existing utilization of both informal and formal comments periods be required and the time periods be maintained.NERC's current process, which is ANSI compliant, provides that the SDT must address all comments directly. The proposal provides the SDT with ability to selectively

Organization	Yes or No	Question 1 Comment
		group comments and respond with a generic statement. The PPL Companies suggest that if a response is to be used multiple times to respond to similar comments from different entities, the response should cite which specific previous response it is referencing rather than just stating, "response above." The PPL Companies recommend that the SDT be directed to continue to provide direct responses back to each comment or accurately reference which response the SDT feedback is referencing, when grouped responses are submitted. This recommendation does not preclude SDTs from responding to similar comments in a similar manner by using the same response multiple times.

Response: Thank you for your comments and support. First, there is no intention to reduce the opportunities that stakeholders have for input; instead, the use of informal forms of input are encouraged so that before a standard is posted for a formal comment period, the drafting team has a good idea that it has uncovered all of the major technical issues and has a draft that is "final." After the 45-day formal posting, every comment will be responded to by the drafting team. The drafting team has the ability to bundle responses if the comments from different stakeholders address the same issues. This process is included in the new Section 4.12 which is replacing the previous Sections 4.12 of the draft SPM:

4.12: Consideration of Comments

If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.

2. **As noted in Question 1, SPIG Recommendation 1 states that NERC should continue to meet the minimum requirements of the American National Standards Institute (ANSI) process to preserve ANSI accreditation. Currently, the NERC standards development process exceeds the minimum ANSI requirements in two areas that involve the treatment of Negative (No) ballots (ballots "rejecting" a standard or standards-related item, both with and without comments):**

   a. **The NERC Standards Development Process considers negative votes with comments (regardless of the nature of the comment or if the comment is even relative to the standard being balloted) in both the determination of quorum and in calculating industry consensus.**

   b. **The NERC Standards Development Process considers negative votes without comments in the determination of quorum and in calculating industry consensus.**

   ANSI requirements consider negative votes with comments related to the proposal under consideration in determining quorum and the calculation of industry consensus. However, ANSI requirements do not require the consideration of negative votes accompanied by comments that are not related to the proposal under consideration, or negative votes without comments in determining industry consensus. ANSI requirements allow for negative votes to be considered only in the calculation to determine quorum.

   Thus, in the revised Standard Processes Manual, negative votes that are submitted without comment, or that are submitted with a comment unrelated to the posted standard, will be included in the determination of quorum but will not be included in the determination of consensus. Stakeholders will be given explicit guidance on submitting constructive comments to drafting teams, and they will be given an explanation if their vote and associated comment are not included in consensus (with the opportunity to appeal). This change ensures that stakeholders are encouraged to offer constructive feedback that drafting teams can use to improve draft standards and reach consensus efficiently.

   Does this proposed revision adequately address SPIG Recommendation 4? If not, please explain why and offer an alternative solution for improving the timely development of standards while maintaining ANSI accreditation.

Summary Consideration:

The Standards Committee Process Subcommittee's (SCPS) goal with this particular revision to the Standards Process Manual (SPM) is addressing several issues identified in the SPIG (Standards Process Improvement Group**)** Recommendations: 1. (*SPIG Recommendation 1 & 5*) the alignment of the ERO Standard Development Process with the ANSI requirements. A key objective in the SPIG recommendations was to ensure that ANSI accreditation is maintained for the process. ANSI currently takes the same approach with 'No" ballots and comments as the proposal incorporated in the draft revisions to the SPM. Close alignment with the ANSI standards will ensure accreditation is maintained. 2. (*SPIG Recommendation 5)* The SPIG recommendations identified a need to shorten the ERO Standard Development Process and it is the opinion of the SCPS that the best way to accomplish this is provide the Standard Drafting Teams (SDT) with the best opportunity to build stakeholder consensus. In order to accomplish this, stakeholders need to be fully engaged early in the process and need to provide meaningful comments that are helpful and constructive, which will assist the SDT in developing revisions that are responsive to the concerns of the industry and establish an adequate level reliability. It has been demonstrated in the past that early engagement of stakeholders in the process produces higher quality standards in a shorter amount of time.

Based on the comments received, the SCPS has re-examined this issue and determined that the approach for evaluating the relevance of comments requires additional clarification and has eliminated the process for reviewing the relevance of comments from the proposed revisions. However, the SCPS has retained the concept of including 'No' ballots that are not accompanied by comments in the calculation of quorum but not being counted in the calculation of consensus.

With respect to making modifications to NERC's balloting software to provide a set of standard options for balloters to choose from to indicate the reason for a 'no' vote, the Standards Committee does not believe it is appropriate to provide specific details about NERC's balloting software in the SPM. Ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details such as those in the SPIG recommendation.

In the revised balloting software that will be implemented to support a revised process, all of the options for casting a vote, and how each is counted in the determination of a quorum and in the weighted segment approval will be clearly articulated so that the entity casting the vote is fully aware that submission of helpful comments to the drafting team is critical to a successful stakeholder process for standards development. The website will clearly indicate how votes are considered and counted towards consensus and quorum.

Organization	Yes or No	Question 2 Comment
Dominion	No	The preceding discussion appears to focus on the ANSI process ascribed in SPIG Recommendation 1 while the question asks about Recommendation 4The four bullets under SPIG Recommendation 4 are not adequately addressed in the revision to the process manual. Dominion believes the ballot process and comment process should be structured in such a way that there is direct linkage between the vote (ballot) and the comments associated with the vote.
Response: The SCPS recognizes that the question asked in the comment form incorrectly identified this revision with Recommendation 4 from the SPIG report. The revisions associated with the 'No Ballot' issue are in response to recommendations 1 & 5. It is the SCPS's intent to enhance the information provided to the Standard Drafting Teams ("SDT") with helpful and constructive input to allow the team to efficiently revise a standard during its development to meet industry concerns. Based on the comments received, the SCPS has re-examined this issue and determined that the approach for evaluating the relevance of comments requires additional clarification and has eliminated the process for reviewing the relevance of comments from the proposed revisions. However, the SCPS has retained the concept of including 'No' ballots that are not accompanied by comments in the calculation of quorum but not being counted in the calculation of consensus. The SCPS believes stakeholders that vote 'No' without comment are not providing enough information to assist the SDT in revising the standard to reach consensus. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. In the revised balloting software that will be implemented to support a revised process, all of the options for casting a vote, and how each is counted in the determination of a quorum and in the weighted segment approval will be clearly articulated so that the entity casting the vote is fully aware that submission of helpful comments to the drafting team is critical to a successful stakeholder process for standards development. The website will clearly indicate how votes are considered and counted towards consensus and quorum. With respect to a linkage between the vote and comments associated with the vote, this information is available to drafting teams now and will be in the future (and this capability is not dependent on software redesign or a comment box being on the same screen as the ballot that is cast). NERC staff will be prepared via software or manual methods if necessary, to ensure that option 2 can be implemented so that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, and the linkage between the comment and ballot will be available.		
ACES Power Marketing Standards Collaborators	No	-1- In general, we disagree with the concept of not counting some negative votes. We believe all votes should be counted towards the approval rate. While it is true

Organization	Yes or No	Question 2 Comment
		that ANSI allows negative votes to not be counted, it is not appropriate, in NERC's case, to lower its current criterion to the minimum ANSI criterion. First, the current NERC criterion simply exceeds the minimum ANSI criterion and is not a violation of ANSI criteria. Second, ANSI-approved standards setting bodies develop standards that are followed for different reasons than NERC standards are. For instance, Underwriting Laboratories develops laudable standards for safety testing and certification. If UL standards are not met, a product cannot use the UL label which might affect its ability to be sold or have other ramifications. UL cannot fine the manufacturer for not following a UL standard. Third, we are not aware of any other ANSI-approved standards setting body that has the authority to enforce those standards with fines of up to $1,000,000/day/violation. Fourth, NERC having the ability to not count a negative vote, ultimately leading to a standard becoming approved and enforceable by NERC, is a conflict of interest. For these reasons, it makes sense to continue to exceed the ANSI requirement. Exceeding this ANSI requirement would also be consistent with the SPIG recommendation to continue to maintain ANSI accreditation. -2- With regard to negative votes without comment or with unrelated comments – it does not seem proper to allow these votes to count toward quorum but not toward approval. Achieving quorum tells you that there was a large enough proportion of the body that voted and had their opinion represented, but then a portion of those opinions (the negative without comment votes) are not represented. This is not a true quorum. We believe that negative votes without comment or with unrelated comments should be counted toward both quorum and approval. But if they must not be counted toward approval, then they should also not be counted toward quorum. In such a case, quorum should be recalculated after certain negative votes have been eliminated. -3- If negative votes are not to be counted, then a high bar should be established for the decision to not count the vote. If there is any doubt whether a comment is

Organization	Yes or No	Question 2 Comment
		related, then the voter should be given the benefit of the doubt, and the vote should be counted. We believe the proposed changes do have a fairly high bar (not considering our comment regarding quorum in comment 2 of this question). However, we further suggest that the primary emphasis should be on encouraging voters submitting negative votes to provide comments rather than on recalculating the ballot. For one, it is entirely possible that recalculation of the ballot will not change whether the standard is approved or not. Obviously, in this case, recalculation of the ballot provides no expedition of the standards development process. -4- As we understand the standards process, comments are no longer submitted with the ballot, but through a separate electronic formal comment process. We assume that these formal comments will be used to determine whether a negative vote was accompanied by a related comment and should count toward calculating approval. We also understand that the standards process only requires that there be one formal comment period during the entire balloting process of a standard. So in the case where a ballot results in a standard achieving approval and it proceeds to recirculation ballot (with no formal comment opportunity), then a voter who did not initially provide comments will not have the opportunity to provide comments in the recirculation ballot period to allow their negative vote to count. We suggest that the standards process allow the opportunity to provide comments, whether formal or not, at each voting opportunity so that each voter has the chance to cast a vote that will be counted. Preferably, voting and commenting should occur simultaneously as it previously had been conducted. This will further ensure that the drafting team is incented to work to gather input rather than discount negative votes. Additionally, we understand that on p. 24 of the whitepaper for this project it states that the NERC website will be rebuilt with a revised balloting page, but we still feel that the actual standards process manual should clearly reflect these elements of the balloting process. -5- Comments simply disagreeing with the need for a standard should be

Organization	Yes or No	Question 2 Comment
		considered an acceptable comment for a negative vote and the process manual should state this directly. First, the SAR is not balloted, so there is no measurable way to indicate whether there is majority support for the standard development activity. Second, the drafting team essentially makes a judgment from comments on whether the SAR has support to proceed. Historically, standards drafting teams have not been able to gauge the level of support for a standard from comments. This can be easily deduced by the fact that the vast majority of standards usually do achieve a very low number of affirmative votes during the initial ballot. For whatever reason, it is only when the standard becomes balloted that support becomes measurable. Thus, commenters could state many objections to the SAR in the comment period, and it still proceeds based on the drafting team's judgment that such comments did not relate.

Response: The SCPS does not understand why the commenter feels that this proposed revision to the SPM is not appropriate for the electric utility industry. It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. The revisions associated with the 'No Ballot' issue are in response to recommendations 1 & 5. It is the SCPS's intent to enhance the information provided to the Standard Drafting Teams ("SDT") with helpful and constructive input to allow the team to efficiently revise a standard during its development to meet industry concerns. Based on the comments received, the SCPS has re-examined this issue and determined that the approach for evaluating the relevance of comments requires additional clarification and has eliminated the process for reviewing the relevance of comments from the proposed revisions. However, the SCPS has retained the concept of including 'No' ballots that are not accompanied by comments in the calculation of quorum but not being counted in the calculation of consensus. The SCPS believes stakeholders that vote 'No' without comment are not providing enough information to assist the SDT in revising the standard to reach consensus. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are.

In the revised balloting software that will be implemented to support a revised process, all of the options for casting a vote, and how each is counted in the determination of a quorum and in the weighted segment approval will be clearly articulated so that the entity casting the vote is fully aware that submission of helpful comments to the drafting team is critical to a successful stakeholder process for standards development. The website will clearly indicate how votes are considered and counted towards consensus and quorum.

Organization	Yes or No	Question 2 Comment
With respect to a linkage between the vote and comments associated with the vote, this information is available to drafting teams now and will be in the future (and this capability is not dependent on software redesign or a comment box being on the same screen as the ballot that is cast). NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, and the linkage between the comment and ballot will be available. The website will clearly indicate how votes are considered and counted towards consensus and quorum. The website is expected to provide a ballot pool member with the ability to enter comments and reference comments provided by other ballot pool members.		
Northeast Power Coordinating Council	No	It addresses the recommendations, however we do not necessarily agree with the approach taken. The revision doesn't address when an entity refers to comments submitted by another entity. For example, NPCC votes "no" with relevant comments, and an entity votes "no", and indicates a reference those comments submitted by NPCC.
Response: The SCPS appreciates the support of the proposed revisions to the SPM. NERC already encourages entities to express support for the comments of another entity if they do not have any additional comments to add, although this is not expressly mentioned in the SPM. NERC has recently implemented a change to the standard commenting form to provide a stakeholder with the ability to indicate support for comments provided by other commenters.		
IRC-SCR	No	We have strong concerns with discounting negative votes without comments or the rejection of ballots for unrelated comments. Ultimately an individual has the right to say a standard is not needed and that no amount of tweaking will make it acceptable. The voting section is very confusing regarding abstentions and how these are accounted for in either the quorum or approval calculations. The confusion would be minimized if the current process was not changed. There was intermingling of "calendar days" and "business days" in this section. We believe the ballot body should get 10 business days to vote.
Response: The SCPS agrees with the commenter that an individual has the right to provide comments that indicate a 'standard is not needed or that no amount of tweaking will make it acceptable', provided the individual provides justification for the comments. Therefore the identified comments will in fact be counted by the latest proposal and the next revision of the manual will reflect this.		

Organization	Yes or No	Question 2 Comment
If the process revisions are implemented, the balloting website will clearly indicate how votes are considered and counted towards consensus and quorum. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS has an obligation to be responsive to the SPIG recommendations and to maintain the 'status quo' is not responsive nor does it address the concerns with SDTs having the ability to develop quality standards in a timely fashion that achieve industry consensus. The SPCS also believes that the current time requirements associated with the individual steps within the standard development process are necessary to minimize the time required for the development of standards. Extending the ballot window from 10 calendar days to 10 working days would be counter to the SPIG recommendations which are calling for improvements to shorten the process.		
Hydro One	No	Hydro One disagrees with the proposed approach for the treatment of negative votes without comments or with comments that are judged to be unrelated to the standard.We believe that while it is desirable for SDTs to know what the objections are, negative votes should be always counted for both the quorum AND the consensus result. The approach should be one of reaching out to the members with negative votes giving them ample opportunity to explain. This can be done through direct contact, modifications to the balloting software, immediate access to the comments submitted by others so they can concur and agree, etc.We recognize that some safeguards were added to the proposed SPM to allow for some of the above. However, in order to make it appear fair, a review/report/appeal process was added. The result is that ballot results will not be final until such process is completed, which could in certain cases take several months. The above will introduce delays that could in cases more than offset any time gains obtained by the efficiencies introduced in other parts of the process. We believe the ballot process must be open, simple and efficient. If the reaching out and communication initiatives mentioned above are implemented, we see no reason to change the way ballots are currently counted, that is, count ALL negative votes, including those without comments in the consensus results.If the proposal is implemented, we request that (a) software is modified to allow check-boxes to be used to indicate objections; (b) access to comments submitted by others immediately after received; (c) software should accept as valid concurrence with comments submitted by other entities; (d)

Organization	Yes or No	Question 2 Comment
		opportunity to submit comments during recirculation ballots which currently does not exist. It also raises the question on hat Criteria constitute a valid interpretation being used by NERC Standards and Legal Staff?
Response: It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. The SCPS believes that the informal and formal comment periods and the ballot periods provide the industry with ample opportunity to clearly articulate their potential opposition to a standard action. Requiring SDTs to reach out to individual negative balloters to further assess their concerns would be counterproductive to the SPIG recommendations and would significantly lengthen the development process. With respect to making modifications to NERC's balloting software to provide a set of standard options for balloters to choose from to indicate the reason for a 'no' vote, the Standards Committee does not believe it is appropriate to provide specific details about NERC's balloting software in the SPM. Ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details such as those in the SPIG recommendation. NERC is considering implementing software changes that will allow an entity's comments to be visible immediately, but the current software tools used for commenting on standards projects do not allow this to be done at the current time. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. Regarding criteria for what constitutes a valid interpretation request, NERC must rely on guidance from the NERC Board of Trustees, which issued guidance at its November 2009 Board meeting.		
AECI and the G&T members Central Electric Power Cooperative, KAMO Power Cooperative, M&A Electric Power Cooperative, Northeast	No	AECI and its' member G&T understands the reasoning for the desired change to the balloting process. However, we disagree with the changes that exclude negative votes without comment. AECI believes this process will not reduce the time to get a standard to BOT for approval. In fact with all the potential appeals and the process associated with the appeals process it will take longer for a standard to get to the

Organization	Yes or No	Question 2 Comment
Electric Power Cooperative, NW Electric Power Cooperative, and ShoMe Power Electric Cooperative		BOT for approval. If "NO" votes w/o comment are not counted they should not be counted to create a quorum. On a side note; other means to assist voters to include a no vote reason have not been proposed here even though they were discussed. The current NERC balloting process is objectionable and does not provide an adequate means to include a reason for a negative ballot. NERC has not demonstrated nor communicated adequately that this issue can be adequately managed, therefore, No votes should count.

Response: It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. The proposed revision of counting 'No' ballots toward quorum provides alignment with the ANSI requirements and supports NERC's ability to maintain ANSI accreditation, which is directly responsive to SPIG Recommendation 1. The SCPS has re-examined this issue and determined that the drafted criteria for comment evaluation requires additional clarification and will be eliminated from the proposed revisions. However, the SCPS will continue to pursue the concept of 'No' ballots that are not accompanied by comments or referenced to comments not being counted in the calculation for consensus, but will however be included in the calculation of quorum.

With respect to making modifications to NERC's balloting software to provide a set of standard options for balloters to choose from to indicate the reason for a 'no' vote, the Standards Committee does not believe it is appropriate to provide specific details about NERC's balloting software in the SPM. Ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details such as those in the SPIG recommendation.

The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process.

Finally, the appeals process in the SPM is a general appeals process that applies to every aspect of the process, and it is not necessary to reference the right to appeal in every section of the manual.

Organization	Yes or No	Question 2 Comment
MRO NSRF	No	The NSRF believes that SPIG Recommendation #4 for "Negative Votes" without comments was not addressed in the revisions to the SPM as stated in the SPIG Report below:Ballot process shall: o Provide options for voting "No" with guiding choices for the answer with a comment section on the ballot. ----------Furthermore, with a dropdown menu in place, Section 4.11 Voting Positions appeals process regarding negative ballots is not needed and should be deleted.
Response: It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. With respect to making modifications to NERC's balloting software to provide a set of standard options for balloters to choose from to indicate the reason for a 'no' vote, the Standards Committee does not believe it is appropriate to provide specific details about NERC's balloting software in the SPM. Ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details such as those in the SPIG recommendation.		
Florida Municipal Power Agency	No	FMPA supports the concept of only counting "no" votes with related comments; however, FMPA checked the "no" box because we are concerned for how the Final Ballot will be conducted. The wording of Section 4.15 and Section 4.13 seems to conflict with the ability to comment with a "no" vote on the final ballot, especially in the case where an entity changes from a "yes" vote to a "no" vote, how will they be allowed to submit a related comment since Section 4.13 states that there will be no formal comment period with the Final Ballot?Typo, this issue was identified in SPIG Recommendation 5, not 4.
Response: Thank you for your comments and support. NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate		

Organization	Yes or No	Question 2 Comment
support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details such as those in the SPIG recommendation.		
SERC Planning Standards Subcommittee	No	We disagree with the process changes that exclude "no" votes for whatever reason. We believe the existing commenting and balloting process is efficient at developing consensus.
Response: It has been identified that the NERC standards development process could be made more efficient. The SPIG solicited the industry in response to these concerns and developed the recommendations to address them. The SCPS has an obligation to be responsive to the SPIG recommendations and to maintain the 'status quo' is not responsive nor does it address the concerns with SDTs having the ability to develop quality standards in a timely fashion that achieve industry consensus. It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval.		
Edison Electric Institute	No	The handling of 'no' votes is a matter that has attracted significant attention. SPIG recommended that the ballot process should use all votes to establish quorum, and provide options for 'no' votes, including changes to the balloting and commenting process that would help useful comments. For example, many comments will briefly state a broad negative comment without showing the specific language of concern, or offering a constructive alternative that the commenter could support.The proposed process change is to disallow simple 'no' votes without comments for purposes of determining final ballot counts. It appears that the logic that moves from the SPIG recommendations to the process proposal to disallow simple 'no' votes is

Organization	Yes or No	Question 2 Comment
		based on the premise that ANSI requirements do not require consideration of 'no' votes without comments and since NERC seeks only to maintain minimum ANSI requirements, this process element is unnecessary.EEI cannot support the proposal. We understand that SPIG seeks to move the process in the direction of having the balloting and commenting process to provide as much substantive feedback as possible. Irrelevant comments or negative votes unaccompanied by comments do not offer helpful feedback, however, it should be a relatively simple matter to address such comments very quickly. EEI recommends that appropriate software changes be designed and implemented as soon as possible that will help gather more focused comments. A simple 'no' vote should be allowed to count both for determining quorum and final ballot count. Finally, somehow we need to find a way to work around the apparent timing issues for making necessary software changes. This should not be a binding constraint on making these important process changes.

Response: Gains in efficiency are sometimes incremental in nature. Although it may be true that answering a unrelated comment or superfluous comment may be relatively straightforward and quick it is nonetheless not helpful and uses resources that could be better used elsewhere. It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process.

In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. participation in the standards development process. With respect to making modifications to NERC's balloting software to provide a set of standard options for balloters to choose from to indicate the reason for a 'no' vote, the Standards Committee does not believe it is appropriate to provide specific details about NERC's balloting software in the SPM. Ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details such as those in the SPIG recommendation, and NERC agrees with EEI that the timing of software changes should not be a limiting factor in moving forward with process improvements..		
Arizona Public Service Company	No	Elimination of negative votes of any kind in calculating industry consensus will be a mistake. Particularly elimination of negative votes with comments considered to be not relevant. There are no defined criteria as to what is a relevant comment and the determination will be subjective. If two thirds of the members do not vote affirmative, the standard should not pass. Eliminating the negative votes without comments or with comments not considered to be relevant could result into a standard which has great deficiency. If a voting member votes no, it should be counted no matter what
Response: It is NERC's intent to enhance the information provided to the SDT with helpful and constructive input to allow them to efficiently revise a standard during its development to meet industry concerns. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval.		
Occidental Energy Ventures	No	Industrial Consumers are very concerned that entities that submit "No" votes without

Organization	Yes or No	Question 2 Comment
Corp. (OEVC) and Electricity Consumers Resource Council (ELCON) together called Industrial Consumers		any explanation may slow the development of certain standards. However, there is also a concern for Stakeholders that represent several affiliated NERC Registered Entities; while one Entity may be registered in the Ballot Body, the comments may be submitted under another Affiliate or through a Trade Association. There needs to be a way to add a comment in the voting process to state "see comments submitted under Company XYZ for this ballot". Similarly, there needs to be a linkage between comments provided during the review and the balloting applications. An automated solution makes the most sense and should save time and effort required by the Project Team and Industry Stakeholders alike. In addition, we are concerned that a project team can reject a commented "No" vote because the answer does not align with the question as written. We agree with the general need to ensure that negative feedback is helpful. Industrial Consumers also are very aware of the significant effort the Standards Committee Process Subcommittee (SCPS) has been taking in an attempt to develop a process by which "No" votes are considered without slowing the process. Industrial Consumers compliment the SCPS for its efforts and point out the complexity of this issue. Industrial Consumers are concerned that if this issue is not resolved to the satisfaction of all stakeholders, it could result in the rejection of the entire process. Thus, Industrial Consumers urge the Standards Committee to be very cautious in recommending SPM changes until the SC is sure that stakeholders are comfortable with the proposed changes. Industrial Consumers are not convinced that the language in the proposed changes to the SPM will be acceptable to all stakeholders.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process.		

Organization	Yes or No	Question 2 Comment
With respect to making modifications to NERC's software - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details about software.		
National Rural Electric Cooperative Association (NRECA)	No	While NRECA agrees it would be helpful if "negative" votes included some form of written support, we are concerned that judgment of whether a comment with a "negative" vote is adequate is likely to be very subjective. It will be a difficult and subjective exercise for SDTs and/or NERC to judge whether a "negative" vote comment is good enough for that vote to be counted towards the ballot result. While the process in the draft SPM provides the "negative" balloter the opportunity to provide a comment after the ballot is concluded that will allow for their vote to be counted, NRECA is concerned that the proposed SPM revisions in this topic area will be very difficult to implement without a significant number of appeals being submitted. To complicate matters, currently a balloter cannot submit a comment with an "affirmative" or "negative" vote. NRECA is not sure of the reason for this current limitation and asks when will this be corrected? Based on the preceding statements, NRECA requests that the proposed modifications to the SPM related to "negative" ballots without comment, or related comment, be deleted. At this time we believe staying with the current process is better than making changes that could be problematic.NRECA also requests clarification regarding the reasoning for removing abstentions from counting toward quorum.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated		

Organization	Yes or No	Question 2 Comment
with participation in the standards development process. With respect to making modifications to NERC's balloting software - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details about software. The method for determining quorum has been corrected to include abstentions as the current SPM does.		
Liberty Electric Power	No	Serious ethical questions arise when individuals with an interest in passing a standard decide whether a comment is "related". All negative votes should count in the balloting. Should the concept of requiring a comment survive, the manual should be modified to allow any comment for the purpose of counting the vote as a negative in the ballot calculations. There have been many cases where a comment has been rejected as beyond the intent of the SDT. These comments are germane, but are subject to rejection. Removal of subjective decisions on the validity of comments is the only fair practice.
Response: The SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Manitoba Hydro	No	The proposed revision does not address Recommendation 4, as it does not address the issues of results-based standards, cost-effectiveness of standards, alignment of RSAWs with standards or retirement of unnecessary standards. The proposed revision simply encourages constructive feedback, which may facilitate achieving "consensus", since "consensus" will essentially be redefined to exclude certain negative voters. It does not address Recommendation 4.
Response: The SCPS recognizes that the question asked in the comment form incorrectly identified this revision with Recommendation 4 from the SPIG report. The revisions associated with the 'No Ballot' issue are in response to recommendations 1 &		

Organization	Yes or No	Question 2 Comment
5.		
Con Edison	No	The revised manual needs to clarify the treatement of negative votes. For example, if an entity votes negative and references concensus comments submitted by their Regional Entity, this negative vote should be counted towards determining industry consensus. We note that in the existing ballot process there are no longer text boxes with the ballot, so how would the comment status of a ballot determined? Who decides what comments are constructive, appropriate and related (an acceptable comment) and which are not (inappropriate and unrelated)? Is there an appeal process? The SPIG must ensure that negative votes are not inappropriately disenfranchised.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. With respect to NERC's balloting software - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. In the current process, NERC can and does manually correlate comments with ballots (including comments submitted by affiliated entities – NERC must maintain an awareness of which entities are 'affiliated' in order to maintain the Registered ballot Body in accordance with the Rules of Procedure). For this reason, SPM revisions will not contain details about software.		
Kansas City Power & Light	No	Although the proposed changes reflect the ANSI process, this proposal to dismiss negative votes that have no comment or are deemed to have unrelated comments

Organization	Yes or No	Question 2 Comment
		does not reflect a representative process nor respects industry guidance. Further the "due process" that is proposed for entities to "appeal" the dismissal of a negative vote will unnecessarily burden the ballot process and result in a delay of determining industry consensus. In addition, the determination of whether a negative comment has merit will take time from the SDT and distract the SDT from the more fruitful activity of developing the standard and requirements. Recommend the current voting process remain and the proposed voting process not be implemented.
Response: The SCPS has an obligation to be responsive to the SPIG recommendations and to maintain the 'status quo' is not responsive nor does it address the concerns with SDTs having the ability to develop quality standards in a timely fashion that achieve industry consensus. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process.		
Texas Reliability Entity	No	Further clarification about when "No" votes will not be counted should be provided, per the discussion at the July Standards Committee meeting. In particular, it should be clear that any relevant comment will be accepted and the corresponding vote will be counted. Would a comment like "This standard provides no reliability benefit" be sufficient?
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		

Organization	Yes or No	Question 2 Comment
American Electric Power	No	Regarding SPIG looking into the issue of "no votes without comments", it needs to be determined exactly why these kinds of votes are being cast and what challenges they might be causing. This needs to be fully understood and communicated before any solution is proposed and discussed. Until that is accomplished, we are unable to determine whether or not the proposed changes are the best course of action. In addition, we are very uncomfortable with the concept of somehow counting "no votes without comments" toward the quorum, and yet not count them towards the vote count itself. In essence, these votes would be counted as abstaining votes. It would be unacceptable to assign "no votes without comments" a different applicability or weight than "yes votes without comments", as in the manner proposed.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The proposed revision of counting 'No' ballots toward quorum provides alignment with the ANSI requirements and supports NERC's ability to maintain ANSI accreditation, which is directly responsive to SPIG Recommendation 1. The SCPS believes that there is a distinct difference between a 'Yes' vote without comments and a 'No' vote without comments. The 'Yes' vote essentially is signifying agreement with the proposed standard action and a 'No' vote signifies or indicates disagreement with the proposed standard action. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are.		
Pepco Holdings Inc.	No	Only NO votes without any comments should not be included in the determination of outcome. If a NO vote has any comment it should be included in the quorum and the calculation.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count		

Organization	Yes or No	Question 2 Comment
toward achieving a quorum and the calculation of the approval.		
NextEra Energy Inc	No	NextEra generally favors a clear bright line that only discounts a "no" vote when no comments are submitted.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Flathead Electric Cooperative, Inc.	No	I can't support the voting change even if it may still comply with ANSI standard development requirements. The ANSI process is generally used for voluntary standards rather than for mandatory/sanctionable standards, so that going above and beyond the ANSI process to provide a broad unfettered voting pool is appropriate. Requiring "related" comments with a negative vote, but not a positive vote dilutes the voting pool for those that disagree with the proposal. Tasking drafting teams with making this distinction of what is "related" seems problematic at best. In addition, this change could violate the due process mandate in Section 215 of the FPA requires NERC "provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties" Allowing the drafting team to omit any negative vote and comment it deems not "related" does not appear to pass either a "due process" or a "balance of interests" test.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Public Service Enterprise Group	No	First, we ask whether last paragraph above should have referred to Recommendation 1 instead of Recommendation 4. Second, with the objective of maximizing

Organization	Yes or No	Question 2 Comment
		transparency, we would like to see the ballot results posted to show which ballots were rejected that meet the criteria for not counting "Negative" ballots. We believe that this information should be made public as soon as possible after the ballot window closes, even though the process in Section 4.11 for addressing a negative ballot may not be completed. If this change is made to the SPM, we would agree with the treatment of "Negative" ballots.
Response: The SCPS recognizes that the question asked in the comment form incorrectly identified this revision with Recommendation 4 form the SPIG report. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Illinois Municipal Electric Agency	No	A "No" vote should be included in both the determination of quorum and determination of consensus regardless of submittal of comment. In order to achieve better use of NERC and registered entity resources, and timely adoption of better reliability stnadards, the SDT should not be spending time asessing whether a comment is related to the proposal under consideration; i.e., critiquing the quality of a comment. NERC should also not be spending resources to develop tools to link a ballot pool member's vote to comments. The separate comment process should be adequate to provide the SDT constructive input and improve timely stakeholder consensus. If a ballot pool member appears to be abusing the ballot process, this can be addresse through other means.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Duke Energy	No	This change goes beyond the SPIG proposal to "provide options for voting no with guidance choices for the answer with a comment section on the ballot." Providing

Organization	Yes or No	Question 2 Comment
		comments is undoubtedly important to facilitating the SDT in crafting a standard that advances reliability, and increases the probability that the industry will develop the requisite consensus. For these reasons Duke Energy offers support for NERC's efforts to educate the industry on the importance of providing comments and efforts to facilitate that commenting through voting software changes. An entity's prerogative to have their vote counted, however, should not be dependent on their submittal of what are judged "related" comments.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. With respect to NERC's balloting software and "providing options for voting no with guidance choices for the answer with a comment section on the ballot" - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. In the current process, NERC can and does manually correlate comments with ballots (including comments submitted by affiliated entities – NERC must maintain an awareness of which entities are 'affiliated' in order to maintain the Registered ballot Body in accordance with the Rules of Procedure). For this reason, SPM revisions will not contain details about software.		
FirstEnergy Corp	No	1. Although FE agrees that "No votes without comments" do not help the drafting team in the development of the standard and believes all balloters should provide a comment, we do not agree with discounting "No Votes without comments" for ballot approval while counting "No Votes without comments" in calculation of the quorum. Although this meets ANSI, we believe NERC should not adopt this proposal. 2. It may

Organization	Yes or No	Question 2 Comment
		be a slippery slope to allow drafting teams to judge whether or not a comment accompanying a negative vote is relevant. Allowing this provision will only have the potential to create controversy among the industry, the drafting teams, and NERC and will not enhance the process. Although FE believes all votes should be relevant in determining ballot outcomes, at a minimum only "No votes without comments" should be excluded. This removes the subjectivity that is introduced when assessing the relevance of a provided comment. Additionally, the process described will prolong a standard development process which is already scrutinized for its ability to timely produce standards. The changes include an additional 40 days allotted for the SDT to inform NERC staff/Legal of negative votes with unrelated comments (and without comments) and the time afforded the balloter to adjust their comments. 3. The statements in sec. 4.11 are troublesome and should be revised. In the bullet item for "Negative with related comments" it states that "Comments should include guidance/input to the drafting team that would assist efforts that would make revisions to the Reliability Standard acceptable and enable an affirmative vote in a subsequent ballot." Although we tend to agree with this, it should not be mandated and suggest changing the phrase "comments should include" to "comment are encouraged to include"4. The voting process adopted by NERC will need to be adequately communicated to industry through education such as webinars so that industry ballot body members are clear on the final rules whatever they may be..
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. Thank you for your suggestion concerning industry education. It will be considered when the process revisions are approved and prior to the implementation.		
Ameren	No	(1) We do not agree with the SDT's proposal; the subjectivity in determining whether a set of comments received with a "NO" vote are relevant or not would be

Organization	Yes or No	Question 2 Comment
		problematic. At the very least, a provision is essential for those providing "NO" votes to see how their comments are handled, and for formally addressing any disregarding of such comments on grounds of irrelevance and thereby not counting "NO" vote for consensus.(2) We believe it is reasonable for SDT to expect a reason for voting "NO"; however, as the SPIG has suggested (See Page 14) - the SDT should provide guiding choices to help with the "no" vote. In this respect we suggest the SDT to provide details on this guidance. (3) In instances where, "NO" votes are disregarded for purposes of determining consensus on a standard, an extreme scenario would be where there is a little industry support for a given standard, yet it becomes an approved standard anyway. (4) We believe that 'No' votes should be considered, even if comments are not included, because everyone will need to live with standards which receive approval. (5) If the SDT recommends to discount "NO" votes for consensus, then we would request the SDT to provide details of the Appeals process.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Indiana Municipal Power Agency	No	IMPA believes that all votes should be considered when developing industry consensus on a NERC standard. If an individual from an entity takes the time to cast a vote it should be counted, regardless if it has comments or comments that are deemed not related to the proposal under consideration. An individual may not comment for a number of reasons such as a lack of time at that particular instance or they may be voting against a standard for a reason they wish not to disclose or be made public. IMPA views not counting negative votes with comments that are unrelated to the standard or interpretation as problematic. An entity may submit a comment that in their view pertains to the standard under consideration and yet NERC may consider it not related. IMPA understands there is an appeal process of the decision not to count a "no" vote with comments, but for something as fundamental as a right to cast a vote in one entity's own opinion, then having to

Organization	Yes or No	Question 2 Comment
		justify it against a potentially subjective determination is not an improvement of the process. Another point that weighs in our comment is the extra time that it would entail to appeal a rejection of a "no" vote comment on both the entity's and NERC's side. An entity may not choose that route due to time constraints already encountered due to the large volume of reliability standard work on everyone's plate. Therefore, IMPA supports counting all votes casted on a proposal under consideration and believes this to be the best solution for the timely development of standards. By not counting "no" votes with unrelated comments, an appeal process is added and could potentially hold up the standard process, especially if there is a relative high number of them.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
American Transmission Company	No	ATC's comments are a repeat of its comments from question 1.Ballot process shall: o Provide options for voting "No" with guiding choices for the answer with a comment section on the ballotThis item was a major discussion point for SPIG and it is not addressed in the proposed SPM. We remind the group modifying the SPM, that the reason for the recommendation is to insure that every "no" vote would have a comment, which eliminates the need for determine if votes should be counted. Because the modification did not incorporate this recommendation completely the team has both rehashed the discussion that took place under SPIG and had to include unnecessary language about appealing "no" votes with comments. The SPIG solution must be incorporated into the SPM In addition to the above comment, we have concerns with the way the team interpreted this clear recommendation. The proposed language fails to give clear guidance as to how "no" votes will be rejected and does not meet the intent of the NERC Board's approval of the SPIG report.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of		

Organization	Yes or No	Question 2 Comment
comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. With respect to NERC's balloting software and "providing options for voting no with guidance choices for the answer with a comment section on the ballot" - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. In the current process, NERC can and does manually correlate comments with ballots (including comments submitted by affiliated entities – NERC must maintain an awareness of which entities are 'affiliated' in order to maintain the Registered ballot Body in accordance with the Rules of Procedure). For this reason, SPM revisions will not contain details about software.		
ISO New England Inc.	No	We have strong concerns with discounting negative votes without comments or the rejection of ballots for unrelated comments. Ultimately an individual has the right to say a standard is not needed and that no amount of tweaking will make it acceptable. The voting section is very confusing regarding abstentions and how these are accounted for in either the quorum or approval calculations. The confusion would be minimized if the current process was not changed. There was intermingling of "calendar days" and "business days" in this section. We believe the ballot body should get 10 business days to vote.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to		

Organization	Yes or No	Question 2 Comment
inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. The SCPS has an obligation to be responsive to the SPIG recommendations and to maintain the 'status quo' is not responsive nor does it address the concerns with SDTs having the ability to develop quality standards in a timely fashion that achieve industry consensus. The SPCS also believes that the current time requirements associated with the individual steps within the standard development process are necessary to minimize the time required for the development of standards. Extending the ballot window from 10 calendar days to 10 working days would be counter to the SPIG recommendations which are calling for improvements to shorten the process.		
Trans Bay Cable LLC	No	I can't support the voting change even if it may still comply with ANSI standard development requirements. The ANSI process is generally used for "voluntary" standards or industry guidelines such as IEE 693, rather than for mandatory/sanctionable standards, so that going above and beyond the ANSI process to provide a broad unfettered voting pool is appropriate. Requiring "related" comments with a negative vote, but not a positive vote dilutes the voting pool for those that disagree with the proposal. Tasking drafting teams with making this distinction of what is "related" seems problematic at best. In addition, this change could violate the due process mandate in Section 215 of the FPA requires NERC "provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing reliability standards and otherwise exercising its duties" Allowing the drafting team to omit any negative vote and comment it deems not "related" does not appear to pass either a "due process" or a "balance of interests" test.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		

Organization	Yes or No	Question 2 Comment
Exelon Corporation	No	Exelon supports the EEI comments on Negative Votes and cannot support the current approach. Including all negative votes to achieve quorum but not allowing equal representation in the vote is disingenuous. Negative votes without comment may not provide input to the standard work, but negative votes may or may not be inconsistent with consensus building. The SPM does not address who and how a comment is deemed unrelated to a proposed standard. It's conceivable that broader influences may be driving a vote that may be unrelated to proposed standard language, but equally valid in determining a vote.Also at play is that the current voting system does not allow voters to submit comments with their vote. This is understandable in avoiding duplicative comments between the comment form and the ballot, but at present, votes are not easily aligned with the separately submitted comments forms. An added technical issue is that at present, no comments are allowed in a recirculation ballot. If the SC insists on only counting negative votes with comments, please confirm that that opportunity to comment will be available in the Final Ballot (section 4.14).In addition, please explain the rationale behind removing abstentions from the quorum (section 4.10). Abstentions have a separate meaning to voters. As currently worded, abstentions hold the same presence as non-responses which is contrary to the distinction.While the ultimate goal is to develop and pass Reliability Standards, this approach appears to be an attempt to "stuff the ballot box." This is contrary to representation in the full process. The technical issues are likely to be easily addressed; however, such a restriction on the use of negative votes and abstentions warrants reconsideration and a more full explanation of the management of these votes.

Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.

The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The

Organization	Yes or No	Question 2 Comment
SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. With respect to NERC's balloting software and "providing options for voting no with guidance choices for the answer with a comment section on the ballot" - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. In the current process, NERC can and does manually correlate comments with ballots (including comments submitted by affiliated entities – NERC must maintain an awareness of which entities are 'affiliated' in order to maintain the Registered ballot Body in accordance with the Rules of Procedure). For this reason, SPM revisions will not contain details about software. The calculation of a quorum has been revised to include abstentions in the same manner as the current SPM.		
Xcel Energy	No	1) We appreciate what was trying to be accomplished with this modification. However, the process to determine if an entity's comment is unrelated seems cumbersome and potentially long, plus there is the possibility that ballot results would not be final for 60+ days. Therefore, we do not see how this change would benefit standard drafting teams or NERC staff. (Nor do we feel it will speed up the process.) The Xcel Energy personnel that participate on standard drafting teams indicated that it is rare to get a truly unrelated comment anyway. So, we recommend that the negative vote be counted in the total approval count, and that the process be removed. We do agree that ballots with no comment at all should not be counted in the ballot pool approval.2) "Consensus vote", under section 1.4, should be modified to match the wording in section 4.10.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The

SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process. The calculation of a quorum has been revised to include abstentions in the same manner as the current SPM.		
Western Electricity Coordinating Council	Yes	WECC believes that the proposed revision adequately addresses recommendation 4 provided the intent is to encourage meaningful feedback to the drafting teams. WECC would be opposed to any change in this area that was intended to allow negative votes to be discounted for the sole purpose of advancing a standard by improving the approval percentage.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
SPP Standards Review Group	Yes	We don't take issue with the proposal for handling 'no' votes but would like clarification on one specific item. During discussions on 'no' votes in another arena, a question came up regarding whether a comment accompanying a 'no' vote had to be specifically with the ballot or could it be a reference to a comment from some other entity. For example, if XYZ voted no and referred to a comment submitted by SPP for its justification for that vote, would this be considered a valid 'no' vote?
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. Organization	Yes or No	Question 2 Comment
With respect to NERC's balloting and commenting software - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. For this reason, SPM revisions will not contain details about software.		
Oklahoma Gas & Electric	Yes	Assuming there is a mechanism for adding comments when casting the ballot. Previously, comments could be submitted individually using the official commenting process or as a group with those in support of the group comments providing that comment when the ballot is cast. Will this still be a mechanism or will individual comments utilizing the official comment form be required in order for a "negative" ballot to be used in the determinatio of the quorum and in calculating industry consensus? We support being able to provide a comment referencing a group's official comments as a means for casting a "negative" ballot and it being used in the quorum and consensus.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval. The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. Organization	Yes or No	Question 2 Comment
revisions will not contain details about software.		
Independent Electricity System Operator	Yes	It appears to be a fair attempt to focus the standard drafting and adoption process
Response: Thank you for your comments. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.		
Georgia System Operations	Yes	The revision addresses the SPIG recommendation; however we disagree with the revision and the recommendation for the following reasons:We do not believe that it will improve the Standards Development Process. We believe that the vast majority of "no" votes without comments are expressing fundamental disagreement with the standard. This belief is based on the fact that if an entity has a specific item they would like changed it is to the entity's benefit to make a comment requesting the change, but if the entity disagrees with the need for the standard, there is no benefit to the entity in making a comment. Accordingly many entities that are currently voting "no" without comment will now simply vote "no" and state a philosophical disagreement. Hence there will be no significant change in the process or result.We believe the phrasing of the question reveals a fundamental shortcoming in the proposal which is the assumption that the only valid comments are those that are helpful in modifying the language of the standard to make it acceptable to the commenter. It is perfectly acceptable (and protected by ANSI) for an entity to express fundamental disagreement with the core intent of a standard and base a "no" vote on a philosophical comment to that effect. It is disturbing that the question refers repeatedly to "constructive" comments but never mentions comments expressing philosophical differences with the approach the SDT has taken. We are concerned that there would be a tendency to omit or downplay entities' rights to make such comments in order to improve the likelihood of standards being approved.Restricting a person's right to vote is simply un-American (we cannot speak

Organization	Yes or No	Question 2 Comment
		for our Canadian neighbors, but it is our understanding that it is a fundamental issue there as well). In this country we go to great lengths to ensure that every person's vote is counted. It goes against our instincts to propose eliminating votes on what many will see as a technicality. We feel it will do far more to damage NERC's reputation and create mistrust throughout the industry than it will do to improve the efficiency of the standards development process. Because of the necessary appeals procedures, this proposal will in fact extend the standards development process and make it less efficient.Alternative measures would be more effective at increasing the number of comments than this proposal without the negative side effects. One possible approach would be to modify the on-line forms to encourage comments by enabling users to give input by selecting options (e.g. standard is not clear enough, cost to benefit ratio is too high, do not believe standard will improve reliability, agree with approach but disagree with specific values or thresholds) as well as free-form comments.

Response:

Thank you for your comments. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count toward achieving a quorum and the calculation of the approval.

The SCPS believes stakeholders that vote 'No' and provide no comment are not supplying helpful guidance to the SDT. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. The SCPS believes that when the entity signifies that they will participate in the standards action ballot (i.e., joins the ballot pool), that entity assumes the responsibilities associated with participation in the standards development process.

With respect to NERC's balloting software and "providing options for voting no with guidance choices for the answer with a comment section on the ballot" - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. In the current process, NERC can and does manually

Organization	Yes or No	Question 2 Comment
correlate comments with ballots (including comments submitted by affiliated entities – NERC must maintain an awareness of which entities are 'affiliated' in order to maintain the Registered ballot Body in accordance with the Rules of Procedure). For this reason, SPM revisions will not contain details about software.		
ReliabilityFirst	Yes	ReliabilityFirst notes that the revised SPM does not address how negative ballot cast without comments, or with unrelated comments during the recirculation ballot are to be handled. For example, if a Ballot Pool member changes their vote from Affirmative to Negative during a recirculation ballot, are they required to submit comments along with the vote? Since the recirculation ballot is the final ballot, it would seem that comment would not be required (i.e. regardless of the negative comment, the SDT is not allowed to change the standard). The revised SPM is silent on this issue. I today's environment, comments are not even collected during the recirculation ballot. ReliabilityFirst recommends adding additional language to clarify how a negative ballot cast without comments, or with unrelated comments during the recirculation ballot are to be handled.
Response: NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff are prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question. In the current process, NERC can and does manually correlate comments with ballots (including comments submitted by affiliated entities – NERC must maintain an awareness of which entities are 'affiliated' in order to maintain the Registered ballot Body in accordance with the Rules of Procedure). For this reason, SPM revisions will not contain details about software.		
Bonneville Power Administration	Yes	
National Grid and Niagara Mohawk (A National Grid Company)	Yes	

Organization	Yes or No	Question 2 Comment
Salt River Project	Yes	
City of Austin dba Austin Energy	Yes	
Essential Power, LLC	Yes	
PPL Corporation NERC Registered Affiliated		The PPL Companies appreciate the Standards Committee's efforts to revise the voting process to streamline and reduce cycle time in the voting process. The PPL Companies do have concerns with the "negative comments test" to determine if comments are "related" to the proposal under consideration and question if these modifications will significantly reduce the time needed for the standard development. Even if the proposed process is implemented, the lack of rigorous criteria for deciding whether comments are "unrelated" appears to complicate the review of negative comments. As stated in ANSI Essential Requirements: Due process requirements for American National Standards,Â§2.7 2., "[Standards Developers] shall record and consider . . . negative votes accompanied by comments of a procedural or philosophical nature." (Emphasis added). Assigning the "negative comments test" to the Standard Drafting Team introduces opportunity for bias in that these persons, having considered their product to be ballot-ready, can reasonably be expected to be hoping for a positive outcome. It is unclear to the PPL Companies how the decision will be made to reject unrelated comments. A definitive and transparent process is needed to establish how comments will be evaluated.The requirement that ballot results will not be finalized until all appeals are evaluated and decided appears to add complexity that could delay the development of standards. This would be inconsistent with the stated intent of providing a more rapid development of standards.
Response: In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. No votes with comments of any kind would count		

Organization	Yes or No	Question 2 Comment
toward achieving a quorum and the calculation of the approval.		

3. **As part of Recommendation 4, the SPIG encouraged NERC to require the alignment of standard requirements/measures with Reliability Standard Audit Worksheets (RSAWs). The SPIG also recommended that NERC revise the Essential Elements of the Standards Template to eliminate redundancies.**

   To address these recommendations, the revised Standard Process Manual eliminates measures from the standard template in favor of having drafting teams work with ERO compliance staff to develop more detailed RSAWs in parallel with the standard.

   Does this proposed revision adequately address SPIG Recommendation 4? If not, please explain why and offer an alternative solution for addressing the SPIG's Recommendations with respect to RSAWs and the Essential Elements of the Standards Template.

Summary Consideration:

We appreciate all of the comments provided on the first draft of SPM changes. In analyzing the comments, there was much support for the move of measures to RSAWs. There was also concern expressed about industry involvement and much of the concern seemed to be generated by lack of information provided on the process that would be used to develop the RSAW. While the SPIG recommendation does not specifically suggest removal of the measures from the standard it does *state "Ensure clarity on reliability objectives and compliance obligations.*

i. SDT is responsible for the development of the standard including requirements and measures.

ii. Compliance staff will develop RSAWs (that will be used in the auditing of compliance) in conjunction and coincident with the development of the standard."

Typically RSAWs have been developed by compliance staff after FERC has approved a reliability standard with no involvement of standard drafting teams or industry. Many of the existing measures included in standards today are nothing more than a repeat of the requirement which offers little value to registered entities or compliance auditors. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. The SDT has access to the SC to voice concerns that they have with the standard development process which would also include the companion RSAW development process. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.

There was also some views expressed about who has the final say on the measures and that currently the SDT and industry have the final say. We believe this concern is alleviated by the process envisioned and the fact that the measures are not enforceable. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)*("The Commission disagrees with commenters that a Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements."*

There was also some question about the transition to the new process. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. In addition, the SDT for COM-003-1 has been working with Compliance Staff to produce a RSAW for the revised standard. This is in its final stages today and the next posting will include the draft standard and the draft RSAW. The new process would be used to develop RSAWs for standards that are being revised or new standards that are being developed.

Organization	Yes or No	Question 3 Comment
Dominion	No	The question is not aligned with the language of SPIG Recommendation 4. The revisions to the SPM provide little to no mention of the four bullets under SPIG Recommendation 4. Dominion supports the retaining the measures as developed by the drafting team.
Response: Thank you for your comment. While the SPIG recommendation does not specifically suggest removal of the measures from the standard it does *state* ***"Ensure clarity on reliability objectives and compliance obligations.*** ***i. SDT is responsible for the development of the standard including requirements and measures.*** ***ii. Compliance staff will develop RSAWs (that will be used in the auditing of compliance) in conjunction and coincident with the development of the standard."***		

Organization	Yes or No	Question 3 Comment
The SDT and compliance staff will work together to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period and may be balloted with a non-binding poll similar to what is done with the VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. Other bullets under Recommendation 4 do not require SPM revisions and are being pursued concurrently (reference the CEAP process and the Paragraph 81 Project).		
IRC-SCR	No	We agree that too much time and effort is spent on some of the compliance elements. The proposal appears geared more to taking the industry out of the process rather than saving total work (particularly for changes to the RSAW after the drafting team has been disbanded). We can't see how there is savings of work if a measure is crafted in an RSAW vs. a standard. Perhaps this could be explained better.If NERC moves to RSAWs rather than Measures, NERC needs to use input from the drafting team. The drafting teams also need some mechanism to voice concerns to the Standards Committee if their input is not used. Finally, NERC needs a transition approach to use present work in progress by drafting teams.If measures are retained, they should be included in the standard as opposed to the RSAW. This will support objectivity and is reflective of a consensus position developed in the standards process.
Response: Thank you for your comment. Typically RSAWs have been developed by compliance staff after FERC has approved a reliability standard with no involvement of standard drafting teams or industry. Many of the existing measures included in standards today are nothing more than a repeat of the requirement which offers little value to registered entities or compliance auditors. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The SDT has access to the SC to voice concerns that they have with the standard development process which would also include the companion RSAW development process. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process may also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the		

Organization	Yes or No	Question 3 Comment
approved reliability standard, the implementation plan and the RSAW. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. The new process would be used to develop RSAWs for standards that are being revised or new standards that are being developed.		
MRO NSRF	No	The NSRF does not agree that the revisions to the SPM address SPIG Recommendation #4 regarding RSAWs. The SPM revisions fail to address the RSAWs altogether including the when and how RSAWs are developed and their review and approval process. A very good RSAW can only be developed upon full approval from the Commission. The Essential Elements of the Standard should include the relationship of RSAWs to the drafted Standard.
Response: Thank you for your comment. While the SPIG recommendation does not specifically suggest removal of the measures from the standard it does *state* ***"Ensure clarity on reliability objectives and compliance obligations.*** ***i. SDT is responsible for the development of the standard including requirements and measures.*** ***ii. Compliance staff will develop RSAWs (that will be used in the auditing of compliance) in conjunction and coincident with the development of the standard."*** We agree that the SPM should address RSAW development; we believe that rather than including the RSAW relationship to the draft standard in the Essential Elements section, it is more appropriate to include language in the section that addresses the Standard Drafting Team responsibility. (Section 3.6) It is not the consensus view that a very good RSAW can only be developed upon full approval of a standard by the Commission. A very good RSAW will be the result of the collaboration of the SDT (subject matter experts) and Compliance Staff. We do agree however that the RSAW may need to be reviewed if the Commission's action on a standard requires substantive change.		
Florida Municipal Power Agency	No	FMPA supports the approach in concept; however, we checked the "No" box because we are concerned with the change of authority concerning who has final say on "Measures". With the new approach, portions of the RSAW will essentially replace the need for Measures in the standard. Currently, the SDT and industry have final say on the Measures. With this approach, Compliance Staff will essentially have final say on the Measures. FMPA understands that certain portions of the RSAW need to remain under the authority of Compliance Staff; however, FMPA believes that the

Organization	Yes or No	Question 3 Comment
		portion of the RSAW that essentially replaces Measures ought to be under the authority of industry through the SDT and balloting.FMPA is also concerned about transition. RSAWs take time to develop; how will the transition from the way we do it now to this new method occur?
Response: Thank you for your comment. While you are correct on the current "final say" on measures being with the SDT and industry through the development and balloting, the measures are not enforceable. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)***("The Commission disagrees with commenters that a Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements."***) The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. In addition, the SDT for COM-003-1 has been working with Compliance Staff to produce a RSAW for the revised standard. This is in its final stages today and the next posting will include the draft standard and the draft RSAW. The new process would be used to develop RSAWs for standards that are being revised or new standards that are being developed.		
SERC Planning Standards Subcommittee	No	While RSAWs developed in parallel is a good idea, measures should remain with the standard. Since there is a potential for the measures to modify requirements, they should remain subject to industry approval.
Response: Thank you for your comment. We appreciate your desire to keep the measures in the standard. However, the measures are not		

Organization	Yes or No	Question 3 Comment
enforceable. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)***("The Commission disagrees with commenters that a Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements."***) The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.		
Occidental Energy Ventures Corp. (OEVC) and Electricity Consumers Resource Council (ELCON) together called Industrial Consumers	No	Industrial Consumers agree that that RSAWs should be posted (but not voted) with draft standards for industry review and comment. Industrial Consumers also believe that RSAWs should be developed collaboratively by the SDTs and NERC compliance staff - not by having "drafting teams work with ERO compliance staff." The language in the proposed changes to the SPM does not recognize this nuance and gives too much authority to the compliance staff. It is our understanding that the Measures, which are presently in the Reliability Standards, will transition to the RSAWs. If an entity disagrees with an RSAW, such entity will need to vote "no" for the Standard, as the Measures must be vetted through the process, as they are today. To the extent that posting RSAWs makes them consistent with the applicable Standard, then there should be no need for Compliance Application Notices (CANs) and CANs should then be eliminated under this process.
Response: Thank you for your comment. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. We will revise the language in the SPM to reflect that intent. The RSAW will be posted for industry review and comment along with the reliability		

Organization	Yes or No	Question 3 Comment
standard during the final 45 day comment/ballot period. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. In addition, the SDT for COM-003-1 has been working with Compliance Staff to produce a RSAW for the revised standard. This is in its final stages today and the next posting will include the draft standard and the draft RSAW. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. We agree that with the collaborative development of the RSAW and a well written results-based standard, the need for CANs should be eliminated.		
National Rural Electric Cooperative Association (NRECA)	No	NRECA does not agree that adequate support has been provided for the elimination of Measures and replacing those elements with a vague role for SDTs in the development of RSAWs. It is unclear what the roles are for NERC staff and SDTs as it relates to the development of RSAW language. In addition, without knowing the role for SDTs, we are unsure if this will be a time saving change for the SPM. We request that further details be provided in this area so stakeholders can make an informed decision on this issue.
Response: Thank you for your comment. We recognize the concern expressed about the lack of information provided on the process that would be used to develop the RSAW. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. We will revise the language in the SPM to reflect that intent. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.		
Manitoba Hydro	No	The proposed revisions could potentially address Recommendation 4, but it depends on how the RSAWs will be modified. Also, we are concerned that if the measures become part of the RSAWs they will no longer be subject to industry voting/approval and that the measures listed in the RSAWs will have no formal industry check in place

Organization	Yes or No	Question 3 Comment
		to ensure that they are aligned with the original intent of the requirements.
Response: Thank you for your comment. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. If a standard is later revised, the RSAW will also be revised using the same process. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. In addition, the SDT for COM-003-1 has been working with Compliance Staff to produce a RSAW for the revised standard. This is in its final stages today and the next posting will include the draft standard and the draft RSAW.		
Kansas City Power & Light	No	Something that clearly dictates what is required for a demonstration of compliance and the data retention required is an important part of the standards process. This information provides the necessary guidance to enable those with the task to demonstrate compliance the information necessary to do so and for those with the task to determine compliance the guidance to do so. The white paper suggests this should be accomplished in the development of the RSAW in parallel with the standard development in replacement of the current measures in the standards. It is immaterial whether a description of what is needed to demonstrate compliance and data retention is in the standard or the RSAW as long as it is part of the standards process for industry approval and sufficiently described. The proposed Standard Process Manual does not sufficiently describe the framework that the RSAW should be nor does the proposed Standard Process Manual stipulate the RSAW should be included in standards process.
Response: Thank you for your comment. We agree that it does not really matter where the measure resides as long as it is clear and reflects the intent of the SDT. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The		

Organization	Yes or No	Question 3 Comment
new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. If a standard is later revised, the RSAW will also be revised using the same process. Details about the framework for RSAW development are not appropriate for inclusion in the SPM. However, sections 3 and 4 of the SPM have been revised to clarify the partnership of the SDT and compliance staff in the development of the RSAW. The Standards Committee has many procedure documents that reflect processes that are used in the development of standards. It is currently envisioned that the SC and Compliance staff will develop a process document that will reside on the Standards Webpage.		
Georgia System Operations	No	GSOC is ambivalent regarding the elimination of Measures. To us the key is not where information is found, but that: 1) the information is well documented and useful to entities and 2) that there is a clear understanding of its purpose and limitations. The proposed changes to the SPM introduce references to RSAWs but do not adequately state the purpose and limitations of RSAWs. It needs to be made very clear that the requirements will remain the only enforceable language and that the intended meaning must be conveyed by the requirements themselves without reference to the RSAW. We are concerned that we may merely be trading poorly written measures for poorly written RSAWs. Wherever this information is located it should provide examples of the type of information an auditor might expect to see as proof of compliance while making clear that it is not a limitation on what evidence can be used.Wherever the information is located, we agree with specifying situations where an attestation would be appropriate, but this should not preclude submitting an attestation in a situation where it is not specified because it is impossible to foresee every scenario. We disagree with specifying what non-compliance would look like; we believe that is beyond the scope of an RSAW. It is the entity's responsibility to show compliance to the standard. Non-compliance should simply be the failure to show compliance.There should be a process for later changes to the RSAW without SDT input (by NERC compliance staff) with some level of review (SC approval perhaps) and an opportunity for industry comment.
Response: Thank you for your comment. We agree that it does not really matter where the measure resides as long as it is clear and		

Organization	Yes or No	Question 3 Comment
reflects the intent of the SDT and provides useful information. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. If a standard is later revised, the RSAW will also be revised using the same process.		
Public Service Enterprise Group	No	Measures" were previously approved by the RBB, the NERC board, and regulatory authorities. We do not object to measures being incorporated into RSAWS provided that the this SPM draft is revised to give the RBB the opportunity to provide comments on the RSAWs (a) in parallel with the standard development and (b) at any time RSAWs changes are proposed.
Response: Thank you for your comment. The RBB will have the opportunity to provide comments on the RSAWs. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. If a standard is later revised, the RSAW will also be revised using the same process.		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency (IMEA) supports comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comment. While you are correct on the current "final say" on measures being with the SDT and industry through the development and balloting, the measures are not enforceable. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)***("The Commission disagrees with commenters that a Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels***		

Organization	Yes or No	Question 3 Comment
of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements.") The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. In addition, the SDT for COM-003-1 has been working with Compliance Staff to produce a RSAW for the revised standard. This is in its final stages today and the next posting will include the draft standard and the draft RSAW. The new process would be used to develop RSAWs for standards that are being revised or new standards that are being developed.		
FirstEnergy Corp	No	1. Section 3.5 indicates NERC Staff will develop the RSAWs with assistance from Drafting Teams "as needed". We are not clear as to when and how these RSAWs are developed. FE believes this activity would be most efficient and effective in parallel with the development of the requirements of the standard. The SDT should always be involved and not "as needed" and the RSAWs should be part of the standard document with a non-binding poll on the RSAWs. We suggest some parameters and discussion be developed in the process as to how RSAWs are developed and if a non-binding poll similar to VRF/VSL will be used.2. FE would like to point out our support of the information in section 2 that clearly specifies the enforceable elements of a standard that are subject to sanctions. We appreciate this additional clarity.
Response: Thank you for your comment. We recognize the concern expressed about the lack of information provided on the process that would be used to develop the RSAW. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. Sections 3 and 4 of the SPM have been revised to clarify that the SDT and compliance staff will work together to develop the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The		

Organization	Yes or No	Question 3 Comment
new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.		
Ameren	No	(1) We believe that the SDT to develop the RSAW is a step in the right direction, but we are not sure whether or not the RSAW would subsequently go through industry review and the ballot process. If not, we recommend that everything that is involved with a standard and what is needed to comply with a standard's requirements (that is, Measures) should be encapsulated within the standard document itself. If the RSAWs are developed at the same time as the standards, we recommend keeping the RSAW language in line with the standards requirements and measures, but the measures need to remain within the standards. Any potential for measures to modify standard requirements should be addressed in the standards development process, where there is industry review and the commenting process is in place. (2) Will the entire SDT be involved in the RSAW development or will this be delegated to a sub group?
Response: Thank you for your comment. We recognize the concern expressed about the lack of information provided on the process that would be used to develop the RSAW. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. It will be up to each combined group how they want to go about developing the RSAW, i.e. subgroup or not, as with other elements of the standard currently, but in the end, the RSAW that is posted for review and comment will be the consensus of the entire team. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. If the measures in the RSAWs have be written such that industry believes that they modify the requirement, the industry should comment so that the SDT and compliance can review and correct any problems before the RSAW is finalized. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.		

Organization	Yes or No	Question 3 Comment
Indiana Municipal Power Agency	No	Indiana Municipal Power Agency supports the comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comment. While you are correct on the current "final say" on measures being with the SDT and industry through the development and balloting, the measures are not enforceable. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. American Transmission Company	No	ATC does not agree that the revisions to the SPM address SPIG Recommendation #4 regarding RSAWs. The SPM revisions fail to address the RSAWs altogether including the when and how RSAWs are developed and their review and approval process.Furthermore, the Essential Elements of the Standard should include the relationship of RSAWs to the drafted Standard.
Response: Thank you for your comment. While the SPIG recommendation does not specifically suggest removal of the measures from the standard it does *state* ***"Ensure clarity on reliability objectives and compliance obligations.***		

Organization	Yes or No	Question 3 Comment
		i. SDT is responsible for the development of the standard including requirements and measures. ii. Compliance staff will develop RSAWs (that will be used in the auditing of compliance) in conjunction and coincident with the development of the standard." We agree that the SPM should address RSAW development; we believe that rather than including the RSAW relationship to the draft standard in the Essential Elements section, it is more appropriate to include language in the section that addresses the Standard Drafting Team responsibility. (Section 3.6) The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.
Exelon Corporation	No	The role of measures and RSAWs going forward is very confusing. The language in the proposed SPM divorces the compliance component from the standard development; however, it's not clear how NERC will ensure that the relevant context and intent of the standard is reflected in the compliance components. Furthermore, removal of the measures takes away a stable piece of the standard that enables entities to build a compliance program based on predictable measures. Compliance components must be developed in tandem with the standard language to capture context and intent of the standard and to create a stable compliance measure. There is value in developing an RSAW within the standard development process if it achieves creating one RSAW to be used by all regions and does not change over time. Many questions remain about the concept of RSAW development in parallel with standard development - will they be BOT approved, will they change, who can change them, etc. Until it is clear how RSAW development will transpire, the measures component should not be dropped from the standard development. This is a matter of NERC creating credible compliance elements that respect the standard language as written and intended and that are stable over time.
Response: Thank you for your comment. We recognize the concern expressed about the lack of information provided on the process that would be used to develop the RSAW. The new process will have the SDT and compliance staff working collaboratively to		

Organization	Yes or No	Question 3 Comment
develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. If the measures in the RSAWs have been written such that industry believes that they modify the requirement, the industry should comment so that the SDT and compliance can review and correct any problems before the RSAW is finalized. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. If a standard is later revised, the RSAW will also be revised using the same process.		
Xcel Energy	No	1) Evidence Retention is being removed as an Element of a Reliability Standard. We assume this will be moved into the RSAW, along with measures. Since there is mention of the drafting team assisting in the development of RSAWs, it would be helpful to provide a short list of items that shall be included in the RSAW, such as evidence retention requirements.2) The last sentence of the first paragraph under section 3.5 needs modification. Currently, it states that the drafting team will assist in the RSAW development "as needed". We disagree that the drafting team's participation be at the discretion of NERC staff. Instead, it should be clarified that the drafting team will actively participate in the development of the RSAW. Furthermore, since they own the technical content in the standard, their perspectives on the technical aspects of the RSAW should also be given significant consideration.
Response: Thank you for your comment. Yes, evidence retention will become part of the RSAW. It is not appropriate for the SPM to include details about the framework for RSAW development. Language will be included in the next revision to reflect the partnership of the SDT and compliance staff in the development of the RSAW. The Standards Committee has many procedure documents that reflect processes that are used in the development of standards. It is currently envisioned that the SC and Compliance staff will develop a process document that will reside on the Standards Webpage. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. The language in the SPM will be revised to reflect that intent and clarify that it is not “as needed”. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process		

Organization	Yes or No	Question 3 Comment
will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.		
ACES Power Marketing Standards Collaborators	Yes	We do not object to this change, but ultimately, we believe that standards should be written clearly enough that neither measures nor RSAWs are even needed. If they truly are needed and must be used, then we also would like to emphasize the need to ensure that RSAWs provide real guidance on what compliance and non-compliance looks like. If they become like the measures and just repeat the requirements, they will not be effective. Some current RSAWS fit this category and offer little guidance because they just repeat what is in the requirements. We would also like to express the concern that removing the measures in favor of RSAWs could potentially make the guidance provided in them less accessible to auditors and also make them less likely to consider it good guidance on the standard. We suggest providing a link in the standard to the RSAWs (perhaps where the measures used to be), making the guidance more accessible. In fact, all guidance that NERC would like entities and auditors to use for compliance should be linked from the standard.
Response: Thank you for your comment and support. Typically RSAWs have been developed by compliance staff after FERC has approved a reliability standard with no involvement of standard drafting teams or industry. We agree that many of the existing measures included in standards today are nothing more than a repeat of the requirement which offers little value to registered entities or compliance auditors. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Some transition has already begun with the development of the RSAWs for PER-005, FAC-003-2 and COM-002-2a. The compliance staff has sought input from the industry and members of the previous drafting team on these new RSAWs. In addition, the SDT for COM-003-1 has been working with Compliance Staff to produce a RSAW for the revised standard. This is in its final stages today and the next posting will include the draft standard and the draft RSAW. The COM-003 SDT has reported that the collaborative effort in development of the RSAW so far has helped them develop more clear and precise requirements. NERC is reviewing and updating it tools and processes and consideration of links will be part of that process.		

Organization	Yes or No	Question 3 Comment
Hydro One	Yes	We request that RSAWs are subject to the same Quality Review that is currently used for Standards.
Response: Thank you for your comment and support. We believe that it is more important that the RSAW be carefully reviewed by industry during the comment period.		
AECI and the G&T members Central Electric Power Cooperative, KAMO Power Cooperative, M&A Electric Power Cooperative, Northeast Electric Power Cooperative, NW Electric Power Cooperative, and ShoMe Power Electric Cooperative	Yes	AECI agrees with the concept in theory. What that means is that some measure to a requirement needs to be available prior to balloting. Therefore if the RSAW is available to review prior to balloting on the standard then we support the proposed revision. However, if the RSAW is not available prior to balloting, then the measures need to stay within the standard. AECI assumes that the RSAWs would go out for comment and non-binding ballots.
Response: Thank you for your comment and support. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. If the measures in the RSAWs have be written such that industry believes that they modify the requirement, the industry should comment so that the SDT and compliance can review and correct any problems before the RSAW is finalized. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW. If a standard is later revised, the RSAW will also be revised using the same process.		
SPP Standards Review Group	Yes	We like the suggestion for using the SDT to develop RSAWs. However, there is an apparent lack of consistency between the revised SPM and the whitepaper. On page 10, the last sentence in the first paragraph of Section 3.5 indicates that NERC staff will determine whether to use the SDT to assist with the RSAW development. Yet on page 8 of the whitepaper, the last paragraph under Recommendations more strongly

Organization	Yes or No	Question 3 Comment
		suggests that SDTs will be used in the development of RSAWs. We prefer the later. We also suggest that requirements be written with sufficient specificity such that determining compliance would not have to rely heavily on the RSAWs.
Response: Thank you for your comment and support. The new process will have the SDT and compliance staff working collaboratively to develop the RSAW at the same time the standard is being developed to ensure the intent of the SDT is accurately reflected in the RSAW. Compliance staff assigned to work with the SDT will be identified at the beginning of each standard project. Section 3.5 of the SPM has been revised to clarify this relationship. The RSAW will be posted for industry review and comment along with the reliability standard during the final 45 day comment/ballot period. The new process will also include a non-binding poll of the ballot pool to help gauge industry support of the RSAW similar to what is done for VRFs and VSLs today. The final RSAW will be presented to the BOT for information as part of the package that includes the approved reliability standard, the implementation plan and the RSAW.		
Bonneville Power Administration	Yes	BPA is in support of the drafting team assisting with the creation of the RSAW to further clarify the intent of the standard throughout the industry's implementation and compliance monitoring.
Response: Thank you for your comment and support.		
National Grid and Niagara Mohawk (A National Grid Company)	Yes	Because measures are not an enforceable aspect of the standard, National Grid supports their removal from the standard. Additionally, National Grid views RSAWs as an effective tool for maintaining auditable compliance and for facilitating the audit process. It makes sense for the RSAWs to be developed in conjunction with the standard to ensure that RSAWs truly track the actual requirements of a standard without adding to or changing them. National Grid cautions against attempting to include examples, factors, specific suggestions for meeting compliance etc. in RSAWs because these types of elements can trend toward changing the actual requirements of a standard or suggesting to auditors a more limited scope of enforcement than the

Organization	Yes or No	Question 3 Comment
		language of a standard permits. The lessons learned in attempting to develop VSLs should inform the RSAW drafting process - i.e. it is impossible to preemptively determine all possible methods of compliance, and attempting to develop examples or factors that are not expressly set forth in the actual requirements can lead to overly restrictive enforcement practices during and audit. The requirements of a standard should be clear enough to permit for compliance, even if the requirements allow for multiple methods to achieve compliance. The RSAWs should simply track and reflect the actual requirements of a standard , and drafting the RSAW in conjunction with the standard should better ensure this outcome. National Grid agrees that RSAWs should not be submitted to FERC for approval along with the standard.
Response: Thank you for your comment and support.		
Independent Electricity System Operator	Yes	As long as measures or similar guidance on how compliance will be assessed is provided, we are indifferent as to where that information is included.
Response: Thank you for your comment and support.		
NextEra Energy Inc	Yes	NextEra agrees with moving the measures/examples of evidence to meet compliance to the RSAWs.
Response: Thank you for your comment and support.		
Duke Energy	Yes	Duke Energy supports the ongoing efforts to revise the RSAW content and process, utilizing the expertise of the Standard Drafting Teams and the industry, providing transparency that should result in clearer communication of auditing intent and

PPL Corporation NERC Registered Affiliated		The PPL Companies agree with the changes made to Section 3. Section 3.0 states: "The only mandatory and enforceable components of a Reliability Standard are the: (1) applicability, (2) Requirements, and the (3) effective dates. The additional components are included in the Reliability Standard for informational purposes, to establish the relevant scope and technical paradigm, and to provide guidance to Functional Entities concerning how compliance will be assessed by the Compliance Enforcement".This revision to the Standard Process Manual constitutes a global change which should eliminate CANs. From this point forward, the only guidance provided on Reliability Standards will be contained in the standards. If additional guidance is needed, the industry shall utilize the Interpretation process as defined in this Manual.The PPL Companies support creating the RSAWs in parallel with the standards. The provisions to allow for quality reviews to be conducted in parallel with standard development should be beneficial. Proposed changes to RSAWs should be required to go back to the Standards Development Team for approval to ensure that the changes are consistent with the intent of the SDT.
Response: Thank you for your comment.		

4. **As stated in Question 3, as part of Recommendation 4, the SPIG encouraged NERC to revise the Essential Elements of the Standards Template to eliminate redundancies, using Violation Severity Levels (VSLs) as an example.**

   To address this Recommendation, the revised Standard Process Manual eliminates VRFs and VSLs from the standard template in favor of a Sanction Table Reference (Results-Based Requirement Category Reference) to conserve drafting team and stakeholder resources and ensure consistency in the application of sanctions.

   Does this proposed revision adequately address SPIG Recommendation 4? If not, please explain why and offer an alternative solution to revise the Essential Elements of the Standards Template to eliminate redundancies such as VSLs.

Summary Consideration: The Standards Committee Process Subcommittee's (SCPS) goal with the proposed revision to the Standards Process Manual (SPM) eliminating the Violation Risk Factors (VRF) and the Violation Severity Levels (VSL) would address several issues identified in the SPIG (Standards Process Improvement Group**)** Recommendations:

1. *SPIG Recommendation 4 Standards Product* speaks to how standards will be developed and areas where the quality of standards can be improved. Specifically, the recommendations identify the VSL, within the Essential Elements of a Reliability Standard, as a potential candidate for revision. Recommendation 4 also encouraged the use of the Results-Based Standard (RBS) philosophy.

2. *SPIG Recommendation 5 Standards Development Process and Resources* identifies a need to shorten the ERO Standard Development Process and it is the opinion of the SCPS that the development of VRFs and VSLs establishes a significant burden on the Standard Drafting Team (SDT), which in turn lengthens the standard development process.

Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.

The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects, and will consider suggestions provided in the comments below as part of that consideration. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders)

to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.

Organization	Yes or No	Question 4 Comment
Dominion	No	SPIG Recommendation 4 does not directly discuss revising the Essential Elements of Standards Template to eliminate redundancies such as VSLs. The topic is however discussed in the document titled: Standard Processes Manual Revisions: SCPS White Papers for Background Information.

Response: The SCPS is acting in good to faith to address the SPIG recommendations and respectfully disagrees with the commenter in that the SPIG Recommendation (4) states the following:

The Board is encouraged to require that the standards development process address:

- The use of RBS;
- Cost effectiveness of standards and standards development;
- Alignment of standards requirements/measures with Reliability Standards Audit Worksheets (RSAWs); and
- The retirement of standards that are no longer needed to meet an adequate level of reliability.

The SPIG report further identifies areas where the overall recommendation is proposed to be applied. These details include the following:

- Revise Essential Elements of the Standards Template to eliminate redundancies such as Violation Severity Levels (VSLs).

Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.

The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best

Organization	Yes or No	Question 4 Comment
manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Northeast Power Coordinating Council	No	The title of the tables should be changed to 'Operations' Sanctions Table Guidelines, 'Cyber Security' Sanctions Table Guidelines, and 'Planning' Sanctions Table Guidelines. Are these three tables intended to encompass all standards?
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
IRC-SCR	No	We agree there is much wasted effort with regard to VRFs and VSLs. But it appears the proposal is to take one confusing process and replace it with another confusing process that has less industry input. The approach needs to be simplified such that it can be explained on a single page each for VRFs and VSLs. We also have concerns with the proposed sanctions tables that are associated with this proposal. For each category, the proposed sanction should expand from zero to the maximum determined by the risk-outcome combination. To do otherwise complicates the FFT and spreadsheet NOP process (it requires additional documentation to prove why the sanction is less than that allowed by the table).
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-		

Organization	Yes or No	Question 4 Comment
binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Hydro One	No	The title of the tables should be changed to 'Operations' Sanctions Table Guidelines, 'Cyber Security' Sanctions Table Guidelines, and 'Planning' Sanctions Table Guidelines. Are these three tables intended to encompass all standards? What about FAC, MOD, PRC, etc. standards?
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Western Electricity Coordinating Council	No	WECC appreciates the opportunity to comment on the NERC Standards Committee Process Subcommittee (SCPS) Proposal related to the elimination of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). From a Standards Development perspective, WECC agrees that the proposed revision adequately addresses SPIG Recommendation 4. The concept of a predefined set of Sanctions Tables, one for Operations Requirements, one for Planning Requirements, and one for Cyber Security

Organization	Yes or No	Question 4 Comment
		Requirements, with each including four violation levels for Performance-based, Risk-based, and Capability-based requirements, would greatly reduce the burden on and the time required of the drafting teams in developing the individual VSLs for each requirement of a standard. The proposed revision would also force the drafting teams to consider the language and content of each requirement helping ensure a results-based requirement that was Performance-based, Risk-based, or Capability-based was drafted. It would also greatly reduce the time expended by the industry in reviewing and commenting on VSLs during the drafting period. In addition, it would do away with the time and effort required to revise VSLs during drafting if the requirements had to be revised based on stakeholder feedback. All of these are positives and have the potential to greatly reduce the amount of time it takes to develop a new or revised reliability standard.However, form an enforcement perspective WECC has concerns. WECC Enforcement staff understands the value in reducing the burden imposed on Standards Drafting Teams; however from an enforcement perspective, WECC Enforcement staff believes the proposed Sanction Table and accompanying procedural changes create unnecessary challenges with enforcing Reliability Standard Violations. The proposed Sanction Table is a significant change in Compliance Enforcement operations and may require considerable procedural, process, and personnel staffing alterations. Therefore, WECC provides the comments below in order to specify a number of concerns, from an enforcement perspective, with the SCPS Proposal and to propose alternative solutions to achieve a desirable outcome. WECC Enforcement staff coordinated the development of these comments with the Texas Reliability Entity (TRE) and WECC understands that TRE supports the position reflected by these comments, but we do not speak for TRE.From an enforcement perspective, WECC has the following concerns:1.The language associated with the proposed levels in the Sanction Table is ambiguous, broad, and imprecise. Furthermore, the thresholds to get to Level 3 and Level 4 are unreasonably high. The increased hurdle to reach such upper levels in combination with the periphrastic language supporting each proposed level creates unnecessary challenges when implementing the SCPS Proposal. The SCPS Proposal is a move to

Organization	Yes or No	Question 4 Comment
		more ambiguous, broad, and imprecise language than that in existing VSLs. Such ambiguous, broad, and imprecise language denies the regulated industry as well as WECC Enforcement staff clear and concise direction in the enforcement of the NERC Reliability Standards. 2.The Sanction Table will lead to inconsistent implementation and delay violation processing. Given the ambiguity described in (1), inconsistency in penalty assessments will likely increase throughout all Regional Entities. Similarly, the proposal will provide challenges when comparing the body of FERC-approved violations (and work-in-progress) with future violations enforced according to the proposed Sanction Table. There is nothing in the SCPS proposal regarding how Regional Entities, NERC, or FERC will ensure transparent or consistent outcomes. Violation severity levels (or their replacements) should ensure uniformity and consistency among all Standards in the determination of penalties.3.The SCPS proposal overstates problems associated with enforcing violations using the active VSLs. Currently, there are a few problems with specific VSLs; there is not a problem with all VSLs. WECC Enforcement sees an opportunity to fix some VSLs, e.g., there is an opportunity to provide additional granularity given the limited levels associated with a subset of Reliability Standards, including, for example, the CIP Standards. 4.The SCPS proposal resembles a one-size-fits-all solution to a problem that requires nuance and careful, deliberate application. Every enforceable violation presents with a unique fact pattern. The proposal takes a mechanical, simplistic approach to risk. Any proposal in this dynamic NERC Reliability Standard regulatory environment that attempts to use such an approach requires careful examination prior to implementation. 5.This is a significant change for Compliance and Enforcement. If a change of this magnitude is made, WECC Enforcement recommends having more discussion and exploring the alternatives, some of which are proposed below, before such a significant process change is implemented. WECC Enforcement Staff provides the following as possible alternative solutions1.Complement and Supplement Existing ProcessWECC Enforcement staff does not see major problems with the VSLs, VRFs, or the existing Base Penalty Table. WECC Enforcement staff does, however, see a problem with a few specific VSLs that could be fixed relatively quickly. In this light,

Organization	Yes or No	Question 4 Comment
		there is value in maintaining the status quo with consideration or emphasis given to only a small subset of VSLs or VRFs. Therefore, WECC Enforcement staff proposes maintaining the status quo be considered an effective option. However, WECC Enforcement staff further proposes that Regional Enforcement personnel could provide recommendations to the drafting teams where Enforcement has already identified problems with existing VSLs. This will reduce any undue burden on the Standards Drafting Teams while also gaining the benefits that come from working within an existing, known, process. 2.Develop Expedited Process WECC Enforcement staff appreciates the Standards Drafting Teams concerns that they are spending entirely too much time drafting VRFs and VSLs. To address this concern, WECC Enforcement staff proposes that the Regional Enforcement Staffs, particularly the Enforcement Sanction and Mitigation Working Group (ESMWG), provide recommendations to the Standards Drafting Teams to improve the VRFs and VSLs. Further, the ESMWG could also review proposed VRFs and VSLs, which could streamline the creation of new VRFs and VSLs. The Commission previously directed NERC to develop VSLs "either through the Reliability Standards development process or through another expedited process" (emphasis added). In that context, there is an opportunity for currently existing working groups, e.g., the ESMWG, to provide for the other "expedited process" that the Commission may desire. At present the ESMWG is comprised of NERC and Regional Enforcement managers and leaders. The ESMWG representatives are uniquely positioned to take on this role. Specifically, the ESMWG representatives ultimately implement, enforce, and defend VRFs and VSLs in all enforcement actions. In the Western Interconnection, WECC Enforcement has resolved nearly 2000 violations with FERC. In each case, WECC Enforcement reviewed the violation facts and circumstances and applied a VSL and VRF in each applicable case. As stated in (1), WECC Enforcement staff has determined a few specific VSLs could be fixed relatively quickly. WECC Enforcement staff made this determination based on their experience resolving violations with Registered Entities, NERC, and FERC. The approach also ensures some level of continuity is maintained throughout the drafting or revision processes, as Regional Enforcement Departments are fully

Organization	Yes or No	Question 4 Comment
		staffed with full-time, long-standing employees. Thus, while new Standards Drafting Teams may always be necessary, there would be a reduction in the development or re-learning process associated with each team as such teams can rely on a stable knowledge base (i.e., Regional Enforcement personnel). 3.Continue Existing Work in this AreaWECC Enforcement staff notes that significant work has taken place in the continued development of streamlined methods for VSL drafting since the Standards Drafting Teams first identified the burden. WECC Enforcement staff believes that the enforcement staffs of each of the eight Regional Entities agree that the previously proposed "pro forma" VSL approach is not a workable solution. WECC Enforcement staff also recognizes furtherance of related work on this project may achieve the desired results of the SCPS Proposal (i.e., eliminate the burden associated with VRF and VSL drafting). For example, following the failure of the pro forma VSL proposal, WECC Enforcement staff understood the next project to include template-based VSLs with associated fill-in-the-blank verbiage. Furtherance of template-based VSLs that allow for the unique nature of specific requirements is likely to lead to consistent VSLs and a reduced drafting and resource burden on the Standards Drafting Teams, with minimal noticeable change in processes or compliance approach.In conclusion, WECC Enforcement staff is supportive of providing relief to Standards Drafting Teams, however we suggest NERC, Regional Entities, and the regulated industry ensure a successful transition to such a drastic change, rather than be forced into a tight deadline. Given the concerns outlined above, if NERC and industry adopt and move to implement the SCPS Proposal, WECC Enforcement staff requests that Regional Enforcement personnel take ownership of the proposed Sanction Table and work in concert with NERC Enforcement personnel to craft fair and reasonable language in support of the respective Sanction Table levels.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.		

Organization	Yes or No	Question 4 Comment
The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
MRO NSRF	No	SPIG Recommendation #4 regarding the example of eliminating the VSLs did not imply they should be replaced by Sanction Tables. The recommendation was a temporary solution on the redundancies. The VSLs should remain until the Sanctions Tables are vetted properly through the proper channels, with NERC Compliance and Stakeholders.The NSRF supports the ultimate removal of the VRFs and VSLs from all Standards in the future once the proposed Sanction Tables are vetted and approved through all required channels.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Edison Electric Institute	No	EEI understands that the proposal framed in the NERC process subcommittee 'white paper' and the proposed draft process manual to be that VRFs and VSLs would no longer be defined as 'essential elements' of a standard, and would no longer be attached to projects with non-binding polls, thus relieving drafting teams of a certain

Organization	Yes or No	Question 4 Comment
		task. In addition, a 'sanctions table' has been proposed as a replacement for the existing base sanctions table contained in the Compliance Monitoring and Enforcement Program (CMEP) manual.SPIG recommended the 'elimination of redundancies such as VSLs.' On the surface, the draft proposed process changes would seem to agree with the underlying process efficiency objective. However, the proposal is confusing for several reasons. First, the white paper simply does not state that VSLs and VRFs will no longer be developed, only suggesting that they will not be developed as part of a drafting team project scope. We may misunderstand the discussion paper, however, we see no alternative process proposal for the development of VSLs and VRFs, and it is important to have a clearer understanding of where and how these variables will be defined.Second, SPIG did not recommend the development of a sanctions table. While we understand that there have been informal discussions on developing such a table, the addition of this material to the SPIG project does not fit with our sense of 'eliminating redundancies.' In addition, the white paper seems to conflate the VSL/VRF process issue with the development of the sanctions table. Certainly, SPIG did not recommend the development of a sanctions table. Third, stakeholders have not actively participated in the setting of enforcement policies and practices, having developed an understanding that NERC did not want to cultivate a perception that stakeholders had an undue influence over such practices. CMEP and the sanctions guidelines were developed with very little stakeholder involvement. VRFs, VSLs, the sanctions guidelines, and their application by NERC and the regions is not well understood. Also, we understand that some standards drafting teams have become very apprehensive about compliance and enforcement matters, becoming worried over how various language might be interpreted by compliance and enforcement. If now there is interest in having a more comprehensive discussion on the overall structure of compliance and enforcement as set forth in CMEP, including various enforcement strategic policies and practices, EEI welcomes that discussion. The nature of enforcement as a tool for properly aligning reliability risks with performance, and creating a structure of strong incentives for avoiding poor performance via enforcement, is a long overdue

Organization	Yes or No	Question 4 Comment
		discussion.Alternatively, if the current proposed approach continues to be included in the SPIG implementation 'package,' EEI notes that the proposed sanctions table contains several ambiguous characterizations such as 'could adversely impact reliability,' which invites potential endless debate if and when such a table were ever to be implemented. Similarly, in the cybersecurity section of the table, the term 'other' is undefined and potentially unbounded. Instead of much needed efficiency and cost savings in compliance and enforcement, implementation of this terminology invites the opposite, that is, endless arguments over whether a particular violation or set of violations "could" have imposed systemic reliability risk. At the very least, the sanctions table needs much further analysis and refinement and should therefore be removed from consideration in the SPIG-related matters. Also, the process for developing VRFs and VSLs needs to be described since it is unclear whether or how these will continue to be developed.In addition, proposed Section 3.9 of the process manual is unnecessary since the role of the Compliance and Certification Committee (CCC) is already defined elsewhere the Rules of Procedure and its own committee charter. The CCC charter also appears to be broadly defined to enable the committee to comment on the enforceability of proposed standards. Committee charters should be complete and self-contained, and not scattered throughout the NERC library of governance and process documents.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		

Organization	Yes or No	Question 4 Comment
Occidental Energy Ventures Corp. (OEVC) and Electricity Consumers Resource Council (ELCON) together called Industrial Consumers	No	Industrial Consumers agree that VRFs and VSLs should be eliminated, but only over the longer term. We all agree that the crafting of risk factors and severity levels under the present process is cumbersome and time consuming. However, this is a reflection of the complexity of equating reliability activities across a wide range of process, planning, and operational functions. In addition, continual refinements have been made over the five years that violations of the Reliability Standards have been subject to penalties - resulting in a level of consistency that is understood by all involved. Further, Industrial Consumers commend the SCPS for its work in developing the "Sanctions Table." The concept appears to have validity. However, it is far from a proven concept. For example, the criteria are high-level and could leave too much discretion to NERC to determine the basis and size of the penalties. It seems that a smaller step should be taken first to establish a level of comfort with the industry - perhaps a limited field trial of the Sanctions Table process. Thus, Industrial Consumers strongly recommend that the SPM not include any mention to the "Sanctions Table."
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
National Rural Electric Cooperative Association	No	After reviewing the draft SPM, NRECA still has questions regarding the elimination of VSLs/VRFs and effectively replacing them with Type of Requirement and Level 1 through 4 violation criteria. How is the proposed Sanctions Table qualitatively

Organization	Yes or No	Question 4 Comment
(NRECA)		different from the current Base Penalty Amount Table? Who will make the determinations in the proposed Sanctions Table to determine the penalty range - NERC/RE staff alone, or with an active role for the SDTs during the standard development process? What is the basis for monetary amounts used in the Sanctions Table?When answers are provided to these questions NRECA will be better able to determine whether it supports these changes.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Manitoba Hydro	No	The maximum penalties appear too high. Specifically, Capability-based requirement pose minimal risk to the bulk electric system and should have lower or no penalties associated with them. Also, it is not clear whether each requirement would be pre-assigned as belonging under Level 1, 2, 3, or 4, or whether this assessment would take place after the violation. If the first instance is true, this would allow less discretion is assessing the extent to which a requirement was violated.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. Kansas City Power & Light	No	The problems and effort required by the SDT and the industry with the current method for VRF and VSL are well stated in the White Paper. The current proposal to eliminate the current VRF and VSL with the "Operations Sanctions Table" is not recommended. The proposed "Sanctions Table" will be subject to debate and interpretation and will be make it difficult to administer and apply. This could lead to an increase in entities and NERC with differences of opinion of the impact of a violation and the subsequent sanction and penalty and lead to an increase of time spent by entities and NERC in appeals. Although it is understood the current process to develop VSL's requires thoughtful consideration and effort, there are some activities in the standards process that are worth the time and effort. The current method for a VSL clearly defines the boundaries for failures and leaves little room for debate and interpretation. There is much value in that for NERC and entities. Further, the current method for VSL's is in direct alignment with performance based requirements. Recommend the current method for VSL's be retained to maintain clarity and avoid interpretation, inconsistent application and ambiguous treatment.The White Paper expresses problems that have been associated with the development and application of VRF's. Although the current method for VRF's may be problematic, this potentially could be overcome with training and education. The White Paper suggested a consideration to increase the number of VRF's from 3 to 5. This would unnecessarily encumber the current process even further and is not recommended. The concepts of requirements that are "Performance Based", "Risk Based", or "Capability Based" and the descriptions of these in the Proposed Standard Manual are attractive. The definitions for these are clear and provide boundary that is useful. Recommend NERC consider replacing the VRF with these as they are well defined and could be directly applied to well written requirements and would help to

Organization	Yes or No	Question 4 Comment
		eliminate the ambiguity and inconsistent application of the current VRF's.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Texas Reliability Entity	No	(1) We do not understand this SPIG proposal, because we do not view VSLs as "redundancies" (redundant with what?). Furthermore, we do not understand how replacing VRFs and VSLs with the proposed Sanction Table addresses the SPIG concern - it merely replaces one process with a different but similar process.(2) We suggest that the proposal to replace VRFs and VSLs should be presented separately from the other SPM revisions and should not be part of the broader SPM revision project. The VRF/VSL proposal will unduly complicate this fast-track project. If presented as a separate project, the proposal to replace VRFs and VSLs can be evaluated on its own merits, and it can be debated deliberately and with due consideration to all of the pertinent issues and alternative approaches.(3) Texas RE understands the value in reducing the burden imposed on Standards Drafting Teams; however, Texas RE believes the proposed Sanction Table and accompanying procedural changes create unnecessary challenges with enforcing Reliability Standard Violations. The proposed Sanction Table represents a significant change in Compliance Enforcement operations and may require considerable procedural, process, and personnel staffing alterations. (4) The language associated with the proposed levels in the Sanction Table is ambiguous, broad, and imprecise.

Organization	Yes or No	Question 4 Comment
		Furthermore, the thresholds to get to Level 3 and Level 4 are unreasonably high. The increased hurdle to reach such upper levels in combination with the indefinite language supporting each proposed level creates unnecessary challenges when implementing this proposal. (5) This proposal would be a move to more ambiguous, broad, and imprecise language than that in existing VSLs ("expected to adversely impact," "could impact," "unlikely to contribute"). Such ambiguous, broad, and imprecise language denies the regulated industry as well as the regional entities clear and concise direction in the enforcement of the NERC Reliability Standards. The Sanction Table will lead to inconsistent implementation and delay violation processing. (6) Similarly, the proposal will provide challenges when comparing the body of FERC-approved violations (and work-in-progress) with future violations enforced according to the proposed Sanction Table. There is nothing in this proposal regarding how Regional Entities, NERC, or FERC will ensure transparent or consistent outcomes. Violation severity levels (or their replacements) should ensure uniformity and consistency among all Standards in the determination of penalties. This proposal resembles a one-size-fits-all solution to a problem that requires nuance and careful, deliberate application. Every enforceable violation presents with a unique fact pattern. The proposal takes a mechanical, simplistic approach to risk. Any proposal in this dynamic NERC Reliability Standard regulatory environment that attempts to use such an approach requires careful examination prior to implementation. This is a significant change for Compliance and Enforcement. If a change of this magnitude is made, Texas RE recommends having more discussion and exploring additional alternatives before such a significant process change is implemented. (7) Texas RE does not see major problems with the existing VSLs, VRFs, or the existing Base Penalty Table. Texas RE does, however, see a problem with a few specific VSLs that could be fixed relatively quickly. In this light, there is value in maintaining the status quo with consideration or emphasis given to only a small subset of VSL or VRFs. Therefore, an alternative proposal is that maintaining the status quo be considered an effective option. However, Texas RE further proposes that Regional Enforcement personnel could provide recommendations to the drafting teams where Enforcement

Organization	Yes or No	Question 4 Comment
		has already identified problems with existing VSLs. This will reduce any undue burden on the Standards Drafting Teams while also gaining the benefits that come from working within an existing, known, process. (8) To address the concern that Standards Drafting Teams are spending too much time and effort drafting VRFs and VSLs, Texas RE proposes that the Regional Enforcement Staffs, particularly the Enforcement, Sanction and Mitigation Working Group (ESMWG), could provide assistance and recommendations to the Standards Drafting Teams in writing and improving the VRFs and VSLs. (9) How does NERC intend for the proposed "Sanction Table reference" for each requirement to be treated in the revised SPM process? Will it be separate from the standard, like VRFs and VSLs are now, and subject to independent NERC and FERC revision; or will it be a full part of the Reliability Standard that is subject to ballot body approval and not subject to revision by NERC and FERC?
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Pepco Holdings Inc.	No	It is not clear with the new sanction tables and the elimination of the VRFs and VSLs, how a determination of a violation would be determined.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have		

Organization	Yes or No	Question 4 Comment
been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Georgia System Operations	No	We do not believe the changes to the SPM are clear enough to adequately address the SPIG recommendation. We agree that VSLs are in many cases not helpful and that a fundamental change needs to be made instead of fine tuning, but the current proposed revision does not provide enough information to provide a thorough response. More detail is needed on how the Sanction Table would be used. Our understanding is that the SDT would only provide input on the appropriate row of the Sanction Table for each requirement, and that the appropriate column would be determined after reviewing the facts surrounding the actual occurrence. We agree with that approach, but there is nothing in the SPM to indicate that this is actually how it would work. Also, the headings in the Sanctions Table are contrary to that understanding. The first heading in the table is: "a violation is not expected to adversely impact electrical state/capability of BES or ability to monitor/control BES". If the column is evaluated with respect to a specific incident it should refer to "the" violation instead of "a" violation. Also the language "is not expected to" would not be applicable since the event has already occurred; consider replacing it with "did not" or "did not have the potential to". If we are incorrect and the SDT would specify both the column and the row of the table, we disagree with the approach. Different violations of a requirement can vary drastically and should not all be placed in the same column.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that		

Organization	Yes or No	Question 4 Comment
certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Public Service Enterprise Group	No	The statement in the question that "the revised Standard Process Manual eliminates VRFs and VSLs from the standard template in favor of a Sanction Table Reference (Results-Based Requirement Category Reference) to conserve drafting team and stakeholder resources and ensure consistency in the application of sanctions" will not occur even if the new SPM were passed as written. It would only occur if the proposed sanctions table is adopted to replace the table in Appendix A, Base Penalty Amount Table. Otherwise the result is no change. This is only made apparent by a careful reading of the clean SPM section on page 8 labeled "Standards Table Reference." We believe that is important detail should be made clear to stakeholders.In addition, the SPM should make it clear that the Sanctions Table will be posted with the standard when it is balloted. We therefore suggest a new sentence be added to the first paragraph in Section 4.7 that states "Each new or modified standard will include all the elements of a Reliability Standard as delineated in Section 2.5." With this addition, we would approve the Sanctions Table.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to		

Organization	Yes or No	Question 4 Comment
provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
City of Austin dba Austin Energy	No	Although Austin Energy (AE) does not oppose the concept of Sanctions Tables, we believe the tables ought to be designed differently. More specifically, we believe the Level 3 violation language should read, "Violation IS LIKELY TO contribute to impeding restoration, damaging equipment or non-consequently load loss or IS LIKELY To contribute to BES instability, separation or cascading sequence of failures." Additionally, we believe the Level 4 violation language should read, "Violation CAUSED BES instability, separation or cascading sequence of failures."
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
FirstEnergy Corp	No	1. FE agrees that VRF and VSL are compliance elements that take many hours of drafting team time and should be removed from the process. However, it is not clear how the standard will make reference to this sanction table and what role the drafting team has in tying the requirements to the sanctions table. Furthermore, the sanctions table has a separate section for Cyber Security requirements and

Organization	Yes or No	Question 4 Comment
		references terms to be used in the next version of the CIP standards. Therefore, timing may be an issue since it is not clear how the implementation of this new process and sanctions table will coordinate with the implementation of CIP V5.2. The proposal also involves what appears to be the removal of time horizons from the requirements. Although it was never quite clear how this element was used in compliance violation assessments, we question whether this will be a detriment to the compliance enforcement staff in determining penalties.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Ameren	No	Conceptually the Sanction table can work, but not enough information about process steps are available at this time to make an informed judgment on its development or applicability. Based on what is available now, it seems like there will be too much subjectivity involved. To avoid this subjectivity issue, the SDT would have to develop a recommendation for each requirement in the standard as to which category (Performance, Risk or Capability) should be applicable to it so that SDT's intention is clear to all stakeholders. Our concern is if this is not done by the SDT there will not be uniformity in its application leading to inconsistency in the way auditors and enforcement would apply these Sanction Tables.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that		

Organization	Yes or No	Question 4 Comment
certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
ReliabilityFirst	No	ReliabilityFirst Corporation ("ReliabilityFirst") appreciates the opportunity to comment on the North American Electric Reliability Corporation ("NERC") Standards Committee Process Subcommittee ("SCPS") Proposal (the "Sanctions Table") related to the elimination of the Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs"). ReliabilityFirst appreciates how burdensome, lengthy, and difficult the task of drafting VRFs and VSLs can be for the standard drafting teams ("SDTs"). However, the proposed Sanction Table creates unnecessary challenges to the effective and efficient enforcement of mandatory Reliability Standards. First, the requirement that violations must result in an "Adverse Reliability Impact" in order to receive a "Severe" VSL is misguided. Currently, the severity of the violation is related to those compliance activities which are within the control of the registered entity. A failure to undertake such activities could result in the maximum allowable penalty before that failure results in a system event. Thus, the possibility of a "Severe" VSL serves a role in promoting compliance activities that seek to prevent system events without waiting for a system event. Second, Option 1 of the Project introduces a new, undefined term, "reliability purpose," and Option 2 introduces a new, undefined term, "discernible impact on reliability." Under either option, assigning VSLs appears to require a substantive determination regarding the relative impact of a particular violation. Without further guidance, Regional Entities will struggle to apply these terms, resulting in more ambiguity and less consistency than is presently experienced

Organization	Yes or No	Question 4 Comment
		using the current VSLs. Additionally, these ambiguous and undefined terms may result in protracted negotiations with Registered Entities during the settlement process over VSL designations. The use of such ambiguous, broad and imprecise language in the Sanctions Table will result in uncertainty among Registered Entities and ReliabilityFirst regarding enforcement of the NERC Reliability Standards.ReliabilityFirst also believes that the Project will unintentionally undermine reliability because only those violations resulting in an "Adverse Reliability Impact" would be punished with "Severe" VSLs. Additionally, the proposed Pro Forma VSLs introduce new terms that will prove difficult to apply. As an alternative, the ESMWG proposes less drastic revisions to the existing VSLs that would result in more accurate depictions of the severity of a violation. Each possible violation of the Reliability Standards presents unique facts and circumstances which require careful analysis and deliberation. The Sanctions Table, however, is presented as a one-size-fits-all solution to VRFs and VSLs. Such an approach would constitute a significant change in the enforcement of the Reliability Standards and requires very careful examination. ReliabilityFirst does not believe the VRF and VSL matrices are ineffective or broken. Rather, ReliabilityFirst believes the VRF and VSL matrices can and should be improved. There are certain VSLs that can be improved upon which could reduce confusion among Registered Entities and Regional Entities and increase consistency across all the regions. ReliabilityFirst enforcement personnel are willing to assist the SDTs in identifying and improving existing VSLs with identified problems. ReliabilityFirst appreciates the burden and difficulty the SDTs face while drafting VRFs and VSLs as part of Reliability Standards. Therefore, ReliabilityFirst recommends that enforcement staffs from the Regional Entities, particularly the Enforcement Sanction and Mitigation Working Group ("ESMWG"), provide recommendations to the SDTs to improve VRFs and VSLs. Further, the ESMWG could review proposed VRFs and VSLs, thereby streamlining the creation of new VRFs and VSLs while also lessening the VRF and VSL related workload of the SDTs. The Federal Energy Regulatory Commission directed NERC to develop VSLs "either through the Reliability Standards development process or through another expedited process" (emphasis added). The ESMWG in

Organization	Yes or No	Question 4 Comment
		particular could provide this other "expedited process." The ESMWG is positioned to take on this role as its representative implement, enforce, and defend VRFs and VSLs in all enforcement actions. ReliabilityFirst also suggests continuing to explore ways to streamline VRF and VSL drafting to maximize clarity to both Registered Entities and Regional Entities and reduce the burden on the SDTs.ReliabilityFirst supports lessening the burden of drafting VRFs and VSLs during the Reliability Standards development process. However, ReliabilityFirst believes the proposed Sanctions Table is an unnecessary change.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
American Transmission Company	No	ATC does not agree with the sanctions table. Recommendation #4 states that redundancies such as VSL should be considered for elimination. The SPIG did not recommend that VSLs must be replaced with the Sanction table. We are concerned that this sanction table/concept tool has not been properly vetted through compliance personnel. In addition, we would like to see a broader discussion of all the different options to address VSL prior to incorporating any specific solution into the SPM. The VSLs should remain until the Sanctions Tables are vetted properly through the proper channels, with NERC Compliance and Stakeholders.
Response:		

Organization	Yes or No	Question 4 Comment
Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. ISO New England Inc.	No	We agree there is much wasted effort with regard to VRFs and VSLs. But it appears the proposal is to take one confusing process and replace it with another confusing process that has less industry input. It could be made much simpler if the current VRFs were replaced with the "Results Based Categories" and if the VSLs used the pro forma approach developed jointly by the SC and CCC.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Exelon Corporation	No	Exelon agrees with and supports the EEI comments on the Sanctions Table and VRFs/VSLs.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Xcel Energy	No	1) The dollar range for Level 2 seems disproportional to the others. We suggest removing a zero from the end of both the min and max range, in all 3 tables.2) Since there appears to be confusion regarding how these sanction tables might impact FFT treatment, we recommend a footer be added (or clarification in the white papers) to clarify that the sanction tables are not used for FFT candidates, as they are not

Organization	Yes or No	Question 4 Comment
		assessed a penalty at all. (Versus $0 penalty)3) Recommend adding another level for items that have no impact on reliability, with a starting value of $0. Currently, the criteria for FFT treatment could still allow a "no impact on reliability" violation to not qualify for FFT treatment. In those cases, enforcement staff should have a level that accurately reflects the circumstances of the violation.4) It would be helpful if more transparency were provided on the discount range for various mitigation actions. (Comparable to a 0-20% good driver discount on auto insurance.) This could be as simple as a non-exhaustive list of most common mitigating actions. We feel this will proactively promote better behavior, and give entities a better idea of expected outcome after a violation has occurred.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Bonneville Power Administration	Yes	BPA is in agreement and support of continued analysis on the Essential Elements of the Standards template and is encouraged with this proposal.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to		

Organization	Yes or No	Question 4 Comment
provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
National Grid and Niagara Mohawk (A National Grid Company)	Yes	National Grid supports the elimination of VSLs in favor of a table in the format of the proposed Results-Based Sanction Table; however, National Grid opposes some of the language proposed in the "Level" descriptions of the table. National Grid recommends the following changes to the table: 1) The name of the table should be changed to "Results-Based Sanction Table Guideline" and each section of the table should include the word "guideline" i.e. "Operations Sanction Table Guideline"; "Cyber Security Sanctions Table Guideline" ; "Planning Sanctions Table Guideline". This change would ensure that those using the table understand that the sanctions presented are not mandatory, fixed penalty amounts, but are a guideline or starting point for a baseline penalty. This aligns with the existing NERC Sanctions "Guideline". National Grid assumes that this table will eventually be incorporated into the Rules of Procedure as part of the NERC Sanctions Guideline, but if the table will be used as a guidance document prior to that time, then the name of the table should be changed to ensure the table is correctly applied correctly. 2) The 'Cyber Security' Sanctions Table should remove references to Low, Medium, and High Impact BES Cyber Systems from the "Level" descriptions. These references will perpetuate one of the major existing problems with the VSL table - i.e. the overstatement of severity of minor violations resulting in higher-than-necessary baseline penalties. By matching the Levels to Low, Medium, or High Impact Elements, any violation of the standard associated with a certain facility, even a mere documentation error, will fall into the Level assigned to that asset. For example, a documentation error that causes little to no risk to the BES that is related to a requirement applicable only to High Impact BES Cyber Systems will fall into Level 3

Organization	Yes or No	Question 4 Comment
		with a high penalty range. In the current draft of CIP Version 5, most of the requirements are applicable only to Medium and High Impact systems; thus, nearly all violations will fall into Level 2 or Level 3 on the proposed table regardless of actual risk. This is not commensurate with the purported purpose of the table as a substitute for VSLs. The remaining language in the table, without the references to affect on Low, Medium, and High Cyber Systems, is sufficient to allow the Regional Entity to asses the impact of a violation of a CIP standard on the BES. The references should be removed. 3) "Other" should be removed from the 'Cyber Security' Sanctions Table in the Performance-based category. The term is too broad. If there are performance-based type requirements other than "acts to protect cyber assets" then they should be spelled out. 4) In the 'Planning' Sanctions Table, the Level 3 and Level 4 language should be modified. Violations of planning requirements occur when an entity fails entirely to have a required plan or fails to have a sufficient plan (one having all required elements). The language should be modified to be more clear so that the focus is on whether the plan is sufficient according to the terms of the standard. As drafted, the language could be read to mean that a plan with all required elements that for some reason does not achieve desired results could be penalized. The following language is recommended: Level 3 - a violation results in a plan that is insufficient pursuant to the requirements of the standard and the plan's insufficiency could contribute to an adverse affect on the BES' ability to respond to contingencies. Level 4 - a violation results in a plan is insufficient pursuant to the requirements of the standard and the plan's insufficiency could directly cause an adverse affect on the BES' ability to respond to contingencies.In addition to the above modifications to the table, National Grid recommends that a transition team be put into place in order to review existing standards for designation and categorization of the existing requirements in accordance with the new table. This will shorten the transition period between use of the VSLs for existing requirements to enabling use of the new table. If the team identifies requirements that do not fit into a category, the team can recommend

Organization	Yes or No	Question 4 Comment
		those requirements for future modification. National Grid realizes that a transition team of this sort requires resources and will need to be prioritized appropriately in light of other ongoing standards development projects. However, continuing to use the VSLs for existing standards until the standards happen to be due for amendment will unnecessarily drag out the transition period where both VSLs and the new Results-Based Table will be used. Considering the problems with applying the VSLs that have been identified, National Grid suggests it would be wise to devote some resources to shortening this transition period as much as possible.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Florida Municipal Power Agency	Yes	Sanctions Table: FMPA supports the table, supports the distinction between performance, risk and capability based requirements, and generally supports the 4 levels/columns identified. FMPA's concern springs from the use of the word "could" in the Levels. FMPA understand that some subjectivity is necessary in determining the Levels, but, the word "could" is too "soft" of a word that leaves too much subjectivity in the process. FMPA recommends the use of "expected" as used in the Level 1 description of the Operations Sanction Table, e.g., Level 2 in the Operations Sanction Table would be re-worded to say: "a violation under reasonably assumed conditions would be expected to directly and adversely impact ...". Also, a more minor comment on the Planning Sanctions Tables, the word "contingencies" should

Organization	Yes or No	Question 4 Comment
		be qualified with “applicable contingencies”FMPA is concerned about transition. How will existing standards be transitioned to this new method? Will we be living in two worlds in the mean-time?
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Arizona Public Service Company	Yes	Yes, the elimination of VRF and VSL is a good idea. VSL’s are currently being misused. Drafting teams are forced to assign medium VRF’s for any requirement other than purely administrative no matter how small is the impact. VSL’s are getting very complicated and have become arbitrarily time based even though reliability impact is not proportional to delay in executing.
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best		

Organization	Yes or No	Question 4 Comment
manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
American Electric Power	Yes	In general, we support the direction that SPIG is taking in regards to eliminating VRFs and VSLs from the standard template in favor of a Sanction Table Reference. While this effort is taking place, we believe it is an opportunity to encourage SPIG to evaluate the current compliance practice that requires 100% compliance at all times, specifically in regards to requirements that have a very large scope and application. For example, these standards have driven entities to track many thousands of individual due dates which must all be met in order to be fully compliant. To track and meet this volume of distinct parameters is not only extremely challenging, but creates a statistical certitude that violations will occur. We suggest that future standards be developed in such a way that promotes the reliability of the BES in a manner which yields a more reasonable volume of milestones and deliverables to track and meet.
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
NextEra Energy Inc	Yes	NextEra agrees with the elimination of VSLs; however, NextEra recommends specific edits to the new Sanctions table. See NextEra's response to question 6, below.
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed		

Organization	Yes or No	Question 4 Comment
revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Illinois Municipal Electric Agency	Yes	Illinois Municipal Electric Agency (IMEA) supports comments submitted by Florida Municipal Power Agency.
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. Duke Energy	Yes	The proposal has the potential to increase the efficiency of the Standard Drafting Teams and allow them to focus their time and effort more productively. Care will need to be taken in further development of the so called “Sanction Table” to ensure that the ranges defined are consistent with previously assessed penalties and with the current Base Penalty Amount table. This appears to be an opportunity to more tightly couple the results of compliance assessment with the actual risk to reliability.

Organization	Yes or No	Question 4 Comment
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
ACES Power Marketing Standards Collaborators	Yes	-1- Since there is little correlation between actual penalties issued to date and the sanctions table (and by extension VSLs and VRFs), this makes sense. Furthermore, VRFs are often skewed high based on what could happen if the requirement is violated, not what is likely to happen. Finally, VSLs rarely represent the full spectrum of violations that could occur which requires enforcement personnel to use their judgment in assigning a VSL anyway. Eliminating VRFs and VSLs should save all stakeholders time in the standards development process. -2- We do have one concern, however, regarding the sanctions table. The sanctions table should reflect differing penalties depending on whether or not a negative consequence has occurred. This accommodation exists in other areas of the law. For example, an attempted crime generally does not carry the same level of penalty as an actual crime.
Response: Thank you for your support. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Independent Electricity System Operator		While this seems like a much simpler approach and we understand how the change will conserve resources insofar as SDTs are concerned, we can't see how it will ensure consistency in application of sanctions; we are concerned that it will blur the landscape quite a bit and leave it entirely up to the auditors/investigators to apply those sanction guidelines in the context of each standard and situation.

Organization	Yes or No	Question 4 Comment

NERC		NERC Staff Compliance Operations and Enforcement comments:The Standards Process Input Group (SPIG) organized by the NERC Member Representatives Committee (MRC) proposed a number of recommendations for changes to the way NERC develops Reliability Standards. One of the specific recommendations to improving the NERC Standard Development Process is revising the essential elements

Organization	Yes or No	Question 4 Comment
		of the Standards Template to eliminate redundant or unnecessary activities, such as drafting of Violation Severity Levels (VSLs). NERC Enforcement supports efforts to improve the Standard Development Process.There have been several proposals to accomplish this objective. One proposal offered by the NERC Standards Committee Process Subcommittee (SCPS), and the subject of this comment process, would revise the existing NERC Base Penalty Amount Table to eliminate the Violation Risk Factor (VRF) and the VSL. Another proposal introduces the development of a pro forma VSL while retaining the existing VRFs. It is likely that additional approaches will be offered during this comment period.While NERC Compliance Operations and Enforcement staff is not at this time specifically endorsing any of the proposals presented, there are several principles that each proposal should meet to ensure that the process is effective and can be administered by NERC and Regional Entity enforcement and complies with FERC orders: o The approach should contemplate existing FERC guidelines on setting VRF/VSL levels and defining base penalty amounts.[1] We would note that FERC has articulated a number of fundamental principles communicated in these guidelines, including:o Penalty amounts must be per violation, per day not per violation, per occurrence;o A penalty level of $1M per violation, per day must be available for serious violations;o VSLs should not have the unintended consequence of lowering the current level of compliance;o VSLs should be based on a single violation, not on a cumulative number of violations;o VRF/VSLs should ensure uniformity and consistency within and among reliability standards;o VRF/VSLs must have a single, consistent description;o Risk factor assignment should not allow a watering down of the VRF where a requirement co-mingles more than one obligation;o Any approach should permit discouraging economic choice to violate a reliability requirement based on penalty amount; ando Any approach should recognize a risk is not minimal simply because there was no adverse impact to the Bulk Power System or if it reveals a serious shortcoming in a registered entity's reliability-related processes.[2] o Any approach should address risk and harm levels in the base penalty determination. o Penalty matrix must permit access to all levels of violation risk/severity for a given violation. o The proposal should ensure

Organization	Yes or No	Question 4 Comment
		consistency with past penalty determinations and the calculation of future penalties. This should be demonstrated by sample calculations under the existing and proposed approaches. o Level definitions must be clear and concise and not create ambiguities that could delay settlement negotiations or engender a lack of clarity in base penalty calculations. o Elements comprising the base penalty determination should be as objective as possible. o The base penalty calculation process should not re-write the standards/requirements to which they apply. o The process should be straight-forward and intuitive in application.NERC Compliance Operations and Enforcement staff believe that the proposals presented through this comment process should receive full consideration, in light of the basic elements presented above, and looks forward to working with the Regional Entities and the industry in their evaluation.---end notes ---[1] Orders addressing FERC guidance on VSL/VRFs include: Order on Violation Severity Levels Proposed by the Electric Reliability Organization, 123 FERC Â¶ 61,284 (June 19, 2008); Order on Rehearing and Clarification and Accepting Compliance Filing, 125 FERC Â¶ 61,212 (November 20, 2008); Order on Compliance and Rehearing, 135 FERC Â¶ 61,166 (May 19, 2011); Order Addressing Violation Severity Level Assignments for Critical Infrastructure Protection Reliability Standards, 130 FERC Â¶ 61,211 (March 18, 2010); Order on Violation Risk Factors, 119 FERC Â¶ 61,145 (May 18, 2007); Order on Rehearing and Compliance Filing, 120 FERC Â¶ 61,145 (August 9, 2007); Order Accepting with Conditions the Electric Reliability Organization's Petition Requesting Approval of New Enforcement Mechanisms and Requiring Compliance Filing, 138 FERC Â¶61,193 (March 15, 2012); and Order on Compliance Filing, 118 FERC Â¶61,030 (January 18, 2007).[2] The Commission has also provided the following guidance specific to a cyber security context: 1) a binary VSL, rather than a graduated VSL, should be applied for requirements where a single lapse in protection can compromise computer network security and 2) VSLs for interdependent tasks should account for the interdependence.
Response: Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-		

Organization	Yes or No	Question 4 Comment
binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise (NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.		
Indiana Municipal Power Agency		no comment

5. **As part of Recommendation 4, the SPIG encouraged NERC to ensure the cost effectiveness of standards through documentation of alternatives analysis.**

   A Cost Effective Analysis Proposal (CEAP) was posted for industry comment on May 7, 2012, through July 6, 2012. Does this draft document adequately address the SPIG Recommendation? If not, please explain why and offer an alternative solution for ensuring the cost effectiveness of standards through documentation of alternatives analysis.

Summary Consideration:

Many entities have submitted a complete set of comments in response to a separate posting of the CEAP, and a thorough summary of all comments received will be provided in the Consideration of Comments for that posting. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized.

Organization	Yes or No	Question 5 Comment
Northeast Power Coordinating Council	No	The revision does not reference the CEAP, therefore not adequately addressing the SPIG recommendation. The CEAP is a separate and proposed guideline document not referred to in this Standard Processes Manual.
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. Organization	Yes or No	Question 5 Comment
intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (e.g. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
IRC-SCR	No	We agree that the CEAP as proposed is a good start. Since the changes to the SPM were to support the SPIG recommendations. The "steering group" and the concept of cost effectiveness need to be brought into Section 4 (Process for Developing, Modifying or Retiring a Reliability Standard"). The underlying precept of the SPIG is that we need to move away from a volumetric approach to standards, to a focused development of standards that add value and provide an ALR. As part of the SAR process, there needs to be a triage that clearly addresses what's missing in ALR, and how the standard will provide it. The process of opening a solicitation every year seeking ideas for new Standards Development proposals should be stopped. The industry is overwhelmed with standards actions. If the issue is important enough to be a standard, a SAR should be submitted.
Response: Thank you for your comment. The Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC.		
Hydro One	No	The revision does not reference the CEAP so does not adequately address the SPIG recommendation. The CEAP is a separate and proposed guideline document not referred to in this SPM.
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual.		

Organization	Yes or No	Question 5 Comment
It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (e.g. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
AECI and the G&T members Central Electric Power Cooperative, KAMO Power Cooperative, M&A Electric Power Cooperative, Northeast Electric Power Cooperative, NW Electric Power Cooperative, and ShoMe Power Electric Cooperative	No	AECI does not believe that the CEAP has been adequately described and it needs further development. Industry should be the ones overseeing the documents and deciding when they are ready for SC or RISC review and consideration, not NERC. This question in the SPM Comment form is premature. The CEAP ballots comments are just now being reviewed, July 26 & 27. There are a number of CEAP provisions that need additional work. We need to wait for the CEAP comment and revision process to play out before balloting it on another document like this SPM comment form. NERC has not taken the time needed to appropriately develop this topic.
Response: Thank you for your comments and we agree that the CEAP is in a developmental stage. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		

Organization	Yes or No	Question 5 Comment
Florida Municipal Power Agency	No	The CEAP was not really a Cost "Effective" Analysis Proposal, but really a Cost Analysis Proposal without sufficient consideration of "Effective"ness. While a good start, the CEAP ought to be revised to include effectiveness of investment at accomplishing reliability goals.
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual. There is nothing in the current proposed CEAP that would prohibit an entity from including in its CEAP survey responses comments regarding more cost effective solutions to achieve reliability goals. This is the type of feedback the CEAP is designed to solicit. The purpose statement of the CEAP document will be revised to clarify this goal.		
Edison Electric Institute	No	EEI submitted the following comments on the cost effectiveness analysis proposal on July 16:EEI appreciates that practical discussions have begun for beginning to more explicitly consider the costs of potential new requirements or modifications to existing requirements in mandatory standards. This is a welcome change. Any management decision needs to have a clear sense of the goal being addressed by a specific initiative, options for addressing the matter, the costs of the various options, and the measures of success. The specificity of the information needed for decision-making will vary depending on the questions under consideration. Initial impressions of the proposal for considering costs and cost effectiveness: To the maximum extent practicable, the general framework for considering potential costs of a new or

Organization	Yes or No	Question 5 Comment
		modified standard should be designed to include both a) general characterizations of investments, and operation and maintenance expenses that would be required, and b) general characterizations of the reliability goals, risks, and contingencies that would be addressed. This could be included in what we understand as the 'phase one' part of the process described to date. EEI also envisions that discussion of these issues should include the newly formed Reliability Issues Steering Group (RISC), as well as standing technical committees that would have an already assembled group of technical expertise that could be tapped for advice and counsel. RISC would also have a natural interest in its normal course of considering reliability issues and risks from a high-level strategic perspective. RISC should be prepared to offer its views on potential standards development projects, including potential costs and benefits. In addition, and in order to begin relevant discussions as early as possible, EEI envisions that FERC staff should be invited to these discussions in order to begin developing shared understandings of both the reliability objectives, and potential costs. As a general matter, we have long believed that proactively engaging the regulatory entities sooner and not later is an important element for shaping successful outcomes. EEI envisions that a SAR will include a description of the kinds of fixed investments, operations and maintenance expenses, or administrative expenses that might be needed to cover any new or modified requirements. The SAR should also include a description of the incremental reliability benefit, including the reliability risk or problem being addressed. It would be the responsibility of the SAR sponsor to make state these general descriptions. As a general matter, we envision that this would be possible with no more than 500 words, that is, not a detailed cost estimate or surgically precise specification. SAR content should also describe performance outcomes that would be expected as a result of compliance, including characterizations of performance that would be viewed as violations. Upon approval of the project and development of more detailed language for the standard, the balloting and commenting phase could seek some refinement of the characterizations of costs and benefits. While the process proposal would seek to

Organization	Yes or No	Question 5 Comment
		gather this information from individual entities, EEI proposes that relevant NERC technical committees perform this exercise. Nothing should prevent NERC from seeking comments from individual entities; however, some may prefer to not provide more detailed information. In addition, at this time we are not convinced that detailed cost estimates are needed. We are also concerned that cost estimate activities not become over-engineered to the point that companies are compelled to make what might be considered to be good faith cost estimates on activities that will take place over long periods of time. Upon filing at FERC, NERC should have gathered information sufficient to plainly describe the reliability problem being addressed, the manner in which the proposed standard will address the problem, the performance expectations, as well as the kinds of investments and expenses likely to be undertaken that would not occur otherwise. Detailed engineering estimates or creating new bureaucracy should not be the goals in this exercise. Nor should companies be held to rough cost estimates that may be offered in response to general analysis of a potential reliability matter.

Response: Thank you for your comment.

The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made.

After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.

Changes to the SAR format are not being addressed as part of the CEAP project. While including anticipated investment requirements and performance outcomes in a SAR might be considered in the future, these inclusions would only present the data as analyzed by the entity or entities sponsoring the SAR and would not provide the type of industry-wide, high-level cost effectiveness

Organization	Yes or No	Question 5 Comment
information that the CEAP seeks. The CEAP 's success is dependent on Trade Groups such as EEI promoting and encouraging their members to respond to SAR and SDT information requests to provide the assistance in identifying alternative solutions that meet the reliability objective of the draft standard that the CEAP should facilitate. The RISC Charter, currently under development may also be an integral part of the CEAP. Recently a meeting was conducted with FERC staff and it was emphasized to Commission staff that this is not a purely analytical tool and is based on good faith estimates provided by the industry. We agree that all estimates used in the CEAP should be considered only high level approximations to provide examples of what costs "may" be. Finally, the Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC.		
Arizona Public Service Company	No	There is no mention of CEAP in this document. There should be additional discussion of how the recommendation is applied.
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. Texas Reliability Entity	No	We agree that alternatives analysis should be an important consideration in the standards process, but we feel the proposed CEAP goes well beyond what is required and adds complexity and work that is counterproductive to the overall effort to streamline and simplify the process. In short, we think the proposed CEAP is not cost-effective, that is, it will not provide benefits commensurate with the amount of effort required to do it right. And if it is not done right (which is a very real risk) then it will be wasted effort. We propose simply requiring each drafting team to produce a documented "alternatives analysis" explaining the alternatives they considered and why one was selected over the others.

Organization	Yes or No	Question 5 Comment
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual. We do agree that the CEAP needs to be done properly. The CEAP as proposed is intended to solicit high level information to supplement the standards development process. The information collected via the CEAP should enable drafting teams to evaluate alternatives, even if a formal "alternative analysis" is not included in the final drafting team product. This type of analysis may not be possible without the input from the industry that the CEAP solicits. We agree that there will be additional burden for the industry. We believe that the benefits of the CEAP outweigh the additional burden on the industry and that the CEAP is not *overly* burdensome because it is high-level. The success of the CEAP pilot will help determine how the project moves forward.		
NextEra Energy Inc.	No	Please see NextEra's comments filed on the CEAP.
Response: Your separately submitted comments on the CEAP will be addressed in that Comment Report.		
Flathead Electric Cooperative, Inc.	No	This Cost Effective Analysis Proposal is a good first step at giving a price tag to each of these standards. However, it is unclear what happens if the price tag is high and where does the consumer-elected governing body or state regulators have a say in whether that cost is worth the price. Regardless the analysis of the cost is a good first step. It is unclear if the information would be gathered early enough in the process of developing a standard for a standard to be cancelled due to cost concerns. Although, it would be difficult to pre-determine the cost of a standard that may change significantly in the development process, thereby increasing its regulatory cost

Organization	Yes or No	Question 5 Comment
		burden. Generally, support the direction of the CEA proposal, but the issue of FERC exercising its reliability authority in areas where it does not also have rate making authority has created a situation whereby costs are created in a mandatory fashion, but the source of funding is an after-thought. Depending upon the outcome of the BES definition process, this tension may be eased somewhat if the focus returns to the bulk transmission system where FERC has more defined rate making authority.
Response: Thank you for your comment. The CEAP is not currently intended to determine whether or not a standard should go forward based on cost. Within Phase 1, the SAR will identify the reliability gap along with cost effective proposed methods to improve reliability. In Phase 2 the cost effectiveness of alternative methods will be identified by the SDT and industry that could satisfy the standard requirements. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
Georgia System Operations	No	There is insufficient detail in the CEAP proposal to provide substantive input. A more detailed vision of the plan to implement this proposal is needed. We recommend doing an informal trial of this approach on a small number of selected standards and developing a more detailed proposal based on the results of that trial. We emphatically agree that it is advisable to include consideration of cost-benefit in the development or revision of Reliability Standards.
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual.		

Organization	Yes or No	Question 5 Comment
It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
Public Service Enterprise Group	No	We do not support the CEAP as written. Please see our separately submitted comments on the CEAP matter.
Response: Thank you for your comment. Your separately submitted comments on the CEAP will be addressed in that Comment Report.		
Illinois Municipal Electric Agency	No	Illinois Municipal Electric Agency (IMEA) supports comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comment. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. Organization	Yes or No	Question 5 Comment
City of Austin dba Austin Energy	No	AE strongly agrees with the idea of employing a cost/benefit analysis before creating new standards or revising existing standards. However, we believe the proposed CEAP will create too much additional burden on the industry. We recommend following the Phase I ("Cost Impact Analysis") as currently proposed (i.e. the "high level" analysis) and then, instead of going directly to the "Cost Effectiveness Assessment" (CEA), asking industry members if they believe a CEA is necessary before proceeding.
Response: Thank you for your comment. It is currently proposed that the CEAP process will be conducted in tandem with the normal standards development process and questions posed during the applicable comment periods for SAR and Standard will capture the information necessary. We believe that the benefits of the CEAP outweigh the additional burden on the industry and encourage entities of all sizes and resource levels to participate as much as possible and to take advantage of pooling comments and industry trade groups for submitting comments. It is anticipated that all entities may benefit from any information that is submitted by other entities, and the more entities that are able to submit will increase these overall benefits. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). One of the issues that will be considered in the future is whether there should be a threshold for conducting a CEA. A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
FirstEnergy Corp	No	FE agrees that a formal process for cost effectiveness should be considered during the development of any new and revised Reliability Standards. An adequate level of reliability (benefits) versus the cost of implementing the standard should be used to determine whether a standard will continue through the various standards process development. However, it is unclear if the phrase "this draft document" in this question is referring to the CEAP or the Standard Process Manual, we assume the latter. In section 4.1 it's indicated that a SAR will require "a discussion of the

Organization	Yes or No	Question 5 Comment
		reliability-related benefits and costs of developing the new Reliability Standard". The SPM should be adjusted to footnote the CEAP process for the cost/benefit analysis that must be performed.
Response: Thank you for your comment. The reference to "this draft document" is in fact referring to the SPM posting in this context. Regarding the reference to addition of the footnote, it is planned that the CEAP Document recently posted for comment in the NERC process is currently envisioned to be a separate guideline document as "part of" the considerations the NERC Standards Committee and Standard Drafting Teams will use as they develop standards. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
Ameren	No	In principle we agree but clarification on how CEAP process will work is still needed. We had reviewed and provided comments separately on another NERC CEAP proposal. We suggest that the SDT should coordinate with that project.
Response: Thank you for your comment. Your separately submitted comments on the CEAP will be addressed in that Comment Report. Clarification: There is only one CEAP proposal. The separate posting ending on July 6, 2012 is the same CEAP that is referred to in this SPM request for comment.		
Indiana Municipal Power Agency	No	Indiana Municipal Power Agency supports the comments submitted by Florida Municipal Power Agency.
Response: Thank you for your comment. Please see the response to FMPA comments.		

Organization	Yes or No	Question 5 Comment
ISO New England Inc.	No	We agree that the CEAP as proposed is a good start. Since the changes to the SPM were to support the SPIG recommendations. The "steering group" and the concept of cost effectiveness need to be brought into Section 4 (Process for Developing, Modifying or Retiring a Reliability Standard"). The underlying precept of the SPIG is that we need to move away from a volumetric approach to standards, to a focused development of standards that add value and provide an ALR. As part of the SAR process, there needs to be a triage that clearly addresses what's missing in ALR, and how the standard will provide it. The process of opening a solicitation every year seeking ideas for new Standards Development proposals should be stopped. The industry is overwhelmed with standards actions. If the issue is important enough to be a standard, a SAR should be submitted.
Response: Thank you for your comments. The concept of a Reliability Issues Steering Committee or "RISC" is being developed which is envisioned to actively Triage newly identified reliability issues and standards development projects. Also, the Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC. As the SPM continues to be revised, additional consideration will be given to the issues you have identified.		
Trans Bay Cable LLC	No	This Cost Effective Analysis Proposal is a good first step at giving a price tag to each of these standards. However, it is unclear what happens if the price tag is high and where does the consumer-elected governing body or state regulators have a say in whether that cost is worth the price. Regardless the analysis of the cost is a good first step. It is unclear if the information would be gathered early enough in the process of developing a standard for a standard to be cancelled due to cost concerns. Although, it would be difficult to pre-determine the cost of a standard that may change significantly in the development process, thereby increasing its regulatory cost burden. 		authority has created a situation whereby costs are created in a mandatory fashion, but the source of funding is an after-thought. Depending upon the outcome of the BES definition process, this tension may be eased somewhat if the focus returns to the bulk transmission system where FERC has more defined rate making authority.
Response: Thank you for your comment. The CEAP is not currently intended to determine whether or not a standard should go forward based on cost. Within Phase 1, the SAR will identify the reliability gap along with cost effective proposed methods to improve reliability. In Phase 2 the cost effectiveness of alternative methods will be identified by the SDT and industry that could satisfy the standard requirements. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
Exelon Corporation	No	In the CEAP comment period, Exelon raised a number of questions about the CEAP including questions about its role relative to the SPM. There is no mention of the CEAP in the proposed SPM. It remains unclear how these two components will interact and be effectively utilized. More information is needed to assess.
Response: Thank you for your comment. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP		

Organization	Yes or No	Question 5 Comment
project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
ACES Power Marketing Standards Collaborators	Yes	We indicated in our comments on the CEAP that it represents a good start for a cost measure that will ultimately need further refinement. Considering the recommendation is high-level, CEAP probably does meet the recommendation.
Response: Thank you for your supportive comment. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
MRO NSRF	Yes	The NSRF agrees with the SPIG recommendation to ensure cost effectiveness of the standards, but notes that the CEAP process should not delay the standards development process.
Response: Thank you for your comment. It is currently proposed that the CEAP process will be conducted in tandem with the normal standards development process and questions posed during the applicable comment periods for SAR and SDT activities will capture the information necessary to evaluate the CEAP impact. A CEAP pilot project is proposed for a couple of standard projects and more information regarding any potential delays will be identified at that time.		

Organization	Yes or No	Question 5 Comment
The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
SPP Standards Review Group	Yes	We are very much in favor of factoring cost consideration into the standard development process. Please refer to our comments that were filed during the CEAP posting and comment period for specific questions, suggestions and comments.
Response: Thank you for your comment. Your separately submitted comments on the CEAP will be addressed in that Comment Report. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
Bonneville Power Administration	Yes	BPA appreciates the Standards Committee's work on this. BPA recognizes that this project will be a continuous improvement process.
Response: Thank you for your support of the project and we agree that over time, much like the standards development process,		

Organization	Yes or No	Question 5 Comment
opportunities for improvement will be identified and revisions proposed. The Cost Effectiveness Analysis Process ("CEAP") is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. Dominion		The Cost Effective Analysis Proposal is currently posted for industry comment and Dominion intends to file comments there.
Response: Thank you for your comment. Your separately submitted comments on the CEAP will be addressed in that Comment Report.		
PPL Corporation NERC Registered Affiliated		While the PPL Companies support a greater consideration of the cost/benefits of a revision or creation of a standard, the PPL Companies have some concerns with the CEAP: a. In Step 1, the responsibility of providing a report and recommendation based upon the CIA questions in Appendix B should not rest with NERC Staff, but with industry

Organization	Yes or No	Question 5 Comment
		SMEs. In Step 4, the report and recommendation should not be provided by NERC Staff, but by industry SMEs. However, NERC staff should be available to support the SMEs work. b. Responses to the questions in Appendix B should be reported separately for each of the groups covered by the draft standard (GOs, TOs, TOPs, etc., as applicable), not as a single figure for all of industry. This will help identify where standards that may be acceptable on an aggregate basis involve placing an excessive burden on one segment of the stakeholders. In addition, the cost/benefit analysis should consider different industry and organizational structures. For example, the burdens placed on a vertically-owned utility and an independent generator for a particular standard may be very different. Additionally, there are differences between ISO/RTO and non-ISO/RTO regions (e.g., black start compensation). Such differences should be considered in assessing the cost and benefits. c. If there are significant differences in costs and benefits between phase 1 and 2, a third phase consisting of a NERC-funded pilot at volunteer entities could be helpful in obtaining greater certainty on actual costs and benefits. d. The phase 1 and 2 inquiries should have added to them the question, "Are there alternative measures that would demonstrate compliance in a less burdensome manner than those presently proposed, or re-phrasings that would eliminate uncertainty?" This aspect of compliance is oftentimes not as well developed in draft standards as the technical requirements. The PPL Companies recommend that NERC, after considering industry comments and with Stakeholder approval, finalize its CEAP before deciding if the CEAP addresses the SPIG recommendation.
Response: Thank you for your comment. You identify many considerations that the CEAP must address. With industry support and involvement, the CEAP will be revised and a new draft will be posted for comment. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment		

Organization	Yes or No	Question 5 Comment
periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		
National Grid and Niagara Mohawk (A National Grid Company)		National Grid's understanding is that the CEAP document that was proposed is not intended for inclusion in the SMP and is not part of the currently proposed SPM revision, therefore is outside the scope of comments related to the SPM at this time.
Response: Thank you for your comment. Your separately submitted comments on the CEAP will be addressed in that Comment Report. The CEAP is not incorporated into the proposed revisions to the Standard Processes Manual. It is initially envisioned to be a Guideline document. In order to address the Standard Process Input Recommendation regarding the consideration of cost in the standard development process, it is proposed that additional questions regarding cost will be included in the posting of comment periods. This is intended to be an interim step until development of the CEAP is fully realized. It is NERC's intent to pilot the CEAP project to determine if any potential revisions need to be made. After successful pilot project(s) have been completed, the CEAP may be revised and an evaluation will be made as to whether and to what extent, the CEAP will need to be incorporated into the Standard Process Manual, the NERC Rules of Procedure, or other NERC documents (*e.g*. Standard Drafting Team Guidelines, etc.). A revised CEAP will be posted for a comment period and NERC will respond in writing to comments in the same manner as prescribed by the NERC Standard Processes Manual.		

6. If you have any other comments on these proposed revisions that you haven't already mentioned above, please provide them here:

Summary Consideration:

Organization	Yes or No	Question 6 Comment
Exelon Corporation		- RISC: The respective roles and responsibilities of the RISC and SC remain unclear. This is a critical component for stakeholders to understand before judging revisions to the SPM. - Section 4.2: For clarity, please consider delineating the drafting team in place at the SAR stage from the drafting team responsible for developing the reliability standard. These are distinctly different tasks in particular because often the SAR requester (either individual or team) participates in developing the draft SAR and in responding to comments on a posted draft SAR. As well, if current practice applies going forward, the Standards Committee can name a SAR comment review team when it approves a SAR for posting. That practice may be prudent in expediting the posting process; however, the SAR review team may not prove sufficiently diverse as a standard drafting team. It is not clear whether the SAR requester/sponsor can serve on the standard drafting team once a SAR is approved as a standard project. This should be clarified to stakeholders. - Section 7.0 – Interpretations: Greater clarity needed on the decision making process behind a potential Standards Committee decision to change a Request for Interpretation into a Standard revision

Organization	Yes or No	Question 6 Comment
		project. As currently proposed, the Standards Committee can reject a request for interpretation if the interpretation seeks to revise a standard, but the SC can also change the interpretation request into a standard revision. It is not clear how such decisions are made and what process transitions occur when a project changes from an Interpretation to a Standard revision. The request should be thoroughly discussed with requesters before a decision is made to change the path forward. The Interpretation requester should also be given the option of objecting to the conversion of an interpretation to a standard revision project and such an objection should be clearly noted in the SAR. In addition, as noted with SARs and Standards projects, it is not clear whether the Interpretation requester can serve on the interpretation drafting team. This should be clarified to stakeholders. If requesters are not to serve on the interpretation drafting team then the SC must emphasize communication with the requester to fully understand the rationale and technical concerns behind the interpretation request. - Section 16: Waiver Provision: Exelon agrees with the EEI comments. This provision is unnecessary and ill advised in its execution - Procedures: The proposed SPM references Standards Committee procedures. Please discuss the role of procedures, the procedure development process, how procedures approved and how procedures are communicated to stakeholders. - Section 4.8, page 20: The language contemplates changes in the individual representing the ballot pool entity, how will changes in the ballot pool entity status such as due to merger or acquisition be managed?

Organization	Yes or No	Question 6 Comment
		- Section 4.1, page 15: Please clarify what criteria determine the decision to remand or reject and whether the SC will post explanations for SAR rejection. - Section 3.7, page 11 The sentence suggests that there are only eight provinces in Canada when I believe it intends to reference only the eight covered by the NERC regions. I believe merely dropping the second "the" clarifies: "…the provincial governments of each of eight Canadian Provinces (Manitoba, Nova Scotia, Saskatchewan, Alberta, Ontario, British Columbia, New Brunswick and Quebec)…" - EEI comments: While referenced in response to some specific questions above, to the points not yet discussed, Exelon reiterates its agreement and support for the concerns raised in the EEI comments. Thank you for the opportunity to comment.
Response: Thank you for your comments. The Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC. However, the Standards Committee has been charged with developing a set of revisions to implement SPIG recommendations 1, 4, and 5 and bringing the proposed revisions to the NERC Board of Trustees for approval in November 2012. Given this charge, the Standards Committee believes that it is appropriate to move forward with a set of changes now to implement as many improvements as possible, recognizing that some aspects of the process		

Organization	Yes or No	Question 6 Comment
		may need to be adjusted as experience is gained with RISC and with the new process. Regarding the delineation of drafting team composition in Section 4.2, there is no single best formula for drafting team composition that will suit every standard development project. Refraining from delineating a specific composition within the SPM provides flexibility necessary to allow a drafting team with the appropriate composition to be formed. To avoid a conflict of interest, NERC has adopted a practice of not allowing interpretation requesters to participate on the drafting team that prepares the interpretation, and will continue this practice, but does not believe it is necessary to include this information in the SPM. Regarding the right of a requester of an interpretation to determine how the request is to be processed, NERC staff does not agree that the requester has an explicit right to maintain control over every aspect of the request. By its nature, an interpretation is inefficient in that it requires all of the same processing steps as revision of a standard, but does not "fix" the underlying standard. A requester does not have a responsibility to make efficient use of industry resources, but NERC staff and the Standards Committee do have this responsibility and without the ability to make processing decisions, will not be able to fulfill the responsibility. Regarding clarification of criteria for remanding a SAR – this section of the SPM was not revised but it is anticipated that future revisions to the process will be required to, among other things, clarify the relative roles of the SC and the RISC. Please provide specific recommendations at that time. Regarding Canadian Provinces – thank you for the clarification. No other entity made this observation and it was not corrected in the revised draft of the SPM that was posted for comment. The change will be reviewed with NERC Legal to provide consistent language with other sections of the NERC Rules of Procedure. The Standards Committee Process Subcommittee has developed a number of detailed procedures which have been circulated for comment to the Process Subcommittee and Standards Committee prior to being approved by the Standards Committee. These procedures are posted on the NERC Standards website under "Resource Documents." Please see the response to EEI comments as well.
Texas Reliability Entity		(1) Why was "Additional Compliance Information" removed as a possible component of a Reliability Standard? (p. 10) That has been a legitimate and helpful component in the past.(2) Even with NERC's Quality Review process in place, there is still room for improvement in the quality of materials that are posted for ballot. We suggest that, under any revised process, the NERC-assigned facilitator/technical writer/project manager (may be more than one person) should be made clearly and

Organization	Yes or No	Question 6 Comment
		fully responsible for the QUALITY of the SDT's work product. This would include compliance with the SPM and other applicable guidelines, consistency (both internally and with other standards), and editorial quality (e.g., unambiguous language, logical organization, completeness, and few if any obvious errors in final documents). The SDT technical members should remain fully responsible for the technical content of the standard.
Response: Thank you for your comment. Additional Compliance Information is intended to be incorporated into the RSAW.		
ACES Power Marketing Standards Collaborators		-1- On p. 25 under "Form Ballot Pool" it says that "NERC Reliability Standards staff shall establish a ballot pool during the first 30 calendar days of the 45-day formal comment period. However, in the next paragraph it says that "Any member of the Registered Ballot Body may join or withdraw from the ballot pool until the ballot window opens," and in the next section under "Conduct Ballot" it says that "The ballot window shall take place during the last 10 calendar days of the 45-day formal comment period." This suggests that there is a 35-day period to join the ballot pool, which contradicts the previously mentioned 30-day period. This contradiction needs to be cleared up. Thank you for your comment. This is not a contradiction – a member of the Registered Ballot Body is allowed to withdraw from a ballot pool that they have joined as long as no ballot has started. A member of the Registered Ballot Body is required to join the ballot pool during the 30-day window that the ballot pool is open to be joined. So, for example, if a member of the RBB erroneously joins a ballot pool, they may contact NERC staff to be removed as long as balloting has not been initiated. The language in the SPM allows for this. -2- Towards the top of p. 6 it says "A quorum, which is established by at least 75% of the members of the ballot pool submitting a response with an affirmative vote, a negative vote, or an abstention." But down on p. 26 it says "A quorum, which is established by at least 75% of the members of the ballot pool submitting a response

Organization	Yes or No	Question 6 Comment
		excluding abstentions and non-responses." I believe that the statement from p. 6 needs to be edited as the statement on p. 26 was. Thank you. The method for calculating a quorum has been revised to include abstentions, consistent with the current SPM. -3- On p. 41 on the Process for Developing an Interpretation Diagram, Step 3, on the right side says that standards staff will form a ballot pool at this time. However, down in step 6 of the same diagram, on the left side, it says that the ballot pool will be formed during first 30 days of the formal comment period. This seems to be a contradiction that needs to be cleared up. Thank you. The diagrams will be corrected when the process revisions have been finalized. -4- On p. 32, under "Process for Developing a Defined Term," it says "Definitions shall not contain statements of performance Requirements." Since results-based standards involve three kinds of requirements, "performance" being one of them, this statement could be interpreted to mean that definitions cannot establish "performance" requirements, but can establish the other two kinds of requirements. Is this the intended meaning? If not, then it needs to be clearly stated that definitions cannot contain statements of any of the three types of standard requirements. The SC anticipates that additional revisions to the standards process will be required in the near future, including changes to address the relative roles and responsibilities of the SC and RISC, and changes to address your comment will be considered at that time.
Response: Thank you for your comments. See responses embedded above.		
National Grid and Niagara		1) Standards Drafting Team Composition: National Grid supports the changes to

Organization	Yes or No	Question 6 Comment
Mohawk (A National Grid Company)		Section 3.6 with regard to composition of drafting teams. However, National Grid believes that the standards drafting teams need better leadership in order to operate effectively, especially if quality review will be an ongoing process. National Grid recommends that this section be further revised to designate a project manager for each Standards Drafting Team with a defined role to: 1) ensure project deliverables and deadlines are met; 2) be responsible for oversight of the quality review process; 3) ensure the work of the team remains within the scope of the SAR. National Grid is not suggesting that a new position be created, but that a better-defined project manager function could be incorporated into either the role of the team chairperson or the team's NERC facilitator. With the addition of more non-technical experts to drafting teams, the project manager role might be better served by a non-technical member of the team. 2) Section 16 Waiver Provision: National Grid generally supports the concept of a waiver provision with appropriate controls/qualifications to ensure the provision is not abused. National Grid is concerned that the proposed Waiver provision, as drafted, is slightly too broad. The provision should require a clear demonstration of why the SPM process is inadequate in the circumstances where a waiver is permitted. National Grid suggests the following edits to the first two bullet points following "limited to the following circumstances": o Where the standards team demonstrates that the SPM process will not allow the team to meet regulatory deadlines set by FERC; o Where the standards team demonstrates that the SPM process will not allow the team to meet deadlines imposed by the NERC Board of Trustees; or. . .

Response: Thank you for your comments. Section 4.3 of the proposed revisions to the SPM addresses the addition of a project management function and other non-technical support to aid the drafting team in timely completion of its work.

The waiver provision was drafted by NERC Legal at the request of the Standards Committee leadership to address circumstances such as the failed PRC-005-2 recirculation ballot. It is not possible to identify in advance all of the circumstances nor what type of demonstration might be necessary; instead, the provision as drafted relies on a common-sense application and accountability to the

Organization	Yes or No	Question 6 Comment
NERC Board of Trustees as a means to appropriately limit its application. In all circumstances, if an entity feels that the process has been waived inappropriately, they may appeal the decision.		
Arizona Public Service Company		1. There appears to be typo error in the Sanction Table. Level 2 penalties start at $75,000. It should be $7,500 to be consistent. For example Level 3 penalties start with $ 15,000.2. There should be guidance on how the sanction table is applied, particularly where a large number of elements are involved. For example: for a maintenance violation, are the penalties based on per item or on the overall impact? In many instances impact is not proportional to number of violations. Another example would be time based violation. If an entity missed a requirement which has a small impact, the impact does not grow with time. Another example is the MVA size. A 20 MVA unit does not have the same impact on BES as a 1000 MVA unit. The sanction should be proportional to possible impact. There should be guidance with examples so that industry is clear on the intent of sanctions.3. The proposed Sanction Table does not contemplate a ZERO (0) or FFT type fine. This needs to be addressed before we can support the table.
Response: Thank you for your comments. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions related to VRFs and VSLs, and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. If the Sanction Table concept moves forward at a future time, please provide comments on that proposal.		
Dominion		1. Page 10 of the SPM redline states the following:a. “The only mandatory and enforceable components of a Reliability Standard are the: (1) applicability, (2) Requirements, and the (3) effective dates. The additional components are included in the Reliability Standard for informational purposes, to establish the relevant scope and technical paradigm, and to provide guidance to Functional Entities concerning how compliance will be assessed by the Compliance Enforcement Authority.”b. Dominion supports the retaining the measures as

Organization	Yes or No	Question 6 Comment
		mandatory and enforceable components of the Reliability Standard and believes the RSAW should align with the Requirements and Measures of the standard. 2. The Standard Processes Manual (SPM) should address the creation of the Reliability ering Committee in Section 3.0. 3. Page 11 of the SPM redline provides conditions for disbanding of a drafting team by the Standards Committee. There is no guidance for the Standards Committee's disposition of the work should that option be exercised. Will another drafting team be appointed or will the project be canceled? 4. The SPM redline text boxes suggest that changes to Section 3.10 are intended to be responsive to SPIG Recommendation 4 by involving compliance staff in the development of RSAWs. Dominion supports the retaining the measures as mandatory and enforceable components of the Reliability Standard and believes the RSAW should align with the Requirements and Measures of the standard. 5. On page 21 of the SPM redline; there is a reference to "NERC's Benchmarks for Excellent Standards." A search on the NERC website failed to locate a document with that title; however, a document with a similar title was found. Please provide clarification as to the specific reference. 6. Step 4.4.2 requires the drafting team to document its justification for the Sanction Table references for each Requirement. Please explain where this justification will be documented. Will the Sanction Table reside in the SPM or in each individual Standard? 7. 8. Step 4.7 does not address the drafting team responding to comments during the formal comment period as described in the SCPS White Paper. 7. Step 4.11 describes the process for handling a negative ballot without comment or with a comment that is unrelated. This appears to be a cumbersome process and does not improve the efficiency of the standards development process (e.g., 30-days to notify the Standard Process Manager another 10 days for the balloter to respond

Organization	Yes or No	Question 6 Comment
		adds 40 days to the ballot process). 8. Step 6.2 in the second paragraph, suggest revising the second sentence to state "Compliance Monitoring and Enforcement Program staff." 9. Examples 3-8 in Section 7 need to be reworded to remove the additional "where" at the beginning of each example. 10. Section 13 states Reliability Standards approved by ANSI as American National Standards shall be reviewed at least once every five years. How is this approval designated on the Reliability Standard? 11. Section 2.5 Sanction Table Reference; Compliance Element is capitalized, this term is not included in Appendix 2 Definitions Used in the Rules of Procedure. Is this going to be a new proposed term?

Response:

1. Thank you for your comments concerning Measures and RSAWs. We believe this concern is alleviated by the process envisioned and the fact that the measures are not enforceable. The Commission has acknowledged that it is in NERC's discretion whether to provide Measures for the Requirements of a Reliability Standard. See e.g., Mandatory Reliability Standards for the Bulk-Power System, 118 FERC 61,218 at P 253 (2007)*("The Commission disagrees with commenters that a Reliability Standard cannot reasonably be enforced, or is otherwise not just and reasonable, solely because it does not include Measures and Levels of Non-Compliance. The Commission adopts the position it took in the NOPR that, while Measures and Levels of Non-Compliance provide useful guidance to the industry, compliance will in all cases be measured by determining whether a party met or failed to meet the Requirement given the specific facts and circumstances of its use, ownership or operation of the Bulk-Power System. As we explained in the NOPR, and reiterate here: 'The most critical element of a Reliability Standard is the Requirements."*
2. The Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination

Organization	Yes or No	Question 6 Comment

between the activities of the RISC and those of the SC.

3. It is impossible to predetermine all of the circumstances that might arise and include the appropriate disposition of a drafting team's work for all of those circumstances. It is appropriate to leave flexibility to address the specific circumstances when this provision is exercised.
4. See response #1 above.
5. The appropriate title is ***Ten Benchmarks of an Excellent Reliability Standard***.
6. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions related to VRFs and VSLs, and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.
7.

To address your concerns regarding comments received during formal commenting periods and other stakeholder's comments regarding bundling of comments and providing responses back, the SPM drafting team is proposing the following new Sections 4.12 and 4.13 to replace the previous Sections 4.12 and 4.13 of the draft SPM:

4.12: Consideration of Comments

If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot.

There is no formal comment period concurrent with the Final Ballot and no obligation for the drafting team to respond to any comments submitted during the Final Ballot.

Organization	Yes or No	Question 6 Comment
		4.13: Additional Ballots A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. 7. In response to comments concerning the time that would be added to the process in determining the "relevance" of comments associated with 'no' votes, the SCPS has modified its proposed revisions to the SPM so that no votes without comments would count toward quorum but would not count in the calculation of approval. 8. This language exists in the current SPM and was not revised. 9. Thank you for your comment. This cleanup edit will be made before the SPM is finalized for recirculation ballot. 10. To date, NERC has not filed any standard with ANSI as an American National Standard, nor has NERC completed a 5-year review of any standard. 11. See response #6 above.
Kansas City Power & Light		1. Section 2.5: Elements of a Reliability StandardOn page 9, the current proposal removes "Evidence Retention" as an element of a reliability standard. Thoughtful consideration of the data needed and a realistic expectation for the retention of different kinds of data to demonstrate compliance is an important element in the standards process. It will be an unreasonable expectation for smaller entities to store real time data sampled every few seconds for three or six years. Consideration for data retention should not be overlooked and it is recommended to retain "Evidence Retention" in standards development.In addition, the current proposal removes "Measures" as an element of a reliability standard. Descriptive measures are in harmony with performance based standards and provide the guidance necessary for entities and auditors to understand compliance expectations with the requirements. It is highly recommended the "Measures" element be retained in the standards process. Removal of the "Measures" will result in ambiguity and debate between entities, Regional Entities, and NERC regarding demonstrations of compliance.2.

Organization	Yes or No	Question 6 Comment
		Section 3.4: Standards CommitteeOn page 12 of the proposal, the first paragraph introduces the concept that the Standards Committee can dismiss a drafting team for a variety of failures of performance. This is considerable power to allow one Committee to hold. There is much in the way of judgment regarding the performance of a drafting team and their efforts and it is a serious matter to consider disbanding a drafting team and the disruption that will cause. It is recommended that the proposal be modified such that the Standards Committee should express standards team performance concerns and recommended actions to another NERC group, such as the Standards Oversight and Technology Committee, and allow the drafting team to defend itself to the NERC group to obtain consensus before actions are taken to disband a drafting team.3. Section 3.6: Drafting TeamsThe bullet points of items drafting teams should consider in the development of standards and requirements does not include Compliance Application Notices (CANs). Recommend these bulleted items include consideration of CANs in the development of new standards and requirements.
Response: The proposal is for Evidence Retention to be included as an element of the RSAW. Regarding Section 3.4, all aspects of the standards process, including this one, are subject to appeal if an entity believes the process has not been followed appropriately. The appeals process already included in the SPM allows for a second level of appeal to be addressed by the NERC Board of Trustees.		
Illinois Municipal Electric Agency		A factor in timely adoption of better reliability standards that doesn't seem to get mentioned very often is the amount of time to achieve regulatory approval. It is my understanding that FERC staff is now more involved in the actual STD standards development process, and that is encouraging. FERC should continue to be encouraged to not duplicate what has been statutorily delegagted to NERC once a proposed standard has been filed with FERC for approval. The self-regulatory process should be allowed to work. If a need is identified after a standard is approved, it can always be refined; i.e., give the standards product a chance to work. A reasonable time limit for regulatory approval action may be appropriate.Illinois Municipal Electric

Organization	Yes or No	Question 6 Comment
		Agency (IMEA) also supports comments submitted by Florida Municipal Power Agency.
Response: This is outside the control of NERC and the Standards Committee.		
Hydro One		a) The proposed SPM now contains provisions for the case when a ballot closes on a day which is a Saturday, Sunday or a federally-recognized United States holiday. We agree with the concept and believe it should be extended to all standards development activities, such as comment periods. Consideration must also be given to Canadian Holidays (national and those used in most Provinces).b) Section 16 is a new section giving the SC authority to "waiver" the process steps. More transparency is needed when a waiver is exercised and a justification process should be required.The concept of a waiver provision with appropriate controls/qualifications to ensure the provision must be used appropriately and with prudence. As drafted, it is too broad. The provision should require a clear demonstration of why the SPM process is inadequate in the circumstances where a waiver is permitted.Suggest the following edits to the first two bullet points following "limited to the following circumstances": o Where the standards team demonstrates that the SPM process will not allow the team to meet regulatory deadlines set by FERC; o Where the standards team demonstrates that the SPM process will not allow the team to meet deadlines imposed by the NERC Board of Trustees; or. . .c) A new paragraph in Section 4.18 proposes to give the SC additional authority to "withdraw" Standards, Interpretations, and Definitions for "good cause" once the Standards, Interpretations, or Definitions has already been approved by industry and the BOT. There appears to give NERC staff authority to discontinue to process Interpretations after the BB approves them. It states, "The NERC Reliability Standards andLegal staffs shall review the final Interpretation to determine whether it has met the requirements for a "valid" Interpretation. Based on this review, the NERC Reliability Standards and Legal staffs shall make a recommendation to the NERC Board of Trustees regarding adoption."d) Standards Drafting Team Composition: We support the changes to Section 3.6 with regard to composition of drafting teams. However,

Organization	Yes or No	Question 6 Comment
		we believe that the standards drafting teams need more defined leadership in order to operate effectively, especially if quality review will be an ongoing process. We recommends that this section be further revised to designate a project manager for each Standards Drafting Team with a defined role to: 1) ensure project deliverables and deadlines are met; 2) be responsible for oversight of the quality review process; 3) ensure the work of the team remains within the scope of the SAR. NPCC is not suggesting that a new position be created, but that a better-defined project manager function could be incorporated into either the role of the team chairperson or the team's NERC facilitator. With the addition of more non-technical experts to drafting teams, the project manager role might be better served by a non-technical member of the team.

Response: The SPCS believes that the current time requirements associated with the individual steps within the standard development process are necessary to minimize the time required for the development of standards. Extending the ballot window from 10 calendar days to 10 working days would be counter to the SPIG recommendations which are calling for improvements to shorten the process, as would adding additional holidays to the calendar of days when a ballot or other action cannot close.

The waiver provision was drafted by NERC Legal at the request of the Standards Committee leadership to address circumstances such as the failed PRC-005-2 recirculation ballot. It is not possible to identify in advance all of the circumstances nor what type of demonstration might be necessary; instead, the provision as drafted relies on a common-sense application and accountability to the NERC Board of Trustees as a means to appropriately limit its application. In all circumstances, if an entity feels that the process has been waived inappropriately, they may appeal the decision.

The new paragraph in Section 4.18 provides necessary flexibility to address events that cannot always be anticipated. For example, an urgent action project to develop a revision to BAL-004-0 to address Time Error Correction was recently determined not to be necessary for reliability and was withdrawn. This allows the SC to make prudent decisions. The express statement that NERC staff will make a recommendation to the Board of Trustees regarding adoption of interpretations is simply giving interpretations commensurate treatment with standards and codifying the process that is already followed. It is NERC staff's responsibility to make these recommendations.

Regarding drafting team composition, Section 4.3 of the proposed revisions to the SPM addresses the addition of a project management function and other non-technical support to aid the drafting team in timely completion of its work.

Organization	Yes or No	Question 6 Comment
American Transmission Company		A. ATC does not agree that Section 16.0, Waiver is needed and should be eliminated. It was not included as one of the SPIG Report recommendations. The waiver provision was drafted by NERC Legal at the request of the Standards Committee leadership to address circumstances such as the failed PRC-005-2 recirculation ballot. It is not possible to identify in advance all of the circumstances nor what type of demonstration might be necessary; instead, the provision as drafted relies on a common-sense application and accountability to the NERC Board of Trustees as a means to appropriately limit its application. In all circumstances, if an entity feels that the process has been waived inappropriately, they may appeal the decision. B. ATC is seeking clarification why the NERC Reliability Standards and Legal staff are reviewing the Request for Interpretation twice in Section 7.0 to determine whether it meets the requirements of as valid interpretation. It is done early in the request (3rd para.) and again near the end of Section 7.0 (2nd to last para.) of the redline copy. Please clarify. The early review is to determine whether the request qualifies as a valid request for interpretation; the latter review is of the interpretation itself, and is done by comparison with established criteria that an interpretation must meet. Also in Section 7.0, the redline eliminated all reference to "Quality Reviews" of Interpretation Requests including the footnote. ATC believes this must be included just as when drafting new or revised Standards. C. Section 10 Processes for Developing a Reliability Standard to a Confidential Issue (or Responsive to Non-Imminent Confidential Issue - Section 10.8) should both include "Quality Reviews" as part of the process, while abiding to the strict nature of confidentiality. All QRs are to be performed in parallel with the language development activities of the SDT and are to begin early in the process so that they don't have to be conducted at the end as a separate activity. D. General Comment: The SPM had several flowcharts, etc. that do not have labeling or reference to Figure numbers. ATC recommends that the SDT review the

Organization	Yes or No	Question 6 Comment
		flowcharts, etc. to make sure they are labeled properly. All charts will be finalized and labeled when the final process revisions have been approved. E. Section 13.0 Process for Conducting Periodic Reviews of Reliability Standards. ATC proposes there be a provision in this periodic review cycle that allows NERC to restart the five (5) or ten (10) year clock once the Standard has gone through a new version, since it was revised within the basic 5 or 10 year period. This would eliminate extra reviews of the Standard since the Standard was already reviewed as part of a previous Standards Development project. This is the intent, but further to this point, the revised SPM relieves NERC of the obligation to perform a ten-year review of a standard unless it has been filed with ANSI as an American National Standard. To date, NERC has not filed any of its standards as American National Standards. F. Possible clarification needed: In Section 4.3, there is no "legal" representative called out as part of the Standards Drafting Team as recommended by SPIG Work Group. (Is this considered Regulatory?) Yes. G. Section 2.2 Reliability Principles are referenced in the SPM as the foundation of Reliability Standards; however, these have not been "formally" defined. ATC recommends that the SDT consider adding this term to the NERC Glossary of Terms. Under the SPM, adding this term to the NERC Glossary requires a standard development project be initiated, with comment and ballot as per the SPM.
Response: Thank you for your comments. See responses embedded above.		
Public Service Enterprise Group		a. In section 3.5, the term "RSAW" is first used in the SPM (other than in text boxes) and should instead be replaced by: Reliability Standard Audit Worksheet

Organization	Yes or No	Question 6 Comment
		("RSAW"). The section has been revised. b. Section 4.5 has footnote 17 that states "The quality review will be conducted in accordance with the Standards Committee's approved procedure for conducting Quality Reviews." The footnote should provide a link to this procedure. Thank you for this suggestion. Once the procedure has been updated to reflect the process revisions, that might be an appropriate time to incorporate the link. Doing so now would be confusing because the current procedure is drafted to support the current SPM. c. Section 1.4 should have a new bullet added that's entitled "Communications Among RBB Members" that states "Registered Ballot Body members may use NERC e-mail "list serves" for their sector to exchange ideas and comments regarding a proposed standard at any time, including when the ballot window described in section 4.9 is open." This will encourage RBB discussion on issues impacting a standard. Thank you for the suggestion. Adopting this suggestion assumes that the only vehicle for such communications will be NERC listservs and it is inappropriate to tie the process to specific technologies. d. In Section 13, the term "American National Standards" should be defined. This is an ANSI term. We will consider adding a footnote to clarify the term if the process revisions are approved and go to a recirculation ballot. e. We strongly object to Section 16 - Waivers. We have several concerns: i. The objective of the SPM is to produce quality standards, and if any of the processes are waived, the result will be rushed and lower quality standards. The ability for the Standards Committee to waive, for good cause, "any of the provisions contained in this manual" is too broad and unconstrained. From a

Organization	Yes or No	Question 6 Comment
		stakeholder perspective, Section 16 completely eviscerates the other changes to the SPM and undermines stakeholder trust in the process. ii. For regulatory imposed deadlines, procedures and processes are in place in the ROP (Section 309.3) and the current SPM (expedited standards development process). Yet this expedited process section has been stricken in the proposed SPM changes. This deletion would be inconsistent with Section 309.3 which specifically references it. The expedited standards development process should be retained. If it does not adequately address the first two bullets in Section 16, then modifications to the expedited process should be proposed. iii. At a minimum, waivers to the SPM should be preceded by the following:a) The posting of an SC document to the RBB that describes the reason for the requested waiver, including the threat to reliability, and what processes would be changed by the waiver.b) A short (10 day) period for accepting RBB comments.c) After comments are received, the SC may either withdraw the waiver or request its expedited approval by the NERC board, ensuring that the board is supplied with the comments received. The waiver provision was drafted by NERC Legal at the request of the Standards Committee leadership to address circumstances such as the failed PRC-005-2 recirculation ballot. It is not possible to identify in advance all of the circumstances nor what type of demonstration might be necessary; instead, the provision as drafted relies on a common-sense application and accountability to the NERC Board of Trustees as a means to appropriately limit its application. In all circumstances, if an entity feels that the process has been waived inappropriately, they may appeal the decision. f. We suggest balloting all SARs, either through the RISC or the appropriate technical committee (OC, PC, or CIPC), to verify the initial need for a standard change. These are all stakeholder bodies with technical expertise. This process would ensure that reliability standards have passed a “reliability need” review before being processed by

Organization	Yes or No	Question 6 Comment
		the SC. The threshold for approval could be lower than the typical 2/3 approval (e.g., it could be a simple majority) to ensure that more SARs proceed to the SC for processing. This suggestion can more appropriately be addressed once the RISC is fully functioning.
Response: Thank you for your comments. See responses embedded above.		
Bonneville Power Administration		BPA has conducted a thorough review of all documents, during the review we have captured several questions and have made note of potential un-intended omissions or typos. Please review the following questions, comments or concerns. Regarding page 18 section 4.1, 2nd paragraph of the redlined Standards Process Manual: BPA believes the word "and" needs to be inserted between NERC Reliability Standard and Standards Committee. We believe this has been addressed – we were unable to locate an error. Regarding page 19, third bullet of the redlined Standards Process Manual: BPA was under the impression that the industry could appeal if the SAR was rejected. Where is the appeals process addressed? There is a single appeals process for any appeal of a process matter, including the handling of a SAR. One of the revisions that was made in the first posting was to streamline sections by moving all references of appeal to Section 8, which describes the appeal process. BPA appreciates the change made in section 4.9 of the redlined Standards Process Manual allowing the ballot to remain open until the next business day if the original closing date falls on a Saturday, Sunday or federal holiday. Thank you for your support. Regarding section 4.10 of the redlined version of the Standards Process Manual: BPA seeks clarification as to why abstain votes are no longer considered as part of the quorum. If they are not counted, what is the purpose of an abstain vote? The method for determining quorum has been corrected to include abstentions as the current SPM does.

Organization	Yes or No	Question 6 Comment
		Regarding Section 4.12 p. 28 of the redlined version of the Standards Process Manual: BPA seeks clarification regarding only responding to comments prior to the final ballot. BPA believes it would be more productive to be responding earlier in the process. The SPM drafting team points out that a draft standard will be improved incrementally as informal input is gathered and it is expected that the draft that will be posted for the formal posting and commenting/ballot will be a more robust draft that will reflect the input that has been obtained from the industry through the multiple informal forums. This is a significant change from the current practice of incremental improvement by successive formal comment periods and ballots and is intended to make more efficient use of drafting team and industry time and resources. Sections 4.12 and 4.13 have been revised to clarify the requirements to consider and respond to all written comments. The proposed new Sections 4.12 and 4.13 are as follows: **4.12 Consideration of Comments** If a stakeholder or balloter proposes a significant revision to a Reliability Standard during the formal comment period or concurrent Ballot that will improve the quality, clarity, or enforceability of that Reliability Standard, then the drafting team may choose to make such revisions and post the revised Reliability Standard for another 45 calendar day public comment period and ballot. Prior to posting the revised Reliability Standard for an additional comment period, the drafting team must communicate this decision to stakeholders. This communication is intended to inform stakeholders that the drafting team has identified that significant revisions to the Reliability Standard are necessary and should note that the drafting team is not required to respond in writing to comments from the previous ballot. The drafting team will respond to comments received in the last Additional Ballot prior to conducting a Final Ballot. There is no formal comment period concurrent with the Final Ballot and no

Organization	Yes or No	Question 6 Comment
		obligation for the drafting team to respond to any comments submitted during the Final Ballot. **4.13 Additional Ballots** A drafting team must respond in writing to every stakeholder written comment submitted in response to a ballot prior to conducting a Final Ballot. These responses may be provided in summary form, but all comments and objections must be responded to by the drafting team. All comments received and all responses shall be publicly posted. However, a drafting team is not required to respond in writing to comments to the previous ballot when it determines that significant changes are needed and an Additional Ballot will be conducted. Regarding Section 7.0, page 37 of the redlined version of the Standards Process Manual: BPA seeks clarification on whether or not an Interpretation can be provided for BOT approved standards that are not yet FERC approved. The section indicates that a request can be made for any standard that has been adopted by the NERC Board of Trustee's. The example given only references the current effective version and a version with a future effective date. Yes, an interpretation can be requested of any standard approved by the Board, regardless of its approval status at FERC, because standards may have different effective dates in Canadian provinces. The language in the SPM should work in either case. Regarding page 39 of the relined version of the Standards Process Manual: The second to the last paragraph appears to be out of order and should be moved to be the second sentence of the next paragraph. Suggesting "If approved by its ballot pool, the Interpretation shall be forwarded to the NERC Board of Trustee's for adoption. The NERC Reliability Standards and Legal staffs shall review the final Interpretation to determine whether it has met the requirements for valid interpretation. Based on this review, the NERC standards and legal staffs shall make a

Organization	Yes or No	Question 6 Comment
		recommendation to the NERC Board of Trustee's regarding adoption." Is the intent to have legal review prior to it being approved by the ballot pool or after? The legal review upon which the NERC staff recommendation to the Board would be based is conducted after the standard is approved by the ballot pool. This language reflects the current practice and was added to clarify that this is the practice. While we understand the suggestion to move the sentence, we believe it is also acceptable in the current location, and in the interest of focusing on the larger issues, have not moved it. P. 41 of the relined version of the Standards Process Manual: Conduct quality review/collect informal feedback - these steps do not appear to be referenced in the narrative section. BPA is in support of the standards being reviewed every 10 years. Thank you for your support. Regarding page 69, Section 16 "Waiver" of the relined version of the Standards Process Manual:BPA has concerns about Section 16, BPA understands the need to have the flexibility of a waiver. The waiver seems to be misunderstood. BPA is concerned that the waiver does not have a sunset period. BPA believes the waiver process should be used on an interim basis as temporary solution, and that NERC should start the NERC Standards Development process in parallel. BPA strongly believes that industry involvement creates the most efficient, effective and reliable standard. The waiver provision is not intended to limit industry involvement. NERC Legal does not believe a blanket sunset provision is necessary, because as drafted, each waiver of a process requirement would need to be reported to the NERC Board of Trustees, who could then determine on a case-by-case basis and in full consideration of the facts surrounding a particular use of a waiver, the best course of action. The waiver does not create an ongoing opportunity to waive the process for the entire development of a standard; instead, it provides flexibility to waive individual elements of the process when it is appropriate to do so for a limited set of circumstances. Regarding 'Cyber Security' Sanctions Table in the White Paper: The performance

Organization	Yes or No	Question 6 Comment
		based level two appears to have a typo. BPA believes this should be 7500 to 300000 ... not 75000 to 300000. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions that would eliminate VRFs and VSLs and replace them with a "Sanction Table Reference" for each requirement, and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM.
Response: Thank you for your comments. Please see responses embedded above.		
Consumers Energy		Consumers Energy disagrees with the indication in the manual that, "The number of votes cast is the sum of affirmative and negative votes with related comments or stated objections, excluding abstentions, non-responses, negative votes without comments, and negative votes with unrelated comments." We believe that negative votes should count regardless of whether comments are submitted or not. This is especially important in light of the fact that currently, there is no allowance for submitting comments directly with the ballot. Without the ability to match comments to ballots, a number of negative ballots could be disregarded when determining whether a project has passed or not. Additionally, we are concerned that even if comments were submitted, they may be disregarded as unrelated. We would question who makes this determination and how industry could be assured that the ballots they cast are properly included.
Response: The revisions associated with the 'No vote" issue are in response to SPIG recommendations 1 & 5. It is the SCPS's intent to enhance the information provided to the Standard Drafting Teams ("SDT") with helpful and constructive input to allow the team to efficiently revise a standard during its development to meet industry concerns. In order to accomplish this, stakeholders need to be fully engaged early in the process and need to provide meaningful comments that are helpful and constructive, which will assist the SDT in developing revisions that are responsive to the concerns of the industry and establish an adequate level reliability. It has been demonstrated in the past that early engagement of stakeholders in the process produces higher quality standards in a shorter amount		

Organization	Yes or No	Question 6 Comment
of time. Based on the comments received, the SCPS has re-examined this issue and determined that the approach for evaluating the relevance of comments requires additional clarification and has eliminated the process for reviewing the relevance of comments from the proposed revisions. However, the SCPS has retained the concept of including 'No' ballots that are not accompanied by comments in the calculation of quorum but not being counted in the calculation of consensus. The SCPS believes stakeholders that vote 'No' without comment are not providing enough information to assist the SDT in revising the standard to reach consensus. This leads to inefficiency and prolongs the standards development process because the SDT is guessing at what the industry concerns are. With respect to NERC's balloting software - ultimately, NERC has a responsibility to provide tools to support whatever process is developed, and NERC staff will be prepared via software or manual methods if necessary, to ensure that balloters will be able to submit comments at each stage of the balloting process including initial, additional and final ballot, including an option to indicate support for another entity's comments without the need to submit full responses to every question.		
Duke Energy		Duke Energy also supports the addition of various resources (technical writers, legal and compliance experts) to the Standard Drafting Teams with authority over the technical content remaining with the industry technical experts. Changes to facilitate performance of quality reviews concurrent with the standard development will hopefully result in more well written standards in a more timely manner.
Response: Thank you for your comments and support.		
FirstEnergy Corp		FE has the following additional comments: 1. Section 1.4 - FE is curious about the reasons for the new section on Metric Policy? Does this mean there will be duplicate versions for U.S. and Canada/Mexico? The metric policy was added to the "Essential Attributes of NERC's Reliability Standards Processes to clarify the policy and make explicit the need to utilize measurements in standards that work in the context of an international ERO. The metric policy is intended to avoid having to develop multiple versions for the US, Canada, and Mexico.

Organization	Yes or No	Question 6 Comment
		2. Section 3.4 - FE supports the additional authority given to the SC to disband drafting teams for not producing results. This will help give the SC greater ability to facilitate the development of standards. Thank you for your support. 3. Section 3.7 - FE suggest the revisions consider adding a reference to Mexico. NERC Legal will consider making this change when specific agreements are in place with Mexican authorities. 4. Section 3.8 - In the new sentence "The Standards Committee may request that a NERC technical committee or other group prepare a Technical document to support development of a proposed Reliability Standard." It appears the word "technical" should not be capitalized. Thank you for identifying this typo. It will be corrected as a non-substantive change, along with other minor changes that have been identified by commenters, prior to recirculation ballot if the process revisions are approved by the ballot pool. 5. Section 3.10 - This section does not seem to address the comment box that appears next to it. There is no text describing the development of the RSAWs in the actual manual text. The section should be re-written to include some of the thoughts from the comment box and better clarify how RSAWs are developed. Although the intent is to have drafting teams work collaboratively with ERO compliance staff to develop RSAWs, Compliance staff are ultimately responsible for RSAWs and the Standard Processes Manual is not the appropriate location for explaining the process for developing RSAWs. The Standards Committee has been working with ERO Compliance to develop a procedure that will provide details of the process. When this is available, it will be publicly posted on the NERC website.
Response: Thank you for your comments. Please see responses embedded above.

Indiana Municipal Power Agency		Indiana Municipal Power Agency supports the comments submitted by Floriday Municipal Power Agency.
Response: See responses to comments from Florida Municipal Power Agency.		
ISO New England Inc.		InterpretationsWe have concerns with section 7.0. The section states an RFI should be rejected if (1) an issue can be addressed by an active standards development activity; (2) RFI request clarity on any items other than a Requirement; and (3) an RFI has already been addressed in the "record." First, the BOT has clarified that a valid RFI need not be limited to the Requirements in a Standard and that a RFI can take into account other parts of the Standard as well as materials that were developed in support of a Standard (i.e. whitepaper, technical guidelines, Q&A, etc.). Second, waiting for a standards development activity to create the requested Interpretation may not be an option, many projects take a year or more and then have to be filed and acted upon by appropriate governmental authorities. In the meantime, lack of a RFI may result in inappropriate enforcement action due to EAs determining their own Interpretation. Finally, it appears that the (2) and (3) completely contradict one another. By its nature, an interpretation is inefficient in that it requires all of the same processing steps as revision of a standard, but does not "fix" the underlying standard. A requester does not have a responsibility to make efficient use of industry resources, but NERC staff and the Standards Committee do have this responsibility and without the ability to make decisions about how to efficiently address a request, will not be able to fulfill the responsibility. Each case needs to be evaluated with the particular facts surrounding the request, and the inclusion of this information in the SPM is intended to clarify for all stakeholders what is the current practice. Compliance WaiversThere remains language allowing for "waivers" of enforceable requirements for field trial purposes. Since the enforceable requirements are essentially backed by law, perhaps NERC should request a policy statement from the

Organization	Yes or No	Question 6 Comment
		applicable governmental authorities that the authorities recognize NERC-approved waivers. This comment will be referred to the Compliance Monitoring and Enforcement program for consideration, but does not require a change to the SPM. WithdrawalsSection 4.18 proposes to give the SC additional authority to "withdraw" Standards, Interpretations, and Definitions for "good cause" once the Standards, Interpretations, or Definitions has already been approved by industry and the BOT. We have concerns with the lack of definition on what constitutes "good cause" and the underlying need that drove this change. This is problematic, given that as a minimum, both the Industry and the Board have previously approved the action. If this section is retained, there needs to be some due process around the withdrawal of an industry and Board approved action. As a minimum, there should be advance notice and opportunity for comment, with the results of the comments provided to the BOT. Interpretations We suggest the new paragraph in the Interpretation Section (7.0) be removed as staff makes recommendations for any standards action and this need not be in the SPM: "The NERC Reliability Standards and Legal staffs shall review the final Interpretation to determine whether it has met the requirements for a valid Interpretation. Based on this review, the NERC Reliability Standards and Legal staffs shall make a recommendation to the NERC Board of Trustees regarding adoption." We agree that NERC staff already make these recommendations as part of every standards action that is brought before the NERC Board, and inclusion of the language in the SPM is intended to clarify this. There needs to be some transparency with regard to rejected interpretation requests. There should be a public posting of rejected requests and the reasons for the rejection. This does not require an explicit change to the SPM, but your suggestion will be considered for future implementation. We disagree with the need for interpretation drafting teams to automatically create

Organization	Yes or No	Question 6 Comment
		SARs if they believe there is a reliability gap or if the drafting team says an interpretation can't be crafted. The industry should be asked if they agree with the drafting team's decision before any further effort is expended. The industry will have this opportunity when the SAR is posted for comment. This language is a direct implementation of the Board of Trustees' November 2009 guidance on interpretations. VariancesThe section on "variances" implies that a variance is needed for "a conflict with an approved tariff"; it is our understanding that where there is a conflict with existing tariffs or market rules, the tariffs take precedence. A variance is still required to make this explicit. Waived ActionsSection 16 will as a minimum, lead to a perception of abuse of the process. There needs to be transparency of each waived action. This would include public notice and an ongoing record of waived provisions. This will assist NERC and the industry in identifying underlying drivers that are causing delays and provide a safeguard to potential challenges on the legality of the standards. Introducing additional processing steps would defeat the intended purpose of having a waiver provision, which is to allow for the development of a standard to address a reliability need to take precedence over process requirements. Each waiver must be reported to the Board of Trustees, and the Board will have an opportunity to consider the facts surrounding each use of a waiver and direct that appropriate actions be taken. This sets a high bar that should discourage abuse of the waiver provision.
Response: Thank you for your comments. Please see responses embedded above.		
MEAG Power		MEAG Power endorses and adopts the votes and comments as provided by AECI.
Response: See response to comments submitted by AECI.		
NextEra Energy Inc		NextEra submits the following comments for consideration:

Organization	Yes or No	Question 6 Comment
		Sections 3.4 and 3.5 of the Standards Process Manual (SPM)The redlined SPM at page Section 3.4 reads in part:The Standards Committee may disband a drafting team if it determines (a) that the drafting team is not producing a standard in a timely manner; (b) the drafting team is not able to produce a standard that will achieve industry consensus; (c) the drafting team has not addressed the scope of the SAR; or (d) the drafting team has failed to fully address a regulatory directive or otherwise provided a responsive or equally efficient and effective alternative. NextEra suggests that the Standards Committee should have options other than disbanding the drafting team, such as adding members, in particular a facilitator and/or legal/technical writer. NextEra also believes that currently there are several structural issues that appear to cause drafting teams to be less than constructive at times, such as: (i) drafting teams insolate themselves or become reactive to such a degree that they are not responsive to stakeholder comments and (ii) drafting teams are not sufficiently coordinating with other drafting teams. The development of COM-002 and COM-003 appears are an example of a lack of coordination. To address these matters, NextEra suggests that Section 3.4 language above be revised to read: "The Standards Committee shall have the authority to at any time in the process: (a) to appoint a facilitator, legal or/and technical writer to a drafting team; (b) replace an ineffective facilitator, legal and/or technical writer; or (c) direct two or more drafting teams to consolidate efforts or coordinate with each other to reconcile any differences and produce consistent Reliability Standard requirements, white papers, etc. The Standards Committee shall also have the authority to disband a drafting team if it determines: (a) that the drafting team is not producing a standard in a timely manner; (b) the drafting team is not able to produce a standard that will achieve industry consensus; (c) the drafting team has not addressed the scope of the SAR or is producing work product outside the scope of the SAR; or (d) the drafting team has failed to satisfactorily or fully address a regulatory directive or otherwise provided a responsive or equally efficient and effective alternative." The language you reference in section 3.4 was added to make explicit that the SC has the authority to disband drafting teams; there is no presumption that this is the only

Organization	Yes or No	Question 6 Comment
		option available to the SC under the circumstances that are mentioned. The Standards Committee already does add new members to drafting teams, including to supplement the skills of the existing team (including facilitation or technical writing skills) or to provide additional leadership. On the two projects you mentioned, COM-002 and COM-003, the two drafting teams in question held a joint meeting in late 2010 and reported to the SC on the outcomes of that meeting. In short, although these changes are not inconsistent with the overall direction of the SPIG recommendations, it is not clear that the suggested language changes would, alone, result in different outcomes. Therefore, in order to focus the changes for the second draft on the substantive changes in hopes of getting support for those, we have not made the suggested changes and hope that you will continue to evaluate whether the changes are needed. Consistent with the above language changes, NextEra suggests that "facilitators" be added to the language in Section 3.5 that lists the members of a drafting team (to complement the additions of compliance and legal personnel), so that each drafting team is required to have a skilled facilitator. NextEra believes that many of the current issues associated with drafting teams result from a lack of structure and facilitation. A skilled facilitator will be able to provide a structure and direct discussions so that progress and decisions can be made in a much shorter timeframe, while at the same time providing a forum for all voices to be heard, including stakeholders and those individuals working on quality reviews. Without the addition of facilitators, NextEra is concerned that many of the current issues that hinder effective drafting teams will continue. We believe this is addressed in the last sentence of the first paragraph of Section 3.6, which reads: "The NERC Reliability Standards Staff shall provide, or solicit from the industry, essential support for each of the drafting teams in the form of technical writers, legal, compliance, and *rigorous and highly trained facilitation support personnel*." (emphasis added) Section 7 of the SPMNextEra also believes that Section 7 on interpretations needs language that outlines what is a valid interpretation request. Currently the new language states what an interpretation is not. NextEra recommends that Section 7

Organization	Yes or No	Question 6 Comment
		include the following statements: A valid interpretation request is a request that seeks clarification or an interpretation of a word, term or sentence(s) of a Reliability Standard requirement. When drafting an interpretation, if the plain language meaning of the word, term or sentence is not clear, the interpretation team may review the record of the standard drafting team that drafted the Reliability Standard, including interviewing members of the standard drafting team to ascertain the intent of the word, term or sentence(s) at issue. Thank you for this excellent suggestion. We believe this language is appropriate for inclusion in the Interpretation Drafting Team guideline, which will be revised for consideration by the Standards Committee Process Subcommittee and subsequent approval by the Standards Committee. The three new Sanction TablesNextEra believes that each of the new Sanction Tables need refinement. First, NextEra believes that level one for each table should start with a zero fine, not $3,000, $2,000 and $1,000 as currently written. NextEra is concerned that without the discretion to implement a zero fine for level 1 that it unduly constricts the discretion of NERC and the Regional Entities to impose zero fines, including fines under the Find, Fix, Track and Report mechanism. Also, NextEra is recommending that each of the levels be re-worded as follows so to consider multiple scenarios: The Operations Sanction Table (OST)Level 1 - a violation did not and would not be expected to adversely impact electrical state or capability of the BES or the ability to monitor or control the BES.Level 2 - a violation did not, but could have directly and adversely impact electrical state or capability of the BES or ability to monitor or control the BES, and the violations did not, but could have in an unlikely situation contributed to BES instability, separation, or a cascading sequence of failures.Level 3 - a violation did not, but under likely circumstances could have contributed to impeding restoration, damaging equipment or non-consequential load loss or could contribute to BES instability, separation, or a cascading sequence of failures.Level 4 - a violation did or could have very likely directly caused BES instability, separation, or a cascading sequence of failures. The Cyber Security Sanctions TableLevel 1 - a violation could adversely impact Low Impact BES Cyber Systems; but did not or would not be expected to expose the

Organization	Yes or No	Question 6 Comment
		electrical state or the capability of the BES; or the ability to effectively monitor and control the BES.Level 2 - a violation could adversely impact Medium Impact BES Cyber Systems; a violation could adversely expose the electrical state or the capability of the BES; or the ability to effectively monitor and control the BES. A violation of the requirement is unlikely to and did not lead to BES instability, separation, or cascading failures.Level 3 - a violation could adversely impact High Impact BES Cyber Systems; a violation did or could have impeded restoration, damaged equipment or non-consequential load loss or could have contributed to BES to instability, separation, or a cascading sequence of failures.Level 4 - a violation did or could have directly exposed the BES to instability, separation, or a cascading sequence of failures.Planning Sanctions TableLevel 1 - a violation did not and would not be expected to adversely affect the ability to assess the long-range reliability of the BES.Level 2 - a violation did not, but could directly and adversely affect the ability to assess the long-range reliability of the BES.Level 3 - a violation did or could contribute to development of a long-range plan that, if followed, could adversely affect the BES' ability to respond to contingencies.Level 4 - a violation did or could directly cause development of a long-range plan that, if followed, could adversely affect the BES' ability to respond to contingencies. Thank you for your thoughtful consideration of the proposed approach to replacing VRFs and VSLs with Sanction Table References. Based on the majority of the comments received, the SCPS has re-examined the proposed revisions and concluded that certain aspects of the proposal require additional clarification. Therefore the proposed revisions to eliminate the VRFs and VSLs have been removed from this draft of the proposed SPM revisions. The VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll will continue to be conducted per the SPM. The SCPS will continue to develop the concepts in response to the SPIG recommendations to ease the burden on the SDTs and to provide an opportunity to shorten the development timeframes associated with standard development projects. The SCPS will continue to work toward the elimination of the VRFs and the VSLs while further developing the concepts which will allow the ERO enterprise

Organization	Yes or No	Question 6 Comment
		(NERC, Regional Entities and stakeholders) to focus on the potential risk to the reliability of the BES and how to best manage that risk by developing quality results-based Reliability Standards, managing effective Risk-based Compliance Monitoring programs and enforcing standards based on comprehensive risk assessments.
Response: Thank you for your comments. Please see responses embedded above.		
SPP Standards Review Group		No.
Trans Bay Cable LLC		None
National Rural Electric Cooperative Association (NRECA)		NRECA has the following additional comments/questions that we request responses to before we can offer complete support for the draft SPM modifications: Has any analysis been completed to determine whether and to what extent these proposed SPM changes will actually shorten the time for developing a standard? Such analysis would be helpful in gaining a better understanding of the impact these proposed changes may have. Without implementing the changes, it is difficult to predict what the outcome of the changes will be. NRECA remains concerned about the lack of clarity related to the RISC proposal and its impact on the current and future role of the SC. Further clarity in this area is urgently needed so stakeholders can better understand the respective roles and responsibilities. The Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination

Organization	Yes or No	Question 6 Comment
		between the activities of the RISC and those of the SC. In the last paragraph of Section 2.5 of the proposed SPM under Application Guidelines, the relevant scope of a standard is stated to be informational only. NRECA believes this language is confusing and appears to state that the relevant scope of a standard is not part of the mandatory and enforceable component of a standard. The relevant scope of a standard should not be only an informational component of the standard. NRECA requests that this language be clarified such that the relevant scope of the standard is not something NERC can appear to be able to change as needed due to its informational-only status. The relevant scope of a standard should only be changed through the use of the standard development process. There is no specific "relevant scope" element of a standard. The scope a standard is determined by the Requirements and Applicability, which are developed as part of the standard development process. NRECA strongly disagrees that Section 3.4, items b and d are not appropriate reasons for the SC to disband a SDT. There may be many reasons why a SDT may not be able to achieve industry consensus or fully address a regulatory directive. We request that items b and d be deleted. Under the current SPM as well as the proposed revisions, Drafting teams report to the Standards Committee and are accountable for producing quality results in a timely manner. The Standards Committee must have the authority to hold drafting teams accountable and take actions that may be necessary to ensure that the ERO can fulfill its obligation to produce standards that address reliability issues, including in response to regulatory directives. The items that you are requesting be deleted are aimed at ensuring that the SC has the tools to fulfill its responsibilities. In Section 4.1, 2nd bullet on what the SC can do with a SAR, NRECA requests that this be revised to require the SC to provide an explanation of why the SAR is being remanded. In addition, in the 3rd bullet it is unclear what is meant by "good cause?"

Organization	Yes or No	Question 6 Comment
		Without further support, it appears the SC can reject a SAR for any reason as long as it provides a written response. NRECA believes this is too broad and that further context is required on the term "good cause." The Standards Committee is responsible for taking into consideration the impact on industry resources and needs to have the authority to take actions that are in the best interest of those resources while ensuring that the standards process produces quality standards that address reliability needs in a timely manner. In remanding a SAR for further work, it is anticipated that the Standards Committee would naturally discuss its reasoning and it is not necessary to place a requirement in the SPM to do so. With respect to reasons for rejecting a SAR, is impossible to anticipate and provide an exhaustive list of the possible reasons for rejecting a SAR. If an entity believes the SC has acted inappropriately, they may appeal the action. In Section 4.6 it is unclear to NRECA how QR will be done in parallel with standard development. Please provide additional direction in the SPM on how this is to be accomplished during standard development. Details about how QR is done are not included in the current SPM, and it is not appropriate to provide that level of detail in the proposed revisions. The details of how QR is conducted will change as experience is gained. In general, the concept of doing a QR in parallel with the development of a standard is to use the same principles that quality review volunteers now review for (as outlined in Background Information for Quality Reviewers), but have the trained legal and compliance volunteers work directly with the drafting team during the drafting of the Requirements and other elements of the standard. Also in Section 4.6, what is "criteria specified" and "specified criteria" referring to? The SPM does not clearly point to such criteria. Please see the document that is referenced (Ten Benchmarks of an Excellent Reliability Standard), posted at http://www.nerc.com/files/10_Benchmarks_of_Excellent_Reliability_Standards.pdf In Section 4.18 NERCA has a similar concern about what "good cause" means in this

Organization	Yes or No	Question 6 Comment
		context. Please provide further SPM language to better quantify this language. Currently it may be overly broad. Please see response above concerning the use of "good cause." In Section 4.19 NRECA believes this section should also reference the retirement of only a requirement, not only the entire standard. This section is intended to reference the retirement of an entire standard. Retirement of an individual Requirement is done through a revision of the standard, following the standard development process. In Section 7.0, item (2), NRECA does not understand why an interpretation can't be done for this reason. Please delete or provide further information to support his change. Also, in item (3), shouldn't this actually say that the interpretation work would be done by the active SDT, not that the RFI would be rejected?Also in Section 7.0, last two paragraphs of this section are confusing. It is not clear how the NERC reliability and legal staff review and the ballot results are coordinated in the process. Please clarify the roles of the staff review and the ballot results so that the SPM is clear on the respective roles. The reasons for rejecting an interpretation request are not limited to cases where an interpretation could not be developed; in some cases, the reason for rejecting the interpretation request is intended to provide the Standards Committee and NERC staff the ability to make responsible use of industry resources. In both item 2 and item 3, this is the case. Item 3 anticipates the case where a standard is being revised by an active team, and while the drafting team is working a Request for Interpretation of the prior version is submitted. In this case, it may be more efficient, depending on the status of the active project, to reject the interpretation request and direct the active team to address the issue in the revised version. The language that has been added about staff review at two different points (first of of the request, to ensure that it is a valid request, and second, of the interpretation that is approved by its ballot pool) have been included to make clear the process that is currently followed. NERC staff have an obligation to provide a recommendation to

Organization	Yes or No	Question 6 Comment
		the Board of Trustees on every standard action that is presented to the Board, including interpretations. NRECA is concerned by the deletion of the expedited process from the SPM. Please provide an explanation of why this helpful provision is being proposed for deletion. The addition of Section 16, the waiver provision, makes the expedited process unnecessary, since a standard can be expedited by exercising a waiver, which would then be reported to the Board. In Section 10.8 how and when will the pre-defined SMEs be determined? The NERC Critical Infrastructure Department maintains contact information for SMEs. NRECA does not support the addition of Section 16.0 to the SPM. We believe such authority is overly broad and we are not aware of any demonstration of need for such a broad waiver authority of any provision of the SPM. NRECA is also concerned that use of this waiver provision would appear to eliminate the need for the SC to report SPM violations to the CCC. While reporting use of the waiver provision to the BOT is helpful, the elimination of the checks and balances of having the CCC review such actions is troubling. Thank you for your comments.
Response: The Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC.		
Northeast Power Coordinating Council		One item not included but needing further discussion is the comment forms beingprovided to the industry on all NERC activities. All the comments forms seem to bestated as “we made this change. Do you agree with this change?” An opportunity

Organization	Yes or No	Question 6 Comment
		forback-and-forth is not being provided to the industry with these types of comment forms.Who or what "body" should be approached with this issue. There should be more opportunities for open discussion with industry through the proper construction of questions on the comment forms. Thank you for your comments. If you have suggestions for constructing better questions on comment forms, please submit them to the NERC Director of Standards Development. Following are additional comments: 1. Section 16 is a new section giving the SC authority to "waiver" the processsteps. I do not support giving the SC this authority, thereby removing therequirement to report deviations of the process. I believe the SC already takes anexceptional amount of liberty with their "authority". More transparency is needed when a waiver is exercised and a justification process should be required.The concept of a waiver provision with appropriate controls/qualifications to ensure the provision must be used appropriately.The proposed Waiver provision, as drafted, is too broad. The provision should require a clear demonstration of why the SPM process is inadequate in the circumstances where a waiver is permitted. Suggest the following edits to the first two bullet points following "limited to the following circumstances": Where the standards team demonstrates that the SPM process will not allow the team to meet regulatory deadlines set by FERC; Where the standards team demonstrates that the SPM process will not allow the team to meet deadlines imposed by the NERC Board of Trustees; or. . . The idea of the waiver provision is to allow the standards process to be responsive to reliability needs by producing a quality standard in a timely manner. Adding additional process requirements is counter to this objective. As drafted, the waiver must be reported to the Board of Trustees, who will then be able to direct other actions as appropriate to the facts surrounding the particular waiver. 2. The section on "variances" implies that a variance is needed for "a conflict withan

Organization	Yes or No	Question 6 Comment
		approved tariff". Are Standards allowed to be developed under such scenarios? A standard may apply continent-wide, but in some instances conflict with a particular tariff. In this situation, a variance is appropriate. 3. NERC and the SC had taken the position that the BOT action had limitedInterpretations to the Requirements. However, upon further inquiry regarding theLevel 1 appeal for the NWPP FRI on BAL-002, the BOT instructed that theiraction had been too strictly interpreted and that their action did not limit thingscontained within the "four corners" of the Standard. However, even after this clarification, as I look through the SPM changes, there continues to be this egregious attempt to limit the Industry's ability to request an appropriate Interpretation and, therefore, stave off inappropriate enforcement. The specifics of this are in the Interpretation section, the SPM indicates that an RFI should be rejected if (1) an issue can be addressed by an active standardsdevelopment activity; (2) RFI request clarity on any items other than aRequirement; and (3) an RFI has already been addressed in the "record." I amnot supportive of these and actually believe that (2) and (3) completely contradictone another. The reasons for rejecting an interpretation request are not limited to cases where an interpretation could not be developed; and do not say a request *should* be rejected, but rather that it *may* be rejected. In some cases, the reason for rejecting the interpretation request is intended to provide the Standards Committee and NERC staff the ability to make responsible use of industry resources. In the case where a standard is being revised by an active team, and while that drafting team is working a Request for Interpretation of the prior version of the standard is submitted. In this case, it may be more efficient, depending on the status of the active project, to reject the interpretation request and direct the active team to address the issue in the revised version. The comment acknowledges that interpretations are sometimes requested to "stave off inappropriate enforcement." There are other vehicles for addressing this concern, and given the industry resources that are involved in drafting, balloting, and

Organization	Yes or No	Question 6 Comment
		commenting on each standard action, including interpretations, it is incumbent on NERC and the Standards Committee to ensure that those resources are not being used inappropriately. 4. There remains language allowing for "waivers" of enforceable requirements forfield trial purposes. Since the enforceable requirements are essentially backed bylaw, I question the SC and BOT authority to enact such "waivers." Thank you. This language has not been changed from the current, FERC-approved SPM. 5. Section 4.18 proposes to give the SC additional authority to "withdraw"Standards, Interpretations, Definitions for "good cause" once the Standards,Interpretations, or Definitions has already been approved by industry and theBOT. See item 1 above. It is impossible to anticipate when a previously-approved standard action may be overtaken by other events and no longer be required. This is not intended to undermine the industry's approval but rather to provide a reasonable way to manage the body of standards products. 6. Clarification is needed for quorum and approval calculations with examples given. The quorum calculation has been revised from the last draft to reflect the same approach to calculating a quorum as is used in the current SPM. A spreadsheet with approval calculation examples will be prepared and posted prior to the ballot of the SPM revisions. 7. Balloting: the Ballot Body has 10 CALENDAR days to vote; however, if a balloter votesNO without providing appropriate comments they will be contacted to enablethem to provide appropriate comments for their NO vote to count and they willhave 10 BUSINESS days. I think both should be business days. The intent of the

Organization	Yes or No	Question 6 Comment
		process revisions is to make the process more efficient, and adding additional days to the timeline by changing calendar days to business days is not consistent with this intent. When a standard is balloted, it has already been posted for 35 days prior to the ballot window and the act of balloting takes only a few minutes at most. It seems reasonable to assume that an individual who joins a ballot pool can either find those few minutes within a window of ten calendar days, or find time in the preceding 35 days to assign a proxy.. 8. The process of opening a solicitation every year seeking ideas for new StandardsDevelopment proposals should cease. We are already inundated withStandards Development activities and anyone can submit a SAR at any time. Thank you for this comment. 9. There is a new paragraph added to the Interpretation Section (7.0), thatappears to give NERC staff authority to continue to not process Interpretationsafter the BB approves them. It states, "The NERC Reliability Standards andLegal staffs shall review the final Interpretation to determine whether it has metthe requirements for a "valid" Interpretation. Based on this review, the NERCReliability Standards and Legal staffs shall make a recommendation to the NERC Board of Trustees regarding adoption." The language that has been added about staff review at two different points (first of of the request, to ensure that it is a valid request, and second, of the interpretation that is approved by its ballot pool) have been included to make clear the process that is currently followed. NERC staff have an obligation to provide a recommendation to the Board of Trustees on every standard action that is presented to the Board, including interpretations. 10. What Criteria constitutes a valid interpretation being used by NERC Standards and Legal Staff? NERC staff must abide by the criteria provided by the NERC Board of trustees at the November 2009 Board meeting. The Board resolution is available in

Organization	Yes or No	Question 6 Comment
		the minutes from that meeting. 11. Standards Drafting Team Composition: NPCC supports the changes to Section 3.6 with regard to composition of drafting teams. However, NPCC believes that the standards drafting teams need more defined leadership in order to operate effectively, especially if quality review will be an ongoing process. NPCC recommends that this section be further revised to designate a project manager for each Standards Drafting Team with a defined role to: 1) ensure project deliverables and deadlines are met; 2) be responsible for oversight of the quality review process; 3) ensure the work of the team remains within the scope of the SAR. NPCC is not suggesting that a new position be created, but that a better-defined project manager function could be incorporated into either the role of the team chairperson or the team's NERC facilitator. With the addition of more non-technical experts to drafting teams, the project manager role might be better served by a non-technical member of the team. Section 4.3 includes the following language: "The NERC Reliability Standards Staff shall provide one or more members as needed to support the team with facilitation, project management, regulatory and technical writing expertise and shall provide administrative support to the team, guiding the team through the steps in completing its project." This is intended to address the issues you have identified. 12. Ultimately an individual has the right to say a standard is not needed and that no amount of "tweaking" will make it acceptable. There has been no attempt to say otherwise.
Response: Thank you for your comments. Please see responses embedded above..		
IRC-SCR		Question 6 (Other Comments)InterpretationsWe have concerns with section 7.0 . The section states an RFI should be rejected if (1) an issue can be addressed by an active standards development activity; (2) RFI request clarity on any items other than a Requirement; and (3) an RFI has already been addressed in the "record." First, the BOT has clarified that a valid RFI need not be limited to the Requirements in a

Organization	Yes or No	Question 6 Comment
		Standard and that a RFI can take into account other parts of the Standard as well as materials that were developed in support of a Standard (i.e. whitepaper, technical guidelines, Q&A, etc.). Second, waiting for a standards development activity to create the requested Interpretation may not be an option, many projects take a year or more and then have to be filed and acted upon by appropriate governmental authorities. In the meantime, lack of a RFI may result in inappropriate enforcement action due to EAs determining their own Interpretation. Finally, it appears that the (2) and (3) completely contradict one another. We suggest the new paragraph in the Interpretation Section (7.0) be removed as staff makes recommendations for any standards action and this need not be in the SPM: "The NERC Reliability Standards and Legal staffs shall review the final Interpretation to determine whether it has met the requirements for a valid Interpretation. Based on this review, the NERC Reliability Standards and Legal staffs shall make a recommendation to the NERC Board of Trustees regarding adoption." By its nature, an interpretation is inefficient in that it requires all of the same processing steps as revision of a standard, but does not "fix" the underlying standard. A requester does not have a responsibility to make efficient use of industry resources, but NERC staff and the Standards Committee do have this responsibility and without the ability to make decisions about how to efficiently address a request, will not be able to fulfill the responsibility. Each case needs to be evaluated with the particular facts surrounding the request, and the inclusion of this information in the SPM is intended to clarify for all stakeholders what is the current practice. There needs to be some transparency with regard to rejected interpretation requests. There should be a public posting of rejected requests and the reasons for the rejection. NERC will consider implementing this suggestion in the future. We disagree with the need for interpretation drafting teams to automatically create SARs if they believe there is a reliability gap or if the drafting team says an interpretation can't be crafted. The industry should be asked if they agree with the

Organization	Yes or No	Question 6 Comment
		drafting team's decision before any further effort is expended. The industry will have this opportunity when the SAR is posted for comment. Compliance WaiversThere remains language allowing for "waivers" of enforceable requirements for field trial purposes. Since the enforceable requirements are essentially backed by law, perhaps NERC should request a policy statement from the applicable governmental authorities that the authorities recognize NERC-approved waivers. This language is unchanged from the current SPM, which has been approved by FERC. WithdrawalsSection 4.18 proposes to give the SC additional authority to "withdraw" Standards, Interpretations, and Definitions for "good cause" once the Standards, Interpretations, or Definitions has already been approved by industry and the BOT. We have concerns with the lack of definition on what constitutes "good cause" and the underlying need that drove this change. This is problematic, given that as a minimum, both the Industry and the Board have previously approved the action. If this section is retained, there needs to be some due process around the withdrawal of an industry and Board approved action. As a minimum, there should be advance notice and opportunity for comment, with the results of the comments provided to the BOT. It is impossible to anticipate when a previously-approved standard action may be overtaken by other events and no longer be required. This is not intended to undermine the industry's approval but rather to provide a reasonable way to manage the body of standards products. Disbanding Drafting TeamsRegarding section 3.4 (Standards Committee), there needs to be transparency and due process with regard to disbanding drafting teams. The drafting team should be able to make a written statement of the underlying causes of delay and present this to the SC before it is disbanded. With regard sub-bullet c under why a drafting team should be disbanded, a SAR only sets the maximum

Organization	Yes or No	Question 6 Comment
		bounds of a standard. The team need not address all aspects of a SAR if dictated by industry comments. There is no requirement that the SC disband a team; the section only provides the SC with the explicit authority to fulfill its obligations. Agree that a team need not address all aspects of a SAR; however, a determination must be made on a case-by-case basis whether the product produced by the drafting team fulfills the obligation of the team. For example, if the team has not addressed a regulatory directive assigned to the project or provided an "equally efficient and effective alternative," the team has not fulfilled its obligations. VariancesThe section on "variances" implies that a variance is needed for "a conflict with an approved tariff"; it is our understanding that where there is a conflict with existing tariffs or market rules, the tariffs take precedence. In this case, a variance would be required. Waived ActionsSection 16 will as a minimum, lead to a perception of abuse of the process. There needs to be transparency of each waived action. This would include public notice and an ongoing record of waived provisions. This will assist NERC and the industry in identifying underlying drivers that are causing delays and provide a safeguard to potential challenges on the legality of the standards. The idea of the waiver provision is to allow the standards process to be responsive to reliability needs by producing a quality standard in a timely manner. Adding additional process requirements is counter to this objective. As drafted, the waiver must be reported to the Board of Trustees, who will then be able to direct other actions as appropriate to the facts surrounding the particular waiver. This creates some transparency, and if the Board directs staff to keep a record of all waived provisions, staff will do so.
Response: Thank you for your comments. Please see responses embedded above.		

Organization	Yes or No	Question 6 Comment
Edison Electric Institute		Regarding proposed Section 16, the waiver proposal:EEI believes that this is unnecessary. Successful implementation of SPIG recommendations will eliminate need for waiver of any standards development process steps. As a general matter and to correctly align various responsibilities, EEI supports full ownership of the technical content of standards development projects by the various drafting teams and stakeholders through comments and balloting, and process oversight by NERC management. In comments to SPIG, EEI asked that the confusion over process oversight be resolved once and for all. NERC has the responsibility to deliver proposed standards to FERC and should have the tools to ensure timely responses.If problems develop that challenge timely project completion, drafting teams and NERC management need to efficiently resolve the matters. In addition, EEI envisions much stronger and more disciplined process oversight than has been practiced in some projects in the past, which should eliminate the problem. Instead of anticipating such a problem, EEI challenges NERC and all stakeholders to make strong commitments to develop and execute plans that define specific milestones and deadlines that ensure timely development. Waiving process steps for 'insubstantial' matters is a slippery slope that NERC should avoid. Moreover, there is case precedent that NERC has filed with FERC various 'minor modifications' that were not returned to the standards development process for balloting. The boundary for determining 'insubstantial' should be carefully considered and clarified from legal and regulatory perspectives before a final decision is made.
Response: Thank you for your comments. The waiver provision was drafted by NERC Legal at the request of the Standards Committee leadership to address circumstances such as the failed PRC-005-2 recirculation ballot. The current set of process revisions to address the SPIG recommendations, by themselves, will not prevent a similar situation unless a waiver provision is included in the SPM. The waiver provision is not intended to be used for insubstantial matters; indeed, setting a high bar for exercising a waiver by requiring the waiver to be reported to the Board of Trustees directly is intended to preclude frivolous exercise of this provision.		
ReliabilityFirst		ReliabilityFirst questions the removal of Time Horizons from section 2.5 of the Standards Processes Manual (SPM). ReliabilityFirst requests the justification of the

Organization	Yes or No	Question 6 Comment
		removal of Time Horizons. RFC notes that Time Horizons are still referenced in the Standard Processes Manual Revisions: SCPS White Papers for Background Information. Page 14 explicitly states: "... the SDT would write the requirement and then would simply identify the appropriate Time Horizon and the requirement type and category..."
Response: Under the proposed revisions, Time Horizons would be incorporated into the RSAW. This is appropriate because a Time Horizon is intended as one piece of guidance that is used to evaluate the seriousness of a violation of a Requirement.		
Florida Municipal Power Agency		Section 1.3, the redline of the second sentence seems to try to parallel Section 215 language. If that is the intent, then "reliability planning" ought to be deleted. These words were included in the current version of the SPM – this language was not changed. Under Section 2.15, on the sentence that has NERC management presenting the standard to the Board, should that include a statement about presenting dissenting opinions to the Board? Section 3.5 contains the following sentence, which seems to address your concern: "When presenting Reliability Standards-related documents to the NERC Board of Trustees for adoption or approval, the NERC Reliability Standards Staff shall report the results of the associated stakeholder ballot, including identification of unresolved stakeholder objections and an assessment of the document's practicality and enforceability." Is Section 4.17 accurately stated in consideration of Rule 321 of the ROP? Yes, NERC Legal believes it is. Section 4.19, second paragraph is missing one reference to Variances. This has been corrected. Section 7.0 disallows an interpretation on other enforceable portions of a standard, e.g., the effective date, Glossary of Term definitions (e.g., if a Term in the Glossary is ambiguouos). This is inappropriate. Interpretation requests should be allowed for any enforceable portion of a standard. If a definition is ambiguous, it needs to be revised

Organization	Yes or No	Question 6 Comment
		through the standard development process. Definitions are not interpreted in the same manner as standards.
Response: Thank you for your comments. Please see responses embedded above.		
Manitoba Hydro		Section 13.0 "Process for Conducting Periodic Reviews of Reliability Standards" - We disagree with the proposal to review standards every 10 years, from the previous five year requirement. Too much can change in ten years. It is just as important to review existing standards, to improve their quality and clarify, as it is to write new standards. A more regular standard review process would lead to a lower number of high-quality standards that are more beneficial to reliability. Section 16.0 "Waiver" - The ability to use a waiver is too broad. It states that a waiver can be used to address a time constrained regulatory directive, and most regulatory directives provide time constraints. A waiver should only be used for urgent reliability issues which pose a direct and significant risk to the Bulk Electric System, and not to fast-track directives.
Response: Thank you for your comments. All of the versions of the NERC standard process to date have had a 5-year review requirement, and the Standards Committee disagrees that the mere presence of a 5-year review requirement in the process will affect the number or quality of standards. As things change, other mechanism are in place to provide for a standard to be changed – any stakeholder can submit a Standard Authorization Request, a Suggestion form, or a request for interpretation (which may or may not lead directly to a revision of the standard, but could be used to apply an existing standard to a condition that was not anticipated when the standard was drafted). The Standards Committee understands your concerns about Section 16.0 but believes a waiver provision is essential to allow the flexibility in the process to ensure that we, as an industry can demonstrate the ability to act expeditiously when necessary for reliability. NERC's ability to respond to regulatory directives in a timely manner is a component of demonstrating this.		
Liberty Electric Power		Suggest modifying the criteria for passing a standard to consider a vote failed if less than 50% of a qualified segment casts affirmative ballots. This is especially important if the rules for counting negatives are going to change. As written, a segment could

Organization	Yes or No	Question 6 Comment
		reject a proposal unanimously but still see the measure pass if the remaining segments approve at a 75% rate.
Response: Thank you for your comments. If NERC is to maintain ANSI accreditation of its standard development process, the formula used to calculate the weighted segment approval of a ballot must not allow any single segment to cause a ballot to fail. Adoption of your proposed criterion is counter to this ANSI principle.		
SERC Planning Standards Subcommittee		The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: Thank you for your comments.		
Independent Electricity System Operator		The IESO has had concerns about the lack of an expedited process to address emergency standard approvals needed under special circumstances when, for example a reliability standard or interpretation is causing unintended consequences that could threaten the reliability of the bulk power system. In our opinion, the industry should grant authority in these circumstances to the NERC Board to act as quickly as needed and with only the amount of industry consultation that urgency allows. In other words, give the ability to act on good judgment to the NERC Board that is elected by the industry. NERC Reliability Standards Development Procedure makes provisions for urgent and emergency actions to be used when "a delay in implementing a proposed standard or revision can materially impact the reliability or security of the bulk power systems or is inconsistent with statutory or regulatory requirements for reliability standards, such as by causing adverse impacts on markets or undue discrimination." The IESO supports the Procedure by which the Standards Committee would have the accountability for determining if, in their judgment, an urgent action is necessary, but recommends that a distinction be made between "urgent" and "emergency" circumstances - with the NERC Board having the discretion to take emergency actions as discussed below.We believe that while this particular

Organization	Yes or No	Question 6 Comment
		section of the NERC Reliability Standards Development Procedure proposes a single provision to cover urgent and emergency reliability standard revisions, clear distinction and separation should be made between an urgent situation requiring an urgent standard development and an emergency situation requiring an immediate action. An emergency reliability standard revision procedural step would give the NERC Board the authority to act on its own motion to address an issue on an interim basis immediately, with a follow-on process to then review and address the issue on a more regular timetable.The current revisions to the Standard Processes Manual include the deletion of the "Expedited Standard Development Process" section and the introduction of a new section titled Section 16: Waiver. The revised version of Standard Processes Manual includes, in Section 16: Waiver, a course for the practical implementation of the urgent and emergency reliability standard revisions in a single process. As discussed above, the IESO believes that the proposed process should also establish an overriding authority on the part of the NERC Board to move immediately to address a reliability emergency.Accordingly, while we believe that the new section makes appropriate allowances for the Standards Committee to waive any of the provisions contained in the Standard Processes Manual for good cause and provide sufficient flexibility to the Standard Committee in administering the urgent standard development process, additional provisions are needed to implement the recommended authority under which the NERC Board would act to address emergency circumstances which present an immediate threat to reliability.
Response: Thank you for your comments. As you have accurately noted, the inclusion of Section 16.0, the proposed waiver provision of the SPM, negated the need for a separate "expedited" process. The Standards Committee believes that the NERC Board already has the authority to direct action to develop a standard in an emergency situation in which reliability is threatened, and therefore, a separate section of the SPM is not needed.		
MRO NSRF		The NSRF does not agree that Section 16.0, Waiver is needed and should be eliminated. It was not included as one of the SPIG Report recommendations. The waiver provision was added to provide flexibility that is lacking in the current

Organization	Yes or No	Question 6 Comment
		process to address unanticipated situations, and is arguably directly responsive to the overall efficiency goal of the SPIG recommendations. As proposed, all uses of a waiver would be reported to the NERC Board of Trustees, so the Standards Committee would not in any way have unilateral power but instead would be accountable to the Board for explaining its need to use a waiver. The Standards Committee understands your concerns about Section 16.0 but believes a waiver provision is essential to allow the flexibility in the process to ensure that we, as an industry, can demonstrate the ability to act expeditiously when necessary for reliability. NERC's ability to respond to regulatory directives in a timely manner is a component of demonstrating this Clarification is requested as to why the NERC Reliability Standards and Legal staff are reviewing the Request for Interpretation twice in Section 7.0 to determine whether it meets therequirements of as valid interpretation. It is done early in the request (3rd paragraph) and again near the end of Section 7.0 (2nd to last paragraph) of the redline copy. Both of the reviews that are included in the proposed revisions are reviews that happen under the current process, so the proposed revisions that include these reviews are simply intended to clarify the process for all stakeholders. The first review is conducted on the request for interpretation before it is accepted for processing; the second review is a review of the interpretation once it has been drafted and prior to being submitted to the NERC Board of Trustees for adoption. Section 10.1: Processes for Developing Reliability Standards Responsive to Imminent, Confidential Issues should include "Quality Reviews" as part of the process, while abiding to the strict nature of confidentiality. To coincide with these additions, the associated Process Steps in Figure 3 should be updated to reflect when the Quality Reviews are conducted. It is likely that a standard developed in response to an imminent confidential issue

Organization	Yes or No	Question 6 Comment
		would be developed with legal and compliance staff working directly with the drafting team in order to facilitate an expedited regulatory filing. For this and other reasons considering the unusual nature of the circumstances under which the NERC Board might be expected to direct that the confidential process be used, quality review was not incorporated into Section 10.1. In Section 4.3, there is no "legal" representative called out as part of the Standards Drafting Team as recommended by SPIG Work Group. This section appears to address your concern: **3.6: Drafting Teams** The Standards Committee shall appoint industry experts to drafting teams to work with stakeholders in developing and refining Standard Authorization Requests ("SARs"), Reliability Standards, definitions, and Variances. The NERC Reliability Standards Staff shall appoint drafting teams that develop Interpretations. The NERC Reliability Standards Staff shall provide, or solicit from the industry, essential support for each of the drafting teams in the form of technical writers, legal, compliance, and rigorous and highly trained facilitation support personnel. Section 2.2: Reliability Principles are referenced in the SPM as the foundation of Reliability Standards; however, these have not been "formally" defined. It is recommended that this term be added to the NERC Glossary of Terms. This suggestion would require initiating a standards development project. Section 13.0: Process for Conducting Periodic Reviews of Reliability Standards The NSRF proposes there be a provision in this periodic review cycle that allows the restart of the five (5) or ten (10) year clock once the Standard has gone through a new version, since it was revised within the basic 5 or 10 year period. This would eliminate extra reviews of the Standard since the Standard was already reviewed as part of a previous Standards Development project. This is the intent. The SPM should include a section that encourages the integration of internal controls

Organization	Yes or No	Question 6 Comment
		process proposed by NERC staff into the standards development process. Explicit direction that deficiencies noted in a process control requirement that are corrected under the required process are not a violation should be included. This is getting too specific about the content of a standard and is not appropriate for inclusion in the SPM. If the sanctions table is retained in lieu of the VRFs and VSLs it is suggested that an "administrative" or low risk column should be added to the sanctions table to distinguish between direct and indirect electric grid impacts. Organizations need policies, procedures, and evidence to be effective, but the presence or absence of these policies, procedures, and documentation doesn't directly impact the electrons flowing on the electric grid, nor does it mean that entities don't implement preventative actions such as testing relays. Therefore, the NSRF suggests an "administrative" column be added to align with the MRO's Performance and Risk Oversight Sub-committee Phase II efforts on developing internal controls and the classification of risk. Policies, procedures, and documentation play a role in being effective, but when categorizing direct BES risk of instability, uncontrolled separation and cascading, administrative issues (policies, procedures, and documentation) should be assigned to "low risk" and "administrative" category.Within the proposed Operations, Cyber Security and Planning "Sanctions Tables" there appears to be a typo in all of the Performance-based Level 2 violations. Rather than a monetary range of "$75,000 - $300,000" it seems like it should instead read as "$7,500 - $300,000". Based on the majority of comments received, indicating the need to further refine the concepts, the SCPS has decided to retain VRFs and VSLs and has abandoned the idea of replacing them with Sanction Table References at this time.
Response: Thank you for your comments. Please see responses embedded within your comments above.		
PPL Corporation NERC Registered Affiliated		The PPL Companies appreciate the Standards Committee's changes to address the SPIG Recommendations but have the following additional concerns about the change

Organization	Yes or No	Question 6 Comment
		in process.The PPL Companies are concerned with the addition of section 16 (waiver). Back-door powers can be abused, so normal processes should be adhered-to under all circumstances.The PPL Companies are also concerned that many parts of this proposal have already been used by NERC without modifying the process and getting FERC approval of new process. The discounting of negative votes is already apparent as is the disregard for providing specific responses to comments by replacing them with bundled generic responses that are not tied to a specific comment from a responsible entity. The elimination of the voting rights of stakeholders on VSL and VFR is also a modification that is replaced by a non-binding poll which gives NERC total freedom on that subject without a meaningful input from Stakeholders.The main goal of the proposed changes to the SPM is to make it faster - faster is not necessarily better. Quality products should be the goal - not just faster or a greater quantity of enforceable standards. The proposals to revise the SDP to reflect the minimum ANSI requirements seems inconsistent with NERC's efforts in promoting "best practices" among its members.

Response: Thank you for your comments. The waiver provision was added to provide flexibility that is lacking in the current process to address unanticipated situations. As proposed, all uses of a waiver would be reported to the NERC Board of Trustees, so the Standards Committee would not in any way have unilateral power but instead would be accountable to the Board for explaining its need to use a waiver.

Under the current SPM, all votes (negative, affirmative, and abstentions) must be counted. NERC has not, to date, made any changes to the formula by which votes are counted and is very concerned by the assertion that negative votes are already being "discounted." With respect to bundling comments and providing generic responses, in the past six years the volume of comments to which drafting teams must respond has grown from 40-50 pages per posting to what is commonly two hundred pages and sometimes more, with many of the comments repeating common themes. While reviewing comments is essential to provide drafting teams with the information needed to determine how best to modify their work to reach consensus, the task of providing individualized responses to every comment has consumed an increasing amount of valuable drafting team time. Many of the proposed process changes (including the proposal to replace VSLs) are designed to free up industry resources from process tasks that do little to enhance the quality of standards or improve reliability.

Under the current SPM, as well as the proposed draft, any stakeholder who feels that the process has not been followed may file an

Organization	Yes or No	Question 6 Comment
appeal.		
Occidental Energy Ventures Corp. (OEVC) and Electricity Consumers Resource Council (ELCON) together called Industrial Consumers		These comments relate to proposed revisions that have NOT been made but should be made. Industrial Consumers are quite concerned about the working relationship between the SC and the RISC. Industrial Consumers have submitted formal comments on the RISC Mandate and incorporate those comments by reference into these comments. The proposed revisions, in a text box, states: "As this recommendation is piloted [Section 4.1 - Standard Authorization Request], it is possible that some changes to the SAT process will be recommended but at this time no changes are proposed to the current process for handling SARs."Industrial Consumers agree that the RISC has not yet been formulated. However, Industrial Consumers believe that significant confusion, at best, may come from a process where some requests for NERC action on reliability issues and risks go through the RISC while others go directly to the SC. Industrial Consumers do not think that changes to the SPM should proceed unless and until this issue is resolved. We believe that this is a threshold issue.Specifically, Section #2 of the proposed RISC Mandate states: "The RISC is responsible for receiving reliability issues and risks from stakeholders, regulators, and the Board which meet the following criteria:" Industrial Consumers certainly agree with this statement - but it seems to bring some confusion. Specifically, some stakeholders feel that some SARs could (or should) be filed directly with the Standards Committee while other SARs, as well as other proposals for "reliability issues and risks," would go through the RISC. Industrial Consumers do not think that such a dual path is either desirable or workable. To resolve this potential problem, Industrial Consumers thus propose adding the word "all" between "receiving" and "reliability" in the RISC Mandate. The statement would then read: "The RISC is responsible for receiving all reliability issues and risks from stakeholders..." (Emphasis should NOT be in the actual document) Alternatively, if the word "all" is not added, Industrial Consumers strongly recommend that the RISC Mandate and the Standards Process Manual be modified to (a) explicitly define and describe the criteria that will be used to differentiate between those filings that go through the RISC and those that are filed directly with the Standards Committee and

Organization	Yes or No	Question 6 Comment
		(b) make specific changes to the Standards Process (including changes to the Standards Process Manual) that would allow the Standards Committee flexibility to reject, or alternatively refer proposals, that are filed with the Standards Committee when, upon a determination by the SC, are not good or complete candidates for standards development.Since such changes have not been proposed, Industrial Consumers recommend that the proposed revisions to the SPM not proceed at this time.
Response: Thank you for your comments. The Charter for the Reliability Issues Steering Committee, (RISC), is not under the purview of the Standards Committee and is not part of the standard development process. The draft charter and initial slate for the RISC was approved by the NERC BOT in August and the SC looks forward to clarifying the relationship between the SC and RISC. The Standards Committee (SC) acknowledges that there will be a necessary interface coordination to be implemented in order to assure effective coordination between the activities of the RISC and those of the SC. However, the Standards Committee has been charged with developing a set of revisions to implement SPIG recommendations 1, 4, and 5 and bringing the proposed revisions to the NERC Board of Trustees for approval in November 2012. Given this charge, the Standards Committee believes that it is appropriate to move forward with a set of changes now to implement as many improvements as possible, recognizing that some aspects of the process may need to be adjusted as experience is gained with RISC and with the new process.		
Ameren		We believe that in several instances, details are lacking. Of a primary significance, we are not sure which proposed process changes would eliminate items which currently require a Stakeholder approval. We would like to have an opportunity to carefully review and assess all such items prior to signing off on the proposed SPM changes.
Response: Thank you for your comments. The Standards Committee maintains a number of procedures that support the Standard Processes Manual, and the processes in the SPM have deliberately been written at a high level to provide flexibility to adjust details as lessons are learned in implementing the new processes. The enforceable elements of a standard will continue to be balloted for stakeholder approval under the new processes. The only item which is balloted as part of the standard in the current process but which is proposed to be handled differently in the new process is Measures. Under the new process, Measures in the standard would be replaced by information in the RSAW. Under the proposed process, the drafting team would participate in developing the		

Organization	Yes or No	Question 6 Comment
RSAW, which would be posted along with the standard during the final ballot, and a non-binding poll of the RSAW would be conducted. Please see the summary consideration under question 3 for additional information.		

END OF REPORT

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Standard Process Manual Revisions to Implement SPIG Recommendations

Comment Period: November 21, 2012 – December 20, 2012
Successive Ballot: December 11, 2012 – December 20, 2012

Available Now

A 30-day comment period and successive ballot for the Standards Processes Manual Revisions is open through **8 p.m. Eastern on Thursday, December 20, 2012.**

Instructions

Members of the ballot pool associated with this project may log in and submit their vote by clicking here.

Please read carefully: All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit comments through the electronic comment form. During the ballot window, balloters who wish to submit comments with their ballot may no longer enter comments on the balloting screen, but may still enter the comments through the electronic comment form. Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.

Next Steps

The Standards Committee Process Subcommittee subteams will review all comments received and determine what revisions are necessary to finalize the SPM. If no significant changes are made, the SPM will be posted for a recirculation ballot and, if approved by the stakeholder body, presented to the NERC Board of Trustees for approval.

Background

At its February 9, 2012 meeting, the NERC Board of Trustees (BOT) requested the assistance of the NERC Member Representatives Committee (MRC) to provide policy input, and a proposed framework, for specific improvements to the standards development process. The MRC Chair and Vice Chair invited several members of the MRC, two NERC BOT members, the NERC CEO, and the Standards Committee (SC) Chair – the group collectively known as the Standard Process Input Group (SPIG) – to join with them as participants in developing recommendations to improve the standards development process. Further detail on the SPIG recommendations is available in the posted SPIG report.

These recommendations were presented to the BOT and approved on May 9, 2012. The SC was specifically charged with addressing SPIG Recommendations 1, 4, and 5. The SC has organized this effort by leveraging each of its subcommittees, the Process Subcommittee (SCPS) and the Communications and Planning Subcommittee (SCCPS), to work in parallel on developing proposed revisions and conducting outreach to industry stakeholders to ensure that all interested stakeholders have an opportunity to provide their input.

An initial ballot of Draft 2 of the proposed revisions to the SPM concluded on October 12, 2012 and received a 63% approval. The SC, its subcommittees, and NERC staff continue to be grateful for the industry support and thoughtful comments on the improvements to the standard development process.

The SCPS and Standards Committee have reviewed all of the comments and made the following substantive changes in response to the comments:

- **VRFs, VSLs, Measures, and RSAWs** - The majority of the commenters recognize the burden that the development of VRFs and VSLs has on SDTs and support the development of potential alternatives. Commenters also expressed support for drafting team participation in developing RSAWs. Both of these items will require collaboration between the Standards Committee, NERC Standards staff, and NERC and Regional Compliance programs to develop and implement. Therefore the SCPS is continuing to work toward the elimination of the VRFs and the VSLs through the development of potential alternatives and is actively working with NERC and Regional Enforcement staff to establish a consensus on the concepts. In the same vein, NERC's Compliance program is working with Regions and stakeholders to develop and implement the Reliability Assurance Initiative (RAI), and as this effort evolves the SC and NERC Standards staff will leverage opportunities to align drafting teams and compliance staff to ensure that the intent of drafting teams is captured in approaches to monitoring compliance.

  While these concepts are further developed, Measures, VRFs and VSLs will continue to be drafted by the SDT and a non-binding poll of VRFs and VSLs will continue to be conducted consistent with current process.

- **Treatment of 'No' Votes During a Final Ballot -** Several commenters identified that during a Final ballot, there is no comment period. There is no obligation in the current SPM to accept comments during a recirculation ballot, and the proposed revisions to the SPM are consistent with the current SPM in that there is no comment period associated with a Final Ballot. Therefore, all 'no' votes submitted in a Final Ballot will count toward determination of both the quorum and consensus. Clarifying language and a new Footnote 24 have been inserted in section 4.11, to clarify this important point. Footnote 24 reads: *The Final Ballot is used to confirm consensus achieved during the Formal Comment and Ballot stage. Ballot Pool members*

voting negative on the Final Ballot will be deemed to have commented or supported the comments of other groups during prior Formal Comment periods.

- **Section 16.0 Waiver Provision** - In response to stakeholders concerns regarding transparency, openness and due process protections, the SCPS incorporated the concept of a notice period for stakeholders prior to consideration of a waiver request by the Standards Committee and clarified how notice to stakeholders will be provided when the waiver provision is exercised. We have also incorporated a provision for the immediate reporting of waivers by the Standards Committee to the Standards Oversight & Technology Committee.
- In addition, stakeholders identified a number of minor typographical errors and minor clarifications. These corrections have been made and are shown in the redline.

The SC, its subcommittees, and NERC staff are grateful for the industry participation and input to develop SPM revisions that result in efficient use of industry resources to develop high-quality results-based standards in a timely manner.

Additional documentation is available on the project page.

For more information or assistance, please contact Wendy Muller, Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

AGENDA

Meeting No. 13
NPCC Governmental/Regulatory Affairs Advisory Group

Omni Mount Royal
1050 Sherbrooke Street West
Montreal, Quebec H3A 2R6

November 27, 2012 – 1:30 PM

Teleconference Information:
Call: (719) 785-1714
Code: 8093

Item	Description	Action	Est. Time
1.	Convene Meeting	Introductions – Carolyn O'Connor, Chair Anti-Trust Compliance Guidelines Roster Update	1:30 - 1:45
2.	Canadian Bulk Electric System Exception Process	Ontario – Barbara Constantinescu, IESO Quebec - Sylvain Clermont, Hydro-Quebec TransEnergie Maritimes – Alden Briggs, NBSO	1:45 – 2:30
3.	Updated NERC Reliability Impact of Environmental Regulations	Status – John Moura, NERC	2:30 – 3:00
4.	Electric Power Dependencies on Natural Gas	NERC Study Status John Moura, NERC	3:00 – 3:30
		Status of Multi-Regional Natural Gas Study Mark Babula, ISO-NE	3:30 – 4:00
5.	Regional Planning Updates	New York – John Buechler, NYISO New England – Anne George, ISO-NE Eastern Interconnection Planning Collaborative – John Buechler	4:00 – 4:50
6.	Next Meeting(s)	All	4: 50 – 5:00

Subject:	RE: My SC Meeting notes
Date:	Friday, November 09, 2012 8:31:34 AM

Guy,

I can only speculate the reason behind your comment/response to Dave's note, that you assumed that since the SC appointed a SAR DT, it implied that the SC already accepted the Cold Weather SAR to launch a standard development project to address the issue.

That's not the case.

Below are some related but key points discussed on this subject not mentioned in Dave's note.

1. Appointing a SAR DT was deemed necessary to respond to comments on the SAR that's posted, regardless of whether or not a standard will be needed and despite the RISC's recommendation.
2. We haven't yet seen the industry comments so there is no presumption that a standard will or not be needed to address this issue.
3. The RISC recommendation is one view; the SC needs to look at views of the entire industry to determine if developing a standard is the right path.

Bottom line: no presumption on the need of the standard; the RISC's input is valuable, but does not trump the industry's majority view.

An interesting thought is: what happens if the views of the RISC and of the majority of the industry are miles apart?

I believe the SC needs to develop some kind of "criteria" to aid its decision making when it comes to proposed projects like this.

Ben

Subject: RE: My SC Meeting notes

Thank you for your notes David.

The Cold Weather Preparedness issue was addressed by the RISC at their first meeting. They directed the NERC Operating Committee to do the following;

* Develop some technical guidance in the form of a guideline.
* Develop some training
* Suggest something such as the old readiness audit to ensure the entities are taking action prior to the cold weather season.

I think it is inefficient to use industry resources to proceed down the standards path when the RISC has already stated that this is an issue to be

addressed by the Operating Committee and that a standard was NOT the appropriate course of action and the industry is not supportive a "standard" type solution to this risk.

Thanks,

Guy V. Zito

Subject: My SC Meeting notes

Hello all,

Please find attached my November 8 meeting notes.

David

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Draft Agenda
Standards Committee

November 8, 2012 | 1:00 p.m. – 5:00 p.m. ET

Phone Number: 1-866-740-1260
Meeting Code: 5247071
Security Code: 1234321

Introductions and Chair's Remarks

NERC Antitrust Compliance Guidelines *

Public Announcement *

SC Expectations *

Quorum obtained

Agenda

1. **Review of Agenda (Approve)**

   Approved with no changes

2. **Waiver of 5-day Rule (Approve)**

   Not needed

3. **Consent Agenda (Approve)**

   Items discussed separately

   - October 10-11, 2012 Standards Committee Meeting Minutes* **(Approve)**

   Approved.

   - Project 2013-01 Cold Weather Preparedness* **(Appoint** – Confidential**)**

     Issue of 3 out of 5 proposed are from TRE.
     Also, RISC directed OC to address issue.

     SAR DT appointments approved (2 abstentions):

   Edward G Schnell, American Electric Power

   Kevin Lynch, PSEG Power Fossil LLC

   Mike Gentry, Salt River

   Jason Fisher, Minnesota Power

JC Culberson, ERCOT (suggested Chair)

Matt Averett, Southern Company

- Project 2013-02 Paragraph 81* **(Appoint** – Confidential**)**

Appointed team was for the SAR phase.

Ken McIntyre (ERCOT) appointed to replace Sam Ciccone in the SAR team.

Also, same team will complete the phase 1 work.

Approved with no opposed or abstention votes.

4. **Projects under Active Development (Review)** (V. Agnew)

a. Status of Projects Under Active Development*

- *Project 2006-06 Reliability Coordination*

The industry approved IRO-002, IRO-005, and IRO-014 on July 25, 2011. The BoT approved the standards at the August 4, 2011 meeting. The BOT approved IRO-001-3 on August 16, 2012 and it will be included with the filing for the previously approved standards. The filing for the IRO standards will be made concurrently with the filing for the TOP standards approved under Project 2007-03 - Real-time Operations r0.

Currently, the two communication standards, COM-001-2 and COM-002-3 have been approved by industry stakeholders and are scheduled to be presented at the November 2012 BOT meeting.

The remaining standard for this project is IRO-003-2, which the drafting team tabled in early January 2012 to focus on moving the other standards forward. The Standards Committee raised a concern during the October meeting in Miami about this remaining standard. NERC staff will evaluate the next steps.

- *Project 2007-03: Real-time Operations r0*

NERC Legal is working on the draft petition which will be filed concurrently with Project 2006-06.

- *Project 2007-09 Generator Verification*

MOD-025, MOD-027 and PRC-019: The standards were posted for a 45-day formal comment period and concurrent initial ballot period from February 29 through April 16. The team met May 15-17 and developed responses to comments and revisions to the standards. The team worked with QR to respond to their comments and re-submitted the documents July 26. The posting schedule was determined during the August 9, 2012 SC meeting for this project. The standards were posted for a formal comment period and successive ballot, which ended on October 31, 2012.

MOD-026 and PRC-024: The standards were posted for a 30 day formal comment period and successive ballot between February 29th and March 29th. The team met May 15-17 and developed responses to comments and revisions to the standards. The team worked with QR to respond to their comments and re-submitted the documents July 26. The posting schedule was determined during the August 9, 2012 SC meeting for this project. The standards were posted for a formal comment period and successive ballot, which ended on October 31, 2012.

A coordination issue with RFC standards MOD-024 and MOD-025 is being addressed. RFC is withholding filing of their MOD -024 and MOD-025 standards until the continent-wide standard MOD-025 is approved. They will then evaluate whether the continent-wide standard meets their needs.

- *Project 2010-07: Generator Requirements at the Transmission Interface*

FAC-001-1 and PRC-004-2.1a were adopted by the BOT on February 9, 2012. PRC-005-1.1b and FAC-003-3 were adopted by the BOT on May 9, 2012. The legal petition, which incorporated all of the standards, was filed with FERC on July 30, 2012.

- *Project 2010-13.2 Generator Relay Loadability*

The standard was posted on October 5 which will facilitate the team meeting prior to Thanksgiving and working toward a formal posting through December with the initial ballot occurring after January 2, 2013. Although the project is currently 15 weeks behind its plan, the team has made substantive changes that would have most certainly been revealed by industry stakeholders resulting in an unnecessary schedule setback. The team is working diligently to compress the schedule as much as possible and will assess the feasibility of achieving the deadline following the initial ballot posting. Preemptively, the team has scheduled a follow up meeting for December should additional time be needed following the November meeting.

Team working to get back to schedule.

- *Project 2010-17 Definition of BES Phase 2*

Phase 2 is well underway. The Planning Committee is taking the lead on investigating threshold limits. The PC has been given a deadline of December 20, 2012 for the completion of its work.

FERC issued a NOPR on Phase 1 on June 21, 2012. Responses were filed on September 4, 2012.

The guidance document is posted for informal comment until November 5.

- *Project 2010-INT-01 Interpretation of TOP-006-2 for FMPP*

Scheduled for BOT adoption at the November 2012 meeting.

- *Project 2011-INT-01 Interpretation of MOD-028 for Florida Power & Light Company*

Rapid Revision Pilot. Approved at the February Board of Trustees meeting. Filed with FERC on 8/24/2012.

- *Project 2011-INT-02 Interpretation of VAR-002 for Constellation Power Gen*

This Interpretation Request was approved by the SC for Rapid Revision on Jan 12, 2012. The team held two conference calls the week of April 9-13 to discuss comments received and determine the next step for the standard. The team has completed developing responses to comments and made conforming revisions to the standard for QR on April 26. The documents were submitted to QR on April 30. The team received feedback from QR and made appropriate revisions to the documents and resubmitted them for posting on May 15.

The draft standard was posted for a 30-day successive ballot and comment period on May 22; and due to a technical issue the posting was extended to June 27. The standard achieved a quorum and passed the successive ballot.

The team held a conference call on July 2 to discuss the comments received on the ballot and prepare for the recirculation ballot. The team developed responses to comments and revised the VSLs for Requirement R2. The Consideration of Comments and revised standard were submitted July 9 for posting. The standard was posted for recirculation from July 18 to July 27 and received enough support to pass the ballot.

The proposed standard was presented to the NERC BOT at the August 16th meeting and approved. The project coordinator is working with NERC Legal on regulatory filing documents.

- *Project 2012-08.1 Glossary Updates Phase 1:Statutory Definitions*

The SAR for adding the definitions for Bulk Power System, Reliable Operation, and Reliability Standard to the Glossary of Terms Used in Reliability Standards was posted for a 45-day formal comment period from June 19 through August 2, 2012. An initial ballot was conducted July 24 through August 2, 2012.

The weighted sector vote for the initial ballot was 54%. Responses to the comments received are currently being developed. No timetable has been established for moving to a successive ballot.

- *Project 2013-02: Paragraph 81*

On October 25, 2012, the requirements being proposed for retirement (38 requirements in 27 standard versions) and an implementation plan were posted for a formal comment period and an initial ballot that will end on Monday, December 10, 2012 (the initial ballot will begin on Friday, November 30, 2012).

- *Project 2007-02 Operating Personnel Communication Protocols*

Draft 4 of COM-003-1 was submitted to Quality Review on October 26, 2012. The SDT will receive the results on Friday, November 2, 2012. A conference call to review the results is scheduled for November 5, 2012 to consider the QR team's recommendations and to prepare for posting draft 4. The OPCPSDT is estimating November 15, 2012 for posting draft 4.

- *Project 2007-06 System Protection Coordination*

The drafting team met at Ameren HQ in St. Louis October 16 -18, 2012. The team progressed in developing responses to comments and modifying the draft standard. Subteams are continuing to work on the draft standard and associated documents, conference calls will be held as needed. The team plans to have the 2nd draft of the standard posted for successive ballot the last week of November, 2012.

NOTE: The SC agreed the delay associated with the QR and results-based feedback is acceptable, but did not want to reforecast completion. The project will continue to be reported as behind schedule, with the understanding that this is an acceptable delay.

- *Project 2007-12 Frequency Response*

NERC filed for an extension of time to complete the proposed standard. FERC responded granting an extension of one year (filing deadline - May 31, 2013). NERC held two technical conferences on Frequency Response and collected technical comments and opinions on relevant issues. NERC filed a progress report at FERC on this standard on July 31, 2012. The SDT has prepared a third draft of the standard and associated documents for posting and a successive ballot. The draft standard and associated documents were posted for a 30-day comment period and successive ballot on October 5, 2012. The comment period and successive ballot is scheduled to end on November 5, 2012.

This project is being coordinated with Project 2010-14.1 Balancing Authority Reliability-Based Controls-Reserves for the BAL-012 standard.

- *Project 2007-17 Protection System Maintenance and Testing*

The recirculation ballot for PRC-005-2 – Protection System Maintenance concluded October 24, 2012 and the standard passed achieving a quorum of 81.08% and a weighted segment vote of 80.51%. The BOT write-up and initial FERC filing documents were prepared and sent to NERC management and legal staff.

NERC has initiated the process of gathering data pertinent to reclosing and auxiliary relays that is necessary to develop requirements for the maintenance of those relays. PRC-005 as well as the definition of Protection Systems will be revised over the course of the next few years in accordance with the timetables filed with FERC. Looking more closely at process here, PRC-005-2 progressed through the normal standards development process including four postings (all formal) for stakeholder comment over a 24 month period, beginning with an initial ballot in July 2009, and a failed recirculation ballot in June 2011. The Standards Committee authorized re-initiating the project with a posting of the SAR and revised standard (Draft 1) for a formal comment period and an initial ballot of the standard in August 2011. Draft 4 was posted for comment with a successive ballot in July/August 2012.

FERC issued Order 758 (February 3, 2012) approving a NERC Interpretation on PRC-005-1 and further directed NERC to include reclosing relays as well as auxiliary and non-electrical sensing relays (including sudden pressure relays).

•NERC believes it is on track to meet all outstanding directives associated with PRC-005, including those emanating from Order 758.

•NERC submitted two informational filings to FERC in response to Order 758.

•NERC drafted a SAR to add the maintenance and testing of reclosing relays in version PRC-005-3 which will begin immediately after PRC-005-2 is BOT approved.

•NERC submitted a schedule to include sudden pressure relays (used in taking transformers out of service) and other auxiliary relays in PRC-005-4 beginning in 2014.

- *Project 2008-06 Cyber Security Order 706*

Since completing a posting of the standards for a 30 day formal comment period and parallel successive ballot, which occurred from September 11, 2012, to October 10, 2012, the drafting

team considered all comments submitted and made clarifying and conforming changes. The SDT posted the standards for a 10-day recirculation ballot that ends on November 5, 2012.

- *Project 2009-01 Disturbance and Sabotage Reporting*

The standard was posted for a 30-day comment period and successive ballot which ended on May 24, 2012. The team met June 6-8 and began to respond to comments and revise the standard. The team conducted stakeholder outreach to help the standard achieve a successful ballot.

The team held an industry webinar July 30, 2012 and then a team meeting to finalize all documents for posting and successive ballot. The team submited the documents for QR on August 3, 2012 and receiverd the results on August 15th.

The team responded to the comments received from QR on August 23.

The standard was posted for successive ballot that ended on September 27th with a 63.40% approval rating. The team met October 4-5 to discuss the comments received and next steps. The team will proceed to recirculation ballot and held an industry webinar on October 22. The recirculation ballot began on October 24th and will be extended until November 5th due to issues arising from "Superstorm Sandy."

- *Project 2010-05.1 Phase 1 of Protection Systems Misoperations*

The drafting team met October 23-25, 2012 to continue developing their responses to comments. The team has scheduled two Ready Talk meetings and another face to face meeting in November with the goal of completing all documentation in December and posting for a successive ballot in January 2013. The team decided to adopt the internal controls concepts for this standard and the next posting of the standard will be as such.

- *Project 2010-14.1 Balancing Authority Reliabilitybased Controls – Reserves*

The four draft Standards were posted on June 4, 2012 for a 30 day formal comment period. The SDT is meeting on October 3 through October 5 to finalize the documents prior to posting. The project was delayed due to other higher priority project postings, but is now being expedited to coordinate with Project 2007-12 Frequency Response. The next posting is anticipated to begin in early November 2012.

b. Status of Outstanding Interpretations* *Recent updates only*

- *Project 2012-INT-05 CIP-002-3 for OGE*

Assigned to CIP IDT. A project team has been formed, and the team is has finished ts first formal comment period (30 day formal comment period was from June 27, 2012, to July 27, 2012). The IDT has reviewed comments, made changes as necessary in the interpretation, and is preparing to post the consideration of comments and the interpretation for formal comment and parrallel initial ballot.

The Request for Interpretation requests clarity on whether a company's SmartGrid Advanced Meter Infrastructure ("AMI") functionality, which may be able to disconnect more than 300 MW

of load, is considered a system or facility critical to automatic load shedding under a common control system capable of shedding 300 MW or more under CIP-002-3, Requirement 1.2.5.

- *Project 2012-INT-03 CIP-007 for TECO*

Interpretation requests clarification on CIP-007-3, Requirement R5. Specifically, the questions relate to the use of "technical and procedural controls" in Requirement R5, and whether each sub-requirement requires both technical and procedural controls. A project team from the Interpretation Drafting Team has begun drafting an interpretation and it expects to post for a first formal comment period in November 2012.

The IDT expects to post for first formal comment in Q4 2012.

- *Project 2009-22 Interpretation of COM-002-2 for the IRC*

The filing for the project 2009-22, COM-002-2a, R2 Interpretation will coincide with the filing of and project 2006-06, COM-002-3 and project 2007-02, COM-003-1. The target for filing will depend on the November 2012 and February 2013 BOT meeting results.

As of October 30, 2012 the status has not changed pending the filing of COM-003-1.

- *Project 2012-INT-02 TPL-003-0a & TPL-004-0 for SPCS*

The interpretation is posted for a 45-day formal comment period from October 22 to December 5 with an initial ballot will be conducted in the last 10 days of the comment period from November 26 to December 5. The team will respond to comments received from industry stakeholders in December and work toward its next posting in January 2013.

- *Project 2009-19 Interpretation of BAL-002-0 R4 and R5 by NWPP Reserve Sharing Group*

Project restarted based on BOT Action re: the scope of this interpretation and the team's ability to rely on language other than solely the requirements. New chair Al DiCaprio assigned.

The interpretation was posted for comment and ballot. The ballot ended on September 4, 2012. The interpretation passed with an 87.78% approval rating. The SDT addressed comments received and a recirculation ballot has been posted (September 28 - October 8, 2012).

Scott Miller resigned as CIP Interpretations DT chair.

Difficult to obtain quorum for non-binding ballots.

c. Posting Projections Through December 2012*

To be posted during the week of November 5:

- *Project 2007-02, COM-003 (30-day comment period and successive ballot)*
- *Project 2010-14 BARC: BAL-012-1 only (45-day comment period and initial ballot)*
- *Project 2012-INT-05 Interpretation of CIP-002-3 for OGE (45-day comment period and initial ballot)*

To be posted during the week of November 12:

- *Project 2007-06, PRC-027 (30-day comment period and successive ballot)*
- *Project 2012-INT-04 Interpretation of CIP-007 for ITC (30-day comment period)*
- *Project 2012-INT-06 Interpretation of CIP-003 for Consumers Energy (30-day comment period)*
- *Standard Processes Manual Revisions (30-day comment period and successive ballot)*

To be posted during the week of November 19:

- *N/A*

To be posted during the week of November 26:

- *Project 2010-14 BARC: BAL-001-1, BAL-002-2, BAL-013-1 (45-day comment period and initial ballot)*

To be posted during the week of December 3:

- *Project 2007-12 Frequency Response (possible recirculation ballot)*

To be posted during the week of December 10:

- *Project 2010-17 DBES Phase 2 (45-day comment period and initial ballot)*
- *Project 2007-09 Generator Verification (possible recirculation ballot)*
- *Project 2010-13.2 Generator Relay Loadability, PRC (45-day comment period and initial ballot)*
- *Project 2010-11, TPL FN "b" (possible recirculation ballot)*

To be posted during the week of December 17:

- *Project 2010-11, TPL FN "b" (possible recirculation ballot)*
- *Project 2013-02 P81 (possible recirculation ballot)*
- *Project 2010-05.1 PRC-004 (45-day comment period and initial ballot)*

To be posted during the week of December 24:

- *N/A*

To be posted during the week of December 31:

- *N/A*

5. Actions

a. NERC Standards Process Manual revisions* **(Authorize** – to be sent separately**)**

Not ready yet. Asking to take to SCEC.

b. Standards Authorization Request to revise CIP-001-2a* (L. Hussey) **(Accept, Reject, or Remand)**

Requirement R4 in the currently effective version 2a of the standard requires that each RC, BA, TOP, GOP and LSE establish communications contact, as applicable, with the FBI and RCMP.

As written, the requirement does not reflect current sabotage reporting and investigation protocols in the different Canadian Provinces.

It is proposed to modify the standard so that Requirement R4 considers the current or future arrangements for sabotage reporting and investigation in different jurisdictions.

Withdrawn given the approval of the new standard by the BoT. No need to modify the CIP-001-2a any more.

6. Discussion Items

a. Strategic Direction for NERC Standards Program (M. Lauby)

b. Report on MRC, BOT, and BOT SOTC Meetings (A. Mosher and M. Lauby)

Work on changes requested to the SC. Plan is to present for approval at the February 2013 BoT meeting.

c. Update on CEAP Pilot (L. Hussey)

Identification of projects to pilot waiting for final standards plan for next year.

d. Subcommittee Reports

1. Communication and Planning Subcommittee (A. Brown)

Still working on projects.

Workshop was successful (180 presnt and ~60 through webinar)

2. Process Subcommittee (B. Li and L. Campbell)

Nothing to report.

Still working on SPM changes.

e. Schedule and Locations for 2013 Meetings* (K. Iwanechko)

Schedule considers aligning with standing committee meetings.

- *January 16-17, 2013 – Atlanta (8-5 p.m. January 16; 8-3 p.m. January 17)*
- *February 2013 – no conference call*
- *March 7-8, 2013 – Albuquerque (8-5 p.m. March 7; 8-3 p.m. March 8) with PC/OC*
- *April 4, 2013 conference call from 1-5 p.m.*
- *May 2, 2013 conference call from 1-5 p.m.*
- *June 5-6, 2013 – Atlanta (8-5 p.m. June 5; 8-3 p.m. June 6)*
- *July 18, 2013 conference call from 1-5 p.m.*
- *August 15, 2013 conference call from 1-5 p.m. Conflict with BoT. Reschedule.*

• September 19-20, 2013 – Denver (8-5 p.m. September 19; 8-3 p.m. September 20) with PC/OC

• October 17, 2013 conference call from 1-5 p.m.

• November 14, 2013 conference call from 1-5 p.m.

• December 12-13, 2013 – Atlanta (8-5 p.m. December 12; 8-3 p.m. December 13)

The Standards Committee has two subcommittees (Communications and Planning Subcommittee and Process Subcommittee) and these subcommittees typically meet on the day immediately preceding the Standards Committee's face-to-face meetings. For 2013, these dates are:

• January 15, 2013 in Atlanta

• March 6, 2013 in Albuquerque

• June 4, 2013 in Atlanta

• September 18, 2013 in Denver

• December 11, 2013 in Atlanta

7. Coordination (Review) (S. Tyrewala)

a. Coordination with Regulatory and Governmental Authorities

b. Upcoming Standards Filings

Some filings are due in November/December and January.
FERC filing comments to the FERC NOPR on GMD.

8. Informational Items (Review)

a. NERC Drafting Team Vacancies*

- *Project 2007-12 Frequency Response*

Seeking individual representing Transmission Dependent Utilities (TDU) with experience in analyzing or modeling frequency response.

- *Project 2007-06 System Protection Coordination*

Seeking an individual from a Canadian entity with experience in coordination of Protection Systems (new installations and revisions).

b. Standards Committee Roster*

c. Highlights of Parliamentary Procedure*

9. Executive Committee Actions (Pre-authorize)

Request: To approve posting of the SPM for another 30-day comment period and ballot.

SC members will receive material at least 3 days prior to the SCEC call and send any comments to SCEC members.

Approved with no apposed or abstentions.

10. Adjourn

*Background materials included.

Subject:	RE: My SC Meeting notes
Date:	Friday, November 09, 2012 7:38:18 AM

Thank you for your notes David.

The Cold Weather Preparedness issue was addressed by the RISC at their first meeting. They directed the NERC Operating Committee to do the following;

- Develop some technical guidance in the form of a guideline.
- Develop some training
- Suggest something such as the old readiness audit to ensure the entities are taking action prior to the cold weather season.

I think it is inefficient to use industry resources to proceed down the standards path when the RISC has already stated that this is an issue to be addressed by the Operating Committee and that a standard was NOT the appropriate course of action and the industry is not supportive a "standard" type solution to this risk.

Thanks,

Guy V. Zito

Subject: FW: NERC DOCUMENT POSTED: Reliability Issues Nomination Form
Date: Tuesday, November 20, 2012 10:02:33 AM

RSC Members,

See below. If there are any issues you would like to raise with the RISC please do so and also let me know. There is a RISC meeting scheduled for December 17th which I plan to attend and I will serve as the NPCC regional contact to the RISC for any reliablity risks we wish to raise. I will have this on the agenda for our Montreal meeting of the Regional Standards Committee.

Thanks,

Subject: NERC DOCUMENT POSTED: Reliability Issues Nomination Form

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Nomination Deadline

Reliability Issues Nomination Form

November 19, 2012

The Reliability Issues Steering Committee (RISC) is accepting nominations for consideration at its December 17, 2012 meeting. Please submit any nominations for this meeting on or before November 30, 2012. Any nominations received after this date will be considered at a subsequent meeting.

NERC bases its operations on four pillars: Reliability, Assurance, Learning , and Risk-based Approach. In support of making risk-informed decisions and enabling prioritization of issues, please use this form to submit potential issues (with as much supporting information as you can provide) for consideration by the RISC. Supported by NERC staff, the RISC will work with the industry to help develop overall ERO strategy by identifying and prioritizing the most important reliability issues facing our industry and properly aligning resources to address them. By providing this information, you are helping to ensure the ERO is focusing on the correct priorities as it moves forward.

   a. Integrating with NERC Planning (2.5 hours)
   b. Nominations
      RISC discussion of issue nominations received prior to December 3.[1]
3. **Action Item Review**
4. **Adjourn**

[1] Any nomination received after this date will be reviewed at a future meeting of the RISC

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

PROJECT 2010-17 DEFINITION OF BES (PHASE 2)

Notes

1. Introduction

The Chair brought the meeting to order at 8:30 a.m. on Wednesday, November 14, 2012 at the NERC offices in Atlanta, GA. Meeting participants were:

Members		
Brain Evans-Mongeon, Utility Services	Pete Heidrich, FRCC, Chair	John Hughes, ELCON
Barry Lawson, NRECA, Vice Chair	Rich Salgo, Sierra Pacific Power	Jason Snodgrass, GTC
Jennifer Sterling, Exelon	Jonathan Sykes, PG&E	Ed Dobrowolski, NERC
Observers		
Mohammed Ahmed, AEP	Laura Anderson, NERC (day one only)	Paul Fiedler, BPA
Jeff Gindling, Duke	Bill Harm, PJM	Bill Hughes, Redding
Ruth Kloecker, ITC	Andres Lopez, FERC	John Martinsen, Snohomish
Alain Pageau, HQ	DeWayne Scott, TVA	Ken Shortt, Pacificorp
Tim Soles, Occidental	Phil Tatro, NERC	Phil Winston, Southern (day two only)

2. Review Emergency Logistics

The emergency logistics for the Atlanta office were reviewed.

3. Determination of Quorum

The rule for NERC Standard Drafting Teams (SDT) states that a quorum requires two-thirds of the voting members of the SDT to be physically present. Quorum was achieved for this meeting.

4. **NERC Antitrust Compliance Guidelines and Public Announcement**

   The NERC Antitrust Compliance Guidelines were reviewed and the public announcement warning was delivered.

5. **Membership Changes and Roster Updates**

   Jerry Murray is retiring and has submitted his resignation from the SDT. At this point in time there will be no request to replace him on the SDT.

   Jennifer Dering is out on medical leave. She will not be participating in SDT activities as a representative of NYPA or counted against quorum until she is re-instated by NYPA.

   There were no other changes to membership or roster information.

6. **Review Meeting Agenda and Objectives**

   The main goal of day one was to complete the review of responses to comments for the Guidance Document. Day two was reserved for addressing possible Phase 2 changes and clarifications.

7. **Liaison Reports**

   a. Standards Committee – Pete Heidrich

      There was no formal presentation on this project at the last meeting. The project was reported as on schedule.

   b. MRC/BOT – Pete Heidrich

      There was no report requested by the MRC/BOT at their November meeting.

   c. Planning Committee Executive Committee – Jeff Mitchell

      Jeff Mitchell was unable to attend this meeting. However, he previously reported that the Planning Committee is on target to achieve the December 20, 2012 deadline. A draft copy of the final report was provided to the SDT for their internal use and this draft was the basis for SDT discussion.

      The Planning Committee Executive Committee was specifically tasked with exploring the 100 kV bright-line. The draft recommendation is to keep the status quo. The final report will state that Planning Committee Executive Committee could not develop a technical justification for the 100 kV bright-line and that they could not develop a justification for any other value either.

   d. System Analysis and Modeling Subcommittee (SAMS) – Bill Harm

The SAMS draft recommendation is no minimum size for reactive devices. This would result in no change to the Phase 1 definition.

The SAMS draft recommendation is that the local network power flow issue be expanded to state that no power can flow out into the BES from any point of connection between the local network and the BES. Another SAMS draft recommendation is that the power flow limitation be constrained to normal and N-1 operations only. In addition, SAMS is suggesting draft recommendation of a 300 MW capacity constraint on the amount of load within a local network. No technical justifications for any of these positions were provided in the draft report nor were any technical analysis done to support the positions.

The 300 MW limit is due to a concern about the possible exclusion of major metropolitan areas if no constraint is imposed. However, SAMS presented no evidence in the draft that such a problem exists or that it was even studied. Three of the metropolitan areas cited in the draft report had representatives at the meeting or on the phone. PG&E stated that such a condition did not exist for San Francisco. Exelon assured the SDT that such a problem was not the case for Chicago. And Consolidated Edison reported no such situation would occur for New York City.

The SAMS draft also recommends that the determination for a local network be done in a planning environment rather than a real-time environment.

e. Reliability Assessment Subcommittee (RAS) – Phil Fedora

Section 3.4 of the draft report represents the recommended course of action from RAS. Once again, they will be recommending that the status quo be maintained. The report will state that no technical justification is possible for the generation thresholds but that no other values can be justified either.

In general, the SDT expressed its displeasure with the draft report. The SDT feels that the draft report is not providing what was asked and that industry will not be pleased with the lack of technical justifications provided for the definition threshold values. In addition, the Planning Committee expanded the scope of the request and is providing recommendations for items that were not requested by the SDT. The SDT is going to send a letter to the Planning Committee expressing its concerns with these issues. Items of concern are the lack of technical justifications and analysis, statements on local networks carving out major metropolitan areas with no justifications provided, misleading statements reflecting back on the September 2011 blackout, and providing recommendations on topics that were not requested. Each SDT member is encouraged to contact their Planning Committee representative with their concerns.

AI – Pete Heidrich will submit a letter to the Planning Committee expressing the dissatisfaction of the SDT with the draft Planning Committee report. This letter needs to be sent prior to the Planning Committee meeting in December.

8. **Review of Previous Action Items**

- Pete Heidrich will distribute the MRC/BOT presentation to the SDT members once it has been finalized. Completed.
  - Distributed to the plus list server on August 20, 2012.
- Ed Dobrowolski to contact NERC management to resolve the expectations and process to be followed to reconcile the BES definition and the ERO Statement of Compliance Registry Criteria as per the BES Definition Phase 2 SAR. Completed.
  - SDT will need to identify any proposed changes in the ERO Statement of Compliance Registry brought about by the Phase 2 BES definition in a memo to Mark Lauby who as an officer of the corporation can submit changes. The memo should contain justification for any suggested changes.
- Jonathan Sykes will draft a set of rules for how to apply the E1 exclusion to evaluations of applicability of the exclusion. Completed.
  - Distributed to the SDT leadership on August 23, 2012.

9. **Review of Guidance Document Comment Responses**

Q1: Inclusion I1 – Jeff Mitchell

Jeff Mitchell was unable to attend the meeting but he did send in draft responses. The main issue was the use of black/blue/green colors in the various diagrams. The SDT decided to place a legend on each diagram explaining the meanings of the different colors on the diagram as opposed to trying to adjust the color scheme for small segments to show BES vs. non-BES segments as this would make the diagrams harder to read. This comment was spread throughout the different questions. The same comment will be used in each response to this issue.

Q2: Inclusion I2 - Phil Fedora

There was some confusion and inconsistency surrounding the use of the terms 'generator site' and 'site boundary'. The term 'generator site boundary' will be used throughout the document. The term will be referenced using an adaptation of work that was done in this area in CA which was supplied by Bill Hughes.

The term 'off site' was deemed confusing and unnecessary and will be deleted.

The glossary definition of Load will be provided in the text of the document.

Q3: Inclusion I4 – Phil Fedora

The same comments from question 2 generally apply to question 4 as well.

In addition, breakers should be deleted from the I4 diagrams for consistency with other diagrams.

The language for interconnection agreements will be changed from 'should' to 'typically included'.

Q4: Inclusion I5 – Jason Snodgrass

Delete the references to breakers in the text boxes.

Delete Figure I5-2 as it is no longer needed.

Delete the breakers in figure I5-1.

Q5: Exclusion E1 – Jonathan Sykes

On page 23, change 'owner' to 'applicable entity'.

On pages 29 and 32, change 'a, b. and c' to 'a, b, or c'.

A diagram is needed to show the Blackstart Resource example.

Text for generator limitations similar to what is in the section on Exclusion E3 should be added.

All switches should be deleted.

This section needs to be checked for consistency of terminology.

Q6: Exclusion E2 – John Hughes

It needs to be emphasized once again that Exclusion E2 is only retail and that net capacity is the key, not nameplate.

Multiple interconnection points do not preclude the use of Exclusion E2.

Q7: Exclusion E3 – Rich Salgo

The text needs to state that entities must be prepared to justify local network determinations.

In Phase 1, no flow is allowed out of the local network in any situation.

The presence of a Blackstart Resource negates the use of Exclusion E3.

Cranking Paths are not included by the use of Exclusion E3.

In Figure E3-2, clarify that flow can be out at one or more points.

Q8: System Diagram – Pete Heidrich

Many of the comments for question 8 are similar to those raised in questions 1 – 7.

The hierarchical discussion will be added in the front sections of the document.

The exclusions may be re-ordered in Phase 2 to match the hierarchy.

Add a Blackstart Resource to the new 69 kV section to the S diagrams in order to show that Cranking Paths are not included in the BES.

Q9: General – Barry Lawson

The SDT can't remove the disclaimer. It can only state its intent.

Rules of Procedure section numbers should be included in the text.

There should be text sections on Inclusion I3 and Exclusion E4 to show that they weren't missed.

There should be a glossary section at the end of the document.

The introduction needs some clean up.

Black and white printing is not a feasible alternative.

The core definition is not constrained simply to a.c. power.

10. **Discuss Need for Supplemental SAR**

There is a consistency issue between Inclusions I2 and I4. Wind, etc., is being treated differently and there is a question as to whether this is fair.

There is also a possible reliability issue as was pointed out by several commenters. These commenters question whether the Phase 1 handling of Inclusion I4 is really addressing the true reliability issue. The comments point to the common point of failure as being the more important reliability issue. This concept could present other problems though if Generator Owners and Generator Operators suddenly didn't need to register.

Data exchange and modeling concerns are not the issue – they are handled in other existing or proposed standards.

The SDT decided that a change was needed to bring in these reliability concerns but that a Supplemental SAR was not required. The SDT believes that the changes being proposed can be made within the scope of the approved Phase 2 SAR.

Inclusion I2 will be for any type unit or units within a single generator site boundary. Inclusion I4 will handle multiple sites. As an example of how this would be shown moving forward, Figure I4-2 would show that the transformer on the far right and the downstream bus would be included in the BES as a single point of connection where generation from multiple sites aggregates to more than 75 MVA. The individual generators in this diagram would not be included in the BES as they are less than 20 MVA individually or 75 MVA per site. A new drawing will be created to display this concept and would be included in a Phase 2 revision of the Guidance Document. Revised language for the inclusions was crafted and distributed to the SDT for approval. Once this language is approved by the SDT it will be part of the initial Phase 2 posting to the industry.

11. **Definition Clarification Items**

a. Discuss possible changes to threshold values

i. 100 kV bright-line

The draft recommendation from the Planning Committee is for retaining the status quo. The report will state that there is no technical justification for change. The SDT generally agrees with staying at 100 kV but is disappointed that no technical justification for that value was provided.

ii. Generation

1. Unit limits in Inclusion I2 and I4

The draft recommendation from the Planning Committee is for retaining the status quo. The report will state that there is no technical justification for change. Furthermore, the report will state that there is no technical justification possible for any threshold value(s). The SDT is disappointed that no technical justification for those values was provided.

It was pointed out that the applicability of standards may be of assistance in trying to sort through this issue. Also, the exception process can be used to sort out one-off situations. However, it may be that this position will drive an inordinate number of exception requests and that this may lead to a demand to re-visit this issue in the future.

Nothing formal can be done until the final report is issued but in general, the SDT can only go forward with the information it was provided so the 20/75 MVA thresholds should be retained.

The SDT is going to report back to the Standards Committee on this issue to inform them that the desired outcome of the Planning Committee assignment was not achieved.

In the meantime, the SDT will form a sub-group to delve into the Planning Committee report in detail to see if there is any room for movement. The sub-group will be led by Rich Salgo and include Jonathan Sykes and Brian Evans-Mongeon. If other members or observers want to participate they should contact Rich Salgo directly. The sub-group will distribute its findings to the SDT for review no later than January 18, 2013.

AI – Rich Salgo to lead a sub-group that will look into the Planning Committee report in detail to see if there is any room for the SDT to move on threshold issues moving forward in Phase 2. This work will be distributed to the SDT for review no later than January 18, 2013.

2. Single threshold for generation

   The discussion here followed the same general line as above and the sub-group will include this in their work.

iii. Local network

1. Power flow

   Due to time limitations, none of the items below this in the agenda were discussed.

2. Size limitation

iv. Reactive resources

b. Should reactive resources be specifically included in Exclusions E1 and E3?

c. Discuss the need for including the net capacity delivered to the BES from customer-owned generation in Exclusions E1 and E3 generation totals

d. Discuss the need to include statements concerning the exclusion of customer-owned 'transmission' equipment in Exclusion E2

e. Discuss the need to change the sequence of Exclusions based on the hierarchical application of the definition which starts with Exclusion E2 and then goes through Exclusion E4 to Exclusion E3 and finishes with Exclusion E1

f. Discuss any needed changes to the ERO Statement of Compliance Registry Criteria due to the revised BES definition

12. **Phase 2 Schedule**

Currently the project is on schedule. However, the SDT will not be able to post early due to the issues surrounding the Planning Committee report on threshold values. The SDT has to wait for the final report and then additionally, wait for any direction from the Standards Committee. The SDT should be able to meet the original posting schedule which is early April as the target date.

13. **Next Steps**

The Guidance Document does not have to be posted for comments again. Once the suggested changes are made and vetted by the SDT it can be published as the reference document it is intended to be. The publication will need to wait on the issuance of the final Order on this matter so that the final document reflects the Commission's findings. However, if the Order is not forthcoming, the SDT may need to publish anyway due to the pressing need for such a document within the industry. If there is no Order by the end of January 2013, then the SDT will consider publication.

As discussed above, the SDT will send a letter to the Planning Committee expressing its disappointment with the draft report.

The SDT will also provide an update on the draft report and its possible consequences to the Standards Committee.

14. Future Meetings

The face-to-face meeting tentatively scheduled for December 4 – 5, 2012 has been cancelled in favor of a conference call/ web ex on December 4, 2012 from 1:00 p.m. to 5:00 p.m. EST. The main goal of this call will be to resolve the Inclusion I2/I4 language. Other standing agenda items will be discussed as time permits. Details for the call will be sent later.

The next face-to-face meeting of the SDT is scheduled for Wednesday, February 20, 2013 and Thursday, February 21, 2013 in San Francisco, CA at the PG&E offices. This may be the last meeting prior to posting so members are requested to allot the full time of the meetings on their schedules so that all open items can be discussed and resolved. Logistical information will be sent later.

15. Action Item Review

The following action items were developed during this meeting:

- Pete Heidrich will submit a letter to the Planning Committee expressing the dissatisfaction of the SDT with the draft Planning Committee report. This letter needs to be sent prior to the Planning Committee meeting in December.
- Rich Salgo to lead a sub-group that will look into the Planning Committee report in detail to see if there is any room for the SDT to move on threshold issues moving forward in Phase 2. This work will be distributed to the SDT for review no later than January 18, 2013.

16. Adjourn

The Chair thanked NERC for its hospitality and adjourned the meeting at 4:00 p.m. on Thursday, November 15, 2012.

Subject: NERC Updated Webinar Announcement: Winter Preparation for Severe Cold Weather - December 10, 2012
Date: Tuesday, November 27, 2012 5:08:15 PM

Updated Webinar Announcement

Winter Preparation for Severe Cold Weather

December 10, 2012| 2:30–4:00 p.m. ET

Please see the updated link below of the Draft Reliability Guideline: Winter Weather Readiness – Current Industry Practices.

Click here for: Southwest Cold Weather Event Report

Click here for: Lessons Learned from Southwest Cold Weather Event

Click here for: Draft Reliability Guideline: Winter Weather Readiness - Current Industry Practices

Teleconference: 1800-269-3762 | Access Code: 4462733| Broadcast Audio Code: 210674

Topic:	NERC will conduct a webinar to remind entities of the need to prepare for severe cold weather, while also reiterating lessons learned from previous extreme cold weather events. During the webinar, information will be shared from the Southwest Cold Weather Event of February 2011. Additionally, a status update will be provided regarding the development of the NERC Operating Committee Reliability Guideline Winter Weather Readiness – Current Industry Practices.
Invited Audience:	NERC Members and Industry Stakeholders
Access Information:	Webinar Registration Link

For more information or assistance, please contact Jordan Mallory (via email).

DRAFT Reliability Guideline: Winter Weather Readiness – Current Industry Practices

Preamble:

It is in the public interest for NERC to develop guidelines that are useful for maintaining or enhancing the reliability of the Bulk Electric System (BES). Reliability Guidelines provide suggested guidance on a particular topic for use by BES users, owners, and operators according to each entity's circumstances. Reliability Guidelines are not to be used to provide binding norms, establish mandatory reliability standards, or create parameters by which compliance to standards is monitored or enforced.

Introduction:

This Reliability Guideline is applicable to electricity sector organizations responsible for the operation of the BES. It provides general concepts that may be considered when developing a winter weather readiness program. This guideline provides a general framework for identifying the concepts and steps to consider for an effective program with a focus on maintaining individual unit reliability. This document, written in the form of a guideline, is a collection of industry practices compiled by the NERC Operating Committee (OC). The use of these methodologies and guidelines are strictly voluntary**.**

Purpose:

The purpose of this guideline is to document and share current winter weather readiness practices and procedures from across the industry that has been found to enhance the effectiveness of these programs. These are not mapped to existing or future mandatory requirements, but rather are intended to show the breadth of industry practices concerning winter weather readiness.

Assumptions:

A. Each entity is responsible and accountable for maintaining unit reliability.

B. Entities should develop and apply plant-specific guidelines (both seasonal and severe event based preparedness) as appropriate based on factors such as geographical location, technology and plant configuration.

Guideline Details:

Components of an effective winter weather readiness program (both seasonal preparedness and severe event based preparedness) may include:

I. Safety

Management must emphasize that personnel safety remains the top priority during winter weather events. Management ensures that job safety briefings are conducted during preparation for winter weather events as well as during response to winter weather events.

DRAFT

II. Management Roles and Expectations

A. Senior Management

1) Sets expectations for safety, environmental compliance, and generation.

2) Ensures that a winter preparation process exists for each operating location for seasonal preparedness, including severe winter weather event preparedness, and executed as necessary (referred to hereafter as a winter weather preparation procedure)

3) Consider a fleet-wide annual winter preparation meeting and/or training exercise to share best practices and lessons learned.

4) Encourage sharing of insights across the fleet and through industry associations such as the North American Generator Forum, EEI, NERC Event Analysis Subcommittee, etc. (formal groups or other informal networking forums).

B. Plant Management

1) Develop a winter weather preparation procedure, including site specific procedures and checklists for seasonal winter preparedness as well as severe winter weather event preparedness. Each site should consider a plant manager appointed designee, responsible for keeping this procedure updated with industry identified best practices and lessons learned.

2) Ensure the site specific winter weather preparation procedure includes processes, staffing plans, and timelines that direct all key activities before, during and after severe winter weather events.

3) Conduct a plant readiness review prior to a severe winter weather event.

4) Ensure completion of the winter weather preparation procedure.

5) Encourage plant staff to look for areas at risk due to winter conditions and bring up opportunities to improve readiness and response.

6) Following each winter, conduct an evaluation of the effectiveness of the winter weather preparation procedure and incorporate lessons learned.

III. Evaluation of Potential Problem Areas

Identify and prioritize components, systems, and other areas of vulnerability which may experience freezing problems or other cold weather operational issues. This includes equipment that has the potential to:

A. Initiate an automatic unit trip,

B. Impact unit start-up,

C. Initiate automatic unit runback schemes and/or cause partial outages,

D. Cause damage to the unit,

E. Adversely affect environmental controls that could cause full or partial outages,

F. Adversely affect the delivery of fuel or water to the units,

DRAFT

G. Cause other operational problems such as slowed or impaired field devices, or

H. Create a safety hazard.

For safety reasons, fire protection systems should also be included in this identification process. These problem areas should be noted in the site specific winter weather preparation procedure.

Typical problem areas during cold weather include, but are not limited to:

A. Level transmitters

1) Drum level transmitters and sensing lines
2) Condensate tank level transmitters and sensing lines
3) De-aerator tank level transmitters and sensing lines
4) Hotwell level transmitters and sensing lines

B. Pressure Transmitters

1) Gas turbine combustor pressure transmitters and sensing lines
2) Feed water pump pressure transmitters and sensing lines
3) Condensate pump pressure transmitters and sensing lines
4) Steam pressure transmitters and sensing lines

C. Flow Transmitters

1) Steam flow transmitters and sensing lines
2) Feed water pump flow transmitters and sensing lines
3) High pressure steam attemperator flow transmitters and sensing lines

B. Instrument Air System

D. Motor-Operated Valves, Valve Positioners, and Solenoid Valves

E. Drain Lines and Steam Vents

1) Instrument air compressor drains

F. Emergency Generators (including Blackstart generators) for critical system(s) backup

G. Water Pipes and Fire Suppression Systems

1) Low/no water flow piping systems

H. Fuel Supply

1) Coal piles and coal handling equipment
2) Transfer systems for backup fuel supply
3) Gas supply regulators, other valves and instrumentation (may require coordination with gas pipeline operator)

DRAFT

IV. Processes and Procedures

A winter weather preparation procedure should be developed for seasonal winter preparedness, as well as severe winter weather preparedness. Components of an effective winter weather preparation procedure are included as Attachment 1.

After a severe winter weather event, entities should utilize a corrective action process to formally identify lessons learned. Procedures should be reviewed and updated using these lessons learned after every winter event to institutionalize knowledge from prior events (what worked well or did not work well during the event).

V. Training

A. Coordinate annual training in winter specific and plant specific awareness and maintenance training. This may include response to freeze protection panel alarms, troubleshooting and repair of freeze protection circuitry, identification of plant areas most affected by winter conditions, review of special inspections or rounds implemented during severe weather, knowledge of the ambient temperature for which the freeze protection system is designed, and lessons learned from previous experiences or the NERC Lessons Learned program.

   1) Consider holding a winter readiness meeting on an annual basis to highlight preparations and expectations for severe cold weather.

   2) Operations personnel may review cold weather scenarios affecting instrumentation readings, alarms, and other indications on plant control systems.

   3) Ensure appropriate NERC GADS coding for unit derates or trips as a result of a severe winter weather events to promote lessons learned, knowledge retention, and consistency. Examples may include NERC GADS code 9036 “Storms (ice, snow, etc.)” or code 9040 “Other Catastrophe.”

VI. Winter Event Communications

A. Before a severe winter weather event, plant management should consider communicating with their appropriate senior management that the site specific winter weather preparation procedure, checklists, and readiness reviews have been completed.

B. Before and during a severe winter weather event, the affected entity (ies) will keep the Balancing Authority up to date on changes to plant availability.

C. After a generating plant trip, derate, or failure to start due to severe winter weather, Plant Management, as appropriate, will conduct an analyses, develop lessons learned, and incorporate best practices.

   1) This process may include a feedback loop to enhance current winter weather readiness programs, processes, procedures, checklists and training (continuous improvement).

   2) Sharing of technical information and lessons learned may be provided to the industry, as appropriate, through the NERC Event Analysis Program or some other method.

DRAFT

Attachment 1

Elements of a Winter Weather Preparation Procedure (Seasonal Preparedness and Severe Winter Weather Event Preparedness)[1]

A. Work Management System

1) Review Work Management System to ensure adequate annual preventative work orders exist for freeze protection and/or winter weather preparedness.

2) Ensure all freeze protection and/or winter weather preparedness preventative work orders are completed prior to the onset of the winter season.

3) Suspend freeze protection measures and remove freeze protection equipment after the last probable freeze of the winter. This may be a plant specific date established by senior management.

4) Ensure all engineered modification and construction activities are performed such that the changes maintain winter readiness for the plant. Newly built plants or engineered modifications can be more susceptible to winter weather.

B. Critical Instrumentation and Equipment Protection

1) Ensure all critical site specific problem areas (as noted above in section III. Evaluation of Potential Problem Areas) have adequate protection to ensure operability during a severe winter weather event. Emphasize the points in the plant where equipment freezing would cause a generating plant trip, de-rate, or failure to start.

C. Insulation, Heat Trace, and Other Protection Options – Processes and procedures that verify adequate protection and necessary functionality (by primary or alternate means) before and during winter weather. Consider the effect of wind chill when applying freeze protection. Considerations include but are not limited to:

1) Insulation thickness, quality and proper installation

   i. Verify the integrity of the insulation on critical equipment identified in the winter weather preparation procedure. Following any maintenance, insulation should be re-installed to original specifications.

2) Heat trace capability and electrical continuity/ground faults

   i. Perform a complete evaluation of all heat trace lines, heat trace power supplies (including all breakers, fuses, and associated control systems) to ensure they maintain their accuracy. This inspection should include checking for loose connections, broken wires, corrosion, and other damage to the integrity of electrical insulation which could lead to the heat trace malfunctioning. Heat trace amperage and voltage should be measured, if possible, to determine whether the circuits are producing the design output. If there are areas where heat tracing is not functional, an alternate means of protection should be identified in the winter weather preparation procedure.

[1] Plants that will remain offline during the winter season would not need to perform winterization preparations unless it is necessary for asset protection/preservation.

DRAFT

ii. Evaluate the current installation of heat trace and insulation on critical lines making sure heat trace is applied properly (i.e., wrapped around the valve and not just across the valve body).

iii. Utilize manufacturer's recommendations in determining the useful life of the heat trace equipment for developing a routine preventative maintenance and replacement plan or schedule.

iv. Re-install removed or disturbed heat tracing following any equipment maintenance to restore heat tracing integrity and equipment protection.

v. Update and maintain all heat tracing circuit drawings and labeling inside cabinets.

3) Wind breaks

i. Install permanent or temporary wind barriers as deemed appropriate to protect critical instrument cabinets, heat tracing and sensing lines.

4) Heaters and Heat Lamps

i. Ensure operation of all permanently mounted and portable radiant heaters.

ii. Evaluate plant electrical circuits to ensure they have enough capacity to handle the additional load. Circuits with ground fault interrupters (GFIs) should be continuously monitored to make sure they have not tripped due to condensation.

iii. Fasten in place to prevent unauthorized relocation.

5) Covers, Enclosures, and Buildings

i. Install a box or enclosure with inside heat for some transmitters.

ii. Install covers on valve actuators to keep the actuator from accumulating ice.

iii. Inspect building penetrations, doors, fan louvers, and other openings for potential exposure of critical equipment to the elements.

D. Supplies – Prior to the onset of the winter season, ensure adequate inventories of all commodities, equipment and other supplies that would aid in severe winter weather event preparation or response, and that they are readily available to plant staff. Supplemental equipment might include:

1) Tarps
2) Portable heaters and/or heat lamps
3) Scaffolding
4) Blankets
5) Extension cords
6) Kerosene/propane
7) Temporary enclosures
8) Temporary insulation

DRAFT

9) Plastic rolls
10) Portable generators
11) Portable lighting
12) Instrumentation tubing
13) Handheld welding torches
14) Ice removal chemicals and equipment
15) Cold weather PPE as appropriate to the respective regions

Prior to the onset of a severe winter weather event, an inventory should be conducted of critical supplies needed to keep the plant operational. Appropriate deliveries should be scheduled based on the severity of the event, lead times, etc. Operational supplies might include:

1) Aluminum Sulfate
2) Anhydrous Ammonia
3) Aqueous Ammonia
4) Carbon Dioxide
5) Caustic Soda
6) Chlorine
7) Diesel Fuel
8) Ferric Chloride
9) Gasoline (Unleaded)
10) Hydrazine
11) Hydrogen
12) Lighter Oil (#2 Diesel)
13) Sulfuric Acid
14) Calibration Gases
15) Lubricating Oils
16) Welding Supplies
17) Limestone

E. Staffing

1) Consideration of enhanced staffing (24x7) during severe winter weather events.
2) Arrangements for lodging and meals.
3) Arrangements for transportation as needed.
4) Support and appropriate staffing from Transmission Service Providers for plant switchyard to ensure minimal line outages.

DRAFT

F. Communications

1) Ensure appropriate communication protocols are followed during a severe winter weather event.

2) Identify a back-up communication option in case the primary system is not working

3) Ensure communication is discussed as part of the job safety briefing during a severe winter weather event.

G. Special Operations Instruction (just prior to or during a severe winter weather event)

1) Consider employing the "buddy system" during severe winter weather events to promote personnel safety.

2) Institute operator rounds utilizing cold weather checklists to verify critical equipment is protected – i.e. pumps running, heaters operating, igniters tested, barriers in place, temperature gauges checked, etc.

   i. Instrumentation and equipment in enclosed spaces (e.g. pump rooms) can still freeze. Room temperatures may need to be monitored.

3) Test dual fuel capability and ensure adequate fuel supply (where applicable).

4) Consider pre-warming and/or early start-up of scheduled units prior to a forecasted severe winter weather event.

5) Run emergency generators immediately prior to severe winter weather events to help ensure availability. Review fuel quality and quantity.

6) Place in service critical equipment such as intake screen wash systems, cooling towers, auxiliary boilers, and fuel handling equipment where freezing weather could adversely impact operations or forced outage recovery.

I. Introduction

The southwest region of the United States experienced unusually cold and windy weather during the first week of February 2011. Lows during the period were in the teens for five consecutive mornings and there were many sustained hours of below freezing temperatures throughout Texas and in New Mexico. Low temperatures in Albuquerque, New Mexico ranged from 7 degrees Fahrenheit to -7 degrees over the period, compared to an average high of 51 degrees and a low of 26 degrees. Dallas temperatures ranged from 14 degrees to 19 degrees, compared to an average high of 60 degrees or above and average lows in the mid-to-upper 30s. Many cities in the region would not see temperatures above freezing until February 4. In addition, sustained high winds of over 20 mph produced severe wind chill factors.

Electric entities located within the Texas Reliability Entity, Inc. (TRE), the Western Electricity Coordinating Council (WECC), and the Southwest Power Pool (SPP) were affected by the extreme weather, as were gas entities in Texas, New Mexico and Arizona.

Between February 1 and February 4, a total of 210 individual generating units within the footprint of the Electric Reliability Council of Texas, Inc. (ERCOT), which covers most of Texas, experienced either an outage, a derate, or a failure to start. The loss of generation was severe enough on February 2 to trigger a controlled load shed of 4000 MW, which affected some 3.2 million customers. On February 3, local transmission constraints coupled with the loss of local generation triggered load shedding for another 180,000 customers in the Rio Grande Valley in south Texas. El Paso Electric Company (EPE), which is outside the ERCOT region, lost approximately 646 MW of local generation over the four days beginning on February 1. It implemented rotating load sheds on each of the days from February 2 through February 4, totaling over 1000 MW and affecting 253,000 customers. The Salt River Project Agricultural Improvement and Power District (SRP), located in Arizona, lost 1050 MW of generation on February 1 through February 2 and shed load of 300 MW, affecting approximately 65,000 customers. The New Mexico communities of Alamogordo, Ruidoso, and Clayton lost approximately 26 MW of load, affecting a little over 21,000 customers, when Public Service Company of New Mexico (PNM) experienced localized transmission failures, although these were largely unrelated to the extreme weather.

In total, approximately 1.3 million electric customers were out of service at the peak of the event on February 2, and a total of 4.4 million were affected over the course of the event from February 2 through February 4.

Natural gas customers also experienced extensive curtailments of service during the event. These curtailments were longer in duration than the electric outages, because relighting customers' equipment has to be accomplished manually at each customer's location. Local distribution companies (LDCs) interrupted gas service to more than 50,000 customers in New Mexico, Arizona and Texas; New Mexico was the hardest hit with outages of over 30,000 customers in areas as widespread as Hobbs, Ruidoso, Alamogordo, Silver City, Tularosa, La Luz, Taos, Red River, Questa, Española, Bernalillo and Placitas.

In the wake of these events, the Arizona Corporation Commission, the Public Regulation Commission of New Mexico, the Public Utilities Commission of Texas (PUCT), the Texas Railroad Commission (TRC), the New Mexico state legislature and the Texas state legislature all initiated inquiries or investigations. The PUCT directed TRE, the regional entity authorized by the North American Electric Reliability Corporation (NERC) to cover the ERCOT region, to investigate the decisions and actions ERCOT took in initiating the rolling blackouts.

On February 7, 2011, NERC announced that it would work with the affected Regional Entities to prepare an event analysis that would examine the adequacy of preparations for the event and identify potential improvements and lessons learned. NERC also stated it would review electric and natural gas interdependencies, in light of the shift toward a greater reliance on natural gas to produce electricity.

On February 14, the Federal Energy Regulatory Commission (FERC) initiated an inquiry into the Southwest outages and service disruptions. The inquiry had two objectives: to identify the causes of the disruptions, and to identify any appropriate actions for preventing a recurrence of the disruptions. FERC stated it was not at that time initiating an investigation into whether there may have been violations of applicable regulations, requirements or standards under FERC's jurisdiction, and that any decisions on whether to initiate enforcement investigations would be made later. Consequently, while this report describes actions which in some cases appear to warrant further investigation, it does not reach any conclusions as to whether violations have occurred.

From the beginning of their inquiries into the causes of the outages and disruptions, the staffs of FERC and NERC have cooperated in their data gathering and analysis. On May 9, FERC and NERC announced their staffs would create a joint task force to combine their separate inquiries. This report is a product of that effort.

The inquiry performed by the joint task force was far-reaching. Noted below in summary form are some of the steps taken by the task force to develop its understanding of the electric and natural gas disruptions that were experienced in the Southwest in early February.

Scope of Data Reviewed

The task force received approximately 54 GB of data through data requests issued to entities in both the electric and natural gas industries, conducted numerous follow-up calls and meetings, and issued follow-up requests to discuss questions raised by the data responses.

For the electric industry, the task force issued 122 data requests to generator operators, transmission operators, balancing authorities, and a reliability coordinator. The task force also utilized event analysis information which NERC and the affected Regional Entities received from 79 registered entities (72 from TRE, four from WECC and three from SPP). Additional event information was received through a request for information issued by NERC and Regional Entities to those entities affected by the extreme weather event. For the gas industry, the task force issued 92 data requests to pipelines (interstate and intrastate), storage facilities, gas processing plants, producers, and public utilities.

The data compiled by the task force focused on the causes of the outages and curtailments during the February cold weather event, critical entities' preparations for the forecasted cold weather and their performance in connection with the rolling blackouts and natural gas curtailments, and any lessons learned that could be applied in the future. As part of its analysis, the task force also reviewed historical data and recommendations compiled during past cold weather events in Texas and elsewhere in the Southwest, to determine whether the 2011 event was unprecedented or whether entities might have been better prepared to deal with it.

Electric Facility Site Visits

Staff from FERC and NERC, together with representatives of TRE and WECC, conducted site visits with various entities involved in the outages, toured facilities and conducted interviews with operations personnel, compliance personnel and company executives. The task force visited ERCOT, four transmission operators in ERCOT, and 15 generators in ERCOT (including coal, natural gas, and wind units); two generators in WECC; and two balancing authorities in WECC. During the generator site visits the task force toured the units, viewing any equipment that led to trips, derates, or failures to start; viewed winterization measures; and discussed maintenance and winterization processes,

fuel supply and market participation. During visits to the balancing authorities and transmission operators, the task force toured control centers and discussed the progression of the events, including specifics on load forecasting, market mechanics, system operations, load shedding and load restoration. The task force also discussed transmission system winterization and load shedding procedures with the transmission operators.

Natural Gas Meetings

The task force conducted numerous meetings with various entities from the gas industry to discuss the curtailments and shortages experienced in early February and the specifics of the entities' winter operations. These meetings included operations and regulatory personnel from two interstate pipelines doing business in Texas, New Mexico, Arizona, Colorado, and California; one LDC/intrastate pipeline located in New Mexico; one LDC from Arizona; and one intrastate pipeline located in Texas. The meetings focused on the companies' preparations for the storm, communications among LDCs, pipelines, marketers, and producers about unfolding events, system operations, underlying causes of the gas supply problems, and lessons learned. In most instances, interviews led to supplemental data requests that provided additional information about the events. The task force also held numerous telephone conferences with companies in the pipeline, LDC, processing and production sectors, both to gather information and to clarify information received in response to data requests.

Outreach Meetings

Task force staff conducted outreach meetings with the following industry associations and groups: the Electric Power Supply Association, the American Gas Association, the Independent Petroleum Association of America, the Texas Pipeline Association, the Interstate Natural Gas Association of America, the Natural Gas Supply Association, the Edison Electric Institute, the National Rural Electric Cooperative Association, the American Public Power Association, and the (ERO) Southwest Outage Advisory Panel. The task force shared its preliminary findings and recommendations on a non-public basis with members of these organizations in order to obtain feedback and, with respect to the recommendations, input as to their practicality and feasibility. The feedback and input provided by these organizations was considered and in a number of instances reflected in the findings and recommendations included in this report.

Coordination with State Inquiries

The task force also reviewed materials acquired in the course of inquiries into the event conducted by legislative bodies and regulatory commissions. The

task force followed legislative and regulatory hearings in Arizona, New Mexico and Texas and reviewed transcripts, testimony and webcasts from the proceedings.

Through contacts with state regulatory agencies, staff was able to review responses to data requests issued by those bodies to ensure that the task force was in possession of all potentially relevant materials. Task force staff also monitored legislative efforts taken in response to the February outage, including conferring with sponsors of pertinent legislation concerning, among other things, the anticipated impacts of their proposals. The task force tracked the bills throughout the legislative process. In addition, as regulatory agencies moved forward with their inquiries into the outage, task force staff reviewed draft and final copies of all relevant reports.

The task force also collaborated with ERCOT's Independent Market Monitor (IMM), which conducted an inquiry into potential market manipulation during the event at the request of the PUCT. Task force staff conducted calls with the IMM to discuss market conditions and reviewed its written assessment of the market impacts from the event. The task force also contacted the TRC regarding gas curtailment matters, submitted written questions about the TRC's activities in connection with the event, and reviewed all information the TRC collected concerning the event.

To assist in its analysis of the materials received, the task force commissioned one outside consultant's study to examine impacts of the cold weather event on gas production, reviewed studies conducted on behalf of regulatory and other bodies, and prepared extensive in-house studies by staff analysts.

This report documents the information received by the task force and presents the task force's conclusions as to the causes of the electric outages and natural gas curtailments that occurred during the February 2011 event. It is divided into several sections, beginning with an overview of the electric and natural gas industries that provides background for the event, discusses the event itself and prior cold weather events in the region, and ends with a summary of key findings and recommendations. Also included are a list of acronyms, a glossary, and a number of appendices which treat in fuller detail many of the matters mentioned in the body of the report.

This page intentionally left blank.

II. Executive Summary

The arctic cold front that descended on the Southwest during the first week of February 2011 was unusually severe in terms of temperature, wind, and duration of the event. In many cities in the Southwest, temperatures remained below freezing for four days, and winds gusted in places to 30 mph or more. The geographic area hit was also extensive, complicating efforts to obtain power and natural gas from neighboring regions.

The storm, however, was not without precedent. There were prior severe cold weather events in the Southwest in 1983, 1989, 2003, 2006, 2008, and 2010. The worst of these was in 1989, the prior event most comparable to 2011. That year marked the first time ERCOT resorted to system-wide rolling blackouts to prevent more widespread customer outages. In all of those prior years, the natural gas delivery system experienced production declines; however, curtailments to natural gas customers in the region were essentially limited to the years 1989 and 2003.

Electric

Going into the February 2011 storm, neither ERCOT nor the other electric entities that initiated rolling blackouts during the event expected to have a problem meeting customer demand. They all had adequate reserve margins, based on anticipated generator availability. But those reserves proved insufficient for the extraordinary amount of capacity that was lost during the event from trips, derates, and failures to start.

In the case of ERCOT, where rolling blackouts affected the largest number of customers (3.2 million), there were 3100 MW of responsive reserves available on the first day of the event, compared to a minimum requirement of 2300 MW. But over the course of that day and the next, a total of 193 ERCOT generating units failed or were derated, representing a cumulative loss of 29,729 MW. Combining forced outages with scheduled outages, approximately one-third of the total ERCOT fleet was unavailable at the lowest point of the event. These extensive generator failures overwhelmed ERCOT's reserves, which eventually dropped below the level of safe operation. Had ERCOT not acted promptly to shed load, it would very likely have suffered widespread, uncontrolled blackouts throughout the entire ERCOT Interconnection.

ERCOT also experienced generator outages in the Rio Grande Valley on February 3, again due to the cold weather. This area is transmission constrained,

and the loss of local generation led to voltage concerns that necessitated localized load shedding.

Spot prices in ERCOT hit the $3,000 per MWh cap on February 2, the worst day of the event. Given the high demand and the huge loss of generation, this was not a surprising development. In fact, very high prices are an expected response to scarcity conditions, one that is built into ERCOT's energy-only market. ERCOT's IMM reviewed market performance during the event and found no evidence of market manipulation.

EPE and SRP likewise suffered numerous generator outages, necessitating load shed of 1023 MW in EPE's case, and 300 MW in SRP's case. As with ERCOT, many of these generators failed because of weather-related reasons.

A number of entities within SPP also experienced outages during the event. In their case, however, load shedding was not required, principally because the utilities were able to purchase emergency energy from other SPP members. One other utility in the Southwest, PNM, experienced blackouts, but these were localized and the result of transmission outages that were mostly unrelated to the weather.

The actions of the entities in calling for and carrying out the rolling blackouts were largely effective and timely. However, the massive amount of generator failures that were experienced raises the question whether it would have been helpful to increase reserve levels going into the event. This action would have brought more units online earlier, might have prevented some of the freezing problems the generators experienced, and could have exposed operational problems in time to implement corrections before the units were needed to meet customer demand.

The February event underscores the need to have sufficient black start units available, particularly in the face of an anticipated severe weather event. In ERCOT's case, for instance, nearly half of its black start units were either on scheduled outage at the time of the event or failed during the event itself, jeopardizing the utility's ability to promptly restore the system had an uncontrolled, ERCOT-wide blackout occurred.

The majority of the problems experienced by the many generators that tripped, suffered derates, or failed to start during the event were attributable, either directly or indirectly, to the cold weather itself. For the Southwest as a whole, 67 percent of the generator failures (by MWh) were due directly to weather-related causes, including frozen sensing lines, frozen equipment, frozen water lines, frozen valves, blade icing, low temperature cutoff limits, and the like. At least

another 12 percent were indirectly attributable to the weather (occasioned by natural gas curtailments to gas-fired generators and difficulties in fuel switching).

Low temperatures returned to the region on February 10. In fact, ERCOT set a new winter peak that day. But no load shedding proved necessary, largely because the temperatures were not quite as cold or sustained as those of the previous week, the winds were less severe, and many of the repairs and protective measures taken by the generators on February 2 remained in place.

Natural Gas

Problems on the natural gas side largely resulted from production declines in the five basins serving the Southwest. For the period February 1 through February 5, an estimated 14.8 Bcf of production was lost. These declines propagated downstream through the rest of the gas delivery chain, ultimately resulting in natural gas curtailments to more than 50,000 customers in New Mexico, Arizona, and Texas.

The production losses stemmed principally from three things: freeze-offs, icy roads, and rolling electric blackouts or customer curtailments. Freeze-offs occurred when the small amount of water produced alongside the natural gas crystallized or froze, completely blocking off the gas flow and shutting down the well. Freeze-offs routinely occur in very cold weather, and affected at least some of these basins in all of the six recent cold weather events in the Southwest with the possible exception of 1983, for which adequate records are not available. During the February event, icy roads prevented maintenance personnel and equipment from reaching the wells and hauling off produced water which, if left in holding tanks at the wellhead, causes the wells to shut down automatically. The ERCOT blackouts or customer curtailments affected primarily the Permian and Fort Worth Basins and caused or contributed to 29 percent (Permian) and 27 percent (Fort Worth) of the production outages, principally as a result of shutting down electric pumping units or compressors on gathering lines.

Processing plants suffered some mechanical failures, although most of their shortfalls resulted from problems upstream at the wellhead. The production declines, coupled with increased customer demand, reduced gas volume and pressure in the pipelines and in those limited storage facilities serving the Southwest. These entities in turn were unable in some instances to deliver adequate gas supplies to LDCs.

When LDCs suffer declines in gas pressure on their systems, they must reduce the amount of gas being consumed to prevent pressures from falling so low that their entire systems might fail. As a result of the high gas demand and the

falling pressures on their systems, four LDCs in New Mexico, Arizona and Texas were forced to curtail retail service or were unable to supply gas to all customers. These curtailments or outages affected more than 50,000 customers in those states, including the cities of El Paso in Texas; Tucson and Sierra Vista in Arizona; and Hobbs, Ruidoso, Alamogordo, Silver City, Tularosa, La Luz, Taos, Red River, Questa, Española, Bernalillo, and Placitas in New Mexico. In contrast to the relative ease of restoring electric service, restoration of gas service was complicated by the necessity to have LDC crews manually shut off gas meters and then relight pilot lights on site.

Winterization

Generators and natural gas producers suffered severe losses of capacity despite having received accurate forecasts of the storm. Entities in both categories report having winterization procedures in place. However, the poor performance of many of these generating units and wells suggests that these procedures were either inadequate or were not adequately followed.

The experiences of 1989 are instructive, particularly on the electric side. In that year, as in 2011, cold weather caused many generators to trip, derate, or fail to start. The PUCT investigated the occurrence and issued a number of recommendations aimed at improving winterization on the part of the generators. These recommendations were not mandatory, and over the course of time implementation lapsed. Many of the generators that experienced outages in 1989 failed again in 2011.

On the gas side, producers experienced production declines in all of the recent prior cold weather events. While these declines rarely led to any significant curtailments, electric generators in 2003 did experience, as a result of gas shortages, widespread derates and in some cases outright unit failure. It is reasonable to assume from this pattern that the level of winterization put in place by producers is not capable of withstanding unusually cold temperatures.

While extreme cold weather events are obviously not as common in the Southwest as elsewhere, they do occur every few years. And when they do, the cost in terms of dollars and human hardship is considerable. The question of what to do about it is not an easy one to answer, as all preventative measures entail some cost. However, in many cases, the needed fixes would not be unduly expensive. Indeed, many utilities have already undertaken improvements in light of their experiences during the February event. This report makes a number of recommendations that the task force believes are both reasonable economically and which would substantially reduce the risk of blackouts and natural gas curtailments during the next extreme cold weather event that hits the Southwest.

Electric and Gas Interdependency

The report also addresses the interdependency of the electric and natural gas industries. Utilities are becoming increasingly reliant on gas-fired generation, in large part because shale production has dramatically reduced the cost of gas. Likewise, compressors used in the gas industry are more likely than in the past to be powered with electricity, rather than gas. As a result, deficiencies in the supply of either electricity or natural gas affect not only consumers of that commodity, but of the other commodity as well.

Gas shortages were not a significant cause of the electric generator outages experienced during the February 2011 event, nor were rolling blackouts a primary cause of the production declines at the wellhead. Both, however, contributed to the problem, and in the case of natural gas shortfalls in the Permian and Fort Worth Basins, approximately a quarter of the decline was attributed to rolling blackouts or customer curtailments affecting producers.

The report explores some of the issues relating to the effects of shortages of one commodity on the other, including the question of whether gas production and processing facilities should be deemed "human needs" customers and thus exempted or given special consideration for purposes of electric load shedding. However, any resolution of the many issues arising from electric and natural gas interdependency must be informed by an examination of more than one cold weather event in one part of the country. For that reason, the report does not offer specific recommendations in this area, but urges regulatory and industry bodies to explore solutions to the many interdependency problems which are likely to remain of concern in the future.

This page intentionally left blank.

III. The Electric and Natural Gas Industries

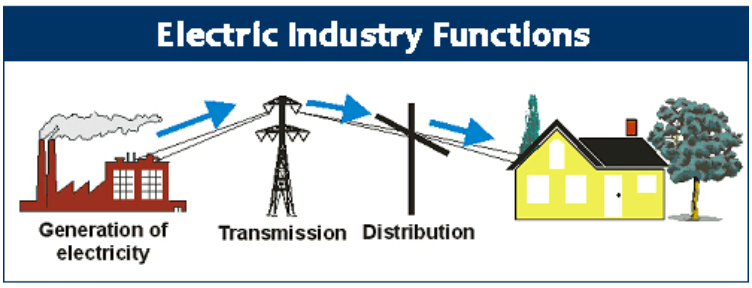
Electricity and natural gas are two of the most essential commodities for the conduct of modern life. However, the industries that produce electricity and natural gas and deliver these commodities from their points of production to consumers differ greatly from one another, as do the regulatory schemes governing them. This section provides an overview of the electric and natural gas industries, their market structures, and the regulatory authorities under which they operate, focusing particularly on the southwest region of the country. This background will be useful in understanding the causes of the outages and curtailments experienced during the first week of February 2011, the actions taken by the entities affected, and the recommendations the task force is suggesting to prevent a recurrence of the widespread service disruptions.

A. The Electric Industry

This subsection describes the structures under which electricity is generated and transmitted, the regulation of electric service providers, and the characteristics of the electricity markets found in the Southwest. A more detailed description of how electricity is produced, transmitted and delivered can be found in the appendix entitled "Electricity: How it is Generated and Distributed."

Overview of Electric Power Production and Delivery

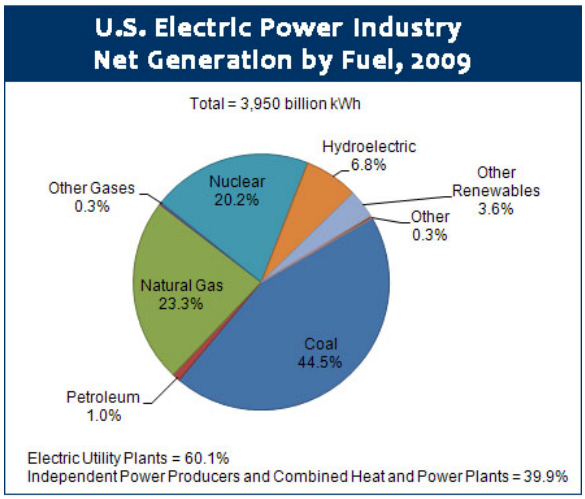
The electric power industry is comprised of three separate functions: generation, transmission, and distribution. These are depicted in the figure below.



Source: EIA

Most of the power produced in the United States uses coal, natural gas, or nuclear fission as the energy source to produce steam or other hot combustion gas that turns a turbine and thereby creates electricity. The figure below shows the fuel source percentages for electricity produced in the US in 2009, with the majority of electricity coming from fossil fuels (coal and natural gas totaling a 68

percent share). While wind and solar energy have experienced fairly rapid growth over the past several years, renewable fuels (including hydroelectric generation's seven percent share) accounted for about 11 percent of the electricity generated in the United States in that year. Wind generation is more common in the Southwest than in most other regions; its share of total generation is about 3.8 percent.[1]



Generating units typically fall into three categories: base load, intermediate, and peaking units. Base load units, usually coal-fired or nuclear, have a relatively low operating cost and have fairly slow or expensive ramping rates.[2] These units are seldom cycled on and off, and are instead scheduled to cover the base levels of projected load. Peaking units, which are generally gas-fired, can be started up very quickly and have relatively expensive operating costs. Accordingly, they are generally last in the dispatch order and are used to cover seasonal (and sometimes daily) peak load levels. Intermediate plants fall somewhere in between base load and peaking with respect to operating characteristics, start-up times, and capacity factors.[3]

Generating plants produce power at a relatively low voltage level, so the power must be "stepped up" to a higher voltage in order to be more efficiently

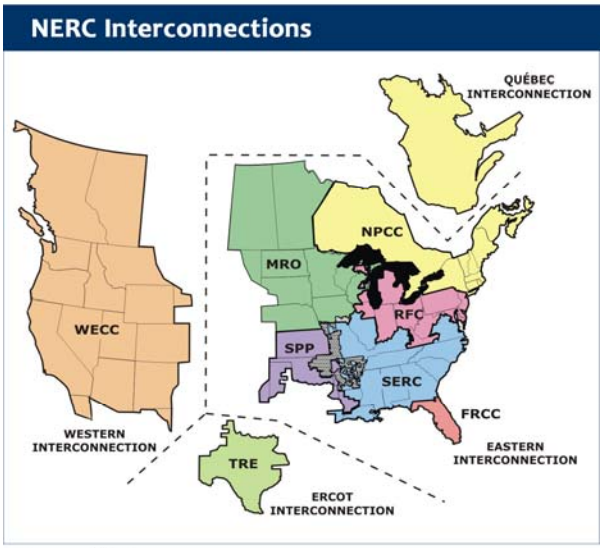
[1] United States Energy Information Administration (EIA), *Electric Power Monthly*, Table 6 - Total Renewable Net Generation by Energy Source and State, 2009 (released August 2010) and *Electric Power Annual*, Figure 2.1 – U.S. Electric Industry Net Generation by State, 2009 (released November 2010, revised January and April 2011).

[2] "Ramping" refers to the generator's ability to produce more or less power on request.

[3] "Capacity factor" refers to the ratio of average generation to the capacity rating of an electric generating unit for a specified period (expressed as a percentage).

transmitted to its ultimate point of use. Energy is carried at these higher voltages over transmission lines (usually between 138 kV and 765 kV) to load centers, where voltage is then stepped back down to a distribution level for delivery to end-use customers. While distribution lines are generally considered to be those operating at 69 kV and below,[4] some industrial end-use customers may take service at transmission-level or intermediate-level voltages.

Virtually all of the transmission system in the continental United States is operated as an alternating current (AC) system, although the West and a few other areas make use of some direct current (DC) lines for long-haul transportation of power or for system stability. DC ties are also used to provide limited connectivity between the three electrically independent grids currently found in the United States: (1) the Eastern Interconnection, which covers the eastern two-thirds of the United States and contiguous parts of Canada; (2) the Western Interconnection, which covers the western third of the United States, the Canadian provinces of Alberta and British Columbia, and a small portion of Baja California Norte, Mexico; and (3) ERCOT, which covers most of the state of Texas. (A fourth interconnection, the Quebec Interconnection, is located wholly in Canada.)



Source: NERC

[4] The bulk electric system, which constitutes transmission as opposed to distribution, has been described by FERC as those facilities operating at 100 kV or above except for defined radial facilities, with exemptions for those facilities not necessary for operating the interconnected transmission network. *Revision to Electric Reliability Organization Definition of Bulk Electric System*, Order No. 743, 75 Fed. Reg. 72,910 (Nov. 26, 2010), 133 FERC ¶ 61,150 (2010), *order on reh'g*, Order No. 743-A, 134 FERC ¶ 61,210 (2011).

Within each interconnection, power generally flows freely across the entire grid. An imbalance of generation versus demand that is significant enough to cause instability on one utility's system can ultimately affect the stability of all systems operating in that interconnection.[5]

Evolution and Regulation of the Electric Industry

Under part II of the Federal Power Act,[6] FERC has jurisdiction over the rates, terms and conditions of wholesale sales of electric energy and transmission services in interstate commerce that are provided by jurisdictional entities (which generally excludes electric cooperatives and federal or state entities, including municipal utilities). Notably, wholesale electric energy sales and transmission services provided wholly within ERCOT are not considered to be interstate under the Federal Power Act, and are therefore not subject to FERC jurisdiction. States generally regulate retail sales of electric energy and distribution services, although publicly-owned and member-owned entities (such as electric cooperatives and municipal utilities) may be exempt from direct state regulatory oversight. In Texas, the PUCT exercises jurisdiction over wholesale sales of energy and the provision of transmission services wholly within the ERCOT footprint.

Historically, all three of the electric sector functions (generation, transmission, and distribution) were provided by one vertically-integrated utility, which was typically granted a monopoly franchise by states to serve retail customers within a given geographic area. While wholesale sales or exchanges of electric energy did occur between utilities, utilities historically planned their systems, both generation and transmission, to serve their own native peak load requirements.

Entities Providing Electric Services in the United States

The electric sector in the United States is made up of a variety of entities, including investor-owned utilities, publicly-owned utilities (including municipal utilities, public utility districts, and irrigation districts), member-owned utilities (generally rural electric cooperatives), Federal electric utilities, and

(cont'd)

[6] 16 U.S.C. § 824 et seq.

independent power producers. Investor-owned utilities (IOUs) are private entities that were historically vertically-integrated, *i.e.*, owning generation, transmission and distribution assets. However, in states with restructured electric markets, many IOUs were required or strongly incentivized to divest or spin-off their generation assets, and now own only transmission and distribution assets as part of the utility company. Based on 2007 data from the United States Energy Information Administration, IOUs serve about 71 percent of the retail customers in the country. Publicly-owned electric utilities and electric cooperatives have generally been exempted from state restructuring initiatives, and have not been required to offer customer choice or to divest generation assets. There are approximately 2,000 publicly-owned utilities in the United States (which own about 9 percent of the installed generating capacity) and over 880 electric cooperatives (which own approximately 4 percent of the installed capacity).

Since the 1970s, a number of changes occurred to alter this traditional, vertically-integrated model. In 1978, Congress created a class of non-utility generators called qualifying facilities (QFs), and in 1992 created a class of independent generators called Exempt Wholesale Generators. This legislation opened the door not only for independent owners to develop generating plants in multiple regions, but also for utilities to develop generating plants in regions outside their service territory.[7]

FERC took a number of steps to further encourage the development of a competitive wholesale market for generation, including by (1) authorizing generation owners to sell wholesale power at market rates if they can demonstrate that they lacked market power in the relevant market; and (2) requiring transmitting utilities to provide open access transmission service for the delivery of power to wholesale customers on terms and conditions comparable to the transmission service the utilities provided themselves in serving their native load customers.[8]

[7] Energy Policy Act of 1992, Pub. L. No. 102, 486.

[8] Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Services by Public Utilities; Recovery of Stranded Costs by Public Utilities and Transmitting Utilities, Order No. 888, FERC Stats. & Regs. ¶ 31,036 (1996), *order on reh'g*, Order No. 888-A, FERC Stats. & Regs. ¶ 31,048, *order on reh'g*, Order No. 888-B, 81 FERC ¶ 61,248 (1997), *order on reh'g*, Order No. 888-C, 82 FERC ¶ 61,046 (1998), *aff'd in relevant part*

FERC also encouraged the formation of Independent System Operators (ISOs)[9] and Regional Transmission Organizations (RTOs).[10] ISOs/RTOs serve a number of functions critical to operation of the wholesale market within a given region, including control and operation of the transmission grid, operation of real-time and day-ahead markets, and transmission system planning.[11] Not all regions in the United States have adopted an ISO/RTO structure, although they may rely on other power pool structures. The map below shows the footprint of the nine ISOs or RTOs currently operating in the US and Canada.

---

sub nom. Transmission Access Policy Study Group v. FERC, 225 F.3d 667 (D.C. Cir. 2000), *aff'd sub nom.* New York v. FERC, 535 U.S. 1 (2002) (Order No. 888).

[9] ISOs grew out of Order No. 888, issued in 1996, as a means of satisfying FERC's requirement that jurisdictional utilities provide non-discriminatory access to transmission services. Order No. 888, FERC Stats. & Regs. ¶ 31,036 at 31,730; and *Regional Transmission Organizations*, Order No. 2000, FERC Stats. & Regs. ¶ 31,089 (1999), *order on reh'g*, Order No. 2000-A, FERC Stats. & Regs. ¶ 31,092 (2000), *aff'd sub nom. Pub. Util. Dist. No. 1 of Snohomish County, Washington v.* FERC, 272 F.3d 607 (D.C. Cir. 2001).

[10] In 1999, as part of Order No. 2000, FERC created and sought to encourage the voluntary formation of Regional Transmission Organizations to oversee electric transmission and ancillary services and transmission planning services across a broader territory. ISOs and RTOs perform similar functions, but RTOs are only recognized as such if they meet FERC's minimum characteristics and minimum functions as set out in Order No. 2000. In addition, ISOs tend to be smaller in geographic size, or are not subject to FERC jurisdiction. *See* "The Value of Independent Regional Grid Operators: A Report by the ISO/RTO Council," *available at* <http://www.isorto.org/atf/cf/%7B5B4E85C6-7EAC-40A0-8DC3-003829518EBD%7D/Value_of_Independent_Regional_Grid_Operators.pdf>. Order 2000: *Regional Transmission Organizations*, Order No. 2000, FERC Stats. & Regs. ¶ 31,089 (1999), *order on reh'g*, Order No. 2000-A, FERC Stats. & Regs. ¶ 31,092 (2000), *aff'd sub nom. Pub. Util. Dist. No. 1 of Snohomish County, Washington v. FERC*, 272 F.3d 607 (D.C. Cir. 2001).

Regional Transmission Organizations/Independent System Operators

In markets where an ISO/RTO has been approved, the ISO/RTO is generally responsible for dispatching generating units based on hourly energy prices offered by the generation owner or other energy marketer. Initially, these competitive wholesale markets were structured to reflect only energy products and ancillary services,[12] with no compensation for the provision of capacity[13] and no corresponding obligation on the part of generators to offer into a specific market.[14] Many of the markets have undergone modifications over time, including

[12] Ancillary services support the reliable operation of the transmission system as it moves electricity from generating sources to retail customers, and in RTO or ISO-based markets are generally procured through a mechanism or market separate from the energy market. Ancillary services typically include regulation, synchronized or spinning reserves, non-spinning reserves, and black-start services. Among ERCOT's various categories of ancillary services are responsive reserve service (RRS) and non-spinning reserve service (NSRS). RRS are operating reserves intended to help control the frequency of the system. NSRS are reserves intended to cover the uncertainties in forecasting load and wind power output.

[13] Capacity (or installed capacity) refers in this context to the maximum kW or MW of output offered into a capacity market and required to be available except as otherwise provided by the relevant market rules. Payments by load serving entities for capacity are made regardless of whether energy is actually provided, as long as the relevant availability requirements are met. Penalties are generally imposed if a supplier fails to meet the availability requirements or otherwise provide energy when called upon.

[14] After an offer is accepted in a given energy or ancillary services market, the generator or its marketer has the obligation to deliver the energy or to cover the real-time cost of replacement if the generator experiences a forced outage or derate. In addition, even in an energy-only market, certain generators that are deemed essential for reliability (often referred to as reliability must-run generators or RMRs), are paid an amount above the base energy payments to ensure that the unit remains operational and available; these generators are subject to some form of penalty if the unit is not available as provided for under the market rules or specific RMR contract.

implementation of day-ahead markets, virtual bidding,[15] nodal pricing,[16] and separate capacity markets.

Energy-Only Markets versus Capacity Markets

In an energy-only market, load serving entities purchase energy on an hourly basis (even if secured or scheduled on a day-ahead or forward basis), and are generally also required to cover minimum ancillary services requirements, including voltage support, regulation, and spinning or non-spinning reserves. These load-serving entities are not obligated to secure capacity to cover their projected peak loads going forward, and generators can only recover their capital costs through payments for hourly energy and ancillary services.

In markets with capacity-based payments, load serving entities are responsible for procuring capacity (including adequate reserves) to cover their peak loads. In the Northeast, capacity prices are set through forward capacity markets, and while generators receive the benefit of a more predictable revenue stream, they must also accept certain obligations to ensure that their unit is available and offered into the energy market when needed, or face penalties for failure to do so.

Reliability Oversight by FERC, NERC and Regional Entities

In 1968, following the extensive 1965 blackout in the Eastern United States and Canada, members of the electric utility industry formed a voluntary council (NERC)[17] to coordinate regional planning for the industry and develop operating

[15] A form of transaction where buyers and sellers place trades based on differences between day-ahead prices and real-time prices. Virtual bidding is intended to improve market efficiency as real-time and day-ahead prices converge.

[16] Nodal pricing uses the locational marginal price (LMP, or the cost of supplying the next megawatt of load) at each specific electric location or bus. In a completely unconstrained system, the nodal price will be the same at each node on the system. When transmission constraints occur, the nodal price will reflect the cost of dispatching generating units out of economic merit order in order to serve load within the constrained area. Nodal pricing allows for separate energy prices at each bus, while zonal pricing sets a locational price for much larger, pre-established zones.

[17] The council was originally named the National Electric Reliability Council, but the name was later changed to North American Electric Reliability Council to reflect Canadian

guides and voluntary standards and practices to protect the reliability of the interconnected system.[18] While efforts were undertaken in the 1990s to require adherence to NERC reliability policies and guidelines, mandatory reliability standards were not adopted in the United States until Congress passed the Energy Policy Act of 2005 (EPAct 2005). That act required FERC to certify an independent Electric Reliability Organization (ERO) tasked with developing and enforcing such mandatory reliability standards.[19]

Pursuant to EPAct 2005, FERC certified NERC as the ERO on July 20, 2006.[20] Under implementation procedures adopted by FERC, NERC is permitted to delegate a portion of its responsibilities for enforcement and for regional standards development to Regional Entities, which NERC in turn oversees. NERC has provided such delegated authority to eight Regional Entities in the United States and Canada, each of which has primary authority for enforcement in the regions shown below.[21]

---

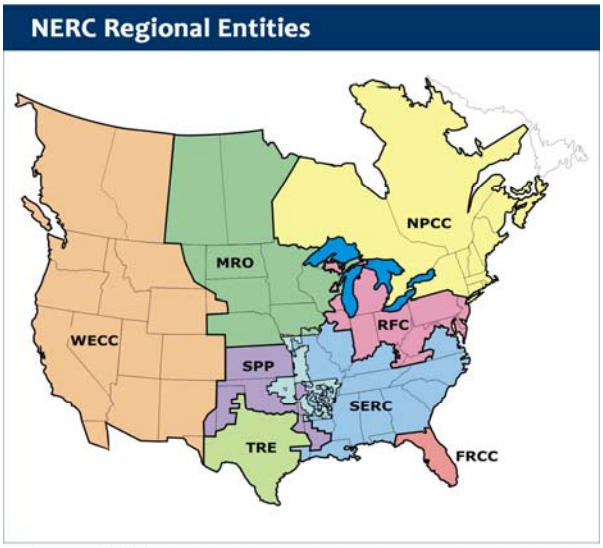
member participation, and changed again to North American Electric Reliability Corporation in 2007 to reflect its new role as the independent Electric Reliability Organization. *See NERC Company Overview: History*, http://www.nerc.com/page.php?cid=1|7|11.

[18] Responsibility for the voluntary standards and operating guidelines was originally given to the North American Power Systems Interconnection Committee (NAPSIC, formed earlier in the 1960s). NAPSIC later became part of NERC. *Id.*

[19] *See* Energy Policy Act of 2005, Pub. L. No. 109-58. The renewed efforts to adopt mandatory reliability standards that prompted this section of the Energy Policy Act came in response to the Northeastern blackout of August 14, 2003, and to the recommendations made in a report prepared by a joint US-Canada task force that reviewed the causes of the blackout. *2003 Blackout Report* at 3 (adopting as its first recommendation: "Make reliability standards mandatory and enforceable, with penalties for noncompliance.")

[20] *N. Am. Elec. Reliability Corp*. 116 FERC ¶ 61,062 (2006).

[21] The eight Regional Entities operating under delegated authority from NERC are Florida Reliability Coordinating Council, Midwest Reliability Organization, Northeast Power Coordinating Council, ReliabilityFirst Corporation, SERC Reliability Corporation, Southwest Power Pool Regional Entity, Texas Reliability Entity, and Western Electric Coordinating Council.



Source: NERC

Under Section 215 of the Federal Power Act, NERC must submit its proposed Reliability Standards to FERC for approval before they may become mandatory and enforceable. In order to approve a Reliability Standard, FERC must find that it is just, reasonable, not unduly discriminatory or preferential, and in the public interest, after giving due weight to the technical expertise of the ERO.[22] In addition, while the ERO has the authority to propose a penalty for violation of a Reliability Standard following notice and opportunity for a hearing, that penalty may only take effect after it has been filed with FERC. FERC can exercise the option to review, set aside, or modify the penalty, on its own motion or on application by the entity subject to the proposed penalty.[23] FERC also has the authority, on its own motion or on complaint, to order compliance with a Reliability Standard or to impose a penalty for violation of a Reliability Standard.[24]

In Order No. 693, FERC approved the first set of 83 Reliability Standards, which became enforceable on June 18, 2007.[25] NERC maintains a Compliance

[22] 16 U.S.C. § 824o(d)(1) and (2).

[23] *Id*. at § 824o(e)(1) and (2).

[24] *Id.* at § 824o(e)(3).

[25] NERC and the Regional Entities may assess penalties for non-compliance with the Reliability Standards. In order for such a penalty to take effect, NERC must file a notice of penalty with FERC. Each penalty determination is subject to FERC review. In the absence of an application for review or action by FERC, each penalty filed by NERC is affirmed by operation of law after 30 days.

Registry that identifies all entities subject to compliance with the approved Reliability Standards. Users, owners and operators of the bulk power system are required to register with NERC under the appropriate functional categories, and each Reliability Standard designates each category of entity to which it applies. Currently, there are over 1900 registered entities subject to the Reliability Standards (a number of entities are counted more than once as they are registered under more than one category). The categories of registered entities are set out in the appendix entitled "Categories of NERC Registered Entities."

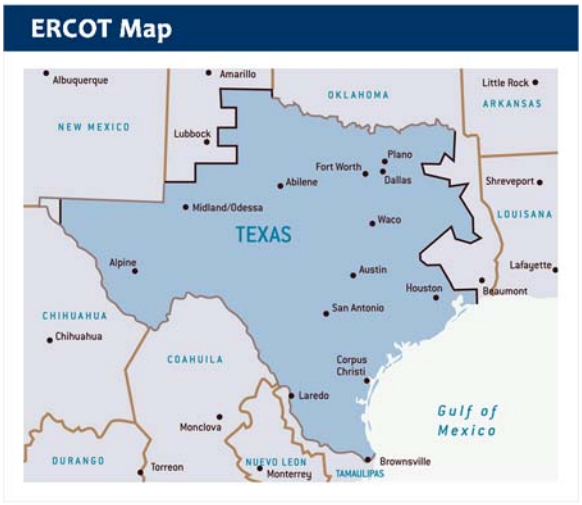
Registered entities are required to report the occurrence of defined bulk power system disturbances and unusual occurrences to the appropriate Regional Entity and to NERC. The Regional Entity and/or NERC in turn undertakes various levels of analysis to determine the causes of the events, assure tracking of corrective actions to prevent recurrence, gather information needed to assess compliance, and provide lessons learned to the industry. The event analysis process also provides input for training and education, reliability trend analysis efforts and Reliability Standards development, all of which support continued reliability improvement. Under NERC's field trial of its event analysis program, the February 2 and February 3 event was classified as a category 4 event due to the overall significance and impact of the event (loss of over 5,000 MW but less than 10,000 MW of load or generation). Based on the scope of the needed analysis, and the fact that it impacted multiple regions, NERC determined that the event review should be coordinated at the NERC level.

Southwest Electricity Markets, Pools and Reserve Sharing Groups

The Southwest contains two ISO/RTOs (ERCOT and SPP), and a number of vertically integrated utilities that are located within the WECC region. These are described below.

ERCOT

The Electric Reliability Council of Texas (ERCOT) is an ISO that covers approximately seventy-five percent of the landmass within Texas, excluding the El Paso area, part of the northern panhandle, and part of the region east of Houston. ERCOT manages access to the transmission system within its footprint and operates the Texas energy and ancillary services markets (it does not have a capacity market).



Source: ERCOT

ERCOT schedules power over 40,500 miles of transmission lines and is responsible for the dispatch of more than 550 generating units.[26] It was founded in 1970 as one of the NERC regional reliability coordination councils, and is currently the registered balancing authority for 85 percent of the electric load in Texas.[27] When it became an ISO in 1996 it undertook a number of new responsibilities, including operation of the wholesale competitive electricity market. When Texas restructured its electric industry in 2002, implementing customer choice for most retail customers and requiring divestiture of generation by IOUs, ERCOT also undertook administration of customer switching for those retail customers in Texas that can choose their electric service provider.

ERCOT is a summer-peaking region, and experienced its highest peak demand to date (68,294 MW) on August 3, 2011. Generation in ERCOT is fairly diverse in terms of fuel sources. Natural gas represented the highest percentage of installed capacity in 2009 (at 59 percent), but coal and nuclear power combined to provide over 50 percent of the energy produced for that year. [28]

ERCOT operates as a functionally separate interconnection, although it has five asynchronous ties with other interconnections.[29] Three of the ties allow

[26] For ERCOT background, *see generally* ERCOT 2009 Annual Report, *available at* http://www.ercot.com/content/news/presentations/2010/2009%20ERCOT%20Annual%20Report.pdf.

[27] ERCOT is also registered in NERC's Compliance Registry as an interchange authority, planning authority, reliability coordinator, resource planner, and transmission service provider. In addition, it also partners with other transmission operators in Texas and in that capacity is listed as a "coordinated functional registration."

exchanges with Mexico (through the Comisión Federal de Electricidad, or CFE): the Laredo Variable Frequency Tie, the South Tie (also called Eagle Pass), and the Railroad Tie, the latter located near McAllen, Texas. Two of the ties allow exchanges with the Eastern Interconnection through SPP: the North Tie, located near Oklaunion, Texas, and the East Tie, located near Mt. Pleasant, Texas. The maximum amount of energy that can be imported on all the ties is 1090 MW (approximately 2.3 percent of ERCOT's 2010/2011 forecasted winter peak), with most of that attributable to the ties to the Eastern Interconnection.[30]

ERCOT originally employed a zonal market design, under which the region was divided into pricing zones and all generators within a zone received the same price for the power they provided. It shifted to a nodal market design in December 2010, under which prices are assessed at points (nodes) where electricity enters or leaves the grid. The settlement price at each node is referred to as the locational marginal price (LMP). A nodal market design allows for more precise price signals and greater dispatch efficiencies than a zonal market design, and permits direct assignment of congestion costs through the more granular locational marginal prices.

Under its previous zonal market, ERCOT had no day-ahead energy market (although ancillary services were procured on a day-ahead basis to ensure sufficient capacity would be available). Under its current nodal market, ERCOT has a day-ahead energy market, which is co-optimized with ancillary services.

ERCOT has an energy-only market, as opposed to both an energy market and a capacity market. Capacity markets are used to address resource adequacy concerns; typically, a planning reserve margin is established to maintain reliability goals, and the ISO/RTO imposes capacity obligations on load-serving entities that are met through bilateral contracting or a centralized capacity market. In contrast, an energy-only market relies on energy price signals to spur investment in new generation. Thus, by design, ERCOT's energy-only market would be expected to

---

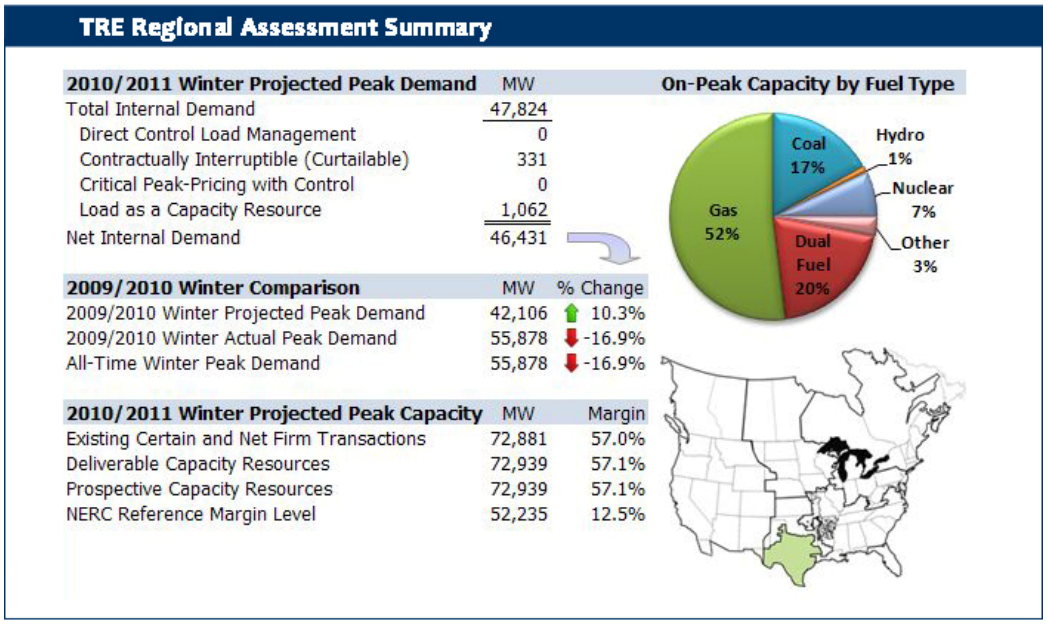
[28] ERCOT reported the following percentage fuel mix of installed capacity in 2009, in declining order: (1) natural gas, 59 percent; (2) coal, 22 percent; (3) wind, 11 percent; (4) nuclear, 6 percent; and (5) hydroelectric and biomass, 2 percent. ERCOT reported the following percentages for energy produced for 2009: (1) natural gas, 42 percent; (2) coal, 37 percent; (3) nuclear, 14 percent (4) wind, 6 percent; and (5) hydroelectric and biomass, 1 percent. ERCOT 2009 Annual Report at 2.

[29] Four are DC interties and one is a variable frequency transformer (VFT) inter-tie.

[30] The maximum MW that can be imported on each of the ties (actual limits may vary based on real-time conditions) is as follows: North, 210 MW; East, 600 MW; South/Eagle Pass, 30 MW; Railroad, 150 MW; and Laredo, 100 MW.

result in higher prices during times of scarcity and produce more volatile prices in general than do dual energy and capacity markets. These price signals are intended to encourage investment in energy resources, such as new generation plants, demand response, and energy efficiency, to meet growing demand.

NERC's regional assessment summary for TRE, which includes the ERCOT control area, for the winter of 2010/2011 is presented in the following chart.[31]



Source: NERC Winter Reliability Assessment 2010/2011

WECC Region and Southwest Reserve Sharing Group

WECC is the largest geographically of the eight NERC Regional Entities, with responsibility for coordinating and promoting system reliability throughout the Western Interconnection. WECC's service territory covers Alberta and British Columbia, the northern part of Baja California in Mexico, and all the states in between, constituting an area of about 1.8 million square miles.

WECC's bulk power system generally transfers energy over long transmission lines from remotely located generators to load centers. The lack of redundant transmission facilities demands a high level of operational scrutiny in order to maintain correct voltages and power flows on the many stability limited transmission paths that exist in the Western Interconnection.

[31] NERC 2010/2011 Winter Reliability Assessment, *available at* http://www.nerc.com/files/2010_Winter_Assessment_Final_Posted.pdf.

WECC has registered 34 balancing authorities;[32] 52 transmission operators, and 3 reserve sharing groups. The California Independent System Operator (CAISO) is the only balancing authority in the Western Interconnection that operates as an ISO or RTO.

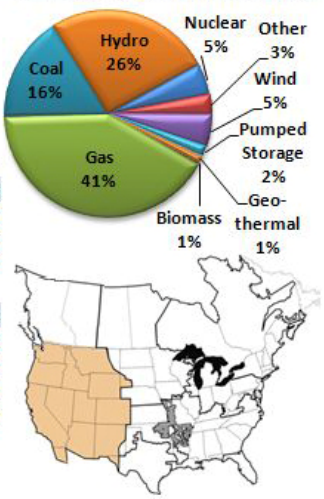
NERC's regional assessment summary for WECC for the winter of 2010/2011 is presented in the following chart.[33]

WECC Regional Assessment Summary

2010/2011 Winter Projected Peak Demand	MW
Total Internal Demand	104,424
Direct Control Load Management	571
Contractually Interruptible (Curtailable)	1,814
Critical Peak-Pricing with Control	25
Load as a Capacity Resource	30
Net Internal Demand	101,984

2009/2010 Winter Comparison	MW	% Change
2009/2010 Winter Projected Peak Demand	108,132	-5.7%
2009/2010 Winter Actual Peak Demand	109,565	-6.9%
All-Time Winter Peak Demand	113,605	-10.2%

2010/2011 Winter Projected Peak Capacity	MW	Margin
Existing Certain and Net Firm Transactions	157,290	54.2%
Deliverable Capacity Resources	159,282	56.2%
Prospective Capacity Resources	159,282	56.2%
NERC Reference Margin Level	116,874	14.6%



Source: NERC Winter Reliability Assessment 2010/2011

Two of the entities that experienced rolling blackouts during the February event, SRP and EPE, are located in the WECC region. SRP, one of Arizona's largest utilities, is vertically integrated and a subdivision of the State of Arizona. Serving over 933,500 retail customers, SRP's eleven main generating stations, combined with numerous smaller facilities, have a peak retail load of over 6400 MW, and serve a 2,900 square mile area. SRP is registered with NERC for all bulk power system functions except interchange authority, reliability coordinator, and reserve sharing group.

[32] NERC defines "balancing authority" as the responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within the BA area, and supports interconnection frequency in real-time.

[33] NERC 2010/2011 Winter Reliability Assessment.

EPE is a vertically integrated electric utility providing generation, transmission, and distribution service in west Texas and southern New Mexico. EPE serves approximately 372,000 customers over a 10,000 square mile service territory via five major generating stations, including three stations local to El Paso, Texas. It has a native peak load of 1616 MW. Like SRP, EPE is registered with NERC for all bulk power system functions except interchange authority, reliability coordinator, and reserve sharing group.

Both SRP and EPE participate in the Southwest Reserve Sharing Group (SRSG), which provides for the sharing of contingency reserves among its participants pursuant to a Participation Agreement. SRSG was formed in 1998 as the successor to an earlier pool, and has participants in Arizona, New Mexico, southern Nevada, part of southern California and El Paso, Texas. SRSG is a NERC Registered Entity, and administers certain requirements related to disturbance control and emergency operations standards. Its participants are obligated to carry reserves in accordance with a contractual formula, and to provide power within a certain time frame to other participants experiencing a disturbance on their systems.

Southwest Power Pool

SPP is both an RTO and a NERC Regional Entity responsible for the enforcement of Reliability Standards within its region. SPP had its origins in 1941, when eleven regional power companies formed the pool in order to ensure sufficient electric service to aluminum plants needed for the war effort. The pool remained intact after the war and was a founding member of NERC in 1968. SPP implemented operating reserve sharing arrangements among its members in 1991, and became a FERC-approved RTO in 2004.

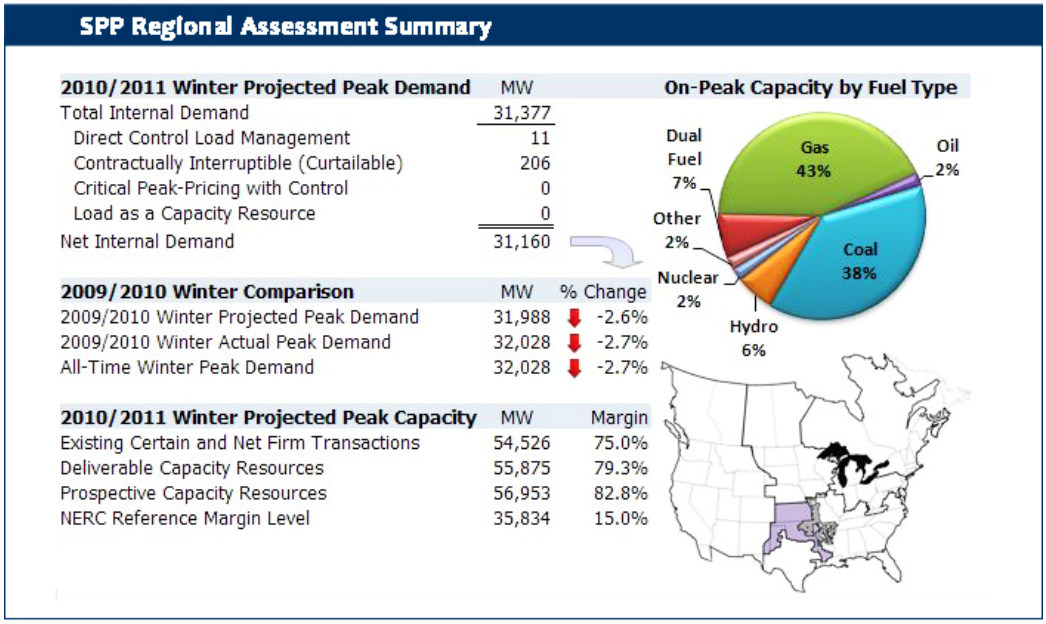
SPP covers a 370,000 mile area that includes all or portions of nine states: Nebraska, Kansas, Oklahoma, Missouri, Arkansas, Louisiana, Texas, New Mexico, and Mississippi.[34] SPP operates 48,930 miles of transmission lines, and has a coincident peak demand within its reliability coordinator[35] footprint of approximately 55,000 MW.

[34] SPP actually has five "footprints," with differing membership and oversight functions, as (1) a NERC Regional Entity; (2) a reserve sharing group; (3) a reliability coordinator area (29 balancing authorities and transmission owners, including certain balancing authorities in SERC and the Midwest Reliability Organization); (4) an RTO (with 15 balancing authorities); and (5) an energy imbalance services (EIS) market region (with 15 balancing authorities). *See* http://www.spp.org/section.asp?pageID=28 (last visited Aug. 2, 2011).

[35] NERC defines "reliability coordinator" as the entity that is the highest level of authority responsible for the reliable operation of the bulk power system, has the wide area view

At present, SPP's market operations are relatively limited, currently allowing participants to buy and sell energy in real time and to settle out any energy scheduling imbalances based on the real-time market price. SPP does not currently operate a separate market for reserves but is working to implement a new integrated marketplace that includes a day-ahead energy and operating reserves market.[36]

NERC's regional assessment summary for SPP for the winter of 2010/2011 is presented in the following chart.[37]



Source: NERC Winter Reliability Assessment 2010/2011

---

of the bulk power system, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The RC has the purview that is broad enough to enable the calculation of interconnection reliability operating limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.

[36] Unlike California, Texas, and the Northeast, most of the states SPP covers have not undertaken a broad restructuring of the electric industry through retail access and/or mandatory unbundling of generation from transmission and distribution. Accordingly, most utilities operating within SPP's footprint still supply a large portion of their customers' electricity needs through their own generation and do not need to access the market to do so.

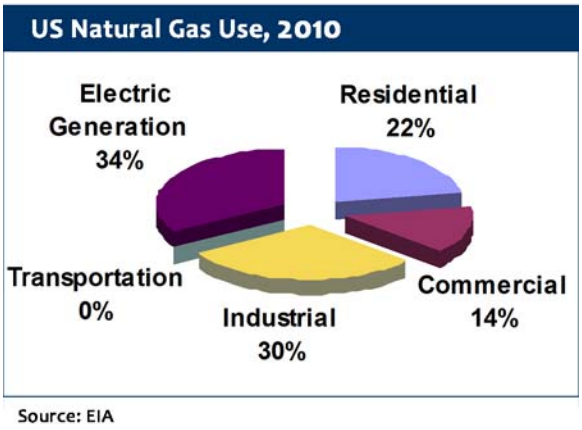
[37] NERC 2010/2011 Winter Reliability Assessment.

B. The Natural Gas Industry

This subsection provides an overview of the manner in which natural gas is produced and delivered, the jurisdictional structures applicable to the industry, and the various producers and pipelines located in the Southwest. A detailed description of the geology and physics of natural gas production and delivery can be found in the appendix entitled "Natural Gas: Production and Distribution."

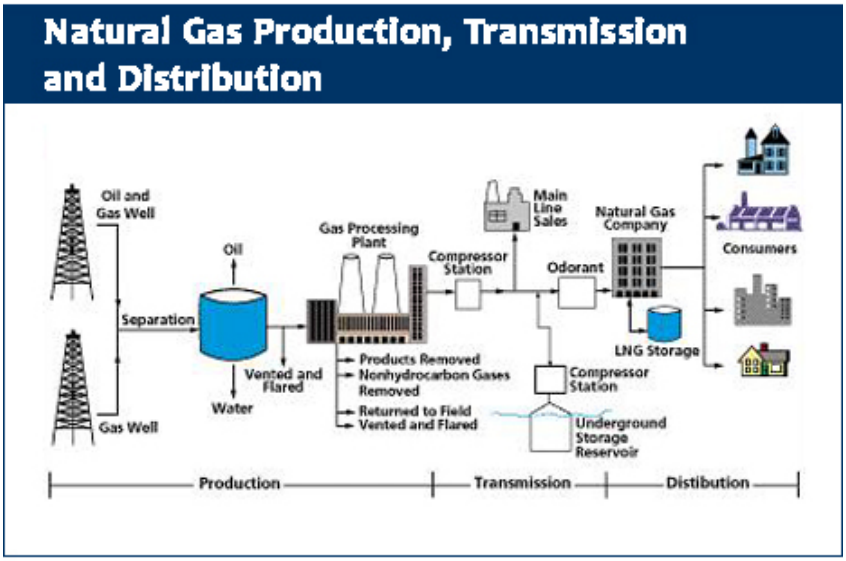
Overview of Natural Gas Production and Delivery

Natural gas is a fossil fuel, formed through the decomposition of organic matter found in underground geological formations. It is a significant source of energy representing 25 percent of the United States energy consumption. In 2010, approximately 22 percent of gas consumption was used for residential heating and cooking, 14 percent for commercial use, 30 percent for industrial processes, 34 percent for electric generation, and less than one percent for transportation.[38]



The delivery framework for natural gas includes production, separation of fluids at or near producing wells, natural gas liquids (NGL) processing, pipeline transmission, storage, and finally distribution by an LDC. The following chart is a simplified schematic of this framework.

[38] EIA, *Natural Gas Consumption by End Use*, http://www.eia. gov/dnav/ng/ng_cons_sum_dcu_nus_a.htm (last visited Aug.27, 2011).

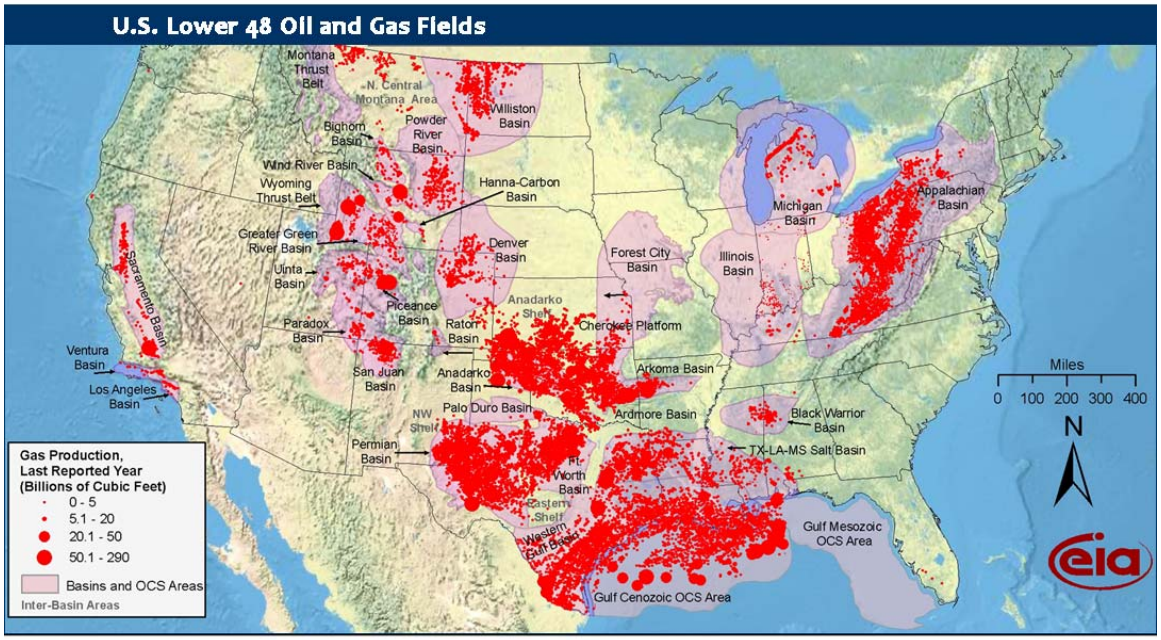


Source: EIA

Natural gas is often produced in locations distant from demand centers. The Energy Information Agency estimates that in 2009 there were 493,100 gas wells in the United States. The majority of these wells were located in the Gulf Coast, Southwest and the Appalachian Basin. The five states with the largest number of wells that year were Texas, 93,507; Pennsylvania, 57,356, West Virginia, 50,602; New Mexico, 44,784, and Oklahoma, 43,600.[39] The following chart shows production basins and the concentration of reported natural gas production.[40]

[39] EIA, *Natural Gas, Number of Producing Wells*, http://www.eia.doe.gov/dnav/ng/ng_prod_wells_s1_a.htm (last visited Aug.2, 2011).

[40] EIA, *Gas Production in Conventional Fields*, http://www.eia.gov/oil_gas/rpd/conventional_gas.pdf (last visited Aug. 2, 2011).



Source: EIA based on data from HPDI, IN Geological Survey, USGS, April 8, 2009

Major oil companies and large independent companies account for a substantial portion of the gas production in the United States. In the first half of 2009, the five largest producers and their daily production were as follows: BP, Inc, 2.33 Bcf per day; Anadarko Petroleum Corporation, 2.33 Bcf per day; XTO Energy, Inc., 2.29 Bcf per day (acquired by ExxonMobil in 2010); Chesapeake Energy Corporation, 2.21 Bcf per day; and Devon Energy Corporation, 2.13 Bcf per day. These producers together accounted for approximately 20 percent of United States production.[41]

In the Southwest, production takes place at the many thousands of wellheads located throughout the basins. The wellhead consists of equipment on top of the well that is used to manage flows of oil and gas, often produced together, arising from the underground formations. The high pressure gas in formations is lighter than air and will often rise on its own through the wellhead to surface pipes. In other gas wells, as well as oil wells with associated natural gas, flow requires lifting equipment. Typical lifting equipment consists of the "horse head" or conventional beam pump. The pumps are recognizable by the distinctive shape of the cable feeding fixture, which resembles a horse's head.[42] They are

[41] Reuters, http://www.reuters.com/article/2009/12/14/xto-exxon-natgas-producers-idUSN1420089920091214; and EIA, http://www.eia.gov/dnav/ng/ng_prod_sum_a_EPG0_FPD_mmcf_a.htm. "Bcf" refers to a billion cubic feet.

[42] *Well Completion*, NATURALGAS.ORG, http://www.naturalgas.org/naturalgas/well_completion.asp (last visited Aug. 2, 2011).

often called "pumpjacks" and are seen throughout west Texas and southeastern New Mexico. The following two photographs are of a wellhead and a pumpjack.

Wells and lift equipment are monitored on a daily basis and maintained by oil and gas company employees, who are often referred to as "pumpers" or "gaugers." Their responsibilities include reporting malfunctions and spills, and ensuring that field processing equipment is operational and that production is correctly measured. Onshore gaugers may drive many miles per day to monitor dozens of wells.

Processing Natural Gas

The natural gas used by consumers consists almost entirely of methane. However, produced gas often contains other hydrocarbons such as ethane, propane, butane, pentanes and liquids such as condensates. It may also include water vapor, hydrogen sulfide (H_2S), carbon dioxide, helium, nitrogen, and other compounds. Some field processing occurs near production wells to remove the water and condensates, but complete processing usually occurs at a gas processing plant. Natural gas processing plants remove other hydrocarbons to produce what is known as "pipeline quality" dry natural gas that meets the heating content and other restrictions necessary for the safe operation of pipeline and distribution company facilities. The removed hydrocarbon NGLs are sold separately.

Natural gas is transported to processing plants[43] typically through small-diameter and low-pressure gathering pipelines. There were an estimated 20,552

[43] More than 500 processing plants operated in the United States in 2004 with 166, or over 31 percent, in the state of Texas. EIA, *Natural Gas Processing: The Crucial Link Between Natural Gas Production and Its Transportation to Market*, (Jan. 2006), http://dnr.louisiana.gov/assets/docs/oilgas/productiondata/ngprocess_20060131.pdf.

miles of gathering system pipelines in the United States in 2009.[44]

After gathering and processing, interstate and intrastate transmission pipelines transport gas to LDCs (as well as to directly attached users such as power plants). Within the United States, the pipeline network delivers gas to 65 million residential, commercial, industrial, and power generation customers. It includes at least 210 gas pipeline systems with a total of more than 300,000 miles of transmission pipelines.[45] The pipeline system also includes more than 1,400 compressor stations, 11,000 delivery points, 5,000 receipt points, and 1,400 interconnection points.[46]

Pipeline companies monitor and control gas flow with computerized supervisory control and data acquisition (SCADA) systems, which provide operating status, volume, pressure, and temperature information. In addition to real-time monitoring, the SCADA system may enable a pipeline to start and stop some facilities remotely.[47]

The following map shows the breadth and integrated nature of the natural gas transmission grid.[48]

Source: EIA, Office of Oil & Gas, Natural Gas Division, Gas Transportation Information System

To meet higher gas demand at various times of the year, gas is stored underground in depleted oil and gas reservoirs, aquifers or caverns formed in salt beds.[49] Storage facilities may be interstate and regulated by FERC, or intrastate and non-jurisdictional. There are over 390 underground storage facilities in the United States,[50] of which approximately 205 are under FERC jurisdiction.[51] Depleted oil and gas reservoirs account for 87 percent of the total FERC jurisdictional storage capacity, with salt caverns (3 percent) and aquifers (10 percent) accounting for the rest.[52] A detailed discussion of the types of storage facilities and their characteristics is included in the appendix entitled "Natural Gas Storage."

[52] http://www.ferc.gov/industries/gas/indus-act/storage/fields.asp.

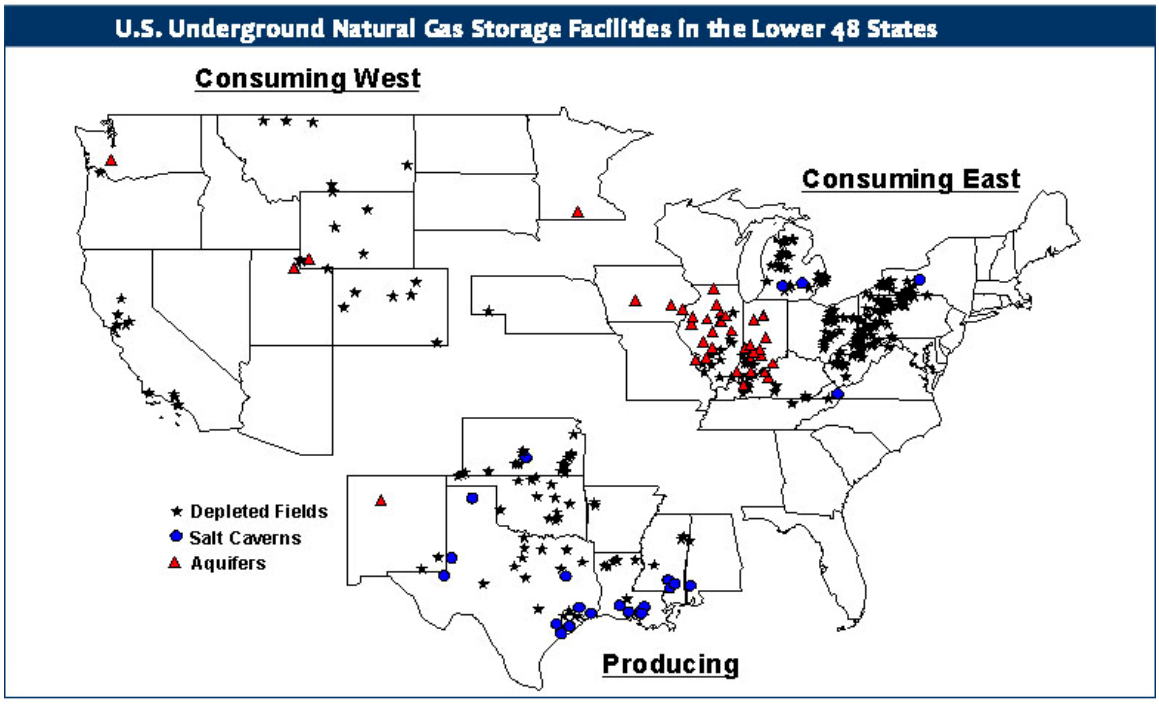
Gas Storage Facilities

- Depleted reservoirs consist of porous and permeable underground formations (average of 1,000 to 5,000 feet deep). The gas is divided into two categories, working or top gas, which can be withdrawn, and cushion or base gas, needed as permanent inventory to maintain adequate reservoir pressure and deliverability rates. Gas is generally withdrawn in the winter heating season and injected during the summer, although the demand for gas in summer months is increasing due to an increase in gas-fired generating plants. This type of storage facility can be used for both system supply and peak day demand.

- Aquifer storage fields are bounded partly or completely by water-bearing rocks. They have a high cushion gas requirement, generally between 50 to 80 percent. They also have high deliverability rates and, similar to depleted reservoirs, gas is generally withdrawn in the winter season and injected in the summer season.

- Salt cavern facilities use solution mining to recover minerals in underground salt deposits (salt domes or salt formations). Salt caverns usually operate with only about 20 to 30 percent cushion gas. Working gas can be recycled multiple times per year. Salt cavern storage has high deliverability and injection capabilities and is used for short peak day deliveries. Salt caverns are more expensive to construct due to the increased capital cost associated with leaching and mining the salt.

The following figure shows the location of United States storage facilities.[53]



Natural Gas Regulation

Natural gas production is not comprehensively regulated, and no government agency monitors daily production activity. However, some aspects of production are subject to regulation; gas-producing states monitor well drilling and permitting, and in Texas, for instance, the TRC has jurisdiction over oil and gas wells located in the state and over persons owning or engaged in drilling oil and gas wells located in the state.[54] Congress deregulated the price on natural gas at the wellhead.[55] FERC does not regulate natural gas producers, but does provide

[53] EIA, *The Basics of Underground Storage*, http://www.eia.gov/pub/oil_gas/natural_gas/analysis_publications/storagebasics/storagebasics.html.

[54] Among the matters covered by the TRC are space and density of drilling; prevention of waste; approval of water flood permits; location exceptions; intrastate pipelines; environmental and safety aspects of production, including well plugging; regulation of the injection of carbon dioxide into reservoirs; and maintenance of well records including logs, maps and production reporting. Jack M. Wilhelm, Texas Land Institute, *What Every Landman Should Know about the Railroad Commission of Texas* (2005), *available at* http://blumtexas.tripod.com/sitebuildercontent/sitebuilderfiles/wilhelm.pdf.

[55] Natural Gas Wellhead Decontrol Act, Pub L. No. 101-60, 103 Stat. 157 (1989).

that producers have not unduly preferential or discriminatory access to transportation on jurisdictional pipelines, and that no undue treatment bias is exercised with respect to transportation services and gas quality standards. Retail natural gas sales to consumers are regulated by state public utility commissions, not by FERC.

FERC's jurisdiction over the transportation of natural gas,[56] which also includes the provision of natural gas storage services, begins when the gas is delivered to an interstate pipeline and continues until the gas is delivered to the wholesale purchaser, absent some intervening transaction which renders the activity exempt from federal jurisdiction under the Natural Gas Act (NGA) or the Natural Gas Policy Act of 1978 (NGPA). While generally the activities of intrastate pipelines and LDCs are exempt from FERC jurisdiction, when those entities engage in the transportation of natural gas in interstate commerce or the wholesale sales for resale of natural gas, their activities are subject to FERC jurisdiction.

FERC's responsibilities include:

- Issuance of certificates of public convenience and necessity to construct and operate interstate pipeline and storage facilities, and oversight of the construction and operation of pipeline facilities at United States points of entry for the import or export of natural gas.
- Regulation of transportation and sales for resale in interstate commerce that are not first sales.
- Regulation of the transportation of natural gas as authorized by the NGPA and the OCSLA (Outer Continental Shelf Lands Act).
- Regulation of liquefied natural gas facility siting.
- Regulation of the abandonment of jurisdictional facilities and services.
- Establishment of rates and terms and conditions for jurisdictional services.

Pipelines publish FERC-approved tariffs that pertain to services, terms of conditions and rates for gas transportation. The North American Energy Standards Board (NAESB) provides business standards for the pipelines in areas such as the scheduling of pipeline transportation.

[56] FERC also has NGA jurisdiction over sales for resale of natural gas that are not deemed first sales. A first sale does not include the sale by an interstate pipeline, intrastate pipeline, or LDC, or affiliate thereof, unless such sale is attributable to volumes of their own production.

Most interstate pipelines no longer offer sales services. The two broad categories of transportation service on an interstate pipeline are firm and interruptible transportation, subject to specified exceptions such as force majeure clauses. (The pipeline companies sell transportation, not the gas itself, which almost always is purchased separately from the producer by the shipper.) Firm transportation is characterized by a reservation of capacity. Shippers customarily pay a charge for the reservation of guaranteed capacity rights on the pipeline and a separate usage charge; pipeline firm rates thus include cost recovery of pipeline facilities in addition to recovery of variable transportation costs such as fuel. Interruptible service rates are usage charges that are derived from the firm service rates. There is no reservation of capacity under interruptible service, and capacity is provided to a shipper only to the extent it is available.[57]

Prior to the deregulation of wellhead gas prices and open access transportation established under Commission Order No. 436 in 1985 and Order No. 636 in 1992, producers typically sold gas to both intrastate and interstate pipelines; these entities in turn sold the gas to LDCs that delivered the gas to end users. With the issuance in 1992 of Order No. 636, the Commission required interstate pipelines to unbundle their services to separate the transportation of gas from the sale of gas. Thus, today most interstate pipelines do not engage in the buying and selling of natural gas except for operational purposes.

Order No. 636 further required interstate pipelines to set up informational postings to show available pipeline capacity and to ensure that all participants have access to available capacity. Additionally, holders of the firm capacity can, through capacity release, resell those rights on a temporary or permanent basis.

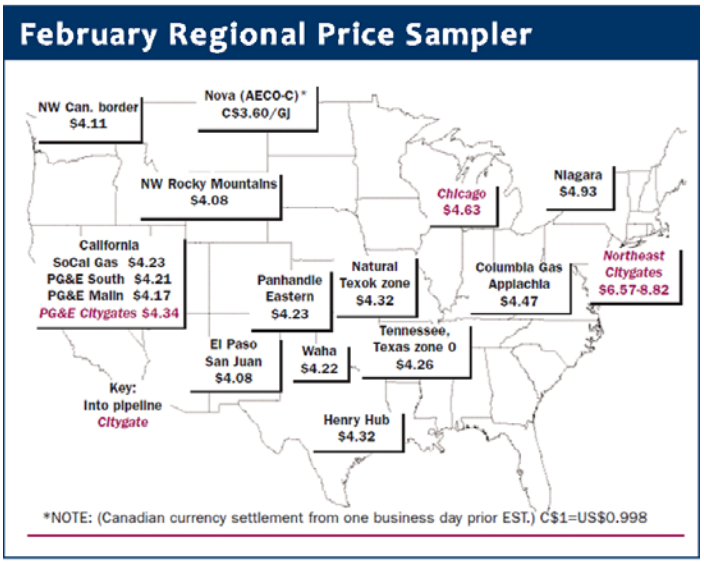
Natural Gas Marketing

Natural gas marketing mushroomed after the opening of access to pipeline capacity. Producers and marketers, in conjunction with the deregulation of wellhead gas, were granted blanket authorization to make sales at market rates. Marketers may now be affiliates of producers, pipeline companies, or local utilities, or be separate business entities unaffiliated with any other industry players. Marketers may also be associated with financial institutions. Marketing natural gas typically includes ensuring secure supplies and arranging for pipeline

[57] Pipeline Knowledge and Development, *The Interstate Natural Gas Transmission System: Scale, Physical Complexity and Business Model* (August 2010), *available at* www.ingaa.org/File.aspx?id=10751.

transportation, storage and accounting. Marketers also trade financial instruments to hedge commodity price risk and to speculate.[58]

For illustrative purposes, the following map depicts the February 2011 price for some regional gas trading hubs.[59] Waha and El Paso San Juan, shown on the map, are trading prices respectively applicable to the San Juan and Permian Basins. These two basins are important Southwest supply areas and figured prominently in the weather event of February 1-5.



Source: Platts Inside FERC's Gas Market Report February 2011

LDCs often make the final sale and transfer of gas to retail consumers. Unlike the interstate pipeline companies, many LDCs provide bundled sales and delivery services, although some may provide delivery services only. Many commercial and industrial customers contract for their own supply and purchase only transportation service from the LDC. There are more than 1,200 LDCs in the United States. LDCs can be stand-alone gas utilities, combination electric-gas utilities, or parts of integrated energy companies. The largest LDC is Southern California Gas Company (SoCalGas) with more than 20 million customers, followed by Pacific Gas and Electric Company and Atmos Energy Corporation.

[58] *Natural Gas Distribution*, NATURALGAS.ORG., http://www.naturalgas.org/naturalgas/marketing.asp (last visited Aug. 2, 2011).

[59] PLATTS INSIDE FERC'S GAS MARKET REPORT (Feb. 2011). Reprinted with permission of Platts.

Natural gas distribution companies typically deliver smaller volumes through smaller diameter pipes and at lower pressures than pipeline companies with systems that end at an individual household or place of business. Compressor stations are generally smaller than those found on the larger pipeline systems. Natural gas traveling through distribution pipelines will often be at a pressure as low as 3 psi to 0.25 psi at the customer's meter.[60]

Natural Gas Production in the Southwest

Texas and New Mexico are both prolific producers of natural gas, while Arizona has negligible production. In January 2011, Texas produced 31 percent of total United States production and New Mexico produced 6.2 percent.[61]

Texas and New Mexico contain a number of natural gas basins. The most significant of these with respect to the outages and curtailments experienced during the February cold weather event are the Permian, San Juan, and Fort Worth Basins.[62] Together, these three basins are responsible for almost 18 percent of total United States natural gas production.

The San Juan Basin straddles the Colorado and New Mexico border in the Four Corners region, and is a leading coal bed methane producing area. The basin is approximately 270 miles wide and covers over 4,000,000 acres.[63] Production is approximately 2.99 Bcf per day. The Permian Basin is located in West Texas and Southeastern New Mexico. It underlies an area approximately 250 miles wide and 300 miles long,[64] and produces on average 2.52 Bcf per day. The Fort Worth Basin contains the Barnett Shale Formation, with one of the largest producible

[60] *Natural Gas Distribution*, NATURALGAS.ORG, http://www.naturalgas.org/naturalgas/distribution.asp (last visited Aug. 2, 2011).

[61] In 2009, U.S. dry gas production was 20,580 billion cubic feet (Bcf) or 56.4 Bcf per day. Texas produced 17.5 Bcf per day on and off shore, and New Mexico produced 3.5 Bcf per day. EIA, *Natural Gas Withdrawals and Production*, http://www.eia.gov/dnav/ng/ng_prod_sum_a_EPG0_VGM_mmcf_m.htm (last visited Aug. 15, 2011).

[62] Other onshore basins in the region include East Texas, the Gulf Coast and South Texas.

reserves of any natural gas field in the United States.[65] The basin produces 4.83 Bcf per day.[66]

Gas processing companies in the San Juan, Permian and Fort Worth Basins include DCP Midstream Partners, L.P., Enterprise Products Partners L.P., Williams Partners, L.P., Southern Union Gas Services, and Frontier Energy, L.L.C.

Natural Gas Pipelines in the Southwest

Intrastate gas pipelines in Texas comprise 45,000 miles out of the 58,600 total miles of gas pipeline in the state. This intrastate network delivers much of the region's natural gas, including deliveries to many large refining and petrochemical facilities, numerous electric generating facilities, and pipeline interconnects.[67] The largest intrastate pipelines in Texas are Enterprise Texas Pipeline LLC (8,750 miles) and the Energy Transfer Partners L.P. (8,800 miles). Other large systems include Atmos Pipeline – Texas (6,162 miles) and the Kinder Morgan Pipeline's Texas Intrastate Natural Gas Group (5,900 miles). Together these pipelines provide for transmission from west Texas supply and market hubs such as Waha, and for gas production in south Texas to the Houston Ship Channel, Katy Hub, the Dallas-Forth Worth area and other markets. Intrastate pipelines have expanded significantly due to increased demand for capacity to transport natural gas from the Barnett Shale Formation in the Fort Worth Basin south to the Katy area or out of the state. The following map shows the Texas intrastate pipeline grid.[68]

[65] The Perryman Group, *Bounty from Below: The Impact of Developing Natural Gas Resources Associated with the Barnett Shale on Business Activity in Fort Worth and the Surrounding 14-County Area*, at 5 (May 2007), *available at* http://www.barnettshaleexpo.com/docs/Barnett_Shale_Impact_Study.pdf. The Barnett Shale is one of the most significant onshore natural gas fields in North America, with thousands of wells producing hundreds of billions of cubic feet of natural gas each year. Production has risen sharply over the past several years as a result of improvements in recovery techniques.

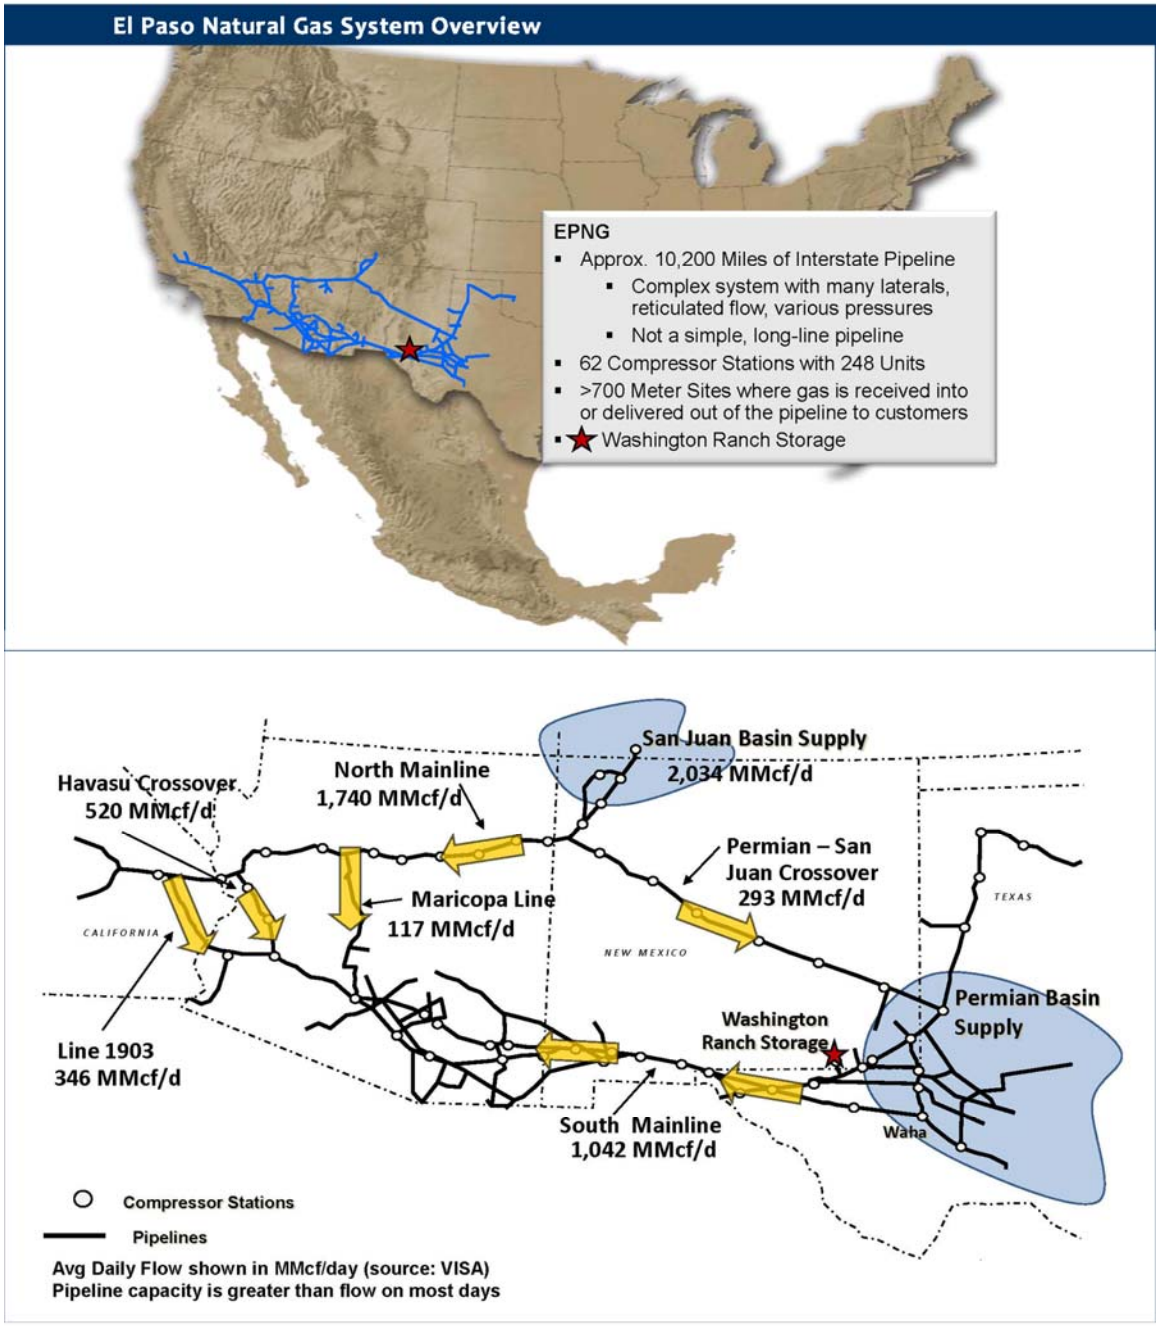
Source: Energy Information Administration

New Mexico and Arizona are supplied largely by two interstate transmission pipelines, Transwestern Pipeline Company, LLC (Transwestern) and El Paso Natural Gas Company (El Paso). These pipelines transport natural gas primarily from the San Juan and Permian Basins to the western regions of the United States. (The many other interstate pipelines that operate in Texas tend to transport gas to the Midwest and Northeast.)

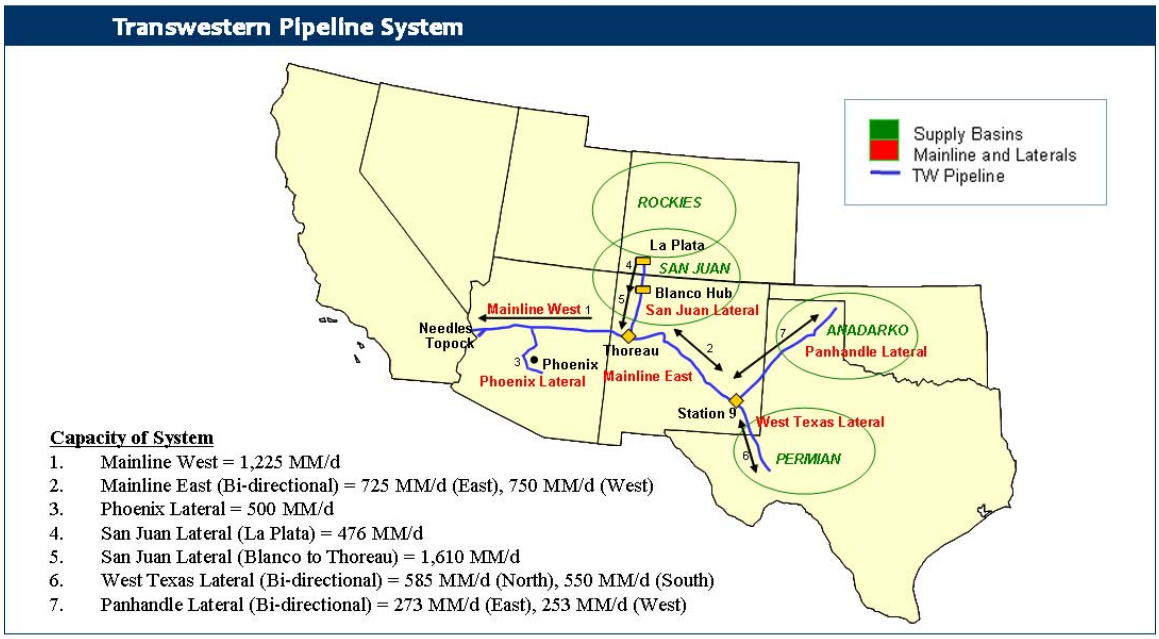
A brief description of these two interstate pipeline systems follows.

El Paso owns a transmission delivery system consisting of approximately 10,200 miles of pipeline. It is a complex, highly networked pipeline system with many laterals and interconnections, operating at a variety of flows and pressures. It includes 62 compressor stations and more than 700 meter sites where gas is delivered. It has 53 delivery meters to New Mexico Gas Company (NMGC), 216 meters to Southwest Gas Corporation (Southwest Gas), and 28 meters to Texas Gas Service. The system also includes the Washington Ranch Storage Field, one of the two storage facilities in the area between west Texas and the Arizona-California border.



Source: El Paso Natural Gas Company

Transwestern has approximately 2,700 miles of pipeline and 26 compressor stations. Its mainline capacity flowing west is 1,225 MMcf/day, and its San Juan Lateral capacity is 1,610 MMcf/day.[69]

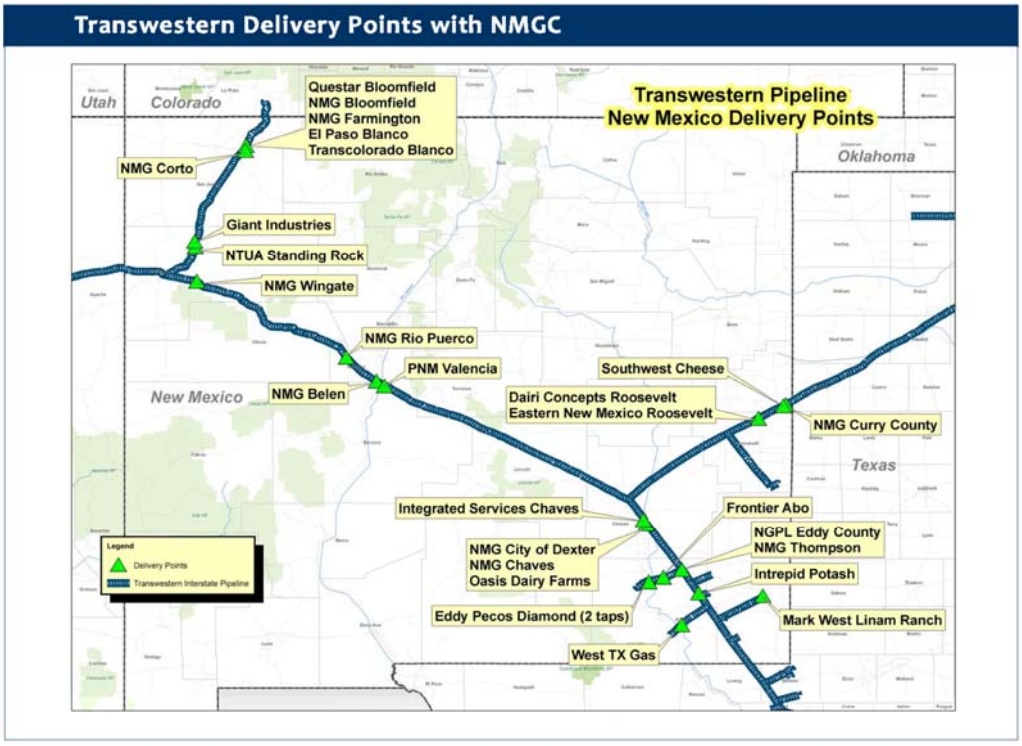


Source: Transwestern Pipeline Company, LLC

Transwestern has at least ten delivery points with NMGC.[70] In terms of flow volumes, the most significant of these during the February cold weather event was the NMG Rio Puerco, as shown in the following map.

[69] Throughout the report, MMcf refers to a million cubic feet, and Mcf to a thousand cubic feet.

[70] http://www.energytransfer.com/ops_interstate.aspx, and materials provided by Transwestern Pipeline Company, LLC to the task force.



Source: Transwestern Pipeline Company, LLC

These two pipeline companies, Transwestern and El Paso, are the interstate providers to those LDCs that experienced customer curtailments or outages in February 2011. Those LDCs are:

- New Mexico Gas Company, headquartered in Albuquerque. It provides gas service to more than 500,000 customers and maintains approximately 12,000 miles of natural gas pipelines.[71]
- Southwest Gas Corporation, providing gas service to more than 1.8 million residential, commercial and industrial customers in Arizona, Nevada and portions of California.[72]
- Texas Gas Service, the third largest natural gas distribution company in Texas. It provides gas to more than 603,000 customers in Austin, El Paso, and Rio Grande Valley areas as well as Galveston, Port

[71] New Mexico Gas Company, *About Us*, http://www.nmgco.com/about_us.aspx (last visited Aug. 2, 2011).

[72] Southwest Gas Corporation, *Profile of Southwest Gas*, http://www.swgas.com/about/aboutus/index.php (last visited Aug. 2, 2011).

Arthur, Weatherford and several communities in the Permian Basin and the Texas panhandle. [73]

- Zia Natural Gas Company, which provides gas service to over 35,000 customers in five New Mexico counties, serving primarily residential and small commercial users. In Lincoln County, where the city of Ruidoso experienced gas outages during the February event, Zia obtains gas from a direct interconnection to the El Paso Natural Gas pipeline.

Natural Gas Storage Facilities in the Southwest

There are two major natural gas storage facilities in the Southwest:

- **Washington Ranch Storage Field**, part of the El Paso system, is located in Eddy County, New Mexico, approximately nine miles southwest of Whites City. This facility has a working storage capacity of slightly more than 47.6 bcf and a maximum daily withdrawal capacity of 250,000 Mcf.

- **Chevron Keystone Storage Facility**, owned by Chevron Corporation, is located in Winkler County, in west Texas near Midland. This is a salt cavern facility with 6.38 Bcf of working gas. Its maximum daily injection capability is 200,000 Mcf and its maximum daily withdrawal capacity is 400,000 Mcf. It has interconnects to Transwestern, El Paso and the Northern Natural Gas Company's pipeline systems.

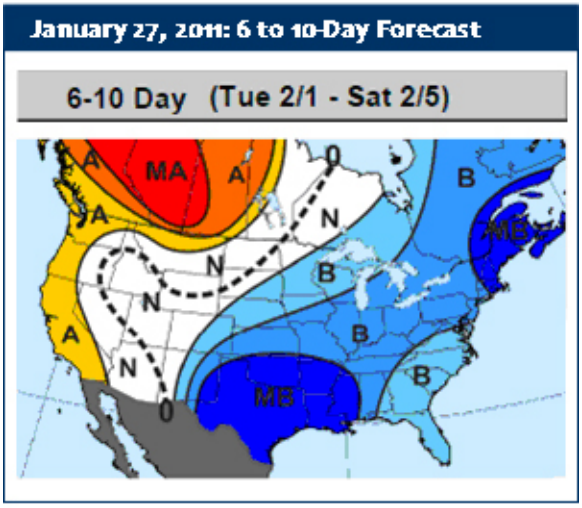
IV. Preparations for the Storm

A severe arctic cold front hit the central and northeastern United States and southern Canada on February 1, 2011, and lasted for several days. It was dubbed the "Groundhog's Day Blizzard of 2011."[74] The front was not unexpected. About a week prior to the event, long-range forecasts predicted an outbreak of very cold temperatures for the first week of February, with wind, ice, and snow from Texas to Mississippi. Arctic air was expected to extend southward to the Gulf Coast by February 2, bringing daytime highs to as low as 30 degrees below normal. Sustained winds of 20-25 mph, with higher gusts, were also anticipated.[75]



[Color legend: N is normal, B is below normal, MB is much below normal, and SB is strong below normal.][76]

[74] National Oceanic and Atmospheric Administration National Climatic Data Center (NCDC), *State of the Climate: Global Hazards for February 2011*(March 2011), http://www.ncdc.noaa.gov/sotc/hazards/2011/2#winter.

[75] Weather data used in this section is drawn from NCDC data. Raw land-based observation data was obtained at http://www.ncdc.noaa.gov/oa/land.html. Quality controlled local climatological data was obtained at http://cdo.ncdc.noaa.gov/qclcd/QCLCD?prior=N. Additional data, unless otherwise noted, is drawn from materials provided to the task force by BAs, transmission operators, generators, producers, processing plants, pipelines and LDCs.

[76] EarthSat is a private forecasting service used by many entities in the energy industry and by the Commission in connection with its market monitoring efforts.

A. Weather Conditions During the Event

Actual weather conditions between February 1 and 5, 2011 turned out to be largely as predicted by the National Weather Service's long-range forecasts. However, actual temperatures were a few degrees lower than forecasted, especially in west Texas and New Mexico. In some places, temperatures did not rise above freezing until February 4. Low temperatures in Albuquerque ranged from -7 degrees to 7 degrees over the four-day period, in Midland from 6 degrees to 12 degrees, and in Dallas from 13 degrees to 19 degrees.[77]

As the storm hit during the early morning hours of Tuesday, February 1, temperatures in the western-most cities of the Southwest plummeted dramatically. Daily highs at Albuquerque and Dallas fell 20 degrees (to 28 degrees and 39 degrees respectively) from the previous day, while at Midland the recorded high was 30 degrees, which was 43 degrees below that of the previous day. Houston's temperatures started out on February 1 at 70 degrees, but by 7:00 AM had dropped to 45 degrees.

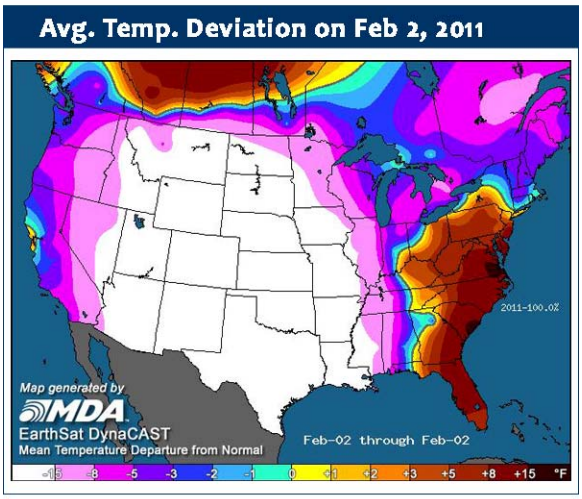
The wind profile was also changing dramatically. Wind speeds had rarely exceeded 10 mph the preceding day, but by the morning of February 1 Albuquerque was experiencing sustained wind speeds of 20 mph (representing a wind chill index of 4 degrees), with gusts to 27 mph. Winds in Midland hovered around 20 mph and gusted to over 30 mph. Light snow began falling in both cities around midnight. It was also windy in Dallas on February 1, with speeds of up to 25 mph and gusts between 20 and 40 mph.

Conditions worsened at all locations through the day, and by midnight temperatures were extremely low. Albuquerque was at 4 degrees, with continuing high winds and snow. Temperatures at Midland were 14 degrees and at Dallas 16 degrees. The cold air finally hit Houston late in the day, with temperatures of 27 degrees and winds of 14 mph, although without precipitation.

By Wednesday, February 2, early morning conditions had become severe. In Albuquerque, the temperature at 8:00 AM was 1 degree, almost 40 degrees below the average for that date, and the wind was blowing at 26 mph. Temperatures in El Paso and Midland hovered around 10 degrees for much of the day, with wind speeds of 15 mph. El Paso set a record low for the day of 6 degrees at 5:00 AM, and recorded the third coldest day in 38 years. In fact, February 2 turned out to be one of the coldest days on record in the last 25 years across the state of Texas, with average temperatures well below freezing and only

[77] All temperatures in this report are in degrees Fahrenheit.

Brownsville escaping severe conditions (with average temperatures of about 35 degrees). Significant winds accompanied the frigid temperatures, with wind chill factors dropping the perceived temperatures to -6 degrees in Dallas and 6 degrees in Austin.



Source: MDA EarthSat

On Thursday, February 3, weather conditions began to marginally improve in some areas, although in Albuquerque and El Paso it would rank as the coldest day in 38 years. Albuquerque, Midland and El Paso were still experiencing highs near 15 to 20 degrees, but the winds had begun to diminish. From Dallas to San Antonio, temperatures moderated about 5 to 10 degrees, but wind speeds remained high.

On Friday, February 4, conditions improved across the region. Temperatures in the western cities finally rose above freezing, and in a few of the eastern-most cities rose above 40 degrees. Nonetheless, during the early morning hours, El Paso hit a low of 3 degrees before reaching a high of 37 degrees, ranking the day as the city's second coldest in 38 years. Four to six inches of snow fell in the Dallas Metropolitan area, causing cancellation of more than 300 flights at Dallas airports just as fans were arriving for the Super Bowl.

Cold weather hit the region again on February 9 and February 10. The coldest temperatures were seen on February 9, when El Paso recorded a low of -2 degrees, and Midland a low of 7 degrees. Daily highs, however, were in the 30s and 40s. Other cities saw lows dip into the 20s and teens, with high temperatures rising into the 40s and 50s.

There is no question that the cold and windy weather during this first week of February was both sustained and severe. Just how severe, when compared to

prior storms, is examined in the section of this report entitled "Prior Cold Weather Events."

B. Preparations for the Storm: Electric

Three balancing authorities in the Southwest shed load during the cold weather event: ERCOT, SRP and EPE. (PNM lost some 26 MW of load as well, although this was the result of localized transmission issues largely unrelated to the storm). Customers in ERCOT were affected the most, by a large margin. ERCOT shed 4000 MW of load, affecting 3.2 million customers, on February 2. It shed another 300 MW on February 3, affecting 180,000 customers. In comparison, SRP shed 300 MW of load, affecting 65,000 customers, and EPE shed a little over 1000 MW of load, affecting 253,000 customers.[78]

The preparations for the storm taken by these three entities are discussed below.

ERCOT

Going into the winter season of 2010/2011, ERCOT had substantial reason to believe it could meet its projected demand with available generation and imports. ERCOT's peak demand for the winter of 2010/2011 was forecasted to be 47,824 MW, with the peak anticipated to occur in January.[79] (This forecasted peak was 11 percent higher than the forecasted peak for the previous winter.[80]) To meet that peak demand, ERCOT had projected generation capacity plus imports of 72,881 MW.[81] Thus, for planning purposes, ERCOT could anticipate a

[78] In the case of ERCOT, these numbers represent the amount of load the transmission providers were directed to shed. Actual load shed was somewhat higher (5411.6 MW on February 2 and 459.5 MW on February 3), for reasons discussed in the section of this report entitled "The Event: Load Shed and Curtailments."

[79] NERC, *2010/2011 Winter Reliability Assessment*, at 16 (Nov. 2010), *available at* http://www.nerc.com/files/2010_Winter_Assessment_Final_Posted.pdf. NERC prepares its reliability assessments based on data and information submitted by the applicable Regional Entity, which in ERCOT's case is TRE.

[80] ERCOT modified the forecasting models because it had experienced extreme cold weather in January of 2010, with load tracking notably higher than forecasted.

[81] Resources listed in the NERC 2010-2011 Winter Reliability Assessment consisted of available generation (72,500 MW) and net firm imports (381 MW), and did not include generating units which were known well in advance to have scheduled maintenance outages spanning the expected peak load period. Demand was calculated based on a 50/50 load forecast (47,824 MW), meaning the forecast is expected to be exceeded five years out of every ten.

comfortable reserve margin of 57 percent. This percentage compares favorably with NERC's reference reserve margin for ERCOT of 13 percent, considered by NERC to be the base level required for reliability.[82]

The estimated demand for the season included only firm load, and therefore did not include ERCOT's two categories of contractually curtailable load: Load Resources (formerly designated as Load Acting as a Resource, or LaaR), which may be automatically disconnected when system frequency drops below a prescribed threshold (totaling 1062 MW as of February 2); and Emergency Interruptible Load Service (EILS), which permits curtailment prior to firm load shedding (totaling 331 MW as of February 2).

Although ERCOT seemingly had a generous reserve margin going into the winter of 2010/2011, the reserve margin cited did not take into account planned outages that were not yet known at the time of the forecast. ERCOT is a summer-peaking system, and the high summer temperatures and demand often extend into what would be considered shoulder seasons in more northerly regions. For that reason, it is not unusual for generators in ERCOT to schedule maintenance outages in February. ERCOT does not have the authority to prohibit generators from scheduling such outages or from taking them as scheduled, unless the outage is scheduled eight days or less before the outage date, or the outage would keep ERCOT from meeting applicable Reliability Standards or its own Protocol requirements.[83] At most, pursuant to its Protocols, ERCOT can ask generators to refrain from taking a scheduled outage if it believes it may need the generator's output. ERCOT also does not have authority under its Protocols to require generators that are on planned outage to come back into service early (assuming the generator is even in a condition to do so). Nor are there any market mechanisms to compensate generators for any costs associated with delaying or coming back early from a scheduled outage.

Despite these potential limitations, ERCOT was far from being generation deficient for winter 2010/2011 seasonal planning purposes. Nor, as will be seen, did it appear to be deficient going into the storm itself. A little background is needed to put in context the generation that ERCOT thought it would be able to call upon during the storm.

---

[82] NERC 2010/2011 Winter Reliability Assessment at 16.

[83] ERCOT Nodal Protocols § 3.1 (Nov. 20, 2010), *available at* http://www.ercot.org/mktrules/nprotocols/2010/index. ERCOT is considering revising this provision to permit it to deny an outage request if it is scheduled 90 days or less from the outage date.

ERCOT uses proprietary forecasts (performed both on a seasonal and daily basis) to predict its load.[84] ERCOT used those weather forecasts, coupled with historical and other information, to gauge expected customer demand during the approaching event. A task force review of ERCOT's forecasts determined that they accurately predicted the February storm conditions, and in some cases their weather estimates were even slightly more accurate than those of the National Weather Service.

ERCOT then compared the anticipated demand[85] against its generation capacity, both for purposes of scheduling power in the day-ahead market and for determining whether it would meet reliability and reserve requirements. For operating purposes, ERCOT's Protocols include a responsive reserve requirement (also referred to as Physical Response Capability, or PRC) of 2300 MW. The primary purpose of the responsive reserves is to restore system frequency to 60 Hz within the first few minutes after the system experiences a significant frequency deviation. The 2300 MW amount is based on a 1988 study that determined the reserves that would be needed to prevent the shedding of firm load upon the simultaneous loss of the two largest generation resources in the ERCOT region.[86] (Actual online responsive reserves at any given time typically exceed the 2300 MW requirement.[87])

ERCOT Protocols

The ERCOT protocols set forth the procedures and processes used by ERCOT and its market participants for the orderly functioning of the ERCOT system and market. They contain

(cont'd)

[84] ERCOT relies on Telvent DTN and Pattern Recognition Technologies (PRT) for the weather data used in its load forecasts.

[85] ERCOT's load forecast projected loads of 52,673 for February 1 and 57,436 for February 2.

[86] This is a more conservative measurement than that required by NERC Reliability Standard BAL-002-0 R3, which sets a "contingency reserve" requirement to cover the loss of the single largest contingency on a Balancing Authority's or Reserve Sharing Group's system (N-1), not the loss of the two largest contingencies. Because ERCOT is not synchronously linked with other interconnections, a larger reserve amount than N-1 is required to maintain proper frequency response.

[87] ERCOT's daily morning report listed responsive reserves of 4196 MW for February 1 and 5944 MW for February 2, projected for the peak hours of those days.

policies for scheduling, operations, planning, reliability, and settlements, as well as ERCOT's rules, guidelines, procedures, and standards. The protocols are developed and amended through stakeholder committees for approval by the ERCOT Board of Directors. Once approved at ERCOT, the protocols are submitted to the PUCT for final approval. In addition to its task of enforcing the FERC-approved Reliability Standards, TRE is responsible for compliance monitoring and enforcement of the ERCOT Protocols.

In addition to the responsive reserve requirement, ERCOT must meet a non-spinning reserve requirement.[88] These reserves are intended to address the risks of load uncertainty and wind power output variability. For February 2011, the non-spinning reserve requirement was set at 2000 MW. (The sources counted for non-spinning reserves are not included in the calculation of available resources for purposes of meeting the responsive reserve requirement of 2300 MW.[89])

Notwithstanding the fact that 11,566 MW of generation were on scheduled outage as of February 1,[90] ERCOT had more than 3100 MW of responsive

[88] Non-spinning reserves in ERCOT are generation resources capable of being ramped to a specified output level within thirty minutes and running at that level for at least one hour, or Load Resources that are capable of being interrupted within thirty minutes after being asked for interruption and remaining de-energized for at least one hour.

[89] Wind resources, which are forecasted on an hourly basis, are also not included in the calculation of available resources for purposes of meeting the responsive reserve requirement. One of the most significant differences between the NERC Winter Assessment and ERCOT operations is how wind power is handled. The NERC Winter Assessment assigns a fixed average output of 8.7 percent of nameplate rating as "existing-certain" generation capacity. For the 9317 MW of installed wind capacity (aggregate nameplate rating) in ERCOT, this amounts to 811 MW. Operations, on the other hand, utilizes wind power forecasts derived from highly localized wind speed forecasts, which provide wind power output values for each of the upcoming 48 hours. The forecasts are re-run hourly and the results updated accordingly, yielding a "rolling" 48 hour look-ahead. ERCOT's Current Operating Plan (COP) for wind power uses a conservative estimate which has an 80 percent chance of being met or exceeded, and already takes into account any equipment outages, either scheduled or forced. On the morning of February 2, the aggregate COP for wind power peaked at about 5200 MW at 3:00 AM and decreased steadily each hour down to 3500 MW at 8:00 AM. The actual wind power output followed the same downward trend, but fell short off the COP numbers anywhere from 400 MW to 1000 MW, depending on the specific hour. (This snapshot picture exhibits the variability of wind power.)

[90] This number grew to 12,413 MW on February 2; however, the additional units might have been ones that experienced forced outages on February 1 and then transitioned into scheduled outages.

reserves available throughout the entire 24 hours of that day, running as high as 5600 MW in the early morning and again during the mid-afternoon hours. This exceeded the responsive reserve requirement of 2300 MW by a comfortable amount.[91]

Thus, on paper, ERCOT had reason to believe it had ample generation going into the storm.[92] As it turned out, the large number of generator outages, derates and failures to start that occurred on February 1 and February 2 would reduce that margin below acceptable levels.

Aside from determining it had sufficient operating reserves listed as available, ERCOT took other steps to prepare for the storm. On January 31, ERCOT issued an Operating Condition Notice (OCN) to its market participants, advising them of the expected cold front. On February 1, it issued another OCN at 2:45 AM and an Advisory at 9:05 AM. ERCOT also reported to the PUCT that it was expecting temperatures in the teens to the low 20s and maximum temperatures near or below freezing, with anticipated impacts on 50 percent or more of its major metropolitan areas.[93]

Notices and Emergency Declarations

The ERCOT Protocols set out three types of preliminary notices to be issued by ERCOT to inform market participants of a potentially adverse operating condition, including extreme weather conditions such as hurricanes and protracted periods of below-freezing temperatures. The type of notice is determined based on the time available for the market to respond before an emergency condition may occur.

(cont'd)

[91] On February 2, responsive reserves would hover in the range of 2700 MW to 3300 MW in the early morning hours, dropping to around 3000 MW at 4:30 AM and then plummeting rapidly.

[92] In addition to the outages already underway, three planned generation outages were scheduled to begin during the time period covered by the anticipated storm. ERCOT requested one of these generators to delay the outage, as discussed later in the report.

[93] ERCOT did not provide any further market notices or indications of projected capacity shortages until 3:00 AM on February 2, when it issued an OCN and an Advisory reporting that reserves were below 3000 MW. These notices, as well as the other actions that took place on February 2, are discussed in the following section of this report entitled "The Event: Load Shed and Curtailments."

- Operating Condition Notice -- issued to inform participants of a possible future need for more resources due to conditions that could affect system reliability; allows ERCOT to confer with transmission providers and participants regarding the potential for adverse reliability impacts and contingency preparedness when adverse weather conditions are expected.

- Advisory -- issued when conditions are developing or have changed such that more ancillary services will be needed, or when weather or conditions require more lead-time than the normal day-ahead market allows; allows ERCOT to increase ancillary services requirements above the quantities originally specified in the day-ahead market, and to require information from participants regarding their fuel capabilities for the next seven day period.

- Watch -- issued when additional ancillary services are needed in the current operating period, or when forced outages or abnormal operating conditions have occurred or may occur that require operating with transmission security violations; allows ERCOT to instruct transmission owners to reconfigure ERCOT system elements to improve reliability in ERCOT; and allows ERCOT to take steps to procure additional regulation services, RRS services, and non-spinning services.

ERCOT issues the fourth level of Notice, an Emergency Notice, when it cannot maintain minimum Reliability Standards or meet its Protocol requirements during the operating period or is otherwise in an unreliable condition. Depending on the severity level, ERCOT may take additional steps to resolve the system emergency, including relaxing transmission constraints, issuing public appeals for conservation, deploying Load Resources and EILS resources, and requiring firm load shedding.

Between January 28 and January 31, ERCOT cancelled, withdrew, or delayed planned outages on ten 345 kV transmission lines, 27 138 kV transmission lines, two 345/138 kV auto-transformers and one 138/69 kV transformer (outage cancellation rules differ as between transmission and generation). On January 31, ERCOT requested one generating unit (Mountain Creek SES Unit 8 at 568 MW) to begin start-up due to its long start-up lead time, and requested another unit (Lake Hubbard SES Unit at 397 MW) to convert from natural gas to fuel oil in anticipation of possible gas curtailments.[94] ERCOT reports that it did not request any generators to return early from scheduled

[94] Texas Reliability Entity, *Event Analysis Report – Feb.2, 2011 EEA-3 Event* at 16 (Apr. 15, 2011) (TRE Report).

outages, nor did it request any generators to defer scheduled outages that were slated to start during the cold weather event.[95]

In the afternoon of January 31, ERCOT decided to adjust its load forecast to factor in the potential effect of the high winds that had been predicted (ERCOT's forecasts do not normally factor in wind chill effects). ERCOT made a manual adjustment to its load forecast for the remainder of February 1 and for February 2, adding 4000 MW.

The storm hit on February 1. Beginning at approximately 12:00 PM on that day, power plants across Texas experienced problems due to the cold weather. These included freezing instrumentation, freezing pipes, freezing drain lines, natural gas curtailments, and natural gas pressure reductions due to high usage.[96] Between noon and midnight on February 1, two large coal units and 18 natural gas units tripped or failed to start for varying periods of time. Another six natural gas units and 13 wind plants were derated during this period. As of midnight on February 1, unavailable generation capacity in ERCOT (not counting scheduled outages) reached 6022 MW.[97]

In addition to the generation scheduled for February 2 by its economic dispatch model, ERCOT committed 24 additional generating units, totaling 3400 MW, through its reliability unit commitment (RUC) process.[98] By midnight, all available generation had been instructed to run on February 2.

[95] ERCOT did discuss with generators deferring scheduled outages planned for the February 10 period, when cold weather was again anticipated. Some of those scheduled outages were postponed.

[96] TRE Report at 7. The details of the types and causes of the forced outages experienced during the February 1-5 weather event are discussed in detail in the section of this report entitled "Causes of the Outages and Supply Disruptions."

[97] This is a net cumulative number; that is, if a failed unit came back online, it is not counted as unavailable.

[98] ERCOT initially committed 13 units through the RUC process on February 1, to be deployed on February 2; it later cancelled six of those unit commitments, leaving a net value of 2049 MW in additional generation as of midnight on February 1. At 3:03 AM on February 2, ERCOT committed 19 units through its RUC process, totaling 1351 MW. Unit generation added on both days through the RUC process for February 2 deployment totaled 3400 MW.

ERCOT's RUC Process

After ERCOT completes the run of its day-ahead market, which matches buy and sell offers for energy and ancillary services for the following operating day, ERCOT runs a Day-Ahead Reliability Unit Commitment (DRUC) study to ensure that sufficient capacity is available to serve load. For each hour of the following day, the DRUC examines whether sufficient resources have been committed, through Day-Ahead awards or as otherwise reflected in each resource's Current Operating Plan (COP), to meet the forecasted load for each hour. If ERCOT determines that any additional resources are needed, it can physically commit those resources for the hours needed, with certain payment levels guaranteed to the resources when ordered to run.

ERCOT runs the DRUC study in the afternoon prior to the operating day studied. Hourly RUC (HRUC) studies are run thereafter, comparing resources and load for each hour remaining in the DRUC period and reflecting any changes in resource commitments (such as forced outages or modified COPs) or other changes in system conditions since the DRUC was run.

The RUC process takes into account resources committed in the Day-Ahead market, resources self-committed in the COPs, and resources committed to provide ancillary services. The RUC process can also recommend decommitment of resources where transmission constraints are not otherwise resolvable. ERCOT can order any available resource to come online as part of the RUC process.

If a resource is selected by the RUC, the resource will at a minimum be made whole for its startup and minimum-energy costs. However, if the energy revenues received during the RUC-commitment period are greater than these guaranteed costs, the resource may be subject to a "clawback" under certain conditions.

Could or should ERCOT have done more to prepare for the event? ERCOT procedures specifically include provisions for severe cold weather operations.[99] In anticipation of severe cold weather, ERCOT may issue an OCN, Advisory, Watch, or Emergency Notice. These various alerts allow ERCOT to react to potential operating conditions by: reviewing planned and existing outages; determining if more lead-time is needed for generating resources to meet their commitments than the normal day-ahead market allows; determining if additional ancillary services are required; ordering on additional units; and increasing staffing. Under the

[99] ERCOT Operating Procedure Manual: Shift Supervisor Desk § 7.5 (July 18, 2011), *available at* http://www.ercot.org/mktrules/guides/procedures/. Severe cold weather is defined by expected temperatures in the mid to low 20 degree range with expected maximum temperatures near or below freezing, impacting 50 percent or more of major metropolitan areas.

various alerts, ERCOT's RUC Operator may also confer with transmission operators and QSEs[100] regarding preparedness, fuel capabilities, the need to reconfigure system elements, or to vary from market timing deadlines.[101]

In anticipation of the event, ERCOT arguably could have better utilized these tools to prepare for the severe cold weather, particularly by increasing ERCOT's responsive reserves well in advance of its decision late on February 1 to schedule all available units for the next day.[102] As events proved, the extensive generator outages substantially exceeded ERCOT's reserves, and would have done so even if the reserves had been substantially larger in number. But this was not known by ERCOT going into the event. Furthermore, if generating units had been online and running, they would have been better able to withstand freezing temperatures,[103] a consideration ERCOT might have factored into its decision-making process.

Another strategy that might have improved generator response would have been the use of pre-warming techniques.[104] ERCOT does not currently have the authority to require generators to engage in these actions, but if generators had done so, they might have prevented some of the extensive freezing problems that developed. Running quick start units prior to their scheduled start time could also

[100] A "Qualified Scheduling Entity" (QSE) is a market participant qualified by ERCOT as a resource entity or a load serving entity, for purposes of communications with ERCOT and the settling of payments and charges.

[101] ERCOT Operating Procedure Manual, Reliability Unit Commitment Desk, Section 6.1 (July 20, 2011), *available at* http://www.ercot.com/mktrules/guides/procedures/.

[102] ERCOT Protocols formerly required it to increase its spinning reserves by an amount at least equal to its responsive reserves during cold weather alerts. *See* Elec. Reliability Council of Tx., *ERCOT Operating Guide No. 12* (May 1989). ERCOT advised the task force that this protocol had been changed to account for the variability of wind power. ERCOT now carries non-spinning reserves continuously rather than only during peak hours, as was its former practice. ERCOT stated its belief that the continuous availability of non-spinning reserves serves virtually the same purpose as the former practice of doubling the spinning reserves.

[103] The use of a generating unit's own radiant heat to prevent freezing is discussed in the section of the report entitled "Key Findings and Recommendations."

[104] For conventional gas steam units, pre-warming can be accomplished by establishing a fire in the boiler to produce warming steam for the turbine while it is on turning gear. This keeps metal temperatures warm enough to prevent freezing in piping and instrumentation lines and helps bring lubricating and hydraulic oils up to proper operational temperatures. Combustion turbines can run at full speed no-load operation for short periods of time prior to start up, in order to warm vital parts, instrumentation, and lubricating oils.

have identified problems before the output of the units was needed, giving them time to make corrections.[105]

Had ERCOT and the generators undertaken these additional measures, it is possible that fewer generating units might have failed. ERCOT might still have been forced to shed load, but the extent of the load shed might well have been reduced. Every generator that could have escaped failure on February 1 and February 2 would have improved the situation for Texas consumers.

ERCOT Generators

Most generators in ERCOT's footprint reported having employed freeze protection measures to protect their facilities. These measures generally fell into two categories: physical readiness and operational readiness.

To prepare physical facilities for the cold weather, generators variously reported that they installed portable heaters to maintain ambient air temperature, added extra insulation to exposed components, installed temporary windbreaks to exposed areas, drained non-essential water systems, and determined that the water in essential water systems was circulating.

Some generators also reported adjusting their operations to adapt to the cold weather. They called in more operating and maintenance staff, increased the frequency of operator rounds, performed checks of freeze protection panels and heat tracing circuits, and added windbreaks. Plant staff also tested emergency equipment, added fuel to heaters and emergency generators, stocked extra supplies of fuels as well as food and other emergency items in case deliveries were disrupted, and prepared sleeping arrangements for employees if roads became impassable. Some generators utilized pre-operational warming during the event.[106]

Despite these reports of having taken steps to prepare for the cold weather event, many generating units in ERCOT failed to perform or suffered derates after

[105] On February 1 and 2, approximately 19 simple cycle and combined cycle units in ERCOT tripped for non-weather related causes and were restored within two hours. Many of the simple cycle and combined cycle unit trips occurred immediately during start-up sequences or very soon after synchronization.

[106] On February 10 as well, some generators utilized pre-operational warming for that day's cold weather snap. At least five generators kept their units running, started units earlier or took other measures to keep from having a "cold start." These generators credited these strategies for their improved performance on that date.

the storm hit. And they failed, in the majority of cases, because of weather-related problems. The various generator outages and their causes are examined in the section of this report entitled "Causes of the Outages and Supply Disruptions."

Salt River Project

SRP is a vertically integrated utility and owns its own generation, transmission, and distribution facilities. Its preparations for inclement weather therefore needed to encompass all three functions. In terms of its forecasting, SRP uses an Artificial Neural Network Short-Term Load Forecaster model, which projects control area loads. This model incorporates SRP's own meteorologist's weather forecast as well as hourly historical load data. SRP reported that while weather on February 2 matched its weather forecasts, its load forecast was lower than actual load demands. The disparity, however, was within five percent.

SRP has generating facilities located throughout central and northern Arizona. Winter temperatures tend to be mild in and around the Phoenix Valley but can be noticeably colder in the more remote areas where the company's two coal burning facilities are located. SRP reports that it carries out preventative maintenance for facilities that have winterization equipment, which generally consists of heat tracing[107] and insulation. Gas-fired generating plants in and around the Phoenix valley use winterization equipment to protect against expected conditions, while hydro generating facilities are almost exclusively contained inside protected buildings. SRP's coal generating facilities at the Coronado and Navajo stations have winterization systems that consist mostly of heat tracing and insulation. SRP advised the task force that every year in the fall, planners for the Coronado and Navajo stations develop work orders to inspect and test these winterization systems to verify they are working properly, and that during the winter months, staff conduct weekly winterization and freeze protection equipment checks.

SRP's immediate preparations for the February event were limited. It did not issue a cold weather alert in advance of the storm.[108] SRP reports that management at the Navajo Generating Station did inform its operators at the beginning of shifts that cold weather was approaching, and inquired if there was anything the employees needed to help them do their job. SRP does not employ a

[107] Heat tracing refers to the application of a heat source to pipes, lines, and other equipment.

[108] Indeed, the only alert the SRP Balancing Authority provided to generators was a "Capacity Alert," indicating that maintenance and operations activities on all operating generating units were to be stopped.

formal checklist of activities that should be carried out prior to a winter storm, and the company reported that the Operations and Maintenance Group at the Navajo Generating Station did not take any formal actions to prepare the station for the anticipated severe weather. However, SRP informed the task force that the group did hold meetings at which the need for staff to frequently check the generating equipment for potential weather-related problems was emphasized.

El Paso Electric

Like SRP, EPE is a vertically integrated utility. It reported to the task force that at the beginning of the winter of 2010/2011, as at the beginning of every winter, it took steps to winterize its generating facilities. This winterization included verifying that heat tracing was properly functioning, as well as making sure insulation was properly installed.

EPE also reported that it verified that the equipment in its substations, the part of the transmission and distribution system most susceptible to cold temperature extremes, could withstand the expected cold temperatures.

On January 31, 2011, EPE initiated preparations for the anticipated severe weather, which included verifying winterization of generation, transmission and distribution facilities, reviewing system operations plans, checking on the availability of fuel, preparing for potential pipeline constraints, and placing employees on call as needed during the weather event. The Systems Operations group requested EPE's Power Marketing and Fuels group to keep additional generation online. In response, the Power Marketing and Fuels group made arrangements to leave on Rio Grande Unit 6, to continue with the start-up of Newman Units GT-3 and GT-4, and verified the ability of Newman Unit 3 to operate on fuel oil.

In contrast to some other areas in the region, EPE reported that actual weather during the event was more severe than forecasted (and significantly colder than historical temperatures). For February 2, EPE reported that the actual high temperature in El Paso was 15 degrees compared to a forecasted high of 37 degrees, and the actual low temperature was 6 degrees compared to a forecasted low of 14 degrees. The forecasted high for February 3 was 30 degrees, compared to an actual high of 18 degrees, and the forecasted low was 14 degrees, compared to an actual low of 1 degree. For February 4, the last day of the freeze event in EPE's service territory, the forecasted high of 43 degrees compared to an actual high of 37 degrees, and a forecasted low of 21 degrees compared to an actual low of 3 degrees. EPE did not report the exact location for its temperature statistics, but presumably they occurred in the west Texas and New Mexico regions.

C. Preparations for the Storm: Natural Gas

Varying levels of preparation for the February cold front were employed by the producers, processing plants, interstate pipelines, intrastate pipelines, and LDCs that together make up the natural gas delivery chain. Depending on the type of facility, preparations included at least one, if not several of the following items: monitoring the weather, increasing staffing, methanol injection, pigging, insulation, tarps, heat tracing, building line pack[109] in pipelines by injecting more gas, over-purchasing gas supplies and enhancing winterization equipment. For the most part, facilities began their preparations by either Sunday, January 30 or Monday, January 31.

This section describes the preparations taken by individual companies in west Texas, the Texas panhandle, north Texas and New Mexico and by the LDCs in Arizona and New Mexico.

Producers

As discussed in detail in the section of this report entitled "Causes of the Outages and Supply Disruptions," the difficulties encountered by LDCs in trying to meet customer demand stemmed principally from supply declines in the basins, and secondarily from problems encountered at processing plants. The preparations for the cold weather event taken by producers is therefore of special interest.

Of the 15 producers who provided information to the task force on this issue, all reported that they had used winterization techniques of one sort or another. The following table shows by basin the numbers of producers that used one of or more of the listed methods.

[109] Line pack refers to the volume of gas in the system at any given point in time.

	PERMIAN	SAN JUAN	FORT WORTH	EAST TEXAS	TEXAS GULF
Methanol Injection or Drip	✓✓✓✓✓✓✓	✓✓✓	✓✓✓✓✓	✓✓✓✓✓✓✓	✓✓✓✓✓✓
Increased Pigging or Clearing of Liquids	✓✓✓	✓	✓✓	✓	✓
Tarps or Cold Weather Barriers	✓	✓✓		✓✓	✓✓
Increased Hauling of Fluid	✓✓	✓	✓✓✓	✓✓✓	✓✓
Heated Anti-Freeze		✓			
Heat Trace	✓	✓✓	✓	✓✓✓✓	✓
Hot Oil Trucks	✓				
Insulation	✓✓✓	✓	✓✓	✓✓	
Burial of Lines	✓				
Heat Lamps or heaters	✓✓	✓			✓

A short description of some of these techniques gives a fuller picture of the actions the producers reported having taken:

- Methanol (an anti-freeze type solution) injection or drip is a common practice for freeze protection of wellbores and pipelines. The methanol is injected into the gas stream by chemical injection pumps or enters the pipeline by methanol drips and effectively lowers the freeze point of the gas. Also, separators (used to separate liquids such as oil from the natural gas) may be filled with heated antifreeze to prevent freezing.

- Pigging refers to the practice of using pipeline inspection gauges or "pigs" inside a pipeline to perform various operations without stopping the flow of gas. Pigging operations are conducted on a year-round basis as needed to keep pipelines in working flow conditions. During cold weather their deployment can be increased to remove liquids that might be prone to freezing.

- Cold weather barriers are a relatively simple weather precaution involving the erection of wind walls around certain compressors to block cold winds that exacerbate freezing conditions. Wrapping and insulating surface equipment, injection lines, supply valves, water lines and other locations may also help prevent freezing and the stoppage of fluid flow.

- Hauling oil and produced water from storage tanks is a necessary part of the production process, since tanks that are not emptied can trigger fail safe shut-in devices that will automatically shut down the well. Prior to cold weather, and in anticipation of trucks not being able to reach the facilities, the tanks may be emptied to reduce the likelihood of automatic shut-off.

- Heat can prevent freezing problems; if the gas is never allowed to reach freezing temperatures, ice cannot form. However, heat application involves expensive equipment and requires additional fuel. Heat is also a potential hazard as it can provide an ignition point for the gas. Nonetheless, heat systems can be very effective for a localized freezing problem, and include heating blankets, catalytic heaters, fuel line heaters, or steam systems. Coupling heat systems with insulation is a common technique for protecting flow lines in northern climates.

- Hot oil trucks may be utilized to thaw out flow lines. Typically the hot oil truck will be filled with water, which is then heated and directly sprayed onto lines at risk of freezing.

As it turned out, the various measures producers described as having employed to prepare for the projected cold weather proved inadequate; a substantial number of wells in the affected basins suffered freeze-offs, which had a significant effect on production during the February cold weather event.

Processing Plants

Individual processing plants reported making anywhere from minimal to extensive preparations. Their winterization included:

- Making equipment checks;
- Adding 24-hour staff and adding to nighttime crews;
- Installing insulation;
- Confirming that heat trace equipment was operational;
- Placing tarps as wind breaks and to capture heat;
- Draining water from cooling systems and fluids from piping low points;
- Coordinating with upstream gathering;
- Reviewing past winter events; and
- Installing hot oil heaters.

A representative sampling of processing plant preparations follows.

The Crosstex Energy-affiliated Silver Creek natural gas processing plant in Weatherford, Texas processes Barnett Shale production from the Fort Worth Basin. In preparation for the weather event, operating personnel reportedly performed checks on all equipment, confirmed that all heat trace equipment was turned on prior to the storm, installed tarps on critical equipment, and drained all air supply low points. (Despite these precautions, the plant did experience a shut down of a steam boiler due to a freezing amine/water mixture.)

Enbridge Energy Company, Inc. operates processing plants in east Texas and in north Texas. Generally speaking, operations in both the east Texas and north Texas plants continued in a routine manner prior to the storm.

Energy Transfer Corporation (Energy Transfer) owns and operates the La Grange processing plant in east Texas and the Godley processing plant in north Texas. As part of its general preparation for cold weather at the La Grange plant, Energy Transfer wrapped air regulators and hung tarps around vessels. In late January, an extra operator was placed on duty. With regard to the Godley plant, Energy Transfer had previously installed louvers on all amine still overhead condensers[110] to assist in cold weather operations. A hot oil heater had also been installed in a still condenser to prevent freezing. In addition, prior to the February weather event, Energy Transfer insulated condenser piping at two plants.

[110] The term “amine still overhead condensers” refers to a piece of equipment used to remove the acid gases from the natural gas stream.

MarkWest Energy Partners has two processing plants in Texas. The company reported that both processing facilities are equipped to run during extreme cold weather and that no additional maintenance, insulation or heat tracing was performed prior to the February cold weather event.

Williams Midstream has four processing facilities, the Markham Cryogenic processing plant in Matagorda County, Texas; the Milagro treating plant in San Juan County, New Mexico; the William FS Kutz (Kutz) processing plant in San Juan County, New Mexico; and the Lybrook processing plant in Rio Arriba County, New Mexico. The company reported that the Milagro plant and related facilities are designed to operate in cold weather. Nevertheless, it is standard practice at the plant to check heat tracing controls and piping insulation in the fall months. For the February event, preparations consisted of round-the-clock staffing for certain facilities and adding staffing for the night crew. Standard winter preparation at the Kutz plant reportedly includes coordination with upstream gathering, draining of water cooling systems, placing catalytic heaters into service, installation of wind barriers and group review of past events. In January and February 2011, additional contractor personnel were provided for night operations and additional heat wagons were placed based on needs. The Lybrook plant had also addressed winter preparation prior to 2011 by upgrading and inspecting piping, tracing, and insulation, and by making repairs to hot oil pumps.

Pipelines

Pipelines also prepared for the anticipated cold snap. Typical preparations for both interstate and most intrastate pipelines included:

- Maintaining higher than normal line pack;
- Optimizing compressor operations;
- Enhancing internal communication such as cold weather operational meetings;
- Increasing availability of personnel;
- Cancelling scheduled maintenance where possible; and
- Communicating with customers.

Interstate Pipelines

Individual interstate pipelines reportedly took the following preparations:

EL Paso prepared for the forecasted colder weather by maintaining higher than normal line pack throughout the weekend of January 29 and January 30. (El

Paso considers line pack volumes between 7,200 MMcf and 7,800 MMcf at any given point in time to be in the normal range; at line pack quantities below 7,200 MMcf or above 7,900 MMcf, El Paso generally considers its system to be at or approaching stressed operational conditions.) On Monday afternoon, January 31, El Paso began gas withdrawals from its Washington Ranch Storage Facility, reaching the field's maximum withdrawal rate by the morning of February 1. This was done to compensate for gas supply underperformance in the San Juan and Permian Basins.

Natural Gas Pipeline Company of America (NGPL) uses its Texas facilities to receive gas in Texas and redeliver that gas to markets in the upper Midwest. For February 1 through February 3, NGPL put in place a severe weather operating procedure that provided for management of cold, high winds, ice and snow. This procedure included conferences and communications involving the managers of the gas control and commercial groups of impacted NGPL facilities. Additional actions reportedly taken by the gas control group included adjusting pipeline pressures to meet anticipated load increases, manning facilities on an around-the-clock basis, and carrying out operating procedures designed to keep facilities from freezing.

Transwestern began operating its compression stations to maximize pressures in New Mexico in advance of the cold weather event.

ANR Pipeline Company (ANR) has no facilities in New Mexico, Arizona or California, and only limited facilities in Texas, which are located in the northeast corner of the Texas panhandle (this is the southern-most part of ANR's Southwest Area). To prepare for and respond to operating concerns and ongoing and expected weather events, ANR conducted daily morning operations meetings. An additional "cold weather" operational meeting specifically addressed the week of February 1. ANR reported reduced horsepower at all its Southwest Mainline compressor stations to help flow gas south into the Texas area if scheduled supply decreased, with the aim of maintaining adequate line pack and constant pressures in Texas and Oklahoma.

Intrastate Pipelines

Intrastate pipelines in general employed many of the same preparations as did the interstate pipelines. Reported examples are provided below.

Atmos Pipeline –Texas began building line pack on January 31, and advised shippers to be in hourly and daily balance effective 9:00 AM on February 1. This action assisted with maintaining line pack. Electric generation customers

were advised that deliveries would be limited to Tier 3[111] beginning at 9:00 AM on February 1. Third-party interruptible storage customers were advised that they would be limited to 50 percent withdrawals effective February 1 at 9:00 AM.

Energy Transfer Partners reported ensuring that critical stations were staffed, spare compressors were placed on standby, line pack was increased, and all scheduled maintenance was postponed.

Enterprise Products Partners reported closely monitoring nominations. Staffing coverage was extended in addition to employees' normal schedules. Operations were also reviewed for potential service adjustments that might be required, although none were anticipated.

The Kinder Morgan Texas Pipes' natural gas pipeline operations and gas control group initiated the Kinder Morgan Gas Pipelines' severe weather operating procedure, designed to manage facilities in the event of severe cold, high winds and frozen precipitation. The procedure prescribes conferences and communications among managers and the gas control and commercial groups, and these communications began several days prior to the cold weather event. The gas control group also adjusted pipeline pressures in anticipation of increased load. In the field, some facilities were reportedly staffed around-the-clock, and procedures were put in place to keep facilities from freezing.

Local Distribution Companies

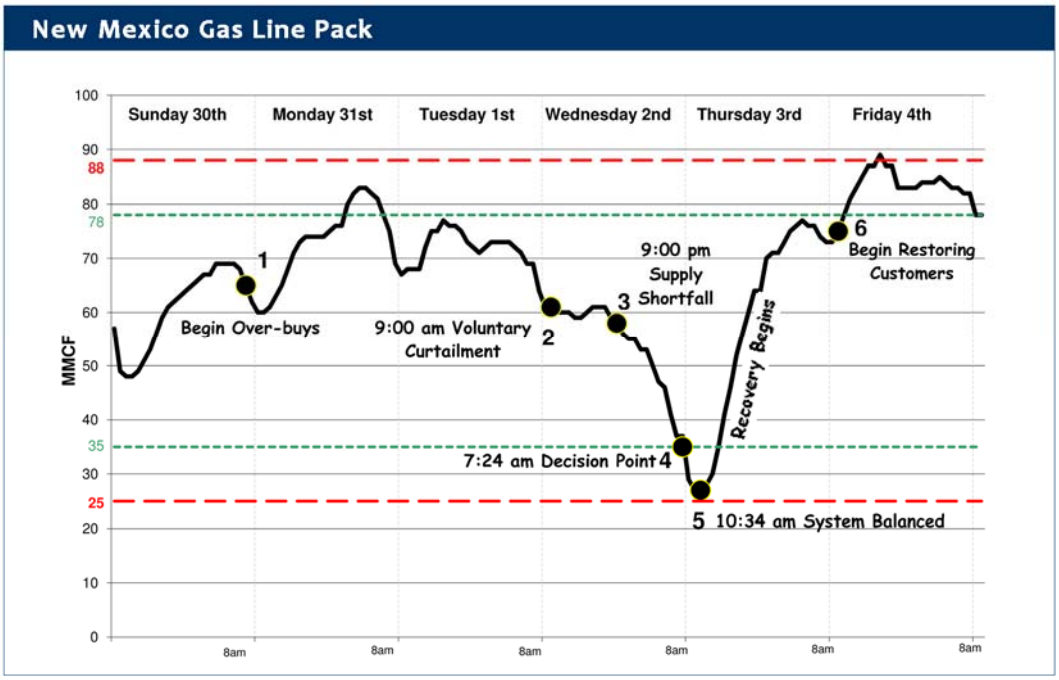
Each of the four LDCs that curtailed customers during the February weather event reported making preparations. They monitored weather forecasts before the event and revised their load forecasts upward. They also increased their purchases of gas to accommodate increased demand and to compensate for freeze-offs, and communicated with suppliers and the pipelines about pending conditions. As conditions worsened, these communications became more frequent.

New Mexico Gas Company packed transmission lines with extra gas, and confirmed that the storage facility it accesses was positioned for withdrawals. Additional gas was purchased for the expected increased demand and in anticipation of freeze-offs. From February 1 through February 3, NMGC had, for each respective day, pre-purchased 36 percent, 55 percent, and 62 percent more gas than its forecasted need. NMGC issued an Alert to all transportation customers concerning the weather forecasts. Given the severity of the anticipated

[111] Tier 3 restrictions applying to electric generating units limit the amount of natural gas the units can take.

storm, at 9:00 AM on February 2, NMGC began requesting that large industrial and commercial customers throughout the state voluntarily reduce or curtail their gas usage. In total, NMGC reported contacting 39 customers, asking for voluntary curtailment.

The following is a chart of NMGC's line pack, juxtaposed with its preparation events.



Source: New Mexico Gas Company

Southwest Gas monitored current weather forecasts on January 30 and January 31, which indicated colder temperatures were expected for southern Arizona. On February 1, a scheduled meeting of engineering and technical services personnel was expanded to include discussions concerning cold weather preparations and system monitoring.

Zia Natural Gas Company (Zia), after observing the dramatically dropping temperatures forecasted for February 1 through February 4 for the state of New Mexico, contacted its primary supplier on January 30 to discuss its supply and receipt options. On February 1, Zia discussed maximum volumes that could be nominated on its pipeline transportation contract.

V. The Event: Load Shed and Curtailments

When the storm hit the Southwest on February 1, both electric and natural gas facilities began experiencing outages and other production difficulties. These difficulties escalated and ultimately led to load shedding by three electric balancing authorities and service curtailments by four gas LDCs, beginning on February 2. The unfolding events that led to these disruptions, and the conduct of the load shedding and curtailments, are described in this section.

A. Electric

ERCOT, SRP and EPE all engaged in load shedding during the cold weather event. Other electric entities in the area, although they experienced generation losses, were able to avoid load shedding (with the exception of PNM, which experienced some small, localized load loss from transmission issues). Each affected utility's actions are discussed separately below. (All times referenced are expressed in local time.)

ERCOT

ERCOT's required responsive reserve level is 2300 MW.[112] This is the amount that ERCOT has determined to be necessary on its system to ensure that the system will maintain frequency and voltage stability; that thermal and voltage limits will remain within applicable ratings; and that there will be no loss of demand, curtailment of firm transfers, or cascading outages.[113] If reserves drop below specified amounts, ERCOT is required by its Protocols to take actions to bring them up again, including the shedding of load.

ERCOT has specified in its Protocols certain triggering events that require taking action to prevent the uncontrolled loss of firm load. In doing so, it has patterned its emergency alert protocol on the Reliability Standard that prescribes

[112] As discussed in the section of this report entitled "Preparations for the Storm," this amount was based on a 1988 study designed to determine the amount of reserves needed to prevent shedding of firm load if ERCOT's two largest contingencies occurred.

[113] This minimum level of reserves is based on an N-2 criterion, a more conservative requirement than that required by the FERC-approved Reliability Standard BAL-002-0 R3.1, which requires that "as a minimum, the Balancing Authority or Reserve Sharing Group shall carry at least enough Contingency Reserve to cover the most severe single contingency." ERCOT's N-1 largest single contingency would be the loss of a nuclear-powered generating unit at the South Texas Nuclear Project, rated at 1354 MW.

an energy emergency alert procedure.[114] Both the Reliability Standard and the ERCOT Protocol categorize these triggering events into three levels, Levels 1, 2, and 3; ERCOT further subdivides Level 2 into 2A and 2B.

ERCOT had to make decisions throughout the morning of February 2 regarding the declaration of these various emergency alert levels and actions. That was particularly so with respect to Level 3, which requires the shedding of firm load.

Energy Emergency Alerts

Reliability Standard EOP-002-2.1 prescribes the use of an energy emergency alert (EEA) procedure when a load serving entity is unable to meet its customers' expected energy requirements. These energy emergencies are declared by the load serving entity's reliability coordinator, and are categorized by level of severity:

- EEA 1 - For conditions where all available resources are committed to meet firm load and reserves, all non-firm sales have been curtailed, and the entity is still concerned about sustaining its operating reserves.

- EEA 2 - For conditions when the entity is no longer able to meet expected energy requirements, and is designated an Energy Deficient Entity.

  The entity is to do the following, as time permits:

  Public appeals to reduce demand,
  Voltage reduction,
  Interruption of non-firm loads,
  Demand-side management, and
  Utility load conservation measures.

  Other entities are to provide emergency assistance as appropriate and available.

- EEA 3 - For conditions when the energy available to the Energy Deficient Entity is only accessible with actions taken to increase transmission transfer capabilities.

  At this point, firm load interruption is imminent or in progress.

(cont'd)

[114] *See* Reliability Standard EOP-002-2.1 (Capacity and Energy Emergencies).

ERCOT:

ERCOT has particularized this emergency energy alert system to the requirements of its own system. It is required under its Protocols to perform certain actions upon the occurrence of distinct triggering events. These are as follows:

Level / Triggering Event / System Operations Actions

- EEA 1 — Less than 2300 MW of Reserves:
  Use capacity available from DC ties, dispatch uncommitted units.
- EEA 2A — Less than 1750 MW of Reserves:
  Deploy Load Resources (LR); begin block-load transfers of load to neighboring grids.
- EEA 2B — To maintain system frequency at 60 Hz or reserves trending downward or not available:
  Deploy Emergency Interruptible Loads (EILS) if available.
- EEA 3 — To maintain system frequency at 59.8 Hz or greater:
  Instruct transmission operators to shed load via rotating outages in blocks of 100 MW.

As discussed in the preceding section of this report, "Preparations for the Storm," severe weather conditions on February 1 precipitated numerous forced generator outages within ERCOT's footprint. By midnight on February 1, 6022 MW of generation capacity was unavailable due to weather-related forced outages and derates, and conditions worsened overnight.

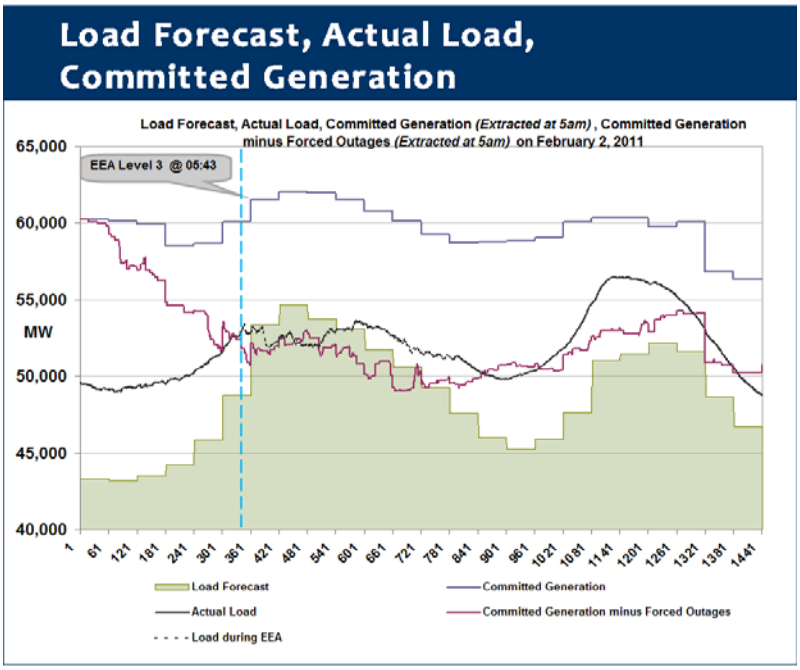
Generation Shortfalls on February 2

By 3:00 AM on February 2, responsive reserves had dropped below 3000 MW. ERCOT issued both an OCN and an Advisory to market participants, notifying them of the severe weather and the falling reserve level.[115] It followed this communication with an emailed report to the PUCT about the falling reserves.

[115] The communication steps taken by ERCOT appear to be consistent with its Operating Guidelines and Protocols. However, a number of transmission providers have stated they could have been better prepared to implement their required load shed if they had had more information about ERCOT's deteriorating system status much earlier during the overnight period of February

At 4:30 AM, ERCOT operators instructed deployment of 1840 MW of non-spinning reserves, principally combustion turbines. (Non-spinning reserves require 30 minutes or longer to come on-line or to ramp up to their next block of power output.) Ten of the units, or a total of 669 MW of capacity, were unable to respond, many because they failed to start. By 5:08 AM, reserves had dropped below 2500 MW, and ERCOT issued a Watch.

ERCOT calculates its operating reserves on a real-time basis by comparing metered demand with its available generation resources. At the same time generation was dropping off during the morning of February 2, demand was rising. The cold weather and winds were placing extraordinary demands for power on the system, and load was running consistently higher than had been forecasted for the day. In fact, at 5:20 AM the demand was 2760 MW higher than on any other day in the history of the ERCOT region at that hour, and was rapidly climbing.[116] The following chart, prepared by TRE, compares actual demand with forecasted demand.



Source: TRE

The actual peak demand for the day, which typically occurs in the morning around 8:00 AM, was artificially skewed downward because of the load shed. The

---

1 to February 2. They would have liked to have received such information as soon as ERCOT began seeing a high number of forced generator outages.

[116] Potomac Economics, Ltd., *Investigation of the ERCOT Energy Emergency Alert Level 3 on February 2, 2011*, at 3 (April 21, 2011) (Potomac Report), *available at* http://www.puc.state.tx.us/files/IMM_Report_Events_020211.pdf.

IMM (Potomac Economics, Ltd.), the market monitor for ERCOT, estimated that the demand that would have materialized absent any load reductions or curtailments would have peaked at 59,000 MW, just after 7:00 AM.[117] This estimate suggests that the high demands already being placed on the system in the early morning hours would likely have continued to escalate.

At 5:09 AM, reserves dropped below 2300 MW, the triggering event for ERCOT's declaration of an EEA 1 (although it was not declared, presumably because events were moving so swiftly). At 5:20 AM, responsive reserves had dropped below 1750 MW, and ERCOT issued an EEA 2A. It also deployed 888.5 MW of Load Resources, with 881.7 MW responding. Load Resources are counted as responsive reserves and, as such, their deployment reduces ERCOT's responsive capability. In this case, however, two factors worked to offset this reduction:

- The dropping of 881.7 MW of load increased the margin between generation and load, and ERCOT allowed a fraction of this increase to be allocated to responsive reserves. (The fraction ERCOT allots is typically 20 percent, but varies based on the specific generation online at any given time.)

- The Load Resources were being deployed over a 10-minute interval during which some additional generation was actually coming online, despite all the problems on the system.

As a result of these factors, for a short time while Load Resources were being deployed, responsive reserves actually increased by about 200 MW. It was not long, however, before additional forced outages and derates of generation, combined with the normal pick-up of morning demand, again decreased the level of responsive reserves.[118]

At 5:26 AM, ERCOT deployed RRS reserves, a form of interruptible load, which briefly raised the reserve level to above 1400 MW.

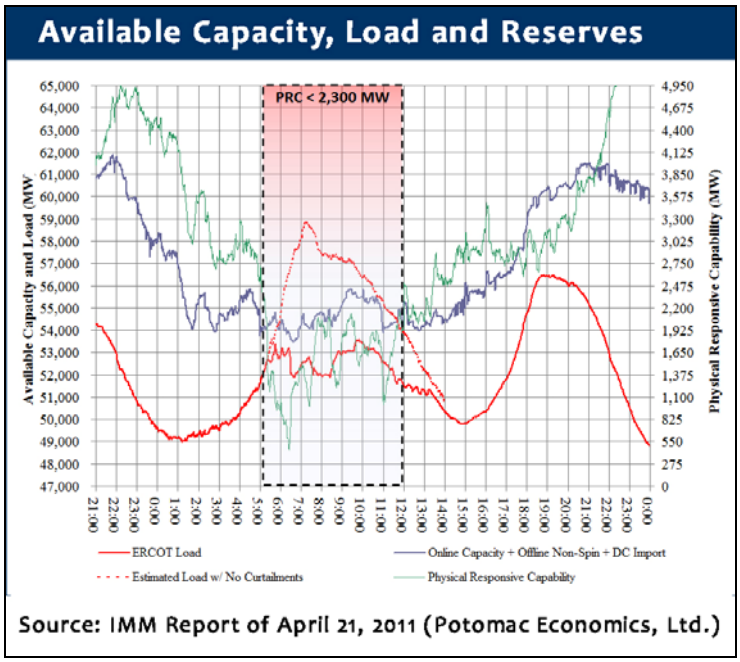
[117] Potomac Report at 3-5. The estimate was based on several factors, including the actual load and rate of load increase prior to the implementation of the first load curtailments, the load shape on similar days, and ERCOT load forecasts produced just after 3:00 AM on the morning of February 2.

[118] Responsive reserves would ultimately fall to a low point of 447 MW at 6:25 AM, after the load shed had already begun.

More units, however, continued to trip off-line. Responsive reserves briefly dipped below 1354 MW (the N-1 contingency reserve level required for safe operation of the system) twice before 5:40 AM. At that time, the responsive reserves dropped below the N-1 contingency level for an extended 73 minute period.[119]

At 5:43 AM, ERCOT declared an EEA 3 and began the process of shedding load.

The following graph[120] indicates the relationship between ERCOT's available capacity, loads and reserves throughout the day.



Counting both February 1 and February 2, a total of 193 generating units in ERCOT tripped, had derates, or failed to start, representing a loss of 29,729 MW of capacity.[121] At the lowest point of available generation, which occurred at 6:12

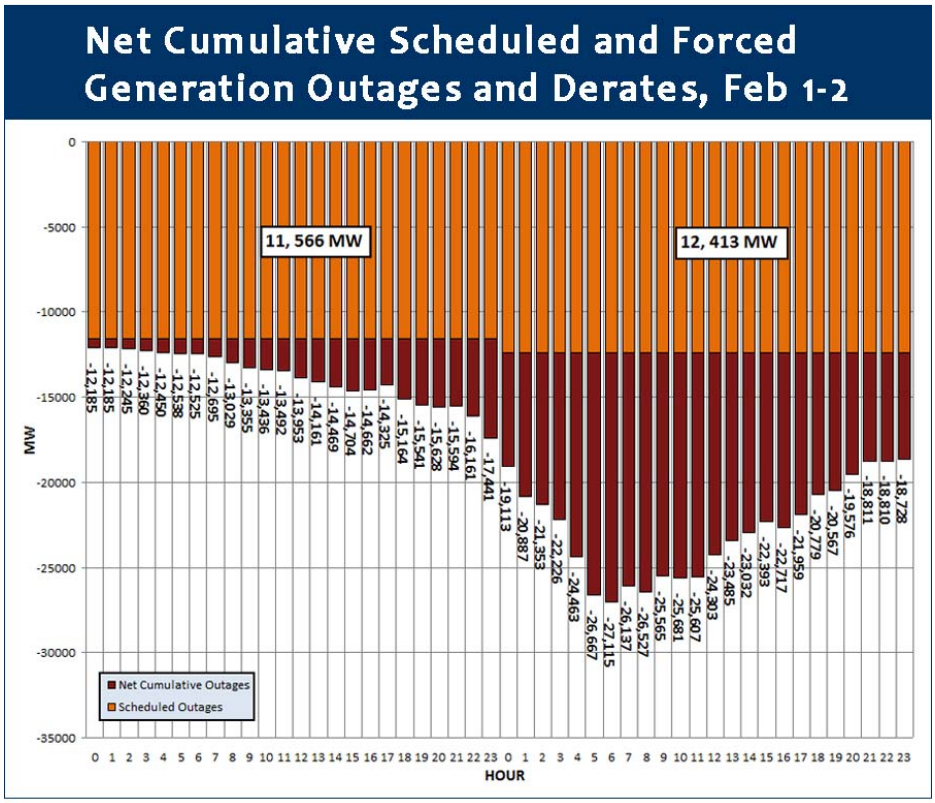
[119] There were six times during the morning of February 2 when ERCOT's response reserves fell below 1354 MW. Those times are: 5:23-5:29 AM, 5:31-5:32 AM, 5:40-6:52 AM, 7:11-7:30 AM, 8:39-8:52 AM, and 10:58-11:15 AM, for a total of two hours and 14 minutes, with the longest interval 73 minutes. (Calculation of the time periods includes the beginning and ending minutes.)

[120] Potomac Report at 6.

[121] This is a gross cumulative number; a unit is counted as having failed regardless of whether it came back online at some point during the event. This measurement gives an

AM, there were 14,702 MW of generation offline from such trips, derates, or failures to start. Adding that number to the scheduled outages for the day of 12,413 MW, means that 27,115 MW, or approximately one-third of the total ERCOT fleet, was unavailable to provide power.

The following two charts depict the net and gross cumulative capacity reduction resulting from forced outages, derates, and failures to start, as added to the scheduled outages, for these two days.[122] Comparing these numbers to total ERCOT generation of approximately 79,700 MW[123] gives a picture of the magnitude of the generation loss, as well as of the difficulties that confronted ERCOT's operators on those two days.

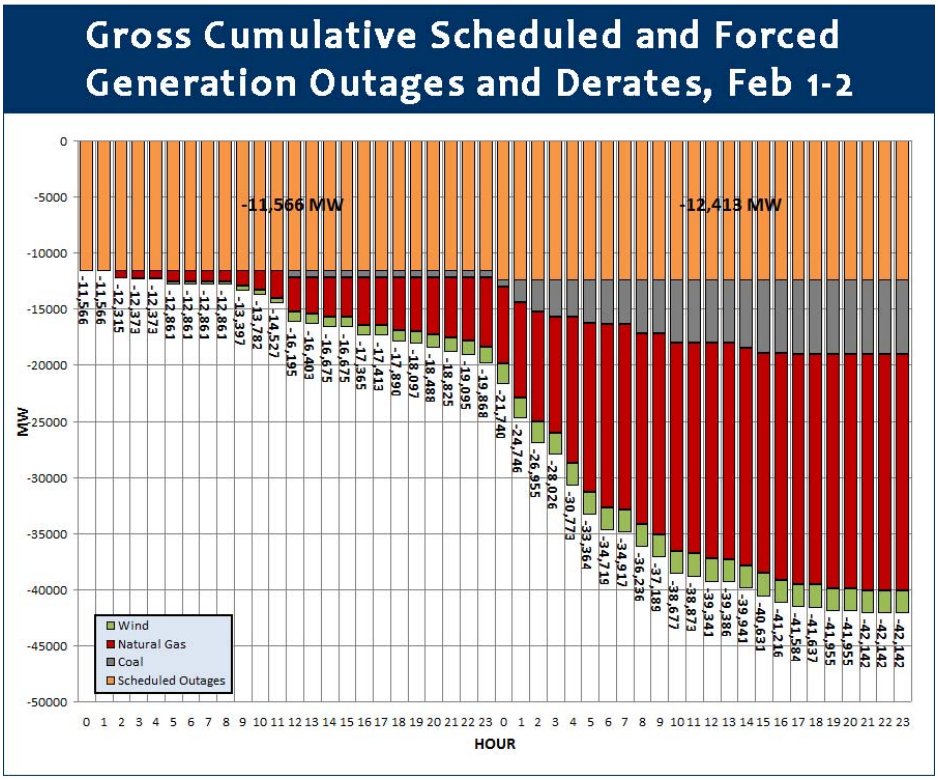


---

indication of the total amount of capacity that failed during the event (rather than the amount offline at any given point in time).

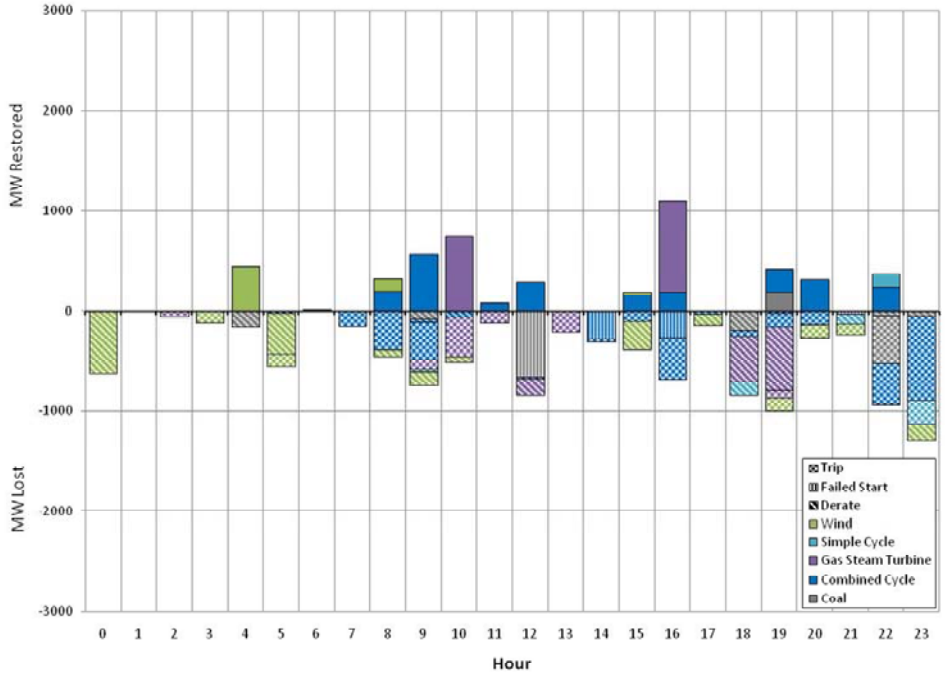
[122] The first chart depicts net outages after subtracting out units that came back online. The second chart shows cumulative outages with no adjustment for units that came back online.

[123] The 79,700 MW number represents total ERCOT fleet capacity, online and offline, measured at 8:00 AM on February 2 (it does not include imports over the DC ties). The wind power capacity embedded in that number, as well as in the capacity reductions for the outages, derates, and failures to start, has been adjusted to reflect the actual hourly wind speed conditions (in lieu of using straight "nameplate" values which pertain only to optimum wind speeds that produce full rated output).

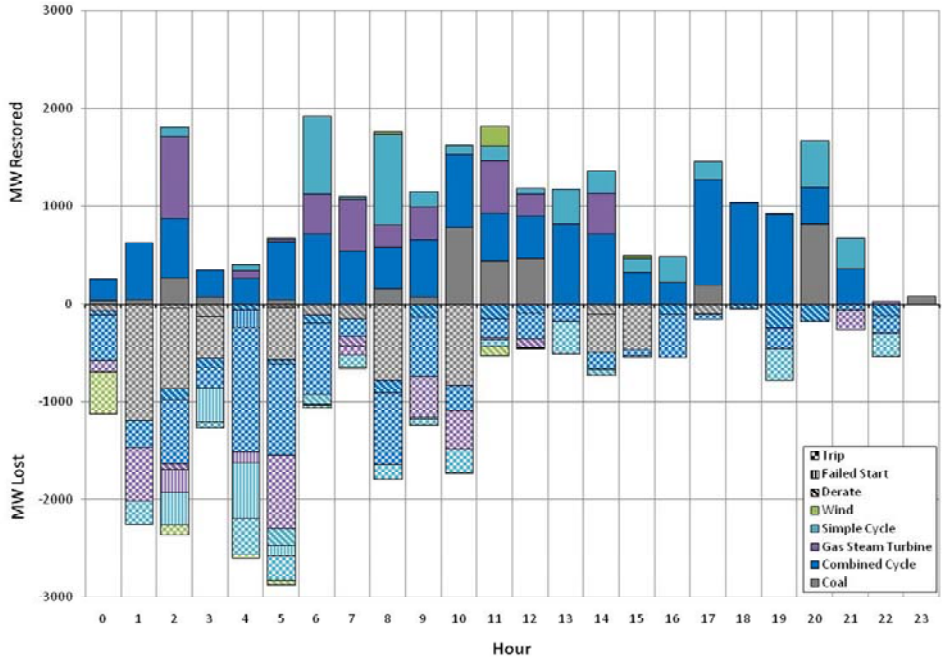


The task force has also prepared charts for February 1 and February 2 that depict, hour by hour, the MWs that failed and the MWs that were restored, both by fuel type and by type of failure (trip, derate, or failure to start). These charts give a running picture of the fluctuations in available capacity, by fuel type, at any given point in time throughout the event.

Capacity Fluctuations by Fuel Type on Feb. 1, 2011



Capacity Fluctuations by Fuel Type on Feb. 2, 2011



The various reasons for the outages, derates and failures to start that occurred during the event (the majority of which were weather-related, either

directly or indirectly) are discussed in the following section of this report entitled "Causes of the Outages and Supply Disruptions."

Adjusted Wind Power Capacity

The capacity of a wind power installation is typically reported on a "nameplate" basis, with the nameplate value representing what the facility can produce when the actual wind speed is optimum for the particular turbine design. When a wind farm is offline on a scheduled or forced outage, the capacity unavailable to the system is also typically reported on a nameplate basis; the same is true for partial outages, which are reported as derates (collectively, nameplate outage value).

The actual wind speed, however, is seldom sufficient to produce full nameplate output simultaneously throughout ERCOT. Therefore, the nameplate outage values must be adjusted downward to realistically represent the impact of outages and derates of individual wind facilities.

Adjusted Outages and Derates

The total installed wind power nameplate capacity in ERCOT is 9321 MW**.** If the aggregate nameplate outage values reported during February 1 and February 2 are subtracted from this 9321 MW total, nameplate available values are obtained on an hourly basis. Dividing the actual measured aggregate wind power output for any given hour by the nameplate available value for the same hour produces a percentage output that reflects how strongly the wind is blowing compared to full-output levels. Over the course of February 1 through February 2, that percentage varied from 40 to 75 percent (which is atypically high). To determine adjusted outage values, the percentage for any given hour is applied to the nameplate outage value for that same hour. For example, if the reported nameplate outage value for the 5:00 AM hour was 3200 MW, and the percentage output was 50 percent, the adjusted outage value is 1600 MW. This value more realistically represents the additional wind power that would have been supplied to the ERCOT grid had it not been for the wind farm outages and derates.

Although this method does not take into account the fact that the wind speed at a specific location where a forced outage has occurred may or may not correlate with the average value, any errors at individual locations should tend to offset one another. The method also assumes that the reports of forced outages and derates were made on a timely basis, which may or may not have been the case.

(cont'd)

Adjusted Capacity

NERC used 8.7 percent of nameplate capacity in calculating the contribution of wind power to existing generation in its 2010-2011 Winter Assessment of the TRE region. This is a planning number that has merit for the seasonal overview, but is not applicable to the high wind conditions of February 1through February 2. Therefore, in determining the wind power capacity in ERCOT for purposes of this inquiry, the task force multiplied the total installed capacity of 9321 MW by the percentage of output actually achieved by those facilities that remained in service, compared to nameplate capacity. The resulting adjusted capacity represents what the total wind power output would have been in ERCOT had there not been any outages or derates during February 1 through February 2. Since the percentage varies with the wind speed, adjusted capacity values were calculated hourly. At 8:00 AM on February 2, the percentage of output vs. nameplate was 57 percent, yielding an adjusted capacity of 5313 MW (0.57 x 9321 MW). This number was then used as wind power's contribution to the total generation fleet. Counting all units, both online and off, that total came to 79,658 MW for the 8:00 AM hour. (Since the adjusted capacity value changes hourly based on wind speed, so too will the numerical size, in MWs, of the total generation fleet.)

The Load Shed Decision

Load shedding is implemented to correct an electrical power imbalance if load exceeds supply and system operators cannot bring the system back into balance through other measures. Load shedding may be used to reduce an overload condition (such as when thermal limits on a transmission line are exceeded), to recover from an under-frequency condition, or to return voltage to a normal level. The operation can be manual (operator-initiated) or automatic (relay- initiated), depending on how quickly the frequency is decaying or the voltage is falling. For slowly declining frequency or voltage issues, the manual option is usually chosen. For rapidly declining frequency or voltage, the automatic option will respond without operator intervention.

ERCOT utilized operator-initiated load shedding on February 2, which preserved the system's ability to implement automatic load shedding had system conditions continued to deteriorate. Had ERCOT not instituted manual load shedding, automatic under-frequency load shedding would have been a last resort before a possible system collapse. Manual load shedding also helped raise the frequency levels, preventing damage to generator turbines.

The task force considered the question of whether ERCOT's decision to manually shed load prevented more extensive blackouts than were experienced as a result of the load shed itself. While a definitive answer would require extensive

modeling and data inputs, the task force concluded, based on the information available, that ERCOT's declaration of an EEA 3 probably prevented widespread, uncontrolled blackouts throughout the ERCOT Interconnection. Because ERCOT operates as a functionally separate interconnection from its neighboring Eastern and Western Interconnections and is linked only by asynchronous ties, the blackouts would not have propagated further.[124]

Frequency Response and Automatic Under-Frequency Load Shedding

Frequency as a measure of the reliability status of a power system can be likened to pulse or heart rate as a measure of human health. It provides a key indicator of the overall integrity of operations. Maintaining frequency requires balancing a system's aggregate generation output to load moment-to-moment. It also requires having sufficient reserves available at all times to withstand the sudden loss of the largest generator on the system, in order to instantaneously make up for the loss of power and thus reestablish balance.

In spite of the enormous amount of generation that was forced off line in successive waves in ERCOT on February 1 and February 2, especially during the overnight and early morning hours between the two days, the overall frequency response of the system was not problematic during the event. Nonetheless, the need to maintain frequency to prevent a collapse of the system was the fundamental driving force behind ERCOT's decision to shed firm load.

Because ERCOT is not synchronously connected to either the Eastern or Western Interconnections, all frequency response must come from internal resources. And because ERCOT is smaller than the other interconnections, the loss of a generator results in a steeper frequency decline, necessitating a more robust frequency response. For this reason, in 1988 ERCOT established a minimum responsive reserve requirement of 2300 MW, based on an N-2 criterion covering the loss of the two largest generators in ERCOT (one nuclear-powered unit and the next largest unit on the system). This is a larger reserve than the N-1 criterion required by Reliability Standard BAL-002-0 R3.1. On the morning of

(cont'd)

[124] NERC has prepared a study on the reliability implications of the February cold weather event entitled "Analyses of Reliability Impacts on the Bulk Power System." The study discusses the impacts on the WECC Interconnection of the events in SRP, EPE, and PNM, and presents an analysis of frequency response performance during the event by the Eastern Interconnection and the ERCOT Interconnection. NERC plans to make the study publicly available.

February 2, 2011, the largest single contingency was an online nuclear-powered generating unit with a capability of 1354 MW.

ERCOT maintains and closely monitors its responsive reserve levels (also referred to by ERCOT as its Physical Response Capability, or PRC), to comply both with its own 2300 MW criterion and with the 1354 MW minimum criterion.

ERCOT relies on demand side load resources to provide up to 50 percent (1150 MW) of its 2300 MW responsive reserve requirement. These resources automatically disconnect when the frequency declines to 59.7 Hz. The purpose of the responsive reserves, both generation and load, is to arrest frequency declines before they reach 59.3 Hz (the trigger threshold for the first block of automatic under-frequency load shedding (UFLS)), and to restore frequency to 60 Hz within a few minutes following an event. Should either generation or load resources be deployed manually by system operators, they are no longer available to provide frequency response.

Between 5:15 AM and 1:20 PM on February 2, responsive reserves dropped below the 2300 MW N-2 criterion three separate times, of varying durations. Ultimately, responsive reserves dropped below the 1354 MW N-1 criterion. This occurred six separate times between 5:23 AM and 11:15 AM, for a combined total of 134 minutes, with the longest interval being 73 minutes. During the times when responsive reserves were below 1354 MW, had the largest generator tripped, reserves would have been insufficient to reestablish the balance between generation and load. The result would have been an inexorable decline in frequency which, when it reached 59.3 Hz per second, would have triggered the first block of automatic under-frequency load shedding, which would have dropped five percent of the system load, or roughly 2600 MW.

Even though the under-frequency load shedding would have tripped automatically, this response would have taken out firm load and would be in addition to any firm load that operators may have already shed, starting with the first directive ERCOT issued at 5:43 AM. Depending on the particular circumstances surrounding the moment of activation of the automatic under-frequency load shedding, it is possible that an overvoltage condition could have occurred in one or more localized areas, that frequency could have significantly overshot the 60 Hz norm, or that other electrical perturbations could have developed that would have resulted in the tripping of even more generation. Only a detailed dynamic simulation could answer the question as to how widespread the February 2 blackout would have been had the automatic under-frequency load shedding been triggered.

ERCOT's Black Start Capability

If the load shed had not prevented an ERCOT-wide blackout, the outages would not only have been more widespread, they might have been of a much longer duration. The task force reviewed the state of ERCOT's black start units to determine whether they could have promptly brought the system back had a collapse occurred. "Black start" refers to restarting the system after a major portion of the electrical network has been de-energized, and generators that have black start capability are those that can be started independently and without external power.

ERCOT has 15 primary and six alternate black start generators. During the event, roughly half of these generators were unavailable: two (totaling 97 MW of capacity) were on planned outage; four (totaling 141 MW) failed to start due to the extreme cold weather; three (totaling 423 MW) tripped offline after starting due to freezing equipment; and one (26 MW) tripped offline due to natural gas fuel curtailment. Had a total blackout of the ERCOT system occurred, the unavailability of 10 of ERCOT's 21 (primary and alternate) black start resources, comprising 687 MW out of a total 1150 MW of black start capacity, could have jeopardized ERCOT's ability to promptly restore the system.

The Load Shed Process

ERCOT accomplishes a controlled load shed by issuing directives to its transmission providers,[125] ordering the load shed to proceed in defined blocks of power (each transmission provider being responsible for its allocated share of the total). On February 2, ERCOT issued its first load shed directive at 5:43 AM and its third and last at 6:23 AM. In total, it directed that 4000 MW be shed.

ERCOT began load restoration at 7:57 AM, and firm load was fully restored at 1:07 PM.

[125] "Transmission provider" is a generic term. ERCOT uses "transmission service provider" to mean an entity that owns or operates transmission facilities to transmit electricity and provide transmission service on the ERCOT grid. NERC uses different terminology to describe the various types of transmission providers, including "transmission service provider," "transmission operator," and "transmission owner." (The definitions of these terms can be found in the appendix entitled "Categories of NERC Registered Entities.") Under NERC terminology, ERCOT is the only "transmission service provider" for its Interconnection. To avoid confusion, the term "transmission provider" will be generally used in the narrative portions of this report to refer to any of those various categories of entities who provide transmission service and who were directed to shed load and took the necessary actions to do so (including load shedding both within and outside of ERCOT).

The actual load shed process and eventual restoration of the system to an EEA 0 state[126] proceeded as follows:

ERCOT issued its first instruction at 5:43 AM, ordering a load shed of 1000 MW. Shortly thereafter, ERCOT also deployed 384.2 MW of Emergency Interruptible Load Service, ERCOT's form of demand response.[127]

At 6:04 AM ERCOT directed the transmission providers to shed an additional 1000 MW of load. In the next second, 6:05 AM, ERCOT's frequency dropped to 59.576 Hz, its lowest point during the event.

At 6:23 AM ERCOT issued its third and last load shed directive, directing the transmission providers to shed an additional 2000 MW. This resulted in a total load shed directive of 4000 MW.

As the transmission providers were implementing ERCOT's directives to shed load, additional generation became unavailable; between 5:45 and 6:30 AM, 18 generating units tripped offline, were derated, or failed to start, totaling 1643 MW of output. (During this same time, 12 units came back online, totaling 774 MW.)

At 6:25 AM, ERCOT's reserve level dipped to 447 MW, its lowest point of the day.

At 6:59 AM, ERCOT issued a media appeal for energy conservation. This was the first notification to the public of the problems ERCOT was experiencing on its system.[128]

At 7:57 AM, ERCOT issued its first load restoration directive, beginning with a 500 MW block. Three seconds later, a combined cycle unit loaded at 77

[126] "EEA 0" signifies a normal state of operation.

[127] While some EILS customers failed to reduce load as contracted (thus exposing themselves to potential penalties), others responded with a load reduction in excess of their contracted amount. The net result was that total EILS load reduction fell short of obligated levels on February 2 in only one fifteen-minute interval.

[128] ERCOT has acknowledged that it could improve its communications with the general public, which it suggests could be accomplished through use of an automated system for contacting the media, deployment of representatives to meet with the media, and through designation of supplemental communications staff to answer phone inquiries during a period of emergency.

MW tripped offline, causing reserve levels to again fall below 1354 MW. However, ERCOT did not shed any additional load.

At 8:22 AM, ERCOT directed the transmission providers to restore another 500 MW block of shed load. ERCOT would issue six more load restoration directives over the course of the next several hours, completing the process at 1:07 PM.[129]

At 8:53 AM, ERCOT deployed an additional 83.5 MW of EILS, at which point reserves increased above the 1354 MW limit.

At 9:25 AM, ERCOT called all QSEs and instructed them not to take any resources offline unless so instructed.

Additional units, including an 849 MW coal unit, continued to trip offline. At 10:58 AM, reserves again dropped below the 1354 MW limit. This situation lasted until 11:15 AM.

At 12:12 PM, ERCOT reported to the QSEs that the Texas Commission on Environmental Quality (TCEQ) had issued a waiver for certain air permitting requirements that might otherwise have prevented generators from producing power during the emergency. (The TCEQ's actual communication did not mention a waiver, but rather indicated it would exercise its "enforcement discretion.")

At 1:57 PM, ERCOT recalled RRS Block 2 Load Resources (463 MW).

At 2:01 PM, ERCOT returned to a state of EEA 2B.

At 2:55 PM, ERCOT recalled RRS Block 1 Load Resources (437 MW).

At 3:14 PM, ERCOT returned to a state of EEA 2A. Reserve levels rose to approximately 2900 MW.

At 7:15 PM, ERCOT set a record winter peak demand of 56,480 MW.

On February 3, at 10:00 AM, ERCOT declared a state of EEA 0 and recalled all EILS loads.

[129] Directives were issued in 500 MW blocks at 9:25 AM, 11:39 AM, 12:04 PM, 12:25 PM, 12:49 PM, and 1:07 PM.

Summing every transmission provider's peak load shed amount (which did not occur at the same time), the cumulative load shed on February 2 was 5411.6 MW. The largest amount of load shed at one point in time (8:02 AM) was 4947.9 MW.[130]

The load shed process by ERCOT's transmission providers is discussed below.

Conduct of the Load Shed by ERCOT's Transmission Providers

ERCOT communicated its oral dispatch instructions to shed load via hotline calls. The percentage of the total requirement that is to be shed by each transmission provider is based on the transmission provider's previous year peak load, as reported to ERCOT.[131] Under ERCOT's Nodal Operating Guides, transmission providers have 30 minutes to shed their required share of load if the curtailment is implemented remotely by SCADA system, and one hour if implemented by dispatch of personnel into the field to manually disconnect feeders.[132]

Load Shed Program Design

Each transmission provider in ERCOT is responsible for determining how load will be shed in order to meet its load shed obligation.[133] The larger transmission providers interviewed by the task force make use of automated systems for shedding load. All transmission providers interviewed pre-designated feeders or blocks that are available for manual load shed. Transmission providers generally take into account the following factors in setting up their load shed system:

---

[130] Based on TRE data supplied to the task force. (This number does not include Greenville, for which comparable data was not available. Adding 8.8 MW for Greenville would bring the total to 4956.7 MW).

[131] See ERCOT Nodal Operating Guides: Emergency Operation § 4.5.3(5) (July 1, 2011), *available at* http://www.ercot.com/mktrules/guides/noperating/cur.

[132] *Id.* at § 4.5.3(7)(a)-(b). These time frames do not apply if the load shed directive exceeds 1000 MW, as was the case for ERCOT's last load shed instruction on Feb. 2, 2011. *Id*. at § 4.5.3(7)(c).

[133] Actual implementation of load shedding is carried out at the distribution level, which may be done through a separate division of the transmission provider or through a separate, affiliated entity (*e.g.*, a member distribution cooperative of a generation and transmission cooperative). This extra layer of communication appears to have caused some delay in the initiation of the load shed process in at least some cases.

1. Minimizing customer disruptions through target outage rotation periods. Transmission providers interviewed utilize a load-shed scheme with a targeted rotation period between 15 minutes at the low end and 30-45 minutes at the high end. During the February 2 event, transmission providers reported difficulties maintaining a short (15-minute) rotation period over the course of the morning, as ERCOT raised their load shed obligation to the highest levels most transmission providers had experienced. Transmission providers reported having to go through their rotation schedule multiple times, and some transmission providers expressed concern that a limited number of customer groups had to carry a disproportionate amount of the load-shed burden.[134]

2. Avoidance of feeders or lines reserved for under-frequency load shedding (UFLS) requirements. All transmission providers interviewed indicated that UFLS blocks[135] are not generally included as available feeders for manual load shedding under their load shed procedures. However, one transmission provider discovered during the February 2 load shed event that some lines designated as available for manual load shed were also designated for UFLS. Except for this one overlap in blocks, the transmission providers interviewed were able to fully meet their load-shedding obligations while maintaining the required 25 percent of load reserved for UFLS. There were no reported instances of automatic under-frequency trips during the February 2 event.

3. Exemptions for critical customers. Transmission providers utilize a variety of approaches for identifying critical customers or loads that are either exempt from rolling outages or are given a higher priority for preservation of service. Customers that typically receive some form of exemption or higher priority include hospitals, airports, and

[134] TRE Report at 41; materials provided to the task force by transmission operators.

[135] Distribution service providers in ERCOT are required to set up relays to automatically trip load as frequency falls, as follows: (1) at 59.3 Hz, a minimum of 5 percent of load must trip; (2) at 58.9 Hz, an additional 10 percent of load must trip; and (3) at 58.5 HZ, an additional 10 percent of load must trip, *i.e.*, the distribution service providers must have at least 25 percent of its load available for UFLS. (This is independent of any manual load shedding directives.) ERCOT Nodal Operating Guides Section 2: System operations and Control Requirements at 2.6.1(1) and (2). Some transmission providers use these same blocks of load for automatic under-voltage protection. (Note that NERC uses the term "distribution provider" to describe this type of entity. This report will use the term "distribution service provider" throughout to avoid confusion.)

other facilities that may affect public safety, such as police stations.[136] Some transmission providers interviewed indicated that they have a process for checking with gas customers for possible critical loads, such as gas compressor facilities without backup generation. But most acknowledged that the process for identifying "critical" gas facilities could be better standardized or otherwise improved.

4. Exemption of large loads and networks needed for system stability. Major downtown areas are generally exempted from the load shed plan, as cutting off service to these heavily networked systems could affect system stability. Large, high-voltage industrial loads are also generally not available for manual load shedding due to system stability concerns.[137]

After taking into account UFLS blocks, critical/exempt customers, and other load that is not appropriate for manual load shedding, the interviewed transmission providers indicated that they had between 30 percent and 70 percent of their total load available for manual load shedding.

Experience on February 2, 2011

The transmission providers' overall load shed response (in MW) was beyond the minimum required by ERCOT and was adequate to protect system frequency.

Most of the larger transmission providers interviewed were able to shed load within a few minutes of receiving each ERCOT directive, and utilized some form of automated system for shedding load. These systems were designed to

[136] The State of Texas also requires transmission providers and distribution service providers to provide notification of interruptions or suspensions of service under certain conditions (set out in their retail delivery tariffs) to customers that meet the criteria for designation as a Critical Load Public Safety Customer (hospitals, police stations, fire stations, and critical water and wastewater facilities), Critical Load Industrial Customer, Chronic Condition Residential Customer, or Critical Care Residential Customer. 16 TEX. ADMIN. CODE § 25.497 (2011).

[137] Some of these high-voltage industrial loads may be under contract as Emergency Interruptible Load Service (EILS) or providing ancillary services (RRS) as Non-Controllable Load Resources (NCLR). *See* TRE Report at 42-44. In such case, those resources would be (and were) called upon by ERCOT through the relevant QSE (at 5:49 for EILS and at 5:20 for NCLR), something that is not communicated to or controlled by the transmission providers or distribution service providers.

look at actual load on the feeders in real time, and were designed to rotate customer blocks by restoring service feeder-by-feeder as the pre-determined rotation period expired. These systems were also designed to ensure that the total curtailment obligation is maintained or exceeded at all times, by restoring a given feeder only *after* another feeder or feeders with off-setting load have been dropped in the next block. At least one of the automated systems in use during the event was designed to take into account cold load pickup prior to restoration of feeders,[138] and therefore may have generated a greater reported level of over-shedding for limited periods of time during the rotation process.[139]

Other transmission and distribution service providers used less sophisticated methods for shedding load during the event, including having a dispatcher record load amounts prior to dropping a given block to calculate the total amount to be reported to ERCOT as having been shed, and using color-coded circuit maps to select lines to be shed.

All but four transmission providers were able to meet or exceed their load shed obligations within 30 minutes of each oral dispatch instruction from ERCOT. Three of the four transmission providers did meet their full load shed obligations at a later point in time. The fourth transmission provider contended that it had not received the dispatch instruction.

Effect of Load Shed on Gas Delivery or Supply

At approximately 8:00 AM on February 2, ERCOT notified all transmission providers that gas companies were reporting low gas pressures, and requested that they confirm that no gas company feeds were included in their

[138] Cold load pickup is a phenomenon that takes place when a distribution circuit is re-energized following an extended outage of that circuit. Cold load pickup is a composite of two conditions: inrush and loss of load diversity. *Cold Load Pickup Issues: A Report to the Line Protection Subcommittee of the Power System Relay Committee of the IEEE Power Engineering Society*, May 16, 2008, § 2.1, at 3, *available at* http://www.pes-psrc.org/Reports/Cold_Load_Pickup_Issues_Report.pdf .

[139] One transmission provider's automated system includes an expectation of a 60 percent increase in load on any feeder coming off of its pre-determined outage period, and therefore requires that feeders in the next block must cover the expected increase before the first feeder can be restored. That transmission provider did report peak load shed amounts well above its requirement (about 49 percent over the required amount at one point), but attributed the reported over-shedding to several factors in addition to the cold load pickup assumptions used, including (1) restoration failure of a certain percentage of breakers; and (2) loads that did not come back on-line until manually re-set, including certain gas compressors.

outage rotation feeders.[140] At 9:25 AM, as part of its third directive to restore 500 MW of load, ERCOT requested that transmission providers serving west Texas concentrate their restoration efforts in that region due to concerns about the impact of the outages on gas compressor facilities. At 10:45 AM, ERCOT notified some transmission providers that gas compressor stations in two west Texas counties were still without power, and requested that service be restored to those counties as soon as possible.[141] In addition, some transmission providers reported additional requests from ERCOT about restoring power to specific gas facilities or regions, but noted that ERCOT did not appear to have reliable or current information as to which transmission or distribution service provider was providing electric service to those facilities.

The task force found that transmission providers currently have only limited information on overall system conditions in ERCOT, and in real-time can typically see nothing more than ERCOT's responsive reserve (PRC) levels and the status of generators connected to the transmission provider's own system. Many transmission providers indicated that they could perform better with respect to load shedding, particularly in increasing staffing and providing notice to the public, if they are able to get information about deteriorating system conditions from ERCOT earlier in the process.

Some transmission providers indicated they are already working on improvements to their public notification protocols, and believe that certain sensitive loads (including loads with back-up generation) could have benefitted from earlier notification of potential outages.

The task force also found that transmission providers with annual training programs, particularly those that require use of hands-on simulations or drills, tended to perform well during the February 2 load shedding event. Transmission providers with less frequent training, or that fail to simulate expected conditions during a load shed event, tended to have more problems with timely implementation of the required curtailment. Automated systems for shedding load may be helpful for larger transmission providers, but do not appear to be necessary

[140] One transmission provider reported that, upon receiving ERCOT's notice, it restored power to facilities believed to be compression facilities; these were later determined to be regulator stations, for which restoration of power would not affect pipeline pressure.

[141] ERCOT directed one transmission provider to restore power to five specific counties in north/central Texas due to concerns about affected gas facilities, which restoration could only be done by working outside the automated outage rotation system to identify each feeder or circuit serving those counties.

for successful implementation of a load shed program under ERCOT's current time requirements for implementation.

Price Effects of the Cold Weather Event

As discussed in the section of this report entitled "The Electric and Natural Gas Industries," ERCOT is an energy-only market. This type of market relies on scarcity pricing to provide price signals for the addition of needed resources. ERCOT transitioned from a zonal market to a nodal market in December 2010, and as part of its preparation for that transition, adopted rules in 2006 that included a Scarcity Pricing Mechanism that relaxed the then-existing system-wide cap of $1,000 per MWh. ERCOT did this by gradually increasing the cap in accordance with a defined schedule to $1,500 per MWh on March 1, 2007, to $2,250 per MWh on March 1, 2008, and finally to $3,000 per MWh on February 1, 2011, two months after the implementation of the nodal market and, as it happened, on the day before the severe weather impacts caused ERCOT to shed load.[142]

The rapidly dwindling supply of generation on February 2 created a scarcity event and, not surprisingly, caused prices to spike. By 4:55 AM, prices had reached a sustained level of $3,000 per MWh.[143]

These high prices, coupled with the fact they occurred the day after the price cap had been raised to $3,000 per MWh, fueled speculation that market manipulation may have been a factor. Such speculation was probably exacerbated by certain instances of past high prices, as well as two studies finding the existence of market power in the ERCOT markets.

In 2001, prices rose to the $1,000 per MWh cap on the first day of operation of ERCOT's pilot zonal market.[144] During the winter storm of February 2003, high prices of $990 per MWh in the balancing market and $967 per MWh in the ancillary service market were later determined to have been partially caused by "hockey stick bidding."[145] According to two studies evaluating behavior in the

ERCOT balancing market, large firms were found to have exercised unilateral market power between 2001 and 2003.[146] And in March of 2008, two days after the market cap rose to $2,250 per MWh, prices hit the cap for three consecutive 15-minute intervals.[147]

Given these historical events, suspicions concerning the causes of the high prices on February 2 were understandable. The Executive Director of the PUCT directed the IMM for ERCOT, Potomac Economics, Ltd., to investigate whether there was any evidence of market manipulation or market power abuse.

In its April 21 report to the PUCT, the IMM concluded there had not been any market manipulation during the cold weather event on February 2. The IMM further concluded that the ERCOT real-time and day-ahead markets operated efficiently, and that the shortage conditions were properly accompanied by scarcity level pricing, a phenomenon consistent with ERCOT's energy-only market design.[148]

The IMM reached its conclusion by examining whether there had been any economic or physical withholding. The IMM's test for economic withholding was to determine whether energy had not been produced when the capacity would have been economic, given the prevailing price. Since all available capacity was being utilized when prices spiked, the IMM concluded there had been no economic withholding.[149] The IMM's test for physical withholding was to determine whether resources were made unavailable that were actually capable of providing energy and were economic at prevailing market prices. This determination

---

involves offers of a small, expendable quantity of energy or capacity well in excess of its marginal cost, which can set the marginal clearing price at times of short-term demand when all offers must be accepted. [149] *Id*. at 8-9.

required a review of the causes of outages and derates. After conducting this review, the IMM found no evidence that the outages and derates were caused by anything other than the physical inability of the generators to produce power.[150]

The IMM observed that the scope of the outages and derates was widespread in geography, generating unit type, and by class of market participant.[151] It also observed that those market participants that were able to operate their generation fleet at greater than 90 percent availability during the morning of February 2 were financially successful that day, and the market participants affected by significant generation outages were unprofitable.[152] Furthermore, those market participants that lost significant generating capacity and were unprofitable on February 2 did not achieve gains on February 3 that significantly exceeded the previous day's losses, despite high day-ahead prices.[153] These findings suggested to the IMM that market participants had every incentive to offer their units' capacity into the market, had they been physically able to do so.

Based both on the IMM's study and on the task force's independent evaluation of the causes of the generator outages, there does not appear to be evidence that the high prices on February 2 were the result of market manipulation. Rather, they appear to be the natural result of scarcity pricing in an energy-only market.

Rio Grande Valley Event: February 3-4

In addition to the ERCOT-wide load shed on February 2, ERCOT experienced more localized difficulties on February 3 and February 4 that necessitated local load shedding. The area affected was the southernmost tip of Texas along the Rio Grande River, designated as the Lower Rio Grande Valley (LRGV).

The weather in the LRGV is typically mild. Temperatures in February for Brownsville, the largest city in the LRGV, average a high of 72 degrees and a low of 53 degrees. For February 2011 as a whole, Brownsville had a high of 90

[150] *Id*. at 12.

[151] *Id*. at 10.

[152] *Id*. at 14.

[153] *Id.*

degrees; on February 3, however, the high reached only 36 degrees, with a low of 28 degrees.[154]

Load in the LRGV generally exceeds available local generation, making the area dependent on imports. The Rio Grande Valley import capability consists of a group of five elements, three 138 kV and two 345 kV transmission lines, owned and operated by American Electric Power (AEP), that allow for the import of energy into the LRGV area. The Rio Grande Valley import limit is a contingency import limit based on the loss of either of the two series compensated 345 kV lines that transmit electricity into the LRGV. The contingency limit is 1200 MW, with economic redispatch occurring at 1100 MW. This limit was exceeded for short periods during the evening hours of February 2, and for over 30 consecutive hours beginning on February 3 and concluding on February 4.

Two types of events can trigger load shedding to prevent an uncontrolled loss of load: under-frequency and under-voltage. Under-frequency load shedding is designed to rebalance load and generation within an electrical island following a system disturbance. Under-voltage load shedding is designed to prevent local area voltage collapse. While the ERCOT-wide February 2 event was the result of under-frequency concerns, the issue in the LRGV was one of under-voltage. Had the entities in the LRGV not implemented manual load shedding on February 3, a subsequent contingency could have resulted in the activation of automatic under-voltage load shedding.

On February 3, the LRGV area hit an all-time winter peak demand of 2734 MW.[155] A total of 829 MW of local generation was on scheduled outage that day, and the picture was further complicated by the loss of the three Frontera units, totaling 486 MW. The two Frontera combustion turbines CTG-1 and CTG-2 tripped due to frozen control equipment pneumatics at 9:47 PM and 9:59 PM, respectively, followed by the steam turbine CTG-3 at 10:00 PM. The import limit of 1200 MW had already been exceeded, beginning at 6:23 AM. When the three Frontera units tripped in rapid succession, the import level rose to 2074 MW (172.8 percent of the limit of 1200 MW). Additionally, the bus voltages at some substations dipped to 91 percent to 93 percent of nominal, which is outside the normal AEP Texas operating voltage range of 95 percent to 105 percent nominal. (The automatic under-voltage load shedding system in the LRGV activates when the voltage declines to 90 percent for three seconds.)

---

[154] Weather Underground, *Almanac for Brownsville*, http://www.wunderground.com/history/airport/KBRO/2011/2/3/Daily History.html.

[155] Texas Reliability Entity, *Event Analysis: February 3-4, 2011 Lower Rio Grande Valley Load Shed Category 2f.1 Event* at 4 (April 15, 2011) (LRGV Event Analysis Report).

The transmission providers for the LRGV area are AEP, Public Utilities Board of Brownsville (BPUB), and the South Texas Electric Cooperative (STEC). AEP had previously developed a procedure with ERCOT, STEC, and BPUB that specified the load allocation for any necessary manual load shed in the event of the loss of one of the 345 kV transmission lines. The entities decided to use that plan for this event, even though it was not caused by the loss of a line but rather by the loss of Rio Grande Valley generation. AEP initiated the load shedding and the three entities each manually shed their portion of the target 300 MW load shed, beginning the process at 10:06 PM on February 3.[156] The maximum actual load shed of 459.5 MW occurred at 10:59 PM. (Power was fully restored to most customers in the early morning hours of February 4.)

Approximately 115,000 customers were affected by the rolling blackouts, with AEP contributing 60 percent of the load shed obligation and BPUB and STEC each contributing 20 percent. The task force determined that load shedding was executed well by all three entities and the required levels of load shedding were reached within ERCOT's specified 30-minute period. The entities attempted to rotate the load shed through different circuits, but due to the size of the allotments of BPUB and STEC relative to their total load, as well as the number of critical loads on their systems, the rotation periods for each circuit of load shedding were longer than desired and more frequent than during the ERCOT-wide load shed of February 2.

Some of the transmission providers in the LRGV region expressed concerns about communications with ERCOT. AEP initiated the first phase of the load shed and then requested ERCOT to notify the other transmission providers to shed their portion, as opposed to ERCOT directing the simultaneous shedding of load. As a result, AEP proceeded alone for the first phase of the load shed. The transmission providers also observed that a public announcement made by ERCOT on February 3, advising customers that further outages appeared unlikely, did not accurately reflect the situation in the LRGV and complicated the conduct of their localized load shed.

The task force concluded that in order to prevent similar problems in the future, additional generation or transmission lines are needed to reinforce the LRGV area. This is in accord with ERCOT's Regional Planning Group analysis, which concluded that there is a need for transmission or market solutions in the LRGV to meet forecasted load beyond 2014.[157] AEP Service Company has

[156] LRGV Event Analysis Report at 20.

[157] *Lower Rio Grande Valley (LRGV) 345 kV Project Analysis*, ERCOT (May 13, 2011), http://www.ercot.com/content/meetings/rpg/keydocs/2011/0513/ERCOT_Lower_Rio_Grande_Valley_345_kV_Project_Analysis.pdf.

proposed a new 345 kV transmission line from the Laredo area into the LRGV; however, improvements at this time are in the early planning stages.

February 10, 2011

In analyzing the implications of the February 2 blackouts, it is instructive to compare that day with February 10, when ERCOT did not shed either firm or interruptible load despite setting a new winter peak.[158] Cold weather was again expected on that day, and actual temperatures in the ERCOT region averaged a low of 19 degrees with a 12 degree wind chill. (This compares to a low on February 2 of 19 degrees with wind chill of 4 degrees; however, low temperatures during the earlier event were more persistent, remaining in the low twenties for four days with wind chills between 10 and 14 degrees.) The average high temperature in the ERCOT region on February 10 was over 42 degrees (compared to an average high between February 2 and February 5 that remained below freezing).

ERCOT avoided service interruptions on February 10 largely because there were far fewer forced outages. ERCOT reports that 11 units, totaling 2160 MW of generation, were forced offline at some point during the day. The biggest difference between February 2 and February 10 was the number of units forced offline on February 2 just during the early morning hours. The cumulative net outages on that morning exceeded 14,700 MW,[159] whereas for the entire day on February 10, only 2160 MW were forced offline. The equivalent total outages for the entire day of February 2 was 21,400 MW, a ten-fold difference.

The majority of the forced outages in ERCOT on February 2 were weather-related, while on February 10, few were weather-related (those few were the result of frozen valves, a frozen transmitter and automatic temperature cut-offs at some wind farms). Representative causes of forced outages on February 10 included control issues, a condensate pump that was out of service, the loss of a vacuum pump, a low head level in a cooling lake, frozen valves, low gas header pressure, and a boiler tube leak.

There appear to be three reasons ERCOT was not forced to shed load on February 10: repairs made and protective measures taken during the event of February 2 remained in place; the temperatures on February 10 were not quite as

---

[158] The peak of 57,915 MW occurred at 7:15 AM.

[159] "Cumulative net outages" subtracts out those units that were successfully brought back online.

cold and the cold temperatures were of shorter duration; and the wind chill was, in the main, not as severe.

In interviews with the task force, generator operators mentioned that on or after the earlier event they had installed wind breaks, including tarps or enclosures, added portable heaters or heat lamps, repaired or added insulation, and repaired or added heat tracing. One generator changed its procedures for monitoring the reliability of its heat tracing. Some generators also continued their increased level of staffing to address freeze protection issues, and others changed elements of their control logic to prevent units from automatically tripping.

Some of the vulnerabilities identified and addressed the week before included re-routing piping or moving vulnerable equipment, correcting transformer oil levels at wind farms, and adding freeze-resistant chemicals. At least five generators kept units running, started units earlier or took other measures to keep from having a cold start. After so many static sensor and other lines froze the week before, some units left water lines draining, or took other measures to keep water flowing.

The storm on February 10 was concentrated in Oklahoma and northern Texas, unlike the more widespread storm of February 2. Temperatures by and large were somewhat less severe, especially during the day when they rose above freezing. A number of generator operators told the task force that the difference in temperatures and the shorter duration of the cold spell on February 10 were significant factors in the improved performance of their units.

Lastly, the wind chill in some areas was not as extreme on February 10 as during the preceding week. Some generator operators cited the lower wind speed as a significant factor in their improved performance, an assessment with which ERCOT concurred.[160]

Salt River Project

ERCOT was not the only entity in the Southwest that was forced to shed load during the storm of February 1 through February 5. SRP shed 300 MW of load on February 2, affecting 65,000 customers. However, only some of the generation losses leading to SRP's load shed were weather-related.

[160] Of special interest to wind units was the absence of precipitation that would ice their turbine blades. Several wind farm operators mentioned this absence as a factor in their improved performance.

SRP's problems began at 6:54 PM on February 1, when Unit 1 at the Navajo Generating Station (NGS) in Page, Arizona, tripped offline.[161] Page was experiencing colder than average temperatures, reaching a high of 36 degrees and a low of 17 degrees, and facing average wind speeds of 10 miles per hour. NGS Unit 1 tripped due to these freezing conditions when a sensing line leading to a waterwall pressure transmitter froze. The trip resulted in a loss of 330 MW of generation for the SRP balancing authority area.[162]

In response to the trip, SRP called on the SRSG for assistance and imported its allowed amount of 170 MW. It also deployed 80 MW of spinning reserves and curtailed 48 MW of interruptible load. At 8:10 PM, SRP restored the interruptible load.

To make up for the loss of NGS Unit 1, SRP's system operator scheduled Santan Generating Station (SGS) Unit 6, a 275 MW combined cycle unit (consisting of a combustion turbine and a steam turbine), to start at 5:00 AM on February 2 (it had not been included in SRP's day-ahead plan). Understanding that it might need additional generation on February 2, SRP also decided to keep SGS Unit 5, a 570 MW unit, online for the following day.

On February 2, SRP's difficulties resumed at 2:56 AM, when Coronado Generating Station (CGS) Unit 2, which is coal-fired, tripped offline due to a non-weather related mechanical problem with its coal pulverizers. Although the unit was running at only 130 MW at the time of the trip, it was scheduled for its full 389 MW output for the morning peak. The loss of CGS Unit 2 also tripped Coronado 500 kV breakers 945 and 948.

SRP lost another 75 MW at 3:20 AM, when Unit 4 at the Four Corners Power Plant (FC) tripped due to control valve problems (all 750 MW of the unit was lost, of which SRP has a ten percent share). The FC unit trip was weather-related and occasioned by frozen sensing lines. SRP dispatched SGS Units 1, 2, 5 and 6 to replace the loss of FC Unit 4 for the morning peak.

SRP was able to close the Coronado 500 kV breaker 945 at 4:21 AM, and brought Coronado 2 back online. Shortly thereafter, at 5:07 AM, SRP dispatched SGS Units 1 and 2 at 90 MW each to meet increasing system loads, and at 5:15 AM ramped SGS Unit 6 to 236 MW.

---

[161] Details are based on information provided to the task force by SRP.

[162] NGS Unit 1 is a 750 MW unit that is owned by the Salt River Project, U.S. Bureau of Reclamation, Los Angeles Department of Power & Light, Arizona Public Service, NV Energy, Inc., and Tucson Electric Power. SRP has a 21.7 percent ownership in the unit. NGS Unit 2, discussed below, has the same ownership structure and total output.

At 5:18 AM, SRP dispatched duct firing on SGS Units 5&6.[163] A few minutes later, at 5:22 AM, the SGS Unit 6 steam turbine tripped, although the unit's combustion turbine was able to continue supplying generation. The steam unit had an output of 80 MW. At this time, SRP system operators told the generator operators at SGS that they needed the steam turbine back online as quickly as possible. The system operators were not aware, and were not advised by the generator operators, that in order to get the steam turbine back online, the combustion turbine would have to be ramped down significantly. Between 5:22 AM and 5:44 AM, as a result of the ramping down of the combustion turbine, the output of SGS Unit 6 was reduced from 159 MW to 15 MW.

SRP experienced a flurry of activity between 5:22 AM and 6:00 AM. After the loss of the SGS Unit 6 steam turbine, SRP dispatched the Mormon Flat Hydro (MFH) Unit 2 to come online at 50 MW, interrupted 38 MW of instantaneous interruptible load, and at 5:30 AM dispatched Horse Mesa Hydro (HMH) Units 1, 2 and 3, for a total of 30 MW additional generation. SRP's system operators also directed its merchant group to purchase 100 MW for the 7:00-8:00 AM hour. At 5:31 AM, SRP called on MFH Unit 1 for 10 MW, and also requested that a large interruptible customer drop 100 MW of 10-minute interruptible load. At this point SRP's reserves were diminishing, and SRP used the interruptible load to increase its spinning reserves.

At 5:39 AM, SRP was able to bring SGS Unit 2 online at 92 MW, and at 5:40 AM, SRP's merchant group called on another interruptible customer to drop 29 MW of contracted interruptible load in the 6:00-7:00 AM hour. However, Tucson Electric Power contacted SRP at the same time to report that it had lost Springerville Unit 3, which diminished SRP's available capacity by another 25 MW. At 5:44 AM, SRP determined that SGS Unit 6 would not be able to return to service, resulting in a total loss of 236 MW of capacity.

SRP was able to bring on SGS Unit 2 online at 40 MW at 5:45 AM, and SGS Unit 1 at 40 MW at 5:57 AM. At 6:00 AM on February 2, SRP system load was running at 3557 MW, which was 161 MW higher than its day-ahead schedule.

At 6:02 AM, SRP dispatched Units 4, 5, and 6 at the Agua Fria Generating Station (AFGS), at approximately 70 MW each, to recover reserves and meet forecasted load. SGS Unit 2 also reached full load of 100 MW at this time. Two minutes later SRP dispatched Kyrene Generating Station (KGS) Units 5 and 6, at 60 MW each. Unit 6 was brought online at 6:11 AM and Unit 5 at 6:14 AM. SRP

[163] Duct firing is a process involving additional burners being fired for a heat recovery steam generator (HRSG) to increase steam production and output. The output of the burners combines with the hot exhaust gas from the gas-fired turbines to create steam.

dispatched the 41 MW KGS Unit 4 at 6:08 AM and HMH Units 1, 2 & 3 at 10 MW each at 6:09 AM. At this point all available SRP generating units were dispatched, and SRP purchased an additional 100 MW to begin at 6:20 AM.

SRP issued a Capacity Alert at 6:17 AM. (A Capacity Alert is an internal alert telling operators in the balancing authority that SRP believes that if another unit were to trip, the balancing authority would have trouble recovering.) A Capacity Alert is a precursor to a NERC EEA-1.

Five minutes later, NGS Unit 2 tripped due to frozen waterwall pressure sensing lines. The trip resulted in the loss of 350 MW for the SRP balancing authority area, and constituted the event that triggered load shedding. In response to the NGS Unit 2 trip, SRP again called on SRSG for assistance and was supplied with 128 MW, 82 MW less than anticipated. EPE, a neighboring balancing authority experiencing its own difficulties, told SRP that it could not deliver the assistance it was obligated to provide under the SRSG Agreement.

Immediately after the NGS Unit 2 tripped at 6:22 AM, SRP's system operator determined, based on the information available to him, that the remaining reserve and emergency assistance was insufficient to recover SRP's ACE in a timely manner.[164] The operator concluded that 300 MW of firm load needed to be shed to insure stable operations of the bulk electric system should additional generation trip offline. The system operator contacted its reliability coordinator, WECC's LRCC (Loveland Reliability Coordination Center), to notify it of the impending load shed. At 6:24 AM LRCC directed SRP (as transmission provider) to shed 300 MW. At the same time, KGS Units 5 and 6 reached full load of 62 MW each, and SRP's merchant group purchased 190 MW for the 7:00-8:00 hour.

At 6:29 AM, SRP called on the last of its 10-minute interruptible load, curtailing 136 MW. At the same time, SRP's distribution service provider initiated its rotating load shed program. Once initiated, load shed is to take place within one minute; however, SRP's distribution service provider encountered problems, requiring five full minutes to initiate the sequence. At 6:31 AM, LRCC declared an EEA 3 for SRP, which was seven minutes after SRP had initiated the shedding of 300 MW of load.

SRP reports that the 300 MW load shed event affected approximately 65,000 customers.

[164] ACE, or area control error, refers to the instantaneous difference between a balancing authority's net actual and scheduled interchange with other balancing authorities, taking into account the effects of frequency bias and correction for meter error.

Immediately after the load shed was initiated, SRP's ACE returned to normal. At this time SRP also restored its reserves to meet its SRSG reserve requirement. At 6:34 AM, Springerville Unit 3 tripped offline due to high furnace pressure, cutting 75 MW of generation (although this did not affect SRP's operations).

AFGS Units 4, 5 and 6 remained online and ramping to full load, and at 6:34 AM SRP's system operator instructed the distribution service provider to restore 100 MW of firm load. However, instead of restoring only the 100 MW, the distribution service provider mistakenly restored all 300 MW of the load that was shed. At 6:45 AM, the distribution service provider realized its mistake and, without further instruction, shed 200 MW of the load that had been restored. Prior to the second load shed of 200 MW, SRP's ACE had returned to normal.

At 6:52 AM, KGS Unit 4 came online and began ramping to full load, and the system operator directed the restoration of another 100 MW of shed load. At 6:55 AM, SGS Unit 6 returned to service and a minute later the system operator directed that the final 100 MW of shed load be restored. By 6:57 AM, approximately a half-hour after the initial load shed, SRP was able to restore service to its customers.[165] At 7:05 AM, LRCC declared a return to an EEA 0 condition effective as of 6:59 AM.

El Paso Electric Company

During the cold weather event, EPE experienced forced outages of all but one generator in its El Paso area fleet. Because of the significant loss of its local generation (six out of seven operational units) and the resulting loss of dynamic reactive support, EPE was limited in the amount of generation that could be imported on its transmission system.[166]

With limited import capability and limited local generation, EPE had to operate its system in such a way as to prevent cascading due to voltage instability. It was therefore necessary for EPE to reduce loads in its service area by manual load reduction. Load shedding occurred four times between February 1 and

[165] Although SRP had directed that all load be restored at this time, some of the distribution service provider's breakers would not close, leaving 4000 customers without service until 9:43 AM.

[166] EPE utilizes WECC Path 47 to import power from Palo Verde and Four Corners. The capability of this path is limited by post-contingency voltages. EPE can also utilize the Eddy DC tie in New Mexico to help regulate the flows on Path 47 by importing up to approximately 200 MWs from Southwestern Public Service (SPS) to the East.

February 4, totaling up to approximately 1023 MW and affecting 253,000 customers. Two of the load shed events occurred on February 2, one on February 3 and one on February 4 (all due to voltage instability concerns).

The four-day sequence of events is set forth below.[167]

Tuesday, February 1, 2011

On February 1, an arctic air mass moved in across the Las Cruces and El Paso area. Temperatures hovered in the low 40s between midnight and 4:00 AM, but dropped as the wind changed direction. The temperature dipped below freezing at approximately 8:51 AM and then plummeted into the middle teens by the late evening hours. Maximum temperature for the day was 43 degrees and the minimum was 14 degrees.

As the colder air moved in, gusty winds picked up in the late evening, measuring up to 26 mph at the El Paso International Airport. These gusts, combined with air temperatures in the middle teens, produced wind chill values below zero. The peak wind gust reached on February 1 was 43 mph (during the 1:00 AM hour).

Timeline of Events

- At 6:34 PM, the Coyote-Dell City 115 kV line tripped (reportedly as a result of gunshot damage to a conductor).
- At 8:07 PM, the first of EPE's gas-fired generators, Newman No. 3, tripped (loss of 40 MW).[168]
- At 10:15 PM, Rio Grande No. 6 tripped (loss of 50 MW).
- At 10:15 PM, system controllers contacted LRCC, EPE's reliability coordinator, and advised it of the loss of local generation.
- At 10:52 PM, system controllers requested that interruptible loads be interrupted due to the extreme weather conditions and the loss of local generation.

[167] Details are based on information provided to the task force by EPE.

[168] The various causes of EPE's unit trips are discussed in the following section of the report, entitled "Causes of the Outages and Supply Disruptions."

- At 11:45 PM, the Copper Generator was brought online.

Wednesday, February 2, 2011

The air temperature continued to drop during the morning of February 2, falling from 13 degrees at 1:00 AM to 8 degrees by 8:00 AM. Temperatures moderated during the afternoon, reaching 15 degrees. On February 2, the maximum temperature was 15 degrees (45 degrees below normal) and the minimum temperature was 6 degrees.

The maximum temperature for the day was the coldest maximum (high) temperature ever recorded in El Paso, Texas. A few wind gusts up to 24-26 mph occurred around mid-day. This, combined with the frigid air temperatures, produced wind chill values of -9 to -10 degrees. The peak wind speed reached on February 2 was 26 mph.

Timeline of Events

- At 12:10 AM, Newman 5 GT3 tripped.
- At 12:26 AM, Newman 5 GT4 tripped.
- At 1:49 AM, Rio Grande No. 8 tripped.
- At 1:53 AM, system controllers contacted LRCC, which declared an EEA l.
- At 2:02 AM, EPE purchased power from SPS; the Eddy DC tie was opened and ramped to 100 MW.
- At 2:27 AM, a switching order was given by the system controller to synchronize PNM's Luna Energy Facility (Luna) to the grid, permitting the transmittal of power EPE had purchased from PNM.
- At 3:17 AM, Newman Generator No. 4 GT1 tripped.
- At 3:20 AM, Four Corners Unit No. 4 tripped.

- At 5:07 AM, the HVDC terminal at the Eddy DC Tie experienced a runback[169] from 100 MW to 48 MW.

- At 5:12 AM, system controllers again contacted LRCC, and the EEA level was heightened to EEA 2. This Alert advised other utilities that EPE was placing its load management procedures in effect due to its energy deficient condition. Actions taken pursuant to this Alert included public appeals to reduce demand, made through media announcements, and other demand-side management procedures.

- At 6:28 AM, the Coyote-Dell City 115 kV line was restored.

- At 7:12 AM, the Newman No. 4 steam turbine (ST) tripped, and the Newman-Butterfield 115 kV line opened at Newman (tripping the line).

- At 7:16 AM, the Newman No.4 GT2 unit tripped. With the loss of Newman No.4 GT2, the Copper unit was the only local unit remaining online that could supply dynamic reactive support (it was producing 55 MW of power).

- At 7:22 AM, system controllers initiated load shedding in order to balance load with generation and maintain voltage stability. Area load was at 982 MW at the time, and approximately 170 MW of firm load was shed.

- At 7:23 AM, EPE again contacted LRCC and EPE's EEA status was increased to an EEA 3. This alert advised other utilities that EPE had implemented firm load interruptions.

- At 7:55 AM, system controllers saw that Luna had lost approximately 130 MW of generation. Another 103 MW of load was shed, with load stabilizing at 710 MW.

- At 8:16 AM, Luna ramped up to 235 MW.

- At 9:51 AM, the combustion turbine portion of PNM's Afton combined cycle generator was placed online (the steam turbine portion of this generator experienced problems and remained unavailable throughout the

[169] "Runback" is a manually or automatically controlled decrease in output designed to protect against loss of thermal transfer capability or transient angle instability.

event). EPE made arrangements to obtain power from that unit on an hourly basis.

- At 12:17 PM, controlled load shedding ended, with load at 977 MW.
- At 12:19 PM, LRCC was contacted and EPE's EEA alert level was decreased to EEA 2.
- At 6:04 PM, the terminal at the Eddy DC tie tripped (opening the Amrad-Eddy 345 kV line).
- At 6:11 PM, load shedding resumed, and continued for approximately two hours and 45 minutes. Load shed amounts varied between 100 and 250 MW during this period.
- At 6:15 PM, EPE contacted LRCC, which again placed EPE under EEA 3 status.
- At 8:58 PM, load shedding terminated because of reduced load demand. EPE contacted LRCC, which changed the EEA alert level back to an EEA 2.
- At 11:04 PM, the Eddy DC tie (and the Amrad-Eddy 345 kV line) resumed operation. (According to SPS, operating agent for the DC Terminal, the tie had tripped due to loss of thyristors.[170])

Thursday, February 3, 2011

The lowest temperatures of the event were experienced in the El Paso area during the morning of February 3, 2011. Temperatures remained in the single digits from midnight through 10:00 AM, slowly climbed into the teens during the late morning, and reached a maximum of 18 degrees at 2:51 PM. The high temperature for the day was 18 degrees, and the low was 1 degree. (The high temperature was 43 degrees below normal, and the low was 34 degrees below normal). The peak wind speed reached on February 3 was 20 mph. The combination of frigid air temperatures and wind speeds produced wind chill values from midnight to 11:00 AM of -10 to -17 degrees.

[170] A thyristor is a semiconductor with an anode, a cathode and a gate. Thyristors have the ability to switch high voltages and withstand reverse voltages, and are used in switching applications, especially in AC circuits, for AC power control, and overvoltage protection for power supplies.

Timeline of Events

- At 3:45 PM, PNM's Afton CT tripped.
- At 4:23 PM, PNM put the Afton CT back online.
- At 5:00 PM, as the evening load increased, LRCC was contacted, and EPE's alert status was elevated to EEA 3.
- At 5:30 PM, controlled rotating load shedding resumed for just over five hours. During this period, the load shed amounts varied between 100 MW and 250 MW.
- At 6:52 PM, Newman 4 GT1 was brought online.
- At 7:20 PM, Newman 4 GT1 tripped.
- At 9:32 PM, Newman 4 GT1 returned online.
- At 10:30 PM, Newman 4 GT2 was brought online.
- At 10:30 PM, EPE terminated the controlled rotating load shedding.
- At 10:40 PM, LRCC lowered the EEA level to Alert Level 2.

Friday, February 4, 2011

On February 4, although skies were clear and winds relatively calm, temperatures were as low as 3 degrees during the early morning hours. By late morning, temperatures moderated, reaching the middle 20s by 12:00 PM. The temperature continued to rise during the afternoon, and the high for the day was 37 degrees. Winds, with speeds under 10 mph, were generally light and variable in direction. The low for the day was 3 degrees. (The maximum air temperature was 24 degrees below normal and the minimum air temperature was 32 degrees below normal).

Timeline of Events

- At 2:02 AM, Newman 4 GT2 tripped.
- At 2:04 AM, Newman 4 GT1 tripped.

- At 3:17 AM, PNM's Luna steam turbine tripped.
- At 3:23 AM, one Luna gas turbine dropped from 90 MW to 11 MW.
- At 3:51 AM, the Luna steam turbine was brought back online and slowly ramped up.
- At 6:30 AM, LRCC issued an EEA Level 3 for EPE. With Copper again as the only local unit online, controlled rotating load shedding of between 100 MW and 250 MW resumed.
- At 6:49 AM, Newman 4 GT2 was brought online.
- At 12:05 PM, the controlled rotating load shedding ended.
- At 12:12 PM, the RC changed EPE's alert status to an EEA Level 2.
- At 3:57 PM, Newman 5 GT4 unit was brought online and remained stable at 50 MW.
- At 5:12 PM, the Rio Grande 8 unit was brought online.

Due to the added generation, which provided the necessary dynamic reactive support, no controlled rotating load shedding was required for the Friday night peak load period or thereafter during the event.

Saturday, February 5, 2011

- At 4:07 PM, Newman 5 GT3 came online.
- At 4:30 PM, LRCC modified EPE's alert status to an EEA Level 1.

Sunday, February 6, 2011

- At 9:46 AM, LRCC decreased EPE's alert status to an EEA Level 0.

Public Service Company of New Mexico

PNM set a new record winter system demand during the February cold weather event and experienced outages on some of the generating units it owns,

co-owns, or from which it purchases power.[171] PNM was generally able to meet its system load requirements and also to provide energy assistance to another utility. On February 3, however, PNM was forced to implement a localized rolling blackout in the Alamagordo and Ruidoso areas in southern New Mexico, and experienced an outage in the town of Clayton in northeastern New Mexico.

In the Alamogordo and Ruidoso areas, the February 3 rolling blackout was implemented at 5:21 AM by the PNM Distribution Operations Center, as a result of a transmission line outage. The PNM Amrad to Alamogordo 115 kV transmission line locked out due to a failed conductor clamp, a condition that was apparently unrelated to the weather. As a result, the Las Cruces to Alamogordo 115 kV transmission line, owned by Tri-State Generation and Transmission Association, Inc. (Tri-State), became overloaded and required load relief from PNM and Tri-State. PNM implemented its share of the load curtailment by sequential curtailment of two separate feeder lines. Approximately 20,207 customers were affected, with an estimated load loss of up to 22.1 MW. All circuits were fully restored at 8:08 AM.

The outage in Clayton began at 5:03 AM as a result of the outage of a Tri-State 69 kV transmission line that serves PNM's Van Buren substation, located in Clayton. A static wire, stretched by the extremely cold weather, snapped and fell on one of the phases of the line, interrupting service to the town. All service was restored at 6:54 AM. The estimated load lost was 3.7 MW.

Southwest Power Pool

SPP also experienced severe weather conditions over much of its footprint during the February cold weather event. However, none of its entities was forced to shed load. Three BAs within SPP declared varying levels of EEAs due to tripping or derating of generating resources or deficiencies in natural gas supply. In one instance, SPS requested an EEA 1 following the trip of a 250 MW gas-fired generating unit. SPS had all of its available resources in use and issued public appeals for energy conservation. In a second instance, Oklahoma Gas & Electric Company (OG&E) experienced multiple generation losses on February 2 and February 3, and requested four separate EEA 2 declarations during the week. It was unable to meet its energy commitments to the reserve sharing group run by SPP. In the last instance, Sunflower Electric Cooperative (Sunflower) requested an EEA 3 on February 2 following the loss and subsequent derating of a large coal

[171] Generating units affected, to a greater or lesser degree, included Four Corners Unit 4, Reeves Unit 1, Reeves Unit 3, Delta Person CT, Valencia, Afton, LGS Units 1 and 2, and Luna Unit 2.

generating unit. The failure to start of a gas-fired combustion turbine aggravated the situation, which continued until the afternoon of February 3. During this period, Sunflower was unable to meet its energy commitments to the SPP reserve sharing group. However, following declaration of the EEA 3, Sunflower obtained sufficient transmission service to purchase energy and was able to meet its own firm energy commitments, thereby avoiding the need to shed load.

In SPS's case, its purchases over the Blackwater Tie (a connection between the Western and Eastern Interconnections) were lost between 9:00 AM and 10:00 AM on February 2, due to capacity emergencies in the Western Interconnection. SPS replaced this purchase with a 100 MW purchase from Public Service Company of Colorado, importing it over the Lamar Tie (another one of the connections between the Western and Eastern Interconnections). SPS ultimately increased this purchase to 210 MW, and was later also able to make limited purchases through the Blackwater Tie.

Notwithstanding SPS's transactions over the ties, the majority of the purchases made by the energy-deficient utilities within SPP were made from other SPP entities. Thus, even if SPP had been separated from its neighbors by asynchronous ties, as is ERCOT, it probably would not have had to shed load during the February event. This suggests that the problems ERCOT experienced did not directly relate to its functionally separate interconnection status, but rather to the ability and preparedness of the generators within its footprint to operate as scheduled during the severe weather conditions.

B. Natural Gas

The extreme cold experienced in early February 2011, particularly on February 2 and February 3, caused widespread production declines. These reductions were typically the result of freeze-offs,[172] mostly at wellheads but also in nearby processing plants. To a lesser extent, other equipment reliability issues contributed to the problems, both at the wellhead and at processing and treating facilities. The rolling power blackouts in ERCOT also played a role in the Fort Worth Basin, as did customer curtailments in the Permian Basin. These supply reductions had adverse effects all the way down the delivery chain.[173]

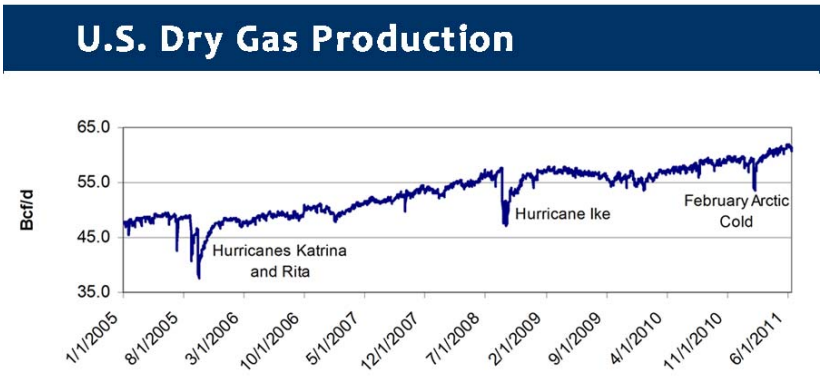
[172] A "freeze-off," as described earlier, occurs when water produced alongside the natural gas crystallizes or freezes, completely blocking off the flow and shutting down the well.

[173] Unless otherwise noted, the entity-specific data was obtained from materials submitted to the task force by producers, processing plants, pipelines, and LDCs.

This subsection summarizes the supply shortfalls resulting from production declines in the basins, discusses the resulting reduced gas volumes and pressures experienced by the pipelines, and ends with a detailed examination of the retail curtailments made by LDCs in the affected states of New Mexico, Arizona, Texas, and California.

Producing and Processing Facilities

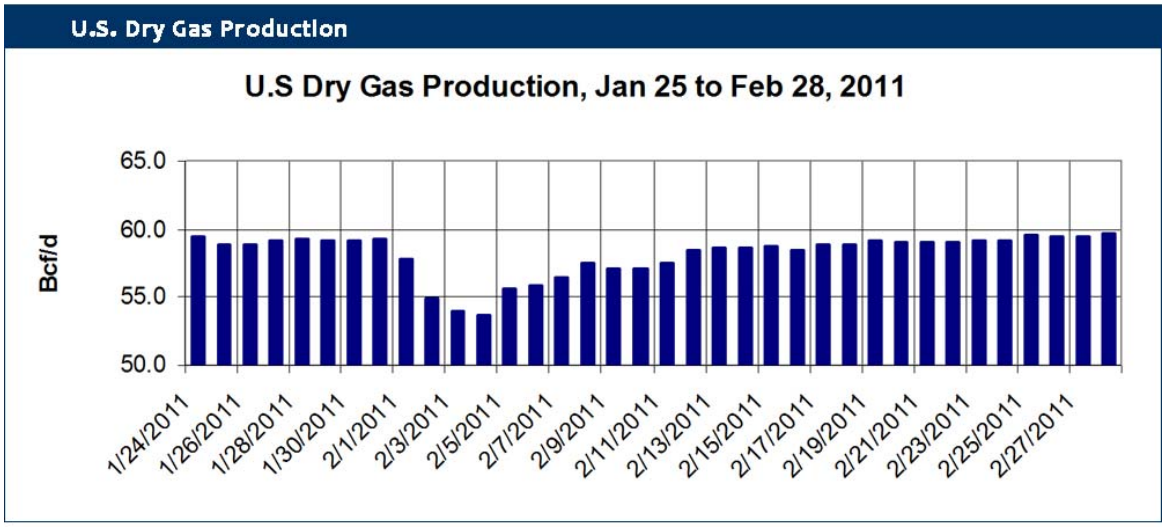
The reductions in supply experienced during the cold weather event were comparable in magnitude to production shut-ins during hurricanes. The following chart illustrates this point.



Source: Task Force chart based on Bentek data

Relative to average dry gas production of 59.22 Bcf per day on January 31, 2011, Bentek estimates that production in the first week of February declined by 5.55 Bcf per day, a reduction of 9.4 percent. The decline began on February 1 and reached its lowest level on February 4.[174]

[174] Data is based on task force analyses using supply and demand history from Bentek.



Source: Task Force chart based on Bentek data

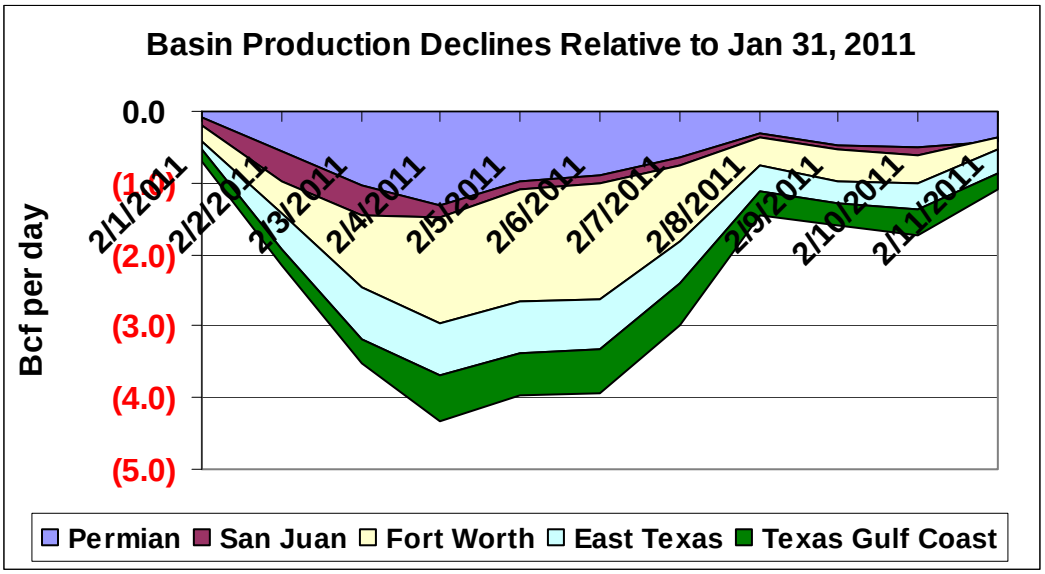
Of the 5.55 Bcf per day decline during the first week in February, 79 percent, or 4.36 Bcf per day, occurred in production basins in Texas and New Mexico (where production declined by 21 percent). Both the San Juan Basin in northern New Mexico and the Permian Basin in west Texas and southeastern New Mexico tend to experience production declines with low temperatures, and the February event was no exception. The declines in these basins, together with the large increases in demand, were almost exclusively responsible for the gas curtailments in Texas, New Mexico and Arizona.[175]

This weather event was so extreme that production freeze-offs were experienced not only in the San Juan and Permian Basins, but throughout Texas and as far south as the Gulf Coast. Based on scheduled pipeline receipts, the task force estimates that production in the Fort Worth Basin declined by 1.63 Bcf per day compared to the last week of January, 2011; East Texas Basin production declined by 0.72 Bcf per day; and Gulf Coast Basin production declined by 0.65 Bcf per day. [176] The shortfalls in these additional Texas basins, while not directly a cause of the natural gas curtailments, did contribute to fuel-related electric

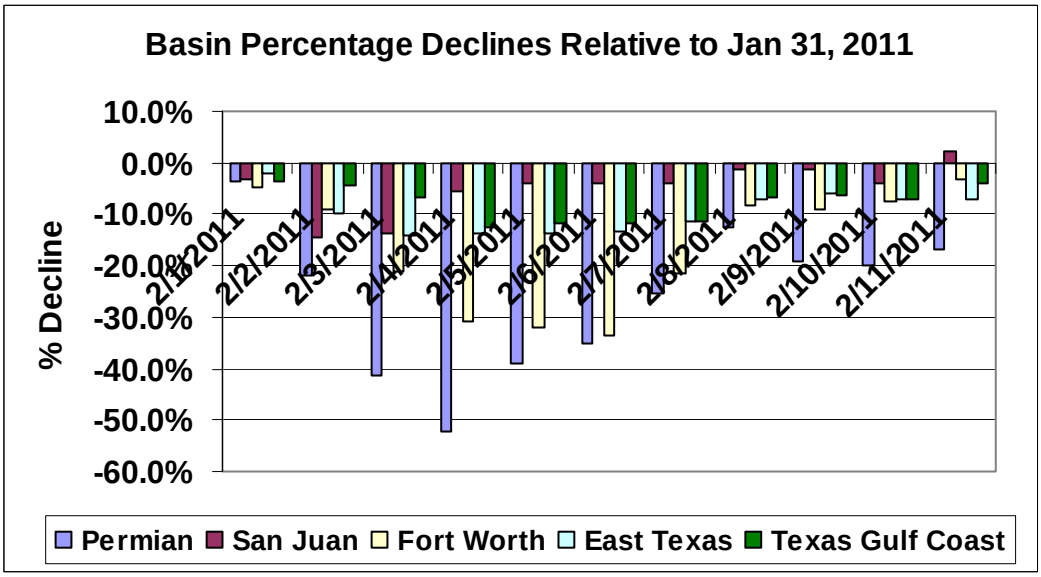
[175] Production declined by 0.43 Bcf per day in the San Juan Basin and by 1.31 Bcf in the Permian Basin, based on task force analyses of Bentek supporting data, pipeline receipts and flow data from El Paso and Transwestern.

[176] Staff's analysis based on supporting data, display reports and data warehouse on file with Bentek (unpublished); s*ee also Market Alert: Deep Freeze Disrupts U.S. Gas, Power, Processing*, Bentek Energy LLC, Feb. 8, 2011, at 2-6; materials submitted to the task force by pipelines. Note that basin level production reductions may not be equal to the total February 4 reduction as not all basin level maximum reductions occurred on February 4.

generation failures in ERCOT. The following charts demonstrate absolute and percentage declines by production basin.



Source: Task Force chart based on Bentek data



Source: Task Force chart based on Bentek data

The causes of these production declines are examined in detail in the following section of this report, entitled "Causes of the Outages and Supply Disruptions."

Effects on the Pipelines and Storage Facilities

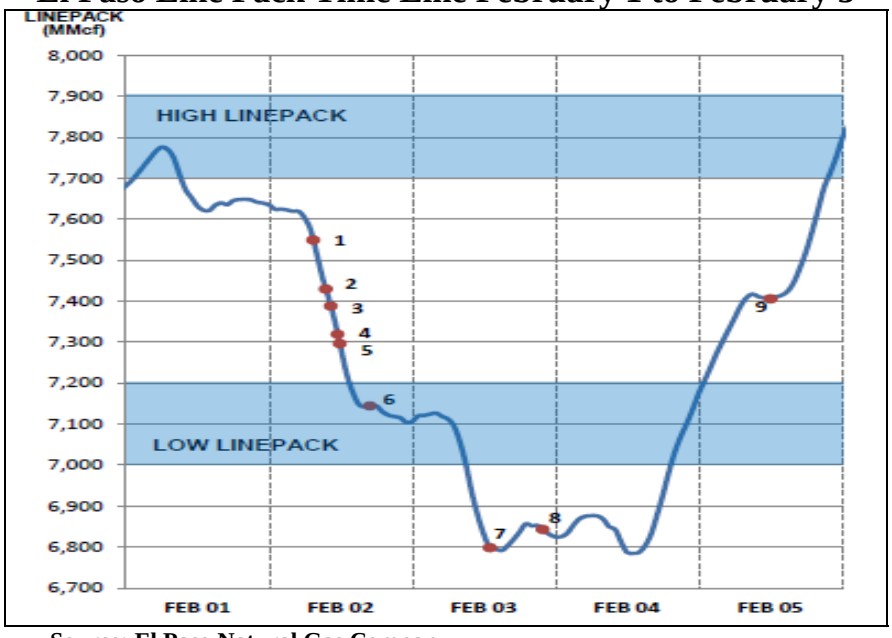
At the same time that gas supplies flowing into the pipelines were reduced, shippers requested increased volumes of gas. The reduced supply relative to higher deliveries (a situation known as a draft condition) resulted in lower line pressures and reduced line pack, which for most pipelines began on February 2.[177]

Between February 1 and February 4, pipelines responded to this draft condition through a variety of approaches. To the extent possible, deliveries to shippers were met by relying upon line pack. Pipelines with storage used increased withdrawals to build line pack. El Paso, for instance, used its Washington Ranch Storage Field to support its south system when gas supplies failed to arrive.

El Paso

The effect of the draft conditions on El Paso's line pack is depicted in the following graph (the numbered dots reference various occurrences on El Paso's system during the cold weather event):

El Paso Line Pack Time Line February 1 to February 5



Source: El Paso Natural Gas Company

[177] Generally by February 4, line pressures and line pack began rising again, as the previous day's scheduled receipts were received into the system. By February 5, line pack grew to a level above that prevailing on February 1.

El Paso system demand increased from 3,416 MDth[178] on January 31 to 3,675 MDth on February 2. For the same period, supply from all sources, including pipeline interconnects, decreased from 3,264 MDth to 3,040 MDth. As supply decreased and demand increased, El Paso used line pack to attempt to maintain deliveries. As a result, line pack fell from almost 7.8 Bcf on February 1 to approximately 6.8 Bcf at 2:00 PM on February 3.

As line pack fell, pipeline pressure on the western edge of the system dropped below 600 pounds per square inch gauge (psig). Pressure on the east side of the system had already dropped below 600 psig, as of 12:00 noon on the previous day. At 10:51 PM on February 3, El Paso issued a low pressure force majeure announcement, suspending its contract obligations and declaring that operating pressure on portions of its system could not sustain contract levels.

Pipeline Communications

Interstate pipelines issue a variety of communications and directives to shippers and, pursuant to FERC regulations (18 CFR §284.12 (2011)), post critical notices to describe strained operating conditions, to issue operational flow orders and, when applicable, to make force majeure announcements. Most intrastate pipelines provide similar information and instructions to shippers, either by posting or direct communications.

Critical notices describe situations when the integrity of the pipeline system is threatened. A critical notice will specify the reasons for and conditions making issuance necessary, and also state any actions required of shippers. Operational integrity may be determined by use of criteria such as the weather forecast for the market area and field area; system conditions consisting of line pack, overall projected pressures at monitored locations, and storage field conditions; facility status (defined as horsepower utilization) and availability; and projected throughput versus availability, for capacity and supply.

Operational flow orders (OFO) are used to control operating conditions that threaten the integrity of a pipeline system. (Individual pipeline companies may have other names for operational flow orders such as alert days, performance cut notices or an emergency strained operating condition.) OFOs request that shippers balance their supply with their usage on a daily basis within a specified tolerance band. An OFO can be system-wide or apply to selected points. Failure by a shipper to comply with an OFO may lead to penalties. Pipelines may also

(cont'd)

[178] "MDth" is a thousand dekatherms.

limit services such as parking and lending of natural gas, no-notice (the provision of natural gas service without prior notice to the pipeline), interruptible storage and excess storage withdrawals and injections.

Force majeure, if authorized by the pipeline's tariff, is a declaration of the suspension of obligations because of unplanned or unanticipated events or circumstances not within the control of the party claiming suspension, and which the party could not have avoided through the exercise of reasonable diligence.

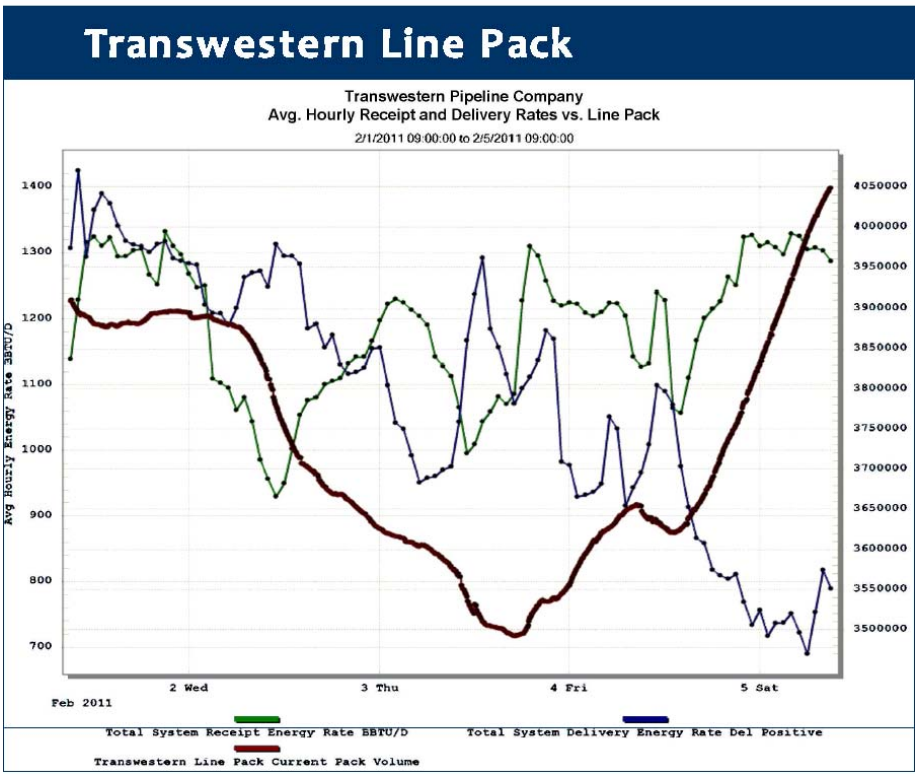
Based on data responses to task force inquiries, the number of companies making use of these various communications and directives for weather-related reasons in the Southwest during the first week of February is as follows:

Type of Pipeline	Number of Data Responses	Number of Companies With a Critical Notice	Number of Companies With an OFO	Number of Companies Declaring Force Majeure
Interstate	24	6	3	1
Intrastate	21	5	5	3

El Paso Natural Gas issued a force majeure declaration on February 3, stating that it had experienced system operating pressure on portions of its mainline and some laterals that could not sustain contract levels. The other interstate pipeline most affected by the supply shortfalls, Transwestern, did not declare a low pressure force majeure.

Transwestern

The effect of the draft conditions on Transwestern's line pack is depicted in the following graph.



Source: Transwestern Pipeline Company, LLC

Scheduled deliveries on Transwestern from January 31 to February 2 increased from 1,426 MDth to 1,526 MDth. Supplies dropped by approximately 400 MDth by midday on February 2; however, Transwestern continued to make scheduled deliveries from line pack. Accordingly, line pack decreased from 3.9 Bcf on February 1 to a low of 3.5 Bcf on February 3. Transwestern, unlike El Paso, did not declare a low pressure force majeure.[179]

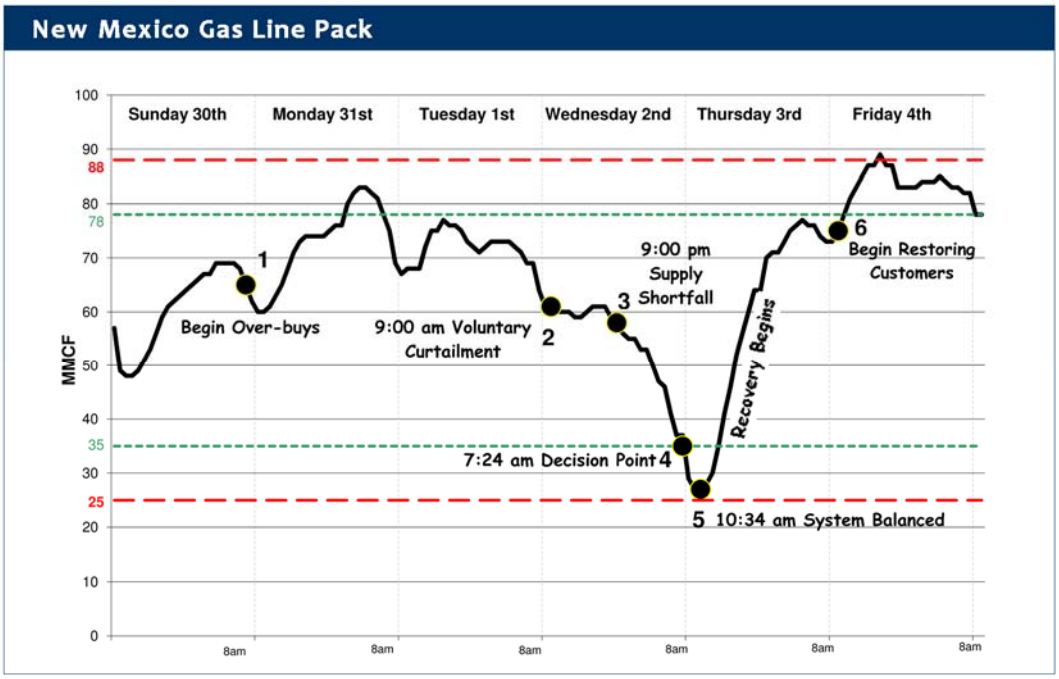
New Mexico Gas Company

NMGC also experienced significant line pack problems on its distribution system. On January 31, NMGC bought additional supply for its north segment and its south/remotes segment, for delivery on the following day. On February 2,

[179] By midday on February 3, pressures and line pack were beginning to increase, and on February 4, NMGC's line pack was over 4 Bcf.

NMGC contacted 39 large industrial and commercial customers, requesting them to reduce or curtail their gas usage. By 9:00 PM on February 2, NMGC reported to supplying pipelines that pre-ordered gas was not being delivered as scheduled.

The effect of events on NMGC's line pack is depicted in the following graph.



Source: New Mexico Gas Company

The vast majority of the shortages experienced on NMGC's north segment on February 2 and 3 was attributable to supply failures at the Transwestern Rio Puerco and El Paso's Wingate interconnection points. An NMGC representative has stated that the failure of Transwestern to deliver scheduled flows of 127,454 MMBtu on February 2 and 146,438 MMBtu on February 3 "was devastating to NMGC and its customers."[180]

Transwestern responded by observing that it scheduled much greater volumes of gas at Rio Puerco than NMGC historically flowed (and equal to the amount nominated by NMGC and other shippers to the point). NMGC was unable to flow all of the scheduled volumes, suggesting there were difficulties on NMGC's system in taking away the gas from the Rio Puerco delivery point. On February 2,

[180] Transcript of Testimony of Tommy Sanders at 13, In the Matter of an Investigation into New Mexico Gas Co.'s Curtailments of Gas Deliveries to New Mexico Consumers, NMPRC (Mar. 17, 2011) (No. 11-0039-UT).

for example, Transwestern scheduled 305,000 MMBtu/d and NMGC took 182,000; on Feb. 3 Transwestern scheduled delivery of 298,000 MMBtu/d at Rio Puerco, and NMGC took 128,000.

NMGC also reported lower pipeline pressure than those on which it typically relies. On an average winter day in the north segment, pressure ranges from 800 to 900 pounds per square inch atmosphere (psia) at Rio Puerco. The average pressures were lower during the week of January 31 and, from February 1 to February 4, the loss of pressure caused NMGC to experience significant pressure losses on its own system. For example, the interstate pipeline pressure at NMGC's interconnection at Rio Puerco fell to a low of 724 psia from a normal operating pressure of 850 psia.

Notwithstanding this decline in pressure, Transwestern's contractual obligation with respect to pressures at Rio Puerco (as opposed to its typical operating pressures) is 700 psia, and Transwestern reports that pressure never fell below that obligation.

The following chart provided by Transwestern depicts the pressure at Rio Puerco (fluctuating brown line) relative to contractually obligated pressure (non-fluctuating red line), total receipts (green line) and deliveries (blue line) on the Transwestern system. According to the chart, pressure did not fall below the contractual obligation of 700 psia.

Coordination Among Pipelines to Address Supply Problems

Flows between and among pipelines through redirected supplies and incremental transactions at least partially alleviated supply shortage conditions during the first week of February, 2011. These flows were the result of active coordination among the involved counterparties to address shortfalls. The redirection of gas came too late to avoid the curtailments in New Mexico and Arizona that occurred on February 2 and February 3. However, in the Texas intrastate markets, the increased purchases of gas at pipeline interconnects was an important factor in maintaining pressure in the Dallas-Fort Worth area and also served to move gas east to west in response to reduced supply at Waha.

Changes in gas deliveries do not occur instantly. Operation Balancing Agreements (OBA) contractually specify how gas imbalances between flows and scheduled amounts are to be managed. (Interstate pipelines are obligated by FERC regulations to have OBAs at interconnects with other interstate pipelines and with intrastate pipelines). These agreements enabled counterparties to make operational changes and revise nominations.

Chevron Keystone Storage Facility

In addition to the pipelines, at least one storage facility experienced weather-related difficulties. These difficulties, however, stemmed not from freeze-offs upstream, but from the rolling blackouts on ERCOT's system and from the facility's own operational problems.

The Chevron Keystone Storage Facility (Keystone), which has interconnections with El Paso, Transwestern, and Northern Natural Gas Company, was affected by two rolling blackouts on February 2, at 6:30 AM and 10:00 AM. It was shut down completely for six hours (from 6:30 AM to 9:30 AM and again from 10:00 AM to 1:00 PM).

Keystone remained at less than 100 percent capacity through February 6, due to line and equipment freeze-offs. Keystone declared force majeure at 9:00 AM on February 2. As a result, during the period February 2 through February 4, Keystone was unable to deliver 100 percent of nominated volumes to its three interconnecting pipelines. Keystone lifted the force majeure effective 9:00 AM on February 7.

Keystone's difficulties did not meaningfully contribute to the curtailments of natural gas customers, but they did affect supplies to gas-fired generators of EPE and SRP. (The failures of EPE's generating units stemmed from other causes,[181] so they would not have been able to utilize the gas in any event; SRP was able to obtain gas from another source.) In order to estimate reduced output per customer, the task force prepared the following table, which compares customer scheduled deliveries with contractual withdrawal rights for the Keystone storage facility. It appears that on the coldest day, February 2, shortfalls were most significant not for NMGC, but for EPE, SRP and the two marketers Sequent and Tenaska.

Keystone Storage Scheduled Deliveries Relative to Contractual Rights

Total (MMbtu)	WD Rights	Scheduled Deliveries	2-Feb	3-Feb	4-Feb

Natural Gas Curtailments to Retail Customers

The retail customer is the last link in the natural gas delivery chain, taking gas for home or business consumption from LDCs. LDCs receive their gas from interstate or intrastate pipelines at a delivery point called the "citygate." They distribute the gas through a large network of increasingly smaller diameter pipes to homes and businesses in the distribution area. LDC distribution networks operate at much lower pressures than transportation pipelines, but must maintain certain minimum pressures in order to deliver gas to end users. Some large LDCs use compressors to help maintain minimum delivery pressure, but others rely solely on pressure supplied by the upstream pipelines.[182]

When receipt pressures from the pipelines fall, or when consumer demand for gas exceeds the volume being delivered to the citygate, gas pressure within the LDC network will decline correspondingly. In such instances, LDCs must reduce

[181] The causes of the generating unit outages experienced by EPE are described in the following section of the report, entitled "Causes of the Outages and Supply Disruptions."

[182] NaturalGas.Org, *Natural Gas Distribution*, http://www.naturalgas.org/naturalgas/distribution.asp.

the amount of gas being consumed to prevent pressures from falling to the point where the entire system could fail. LDCs typically do this by first seeking voluntary curtailment from large users. If voluntary curtailment fails to stabilize gas pressure in the system, they will further reduce consumption by cutting off sections of the network, usually beginning with remote sections that would be the first to fail under strained conditions.[183]

State Regulation of Curtailment

Arizona, New Mexico, Texas, and California all regulate curtailments by LDCs in their states, but generally grant LDCs a great deal of discretion in determining how curtailments are implemented.

In Arizona, for example, the Arizona Administrative Code directs utilities to file, as a part of their general tariffs, a procedural plan for handling severe supply shortages or curtailments.[184] The definitions of customer classes and the priority of curtailment are left to the utilities. Southwest Gas's Arizona curtailment rule places residential and other human needs customers at the highest service priority. Electrical generators are classified below that, at priority 2 or 3, depending on the amount of gas they consume.

New Mexico also requires LDCs to create and file a list of customer classifications prioritizing curtailments during a system emergency, but does not prescribe how customers should be ranked.[185] NMGC Original Rule 21 sets forth the company's curtailment priorities, assigning the highest priority to residential and other human needs end users, including suppliers of service to human needs customers.[186] Under the NMGC plan, electrical generators fall within this highest priority category. Zia gives the highest curtailment priority to residential and small commercial or industrial customers.[187]

[187] Zia Natural Gas Co., Second Revised Rule 21 (C) (1997).

In Texas, state law provides that the highest priority of service should be given to "residences, hospitals, schools, churches, and other human needs customers," but LDCs have the authority to set their own priorities, which override the general provisions if the TRC approves the LDC's plan. The TRC-approved plan of Atmos Energy, for example, classifies electric generators several levels below residential customers.[188] Texas Gas Service's curtailment plan gives top priority to residential customers, ranking all commercial and industrial users below them.[189]

The California Public Utility Commission allows LDCs to set curtailment priorities, subject to PUC approval, and it has specifically declined to mandate priority service for electric generators.[190] Both San Diego Gas & Electric Company (SDG&E) and SoCalGas assign the highest priority of service to all residential customers and to small core commercial customers (including some electric generators) that use less than 20,800 therms per month.[191]

Restoration of Gas Service Following a Curtailment

Restoration of gas service to residences following curtailment is a lengthy process that must be performed by trained, qualified personnel. The first step is to shut off each individual gas meter. The LDC's distribution lines and lines from the meters to homes must then be purged of air and re-pressurized with gas. Once this is done, workers visit each home, inspect gas appliances for safety, open meter valves, relight pilot lights, and confirm that the appliances are operating safely. This can only be done when the customer is home, and if workers find that any appliances are not operating properly, service cannot be restored to that home until repairs have been made.

The February 2011 Curtailments

From February 2 through February 4, 2011, LDCs interrupted gas service to more than 50,000 customers in New Mexico, Arizona, and Texas. Areas affected included the cities of El Paso, in Texas (863 customers) Tucson (14,620) and Sierra Vista (4,596) in Arizona, and Hobbs (406), Ruidoso (50), Alamogordo (2,385), Silver City (290), Tularosa (1,445), La Luz (475), Taos (8,505), Red River (557), Questa (548), Española (12,367), Bernalillo (3,172), and Placitas (1,114) in New Mexico.

The New Mexico Curtailments and Outages

Zia Natural Gas Company

The city of Hobbs, in southeastern New Mexico, was the first to experience gas outages. Its LDC, Zia Natural Gas Company, receives gas from DCP Raptor Pipeline, LLC, (DCP) an intrastate pipeline that receives its supply from processing plant tailgates and wellheads. Zia serves approximately 11,000 retail customers in the Hobbs area.

On February 1, 2011, DCP fell behind for a two-hour period on deliveries to Zia because of wellhead freeze-offs and other supplier issues. However, the pipeline made arrangements with the Northern Natural Gas (NNG) pipeline to reverse the flow of gas at a DCP/NNG interconnect near Hobbs, making additional supplies available. Thus, according to both Zia and DCP, DCP's temporary supply shortage did not adversely affect customers in Hobbs.

At approximately 3:00 AM on February 2, an electrical blackout affected approximately 2,065 homes in the northeast area of Hobbs.[192] Zia was not notified of the blackout until approximately 7:30 AM, but at 5:55 AM, the company received a low pressure alarm from a regulator station on the northeast end of the system. Personnel sent to the site reported that pressure was well below normal levels, and Zia immediately contacted DCP, which informed them that a plant had gone out of service due to a cold weather-related mechanical failure and that DCP was attempting to address the problem. The DCP plant in question did not return to service until February 6.

Zia reported that it was able to continue supplying gas to all its customers in Hobbs until approximately 7:30 AM that day, when electric power was restored. At that point, there was a surge in demand as gas appliances that had been unable

[192] SPS is the city's electrical supplier.

to operate without electricity simultaneously came back in service. Almost immediately, Zia began receiving calls from customers reporting that they had no gas or very low gas pressure. In all, 406 customers called in to report supply problems.

Zia believes the reason for the outages was the sudden surge in demand when electric power came back online, coupled with the low line pressures that resulted from the DCP plant outage. That morning, Zia began the process of relighting the primarily residential customers that were affected, and the company was able to restore all gas service by 10:00 PM the same day.

Zia customers in the Ruidoso, New Mexico area also lost gas service as a result of the cold weather events. During the early morning hours of February 3, the Ruidoso area experienced power outages that lasted until 8:00 AM. At the same time, receipt pressures from El Paso were declining.

At approximately 7:30 AM, Zia began receiving complaints of no gas or low gas pressure. Personnel sent to the area reported extremely low pressures, and did what they could to boost flow by bypassing regulator stations. Through a local radio station that was operating on backup power, the company asked the community to cut back on gas use. Pressures were critically low through most of the morning but began to rise just before noon. However, when electrical power was restored, there was a surge in demand that further strained the system. A total of 50 customers at the far reaches of the distribution system lost gas service that day, but their service was fully restored by the end of the working day.

According to Zia, it has no industrial or large load single customers; almost all of its customers are residential or small commercial users. Thus, it was not possible for Zia to reduce demand by curtailing large commercial accounts. Zia believes the Ruidoso outages were caused by high demand on the system, combined with low supply pressures and the surge in demand that occurred when power was restored.

New Mexico Gas Company

NMGC serves more than 500,000 retail customers in towns, pueblos, cities and rural areas throughout New Mexico. NMGC's distribution system is divided into two areas: (1) the north segment, serving the Albuquerque metropolitan area and communities to the north; and (2) the south/remotes segment, consisting of (a) the southeast system, which serves the towns of Roswell, Artesia, Carlsbad, Lovington, Eunice, and surrounding areas, and (b) remote locations, including Alamogordo, Silver City, Clovis, Portales, Tucumcari, Hatch, and Truth or Consequences. The north and the south/remotes segments are served by the

Transwestern and EL Paso interstate pipelines and by other third-party pipelines. The remote locations that lost gas service during the period in question were supplied solely by El Paso.

NMGC: The North Segment

On February 2, 2011, NMGC personnel monitoring the company's north segment, which serves the Albuquerque metropolitan area and communities to the north, noted that gas volumes at the company's receipt points with El Paso and Transwestern were not increasing, indicating that much of the company's nominated gas was not being received. However, although line pack was decreasing, the system was still operating within sustainable limits. Based on additional gas purchases made during the day, the company expected pressures at receipt points to increase at 9:00 PM that night and at 8:00 AM the following morning.

As a precautionary measure, the company began telephoning large commercial users on the morning of February 2, seeking voluntary reductions of gas consumption. NMGC employees, working from a list of the company's 200 largest customers, placed phone calls or sent emails to points of contact on the list. Customers were informed that the company was expecting a gas shortage and that cutting back on gas usage was necessary to maintain service to home, hospitals, and other top priority consumers.

In some instances, large customers agreed to reduce their gas use, either by switching to alternative fuel supplies, lowering thermostats, or shutting down equipment or manufacturing processes. However, some of the customers (approximately 10 percent of those contacted) indicated that they could not or would not reduce their usage.

One of the large customers NMGC contacted was PNM, which operates two gas-fired generating plants in the Albuquerque area. Contacted at 9:42 AM on February 2, PNM responded by stating that no curtailment options were available to it, and that the plants would be increasing their gas consumption to meet power generation requirements.

In other instances, NMGC was unable to reach a point of contact for its large customers and could only leave messages requesting cutbacks or return calls. NMGC estimates that it was ultimately able to contact 30 percent of the top 200 users to request voluntary curtailment.

NMGC was expecting the supply problems to improve at 9:00 PM on February 2, because of the extra gas it had purchased. When line pressure did not

improve at that time, due to the inability of suppliers to put the purchased gas on the system, the company began contacting other pipelines and suppliers in an effort to purchase more gas.

During the early morning hours of February 3, NMGC personnel monitoring line pressure on the north segment, from both the company's gas control center and field locations, believed the system would have enough gas to meet the anticipated morning demand, based on the amount of gas that had been used the previous day. However, beginning at 7:12 AM, the demand for gas rose to unprecedented levels, even though temperatures were only slightly higher than the day before.[193]

Even at this point, however, the company concluded that if pressures at receipt points began to rise at 8:00 AM, as expected based on the additional gas that had been purchased, they would be able to meet the increased demands on the system.

However, pressures continued to decline at 8:00 AM, leading NMGC to conclude that it was in immediate danger of losing the entire system and that they must immediately reduce demand by cutting off sections of the system. At around this time, the company also began receiving reports of no gas or low gas pressure in the Albuquerque area, further indicating that its system was near collapse.

Because NMGC needed to act quickly, and because the distribution systems in the larger metropolitan areas of Santa Fe and Albuquerque were not configured so as to allow curtailment of large numbers of customers by closing just a few valves, the company decided to curtail the areas served by the Taos mainline, which runs from the company's north-south mainline at Otowi junction, located approximately 80 miles north of Albuquerque. That line serves the communities of Española, Dixon, Taos, Questa, and Red River. The Otowi Junction valve was closed at 8:37 AM, cutting off service to those communities.

The company also curtailed two additional communities just north of Albuquerque by closing two valves that supplied the town of Bernalillo at 8:55 AM and 9:14 AM, and by closing one valve to the town of Placitas at 9:29 AM.

[193] NMGC told the task force that although temperatures were slightly warmer on the morning of February 3, compared to the previous morning, demand was nevertheless higher, despite NMGC's efforts to seek voluntary curtailment from large users, and despite appeals through the media for residential customers to conserve gas. NMGC does not know the reason for the increased demand.

If pressures continued to decline, the next step anticipated by NMGC was curtailing sections of the Albuquerque metropolitan area. Curtailment options in that area were limited, however, because of the lack of shut off valves capable of curtailing a large block of customers at one time. The company nevertheless prepared for curtailments by sending a crew with a backhoe to two sections of pipeline that served 2,000 customers, with the intention of digging up the pipes and pinching them off.[194]

At 9:20 AM, following discussions between NMGC and PNM about system conditions, PNM decided to switch its Delta Person (Cobisa) power plant from gas to backup fuel oil. PNM was unable to make the changeover because of a faulty valve, and as a result the plant went out of service and did not draw gas from the system for the duration of the cold weather event.

By 10:30 AM, pressure on the north segment had stabilized and had begun to increase. The restoration process was already underway at that point, as NMGC teams began shutting off meter valves to individual customers so that the lines could be purged and recharged.

NMGC: The South/Remotes Segment

On February 2, line pressure on El Paso's delivery pipeline to NMGC's south/remotes segment steadily declined, dropping below contract pressure[195] at approximately 10:00 AM. As the day progressed, NMGC personnel monitored line conditions and began considering the possibility that if conditions worsened, they would have to curtail certain areas.

At approximately 3:00 PM, NMGC started calling large customers on the south segment to ask them to voluntarily reduce their gas consumption. Some of the larger customers, such as Western New Mexico University, Silver City School System, and the Alamogordo School System, agreed to reduce usage, but two other large users -- Holloman Air Force Base and the White Sands Missile Range -- could not be reached that day, reportedly because the bases were closed because of the weather conditions and the contact persons were not present. (Holloman Air Force Base was successfully contacted the following day at approximately 1:00 AM, and agreed to reduce its usage at that time.)

[194] Transcript of Testimony of Doug Arney at 4, In the Matter of an Investigation into New Mexico Gas Co.'s Curtailments of Gas Deliveries to New Mexico Consumers,, NMPRC (Mar. 17, 2011) (No. 11-00039-UT).

[195] Contract pressure is the minimum gas pressure, measured in pounds per square inch, that a pipeline agrees to provide to a customer at a given delivery point.

Shortly before 5:00 PM on February 2, NMGC received notice from El Paso that line pressure was not expected to improve during the next 24 hours.

At 1:50 AM on February 3, NMGC began cutting off service to schools and non-essential government buildings in Alamogordo. At 2:36 AM, seeing that conditions were continuing to deteriorate, the company declared a system emergency on the south segment.

At 3:00 AM, NMGC cut off service to the communities of Tularosa and La Luz, which are located at the end of the NMGC distribution pipeline that serves Alamogordo. Line pressures continued to decline, however, and at 5:05 AM, the company shut off one section of Alamogordo. At 6:00 AM, the Alamogordo area experienced an electrical blackout. When electricity was restored at 8:00 AM, the resulting surge in demand for gas caused pressure to drop to zero on the southern part of the Alamogordo system, forcing NMGC to cut off that section as well. In all, more than 4,300 customers lost gas service in Alamogordo, Tularosa and La Luz, out of a customer base of approximately 15,000. By 9:25 AM, pressures in the Alamogordo area began to stabilize, and by 3:00 PM that day, the company began restoring service to curtailed areas.

Another community on the NMGC south/remotes segment that lost a portion of its gas service on February 3 was Silver City. According to NMGC, the Silver City distribution network lacked the capacity to meet the unprecedented demand for gas on February 2 and February 3, due to system limitations. NMGC stated that in 2007, it determined that the system's maximum operating pressure should be reduced from 40 psi to 30 psi for safety reasons. With that limitation, the system could not transport the volumes demanded by customers.

Although two large users in that area, the Silver City Consolidated School District and Western New Mexico University, agreed to curtail gas use on February 2, mitigating demand on the system to some extent, pressure continued to drop. NMGC curtailed a section of Silver City at approximately 6:00 AM the following day, February 3, in order to avoid total collapse of the system. Pressure began to recover by 11:00 AM, and restoration efforts began shortly thereafter. A total of 271 out of approximately 9,200 customers in the area lost gas service due to the curtailments.

NMGC has informed the task force that it is in the process of making improvements to the Silver City distribution system that should allow it to meet peak loads of the sort that occurred during the February event.

Restoration of Service

Closing individual gas meters, which is the first stage of restoring service, began shortly after NMGC cut off service on the morning of February 3. In some areas, NMGC personnel began shutting off meters within minutes of the curtailment. As restoration efforts got underway, the company sought additional help through its mutual assistance agreements with the American Gas Association and the Southern Gas Association, whereby member LDCs agree to help each other in emergency situations. That morning, NMGC asked other member LDCs by email and by conference call to send personnel to help them restore service in the affected areas. Out-of-state LDCs responded by sending qualified service personnel, who began to arrive the following day. NMGC also sought help from other New Mexico LDCs, and hired local contractors and plumbers to help restore service. Police, fire department, and National Guard personnel all eventually played roles in the effort to restore service.

Relighting continued through the weekend and into the following week, with a workforce of more than 700 persons participating. Service was restored to some areas as early as February 5, but the statewide relighting effort was not substantially completed until the following week, on February 10.

The Arizona Curtailments and Outages

Southwest Gas, a multistate LDC whose service areas include the cities of Tucson and Sierra Vista in Arizona, was forced to curtail service to parts of those cities on February 3 due to low pressures at receipt points with El Paso. After El Paso declared a system-wide Critical Operating Condition at 11:52 AM on February 2, due to declining line pack and drop offs in gas supply, Southwest Gas's management met at 1:00 PM to plan for increased monitoring of the distribution systems. Shortly thereafter, at about 2:00 PM, the company started calling large commercial customers to alert them to possible curtailments.

At 10:00 PM, as conditions on the El Paso pipeline continued to deteriorate, Southwest Gas concluded that it might be necessary to cut off some customers in order to preserve system operability. When pressures on the Sierra Vista system reached a critical stage at approximately 3:30 AM on February 3, the company identified several sections of the system that should be shut down to reduce demand. At approximately 6:30 AM, crews began closing valves in Sierra Vista and Tucson. Out of a total of 17,801 customers in Sierra Vista, 4,596 were shut off; out of a total of 279,362 customers in Tucson, 14,620 were shut off.

Starting at approximately 5:00 AM on February 3, the company began curtailing several large commercial customers, including an electric power plant in

Tucson. Other commercial users voluntarily curtailed or reduced their use throughout the day.

By 8:30 AM, pressures began to stabilize and recover, and the restoration process was initiated. Southwest Gas brought in 130 employees from other divisions in California, Nevada, and Central Arizona to help with the relighting process, and service was fully restored on the afternoon of February 7, 2011.

The Texas Curtailments and Outages

Texas Gas Service (TGS) serves several communities in Texas, with a total of 616,462 residential, commercial, and transportation customers. The City of El Paso is one of those communities, and during the week in question it was the only city in Texas to experience gas curtailments, with 863 residential customers (out of approximately 231,000) losing service.

Gas is delivered to TGS by the El Paso and ONEOK WesTex Transmission, L.L.C. (ONEOK WesTex) pipelines. Beginning around February 2, TGS received cuts from its suppliers and had to make alternative arrangements to obtain gas for the anticipated cold weather demand, including buying compressed natural gas (CNG) for expedited delivery by tanker truck from Arizona. The company also experienced low delivery pressures from El Paso later that week. However, those factors were not responsible for the service disruptions that occurred. According to TGS, the El Paso system experienced unprecedented demand during the winter event, as much as 41 percent higher than the previous historical peak.[196] The company's distribution system was simply unable to handle that much volume.

Beginning on February 2, at approximately 8:00 AM, residential customers began reporting low pressures. Shortly thereafter, customers in low pressure areas of the system began losing service. TGS responded to each reported outage, and in some instances service was restored the same day. A total of 863 customers lost service during an approximately 24 hour period. Service was fully restored by February 5. The restoration process was hampered by icy road conditions, and by the fact that TGS workers could not restore service when customers were not at home.

In order to alleviate pressure on the system during the period of peak demand, TGS asked ten large transportation customers to reduce consumption at

[196] On February 3, 2011, TGS delivered 258,853 MMBtu to its customers in El Paso. The previous peak at that location was 184,088 MMBtu, in January 2007.

approximately 10:00 AM on February 3. The company also restricted service to 36 commercial customers in areas that were experiencing low pressure, and on February 3, extended a gas main to boost pressures in one of the affected areas. In addition, TGS used two CNG tankers to help deal with low pressure issues. One was used to maintain service to a hospital, and the other was deployed to assist in the restoration process in one of the affected neighborhoods.

TGS plans to make additional system improvements to increase delivery capacity by extending gas mains in several areas that experienced low pressures during the period in question. The cost of these improvements is expected to total more than $1.7 million and the company estimates that they will be completed by September 30, 2011.

The California Curtailments

SoCalGas and SDG&E are separate utility companies, both owned by Sempra Energy. SoCalGas serves approximately 20 million customers in Central and Southern California; SDG&E serves approximately 3.4 million customers in Orange and San Diego Counties, California. SoCalGas operates the natural gas transportation systems of both companies.[197]

Beginning on January 31, 2011, SoCalGas monitored weather developments in the Southwest and was aware of the supply problems that had developed because of the severe cold weather. The company responded to supply shortfalls by increasing withdrawals from on-system storage and by purchasing operational gas to support the southern system, which cannot be served by storage gas. Delivery shortfalls were highest on February 2 and February 3. SoCalGas estimates that the net cost of the operational gas it purchased was $3.81 million, representing the purchase price of the gas less the price at which SoCalGas was later able to sell it.

On the morning of February 3, the company issued a curtailment advisory to non-core (lower priority) customers, informing them that curtailments could occur. At 1:15 PM, due to the continuing severe weather and its effect on production, the company declared a system emergency and curtailed transmission service on its southern system for all interruptible and some firm non-core customers by limiting the amounts they could withdraw from the system.

SoCalGas curtailed 19 interruptible retail non-core and electric generator customers, and 40 firm non-core and electric generator customers. SDG&E

[197] Sempra Energy, *Our Companies*, http://www.sempra.com/companies/companies.htm.

curtailed all its interruptible load and all its firm service to three electric generator customers. SoCalGas reported that its non-core customers and electric generator customers generally complied with curtailment limits during the emergency. When the CAISO informed the two companies that approximately 500 MW of total generation was needed from two of the curtailed electric generators in order to ensure reliable grid operations, SoCalGas and SDG&E adjusted the curtailments so that the two plants could provide the necessary generation.

Resumption of Production

Weather conditions moderated slightly in the Southwest on February 3 and improved further on February 4, rising above freezing for the first time in days. Although production did not return to pre-event levels for several weeks, consumer demand slackened with the warmer weather, and line pack and system pressure rose steadily on the interstate pipelines. As a result, El Paso issued a warning of a system pack condition on February 5, and declared a system -wide Strained Operating Condition for high line pack February 6, 2011.[198]

Impacts of the Event on Natural Gas Prices

Gas prices responded to the winter weather and associated freeze-offs, although the increases were short-lived and not exceptionally dramatic. Some points in the midcontinent and southwest regions did post increases of approximately two dollars to three dollars per MMBtu, which were gains of 40 to 60 percent relative to February 1. West Texas prices were particularly strong with a basis at Waha of $2.60 relative to Henry Hub.[199] Southern California prices at Ehrenberg and Needles also traded higher by $1.77, reflecting upstream supply shortfalls.

The price gains in east Texas and south Texas were more muted, despite the freeze-offs extending to the Gulf Coast, and limited to $0.50 to $0.60 per MMBtu. The Houston Ship Channel, however, had an increase of almost $1.57.

The NYMEX (New York Mercantile Exchange) futures contract was flat to declining for the week. Cash prices at Henry Hub increased by only $0.29.

Most gains were gone by February 5, at which time warmer weather had returned. Prices on February 8 actually traded below those of February 1.

[198] Production figures from Bentek, supporting documentation for *Deep Freeze Disrupts U.S. Gas, Power, Processing* (Feb. 8, 2011); information provided to the task force by pipelines.

[199] Basis is the price differential between, in this case, Henry Hub and Waha.

The following table shows spot prices at a variety of locations for February 1 to February 8.[200] Daily closing prices are also listed for the NYMEX March gas futures contract, which is based on delivery at Henry Hub. The NYMEX price was relatively unaffected by the spot price increases during February 1 to February 8, suggesting that traders viewed the increases as a temporary, weather-related event.

Spot Prices

Flow Date	1-Feb	2-Feb	3-Feb	4-Feb	5-Feb	6-Feb	7-Feb	8-Feb
Waha	$ 4.47	$ 4.79	$ 5.80	$ 7.30	$ 4.76	$ 4.76	$ 4.76	$ 4.25

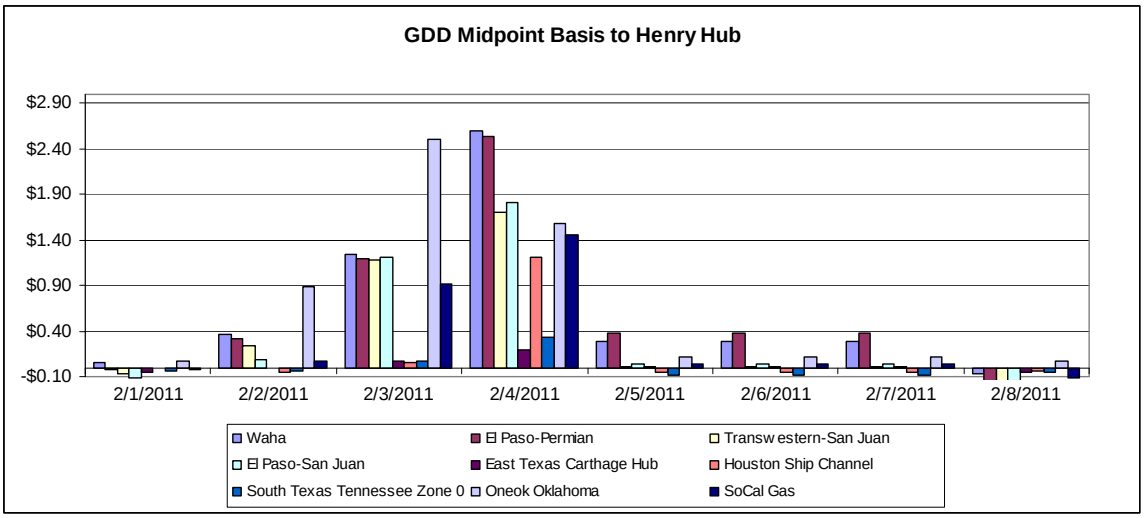
Source: Task Force analysis based on Platts data



Source: Task Force analysis based on Platts data

The causes of the electric generator failures and the natural gas shortfalls described above are examined in the following section of this report, entitled "Causes of the Outages and Supply Disruptions."

VI. Causes of the Outages and Supply Disruptions

The precipitating cause of the rolling blackouts experienced in Texas and Arizona during the February 2011 cold weather event was the large number of electric generator outages. The principal cause of the gas service curtailments experienced in several southwestern states was the production declines in the supply of natural gas, which led to volume and pressure reductions in the pipelines. The task force has analyzed in detail the causes of these outages and declines, and found that the majority of them were directly or indirectly related to the weather, particularly so with respect to production declines in the gas supply. This section of the report describes in detail those causes, both weather and non-weather-related.

While the storm itself was an uncontrollable event of force majeure, the question arises as to whether the facilities affected should have been better prepared to withstand the severe weather. Was the cold spell so unprecedented that the entities responsible for those facilities could not reasonably be expected to have taken preventative actions? Or did entities fail to take into account lessons that could have been learned from past cold weather events in the Southwest? These questions are addressed in the next section of this report, entitled "Prior Cold Weather Events."

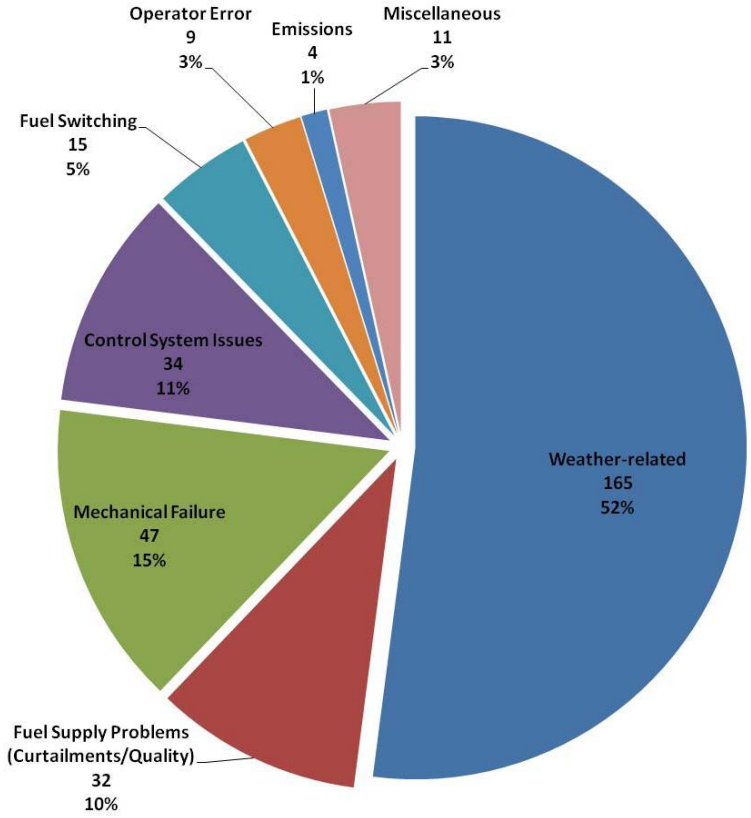
A. Electric

The rolling blackouts that utilities implemented during the cold weather event, which centered in Texas (ERCOT, EPE) and Arizona (SRP), were almost entirely the result of trips, derates, and failures to start of the generating units in those regions. The localized blackouts experienced by PNM in New Mexico, however, were caused by transmission trips. Units in Oklahoma and Kansas also experienced generator outages, but these did not result in blackouts.

The task force has analyzed these various generator outages to determine their underlying causes. By far, the most common cause of the outages was the cold weather, most commonly when sensing lines froze and caused automatic or manual unit trips. There were also several outages that were due to operator error or non-weather-related equipment failures. In a lesser number of cases, an interruption in the supply of natural gas prevented gas-fired units from providing power.

The following two charts[201] and supporting table depict the various causes of the trips, derates, and failures to start[202] for generating units throughout the Southwest, both by number of units and by MWhs.

Southwest - Number of Units Tripped, Derated, and Failed to Start - Feb. 1 - 5, 2011

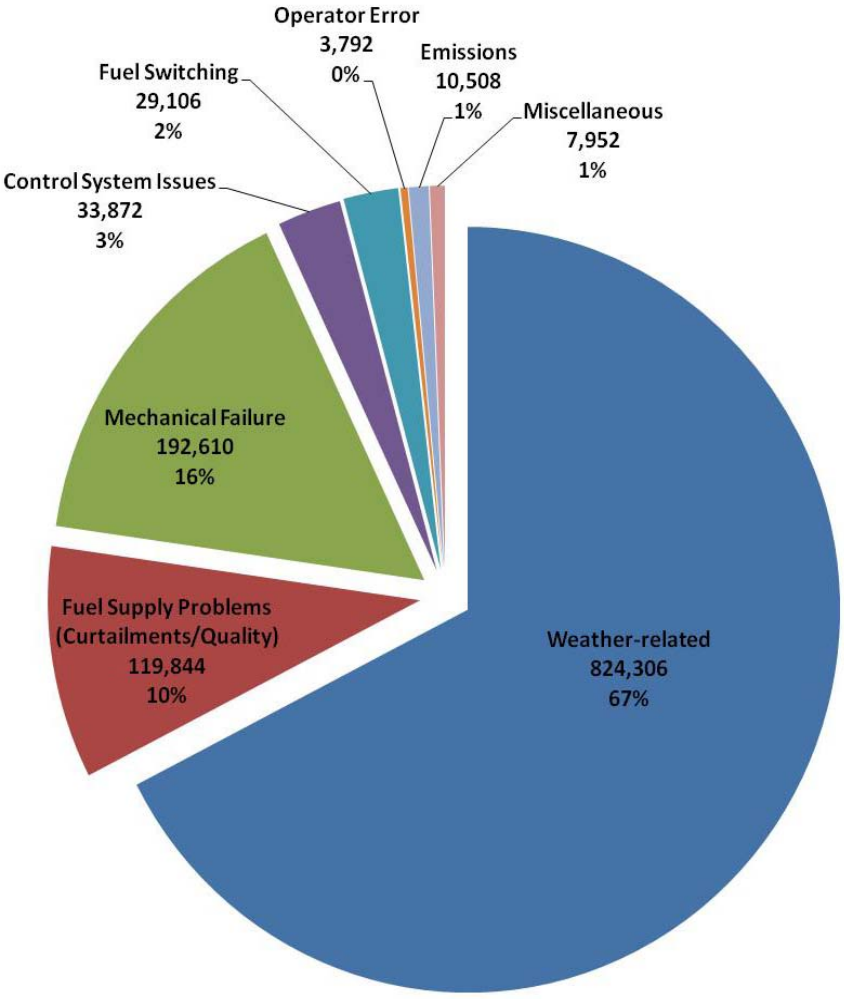


Total Entries in Pie Chart:	317
Total Number of Units Forced Out, Derated, or Failed to Start:	268

[201] Data includes generation in Texas (ERCOT and non-ERCOT), New Mexico, Arizona, and SPP. Units on the first chart are counted more than once if they failed multiple times from different causes (75 units failed on more than one occasion during the event); however, they are only counted once per cause. Data used in the preparation of this chart are drawn from materials submitted to the task force by balancing authorities and generators. Data throughout the section are drawn from materials submitted by transmission operators, generators, producers, processing plants, and pipelines.

[202] Trips totaled 167 units (30,376 MW), derates totaled 57 units (5024 MW), and failures to start totaled 44 units (4743 MW).

Southwest – MWh[203] of Generation Unavailable - Feb. 1 - 5, 2011



Total MWh in Pie Chart*: 1.2 Million
Total MWh of Load Served in affected Southwest Areas: 6.7 Million
Generation unavailable as a percentage of Total MW-hours Load Served: 18%
*Total time period is 106 hours (Midnight going into Feb. 1 through 10 AM Feb. 5)

[203] Megawatt hours were used for this chart to give an indication of the time impact of the outages, derates, and failures to start. (From an operator's perspective, a smaller unit out for a longer time might have a greater impact than a larger unit out for a short time, depending on the circumstances.) To capture this time factor, each instance of unavailable capacity was multiplied by the associated duration of the particular outage or derate and the results were summed.

Supporting Table (Southwest):

Cause	# of Unique Units	MWh
Total Frozen Sensing lines:	89	432,897
Frozen - Drum level sensing lines	48	150,000
Frozen - Other Sensing lines	41	282,896
Frozen Equipment (General)	21	153,393
Frozen Water lines	14	80,091
Frozen Valves	12	20,603
Blade Icing (Wind Turbines)	10	53,989
Low Temperature Limits (Wind Turbines)	17	80,389
Transmission Loss	2	2,944
Fuel Supply Problems (Curtailments/Quality)	32	119,844
Mechanical Failure	47	192,610
Control System Issues	34	33,872
Operator Error	9	3,792
Emissions	4	10,508
Fuel Switching	15	29,106
Miscellaneous	11	7,952

The large percentage of weather-related outages speaks in part to the design and construction of generating facilities in the Southwest. Unlike facilities in cold climates, generating stations in the Southwest are typically designed and constructed so that their boilers, turbines, and other auxiliary systems are exposed to ambient weather conditions. This design prevents heat build-up from occurring in the hot summer months. A more detailed discussion of generating plant design is contained in the appendix entitled “Power Plant Design for Ambient Weather Conditions.”

Sub-freezing temperatures can have adverse operational effects on generating stations if systems containing water do not have sufficient freeze protection, if pneumatic air systems do not have sufficient air drying capacity or freeze protection, or if equipment lubricants are not maintained above prescribed minimum temperatures. Generators with exposed elements typically employ a combination of heat tracing, insulation, wind breaks or enclosures, and heat sources to prevent freezing and to maintain minimum lubricant temperatures. Frozen sensing lines were a particular problem during the February cold weather event, when many generators automatically tripped offline due to faulty readings

from transmitters whose sensing lines froze (most notably steam drum[204] level transmitters).

A detailed examination of the causes of the generator outages experienced within ERCOT, SRP and EPE during the February event, both weather and non-weather-related, is set forth below.

Generation Outages in ERCOT

As a preliminary matter, the task force categorized by age and fuel type the ERCOT units that failed, to determine whether there was any statistical indication that older units or units of a given fuel type were more prone to developing problems. With respect to age, no strong correlation was found. The failure percentage of units with in-service dates before 1981 (19 percent) was actually less than their percentage contribution to the ERCOT fleet as a whole (22 percent).[205] The failure of units with recent in-service dates (between 2001 and 2010) represented 55 percent of the failures, which was slightly more than their contribution to the fleet as a whole (48 percent).

The results are more equivocal with respect to type of unit, where a more significant correlation was found with respect to combined cycle units. Otherwise, however, no significant correlation was found between failure and type of unit. Of ERCOT's combined cycle units, 48 percent failed, compared to their 35 percent of the total. For wind units, 16 percent failed, compared to their 15 percent of total units. For simple cycle units, 21 percent failed, compared to their 20 percent of total units. For gas-steam and coal units, the percentage that failed exactly matched their percentage contribution of total units (13 percent and 7 percent, respectively). Nuclear facilities account for only 1 percent of the total fleet, and no nuclear units failed.[206]

[204] Steam drums are used in boilers (excluding once-through supercritical boilers) to take in a mixture of steam and water coming from the boiler's waterwall tubes. The drum separates the steam from the water by gravity and mechanical separation (such as baffles). The water level in the drum is controlled to keep water in the waterwall tubes and to prevent water carrying over into the steam section of the boiler. The drum also functions to remove solids from the steam.

[205] This statistic and those immediately following are based on number of units, rather than on capacity. (Coal units, for instance, have a larger capacity contribution to the fleet as a whole than seven percent, which is their percentage contribution based on number of units.)

[206] The totals do not add up to 100 percent because certain other facilities have not been taken into account, such as hydro facilities and storage facilities.

For purposes of further analysis, the task force sorted by unit[207] the ERCOT generator trips, derates, and failures to start into three broad categories: weather-related, non-weather-related, and fuel supply. (The weather-related category considers only failures directly related to the weather; problems of insufficient fuel supply as well as outages and derates resulting from fuel switching, although indirectly related to the weather, are listed separately.) Direct weather-related causes accounted for 52 percent of the total failures, non-weather-related causes for 40 percent, and problems with fuel supply for nine percent.[208] Sub- categories within these major groupings, as well as specific examples of the various types of failures, are provided below.

ERCOT Weather-Related Outages and Derates

The task force identified the various specific causes for the trips, derates, or failed starts in ERCOT between February 1 and February 5 that were due directly to the cold weather.[209] (Some of the other failures experienced by ERCOT generators, such as reduced supplies of natural gas, were indirectly related to the weather.) The task force has identified the specific causes of these weather-related failures, by number of units and number of MWs:

Cause	No. of Units Lost	MW Lost
Frozen Sensing Lines (Total)	68	15,255
Frozen Drum Level Sensing Lines	(43)	(9438)
Frozen Other Sensing Lines	(25)	(5817)
Frozen Equipment (General)	13	2942
Frozen Water Lines	12	1072
Frozen Valves	8	1501
Blade Icing (Wind Turbines)	10	709
Low Temperature Limits (Wind Turbines)	17	1237
Transmission Loss	2	89
Total Weather-Related	**130**	**22,805**

[207] A unit that failed multiple times for different reasons is counted under each separate reason; if it failed multiple times for the same reason, it is counted once. That convention applies as well to the three charts detailing ERCOT's weather, non-weather, and fuel failures.

[208] Numbers add up to slightly higher than 100 percent due to rounding.

[209] The weather effects stemmed not only from the prolonged cold, but from high wind chill factors. Although typically thought of as applying to living beings, wind chill also more quickly cools inanimate objects, such as water pipes, bringing them down to the current air temperature. Wind also causes the loss of radiant heat, which otherwise can protect equipment from freezing. This phenomenon is discussed at more length in the appendix entitled "Impact of Wind Chill."

A sample of the ERCOT generating units that experienced weather-related failures, categorized by the specific cause of failure, provides some insight into the variety of concerns with which the generator operators had to contend during the event, and illustrates the complexity of the protections needed for generating plant systems.

- **Frozen Sensing Lines:** Instrumentation provides operational data necessary to monitor and control the generator's systems. Typically, sensing lines containing a standing water column sense changes in pressure and a transducer produces an electronic signal that is transmitted to instrumentation or controls. In sub-freezing temperatures, if freeze protection is not employed on critical unit systems, the water in the sensing lines freezes, causing faulty signals and subsequent unit trips or derates. During the February event, frozen sensing lines were the leading cause of outages, with steam drum sensing lines being the most prevalent (43 units tripped from this cause alone).

  - ✓ JK Spruce Unit 2, a 785 MW coal unit, tripped due to frozen sensing lines that caused a false high water level reading in the steam drum.

  - ✓ Ingleside Cogeneration lost two units due to frozen sensing lines. The lines were heat traced, but the ground fault interrupter breakers protecting the heat trace circuits tripped, resulting in a loss of 176 MW.

  - ✓ Another unit tripped due to frozen sensing lines on feedwater heater level controls. The freezing caused a high condensate level in a feedwater heater, which in turn incorrectly initiated a trip of the unit.

  - ✓ Non-drum sensing line failures included a unit whose vacuum system became erratic when the sensing line to the auxiliary steam pressure indication froze. Another unit tripped when the sensing lines to the rotor air cooler level transmitters froze.

Sensing Lines and Frozen Transmitters

There were many reports of frozen transmitters causing generating units to be forced offline during the cold weather event. In almost all cases, it was not the transmitters themselves that froze, but rather sensing lines filled with standing (non-flowing) water routed between the transmitters and the points the sensing lines are measuring.

(cont'd)

Transmitters

The transmitter assemblies perform three distinct functions. First, they detect the difference in pressure between two water lines, typically with a diaphragm-type sensor that deflects in the direction of, or towards, the lower pressure. Second, they serve as transducers that translate the pressure difference into an electrical signal. Third, they boost or otherwise process the signal for transmitting to the plant's control room, generally using electronics.

Differential Pressure Measurement

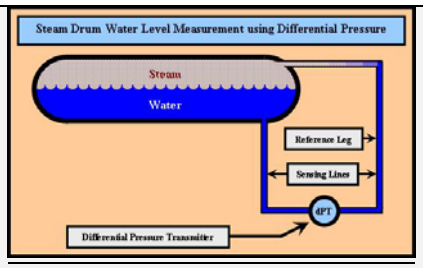
The technique of measuring the pressure difference (differential pressure) between two sensing lines filled with water has widespread application throughout power plants, especially in steam-powered generating units. This is due to the fact that differential pressure can be used to provide not just a measure of pressure itself, but also of water levels and flow rates. Significant applications include the following:

- **Pressure Measurement**
  - Between a boiler feedwater pump and the steam drum
- **Water Level Measurement**
  - In feedwater heater tanks
  - In the deaerator tank
  - In the steam drum
- **Water Flow Measurement**
  - Feedwater flow
  - Generator stator cooling water flow

Water Level Measurement

Differential pressure can be used to measure water level by virtue of the force of gravity, which results in greater pressure as the water level increases. This is akin to the hydraulic head resulting from water in an open reservoir, which is a measure of water pressure compared against standard atmospheric pressure. The method needs to be modified, however, to account for the fact that the space within a tank above the water is pressurized. Hence the use of differential pressure measurement, with one sensing line connected to the bottom of the tank to sense the water pressure, and the other to the top of the tank to sense the water vapor or steam pressure. The line at the top of the tank is known as the reference line. Even though the reference line connects to the top of the tank, which is above the water level, it will itself still fill up with water because the vapor/steam condenses in the line due to the much cooler ambient air temperature external to the tank.

(cont'd)



Water Flow Measurement

Differential pressure can be used to measure water flow by virtue of Bernoulli's principle: an increase in the speed of a flowing fluid is accompanied by a decrease in pressure. This increase in speed can be forced by placing a constriction such as an orifice plate or nozzle inside a pipeline, reducing its effective diameter. In order for the rate of flow in gallons per minute, for example, to remain the same, the velocity of the fluid must increase to make up for the fact that it is travelling through a smaller opening. This phenomenon is known as the Venturi effect. The higher velocity translates into lower pressure by Bernoulli's principle. Thus, measuring the differential pressure on either side of the constriction provides a measure of the rate of flow through the pipeline.

For exact flow measurement, the design and dimensions of the constriction are critical. In some cases, however, the concern lies more with changes in flow rate, indicative of blockages in the piping or overall flow path. This concern is important when strainers are used to filter out undesired particles from the fluid, especially in generator stator cooling systems. The strainers provide constriction to the water flow, resulting in a pressure difference. When the strainers are clogged, the pressure difference increases.

Steam flow can also be measured using the Venturi effect. But in that case, long sensing lines are not needed, as pressure immediately on either side of the orifice plate or nozzle is measured.

The Freezing Problem

Since differential pressure measurement requires gauging the difference in pressure between two separate sensing lines, if the water in either or both of those lines freezes, the measurement will be false. When a sensing line is plugged with ice, it cannot convey the intended water pressure to the transmitter location.

The fact that the water in the sensing lines is not flowing makes freezing all the more likely, and emphasizes the need for proper freeze protection methods such as insulation and heat tracing. Some sensing lines must run long distances through areas exposed to outdoor ambient air, which significantly exacerbates the risk of false readings.

- **Frozen Equipment (General):** Many other critical systems besides sensing lines experienced problems from the low temperatures. These included emissions systems, feedwater systems, control air systems, lubricating oil systems, and the like. Emissions systems sometimes rely on water, which is susceptible to freezing. Control air systems contain moisture-laden air; if the moisture is not removed, freezing can occur. Changes in the viscosity and properties of lubricants that are not kept at specified temperatures can adversely affect the operation of equipment.

  - ✓ Two units at one plant were derated when the NOx water storage tank lines froze.

  - ✓ At a City of Garland unit, 78 MW were lost from a draft fan failure, which was caused by frozen damper controls and a resulting low air flow trip.

  - ✓ A wind facility lost six units when lubricating oil fell below the minimum operating temperature and automatically tripped the units.

- **Frozen Water Lines:** The condensate and boiler feedwater systems of steam-cycle generating units (coal, conventional gas, and combined cycle) utilize water from the condenser and add heat (through a series of feedwater heaters) and pressure (through condensate and boiler feedwater pumps) to increase cycle efficiency before the water enters the boilers. Piping, pressure vessels, and valves contained in these systems are susceptible to freezing, absent freeze protection measures. (This is especially true if the unit is offline at the onset of freezing temperatures.)
  .

  - ✓ One facility lost a 160 MW unit when air compressor drains froze. Another unit was shut down because of high boiler "superheat" temperature when its superheat spray lines froze.

- **Frozen Valves:** The operation of valves can become sluggish when exposed to severe cold weather. Depending on the particular application of these components, sluggish valves can cause instability in the boiler or turbine controls, which can eventually lead to a unit trip.

  - ✓ Kiowa Power Partners attempted to free up a frozen valve and, in the process, shut the valve completely, cutting off steam to the turbine and tripping 307 MW of capacity.

  - ✓ Another generating unit experienced a frozen valve on a fuel gas temperature controller, which caused gas temperatures to become

erratic. A bypass valve on another unit's fuel gas temperature controller froze, preventing the unit from reaching full capacity for a period of time.

- **Blade Icing:** Blade icing caused problems for wind generators. Precipitation and condensation during cold weather can cause layers of ice to form on turbine blades, causing potential balancing, bearing, and other equipment problems (as well as safety problems resulting from "ice throws").

  - ✓ Turkey Track Wind Energy lost 27 turbines and 40.5 MW of capacity during the event due to blade icing problems.

- **Low Temperature Limits:** Wind turbines are typically designed to operate within a designated range of temperatures, and have an automatic shutdown feature to protect their components if the range is exceeded. Although manufacturers offer a "cold weather package"[210] that allows a turbine to continue operating in colder temperatures, it does not appear that the package is used in the Southwest.

  - ✓ McAdoo Wind Energy suffered outages of 90 of its 100 turbines when the turbines, designed to shut down when the temperature drops below five degrees, performed as expected. Although McAdoo's turbines restarted automatically when the temperatures rose above the shutdown point, other units, such as Bull Creek Wind, did not come back online as temperatures rose.

- **Transmission Loss:** Generators can also be affected by external outages of transmission facilities.

  - ✓ At one generating plant, cold grease in a breaker appears to have caused slow clearing of the breaker, tripping six units.

[210] Press Release, General Electric, GE Energy's 2.5xl Wind Turbine Now Offers Extreme Cold Weather Capabilities for Challenging Applications in North America and Europe (Sept. 21, 2009), *available at* http://www.genewscenter.com/content/Detail.aspx?ReleaseID=8415& NewsAreaID=2.

ERCOT Non-Weather-Related Outages and Derates

While the majority of the ERCOT generator failures during the February event were weather-related, other causes also played a part. This is not surprising, as on any given day generating units can and do experience problems. To determine whether the amount of non-weather-related failures during the February cold weather event was typical, the task force reviewed ERCOT's 2010 daily forced outage data. During that year, forced outages ranged from 900 MW to 6300 MW per day, averaging 3200 MW per day or 16,000 MW for a five-day period. Therefore, the task force concluded that the 14,386 MW of non-weather-related failures experienced by ERCOT generators between February 1 and February 5, 2011 were comparable to what might be expected over a normal five-day period.

The causes (other than fuel supply) of the non-weather-related outages between February 1 and February 5 included difficulties with mechanical equipment, control equipment, operator error, emissions limitations, and fuel switching failures. The task force identified six general categories of non-weather-related causes of generator trips, derates, and failed starts over these five days:

Cause	No. of Units Lost	MW Lost
Mechanical Failure	37	7588
Control System Issues	28	3624
Fuel Switching	12	909
Operator Error	9	980
Emissions	3	358
Miscellaneous	11	927
Total Non-Weather-Related	**100**	**14,386**

Representative problems within these categories are discussed below.

- **Mechanical Failure**: A number of generators experienced mechanical equipment problems that were not related to the cold weather. For instance, several had combustion turbines trip due to high exhaust temperature spreads, which is an indicator of internal problems with the combustion turbine (or with the thermocouple[211]). Another common combustion turbine problem encountered during the event was high blade path

[211] Thermocouples are used to measure process temperatures and consist of two dissimilar metal wires soldered together at the tip, which produce an electrical current in response to temperature changes. Thermocouples can fall out of calibration over time or fail suddenly due to broken wires or damaged lead wire insulation.

spread,[212] which resulted in several more trips. Other trips, derates, and failures to start resulted from such problems as boiler and heat recovery steam generator leaks, plugged suction strainers on condensate pumps, improper boiler feed water pump oil pressure, gas pressure regulation issues (which were mainly resolved by the pipelines), and an assortment of gas turbine tuning issues.

- ✓ Greens Bayou CT 81 (54 MW) tripped due to a high combustible gas alarm, which was triggered by a leak in a coupling.

- ✓ San Miguel Unit 1 (395 MW) tripped due to a waterwall tube leak.

- **Control System Issues:** A prominent problem with control equipment appears to have been failed thermocouples. Control parameters, logic, and dynamics probes also resulted in several trips. Other problems included, but were not limited to, malfunctioning flame detectors and sheared air register pins,[213] loose wiring, a failed speed sensor, broken control linkages and faulty flow meter switches.

  - ✓ Deer Park CT 1 (195.5 MW) tripped due to a blade path temperature spread resulting from a failed sensor in the plant's distribution control system logic.

  - ✓ One facility experienced problems with its 46 relay,[214] which caused an outage. Another unit had a false indication of a ground fault on a generator rotor, which prompted the operator to take the unit offline.

- **Fuel Switching:** ERCOT has approximately 90 generating units with fuel switching capabilities, permitting them to switch from natural gas to an alternate fuel when natural gas is in short supply. (Generators may wish to switch fuel for other reasons as well, such as economics.) During the February event, 20 units attempted to switch from natural gas to their

[212] Blade path spread is a measurement, utilizing thermocouples, designed to identify turbine exhaust temperatures. A temperature spread beyond allowable limits will initiate an alarm or a trip. However, the alarm or trip can also be triggered by a defective thermocouple, rather than by actual fuel problems or air cooling problems.

[213] The failed flame detectors and air register pins caused burners inside the boiler to malfunction.

[214] A 46 relay (negative sequence relay) is used to detect unbalanced load on a generator that may cause excessive rotor heating and result in significant damage to the generator.

alternate fuel, with 15 units managing the switch successfully. The other units encountered various failures in their switching equipment. Derates also resulted from fuel switching.

- ✓ The Decker CT 2 (54 MW) tripped when attempting to burn fuel oil.
- ✓ The GEUS steam plant was derated by 5 MW due to operating on fuel oil.

- **Operator Error:** Several generators experienced minor problems associated with operator error. In some cases, the problems arose when operators switched control systems from automatic to manual mode. In other cases, generators tripped as the result of improper maintenance procedures.
  - ✓ A flameout of the boiler at one unit forced the burner valves to close but left the main gas trip valve open. In attempting to close the trip switch before restarting the unit, an operator selected the trip switch for the second unit, putting the second unit out of service.
  - ✓ An operator noticed that the fuel forwarding system for two units were operating in the incorrect mode. In attempting to rectify this situation, the operator correctly selected the automatic mode for one pump (it was operating in manual), but mistakenly selected "lagging" instead of "leading." This caused both units to give low pressure alarms and trip offline.
  - ✓ Hydraulic oil heaters at a generating unit had been left unplugged since the summer of 2009 (they had been unplugged at that time to avoid overheating). During the February event, trips resulted from low hydraulic oil temperatures.

- **Emissions:** At approximately 12:00 PM on February 2, ERCOT informed generators that the Texas Commission on Environmental Quality (TCEQ) was temporarily waiving air permit requirements that were preventing some generators from operating at full capacity during the emergency. (Although ERCOT characterized the action as a waiver, the TCEQ actually stated that it was exercising enforcement discretion.) This decision had little effect on the situation within ERCOT, as it was not announced until after half of the shed load had been restored.
  - ✓ Prior to issuance of the notice, Calpine's Clear Lake facility, which consists of three combustion turbines and two heat recovery steam

generators, was forced to manually shut down its GT102 and GT104 turbines in order to avoid exceeding NOx Limits.

- ✓ On February 3, another Calpine unit, Freestone Unit GT4, was derated so as not to exceed its NOx permit limits.

- **Miscellaneous:** A variety of other problems was also experienced, such as the following:

  - ✓ **Switchyard Equipment Problems:** Some generators encountered switchyard problems that led to units failing during the event. One entity was unable to start certain units because a standby transformer was not energized.

  - ✓ **Low Frequency Related Issues:** Two facilities reported frequency-related issues as causes for their units tripping. One facility's three generators tripped as a result of a low frequency turbine protection relay operating improperly. At another facility, the decline in frequency during the event caused the turbine control system to initiate an increase in fuel pressure to increase turbine speed, but it overshot its set point.

ERCOT Gas Supply Outages and Derates

Fuel supply problems did not significantly contribute to the amount of unavailable generating capacity in ERCOT during the first week in February. The outages and derates from inadequate fuel supply totaled 1282 MW from February 1 through February 5. (For comparison, the overall net generating capacity reduction in ERCOT peaked at 14,702 MW on the morning of February 2.) The fuel supply problems also did not occur all at the same time. The following table summarizes generation capacity reductions in ERCOT due to fuel curtailment and fuel quality problems.

Generator	Trip Time	Unit	Gen MW	MW Reduction	Pipeline (s)
Bosque Power Company	2/2 9:26 AM	Bosque Power: Unit 1, Unit 2, Unit 3, and Unit 4	597	154	Enterprise Texas Pipeline, Markwest Lateral
Calpine	2/4 7:55 AM	Corpus Christi: GT1, GT2, and ST1	516	174	South Cross CCNG Transmission
City of Austin (Austin Energy)	2/2 7:30 AM	Decker : Unit 2	450	100	Enterprise Texas Pipeline / Atmos Texas Pipeline
Power Resources	2/2 5:14 PM	Cal Energy: Unit 1	212	7	ONEOK WesTex Transmission
Luminant	2/1 10:00 AM	Lake Hubbard: Unit 1	441	174	Atmos-Texas Pipeline
GEUS	2/1 9:00AM	GEUS Steam Plant	112	112	Atmos-Texas Pipeline
Exelon	2/1 7:30 PM 2/2 11:00 AM 2/2 3:00 PM 2/2 6:00 PM	Mountain Creek: Unit 6, Unit 7, and Unit 8	808	476 396 476 396	Atmos-Texas Pipeline and Energy Transfer Fuel
Frontera Generation	2/2 8:16 AM	Frontera: Unit 1, Unit 2, and Unit 3	485	85	Kinder Morgan Tejas

- **Bosque Power Company:** MarkWest PNG Utility operates an intrastate, 30-mile, 18 inch diameter lateral in Hill, Johnson, and Bosque Counties, Texas. The lateral has an operating pressure of approximately 700 psi, and has no compressor stations. Gas is transported from Enterprise Texas Pipeline, a second intrastate pipeline, to the Bosque County Power Plant, the only electric generation facility served by the pipeline.

Bosque Power Company's QSE, EDF Trading North America (EDF), manages all transportation and gas supply purchases, nominations, and scheduling, including capacity on the Enterprise Texas Pipeline. EDF has only interruptible capacity on the Enterprise Texas Pipeline. The majority of its receipt points are in Waha and West Texas.

The power plant's units are programmed to automatically shut down if pipeline pressure drops below a certain point. On February 2, gas pressure steadily dropped to near the automatic shut down point. To mitigate the effects of lower gas pressures, the plant began reducing energy output on all four of its units.

MarkWest informed the task force that there are no compressors on their pipeline, and therefore the declining pressure was likely a gas supply issue. The pipeline had no capacity constraints.

- **Calpine:** The Calpine Corpus Christi facility is supported by one pipeline system, the Southcross CCNG Transmission pipeline (Southcross). Calpine Energy Services (CES), a subsidiary of Calpine Corporation, is an energy marketer that arranges for natural gas supplies for generation facilities owned by Calpine, including the Corpus Christi facility.

  On February 3 and 4, CES delivered gas into Southcross at four separate locations. However, at approximately 7:55 AM on February 4, the Calpine units tripped off line due to declining pipeline pressure on the Southcross system. The pressure on Southcross fell below the minimum delivery pressure obligation of 560 psig that is stated in both of CES's firm and interruptible agreements. Southcross reported that the low pressures on its system were due to supply freeze-offs that reduced expected deliveries into its system.

  Calpine was able to restart one of its units in less than one hour and run the facility at a derated level. Later in the day on February 4, once Southcross restored its line pack pressures, Calpine successfully brought all units back online.

- **City of Austin (Austin Energy):** The city of Austin has firm capacity on the Enterprise Texas Pipeline and is connected to the Atmos Pipeline-Texas (Atmos), both intrastate pipelines. Under the terms of the city's agreement with Atmos, its capacity rights are reduced when freezing weather is forecasted, pursuant to a specific formula in the contract. Most of the gas supply for the transportation is from Waha.

The plant did not experience curtailments. However, given the limitations on Atmos, usage was limited on February 2. Austin Energy exceeded its contractual hourly take on Enterprise Texas Pipeline and was requested by Enterprise to reduce flows to the hourly take (this is referred to as "back on rate"). This reduction caused a 100 MW derate of the Decker unit.

- **Power Resources:** Power Resources' Cal Energy Plant ramped down one hour early due to low gas pressure on its supplying pipeline, ONEOK WesTex, an intrastate pipeline located primarily in west Texas and the Texas panhandle.

  ONEOK WesTex states that it did not interrupt service but did experience operational difficulties and supply reductions. Beginning on February 1, increased gas usage by towns and power plants reduced the pipeline pressure, and several interconnecting gas processing plants also experienced supply difficulties. Normal operating pressures were restored by the afternoon of February 2.

- **Luminant and GEUS:** These plants are connected to the Atmos system, which traverses the Fort Worth, Permian, and East Texas Basins, all of which experienced supply losses due to freeze-offs.

  Transportation for power generation feeding off Atmos is only offered as an interruptible service, and is subject to electric generation restrictions, called "Tier 3 restrictions." Atmos instituted Tier 3 restrictions beginning at 9:00 AM on February 1, restricting gas flow to zero for the GEUS steam units and for Luminant's Lake Hubbard generating station. On February 2, increased demand resulted in continued loss of line pack and declining pressures at citygate points in Dallas-Fort Worth. Additionally, suppliers experienced well freeze-offs and equipment problems.

  On the morning of February 2, ERCOT initiated rolling blackouts to maintain the grid. The TRC contacted Atmos at approximately 10:00 AM to ask if additional volumes could be delivered to the Lake Ray Hubbard Electric Generating Station to assist with electric grid issues. Atmos explained to the TRC that such action would result in the loss of service to firm residential and commercial customers served by LDCs located to the north of the electric generation station on the pipeline system, and that therefore such deliveries could not be made to an interruptible customer.

- **Exelon:** Exelon has a firm gas transportation contract with Energy Transfer Fuel (ET Fuel) for the Handley Generating Station and an

interruptible gas transportation contract with Atmos for Handley Generating Station and Mountain Creek Station. Atmos implemented a Tier 3 restriction during the extreme weather event, which limited hourly flow to both the Handley and Mountain Creek stations.

The fuel curtailments at Handley did not affect operations until Unit 3 was called on the evening of February 2. Gas supply during the day was enough to allow Units 4 and 5 to run at full load. When Unit 3 was brought on line, it fuel switched Unit 4 to run partially on oil to allow Units 3 and 5 to increase output. Mountain Creek Units 6 and 7 ran at minimum load due to fuel restrictions. Mountain Creek Unit 8 ran at full load (but did have other non-gas related derates that affected output).

- **Frontera Generation:** The Frontera Generation plant is on the Kinder Morgan network of pipelines (collectively, KM Texas Pipes). The KM Texas Pipes receive natural gas from producing fields in south Texas, east Texas, the Gulf Coast, the Gulf of Mexico, and the Permian Basin. They also own or control gas storage capacity.

  Frontera has firm transportation service with deferred account service. "Deferred account service" is a balancing service that enables a shipper to acquire supply during low demand and deliver it to the KM Texas Pipes for future redelivery during peak demand, subject to contractual limits on hourly, daily, and total quantities.

  During the morning of February 2, the KM Texas Pipes contacted those customers that were taking more than their firm contractual rights, including both of the Frontera plants, requesting they stay within their contractual rights because pipeline pressures were falling and putting all firm services at risk. Later that day, ERCOT, along with the TRC, advised the KM Texas Pipes that ERCOT had declared an emergency condition. ERCOT then advised the KM Texas Pipes that the power grid in the Rio Grande Valley was in a critical state. ERCOT and the TRC requested the KM Texas Pipes to allow the Frontera electric generating plant to pull supplies in excess of their firm contractual rights. The KM Texas Pipes complied with this request.

Generation Outages in Salt River Project

The SRP balancing authority suffered several generator outages during the cold weather event, which severely affected its ability to serve load. On February 1 and 2, SRP lost a total of seven units. The failures of three of them were related to weather. On February 1, SRP lost Unit 1 at its Navajo Generating Station due

to a frozen transmitter sensing line, reducing generation capacity by 330 MW. On February 2, SRP lost additional generation due to weather-related problems: it lost 75 MW, its 10 percent share, from Unit 4 at Four Corners Generating Station (operated by Arizona Public Service Company), which failed due to a frozen sensing line that served the throttle pressure transmitter; and it lost Unit 2 at Navajo Generation Station, which tripped due to frozen waterwall pressure transmitter sensing lines.

SRP also suffered generation losses from the trips of four units on February 2, due to non-weather related issues: Coronado Generating Station Unit 2 , which experienced a mechanical problem with a coal pulverizer, losing peak load of 389 MW; the combustion turbine and the steam turbine units at Santan Generation Station Unit 6, which suffered an internal mechanical failure on the heat recovery steam generator and an accompanying runback of the combustion turbine; Springerville Unit 3 (operated by Tucson Electric Power), which developed high furnace pressure, causing a loss to SRP of its 75 MW share of the plant's 400 MW.

Generation Outages in El Paso Electric

The EPE balancing authority shed approximately 623 MW of firm load over the course of the February event, due to the loss of 646 MW of local generation. Unlike SRP, almost all of EPE's's outages were due to the cold weather.

On February 1, EPE lost its Newman Unit 3 because of frozen condensation on the fresh air inlet, and lost Rio Grande Unit 6 because of a frozen gas transmitter. The loss of these units resulted in a 152 MW reduction of capacity.[215]

On February 2, EPE lost 495 MW of capacity from its Newman and Rio Grande plants. Newman Gas Turbines 1 and 2 at Newman Unit 4, each with a capacity of 73 MW, tripped due to faulty drum level readings resulting from the cold weather. Gas Turbines 3 and 4 at Newman Unit 5, each with a 70 MW capacity, also tripped due to frozen drum level instrumentation sensing lines. Newman Unit 4 Steam Turbine, a 64 MW unit, tripped on February 2 due to frozen instrumentation associated with the condenser vacuum. Finally, EPE lost Rio Grande Unit 8, a 145 MW unit, due to frozen transmitter sensing lines that caused a low gas pressure signal.

[215] The Newman plant is not enclosed; the Rio Grande plant is enclosed.

El Paso attempted to bring its units back online on February 3 and February 4, with limited success. Newman Unit 4's GTs were restarted, only to trip on subsequent occasions for similar weather-related issues. (Luna and Afton, PNM remote generating facilities from which EPE was receiving energy, also experienced outages on February 3 and February 4.)

During the event, two EPE units, Newman Unit 1 and Rio Grande Unit 7, were offline and EPE tried to bring them online to assist with the shortages. Both units, however, failed to start due to frozen components and, in the case of Newman Unit 1, frozen drum drain lines and transmitter.

B. Natural Gas

Most of the natural gas supply problems experienced in the Southwest during the cold weather event were caused by freeze-offs, principally at the wellhead or, to a lesser degree, at nearby processing plants. Other equipment failures also played a role, as did the rolling blackouts and customer curtailments in the ERCOT region.

In order to analyze the causes of the supply shortfalls, the task force reviewed daily shortfalls at receipt points on pipelines. Most of these receipt points were at processing plants. The following table summarizes the information received from 13 processing companies, which overwhelmingly pointed to upstream supply outages as the major cause of the reduced volumes. (The second column is the maximum estimated production shortfall by basin; the third column is the percentage of shortfall of the processing plants that provided information; the final column lists the causes of the shortfalls.)

Processing Plant Outages Relative to Daily Production Shortfalls

BASIN	MAXIMUM DAILY PRODUCTION OUTAGE	PROCESSING RESPONSES AS A % OF THE DAILY OUTAGE	CAUSES
Permian	1.31 Bcf on Feb 4	0.44 Bcf (34%)	85% Upstream Supply Freeze-offs, 15% Mechanical/Electricity Outages
San Juan	.43 Bcf on Feb 2 and Feb 3	0.21 Bcf (52%)	Upstream Supply Freeze-offs, Minimal Amount due to Mechanical
Fort Worth	1.63 Bcf on Feb 6	0.17 (11%)	Upstream Supply Freeze-offs, Minimal Amount due to Mechanical
East Texas	.72 Bcf on Feb 3 and Feb 5	NA	NA
Gulf Coast	.65 Bcf on Feb 4	NA	NA

The task force further explored these upstream production outages by surveying 15 of the larger producers in the San Juan, Permian, Fort Worth, East Texas, and Gulf Coast Basins. These producers accounted for almost 40 percent of the total production for the five basins, with the highest percentages from the Fort Worth, San Juan, and Permian Basins.

For February 1 to February 5, an estimated 14.8 Bcf of production was lost from these five basins due to weather-related reasons. Of that amount, the surveyed producers lost 7.1 Bcf, equal to 48 percent of the total.

These production losses occurred for a variety of reasons. Some of the most common occurrences reported to the task force included:

- Freeze-offs (in some circumstances winterization was only designed for temperatures in the 20s),
- Icy roads that hampered logistics such as hauling away water produced by treatment equipment, and
- Rolling blackouts and customer curtailments.

Rolling blackouts were a problem particularly in the Fort Worth Basin, where they caused outages of compressors on gathering lines. In the Permian Basin, deployment of Load Resources by ERCOT during the event caused disruption to electric pumping units. According to information received from the

surveyed producers, 27 percent of the outages in the Fort Worth Basin were due to the rolling blackouts, and 29 percent of the outages in the Permian Basin were due to rolling blackouts or the curtailment of interruptible load.

The following table itemizes the reasons stated by these 15 producers for the supply shortfalls (the check marks indicate how many separate producers submitted information for each category):

	Permian	San Juan	Fort Worth	East Texas	Texas Gulf
Rolling Black Outs/ Curtailed Load	✓✓✓✓		✓✓		
Icy Roads	✓✓✓✓	✓	✓✓✓✓✓✓	✓✓	
Freezing of Compressors		✓✓	✓✓✓	✓✓	✓✓
Freezing Meters		✓			✓
Wellhead Freeze-offs	✓✓✓✓✓	✓✓	✓✓✓	✓✓✓✓✓	✓✓✓✓
Processing Facility Shut-in	✓	✓	✓	✓	
Ice Plugs in Gathering Lines	✓				
Frozen Salt Water Disposal Facilities	✓				

A basin-by-basin description of the gas production declines, and the resulting reduction in flows, follows.[216]

Permian Basin

The Permian Basin suffered production losses from February 1 through February 5 of 3.98 Bcf, with a maximum daily decline of 1.31 Bcf on February 4. The reasons provided for these declines are based on information received from

[216] The information is drawn from materials provided to the task force by producers and processing plants.

processors representing 34 percent of the maximum daily outage and producers representing 28 percent of the cumulative losses.

Reduced Flows at Processing Plant Pipeline Receipt Points

The task force reviewed receipt points on El Paso, Transwestern, Northern Natural Gas Company, and Enterprise Texas pipelines that had reductions exceeding 20,000 MMBtus per day, and thirteen processing plant points that had reductions of approximately 0.6 Bcf per day.

The receipt points on the El Paso pipeline with flow declines exceeding 20,000 MMBtus per day from February 1 to February 3 are all processing plant/gathering locations. They include Enterprise Waha (reduction of 120,681 MMBtus per day); Southern Union Jal#3 (reduction of 35,966 MMBtus per day); DCP Midstream GPS Eunice, reduction of 32,055 MMBtus per day; DCP Midstream Goldsmith Plant (reduction of 29,562 MMBtus per day); Southern Union Keystone (reduction of 28,515 MMBtus per day); Versado Gas Processors Texaco Eunice (reduction of 26,407 MMBtus per day); DCP Midstream Pegasus (reduction of 23,475 MMBtus per day); and Versado Gas Processors, Warren Monument (reduction of 21,460 MMBtus per day).

Transwestern's supply shortfalls in the Permian Basin were modest, relative to El Paso's, and were most significant at the Frontier Maljamar Gas Plant (reduction of 33,000 MMBtus per day) and at the Agave producer gathering connection (reduction of 44,000 MMBtu per day). Northern Natural processing plant receipt points with large reductions were the Atlas Midkiff Plant (reduction of 63,997 MMBtus per day) and the DCP Linam Ranch Plant (reductions of 106, 406 MMBtus per day). Finally, on Enterprise Texas Pipeline, the Crockett Gas Plant had a production shortfall of 34,376 MMBtus per day.[217]

Explanations varied for the reductions from the processing plants located in the Permian Basin.[218] The largest supply reduction to El Paso was the Enterprise Waha treating plant, which has a capacity of 280 MMcf per day. Enterprise reported that volumes delivered to the Waha Treating Plant decreased from 120 MMcf per day to approximately 40 MMcf per day, due to gas supply freeze-offs on February 2 and February 3. The plant's GE turbine then went down on

[217] Staff's analysis based on supporting data, display reports and data warehouse on file with Bentek (unpublished); *See also Market Alert: Deep Freeze Disrupts U.S. Gas, Power, Processing*, Bentek Energy LLC, Feb. 8, 2011, at 2-6.

[218] The task force received materials from a number of processing plants located in the basin. The material cited represents a sampling of data from those materials.

February 3, due to high discharge pressure when El Paso closed its valve at the plant tailgate (because of a high dew point in the gas stream).

On February 2, DCP's Linam Ranch plant in east New Mexico experienced freezing air ducts, resulting in a modest reduction to El Paso of 4,865 MMBtu per day from February 1 to February 3 (the reduction is 24,092 when measured from January 31). The plant then experienced a delay returning to service because of gas supply shortages from well freeze-offs, resulting in a lack of gas to restart the plant. The plant returned to normal operations on February 6 and supply returned to normal levels on February 7. Reductions in volume at three other DCP plants, Goldsmith, Pegasus, and Eunice, were the result of supply shortages from wellhead freeze-offs. Goldsmith and Pegasus experienced rolling blackouts that resulted in only brief outages, with gas being at the time either processed at the plants or delivered directly into pipelines.

Four DCP Texas processing plants were impacted by the rolling blackouts on February 2, but only one of them had resulting operational problems. The power outage caused the cooling water used for compression at the Roberts Ranch Plant in west Texas to freeze, leading to a plant shut down. (The plant was back in service on February 5.) The remaining plants did not experience any operational issues from the power outages. When the brief power outages occurred, the upstream gas bypassed the plants and was delivered without being processed.

Southern Union operates the Keystone and Jal #3 plants that together flowed reduced volumes of 64,481 MMBtu per day to El Paso. Southern Union reported that it experienced major property damage and significant financial losses due to freezing and failure of wells, pipes, and other facilities. The weather event ultimately resulted in the cessation of operations at many plants and field facilities, with corresponding reductions in deliveries to downstream pipelines. Some of Southern Union's issues were a direct result of rolling power outages at the Keystone facility at 7:25 AM and 9:05 AM on February 2, lasting 34 and 30 minutes, respectively.

Producer Declines in the Permian Basin

Producers representing a customary production level of approximately 0.75 Bcf per day[219] (approximately 30 percent of total basin production), reported production losses for the period February 1 through February 5 of 1.1 Bcf,

[219] This number represents the producers' usual production level, absent reductions experienced during the event.

estimated to be approximately 28 percent of the total basin production losses for the five days. The losses were attributed to the following:

- Power disruptions to electric motors on pumping units (29 percent of the total losses, or 0.32 Bcf),
- Icy roads,
- Ice plugs in gathering lines,
- Freeze-offs, and
- Downtime at processing plant.

Occidental Energy Marketing reports that on February 2, because of its status as a Load Resource on ERCOT's system, electric service to its production facilities were interrupted when ERCOT deployed it as a Load Resource. This interruption resulted in significant production losses. Power began to be restored approximately 1.5 hours after the disruption occurred.

ConocoPhillips Company reports that a significant percentage of its production losses in the Permian Basin were attributable to rolling blackouts that knocked out processing plants and pumps and lifts. The majority of its Permian Basin production comes from oil wells that rely on electric pumps and lifts to maintain oil flow. When the pumps failed, the natural reservoir pressures were unable to sustain flow, the oil congealed, and the wells and flow lines froze.

San Juan Basin

The San Juan Basin suffered production losses from February 1 through February 5 of 1.3 Bcf, with a maximum daily decline of 0.43 Bcf on February 3 and February 4. The reasons provided for these declines are based on information received from processors representing 52 percent of the maximum daily outage and producers representing 71 percent of the cumulative losses.

Reduced Flows at Processing Plant Pipeline Receipt Points

The task force reviewed receipt points on El Paso and Transwestern that had reductions exceeding 20,000 MMBtus per day, and eight processing plant receipt points with a reduction of approximately 0.35 Bcf per day (when netted against increased flows elsewhere).

Receipt points off of El Paso that had flow reductions exceeding 20,000 MMBtus per day are the BP Florida River Plant, with a reduction of 155,691 MMBtus per day, and two Williams Field Services processing plant/gathering locations; Milagro, with a reduction of 66,764 MMBtus per day, and #37, with a reduction of 24,047 MMBtus per day. Transwestern's most significant supply

shortfalls in the San Juan Basin for February 1 through February 3 were the William FS Kutz Plant, with reductions of 36,000 MMBtus per day, the Red Cedar Arkansas Loop gathering facility, with a reduction of 33,000 MMBtus per day, the Valverde Gas Plant, with a reduction of 48,000 MMBtus per day, and the Enterprise Chaco Plant, with a reduction of 87,000 MMBtus per day. These reductions were partially offset by increased flow of 100,000 MMBtus per day from the Williams FS Ignacio Plant.

Williams Fields Services reported that they had no operational problems, and the reduced volumes at Milagro and Kutz were due to upstream production shut-ins. With regard to the Chaco Plant, Enterprise reported it was operating at less than full capacity during the first week of February primarily because: (i) gas supplies were limited, (ii) ConocoPhillips moved approximately 100 MMcfd[220] from Chaco to their own San Juan processing plant on February 1, and (iii) winter production shut-ins occurred. In addition, the plant tripped on February 2 due to a hazardous gas supply alarm, and Enterprise's attempts to restart it were impeded by the combination of the lower volumes being nominated by producers and the cold weather experienced at the time.

Producer Declines in the San Juan Basin

Producers representing a customary production level of 2.0 Bcf per day (approximately 67 percent of total basin production), reported production losses for February 1 through February 5 of 0.9 Bcf, estimated to be approximately 71 percent of the total basin production losses for the five days.

None of the producers cited power outages as a cause of production losses. The losses were attributed to the following:

- Problems with compressor units,
- Freezing of wellhead meters,
- Cold weather, Freeze-offs,
- Icy roads, and
- Downtime at a processing plant.

Fort Worth Basin

The Fort Worth Basin suffered production losses from February 1 through February 5 of 4.7 Bcf and a maximum daily decline of 1.63 Bcf on February 6. The reasons provided for these declines are based on information received from

[220] MMcfd is a million cubic feet per day.

processors representing 11 percent of the maximum daily outage and producers representing 80 percent of the cumulative losses.

Reduced Flows at Processing Plant Pipeline Receipt Points

The Fort Worth Basin experienced supply reductions of almost 1.3 Bcf per day. Energy Transfer Fuel (ET Fuel) and Crosstex North Texas Pipeline (Crosstex) both receive gas from the Fort Worth Basin, and experienced reduced receipts.

ET Fuel had reduced receipts of 0.35 Bcf per day from January 31 through February 4. The largest reductions on the system occurred at the following receipt points: Chesapeake Energy production, with a reduction of 71,314 MMBtus per day; EOG Resources production, 127,418 MMBtus per day; Quicksilver Gathering, reduction of 69,675 MMBtus per day; and an ET Fuel processing plant, reduction of 61,668 MMBtu per day.[221]

Crosstex had a flow reduction estimated at 0.14 Bcf per day. The reduced volumes were due largely to the weather-related shut-down of the Silver Creek processing plant. Primarily due to freeze-offs, production at the plant declined by approximately 110,000 MMBtus per day from a normal flow rate of 185,000 MMBtus per day, to a five day average of 75,000 MMBtus per day on the outlet.

Atmos reported that intermittent supply reductions from nominated volumes were 0.13-0.17 Bcf per day.

The Energy Transfer Corporation Texas (ETC Texas) Godley area plant in north Texas experienced weather related difficulties on February 1 when one of its amine systems froze. ETC Texas was able to flow amine again on February 5. From February 1 through February 5, the inlet volume of the Godley Processing Plant decreased by 100 MMcfd, due to the loss of third party production from freeze-offs.

Producer Declines in the Fort Worth Basin

Producers representing a customary production level of 3.3 Bcf per day (approximately 69 percent of total basin production), reported production losses from February 1 through February 5 of 3.8 Bcf, estimated to be approximately 80

[221] Staff's analysis based on supporting data, display reports and data warehouse on file with Bentek (unpublished); pipeline scheduled volumes.

percent of the total basin production losses for the five days. The losses were attributed to the following:

- Rolling blackouts primarily affecting compressors on gathering lines (27 percent, or at least 1.0 Bcf),
- Icy roads, and
- Freeze-offs.

One large producer in the basin reported production losses for the period February 1 through February 5 as a result of electrical compression being shut down on a gathering system in the Dallas/Ft. Worth area. After power was restored, production was slow to return to standard rates. It therefore appears likely that a significant percentage of the lost production even after February 2 was due to the loss of power during the rolling blackouts.

East Texas

Producers representing a customary production level of 1.2 Bcf per day (approximately 24 percent of total basin production), reported production losses from February 1 through February 5 of 0.9 Bcf, estimated to be approximately 33 percent of the total basin production losses for the five days. The losses were attributed to the following:

- Equipment freeze-offs,
- Icy roads,
- Downtime at processing plants,
- Freezing of equipment, and
- Wellhead freeze-offs.

Gulf Coast

Producers representing customary production level of 0.7 Bcf per day from February 1 through February 5 (approximately 14 percent of total basin production), reported production losses from February 1 through February 5 of 0.36 Bcf, estimated to be approximately 18 percent of the total basin production losses for the five days. The losses were attributed to the following:

- Compressors freezing,
- Frozen meters, and
- Freeze-offs.

VII. Prior Cold Weather Events

The arctic cold front that descended on the Southwest during the first week of February 2011 was indisputably severe. Many cities in Texas and New Mexico experienced a 50 degree drop in temperature over an eighteen-hour period. Temperatures dropped to the low teens in Texas and below zero in New Mexico. Much of north Texas experienced record setting sleet and snow, totaling up to seven inches. Exacerbating the effects of the cold temperatures were accompanying sustained winds of 30-40 mph, with gusts as high as 51 mph.

The 2011 winter weather event has been determined by at least one weather service to be a one in 10 year occurrence for some regions of Texas, in terms of low temperatures and duration.[222] Adding the sustained winds to these low temperatures, the resultant convective heat loss (wind speed plus ambient temperature) for some generators was estimated to approach a one in 25 year severity. Specifically in El Paso, only four prior recorded cold weather events approached 2011 in severity, making the storm the worst weather event in the El Paso area in 49 years.[223]

This cold weather event was thus unusual in terms of temperature, wind, and duration. It was not, however, entirely without precedent. The Southwest experienced other cold weather events in 1983, 1989, 2003, 2006, 2008, and 2010. In fact, two of those years, 1983 and 1989, had lower temperatures than 2011.[224] But only in l989 were the severity, geographical expanse, and duration of cold temperatures and high winds comparable to the February 2011 event.

In most of those prior years, utilities avoided any significant outages or curtailments. In other years, however, that was not the case. This section examines pertinent prior winter weather events to determine if there were lessons that could have been learned that might have prevented or ameliorated the service disruptions experienced in 2011.

[224] Based on data from the National Weather Service.

A. Electric

The two prior cold weather events of most significance for the ERCOT region occurred in 2003 and 1989; generators experienced weather-related outages in both of those years, and rolling blackouts were implemented in 1989. The winter of 1989 in particular resembles that of 2011, both in the severity of the weather and in loss of load.

These two events are described below, beginning with the most recent.

2003 Event

On Friday, February 21, 2003, weather forecasts predicted a cold front over a large part of Texas. The front moved in earlier and was more severe than projected. Statewide, temperatures ranged from 15 to 27 degrees below normal. On Monday, February 24, with freezing temperatures as far south as San Antonio, the demand for electricity reached 42,029 MW, exceeding ERCOT's forecast by 4218 MW, or 11 percent. Owners of gas-fired generating units were short on gas and tried to acquire more gas on the intraday market. At the same time, the demand for gas increased as a result of heating needs.

System Events

By 6:00 PM on February 24, ERCOT issued a Market Alert to increase available energy and capacity, and ordered all Reliability Must Run (RMR) units raised to maximum output levels. Temperatures remained below freezing in Austin and Dallas into Tuesday. By 7:30 AM on Tuesday, ERCOT issued a Market Advisory requesting more bids. At the same time, gas companies informed customers that they were activating tariff provisions to curtail gas for purposes other than "human need." At the request of three QSEs, the ERCOT Chief Operating Officer signed affidavits stating that gas needed for electric generation met the qualification of human need.

At 9:08 AM on February 25, gas curtailment to a power plant caused three units to trip, resulting in the loss of 745 MW of generation. System frequency dropped to 59.81 Hz and could not be restored. The ERCOT system control error (SCE) was -1,500 MW and increasing. At 12:01 PM, ERCOT declared Emergency Electric Curtailment Plan (EECP) Step 1 (EECP was the predecessor to today's Emergency Energy Alerts). Step 1, invoked when reserves fall below 2300 MW, entailed instructing all available generation to come on line, and securing emergency power from neighboring electrical grids through the DC ties.

The EECP Step 1 succeeded in rebalancing the system within 30 minutes. Step 1 remained in effect for about seven hours and 30 minutes.[225]

Gas Supply Problems

Generator owners reported to the PUCT that they had problems acquiring natural gas to run their gas-fired units. Natural gas was suddenly in short supply, but equally significant was the fact that the structure of the natural gas market limited the way generators were able to respond to fuel shortages in real time. Specifically this involved the following:

- **Depleted reserves:** The amount of gas in storage declined rapidly starting in November 2002, faster than the usual drawdown over the winter period, dropping from a five year high to a five year low in just four months.

- **Timeline for gas nominations:** Natural gas trading closed for the weekend, meaning that fuel for Monday must be procured on Friday, thereby not allowing leeway for late changes in the forecast.

- **Fuel shortages and curtailments:** Delivery constraints reduced the fuel supply to some plants, forcing their electric generating capacities to be derated.

- **Lack of on-site storage:** Natural gas pipeline companies have the bulk of their storage underground, but most of the former vertically integrated electric utilities had their own gas storage facilities. Independent power producers generally do not have their own gas storage; in a deregulated environment, most believe it is uneconomical to maintain it.

In 2003, almost three-quarters of the installed electric generating capacity was fueled by natural gas. Of those units, 16 percent had dual fuel capability, the other fuel being oil. Many units switched from gas to oil on February 24 and February 25, but most had to be derated in the process, and some experienced operating problems. Of the total of 5500 MW of capacity that was lost due to gas curtailments, ERCOT estimated that only 3200 MW was regained on back-up fuel oil, yielding a net loss of 2300 MW.

[225] Prices spiked to $990 per MWh on February 24 and February 25, 2003, as the result of hockey stick bidding. For a discussion of this phenomenon, see the earlier section of this report entitled "The Event: Load Shed and Curtailments."

PUCT Recommendations

The Market Oversight Division of the PUCT investigated the 2003 cold weather event and issued a number of recommendations.[226] Notable among these are the following:

- Stricter enforcement of Resource Plan accuracy.
- Improved weather and electric demand forecasting.
- Consider providing financial incentives for fuel oil inventories to be maintained for use by dual fueled units.
- Curtailment prioritization – development of a joint curtailment methodology for natural gas and electricity production.
- ERCOT should communicate with both QSEs and Transmission / Distribution Service Providers in the future when the power system is under stress.

Consequences

Following the 2003 generating unit outages, ERCOT revised its Protocols to establish Resource Plan performance metrics. These were put in place in 2004. The February 2003 event ultimately became an impetus for the establishing of Emergency Interruptible Load Service in ERCOT.

1989 Event

Beginning on Thursday, December 21, 1989, an arctic air mass descended on Texas for three days, delivering some of the coldest temperatures ever recorded in the state over a one hundred year period. Temperatures bottomed out at 7 degrees in Houston, -1 in Dallas, and -7 in Abilene. As a result of the cold weather, the demand on the ERCOT power system peaked at 38,300 MW, an 11 percent increase over the previous winter's peak and 18 percent above the projected peak for the winter of 1989-1990. This load level was equivalent to 93 percent of the summer peak demand.[227]

Comm'n of Tex., Market and Reliability Issues Related to the Extreme Weather Event on February 24-26, 2003, 29 (May 19, 2003), *available at* http://puc.state.tx.us/industry/electric/reports/ERCOT_annual_reports/special/weather_event.pdf (PUCT 2003 Report).

[227] Elec. Reliability Council of Texas, *ERCOT Emergency Operation: December 21-23, 1989* (Undated), at 5 (ERCOT Emergency Operation).

The high demand, combined with weather-related forced outages of generating units and the curtailment of natural gas fuel supplies, resulted in the need for ERCOT to shed firm load system-wide for the first time in its history or the history of its predecessor.[228] Although there were two subsequent years in which ERCOT shed load during hot weather spells,[229] the 1989 event remained the only cold weather-related load shed event until February 2011.[230]

The 1989 event predated deregulation of the electric utility business in Texas, which began in 2002. Utility companies were therefore still vertically integrated and owned and operated generation, transmission, and distribution in their franchise service territories.

System Events

On Wednesday, December 20, 1989, a severe cold weather alert was declared for north Texas, effective the following morning; by 6:00 PM on Thursday, all of ERCOT's territory had been placed under severe alert. The temperature was 21 degrees in Dallas and 41 in Houston at that time. Gas curtailments were experienced starting on December 21, and continued for several days thereafter. These resulted in a considerable number of generators switching to or increasing their mix of fuel oil.

On Friday, December 22, ERCOT was unable to maintain minimum required operating reserve levels, due to record-high loads and a large number of generating units being forced offline. The frequency dropped below 59.95 Hz at 8:30 AM, and ERCOT ordered the start up of all available units. Those local control centers experiencing generation deficiencies also shed interruptible loads and minimized their own internal loads such as mining operations and station

[228] ERCOT's predecessor was Texas Interconnected Systems, formed in 1941. *Id.* at 1.

[229] In May 2003, the loss of two nuclear-powered generating units tripped automatic UFLS relays, resulting in the shedding of 1549 MW of firm load; service was restored within three hours and 30 minutes. In April 2006, an early season heat wave and the loss of four generating units caused ERCOT to shed 1000 MW of firm load via rolling blackouts; service was restored within one hour and 45 minutes.

[230] For the Houston area, which was the hardest hit in Texas, it was the first shedding of firm load in the history of the Houston Lighting and Power Company, dating back to the energizing of its first lighting load in 1882. *See* Bill Beck, At Your Service: An Illustrated History of Houston Lighting & Power Company (Houston Lighting & Power Company, 1st ed.1990) at 409; *see also* A Brief history of CenterPoint Energy, 1880-1889, CenterPoint Energy, http://www.centerpointenergy.com/about/companyoverview/companyhistory/timeline/23b55aef7af66210VgnVCM10000026a10d0aRCRD/ (last visited Aug. 3, 2011.

lighting. Utilities made public appeals for customers to voluntarily reduce consumption.

At 10:00 AM on December 22, ERCOT's load peaked at 38,300 MW. At this point, the online generating capacity was 39,800 MW, or 1500 MW greater than the load. Within two hours, decreasing load and the restoration of some generating units that had been forced offline earlier succeeded in bringing reserves back up to acceptable levels. Thus, the record-setting peak load period was met without the need to shed firm load.

However, temperatures continued to drop overnight Friday into Saturday, December 23, when they reached minimums of -7, -1, and 7 degrees in Abilene, Dallas, and Houston, respectively, with wind chill factors down to -35 degrees.

Up until midnight Friday night, approximately 3000 MW of generation was offline due to weather-related problems. The system also suffered 1500 MW of capacity reduction on account of units switching from natural gas to fuel oil. Between midnight and 7:00 AM on the following morning, an additional 4700 MW of generation was forced offline due to weather-related problems. It was also difficult getting power from outside ERCOT. West Texas Utilities offered 220 MW of emergency power to Houston Lighting and Power Company (HL&P), to be delivered over the North Tie, but then had to withdraw the offer due to unspecified technical problems.

By 5:36 AM on Saturday, December 23, the frequency had again dropped below 59.95 Hz, and over the course of the next hour and a half it hovered between 59.79 and 59.92 Hz, indicating the system was in difficulty. Interruptible loads were shed during the early morning hours. At 7:49 AM, ERCOT directed the utilities that were generation deficient to shed firm load.

HL&P had already begun shedding firm load, and increased its load shed to 1000 MW. Lower Colorado River Authority and the City Public Service of San Antonio shed 60 and 150 MW of firm load, respectively.

This firm load shedding, combined with some internal and external power transfers, succeeded in restoring the frequency to 60 Hz, re-stabilizing the system. Around 10:20 AM, however, seven generating units producing a combined 1275 MW were all forced offline nearly simultaneously, causing the frequency to plummet to 59.65 Hz. ERCOT was then forced to invoke system-wide load shedding, beginning with 500 MW, allocated among the utilities. Within ten minutes, the frequency had recovered and the system was stable once again.

As the midday Saturday load declined (typical for a weekend midday), much of the firm load that had been shed was able to be restored within only 30 minutes. The load shed directive was terminated slightly more than two hours later, when reserves increased to acceptable levels.

Accounts vary regarding the amount of total firm load that was shed. The PUCT reported a total load shed of 1710 MW.[231]

Generation Outages, Derates and Failures to Start

The following table presents a summary of the causes of the outages, derates, and failures to start experienced in ERCOT during the 1989 cold weather event.

Number of Units	Capacity	Cause
34	11,623 MW	Frozen Instrumentation
6	1385 MW	Paralyzed or Dead Fish Clogging Water Intakes
9	1051 MW	Other, Cold Weather-related
7	1246 MW	Non-weather-related
56	**15,305 MW**	**Subtotal**
Not Available	1500 MW	Gas curtailment impact (oil burning derate)
56+	**16,805 MW**	**Total**

[231] *See* Pub. Util. Comm'n of Tex., Electric Utility Response to the Winter Freeze of December 21 to December 23, 1989 (Nov. 1990), at 14 (PUCT 1989 Report); ERCOT Emergency Operation at 6.

.

Virtually all types of generating units encountered problems, whether viewed from the perspective of fuel type or unit type, suggesting that the problems could not be attributed to a particular fuel or unit design. The breakdown is as follows:

- Sorted by **Fuel Type:**
  - Coal: 8 units; 4669 MW
  - Natural Gas: 29 units; 3881 MW
  - Distillate Oil: 1 unit; 257 MW
  - Dual Fuel – Gas & Oil: 15 units; 4418 MW
  - Dual Fuel – Coal & Gas: 1 unit; 670 MW
  - Nuclear: 1 unit; 1250 MW *
  - Petroleum Coke: 1 unit; 160 MW

    *This unit was forced off line the previous weekend due to the failure of an expansion joint in a steam condenser. An attempt was made to start it up during the December 21-23 cold spell, but that failed due to equipment freeze-ups.

- Sorted by **Unit Type:**
  - Conventional Steam Turbine Generators: 32 units; 13,298 MW
  - Simple Cycle Gas Turbines: 7 units; 235 MW
  - Combined Cycle Units: 17 units; 1772 MW

PUCT Recommendations

The PUCT staff investigated the cold weather event of 1989 and issued a report the following year that evaluated the causes of the generator outages and made recommendations. Because the circumstances of the event, and the causes of the outages, are so similar to those of the 2011 event, it is worth reproducing those recommendations verbatim:[232]

- All utilities should ensure that they incorporate the lessons learned during December of 1989 into the design of new facilities in order to ensure their reliability in extreme weather conditions.

- All utilities should implement procedures requiring a timely annual (each Fall) review of unit equipment and procedures to ensure readiness for cold weather operations.

[232] PUCT 1989 Report at 7.

- All utilities should ensure that procedures are implemented to correct defective freeze protection equipment prior to the onset of cold weather.

- All utilities should maintain insulation integrity and heat tracing systems in proper working order. Generating unit control systems and equipment essential to cold weather operations should be included in a correctly managed preventive maintenance program.

- Additional training programs for plant personnel on the emergency cold weather procedures, including periodic drills, should be implemented by each responsible utility.

- PUC Engineering Staff should modify procedures for power plant CCN [Certificates of Convenience and Necessity] reviews to include a specific review for plant reliability under adverse weather conditions. Of special interest would be the selection of proper design temperature ranges for the power plant site.

The PUCT identified inoperative or inadequate heat tracing systems and inadequate insulation on instrumentation sensing lines as the most common technical equipment problems encountered during the freeze. (These problems also featured prominently in the failure of many generators during the February 2011 event.) Many of the PUCT's recommendations involve weatherization improvements it advised the generators to make, including ensuring the working operation of freeze protection equipment, insulation, and heat tracing systems; instituting preventative maintenance for cold weather equipment; and implementing adequate training for extreme conditions.

The report concluded that "the near complete loss of the ERCOT grid brings an awareness that, even in Texas, plant operators must prepare for cold weather emergencies...this awareness of and attention to cold weather problems must be continued."[233]

Comparison of 1989 and 2011 Events

A summary of the statistics for the 1989 event and the 2011 event show how similar they were. Weather conditions and system events for each year are set forth below.

[233] *Id.*

Comparison Table: Basic Information

	December 21-23, 1989	February 1-2, 2011
Min. Temps & Wind Chills in Dallas Area	Temperature: -1 degrees F Wind Chill: -12 degrees F	Temperature: 13 degrees F Wind Chill: -6 degrees F
Peak System Load	38,300 MW	56,334 MW
Net Generating Capacity Reduction	11,809 MW 31% of peak load	14,702 MW 26% of peak load
Gross Generating Capacity Reduction	56+ units 16,805 MW	193 units 29,729 MW
Firm Load Shed	1710 MW 4.5% of peak load	4900 MW 8.7% of peak load
Overall Duration of Firm Load Shedding	5 hours, 47 minutes	7 hours, 24 minutes

The following table compares the causes of the outages, derates, and failures to start for each year.

Comparison Table: Generator Problems

	December 21-23, 1989	February 1-2, 2011
Frozen Instrumentation	34 units 11,623 MW	61 units 13,924 MW
Fish Clogging Water Intakes	6 units 1385 MW	None reported
Other Cold Weather-related	9 units 1051 MW	54 units 6365 MW
Non-weather-related	7 units 1246 MW	63 units 7905 MW
Gas Curtailment Impact	No. of units not specified 1500 MW	15 units 1534 MW
Weather-related % of Gross Capacity Reduction in MW	**84 % ***	**68 % ***
Frozen Instr. % of Gross Capacity Reduction in MW	**69 %**	**47 %**

* Does not count gas curtailments as weather-related.

Despite the recommendations issued by the PUCT in its report on the 1989 event, the majority of the problems generators experienced in 2011 resulted from failures of the very same type of equipment that failed in the earlier event. And in many cases, these failures were experienced by the same generators. Of the over 56 units and 16,805 MW of generating capacity that became unavailable during the December 1989 event, 43 units (representing 13,606 MW of capacity) are still in service in 2011. And 26 of those units, representing 5654 MW of capacity, experienced problems again during the February 2011 cold weather event.

The failures of these repeating units alone eroded a large share of ERCOT's reserve margin going into the morning of February 2, 2011, putting the entire system in jeopardy. Weighing the shedding of 4000 MW of firm load in February 2011 against the 5654 MW of generation capacity that experienced problems in both the December 1989 and February 2011 events, it can be argued that had three-quarters of that capacity not failed again in 2011, the February 2011 blackouts would not have happened. [234]

In its 1989 report, the PUCT commented that "whether the corrective actions being implemented [by the generators in the wake of the event] are sufficient to prevent future freeze-off related power plant failures, only direct experience with another deep freeze will ascertain."[235] Texas has now had that second event, and the answer is clearly that the corrective actions were not adequate, or were not maintained. Generators were not required to institute cold weather preparedness, and efforts in that regard lapsed with the passage of time. It is also possible that new ownership or new plant personnel lacked the historical perspective to make these efforts a priority, at least in the absence of externally imposed requirements.

The task force considered whether cost alone could have been the driving factor in the failure to maintain adequate winterization, and believes it to be unlikely. Based on current industry data, the task force estimates that for conventional gas-fired units and combined cycle units, the capital cost of upgrading basic equipment such as insulation and heat tracing could range from $50,000 to $500,000, depending on the age and condition of the materials, the original design temperature of the unit, and any change in the design temperature.[236] (However, if significant plant components needed to be upgraded

[234] The number of units that tripped, had derates, or failed to start was much larger in 2011 than in 1989. This is primarily a matter of scale. The number of generating units in ERCOT increased from 323 in 1989 to 550 in 2011. However, the increase in the number of units does not correlate exactly with the increase in generating capacity from 54,000 MW to 84,400 MW (using full wind power nameplate capacity, i.e., not adjusted) because of the large increase in combined cycle natural-gas fired plants since 1989 and the introduction of wind power. Combined cycle plants have multiple, and smaller, generating units than conventional steam-turbine plants. Wind power installations vary widely in size from tens of megawatts to hundreds of megawatts, adding greatly to the unit count, but less so to the actual capacity. With so many more, and smaller, units on line in 2011, it is not surprising that the number of trips, derates, and failures to start were greater than in 1989.

[235] PUCT 1989 Report at 6.

[236] *See* Black and Veatch Corp., *Cold Weather Protection Assessment for El Paso Electric Company (Rev. 1)*, at 6-4 and 6-7. In the event an independent engineering analysis is commissioned, and based on current industry estimates, the costs for such an analysis for a gas-fired unit could range from $25,000 to $150,000, depending on the type of unit.

or replaced, the cost could be significantly higher. For instance, if cooling towers had freezing problems, the addition of a cooling tower bypass or variable speed tower fan motor might be needed; such costs could range from $150,000 to $500,000.[237])

Texas has recently enacted legislation to deal with the problem of inadequate winterization by generators. A bill was introduced in the Texas legislature following the February 2011 blackouts, with provisions directing the PUCT to prepare a weather emergency preparedness report, to review the emergency operations plans on file, and to recommend improvements to the plans to ensure electric service reliability. In introducing the bill, State Senator Glenn Hegar stated: "What I don't want, is another storm and another report someone puts on the shelf for 21 years and nobody looks at."[238]

After a Senate Committee hearing, the bill was amended and unanimously adopted by the Texas Senate.[239] The House unanimously passed the bill on May 23, and the bill was signed into law by Governor Richard Perry on June 17, 2011.

B. Natural Gas

Gas production suffered declines in each of the six prior years identified by the task force as having had severe cold weather, and in 1989 and 2003, the declines led to gas curtailments that caused outages or derates to a number of gas-fired electric generators. While some winterization has been put in place by producers and processing plants, production declines occur with each successive severe cold weather event, including the event of February 2011. It may well be that producers have limited market incentives to pay for more elaborate winterization, as they will likely lose less money from short periods of non-production than they would expend on preventing freeze-offs at each of the many wells a producer typically owns.

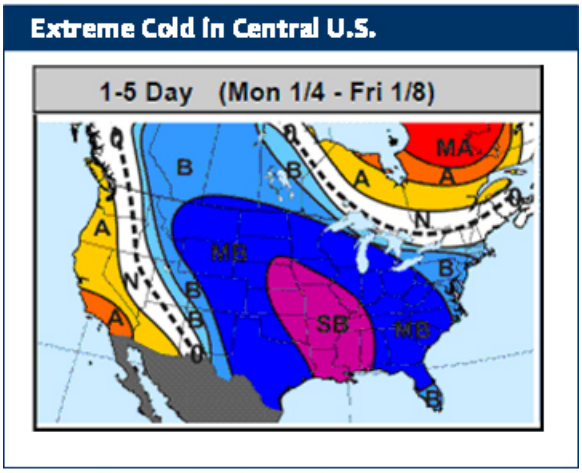
[239] SB 1133, 82 Leg., Reg. Sess. (TX 2011) *available at* http://www.capitol.state.tx.us/tlodocs/82R/billtext/pdf/SB01133E.pdf#navpanes=0. The bill would also allow the PUCT to require entities to update their emergency operations plans and to adopt rules relating to implementation of the bill.

Gas production declines in these prior extreme cold weather years are presented below, beginning with the most recent.

January 2010

In 2010, an ongoing cold spell led to wellhead and gathering line freeze-offs in the Rockies, San Juan and other southwestern producing basins. About 0.5 Bcfd[240] was lost in the Rockies and another 1.0 Bcfd was lost from the Southwest and shale basins. From January 21 through January 28, Northern Natural Gas and Southwest Gas issued low line pack alerts. High temperatures in every city in the area were above freezing during the month, and low temperatures fell only to the low 20s in a few cities on a few days.



[Color legend: N is normal, B is below normal, MB is much below normal, and SB is strong below normal.]

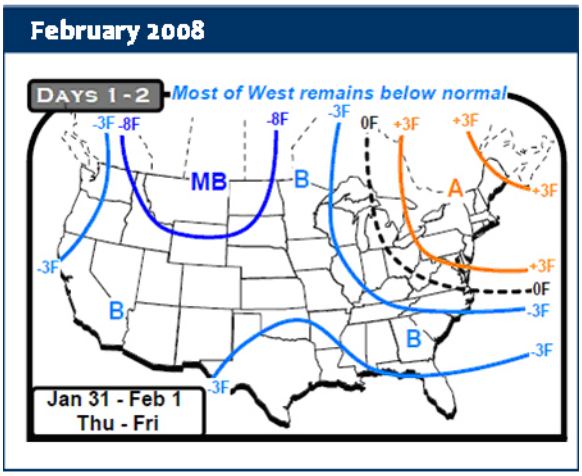
February 2008

There was widespread cold weather during late January and early February 2008 in the Rockies, Midwest, and Northeast. El Paso, Southwest Gas, Mississippi River Transmission (MRT), Natural Gas Pipeline Company of America (NGPL), ANR, Northern Natural Gas, and Kern River issued low line pack warnings, and receipts at the Opal[241] processing plant in Wyoming fell due to

[240] Production data in this section is drawn from Bentek, Supply and Demand Daily report.

[241] The Opal processing plant is a major source of output for Rockies production. Major interstate pipelines transport output from that plant to regional markets and markets in the East, the Pacific Northwest, California and the desert Southwest.

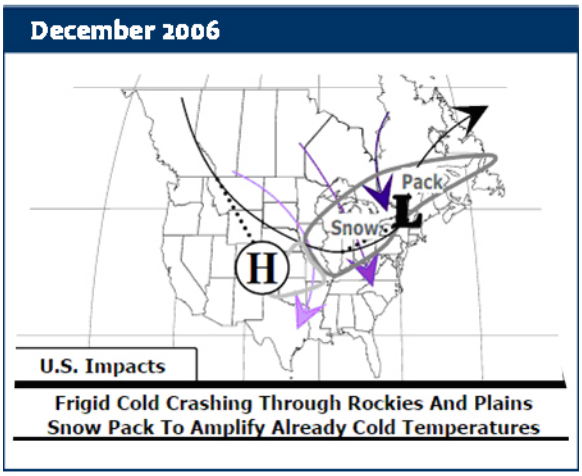
wellhead and gathering line freeze-offs in the region. Rockies production was off between 0.5 and 1.0 Bcfd over a 10-day period. Southwest regional production also fell by about 0.5 Bcfd during that time.



Source: MDA EarthSat, 1-5 Day Outlook, January 31, 2008

December 2006

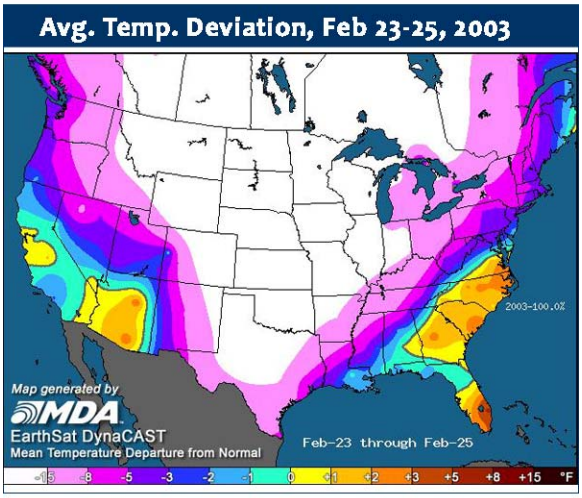
During the first few days of December 2006, unseasonably cold air accompanied by a good deal of snow covered much of the Rockies, the Great Plains and the Midwest. The Midwest and Chicago took the brunt of the frigid temperatures. Lows were in the single digits with a wind chill of -12 degrees. For two days, wellhead freeze-offs caused midcontinent production to fall almost 1 Bcfd, while Rockies and Texas/Louisiana production each were off about 0.5 Bcfd. Temperatures in Midland and El Paso dipped into the low teens for a short time. The short cold snap set off a flurry of operational warnings and alerts; El Paso issued a system operating condition flow order, and Southwest Gas, MRT, NGPL, Kern River, and Transwestern issued low line pack warnings.



Source: MDA EarthSat, Friday December 1, 2006.

February 2003

Overall, the winter of 2002/2003 was the third coldest of the most recent 11 winter periods. The winter began with record inventories (at that time) of gas in underground storage. But by April, over 2.5 Tcf (trillion cubic feet) was withdrawn, also a record at the time. Regional and national natural gas storage inventories were at record lows when compared to many metrics. During the period from February 23 through February 25, a shot of very cold air swept out of the Rockies and through the Midwest. It brought wind chills of -50˚ to portions of Wyoming and Colorado and lows below zero in Chicago. Gathering system and wellhead freeze-offs were reported in the Permian Basin and the midcontinent and Rockies regions, and NGPL issued an operational flow order. Midland and Dallas temperatures fell below freezing, although only for a short time. El Paso and Transwestern did issue low line pack alerts that were quickly lifted. As noted earlier, in ERCOT there were gas curtailments to electric generators, estimated by ERCOT to have resulted in a loss of 5500 MW of capacity.



Source: MDA EarthSat

In a May 19, 2003 report on the 2003 cold weather event, the PUCT observed that the gas supply shortages experienced by electric generators in Texas were due in part to an unusually steep decline in storage volumes in the months preceding the event. Those depleted storage reserves during a time of increased demand made it difficult for generators to obtain adequate gas supply, although only one supplier, the TXU Lone Star Pipeline (now Atmos Pipeline-Texas), actually curtailed industrial customers. The PUCT also noted that newly independent power producers, unlike the old vertically integrated utilities, tended not to have their own storage facilities, a factor that contributed to the supply shortage.[242]

[242] PUCT 2003 Report at 12-16.

The 2003 PUCT report recommended that the PUCT and the TRC collaborate on developing a joint curtailment methodology for natural gas and electricity.[243] According to industry observers at the time, the recommendation was aimed at coordinating electrical generation needs with gas supply, to ensure that supply was being used where it was most needed during shortages. However, the agencies reportedly were unable to develop a policy and the project died.[244]

December 1989

December 1989 was described at the time by the National Weather Service as the coldest December ever recorded for the combined northeast, central, and southeast regions of the United States. The freeze of December 21 through December 25 caused severe problems for Texas electric utilities, as described earlier in the discussion on electric prior cold weather events. Record and near record low temperatures occurred across the state. For Dallas, it was the coldest and second coldest days in the last 38 years; for Midland, the third and fifth coldest days; for San Antonio, the first and fourth. Houston and Brownsville each had two days among the top five coldest. Wind chill factors in Houston fell to -5 degrees, and in Dallas and Midland, to -12 degrees and -14 degrees, respectively.

While the gas supply situation was more precarious in the Northeast, the Gulf Coast supply regions, Texas and the Southwest were not without their problems. United States productive capacity had not been tested by a prolonged cold snap for more than a decade. Major processing plants[245], refineries and petrochemical plants in the Gulf Coast region shut down. Supply problems occurred in the Gulf of Mexico, Kansas, Texas, Oklahoma, Arkansas, and Louisiana. High winds prevented crews from reaching offshore production platforms that froze off. A major gathering operation in Oklahoma saw 40 percent of its supply frozen off. Producer respondents to a 1991 AGA study said that 10 percent of their production was affected by the cold temperatures.[246]

Most major interstate pipelines accessing Gulf supply experienced some kind of problem. Texas Eastern Transmission Corporation (TETCO) suspended all interruptible transportation deliveries and reduced firm deliveries by 0.5

Bcfd.[247] Trunkline and NGPL also suspended interruptible transportation services. Transco curtailed firm service between 22 percent and 50 percent.[248]

In ERCOT there were gas curtailments to electric generators, tabulated earlier in the section on prior electric cold weather events.

December 1983

At the end of December 1983, a nine-day stretch of cold weather in Texas resulted in a 3 Bcfd shortfall in supply. Demand was met by massive withdrawals from storage and fuel switching by generators. Refinery operable capacity fell over 72 percent during the week, due to gas supply curtailments. The TRC said that if schools and factories had not been closed for the Christmas holiday, deliveries to high priority customers would have been curtailed. Producers behind Valero Energy reported well freeze-offs, accounting for a 43 percent drop in supply.[249]

[247] TETCO reported a field supply shortfall of 1 Bcfd from its normal of 1.9 Bcfd.

An examination of these prior years reveals that production declines are common during cold weather events. However, only in limited circumstances did they lead to curtailment of natural gas customers, including curtailment of gas-fired electric generators.

The production declines raise the question as to why producers did not improve their winterization preparations to withstand these not uncommon cold snaps. The reason most likely comes to one of cost (as well as to the lack of regulation requiring it). A study performed for the task force by the Gas Technology Institute[250] has estimated that capital costs for winterization could vary from as little as $2,800 to more than $30,000 per well, depending on the degree of cold weather protection required and other variable factors such as gas flow rates, pressures, existing winterization, and the like. In addition to these capital costs, the cost of maintenance and operational supplies such as methanol (antifreeze) could add up to several thousand dollars per year for each well. (These costs include costs associated with protecting field processing, such as separating water from the gas, as well as the flow lines to the separating facilities.)[251] Since it is not uncommon for the larger producers to have hundreds of wells in a given basin, these costs would quickly mount up. Such costs need to be accounted for in some fashion if mandatory weatherization were to be considered by regulatory or legislative bodies (as would the costs that would be incurred by electric generators to meet comparable requirements.)

[250] This report is included as an appendix, entitled "GTI: Impact of Cold Weather on Gas Production."

[251] Kent F. Perry, Gas Technology Institute, *Impact of Cold Weather on Gas Production in the Texas and New Mexico Gas Production Regions of the United States During Early February, 2011* (June 2011) at 33.

Producers suggest that even improved winterization of the wells would not prevent a significant portion of production declines, since other problems, such as icy roads that prohibit hauling off water (which, if not done, shuts down the well), are also commonly encountered.

VIII. Electric and Natural Gas Interdependencies

The February 2011 cold weather event highlights the interdependency of electricity and natural gas, an interdependency that has grown in recent years. Natural gas has become an increasingly popular fuel choice for electric generators. Concurrently, compressors used in the production and transportation of natural gas have come to rely increasingly on electricity for their power source, rather than natural gas.

The reason for the increased popularity of gas-fired electric generation is one of economics. Natural gas prices have fallen due to increased gas production, beginning in 2008 when producers developed the technology to drill the Barnett Shale. Just prior to 2008, average daily marketed production was about 55.5 Bcf per day. Spot prices at the Henry Hub during 2007 averaged almost $7.00 per MMBtu. Shale production accounted for perhaps five percent of total United States production, and offshore production comprised approximately 15 percent.

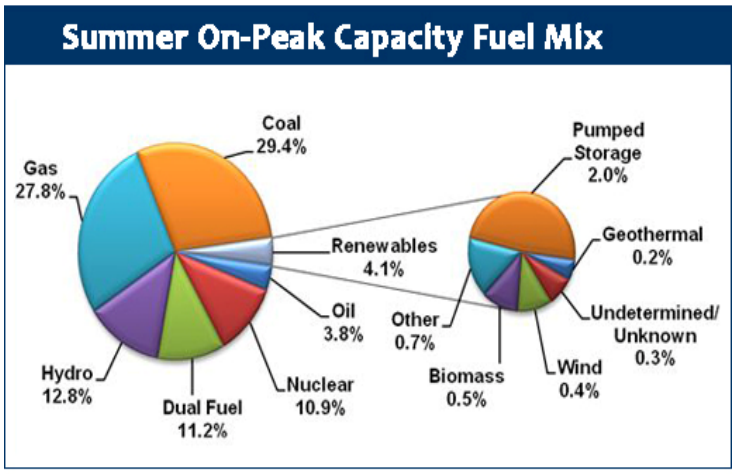
But by the end of 2008, average daily production had grown to over 59.3 Bcf per day. In the ensuing years, producers applied the lessons learned in the Barnett Shale to other basins, most notably the Fayetteville, Haynesville and Marcellus Shales, with notable results. Thus far in 2011, gas production is averaging almost 62.8 Bcf per day (and recently topped 64 Bcf per day), while average daily spot prices at the Henry Hub have fallen to $4.27 per MMBtu. Offshore production in 2010 accounted for only 10 percent of total United States production, and analysts estimate that shale production alone now accounts for 25 percent of total production.

At the same time, gathering companies, as well as pipelines and LDCs located in urban areas, have increasingly turned to electric-powered compressors. Gathering companies prefer electric-powered compressors because they can fit in smaller spaces than gas-fired compressors, and the companies do not need as much compressive power as the large pipelines. For pipelines and LDCs in urban areas, environmental restrictions relating to noise and air quality, as well as the ready availability of electricity, tip the scales in favor of electricity over natural gas. The large pipelines favor gas-fired compressors, because the gas is readily available to them and they have large horsepower demands.

The following chart depicts the mix of generation available for United States electricity needs in the summer of 2010, by fuel type.[252] It shows that 27.8

[252] NERC 2010 Summer Reliability Assessment (May 2010) at 10, http://www.nerc.com/files/2010%20Summer%20Reliability%20Assessment.pdf.

percent of all generation uses gas as the fuel source, and an additional 11.2 percent is dual-fueled (mostly gas and diesel oil).



Source: NERC's Summer Reliability Assessment, May 2010

The Southwest relies heavily on gas-fired generation to meet its peak capacity needs. In ERCOT, approximately 57 percent of the available on-peak summer and winter capability is from gas-fired generation (with 40 percent solely gas-fired and 17 percent having dual-fuel capability with gas as the primary fuel).[253] In the SPP region, 50 percent of the summer and winter on-peak capability is from gas-fired generation, and in WECC, 41 percent.

In New Mexico, gas-fired generating units consume approximately 70,102 MMcf annually, representing approximately one percent of total national consumption of gas used in the utility sector.[254] In Texas, gas-fired generating units consume approximately 1,387,421 MMcf of natural gas annually, representing approximately 20.2 percent of total national consumption of gas used in the utility sector.[255] And in Arizona, gas-fired generating units consume approximately 261,904 MMcf of natural gas annually, representing approximately 3.8 percent of total national consumption of gas used in the utility sector.[256]

[256] *Id.* at 70-71 (Table 29).

Interdependency Effects During the February Event

The task force examined data from numerous electric and gas entities to gauge the severity that shortfalls in one commodity had on the other during the February event. Materials received from natural gas producers indicate that the rolling blackouts (or customer curtailments) in ERCOT were a significant cause, from 29 to 27 percent respectively, of production shortfalls in the Permian and Fort Worth Basins. For pipelines and LDCs, however, the effects of the rolling blackouts were negligible.[257]

Gas shortfalls caused problems for some generators in Texas, although not nearly to the extent as did direct weather-related causes such as equipment failure from below-freezing temperatures. In ERCOT, as detailed in the section of this report entitled "Causes of the Outages and Supply Disruptions," the outages and derates from inadequate gas supply during the cold weather event totaled 1282 MW, compared to a peak net capacity reduction of 14,702 MW. While gas supply to SRP and EPE was compromised due to problems at the Chevron Keystone Storage Facility, EPE's generating units failed for other reasons, and SRP was able to obtain gas from other sources. However, during the 2003 cold weather event, there were significant gas curtailments to electric generators in Texas, which affected generating capacity. Gas curtailments also caused a loss of generating capacity in 1989, although to a lesser extent.

The task force was cognizant of the possibility that gas shortages may have been a less significant factor only because so many generators were forced offline for other reasons, and thus unable to take the gas (as was the case with EPE). The task force attempted to answer the question of whether there would have been adequate gas supplies to ERCOT had its failed gas-fired generators been able to take the gas. To do so, the task force tallied and compared the MWs forced offline, the amount of gas demand the generators would have imposed on suppliers had they been capable of running, and the capacity of the gas supply system at the time.

The task force determined that 5256 MW of generation in ERCOT could have imposed demands on the gas supply system had the generating units not experienced trips, derates, or failures to start. This number represents the total 5556 MW of the 55 gas-fired generating units in ERCOT, reduced by 300 MW for those generating units connected to a single pipeline that had pressure or gas

[257] An exception for LDCs supplying gas is the surge effect experienced when electricity is restored after an outage, which places instant and simultaneous demand on gas equipment and systems. This effect is described in the section of this report entitled "The Event: Outages and Curtailments."

quality problems (making it unlikely the generating units could have received gas even if they had had no operational difficulties). Each unit was assumed to have a 9,000 Btu/kWh heat rate. In the aggregate, these units would have added a maximum additional gas demand of approximately 1.1 Bcf per day.

Adding this additional hypothetical demand to the actual peak demand of 12.5 Bcf per day[258] would have imposed total demand on the system of 13.6 Bcf. Supply in January was running at 17.7 Bcf per day; these volumes declined during the first week of February. On February 2, the worst day from the standpoint of ERCOT, supply declined to 16.35 Bcf per day. On February 4, when production volumes hit their lowest point for the week, supply declined to 14.08 Bcf per day.

A comparison of these supply and demand numbers shows that total demand (actual demand plus hypothetical demand) would still have been below the available supply during the February cold weather event, particularly so on February 2, the day rolling blackouts were implemented. The task force's analysis therefore indicates there would have been adequate gas to supply the generators in ERCOT that failed for other reasons.[259] This conclusion was confirmed by knowledgeable industry observers, who were of the opinion that the Texas supply of gas would have been adequate had the generators not experienced weatherization problems.

Fuel Switching

A not insignificant amount of gas-fired generation in the Southwest has fuel switching capability. In ERCOT, 16 percent of total generation can fuel switch; in SPP, it is seven percent. Within WECC, of those generating units that are directly connected to El Paso, Northern Natural Gas, or ONEOK WesTex, 38 have fuel switching capability.

Fuel switching enables a simple or combined cycle generating turbine to alternate between fuel sources, typically natural gas and some type of fuel oil.

---

[258] The actual demand listed is a worst case scenario, because the calculation was derived by adding together the peak demand of each of the three major pipelines in Texas serving gas-fired generating units. A more realistic number would probably be demand of approximately 12 Bcf per day or less.

[259] The excess gas was sold out of state, but had the generators in ERCOT been able to use it, they could have gotten it. Since gas prices rose modestly in the region during the event, the shippers would very likely have redirected the gas to Texas to take advantage of the higher prices, had the generators been able to accept it. This would be true whether or not the contracts were interruptible, since a shipper could adjust its purchases and sales to take advantage of the pricing differential.

Fuel switching can be as simple as a control room operator pushing a button which automatically switches to oil, or as complicated as having to remove gas injectors and install oil injectors in every position around the boiler, a process that can take days rather than minutes.

It is common for units that switch to an alternate fuel type to experience a capacity derate, since normally each unit is designed to most efficiently burn a particular fuel.

The choice to perform fuel switching is primarily based on three factors: 1) cost, 2) environmental restrictions, and 3) the availability of natural gas. Running the generating unit on alternate fuels, such as fuel oil, may cost up to twice as much on a MW basis.[260] And environmental and air quality control restrictions, which vary by state, may limit the number of hours per year a generator is allowed to run on fuel oil.

Fuel switching capability was a more desirable option in the past, when the relative prices of gas and oil fluctuated, making one or the other more economical at any given time. Given the decline in natural gas prices, this option has become less valuable.

During the February event, 20 generating units in ERCOT attempted to switch fuels, with 15 managing it successfully.[261] (This echoed ERCOT's experience during the 2003 cold weather event, when a number of units that attempted to switch fuels were unable to do so, and those that did switch experienced derates of capacity.[262]) SRP has nine units capable of switching, and EPE has three units capable of switching. None was asked to switch during the event, as the units either failed for other reasons or were able to obtain adequate gas supply. In SPP, of the three representative entities the task force examined, eight generating units have fuel switching capabilities; four attempted to switch during the event and ultimately succeeded, although half had initial difficulties.

---

[260] Based on information supplied to the task force by an LDC.

[261] A majority of the units that attempted to switch fuels but were unable to do so experienced a mechanical failure of some sort in the switching equipment, which could have been due to the cold temperatures, inadequate maintenance, lack of regular testing, or the infrequent use of the alternate fuel in normal operations.

[262] PUCT 2003 Report at 17. The PUCT recommended that providing financial incentives for fuel oil inventories, to be maintained for use by dual-fueled generating units, should be considered.

Fuel switching raises a number of questions, such as: whether generators that have the capability to switch fuels should be required to maintain their alternate fuel equipment and stockpile an adequate supply of the alternate fuel, whether subsidies or incentives should be instituted to compensate for such requirements or to add fuel switching capabilities to those units that do not currently have it, and whether units that can switch fuels should be paid to do so in order to preserve gas supplies for residential consumers. These are issues that can be most fruitfully addressed in forums involving representatives of both the electric and natural gas industries operating in the region, as well as the regulatory bodies overseeing them.

Communications

In 2004, NERC released a report entitled "Gas/Electricity Interdependencies and Recommendations," which summarized the findings of its Gas/Electricity Interdependency Task Force (GEITF). The GEITF held a series of meetings with representatives of both the electric and gas industries and prepared a list of recommendations for NERC's consideration. The GEITF reported that a recurring theme expressed by gas industry participants was concern about communications between pipeline operators and entities other than the pipeline's contractual customers. While the pipelines communicate with the LDCs serving a generator or with the generator itself, they do not communicate with a regional reliability coordinator, apparently due to confidentiality restrictions. The GEITF recommended that NERC, in concert with other energy industry organizations, formalize communications between the electric industry and the gas transportation industry for the purposes of education, planning, and emergency response.

Communication failures between gas and electric entities did not seem to play a role during the February 2011 event (although there were complaints of communication issues between shippers and pipelines). Nonetheless, the electric and gas industries might consider revisiting the GEITF recommendations to see if procedures should be developed for communications between pipelines and reliability coordinators.[263]

[263] NERC plans to conduct an electric/gas interdependency study in 2011 to reevaluate the GEITF recommendations. The study will analyze whether procedures should be developed for communications between the electric and gas industries.

IX. Key Findings and Recommendations

The facts that came to light in the course of the joint inquiry conducted by the staffs of FERC and NERC, as well as the conclusions drawn from them, have been presented throughout the body of this report. Because the matters examined are complex and detailed, this section presents in summary form the task force's key findings. It also presents recommendations that the task force believes, if implemented, could significantly contribute to preventing a recurrence of the rolling blackouts and natural gas curtailments experienced in the Southwest during the February 2011 cold weather event.

A. The Electric Industry

Key Findings -- Electric

- During the February event, temperatures were considerably lower (15 degrees plus) than average winter temperatures, and represented the longest sustained cold spell in 25 years. Steady winds also accelerated equipment heat loss. However, such a cold spell was not unprecedented. The Southwest also experienced temperatures considerably below average, accompanied by generation outages, in December 1989. Less extreme cold weather events occurred in 2003 and 2010. Many generators failed to adequately apply and institutionalize knowledge and recommendations from previous severe winter weather events, especially as to winterization of generation and plant auxiliary equipment.

- While load forecasts fell short of actual load, the forecasts were not a factor in the loss of load. ERCOT manually increased its February 1 and February 2 forecasts by 4000 MW to factor in wind chill, and had established sufficient reserves to accommodate both forecasted load and the actual load that transpired. The reason blackouts had to be initiated was that over 29,000 MW of generation that was committed in the day-ahead market or held in reserve either tripped, was derated, or failed to start. This was the largest loss of generation in ERCOT's history, including during the prior cold weather load shed event in December 1989 and the two hot weather load shed events in 2003 and 2006. While units of all types (except nuclear generating units) tripped, derated, or failed to start in 2011, in ERCOT, gas combined cycle units had the highest percentage of failures, compared to their percentage of the total fuel mix.

- ERCOT and the generators within ERCOT could better coordinate generator scheduled outages, both in terms of the total amount of scheduled outages at a given time and their location. A substantial amount of generation (11,566 MW) was on scheduled outage going into the cold weather event. ERCOT's current Protocols provide that requests for scheduled outages submitted earlier than eight days before the outage is to begin are automatically approved, unless they would violate a Reliability Standard.

- ERCOT's fast action in initiating rolling blackouts prevented more widespread and less controlled ERCOT-wide blackouts. Had ERCOT not initiated manual load shedding, its under-frequency load shedding relays would have instantaneously dropped approximately 2600 MW (five percent of system load), a loss that could have created further system disturbances and resulting generation outages. Load shedding by the transmission and distribution operators in ERCOT's footprint was generally carried out in a timely and effective manner.

- Transmission operators and distribution providers generally did not identify natural gas facilities such as gathering facilities, processing plants or compressor stations as critical and essential loads.

- Balancing authorities, reliability coordinators and generators often lacked adequate knowledge of plant temperature design limits, and thus did not realize the extent to which generation would be lost when temperatures dropped.

- The lack of any state, regional or Reliability Standards that directly require generators to perform winterization left winter-readiness dependent on plant or corporate choices. While Reliability Standard EOP-001 R.4 and R.5 refer to winterization as a consideration in emergency plans, these requirements apply only to balancing authorities, transmission owners, and transmission operators.

- Generators were generally reactive as opposed to being proactive in their approach to winterization and preparedness. The single largest problem during the cold weather event was the freezing of instrumentation and equipment. Many generators failed to adequately prepare for winter, including the following: failed or inadequate heat traces, missing or inadequate wind breaks, inadequate insulation and lagging (metal covering for insulation), failure to have or to maintain heating elements and heat lamps in instrument cabinets, failure to train

operators and maintenance personnel on winter preparations, lack of fuel switching training and drills, and failure to ensure adequate fuel.

- Gas curtailment and gas pressure issues did not contribute significantly to the amount of unavailable generating capacity in ERCOT during the event. The outages, derates, and failures to start from inadequate fuel supply totaled 1282 MW from February 1 through February 5, as compared to an overall peak net generating capacity reduction of 14,702 MW.

Recommendations -- Electric

PLANNING AND RESERVES

1. Balancing Authorities, Reliability Coordinators, Transmission Operators and Generation Owner/Operators in ERCOT and in the southwest regions of WECC should consider preparation for the winter season as critical as preparation for the summer peak season.

The large number of generating units that failed to start, tripped offline or had to be derated during the February event demonstrates that the generators did not adequately anticipate the full impact of the extended cold weather and high winds. While plant personnel and system operators, in the main, performed admirably during the event, more thorough preparation for cold weather could have prevented many of the weather-related outages.

Capacity margins going into the winter of 2010/2011, for both ERCOT and the southwest regions of WECC, were adequate on paper. (ERCOT reported a 57 percent margin above forecasted winter peak demand, and the southwest regions of WECC projected a 105.7 percent margin.) But those margins did not take into account whether many of the units counted would be capable of running during the severe cold weather that materialized in February.

While the probability of a winter event in the predominantly summer peaking Southwest appears to be low, shedding load in the winter places lives and property at risk. The task force recommends that all entities responsible for the reliability of the bulk power system in the Southwest prepare for the winter season with the same sense of urgency and priority as they prepare for the summer peak season.

2. Planning authorities should augment their winter assessments with sensitivity studies incorporating the 2011 event to ensure there are sufficient generation and reserves in the operational time horizon.

Both ERCOT and the Southwest regions of WECC undertake planning studies to ensure that sufficient reserves are available to meet seasonal peak loads. However, the forecasted peak demand in the winter assessments for 2010/2011 was not as high as that actually experienced in early February.

Planners should undertake a sensitivity study, using the 2011 actual conditions as a possible extreme scenario, that reflects expected limits on available generation. These limits would include those due to planned outages, limited operations during periods of extreme cold weather, ambient temperature operating limitations, and any likely loss of fuel sources.

This sensitivity study should be used by operational planners to identify various system stress points, and by Reliability Coordinators, Balancing Authorities, and Transmission Operators to improve and refine strategies to preserve the reliability of the bulk power system during an extended cold weather event. These strategies should include procedures relating to utilization of generators with fuel switching capabilities and implementing early start-ups for generators with long start-up times.

3. Balancing Authorities and Reserve Sharing Groups should review the distribution of reserves to ensure that they are useable and deliverable during contingencies.

This recommendation is designed to ensure that Balancing Authorities take into account transmission constraints, other demands on reserve sharing resources, the possibility that more than one reserve sharing group member might experience simultaneous emergencies, and other factors that might affect the availability or deliverability of reserves. ERCOT is currently considering a similar recommendation, which was presented to its Board of Directors in March, 2011.

4. ERCOT should reconsider its protocol that requires it to approve outages if requested more than eight days before the outage, consider giving itself the authority to cancel outages previously scheduled, and expand its outage evaluation criteria.

ERCOT's Protocols provide that it may not forbid an outage request submitted more than eight days prior to the scheduled outage, unless the outage would keep ERCOT from meeting applicable Reliability Standards or Protocol requirements. The Protocols further limit review of outage requests made earlier

than eight days before the outage to the following three things: load forecast, other known outages of both generation and transmission, and the results of a contingency analysis to indicate whether the outages would cause overloads or voltage problems.

The task force recommends that ERCOT consider lengthening the period for which ERCOT may deny an outage request, assuming the conditions for doing so are met. (ERCOT is presently considering a Protocol revision to give itself the authority to deny an outage request that is not scheduled more than 90 days prior to the outage date, a revision which the task force supports.) In addition, ERCOT should consider giving itself the authority to cancel previously approved outages in cases of approaching extreme weather conditions, even up to the time of the event itself. In making this evaluation, ERCOT should take into account the costs that would be imposed on the generator as well as the practical difficulties of returning it to service if plant components are disassembled, as well as the generator's need to perform maintenance at some point while also avoiding the high demand summer season.

In addition to the criteria for outage evaluation currently provided in the Protocols, the task force recommends that ERCOT take into consideration the potential loss of units based on weather conditions beyond their design limits, and the effects likely to result from the totality of scheduled and proposed outages.

In furtherance of these criteria, ERCOT should:

- Have available to it the design temperatures of all generation resources.
- Take into consideration as an extreme weather event approaches which plants will not be available based on their design temperature limits.
- Consider increasing reserve levels during extreme weather events.
- Commit, for purposes of serving load and being counted as reserves, only those plants whose temperature design limits fall within the forecasted temperature range.
- Determine, prior to approving an outage, if the combination of previously approved scheduled outages with the proposed scheduled outages might cause reliability problems.

5. ERCOT should consider modifying its procedures to (i) allow it to significantly raise the 2300 MW responsive reserve requirement in extreme low temperatures, (ii) allow it to direct generating units to utilize pre-operational warming prior to anticipated severe cold weather, and (iii) allow

it to verify with each generating unit its preparedness for severe cold weather, including operating limits, potential fuel needs and fuel switching abilities.

ERCOT data on forced outages during the 50 coldest days between 2005-2011 show a correlation between low temperatures and forced outages. This was demonstrated not only by the February 2011 event but also by the 1989 event; in both cases, extremely low temperatures led to the loss of large amounts of generation and the implementation of rolling blackouts.

Increasing the amount of responsive reserves going into a cold weather event would compensate for the probability that a number of generating units might fail, and would provide better response to system instability in the event of such losses.

Additionally, pre-operational warming would help prevent freezing and identify other operational problems. Running a unit prior to the start of extreme cold weather would utilize the unit's own radiant heat to help prevent freezing. And starting it up would permit correction of any problems that otherwise would not be noticed until the unit was called upon for performance.

While pre-operational warming has considerable value, issues of whether or how generators are to be compensated for taking such actions at ERCOT's direction would need to be addressed.

COORDINATION WITH GENERATOR OWNERS/OPERATORS

6. Transmission Operators, Balancing Authorities, and Generation Owner/Operators should consider developing mechanisms to verify that units that have fuel switching capabilities can periodically demonstrate those capabilities.

Sixteen percent of ERCOT's generation capacity is listed as having fuel switching capabilities. During the February cold weather event, a quarter of the 20 units that attempted to switch fuel were unsuccessful. If a unit represents itself as having fuel switching capability, verification of the adequacy of its capability would provide useful information to the Balancing Authority or Transmission Operator as to the availability of that unit in the event of natural gas curtailments.

Fuel switching verification might consist of the following:

- Documented time required to switch equipment,
- Documented unit capacity while on alternate fuel,
- Operator training and experience,

- Fuel switching equipment problems, and
- Boiler and combustion control adjustments needed to operate on alternate fuel.

7. Balancing Authorities, Transmission Operators and Generator Owners/Operators should take the steps necessary to ensure that black start units can be utilized during adverse weather and emergency conditions.

The task force determined that a combination of scheduled and forced outages of ERCOT's black start units would have put ERCOT's ability to restore the system in jeopardy, had an uncontrolled blackout not been averted by the implementation of load shedding. Balancing Authorities and Transmission Operators should take steps to ensure the availability and reliability of their black start units during adverse weather and emergency conditions, particularly to prevent a gap in this function before 2013, when the provisions of Reliability Standard EOP-005-2 on System Restoration from Blackstart Resources becomes mandatory. These steps should ideally include auditing Generator Owner/Operators, random testing of black start units during temperature extremes (both hot and cold), determining the ambient operating temperature limitations of the black start units, evaluating the effects of extreme temperatures on implementation of the entity's black start plan; and ensuring that operators are trained to start the black start units during extreme weather conditions. ERCOT is presently considering Protocol revisions that would provide for unannounced testing of black start units and "claw back" payments for black start units that fail testing or fail to perform.

8. Balancing Authorities, Reliability Coordinators and Transmission Operators should require Generator Owner/Operators to provide accurate ambient temperature design specifications. Balancing Authorities, Reliability Coordinators and Transmission Operators should verify that temperature design limit information is kept current and should use this information to determine whether individual generating units will be available during extreme weather events.

In order to ascertain actual capabilities during extreme weather conditions, Balancing Authorities and Reliability Coordinators should require Generator Owner/Operators to provide accurate ambient temperature design operating limits for each generating unit that is included in its portfolio (including the accelerated cooling effect of wind), and update them as necessary. These limits should take into account all temperature-affected generator, turbine, and boiler equipment, and associated ancillary equipment and controls.

The Balancing Authorities should take steps to verify that Generator Owner/Operators comply with this requirement, and should prepare for the winter season by developing a catalog of individual generating unit temperature limitations. These should be used to determine if forecasted temperatures place a particular generating unit in a high risk category.

Lastly, Balancing Authorities and Reliability Coordinators should consider the feasibility of counting on a generating unit whose rating falls below forecasted weather conditions, and should consider whether to take into account weather-related design specifications in ranking units in the supply stack during critical weather events.

9. Transmission Operators and Balancing Authorities should obtain from Generator Owner/Operators their forecasts of real output capability in advance of an anticipated severe weather event; the forecasts should take into account both the temperature beyond which the availability of the generating unit cannot be assumed, and the potential for natural gas curtailments.

Balancing Authorities are permitted to request a forecast of real output capability under Reliability Standard TOP-002-02 R15. Doing so would allow operators to make proactive decisions prior to the onset of cold weather, including but not limited to:

- Requesting cancellation of planned outages,
- Directing advanced fuel switching,
- Directing startup of units with startup times greater than one day,
- Requesting startup of seasonally mothballed units, and
- Making advance requests for conservation.

In the case of ERCOT, which does not own the generators in its footprint, consideration needs to be given to ensuring that there is an adequate cost recovery mechanism in place for reliability measures taken by the generators at ERCOT's direction.

10. Balancing Authorities should plan ahead so that emergency enforcement discretion regarding emission limitations can be quickly implemented in the event of severe capacity shortages.

Some generators experienced derates during the event due to emission limitations. The Texas Commission on Environmental Quality (TCEQ) exercised enforcement discretion with respect to its emission restrictions during the event; however, this action, which was taken after the TCEQ received requests during the event itself, did not come in time to prevent all the emissions-related derates that

occurred on February 2. It is recommended that ERCOT work out procedures in advance with the TCEQ for the exercise of its enforcement discretion in the case of severe weather events, and have an internal procedure in place that delegates specific ERCOT personnel as responsible for contacting the TCEQ and other environmental regulatory bodies during the early stages of an event, in order to inform them of the significance of the situation.

WINTERIZATION

11. States in the Southwest should examine whether Generator/Operators ought to be required to submit winterization plans, and should consider enacting legislation where necessary and appropriate.

The task force determined during its inquiry that certain generators were better prepared than others to respond to the February cold weather event. In many cases the entities that performed well had emergency operations or winterization plans in place to provide direction to employees on how to keep their units operating. Although the implementation of a winterization plan cannot guarantee that a unit will not succumb to cold weather conditions, it can reduce the likelihood of unit trips, derates and failed starts.

The state of Texas has provided a starting point for such legislation with SB 1133, which was signed into law on June 17, 2011. This statute incorporates two important components: (1) mandatory reporting of emergency operations procedures, and (2) independent review by the PUCT.

In addition to the matters covered in the Texas statute, the task force recommends that planning take into account not only forecasts but also historical weather patterns, so that the required procedures accommodate unusually severe events. Statutes should ideally direct utility commissions to develop best winterization practices for its state, and make winterization plans mandatory. Lastly, it is recommended that legislatures consider granting utility commissions the authority to impose penalties for non-compliance, as well as to require senior management to acknowledgement that they have reviewed the winterization plans for their generating unit, that the plans are an accurate representation of the winterization work completed, and that they are appropriate for the unit in light of seasonal weather conditions.

NERC staff has concluded there would be a reliability benefit from amending the EOP Reliability Standards to require Generator Owner/Operators to develop, maintain, and implement plans to winterize plants and units prior to extreme cold weather, in order to maximize generator output and availability. Accordingly, NERC intends to submit a Standard Authorization Request, the first

step in the Reliability Standards development process, proposing modifications to the Reliability Standards for Emergency Preparedness and Operations.

Plant Design

12. Consideration should be given to designing all new generating plants and designing modifications to existing plants (unless committed solely for summer peaking purposes) to be able to perform at the lowest recorded ambient temperature for the nearest city for which historical weather data is available, factoring in accelerated heat loss due to wind speed.

The ideal time to prepare a generating unit to withstand cold temperatures is in the design stage. For that reason, the low temperatures and wind chills that can occur during the occasional severe storm should be incorporated in the design process.

13. The temperature design parameters of existing generating units should be assessed.

The task force found that for existing generating units, it is often not known with any specificity at what temperature the unit will be able to operate, or to what temperature heat tracing and insulation can prevent the water or moisture in its critical components from freezing. For that reason, Generator Owner/Operators should conduct engineering analyses to ascertain each unit's operating parameters, and then take appropriate steps to ensure that each unit will be able to achieve the optimum level of performance of which it is capable.

The task force recommends the following:

- Each Generator Owner/Operator should obtain or perform a comprehensive engineering analysis to identify potential freezing problems or other cold weather operational issues. The analysis should identify components/systems that have the potential to: initiate an automatic unit trip, prevent successful unit start-up, initiate automatic unit runback schemes and/or cause partial outages, adversely affect environmental controls that could cause full or partial outages, adversely affect the delivery of fuel to the units, or cause other operational problems such as slowed valve/damper operation.

- If a Generator Owner/Operator does not have accurate information about the ambient temperature to which an existing unit was designed, or if extensive modifications have been made since the unit was designed (including changes to plant site), it should obtain an engineering analysis

regarding the lowest ambient temperatures at which the unit can reliably operate (including wind chill considerations).

- Each Generator Owner/Operator should ensure that its heat tracing, insulation, lagging and wind breaks are designed to maintain water temperature (in those lines with standing water) at or above 40 degrees when ambient temperature, taking into account the accelerated heat loss due to wind, falls below freezing.

- Each Generator Owner/Operator should determine the duration that it can maintain water, air, or fluid systems above freezing when offline, and have contingency plans for periods of freezing temperatures exceeding this duration.

Maintenance/inspections generally

14. Generator Owner/Operators should ensure that adequate maintenance and inspection of its freeze protection elements be conducted on a timely and repetitive basis.

The task force found a number of inadequacies in generating units' preparations for winter performance. These included a lack of accountability and senior management review, lack of an adequate inspection and maintenance program, and failure to perform engineering analyses to determine the correct capability needed for their protection equipment.

The task force recommends the following:

- Each Generator Owner/Operator's senior management should establish policies that make winter preparation a priority each fall, establish personnel accountability and audit procedures, and reinforce the policies annually.

- Each Generator Owner/Operator should develop a winter preventative maintenance program for its freeze protection elements, which should specify inspection and testing intervals both before and during the winter. At the end of winter, an additional round of inspections and testing should be performed and an evaluation made of freeze protection performance, in order to identify potential improvements, required maintenance, and freeze protection component replacement for the following winter season.

- Each Generator Owner/Operator should prioritize repairs identified by the inspection and testing program, so that repairs necessary for

the proper functioning of freeze protection systems will be completed before the following winter.

- Each Generator Owner/Operator should use the recommended comprehensive engineering analysis, combined with previous lessons learned, to prepare and update a winter preparation checklist. Generator Owner/Operators should update checklists annually, using the previous winter's lessons learned and industry best practices.

Specific Freeze Protection Maintenance Items

The task force found that many generating units tripped, were derated, or failed to start as a result of problems associated with a failure to install and maintain adequate freeze protection systems and equipment. Based on these findings, on an examination of freeze protection systems of many of the affected generating units, and in some cases on standards issued by the Institute of Electrical and Electronics Engineers, the task force has prepared a number of recommendations designed to prevent a repeat of the spotty generator performance experienced during the February cold weather event. Of course, specific actions should conform to best industry practices at the time improvements are made, as well as to the requirements of any mandatory winterization standards imposed by regulatory or legislative bodies.

Heat tracing

15. Each Generator Owner/Operator should inspect and maintain its generating units' heat tracing equipment.

Specifically, the task force recommends:

- Each Generator Owner/Operator should, before each winter begins and before forecasted freezing weather, inspect the power supply to all heat trace circuits, including all breakers and fuses.

- Each Generator Owner/Operator should, before each winter begins and before forecasted freezing weather, inspect the continuity of all heat trace circuits, check the integrity of all connections in the heat trace circuits, and ensure that all insulation on heat traces is intact. This inspection should include checking for loose connections, broken wires, corrosion, and other damage to the integrity of electrical insulation which could cause grounds.

- Each Generator Owner/Operator should, before each winter begins, inspect, test, and maintain all heat trace controls or monitoring devices for proper

operation, including but not limited to thermostats, local and remote alarms, lights, and monitoring cabinet heaters.

- Each Generator Owner/Operator should, before each winter begins, test the amperage and voltage for its heat tracing circuits and calculate whether the circuits are producing the output specified in the design criteria, and maintain or repair the circuits as needed.

- Each Generator Owner/Operator should be aware of the intended useful life of its heat tracing equipment and should plan for its replacement in accordance with the manufacturer's recommendations.

Thermal Insulation

16. Each Generator Owner/Operator should inspect and maintain its units' thermal insulation.

Specifically, the task force recommends:

- Each Generator Owner/Operator should, before each winter begins, inspect all accessible thermal insulation and verify that there are no cuts, tears, or holes in the insulation, or evidence of degradation.

- Each Generator Owner/Operator should require visual inspection of thermal insulation for damage after repairs or maintenance have been conducted in the vicinity of the insulation.

- Each Generator Owner/Operator should ensure that valves and connections are insulated to the same temperature specifications as the piping connected to it.

- Each Generator Owner/Operator should be aware of the intended useful life of the insulation of water lines and should plan for its replacement in accordance with the manufacturer's recommendations.

Use of Wind breaks/enclosures

17. Each Generator Owner/Operator should plan on the erection of adequate wind breaks and enclosures, where needed.

Specifically, the task force recommends:

- A separate engineering assessment should be performed for each generating unit to determine the proper placement of temporary and/or permanent wind breaks or enclosures to protect and prevent freezing of critical and vulnerable elements during extreme weather.

- Temporary wind breaks should be designed to withstand high winds, and should be fabricated and installed before extreme weather begins.

- Generator Owner/Operators should take into account the fact that sustained winds and/or low temperatures can result in heat loss and freezing even in enclosed or semi-enclosed areas.

Training

18. Each Generator Owner/Operator should develop and annually conduct winter-specific and plant-specific operator awareness and maintenance training.

Operator training should include awareness of the capabilities and limitations of the freeze protection monitoring system, proper methods to check insulation integrity and the reliability and output of heat tracing, and prioritization of repair orders when problems are discovered.

Other Generator Owner/Operator Actions

19. Each Generator Owner/Operator should take steps to ensure that winterization supplies and equipment are in place before the winter season, that adequate staffing is in place for cold weather events, and that preventative action in anticipation of such events is taken in a timely manner.

Specifically, the task force recommends:

- Each Generator Owner/Operator should maintain a sufficient inventory of supplies at each generating unit necessary for extreme weather preparations and operations.

- Each Generator Owner/Operator should place thermometers in rooms containing equipment sensitive to cold and in freeze protection enclosures to ensure that temperature is being maintained above freezing and to determine the need for additional heaters or other freeze protection devices.

- During extreme cold weather events, each Generator Owner/Operator should schedule additional personnel for around-the-clock coverage.

- Each Generator Owner/Operator should evaluate whether it has sufficient electrical circuits and capacity to operate portable heaters, and perform preventive maintenance on all portable heaters prior to cold weather.

- Each Generator Owner/Operator should drain any non-critical service water lines in anticipation of severe cold weather.

Transmission Facilities

20. Transmission Operators should ensure that transmission facilities are capable of performing during cold weather conditions.

Transmission Operators reported several incidents of unplanned outages during the February 2011 event as a result of circuit breaker trips, transformer trips, and other transmission line issues. Although these outages did not generally contribute materially to any transmission limitations, some transmission breaker outages did lead to the loss of generating units. Many breaker trips were the result of low air in the breaker, low sulfur hexa-fluoride (SF_6) gas pressure, failed or inadequate heaters, bad contacts, and gas leaks.

Specifically, the task force recommends:

- Transmission Owner/Operators should ensure that the SF_6 gas in breakers and metering and other electrical equipment is at the correct pressure and temperature to operate safely during extreme cold, and also perform annual maintenance that tests SF_6 breaker heaters and supporting circuitry to assure that they are functional.

- Transmission Owner/Operators should maintain the operation of power transformers in cold temperatures by checking heaters in the control cabinets, verifying that main tank oil levels are appropriate for the actual oil temperature, checking bushing oil levels, and checking the nitrogen pressure if necessary.

- Transmission Owner/Operators should determine the ambient temperature to which their equipment, including fire protection systems, is protected (taking into account the accelerated cooling effect of wind), and ensure that temperature requirements are met during operations.

COMMUNICATIONS

21. Balancing Authorities should improve communications during extreme cold weather events with Transmission Owner/Operators, Distribution Providers, and other market participants.

During the February event, ERCOT communicated with Transmission Owners and Transmission Service Providers (an ERCOT-specific term) concerning the initiation of load shedding and the subsequent restoration of service. These communications appear to have been made in accordance with applicable ERCOT Operating Guidelines and Reliability Standards. However, ERCOT and several of its Transmission Service Providers that were responsible for curtailing firm load suggested areas for improvement in communications.

Transmission Service Providers are dependent on ERCOT for much of their information on ERCOT-wide system conditions, as they do not have information regarding generator trips beyond those on their own systems, and can only track ERCOT-wide system status by monitoring ERCOT's posted Physical Response Capability levels or monitoring frequency levels. Some of these Transmission Service Providers suggested that ERCOT should have communicated concerns about deteriorating conditions much earlier than it did.

A task force appointed by ERCOT's Board of Directors to look into the February 2 rolling blackouts concluded that there was a need for earlier dissemination of operational information to Transmission Service Providers and Distribution Service Providers (an ERCOT-specific term) during the period leading up to a possible emergency, a conclusion with which this task force agrees.

22. ERCOT should review and modify its Protocols as needed to give Transmission Service Providers and Distribution Service Providers in Texas access to information about loads on their systems that could be curtailed by ERCOT as Load Resources or as Emergency Interruptible Load Service.

Some ERCOT Transmission Service Providers expressed concern that they have virtually no information regarding loads on their own systems that may be deployed by ERCOT as Load Resources or Emergency Interruptible Load Service resources. These loads contract directly with ERCOT, and the Transmission Service Provider does not receive information about their status. When these loads are shed by ERCOT without prior notification to the Transmission Service Providers and Distribution Service Providers, they have the potential to cause localized imbalances in line flows, voltages, and other system parameters that may be problematic.

The task force suggests that ERCOT share information about the status of these loads with Transmission Service Providers on a daily basis, and study the effects of the loss of large blocks of these loads on the transmission grid.

23. WECC should review its Reliability Coordinator procedures for providing notice to Transmission Operators and Balancing Authorities when another Transmission Operator or Balancing Authority within WECC is experiencing a system emergency (or likely will experience a system emergency), and consider whether modification of those procedures is needed to expedite the notice process.

The Task Force observed a lag in communicating a declared system emergency in WECC. In one instance, a Reliability Coordinator did not issue an EEA 3 declaration until seven minutes after the decision had been made to do so; the delayed declaration appeared to have been the first official notice by the Reliability Coordinator to other WECC entities of the seriousness of the generation failures on the system of the Balancing Authority in question.

24. All Transmission Operators and Balancing Authorities should examine their emergency communications protocols or procedures to ensure that not too much responsibility is placed on a single system operator or on other key personnel during an emergency, and should consider developing single points of contact (persons who are not otherwise responsible for emergency operations) for communications during an emergency or likely emergency.

The task force's review of incidents during the event, as well as of operating procedures and protocols in place at the time, indicated that critical employees such as operators had numerous responsibilities that, while manageable in non-emergency situations, could prove impossible to meet during the often-compressed time frame of an emergency situation. In at least one instance, overloading a single on-call operations representative appears to have led to a delay in making emergency power purchases.

LOAD SHEDDING

25. Transmission Operators and Distribution Providers should conduct critical load review for gas production and transmission facilities, and determine the level of protection such facilities should be accorded in the event of system stress or load shedding.

Keeping gas production facilities in service is critical to maintaining an adequate supply of natural gas, particularly in the Southwest where there is a relatively small amount of underground gas storage. And keeping electric-

powered compressors running can be important in maintaining adequate pressure in gas transmission lines.

The task force suggests that a review of curtailment priorities be made, to consider whether gas production facilities should be treated as protected loads in the event of load shedding.

26. Transmission Operators should train operators in proper load shedding procedures and conduct periodic drills to maintain their load shedding skills.

The task force found that at least one Transmission Operator in WECC experienced a minor delay in initiating its load shedding sequence, due to problems notifying the concerned Distribution Provider. Another Transmission Operator experienced delay in executing its load shedding because the individual operators had never shed load before and had not had recent drills. These incidents underscore the necessity of adequate training in load shedding procedures.

B. The Natural Gas Industry

Key Findings -- Natural Gas

- Extreme low temperatures and winter storm conditions resulted in widespread wellhead, gathering system, and processing plant freeze-offs and hampered repair and restoration efforts, reducing the flow of gas in production basins in Texas and New Mexico by between 4 Bcf and 5 Bcf per day, or approximately 20 percent, a much greater extent than has occurred in the past.

- The prolonged cold caused production shortfalls in the San Juan and Permian Basins, the main supply areas for the LDCs that eventually curtailed service to customers in New Mexico, Arizona, and Texas.

- Wellhead freeze-offs normally occur several times a winter in the San Juan Basin but are not common in the Permian Basin, which is the supply source that LDCs in the Southwest region typically rely upon when cold weather threatens production in the San Juan Basin.

- Electrical outages contributed to the cold weather problems faced by gas producers, processors, and storage facilities in the Permian and Fort Worth Basins, with producers being more significantly affected by the blackouts; however, based on information obtained from a sampling of producers and

processing plants in the region, the task force concluded that the effect of electric blackouts on supply shortages was less important than the effect of freezing temperatures.

- Although producers in the New Mexico and Texas production areas implemented some winterization measures such as methanol injection, production was nevertheless severely affected by the unusually cold weather and icy road conditions, which prevented crews from responding to wells and equipment that were shut in.

- The extreme cold weather also created an unprecedented demand for gas, which further strained the ability of the LDCs and pipelines to maintain sufficient operating pressure.

- The combination of dramatically reduced supply and unprecedented high demand was the cause of most of the gas outages and shortages that occurred in the region.

- Low delivery pressures from the El Paso Natural Gas interstate pipeline, caused by supply shortages, contributed to gas outages in Arizona and southern New Mexico.

- Some local distribution systems were unable to deliver the unprecedented volume of gas demanded by residential customers.

- No evidence was found that interstate or intrastate pipeline design constraints, system limitations, or equipment failures contributed significantly to the gas outages.

- The pipeline network, both interstate and intrastate, showed good flexibility in adjusting flows to meet demand and compensate for supply shortfalls.

- Additional gas storage capacity in Arizona and New Mexico could have prevented many of the outages that occurred by making additional supply available during the periods of peak demand. Natural gas storage is a key component of the natural gas grid that helps maintain reliability of gas supplies during periods of high demand. Storage can help LDCs maintain adequate supply during periods of heavy demand by supplementing pipeline capacity, and can serve as backup supply in case of interruptions in wellhead production. Additional gas storage capacity in the downstream market areas closer to demand centers in Arizona and New Mexico could

have prevented most of the outages that occurred by making additional supply available in a more timely manner during peak demand periods.

Recommendations – Natural Gas

1. Lawmakers in Texas and New Mexico, working with their state regulators and all sectors of the natural gas industry, should determine whether production shortages during extreme cold weather events can be effectively and economically mitigated through the adoption of minimum, uniform standards for the winterization of natural gas production and processing facilities.

The Texas and New Mexico production basins experienced unusually sharp declines due to the prolonged freezing weather of early February 2011. Although these areas typically experience occasional freeze-offs during periods of sub-freezing weather, and although natural gas producers and processors in those regions employ some winterization techniques, to a significant degree those measures were inadequate to meet consumer demand during this event. Production difficulties were compounded by icy road conditions, which disrupted routine maintenance and delayed repairs.

Some industry representatives stated that producers and processors already have strong economic incentives to keep gas flowing at all times, and that increased winterization would not have prevented many of the shortfalls that occurred in the Southwest production basins in early February 2011. Others stated that the levels of winterization typically employed in these areas are designed to deal with less severe, more typical winter weather conditions, and that additional winterization could protect the system from the effects of unusually harsh weather. Many expressed the view that along with increased reliance upon natural gas for energy, steps should be taken to improve the reliability of gas supply during extreme cold weather events.

Whether the adoption of uniform winterization standards for natural gas facilities is the right way to meet the goal of increased reliability is a complex question. Among the issues that need to be resolved are the following:

- Determining the costs of increased winterization and balancing those costs against the need for increased reliability,
- Determining who should ultimately bear the costs of additional winterization, and whether ratemakers would be willing to pass the costs of increased reliability along to consumers,
- Determining whether it is practical to design for very low temperatures, which may not recur for years or even decades,

- Ensuring that standards are uniformly applied, and determining whether state commissions would have adequate resources or authority to promulgate and enforce those standards, and
- Identifying possible incentives for industry that could improve the reliability of winter supply without government regulation.

Because the Commission does not have jurisdictional authority over this sector of the natural gas industry for these purposes, we recommend that state lawmakers and regulators in Texas and New Mexico investigate whether minimum standards for the winterization of gas production and processing facilities should be adopted, by way of legislation, regulation, or the adoption of voluntary industry practices, and whether such standards would be likely to effectively and reliably improve supply during extreme weather events.

2. The gas and electric sectors should work with state regulatory authorities to determine whether critical natural gas facilities can be exempted from rolling blackouts.

The natural gas industry depends in many instances on electric utilities for the power that helps move gas from the production fields to end users. Electric-powered instrumentation, compression, pumps, and processing equipment are essential links in that process, and in some instances, even the brief, temporary loss of electric power can put a gas production, processing, compression, or storage facility out of service for long periods of time, especially where weather conditions delay access to those facilities. The resulting gas outages can contribute to electricity shortages by cutting off or reducing fuel supply to gas-fired generating plants.

Gas producers, processors, pipelines, storage providers, and LDCs should identify portions of their systems that are essential to the ongoing delivery of significant volumes of gas, and which are dependent upon purchased power to function reliably under emergency conditions. State regulatory authorities should work with the gas industry and electric transmission operators, balancing authorities and reliability coordinators to determine whether such facilities can be shielded from the effects of future rolling blackouts.

3. State utility commissions should work with LDCs to ensure that voluntary curtailment plans can reduce demand on the system as quickly and efficiently as possible when gas supplies are disrupted.

One tool available to LDCs faced with supply disruptions during periods of high consumer demand is the implementation of voluntary curtailment plans, which seek reductions or curtailment from large commercial users. State

regulators, who review and approve the voluntary curtailment plans of LDCs, should assess whether they are designed and implemented in a way that maximizes their potential effect in emergency situations.

Voluntary curtailment plans should include multiple points of contact for large customers and up to date, 24-hour contact information. Where appropriate, the plans should provide for pre-event planning, training, and customer education. Large customers should be contacted prior to emergencies and efforts should be made to explain the circumstances under which reductions or curtailments would be sought and to obtain advance commitments for possible reductions, giving LDCs a clearer idea of the amount of demand that can be reduced in an emergency. While voluntary curtailment does nothing to increase supply, in light of the importance of reducing demand when distribution systems are near collapse, regulators and the LDCs should ensure that planning for voluntary curtailments is as thorough and well-thought out as possible.

4. State utility commissions should work with balancing authorities, electrical generators, and LDCs to determine whether and under what circumstances residential gas customers should receive priority over electrical generating plants during a gas supply emergency.

Gas-fired generation provides much needed electrical power during a weather emergency, but also consumes large amounts of natural gas. Although restoring residential electricity service after a rolling blackout is a fairly simple process, restoring gas service after an outage is both labor-intensive and time-consuming.

State utility commissions should work with LDCs to identify situations where consumption by gas-fired generators could contribute to residential gas customer outages, and should consult with those generators and the relevant Balancing Authority to determine whether alternative power suppliers or fuel supplies could be used in emergency situations. The state commissions should also evaluate the relative importance, for human needs customers, of gas-fired generation and residential use, and should assess the relative impacts of curtailing generating plants versus gas supply to residences.

5. State utility commissions and LDCs should review the events of early February 2011 and determine whether distribution systems can be improved to increase flows during periods of high demand.

In some instances during the winter storm event, LDC distribution systems were unable to flow scheduled volumes, suggesting that downstream parties may not have had sufficient capacity or facilities to handle historically high demand.

Accordingly, state commissions and distribution companies should determine whether system enhancements can be made to improve volume handling capacity, such as additional distribution valving, looping, more compression, or reconfigured compression. Although such system improvements would probably not compensate for the level of supply shortfalls that occurred in early February 2011, they might allow LDCs to take higher volumes for longer periods of time.

6. State utility commissions should work with LDCs to determine whether the LDC distribution systems can be improved so that curtailments can be implemented, when necessary, in a way that improves the speed and efficiency of the restoration process.

The events of early February 2011 demonstrated that once operational pressures and line pack begin to fall beyond normal tolerances, little time may be available to evaluate, locate, and shut off portions of the pipeline systems of the LDCs to avoid system collapse. Regulators should work with LDCs, as part of the annual system review process, to determine whether the systems under their regulatory authority should be further sectionalized to provide more options when involuntary curtailments are necessary.

Glossary

Active Power - Also known as real power, this is the rate at which work is performed or at which energy is transferred, usually expressed in kilowatts (kW) or megawatts (MW) when referring to electricity. In the field of electric power, the terms “active power” or “real power” are often used in place of the term “power” alone to differentiate it from reactive power. (See Reactive Power)

Allocation of Capacity - A process by which capacity available in a pipeline is distributed to parties in the event requests for volume (*i.e.*, nominations) are in excess of the available space. Typically the allocation is based on service type, contract type and a company's tariff provisions.

Alternating Current (AC) - Electric current that changes periodically in magnitude and direction with time. In power systems, the changes follow the pattern of a sine wave having a frequency of 60 cycles per second in North America. AC is also used to refer to voltage which follows a similar sine wave pattern.

Ambient Conditions - Common, prevailing, and uncontrolled atmospheric conditions at a particular location, either indoors or out. The term is often used to describe the temperature, humidity, and airflow or wind that equipment or systems are exposed to.

Ancillary Services - The services necessary to support the transmission of electric power from seller to purchaser given the obligations of control areas and transmitting utilities within those control areas to maintain reliable operations of the interconnected transmission system. These include, but are not limited to, voltage support, regulation, reserves, and black start capability.

Aquifer Storage - The storage of gas underground in porous and permeable rock stratum, the pore space of which was originally filled with water and in which the stored gas is confined by suitable structure, permeability barriers, and hydrostatic water pressure.

Area Control Error (ACE) - The instantaneous difference between a Balancing Authority’s net actual and scheduled interchange, plus the instantaneous difference between the interconnection’s actual frequency and scheduled frequency and a correction for meter error.

Asynchronous - In AC power systems, two systems are asynchronous if they are not operating at exactly the same frequency. Two systems may also be considered asynchronous if, at potential interconnection points, there is a significant difference in phase angle between their respective voltage waveforms.

Glossary

Auto-Transformer - A power transformer with a single coil for each electrical phase, as opposed to a conventional transformer, which has two coils per phase. In an auto-transformer, the entire coil acts as the primary winding while a portion of the same coil acts as the secondary winding.

Automatic Generation Control (AGC) - A feature of a power system's centralized control system that automatically adjusts generation in a Balancing Authority Area to maintain the Balancing Authority's interchange schedule plus its Frequency Bias.

Balancing (Natural Gas) - Equalizing a shipper's receipts and deliveries of gas on a transportation pipeline. Balancing may be accomplished daily, monthly or seasonally, with penalties generally assessed for excessive imbalances.

Balancing Authority (BA) - The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority area, and supports interconnection frequency in real time.

Base Load (Natural Gas) - A given volume of gas used by a LDC or other large user, remaining fairly constant over a period of time. Base load does not vary with heating degree-days.

Baseload Generating Units - Electric generating units which produce energy at a constant rate, usually at a low cost relative to other generating units available to the system. Baseload units are used to meet some or all of a given region's continuous energy demand on a seasonal or daily basis, including at minimum load levels, and tend to operate non-stop except for maintenance or forced outages.

Base Load Storage (Natural Gas) - Storage facilities capable of holding enough natural gas to satisfy long term seasonal demand requirements.

Blade - The component of a steam turbine that is acted upon by the flow of steam. Blades in steam turbines are also referred to as "buckets." Similarly, in gas, or combustion turbines, the blades are the components acted upon by the flow of the high pressure, high temperature gases produced in the combustor. In both steam turbines and combustion turbines, the blades are arranged in multiple stages of varying diameter, with many blades per stage. Modern wind turbines, in contrast, typically utilize only three long blades. The purpose of the blades is to extract energy from the motion of the propelling fluid (steam, combustion gases, or air) and convert it into rotational form by direct coupling to a common spinning shaft which is in turn used to drive a generator.

Glossary

Boiler - The component of a steam power plant in which water is heated and converted into steam.

British Thermal Unit (BTU) - the measurement of heat released by burning any material. The amount of energy necessary to raise the temperature of one pound of water by one degree Fahrenheit from 58.5 to 59.5 degrees Fahrenheit under standard pressure of 30 inches of mercury at or near its point of maximum density.

Bulk Electric System - The electrical generation resources, transmission lines, interconnections with neighboring systems, and associated equipment, generally operated at voltages of 100 kV or higher. Radial transmission facilities serving only load with one transmission source are generally not considered to be part of the bulk electric system.

Capacitor Bank - A capacitor is a device that stores an electric charge. Although there is energy associated with the stored charge, it is negligible in terms of its capability to serve load. A capacitor bank is made of up of many individual capacitors. Its purpose is to provide reactive power to the system to help support system voltage by compensating for reactive power losses incurred in the delivery of power.

Capacity Market - A market where Load Serving Entities purchase generating capacity (including adequate reserves) to cover their peak loads.

Capacity Release (Natural Gas) - A mechanism by which holders of firm interstate transportation capacity can relinquish their rights to utilize the firm capacity to other parties that are interested in obtaining the right to use that capacity for a specific price, for a given period of time and under a specifically identified set of conditions. The firm transportation rights may include transmission capacity and/or storage capacity.

Capacity-Short Charge - In ERCOT, a monetary charge to Qualified Scheduling Entities (QSEs) who cannot meet their resource commitments when a Reliability Unit Commitment (RUC) study (conducted periodically) determines there is insufficient generation to meet projected demand, and the costs associated with bringing the needed additional generation on-line cannot be fully recovered using energy revenue. The capacity-short charge is the mechanism for covering those costs. This is done on the basis of settlement intervals.

Centrifugal Compressor Unit(s) -Compressors that produce pressure by centrifugal force from rotation of a compressor wheel that translates kinetic energy

into pressure energy of the gas. Centrifugal compressors are commonly used in gas transmission systems due to their flexibility.

Charge - In physics, charge, also known as electric charge, electrical charge, or electrostatic charge is a characteristic of an object that expresses the extent to which it has more or fewer electrons than protons. A single electron carries an elementary charge of negative polarity, whereas a single proton carries the same, except of positive polarity. The unit of electrical charge is the coulomb (symbolized C) where 1 C is equal to 6.24×10^{18} elementary charges. It is not unusual for real-world objects to hold charges of many coulombs. When two objects having electric charges are brought into proximity with each other, an electrostatic force is manifested between them – attractive if the charges are of opposite polarity and repulsive if the charges are of the same polarity.

Circuit Breaker - In electrical power systems, circuit breakers are used to disconnect and reconnect transmission lines, transformers, generators, and other facilities from the power system or from each other. Circuit breakers trip to interrupt the flow of current when faults develop, de-energizing the faulted facility and isolating it from the system. They are also used to switch facilities in or out of service.

Citygate - The point at which a Local Distribution Company receives natural gas from an interstate or intrastate pipeline.

Cold Load Pickup - Phenomenon that takes place when a distribution circuit is re-energized following an extended outage of that circuit. Cold load pickup is a composite of two conditions: 1) inrush current which reestablishes the magnetic fields in motors and transformers and the necessary temperatures in heating coils and incandescent lamp filaments and 2) loss of load diversity due to cyclic loads which normally cycle randomly with respect to one another, such as refrigerator compressors, all restarting at the same time. The inrush current may last up to several seconds while the loss of load diversity may persist for many minutes.

Combined Cycle Unit - This type of electric generating unit consists of one or more gas turbines, also referred to as combustion turbines, equipped with heat recovery steam generators to capture heat from their exhaust. Steam produced in the heat recovery steam generators then drives a steam turbine generator to produce additional electric power. A typical arrangement consists of two natural gas-fired combustion turbines combined with a single steam turbine, each driving its own electrical generator, for a total of three generators. The heat recovery aspect of combined cycle units increases the overall efficiency of electric power production.

Glossary

Comisión Federal de Electricidad (CFE) - A Mexican governmental entity that generates, transmits, distributes and sells electricity to more than 34.2 million customers, representing more than 100 million people annually. CFE interconnects to ERCOT via two high voltage DC (HVDC) ties and to WECC via AC transmission lines at the California border just south of San Diego.

Compressor or Compressor Units - Mechanical equipment that adds pressure to the natural gas stream to enable the flow of natural gas through a pipeline system.

Compressor Station - A permanent facility that houses compression equipment that supplies pressure to move natural gas through pipelines.

Condensate and Water Return Lines - Plumbing in a generating station that captures condensate and used water for recycling or re-use.

Condenser - In a steam turbine generating station, the condenser is a type of heat exchanger that cools the steam exiting the turbine to the point where it condenses into water, thereby recovering the high quality feed water for reuse. The cooling is accomplished using separate cooling water. Surface condensers use a shell and tube assembly wherein the cooling water is circulated in the tubes, and the steam and condensate are contained in the tank-like housing, or shell, that surrounds and encloses the tubes.

Conductor - In physical terms, any material, usually metallic, exhibiting a low resistance to the flow of electric current. A conductor is the opposite of an insulator. In electric power systems, the term conductor generally refers to the actual wires in overhead transmission and distribution lines, underground cables, and the metallic tubing used for busses in substations. Aluminum and copper are the predominant metals used for conductors in power systems.

Contingency - The unexpected and sudden failure or outage of a power system component, such as a generator, transmission line, transformer, or other electrical element.

Contingency Reserve Level - Contingency reserve is the provision of capacity deployed by a Balancing Authority to meet the Disturbance Control Standard (DCS) and other NERC and Regional Reliability Organization contingency requirements. The Contingency Reserve Level is that level of reserves required for the reliable operation of an interconnected power system. Adequate generating capacity must be available at all times to maintain scheduled frequency, and avoid loss of firm load following transmission or generation contingencies. This

capacity is necessary to replace capacity and energy lost due to forced outages of generation or transmission equipment.

Contract Pressure (Natural Gas) - The maximum or minimum required operating pressure at a natural gas receipt or delivery point, as specified in the agreement between a pipeline and its customer.

Control Area - An electric power system or combination of electric power systems to which a common automatic control scheme is applied in order to: 1) match, at all times, the power output of the generators within the electric power system(s) with the load in the electric power system(s); 2) maintain scheduled interchange with other Control Areas; 3) maintain the frequency of the electric power system(s); and 4) provide sufficient generating capacity to maintain operating reserves, all within reasonable limits in accordance with Good Utility Practice.

Controllable Load Resources (CLR) - In ERCOT, CLRs are a type of load resource capable of controllably reducing or increasing consumption under dispatch control (similar to automatic generation control or AGC) and able to immediately respond proportionally to frequency changes (similar to generator governor action) to provide the following ancillary services: Up and Down Regulation (URS & DRS), Responsive Reserve (RRS), and Non-Spinning Reserve (NSRS).

Cooling Tower - A structure and associated equipment intended to facilitate the evaporative cooling of water by contact with air. In steam turbine generating stations, cooling water is routed through the cooling tower for cooling after having absorbed heat in the condenser.

Cooling Water - In steam turbine generating stations, water that is used in the condenser to extract heat from steam exiting the turbine for the purpose of condensing that steam back to feed water. The feed water is then cycled back through the boiler to make steam again. The cooling water is generally taken from a nearby lake (often man-made for this purpose) or river and is distinctly separate from the feed water that is used to make steam and which must be specially treated to prevent corrosion. Electric generating stations use wholly separate cooling water systems to extract heat from the large copper conductors comprising the generator stator windings.

Cooling Water Intakes - The point at which industrial plants, including power plants, bring cooling water into their system from lakes, rivers, or other sources.

Broadly, the total physical structure and any associated constructed waterways used to withdraw cooling water.

Current (Electric) - The rate of flow of electrons in an electrical conductor. The symbol for current is “I” and the unit is the ampere, or amp, where one amp is defined as one coulomb of charge per second.

Current Operating Plan (COP) - In ERCOT, a plan by a Qualified Scheduling Entity (QSE) reflecting anticipated operating conditions for each of the resources that it represents for each hour in the next seven operating days, including resource operational data, resource status, and ancillary service schedule.

Curtailment (Electric) - A reduction in the scheduled capacity or energy delivery of an Interchange Transaction.

Curtailment (Natural Gas) - A method to balance a utility's natural gas requirements with its natural gas supply. Customers are typically ranked by priority in the utility’s curtailment plan. A customer may be required to partially cut back or totally eliminate its take of gas depending on the severity of the shortfall between gas supply and demand and the customer's priority.

Day-Ahead Market - A daily, co-optimized market in the 24 hour period before the start of the next operating day for ancillary service capacity, certain congestion revenue rights, and forward financial energy transactions.

Day-Ahead RUC (DRUC) - In ERCOT, a Reliability Unit Commitment (RUC) process performed for the next operating day.

Decommitment Payment - In ERCOT, a payment made to a resource committed by the Reliability Unit Commitment (RUC) process if the directive to use that resource is cancelled prior to its scheduled start time.

Demand (Electric) - The rate at which electric energy is delivered to or by a system or part of a system, generally expressed in kilowatts (kW) or megawatts (MW), at a given instant or averaged over any designated interval of time. The term “demand” is often used interchangeably with the term “load” with respect to electric power systems.

Depleted Oil and/or Gas Fields - Naturally occurring reservoirs that once held deposits of oil and gas, consisting of porous and permeable underground formations confined by impermeable rock or water barriers. The working gas requirement for this type of storage reservoir is generally about 50% of the total

reservoir capacity. Gas is typically withdrawn in the winter season and injected in the summer.

Derate (Electric Generator) - A reduction in a generating unit's net dependable capacity.

Direct Current (DC) - Electric current that is steady and does not change in either magnitude or direction with time. DC is also used to refer to voltage and, more generally, to smaller or special purpose power supply systems utilizing direct current either converted from AC, from a DC generator, from batteries, or from other sources such as solar cells.

Direct Current (DC) Tie - In electric power systems, the term "DC Tie" or, more correctly, "HVDC Tie" referring to high voltage DC, is used to describe a transmission-level facility that interconnects between two portions of a power system, two different power systems, or two different electric power interconnections. The DC Tie consists of: (1) a converter station to convert three phase AC power to DC; (2) a DC connection to a second converter station; and (3) a second converter station that reconverts the DC power back to three-phase AC. The DC connection between the two converter stations (step 2 above) may be either a long HVDC transmission line or, in the case of "back-to-back" converters at the same location, a simple set of bus bars. The power flow in DC ties is not free-flowing as it is in AC lines, but rather is controlled precisely by control systems on the converters. Unlike AC lines, DC ties can interconnect between asynchronous interconnections such as ERCOT, the Eastern Interconnection, and the Western Interconnection because concerns about frequency, phase angle, and voltage differences are rendered immaterial by the AC-to-DC-to-AC conversion process.

Distribution (Electric) - The function of distributing electric energy to retail customers, and all associated physical means of serving that function, including substations, low voltage distribution lines, transformers, etc.

Distribution Provider - As defined by NERC, a Registered Entity that provides and operates the "wires", *i.e.*, distribution lines, transformers, and associated facilities, between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider.

Distribution Service Provider - As defined by ERCOT, an entity that owns or operates a Distribution System for the delivery of energy from the ERCOT Transmission Grid to Customers.

Electrical Energy - Electric power generated, transmitted, distributed, and consumed over a period of time, expressed in kilowatt hours (kWh), megawatt hours (MWh), or gigawatt hours (GWh).

Electric Reliability Council of Texas, Inc. (ERCOT) - ERCOT is an Independent System Operator (ISO) that manages the flow of electric power to 23 million customers in Texas representing 85 percent of the state's electric load and 75 percent of its land area. ERCOT is registered with NERC to serve the following roles: Balancing Authority, Interchange Authority, Planning Authority, Reliability Coordinator, Resource Planner, and Transmission Service Provider. It is also jointly registered with other entities as a Transmission Operator**.**

Electric Reliability Organization (ERO) - The Energy Policy Act of 2005 required the creation of an independent Electric Reliability Organization (ERO) to be certified by FERC and tasked with developing and enforcing mandatory reliability standards applying to the bulk power system. (*See* Energy Policy Act of 2005, Pub. L. No. 109-58, section 102.)

Electromagnetic Induction - The creation of a voltage in a conductor due to a relative movement between the conductor and a magnetic field. Electromagnetic induction is the basic principle of operation of generators.

Emergency Interruptible Load Service (EILS) - In ERCOT, EILS is an emergency load reduction service designed to decrease the likelihood of the need for firm load shedding. It is provided by qualified loads that make themselves available for interruption in an electric grid emergency. Customers meeting EILS criteria may bid to provide the service through their Qualified Scheduling Entities (QSEs). EILS is called upon during an Energy Emergency Alert (EEA) Level 2B to assist in maintaining or restoring system frequency. EILS is not an Ancillary Service.

Energy - See Electrical Energy.

Energy Emergency Alert (EEA) - NERC Reliability Standard EOP-002-2.1 prescribes the use of an energy emergency alert (EEA) procedure when a load serving entity is unable to meet its customers' expected energy requirements. These energy emergencies are declared by the load serving entity's Reliability Coordinator, and are categorized by level of severity, *i.e.*, EEA1, 2, or 3, with level 3 being the most severe. ERCOT defines EEA as an orderly, predetermined procedure for maximizing use of available resources and, only if necessary, curtailing load during an emergency condition while providing for the maximum possible continuity of service and maintaining the integrity of the ERCOT system.

Energy Imbalance Service (EIS) - EIS is provided when a difference occurs between the scheduled and the actual delivery of energy to/from the transmission system over a single hour. The market participant must purchase this service from the transmission provider or make comparable alternate arrangements with another market participant who will purchase this service from the transmission provider.

Energy-only Market (Electric) - A market for electric energy that pays resources only for delivered energy and ancillary services, and does not pay for installed capacity (ICAP).

Energy-only Resource Adequacy Mechanism - A mechanism that allows real-time energy prices to rise in times of scarcity in order to provide incentives for investment in peaking as well as base-load generation.

E-Tag - Electronic Tagging, or e-Tag, is used to schedule an interchange transaction in a wholesale electricity markets. NERC and/or Regional Entities (such as WECC) collect all e-Tag data in near real-time to assist Reliability Coordinators in identifying transactions to be curtailed to relieve overload when transmission constraints occur. NERC defines an interchange transaction as "an agreement to transfer energy from a seller to a buyer that crosses one or more Balancing Authority area boundaries."

Export - In electric power systems, exports refer to energy that is generated in one power system, or portion of a power system, and transmitted to, and consumed in, another.

Firm Service (Natural Gas) - Transportation service on a firm basis means that the service is not subject to a prior claim by another customer or another class of service and receives the same priority as any other class of firm service.

Flow Line - Flow lines carry the fluids or natural gas from the wellhead to and in-between individual vessels in separation, treating, heating, dehydrating, compression, pumping or other processing equipment generally located at or near the well site.

Force Majeure - A superior force, "act of God" or unexpected and disruptive event, which may serve to relieve a party from a contract or obligation.

Forced Outage - The removal from service availability of a generating unit, transmission line, or other facility for emergency reasons. This can be done automatically, as in the case of tripping, manually, as in the case of forced

shutdowns, or by withholding a generating unit, transmission line, or other equipment from returning to service due to unresolved problems.

Frequency - The rate, in terms of time, at which a periodic pattern repeats itself. In electric power systems, frequency is measured in cycles per second, or Hertz (Hz). The symbol is "F". The nominal, or base, frequency for power systems in North America is 60 Hz.

Frequency Bias - A weighting factor applied to the difference between the Interconnection's actual frequency and scheduled frequency during the calculation of a Balancing Authority's Area Control Error (ACE). The weighting factor determines how strongly a Balancing Authority will respond to deviations from the scheduled frequency. Larger Balancing Authorities will usually have a larger Frequency Bias.

Frequency Deviation - Broadly, a change in the frequency of an electrical interconnection. More typically, sudden changes that result in the frequency of the interconnection going outside the normal bounds of 59.95 Hz to 60.05 Hz due to the unexpected loss of a significant amount of generation or load.

Generation - The process of producing electrical energy from other sources of energy such as coal, natural gas, uranium, hydro power, wind, etc. More generally, generation can also refer to the amount of electric power produced, usually expressed in kilowatts (kW) or megawatts (MW) and/or the amount of electric energy produced, expressed in kilowatt hours (kWh) or megawatt hours (MWh).

Generator - Generally, a rotating electromagnetic machine used to convert mechanical power to electrical power. The large synchronous generators common in electric power systems also serve the function of voltage support and voltage regulation by supplying or withdrawing reactive power from the transmission system, as needed.

Generator Operator - An entity that operates a generating unit or a fleet of generating units and performs the functions of supplying energy and interconnected operations services to a power system.

Generator Owner - An entity that owns and maintains a generating unit or a fleet of generating units.

Generator Runback - The intentional rapid reduction of the output level of an electric generating unit or an entire generating station, either manually or

automatically via plant controls, due to any of a variety of problems in the plant that limit the plant's capacity to generate power, or problems on the transmission system external to the plant which limit the capability of the system to accept the plant's power output.

Good Utility Practice - Any of the practices, methods and acts engaged in or approved by a significant portion of the electric power industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region.

Grid - An electrical transmission and/or distribution network. Broadly, an entire interconnection.

Heat Tracing - The application of a heat source to pipes, lines, and other equipment which, in order to function properly, must be kept from freezing. Heat tracing typically takes the form of a heating element running parallel with and in direct contact with piping.

Hertz - The unit of frequency equal to one cycle per second.

Hockey Stick Bidding - A pricing strategy during a supply shortage whereby a trader offers to sell a small quantity of energy at a price well above marginal cost, in order to manipulate prices upward.

Hourly RUC (HRUC) - In ERCOT, any Reliability Unit Commitment (RUC) executed after the Day-Ahead RUC (DRUC).

Human Needs Customers - Customers such as residential users, hospitals, and nursing homes, who use natural gas for essential human needs.

Hydrate Crystals - Crystals of hydrates formed under certain pressure and temperature conditions by hydrates and water present in natural gas. Hydrate crystals can form when the temperature is above the melting temperature of ice and can block natural gas wells, gathering systems, and pipelines.

Import Limit - The maximum level of electric power that can flow into a power system or portion of a power system over a transmission path or paths without

violating facility thermal ratings, voltage ratings, transient stability limits, or voltage stability limits either in real-time or post contingency, *i.e.*, after the loss of a generator, transmission line, or other facility.

Independent System Operator (ISO) - An organization responsible for the reliable operation of the power grid in a particular region and for providing open access transmission access to all market participants on a nondiscriminatory basis. ISOs in the U.S. include the California ISO, ISO New England, the New York ISO, PJM, the Midwest ISO, and ERCOT. These ISOs dispatch generation in their respective geographic territories.

Induction Machine - A rotating electromagnetic machine using alternating current that may be a generator or a motor. When a generator, the induction machine's rotor is driven at a speed greater than synchronous speed. When a motor, the induction machine's rotor is driven at a speed less than synchronous speed. Induction generators are rarely used for large scale power generation. Induction motors, on the other hand, are the most common type of AC motor. Induction machines absorb reactive power and cannot be used to produce reactive power (as a synchronous machine can).

Insulator - A material with a high resistance to the flow of electric current. More broadly, mechanical supports and spacers constructed of insulating materials. Electrically speaking, an insulator is the opposite of a conductor.

Interchange - Electrical energy transfers that cross Balancing Authority boundaries.

Interconnection - In North America, any one of the four major electric system networks – Eastern, Western, Quebec, and ERCOT. These operate asynchronously with respect to one another.

Interruptible Service - Service on an interruptible basis means that the capacity used to provide the service is subject to a prior claim by another customer or another class of service and receives a lower priority than such other classes of service.

Interruptible Responsive Reserve - In ERCOT, Interruptible Responsive Reserve is provided by load resources that are automatically interrupted when system frequency decreases to 59.7 Hz. The total amount of Interruptible Responsive Reserve procured for a given hour is limited to one half of the Responsive Reserve Service required for that hour.

Inverter - A converter designed and operated to convert DC power to AC power. In power systems, inverter generally refers to high voltage DC (HVDC) converters.

Island (Electrical) - An electrically isolated portion of an interconnection.. The frequency in an electrical island must be maintained by balancing generation and load in order to sustain operation. Islands are frequently formed after major disturbances wherein multiple transmission lines trip, or during restoration following a major disturbance.

Joule-Thomson Effect - The cooling that occurs when a compressed gas is allowed to expand in such a way that no external work is done. The effect is approximately 7 degrees Fahrenheit per 100 psi for natural gas.

Lateral Line - A pipe in a gas distribution or transmission system that branches away from the central and primary part of the system.

Line Pack - Natural gas occupying all pressurized sections of the pipeline network. Introduction of new gas at a receipt point "packs" or adds pressure to the line. Removal of gas at a delivery point lowers the pressure (unpacks the line).

Line Trip - This refers to the automatic disconnection of a transmission line by its circuit breakers. Line trips are initiated by protective relays and are designed to protect the power system when a short circuit, or fault, occurs on a line by isolating the faulted line from the system.

Liquefied Natural Gas (LNG) - Natural gas (primarily methane) that has been liquefied by reducing its temperature to -260 degrees Fahrenheit at atmospheric pressure.

Long Haul Pipeline - A transportation pipeline that transports natural gasa significant distance (hundreds of mile or more) from the production area.

Load - See Demand (Electric).

Load Acting as Resource (LaaR) - This term, discontinued by ERCOT when they transitioned from a Zonal Market to a Nodal Market on December 1, 2010, was replaced by the term Load Resource (see below).

Load Resource - In ERCOT, Load Resources provide ancillary services for either Responsive Reserve Service (RRS) or Non-Spinning Reserve Service (NSRS). There are two types of Load Resources – Controllable Load Resources (CLRs)

and Non-Controllable Load Resources (NCLRs). "Controllable" refers to the capability to control the load remotely from the ERCOT control center rather than solely at the end-use customer location (or by its Qualified Scheduling Entity (QSE)).

Load Service Entity - An entity that secures energy and transmission service (and related interconnected operations services) to serve the electrical demand and energy requirements of its end-use customers.

Load Shedding - The reduction of electrical system load or demand by interrupting the load flow to major customers and/or distribution circuits, normally in response to system or area capacity shortages or voltage control considerations. In cases of capacity shortages, load shedding is often performed on a rotating basis, systematically and in a predetermined sequence. (See Rolling Blackouts.)

Local Distribution Companies (LDC) - Any firm, other than a natural gas pipeline, engaged in the transportation or local distribution of natural gas and its sale to customers that consume the gas.

Magnetic Field - The invisible lines of force between the north and south poles of a magnet. A magnetic field is created when electric current flows through a conductor.

Make-Whole Charge - In ERCOT, a charge made to a Qualified Shedding Entity (QSE) for a resource to recapture all or part of the revenues received by a QSE that exceed the Make-Whole Payment for a resource (see below).

Make-Whole Payment - In ERCOT, a payment made to a Qualified Scheduling Entity (QSE) for a resource to reimburse it for allowable startup and minimum energy costs of a resource not recovered in energy revenue when a resource is committed by the Day-Ahead Market (DAM) or by a Reliability Unit Commitment (RUC).

Maximum Allowable Operating Pressure - The maximum operating pressure at which a pipeline system may be operated safely.

Mercaptans - A group of strong-smelling chemical compounds added to natural or LP gases as a safety measure, to warn of leaks.

Metering (Electric) - A meter is a device for measuring and displaying an electrical quantity. For example, meters are used to measure power flows, voltage, current, frequency, etc. The term "metering" generally refers to a group of meters

associated with a given facility, and the information from those meters transmitted to and displayed in a control room or control center.

Methanol - A light volatile flammable poisonous liquid alcohol used especially as a solvent, antifreeze, or denaturant for ethyl alcohol, and in the synthesis of other chemicals.

Nomination - A request for a physical quantity of natural gas under a specific purchase, sales or transportation agreement, or for all contracts at a specific point. A nomination will continue for specified number of days or until superseded by another service request for the same contract.

North American Energy Standards Board - A non-profit, private standards development organization established in January 2002 to develop voluntary standards and model business practices designed to promote more competitive and efficient natural gas and electric service.

Nodal Market (Electric) - Prices are assessed at points (*i.e.*, nodes) where electricity enters or leaves the grid. Transmission lines throughout the grid may be subject to congestion rents, which means generators may receive different prices based on how they contribute to or relieve congestion on the grid. ERCOT transitioned from a zonal to a nodal market on December 1, 2010. Their nodal market calculates transmission costs from the point of generation from roughly 4,000 delivery points. Nodal pricing is intended to provide a more detailed and accurate picture of transmission and generation than zonal pricing. ERCOT's nodal system reduces the time interval for which the market-clearing price is calculated to five minutes (from fifteen minutes in their former zonal market).

Non-Controllable Load Resources (NCLRs) - In ERCOT, these represent loads that provide selected Ancillary Services, but that do not have the capability of being switched or controlled directly from the EROCT control center. (Compare Controllable Load Resources)

Non-Spinning Reserve Service - In ERCOT, this refers to generation resources capable of being ramped to a specified output level within thirty minutes or load resources that are capable of being interrupted within thirty minutes. The generation resources must be capable of running at a specified output level for at least one hour, and the load resources must similarly be capable of remaining out of service for at least one hour.

Operating Condition Notice (OCN) - In ERCOT, this is the first of four possible levels of communication issued (by ERCOT) in anticipation of a possible emergency condition**.**

Operating Reserve - That capability above firm system demand required to provide for regulation, load forecasting error, forced and scheduled equipment outages, and local area protection. It consists of spinning and non-spinning reserve.

Operational Balancing Agreement - A contract that specifies the procedures that will be used between two interconnected natural gas pipelines in order to manage variances or imbalances at major interconnect points.

Operational Flow Order (OFO) - A notice to natural gas pipeline users designed to protect the operational integrity of the pipeline. OFOs require shippers to take action to balance their supply with their customers' usage on a daily basis within a specified tolerance band. Shippers may deliver additional supply or limit supply delivered to match usage.

Outage - The period during which a generating unit, transmission line, or other facility is out of service. Outages are typically categorized as forced, due to unanticipated problems that render a facility unable to perform its function and/or pose a risk to personnel or to the system, or scheduled / planned for the sake of maintenance, repairs, or upgrades.

Peak Load - As defined by NERC, the highest hourly integrated Net Energy For Load (generation plus imports minus exports) within a Balancing Authority area occurring within a given period (*e.g.*, day, month, season, or year), or the highest instantaneous demand within the Balancing Authority area.

Peak Load Storage (Natural Gas) - Storage that provides high-deliverability of gas supplies to the market over short periods of time.

Peaking Unit or Peaking Power Plant - Peaking plants operate primarily during times when load or demand increases rapidly to a maximum level and remains there for only a short time, *e.g.*, on hot summer afternoons when air conditioning causes electricity usage to reach its highest level in the daily cycle. Peaking plants are often powered by natural gas, but they can also be powered by water at hydroelectric dams or by fuel oil. These plants can be brought online and taken offline quickly, in response to changing demand.

Phase (Electrical) - In AC power systems, power is generated, transmitted, and distributed using three virtually identical sets of (1) coil windings in generators and transformers, (2) conductors in overhead and underground transmission and distribution lines and busses, (3) electrical poles and contacts in circuit breakers and switches and (4) other power equipment such as capacitor banks, reactors, etc., known as phases, and often identified by the letters A, B, and C. The three individual phase windings of a typical generator stator are arranged so that they're evenly spread out around the circular / cylindrical design/construction, each oriented one third of a turn apart (120 degrees) from the other two. As the rotor spins, its magnetic field sweeps through each of these windings sequentially as it completes a single rotation. The voltage, current, and power associated with each phase are therefore separated in time from the other two phases by virtue of this sequence. This method is much more efficient than a single phase approach not only for generating power, but also for its transmission and distribution.

Physical Responsive Capability (PRC) - In ERCOT, this is defined as the total amount of system wide On-Line capability that has a high probability of being able to quickly respond to system disturbances. It can be made up of generation and load resources.

Pigging - The practice of using pipeline inspection gauges or 'pigs' to perform various operations on a pipeline without stopping the flow of natural gas in the pipeline.

Planning Reserve Margin - Planning reserve margin is designed to measure the amount of generation capacity available to meet expected demand through the planning horizon, which can range from the upcoming season to a ten-year period. It is calculated as the difference between resources and peak demand, divided by peak demand to arrive at a percentage figure.

Poles - The opposite ends of a magnet where the field is most concentrated, designated as the north and south poles. In a synchronous generator, the magnetic poles are established by DC current passing through the field winding on the rotor which is essentially the coil of an electromagnet. Separately, in AC electrical equipment, particularly in switches and circuit breakers, poles refer to the contact assemblies associated with a particular phase. For example, it is common to refer to pole A, B, or C of a three phase disconnect switch. (See Phase)

Potomac Economics, Ltd. - The Independent Market Monitor (IMM) for ERCOT.

Power - In physics, power is defined as the rate at which energy is expended to do work. In the electric power industry, power is measured in watts (W), kilowatts (1 kW = 1,000 watts), megawatts (1 MW = 1 million watts), or gigawatts (1 GW = 1 billion watts). For reference, 1 kW = 1.342 horsepower (hp).

Power System - The collective name given to the elements of the electrical system. The power system includes the generation, transmission, distribution, substations, etc. The term power system may refer to one section of a large interconnected system or to the entire interconnected system.

Processing Plant - A surface installation designed to separate and recover natural gas liquids such as propane, butane, ethane, or natural gasoline from a stream of produced natural gas through the processes of condensation, absorption, adsorption, refrigeration, or other methods, and to control the quality of natural gas marketed or returned to oil or gas reservoirs for pressure maintenance, re-pressuring, or cycling.

Production Separator - An item of production equipment used to separate liquid components of the well stream from gaseous elements.

Qualified Scheduling Entity (QSE) - In ERCOT, a Market Participant that is qualified for communication with ERCOT for Resource Entities and Load Serving Entities (LSEs) and for settling payments and charges with ERCOT**.** QSEs submit schedules on behalf of Resource Entities or LSEs such as retail electric providers (REPs). QSEs must submit daily schedules for their bilateral transactions with total generation and demand and bid curves for zonal balancing up and balancing down energy. The schedules for generation and demand are required to be balanced so that supply equals demand. QSEs also bid for ancillary services.

Ramp or Ramp Rate (for Interchange Schedules) - The rate, expressed in megawatts per minute, at which the interchange schedule is attained during the ramp period.

Ramp or Ramp Rate (for Generator Output) - The rate, expressed in megawatts per minute, that a generator changes its output, or is expected to change its output.

Rating - The operational limits of a transmission system element under a set of specified conditions**.** In power systems, equipment and facility power-handling ratings are usually expressed either in megawatts (MW) or in mega-volt-amperes (MVA). The term is also sometimes used to describe the output capability of generators.

Reactive Power - The portion of electricity that establishes and sustains the electric and magnetic fields of AC equipment. Reactive power must be supplied to most types of magnetic equipment, such as motors and transformers. It is also needed to make up for the reactive losses incurred when power flows through transmission facilities. Reactive power is supplied primarily by generators, capacitor banks, and the natural capacitance of overhead transmission lines and underground cables (with cables contributing much more per mile than lines). It can also be supplied by static VAR converters (SVCs) and other similar equipment utilizing power electronics, as well as by synchronous condensers. Reactive power directly influences system voltage such that supplying additional reactive power increases the voltage. It is usually expressed in kilovars (kvar) or megavars (Mvar), and is also known as "imaginary power."

Reciprocating Compressor Unit(s) - Also known as "positive displacement" compressors, reciprocating compressors operate by trapping a certain volume of natural gas within the compressor and reducing the volume. The high-pressure gas is then released through the discharge valve into the pipeline. Piston-operated reciprocating compressors fall within the category of positive displacement compressors. These compressors have a fixed volume and are able to produce high compression ratios.

Rectifier - A converter designed and operated to convert AC power to DC power. Electrically speaking, rectifiers are the opposite of inverters. High voltage DC (HVDC) converter stations contain large numbers of high power rectifiers.

Regional Entity - An independent, regional entity having delegated authority from NERC to propose and enforce Reliability Standards and to otherwise promote the effective and efficient administration of bulk power system reliability.

Regional Transmission Organization (RTO) - A voluntary organization of electric transmission owners, transmission users and other entities approved by FERC to efficiently coordinate electric transmission planning (and expansion), operation, and use on a regional (and interregional) basis. Operation of transmission facilities by the RTO must be performed on a non-discriminatory basis.

Regulation - The ability to maintain a quantity within acceptable limits. For example, frequency regulation is the control or regulation of the system frequency to within a tight bandwidth around 60 Hz. Voltage regulation is the control of a voltage level within a set bandwidth. In power systems operations, regulation often refers broadly to changing the output level of selected generators to match changes in system load.

Regulator, Pressure - A device that maintains the pressure in a fluid flow line, less than its inlet pressure within a constant band of pressures, regardless of the rate of flow in the line or the change in upstream pressure.

Relay Misoperation - Any unintentional operation of a protective relay when no fault or other abnormal condition has occurred.

Reliability Must Run (RMR) Unit - A unit that must run for operational or reliability reasons, regardless of economic considerations. ERCOT specifies that an RMR unit would not otherwise be operated unless it is necessary to provide voltage support, stability or management of localized transmission constraints under first contingency criteria where market solutions do not exist.

Reliability Unit Commitment (RUC) - In ERCOT, a process to ensure that adequate resource capacity and ancillary service capacity are committed in the proper locations to serve the forecasted load. ERCOT conducts at least one Day-Ahead RUC (DRUC) and at least one Hourly RUC (HRUC) before each hour of the operating day, but additional RUCs are conducted when needed to evaluate and resolve reliability issues.

Reserve Sharing Group - A group whose members consist of two or more balancing authorities that collectively maintain, allocate, and supply operating reserves required for each balancing authority's use in recovering from contingencies within the group.

Resource Entity (RE) - In ERCOT, Resource Entities either own or control a generation resource or behave as a load resource that can comply with ERCOT instructions to reduce electricity usage or provide an ancillary service. Each RE must also be represented by a Qualified Scheduling Entity (QSE), which establishes a control interface with ERCOT.

Responsive Reserve Services (RRS) - As defined by ERCOT, an ancillary service that provides operating reserves that is intended to: (1) arrest frequency decay within the first few seconds of a significant frequency deviation on the ERCOT transmission grid using primary frequency response and interruptible load, (2) help restore frequency to its scheduled value to return the system to normal, (3) provide energy or continued load interruption during the implementation of an Energy Emergency Alert (EEA), and (4) provide backup regulation. RRS can be provided by generation or by load resources having Interruptible Responsive Reserve capability.

Restoration - The process of returning generators and transmission system elements and restoring load following an outage on the electric system.

Reticulated Pipelines - Natural gas pipelines with highly networked, web-like transmission lines, with many possible transportation paths for natural gas supplies to reach the desired marketplace.

Rolling Blackouts - Also known as rotating outages, these are controlled, temporary interruptions of service to customers, most commonly initiated by switching off selected distribution circuits intended to reduce load during times of capacity shortfalls due to significant forced outages of generation and/or transmission facilities. The service interruptions are transferred from one group (or block) of customers to another over time so that no one group bears the entire burden of the necessary reduction in load.

Rotor - The rotating component of a generator attached to the spinning shaft of the generator. In the large synchronous generators that are predominant in electric power systems, the rotor winding acts as an electromagnet that produces the magnetic field used to induce voltage in the stator windings.

RUC Clawback Charge - In ERCOT, money returned by a Qualified Scheduling Entity (QSE) to ERCOT for a resource that was committed by the RUC process when the resource's start-up and minimum energy costs are lower than those allowed by the prevailing RUC guaranteed payment.

RUC Make-Whole Payment - In ERCOT, a payment made to a Qualified Scheduling Entity (QSE) for a resource that was committed by the RUC process when the resource's start-up and minimum energy costs are less than revenues received.

Salt Cavern - An underground natural gas storage cavern which has been developed in a salt dome by the solution mining process.

Scarcity Pricing Mechanism - A pricing mechanism based on the idea that under scarcity conditions, generating units will receive higher compensation for producing electricity. The additional revenue is intended to provide an incentive for investment in new generation facilities, and to promote overall system reliability. Under this mechanism, when available supply falls below a predetermined threshold, the price of additional power rises significantly.

Scheduled Frequency - For power systems in North America, the scheduled frequency is normally 60.00 Hz. During periods of time error correction, which

may last several hours, the scheduled frequency in a given interconnection is set to 59.98 Hz to slow down clocks that use synchronous motors when they are running fast, and to 60.02 Hz to speed them up when they are running slow The fact that the clocks are running fast or slow is an indication that system frequency averaged slightly higher or lower than 60.00 Hz over a long duration, signaling the need for a correction.

Sine Wave - The graphical representation of a mathematical function that describes the smooth, symmetrical, and periodic variation of a quantity that oscillates in magnitude or amplitude. In AC electric power systems, the voltage and current are characterized by sine waves having a frequency of 60 Hz. These waveforms, starting from a zero baseline, traverse a path that increases to a crest (positive maximum), then falls back to zero, continues downward to a trough (equal but opposite to the crest, *i.e.*, in the negative direction), and back to zero in one-sixtieth of a second.

Sluicing/Service Water Systems - A system used to remove bottom ash from many coal-fired boilers.

Southwest Power Pool (SPP) - A Regional Transmission Organization serving members in Arkansas, Kansas, Louisiana, Mississippi, Missouri, Nebraska, New Mexico, Oklahoma, and Texas (non-ERCOT). SPP is connected to and is part of the Eastern Interconnection.

Southwest Reserve Sharing Group (SRSG) - A pool of electric load-serving entities in Arizona, New Mexico, Nevada, southern California, and El Paso, Texas that have entered into an agreement to share contingency reserves. SRSG is a NERC Registered Entity that administers certain requirements on behalf of its members related to disturbance control and emergency operations. SRSG is connected to and is part of the Western Interconnection.

Spinning Reserve - Unloaded generation capacity that is synchronized and available to serve additional demand.

Stability - The ability of an electric power system to maintain a state of equilibrium during normal and abnormal system conditions or disturbances. Instances of instability are serious because they have the potential to cause widespread outages in the power system, and possibly even in the entire interconnection.

Static VAR Converter / Compensator (SVC) - A combination of shunt reactors and shunt capacitors whose switching is precisely controlled by power electronics

to automatically manage reactive power injections and withdrawals from the power system to help maintain proper transmission voltage.

Stator - The stationary component of a motor or generator surrounding but not making physical contact with the spinning rotor in the typical cylindrical design/construction.

Substation - A site that houses circuit breakers, disconnect switches, transformers, reactors, capacitors, and other equipment serving as an electrical hub in the power system, especially at interfaces between different voltage levels. The prefix "sub" distinguishes substations from generating stations. A central control house is often provided to house control and protective equipment.

Supervisory Control and Data Acquisition Systems (SCADA) - A system of remote control and telemetry used to monitor and control a power system or a natural gas transportation or distribution system.

Synchronize - The process of bringing two electrical systems together by closing a circuit breaker at an interface point when the voltages and frequencies are properly aligned. Also, when generators are brought on-line, they are said to be synchronized to the system.

Synchronous - To be in-step with a reference. The rotor of a synchronous machine, be it a motor or a generator, spins in unison with the power system in terms of frequency (see Synchronous Speed, below).

Synchronous Speed - The speed at which the rotor of a synchronous generator must rotate in order to stay in synchronism with the rotating magnetic field of the system. The synchronous speed is determined by the frequency of the power system and the number of magnetic poles in the rotor. For example, the synchronous speed of a two pole steam-turbine generator in a 60 Hz system is 3600 revolutions per minute (rpm), while the synchronous speed of a 24 pole hydro generator is only one-twelfth of that, or 300 rpm.

System (Electric Power) - A combination of generation, transmission, and distribution facilities, equipment, and components.

System Operator - An individual at a control center (Balancing Authority, Transmission Operator, Generator Operator, Reliability Coordinator) whose responsibility it is to monitor and control that electric system in real time.

System Operating Limit (SOL) - The value of any of a number of electrical quantities such as real power flow (in MW), total power flow (real plus reactive) (in MVA), voltage (in kV), current (in amperes) or frequency (in Hz) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure that established reliability criteria are satisfied.

Telemetry - Equipment for measuring a quantity (amperes, volts, MW, etc.) and transmitting the result via a telecommunication system to a remote location for indication and/or recording.

Texas Reliability Entity (TRE) - Texas Reliability Entity, Inc. is authorized by NERC to develop, monitor, assess, and enforce compliance with NERC Reliability Standards within the geographic boundaries of the ERCOT region. In addition, TRE has been authorized by the Public Utility Commission of Texas (PUCT) and is permitted by NERC to investigate compliance with the ERCOT Protocols and Operating Guides. TRE is independent of all users, owners, and operators of the bulk power system.

Thermal Insulation - Any material which slows down or retards the flow or transfer of heat.

Transformer - A type of electrical equipment in the power system that operates on electromagnetic principles to increase (step up) or decrease (step down) voltage.

Transient Flow or Unsteady State Flow - The process which involves changes within the control volume with time.

Transmission - An interconnected group of lines and associated equipment operated at high voltage levels in the range of 100 kV to 765 kV in North America for the movement or transfer of electric energy between points of supply and points at which it is transformed for delivery to customers or is delivered to other electric systems.

Transmission Operator - The entity responsible for the reliability of its “local” transmission system, and that operates or directs the operations of the transmission facilities.

Transmission Owner - The entity that owns and maintains transmission facilities, including, but not limited to, overhead and underground transmission lines, substations, transformers, circuit breakers, capacitor banks and busses.

Transmission Service Provider (TSP) - As defined by NERC, an entity that administers the transmission tariff and provides transmission service to transmission customers under applicable service agreements. ERCOT specifies that TSPs own or operate transmission facilities.

Treatment Plant - A plant designed primarily to remove undesirable impurities from natural gas to render the gas marketable. Examples of these impurities are water, water vapor, sulfur compounds, carbon dioxide, nitrogen and helium.

Turbine - A rotating mechanical device driven by the force of a working fluid. The working fluid is typically steam, water, combustion gases or, in the case of wind turbines, air.

Under Frequency Load Shedding (UFLS) - The automatic disconnection or tripping of customer load based on a decline in system frequency. The set points are predetermined. For example, a utility may trip 5% of their connected load if frequency falls below 59.3 Hz, an additional 10% if it falls below 58.9 Hz, and a final 10% if it falls below 58.5 Hz. The purpose of UFLS is to arrest the frequency decline accompanying major system disturbances generally involving the sudden loss of large amounts of generation or multiple transmission line tripping that results in the formation of an electrical island in which the remaining generation is inadequate to supply the load, thereby forestalling a complete system collapse.

Under Voltage Load Shedding (UVLS) - The tripping of customer load based on a decline in system voltage. For example, a utility may trip 5% of their connected load if voltage falls below 92% of nominal and an additional 10% of their load if voltage falls below 90% of nominal. The purpose of UVLS is typically to avoid a voltage collapse, but it can also be used to avoid overloading transmission facilities during contingency conditions when other transmission facilities trip or are forced out of service.

Unit Commitment - The process of selecting which generating units will be placed on line to serve the load and reserve requirements.

Verbal Dispatch Instruction - In ERCOT, a dispatch instruction issued by operators in the control center to a generating unit or units, load resource, or their Qualified Scheduling Entities (QSEs) orally over the telephone, as opposed to one issued in writing or issued automatically by a control system and delivered electronically via telecommunications.

Vertically Integrated Utility - An electric utility company or a federal, state, or municipal agency that owns and operates all aspects of the power system in its franchise service territory, *i.e.*, generation, transmission, and distribution. The ownership of certain facilities may be shared or held wholly by others, but the vertically integrated utility still controls the power system in the territory.

Voltage - The force characteristic of a separation of charge that causes electric current to flow. The symbol is "V" and units are volts or kilovolts (kV).

Well Freeze-offs - Natural gas flow blockages resulting from water vapor freezing or the formation of crystal hydrates in the gas stream.

Wellhead - The assembly of fittings, valves, and controls located at the surface and connected to the flow lines, tubing, and casing of the well so as to control the flow from the reservoir.

Wellhead Choke - Points at the wellhead where flow and pressure are primarily controlled.

Western Electricity Coordinating Council - The Regional Entity responsible for coordinating and promoting bulk electric system reliability in the Western Interconnection.

Wheeling (Natural Gas) - The transportation of customer-owned gas by a transmission company for the customer at a pre-determined cost to the customer.

Windbreaks - Temporary or permanent structures intended to obstruct, or serve as a barrier against, the wind for the comfort and safety of people and/or the protection of property or equipment.

Wind Chill Factor - The term "Wind Chill Factor," is often used to explain the additional heat loss people experience through convection cooling when exposed to the wind. Whenever there is a temperature difference at a surface, *e.g.*, the difference between normal body temperature and ambient air at a lower temperature on the surface of human skin, heat is conducted across the surface from the warmer body to the cooler air. In the process, the layer of air on the surface is warmed and forms a thermal boundary which tends to slow the rate of heat loss. Wind accelerates the heat loss by literally sweeping away that boundary layer and replacing it, continuously, with air at the ambient temperature. This acceleration of heat loss caused by the wind makes people to feel that the air temperature is colder than it actually is. This feeling is quantified by assigning a

stationary air temperature, known as the Wind Chill Temperature, which yields an equivalent perception of cold.

Zonal Market - A market for electric energy divided into regional pricing zones. Generators within a zone receive the same price for the power they provide, and transmission lines crossing zonal boundaries are assessed additional costs due to market congestion when the power flowing through them reaches operational constraints.

Appendix: Legislative and Regulatory Responses by the States

The natural gas and electricity shortages that occurred in the Southwest in early February 2011 seriously affected three states: Arizona, New Mexico and Texas.[1] Each state took different regulatory and legislative actions in response to the events. As part of its inquiry, the task force contacted state regulators and followed subsequent legislative and regulatory developments. The following section describes the actions taken by each state.

Arizona

In Arizona, approximately 19,000 customers in the Tucson and Sierra Vista areas lost gas service on February 3, 2011. Most of those customers had their service restored within four days.[2] The Arizona Corporation Commission (ACC), which among other things, regulates public utilities in the state, took the lead in reviewing the circumstances surrounding the gas outages.[3] One commissioner met with Southwest Gas Corporation representatives on February 3,[4] and another sent data requests to four impacted pipelines on February 16, 2011.[5]

On March 2, 2011 the ACC held an open meeting on the Southern Arizona gas outages, with witnesses from Southwest Gas Corporation and El Paso Natural Gas Company testifying. At the hearing, representatives from both companies stated that cold weather was the primary reason for the outage, as demand far outweighed supply during the record-low cold temperatures.

---

[1] The task force contacted regulatory staff with the Public Service Commission of Nevada and the California Public Utilities Commission, who informed us that they did not experience a substantial, direct impact from the February 2011 gas supply shortages, and that no related inquiries or proceedings were underway in their states.

[2] *See* Alex Dalenberg, *ACC Meeting will Delve into SW Gas Outage, Arizona Daily Star* (Feb. 13, 2011).

[3] The Arizona legislature did not hold hearings or take any legislative actions in response to the outages.

[4] *See* Letter from Commissioner Barbara Burns to the Chairman and Commissioners of the Arizona Corporation Commission, Docket No. G-00000C-11-0081 (Feb. 11, 2011), *available at* http://images.edocket.azcc.gov/docketpdf/0000123284.pdf (last visited Aug. 5, 2011).

[5] *See* Letter from ACC Commissioner Sandra Kennedy to Southwest Gas Corporation; El Paso Natural Gas Company; UNS Gas, Inc.; and Transwestern Pipeline Company, LLC, Docket No. G-00000C-11-0081 (Feb. 7, 2011), *available at* http://images.edocket.azcc.gov/docketpdf/0000123172.pdf (last visited Aug. 5, 2011).

The ACC held two follow up meetings, on April 6, 2011 and April 7, 2011, to gather information from customers affected by the outages.[6] No further action has taken place in the ACC proceeding.

New Mexico

More than 30,000 customers lost gas service in New Mexico on February 2 and 3, 2011, some for as long as a week. Shortly thereafter, a New Mexico State Senator asked the state's Attorney General to look into the causes of the outages,[7] and the legislature announced that it would hold hearings. On February 11, 2011, a hearing was held before the full New Mexico Senate, which heard testimony from some of the individuals who lost gas service and from representatives of New Mexico Gas Company (NMGC), El Paso Natural Gas Company, and the New Mexico Public Regulation Commission (PRC).

On February 14, 2011, the New Mexico Senate directed the PRC to convene a task force to investigate how and why New Mexico consumers lost natural gas service and to make recommendations on how to prevent such loss of service in the future.[8]

On March 16, 2011, Governor Susana Martinez signed a bill[9] into law that created a state task force to investigate the causes of the outages and to make recommendations on how to prevent similar outages in the future.[10] As of the date of this report, the report from the Natural Gas Emergency Investigation Legislative Task Force is pending.

Appendix: Legislative and Regulatory Responses by the States

The United States Senate Committee on Energy and Natural Resources held a field hearing in New Mexico on February 21, 2011 to receive testimony regarding the natural gas service disruptions in New Mexico and the reliability of regional energy infrastructure.[11] The Committee heard testimony from three different panels, and sent follow up questions to the Federal Energy Regulatory Commission.

The PRC opened its investigation into the outages on February 11, 2011.[12] In its order opening the inquiry, the PRC directed NMGC, Public Service Company of New Mexico, El Paso Electric Company, and Southwestern Public Service Company to provide testimony responding to specific questions within 30 days of the order.[13]

At the same time, the PRC also initiated a non-docketed proceeding entitled the NMPRC Informal Task Force Investigation into Severe Weather Cascading Events. The Informal Task Force, which included representatives of several New Mexico utilities,[14] PRC staff, the state Attorney General's Office, several municipalities, and the general public, was charged with developing a summary of the weather event, identifying the causes, determining how to mitigate the impact of future events, and reviewing the policies and rules of the PRC and other New Mexico agencies.[15]

On May 3, 4, and 5, 2011, the PRC held hearings on the outages, hearing testimony from gas company representatives and other parties, including

[14] The utilities are Public Service Company of New Mexico, Southwestern Public Service Company, El Paso Electric Company, NMGC, Zia Natural Gas Company, and Raton Natural Gas Company.

[15] February 2011 Severe Cold Weather Investigations & Status, Presentation before the Natural Gas Emergency Investigation Legislative Task Force (July 25, 2011) at pp. 1-2.

representatives of the affected municipalities. Since then, the parties have submitted additional written testimony and briefs to the PRC. As of the date of this report, the PRC's investigation is still pending.

Texas

With several million consumers affected by electrical blackouts, the State of Texas was severely impacted by the extreme weather events of early February. Two regulatory agencies in Texas have jurisdiction over the industries in question – the Public Utilities Commission of Texas (PUCT) (which has primary jurisdiction over the electrical power industry) and the Texas Railroad Commission (TRC), whose jurisdiction includes the natural gas industry.

The PUCT reacted at once to the electric outages, asking the state's independent energy market monitor on February 4, 2011 to investigate whether power generators, pipeline companies or others broke market rules.[16]

The PUCT also directed the Texas Reliability Entity, Inc. (TRE) to investigate the Electric Reliability Council of Texas (ERCOT) Energy Emergency Alert Level 3 that occurred on February 2, 2011. At the same time, the PUCT asked El Paso Electric Company to investigate and report back on the weather-related issues surrounding this event.

On February 8, 2011, the TRC held the first state hearing on the outages. One of the witnesses, the TRE, addressed the impact of the rolling blackouts on natural gas service.[17]

On February 15, 2011, the Texas Senate's Committee on Natural Resources and Committee on Business and Commerce jointly convened a hearing to discuss the causes of the rolling blackouts.[18] The hearing included testimony from the PUCT, the TRC, the Texas Commission on Environmental Quality, ERCOT, and the Office of Public Utility Counsel. The House Committee on State Affairs also held a hearing on the causes of the rolling blackouts on February 17, 2011.

---

[16] *See* Rebecca Smith, *Texas to Probe Rolling Blackouts, Wall Street Journal* (Feb. 7, 2011).

[17] *See* Press Release: Railroad Commission Emergency posted item to be discussed at 1:30 P.M today, Texas Railroad Commission (Feb. 8, 2011), *available at* http://www.rrc.state.tx.us/pressreleases/2011/020811.php (last visited Aug. 5, 2011).

[18] *See* Chris Tomlinson, *Texas Senate Investigates Power Outages, The Associated Press* (Feb. 16, 2011).

Prompted by the hearings, the legislature enacted a bill to address the perceived causes of the rolling blackout.[19] On June 17, 2011, that bill was signed into law.[20]

The law directs the PUCT to prepare a "weather emergency preparedness report on power generation weatherization preparedness." [21] Under the law, the PUCT must review the emergency operations plans it currently has on file,[22] determine the Texas electricity grid's ability to operate continuously during extreme weather events in the upcoming year, consider the upcoming year's forecasted weather patterns, and recommend improvements to emergency operations plans to ensure electric service reliability.[23] In addition, the law permits the PUCT to require entities to update their emergency operations plan when it does not contain information sufficient to determine whether that entity can perform during adverse weather. The law also permits the PUCT to adopt rules implementing the legislation.[24]

On April 21, 2011, the Independent Market Monitor reported that "there was no evidence of market manipulation or market power abuse" within the ERCOT region.[25] The Independent Market Monitor similarly determined "that the ERCOT real-time and day-ahead wholesale markets operated efficiently and the outcomes are consistent with the ERCOT energy-only wholesale market design."[26]

Appendix: Legislative and Regulatory Responses by the States

On May 13, 2011, the TRE issued a report on whether ERCOT Protocols and Operating Guides were followed during the period leading up to the Energy Emergency Alert event.[27] The TRE concluded that event "was caused by either insufficient or ineffective preparation of generating facilities for prolonged freezing weather."[28] The report went on to find that "ERCOT Market Participants committed potential violations of the ERCOT Protocols and Operating Guides in connection with the event."[29] The TRE will conduct additional investigations as necessary and forward information to the PUCT for further action, as appropriate.[30]

Also, on May 13, 2011, PUCT staff issued a report on El Paso Electric Company's activities during the weather event.[31] PUCT staff did not identify any violations of the Public Utility Regulatory Act or the PUCT's Substantive Rules.[32] The report, however, did conclude that "designed cold weather tolerances of El Paso Electric Company's current generation equipment and/or weatherization preparation were inadequate to prevent failures in the conditions during the event timeframe."[33]

Appendix: Categories of NERC Registered Entities

All entities that fall within one or more of the following categories must register with NERC. Many entities carry out multiple roles and therefore have multiple registrations.

Function Type	Acronym	Definition/Discussion
Balancing Authority	BA	The responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within BA area, and supports interconnection frequency in real-time.
Distribution Provider	DP	Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the DP. Thus, the DP is not defined by a specific voltage, but rather as performing the distribution function at any voltage.
Generator Operator	GOP	The entity that operates generating unit(s) and performs the functions of supplying energy and interconnected operations services.
Generator Owner	GO	Entity that owns and maintains generating units.
Interchange Authority	IA	The responsible entity that authorizes implementation of valid and balanced Interchange Schedules between Balancing Authority Areas, and ensures communication of Interchange information for reliability assessment purposes.
Load-Serving Entity	LSE	Secures energy and transmission service (and related interconnected operations services) to serve the electrical demand and energy requirements of its end-use customers.
Planning Authority	PA	The responsible entity that coordinates and integrates transmission facility and service plans, resource plans, and protection systems.

Appendix: Categories of NERC Registered Entities

Purchasing-Selling Entity	PSE	The entity that purchases or sells and takes title to energy, capacity, and interconnected operations services. PSE may be affiliated or unaffiliated merchants and may or may not own generating facilities.
Reliability Coordinator	RC	The entity that is the highest level of authority who is responsible for the reliable operation of the bulk power system, has the wide area view of the bulk power system, and has the operating tools, processes and procedures, including the authority to prevent or mitigate emergency operating situations in both next-day analysis and real-time operations. The RC has the purview that is broad enough to enable the calculation of interconnection reliability operating limits, which may be based on the operating parameters of transmission systems beyond any Transmission Operator's vision.
Reserve Sharing Group	RSG	A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating reserves required for each BA's use in recovering from contingencies within the group. Scheduling energy from an adjacent BA to aid recovery need not constitute reserve sharing provided the transaction is ramped in over a period the supplying party could reasonably be expected to load generation in (e.g., ten minutes). If the transaction is ramped in quicker, (e.g., between zero and ten minutes) then, for the purposes of disturbance control performance, the areas become a RSG.
Resource Planner	RP	The entity that develops a long-term (generally one year and beyond) plan for the resource adequacy of specific loads (customer demand and energy requirements) within a PA area.

Appendix: Categories of NERC Registered Entities

Transmission Owner	TO	The entity that owns and maintains transmission facilities.
Transmission Operator	TOP	The entity responsible for the reliability of its local transmission system and operates or directs the operations of the transmission facilities.
Transmission Planner	TP	The entity that develops a long-term (generally one year and beyond) plan for the reliability (adequacy) of the interconnected bulk electric transmission systems within its portion of the PA area.
Transmission Service Provider	TSP	The entity that administers the transmission tariff and provides transmission service to transmission customers under applicable transmission service agreements.

Appendix: Electricity - How It Is Generated and Distributed

Electricity is one of the most widely used forms of energy in the industrialized world. According to the U.S Energy Information Administration, in 2009 the U.S. electric utility net generation was 2,372,776 gigawatt hours. Table 1 shows the share of net electricity generation by energy source in the United States.

Energy Source	Net Generation (%)
Coal	44.5
Nuclear	20.2
Natural Gas	23.3
Hydro	6.8
Oil (Petroleum) and other	1.6
Renewables	3.6

Table 1: Share of net electricity generation in 2009 in the U.S. (Source: U.S. Energy Information Administration)

Electric power is produced at generating stations and transmitted via transformers, transmission lines, switching devices and protection and control equipment for delivery to end users. The electric power system as shown in figure 1 is an integrated system made up of generation, transmission and distribution subsystems.

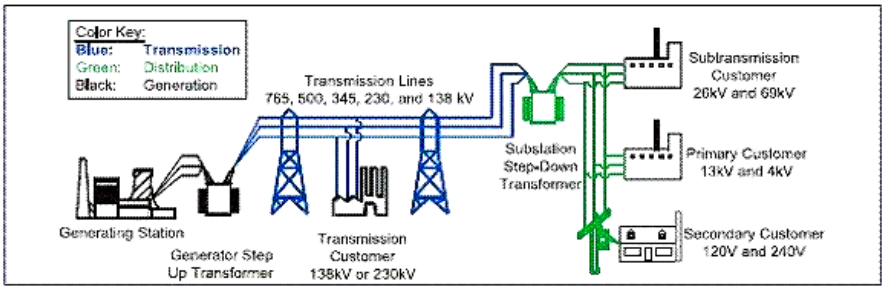

Figure 1 – Basic structure of the electric system (NERC)

Generation

Generating plants produce electricity by burning fuels such as oil, coal, natural gas, or lignite to create steam that drives a turbine, which in turn drives a turbine generator shaft. In a coal-fired plant (figure 2), coal is ground by pulverizers into fine powder, mixed with pre-heated air and injected into a combustor, where it is ignited. The hot combustion gas rises through the boiler and heats water that enters the steam generator. The partially vaporized water enters the steam drum, where steam is separated from the water. The remaining

water cycles through the boiler again, and through tubes lining the furnace walls. The steam is passed through another section of the boiler known as the superheater, where the temperatures are increased to well above boiling.

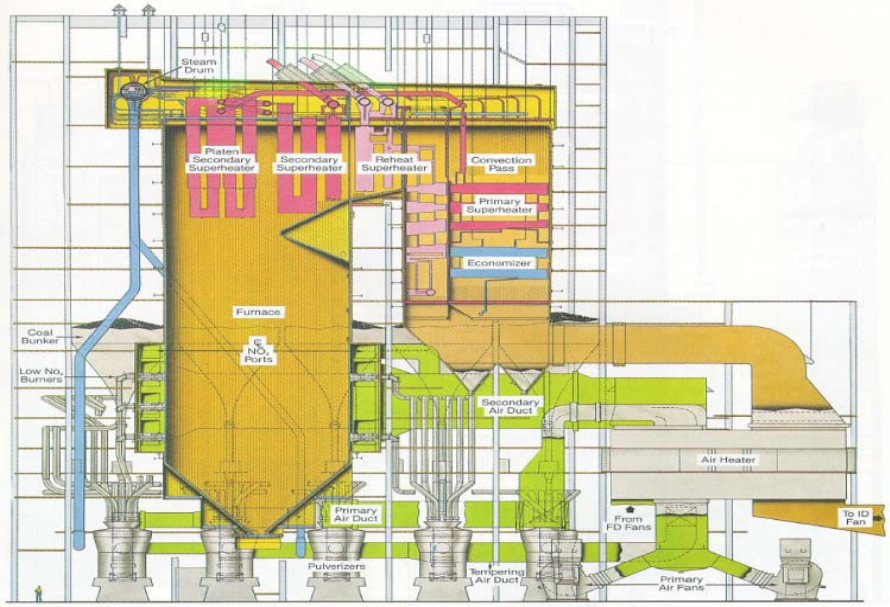

Figure 2 – Typical drum-type coal/lignite boiler plant
(PJM Generation Basics)

The superheated steam, now at very high pressure, passes through a high pressure turbine (shown in figure 3), causing the turbine to spin and turning the shaft of an electrical generator. After passing through the high pressure turbine, the steam is piped back to the boiler to be reheated, then enters an intermediate pressure turbine and low pressure turbine before it passes through a condenser, where the steam is converted back to water, which is usually cycled back to the steam generator for reuse. The mechanical energy generated by the spinning generator shaft is converted to electrical energy for delivery to the electric power system.

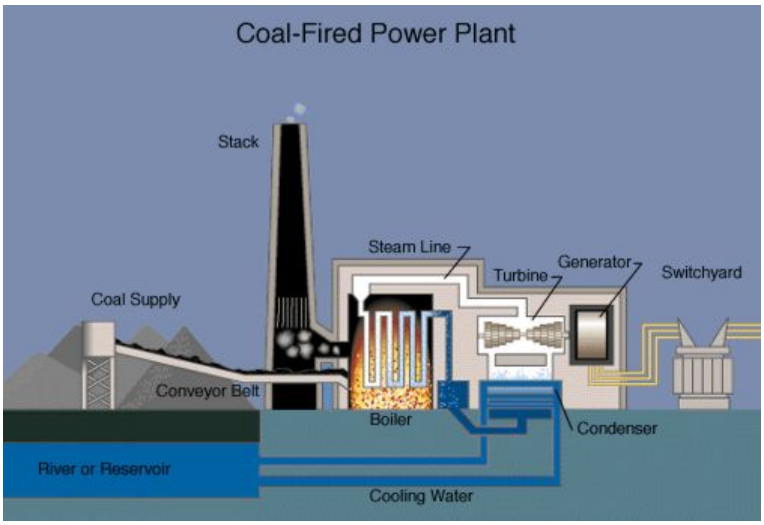

Figure 3: Typical coal burning generating plant with cooling tower (Department of Energy)

In nuclear generating stations, steam is also used to drive a turbine. However, the energy required to produce the steam is derived from nuclear fission, typically fueled by uranium.

Wind turbines use blades to collect the energy of the wind. As wind blows, it flows over the blades, causing them to turn. The blades are connected to a gear box with a drive shaft that turns an electric generator to produce electricity.

In hydroelectric plants, the gravitational force of water flowing downhill drives the turbine generator shaft (as shown in figure 4). The mechanical energy of the spinning shaft is then converted to electrical energy.

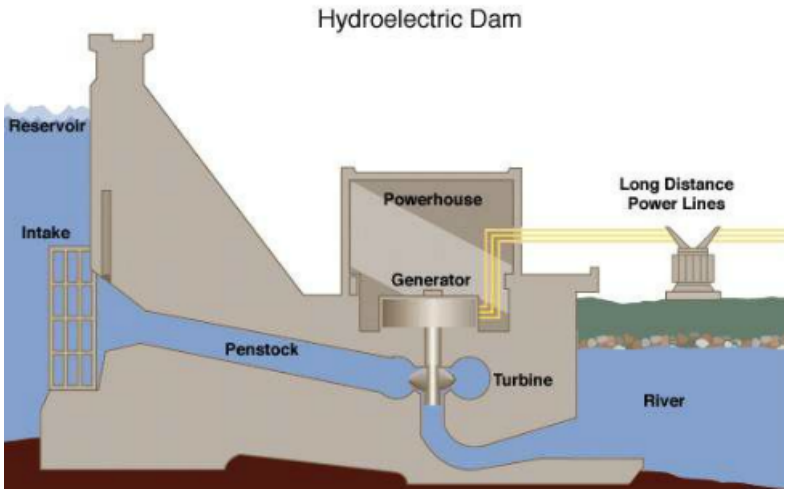

Figure 4: Typical hydroelectric generator
(Energy Information Administration)

Electric energy can also be produced by simple cycle or combined cycle combustion turbines or internal combustion engines, which usually burn natural gas or fuel oil. The combustion turbine drives an electric generator to produce electricity. One advantage of combustion turbines is that they can be started quickly, making them suitable for emergencies and during peak periods, when demand for electricity is at its highest.

A combined cycle combustion turbine is shown in figure 5. Note: a simple cycle combustion turbine plant does not include a heat recovery steam generator (HRSG), steam turbine, and a second generator as depicted in figure 5.

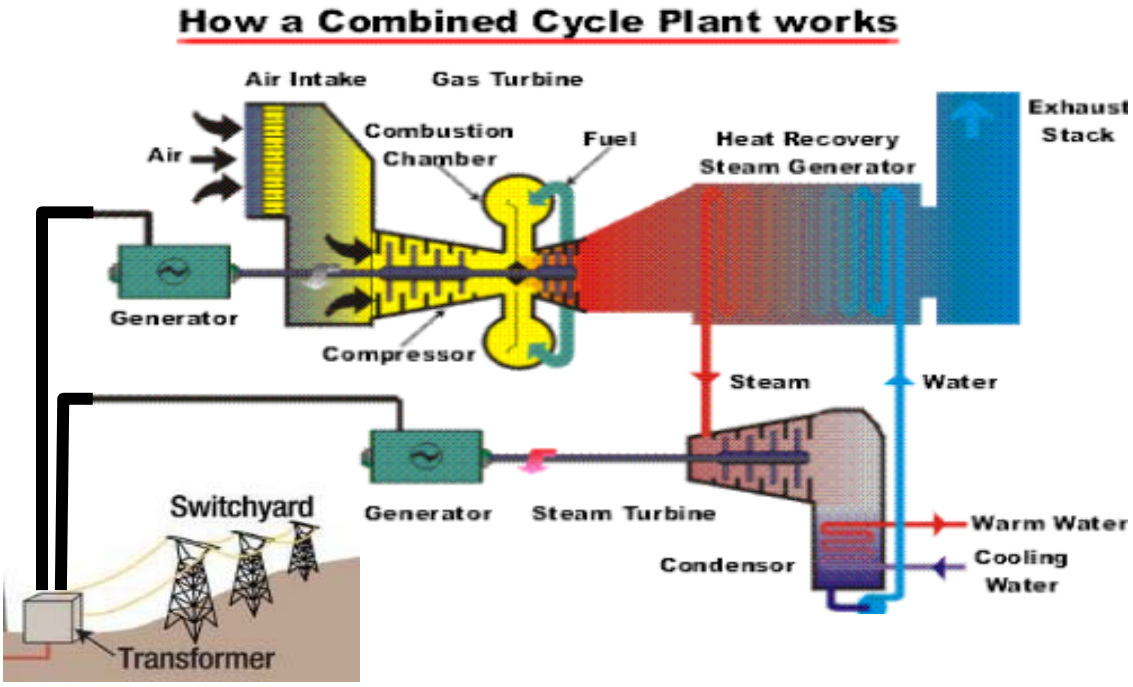

Figure 5: Combined cycle turbine generator with steam generator and HRSG (Washington State University)

Conversion of Mechanical Energy to Electrical Energy

A generator works on the principle of electromagnetic induction, discovered by scientist Michael Faraday between 1831 and 1832. Faraday discovered that the flow of electric charges could be induced in a coil of wire by passing a magnet through the coil. This movement creates a voltage difference between the two ends of the wire or electrical conductor, which in turn causes the electric charges to flow, thus generating electric current.

Every modern generator consists of two main components: the rotor (the moving part) and the stator (the stationary part). In an AC generator, the rotor spins inside the stator. A mechanical device is used to spin or turn the rotor. With every rotation, the changing magnetic field creates a current in the stator windings. A generator does not actually make electrical energy. Instead, it uses mechanical energy supplied to it to cause the movement of electric charges present in the wire of the stator windings, thereby generating an electric current that is supplied to the grid. A generator is akin to a water pump, which causes the flow of water but does not actually create the water flowing through it.

Most large power generators are three-phase generators and have three windings (A, B and C phases), one winding for each phase. In a three-phase

generator, a rotor rotates at the center of the three windings creating the changing magnetic field. Each one of the winding sets produces a voltage. Each phase voltage has a 120º phase angle separation from the other two phase voltages as shown in figure 6. The waveform of the induced voltages is a sine wave (also shown in figure 6) in which each phase voltage periodically reverses direction. The current produced from this generator is known as alternating current (AC).

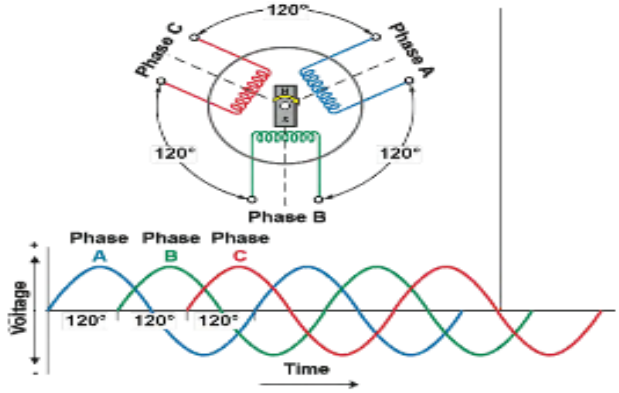

Figure 6: Three-phase generator diagram & waveform
(Electric Power Research Institute)

Figure 7: Three-phase power generator
(Electric Power Research Institute)

There are two general types of AC generator: synchronous and asynchronous. The terms synchronous and asynchronous refer to the relationship between the generator rotor's speed of rotation and the power system speed. Power system speed (or synchronous speed) is the speed of rotation of the AC electrical system to which the generator is connected. When a generator is connected to the power system, the rotating magnetic field of the generator is synchronized with the rotating magnetic field that already exists in the three-phase system. An AC generator can be designed to rotate in-step, or in synchronism,

with the power system's rotating field. This type of AC generator is called a synchronous machine. Most utility power generators and most large motors are synchronous machines.

An AC generator's rotor can also be designed to rotate slower or faster than synchronous speed. This type of machine is called an asynchronous machine. Most small AC motors are asynchronous machines. Induction machines – alternating current machines in which power is supplied to the rotor by means of electromagnetic induction – are the most common type of asynchronous machines. Most wind turbines use induction generators.

Synchronous machines are the most common type of generator used for large-scale power production, and can be used to produce both active[1] and reactive power[2]. This is in contrast to conventional induction machines, which cannot produce reactive power, only active power. The latest design for wind turbine generators, however, includes sophisticated power electronic interfaces and controls that allow these units to inject or absorb reactive power from the grid, as well as providing frequency response, inertial response, etc.

Transmission

Electricity from generators is stepped up to higher voltages by means of a generator step-up transformer for transportation in bulk over transmission lines. Operating the transmission lines at high voltage (100,000 to 765,000 volts) reduces electricity losses from conductor heating and allows power to be transported economically over long distances. The higher the voltage, the lower the current flow needed to transmit the same amount of power. Since losses are related to high current flow, lowering the current lowers the losses. Transmission lines are interconnected at switching stations and substations to form a network of lines and stations called a power grid. Electricity flows through the interconnected network of transmission lines from the generators to the loads in accordance with the laws of physics, along paths of least resistance. When power arrives near a load center, it is stepped down to lower voltages by means of step-down transformers, usually located at substations throughout the system. These substations contain other equipment such as communication, control, protection

[1] Active Power is the useful or working energy supplied by a power source. It is used to perform work such as lighting a room or heating a building or turning a motor shaft.

[2] Reactive Power is used to support the magnetic and electric fields necessary to operate power system equipment. Reactive power is never consumed by the power system and is stored in the electrical and magnetic fields that exist in the system.

and metering equipment. The Bulk Power System (BPS) is predominantly an AC system, as opposed to a direct current (DC) system, because of the ease and low cost with which voltages in AC systems can be converted from one level to another.

Three-phase AC power is normally transmitted by overhead AC circuits, which consist of aluminum conductors with a reinforcing steel core suspended from metal towers by porcelain insulators, as shown in figure 8. Underground transmission circuits can also be used, but are used less frequently than overhead circuits due to the costs involved, as well as the associated reduction in current carrying capacity. Transmission cables installed underground must be insulated, increasing cost and limiting the current carrying capability of the system.

High Voltage Direct Current (HVDC) systems are usually employed for special purposes, including the transmission of large blocks of power from remote sources to load centers or interconnection to systems that operate at different frequencies. A DC transmission system consists of a two conductor line connecting two AC systems. A rectifier at one end of the line converts the AC voltage to a constant DC value and an inverter at the other end reconverts the DC into AC.

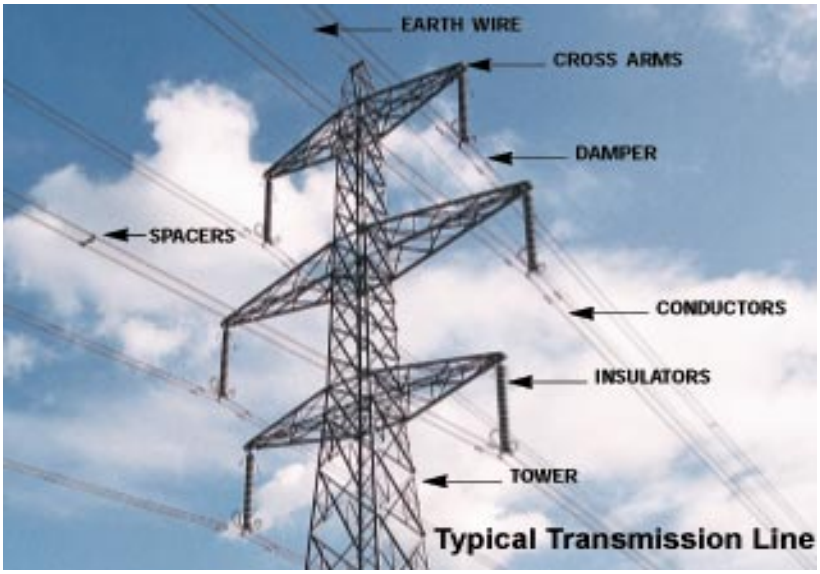

Figure 8: Transmission tower (National Grid)

While the power system is commonly referred to as “the grid,” there are actually three distinct power grids or interconnections in the United States. Figure 9 shows the various interconnections. The Eastern Interconnection includes the eastern two-thirds of the continental United States and Canada from Saskatchewan east to the Maritime Provinces. The Western Interconnection includes the western

third of the continental United States (excluding Alaska), the Canadian provinces of Alberta and British Columbia, and a small part of Mexico near the California border. The third interconnection comprises most of the state of Texas. The three interconnections are electrically independent from each other except for a few small DC ties. Within each interconnection, electricity is produced the instant it is used, and flows over virtually all transmission lines from generators to loads. The frequency at which the various interconnects were designed to operate is 60 Hz.

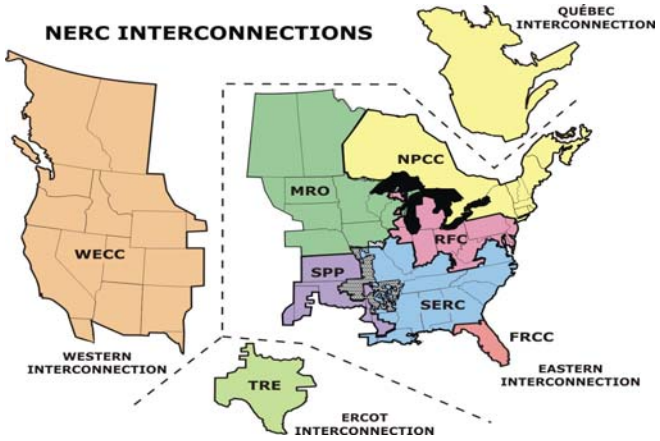

Figure 9: North American interconnections (NERC)

System Frequency

If the total demand from customers is not in balance with the available generation, the electrical frequency of an entire interconnection will deviate from 60 Hz. The target frequency is referred to as the scheduled frequency. When the actual frequency deviates from the scheduled frequency, a frequency deviation has occurred. For example, if the scheduled frequency is 60 Hz but the actual frequency is 59.95 Hz then a -0.05 Hz frequency deviation has occurred. When the supply of generation to the transmission system is inadequate, the frequency falls below 60 Hz. When too much generation is supplied to the transmission system, the frequency rises above 60 Hz. Individual power systems within an interconnection work together to maintain the frequency within a narrow band around the 60 Hz nominal frequency.

Under normal conditions, the power system frequency in a large interconnection (such as the Eastern Interconnection) varies approximately ±0.03 Hz from the scheduled value. If the scheduled frequency is 60 Hz, the normal range is 59.97 to 60.03. These variations are normal and constantly occur due to the varying nature of the interconnection's load. However, large downward, or negative, frequency deviations can trigger automatic load shedding schemes in most areas, designed to reestablish the necessary balance between generation and

load. Depending on the region, automatic under-frequency load shedding usually begins when the frequency declines to levels of 59.3 to 59.7 Hz. Distribution loads are typically shed in various size blocks before generating units start to trip.

System Voltage

The maintenance of voltage within a narrow range is critical to utility customers. Transmission voltage fluctuations of more than ten percent can affect the overall stability of the transmission system. Entities that experience sustained voltage fluctuations equal to or greater than ten percent must file a report with NERC.[3] Capacitor banks, Static VAR Compensators, load tap changing transformers, phase shifters, and voltage regulators are used to control system voltage. Low voltage conditions are usually caused by the loss of critical transmission or generation facilities and may result in the overload of adjacent circuits, which could require bringing power in over tie lines.

Load Balancing

An electric power system must have enough generating capacity to supply expected peak load demand plus a reserve margin to accommodate forced outages of generating units. Operating reserves also are necessary to regulate and respond to unanticipated events such as load forecast errors.

Large frequency deviations from the scheduled value occur when there is a significant mismatch between total load demand and total generation. The frequency rise or decay will in most cases be halted by the action of the speed governors on generators which respond to frequency changes and automatically adjust generation to meet demand. Governor action is supplemented by the Automatic Generation Control (AGC) system which over a period of several minutes brings the frequency and interchange (energy transfers that cross Balancing Authority boundaries) back to schedule.

AGC can be a very effective tool during system restoration. The primary function of AGC is to make continuous and automatic adjustments to the output of selected generators in a way that meets load demand and the established interchange schedule at the desired operating frequency. AGC software is normally designed to control a defined portion (within the Balancing Authority boundaries) of the interconnected system. To accomplish the AGC control function, control parameters are continuously monitored. The control parameters

[3] Reliability Standard EOP-004-1 (Disturbance Reporting).

consist of an actual frequency reading and all tie-line MW flows to neighboring Balancing Authority areas. These control parameters are selected and normally fixed for the portion of the system being controlled. A key assumption to the typical AGC control strategy is that the power system is operating in an interconnected mode.

Distribution

Some larger industrial and commercial customers take service at intermediate voltage levels (4,000 to 115,000 volts), but most residential customers take their electrical service at 120 and 240 volts. Residential customers receive power via overhead or pad mounted transformers supplied by distribution feeders from substations. The transformers step down the voltage from a typical voltage of 13,000 volts to 120/240 volts. The lines carrying the power to a business or residence usually terminate at an electric meter owned and maintained by the distribution company. The meter records the energy consumed by the end user and is read periodically by the distribution company to monitor energy usage and for billing purposes.

Appendix: Power Plant Design for Ambient Weather Conditions

Geographic location and the corresponding ambient weather conditions, including expected temperatures and wind speed, have a direct impact on the preferred design for generating facilities. In the northern regions of the United States, most generating plants (especially steam-cycle plants) are designed and constructed with the boilers, turbines/generators, and certain ancillary equipment housed in one or more enclosed buildings. In the colder months, heat radiated from boilers, other generation equipment, and supplemental heaters can generally maintain temperatures at a high enough level to prevent freezing. Enclosed areas are generally designed and constructed with fresh air inlets and roof-mounted exhaust ventilators for cooling purposes during the hot weather months.

Enclosed coal fired power plant in the northeastern United States (Allegheny Energy)[1]

In the southern and other warm weather regions of the U.S., generating plants are designed and constructed without enclosed building structures, with the boilers, turbine/generators, and other ancillary systems exposed to the weather, in order to avoid excessive heat build up. For the colder months, when temperatures may fall below freezing, generation owners and operators undertake specific freeze protection efforts, which typically involve a combination of heat tracing, insulation, temporary heating, and temporary wind breaks (to prevent heat loss from normal operations and from supplemental heating sources).

Non-enclosed coal fired power plant in the southern United States (Luminant)[2]

Common Freezing Problems

Some power plant components and systems are susceptible to freezing. Any power station system that uses water, air (which can contain moisture), or rotating machinery (which uses lubricating oil) can develop operational problems or trip off-line as a result of sub-freezing temperatures, unless adequate cold weather protection is in place.

- Instrumentation - Instrumentation provides operational data necessary for process monitoring and control systems. Freezing often may occur not in the instrumentation itself, but in the sensing lines that run from piping, pressure vessels, and tanks that contain water or steam. The sensing lines are filled with a static water column that, if frozen, will send incorrect data, possibly resulting in unit trips, load rejection, unit runback schemes, or incorrect operator actions. Critical instrumentation sensing lines that are susceptible to freezing include lines used to monitor boiler steam drum water level, deaerator pressure, feedwater heater water levels, and various critical cooling water flows (generator, turbine oil cooling, etc.).

- Feedwater systems - The condensate and boiler feedwater systems for steam-cycle generation units utilize water from the condenser and add heat (through a series of feedwater heaters) and pressure (through condensate and boiler feedwater pumps) to increase cycle efficiency before the water enters the boilers. Piping, pressure vessels, and valves contained in these systems are all susceptible to freezing. This is especially true of generation units that are not in operation at the onset of freezing temperatures, due to static water in the feedwater systems. In addition, the reverse osmosis

[2] *Available at* http://www.powermag.com/environmental/Luminants-Oak-Grove-Power-Plant-Earns-POWER-s-Highest-Honor_2877_p2.html (last visited Aug. 10, 2011).

equipment, demineralizers, filters, and storage tanks often found in condensate make-up water systems are susceptible to freezing.

Cooling Water Systems

- Cooling Water Intakes - Steam cycle power plants require large quantities of cooling water, often supplied by rivers or lakes. Water drawn from a river or lake is filtered through trash racks and circulating water screens to remove tree branches, debris, and fish. When temperatures drop below freezing, ice can clog racks and screens, limiting the flow of cooling water. Water intakes can also become clogged by fish kills during extreme cold weather, as happened in Texas in 1989.

- Cooling Towers - Cooling towers lower the temperature of water used in the cooling process so that it can be reused (reducing the amount of water taken from lakes and rivers) or discharged at lower temperatures. Cooling towers use mechanically induced draft or natural draft designs. Mechanical cooling towers (box) have fans mounted on the top to draw air through the water as it falls over trays to remove the heat gained in the steam condenser. Natural draft cooling towers are of the familiar, hyperbolic design that can be seen at many large coal and nuclear power plants. During extended periods of freezing temperatures, ice can accumulate on the trays in the towers and affect operations or damage the unit.

- Equipment Cooling Water - Various equipment and systems in power plants require cooling water to stay operational. These include turbine lubricating oil coolers, generator/hydrogen coolers, pump and fan bearings, and air compressors. Freezing of the piping, valves, and instrumentation sensing lines in these systems can cause derates or outages.

- Sluicing/Service Water Systems - Sluicing water is used to remove bottom ash from coal-fired boilers. Icing problems in the bottom ash removal system can interfere with ash removal and may lead to derates or outages. Service water is used for various wash down systems and fire protection systems. Loss of service water due to freezing should not affect unit capacity, but could affect equipment protection systems.

- Wastewater Systems - Various power plant systems that use water can create waste streams that must be treated for contaminants before re-use or discharge. Those systems include boiler blowdown, cooling tower blowdown, various cooling systems, bottom ash sluicing water, and service water systems.

Freezing of valves and piping on these systems can result in the accumulation of wastewater, which could affect other systems.

Emission Reduction Systems

- Sulfur Dioxide Removal Systems - Among the methods available to reduce and remove sulfur dioxide from emission flue gas on coal plants, the predominant technology has been use of wet lime or limestone scrubbers. Lime or limestone contains calcium oxide, which when mixed (slaked) with water forms calcium hydroxide. Calcium hydroxide is sprayed through the flue gas to produce a chemical reaction to form calcium sulfite or sulfate (gypsum). As the waste product is processed, it contains less and less water, which is then reused in the scrubber. The scrubbing and waste processes require many runs of piping and instrument/control locations, many of which are susceptible to freezing. Freezing problems on piping runs or sensing lines could cause scrubber chemistry problems, tank overflows, etc., which could lead to derates or unit shutdowns if the plant is unable to stay within permitted emission limits.

- Nitrogen Oxides Reduction Systems - As with sulfur dioxide systems, numerous technologies are available to reduce nitrogen oxides in fossil fuel plants. Many of these technologies use water in the emissions reduction process. These systems are susceptible to freezing that can lead to failure in the emissions reduction process, resulting in derates or unit shutdowns.

Control Air Systems, Control Drives, Valve Actuators, Valves

- Freezing in Control Air Systems - Air is compressed and used to operate pneumatic control valves, boiler damper control drives, and various other pneumatic controls in the plant. Moisture in the air can condense and accumulate in lines, air receivers, and component control mechanisms. If moisture is not removed (through use of air dryers and air receiver blow-downs), these pneumatic controls can freeze and cause equipment controls to malfunction or fail, which can in turn cause a unit shutdown or limit the unit's output.

- Sluggish Valve Operation - When exposed to severe cold weather, the operation of valves and control valves can become sluggish. This can lead to instability in boiler or turbine controls and ultimately lead to a unit trip.

- Lubricating Oil - Various types and grades of lubricating oil and grease are used in power plants on rotating machinery and other moving parts. As the temperature decreases, the lubricating properties and viscosity of these oils change, possibly affecting operation of the equipment.

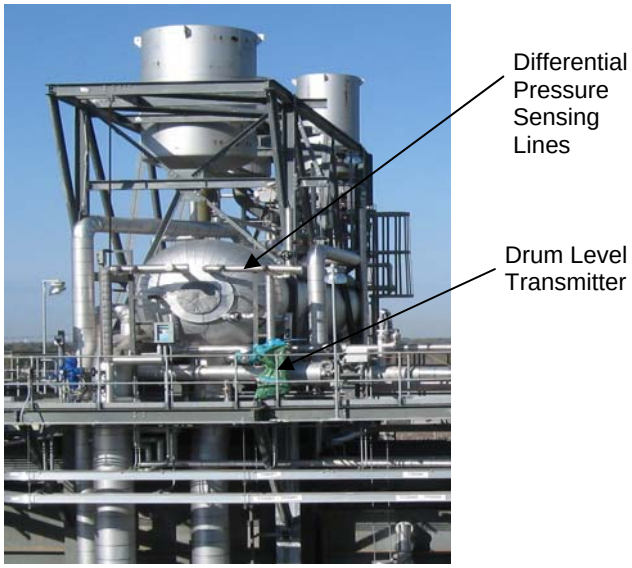
Fuel

- Coal - Severe cold weather can limit or prevent the transfer of coal into a plant. Coal in Texas (lignite) typically contains between 30 and 40% moisture. When temperatures are low enough to freeze moisture in the coal, the coal may slide on conveyor belts or block belt transfer points, chutes, and crushers, limiting supply.

- Natural Gas Supply - Freezing weather can cause gas valves to malfunction, adversely affecting gas supply to the units.

- Fuel Oil - During cold and freezing weather, fuel oil supplies in storage can gel without the appropriate additives. Gelled fuel oil can affect pump and burner performance, which in turn affects the unit's output. Some types of fuel oil must be heated before they can be used in cold weather.

Steam Drum Level Measurements



One of the most critical measurements made on a drum type steam boiler is the water level in the main drum. Too high a water level can result in water being

injected into the boiler tubes or steam turbine, damaging the boiler tube or turbine blade. Too low a water level or no water can result in overheating the drum or boiler tubes, leading to drum or boiler tube damage.

The steam drum in a southern plant can be located outside, near or at the top of the boiler. During the February 2011 cold weather event many of the plants had problems with freezing in the drum level water level regulating system.

A typical drum level measurement system works by maintaining the differential pressure between the steam side and water side of the drum to a constant value. The drum level transmitter monitors and regulates this differential pressure by controlling the amount of water being added or removed from the drum. On a normal drum, the water level is controlled to approximately plus or minus 2 inches of the desired level.

Appendix: Impact of Wind Chill

Wind Chill Factor

The term "Wind Chill Factor," is often used to explain the additional heat loss people experience through convection cooling when exposed to the wind. Whenever there is a temperature difference at a surface, *e.g.*, the difference between normal body temperature and ambient air at a lower temperature on the surface of human skin, heat is conducted across the surface from the warmer body to the cooler air. In the process, the layer of air on the surface is warmed and forms a thermal boundary which tends to slow the rate of heat loss. Wind accelerates the heat loss by literally sweeping away that boundary layer and replacing it, continuously, with air at the ambient temperature. This acceleration of heat loss caused by the wind makes people feel that the air temperature is colder than it actually is. This feeling is quantified by assigning a stationary air temperature, known as the Wind Chill Temperature, which yields an equivalent perception of cold.

The polar explorer and geographer Paul Siple first used the term "wind chill" in 1939. During the second expedition of Admiral Richard Byrd, Siple and his partner Charles Passel conducted experiments at Little America, Antarctica, to determine the time required to freeze water in plastic vials exposed outside in the wind. They developed a formula for relating heat loss to wind speed and air temperature, expressed in units of atmospheric cooling-watts per square meter. Later, the formula was modified to allow computation of a wind chill equivalent temperature.

Wind Chill Temperature is only defined for ambient temperatures at or below 50 degrees Fahrenheit and wind speeds above 3 mph. Bright sunshine may increase the wind chill temperature by 10 to 18 degrees.

Wind Chill Effect on Inanimate Objects

The Wind Chill Factor, per se, applies only to human beings and animals. The only effect wind chill has on inanimate objects, such as car radiators and water pipes, is to more quickly cool objects to the current air temperature. Objects will not cool below the actual air temperature. For example, when the temperature outside is -5 degrees and the Wind Chill Temperature is -31 degrees, a car's radiator will not get any colder than -5 degrees. Similarly, if the ambient temperature is above freezing, stationary water in piping exposed to the wind will not freeze, no matter how strongly the wind may blow.

Appendix: Impact of Wind Chill

Wind Chill Effect on Industrial Plants

Industrial plants, including electric generating stations, can nevertheless be affected by the accelerated rate of heat loss, or cooling, caused by air movement. During the hot summer months, this cooling effect can help prevent temperatures from exceeding equipment operating limits. For this reason, many plants in warmer climates are of an open-air design, without walls or enclosures. In the winter, however, the enhanced cooling from the unimpeded flow of air can cause freezing problems.

On cold days when the outside temperature drops below freezing, sustained high winds can quickly and continuously remove the heat radiating from boiler walls, steam drums, steam lines, and other equipment in an electric generating station, causing ambient temperatures to drop below freezing in spite of the heat being produced by the facility. If stationary water lines, such as those used for differential pressure measurement, are exposed to the wind under those conditions, they can freeze if they lack adequate freeze protection such as heat tracing and insulation. Wind screens and enclosures can slow the rate of heat loss caused by high winds, while at the same time acting to contain heat supplied by supplemental space heaters at critical locations.

Wind Chill Effect on Electric Demand or Load

The accelerated cooling effect of the wind affects buildings and homes throughout the community, and can significantly increase demand for electric power. In particular, buildings that are not well insulated, with frequently opened doors or drafty windows, can experience higher rates of heat loss on windy days, increasing the demand for heating energy.

During the February 2011 weather event, ERCOT engineers and operators concluded, based on archived historical data, that the forecasted wind speeds would significantly increase the load on the system. They therefore increased the conventional load forecast by 4000 MW to account for the added load created by high winds combined, with low temperatures.

Appendix: Winterization for Generators

Extreme cold weather can cause generators to fail for many reasons, including the failure or absence of heat tracing on key components, missing or inadequate wind breaks, inadequate insulation, lack of supplemental heating devices, human error, or inadequate training, maintenance, or preparation. As discussed below, effective winterization programs incorporate both physical components and operational processes to protect generating plants from freezing weather.

Physical Components of Winterization

Physical freeze protection is accomplished by three primary components:

- Heat tracing – the application of a heat source to pipes, lines, and other equipment that must be kept above freezing;
- Thermal insulation – the application of insulation material to inhibit the dissipation of heat from a surface; and
- Windbreaks – temporary or permanent structures erected to protect components from wind.

Generators use other temporary measures to prevent freezing in plants, including installing space heaters, draining non-essential water lines, and placing small heat lamps in cabinets.

Heat Tracing

Types of Heat Tracing Cable

Electric heat tracing involves the application of heat to the outside of pipes or other lines to maintain proper operating temperature. A heat tracing system is typically made up of the following: (i) heat tracing cable wound around the pipe; (ii) a thermostat that measures ambient air temperature; (iii) thermal insulation; and (iv) a power source. The failure of any of these components can result in frozen instrumentation.

There are five main types of heat trace cable. "Self-regulating" cable automatically increases power to produce additional heat as the temperature falls. It can be used on metal or plastic components for freeze protection, temperature maintenance, and foundation heating, and is typically found on sensing lines and other ancillary components. However, it cannot be used on surfaces that have high surface temperatures.

"Power-limiting" heat tracing is similar to self-regulating heat tracing in that it increases power and heat as temperatures drop, and decreases power as temperatures rise. It is specifically designed to produce high temperatures and to be used on high surface temperature fixtures.

"Parallel constant watt" heat tracing cable consists of a continuous series of short, independent heating circuits that maintain a consistent output of heat for up to several hundred feet. One benefit of this type of cable is that if one of the independent circuits fails, the rest of the cable will continue to operate. However, the length of the cable is limited, based upon the distance between the circuits, making it impractical for certain situations.

A "series constant watt" heat tracing cable is designed specifically for components that need longer circuit length. These cables are made of high-resistance wire that is powered at a particular voltage to generate heat. However, a break anywhere along the cable will result in failure of the entire heat tracing installation.

Another common type is "mineral insulated" heat tracing cable, which is typically used to maintain high temperatures, or in locations where it will be exposed to high temperatures. Mineral insulated cable is also used to provide heat over long distances, and is often used to protect high temperature steam lines.

Power Supply

Each heat tracing cable must be connected to a power source. In a typical installation, several cables covering one component of a generating unit will be connected to a freeze protection electric panel that contains circuit breakers or fuses for the various circuits. Depending on the size and layout of the generating unit, it may have dozens of freeze protection panels. These panels are often equipped with visual displays that indicate when the system is energized and when the heat tracing is activated. Images 1 and 2 are examples of the inside and outside of a new freeze protection panel.

Figure 1: Freeze Protection Panel Interior

Figure 2: Freeze Protection Panel Exterior

As can be seen in the example above, lights on the front of the panel indicate the status of the freeze protection system. Such indicator lights must be regularly monitored and tested by plant employees, since control room personnel are not always able to monitor panels remotely.

The failure of a freeze protection panel during cold weather can cause heat trace cables connected to that panel to fail. Failure to properly maintain or inspect the panel can cause corroded connections to go unnoticed and go unrepaired, possibly resulting in a short circuit that shuts off power to other panels.

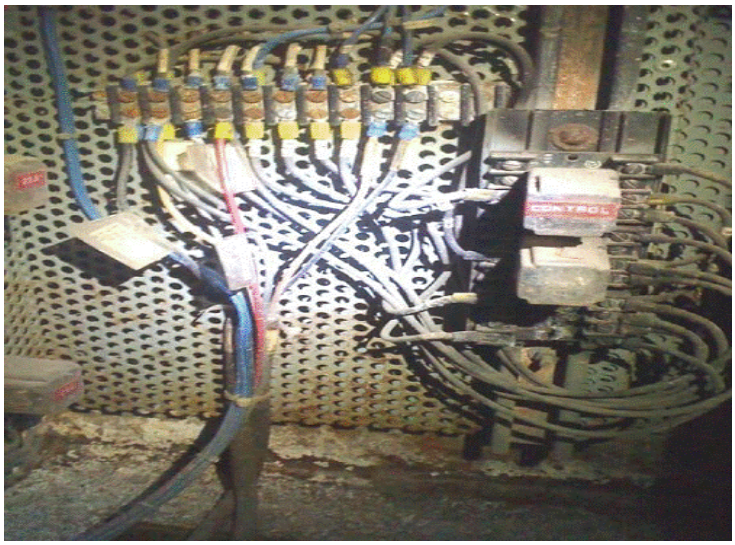


Figure 3: Corroded Freeze Protection Panel

Thermostats

Although the panel is always energized, heat tracing cables are turned on only when low temperatures call for freeze protection. Power to the cable is supplied either by a contactor (wherein two metal plates, usually separated, are pressed together to power the cables), or by a solid state controller. In most cases the system is turned on by a thermostat located at the panel. In some cases plants initiate freeze protection procedures at certain specific temperatures, and in some instances, the heat tracing must be turned on manually by plant personnel.

Thermal Insulation

A layer of thermal insulation is placed on top of the heat tracing that is installed on a pipe. This insulation is similar to home insulation, but is composed of different materials. A weatherproof skin is typically applied as an external layer to protect the insulation and heat trace from damage.

Figure 4: Insulated Piping with Heat Tracing

Thermal insulation plays a significant role in freeze protection, particularly in windy conditions, by preventing rapid heat loss. However, even small gaps in insulation have been known to result in frozen lines.

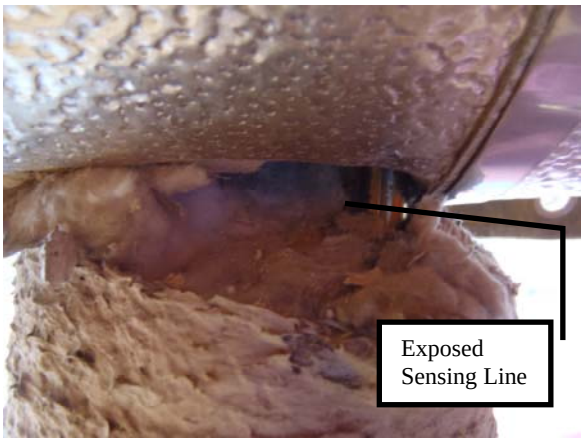

Figure 5: Gap in Insulation

In addition to the pipe itself, valves, flanges, traps and fittings should be insulated to the extent possible. Non-insulated valves, like those pictured below, can cause pipe to freeze if enough surface area is exposed to freezing wind conditions.

Figure 6: Exposed valves emerge from thermal insulation and are not heat traced

Windbreaks

The third major component to winterization is windbreaks. Windbreaks are temporary or permanent structures used to prevent wind from blowing directly over exposed components and dissipating heat at an increased rate.

Figure 7: Temporary windbreak created with scaffolding and tarpaulin

Other Winterization Efforts

In addition to the three major winterization techniques, generating stations sometimes use other freeze protection measures. These include keeping water flowing to reduce freezing, draining liquids from valves, purging drained lines of water with compressed air, and installing space heaters in enclosed areas to raise ambient air temperatures.

Winterization Processes

Although designing freeze protection systems for exposed areas is critical to cold weather operation, preparation for freezing conditions is equally important. In order to achieve good freeze protection, a generator must know what areas are likely to freeze, and must take steps to ensure that appropriate procedures are put in place. The following paragraphs describe some of the steps that can be taken to prepare for winter, and discuss how the proper use of checklists can help plant managers implement effective winterization measures.

Winter Preparation

Preparation for winter weather should begin well before its arrival, and many generator operators in Texas and the Southwest start their winterization programs in the fall of each year. These procedures include verifying that installed heat tracing is working, components are properly insulated, space heaters are operational, fuel switching can be initiated, and instrument systems are free of moisture. Many generators also verify that their inventory of freeze protection equipment – such as heat lamps, heat guns, propane torches, tarps, de-icing

material, fuel, insulation, sand, and extension cords – is adequate for the upcoming season. Timeliness is an important aspect of pre-winter preparation – it should begin early in the season so that there is time to make necessary repairs before cold weather hits.

In addition to pre-season preparation, generating stations typically have a set of procedures that are initiated whenever a winter storm is expected. Much of the work that is done before a storm arrives is similar to pre-season preparation. However, the pre-storm procedures may include calling in additional operators and maintenance personnel, moving motor vehicles into garages, draining non-essential water lines, and moving portable heaters into position.

As winter weather sets in, generating stations may adjust their operations to protect against freezing conditions. Such changes may include switching instrument air to nitrogen backup, warming up standby boilers every two hours, opening bypass valves on steam traps, and rotating pumps every two hours.

A critical component of winterization plans is the opportunity for post-winter critiques and reports on lessons learned. Applying lessons learned is sometimes done informally but some generators go further, requiring plant managers to conduct post-winter meetings to identify necessary improvements and to file written reports on the plant's performance during the winter season.

Checklists

In order to ensure that all of the plant-specific tasks are properly completed, many generator operators create checklists for plant personnel to follow. Although the form of such checklists may vary depending on the size of the plant and the types and locations of the generating units, effective checklists tend to have certain characteristics.

Good checklists are sufficiently detailed to allow plant operators and maintenance personnel to adequately prepare for and deal with cold weather events. For example, a checklist may specify who is responsible for assigning personnel to freeze protection duty, or may identify specific tasks triggered by different freeze alert levels.

A checklist can be broken down not only by task, but also by area and by individual components or areas to be checked. For example, the checklist can specify which particular lines should be drained and which vents should be closed.

Appendix: Winterization for Generators

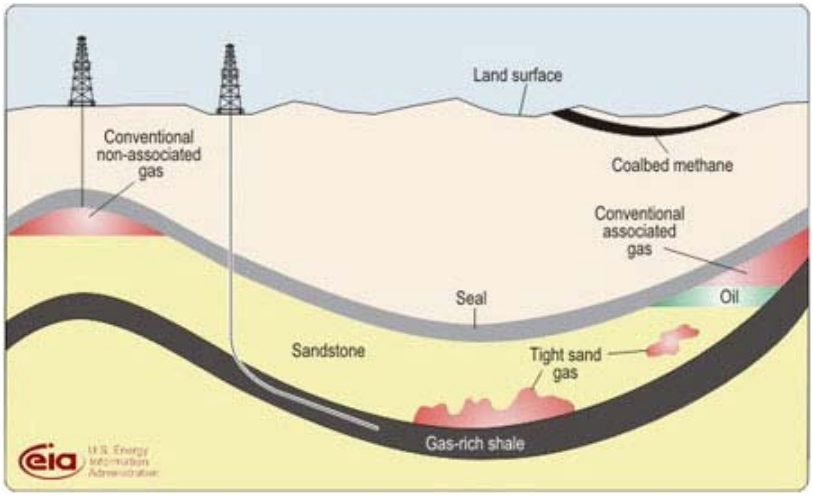
A list that is lacking in detail and that only includes general tasks such as turning off vent fans or checking boiler and duct air heater enclosures will not be effective. Plant employees might understand which components should be included in such general references, but non-specific descriptions are inadequate to ensure that all systems are identified and checked.

Checklists can also offer generating stations the ability to audit their performance in implementing winterization. A common feature of effective checklists is a requirement that employees initial and date the checklist for each task completed. Not only does this provide confirmation that the tasks were completed, but it also holds operators and maintenance staff accountable for their performance.

Appendix: Natural Gas – Production and Distribution

What Is Natural Gas?

Natural gas is a highly compressible, naturally occurring mixture of hydrocarbons, principally containing methane, that migrate upward through geological formations until the migration is halted by a physical barrier that allows the natural gas to accumulate in the small pore spaces within a geological formation, or reservoir. The physical barrier is a non-permeable formation that is known as a reservoir seal or caprock. The type of formation where the natural gas can accumulate, which can include sandstone, coal as well as shale, depends upon the location of deposition of the original organic material and the geologic formations that lie above. To access the natural gas that has accumulated within the reservoir, drilling companies will drill down to the formation using drilling rigs that punch into the formation using drill bits and long string pipes to bring the natural gas to the surface at the well site.



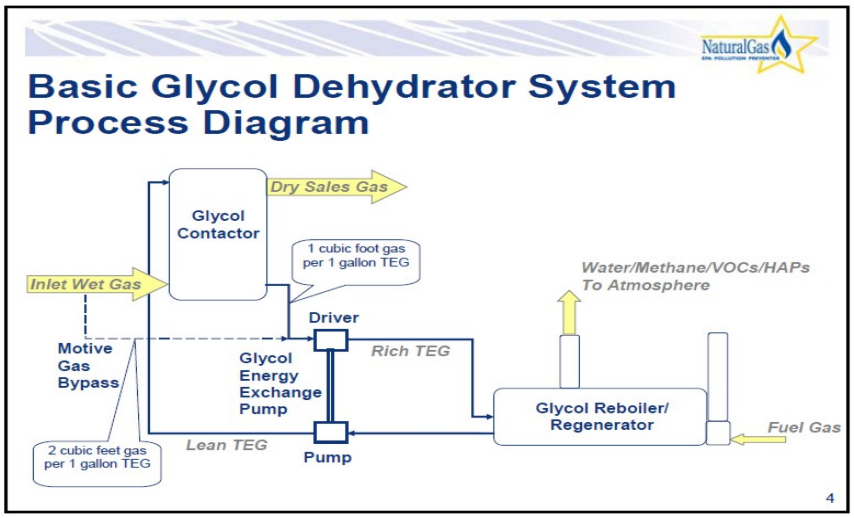
(Energy Information Administration)

While in the ground, the natural gas is under high pressure. When these formations are produced, the natural differential in pressure, between the high pressure in the formation and lower pressure at ground level, can provide the driving force to move the gas to the surface. The company in charge of producing the natural gas, by allowing the natural gas to flow from the subsurface formation up to the surface, will drill several wells to maximize its ability to produce the natural gas while maintaining the integrity of the reservoir within the geological formation to ensure a long and active production life.

As part of the natural gas stream that reaches the surface and is produced from the wellhead, there are many other gas constituents other than methane. Heavier hydrocarbons, such as ethane, propane, butane, and pentane plus, are also produced along with the methane-rich gas stream. After production, these heavy hydrocarbons or natural gas liquids (NGLs) can be removed through processing and sold separately from the natural gas. Other gases, such as hydrogen, carbon dioxide, nitrogen, oxygen, sulfur, and hydrogen sulfide, are also produced, and most of the gases will be removed from the

natural gas stream through the use of treating plants. Unlike NGLs, some of these gases are undesired impurities with little or no commercial value.

Another common byproduct of natural gas production is water. Just as natural gas can migrate through geologic formations and into reservoirs, water and crude oil can follow the same process. Water that accompanies natural gas is removed through the use of dehydration facilities located at or near the wellhead.[1] The water is then commonly injected back into the outer limits of the reservoir's geological formation to help produce additional natural gas from the reservoir by displacing the natural gas from the pore spaces within the geologic formation and push the natural gas toward the producing wells. Unless water is removed from the gas stream, it can freeze in the pipeline and stop the flow of gas from the wellhead.



(Environmental Protection Agency)

Over time, multiple wells are drilled into the formation in order to maximize production of natural gas in the reservoir. After each well is tested and examined by the production company, the wells are connected through a series of pipelines increasing in diameter as more gas is gathered and transported through the gathering pipeline.

[1] The dehydration of natural gas usually involves one of two processes – absorption or adsorption. Absorption occurs when the water vapor is taken out by a dehydrating agent. Adsorption occurs when the water vapor is condensed and collected on the surface. The absorption process requires a chemical with an affinity for water, such as glycol, which is the most commonly used dehydration agent. After absorbing the water, the glycol falls out of solution to the bottom of the tank where the water-rich glycol is removed. The adsorption process is a physical-chemical process in which the gas is concentrated on a surface of a solid or liquid to remove the impurities. Natural Gas Supply Association, Processing Natural Gas, *available at* http://www.naturalgas.org/ naturalgas/processing_ng.asp (last visited Aug. 5, 2011); Saeid Mokhatab, William A. Poe & James G. Speight, Handbook of Natural Gas Transmission and Processing 262 (Elsevier 2006).

Depending upon the impurities in the natural gas stream, the pipeline will funnel the natural gas stream to processing and treatment plants. The treatment plants are used to remove impurities and other objectionable material usually before the natural gas stream is transported to the processing facilities.

The natural gas stream often contains other contaminants that must be removed before the natural gas stream is delivered to downstream pipelines. Some of these contaminants are hydrogen sulfide, carbon dioxide and other sulfur-based impurities, which are sometime referred to as "acid gas."[2] When hydrogen sulfide combines with water in the natural gas stream, sulfuric acid forms. Similarly, carbon dioxide that combines with oxygen forms carbonic acid. These acid gases can cause damage which, if left unchecked, could lead to pipeline failure.[3]

The processing plants typically remove NGLs through a refrigeration process that involves a form of rapid cooling of the natural gas stream. Two types of this cooling process are mechanical refrigeration, as used in lean oil absorption, and turbo-expander or cryogenic process. The technology used will depend upon the age of the processing facilities as well as the desired result. Mechanical refrigeration is a process whereby the natural gas stream is chilled by a vapor compression refrigeration process, similar to the process used by a refrigerator or an air conditioner, but producing much colder temperatures. This is coupled with the use of glycol as an absorption fluid that combines with the NGLs and falls out of the gas stream. In the cryogenic process, the high pressure natural gas stream is rapidly expanded by decreasing the pressure. This process causes the gas stream to cool rapidly (Joule-Thomson Effect)[4] to temperatures that will cause the NGLs to move from a gaseous phase to a liquid phase. The NGLs fall out of the gas stream and are collected for sale and additional processing. The residual gas, from which the NGLs have been removed, is transferred to a downstream pipeline for transmission to end users. Both of the above processes are effective means for recovering NGLs and for reducing the possibility that NGLs will condense and fall out of the gas stream as liquids that could cause damage to downstream equipment.

[2] Natural gas containing hydrogen sulfide is considered "sour" gas while natural gas without hydrogen sulfide is considered "sweet" gas. *Id*. at 261.

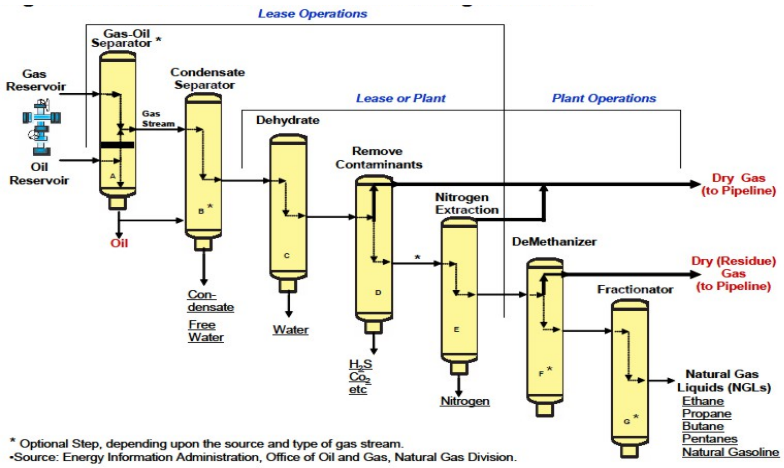
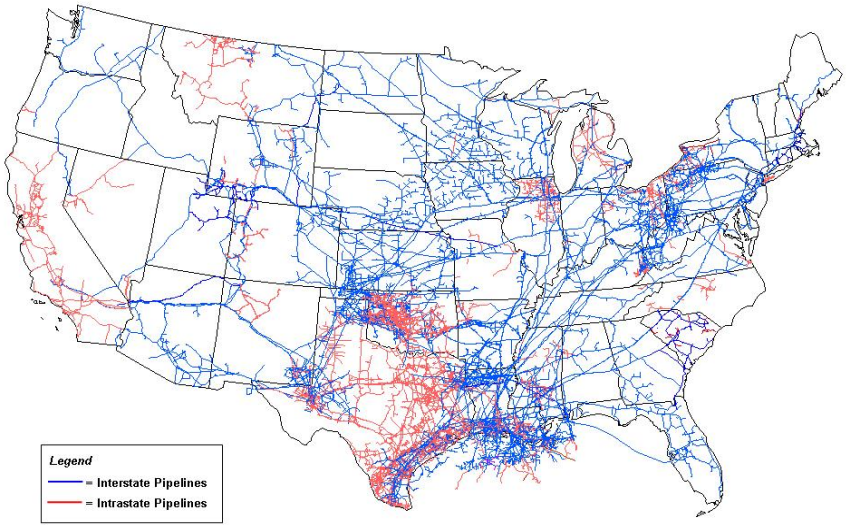
[4] Joule-Thomson Effect is the change in temperature or cooling effect resulting from the rapid expansion of pressurized natural gas through a valve.



After treating and processing, the natural gas can be transported to market centers by the intrastate and interstate pipeline system. This network is made up of more than 210 pipeline systems with over 305,000 miles of varying diameter pipeline, 1,400 compressor stations, and 400 underground storage facilities, all connecting the various natural gas production areas, both onshore and offshore, to multiple markets throughout the United States.[5]



Source: Energy Information Administration, Office of Oil & Gas, Natural Gas Division, Gas Transportation Information System

Types of pipeline systems

The interstate pipelines can divided into two types of systems – long-haul and reticulated. Long-haul pipelines receive natural gas supplies from producers and

[5] U.S. Energy Information Administration, *About U.S. Natural Gas Pipelines – Transporting Natural Gas, available at* http://www.eia.doe.gov/pub/oil_gas/natural_gas/analysis_publications/ngpipeline/index.html (last visited July 20, 2011).

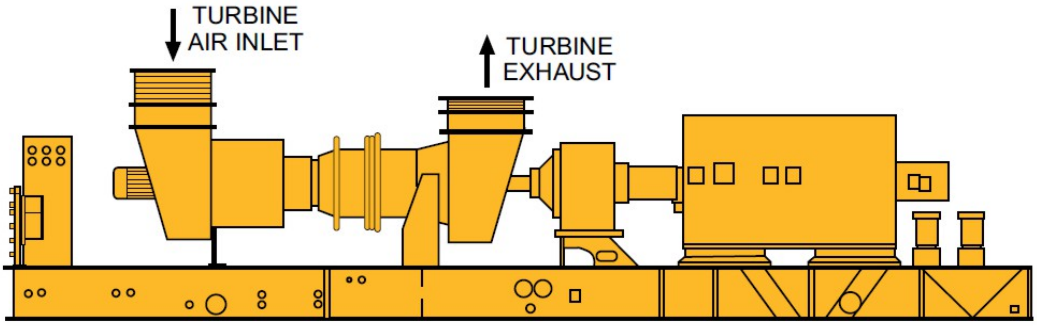
processors and transport it across hundreds of miles to market areas outside the production areas. Reticulated pipelines resemble a spider web that overlays both the supply areas and the market areas, and typically have multiple lines that can change direction of gas flow through the system, depending upon market needs.

Pipeline Design

A natural gas pipeline system can be as simple as a single diameter pipe receiving gas from one source and transporting it to a single delivery point, or as complex as a network of multiple diameter pipes covering hundreds of miles with compressor stations, storage facilities, and numerous receipt and delivery points. In order to move natural gas supplies from the supply areas to the market areas, a pipeline must be designed to transport the required volume of gas supplies, while maintaining system pressures along the length of the pipeline necessary to serve its shippers.

The design of all pipeline systems starts with the same basic idea, the need to transport a specific volume of natural gas from at least one supply source to a specific destination while maintaining contractual delivery pressure obligations. Due to frictional loss resulting from the gas flow, the pressure of the gas stream will decrease. Compressor stations are designed to re-pressurize the gas stream in order to overcome the pressure losses associated with movement of gas in a pipeline. Compressor stations are above-ground facilities where the pipeline connects with large individual compressor units through various smaller pipelines or “yard piping” as well as meter and regulation equipment. Compressors are mechanical devices that increase the pressure of the gas stream. After the gas stream has been re-pressurized, the gas re-enters the pipeline for further transmission to downstream markets. Compression facilities are needed along the length of the pipeline, and are typically placed at 40 to 60 mile intervals.

Compressors are split into two basic parts, the compressor and the driver, or motor. The motor, which can be fueled by electricity or gas-fired, powers the compressor unit that compresses the gas. The two types of compressors that are most commonly used by the interstate natural gas companies are centrifugal and physical displacement or reciprocating compressors. Centrifugal units are turbines that spin at high rates of speed to compress and accelerate the gas stream. These compressors are used to accommodate high flow rates at high pressures. Most interstate pipeline systems use centrifugal compressor units on their mainlines. The following is an illustration of a centrifugal compressor and gas-fired motor.



(Solar Turbines Incorporated (a Caterpillar Company))

The gas stream enters the inlet or suction side of the compressor unit, where it is forced through the rotating turbines at high speed and exits the compressor at the discharge side, moving back into the transmission pipeline. With gas-fired compressor motors, a small amount of natural gas is funneled from the gas stream at the suction side to provide fuel for the motor.

Reciprocating units increase the pressure of the gas stream by compressing or reducing the volume of the gas through the use of pistons within a cylinder similar to the pistons in a car engine. These compressors can be found on interstate pipelines' mainline systems, which need to compress gas volumes with greater pressure differentials. Storage facilities also utilize reciprocating compressors to inject gas supplies received from pipeline systems at pressures ranging from 500-1,000 psig, into storage caverns at pressures that can exceed 2,000 psig. Just like the motors used by gas-fired centrifugal compressors, a small amount of natural gas is taken from the gas stream to provide fuel.

Line pack

Line pack is the volume of gas in the pipeline at a given point in time. Pipeline operators use line pack to maintain system operating pressures while accommodating the system's highly variable load requirements.

Most gas supplies enter a pipeline system at a relatively even hourly rate, or about 1/24th of the total amount of gas per hour (4.17 percent per hour) for the entire day, also known as "steady-state" conditions.[7] On the demand side, deliveries rarely leave the system at an even hourly rate. Deliveries are not constant primarily due to variations in demand caused by inlet and outlet flow changes, non-performance of receipt or delivery points, scheduled or unscheduled maintenance, and compressor startups and shutdowns.[8] Flow conditions that vary over time are known as transient flow conditions. Depending upon the flexibility provided by the interstate pipeline within its tariff or contract with the customer, the hour rates for gas delivery could be 5 percent and even up to 8 percent per hour. These hour rates are equivalent to a 20 hour to a 12.5 hour day, or simply stated, the customer can take the entire scheduled and confirmed quantity of gas for the entire 24-hour gas day in as little as 20 to 12.5 hours. Managing these transient loads could not be done without actively managing system line pack.

In order to prepare for the upcoming gas day, the pipeline operator will increase system pressures by increasing the use of available compression horsepower at compressor stations strategically located along the pipeline system. The increase in pressure will allow the pipeline operator to "pack" the pipes with additional gas from other portions of the pipeline system located closer to the supply points. Further, depending upon demand forecasts for the upcoming gas day, customers will often increase their receipts in order to ensure that they will be able to meet their load requirements. Unlike electricity, which is added to the transmission lines instantaneously, natural gas must be physically moved through the pipeline from the supply areas to the market areas for delivery. Depending upon the length of the pipeline system, this physical transportation of gas from the supplier to the end user can take days. Most interstate pipeline systems move gas at speeds between 20 and 30 mph. If the pipeline has its origin in the Gulf of Mexico and the destination is the New York City market area, 1,500 miles away, the gas will need roughly two days to travel that distance

[7] Steady-state flow conditions exist when the gas volumes both received into and delivered out of the pipeline system are equal at every moment in time while the pipeline is operating at a constant pressure and temperature. For example, a pipeline is said to operate under steady-state conditions when 1/24th of the gas volumes are entering the system every hour while simultaneously 1/24th of the gas volumes are leaving the pipeline system every hour. Gas volumes going into the system must equal the gas volumes leaving the system to be considered steady-state conditions.

[8] Saeid Mokhatab, William A. Poe & James G. Speight, Handbook of Natural Gas Transmission and Processing 414 (Elsevier 2006).

at 30 mph. This is why it is critical for pipeline systems to receive gas supplies nominated, scheduled and confirmed in order to replace the system line pack in a timely manner.

Maximum Allowable Operating Pressure

The Maximum Allowable Operating Pressure (MAOP) is one of the many design assumptions that will limit either a pipeline's design capacity or peak day capacity. The MAOP, which represents the maximum pressure at which a pipeline may operate its system,[9] is an operational or safety-based constraint that protects the integrity of the pipeline system while defining an upper capacity limit. As such, the MAOP will act as a physical constraint[10] that the pipeline companies' system design engineers must address with each pipeline expansion project before the Commission.

When a pipeline company files an application to add a new service or to expand its existing facilities, it will look to the Commission's regulations (18 C.F.R. § 157.14(a)(7)-(9)(vi)) for guidance. Under these regulations, the pipeline company is required to provide to the Commission flow diagrams reflecting "Daily Design Capacity" and "Maximum Capabilities" for both its existing and proposed facilities. Currently, most of the interstate pipeline companies justify the need for facility augmentation through the use of a steady-state model of their respective systems while operating under design peak day flow conditions. These models are designed to meet the pipeline's firm contractual obligations while maintaining: (1) the volumetric requirements of its existing firm shippers; (2) the minimum contractual delivery pressure obligations; (3) controlling pressures located at critical points on their system; and (4) the full utilization of the existing available capacity through the use of all available compression horsepower along the path of the new service.

Implicit in the pipeline companies' design process is the need to maintain actual operating pressures at or below the MAOP in order to maximize throughput levels on their respective systems. From the design perspective, this is a relatively simple task. In most cases the pipeline's design capacity is based upon maximum utilization of compression facilities while transporting gas volumes between primary contractual

[9] In its November 14, 2002 comments in Docket No. PL02-9-000, the Office of Pipeline Safety (OPS) stated that the purpose of setting regulatory standards for determining pipeline MAOP is to "prevent pipeline failure that could result from excess operating pressure, startup and shutdown." OPS defines MAOP as the maximum pressure at which a pipeline or pipeline segment may operate. The Office of Pipeline Safety, Comments in Response to Open Forum at the Natural Gas Markets Conference Oct. 25, 2002, Docket No. PL02-9-000 at 4 (filed 11/14/2002); s*ee also* 49 C.F.R. § 192.3.

[10] Physical constraint, or pipeline bottleneck, is a point on a system where the existing facilities are inadequate to accommodate 100 percent of the flowing capacity of the upstream pipeline facilities.

receipt and delivery points. Under these specific design assumptions, maintaining operating pressures at or approaching the MAOP will ensure that existing shippers will receive their gas requirements.[11] However, as previously discussed, the changing load requirements and the capacity release market could potentially reduce the pipeline's ability to maintain optimum operating pressures to meet new demands on its system if the new loads are not proximate to the traditional markets. The potential impact of new markets could reduce the operational flexibility of the pipeline by reducing the operating pressure. If the pipeline cannot maintain historical operating pressures that are necessary to meet the requirements of its shippers, the throughput capacity of the pipeline will be reduced.

[11] Scheduled and unscheduled maintenance is not incorporated into the pipeline's design capacity. As a result, required maintenance will reduce the pipeline's ability maximize throughput capacity and could prevent the pipeline from meeting its firm contractual requirements.

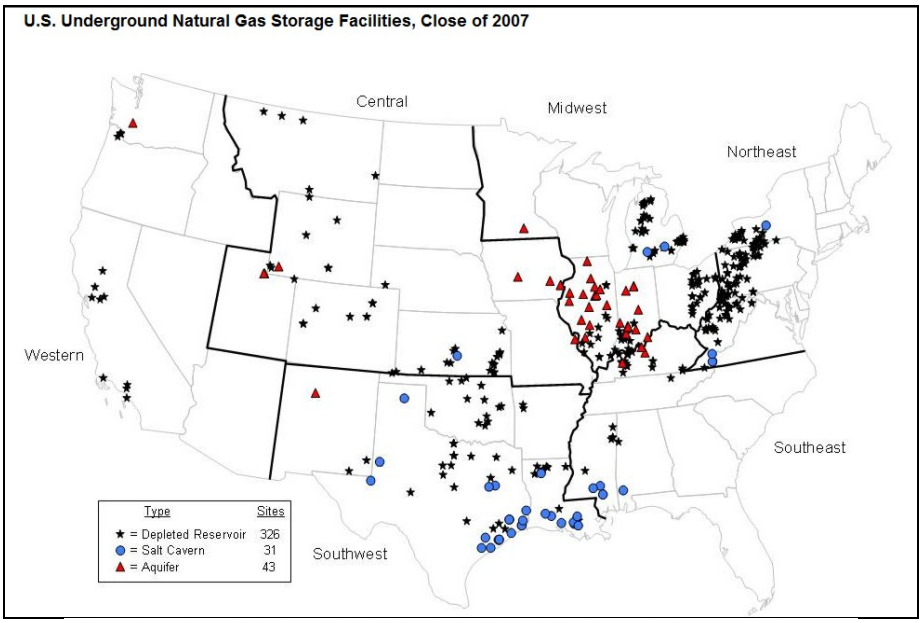
Appendix: Natural Gas Storage

Natural gas, like many other sources of energy, can be stored during periods of low use and called upon during periods of greatest demand. There are over 400 underground storage facilities, eight LNG import facilities and over 100 LNG peaking facilities located throughout the U.S.[1]



Source: Energy Information Administration, Office of Oil & Gas, Natural Gas Division Gas, Gas Transportation Information System, December 2008.

Base load vs. Peak load Storage Facilities

Storage facilities are designed to meet either base load or peak load requirements. Base load storage is designed to meet seasonal demand that exceeds the average deliverability of the pipeline system. Base load storage facilities have sufficient capacity to meet the long-term seasonal demand requirements for the pipeline's market areas. Historically, these storage facilities were used by the pipeline's customers to inject natural gas supplies into the storage facility during periods of low system use, such as the non-heating season (when gas prices are low), which typically runs from April 1 through October 31. These gas volumes were then withdrawn to meet base load requirements during the heating season, which usually runs from November 1 through March 31.[2]

[1] United States Energy Information Administration, *About U.S. Natural Gas Pipelines – Transporting Natural Gas, available at* http://www.eia.doe.gov/pub/oil_gas/natural_gas/analysis_publications/ngpipeline/index.html (last visited July 20, 2011).

[2] This trend has changed in the last decade as newer and more efficient natural gas-fired electric generation facilities have replaced higher emission oil-burning facilities. As a result, more natural gas is needed during the spring and summer months to meet increased electrical demand for the summer cooling season. Now, instead of having one peak season, market areas served by some pipelines may have two peak periods, during both the summer and winter months.

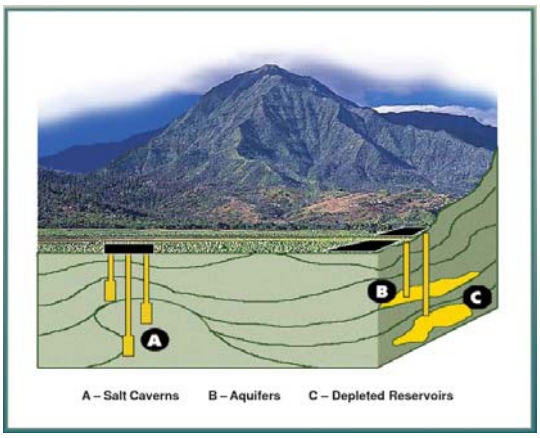
Base load storage facilities are usually large depleted oil or gas reservoirs that have relatively low withdrawal rates. They can provide a steady flow of natural gas and typically have turnover rates of once a year due in part to the length of time necessary to replenish the gas supplies. Depleted gas reservoirs are the most common type of base load storage facilities.

Peak load storage facilities, on the other hand, are designed to operate at high rates of withdrawal. These facilities are used to meet peak load requirements that can call for large amounts of gas over short periods of time. Peak load facilities are much smaller than base load facilities but can be quickly replenished – in some cases within days or weeks.

Different Types of Underground Storage Facilities

Three types of reservoirs or geological formations are used as underground storage facilities – aquifers, depleted reservoirs, and salt caverns. All of these formations must be developed or reworked in order to create the space necessary to provide the storage service. Natural gas is injected slowly into the formation through the use of compression facilities in order to build up the reservoir pressure necessary to allow the natural gas to flow freely from the storage facility directly into the downstream pipeline systems. Toward the end of the withdrawal season, when the prevailing reservoir pressures fall below the operating pressures of downstream pipeline systems, compression equipment that was used to inject gas volumes into storage is used to re-pressurize the gas stream so that gas from storage can be moved downstream into the pipeline systems.

Not all of the natural gas in storage facilities can be withdrawn. In order to maintain the integrity of the formation and to prevent migration of water into the reservoir, some natural gas must be left in the reservoir. This is typically called “base gas” or “cushion gas.” Similar to line pack in a natural gas pipeline, base gas is the volume of gas left in the reservoir to provide the pressure needed to extract the remaining gas. The gas that is withdrawn from the storage field is referred to as “working gas.” The amount of working gas within the reservoir represents the storage capacity of the facility.



Types of Underground Natural Gas Storage Facilities (FERC)

Depleted Reservoirs

Depleted gas reservoirs are the most commonly used formations for storage reservoirs. These formations are formerly producing gas reservoirs that have had all of the economically recoverable natural gas extracted, and which can be readily converted from production to storage. However, to maximize the usefulness of the facility, the reservoir should be located near a market area (for base load or peaking facilities) or a supply area, (to supplement supply when production is interrupted). The reservoir also must be located near a mainline pipeline facility. Most depleted gas reservoirs are located in production areas, leaving aquifers and salt caverns as the only option for storage development in other areas.

Aquifers

Aquifers are underground porous, permeable rock formations that act as natural water reservoirs. A porous rock formation has small spaces between the grains of rock where natural gas, oil and water can be found. A permeable formation is one where liquid can flow through small channels that connect the small pore spaces within the formation. Aquifers are the least desirable and most expensive types of natural gas storage facilities for the following reasons:

- The geological formations are not as well known as depleted reservoirs, which are explored during the development and production process. Accordingly, there is a significant cost associated with developing and studying the geological characteristics of an aquifer in order to determine its suitability as a storage reservoir.

- Aquifers do not have in place the facilities and equipment associated with a producing gas reservoir, such as extraction equipment, pipelines, dehydration facilities, and compressors. Aquifers may also produce large

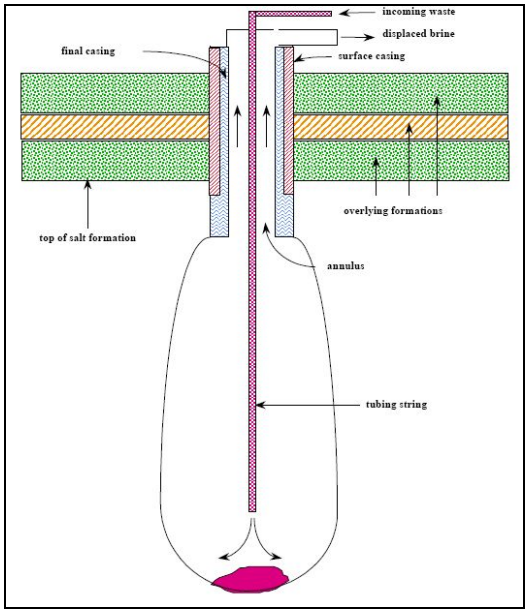
volumes of water as natural gas is withdrawn from storage, increasing costs.

- Development of an aquifer as a gas storage facility can take twice as long as development of a depleted reservoir facility.

Salt Caverns

A salt formation is a naturally occurring deposit of salt that may exist in two forms: salt domes and salt beds. Salt domes are formations that have migrated through sedimentary geological formations to form large domes of salt. These domes can be a mile wide and 30,000 feet thick. Salt domes most often used as salt caverns are generally found about 6,000 feet beneath the surface. Salt beds are not as thick or as deep – these formations are usually less than 1,000 feet thick and are less stable than salt domes, but both formations are well suited to natural gas storage.

Salt Cavern Underground NG Storage Reservoir
(Energy Information Administration)

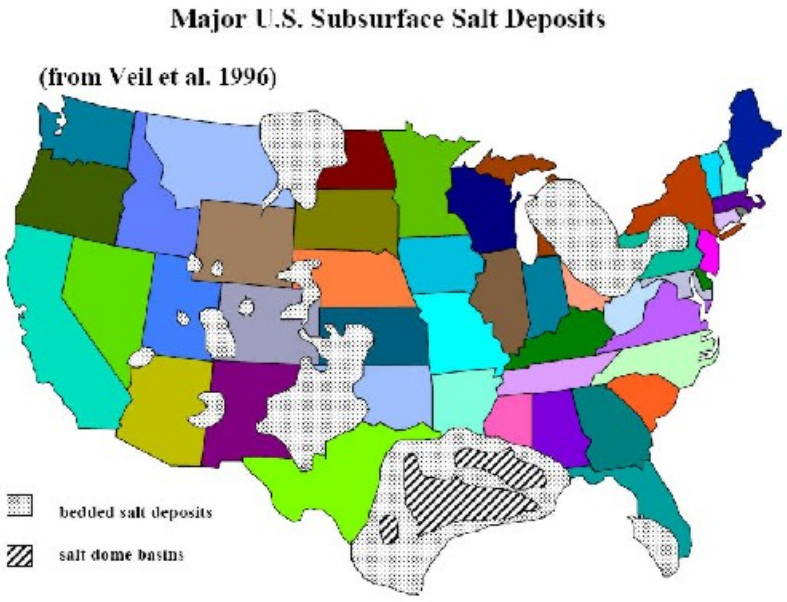


Salt Cavern Leaching
(Oregon National Laboratory)

Salt caverns are developed by drilling into the salt formation and circulating large amounts of water under high pressure to dissolve and extract the salt, leaving a large void. This process is known as "salt cavern leaching."[3] Once created, the salt cavern offers an underground vessel-like structure that can provide very high rates of delivery.

[3] Salt Cavern Storage, *What is Salt Cavern Storage? available at* http://www.saltcavernstorage.com/what-is-salt-cavern-storage.html (last visited July 20, 2011).

Salt caverns provide another operational benefit, in that they can operate with less base gas than depleted reservoirs and aquifers.



(Oregon National Laboratory)

Because salt cavern storage reservoirs are typically much smaller than depleted gas reservoirs, they cannot hold the volumes necessary to meet base load storage requirements. However, because the deliverability of the salt caverns is typically much higher, gas stored in these facilities can be more quickly withdrawn and replenished than gas stored in any other type of facility.

LNG and LNG Peak Shaving Facilities

Liquefied natural gas (LNG) is natural gas that is stored and transported in liquid form at -260 degrees Fahrenheit. In liquefied form, the gas volume is reduced by a factor of 610. This reduction in volume makes the transportation and storage of liquefied natural gas more practical.

In order to introduce LNG into the pipeline system, the LNG must be warmed and re-gasified. This is done at specially built re-gasifier terminals attached directly to the interstate pipeline grid or to LDC distribution systems.

LNG can also be produced on a much smaller scale at liquefaction facilities, which receive natural gas directly from the pipeline system, convert it to liquid form, and store it in above ground facilities until needed to meet peak load requirements. These facilities are referred to as “peak shaving” plants.

Appendix: Natural Gas Storage

LNG Peak shaving plant (Energy Information Administration)

Appendix: Natural Gas Transportation Contracting Practices

Interstate natural gas pipeline rates for transportation of natural gas may be based on distance transmitted (zone matrix) or on a "postage-stamp" basis, where all consumers pay the same rate regardless of distance transmitted. Natural gas pipelines' tariffs may contain rates based on a function of the volume reserved for a particular buyer (a set capacity charge) and a variable based on the pipeline volume actually consumed by the buyer (a commodity charge). Gas is sold by unit of energy, not by volume. Prices are usually stated in price per unit of energy, such as dollars per million British thermal units (Btu), rather than price per unit volume, such as dollars per thousand cubic feet (Mcf). Interstate natural gas transportation tariffs are often priced per thermal unit or energy unit, not on a volumetric basis.

The wholesale market is composed of both the natural gas commodity market and the transportation market. Since 1984, when FERC Order No. 436 was issued, large numbers of industrial customers, electric generators, and end use customers have been buying gas from parties other than the pipelines or LDCs. After the issuance of FERC Order No. 636 in 1992, the industry witnessed a dramatic growth in the use of marketers to provide gas, arrange transportation, or provide both services to LDCs, industrials, retail users, and electric generators.

Gas customers use marketers in a variety of ways. LDCs, which hold firm transportation rights on a single pipeline, can use the marketer to obtain and deliver gas to an interconnect point on that pipeline, and the LDC can use its firm transportation service to deliver that gas to its citygate delivery point. Other customers, such as industrials, may employ a marketer to acquire gas and interstate transportation service to deliver the gas to the industrial's citygate delivery point. Increasingly, marketers are offering additional services to customers such as asset management services, where the marketer manages capacity for LDCs, as well as providing price hedging, financing, and risk management services.

The transportation market also has developed to provide shippers with alternative means of acquiring capacity. Shippers can choose either short or long-term services from the pipeline or can acquire capacity from other shippers through the capacity release mechanism.

The use of released capacity has made possible the development of virtual pipelines. A virtual pipeline can be created when a marketer or other shipper acquires capacity on interconnecting pipelines and schedules gas supplies across the interconnect, creating in effect a new pipeline between receipt and delivery points not on a single pipeline company's system.

Nominations, Confirmations, and Scheduling

The North American Energy Standards Board (NAESB) is an independent, industry-supported entity whose primary purpose is to set business standards across the industry. The Commission's standards relating to nominating, confirming, and scheduling gas across the interstate pipeline system were developed by industry representatives in conjunction with NAESB. The nomination, confirmation, and scheduling processes control the movement of gas across the interstate pipeline system.

Nominations

A nomination is a request for service under any transportation agreement by a gas purchaser (referred to as the shipper) to transport gas from a specified receipt point to a specified delivery point over a specific time period. In short, a nomination is the request for space in a pipeline to ship gas. Pipelines use the nomination process to coordinate and reconcile gas from different shippers on their pipelines.

A shipper purchases capacity on a pipeline by entering into a service agreement with that pipeline. For example, a shipper may have a firm transportation agreement with Pipeline A for 100,000 dekatherms (DTH) per day of service. Since the agreement is firm in nature, as opposed to interruptible, the shipper pays for that full capacity whether it uses it or not, and has priority for that capacity on the pipeline.

On a given day, the shipper may not need the full 100,000 DTH of capacity, but might need, for instance, 75,000 DTH to meet its needs. The shipper will thus nominate 75,000 DTH for that day, and the pipeline can then schedule the unused 25,000 DTH of available pipeline capacity to another shipper as interruptible transportation.

The industry-standard gas day begins each day at 9:00 AM central time, and runs for 24 hours. In order to standardize nominations across the interstate pipeline system, FERC has implemented four time cycles where shippers may nominate gas (or change their nominations) over the course of each gas day. These nomination cycles follow the NAESB standards. While this is the minimum number of nomination cycles that a pipeline must have in its tariff, some pipelines offer more nomination options.

The first of the four standard nomination times is the "timely nomination cycle." Under the timely nomination cycle, shippers must make their nominations

by 11:30 AM the day before the gas is to flow. The pipeline will acknowledge receipt of the nomination by 11:45 AM and will issue its final confirmations by 3:30 PM and post scheduled quantities by 4:30 PM. Gas under the timely nomination cycle will flow at 9:00 AM the following morning, which is the beginning of the gas day.

The second nomination cycle – which also occurs prior to gas flow – is the "evening nomination cycle." Shippers must make their nominations for this cycle by 6:00 PM the day before gas flows, and the pipeline will acknowledge receipt of the nomination by 6:15 PM, issuing its final confirmations by 9:00 PM and posting scheduled quantities by 10:00 PM. Gas under the evening nomination cycle will flow at 9:00 AM the following morning. During the evening nomination cycle, the firm shipper can adjust his nomination to his full contractual capacity for the next day, taking precedence over, or "bumping," an interruptible shipper's nomination.

The two remaining cycles are known as intra-day nomination cycles, since they occur while gas is flowing during the same gas day. Under the intraday 1 nomination cycle, shippers must make their nominations by 10:00 AM on the gas day. The pipeline will acknowledge receipt by 10:15 AM, issue its final confirmations by 1:00 PM, and post scheduled quantities by 2:00 PM. Gas under the intraday 1 nomination cycle will flow at 5:00 PM on that gas day. The same bumping procedures apply to the intraday 1 nomination cycle. The intraday 1 nomination cycle is the first opportunity for shippers to adjust their gas flows during the gas day.

For the intraday 2 nomination cycle, shippers must make their nominations by 5:00 PM, and the pipeline will acknowledge receipt of the nomination by 5:15 PM, issue its final confirmations by 8:00 PM, and post scheduled quantities by 9:00 PM. Gas nominated under the intraday 2 nomination cycle flows at 9:00 PM on the same gas day.

Bumping rights do not apply to the intraday 2 nomination cycle. FERC implemented this no-bumping rule for the intraday 2 nomination cycle because shippers bumped this late in the gas day would be unlikely to be able to arrange alternative transportation.

Confirmations

Once a nomination is received by the pipeline or the party providing the requested service, the nomination must be confirmed. The confirmation process verifies that (a) the shipper agrees to supply the nominated quantity to the pipeline

for transportation, and (b) the pipeline agrees to transport the nominated quantity, based on the availability of capacity. The confirmation process provides a degree of assurance to the parties that gas will be delivered, and is also important for record keeping purposes.

Scheduling

For each nomination cycle, once the shippers nominate gas on a particular pipeline, it is the pipeline's responsibility to schedule the gas. Scheduling refers to the process by which nominations are consolidated by receipt point and by contract, and verified by upstream and downstream parties. If there is enough capacity to accommodate all nominations, then all nominated quantities will be scheduled. If the nominated capacity exceeds the available capacity on a pipeline, quantities will be allocated according to what is referred to as scheduling priorities. Shippers with a higher priority service will receive their capacity before shippers with a lower priority service.

Scheduling priorities for each pipeline are set forth in that pipeline's tariff. Although scheduling priority specifics may differ from pipeline to pipeline, all follow a general priority model. In general, primary firm shippers are given highest priority. Firm shippers are shippers that have entered into firm transportation agreements with pipelines. Firm shippers reserve a volume of capacity on a pipeline and pay for that capacity whether they use it or not. Each transportation agreement specifies a primary receipt and delivery point for service under the agreement. In some cases, the agreements may set forth multiple primary receipt and delivery points that can be used. When the shippers take service under the primary receipt and delivery points set forth in the agreement, they are considered primary firm shippers, and receive the highest priority of service.

In general, secondary firm shippers are given the second highest service priority. Under FERC policy, shippers may use receipt and/or delivery points for service other than the primary points set forth in their agreements, but only if capacity is available at those points. These alternate points are referred to as secondary points. In general, when a firm shipper takes service under secondary receipt and/or delivery points, that shipper no longer has the highest priority of service, but rather the second highest service priority. These secondary firm shippers get their gas scheduled after the primary firm shippers.

Interruptible shippers are generally given the third highest priority service. Interruptible service is service that is not guaranteed. Whereas firm shippers pay for the capacity whether they use it or not (and are given highest priority on that

capacity), interruptible shippers only pay for transportation capacity when it is used.

Pipelines implement various methods for allocating interruptible capacity. One method is to schedule interruptible nominations *pro rata*, whereby all shippers with interruptible capacity have a proportional share of their capacity scheduled. Another method is based on economic ranking, where shippers who pay more for their interruptible capacity receive priority over shippers who pay less. A particular pipeline's practices for scheduling interruptible capacity will be set forth in the priority provisions of its tariff.

Nominations and Scheduling on Intrastate Natural Gas Pipelines

The NAESB standards do not apply to intrastate pipelines, which follow their own scheduling practices. Only thirteen percent of the member companies of the Texas Pipeline Association that responded to an informal poll reported that they accept electronic nominations, and none indicated that they follow the NAESB standards.

In Texas, intrastate pipelines schedule gas transportation five days a week, with no weekend scheduling. Some intrastate pipelines do not schedule volumes at particular delivery points on their systems, but instead accept nominations from customers, typically LDCs, that can have hundreds of delivery points. These customers do not schedule volumes at a particular point, but submit a nomination that covers all of their points, with the right to obtain delivery at any of them.

The Commission requires major non-interstate pipelines to post scheduled volumes no later than 10:00 PM central time the day before gas is to flow. This deadline occurs after interstate natural gas pipelines are required to post their evening cycle schedule confirmations by receipt and delivery point.

Imbalances

A point imbalance is the difference between the volume of gas that is scheduled to flow at a receipt or delivery point, and the volume of gas that actually flows through the point (typically determined by meters). A transportation imbalance is the difference between net receipts under a specific agreement (total receipts minus any fuel receipts), and total deliveries made under a specific agreement. When an imbalance occurs on a pipeline system, the pipeline must resolve that imbalance to keep all parties whole. There is no single method pipelines use to handle system imbalances. Instead, each pipeline resolves

imbalances in accordance with the imbalance provisions set forth in its FERC NGA Gas Tariff.

Operational Balancing Agreements

An operational balancing agreement (OBA) is a contract between two physically interconnected parties specifying the procedures to be used in processing imbalances or differences in hourly flows between the parties. An OBA ensures that a shipper, once it has properly nominated and had its gas confirmed, will not be subjected to imbalance penalties resulting from the transfer of gas between the pipelines. In Order No. 587-G, the Commission adopted a requirement that each interstate pipeline enter into an Operational Balancing Agreement at all points of interconnection between its system and the system of another interstate or intrastate pipeline. That requirement is codified in section 284.12(b)(2)(i) of the Commission's regulations.

Impact of Cold Weather on Gas Production in the Texas and New Mexico Gas Production Regions of the United States During early February, 2011

Introduction

Colder-than-normal weather during the first week in February led to the biggest non-hurricane natural gas supply disruption in the United States since at least 2005.

Due to a combination of well freeze-offs (gas flow blockages resulting from water vapor freezing in the gas stream) and other temperature-related well failures, processing plant shutdowns, electric power outages, and pipeline operational issues, estimated daily natural gas production fell from about 62 billion cubic feet per day (Bcfd) to less than 57 Bcfd, a decrease of 8%. (Ref. 1)

The cold weather likely impacted thousands of natural gas wells in Texas and Louisiana, home to one-third of U.S. gas production. Because it rarely freezes in these southern U.S. latitudes gas wells aren't built to withstand the phenomenon called "well head freeze off." That's when the small amount of water produced alongside the natural gas crystallizes inside pipelines, completely blocking off the flow and shutting down the well.

In particular, along with the cold weather came severe icing conditions. Icy roads inhibited the movement of water hauling trucks in particular and the ability to access wellheads. The result was that fail safe switches on water and condensate storage tanks at wellheads and at compressor stations were activated. The fail safe switches are designed to shut down operations to prevent spills. (Ref. 2)

This report focuses on gas well winterization technology that is deployed in colder climates and discusses to what degree they might be applied to the impacted production areas (Texas and New Mexico) addressed with this study.

The Phenomena of Wellhead Freezing and Cold Weather Impact on Gas Production Operations

Freezing is a potential and serious problem starting at the production wellhead through the last point in the customer delivery system. The occurrence of freezing is continuously reduced each step of the way, but care must be taken at each and every step to assure smooth operational conditions and satisfied consumers at the end of the line. Freezing not only affects the wellhead and gas pipeline but is also a significant contributor to measurement errors, instrumentation upsets or failures and other regulation equipment that can be found at compressor stations, gas processing plants, regulator stations and other critical points of operation. (Ref. 3)

Many criteria can have an impact on the freezing issue including:

- Gas quality and composition
- Wellhead and wellbore design and configuration
- Piping designs, regulation or restriction points

- Instrument take-off points
- Other

Three areas will be reviewed as to the potential for freezing due to cold weather conditions:

1. The reservoir, wellbore and wellhead environment.
2. The gas well production facilities located at or near the wellhead.
3. The gas gathering system including compressor stations and gas processing plants.

Potential for Freezing - Within the Reservoir, Wellbore and Wellhead

Natural gas resides in geologic formations for time periods of millions of years (geologic time). Over this extended time period the gas becomes saturated with water. The volume of water that natural gas can carry as water vapor is a function of pressure, temperature and gas composition. Figure 1 is a schematic of a gas reservoir (Barnett shale in this example), its gas quality, reservoir conditions and gas flow pathway from the reservoir to the surface. The gas flows from the reservoir through perforations in the pipe (casing) and then up through the production tubing, through the wellhead and then to production facilities.

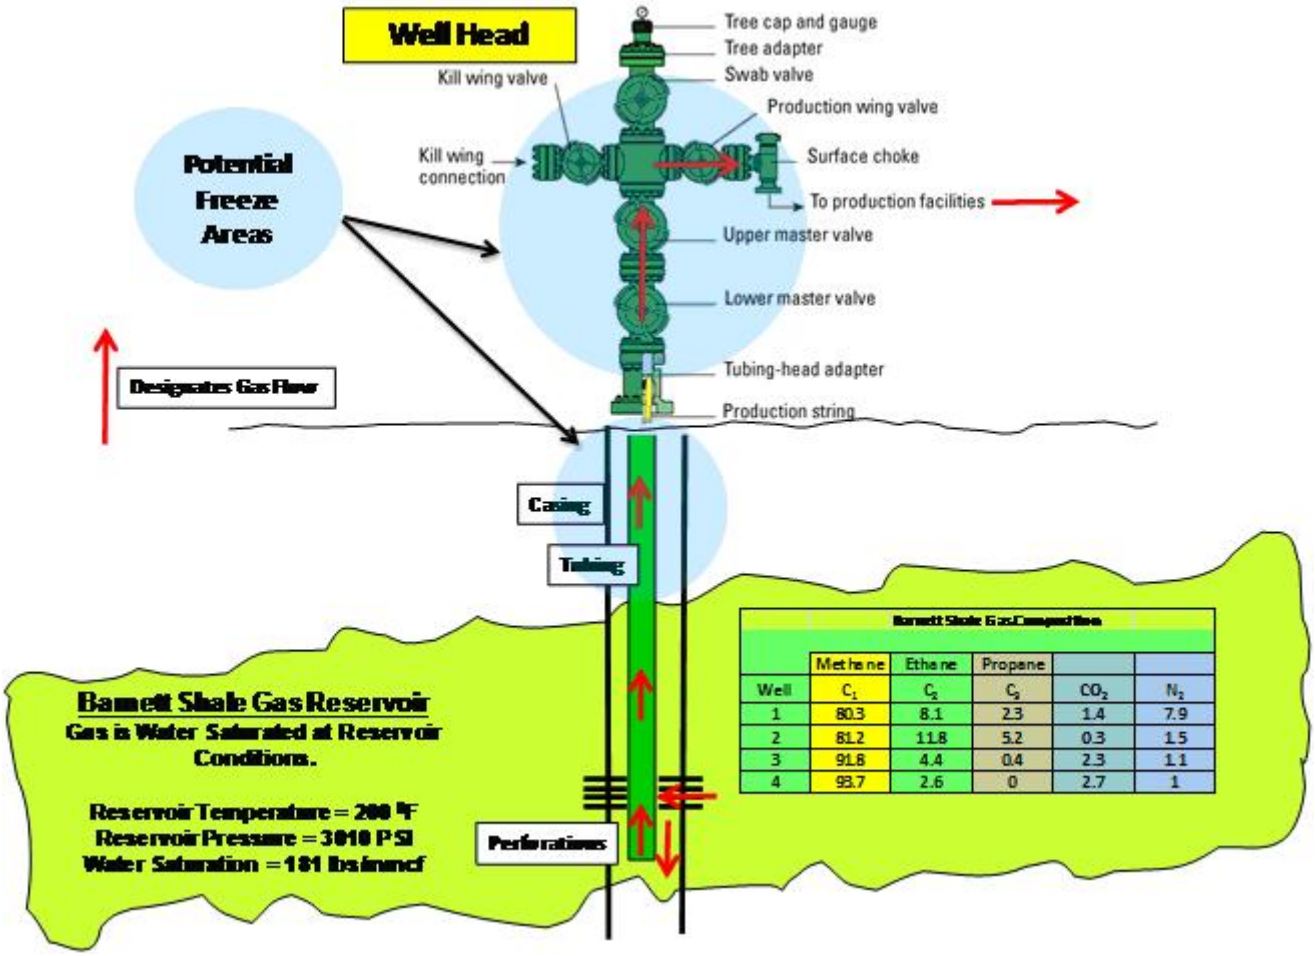

Figure 1 – Schematic of Gas Reservoir (Barnett Shale as example), wellbore and wellhead flow paths to Production Facilities, (Ref. 4&5) (Figure from GTI)

Under the Barnett example reservoir conditions the gas can hold as much as 181 lbs of water per mmcf of natural gas. For production operations, 7 lbs of gas per mmcf is considered to be dry gas, or at least dry enough for safe and efficient transportation of the gas without undo problems due to water fallout or freezing. Many natural gas compositions include not just methane CH_4 but also heavier hydrocarbons such as ethane and propane. In the Barnett example, the composition of well #2 contains over 11% ethane and 5% propane. The existence of these heavier hydrocarbons can facilitate the formation of hydrates (a combination of hydrocarbons and water that form ice under conditions well above freezing). Hydrates are discussed in more detail later but for this discussion can be thought of as ice capable of reduction or complete blockage of gas flow. (Ref. 4 &5)

As the gas flows up the production tubing and nears the surface it experiences a drop in pressure and can also be cooled by gas expansion (Joule Thompson effect) and exposure to cold ambient temperatures at the surface. The Joule-Thomson rule of temperature effect as a result of pressure reduction is such that temperature will decrease approximately 7 degrees Fahrenheit for every 100 psi

pressure reduction. As an example, if you can have gas flowing at 60 degrees Fahrenheit and 700 psi and you may have no evidence of freezing. If you pass through a flow choke and cut the pressure to 225 psi, the flowing temperature at the point of regulation will drop 33 degrees to approximately 27 degrees Fahrenheit. If the gas stream is saturated with water vapor and condensate, you will quickly experience freezing. The gas stream is the same, but conditions have changed and icing problems can impact your operations. (Ref. 3 &4)

The presence of ice or hydrates can not only shut off the pipeline, but can also alter measurement. If ice forms on the rim of the orifice plate, the flow measurement will be in error as a result of the reduced orifice diameter. If ice forms in the instrumentation supply lines, controllers will cease to function causing a loss of control of the system. Ice can block off sensing ports and other vital instrument readings. Once the ice begins to thaw, problems are still going to be present. On the initial start-up of a new or cold well, probes, intrusive instruments and orifice plates should have been removed from the pipeline. Large balls of ice traveling down the pipeline can do physical damage to the pipeline itself and to any object protruding into the pipeline such as sample probes, temperature probes, meters, orifice plates and similar intrusive devices. After the flowing stream has stabilized and temperature conditions are above the hydrate point, these items can be safely re-installed. (Ref. 3 &4)

The likely areas for icing and/or hydrate buildup and the typical solution for these problems as applied in cold weather climates are described in Table 1. See also Figure 1.

Table 1 – Points of Freezing Potential in the Reservoir, Wellbore and Wellhead (Ref.4)

Point of Freezing Potential	Cause of Freezing	Solution
Near Surface Wellbore	As the natural gas travels from the reservoir to the surface, cooling can occur due to gas expansion and exposure to colder temperatures near the surface.	Methanol is injected into the flow stream at the wellhead. The flow of methanol is down the wellbore annulus and then is carried up the gas flow stream through the wellhead preventing freezing.
Wellhead including Wellhead Valves	At the wellhead a change in flow path size can change causing an increase in velocity and cooling. Well head also exposed to surface weather conditions.	Solution is as above, methanol injection. In some cases the wellhead can be completely enclosed in a small building or “hut”, insulated and heated, but methanol is the most practiced solution.
Wellhead Chokes	Wellhead chokes are points at the wellhead where flow and pressure is primarily controlled. Significant pressure	As above with methanol application. Also, wellhead design should consider choke points and avoid wherever

	drop often occurs and expansion cooling can be severe. This cooling combined with cold ambient temperatures can cause significant freezing issues.	possible.

Potential for Freezing – Gas Well Production Facilities Located at or Near the Wellhead

The basic flow of natural gas from a wellhead through the processing equipment and to the gas sales distribution system is illustrated in Figure 2. Note that this is described as a typical configuration keeping in mind that variations to equipment placement and metering occur dependent upon the number of wells, their proximity to each other, well ownership and other factors.

Referencing Figure 2, when gas leaves the wellhead it sometimes flows through a line heater which will warm the gas, any gas condensate and water within the flow stream, mitigating freezing and facilitating the separation of these three phases. (Line heaters are not always deployed in warmer production climates unless large flow volumes requiring pre-heating before separation of phases are experienced). The flow stream next enters the production separator (sometimes described as a heater treater) where gravity, heat and flow through mesh material separate the gas condensate from gas and from water. The condensate and water flow to storage tanks through liquid meters in some cases, or alternatively volumes are measured directly within the storage tank. These liquids are marketed by truck or pipeline in the case of condensate and the water sent to disposal facilities by truck or pipeline dependent on volumes and distances.

The gas flow stream exits the top of the production separator and flows to the dehydration unit. It is noted that the gas, while free of liquid phase water and condensate at this stage, is still saturated with liquid vapors notably water. Gas flows into a dehydration unit for removal of water or dehydration of the gas, drying it to normally 7 lbs/mmcf or less allowing for transport without freezing and water fallout issues. The normal dehydration process utilizes glycol which absorbs the water from the gas leaving the hydrocarbons within the flow stream. The glycol when saturated with water is sent to a glycol reboiler that through application of heat boils off the water. The dry gas is now metered and flows to the gas gathering system. (Ref. 4&6)

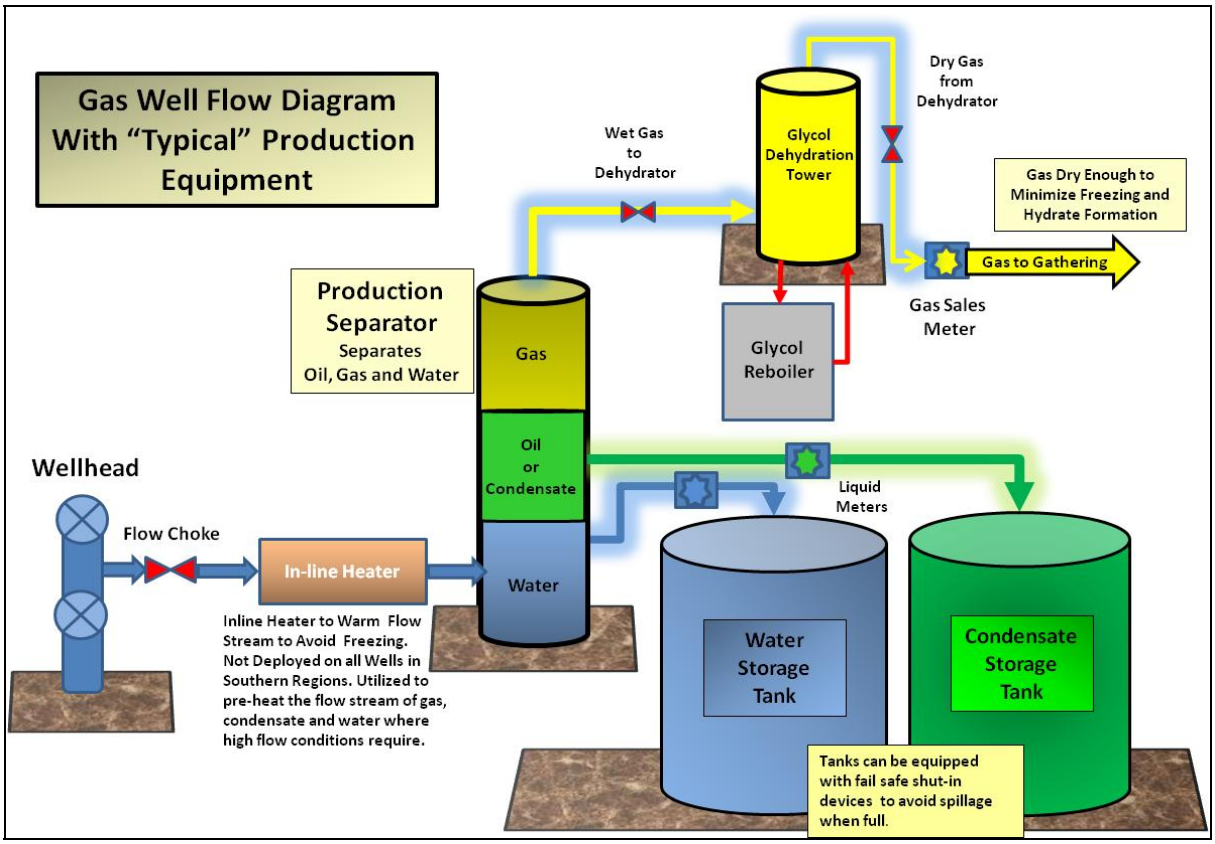

Figure 2 – Gas Well Producing Location with Typical Equipment for Gas Production Operations – Does not Include Gas Processing or Compressor Station. Production Equipment is Equipped with Fail Safe Devices to Shut-in Production to Avoid Spillage and Equipment Damage - (Ref. 4&6). (Figure from GTI)

The likely areas for icing and/or hydrate buildup and the typical solution for these problems as applied in cold weather climates are described in the following Table 2. See also Figure 2.

Table 2– Potential for Freezing – Gas Well Production Facilities Located at or Near the Wellhead. (Ref. 3, 4&6)

	Cause of Freezing	Solution Utilized in Colder Gas Production Regions
Flow lines from wellhead to line heater. If no line heater (common in warmer regions)	Exposure to low surface temperatures, gas has cooled due to expansion, gas contains water and heavier hydrocarbons which are prone to freezing or hydrate development.	Methanol injection, line heating, maintaining level flow lines to avoid liquid build-up, and limit choking points. Additional protection is usually required including insulating

then flow line to separator.		flow lines, wrapping with heat tape or glycol tubing under the insulation.
Production Separator	The production separator has equipment and instrumentation that can be impacted by cold weather. Gas, water and condensate flow throughout the unit. It is exposed to surface temperatures.	The unit is sometimes placed in a heated housing unit or hut. Alternatively, a cold weather version needs to be utilized. The cold weather unit is designed such that all piping and potential freeze instruments are internalized to the unit or insulated.
Gas Flow lines to Dehydration Facilities	If exposed these lines, which are still carrying water saturated gas and other hydrocarbons are prone to freezing and hydrate formation. This can take place in a particularly exposed portion of the line or at a bend or reduction in line size.	Sometimes these lines can be buried if it is some distance to the dehydration facility. This alone may not be adequate and insulation and heating may be required. A methanol injection point can be designed into the flow scheme if a particular area becomes a problem.
Flow Line to Sales Meter and Meter	The gas flowing to the sales meter has now been dried and is much less prone to freezing. The gas however can still be comprised of ethane and higher hydrocarbons as well as CO2 or N2 or other constituents. Depending on conditions of T & P Hydrates can still form despite dry (water content) gas.	Hydrate control can be achieved through application of heat, housing the meter and protecting from weather, methanol injection and other techniques described for managing wet gas freezing.
Condensate and Water Lines and Storage Tanks.	The lines to the storage tanks are at low pressures and the water is usually brine so freezing and hydrates are not as much of an issue. Depending on fluids and climate however some freezing can occur. If this takes place in the flow lines it can disrupt the separator causing production shut-in.	These lines can be insulated or in severe conditions heated with electric tape or glycol tubing. The tanks themselves do not normally present a problem.

Potential for Freezing - Gas Gathering System Including Compressor Stations and Gas Processing Plants.

After natural gas leaves the wellhead and wellhead production site it continues flow downstream through the natural gas system (Figure 3). Along the way, gas compression is required to maintain pressure and gas processing is applied to further dry the gas and remove heavy hydrocarbon components. Each is discussed further in this section.

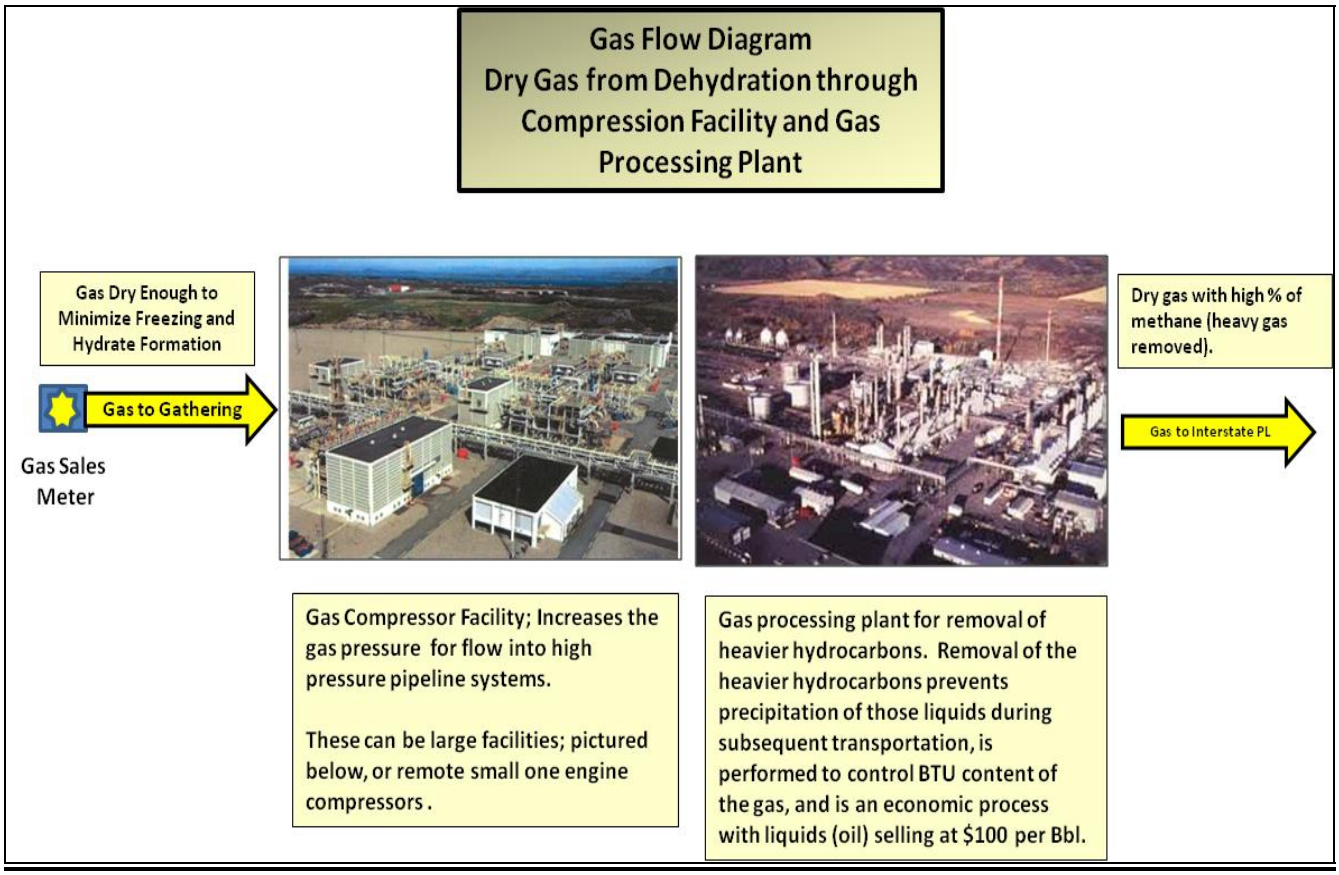

Figure 3 – Gas Flow Diagram – Dry Gas from Dehydration Facilities through Gas Compression and Gas Processing Plant. (Figure from GTI and ABB Oil and Gas and Duke Energy Canada)

Compression - After the natural gas stream leaves the dehydration facility it will at times flow through a compression facility or single compressor. The purpose of this is to boost the pressure of the gas such that it is able to flow into a sales line that is at higher pressure. The natural gas industry utilizes a large number and wide variety of compressors. Overall greater than 45,000 compressors are in place in the United States (Figure 4) (Ref. 7).

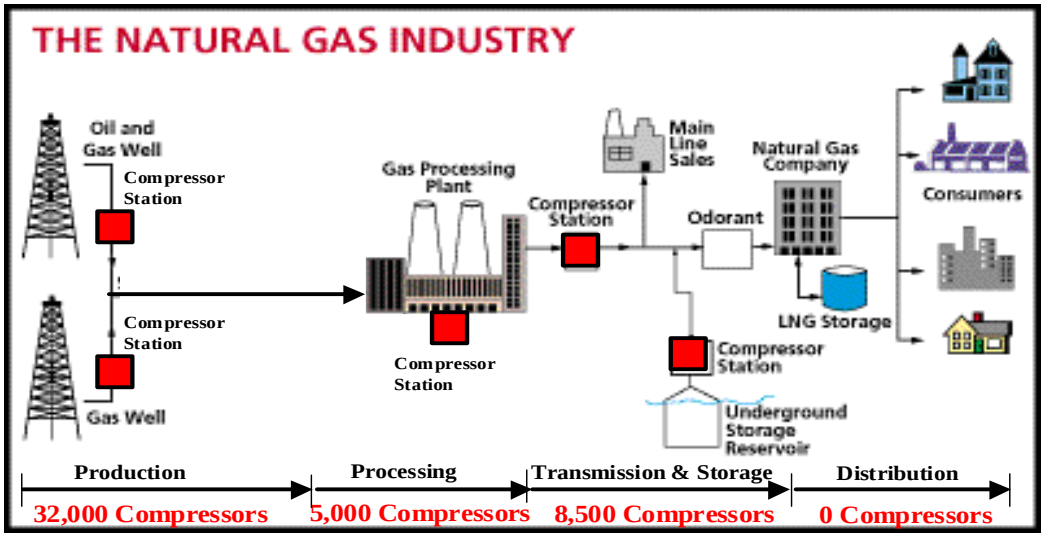

Figure 4 – Natural Gas Compressors in the U.S. Natural Gas System (Ref. 9) (Diagram from Wikimedia Commons)

Compression facilities range from small single compressors to large facilities handling large volumes of gas at aggregation points. The compression facilities within a producing gas field will change with time due to several factors:

- The drilling of new wells over time introduces increased gas volumes in a gas producing region.
- Existing wells will decline in gas production volumes over time reducing gas volumes.
- Gas flowing from the wellhead is initially at high pressure but then declines as gas is produced. This decline can be very rapid for the newer gas shale wells being developed, requiring compression facilities to be installed at appropriate points to keep wells flowing.
- The older well flow rates (at low pressure) will be reduced by the high pressure new wells in the absence of compression facilities. It is under these circumstances that new and sometimes remotely located compressors are installed.

The overall effect of these changing conditions is that compressors may need to installed, removed or resized based on the many factors impacting their size and number requirements.

The impact of cold weather on compressor stations can vary. Compressors stations all have safe guard instrumentation that senses temperature, pressures and flow rates. If pressure, as an example, gets too high or too low, the compressor will shut itself down to prevent expensive damage. These instrumentation processes can be impacted by cold weather. In colder climates, compressors can be housed to protect against any severe weather conditions (Figure 5). The majority of these compressors are fueled by natural gas as it is readily available due to it being the medium being compressed and transported. (Ref. 4, 7, 8)

Compressor stations take low pressure gas and increase the pressure significantly which is accompanied with temperature increases of the gas flow stream. Changes in pressure and temperature will cause additional liquids to drop out of the gas stream. The temperature and pressure conditions can vary considerably at these facilities. Some of the variables and conditions involved include:

- Pressure changes can occur; pressures can be dropped to manage the inlet pressure conditions to the compressor. High pressure and low pressure wells may be feeding the inlet side of the compressor. These well pressures are brought into balance at the inlet section of the compressor by dropping some well pressures to balance with the low pressure wells.
- The drop in pressure can cause gas cooling (Joule Thompson effect).
- Increasing pressure through the compression facility can cause gas heating.
- Temperatures and pressures are monitored throughout the compressor system and automatic shut down devices will be activated if they deviate from a defined range (too high or too low).
- Many of these changes can cause liquids (water and condensate) to condense from the gas stream and need to be removed and stored in nearby storage tanks.
- The storage tanks must be emptied on a regular schedule or fail safe shut-in devices will activate.

In urban areas (Dallas Ft. Worth as an example) electric compression is sometimes required due to noise limitations or emissions constraints. These facilities in particular are subject to any reduction in electric power due to weather or other conditions. There are some electric compression facilities in the Ft. Worth area but not in large enough numbers to have significant impact on gas production. (Ref. 4, 7, 8, 9)

Figure 5 - Fully enclosed, insulated and heated compressor; for cold weather environments. The unit offers metering, separation, and compression, all on one skid. (Photo Wikimedia Commons)

Larger compressor facilities are located at gas aggregation points where larger volumes of gas are compressed to higher pressures. These can be complex facilities with extensive piping, metering, and instrumentation. Cold weather can impact these facilities similar to smaller, more remote facilities. The incentive to weatherize however is greater at these locations due to the size and gas flow rates they address. There is an economic incentive as well as a reliability of service incentive to maintain flow at these aggregation points. The technology is readily available for winterization of these facilities and is commonly applied in colder regions of the country. As with the wellhead and production sites, the weatherization approach is a combination of heating important components via electric supply or warmed liquid flow (glycol), insulation of components, housing critical portions of the facility, injection of anti-freeze type chemicals (methanol), drying of the gas flow components, drying instrumentation gas via desiccants or other drying medium, or a combination of these techniques. (Ref. 4, 6)

Gas processing plants function to remove heavier hydrocarbons from the gas stream. These include ethane, propane, butane and others. There are three factors that drive the gas processing business:

1. The need to control gas heating value (BTU). Gas going into most end use functions (residential, commercial) requires gas within a certain BTU range which is often a narrow window around 1000 BTU/Ft^3 of gas.
2. For gas to be transported long distances through interstate pipeline systems it needs to be relatively free of heavier hydrocarbons. The heavier constituents will eventually precipitate during the pressure ups and downs encountered during long distance transportation. They then form liquids inside of the pipeline causing an unwanted pressure drop, freezing (through hydrate formation) or other interference.
3. With high oil prices, liquids are more valuable than natural gas. Therefore an economic incentive exists to remove the heavier hydrocarbons and sell into the liquids market as opposed to keeping them in the gas phase and selling based on BTU value alone.

These plants can be very complex (Figure 6) with extensive piping, processing units, regulators, instrumentation and other components. Many of these components can be impacted by weather conditions and to assure ongoing processing plant operation must be protected against weather. (Ref. 4, 10)

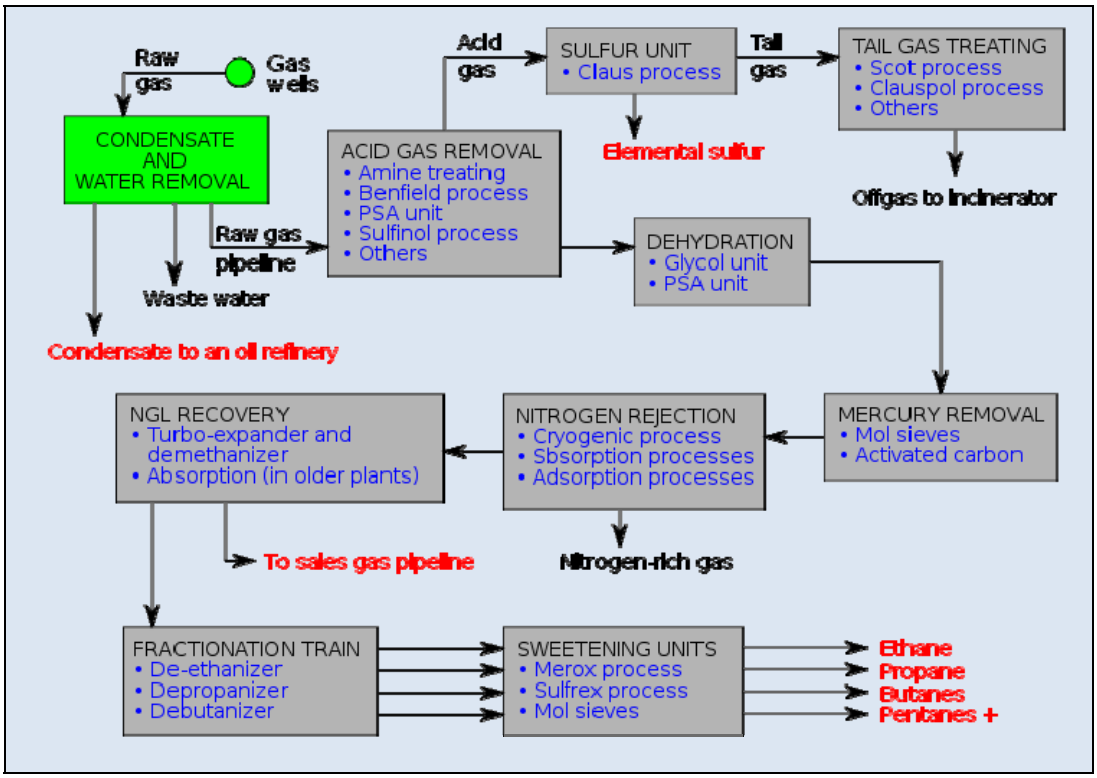

Figure 6 – Flowchart for a Gas Processing Facility – Illustrates the Complexity of the Process and the many Steps that can be Required. Levels of Complexity vary from Plant to Plant based on Need. (From ABB Oil and Gas).

Gas processing plants operate in cold weather climates along with other gas production facilities and as such, winterization equipment and processes are well known. It is a matter of frequency of events (cold weather) and the amount of time the facility is impacted, vs. the cost and time to winterize. Some processing plants have adequate piping and flow schematics to bypass some processes that might be impacted by cold weather. (Ref. 10)

Prevention of Wellbore, Wellhead and Production Facilities from Freezing – General Discussion and Description

There are several options for the prevention of freezing problems. Many of these are practiced on a regular basis in the colder regions of the country, to a lesser extent in the Mid-Continent region of the United State and not at all (in many cases) in Southern regions of the country. In order to correct freezing problems that occur under differing operational conditions, solutions must be designed for the particular needs of the location where the problem exists. Protection against freezing requires deployment of one or more mitigation techniques. Each of these techniques requires and investment in capital and operating expenses. The application of these techniques is usually determined by the

need or frequency of use along with the consequences (loss of production for a certain time period) of not utilizing.

In Southern regions of the United States, cold weather can be infrequent and when it does occur, can be limited in duration. A consequence is that the investment in freeze protection equipment and operations can be limited. The consequence to the producing life of a well can be minimal compared to the investment for cold weather operations in that lost production occurs for several days from a well with 20-30 years of operation life. On the other hand, if the level of impact is similar to the events of early February, 2011 and occurs on a more frequent basis, there can be a detrimental impact to the overall natural gas industry, as lack of reliability and accountability can result in loss of market. (Ref. 4)

Described below in general order of frequency of use are several techniques that can be applied to prevent freezing in gas operations:

1. **Methanol Injection to Prevent Freezing** - Methanol (an anti-freeze type solution) injection is a very common practice for freeze protection of wellbores and pipelines where wet gas flow occurs. Injection down the annulus of a wellbore by chemical injection pumps is utilized in production facilities in cold climates and in many gas storage operations where reliable, high flow rates in cold weather is required. The same technique can be practiced within a pipeline system and production facilities. The methanol is injected into the gas stream by chemical injection pumps or enters the pipeline by methanol drips and effectively lowers the freeze point of the gas. The amounts of methanol required can be calculated by using available tables for specific applications.

   A small volume methanol tower can also be fabricated allowing small volumes of gas to pass through the methanol for treatment. Because of the sensitive nature of many pneumatic controllers, this method is occasionally used to prevent freeze-ups in these devices and to prevent liquid migration into small orifices and passages. An additional filter is often used to ensure that the methanol is not carried over into the instrumentation. (Ref. 4, 11)

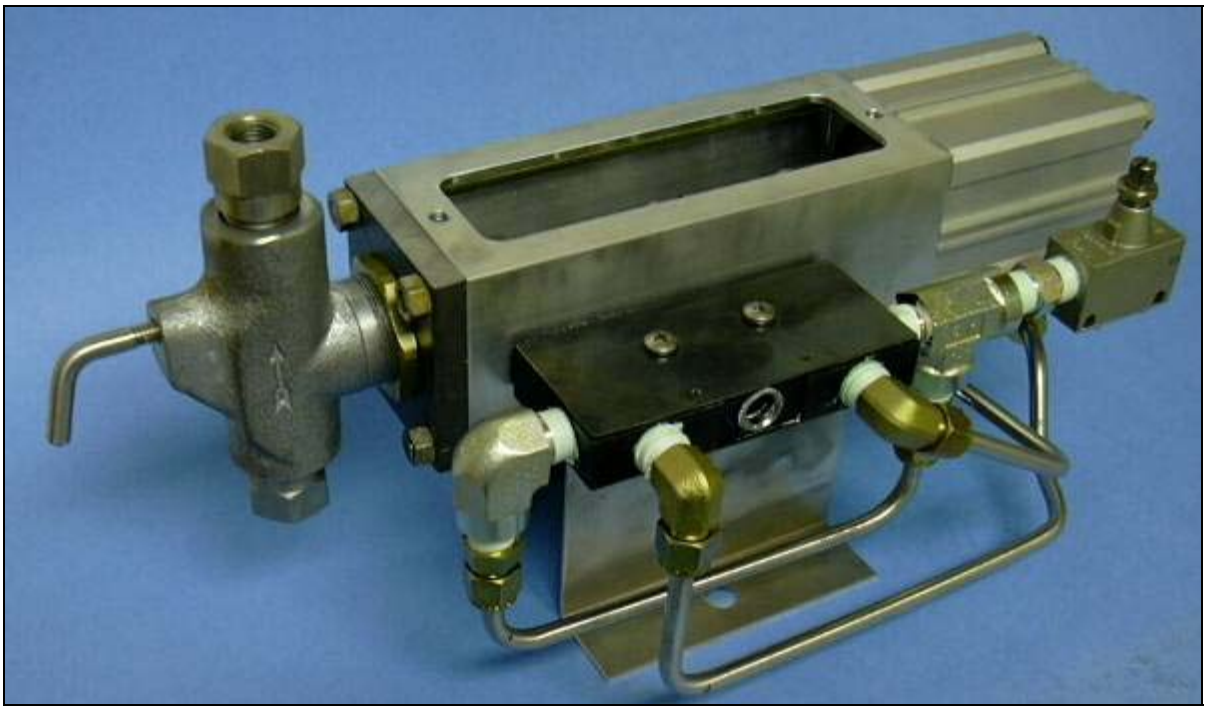

Figure 7 – Methanol Injection Pump Utilized to Inject Methanol into a Wellhead and/or Flow line to Prevent Freezing and Hydrate Buildup. Usually Located in Protected Housing on the Gas Well Location. (Ref. 11) (Photo Source ZKO Oilfield Industries; PTAC.org)

2. **Buildings or "Huts" to Enclose Production Equipment and other Weather Sensitive Equipment**
   Buildings are often constructed to house weather sensitive equipment in cold weather. This can be the preferred method for protecting production equipment and is widely applied in colder climates. The housing can be heated by catalytic heaters and can be insulated as needed for the extremes of weather conditions anticipated.

   Figure 8 is a typical setup for a Midwest Gas Storage Field (Manlove Gas Storage Field near Champaign, IL). The green fiberglass housing structure protects metering and other production equipment from freezing. Heating devices of various types can be utilized within the structure. Methanol chemical injection pumps are housed within the structure. During gas withdrawal operations (winter conditions) methanol is injected into the wellbore to prevent freezing. The wellhead itself is not enclosed. The wellhead is left open to allow for workover rigs to access the wellbore for any type of downhole maintenance required. Also, the heating of the wellhead may not preclude the formation of gas hydrates down in the wellbore some distance. This requires methanol injection as described in #1 above (Ref. 4, 12)

Figure 8 - Fiberglass Housing Surrounding Production Equipment at Gas Storage Field in Midwest United States (Ref. 12) (Photo credit Wikimedia Commons)

3. **Water Removal from the Gas Stream by Glycol Dehydration.** Gas dehydration is practiced on all natural gas flow systems to enable flow of gas without problems of hydrate formation, freezing, water drop out, corrosion and other issues. One of the most common methods of dehydration for large volumes of gas is glycol absorption. Gas passes through the glycol inside a vessel called a contactor (See Figure 2). The object is to remove the water to a point where the water vapor dew point of the gas will not be attained at the highest pressure and lowest temperature of the pipeline system. The glycol absorbs water and is then treated by circulating the glycol to a regenerator and distilling the water out of the glycol. The reconditioned glycol is returned to the contractor and the procedure is repeated. This process can reduce the water dew point to 60-70 degrees Fahrenheit. Colder climates frequently dictate a dehydration system in a natural gas system, but even warmer climates may require central dehydration due to pressure, temperature and gas composition. A producer can basically look at three dehydration options.
    a. Partial dehydration at the well head and later additional steps to meet contract specifications.
    b. Chemical injection at the well head with later dehydration at the central delivery point.
    c. Full and complete dehydration at each and every well head.

The glycol dehydration system is a low cost system with continuous operation and minimal pressure loss across the unit, thus making it a preferred approach in several areas of operation. The drawbacks can be glycol carry-over during surges, contamination by solid particles and inefficiency during fluctuating flow rates. (Ref. 4, 13)

4. **Heat Application for freeze protection** - Heat is a logical solution to freezing problems. It is also a costly approach to the problem for several reasons. Obviously, if the gas is never allowed to reach freezing temperatures, ice cannot form and will not be present. The water will likely not be removed, which remains an issue for operations and contracts, but the freezing is eliminated. The problems with heat are that it is expensive equipment to install, it requires additional fuel (energy and revenue) to produce the heat, and the heat will not remain effective as it travels down the pipeline and away from the heat source. Heat is also a potential hazard as it can provide an ignition point for the gas. Safety and special emphasis on proper application is a must when using a heat source. The most common application of heat for freeze protection is in a specific and direct situation, as in the case of a regulator valve body. The pressure drop at the regulator is the only problem point and therefore, can be the only specific location where freeze protection is required. There are multiple ways to apply heat from heating blankets, to catalytic heaters, to fuel line heaters, or in some cases, steam systems where they are properly designed, installed and maintained. Heat systems can be very effective for a localized freezing problem. Heat application coupled with insulation is a common technique for protecting flow lines in northern climates. (Figure 11). (Ref. 3)

Figure 9 – Gas Wellhead with Insulation on Flow line to Protect Freezing. (Photo Courtesy of ABB Oil and Gas)

5. **Combination of Techniques are Often Utilized –** A combination of winterization techniques are often required to fully protect a gas well production facility. Figure 10 illustrates a typical installation for a cold climate.

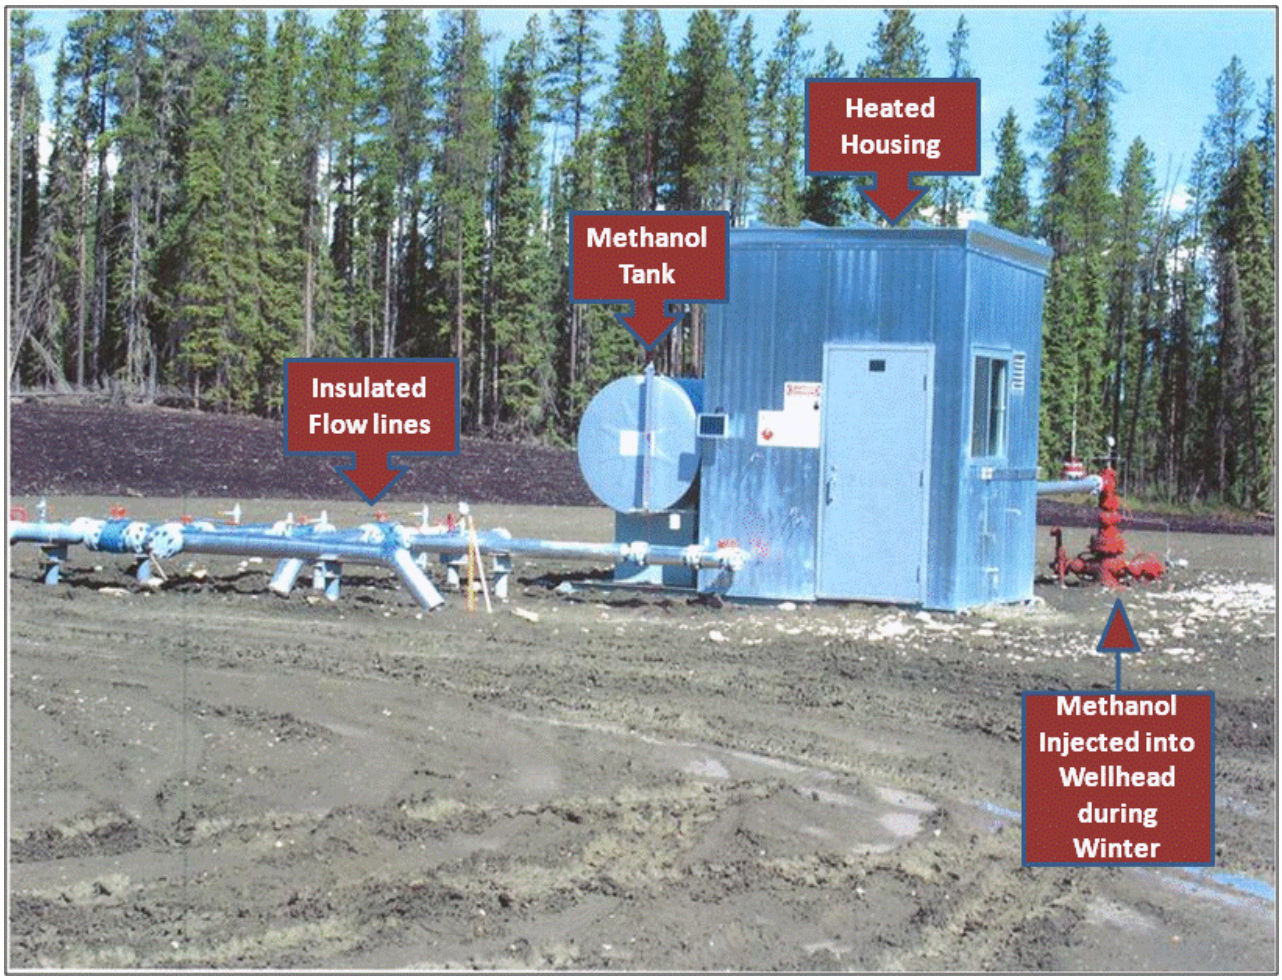

Figure 10 – Gas Production Wellhead and Production Equipment in Northern Region of United States Winterized for Cold Weather Operations. (Photo Source ZKO Oilfield Industries; PTAC.org and modified by GTI)

Referencing Figure 10, the following equipment and steps are practiced for flow assurance in cold weather climates:

- Flow lines are insulated.
- All wellheads are set up to inject Methanol which is done throughout the cold months.
- Assurance that flow lines are level, avoiding low spots where water can accumulate.
- Utilization of gas fired line heaters ahead of the production separators to keep all fluids warm enough to avoid freezing prior to separation of gas, gas condensate and water phases (See Figure 6).

- All flow lines beyond the production separator are insulated and heat traced. This is accomplished by electrical heat tape when electricity is available. Where there is no electric service, glycol tubes for circulating glycol are utilized to maintain flowing temperatures.
- Minimizing flow chokes is also practiced wherever feasible. Flow chokes are notorious Joule Thompson freeze points.
- Fiberglass huts over the wellheads are sometimes considered but difficult to accommodate due to impediments to accessing the wellbore for work-over and other considerations. (Ref. 3, 4, 6, 11)

6. **Pipeline Pigging** - Pigging in the maintenance of gas pipelines refers to the practice of using pipeline inspection gauges or 'pigs' to perform various operations on a pipeline without stopping the flow of the gas in the pipeline (Figure 11).

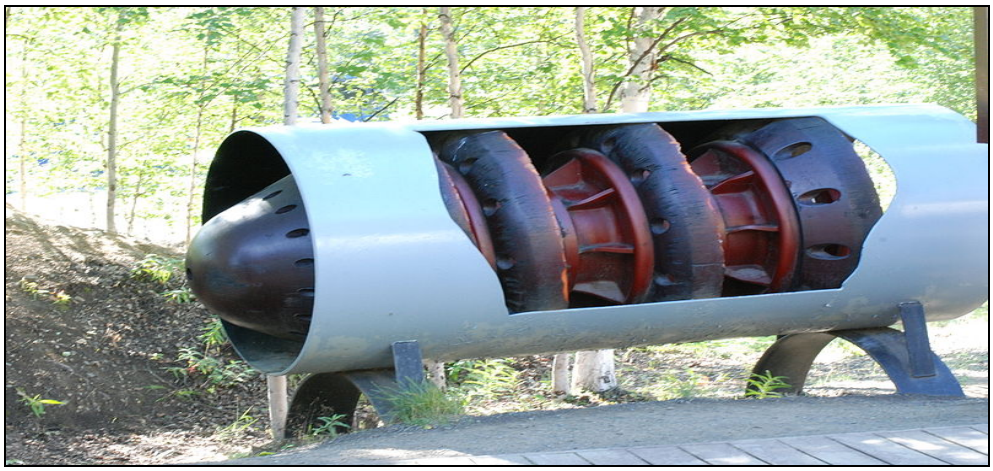

Figure 11 – Pipeline Pig Inside of Cut out Section of Pipeline (Photo Credit Wikimedia Commons).

These operations include but are not limited to cleaning and inspecting of the pipeline. This is accomplished by inserting the pig into a 'pig launcher. The launcher / launching station is then closed and the pressure of the product in the pipeline is used to push it along down the pipe until it reaches the receiving trap - the 'pig catcher' (Figure 12). (Ref. 14)

Figure 12 – Pipeline Pig Launch and Receiving Station (Photo credit Wikimedia Commons).

If the pipeline contains butterfly valves or other restrictions in line diameter the pipeline cannot be pigged. Pigging has been used for many years to clean larger diameter pipelines in the oil industry. Today, however, the use of smaller diameter pigging systems is now increasing in many areas to maintain pipeline flow integrity.

Pigs are also used in gas pipelines where they are used to clean the pipes, but also there are "smart pigs" used to measure pipe properties such as pipe thickness and corrosion. They usually do not interrupt production, though some natural gas can be lost when the pig is extracted. Most of the pigging operations are deployed in the gas gathering, transmission and distribution portions of the gas system as opposed to the wellhead production areas where pipeline configurations and sizes do not allow for pigging operations.

Pigging operations are conducted on a year around basis as needed to keep pipelines in working flow conditions. During cold weather their deployment can be increased due to additional liquids fallout and due to increased flow rates during cold weather. (Ref. 14)

7. **Practical Piping and Equipment Construction Considerations for Freeze Protection** - During the design phase of the piping and the instrumentation system, certain steps can be taken to reduce the negative effects of freezing problems. Piping configurations that would allow for liquid accumulation should be avoided if at all possible. Drainage should slope towards drain fittings located at low spots. Where possible, use ball valves and large diameter tubing for instrument feed lines and sensing lines. Avoid restrictions where flow will occur. Limit choking points. Tubing runs should slope back toward the pipeline and you should have a leak free

instrument system. Liquids, if they are present, will be drawn towards the leak. If you avoid creating traps and liquid drop out areas, your freezing problems will be minimized. (Ref. 3, 4).

8. **Other Water Removal Techniques for Cold Weather Protection, Especially for Instrumentation**
    a. **Solid Absorption -** A very efficient method of water removal is the dry bed or molecular sieve method. The gas is passed through large towers of solid particles and the molecular sieve absorbs the water very aggressively. Very dry gas over a wide range of flow rates can be attained by this method. Eventually, the sieve becomes saturated and must be regenerated. The stream must be switched to a second tower and hot gas is introduced to the original unit to evaporate the water and dry the sieve. Cool gas is then used to cool the desiccant and the tower is ready for re-use. This cycle is repeated until the desiccant has degenerated and is no longer effective. While this method produces very dry gas and has several positive operating characteristics, it is more costly than typical glycol systems and more complex to operate. If the gas contains heavier hydrocarbons they can sometimes interfere with the sieves.
    b. **Drip pots, coalescers and automatic liquid dumps can reduce freezing problems on instrumentation** - Occasional slugs of liquid can damage or even "shut in" many instrument supply systems. Where this slug potential exists or in cases where liquid is a severe problem in the gas supply used for instrumentation, drip pots and coalescers can effectively knockout or reduce the water and condensate in a small volume instrument supply system. If the problem is excessive, an automatic liquid dump designed for instrumentation can be extremely helpful. Whereas the drip pot requires routine manual draining, the automatic liquid dump will act as a drip pot collection vessel with a coalescer and as a result of an internal float assembly and pivot valve, will automatically release the collected liquid to a lower pressure point.
    c. **Instrument filters designed for freeze protection to control equipment** - Many instrument controllers and other sensitive measurement equipment powered by instrument gas supply need the highest level of clean and dry instrument supply that is attainable. In some cases a good linear polyethylene filter can provide adequate protection. But the most common solution for instrument supply gas is the filter dryer. These units are designed for high pressure applications with removable media cartridges. While various types of media are available from molecular sieve to special H2S removal media, most are equipped with a combination desiccant and charcoal filter cartridge. Coupled with providing extremely dry and fresh gas, the ancillary filtration elements in the cartridge provide for 2-4 micron protection as well. (Ref. 3, 4).

Natural gas systems, from mainstream pipeline flow to low pressure instrumentation, are subject to freezing conditions. Figure 10 is contrasted with Figure 13 where a non winterized location is illustrated.

Through careful planning and evaluation of a specific application, proper selection of available options, and a good routine maintenance program, this industry wide concern can be controlled and minimized. The cost of dealing with the aftermath can be more expensive than the preventative action that could have been taken.

Figure 13 - Typical wellhead in Warm Climate. (GTI) No methanol or other injection equipment for freeze mitigation. Flow line is elevated without insulation of other protection from cold weather. Tank battery and other production equipment are not protected from cold weather. (Ref. 4)

Alternatives to Cold Weather Control Techniques

Emissions of natural gas and other greenhouse gases are under increasing scrutiny as the concern about global warming continues to grow. Natural gas can be emitted to the atmosphere in many locations along the gas system. The gas industry has taken steps to mitigate these releases and continues to do so. Gas dehydration facilities are one step in the process where some gas is emitted. The dehydration step is required to remove water vapor from the gas stream to allow for safe and efficient transportation of the gas, and in particular to avoid gas line freeze-up when weather conditions turn cold.

One alternative to gas dehydration is the continuous injection of methanol into the system from the wellhead to a point of aggregation of the gas where it can be dried to pipeline specifications. This practice would eliminate the need for many individual dehydration facilities and thus the gas emissions. This is relevant when discussing flow assurance under cold weather conditions as well. The

injection of methanol could have the additional impact of avoiding freezing conditions within the gas flow system. This mechanism is practiced in the offshore environment where long pipelines transport oil, gas and water to onshore facilities for processing. Application of this technique onshore however, is often hampered by the many different mineral owners involved with each well. Each mineral owner has a royalty interest in the well allowing him a percentage of the revenue generated. This requires that a gas sales meter be installed to measure his appropriate share prior to mixing the flow volume with another well. Accurate gas measurement requires dry, liquid free gas leading to dehydration facilities at most wells. In the offshore environment there is only one royalty owner, the Federal Government. (Ref. 4, 11)

Discussion of Gas Hydrates Formation

Gas hydrate formation, also known as freezing, is a potentially serious problem in natural gas flow lines starting at the production well all the way through to the customer delivery system. The effective inhibition of hydrate formation, especially during cold weather, is essential for producers and transmission companies if they are to maintain a continuous supply of natural gas. Methods to control freezing range from removing water from the gas stream to lowering the water's dew point by injection of chemicals such as methanol.

Natural gas hydrates are ice-like substances that form through entrapment of hydrocarbon molecules inside the lattice of ice crystals. Hydrate crystals are formed under certain pressure and temperature conditions where the temperature may be above the melting temperature of ice. Many types of hydrates can form based on the presence of various gases. These include methane, ethane and propane hydrates, carbon dioxide and nitrogen hydrates and others.

Hydrates are very complex systems and their formation and dissolution remain a topic of ongoing research. They are known to exist in nature and form frequently within natural gas flow systems from the wellbore through the distribution systems for natural gas. They have been known to plug pipelines in the Gulf of Mexico for thousands of feet shutting in flow from multiple production platforms and significantly interrupting gas supply. In the Gulf of Mexico, where flow lines lay on the ocean floor in deep, cold water, and where the flow through the pipelines includes oil, gas and water prior to separation at onshore facilities; hydrate formation is a threat throughout the year. The solution to this problem is simply to inject methanol and other chemicals that inhibit hydrate development. This is performed as an ongoing operation and continues to be practiced. Research continues to better understand and control the formation of hydrates under these conditions, but today the application of methanol is the only effective solution. (Ref 4, 16)

Figure 14 – Hydrate Photos – Inset is the Water- Methane Hydrate Structure (Ref. 16, 17) (Photo Credits National Energy Technology Center (DOE) and Wikimedia Commons)

Figure 14 is comprised of two hydrate photos, one illustrating the melting of hydrates with the associated release of methane which has been ignited. It is through this phenomenon that the term "burning ice" is often used when describing hydrates. The smaller inset figure illustrates the hydrate cage formed by water and methane.

Methane hydrate, much like ice, is a material very much tied to its environment—it requires very specific conditions to form and be stable. Remove it from those conditions, and it will quickly dissociate into water and methane gas. A key area of basic hydrate research is the precise description of these conditions so that the potential for occurrence of hydrates in various localities can be adequately predicted and the response of that hydrate to intentional, unintentional, and/or natural changes in conditions can be assessed.

Figure 15 illustrates the combination of temperatures and pressures (the phase boundary) that describes hydrate formation conditions. When conditions move to the left across the boundary, hydrate formation will occur. Moving to the right across the boundary results in the dissociation (akin to melting) of the hydrate structure and the release of free water and methane.

In general, a combination of low temperature and high pressure is needed to support methane hydrate formation. Note that depending on the ambient pressure, methane hydrate can form at temperatures well above the freezing temperature for water; for example at 2500 psi pressure, the ice-like methane hydrate will form at 65 ^{o} F.

Heavier hydrocarbon gases and other gases such as carbon dioxide can form hydrates at higher temperatures and lower pressures than methane. Hydrates may form in wet natural gas streams containing high percentages ethane, propane, CO_2 and H_2S where no methane hydrate is formed.

Referring to Figure 15, note that the phase line for CO_2 and ethane are to the warm side of the methane phase boundary indicating that under a given pressure CO_2 and ethane hydrates form at higher temperatures. (Ref 4, 16, 17)

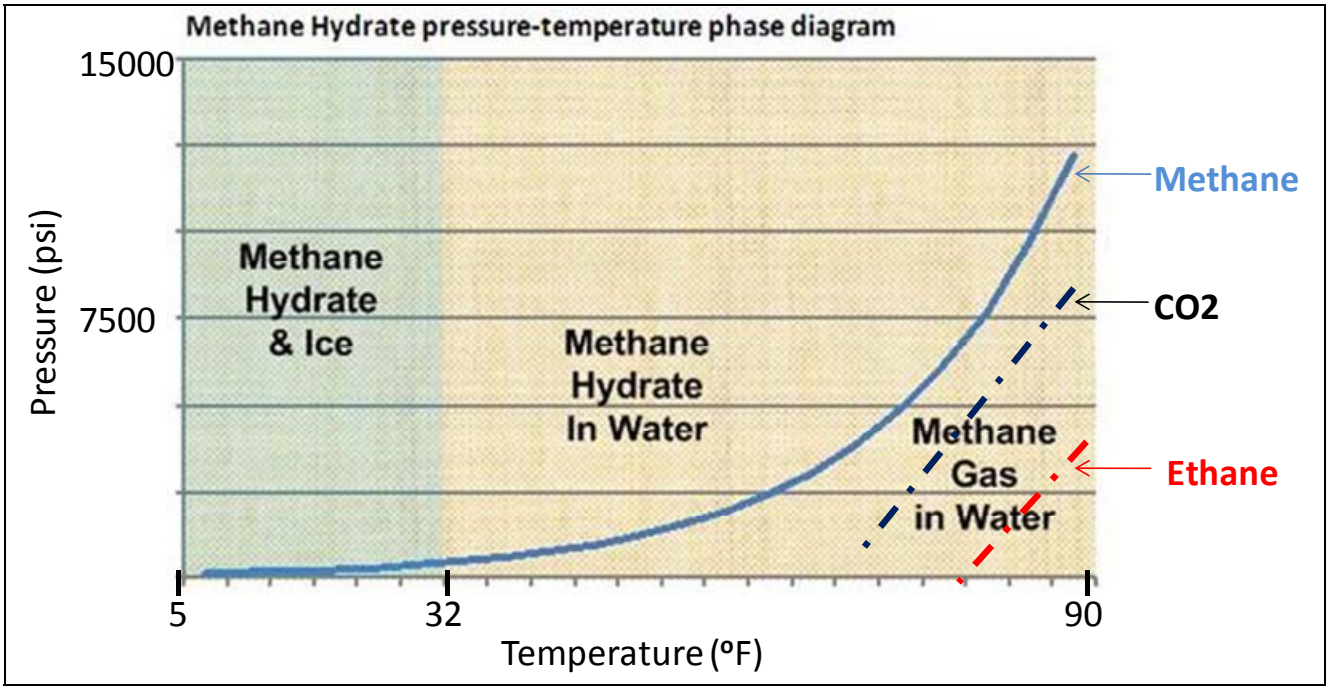

Figure 15 - Methane Hydrate Phase Diagram (Diagram Modified from Physical Chemical Characteristics of Natural Gas Hydrate).

The control of hydrates as previously discussed is accomplished in the same manner as for the control of icing conditions; application of heat, drying of the gas or chemical injection. With hydrates however it must be noted that they can form in somewhat dry gas especially if heavier hydrocarbons are present.

Gas Quality Considerations and Gas Processing

New technology has enabled the development of many new and significant shale gas plays in the United States including the Barnett, Marcellus, Eagle Ford, Fayetteville and others. The quality of the gas from these shale resources is different in each area requiring different approaches to production and gas processing. The volume of ethane, propane, carbon dioxide, nitrogen and other constituents vary considerably from play to play and can vary considerably within a single shale area such as the Barnett.

The gas processing industry has scrambled to keep up with the growth of the Barnett shale. Gas production has increased to 4 Bcf/day from near zero in 1999. Major gas processing plants have been constructed by Devon, Quicksilver, Enbridge and others. Most of the plants include compression, CO_2 treating with amine units, Cryogenic separation and fractionation. The process gas moves east toward Carthage, Texas where it can reach the Midwest markets via various hubs or it moves Southeast via the Transco or Florida gas pipeline. The gas processing plant typically process large volumes of gas. Within the Barnett region, plant capacities can range from 35 mmcf/day increasing to 1.0 bcf/day. Given the size of these plants, the volume of gas processed, the investment and sophisticated processes and equipment they are likely better able to withstand weather changes and disruptions due to rapid declines in temperature. When they do occur the problems can be identified and resolved. Unlike individual well locations the scale of these operations can justify winterization equipment and processes even for infrequent events. (Ref. 4, 5)

Table 3 – Barnett Shale Gas Compositions (Ref. 5) *Oil and Gas Journal*, March 9, 2009, Compositional Variety Complicates Processing Plans for U.S. Gas Shales.

Barnett Shale Gas Composition					
	Methane	Ethane	Propane		
Well	C_1	C_2	C_3	CO_2	N_2
1	80.3	8.1	2.3	1.4	7.9
2	81.2	11.8	5.2	0.3	1.5
3	91.8	4.4	0.4	2.3	1.1
4	93.7	2.6	0	2.7	1

Table 3 illustrates the gas composition from 4 wells from the Barnett shale producing area. As can be seen the compositions vary considerably. These changes and levels of gas constituents across the Barnett region have the following impact on gas production with respect to cold weather:

- The presence of the heavier hydrocarbons establishes a higher probability of hydrate formation even after the gas stream has been dried to 7 lbs/mmcf.

- There is the potential for liquids fallout with the heavier gases that may be accelerated during cold weather. This condensation may occur without hydrate formation.
- The heavier liquids provide an economic incentive along with high oil prices to establish gas processing plants to remove liquids.
- The presence of CO_2 and N_2 require that these waste gases be removed or blended with other gases to bring their percentage levels down to pipeline specifications.

In general the variation in gas composition adds complexity as compared to a dry gas producing region. The complexity consists of additional gas handling, processing, transportation, blending, metering and other operations that potentially can be impacted by cold weather. The exposure of this additional equipment to weather can impact the reliability of gas flow under conditions not normal for an area. (Ref. 4)

On the other hand, independent of the heavier hydrocarbons, gas shale production has all of the issues associated with water production and methane hydrate formation. There is the possibility that these conditions alone are enough to cause disruption during cold weather spells and as such the presence of heavier hydrocarbons may have limited additional impact. (Ref. 4)

What needs to be determined is the impact of cold weather on gas processing plants which are established solely for heavy gas removal. They being located at aggregation points can disrupt large volumes of gas flow when problems occur. Alternatively they are large complex facilities, located in a contained area (as compared to wellheads spread across many miles) which combines to provide both the incentive and opportunity for cold weather control technology.

Discussion of Cost Implications to Winterize Gas Wells – Per Well Cost and Per Field Cost

Recent technology development has enabled the recovery of gas from shale formations around the U.S. and now around the world. Unlike offshore platforms or large flow volume conventional gas wells, many wells are required to recover gas from low permeability gas fields. Gas well spacing requirements can reach down to one well per 10 or 20 acres in some cases. In the Barnett area typical spacing is one well per 40 acres and over time greater than 14,000 gas wells have been drilled over a 12 county area (Figure 10). This development took place in stages over a 10 year period as a better understanding of the full potential developed.

Another factor regarding gas fields with a large number of wells is the time required to respond to an event that impacts every wellhead. Within the time frame of the recent cold weather event it would have been impossible to attend to each of 14,000 wellheads, most at a different location to alleviate freezing and/or other cold weather issues. (Ref 4, 18)

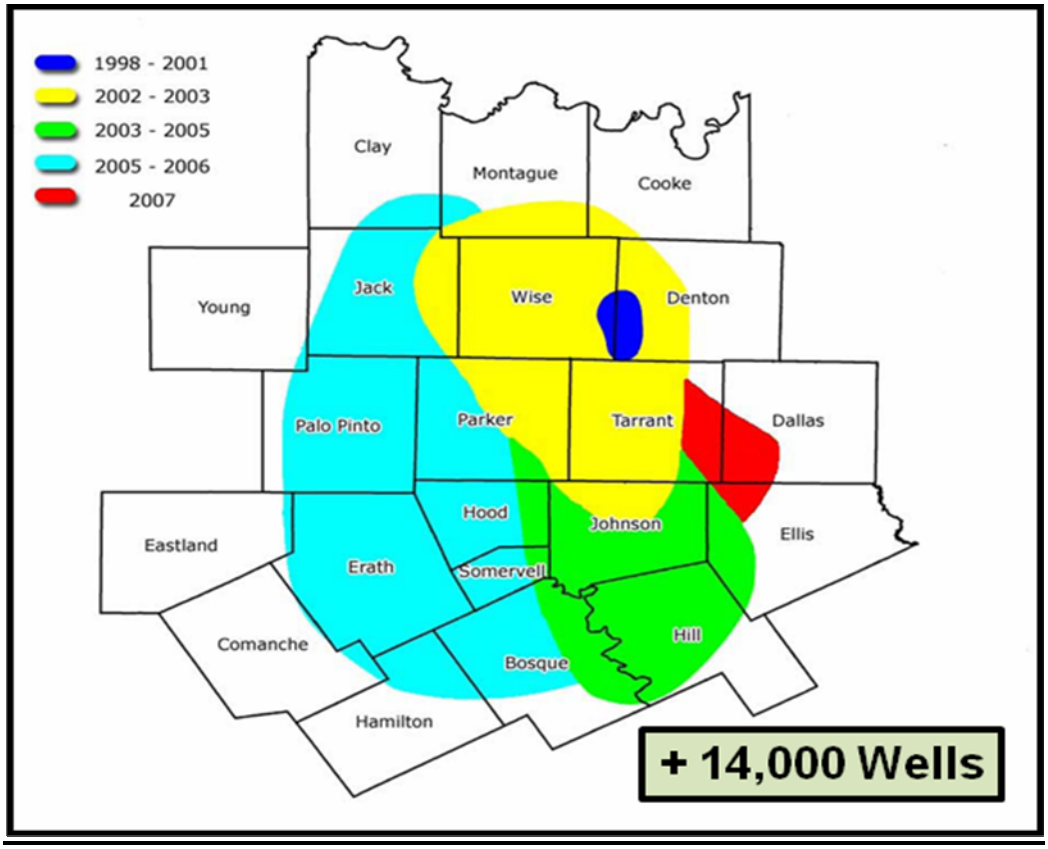

Figure 16 – Barnett Shale Gas Development Area near Dallas, TX, (Ref. 18) (Figure Courtesy Perryman Group – HART Unconventional Gas Conference).

The implications for cold weather flow assurance is that unlike the ability to winterize a large volume of gas flow at a single well location with a single investment, unconventional gas development requires winterization of many locations at practically the same capital expense.

Winterization of a gas well requires both capital expenditures and annual operating expense. Table 6 identifies the cost per well of these items.

In Northern regions of the country this equipment is normally part of the original well design and installed as a matter of necessity along with all other production equipment. On wells that can cost well in excess of $1 million each, these costs are not as significant as when compared to a retrofit after the well has been placed on production. This investment needs to be weighed against the impact and ramifications of the reduction in gas flow, power reductions and outages during this time period. (Ref 4, 19, 20)

Winterization cost of a wellhead or associated production equipment can varying considerably based on the size of facilities to be winterized, location, weather conditions, gas quality and other criteria.

Some approaches can be relatively simple with other facilities requiring more elaborate winterization equipment. Several scenarios based on conditions are described below with discussion of cost.

- **Case 1 - Cost Analysis for Simple Methanol Injection Pump and Hookup**

In some areas, possibly in many locations in the warmer climate production areas in Texas and New Mexico, a simple installation of a methanol injection system to be utilized during cold weather spells may be effective. Unlike northern climates where severe cold is experienced throughout the extended winter, the warmer production regions may not require significant equipment installation. If problem areas or key producing facilities are identified they may be protected with a simple investment.

A methanol injection and solar powered pump system can be installed for a capital cost of approximately $2,800 per installation. The systems are designed to reduce maintenance and operation expenses. Methanol costs are $12.00 per mmcf of gas throughput based on a treating ratio of 3 gallons of methanol per mmcf at a cost of $4.00 per gallon. Based on a well producing 1 mmcf per day of gas, methanol costs would equal $12 per day. On an annualized basis assuming methanol injection for 5 months the methanol cost equals $1800. Labor is estimated at $1000 per month or $5000 total. (Ref. 15)

Capital Cost = $2800 per installation.
Operating Cost for 5 months cold weather = $6800.

- **Case 2 - Cost Analysis for Building to Enclose Production Equipment**

In some cold weather climates the most efficient approach to winterization is to house the susceptible equipment in a small building or hut. This can sometimes save on more expensive approaches while at the same time protecting all equipment from year around weather conditions. These buildings can be heated with specialized heating equipment or in many cases can be warmed simply from the heat given off by the production equipment itself (assumes a heated production unit is within the building). In cold weather climates the design and construction of the production equipment includes the insulated housing, all of which is skid mounted for portability. When managed in this fashion the additional cost for winterization can be negligible compared to total well cost. Building cost can vary according to size requirements. This may be an option for critical equipment in the Texas, New Mexico producing regions.

Building cost = $2500 to $10,000

- **Case -3 - Cost Analysis for Equipment to Winterize Gas Wellhead in Very Cold Climate e.g., Canada (See Figure 10).**

In very cold production areas such as Canada, several winterization techniques need to be applied including methanol injection, line insulation, a small hut to protect chemical injection pumps small heaters, and methanol storage. The total cost of this installation is estimated at $34,425 per installation (see itemization below). (Ref. Table 10) Operating cost for a 5 month period is estimated at $6800 the same as Case 1.

Table 4 – Winterization Equipment Cost for a Gas Well Located in a Cold Climate

Equipment		Description		Cost
Winterized Production Unit - Net Cost for Winterization		Production unit winterized by internal piping and insulation.		$23,000
Timberline solar powered methanol pump w/solar panels				$2,800
Chemical Pump to Supply Chemical Inhibitors		Chemical Inhibitor Pump for Corrosion Protection		$1,350
Vent Gas Bottle to Supply Heater		System to Collect Vent Gas from Injection Pumps to Supply Heaters		$675
Methanol Tank		Stores Methanol		$1,000
Methanol Injection Tubing - High Pressure - $5/Ft - 100 Ft		Methanol Transfer		$500
Flow Line Insulation - $3/Ft - 100 Ft		Insulate Flow Line		$300
Flow Line Heat Tape - $4/Ft - 100 Ft		Provide Heat to Flow Line		$400
Fiberglass Hut for Enlcosing Production Equipment		Weather Protection		$1,500
Catalytic Heater for Location Housing		Heating for Hut		$500
Installation Cost - 2 men for 3 days at $50 per hour.		Labor		$2,400
Total Capital Cost per Well				**$34,425**

- **Case 4 - Cost Analysis for Equipment to Winterize Gas Wellhead Equipment Including Gas Production Unit**

In areas where a gas production unit is required to remove liquids (water or condensate or both) from the production stream a gas separator must be installed. The cost of a separator can vary based on

size which is dependent on the total flow volume to be handled by the separator. In warm weather climates the piping and instrumentation for the separator is installed externally to the unit as freezing is not an issue. For cold weather climates all of the piping needs to be internalized where heat from the production unit itself, in addition to insulation where required will prevent freezing. The additional design requirements, locating of piping and instrumentation in a confined space can add as much as $23,000 to the cost of a production unit. (Ref. 20) A less expensive option in some cases can be as described in Case 2 where all of the production equipment is housed in a small building or hut. These insulated buildings often require no additional heat beyond what is supplied by the heating unit in the production separator itself. (Ref 21)

- **Case 5 – Installation of Additional Storage Capacity at Critical Facilities**

During the recent cold weather spell in Texas and New Mexico many wells and compressor facilities were shut-in by automatic fail safe shut down devices that were triggered by tanks filling up with liquids. The fail safe shut-in devices protect against tank overflow and spillage. For critical facilities such as central compressor stations, gas processing plants or important well tank batteries, additional storage could be installed to allow for operations during bad weather conditions. Additional tanks are relatively inexpensive when compared to the impact of significant gas flow reductions.

Total Cost Discussion

The cost estimates for winterization can vary considerably based on the type of facility, the number of installations being considered, the degree of cold weather protection that is required, gas flow rates, pressures and other factors.

Simple weatherization such as for Case 1 above can be accomplished for an estimated $2800 capital cost and $6800 annual operating cost.

More comprehensive winter protection can increase the capital cost to over $11,000 per installation.

Winterization of production units, if required can add an additional $23,000 per installation depending on production unit size.

Overall, the cost of winterization, given the number of wells can be considerable. The simple table below illustrates cumulative capital cost with variable well counts and per well equipment costs.

Table 5 – Cumulative Cost for Winterizing Gas Wells – Variable Well Counts and Individual Well Equipment Cost.

			Well Count		
	10,000	20,000	30,000	40,000	50,000
Cost per Well			Cumulative Cost		
$2,500	$25,000,000	$50,000,000	$75,000,000	$100,000,000	$125,000,000
$10,000	$100,000,000	$200,000,000	$300,000,000	$400,000,000	$500,000,000
$20,000	$200,000,000	$400,000,000	$600,000,000	$800,000,000	$1,000,000,000
$35,000	$350,000,000	$700,000,000	$1,050,000,000	$1,400,000,000	$1,750,000,000

For 50,000 wells the total cost could vary from $125 million to $1.75 billion based on per well equipment needs. It may be that key compressor locations and gas processing facilities, if winterized or supplied with additional liquid storage tanks, could mitigate a significant percentage of the cold weather flow problem. The total number of these locations is likely to be much reduced from the number of wells noted in Table 5 above. If 1000 facilities of this type required a $10,000 investment each the total would equal $10 million, a much reduced number from those illustrated above.

Table 6 which follows itemizes capital cost and operating expenses for winterization of production facilities. The capital costs do not total within the spreadsheet as there is duplication of equipment in some cases.

Table 6 – Itemization of Capital and Operating Expenses for a Typical Gas Well – (Note, the Capital Costs Items Listed in the Table are not Totaled as Locations will require a Subset of these Items).

Gas Well Winterization Expenses						
Cold Weather Protection Equipment		**Description**		**Cost Per Well - Excludes Duplicate Applications**	**Source**	
Capital Cost						
Winterized Production Unit - Net Cost for Winterization		Production unit winterized by internal piping and insulation.		$23,000	Sivals Engineering, Odessa, Tx., Ref 20	
Methanol Injection Pump		High Pressure Pump to Inject Methanol		$1,648	ZKO Oilfield Industries, Ref. 11	
Timberline solar powered methanol pump w/solar panels				$2,800	Timberline Manufacturing, Ref. 22	
Chemical Pump to Supply Chemical Inhibitors		Chemical Inhibitor Pump for Corrosion Protection		$1,350	ZKO Oilfield Industries Ref. 11	
Vent Gas Bottle to Supply Heater		System to Collect Vent Gas from Injection Pumps to Supply Heaters		$675	ZKO Oilfield Industries Ref. 11	
Methanol Tank		Stores Methanol		$1,000	estimate	
Methanol Injection Tubing - High Pressure - $5/Ft - 100 Ft		Methanol Transfer		$500	Drillspot .com	
Flow Line Insulation - $3/Ft - 100 Ft		Insulate Flow Line		$300	Drillspot .com	
Flow Line Heat Tape - $4/Ft - 100 Ft		Provide Heat to Flow Line		$400	Drillspot .com	
Fiberglass Hut for Enlcosing Production Equipment		Weather Protection		$500	JW Williams Co. Casper, Wyoming, Ref. 21	
Catalytic Heater for Location Housing		Heating for Hut		$500	ZKO Oilfield Industries Ref. 11	
Installation Cost - 2 men for 3 days at $50 per hour.		Labor		$2,400	JW Williams Co. Casper, Wyoming, Ref. 21	
Operating Expense for Methanol Injection						
Methanol costs are $4.00 per gallon. Assume 10 gallons per day for 5 months. Methanol cost = 5 months * 30 days/mo.*10 gal/day * $4/gallon = $6000		Methanol Cost		$6,000	Timberline Manufacturing, Ref. 22	
Maintenance - Per Month - $200 @ 5 months				$1,000		
Total - Cost per Year				$7,000

Subject: NERC Reliability Assurance Initiative – Concept White Papers Posted
Date: Monday, November 26, 2012 6:31:30 PM

Reliability Assurance Initiative – Concept White Papers Posted

November 26, 2012

Ladies and Gentlemen:

The Reliability Assurance Initiative is for identifying (and implementing where appropriate) changes that enhance the effectiveness of the Electric Reliability Organization (ERO) compliance and enforcement program to avoid cascading events and the resulting major loss of load. This undertaking is for the purpose of the ERO outlining to the Federal Energy Regulatory Commission (FERC) revised practices that better achieve a risk based compliance monitoring policy objective and identify the end state of a mature compliance monitoring program to be fully functional and implemented by 2016. Activities include drafting six conceptual white papers that describe the desired end state and change state elements necessary to achieve the attributes of compliance of a mature ERO. The white papers and the corresponding input and feedback to these papers will be included in a formal filing to FERC targeted for March 2013.

The overarching conceptual white paper and the first Key Change State Element paper, "Restyle the Compliance Monitoring Approach," have been posted to the NERC website under Reliability Assurance Initiative. Additionally, questions specific to the first paper have been posted for industry comment and feedback; this includes feedback on the desired value outcome of reliability assurance from the end-state program. It is recommend that all Regional Entities and registered entities check the NERC website regularly to ensure the latest version of each paper is being used, as each paper will be updated on a routine basis based on feedback submitted to NERC.

Anticipated posting dates for the remaining papers are provided below:

Paper No. 1 – Overarching Conceptual White Paper (Posted)

Change State Element Paper No. 2 – Restyle the Compliance Monitoring Approach (Posted)

Change State Element Paper No. 3 – Establish Compliance Data Requirements – Target Posting Date: December 10, 2012

Change State Element Paper No. 4 – Refine Compliance and Enforcement Information Flow – Target Posting Date: January 7, 2013

Change State Element Paper No. 5 – Redesign the Enforcement Strategy – Target Posting Date: January 21, 2013

Change State Element Paper No. 6 – Pilot Program – Target Posting Date: February 4, 2013

Entity comments and responses to posted questions should be submitted to: RAIcomments@nerc.net
For more information or assistance, please contact Jerry Hedrick (Via Email) or at (404) 446-9704; Earl Shockley (Via Email) or at (404-446-2560)

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Reliability Assurance Initiative

Purpose of the Reliability Assurance Initiative (RAI)

The RAI is to identify and implement changes that enhance the effectiveness of the Electric Reliability Organization (ERO) compliance and enforcement program to avoid cascading events and the resulting major loss of load. The foundational principles of the RAI are that:

- It is not practical, effective or sustainable for the ERO Enterprise and Registered Entities to monitor and control all compliance to the same degree.

- It is not practical, effective, or sustainable for the ERO Enterprise and Registered Entities to treat all findings and discrepancies, as violations triggering the same degree of enforcement and evidentiary documentation.

The RAI will be successful if the end state compliance monitoring and enforcement program is effective (resources expended to achieve and monitor compliance and carry out enforcement are sufficient on the larger risk areas and not unnecessarily over applied on lower risk areas) at providing reasonable assurance through compliance monitoring, appropriate deterrence through enforcement and a feedback loop to continuously improve reliability standards.

Activities of this initiative will include drafting of conceptual white papers describing the desired end state attributes as well as the change state elements necessary to achieve the attributes of compliance for a mature ERO. The white papers and the corresponding input and feedback to these papers will be included in a formal filing to FERC targeted for March 2013.

Background

Over the last five years through experience with the compliance and enforcement processes and feedback from stakeholders, the ERO Enterprise has envisioned an end state for compliance and enforcement that is founded on a risk-based approach. This vision will be developed through maturing the ERO Enterprise processes over the next three to five years and be tested through a pilot project as we reach full implementation.

The risk-based approach the ERO Enterprise envisions will consider risk relative to the tools and *processes* applied to assure compliance as well as the disposition of instances of noncompliance

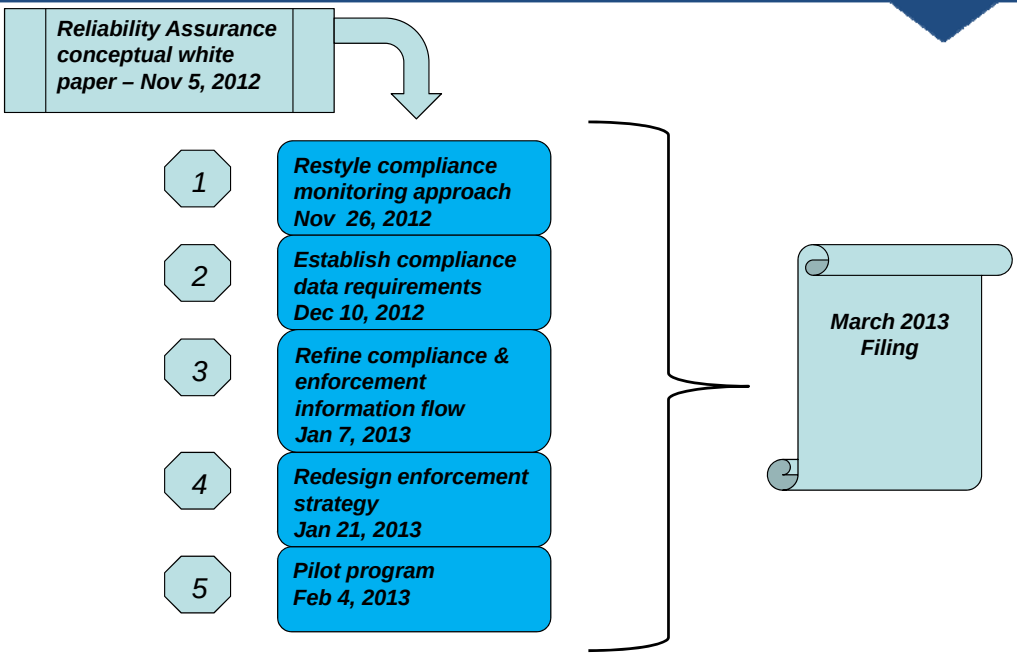
incorporate risk concepts. To this end, the future risk-based approach of the Compliance Monitoring and Enforcement Program (CMEP) will be a consistent (ERO Enterprise-wide) application of (A) compliance monitoring practices based on risk, (B) a "range of tools" to prioritize and treat violations based on risk, (C) enforcement practices with clear distinctions based on risk to reliability and (D) a strengthened feedback loop from compliance monitoring and enforcement to the standards development process to incorporate considerations of actual risk into the standards development process. This overall risk-informed end state will guide registered entities to be increasingly focused on reliability and toward self-critical corrective actions which will result in continuous contribution toward reliability. At the same time, the current enforcement and penalty model will be used for higher risk or serious violations.

Conceptual White Papers

This paper is the second in a series of six conceptual white papers that outline the foundational principles and the major change state elements for the RAI. The first white paper presented overarching fundamentals and the end state vision of the RAI. The remaining five papers will better outline the major change state elements and a pilot program to tests the concepts. NERC is seeking industry feedback on the fundamental design of the concepts and the proposed policy changes. This input will be solicited in the form of structured questions which will accompany each white paper. Each of these papers and their corresponding questions will be announced and posted on the NERC website. Below is a diagram that outlines the target posting dates.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

White Paper Strategy



Change State Element No. 1 – Restyle the Compliance Monitoring Approach

I. PURPOSE:

The purpose of this paper is to begin the discussion of key elements and activities that are necessary for a mature compliance monitoring program to be fully functional and implemented by **2016**. The compliance monitoring program will evolve in a deliberate and purposeful manner over the next four years and will identify near-term solutions and long-range activities that lead to its full implementation. Details pertaining to development, implementation, the timing of implementation, and measurements of success will be provided in successive releases of this paper and subsequent to a filing with the Federal Energy Regulatory Commission (FERC or Commission). The basis of these concepts will be outlined in this paper, vetted with stakeholders, and presented in the planned March 2013 filing with FERC. This filing will outline the initiatives that support a desired end state for a sustainable and consistent Compliance Monitoring and Enforcement Program.

DRAFT

The end state of the compliance monitoring program consists of:

- Self-monitoring registered entities that work with the Compliance Enforcement Authority (CEA) to make determinations of risk and levels of reporting.
- Professional development of staff to promote consistency of approach and uniformity of processes through the use of standardized tools.
- Annual compliance monitoring planning[1] that properly balances risk and coverage relative to the use of compliance monitoring methods (*See*, § IV.3 below).
- Audit design that considers risk in the scoping of engagements, relies on tests of controls to gain reasonable assurance of compliance, considers data requests that supports the testing of controls, and determines staffing appropriate to the engagement.
- A robust program that utilizes sound professional judgment and provides Enforcement with determinations.
- CEA reporting that provides strong recommendations that support corrective actions, an opinion that there is a reasonable assurance of sustainable compliance, and findings that are relevant and meaningful.
- A quality assurance program that utilizes established Key Performance Indicators (KPI) to measure results, identify process improvements, and communicate results for the ERO Enterprise.

[1] North American Electric Reliability Corporation, Rules of Procedure: Section 400, Compliance Enforcement; See also, Rules of Procedure: Appendix 4C: Compliance Monitoring and Enforcement Program.

II. COMPLIANCE MONITORING:

Ensuring the reliability of the bulk power system (BPS) is a primary objective of industry and is the mission of the North American Electric Reliability Corporation (NERC) and the Regional Entities (collectively, the ERO Enterprise) and FERC. The NERC Reliability Standards define the mandatory requirements applicable to users, owners, and operators of the BPS for ensuring its reliable planning, operation and protection. Compliance monitoring serves the foundational purpose of promoting confidence and elevating the level of assurance that registered entities are complying with reliability standards. Further, compliance monitoring serves the public interest by providing necessary accountability and transparency in regard to compliance with mandatory standards. Finally, compliance monitoring provides value and process improvement information, which allows a registered entity to strengthen its operations. The changes introduced in this paper are intended to reinforce the trust of the public, industry, and government with the primary understanding that NERC's objective is compliance in the service of reliability. In this regard, the compliance monitoring approach will be restyled to be more explicitly shaped around the risk to reliability. The primary focus of the ERO Enterprise going forward will be on implementing an "Integrated Compliance Framework" that focuses on people, processes and systems. This approach to compliance monitoring will be introduced and embedded across NERC's business groups. This will drive uniformity and provide the public with a reasonable assurance of compliance.

The Integrated Compliance Framework (Framework) will provide a coherent system that facilitates consistent development, interpretation, and application of concepts, methodologies, and techniques across the ERO Enterprise. This Framework supports a more robust compliance monitoring process that: (1) considers risk in the compliance monitoring methods; (2) evaluates a registered entity's controls for ensuring compliance with Reliability Standards and actions taken in the event of noncompliance; (3) utilizes tests of those controls to provide greater assurance for sustained compliance that mitigates reliability and security risk; (4) provides uniform practices; (5) empowers increased use of regional discretion; and (6) supports robust systems to promote higher transparency and greater efficiency. The Framework includes defining capability development needs (focusing on people and systems) and honing compliance monitoring practices (focusing on audit processes). The Framework will define key focus areas for the full program implementation. The Pilot Program (to be introduced in a later concept paper) will demonstrate the application of the Framework and allow for refinement prior to full program implementation (e.g., development of systems, training, and procedures to replicate across the Regional Entities and NERC). The outline for each focus area is provided below, and activities supporting each initiative are located in the Appendix.

DRAFT

Integrated Compliance Framework

Capabilities Development: (*See*, § III below)

- ✓ People
    1. Acquire – Create common staffing practices.
    2. Develop – Design core training, education and evaluation programs to drive consistency.
    3. Retain – Identify development and performance growth opportunities.
- ✓ Systems
    1. Tools – Establishing uniform tools and applications across the ERO Enterprise.
    2. Reporting – Standardized documentation to promote consistent communication.
    3. Evaluation – Continuous improvement with transparent communication.

Compliance Monitoring Practices: (*See*, § IV below)

- ✓ Processes
    1. Audit Techniques – Compliance that uses professional standards and practices.
    2. Audit Planning Tools – Regional flexibility to plan and execute engagements based on risk and required coverage.
    3. Compliance Monitoring Methods – Using existing monitoring tools to gain reasonable assurance of compliance.
- ✓ Centers of Competency (COCs)
    1. Multi-Regional Registered Entities – Cross-regional teams performing singular entity engagements.
    2. Complex Standards – Leveraging core regional skills for complex audits.

Pilot Program Design: (*See*, § V below)

The pilot program will be built using a phased approach. It will initially focus on select Regions and registered entities and will evolve as people, processes, and systems advance and are able to broadly apply the changes. Elements that will be addressed in the future Pilot Program paper include:

- ✓ Entity Selection – Establish criteria for participation and expectations for participation
- ✓ ERO Enterprise Alignment – Formalizing approach across and among the Regions
- ✓ Process Development – Create and conduct training to establish consistency
- ✓ Pilot Program Evaluation Criteria – Create baseline measurements and communication processes to demonstrate processes, modify approaches, and implement improvements to the overall implementation design.

Restyling the compliance monitoring approach is grounded in foundational audit principles (e.g., Generally Accepted Government Auditing Standards (GAGAS) and the International Professional Practices Framework by The Institute of Internal Auditors (IIA)) and NERC's governing documents (e.g., Rules of Procedure (ROP) and Compliance Monitoring and Enforcement Program (CMEP)). The Framework will provide a structural design that incorporates the current body of knowledge and

DRAFT

guidance to drive a coherent and consistent approach to compliance. Focusing on people, processes, and systems will ensure the ERO Enterprise is grounded in the foundational purpose of compliance monitoring as well as the long-range sustainability of the compliance monitoring program. Through the use of a pilot program, processes will be demonstrated, while designs of systems and training of people will be refined for full implementation. The Pilot Program will be described in a subsequent concept paper.

DRAFT

III. CAPABILITIES DEVELOPMENT:

Capabilities development addresses necessary resource attributes for managing an effective ERO Enterprise that operates in a consistent and sustainable manner. The adoption of common practices for staffing and systems will facilitate the ERO Enterprise in achieving desired end-state elements. The two primary resources with the greatest impact on an organization carrying out its responsibilities are people and the systems they use.

A. People

Staffing, specifically the acquisition, development, and retention of staff, is paramount to achieving the desired end state.

1. *Acquire* – Creating common staffing practices is fundamental to all ERO Enterprise compliance monitoring functions. The following activities will be performed to achieve alignment:
   - Create a standard staffing prototype that identifies critical capabilities required to meet staffing objectives and sets appropriate standards and criteria.
   - Review all auditor job descriptions across the ERO Enterprise to define best practices and approach to staffing.
   - Create routine processes to evaluate appropriate staffing needs to achieve a proper balance of engagements based on risk and coverage.
   - Create a monitoring and reporting process to routinely review and discuss talent acquisition, staffing levels, and auditor development.
2. *Develop* –"Auditors must use professional judgment in planning and performing audits and in reporting the results."[2] Designing core training and educational and evaluation programs ensures the consistency of a compliance monitoring approach. In order to carry out their professional duties, the compliance auditors must possess requisite knowledge, skills, and applicable competencies. The following activities will be performed to achieve alignment:
   - Ensure applicable GAGAS and IIA rules of conduct and ethical principles are followed and are part of the ERO Enterprise's core policies and procedures.
   - Identify necessary competencies to create a robust training program.
   - Develop a mandatory ERO Enterprise-wide training and continuing professional development program.
   - Create a uniform auditor evaluation and feedback form with defined competencies.
   - Define training and evaluation frequency.
   - Conduct annual capability assessments and report the results as well as any corrective measures.
3. *Retain* – Sustaining a high organizational competency level requires retaining competent and highly skilled talent while providing development and performance growth opportunities. The following activities will be performed to achieve alignment:
   - Identify competencies to create a continuous training program.

[2] Government Auditing Standards, Chapter 3, Section 3.60 - Professional Judgment

DRAFT

- Create a set of common ERO Enterprise core competencies and performance criteria.
- Design development and performance feedback tools.

B. Systems

The use of uniform tools, systems, and applications will provide for consistent and harmonized processes and procedures across the ERO Enterprise, securely managed information, consistent reporting, and the ability to evaluate program effectiveness. Additional benefits include: saving time and ensuring consistency by creating common templates that provide flexibility as needed; improving auditor efficiency by enabling them to test, document and report in a repeatable and sustainable manner; and improving collaboration by enabling information sharing across the ERO Enterprise.

1. *Tools* – An effective ERO Enterprise utilizes common tools and information system applications to ensure data is retained in a secure and consistent manner and that tools are designed to facilitate a common approach. The following activities will be performed to achieve alignment:
   - Identify and catalogue all existing ERO Enterprise tools and applications.
   - Evaluate each tool and application for use, purpose, and design.
   - Adopt best practice tools and applications across the ERO Enterprise.
   - Identify an existing system or recommend implementation of a centralized compliance monitoring management solution to be utilized across the ERO Enterprise.
   - Eliminate applications and tools that prevent common practices (except for identified Region-specific needs).
2. *Reporting* – Accurate and precise communication is necessary to convey strong recommendations that support corrective actions; present findings in a relevant and meaningful manner; and provide reasonable assurance of sustainable compliance with standards. The following activities will be performed to achieve alignment:
   - Design a standardized report format.
   - Develop consistent writing practices.
   - Create or adopt a uniform style guide and provide continuous training.
   - Define metrics to measure consistency of reporting.
3. *Evaluation* – Continuous improvement is facilitated by developing and reporting on KPIs. Success is a measurement of progress towards goals, the demonstration of repeated achievement, and an established level of performance. Understanding what is important and reporting the level of achievement is necessary for any organization to continuously improve. The following activities will be performed to achieve alignment:
   - Define consistent and meaningful measurements pertaining to the execution of compliance monitoring activities.
   - Establish measurements for execution to the change state elements.
   - Create reporting mechanisms to demonstrate achievement of KPI goals.
   - Track and monitor the completion of management actions.

DRAFT

IV. COMPLIANCE MONITORING PRACTICES:

Compliance monitoring is performed by the ERO Enterprise in diverse environments within registered entities that vary in size and structure. While risk and the designs of controls may vary, the application of audit techniques and tools should not. Compliance monitoring practices address the consistent application of audit techniques and the use of uniform tools to carry out compliance monitoring activities. The use of common tools and practices is fundamental to the credibility and reliability of an auditor's report. Compliance monitoring practices must continue to adhere to guidance provided by the ROP and be grounded in specific requirements set out through GAGAS and IIA for conducting engagements. In this regard, these documents serve as our foundational principles for executing compliance activities, and our objective is to demonstrate their use in a more transparent manner.

A. Processes

Processes allow us to define a methodology or set of tools that, when applied in a similar fashion, should result in a consistent output. Defining and applying well-defined techniques, tools, and methods to perform compliance monitoring will drive the ERO Enterprise to audit, review, and assess information in a consistent manner that leads to similar results and conclusions.

1. *Audit Techniques* – Auditing, by design, should provide objective analysis and information needed to make decisions necessary to determine compliance. Utilizing foundational approaches presented by the IIA and GAGAS provide for the design and staffing of an engagement as well as fundamental activities related to audit planning, performance (production), communication (publish), and the monitoring of mitigation plans. Following this guidance will assure that audits are properly staffed, designed, and executed in a coordinated and consistent manner. The following activities will be performed to achieve alignment:
    - Evaluate existing planning activities and related processes to create a uniform design specifically focusing on:
        - Understanding the risks associated with the registered entity
        - Defining engagement objectives
        - Determining data request needs
        - Determining resource allocation and needs relative to scope
        - Understanding registered entity control design
        - Determining tests of controls to establish reasonable assurance of compliance with reliability standards
        - Documenting planning activities to support work and ensure that any on-site testing is properly designed, effective, and efficient
    - Evaluate existing production activities and related processes to create a uniform design
        - Develop consistent testing methodology
        - Set criteria for information requirements to achieve engagement objectives
        - Implement criteria for maintaining documentation of work
        - Assess existing templates to determine if they should be adopted, changed, or removed and what additional templates are required

DRAFT

- Evaluate existing publication activities and related processes to create a uniform design (*this is addressed in the Systems section, III.B.2 "Reporting")
- Mitigation Plans – review processes and systems for documenting, tracking and validating the implementation of corrective actions

2. *Audit Planning Tools* – It is the responsibility of NERC to work with the Regional Entities to develop and provide useful tools. In certain instances these tools should also be beneficial to industry to evaluate risk, test their controls, understand the achieved compliance through those controls, and develop necessary corrective actions, as well as facilitate dialogue with the appropriate CEA. The following activities will be performed to achieve alignment:
   - Evaluate and adapt existing tools:
     - Actively Monitored List (AML) – modify the design to provide information relevant to the ERO Enterprise to empower the Region to determine a registered entity's audit scope based on risk and the understanding of controls
     - Annual Monitoring Plan – create a uniform ERO Enterprise Implementation Plan that is based on ROP coverage requirements and consideration of risk. Monitoring plans should:
       - Properly plan for required coverage
       - Balance resources for risk
       - Build in white space to add registered entities or flex for emerging risks
       - Be flexible to change engagements
       - Address risk relative to the entity
       - Understand staffing requirements relative to audits, spot checks, review of self-certification documentation and data submittals
     - FERC "13 – Questions" on Internal Compliance – Review the questions for incorporation into the risk assessment process.
     - Reliability Standard Audit Worksheet (RSAW) – Evaluate the document and potentially redesign it to assure it is a valuable tool that can be applied by auditors in the execution of their compliance monitoring work and by industry to have transparency to those approaches. Further, the processes must be reviewed for the maintenance and warehousing of the documents.
   - Continue to develop tools and identify opportunities for additional ones:
     - Entity Impact Evaluation (EIE) – The existing template needs to be reviewed to better define the attributes of risk that are necessary to monitor a registered entity for compliance with Reliability Standards, determine appropriate monitoring methods and scope (e.g., Audits, Spot Checking, etc.), and define the capture, retention, and maintenance of data.
     - Through the course of cataloguing tools relative to the documentation of systems, determine if additional tools exist that can be developed and applied to aid in audit planning.
3. *Compliance Monitoring Methods* – The ROP provides four primary compliance monitoring discovery methods to be used to assess compliance with Reliability Standards. In addition to

DRAFT

these methods, self-reporting is a very important aspect of the program as it is the most efficient way to identify issues annually accounts for nearly two-thirds of reported violations. In this regard, the ERO Enterprise wants to look for the discovery methods to be complementary to this reporting mechanism. Annual plans should allocate resources to activities to address risk and comply with refined coverage requirements while providing flexibility to address emerging risks.

- *Audits* – Audits involve a significant amount of resources and time and should be reserved for high-risk and complex engagements. Audits should be scoped to address the potential risk the entity poses to the BPS and the potential risk to comply with established reliability standards. Audits may be performed off-site or on-site; scoping may be broad or narrow; testing depth will vary depending on the design of controls and the level of assurance that can be obtained to determine that controls are functioning as designed. In this regard, audits must be redesigned from the current rigid structure to a more flexible format that allows Regional Entities to select the standards for the audit scope. (During 2013 we will undertake a project to review the AML to design a tool that better aids ERO Enterprise audit planning). The design of the audit engagement will be based on multiple opinions and scoped according to risk and the need to comply with coverage requirements outlined in the ROP. Audits will not be "one size fits all."
- *Spot Checking* – Spot Checking is an effective method to validate self-certification, periodic data submittals, mitigation activities, Find, Fix and Track, and Technical Feasibility Exceptions. It is an effective method for monitoring corrective actions as a result of items noted through an engagement or responding to emerging or changing risk. The method provides a level of precision that allows a Region to quickly mobilize to address changing or newly identified risk. Annual Implementation Plans should be designed to allow resources to be deployed based on risk assessments and changing needs.
- *Periodic Data Submittals* – Data submittals provide a cost-effective method for verifying compliance with reliability standards. Data submittals should be used to verify information submitted through self-certifications, as a tool to follow up on corrective actions, and as a way to quickly assess a registered entity's capability of handling emerging risks. Periodic data submittals should be designed into the overall annual plan and also used as a method when on-site visits cannot be performed. Ensuring that these submittals are efficient and useful—and not simply intensive paper exercises—is important to their effectiveness.
- *Self-Certification* – The self-certification tool should be designed to effectively engage with registered entities out of audit cycle in order to monitor changes in systems and control design and to discuss self-identified findings to ensure continued compliance. Self-certifications should also be used as a method to maintain a perpetual entity risk profile that would aid in scoping future engagements or trigger potential spot checking. Self-certifications need to be reviewed and assessed by the Regional Entities to identify what is being reported and determine any needed actions. Activities necessary to evolve this method include:
    - Assessing the current data request template for modifications

DRAFT

- Defining data and informational needs to minimize intrusiveness
- Designing a process to tailor self-certifications based on entity risk
- Building processes into annual planning to ensure certifications are reviewed and tested
- Creating a feedback process with the entity to provide possible process improvements or recommendations

B. Centers of Competency

The purpose of the Center of Competency will be to address a Multi-Registered Regional Entity's (MRRE) unique organizational structure. A center of competency will leverage a deep entity or functional expertise (at the Regional Entity level) to deliver an effective and efficient review that is applied in a consistent manner. Centers of competency will be built around three defining features:

- Demonstrated expertise
- Structured processes
- Continuous improvement to ensure approaches become more efficient

Skill sets will be used collaboratively across the ERO Enterprise to provide accountability within the regional footprint while activities are orchestrated out of the Center of Competency. An effective Center of Competency will optimize scarce resources, reduce engagements times, decrease duplication, and build on past successes.

V. PILOT PROGRAM:

The proposed Pilot Program will be outlined in the fifth concept paper, which collectively with the first four papers will form the basis of the informational filing with FERC in March 2013. General concepts and the purpose of the Pilot Program are being introduced within this paper to solicit discussion. The program will be managed in phases with the first phase beginning during the first half of 2013 and the final phase, which will lead to full implementation, occurring in the second half of 2015. Throughout each phase of the program, we will continue to refine audit tools and processes, deliver relevant training to develop staff capabilities, and openly communicate results while broadening capabilities and applications by Region and entity.

VI. CONCLUSION:

Restyling the compliance monitoring approach is built around reaching a desired end state that:

- Focuses on reliability to the Bulk Electric System
- Encourages self-monitoring of registered entities
- Fully utilizes discovery methods
- Balances risk and coverage to develop annual plans and design engagement;
- Utilizes tests of controls to validate compliance
- Delivers reports and findings that are relevant

DRAFT

- Supports the use of uniform tools by highly trained professionals
- Effectively provides information to Enforcement
- Openly communicates results

The ERO Enterprise approach is grounded in foundational audit principles and the ERO Enterprise governing documents. Focusing on people, processes, and systems will drive consistency and uniformity of approach. Through the use of the Pilot Program, we will demonstrate tools and approaches while designs of systems and training of people will be refined to reach full implementation. This paper serves as a basis for developing direction, setting high-level projects and sub-projects, assigning ownership, and establishing delivery dates. Provided as an appendix to this paper are three tables that discuss the activities to be undertaken. These tables will evolve as the ERO Enterprise identifies specific activities that must occur to support the sustainable end state.

DRAFT

APPENDIX

Table 1 - People

Primary Activity	Action	Regional Lead	Delivery Date
Acquire	Identify team to begin assessment	MRO	2/1/13
	Review existing job descriptions		5/1/13
	Identify and define core auditor competencies		7/1/13
	Develop standard staffing prototype		8/1/13
	Perform a regional staffing capability review and report results		10/1/13
	Create defined interviewing processes and interview training		10/1/13
	Create a long-term talent acquisition strategy and metrics		11/1/13
	Recommend proper staffing levels for risk and coverage		12/1/13
	Train staff how to interview candidates		
	Begin executing on acquisition strategy		
	Develop standardized annual reporting tool for staffing		12/1/13
Develop	Identify team to begin assessment	SERC	2/1/13
	Review all existing training tools and resources		5/1/13
	Provide recommendations on existing tools and needs		7/1/13
	Create development plan for staff, lead and managing auditors		
	Create tools to track training		
	Set minimum standards for training		
	Develop uniform auditor performance feedback tools		10/1/13
	Create training plan for existing staff		
	Create plan for newly acquired talent		
	Create annual review process for performance and development		12/1/13
	Reach full ERO Enterprise staff development		12/1/15
Retain	Identify team to begin assessment		2/1/13
	Review all existing retention tools – job growth, salary, etc.		5/1/13
	Report back recommendations		7/1/13
	Define key metrics for success of retention		
	Create annual reporting to discuss metrics		12/1/13

DRAFT

Table 2 - Processes

Primary Activity	Action	Project Lead	Delivery Date
Techniques	Planning Activities:		
	Identify team to perform assessment		
	Review and perform analysis on all planning activities		
	Make recommendations for best practices and needs		
	Create a uniform planning process		
	Deploy the uniform planning process		
	Production Activities:		
	Identify team to perform assessment		
	Review and perform analysis on all production practices		
	Provide recommendations for best practices and needs		
	Establish processes for assessment and testing of controls		
Audit Planning Tools	Identify team to begin assessment of tools	WECC	2/1/13
	Review and assess all audit planning tools and resources		
	Provide recommendations on base practices and needs		
	Review Actively Monitored List and make change recommendations	NERC	5/1/13
	Review CMEP-IP and make change recommendations	NERC	5/1/13
	Review RSAWs and make change recommendations	NERC	9/1/13
	Restart the EIE project and further define deliverables		
	Develop annual plans that leverage monitoring tools		
	Evaluate the current design of tools for application		
Compliance Monitoring Tools	Identify team to begin assessment	RFC	
	Audit:		
	Define the planning, production and publication phases		
	Create common work-paper procedures		
	Assess processes for on/off site engagements and scoping		
	Spot Checks:		
	Assess existing procedures for spot checks		
	Provide recommendations for restyling spot check		
	Implement spot check process changes		
	Data Submittals:

Glossary of Terms:

1. Compliance Enforcement Authority (CEA) – The entity responsible for assessing performance or outcomes if an entity is compliant with the associated Reliability Standard. The Compliance Authority may be either NERC or the Regional Entity.

2. ERO Enterprise – Refers to NERC and the eight Regions collectively.

3. Multi Regional Registered Entities – Entities that operate across more than one defined regional territory.

4. Center of Competency – A Center of Competency will be level of demonstrated competency at the Regional Entity level.

5. Complex Standards – Circumstances or situations that require a specific skill set or experience that may not be a core competency within a given Region.

Change State Element #1, Concept Paper
Restyle the Compliance Monitoring Approach

Feedback Questions for stakeholders:

1. From a registered entity perspective, how is the current compliance monitoring methods driving industry behavior. What should change?
2. What are the greatest burdens of time and resources for preparing for an audit and what can be done to alleviate the burden while still achieving reasonable assurance of compliance?
3. As a registered entity, what level of compliance monitoring and information gathering do you believe would provide NERC and Regional Entities assurance that you are meeting compliance obligations?
4. How does your entity sustain reasonable assurance of compliance with standards between scheduled engagements?
5. How should risk be considered in planning an audit? What elements of risk do you believe are relevant?
6. What are the anticipated challenges of considering risk for scoping and utilizing controls to gage compliance?
7. What are the anticipated benefits of monitoring activities considering risk for scoping and utilizing controls to gauge compliance? What are your concerns?
8. From a registered entity perspective, what types of reliability activities should be monitored with risk controls? Are these elements controllable? What reliability activities would not lend themselves to being monitored with risk controls?
9. As a registered entity, how do you feel professional judgment is being exercised today? What changes or improvements would you like to see?
10. Multi Regional Registered Entities - What are the most important considerations the ERO should focus on that will drive consistency or uniformity of the compliance program?

Incorporating Risk Concepts into the Implementation of Compliance and Enforcement

I. Introduction and The Need for Change

The Energy Policy Act of 2005 (the Act) created a reliability framework that includes the Federal Energy Regulatory Commission (FERC or the Commission), the Electric Reliability Organization (ERO) (designated as the North American Reliability Corporation (NERC)), and eight Regional Entities (NERC and the Regional Entities, collectively referred to as the ERO Enterprise) with thousands of stakeholders and nearly 2000 entities subject to the ERO's rules. Three of the primary responsibilities outlined by the Act are developing standards, promoting and monitoring compliance with those standards and enforcing acts of non-compliance with the standards – all with the overarching objective of avoiding cascading events and the resulting major loss of load.

Compliance and enforcement of the standards was delegated to the eight Regional Entities, subject to oversight by NERC and FERC. This responsibility came with the requirement and expectation that every violation, regardless of risk, be prosecuted. Violations came with the prospect of significant monetary penalties for noncompliance. This "zero tolerance" application of compliance and monitoring without regard to the risk to the bulk electric system (BES) has unduly focused attention and resources on compliance risk and administrative processes as opposed to reliability risk.

Over the last five years' through experience with the compliance and enforcement processes and feedback from stakeholders, the ERO Enterprise[1] has envisioned an end state that is founded on a risk-based approach. This vision will be developed through maturing the ERO Enterprise processes over the next three to five years and be tested through a pilot project as we reach full implementation[2]. It is not practical, effective or sustainable for the ERO Enterprise and Registered Entities to monitor and control all compliance to the same degree. Further, it is not practical, effective, nor sustainable for the ERO Enterprise and Registered Entities to treat all findings and discrepancies, as violations triggering the same degree of enforcement and evidentiary documentation. Where a violation does not pose a serious or higher risk to the reliability of the bulk power system, and the Registered Entity has a compliance program and internal controls that detect, assess, mitigates and self-reports the violation, the Regional Entity may decline to pursue and enforcement action.

[1] ERO Enterprise refers to NERC and the eight Regional Entities.
[2] The end-state envisioned will be developed over time, in part through pilot projects and the measured implementation of activities, tools and processes.

The risk-based approach the ERO Enterprise envisions will consider risk relative to the tools and processes applied to assure compliance as well as the disposition of instances of noncompliance incorporate risk concepts. To this end, the future risk-based approach of the CMEP will be a consistent (ERO Enterprise-wide) application of (A) compliance monitoring practices based on risk, (B) a "range of tools"[3] to prioritize and treat violations based on risk, (C) enforcement practices with clear distinctions based on risk to reliability and (D) a strengthened feedback loop from compliance monitoring and enforcement to the standards development process to incorporate considerations of actual risk into the standards development process.[4] This overall risk-informed end state will guide Registered Entities to be increasingly focused on reliability and toward self-critical corrective actions resulting in continuous contribution toward real reliability, rather than the current model. At the same time, the current enforcement and penalty model will be used for higher risk or serious violations.

This white paper discusses the end state envisioned as well as the benefits associated with incorporating risk management practices into the CMEP work and linking it to the standards development process through a feedback loop. Throughout the course of the whitepaper, the need and the basis for changing the compliance monitoring and enforcement work of the ERO Enterprise is established; the framework for changes to the compliance monitoring and enforcement work is presented; and the next steps to define the path forward and related activities are outlined. The changed state contemplated by this whitepaper is intended to be the basis for an informational filing by NERC with the Commission in March 2013.

II. The Proposed Changes Promote BES Reliability

The North American electric grid operating in real time is the world's most complex transmission system; in this regard, reliability risk is neither uniform across the grid nor constant over time, but is complex and interdependent. Assuring the reliability of this system requires understanding the risks that may impact its function and developing the controls to

[3] *See* Malcolm K. Sparrow, *The Regulatory Craft*, 100 (2000). Sparrow advocates using a "range of tools for procuring compliance and eliminating risks …." Our existing rules of procedure together with foundational documents referenced in the rules of procedure, such as the Yellow Book Government Audit Standards provide a range of tools which can be scoped and deployed based on risk. Those tools include audits, spot checks, data submittals and self-certifications. These tools, together with the ability of the Regional Entity to decline to enforce a violation, comprise a full "range of tools."

[4] These concepts will be implemented by (1) restyling the ERO's overall compliance approach to conform to well-established audit principles as described herein including the right to decline to pursue violations across the ERO Enterprise; (2) establishing the requirements for Regional Entity's records to facilitate NERC and FERC oversight; (3) establishing processes for information flow between compliance functions and enforcement functions as well as an open, transparent and clear approach as to which matters will be subject to enforcement procedures; and (4) redesigning the enforcement strategy to focus on serious or higher risks to the BES.

discover and mitigate those risks. Ultimately it is this proactive, risk-based approach that will allow the ERO Enterprise to provide reasonable assurance of current and future BES reliability.[5]

The end-state vision of a sound risk-based reliability approach will reflect principles that form the foundation for focus and prioritization, as well as recognition of the core elements that ensure reliability of the bulk electric system. In this end-state vision, the compliance, enforcement and standards elements form an integrated structure with focus on the priorities that most influence reliability. The alignment of processes, systems and resources will ensure the proper attention to those reliability matters. Lesser and more minor matters are considered and addressed in a far simpler fashion which encourages the documentation of internal self-corrective activities that diminish the potential for the accumulation of minor unaddressed matters.

The ERO must abandon "zero tolerance" compliance monitoring and enforcement because:

- The pursuit of all violations without regard to risk or administrative burden is neither effective nor sustainable.
- The focus has become documenting compliance, not reducing risk and improving reliability.
- Enforcement considers a historic state of reliability, not the current or future state of reliability.
- Improvements to processes, such as the administrative citation process or find, fix, track and report, reduce the ERO's administrative burden, but do not have commensurate impact on improving reliability and reducing industry's administrative burdens.

Therefore, to encourage and reward proactive self-assessment the ERO Enterprise should use a "full range of tools[6]" to shape compliance, monitoring and enforcement based on risk. The incorporation of risk management concepts into the ERO's work, from standards development to compliance monitoring and enforcement, will encourage compliance and risk mitigation.

DRAFT

[5] Former FERC Commissioner and Chairman Joseph T. Kelliher stated: "The Energy Policy Act of 2005 did not outlaw blackouts and the reliability provisions of section 215 do not promise perfect reliability at any price." *See*, *Remarks of the Honorable Joseph T. Kelliher, Executive Vice President – Federal Regulatory Affairs, FPL Group, Inc., Reliability Primer for Lawyers and Energy Professionals, Energy Bar Association,* 6,7 (April 28, 2010), http://utilitysvcs.info/docs/Kelliher%20NERC%20speech.pdf

[6] A full "range of tools" includes the ability to decline to pursue a violation. *See also note 2, supra.*

III. Effective Regulation Uses Risk-Based Concepts

Moving from zero tolerance to a risk management approach requires a different way of assessing reliability concerns. Dr. Malcolm K. Sparrow advocates that regulators use a risk-based "problem solving" approach which he describes in his book, *The Regulatory Craft*[7], as the:

> systemic identification of important hazards, risks, or patterns of noncompliance; an emphasis on risk assessment and prioritization as a … basis for resource allocation decisions … capacity for designing and implementing effective, creative, tailor-made solutions for each identified problem; the use of a range of tools for procuring compliance and eliminating risks; and the recognition of the need to retain and enhance the agency's enforcement 'sting' while using enforcement actions economically and with the context of coherent compliance strategies.[8]

The ERO Enterprise will adopt a "problem solving" approach that incorporates risk-based practices into its work, similar to other regulatory bodies with compliance and enforcement responsibilities. This approach will increase BES reliability and ERO Enterprise efficiency and effectiveness. The following describes how other U.S. Federal entities use a risk-based problem solving approach.

Many US federal agencies responsible for compliance and enforcement utilize risk management practices. The Securities and Exchange Commission (SEC)[9], the Environmental Protection Agency (EPA)[10], and the Occupational Safety and Health Administration (OSHA)[11] all have

[7] *See* Sparrow, *supra* note 1.

[8] *Id.*

[9] In "Compliance Programs, Penalty Mitigation and the FERC" former FERC General Counsel and Chief of Staff John Moot cites an SEC action forgoing enforcement because "the company had quickly identified the violations, promptly reported them, remedied them internally through disciplinary actions, and taken prospective corrective action to avoid future violations." *See*, John C. Moot, *Compliance Programs, Penalty Mitigation and the FERC*, 29 Energy Law Journal 547, 562-563 (2008).

[10] The EPA's policy on Incentives for Self-Policing, Discovery, Disclosure, Correction and Prevention of Violations provides: "The revised Policy … is designed to encourage greater compliance with Federal laws and regulations that protect human health and the environment. It promotes a higher standard of self-policing by waiving gravity-based penalties for violations that are promptly disclosed and corrected, and which were discovered systematically-that is, through voluntary audits or compliance management systems." See, *Environmental Protection Agency, Incentives for Self-Policing: Discovery, Disclosure, Correction and Prevention of Violations*, 65 Fed. Reg. 19,618 (2000), http://www.epa.gov/oecaerth/resources/policies/incentives/auditing/auditpolicy51100.pdf cited by Moot, *supra* note 8 at 564-65.

[11] OSHA's "star" status program also seeks to improve safety and health outside of enforcement. Under the "star" program, OSHA can exempt employers from routine inspections and allow them to claim "star" status in exchange for maintaining exemplary safety records and satisfying other program certification requirements. The pursuit of "star" status improves employee safety and health, decreases regulatory costs and enhances an entity's reputation. S*ee* Orly Lobel, *Interlocking Regulatory and Industrial Relations: The Governance of Workplace Safety,* 57 ADMIN. L. REV. 1071, 1105-08 (2005).

policies, programs and discretion to encourage compliance and allow the agency to decline to pursue a violation based on the particular set of circumstances and facts.[12] Companies subject to regulations are encouraged to be self-policing "because government resources are limited, universal compliance cannot be achieved without active efforts by the regulated community to police themselves."[13]

FERC's processes provide "great flexibility in fashioning the most appropriate and effective remedies and sanctions for each violation…." This includes the ability to decline to pursue an enforcement matter. In its Revised Policy Statement on Enforcement[14] the Commission stated "between 2005 and 2007, Enforcement staff closed approximately 75% of its investigations without any sanctions being imposed, even though Enforcement staff found a violation in about half of those closed investigations."[15]

Risk-based concepts are clearly contemplated in NERC's Rules of Procedure Appendix 4C - Compliance Monitoring and Enforcement Program which provides: "Compliance Audit process conducted in the United States shall be based on professional auditing standards recognized in the U.S. including Generally Accepted Auditing Standards, Generally Accepted Government Auditing Standards, and standards sanctioned by the Institute of Internal Auditors."[16] These professional standards are well-established and well-accepted. They provide a principled basis for conducting the ERO's compliance monitoring work in a consistent manner and they incorporate risk-based concepts. For example, the Generally Accepted Government Auditing Standards (GAGAS) "provide a framework for conducting high quality audits with competence, integrity, objectivity and independence."[17] "GAGAS contains requirements and guidance

[12] *See*, John C. Moot, *Compliance Programs, Penalty Mitigation and the FERC*, 29 Energy Law Journal 547(2008).
[13] *See, Environmental Protection Agency, Incentives for Self-Policing: Discovery, Disclosure, Correction and Prevention of Violations, 65 Fed. Reg. 19,618 (2000),* http://www.epa.gov/oecaerth/resources/policies/incentives/auditing/auditpolicy51100.pdf *cited by Moot, supra note 8 at 564-65.*
[14] *See Revised Policy Statement on Enforcement,* 123 FERC ¶ 61,156 (2008).
[15] *Id.* at P 9. For examples of self-reports and investigations closed with no action, *see* 2011 Report on Enforcement Prepared by the Staff of the Office of Enforcement, Federal Energy Regulatory Commission (November 17, 2011), http://www.ferc.gov/legal/staff-reports/11-17-11-enforcement.pdf.
[16] *See GAO Government Audit Standards (December 1, 2011)*, 6.05, 6.16-6.22, 5.44(b.), citing *Institute of Internal Auditors (IIA) International Standards for the Professional Practice of Internal Auditing*. Chapter 6 "Field Work Standard for Performance Audits" provides an existing guide. For example, "adequacy of the audited entity's systems and processes to detect significant errors" is a factor affecting audit risk. The "nature, timing or extent" of the audit may be altered based on the auditor's assessment of internal controls. Similarly, the Institute of Internal Auditors (IIA) International Professional Practices Framework Performance standard 2130 – Control requires that the internal audit function "evaluate the adequacy and effectiveness of controls…" These themes are also common in American Institute of Certified Public Accountants (AICPA) Generally Accepted Auditing Standards (GAAS) – Standards of Field Work.
[17] *See GAO Government Audit Standards (December 1, 2011)*, 1.04.

dealing with ethics, independence, auditors' professional competence and judgment, quality control, the performance of field work and reporting."[18]

IV. The End State of the Compliance Monitoring and Enforcement Program

A. Transition to Compliance Monitoring Based on Risk

The ERO Enterprise is in the "assurance" business. There are three common risks – inherent risk[19], control risk[20], and detection risk,[21] that must be considered. The FERC approved reliability paradigm already addresses inherent risk to the BES in the functional model, tiers of standards, and degrees of violations. Accordingly, the Regional Entities' compliance staffs now seek to understand the inherent risk posed by Registered Entities to the BES by considering such factors as their registered functions and applicable standards, as well as their size, geography, technological capability, and past performance.

To move away from the existing compliance monitoring processes and incorporate a risk-based approach, the Regions will also need to understand the control risk posed by the Registered Entities, an effort that would require examining the procedures and controls[22] those entities have in place to reduce risk and comply with the standards. An agreed-upon method or set of criteria used by the ERO Enterprise that adequately addresses control risk will be developed through the course of the pilot project.[23] While the assessment methodology will be based on consistent foundational audit principles, the consideration of risk and actual design of controls will vary, as no two entities are exactly alike in system design, configuration, programs, plans, and business plans or functions performed. This approach therefore takes into account the differences in Registered Entities and the risks posed to the BES. It also reflects the well-established assurance work practice to document an understanding of controls during the conduct of work as opposed to using a generic one size fits all approach that ignores or does

[18] *Id*. at 1.05.

[19] Inherent risk is the risk posed by the Registered Entity because of intrinsic factors such as its registered functions. For example, all other factors being equal a TOP (Transmission Operator) poses more inherent risk to BES reliability than a PSE (Purchasing-Selling Entity).

[20] Control Risk refers to the risk that a violation or risk to BES reliability could occur but may not be detected and corrected or prevented by the Registered Entity's compliance program and internal control mechanism.

[21] Detection risk is the risk that the ERO Enterprise will not identify a serious or higher risk to BES reliability. Detection risk increases when inherent risk or control risk increases. Therefore, when control risk and/or inherent risk is high, audit scope and procedures must increase.

[22] *See GAO Government Audit Standards (December 1, 2011)*, 6.16-6.22, 5.44(b.), citing *Institute of Internal Auditors (IIA) International Standards for the Professional Practice of Internal Auditing*.

[23] Criteria such as the five principles of "highly reliable organizations" may be used in the beginning and refined over time – those five principles being: preoccupation with failure, reluctance to simplify, sensitivity to operations, commitment to resilience, and deference to expertise. *See generally* Kathleen Sutcliffe and Karl Weick, *Managing the Unexpected, Resilient Performance in an Age of Uncertainty*, John Wiley & Sons (2d ed. 2007).

not take into account the company's internal controls or the risk posed by the Registered Entity.

Once the ERO Enterprise establishes the method for understanding Registered Entities' risk and controls, the Regional Entities would refer to these characteristics to assess, evaluate and document the strength of those controls as part of their audits and to plan other compliance work. During the course of the pilot project the ERO will develop the practices, procedures and training to ensure consistency across the eight Regional Entities. During full deployment the ERO will continue to provide oversight and work with the eight Regional Entities to develop best practices and ensure consistency (and where applicable uniformity). Understanding both the risk and the environment within which the risk is occurring as well the Registered Entities' internal controls, the Regional Entities would take existing controls into account to develop the scope, method, and frequency of their compliance work.[24] The Regional Entities would also recognize that Registered Entities may exhibit varying levels of maturity vis-à-vis other members of the industry and/or in regard to their own distribution of resources.

These changes can be implemented by using the existing compliance monitoring tools including audits, spot checks, self-certifications, and data submittals. These tools can also be tailored both in terms of scope, conduct, and frequency based on risk and the Registered Entities' internal controls. Registered Entities that demonstrate an acceptable level of controls would be benefited by more focused testing because the risk controls could be documented and generally relied upon by the compliance staff in the conduct of the work.

The long-reaching benefits to reliability and to the industry members will be significant. Registered Entities will be encouraged to self-assess their actual controls on an ongoing basis and self-report any instances of non-compliance. These self-reports, absent significant risk to the BES, will be recorded by the Regional Entity in a segregated database without additional regulatory filings or approvals. The Regional Entity's determinations documented by work papers will be final. The Regional Entity will be accountable for and subject to oversight and audit by NERC and by FERC for the conduct of its work. The work of the Regional Entities' compliance personnel and the efforts by Registered Entities to demonstrate compliance will have a more focused scope. Thus, as a result of Registered Entities' implementing acceptable risk controls and self-reporting any instances of non-compliance, the cost of compliance will be aligned with the management of reliability risks and ultimately the cost of compliance will be

[24] Evaluating risk controls along these lines is not novel, and has been used in other industries, for example with respect to Audit Standard-5 (AS-5). *Approved by the Securities Exchange Commission, AS-5* allows auditors to scale the scope of an audit based on the strength of controls developed by the company being audited. *See PCAOB Release No. 2007-005A* (June 12, 2007). This method is also consistent with the GAO standards relating to internal controls. *See GAO Government Audit Standards* (December 1, 2011), paragraphs 6.16 - 6.22.

lower. The investments in strong procedures around reliability and security will have a far greater payoff in terms of the reliability and resiliency of the BES. Robust compliance monitoring will not only improve BES reliability but will also provide value for both the ERO Enterprise and Registered Entities.[25]

B. Transition to Prioritizing and Treating Violations in Accordance with their Risk

With an understanding of a Registered Entity's inherent and control risk, the Regional Entities' staff would then be able to consider whether and to what extent that entity's compliance with the standards poses a risk to BES reliability. The ERO Enterprise's[26] compliance monitoring and enforcement discretion will be guided by an understanding of the risk; the environment within which the risk is occurring; the Registered Entities' internal controls; any patterns of non-compliance; and the significance of the potential violation to BES reliability given the complexity, location, nature and size of the Registered Entity. Errors or potential violations that are detected through internal controls, corrected through a strong compliance culture, and self-reported generally should not be punished with administrative process, enforcement proceedings, or penalties absent a material risk to the BES.

If a Regional Entity declined to pursue a matter, it would be recorded in a database[27] that NERC and FERC could audit. This will enable the ERO Enterprise and the Registered Entities to expend their resources more efficiently and effectively, and shift focus beyond compliance risk to include meaningful self-assessments and an evaluation of risk to the BES, thereby improving the standards development process. Traditional enforcement will be reserved for matters that pose a serious or higher risk to the BES and penalties will be assessed to send clear signals to the industry about the most significant risks in order to create change.

This approach will introduce greater flexibility into the ERO Enterprise practices, which will allow it to focus on the higher risks to reliability while simultaneously providing clear signals to the Registered Entities about the ERO Enterprise's identified areas of concern and its risk prioritization. Moreover, this risk-based regulatory strategy will encourage strong internal controls and self-reporting such that self-reporting will be an objective measure of its success.

---

[25] *See Ernst & Young, Leveraging Value from Internal Controls, 5 (2006)("By not aligning risk management and internal controls investments with strategic initiatives, companies are jeopardizing operational and financial performance and, over the long run, will not optimize return to shareholders.").* http://www.section404.org/UserFiles/File/research/Ernst/44_ernst_young_leveraging_value_from_internal_controls.pdf

[26] The ERO Enterprise refers to NERC and the eight Regional Entities.

[27] The database must be uniform across the eight Regional Entities and must be administratively easy for both Regional Entities and Registered Entities to use.

As the Commission has stated, "[a]chieving compliance, not assessing penalties is the central goal of our enforcement efforts."[28]

C. Transition to Utilizing Compliance Monitoring and Enforcement to Send Meaningful Signals Based on Risk

The ERO Enterprise will refine its use of the compliance monitoring and enforcement process to ensure that it provides more meaningful signals to the Registered Entities about the ERO Enterprise's identified areas of concern and its risk prioritization.

Going forward, the Regional Entity may decline to pursue possible violations that are promptly identified and reported as the result of an effective internal compliance program or controls before the occurrence of any harm. These matters will be recorded in a data base. The matter is then final as to the Registered Entity; the Regional Entity's decision and work papers are subject to audit by NERC and by FERC. This is important because it encourages the regulated community to adopt and enhance existing strong, effective controls which includes the correction of errors or instances of non-compliance that are detected. BES reliability depends on robust compliance programs and internal controls. The ERO Enterprise will retain the ability to impose penalties up to the statutory maximum and/or increased monitoring and broader audit scope, for those violations that pose a serious or higher risk and/or represent the failure to implement adequate controls.

Making a clear distinction between the ERO's response to violations that are detected, assessed and mitigated pursuant to robust internal controls and compliance programs and those matters that are discovered by the ERO or pose a serious risk to the BES will provide unambiguous signals about the ERO Enterprise's identified areas of concern and risk prioritization. More importantly, Registered Entities will strengthen their existing internal controls and compliance programs that promptly detect, assess, correct and self-report possible issues of noncompliance to the ERO Enterprise.

D. Transition to Reliability Standards Based on Risk

The ERO Enterprise will develop a feedback loop from compliance monitoring and enforcement to the standards development process that will assist in the identification and development of Reliability Standards that are intended to address the most significant risks to BES reliability. The ERO Enterprise will continue to leverage industry and ERO Enterprise subject matter experts in the standards development process and support those subject matter expert teams

[28] *See Policy Statement on Compliance,* 125 FERC ¶ 61,058 (2008) at P.1.

with legal and compliance staff expertise to help ensure that upon implementation the Reliability Standards address the intended risk to reliability and are clear, concise and narrowly drawn to avoid unintended consequences.

When a given Reliability Standard is found to be ineffective because it has only a minimal impact on reducing risk (or in fact increases risk), the ERO Enterprise will work to revise, replace or eliminate the Reliability Standard.

V. Next Steps: Implementing Risk-Based Concepts

NERC will address the key components of these changes in an informational filing made March 2013 to FERC. The key components include: (1) restyling the ERO's overall compliance approach to conform to well-established audit principles as described herein including the right to decline to pursue violations across the ERO Enterprise; (2) establishing the requirements for Regional Entity's records to facilitate NERC and FERC oversight; (3) establishing processes for information flow between compliance functions and enforcement functions as well as an open, transparent and clear approach as to which matters will be subject to enforcement procedures; and (4) redesigning the enforcement strategy to focus on serious or higher risks to the BES.

Presentations regarding these concepts and next steps will be made at the November NERC BOTCC, MRC and BOT meetings. In addition, there will be subsequent presentations at regularly scheduled meetings and supplemental webinars as needed to introduce and discuss the key change state elements and related activities. The ERO Enterprise anticipates that this model will mature and be fully deployed over the next three to five years.

The ERO Enterprise will also introduce these approaches through a pilot project[29] as the initial steps towards full implementation. FERC has previously recognized the value of pilot projects, pointing out that "[n]o matter how good the data suggesting that a regulatory change should be made, there is no substitute for reviewing the actual results of a regulatory action." Order No. 637, FERC Stats. & Regs. ¶ 31,091 (2000) at 31,279. The U.S. Court of Appeals for the D.C. Circuit agrees: "For at least 30 years this court has given special deference to agency development of such experiments, precisely because of the advantages of data developed in

[29]The pilot project will performed across and among the regions with ERO oversight in conjunction with selected registered entities, the results of which will be communicated as lessons learned in the overall development of the Compliance Enforcement Initiative.

the real world."[30] The goal of each pilot project will be to further define the risk-based approach and develop effective tools, training, procedures, and policies to allow the ERO Enterprise to deploy these concepts in a consistent manner across all Regional Entities. The ERO Enterprise will keep FERC apprised of the progress of the pilot projects, and at the conclusion of each pilot project, the ERO Enterprise will make appropriate revisions to the pilot projects and any necessary filings to deploy the pilot projects throughout the ERO Enterprise.

Beginning in November 2012 through early February 2013, NERC will be issuing a series of concept papers addressing the four key components described, the pilot project and a draft filing.

VI. Conclusion

The ERO Enterprise believes that the following benefits will result from employing risk-based methods:

- Improved Bulk Electric System reliability due to Registered Entities' enhancing their existing policies, processes and procedures; internal controls; and cultures of compliance that self-assess risk and compliance and promptly correct matters before they have a material impact on reliability.
- Improved standards development and retirement process because there is a compliance monitoring and enforcement feedback loop.
- Improved utilization of all participants' resources due to focus on higher risks.
- Increased efficiency for the ERO Enterprise and Registered Entities resulting in lower administrative costs because not all potential violations are processed.
- Drive consistency with the eight Regional Entities in compliance and enforcement.
- Improved Bulk Electric System reliability due to the use of the compliance monitoring and enforcement process to provide more meaningful signals about the ERO Enterprise's identified areas of concern and risk prioritization.

Subject: RCC Nov 2012 Meeting - TFSP Letter Regarding the NPCC Disturbance Monitoring Equipment Standard

Phil,

Attached, please find the TFSP letter regarding the NPCC Disturbance Monitoring Equipment Standard for the November 27, 2012 RCC Meeting.

Thanks,
Quoc

A. Introduction

1. **Title:** **Disturbance Monitoring**

2. **Number:** PRC-002-NPCC-01

3. **Purpose:** Ensure that adequate disturbance data is available to facilitate Bulk Electric System event analyses. All references to equipment and facilities herein unless otherwise noted will be to Bulk Electric System (BES) elements.

4. **Applicability:**

   4.1. Transmission Owner

   4.2. Generator Owner

   4.3. Reliability Coordinator

5. **(Proposed) Effective Date:** To be established.

B. Requirements

R1. Each Transmission Owner and Generator Owner shall provide Sequence of Event (SOE) recording capability by installing Sequence of Event recorders or as part of another device, such as a Supervisory Control And Data Acquisition (SCADA) Remote Terminal Unit (RTU), a generator plant Digital (or Distributed) Control System (DCS) or part of Fault recording equipment. This capability shall: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

1.1 Be provided at all substations and at locations where circuit breaker operation affects continuity of service to radial Loads greater than 300MW, or the operation of which drops 50MVA Nameplate Rating or greater of Generation, or the operation of which creates a Generation/Load island.

Be provided at generating units above 50MVA Nameplate Rating or series of generating units utilizing a control scheme such that the loss of 1 unit results in a loss of greater than 50MVA Nameplate Capacity, and at Generating Plants above 300MVA Name Plate Capacity.

1.2 Monitor the following at each location listed in 1.1:

1.2.1 Transmission and Generator circuit breaker positions

1.2.2 Protective Relay tripping for all Protection Groups that operate to trip circuit breakers identified in 1.2.1.

1.2.3 Teleprotection keying and receive

R2. Each Transmission Owner shall provide Fault recording capability for the following Elements at facilities where Fault recording equipment is required to be installed as per R3: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

2.1 All transmission lines.

2.2 Autotransformers or phase-shifters connected to busses.

2.3 Shunt capacitors, shunt reactors.

2.4 Individual generator line interconnections.

2.5 Dynamic VAR Devices.

2.6 HVDC terminals.

R3. Each Transmission Owner shall have Fault recording capability that determines the Current Zero Time for loss of Bulk Electric System (BES) transmission Elements. *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

R4. Each Generator Owner shall provide Fault recording capability for Generating Plants at and above 200 MVA Capacity and connected through a generator step up (GSU) transformer to a Bulk Electric System Element unless Fault recording capability is already provided by the Transmission Owner. *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

R5. Each Transmission Owner and Generator Owner shall record for Faults, sufficient electrical quantities for each monitored Element to determine the following: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

5.1 Three phase-to-neutral voltages. (Common bus-side voltages may be used for lines.)

5.2 Three phase currents and neutral currents.

5.3 Polarizing currents and voltages, if used.

5.4 Frequency.

5.5 Real and reactive power.

R6. Each Transmission Owner and Generator Owner shall provide Fault recording with the following capabilities: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

6.1 Each Fault recorder record duration shall be a minimum of one (1) second.

6.2 Each Fault recorder shall have a minimum recording rate of 16 samples per cycle

6.3 Each Fault recorder shall be set to trigger for at least the following:

6.3.1 Monitored phase overcurrents set at 1.5 pu or less of rated CT secondary current or Protective Relay tripping for all Protection Groups.

6.3.2 Neutral (residual) overcurrent set at 0.2 pu or less of rated CT secondary current.

6.3.3 Monitored phase undervoltage set at 0.85 pu or greater.

6.4 Document additional triggers and deviations from the settings in 6.3.2 and 6.3.3 when local conditions dictate.

R7. Each Reliability Coordinator shall establish its area's requirements for Dynamic Disturbance Recording (DDR) capability that: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

7.1 Provides a minimum of 1 DDR per 3,000 MW of peak Load.

7.2 Records dynamic disturbance information with consideration of the following facilities/locations:

7.2.1 Major Load centers.

7.2.2 Major Generation clusters.

7.2.3 Major voltage sensitive areas.

7.2.4 Major transmission interfaces.

7.2.5 Major transmission junctions.

7.2.6 Elements associated with Interconnection Reliability Operating Limits (IROLs).

7.2.7 Major EHV interconnections between operating areas.

R8. Each Reliability Coordinator shall specify that DDRs installed, after the approval of this standard, function as continuous recorders. *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

R9. Each Reliability Coordinator shall specify that DDRs are installed with the following capabilities: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

9.1 A minimum recording time of sixty (60) seconds per trigger event.

9.2 A minimum data sample rate of 960 samples per second, and a minimum data storage rate for RMS quantities of six (6) data points per second.

9.3 Each DDR shall be set to trigger for at least one of the following (based on manufacturers' equipment capabilities):

9.3.1 Rate of change of Frequency.

9.3.2 Rate of change of Power.

9.3.3 Delta Frequency (recommend 20 mHz change).

9.3.4 Oscillation of Frequency.

R10. Each Reliability Coordinator shall establish requirements such that the following quantities are monitored or derived where DDRs are installed: *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

10.1 Line currents for most lines such that normal line maintenance activities do not interfere with DDR functionality.

10.2 Bus voltages such that normal bus maintenance activities do not interfere with DDR functionality.

10.3 As a minimum, one phase current per monitored Element and two phase-to-neutral voltages of different Elements. One of the monitored voltages shall be of the same phase as the monitored current.

10.4 Frequency.

10.5 Real and reactive power.

R11. Each Reliability Coordinator shall document additional settings and deviations from the required trigger settings described in R9 and the required list of monitored quantities as described in R10, and

report this to the Regional Entity (RE) upon request. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R12. Each Reliability Coordinator shall specify its DDR requirements including the DDR setting triggers established in R9 to the Transmission Owners and Generator Owners. *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

R13. Each Transmission Owner and Generator Owner that receives a request from the Reliability Coordinator to install a DDR shall acquire and install the DDR in accordance with R12. Reliability Coordinators, Transmission Owners, and Generator Owners shall mutually agree on an implementation schedule. *[Violation Risk Factor: Medium] [Time Horizon: Planning and Operations Planning]*

R14. Each Transmission Owner and Generator Owner shall establish a maintenance and testing program for stand alone DME (equipment whose only purpose is disturbance monitoring) that includes: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

14.1 Maintenance and testing intervals and their basis.

14.2 Summary of maintenance and testing procedures.

14.3 Monthly verification of communication channels used for accessing records remotely (if the entity relies on remote access and the channel is not monitored to a control center staffed around the clock, 24 hours a day, 7 days a week (24/7)).

14.4 Monthly verification of time synchronization (if the loss of time synchronization is not monitored to a 24/7 control center).

14.5 Monthly verification of active analog quantities.

14.6 Verification of DDR and DFR settings in the software every six (6) years.

14.7 A requirement to return failed units to service within 90 days. If a DME device will be out of service for greater than 90 days the owner shall keep a record of efforts aimed at restoring the DME to service.

R15. Each Reliability Coordinator, Transmission Owner and Generator Owner shall share data within 30 days upon request. Each Reliability Coordinator, Transmission Owner, and Generator Owner shall provide recorded disturbance data from DMEs within 30 days of receipt of the request in each of the following cases: *[Violation Risk Factor: Lower] [Time Horizon: Operations]*

15.1 NERC, Regional Entity, Reliability Coordinator.

15.2 Request from other Transmission Owners, Generator Owners within NPCC.

R16. Each Reliability Coordinator, Transmission Owner and Generator Owner shall submit the data files conforming to the following format requirements: *[Violation Risk Factor: Lower] [Time Horizon: Operations]*

16.1 The data files shall be capable of being viewed, read, and analyzed with a generic COMTRADE analysis tool as per the latest revision of IEEE Standard C37.111.

16.2 Disturbance Data files shall be named in conformance with the latest revision of IEEE Standard C37.232.

16.3 Fault Recorder and DDR Files shall contain all monitored channels. SOE records shall contain station name, date, time resolved to milliseconds, SOE point name, status.

R17. Each Reliability Coordinator, Transmission Owner and Generator Owner shall maintain, record and provide to the Regional Entity (RE), upon request, the following data on the DMEs installed to meet this standard: *[Violation Risk Factor: Lower] [Time Horizon: Operations]*

17.1 Type of DME.

17.2 Make and model of equipment.

17.3 Installation location.

17.4 Operational Status.

17.5 Date last tested.

17.6 Monitored Elements.

17.7 All identified channels.

17.8 Monitored electrical quantities.

C. Measures

M1. Each Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it provided Sequence of Event recording capability in accordance with 1.1 and 1.2. (R1)

M2. Each Transmission Owner shall have, and provide upon request, evidence that it provided Fault recording capability in accordance with 2.1 to 2.6. (R2)

M3. Each Transmission Owner shall have, and provide upon request, evidence that it provided Fault recording capability that determined the Current Zero Time for loss of Bulk Electric System (BES) transmission Elements in accordance with R3.

M4. Each Generator Owner shall have, and provide upon request, evidence that it provided Fault recording capability for its Generating Plants at and above 200 MVA Capacity in accordance with R4.

M5. Each Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it records for Faults, sufficient electrical quantities for each monitored Element to determine the parameters listed in 5.1 to 5.5. (R5)

M6. Each Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it provided Fault recording capability in accordance with 6.1 to 6.4. (R6)

M7. Each Reliability Coordinator shall have, and provide upon request, evidence that it established its area's requirements for Dynamic Disturbance Recording (DDR) capability in accordance with 7.1 and .2. (R7)

M8. Each Reliability Coordinator shall have, and provide upon request, evidence that DDRs installed after the approval of this standard function as continuous recorders. (R8)

M9. Each Reliability Coordinator shall have, and provide upon request, evidence that it developed DDR setting triggers to include the parameters listed in 9.1 to 9.3. (R9)

M10. Each Reliability Coordinator shall have, and provide upon request, evidence that DDRs monitor the Elements listed in 10.1 through 10.5. (R10)

M11. Each Reliability Coordinator shall have, and provide upon request, evidence that it documented additional settings and deviations from the required trigger settings described in R9 and the required list of monitored quantities as described in R10. (R11)

M12. Each Reliability Coordinator shall have, and provide upon request, evidence that it specified its DDR requirements which included the DDR setting triggers established in R9 to the Transmission Owners and Generator Owners in the Reliability Coordinator's area. (R12)

M13. Each Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it acquired and installed the DDRs in accordance with the specifications contained in the Reliability Coordinator's request, and a mutually agreed upon implementation schedule. (R13)

M14. Each Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it has a maintenance and testing program for stand alone DME

(equipment whose only purpose is disturbance monitoring) that meets the requirements in 14.1 through 14.7. (R14)

M15. Each Reliability Coordinator, Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it provided recorded disturbance data from DMEs within 30 days of the receipt of the request from the entities listed in 15.1 and 15.2. (R15)

M16. Each Reliability Coordinator, Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it submitted the data files in a format that meets the requirements in 16.1 through 16.3. (R16)

M17. Each Reliability Coordinator, Transmission Owner and Generator Owner shall have, and provide upon request, evidence that it maintained a record of and provided to NPCC when requested, the data on DMEs installed meeting the requirements 17.1 through 17.8. (R17)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

NPCC Compliance Committee

1.2. Compliance Monitoring Period and Reset Time Frame

Not Applicable

1.3. Data Retention

The Transmission Owner and Generator Owner shall keep evidences for three calendar years for Measures 1, 5, 6, 13, 16 and 17.

The Transmission Owner shall keep evidence for three years for Measures 2 and 3.

The Generator Owner shall keep evidence for three years for Measure 4.

The Reliability Coordinator shall keep evidence for three years for Measures 7, 8, 9, 10, 11, 12, 16 and 17.

The Transmission Owner and Generator Owner shall keep evidences for twenty-four calendar months for Measures 14 and 15.

The Reliability Coordinator shall keep evidence for twenty-four calendar months for Measure 15.

If a Transmission Owner, Generator Owner or Reliability Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit and all subsequent record.

1.4. Compliance Monitoring and Assessment Processes

- Self-Certifications
- Spot Checking
- Compliance Audits
- Self-Reporting
- Compliance Violation Investigations
- Complaints

1.5. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1 The Transmission Owner or Generator Owner provided the Sequence of Event recording capability meeting the bulk of R1 but missed…	Up to and including 10% of the total set, which is the product of the total number of locations in 1.1 times the total number of parameters in 1.2. Version History

Version	Date	Action	Change Tracking
1	November 4, 2010	Adopted by NERC Board of Trustees	New
1	October 20, 2011	FERC Order issued approving PRC-002-NPCC-01 (FERC's Order became effective on October 20, 2011)	

Implementation Plan for PRC-002-NPCC-1

Disturbance Monitoring

Background

In developing the Implementation Plan for PRC-002-NPCC-1 the Standard Drafting Team considered the following:

1. The requirements listed in this Regional Standard are intended to cover all aspects of the utilization of Disturbance Monitoring equipment. The intent of the Standard is to be more stringent than the continent wide Standard under development at NERC. After the approved NERC continent wide Standard is issued, PRC-002-NPCC-1 will be revisited to eliminate any redundancies.

2. The refueling outage schedules of nuclear plants will be considered when determining their compliance.

3. Any implementation plan will be impacted by the resource availability and approval processes of the Reliability Coordinators, Transmission Owners, and Generator Owners.

4. It is assumed the Reliability Coordinators have already established their DDR needs. If not, "time zero" will be after the Reliability Coordinator issues the locations and needs for additional DDR equipment.

Effective Dates

1. Within two (2) years of FERC and Canadian entities' approvals, entities shall be 50 percent compliant at facilities required to have DME capabilities by:

   a. Installing Sequence of Events (SOE) capability at 50 percent of the facilities that previously had no SOE capability (percent complete will be based on the number of facilities completed)

   b. Installing additional SOE capability to facilities with existing SOEs such that 50 percent of the total required capability is complete (percent complete will be based on the number of SOE points required)

   c. Installing Fault Recording capability at 50 percent of the facilities that previously had no Fault Recording capability (percent complete will be

based on the number of facilities completed)

d. Installing additional Fault Recording capability to facilities with existing Fault Recording capability such that 50 percent of the required capability is complete (percent complete will be based on the number of traces required)

e. Installing Dynamic Disturbance Recording (DDR) capability at 50 percent of the facilities that previously had no DDR capability (percent complete will be based on the number of facilities completed versus those required by the Reliability Coordinator)

f. Installing additional DDR capability to facilities with existing DDR capability such that 50 percent of the required capability is complete (percent complete will be based on the number of elements as required by the Reliability Coordinator)

2. Within three (3) years of FERC and Canadian entities' approvals, entities shall be 75 percent compliant at facilities required to have DME capabilities by:

a. Installing SOE capability at 75 percent of the facilities that previously had no SOE capability (percent complete will be based on the number of facilities completed)

b. Installing additional SOE capability to facilities with existing SOEs such that 75 percent of the total required capability is complete (percent complete will be based on the number of SOE points required)

c. Installing Fault Recording capability at 75 percent of the facilities that previously had no Fault Recording capability (percent complete will be based on the number of facilities completed)

d. Installing additional Fault Recording capability to facilities with existing Fault Recording capability such that 75 percent of the required capability is complete (percent complete will be based on the number of traces required)

e. Installing DDR capability at 75 percent of the facilities that previously had no DDR capability (percent complete will be based on the number of facilities completed versus those required by the Reliability Coordinator)

f. Installing additional DDR capability to facilities with existing DDR capability such that 75 percent of the required capability is complete (percent complete will be based on the number of elements as required by the Reliability Coordinator)

3. Within four (4) years of FERC and Canadian entities' approvals, all (100 percent) SOE, Fault Recording, and DDR capability shall be installed to satisfy the requirements of this Standard.

Re: TFSP Response to the RCC request for clarification to NPCC Disturbance Monitoring Regional Standard PRC-002-NPCC-01 as it pertains to the changes to the BES definition and the resulting applicability expansion beyond the original intent.

Ladies and Gentlemen:

At the September 2012 Reliability Coordinating Committee (RCC) meeting, the RCC gave direction to the Task Force on System Protection (TFSP) to explore the possibility of providing an interpretation document which could stand with the existing approved NPCC regional standard. This would provide an avenue around (without going through the standards review process) the tremendous cost that would be borne by the member entities in the NPCC region due to the modification to definition of the term "BES".

At the September, 2012 meeting, the TFSP discussed the topic at length, coming to the conclusion, that the technical aspects of the document were sound with no avenue for any different interpretation. As a result, TFSP would like to review some previous statements made and put forth two actionable items for the RCC.

In regards to the expanded applicability resulting from the definition change, the TFSP does not support the automatic expanded applicability of PRC-002-NPCC-1 Standard to all facilities as defined by the NERC approved revised BES definition for the following reasons:

1. The standard's applicability to non-BPS facilities is not supported by the original SP-6 Technical Report.
2. There was a prior understanding by all involved in the development and approval of PRC-002-NPCC-1 that any future revision to the BES definition would necessitate a review and revision to this Standard based upon the final definition of the BES.
3. The cost associated with applying PRC-002-NPCC-1 to all facilities as defined by the NERC approved revised BES definition is prohibitive, unjustifiable, and places an undue burden on the entities in terms of financial and human resources. Without due regard given to the impact of the standard by the revised BES definition, this standard

NPCC, Inc.
NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE. OF THE AMERICAS, NEW YORK, NY 10018 (212) 840-1070 FAX (212) 302-2782

will no longer meet cost effectiveness requirements and will likely result in members spending less on other reliability improvements such as relay replacements.

Table 1 below provides the RCC with the estimated capital installation costs alone for several member utilities. Included in these costs are the engineering, construction, and test resources required for these installations. There will also be additional costs involved to provide the necessary communications to some of the smaller and more remote substations (where communications are not presently available) for physical retrieval of records, and additional equipment needed for archiving all the additional records. In addition, from an O&M perspective, there will be significant ongoing engineering and field testing resources required to accomplish the periodic verification, collection, analysis, and archival of the volumes of data that will be created. There will also be additional control center, ISO and field testing resources required to make application, schedule the outage, if necessary, and perform periodic maintenance tests and repair of the additional equipment. In many cases, this will result in the need for entity to add one or more additional full time employee to perform this work.

Table 1 – Estimated Capital Installation Costs if PRC-002-NPCC-1 Standard is Mandated to All BES Facilities as defined by the NERC Revised BES Definition

UTILITY	ADDITIONAL BES FACILITIES	INSTALLATION COST in MILLION
HYDRO ONE	51	$20
NGRID	100	$25
NU (Including NSTAR)	122	$41
UI	16	$1
CMP, NYSEG,RG&E	142	$57
Con Ed	196	$23
NBPT	15	$2

In addition, TFSP notes the following:

1. There is an underlying flaw in the NPCC process which allows for a change to a critical glossary term used in standards without a resulting review of the standards which utilize the term.
2. It appears that the RSAR procedure as defined in the Regional Reliability Standard Development Procedure is unclear or is not being followed. Attempts by one member entity to have an RSAR processed have been unsuccessful due to an apparent requirement that there

NPCC, Inc.

NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE. OF THE AMERICAS, NEW YORK, NY 10018 (212) 840-1070 FAX (212) 302-2782

be technical justification for an RSAR modification request, there is no mention of this requirement in the NPCC procedure document.

The TFSP acknowledges that the approved PRC-002-NPCC-1 standard is an extremely comprehensive and will ensure the adequate monitoring of all BPS facilities in the NPCC region. Indeed it would be advantageous for all electrical facilities, regardless of importance on the electrical grid, to be subject to the requirements set out in this standard. Realistically though, the resulting cost for accomplishing this would be excessive and is only used here to illustrate the TFSP assertion that the cost effective application of standards is a critical component in a reliability organizations mandate.

In summary, what must be recognized and given proper consideration is the impact on standards when an underlying definition of a defined term used in standards is modified.

As stipulated in the NPCC Regional Reliability Standards Development Process Document, the RCC "will also provide a technical advisory role in the Regional Reliability Standards development procedure through recommendations."

The TFSP requests the following action items to be taken by the RCC:

1. Advise RSC that an RSAR should be approved to review and revise PRC-002-NPCC-1 immediately to clarify the intended applicability of the standard in light of the new NERC approved BES definition. To accomplish this objective, the NPCC RSC staff position of requiring a technical justification for a RSAR must be waived in lieu of a cost effectiveness justification. Once a Standards Drafting Team has been convened, the TFSP recommends that the applicability of the standard be expanded beyond the present definition of BES in the NPCC region (A10 testing) to comply with the intent of the approved NERC BES definition.

2. Advise RSC that NPCC process changes be investigated to ensure NPCC specific standards utilizing defined terms, that undergo a revision, be reviewed by the applicable Task Force who are the subject matter experts for the affected standard. If that Task Force sees the need for a revision, an RSAR should be initiated to make changes to the standard.

The Task Force on System Protection respectively requests your support for the above recommendations as a way for NPCC to formally address the issue.

I will be available at the November 27, 2012 RCC meeting to review with you the above recommendation.

1.0 Introduction

1.1 Title - Design and Operation of the Bulk Power System

1.2 Directory Number 1

1.3 Objective

The objective of these criteria is to provide a "design-based approach" to ensure the **bulk power system** is designed and operated to a level of reliability such that the loss of a major portion of the system, or unintentional separation of a major portion of the system, will not result from any design **contingencies** referenced in Sections 5.4.1 and 5.4.2. In NPCC the technique for assuring the reliability of the **bulk power system** is to require that it be designed and operated to withstand representative **contingencies** as specified in this Directory. Analyses of simulations of these **contingencies** include assessment of the potential for widespread cascading outages due to overloads, instability or voltage collapse. Loss of small portions of a system (such as radial portions) may be tolerated provided these do not jeopardize the reliability of the remaining **bulk power system**.

Criteria described in this document are to be used in the design and operation of the **bulk power system.** These criteria are applicable to all entities which are part of or make use of the **bulk power system**.

The characteristics of a reliable **bulk power system** include adequate **resources** and transmission to reliably meet projected customer electricity demand and energy requirements as prescribed in this document and include:

a. Consideration of a balanced relationship among the fuel type, capacity, physical characteristics (peaking/base **load**/etc.), and location of **resources**.

b. Consideration of a balanced relationship among transmission system **elements** to avoid excessive dependence on any one transmission circuit, structure, right-of-way, or substation.

c. Transmission systems should provide flexibility in switching arrangements, voltage control, and other control measures

1.4 Effective Date - December 01, 2009

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

1.5 Background

This Directory was developed from the NPCC A-2 criteria document - Basic Criteria for the Design and Operation of Interconnected Power Systems (May 6, 2004 version). Guidelines and Procedures for consideration in the implementation of this Directory are provided in the Appendices.

1.6 Applicability

1.6.1 Functional Entities

Reliability Coordinators

4.0 NPCC regional Reliability Standards Requirements

None

5.0 NPCC Full Member, More Stringent Criteria

NPCC provides a forum for coordinating the design and operations of its five Reliability Coordinator Areas. NPCC shall conduct regional and interregional studies, and assess and monitor Planning Coordinator Area studies and Reliability Coordinator operations to assure conformance to these criteria through committees, task forces, and working groups.

It is the responsibility of each Reliability Coordinator to ascertain that their portion of the **bulk power system** is operated in conformance with these criteria. It is the responsibility of each Transmission Planner and Planning Coordinator to ascertain that their portion of the **bulk power system** is designed in conformance with these criteria

5.1 General Requirements

Specific system conditions may require Planning Coordinators or Reliability Coordinators to develop criteria which are more stringent than those set out herein. Any constraints imposed by these more stringent criteria will be observed. It is also recognized that these Criteria are not necessarily applicable to those **elements** that are not a part of the **bulk power system** or in the portions of a system where instability or overloads will not jeopardize the reliability of the remaining **bulk power system.**

5.1.1 Design Criteria

These design criteria will be used in the assessment of the **bulk power system** by each of the NPCC Transmission Planners and Planning Coordinators, and in the reliability testing at the Transmission Operator, Reliability Coordinator and Regional Council levels.

Design studies shall assume **power** flow conditions utilizing transfers, **load** and generation conditions which stress the system. Transfer capability studies shall be based on the **load** and generation conditions expected to exist for the period under study. All **reclosing** facilities shall be assumed in service unless it is known that such facilities will be rendered inoperative.

S**pecial protection systems (SPS)** shall be used judiciously and when employed shall be installed, consistent with good system design and operating criteria found in Directory #7 – *Special Protection Systems*.

A SPS may be used to provide protection for infrequent **contingencies**, or for temporary conditions that may exist such as project delays, unusual combinations of system demand and equipment outages or availability, or specific equipment maintenance outages. A **SPS** may also be applied to preserve system integrity in the event of severe facility outages and extreme **contingencies.** The decision to employ a **SPS** shall take into account the complexity of the scheme and the consequences of correct or incorrect operation as well as its benefits.

The requirements of **special protection systems** are defined in the NPCC *Bulk Power System Protection Criteria*, (Directory#4), and the *Special Protection Systems*, (Directory #7).

5.1.2 Operating Criteria

Coordination among and within the Reliability Coordinator Areas of NPCC is essential to the reliability of interconnected operations. Timely information concerning system conditions shall be transmitted by the NPCC Reliability Coordinators to other NPCC Reliability Coordinators, adjacent Reliability Coordinators or other entities as needed to assure reliable operation of the **bulk power system**.

The operating criteria represent the application of the design criteria to inter-Reliability Coordinator Area, intra- Reliability Coordinator Area operation.

The operating criteria define the minimum level of reliability that shall apply to inter-Reliability Coordinator Area operation. Where inter-Reliability Coordinator Area reliability is affected, each Reliability

 This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Coordinator shall establish limits and operate so that the **contingencies** stated in Section 5.5.1 and 5.5.2 can be withstood without causing a **significant adverse impact** on other Reliability Coordinator Areas.

When adequate **bulk power system** facilities are not available, **special protection systems** (SPS) may be employed to maintain system security.

Two categories of transmission transfer capabilities, normal and **emergency**, are applicable. Normal transfer capabilities are to be observed unless an **emergency** is declared.

5.1.3 Data Exchange Requirements for Modeling and System Analysis

It is the responsibility of NPCC and NPCC Members to protect the proprietary nature of the following information and to ensure it is used only for purposes of efficient and reliable system design and operation. Also, any sharing of such information must not violate anti-trust laws.

For reliability purposes, Reliability Coordinators shall share and coordinate forecast system information and real time information to enable and enhance the analysis and modeling of the interconnected **bulk power system** by security application software on energy management systems. Each Registered Entity within an NPCC Reliability Coordinator Area shall provide needed information to its Reliability Coordinator as required. Analysis and modeling of the interconnected power system is required for reliable design and operation. Data needed to analyze and model the electric system and its component facilities must be developed, maintained, and made available for use in interconnected operating and planning studies, including data for fault level analysis.

Reliability Coordinators and Registered Entities shall maintain and submit, as needed, data in accordance with applicable NPCC Procedures.

Data submitted for analysis representing physical or control characteristics of equipment shall be verified through appropriate methods. System analysis and modeling data must be reviewed annually, and verified on a periodic basis. Generation equipment, and its component controllers, shall be tested to verify data.

5.2 Resource Adequacy – Design Criteria

The probability (or risk) of disconnecting **firm load** due to resource deficiencies shall be, on average, not more than one day in ten years as

determined by studies conducted for each Resource Planning and Planning Coordinator Area. Compliance with this criterion shall be evaluated probabilistically, such that the loss of **load** expectation (LOLE) of disconnecting **firm load** due to resource deficiencies shall be, on average, no more than 0.1 day per year. This evaluation shall make due allowance for demand uncertainty, scheduled outages and deratings, forced outages and deratings, assistance over interconnections with neighboring Planning Coordinator Areas, transmission transfer capabilities, and capacity and/or **load** relief from available operating procedures.

5.3 Resource Adequacy – Operating Criteria

Each Balancing Authority shall have procedures in place to schedule outages and deratings of **resources** in such a manner that the available **resources** will be adequate to meet the Resource Planner's and Planning Coordinator's forecasted demand and **reserve** requirements, in accordance with the NPCC *Operating Reserve Criteria* (Directory#5).

For consistent evaluation and reporting of **resource** adequacy, it is necessary to measure the net capability of generating units and **loads** utilized as a **resource** of each Planning Coordinator Area.

5.4 Transmission Design Criteria

The portion of the **bulk power system** in each Planning Coordinator Area and in each Transmission Planning Area shall be designed with sufficient transmission capability to serve forecasted demand under the conditions noted in Sections 5.4.1 and 5.4.2. These criteria will also apply after any critical generator, transmission circuit, transformer, series or shunt compensating device or HVdc pole has already been lost, assuming that the Planning Coordinator Area generation and **power** flows are adjusted between outages by the use of **ten-minute reserve** and where available, phase angle regulator control and HVdc control.

Anticipated transfers of **power** from one Planning Coordinator Area to another, as well as within Planning Coordinator Areas, shall be considered in the design of transmission facilities. Transmission transfer capabilities shall be determined in accordance with the conditions noted in Sections 5.4.1 and 5.4.2.

5.4.1 Stability Assessment

Stability of the **bulk power system** shall be maintained during and following the most severe of the **contingencies** stated below, with due regard to **reclosing**. For each of the **contingencies** below that involve a fault, **stability** shall be maintained when the simulation is based on

 This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

fault clearing initiated by the **"system A" protection group**, and also shall be maintained when the simulation is based on **fault clearing** initiated by the **"system B" protection group**.

a. A permanent three-phase fault on any generator, transmission circuit, transformer or bus section with **normal fault clearing**.

b. Simultaneous permanent phase to ground faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with **normal fault clearing**. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded. Other similar situations can be excluded on the basis of acceptable risk, provided that the Reliability Coordinating Committee specifically accepts each request for exclusion.

c. A permanent phase to ground fault on any transmission circuit, transformer, or bus section with **delayed fault clearing**.

d. Loss of any **element** without a fault.

e. A permanent phase to ground fault on a circuit breaker with **normal fault clearing**. (**Normal fault clearing** time for this condition may not always be high speed.)

f. Simultaneous permanent loss of both poles of a direct current bipolar facility without an ac fault

g. The failure of a circuit breaker to operate when initiated by a **SPS** following: loss of any **element** without a fault; or a permanent phase to ground fault, with **normal fault clearing**, on any transmission circuit, transformer or bus section.

5.4.2 Steady State Assessment

a. Each Transmission Planner shall design its system in accordance with these criteria and its own voltage control procedures and criteria, and coordinate these with adjacent Transmission Planner Areas**.** Adequate **reactive power** resources and appropriate controls shall be installed in each Transmission Planner Area to maintain voltages within

normal limits for pre-**disturbance** conditions, and within **applicable emergency limits** for the system conditions that exist following the **contingencies** specified in 5.4.1.

b. Line and equipment loadings shall be within normal limits for pre-**disturbance** conditions and within **applicable emergency limits** for the system conditions that exist following the **contingencies** specified in 5.4.1.

5.4.3 Fault Current Assessment

Each Transmission Planner and Planning Coordinator shall establish procedures and implement a system design that ensures equipment capabilities are adequate for fault current levels with all transmission and generation facilities in service for all potential operating conditions, and coordinate these procedures with adjacent Planning Coordinator Areas.

5.5 Transmission Operating Criteria

Scheduled outages of facilities that affect inter-Reliability Coordinator Area reliability shall be coordinated sufficiently in advance of the outage to permit the affected Reliability Coordinators to maintain reliability. Each Reliability Coordinator shall notify adjacent Reliability Coordinators of scheduled or forced outages of any facility on the NPCC Transmission Facilities Notification List and of any other condition which may impact on inter-Reliability Coordinator Area reliability. Work on facilities which impact inter-Reliability Coordinator Area reliability shall be expedited to minimize the time that the facilities are out of service.

Individual Reliability Coordinator Areas shall be operated in a manner such that the **contingencies** noted in Section 5.5.1 and 5.5.2 can be withstood and do not adversely affect other Reliability Coordinator Areas.

Appropriate adjustments shall be made to Reliability Coordinator Area operations to accommodate the impact of **protection group** outages, including the outage of a **protection group** which is part of a Type I **special protection system**. For typical periods of forced outage or maintenance of a **protection group**, it can be assumed, unless there are indications to the contrary, that the remaining **protection** will function as designed. If the **protection group** will be out of service for an extended period of time, additional adjustments to operations may be appropriate considering other system conditions and the consequences of possible failure of the remaining **protection group**.

5.5.1 Normal Transfers

 This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Pre-**contingency** voltages, line and equipment loadings shall be within normal limits. Unless specific instructions describing alternate action are in effect, normal transfers shall be such that manual **reclosing** of a faulted **element** can be carried out before any manual system adjustment, without affecting the **stability** of the **bulk power system**.

Stability of the **bulk power system** shall be maintained during and following the most severe of the **contingencies** stated below, with due regard to **reclosing.** For each of the **contingencies** stated below that involves a fault, **stability** shall be maintained when the simulation is based on **fault clearing** initiated by the **"system A" protection group**, and also shall be maintained when the simulation is based on **fault clearing** initiated by the **"system B" protection group**.

a. A permanent three-phase fault on any generator, transmission circuit, transformer or bus section, with **normal fault clearing**.

b. Simultaneous permanent phase to ground faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with **normal fault clearing**. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded. Other similar situations can be excluded on the basis of acceptable risk, provided that the Reliability Coordinating Committee specifically accepts each request for exclusion.

c. A permanent phase to ground fault on any transmission circuit, transformer, or bus section with **delayed fault clearing**.

d. Loss of any **element** without a fault.

e. A permanent phase to ground fault on a circuit breaker, with **normal fault clearing**. (**Normal fault clearing** time for this condition may not always be high speed.)

f. Simultaneous permanent loss of both poles of a direct current bipolar facility without an ac fault.

g. The failure of a circuit breaker to operate when initiated by a **SPS** following: loss of any **element**

without a fault; or a permanent phase to ground fault, with **normal fault clearing**, on any transmission circuit, transformer or bus section.

Reactive power resources shall be maintained in each Reliability Coordinator Area in order to maintain voltages within normal limits for pre-**disturbance** conditions, and within **applicable emergency limits** for the system conditions that exist following the **contingencies** specified in the foregoing. Adjoining Reliability Coordinators shall mutually agree upon procedures for inter-Reliability Coordinator Area voltage control.

Line and equipment loadings shall be within normal limits for pre-**disturbance** conditions and within **applicable emergency limits** for the system conditions that exist following the **contingencies** specified in the foregoing.

Since **contingencies** b, c, e, f, and g, are not confined to the loss of a single **element**, individual Transmission Operators and Reliability Coordinators may choose to permit a higher post **contingency** flow on remaining facilities than for **contingencies** a and d. This is permissible providing operating procedures are documented to accomplish corrective actions; the loadings are sustainable for at least the anticipated time required to effect such action, and other Transmission Operator Areas or Reliability Coordinator Areas will not be subjected to the higher flows without prior agreement.

5.5.2 Emergency Transfers

When **firm load** cannot be supplied within normal limits in a Transmission Operator Area, or a portion of a Transmission Operator Area, transfers may be increased to the point where pre-**contingency** voltages, line and equipment loadings are within **applicable emergency limits**. **Emergency** transfer levels may require generation adjustment before manually **reclosing** faulted **elements**.

Stability of the **bulk power system** shall be maintained during and following the most severe of the following **contingencies**, and with due regard to **reclosing**:

a. A permanent three-phase fault on any generator, transmission circuit, transformer or bus section, with **normal fault clearing**.

b. The loss of any **element** without a fault.

 This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Immediately following the most severe of these **contingencies**, voltages, line and equipment loadings will be within **applicable emergency limits**.

5.5.3 Post Contingency Operation

Immediately after the occurrence of a **contingency**, the status of the **bulk power system** must be assessed and transfer levels must be adjusted, if necessary, to prepare for the next **contingency**. If the readjustment of generation, **load** resources, phase angle regulators, and direct current facilities is not adequate to restore the system to a secure state, then other measures such as voltage reduction and shedding of firm **load** may be required. System adjustments shall be completed as quickly as possible, but in all cases within 30 minutes after the occurrence of the **contingency**.

Voltage reduction need not be initiated and firm **load** need not be shed to observe a post **contingency** loading requirement until the **contingency** occurs, provided that adequate response time for this action is available after the **contingency** occurs and other measures will maintain post **contingency** loadings within **applicable emergency limits**.

Emergency measures, including the pre-**contingency** disconnection of **firm load** if necessary, must be implemented to limit transfers to within the requirements of 5.5.2 above.

5.5.4 Operation under High Risk Conditions

Operating to the **contingencies** listed in Sections 5.5.1 and 5.5.2 is considered to provide an acceptable level of **bulk power system** security. Under certain unusual conditions, such as severe weather, the expectation of occurrence of some **contingencies**, and the associated consequences, may be judged to be temporarily, but significantly, greater than the long-term average expectation. When these conditions, referred to as high risk conditions, are judged to exist in a Transmission Operator Area, consideration should be given to operating in a more conservative manner than that required by the provisions of Sections 5.5.1 and 5.5.2.

5.6 Extreme Contingency Assessment

Extreme **contingency** assessment recognizes that the **bulk power system** can be subjected to events which exceed, in severity, the **contingencies** listed in Section 5.4.1. One of the objectives of extreme **contingency** assessment is to

determine, through planning studies, the effects of extreme **contingencies** on system performance. This is done in order to obtain an indication of system strength, or to determine the extent of a widespread system **disturbance**, even though extreme **contingencies** do have low probabilities of occurrence.

The specified extreme **contingencies** listed below are intended to serve as a means of identifying some of those particular situations that could result in a widespread **bulk power system disturbance**. It is the responsibility of each Planning Coordinator Area to identify any additional extreme **contingencies** to be assessed.

Assessment of the extreme **contingencies** listed below shall examine post **contingency** steady state conditions, as well as **stability**, overload, cascading outages and voltage collapse. Pre-**contingency load** flows chosen for analysis shall reflect reasonable **power** transfer conditions within or between Planning Coordinator Areas.

Analytical studies shall be conducted to determine the effect of the following extreme **contingencies**:

a. Loss of the entire capability of a generating station.

b. Loss of all transmission circuits emanating from a generating station, switching station, dc terminal or substation

c. Loss of all transmission circuits on a common right-of-way.

d. Permanent three-phase fault on any generator, transmission circuit, transformer, or bus section, with **delayed fault clearing** and with due regard to **reclosing**.

e. The sudden dropping of a large **load** or major **load** center.

f. The effect of severe **power** swings arising from **disturbances** outside the Council's interconnected systems.

g. Failure of a **special protection system**, to operate when required following the normal **contingencies** listed in Section 5.4.1.

h. The operation or partial operation of a **special protection system** for an event or condition for which it was not intended to operate.

i. Sudden loss of fuel delivery system to multiple plants, (i.e. gas pipeline **contingencies**, including both gas transmission lines and gas mains.)

 This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Note: The requirement of this section is to perform extreme **contingency** assessments. In the case where extreme **contingency** assessment concludes there are serious consequences, an evaluation of implementing a change to design or operating practices to address such **contingencies** shall be conducted.

5.7 Extreme System Conditions Assessment

The **bulk power system** can be subjected to wide range of other than normal system conditions that have low probability of occurrence. One of the objectives of extreme system conditions assessment is to determine, through planning studies, the impact of these conditions on expected steady-state and dynamic system performance. This is done in order to obtain an indication of system robustness or to determine the extent of a widespread system **disturbance**. Each Transmission Planner and Planning Coordinator has the responsibility to incorporate special simulation testing to assess the impact of extreme system conditions.

Analytical studies shall be conducted to determine the effect of design **contingencies** under the following extreme conditions:

a. Peak **load** conditions resulting from extreme weather conditions with applicable **rating** of electrical **elements**.

b. Generating unit(s) fuel shortage, (i.e. gas supply adequacy)

After due assessment of extreme system conditions, measures may be utilized, where appropriate, to mitigate the consequences that are indicated as a result of testing for such system conditions. .

Prepared by: Task Force on Coordination of Planning

Review and Approval: Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon satisfactorily addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval.

Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Revisions pertaining to the Appendices or any other portion of the document such as Links glossary terms, etc., only RCC Members will need to conduct the final approval ballot of the document.

This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

NPCC Glossary of Terms
Bulk Power System Protection Criteria (Directory#4)
Emergency Operations (NPCC Directory #2)
Special Protection Systems (Directory #7))

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Appendix A - Definition of Terms

Applicable emergency limits - These limits depend on the duration of the occurrence, and on the policy of the various member systems of NPCC regarding loss of life to equipment, voltage limitations, etc.

Emergency limits are those which can be utilized for the time required to take corrective action, but in no case less than five minutes.

The limiting condition for voltages should recognize that voltages should not drop below that required for suitable system **stability** performance, and should not adversely affect the operation of the **bulk power system**.

The limiting condition for equipment loadings should be such that cascading outages will not occur due to operation of protective devices upon the failure of facilities. (Various definitions of equipment **ratings** are found elsewhere in this glossary.)

Bulk power system - The interconnected electrical systems within north-eastern North America comprising **generation** and transmission facilities on which **faults** or **disturbances** can have a **significant adverse impact** outside of the local area. In this context, local areas are determined by the Council members.

Contingency - An event, usually involving the loss of one or more **elements,** which affects the **power** system at least momentarily.

NPCC Specific Definitions:

NPCC Emergency Criteria **Contingencies** - The set of **contingencies** to be observed when operating the **bulk power system** under **emergency** conditions. (Document C-1; also reference Document A-2, Section 6.2 - Emergency Transfers.)

NPCC Normal Criteria **Contingencies** - The set of **contingencies** to be observed when operating the **bulk power system** under normal conditions. (Document C-1; also reference Document A-2, Section 6.1 - Normal Transfers.)

Double Element Contingency - A **contingency** which involves the loss of two **elements**. (Document C-1)

Single Contingency - A single event which may result in the loss of one or more **elements.**

Single Element Contingency - A **contingency** involving the loss of one **element**. (Document C-1)

Limiting Contingency - The **contingency** which establishes the **transfer capability**. (Document C-1)

First Contingency Loss - The largest **capacity** outage including any assigned Ten-Minute Reserve which would result from the loss of a single **element** (Documents A-6 and C-1)

Second Contingency Loss - The largest **capacity** outage which would result from the loss of a single **element** after allowing for the First Contingency Loss. (Documents A-6 and C-1)

Disturbance - Severe oscillations or severe step changes of current, voltage and/or frequency usually caused by **faults**.

System Disturbance - An event characterized by one or more of the following phenomena: the loss of **power** system **stability**; cascading outages of circuits; oscillations; abnormal ranges of frequency or voltage or both.

Element - Any electric device with terminals that may be connected to other electric devices, such as a generator, transformer, circuit, circuit breaker, or bus section.

Limiting Element - The element that is either operating at its appropriate **rating** or would be, following a limiting **contingency** and, as a result, establishes a system limit.

Emergency - Any abnormal system condition that requires automatic or manual action to prevent or limit loss of transmission facilities or **generation** supply that could adversely affect the **reliability** of the electric system.

Specific to NPCC: An **Emergency** is considered to exist in an Area if **firm load** may have to be shed.

Fault Clearing

Delayed fault clearing - Fault clearing consistent with correct operation of a breaker failure **protection group** and its associated breakers, or of a backup **protection group** with an intentional time delay.

High speed fault clearing - Fault clearing consistent with correct operation of high speed relays and the associated circuit breakers without intentional time delay.
Notes: The specified time for high-speed relays in present practice is 50 milliseconds (three cycles on a 60Hz basis) or less. [IEEE C37.100-1981]. For planning purposes, a total clearing time of six cycles or less is considered high speed.

Normal fault clearing - Fault clearing consistent with correct operation of the **protection system** and with the correct operation of all circuit breakers or other automatic switching devices intended to operate in conjunction with that **protection system**.

Load - The electric **power** used by devices connected to an electrical generating system. (IEEE Power Engineering). Also see **Demand**.

NPCC Specific Definitions:

Firm Load - Loads that are not **Interruptible Loads**.

Interruptible Load - Loads that are interruptible under the terms specified in a contract.

Power

Apparent Power - The product of the volts and amperes. It comprises both *real* and *reactive* power, usually expressed in kilovoltamperes (kVA) or megavoltamperes (MVA).

Reactive Power - The portion of electricity that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive power must be supplied to most types of magnetic equipment, such as motors and transformers. It also must supply the reactive losses on transmission facilities. Reactive power is provided by generators, **synchronous condensers**, or electrostatic equipment such as capacitors. Reactive power directly influences electric system voltage. It is usually expressed in kilovars (kVAr) or megavars (MVAr).

Real Power - The rate of producing, transferring, or using electrical energy, usually expressed in kilowatts (kW) or megawatts (MW).

Protection - The provisions for detecting power system **faults** or abnormal conditions and taking appropriate automatic corrective action.

Protection group - A fully integrated assembly of **protective relays** and associated equipment that is designed to perform the specified protective functions for a power system **element**, independent of other groups.

Notes:
(a) Variously identified as Main Protection, Primary Protection, Breaker Failure Protection, Back-Up Protection, Alternate Protection, Secondary Protection, A Protection, B Protection, Group A, Group B, System 1 or System 2.

(b) Pilot protection is considered to be one protection group. Protection system
Element Basis One or more protection groups; including all equipment such as instrument transformers, station wiring, circuit breakers and associated trip/close modules, and communication facilities; installed at all terminals of a power system **element** to provide the complete protection of that **element**.

Terminal Basis
One or more protection groups, as above, installed at one terminal of a power system **element**, typically a transmission line.

Pilot Protection - A form of line protection that uses a communication channel as a means to compare electrical conditions at the terminals of a line.

Rating - The operational limits of an electric system, facility, or **element** under a set of specified conditions.

Reclosing

Autoreclosing - The automatic closing of a circuit breaker in order to restore an **element** to service following automatic tripping of the circuit breaker. Autoreclosing does not include automatic closing of capacitor or reactor circuit breakers.

High-speed autoreclosing - The autoreclosing of a circuit breaker after a necessary time delay (less than one second) to permit **fault** arc deionization with due regard to coordination with all **relay** protective systems. This type of autoreclosing is generally not supervised by voltage magnitude or phase angle.

Manual Reclosing - The closing of a circuit breaker by operator action after it has been tripped by **protective relays**. Operator initiated closing commands may originate from local control or from remote (supervisory) control. Either local or remote close commands may be supervised or unsupervised.

Supervision- A closing command is said to be supervised if closing is permitted to occur only if certain prerequisite conditions are met (e.g., **synchronism-check**).

Synchronism-check - refers to the determination that acceptable voltages exist on the two sides of the breaker and the phase angle between them is within a specified limit for a specified time.

Relay - An electrical device designed to respond to input conditions in a prescribed manner and after specified conditions are met to cause contact operation or similar abrupt change in associated electric control circuits. (Also: see **protective relay**).

Reliability - The degree of performance of the bulk electric system that results in electricity being delivered to customers within accepted standards and in the amount desired. Reliability may be measured by the frequency, duration, and magnitude of adverse effects on the electric supply. Electric system reliability can be addressed by considering two basic and functional aspects of the electric system — **Adequacy** and **Security**.

Adequacy — The ability of the electric system to supply the aggregate electrical **demand** and energy requirements of the customers at all times, taking into account scheduled and reasonably expected unscheduled outages of system **elements**.

Security — The ability of the electric system to withstand **disturbances** such as electric **short circuits** or unanticipated loss of system **elements**.

Reserve - In normal usage, reserve is the amount of **capacity** available in excess of the **demand**

Reserve Requirement - That capability above firm system **demand** required to provide for regulation, **load** forecasting error, equipment forced and scheduled outages, and local area supply **adequacy**

NPCC Specific Definitions:

Non-Synchronized Reserve — That portion of operating capacity which is available by synchronizing a generator to the network, and that capacity which can be made available by reducing load that is dependent on starting a generator to replace energy that is supplied from the grid. Non-Synchronized Reserve also includes the capacity achieved through the implementation of voltage reduction. (Documents A-6 and C-1)

Operating Reserve - The sum of **ten-minute** and **thirty-minute reserve**. (Documents A-3, A-6, and A-1)

Reserve on **Automatic Generation Control (AGC)** - That portion of **synchronized reserve** which is under the command of an automatic controller to respond to **load demands** without need for manual action. (Documents A-6 and C-1)

Synchronized Reserve - The unused capacity from resources that are synchronized to the system and ready to achieve claimed capacity (Documents A-6 and C-1)

Ten-minute reserve - The sum of **synchronized** and **non-synchronized reserve** that is fully available in ten minutes. (Documents A-6 and C-1)

Thirty-Minute Reserve - The sum of synchronized and non-synchronized reserve that can be utilized within thirty minutes of receiving an activation request, excluding capacity assigned to ten minute reserve. (A-6, C-1)

Resource - Resource refers to the total contributions provided by supply-side and demand-side facilities and/or actions. Supply-side facilities include utility and non-utility generation and purchases from neighboring systems. Demand-side facilities include measures for reducing load, such as conservation, demand management, and interruptible load.

Significant adverse impact - With due regard for the maximum operating capability of the affected systems, one or more of the following conditions arising from **faults** or **disturbances**, shall be deemed as having **significant adverse impact**:

a. instability:
- any instability that cannot be demonstrably contained to a well defined local area,
- any loss of synchronism of generators that cannot be demonstrably contained to a well-defined local area.

b. unacceptable system dynamic response:

• an oscillatory response to a contingency that is not demonstrated to be clearly positively damped within 30 seconds of the initiating event.

c. unacceptable equipment tripping:

• tripping of an un-faulted **bulk power system** element (element that has already been classified as **bulk power system**) under planned system configuration due to operation of a protection system in response to a stable power swing,

• the operation of a Type I or Type II **Special Protection System** in response to a condition for which its operation is not required

d. voltage levels in violation of **applicable emergency limits**;

e. loadings on transmission facilities in violation of **applicable emergency limits**.

Special Protection System (SPS) – A protection system designed to detect abnormal system conditions, and take corrective action other than the isolation of faulted elements. Such action may include changes in load, generation, or system configuration to maintain system stability, acceptable voltages or power flows. Automatic underfrequency load shedding as defined in the NPCC Directory #2 - Emergency Operations - is not considered a SPS. Conventionally switched, locally controlled shunt devices are not **special protection systems**.

Stability - The ability of an electric system to maintain a state of equilibrium during normal and abnormal system conditions or **disturbances**.

Small-Signal Stability - The ability of the electric system to withstand small changes or **disturbances** without the loss of synchronism among the synchronous machines in the system.

Transient Stability - The ability of an electric system to maintain synchronism between its parts when subjected to a **disturbance**, and to regain a state of equilibrium following that **disturbance**.

Appendix B - Guidelines and Procedures for NPCC Area Transmission Reviews

1.0 Introduction

NPCC has established a Reliability Assessment Program to bring together work done by NPCC, Transmission Planners and Planning Coordinators relevant to the assessment of **bulk power system reliability**. As part of the Reliability Assessment Program, the Task Force on System Studies (TFSS) is charged on an ongoing basis with conducting periodic reviews of the **reliability** of the planned bulk power transmission system of each Planning Coordinator Area of NPCC and the transmission interconnections to other Planning Coordinator Areas. The purpose of these reviews is to determine whether each Planning Coordinator Area's planned bulk power transmission system is in conformance with the NPCC *Design and Operation of the Bulk Power System* (Directory #1). Since it is the intention of the NPCC that the *Basic Criteria* in Directory #1 be consistent with the NERC *Standards*, conformance with the NPCC *Basic Criteria* in Directory #1 assures consistency with the NERC *Standards*.

To assist the TFSS in carrying out this charge, each NPCC Planning Coordinator shall conduct an annual assessment of the **reliability** of the planned bulk power transmission system within the Planning Coordinator Area and the transmission interconnections to other Planning Coordinator Areas (an Area Transmission Review), in accordance with these Guidelines, and present a report of this assessment to the TFSS for review. Each Planning Coordinator is also responsible for providing an annual report to the Compliance Committee in regard to its Area Transmission Review in accordance with the *NPCC Reliability Compliance and Enforcement Program* (Document A-8).

The NPCC role in monitoring conformance with the NPCC *Basic Criteria* in Directory #1 is limited to those instances where non-conformance could result in adverse consequences to more than one Planning Coordinator Area. If in the process of conducting the **reliability** review; problems of an intra-Reliability Coordinator Area nature are identified, NPCC shall inform the affected systems and the Planning Coordinator within which the systems are located, but follow-up concerning resolution of the problem shall be the Planning Coordinators responsibility and not that of NPCC. The affected Planning Coordinator will notify NPCC on a timely basis as to the resolution of the identified problem. If the problem is of an inter-Reliability Coordinator Area nature, NPCC shall inform the affected Planning Coordinators and, further, shall take an active role in following-up resolution of the identified problem.

2.0 Purpose of Area Review Presentation

The purpose of the presentation associated with an Area Transmission Review is to demonstrate that the Planning Coordinators planned transmission system, based on its projection of available **resources**, is in conformance with the NPCC *Basic Criteria* in Directory #1. By such a presentation, the Task Force will satisfy itself that the criteria have been met and, in general, that the **reliability** of the NPCC Interconnected Systems will be maintained. Analysis of this material should include a review of **Special Protection Systems**, as well as an assessment of the potential for widespread cascading due to overloads, instability or voltage collapse. In addition, the potential consequences of failure or misoperation of Dynamic Control Systems (DCS), which include Transmission Control Devices as defined in the NERC *Standards*, should be addressed.

This review by the TFSS does not alter Planning Coordinators and/or Company responsibilities with respect to their system's conformity with the NPCC *Basic Criteria* in Directory #1.

3.0 The Study Year to be considered

It is suggested that a study year of 4 to 6 years from the reporting date is a realistic one, both from the viewpoint of minimum lead times required for construction, and the ability to alter plans or facilities. The reviews may be conducted for a longer term beyond 6 years to address identified marginal conditions that may have longer lead-time solutions

4.0 Types and Frequency of Reviews

Each Planning Coordinator is required to present an annual transmission review to TFSS. However, the review presented by the Planning Coordinator may be one of three types: a Comprehensive (or Full) Review, an Intermediate (or Partial) Review, or an Interim Review.

A Comprehensive Review is a thorough assessment of the Planning Coordinator’s entire bulk power transmission system, and includes sufficient analyses to fully address all aspects of an Area Transmission Review as described in Section 5.0. A Comprehensive Review is required of each Planning Coordinator at least every five years. TFSS may require a Planning Coordinator to present a Comprehensive Review in less than five years if changes in the Planning Coordinator’s planned facilities or forecasted system conditions (system changes) warrant it.

In the years between Comprehensive Reviews, Planning Coordinators may conduct

either an Interim Review, or an Intermediate Review, depending on the extent of the Planning Coordinator's system changes since its last Comprehensive Review. If the system changes are relatively minor, the Planning Coordinator may conduct an Interim Review. In an Interim Review, the Planning Coordinator provides a summary of the changes in planned facilities and forecasted system conditions since its last Comprehensive Review and a brief discussion and assessment of the impact of those changes on the bulk power transmission system. No new analyses are required for an Interim Review.

If the Planning Coordinator's system changes since its last Comprehensive Review are moderate or concentrated in a portion of the Planning Coordinator's system, the Planning Coordinator may conduct an Intermediate Review. An Intermediate Review covers all the elements of a Comprehensive Review, but the analyses may be limited to addressing only those issues considered to be of significance, considering the extent of the system changes. If the system changes are major or pervasive, the Planning Coordinator should conduct a Comprehensive Review.

In March of each year, each Planning Coordinator shall present to the TFSS a proposal for the type of review to be conducted that year. TFSS will consider each Planning Coordinator's proposal and either indicate their concurrence, or require the Planning Coordinator to conduct a more extensive review if the Task Force feels that such is warranted based on the Planning Coordinator's system changes since its last Comprehensive Review. Area Interim Review reports shall be presented to TFSS by the end of that calendar year, and Area Intermediate and Comprehensive Review reports shall be presented to TFSS by April of the following year.

5.0 Format of Presentation – Comprehensive and Intermediate Review

Introduction

- Reference the most recent Area Comprehensive Review and any subsequent Intermediate or Interim reviews as appropriate.
- Describe the type and scope of this review.
- For a Comprehensive Review, describe the existing and planned **bulk power system** facilities included in this review.
- Describe changes in system facilities, schedules and **loads** since the most recent Comprehensive Review.
- Include maps and one-line diagrams of the system showing proposed changes as necessary.
- Describe the selected demand levels over the range of forecast system demands.

- Discuss projected firm transfers and interchange schedules.

Study results demonstrating conformance with Section 5.4 of NPCC Directory #1, *Design and Operation of the Bulk Power System* entitled, "Transmission Design Criteria", which includes evaluation of contingencies after any critical generator, transmission circuit, transformer, series or shunt compensating device or HVDC pole has already been lost.

a) Discuss the scope of the analyses. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

b) Steady State Assessment

- Discuss the **load** model, power factor, demand side management, and other modeling assumptions used in the analysis. Discuss the methodology used in voltage assessments. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why the remaining simulations would produce less severe results.

- Include plots of "base case" **load** flows with all lines in service for the various conditions studied, e.g., peak, off-peak, and heavy transfers.

- Discuss the **load** flows showing the effects of major planned changes on the system.

- Discuss applicable transfer limits between contiguous areas.

- Discuss the adequacy of voltage performance and voltage control capability for the planned bulk power transmission system.

- Include in the study the planned (including maintenance) outage of any bulk electric equipment (including **protection** systems or their components) at those demand levels for which planned (including maintenance) outages are performed.

c) Stability Assessment

Discuss and/or refer to significant studies showing the effect on the system of **contingencies** as specified in Section 5.4.1 of NPCC Directory #1, *Design and Operation of the Bulk Power System*, entitled "Stability Assessment" and report on the most severe **contingencies** in the following manner:

- Provide supporting information on the **contingencies** selected for evaluation and an explanation of why the remaining simulations would produce less severe results.

- Nature of fault, **elements** switched, switching times.

- Plots of angles versus time for significant machines, HVdc and SVC response, voltages at significant buses and significant interface flows.

- Include the effects of existing and planned **protection systems**, including any backup or redundant systems.

- Include the effects of existing and planned control devices.

- Include in the study the planned (including maintenance) outage of any bulk electric equipment (including **protection systems** or their components) at those demand levels for which planned (including maintenance) outages are performed.

For a Comprehensive or Intermediate Review, discuss the **load** model and other modeling assumptions used in the analysis. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

d) Fault Current Assessment

- Discuss the methodology and assumptions used in the fault current assessment. (An Intermediate Review may refer to the discussion from the last Comprehensive Review.)

- Discuss instances where fault levels exceed equipment capabilities and measures to mitigate such occurrences.

- Discuss changes to fault levels at stations adjacent to other Planning Coordinator Areas.

Extreme Contingency Assessment

a) Discuss the scope of the analyses. The analyses conducted for a Comprehensive Review should be thorough, but an Intermediate Review may focus on specific areas of the system, specific system conditions, or a more limited set of "critical" **contingencies**.

b) Provide supporting information on the extreme **contingencies** selected for evaluation and an explanation of why the remaining simulations would produce less severe results.

c) Discuss and/or refer to significant **load** flow studies showing the base case and the post fault conditions for the **contingencies** as specified in Section 5.6 of Directory #1 entitled "Extreme Contingency Assessment". Report on the most severe **contingencies** tested.

d) Discuss and/or refer to significant **stability** studies showing the effect on the system of **contingencies** as specified in Section 5.6 of Directory #1. Report on the most severe **contingencies** tested.

e) In the case where **contingency** assessment concludes serious consequences, conduct an evaluation of implementing a change to address such **contingencies**.

Extreme System Condition Assessment

a) Discuss the scope of the analyses.

b) Discuss and/or refer to significant **load** flow studies showing the effect on the steady state performance of extreme system conditions as specified in Section 5.7 of Directory #1, entitled "Extreme System Condition Assessment". Report on the most severe system conditions and **contingencies** tested.

c) Provide supporting information on the **contingencies** selected for evaluation and an explanation of why the remaining simulations would produce less severe results.

d) Discuss and/or refer to significant **stability** studies showing the effect on the dynamic performance of extreme system conditions as specified in Section 5.7 of Directory #1. Report on the most severe system conditions and **contingencies** tested.

e) In the case where extreme condition assessment concludes serious consequences, conduct an evaluation of implementing measures to mitigate such consequences.

Review of Special Protection Systems (SPSs)

a) Discuss the scope of review. A Comprehensive Review should review all the existing, new, and modified **SPSs** included in its transmission plan. An Intermediate Review may focus on the new and modified **SPSs**, and just those existing **SPSs** that may have been impacted by system changes since they were last reviewed.

b) For those **SPSs** whose failure or misoperation has an inter-Planning Coordinator Area or interregional effect, discuss and/or refer to appropriate **load** flow and **stability** studies analyzing the consequences.

c) For those **SPSs** whose failure or misoperation has only local or inter-company consequences, discuss and/or refer to **load** flow and **stability** studies demonstrating that this is still the case for the time period being reviewed.

d) For instances where a **SPS** which was formerly considered to have only local consequences is identified as having the potential for inter-Planning Coordinator Area effects, for the time period being reviewed, the TFSS should notify the Task Forces on Coordination of Planning, System Protection and Coordination of Operation. In such instances a complete review of the **SPS** should be made, as per the *Procedure for NPCC Review of New or Modified Bulk Power System Special Protection Systems (SPS)* in Directory #7.

Review of Dynamic Control Systems (DCSs)

For those DCSs whose failure or misoperation may have an inter-Planning Coordinator Area or interregional effect, discuss and/or refer to appropriate **stability** studies analyzing the consequences of such failure or misoperation in accordance with the Joint Working Group (JWG)-1 report, "Technical Considerations and Suggested Methodology for the Performance Evaluation of Dynamic Control Systems". A Comprehensive Review should address all potentially impactive existing and new DCSs, but an Intermediate Review may focus on new DCSs and just those existing DCSs that may have been impacted by system changes since they were last reviewed.

Review of Exclusions to the *Basic Criteria*.

Review any exclusions granted under the NPCC *Guidelines for Requesting Exclusions to Sections 5.4.1(b) and 5.5.1(b) Directory #1 Design and Operation of the Bulk Power System* (Appendix E). A Comprehensive Review should address all exclusions, but an Intermediate Review may focus

on just those exclusions that may have been impacted by system changes since they were last reviewed.

Overview Summary of System Performance for Year Studied

6.0 Format of Presentation - Interim Review

Introduction of Interim Review

Reference the most recent Comprehensive Review and any subsequent Intermediate or Interim Reviews as appropriate.

Changes in Facilities (Existing and Planned) and Forecasted System Conditions Since the Last Comprehensive Review.

a) **Load** Forecast

b) Generation **Resources**

c) Transmission Facilities

d) **Special Protection Systems**

e) Dynamic Control Systems

f) Exclusions

Brief Impact Assessment and Overview Summary

The Planning Coordinator will provide a brief assessment of the impact of these changes on the **reliability** of the interconnected **bulk power system**, based on engineering judgment and internal and joint system studies as appropriate.

7.0 Documentation

The documentation required for a Comprehensive or Intermediate Review should be in the form of a report addressing each of the **elements** of the above presentation format. The report should be accompanied by the Planning Coordinator'**s bulk power system** map and one-line diagram, summary tables, figures, and appendices, as appropriate. The report may include references to other studies performed by the Planning Coordinator or by utilities within the Planning Coordinator Area that are relevant to the Area review, with appropriate excerpts from those studies.

The documentation required for an Interim Review should be in the form of a

summary report (normally not exceeding 5 pages), containing a description of system changes and a brief assessment on their impact on the **reliability** of the interconnected **bulk power system**.

8.0 Task Force Follow-Up Procedures

8.1 Once a Planning Coordinator has presented its Review report to the TFSS, TFSS will review the Planning Coordinator's report and any supporting documentation and:

a. Consider whether to accept the report as complete and in full conformance with these Guidelines. If the report is found to be unacceptable, TFSS will indicate to the Planning Coordinator the specific areas of deficiency, and request the Planning Coordinator to address those deficiencies.

b. Consider their concurrence with the results and conclusion(s) of the Planning Coordinator's Review. If there is not concurrence, TFSS will indicate to the Planning Coordinator the specific areas of disagreement, and work with the Planning Coordinator to try to achieve concurrence. If agreement has not been reached within a reasonable period of time, TFSS shall prepare a summary of the results of its review, including a discussion of the Planning Coordinators of disagreement.

8.2 If the results of the Area Review indicates that the Planning Coordinator's planned bulk power transmission system is not in conformance with NPCC Directory #1, TFSS will request the Planning Coordinator to develop a plan to achieve conformance with the Criteria.

8.3 If the Area Review indicates an overall **bulk power system** reliability concern (not specific to the Planning Coordinator's planned bulk power transmission system), TFSS will consider what additional studies may be necessary to address the concern, and prepare a summary discussion and recommendation to the Task Force on Coordination of Planning.

8.4 Upon completion of an Area Review, TFSS will report the results of the review to the Task Force on Coordination of Planning and to the Reliability Coordinating Committee.

Appendix C - Procedure for Testing and Analysis of Extreme Contingencies

1.0 Introduction

Extreme **Contingencies** (ECs) are tested "as a measure of system strength", in order to identify potential patterns of weakness in the bulk power transmission system. This procedure for the testing and analysis of ECs should be used when testing ECs for NPCC studies or studies submitted for NPCC review.

This procedure applies to **reliability** studies that consider the overall performance of the interconnected systems of the NPCC Planning Coordinator Areas. It principally applies to NPCC - wide studies of the **bulk power system**, and generally does not apply to studies normally conducted by NPCC Planning Coordinators that concentrate on individual or a limited number of facilities. This procedure applies to NPCC Overall and Area Transmission Reviews, and may be applicable to other **reliability** studies conducted by the Planning Coordinators, and even to individual facility investigations, where such studies and investigations consider the overall performance of the interconnected systems of the NPCC Planning Coordinator Areas. Certain Transmission Planners or Planning Coordinators may elect to completely mitigate the effects of specific ECs.

Finally, this procedure should be followed in multi-regional **reliability** studies in which NPCC is an active participant, to the extent that this is possible within the framework of such multi-regional efforts.

2.0 Choosing Contingencies for Testing

The ECs are defined in the NPCC Directory #1- Design and Operation of the **Bulk Power System**, and in the NERC Standards. Testing should focus on those ECs expected to have the greatest potential effect on the interconnected system. Particular attention should be paid to contingencies which would result in major angular power shifts, e.g., interruption of shorter transmission paths carrying heavy power flows, leaving longer transmission paths as the only remaining paths. Additionally, contingencies which would result in reversal of major power transfers, e.g., loss of major ties in a neighboring region or Area when said region or Area was transferring power away from the area of interest, should be considered for their impact in subjecting the system to severe power swings (reference EC type “f”). In considering specific **contingencies** to be investigated in an NPCC **reliability** study, all relevant testing done at the Planning Coordinator level should first be reviewed.

In general, a **contingency** in a particular Planning Coordinator Area should be studied, if requested by any other Planning Coordinator, based on a reasonable surmise that the requesting Planning Coordinator may be adversely affected.

3.0 Modeling Assumptions

The assumed generation dispatch is a major consideration in all EC testing. In general, EC testing should use a dispatch pattern considered to be highly probable for the year and **load** level being studied. Intra-Reliability Coordinator Area inter-Reliability Coordinator Area and, where appropriate, inter-regional transfers should be simulated at a level which is experienced or expected at least 75% of the time on a flow duration basis, up to the maximum operating limit for the interfaces being tested. It is not the NPCC intent to test the worst imaginable extreme, but EC tests should be severe.

Each Planning Coordinator shall specify the appropriate Planning Coordinator **load** representation (e.g. active and reactive power as a function of voltage) for use in NPCC **reliability** studies. This applies to long term stability tests or post-transient loadflows as well as **transient stability** tests.

4.0 Evaluating Individual Test Results

A question in evaluating the results of a particular test run is - “Does the system "pass" or "fail" for this **contingency**?” While in the final analysis this is a matter of informed engineering judgment, factors which should be considered include:

1. Lines or transformers loaded above **short time emergency ratings**,

2. Buses with voltage levels in violation of **applicable emergency limits**, (which vary depending on the location within the system),

3. Magnitude and geographic distribution of such overloads and voltage violations across the system,

4. Transient generator angles, frequencies, voltages and power,

5. Operation of Dynamic Control Systems and **Special Protection Systems** (SPS),

6. Oscillations that could cause generators to lose synchronism or lead to dynamic instability,

7. net loss of source resulting from any combination of loss of synchronism of one or more units, generation rejection or runback initiated by SPS, or any other defined system separation,

8. Identification of the extent of the Planning Coordinator Area (s) involved for any indicated instability or islanding (the involvement of more than one

Planning Coordinator Area, should be a major consideration),

9. **Relay** operations or the proximity of apparent impedance trajectories to **relay** trip characteristics,

10. The angle across opened breakers,

11. Adequacy of computer simulation models and data.

Finally, a judgment should be attempted as to whether a "failure" is symptomatic of a basic system weakness, or just sensitivity to a particular EC. For example, should failures turn up for several EC tests in a particular part of the system, it is likely that a basic system weakness has been identified.

The loss of portions of the system should not necessarily be considered a failed result, provided that these losses do not jeopardize the integrity of the overall **bulk power system**.

NPCC study groups should avoid characterizations like "successful" and "unsuccessful" when commenting on individual runs. Rather, the specific initial conditions directly causing or related to the failure, the complete description of the nature of the failure (e.g., voltage collapse, instability, system separation, as well as the facilities involved), and the extent of potential impact on other Planning Coordinator Areas should be reported.

5.0 Evaluating the Results of a Program of EC Testing

The NPCC Directory #1 document - "*Design and Operation of **Bulk Power System***", calls for testing of Extreme **Contingencies** (EC) "as a measure of system strength." The results of all NPCC **reliability** studies are made available to the Planning Coordinators as a guide for planners and designers in the conduct of their future work. The focus of NPCC reports, then, should be on indicating those portions of the system in which basic system weaknesses may be developing, rather than on the results of one specific **contingency**.

Any patterns of weaknesses should be identified, which may include reference to earlier NPCC **reliability** studies and/or Planning Coordinator or member system investigations. There is also a need to distinguish between a "failed" test which indicates sensitivity only to a particular **contingency** run and a "failed" test which indicates a more general system weakness (always keeping in mind the severity of possible consequences of the **contingency**). Actions taken by member systems or Planning Coordinators to reduce the probability of occurrence or mitigate the consequences of the **contingency** should also be cited.

NPCC follow-up, after publication of a final report, is appropriate only for instances

of possible general system weakness. In these instances, the results should be specifically referred to the affected Planning Coordinator or Planning Coordinators for further and more detailed investigation with subsequent reporting to NPCC.

Appendix D - Guidelines for Area Review of Resource Adequacy

1.0 Introduction

NPCC has established a Reliability Assessment Program to bring together work done by the NPCC and Planning Coordinators relevant to the assessment of **bulk power system reliability**. As part of the Reliability Assessment Program, each Planning Coordinator submits to the Task Force on Coordination of Planning its resource adequacy assessment consistent with these guidelines. The Task Force is charged, on an ongoing basis, with reviewing and recommending NPCC Reliability Coordinating Committee approval of these reviews of **resource** adequacy of each Planning Coordinator Area of NPCC.

Resources refer to the total contributions provided by supply-side and demand-side facilities and actions. Supply-side facilities include all generation sources within a Planning Coordinator Area and firm capacity backed purchases from neighboring systems. Demand-side facilities include measures for reducing or shifting **load**, such as conservation, **load** management, interruptible **loads**, dispatchable **loads** and small identified generation which is not metered at the control centers.

The NPCC role in monitoring conformance with the NPCC Directory #1 - *Design and Operation of Bulk Power System* is essential because under this criterion, each Planning Coordinator determines its resource requirements by considering interconnection assistance from other Planning Coordinators, on the basis that adequate **resources** will be available in those Planning Coordinator Areas. Because of this reliance on interconnection assistance, inadequate **resources** in one Planning Coordinator Area could result in adverse consequences in another Planning Coordinator Area.

It is recognized that all Planning Coordinators may not necessarily express their own **resource** adequacy criterion as stated in the NPCC Basic Criteria in Directory #1. However, the NPCC Basic Criteria provides a reference point against which a Planning Coordinator's **resource** adequacy criterion can be compared.

The NPCC will not duplicate reviews and studies completed by member systems and Planning Coordinators**.** The NPCC may reference these reviews in appropriate NPCC reports.

2.0 Purpose of Presentation

The purpose of the presentation associated with a **resource** adequacy review is to show that each Planning Coordinator's proposed **resources** are in accordance with the NPCC Directory #1 - *Design and Operation of the Bulk Power System.*
By such a presentation, the Task Force will satisfy itself that the proposed **resources** of each NPCC Planning Coordinator will meet the NPCC Resource Adequacy -

Design Criteria, as defined NPCC Directory #1, over the time period under consideration. The review by the Task Force on Coordination of Planning does not replace Planning Coordinator and/or company responsibility to assess their systems in conformity with the NPCC Basic Criteria in Directory #1.

3.0 Time Period to be Considered

The time period to be considered for a Planning Coordinator's Comprehensive **Resource** Review will be five years and be undertaken every three years. In subsequent years, the Planning Coordinator shall conduct Annual Interim Reviews that will cover, at a minimum, the remaining years studied in the Comprehensive Review. Based on the results of the Annual Interim Review, the Task Force may recommend that the Planning Coordinator conduct the next Comprehensive Review at a date earlier than specified above. Comprehensive and Interim reviews are normally expected to be presented to the Task Force before the beginning of the first time period covered by the assessment.

4.0 Format of Presentation and Report – Comprehensive Review

Each Planning Coordinator should include in its presentations and in the accompanying report documentation, as a minimum, the information listed below. At its own discretion, the Planning Coordinator may discuss other related issues not covered specifically by these guidelines.

4.1 Executive Summary

4.1.1 Briefly illustrate the major findings of the review.

4.1.2 Provide a table format summary of major assumptions and results.

4.2 Table of Contents

4.2.1 Include listing of all tables and figures.

4.3 Introduction

4.3.1 Reference the previous NPCC Area Review.

4.3.2 Compare the proposed **resources** and **load** forecast covered in this NPCC review with that covered in the previous review

4.4 Resource Adequacy Criterion

4.4.1 State the Planning Coordinator's **resource** adequacy criterion.

4.4.2 State how the Planning Coordinator criterion is applied; e.g., **load** relief steps.

4.4.3 Summarize **resource** requirements to meet the criteria for the time period under consideration. If interconnections to other Planning Coordinators and regions are considered in determining this requirement, indicate the value of the interconnections in terms of megawatts.

4.4.4 If the Planning Coordinator criterion is different from the NPCC criterion, provide either an estimate of the **resources** required to meet the NPCC criteria or a statement as to the comparison of the two criteria.

4.4.5 Discuss **resource** adequacy studies conducted since the previous Area Review, as appropriate.

4.5 Resource Adequacy Assessment

4.5.1 Evaluate proposed **resources** versus the requirement to reliably meet projected electricity demand assuming the Planning Coordinator's most likely **load** forecast.

4.5.2 Evaluate proposed **resources** versus the requirement to reliably meet projected electricity demand assuming the Planning Coordinator’s high **load** growth scenario.

4.5.3 Discuss the impact of **load** and **resource** uncertainties on projected Planning Coordinator Area **reliability** and discuss any available mechanisms to mitigate potential **reliability** impacts.

4.5.4 Review the impacts that major proposed changes to market rules may have on Planning Coordinator Area **reliability**.

4.6 Proposed Resource Capacity Mix

4.6.1 Discuss any **reliability** impacts resulting from the proposed **resources** fuel supply and transportation or environmental considerations.

4.6.2 Describe available mechanisms to mitigate any potential **reliability** impacts of **resource** fuel supply, demand resource response, transportation issues and/or environmental considerations.

4.6.3 Discuss any **reliability** impacts related to an **Area**'s compliance with state, Federal or Provincial requirements (such as environmental, renewable energy, or greenhouse gas reductions).

5.0 Format of Presentation and Report – Annual Interim Review

The Annual Interim Review should include a reference to the most recent Comprehensive Review; a listing of major changes in: facilities and system conditions, **load** forecast, generation resources availability; related fuel supply and transportation information, environmental considerations, demand response programs, transfer capability and **emergency** operating procedures. In addition, the assessment should also include a comparison of major changes in market rules, implementation of new rules, locational requirements, and installed capacity requirements. Finally, the report should include a brief impact assessment and an overall summary.

The Planning Coordinator will provide a brief assessment of the impact of these changes on the **reliability** of the interconnected **bulk power system**. This assessment should be based on engineering judgment, internal system studies and appropriate joint interconnected studies. To the extent that engineering judgment or existing studies can be used to clearly demonstrate that a Planning Coordinator Area is expected to meet the NPCC resource adequacy criterion, detailed system LOLE studies are not required.

The documentation for the Annual Interim Review should be in the form of a summary report (normally not exceeding three to five pages.)

Sections A and B should describe the **reliability** model and program used for the **resource** adequacy studies discussed in Section 4.5. Section C should describe the Task Force follow-up procedures.

A. <u>Description of Resource Reliability Model</u>

1.1 Load Model

1.1.1 Description of the **load** model and basis of period **load** shapes.

1.1.2 How **load** forecast uncertainty is handled in model.

1.1.3 How the electricity demand and energy projections of interconnected entities within the Planning Coordinator Area that are not members of the Planning Coordinator Area are addressed.

1.1.4 How the effects (demand and energy) of demand-side management programs (e.g., conversion, interruptible demand, direct control **load** management, demand (**load**) response programs) are addressed.

1.2 Supply Side **Resource** Representation

1.2.1 Resource Ratings

1.2.1.1 Definitions.

1.2.1.2 Procedure for verifying **ratings**. Reference NPCC Document B-9, *Guide for Rating Generating Capability*.

1.2.2 Unavailability Factors Represented

1.2.2.1 Type of unavailability factors represented; e.g., forced outages, planned outages, partial derating, etc.

1.2.2.2 Source of each type of factor represented and whether generic or individual unit history provides basis for existing and new units.

1.2.2.3 Maturity considerations, including any possible allowance for in-service date uncertainty.

1.2.2.4 Tabulation of typical unavailability factors.

1.2.3 Purchase and Sale Representation.

1.2.3.1. Describe characteristics and level of dependability of transactions.

1.2.4 Retirements.

1.2.4.1 Summarize proposed retirements.

1.3 Representation of Interconnected System in Multi-Area **Reliability** Analysis, including which Planning Coordinator Areas and regions are considered, interconnection capacities assumed, and how expansion plans of other Planning Coordinators and regions are considered.

1.4 Modeling of Variable and Limited Energy Sources.

1.5 Modeling of Demand Side Resources and Demand (**Load**) Response Programs.

1.5.1 Description should include how such factors as in-service date uncertainty, **rating**, availability, performance and duration are addressed.

1.6 Modeling of all **Resources**.

1.6.1 Description should include how such factors as in-service date uncertainty; capacity value, availability, **emergency** assistance, scheduling and deliverability are addressed.

1.7 Other assumptions i.e., internal transmission limitations, maintenance over-runs, fuel supply and transportation and environmental constraints.

1.8 Incorporate the **reliability** impacts of market rules.

B. Other Factors, If Any, Considered in Establishing Reserve Requirement Documentation

The documentation required to meet the requirements of the above format should be in the form of summaries of studies performed within a Planning Coordinator Area, including references to applicable reports, summaries of reports or submissions made to regulatory agencies.

C. Task Force Follow-Up Procedures

Once a specific Planning Coordinator has made a presentation or a series of presentations to the Task Force on Coordination of Planning, the latter shall:

1. Prepare a brief summary of key issues discussed during the presentation.

2. Note where further information was requested and the results of such further interrogations.

3. Note the specific items that require additional study and indicate the responsibilities for undertaking these studies.

4. Recommend approval to the Reliability Coordinating Committee.

Appendix E - Guidelines for Requesting Exclusions to Sections 5.4.1 (B) and 5.5.1 (B) of NPCC Directory #1 – *Design and Operation of the Bulk Power System*

1.0 Introduction

The Northeast Power Coordinating Council (NPCC) was formed to promote the **reliability** and efficiency of electric service of the interconnected **bulk power system** of the members of the NPCC by extending the coordination of their system design and operations as cited in the NPCC Memorandum of Agreement. Towards that end, the Member Systems of NPCC adopted the *Basic Criteria for Design and Operation of Interconnected Power Systems* (Directory #1 – *Design and Operation of the Bulk Power System*), which establishes the minimum standards for design and operation of the interconnected **bulk power system** of NPCC. In accordance with those standards, the **bulk power system** should be designed and operated so as to withstand certain specific **contingencies**.

One such **contingency**, listed under Section 5.4.1(b), Transmission Design Criteria - **Stability** Assessment, and under Section 5.5.1(b), Transmission Operating Criteria - Normal Transfers, involves "simultaneous permanent phase to ground faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with normal **fault clearing**." Although this **contingency** is normally included in the NPCC Criteria, the Basic Criteria in Directory #1 define specific conditions for which a multiple circuit tower situation is an acceptable risk and, therefore, can be excluded.

Directory #1 also allows for requests for exclusion from this **contingency**, on the basis of acceptable risk, for other instances of multi-circuit tower construction. All exclusions must be approved by the Reliability Coordinating Committee (RCC). An acceptance of a request for exclusion is dependent on the successful demonstration that such exclusion is an acceptable risk. These guidelines describe the procedure to be followed and the supporting documentation required when requesting exclusion, and establishes a procedure for periodic review of exclusions of record.

2.0 Documentation

The documentation supporting a request for exclusion to Sections 5.4.1(b) and 5.5.1(b) of the Basic Criteria must include the following:

2.1 A description of the facilities involved, including geographic location, length and type of construction, and electrical connections to the rest of the interconnected power system;

2.2 Relevant design information pertinent to the assessment of acceptable risk, which might include: details of the construction of the facilities, geographic or

atmospheric conditions, or any other factors that influence the risk of sustaining a multi-circuit **contingency**;

2.3 An assessment of the consequences of the occurrence of a multi-circuit **contingency**, including, but not limited to, a discussion of levels of exposure and probability of occurrence of **significant adverse impact** outside the local area;

2.4 For existing facilities, the historical outage performance, including cause, for multi-circuit **contingencies** on the specific facility (facilities) involved as compared to that of other multi-circuit tower facilities;

2.5 For planned facilities, the estimated frequency of multi-circuit **contingencies** based on the historical performance of facilities of similar construction located in an area with similar geographic climate and topography.

3.0 Procedure for obtaining an Exclusion

The following procedure shall be used in obtaining exclusion to Sections 5.4.1(b) or 5.5.1(b) of Directory #1:

3.1 The entity requesting the exclusion (the Requestor) shall submit the request and supporting documentation to the Task Force on System Studies (TFSS) after acceptance has been granted by the Requestor's own Planning Coordinator, if such process is applicable.

3.2 TFSS shall review the request, verify that the documentation requirements have been met, and determine the acceptability of the request.

3.3 If TFSS deems the request acceptable, TFSS shall request the Task Force on Coordination of Planning (TFCP), the Task Force on Coordination of Operation (TFCO), and the Task Force on System Protection (TFSP) to review the request. The Requestor shall provide copies of the request and supporting documentation to the other Task Forces as directed by TFSS. If additional information is requested by the other Task Forces as part of their assessment, the Requestor will provide this information directly to the interested Task Force, with a copy to the TFSS. The other Task Forces shall review the request and indicate their acceptance or non-acceptance to TFSS.

3.4 If any of the four Task Forces determines the request is not acceptable, TFSS will respond to the Requestor with the determination and inform the RCC and the other Task Forces of the decision.

3.5 TFSS shall notify TFCP, TFCO, and TFSP of an exclusion that has been accepted by the Task Forces and the basis for the exclusion. The TFSS will then make a recommendation to the RCC regarding the exclusion.

3.6 The NPCC Policy for Alternative Dispute Resolution is available for use if the decision is unacceptable to the Requestor.

Upon acceptance of the requested exclusion by the RCC, TFSS shall so notify the Requestor and update a summary list of the exclusions. The summary list and supporting documents shall be maintained by NPCC.

4.0 Periodic Review of Exclusions of Record

Exclusions shall be reviewed within the Planning Coordinator's transmission reviews as provided in *Guidelines for NPCC Area Transmission Reviews* (NPCC Directory #1 – Appendix C). This review shall verify that the basis for each exclusion is still valid. TFSS shall notify TFCP, TFCO, TFSP, and the RCC when a Planning Coordinator's transmission review has determined exclusion is no longer applicable, and revise the exclusion summary list accordingly.

Appendix F – Procedure for Operational Planning Coordination

1.0 Introduction

The Reliability Coordinators (RC) of the Northeast Power Coordinating Council, Inc. (NPCC) require access to the security data specified in this procedure in order to adequately assess the reliability of the NPCC bulk power system. All users of the electric systems, including market participants, must supply such data to the NPCC Reliability Coordinators. Coordination among and within the Reliability Coordinator Areas (RC Area) of NPCC is essential to the reliability of interconnected operations. Timely information concerning system conditions should be transmitted by the NPCC RC Areas to other RC Areas as needed to assure reliable operation of the **bulk power system**. One aspect of this coordination is to ensure that adjacent RC Areas and neighboring systems are advised on a regular basis of expected operating conditions, including generator, transmission and **system protection**, including Type I **special protection system,** outages that may materially reduce the ability of an RC Area to contribute to the reliable operation of the interconnected system, or to receive and/or render assistance to another RC Area. To the extent practical, the coordination of outage schedules is desirable in order to limit the severity of such impacts.

To ensure that there is effective coordination for system **reliability** concerns, this document establishes procedures for the exchange of information regarding load/capacity forecasts, including firm sales and firm purchases, generator outage schedules, and transmission outage schedules for those facilities that may have an adverse impact on other RC Area(s). It also details general action that may be taken to improve the communication of problems as well as specific topics that may be discussed in regularly scheduled, pre-arranged conference call meetings or in conference calls arranged in anticipation of problems such as capacity deficiency or inadequate light load margin in one or more RC Areas.

Participants and other recipients of the information provided by this process must adhere to the NERC *Confidentiality Agreement for Electric System Operating Reliability Data*.

2.0 Load/Capacity Forecasts

2.1 Twice yearly, by May 15th and November 15th respectively, the Operations Planning Working Group (CO 12) will perform a summer and winter assessment for the next season. The methodology and format of the seasonal report will be presented in NPCC Document C-45, "CO-12 Seasonal Assessment Methodology," currently under development.

The results will be reviewed by the NPCC Task Force on Coordination of Operation (TFCO) and the NPCC Reliability Coordinating Committee (RCC) in advance of the spring and autumn meetings of both groups.

2.2 Each week, each RC Area will review its weekly net resource capacity margin, as defined in Attachment A, for the twelve weeks to follow and forward the information to the NPCC Staff for distribution to all NPCC RC Areas. If an NPCC RC Area identifies a deficiency or light load condition, the RC Area should identify the cause(s) and mitigation measures that have been implemented, or will be implemented, to manage the issue.

3.0 Generator Outage Coordination

3.1 Each RC Area should exchange current and expected critical generation outages.

4.0 Transmission Outage Coordination

4.1 Advance Planning of Transmission Facility Outages

NPCC Document Directory#1, *Basic Criteria for Design and Operation of Interconnected Power Systems,* requires that scheduled outages of transmission facilities that affect **reliability** between RC Areas be coordinated sufficiently in advance of the outage to permit the affected RC Area to maintain **reliability**. For the purposes of this procedure, each RC should exchange critical transmission outages as identified in coordination agreements with their interconnected neighbors and jointly develop and maintain a Facilities Notification List.

4.2 Facilities Notification List

The NPCC Facilities Notification List, Attachment D, has two components:

1) the NPCC Transmission Facilities Notification List; and
2) the list of NPCC Type I **special protection systems**.

The Facilities Notification List is developed by each RC Area and specifies all facilities that, if removed from service, may have a significant, direct or indirect impact on another RC Area's transfer capability. The cause of such impact might include stability, voltage, and/or thermal considerations.

Prior to October 1st of each year, each RC Area will review and update its Facilities Notification List and coordinate necessary changes with other appropriate NPCC RC Areas. Prior to January 1st, and after review by the TFCO, the approved, updated Facilities Notification List will be posted on the NPCC secure website.

The Task Force on System Protection develops yearly the list of NPCC Type 1 **special protection systems** with input from the Task Force on System Studies.

It should be noted that revisions to the Facilities Notification List only will not follow the NPCC Process for Open Review due to the secure nature of the information contained, and Attachment D is not openly published with this Procedure.

A temporary reconfiguration of the network may result in an outage to one or more facilities not listed in Attachment D having an impact on other NPCC RC Areas. It is the responsibility of the RC experiencing the condition to notify impacted RCs in a timely manner and provide updated status reports during the condition.

4.3 Notifications of Work

4.3.1 Notification requirements should be defined in interconnected coordination agreements. The time frames identified below are the minimum notification requirements.

4.3.2 The initiating RC will advise affected RCs of all applications for outages of facilities on the Facilities Notification List, including those which have been planned.

All outages to equipment listed in the Facilities Notification List should be planned with as much lead time as practical.

Normally, notification for work on facilities covered by this instruction will be submitted to the appropriate RC Areas at least two (2) working days prior to the time the facility is to be taken out of service.

When an RC Area receives an outage notification from another RC Area, prompt attention will be given to the notification and appropriate comments rendered. Analysis will be conducted by each RC Area in accordance with internal procedures.

4.3.3 An RC Area will not normally remove from service any transmission facility, which might have a **reliability** impact on an RC Area without prior notification to and appropriate review by that RC Area. In the event of an **emergency** condition, each RC Area may take action as deemed appropriate. Other RC Areas should be notified immediately.

An RC Area will make every effort to reschedule routine (non-emergency) transmission outages that severely degrade the reliability of an adjacent RC Area or neighboring system.

4.3.4 Each RC Area will advise the other affected RC Areas of any protection outage associated with RC Area tie line facilities. Coordination agreements may identify additional reporting

requirements associated with protection outages.

5.0 Data Providers

NPCC entities are to provide the data in order to adequately assess the reliability of the NPCC bulk power system.

6.0 Specific Communications

Conditions in an RC Area that may have an impact on another RC Area should be communicated in a clear and timely manner. Specific communications are conducted as follows:

6.1 Weekly

Each Thursday a conference call will be initiated by the NPCC Staff to discuss operations expected during the seven-day period starting with the following Sunday. Operations personnel from the NPCC RC Areas will participate. In advance of the conference call, each RC Area will prepare the data specified in Attachments A and B, and forward it to the NPCC Staff a minimum of one hour in advance of the scheduled call. The completed "NPCC Weekly Conference Call Generating Capacity Worksheet," Attachment B, together with the list of "Twelve Weeks Projections of Net Margins," Attachment C, will be forwarded to the conference call participants by the NPCC Staff.

Each RC will review its weekly capacity margins for the next twelve week period. If a deficiency or light load condition is identified, the RC will identify the cause of the deficiency or light load condition and discuss proposed mitigation measures.

The NPCC Staff will prepare Conference Call Notes that will be forwarded to the conference call participants and members of the TFCO by the following Friday afternoon.

If a deficiency or light load condition, or if adverse system operating conditions are expected within the next week, any RC Area may recommend that an Emergency Preparedness Conference Call (NPCC Document C-01) take place at an appropriate time.

Items of particular concern that should be discussed during the weekly conference call are described in Attachment C.

6.2 Emergency Preparedness Conference Call

Whenever adverse system operating or weather conditions are expected, any RC Area may request the NPCC Staff to arrange an Emergency Preparedness Conference Call (NPCC Document C-01) to discuss operating details with appropriate operations management personnel from the NPCC RC Areas and neighboring systems.

6.3 Daily Conference Calls

Each of the NPCC Reliability Coordinator Area control rooms participate in a regularly scheduled daily conference call. The goal of this call is to alert NPCC Reliability Coordinators of any potential emerging problems. Subjects for discussion are limited to credible events which could impact the ability of a Reliability Coordinator to serve its load and meet its operating reserve obligations, or which would impose a burden to the Interconnection.

Procedure for Operational Planning Coordination – Attachment A

Load and Capacity Table Instructions

and

Generating Capacity Worksheet Instructions

Week Beginning	The seven day period for which data is to be reported is defined as starting with the Sunday following the conference call through the following Saturday.
Installed Generating Capacity (Line Item 1)	Include all available generation at its maximum demonstrated capability for the appropriate seasonal capability period.
Firm Purchases (Line Item 2)	Include only those transactions where capacity is delivered. Exclude "energy only" transactions.
Firm Sales (Line Item 3)	Include only those transactions where capacity is delivered. Exclude "energy only" transactions.
Net Capacity (Line Item 4)	Add Installed Generating Capacity and Firm Purchases. Subtract Firm Sales. (Line 1+Line 2-Line3)
Peak Load Forecast (Line Item 5)	The peak load forecast should be the best estimate of the RC Area's maximum peak load exposure anticipated for the week reported.
Available Reserve (Line Item 6)	Subtract Peak Load Forecast from Net Capacity. (Line 4-Line5.)
Demand Side Management (Line Item 7)	Include only maximum capability which can be obtained by operator initialization within four (4) hours.

Attachment A (continued)	
Known Unavailable Capability (Line Item 8)	Include all known outages, as well as those deratings or unit outages presently forced out, unavailable, on extended cold standby or which are anticipated to remain out of service. This would also include capacity unavailable due to transmission constraints.
Net Reserve (Line Item 9)	Available Reserve plus Demand Side Management minus Known Unavailable Capacity. (Line 6+Line 7-Line 8)
Required Operating Reserve (Line Item 10)	The methodology used by each RC Area in calculating operating reserve must, as a minimum, meet the requirements of NPCC Document A-06, "Operating Reserve Criteria." Methodologies differing from the A-06 requirements should be clarified in Attachment B, "NPCC Weekly Conference Call Generating Capacity Worksheet," under the tab for "Operating Reserve."
Gross Margin (Line Item 11)	Subtract Required Operating Reserve from Net Reserve. (Line 9-Line 10)
Unplanned Outages (Line Item 12)	Estimate the amount of generating capacity which will be unavailable. This quantity should be based on historical averages for forced outages and deratings.
Net Resource Capacity Margin (Line Item 13)	Subtract Unplanned Outages from Gross Margin. A positive value reflects surplus reserve. A negative value reflects a deficiency. (Line 11-Line 12)
Forecast High / Low Temperatures and Days (Line Item 14)	Include the expected high and low temperatures for the RC Area for the week, and indicate the day on which they are expected to occur.

Attachment A (continued)	
Seasonal High / Low Temperatures (Line Item 15)	Include the expected high and low forecast seasonal temperatures for the RC Area.
Minimum Load Forecast (Line Item 16)	The minimum load forecast should be the best estimate of the RC Area's minimum load exposure anticipated for the week reported.
Minimum Resources (Line Item 17)	The Minimum Resources are the Reliability Coordinator Area's total expected on-line generator minimum output capability and must-take purchases.
Light Load Margin (Line Item 18)	Subtract Minimum Resources from Minimum Load Forecast. A negative number indicates a light load condition. (Line 16-Line 17)

Procedure for Operational Planning Coordination – Attachment B

NPCC Weekly Conference Call Generating Capacity Worksheet

The "NPCC Weekly Conference Call Generating Capacity Worksheet" is an active Excel spreadsheet used each week to assist in the calculation of the data discussed during the weekly conference call. A blank template, in Microsoft Office Excel 2003, is available from the NPCC office.

Procedure for Operational Planning Coordination - Attachment C

CONDITIONS FOR DISCUSSION

Items of particular concern that should be discussed during a conference call include, but are not limited to, the following:

- anticipated weather;
- largest first and second contingencies;
- operating reserve requirements and expected available operating reserve;
- capacity deficiencies;
- potential fuel shortages or potential supply disruptions which could lead to energy shortfalls;
- light load margins;
- general and specific voltage conditions throughout each system or RC Area;
- status of short term contracts and other scheduled arrangements, including those that impact on operating reserves;
- additional capability available within twelve hours and four hours;
- generator outages that may have a significant impact on an adjacent RC Area or neighboring system;
- transmission outages that might have an adverse impact on internal and external energy transfers;
- potential need for emergency transfers;
- expected transfer limits and limiting elements;
- a change or anticipated change in the normal operating configuration of the system, such as the temporary modification of relay protection schemes so that the usual and customary levels of protection will not be provided, or the arming of special protection systems not normally armed, or the application of abnormal operating procedures; and
- update of the abnormal status of NPCC Type I special protection systems forced out of service.

Attachment D

NPCC Facilities Notification List

Attachment D is not publicly available due to the confidential nature of the information presented.

Appendix G - Procedures for Inter Reliability Coordinator Area Voltage Control

1.0 Introduction

This Procedure provides general principles and guidance for effective inter-Transmission Operator Area voltage control, consistent with the NPCC, Directory #1, "Design and Operation of the Bulk Power System," and applicable NERC Standards. Specific methods to implement this Procedure may vary among Transmission Operators, depending on local requirements. Coordinated inter- Transmission Operator Area voltage control is necessary to regulate voltages to protect equipment from damage and prevent voltage collapse. Coordinated voltage regulation reduces electrical losses on the network and lessens equipment degradation. Local control actions are generally most effective for voltage regulation. Occasions arise when adjacent Transmission Operators can assist each other to compensate for deficiencies or excesses of **reactive power** and improve voltage profiles and system security.

2.0 Principles

Each Transmission Operator develops, and operates in accordance with, its own voltage control procedures and criteria which are consistent with NPCC, Inc. Criteria and NERC Standards. Adjacent Transmission Operators should be familiar with the respective criteria and procedures of their neighboring Transmission Operators should mutually agree upon procedures for inter- Transmission Operator Area voltage control. Whether inter- Transmission Operator Area voltage control is carried out through specific or general procedures, the following should be considered and applied:

2.1 To effectively coordinate voltage control, location and placement of metering for **reactive power** resources and voltage controller status should be consistent between adjacent Transmission Operators.

2.2 the availability of **voltage regulating transformers** in the proximity of **tie lines**;

2.3 voltage levels, limits, and regulation requirements for stations on either side of an inter- Transmission Operator Area interface;

2.4 the circulation of **reactive power** (export at one tie point in exchange for import at another);

2.5 **tie line** reactive losses as a function of real **power** transfer;

2.6 reactive **reserve** of on-line generators;

2.7 shunt reactive device availability and switching strategy; and

2.8 **static VAR compensator** availability, reactive **reserve**, and control strategy.

3.0 Procedure

Transmission Operators maintain normal voltage conditions, in accordance with their own individual or joint operating policies, procedures and applicable interconnection agreements. In the event the system state changes to an abnormal voltage condition, the Transmission Operator in which the abnormal condition is originating should immediately take corrective action. If the corrective control actions are ineffective, or the Transmission Operator has insufficient reactive resources to control the problem, assistance may be requested from other Transmission Operators.

3.1 Normal Voltage Conditions

The **bulk power system** is operating with Normal Voltage Conditions when:

- actual voltages are within applicable normal (pre-**contingency**) voltage ranges; and
- expected post-**contingency** voltages are within applicable post-**contingency** minimum and maximum levels following the most severe **contingency** specified in Directory #1 "Design and Operation of the Bulk Power System."

Each Transmission Operator should maintain a mix of static and dynamic resources, including reactive **reserves**.

3.1.1 Providing that it is feasible to regulate reactive flows on its **tie lines**, each Transmission Operator should establish a mutually agreed upon voltage profile with adjacent Transmission Operators and with other neighboring systems. This voltage profile should conform to the provisions of the relevant interconnection agreements and may provide for:

- The minimum and maximum voltage at stations at or near terminals of inter-Transmission Operator Area tie lines;
- The receipt of reactive flow at one tie point in exchange for delivery at another;
- The sharing of the reactive requirements of **tie lines** and series regulating equipment (either equally or in proportion to line lengths, etc.); and
- The transfer of **reactive power** from one Transmission Operator to another.

This voltage profile, adjusted for changes in operating conditions, should be considered as the basis for determining which Transmission Operator should implement necessary measures to alleviate abnormal voltage conditions affecting more than one Transmission Operator as discussed in 3.2.10 below.

3.1.2 Each Transmission Operator should anticipate voltage trends and initiate corrective action in advance of critical periods of heavy and light **loads**.

4.0 Procedure for Triennial Monitoring and Reporting of Inter-Area Voltage Control

4.1 On, or shortly before, the first of July, the TFCO Secretary will write to each TFCO member, requesting a written response by the end of July in the form of:

a) A copy of any new procedures and principles between the reporting Reliability Coordinator and adjacent Reliability Coordinators providing detailed application, or,

b) a copy of any new understanding, such as the minutes of an operating committee meeting between Reliability Coordinators, indicating that such detailed application is not required, and why;

c) a copy of any revisions to the procedures and principles, or understandings currently on file at NPCC, that exists between the reporting Reliability Coordinator and adjacent Reliability Coordinators;

d) a response indicating no change to existing procedures and principles, or understandings currently on file at NPCC.

4.2 The TFCO Secretary will draft a report summarizing the extent to which responses indicated conformance with the NPCC Procedures, and will forward it to TFCO members at least two weeks prior to the October TFCO meeting.

4.3 Following TFCO review and adoption, the TFCO Chairman will forward the report to the Chairman of the Reliability Coordinating Committee (RCC) recommending acceptance or other action as deemed appropriate. This will normally be forwarded three weeks prior to the next regularly scheduled RCC meeting.

1.0 Title **Reserve**

1.1 Directory Number 5

1.2 Objective

The purpose of this Directory is to present the requirements with which the applicable entity must plan for and deploy adequate **reserve**. This Directory provides minimum requirements governing the amount, availability, distribution, and activation of **reserve** in addition to those specified in applicable NERC standards.

1.3 Effective Date **December 2, 2010**

1.4 Background

This Directory was developed from the NPCC A-6 Operating Reserve Criteria document. Guidelines and procedures for consideration in the implementation of this Directory are provided in the Appendices. Content from various NPCC B and C documents was used in both the body of this Directory and in the Appendices.

1.5 Applicability

1.5.1 Functional Entities

Balancing Authorities
Reliability Coordinators
Load Serving Entities
Generator Owners

2.0 Terms Defined in this Directory

NPCC-defined terms found in this Directory appear in bold typeface and can be found in the NPCC Glossary.

3.0 NERC ERO Reliability Standard Requirements

The NERC ERO Reliability Standards containing requirements that are associated with this Directory include, but may not be limited to:

BAL-001
BAL-002
BAL-003
BAL-005
EOP-002

4.0 NPCC Regional Reliability Standard Requirements

None.

5.0 NPCC Full Member, More Stringent Criteria

In the continuous operation of electric power systems, **operating capacity** is required to meet forecast demand, including an allowance for error, to provide protection against equipment failure which has a reasonably high probability of occurrence, and to provide adequate regulation of frequency and **tie line** power flow. The **operating capacity** in excess of that required for actual load is commonly referred to as **reserve.**

5.1 **Ten-Minute Reserve** Requirements

NPCC **ten-minute reserve** meets the requirement for the contingency reserve within the NERC standards. Each Balancing Authority shall have **ten-minute reserve** available to it that is at least equal to its **first contingency loss. Ten-minute reserve** shall be sustainable as specified in section 5.13.

5.2 Restoration of **Ten-Minute Reserve**

If a Balancing Authority becomes deficient in **ten-minute reserve** or forecasts a deficiency without counting the contribution of either curtailment of interruptible loads that is not part of normal operations, and/or public appeals:

5.2.1 It shall restore its ten-minute reserve as soon as possible and within the duration specified by the appropriate NERC standard.

5.2.2 If 5.2.1 cannot be achieved, minimize the magnitude and duration of **ten-minute reserve** deficiency.

Refer to Appendix 3, Section 3.1 for guidance on the restoration of ten-minute reserve.

If the actions identified in Appendix 3 do not fully restore **ten-minute reserve** within the specified duration, see Directory 2, "Emergency Operations," to determine additional actions required.

5.3 **Thirty-Minute Reserve** Requirements

Each Balancing Authority shall have **thirty-minute reserve** available to it that is at least equal to one-half its **second contingency loss**. **Thirty-minute reserve** shall be sustainable as specified in section 5.13.

5.4 Restoration of **Thirty-Minute Reserve**

If a Balancing Authority is deficient in **thirty-minute reserve** for four hours, or if it forecasts a deficiency of any duration beyond a four hour horizon, refer to Appendix 3, Sections 3.6 and 3.7 for guidance on the restoration of **thirty-minute reserve**.

No further corrective actions are required if the actions in Appendix 3, Sections 3.6 and 3.7, do not restore **thirty-minute reserve**.

5.5 Requirement for **Synchronized Reserve** Available Within Ten Minutes

Requirements for **synchronized reserve** available within ten minutes for NPCC Balancing Authorities shall be based on demonstrated performance. The requirements shall not be more than 100% or less than 25% of the **ten-minute reserve** requirement.

5.5.1 Computing Adjustments to the Requirement of **Synchronized Reserve** Available Within Ten Minutes

The requirement for **synchronized reserve** available within ten minutes shall be adjusted based upon the Balancing Authority's past performance in returning its Area Control Error (ACE) to pre-contingency values, or to zero, within fifteen minutes following loss of resource, in accordance with the following relationship:

- The requirement for **synchronized reserve** available within ten minutes shall be reduced to a minimum of 25 percent of the **ten-minute reserve** requirement in steps of 10 percent of the **ten-minute reserve** requirement for every time a Balancing Authority successfully

returns its ACE to pre-contingency values, or to zero, following successful recoveries for events meeting or exceeding the NPCC reportable event threshold. Successful recoveries that occur in the same month as a failure shall not be counted in that month towards a reduced synchronized reserve requirement. However, successful recoveries subsequent to a failure can be counted in the next month provided there are no failures in that month.

- The requirement for **synchronized reserve** available within ten minutes shall increase by 20 percent of the **ten-minute reserve** requirement for every time a Balancing Authority fails to return its ACE to pre-contingency values or to zero within fifteen minutes when a contingent Balancing Authority experiences a contingency whose size is greater than or equal to the NPCC Reportable Event Threshold but less than the NERC Disturbance Control Standard default reporting threshold of 80% of the **first contingency loss**. The maximum requirement for **synchronized reserve** available within ten minutes shall be 100 percent of the Balancing Authority's **ten-minute reserve** requirement.

- Changes in the requirement for **synchronized reserve** available within ten minutes shall be calculated within twenty days after the end of each month. The new requirement for **synchronized reserve** available within ten minutes is applied on the first calendar day of the new month following the calculation of the new requirement and shall remain in effect for the full month.

5.5.2 Restoration of **Synchronized Reserve** Available Within Ten Minutes

If a Balancing Authority becomes deficient in the NPCC requirement for **synchronized reserve** available within ten minutes, it shall be restored according to the time constraints specified for **ten minute reserve**. If a Balancing Authority becomes deficient in meeting its requirement for **synchronized reserve** available within ten minutes, Appendix 3 provides guidance for eliminating the deficiency.

5.6 Distribution of **Reserve**

Reserve available to a Balancing Authority shall be distributed so as to ensure that it can be utilized without exceeding individual element ratings or transfer limitations.

5.7 Activation of Inter-Balancing Area **Reserve**

When a Balancing Authority acquires **reserve**, through direct procurement, bilateral or multi-lateral operating agreements, or through reserve sharing

agreements from another Balancing Authority, the provider of the **reserve** shall deliver an increase in energy equal to the amount of **reserve** acquired when the acquiring Balancing Authority requests its activation. Unless the provider experiences its own contingency, it shall not initiate the curtailment of an existing or planned energy sale to any Balancing Authority to support the activation of the **reserve** that was acquired until the contingent Balancing Authority has recovered from the contingency. **Reserve** acquired from another Balancing Authority shall be sustainable as specified in section 5.13.

Inter-Balancing Area **reserve** may be acquired by NPCC Balancing Authorities beyond that specified in section 5.8. All activations of inter-Balancing Area **reserve** are subject to the following constraints:

- Decision-making related to the specific resources to be activated to provide inter-Balancing Area **reserve** is restricted to the affected Balancing Authorities.

- Due to the potential difficulties in managing interchange schedules in a timely and consistent manner and in monitoring the deliverability of inter-Balancing Area **reserve** with intermediary Balancing Authorities and Reliability Coordinators, the provision of inter-Balancing Area **reserve** shall be limited to adjacent Balancing Authorities only, unless specifically facilitated by an approved NPCC procedure or multilateral Balancing Authority/Reliability Coordinator procedure.

- The activation of inter-Balancing Area **reserve** shall be implemented by either step changes to interchange schedules, by normal ramping of interchange schedules or by dynamic transfers. Where dynamic transfers are used to activate inter-Balancing Area **reserve**, it must be agreed to by the affected Balancing Authorities, and approved by the TFCO. Host and acquiring Balancing Authorities and Reliability Coordinators may establish and document further restrictions for these activation techniques.

- If inter-Balancing Area **reserve** is utilized for a Disturbance Control Standard recovery or an NPCC **reportable event**, it shall be activated within 5 minutes of the disturbance.

- The Balancing Authority acquiring **reserve** from a host Balancing Authority shall continually update the host Balancing Authority and affected Reliability Coordinators with any changes to the scheduling of inter-Balancing Area **reserve**.

- When inter-Balancing Area **reserve** is activated, the acquiring Balancing Authority notifies the host Balancing Authority to agree on interchange schedule modifications, and the host Balancing Authority activates the

reserve. **Reserve** activation is subject to the concurrence of the affected Reliability Coordinators.

- When an energy transaction associated with Inter-Balancing Area **reserve** terminates at the end of a scheduling period (i.e., the **reserve** is not scheduled in the subsequent scheduling period), the Balancing Authorities participating in the transaction shall agree on the terms of the schedule change in advance. As a minimum, these terms shall address the start time, ramp rate, and duration of the curtailment of the **reserve** being delivered.

5.8 Simultaneous Activation of **Ten-Minute Reserve**

Simultaneous activation of **ten-minute reserve** (SAR) is a program in which two or more Balancing Authorities agree to individually maintain but jointly activate **ten-minute reserve** to facilitate a more rapid recovery from an NPCC Reportable Contingency (500 MW or greater; 300 MW or greater for New Brunswick) or for stressed system conditions. Balancing Authority participation in SAR is contingent on submission of the form located in Appendix 7 and approval by Task Force on Coordination of Operation. This form will also be used to indicate if a Balancing Authority wishes to act as the SAR Coordinator for the SAR program, contingent upon the approval of TFCO. All participating Balancing Authorities in the SAR program shall form an electrically contiguous area. Adjacent and directly connected non NPCC Balancing Authorities may participate in the Simultaneous Activation of Ten- Minute Reserve program described in this Directory.

Given that **reserve** is not shared under this arrangement, the SAR program is not a Reserve Sharing Group as defined by NERC.

Recovery from a large loss of resource(s) can be achieved faster by simultaneously activating **ten-minute reserve** in several Balancing Areas. Assisting Balancing Authorities provide SAR energy by implementing schedule changes with a zero ramp time, assuring that the reserve being activated responds as quickly as possible. Simultaneous activation of **ten minute reserve** is implemented in order to:

- more quickly relieve the initial stress placed on the interconnected transmission system following a large loss of **generation** or energy purchase
- effect an improvement in **reliability** achieved by the faster recovery
- assist in achieving compliance with the NERC Disturbance Control Standard (DCS)

- provide relief for transmission overloads, low voltage, or other abnormal conditions which evolve over time without an actual contingency, but might not otherwise be relieved by normal **reserve** pickup response**.**

When the resource loss is a generator, the contingent Balancing Authority's loss equals the total output of the generator irrespective of any energy or capacity sales from that generator to any other Balancing Authority. See Appendix 4 for guidance related to resource losses that occur at a specific point of delivery, and the source Balancing Authority cannot deliver energy on another path.

Balancing Authorities that participate in the Simultaneous Activation of Reserve program shall do so in accordance with the requirements in sections 5.8.1 through 5.8.6 below. Contingent Balancing Authorities are solely responsible for their DCS recovery.

5.8.1 Preliminary **Reserve** Assessment

On a continuing basis, participating Balancing Authorities shall keep the SAR Coordinator(s) informed of the largest, single **generation** or import energy transaction **contingency** in their respective Balancing Areas.

Information pertaining to a Balancing Authority's inability to participate in SAR shall be reported to the SAR Coordinator by the participating Balancing Authorities.

5.8.2 Notification of Contingency

A participating Balancing Authority may choose to implement the SAR program if it experiences a loss of **generation** or imported energy transactions equal to or greater than an NPCC **reportable event**, or for stressed system conditions.

A participating Balancing Authority that suffers a contingency meeting the activation threshold and wishes to receive SAR assistance shall report the following information to the SAR Coordinator via the direct telephone lines:

- Time T+0 (see below)
- If applicable, name of generating resource and megawatts lost
- If applicable, name of energy purchase and megawatts lost
- Megawatts of assistance requested including that provided by the Contingent Balancing Authority
- Cause of SAR request.

For a loss of resource, T+0 is estimated to be consistent with the time specified in section 5.17 below, rounded to the nearest minute. This

estimate is for event identification purposes only, and the T+0 used for compliance determination will be performed after-the-fact, consistent with section 5.17 below. For system conditions not directly associated with a contingency, it is the time of the request for SAR assistance.

The contingent Balancing Authority shall request SAR assistance, providing sufficient time for the SAR Coordinator to distribute the shares, and for the assisting Balancing Authorities s to implement the schedule changes within five minutes of the contingency, allowing for a full 10 minutes to provide the reserve assistance assigned prior to the expiration of the 15 minute NERC Disturbance Recovery Period. This time constraint also applies for NPCC **reportable events** that are less than the Disturbance Control Standard reporting threshold.

5.8.3 Allocation of SAR

The SAR Coordinator shall assign 100% of the contingency to the Contingent and Assisting Balancing Authorities collectively. The SAR Coordinator shall assign allocations to the Assisting Balancing Authorities that are within their respective response capability.

After receiving a request for the activation of SAR, the SAR Coordinator shall:

a. Determine each Balancing Authority's SAR allocation in accordance with the following:
   - At least fifty percent (50%) of a loss is allocated to the Contingent Balancing Authority.
   - The remainder of a loss is normally allocated among the Assisting Balancing Authorities.
   - A Balancing Authority shall not be requested to provide more assistance during a **reserve** pickup than is required to meet its own largest **contingency**.

b. Immediately inform each Balancing Authority of its SAR allocation, the time that the schedule change is effective, and the time that the **contingency** occurred.

c. SAR participants may activate additional **reserve** beyond the SAR allocations to assure that the needed **ten minute reserve** is provided successfully. The Balancing Authority receiving SAR assistance may activate additional reserve to prepare for the eventual withdrawal of SAR assistance.

5.8.4 Provision of SAR Assistance

Assisting Balancing Authorities shall initiate immediate action to provide their allocated SAR assistance**.**

The Contingent Balancing Authority shall initiate immediate action to provide its share assigned by the SAR Coordinator to recover from the resource loss, and the Contingent Balancing Authority shall prepare for the replacement of the SAR assistance energy assigned to assisting Balancing Authorities.

Assisting Balancing Authorities shall activate **ten-minute reserve** and provide assistance by **interchange schedules** that are:

a. Implemented at a zero time ramp rate immediately following allocation notification.

b. Maintained until the Contingent Balancing Authority requests a return to normal up to a maximum of thirty minutes.

c. Sustained, from the time of implementation, for a minimum of ten minutes unless reliability is affected adversely.

5.8.5 Termination of SAR

The Contingent Balancing Authority shall notify the SAR Coordinator when it wishes to terminate the delivery of SAR assistance.

- The SAR Coordinator shall notify all participating Balancing Authorities and confirm the time that the activation is terminated. Revised **interchange schedules** are mutually established as required so that the Assisting Balancing Authorities properly recall assistance.
- The Contingent Balancing Authority shall replace the **reserve** assistance assigned to assisting Balancing Authorities in a manner consistent with mutually established **interchange schedules**.
- **Interchange schedules** associated with SAR shall be ramped out at a ten-minute ramp rate following communications initiated by the Contingent Balancing Authorities, resulting in mutually established **interchange schedules**.
- In the event that a Contingent Balancing Authority is not prepared to replace the remaining portion of its **reserve** obligation within the time specified in section 5.8.4, the Contingent Balancing Authority shall arrange for additional assistance in accordance with applicable policies and agreements covering **interchange** and **emergency** assistance.

5.8.6 Reallocation and/or Subsequent **Contingencies**

In the event that the reliability of an Assisting Balancing Authority becomes jeopardized, that Balancing Authority may cancel all or part of its allocation (using a step schedule change) by notifying the SAR Coordinator, which shall then notify the Contingent Balancing Authority to increase its SAR allocation to replace the assistance that has been withdrawn.

In the event that a subsequent loss of **generation** or imported energy transaction occurs during the period when SAR is in progress, regardless of the size of the **contingency**, the second Contingent Balancing Authority may, at its discretion, withdraw SAR assistance and request the SAR Coordinator to reallocate the assistance in accordance with the provisions of this procedure. Upon such notification, the SAR Coordinator shall notify the first Contingent Balancing Authority of the amount of withdrawal. Both Contingent Balancing Authorities shall immediately enter new **interchange schedules** that reflect the loss of the assistance, using a zero time ramp.

In the event that a second Balancing Authority experiences a **contingency** that qualifies for SAR, the SAR Coordinator shall allocate assistance from the remaining Assisting Balancing Authorities in accordance with this procedure, upon the request of that Contingent Balancing Authority.

If the second **contingency** occurs in the Balancing Authority that has incurred the first **contingency**, that Balancing Authority may request additional assistance, in accordance with this procedure, regardless of the size of the **contingency**.

5.9 Energy Scheduling and Managing **Reserve**

A Balancing Authority shall meet its requirement for **reserve** using resources within its Balancing Area and/or obtain deliverable **reserve** from other Balancing Authorities.

When a Balancing Authority acquires energy from another Balancing Authority that is immediately recallable, the acquiring Balancing Authority:

a. shall not use such energy to meet its **reserve** requirements, and resources displaced by the energy must remain available to cover for the curtailment of said energy at any time; and,

b. shall adjust its **ten-minute reserve** requirement to cover the larger of the Balancing Authority's **first contingency loss**, or the largest sum of such energy acquisitions that could be withdrawn at the same time due to a single contingency or event.

A Balancing Authority acquiring energy not associated with the capacity used to meet **reserve** requirements of another Balancing Authority is the only Balancing Authority that can use this energy to augment its **reserve**. The Balancing Authority providing such energy is obligated to advise the acquiring Balancing Authority of any change in the surplus status of the energy.

5.10 Requirements for **Reserve on Automatic Generation Control (AGC)**

Balancing Authorities shall have available and deploy sufficient **reserve on Automatic Generation Control (AGC)** to meet NERC control performance standards. R**eserve on Automatic Generation Control (AGC)** shall be sustainable as specified in section 5.13. NPCC Balancing Authorities operating synchronously within the Eastern Interconnection may meet a portion of their requirements for **reserve on Automatic Generation Control (AGC)** by participating in ACE Diversity Interchange as described in section 5.11. See Appendix 5 for the NPCC control performance standard reporting processes.

5.11 ACE Diversity Interchange

ACE Diversity Interchange (ADI) is a method of regional regulation among participating Balancing Authorities that can achieve a mutual reduction in requirements for **reserve on Automatic Generation Control (AGC)** and generator output adjustments. ADI uses the sign diversity of the Area Control Error (ACE) values of the participating Balancing Authorities to achieve this mutual reduction. ADI is a form of supplemental regulation as permitted by NERC Standards.

All participating Balancing Authorities in ACE Diversity Interchange shall form an electrically contiguous area. Adjacent and directly connected non NPCC Balancing Authorities may participate in ACE Diversity Interchange. Participation in ACE Diversity Interchange is contingent on submission of the form located in Appendix 7 and approval by TFCO.

This form will also be used to indicate if a Balancing Authority wishes to act as the ADI Coordinator for the ADI participants, contingent upon the approval of TFCO.

Balancing Authorities that participate in Ace Diversity Interchange (ADI) shall do so in accordance with the requirements in section 5.11.1 & 5.11.2 below.

5.11.1 ADI General Requirements

In order to participate in ADI, Balancing Authorities shall establish the appropriate data exchange and apply the ADI term to their respective ACE in AGC.

Transmission limits or other internal constraints that preclude the normal implementation of ADI shall be communicated immediately to the ADI Coordinator. Whenever normal implementation of the procedure is precluded, the ADI Coordinator shall notify the other participants.

The industry sign standard for ACE is used, i.e., a negative ACE indicates under-generation. The ADI sign convention is such that a positive ADI allocation will make the adjusted ACE of the participating Balancing Authority less negative with respect to the unadjusted ACE. The positive ADI limit will restrict the amount of positive ADI that can be allocated to make a participating Balancing Authority's adjusted ACE less negative with respect to a negative unadjusted ACE. The converse is applied to positive ACE values and negative ADI allocation and limits.

Inadvertent interchange is affected by the implementation of ADI. In general the unadjusted ACE values have equal likelihood over an hour to be positive or negative. ADI allocations will be monitored carefully for inequitable or inordinately large accumulations of inadvertent. These issues will be addressed and remedied promptly.

ADI may be biased to correct for inadvertent among participants that have accumulated balances that are opposite in sign. Two or more ADI participants may engage in this activity. At least one participant's accumulated inadvertent balance must be opposite in sign to the other's.

5.11.2 ADI Methodology

Changes to the ADI states (enable/disable) and parameters are coordinated through the ADI Coordinator. The ADI Coordinator has the authority to globally disable ADI. Following this action, all participants shall be notified. A change to an individual participating Balancing Authority's enable/disable status is communicated electronically and is available to all participants.

The participating Balancing Authorities have the authority to disable their respective participation in ADI. The ADI Coordinator has the capability to disable any individual participating Balancing Authority, but shall only do so at the participating Balancing Authority's request, unless a reliability problem requires immediate action by the ADI Coordinator.

a) The ADI Coordinator notifies all participating Balancing Authorities of any changes in a participating Balancing Authority's ADI state.
b) The ADI Coordinator has the authority to enable or disable ADI exchange and/or related parameters if:

- Control Performance is adversely affected by the ADI
- ADI contributes to inordinately large or inequitable accumulations of inadvertent
- Flows on the transmission system are affected adversely by ADI.
- Data received from a participating Balancing Authority do not meet the data refresh criterion.

c) Participating Balancing Authorities determine their level of participation in conjunction with the NPCC Working Group CO-1. ADI values that determine the limit for total ADI participation shall be recommended by NPCC Working Group CO-1 and require approval by the TFCO. All changes that affect ADI participation must be communicated through the ADI Coordinator. Limit changes to control inadvertent accumulations will be made simultaneously by the ADI Coordinator and communicated to all participants.
d) Any Participating Balancing Authority may request that ADI be enabled or disabled globally.
e) All actions to globally enable or disable ADI or otherwise modify ADI parameters shall be communicated by the ADI Coordinator to the other ADI participants. A concise reason for the change is to be given.
f) Participating Balancing Authorities will disable ADI participation if AGC execution is paused, suspended, placed in a monitor mode, or if data quality problems result in an unreliable calculation of the unadjusted ACE.
g) The NPCC Control Performance Working Group (CO-1) shall monitor the ADI process to determine the appropriate ADI operating parameters and to assure that reliability is not adversely affected by its use. CO-1 shall periodically verify that unadjusted ACE values used for ADI assignments are reasonably close to an equal distribution of positive and negative values, and monitor ADI monthly on and off peak accumulations to assure that inadvertent accumulations are not experiencing a significant adverse impact. CO-1 will assure that any increase in ADI limits will not have an adverse impact on reliability, and will coordinate any limit and parameter changes with NPCC CO-8 members of participating Balancing Authorities.
h) As ADI is treated as a pseudo-tie, data retention requirements shall match those specified for tie-line data in accordance with applicable NERC standards.

5.12 Frequency Responsive **Reserve**

See Appendix 1 for NPCC-specific reporting procedures.

5.13 Sustainability of **Operating Reserve**

Synchronized reserve, **ten-minute reserve**, and **thirty-minute reserve** available to a Balancing Authority, if activated, shall be sustainable for at least one hour from the time of activation. Balancing Authorities shall determine their sustainability requirement for reserve on Automatic Generation Control (AGC) based on their ability to achieve compliance with relevant standards, with due consideration of their operating characteristics.

5.14 Resource-Specific Requirements

The Balancing Authority is responsible for meeting the following:

a) **Synchronized reserve**, **ten-minute reserve**, and **thirty-minute reserve** cannot be provided from loads where the same capacity is included in demand response programs and would result in double counting the same capacity.
b) Loads cannot provide **synchronized reserve** if the reduction in load is dependent on starting a generator to replace energy that is supplied from the grid.
c) To be eligible to provide **synchronized reserve**, **ten-minute reserve**, or **thirty-minute reserve**, the Load Serving Entity or Generator Owner responsible for the **Resource** shall meet the metering and testing requirements of the relevant Balancing Authorities.
d) To be eligible to provide **synchronized reserve**, **ten-minute reserve**, or **thirty-minute reserve**, the **Resource** shall continuously meet the dispatch instruction requirements of the relevant Balancing Authority(s).
e) To be eligible to provide **synchronized reserve**, **ten-minute reserve**, or **thirty-minute reserve**, the Load Serving Entity or Generator Owner responsible for the **Resource** shall meet the requirements specified by the relevant Balancing Authorities for operating limits and response rate, so that available **reserve** shall be computed accurately.
f) To be eligible to provide **synchronized reserve**, **ten-minute reserve**, or **thirty-minute reserve**, the Load Serving Entity or Generator Owner responsible for the **Resource** providing inter-Balancing Area **reserve** shall not offer the same reserve to more than one acquiring Balancing Authority for the same scheduling interval.
g) When energy and **reserve** are being provided concurrently from a **Resource** for a host and acquiring Balancing Authority respectively, a host Balancing Authority providing inter-Balancing Area **reserve** cannot count that **reserve** to

meet its own **reserve** requirement, and, the acquiring Balancing Authority cannot count capacity that is allocated for energy to the host Balancing Authority as **reserve**.

5.15 Reporting of Simultaneous Activation of **Reserve** Events

Contingent Balancing Authorities initiating a SAR event have successfully recovered when their ACE crosses zero (or returns to the ACE value just prior to the loss of resource if it was negative) within 15 minutes of the occurrence of the contingency.

Assisting Balancing Authorities have successfully provided their assistance if either of the following conditions exists:

(1) ACE crosses zero after the step schedule change to provide their assistance has been entered and within fifteen minutes of the time of the contingency, or;
(2) If their ACE was negative just prior to the step schedule change to provide their assistance, their ACE returns to the negative ACE value just prior to the schedule change and within fifteen minutes of the time of the contingency.

Assisting Balancing Authorities are not subject to the above recovery evaluations if the notification time for assistance supplied by the SAR Coordinator is not less than five minutes from the time of contingency.

If an assisting Balancing Authority has not provided its assistance successfully per either (1) or (2) above, and, the notification time was within five minutes of the occurrence of the contingency, then the assisting Balancing Authority shall provide a written explanation to the TFCO. If an assisting Balancing Authority incurs 3 shortfalls within the most recently completed twelve months, TFCO is empowered to take actions they deem to be appropriate up to and including termination from future participation in the SAR program. See Appendix 2 for reporting details.

If a Balancing Authority receiving or providing assistance experiences a resource loss when an SAR event is in progress, that Balancing Authority may adjust their ACE by the amount of the resource loss and use that adjusted ACE in the evaluation of the success of its recovery.

5.16 Light Load Conditions

Guidance for mitigating adverse light load conditions is provided in Appendix 6.

5.17 Determining the Time Associated With the Loss of a Resource

The determination of time T+0 for resource losses is consistent with the methodology described in the NERC Performance Standard Reference Guide. For performing compliance evaluations, time T+0 for NPCC Reportable Events is determined by the following process:

1. A sliding 60 second interval (with EMS scan rate data as a source) is used to determine when the magnitude of the resource loss qualifies as an NPCC Reportable Event.
2. When the change in output of the resource loss exceeds the NPCC Reportable Event Threshold within a sliding 60 second interval, time T+0 is the first observation of declining output within that sliding 60 second interval.
3. When the change in output of the resource loss exceeds the DCS Event Threshold within a sliding 60 second interval, time T+0 is the first observation of declining output within that sliding 60 second interval.
4. If (2) and (3) above result in differing computations of T+0, the DCS computation in (3) takes precedence.
5. Any portion of the resource loss preceding the sliding 60 second interval identified in (2) and/or (3) is not included in the determination of the megawatts lost for the event.

Prepared by: Task Force on Coordination of Operation

Review and Approval: Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon satisfactorily addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval.

Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC. Bylaws" in effect at the time the ballots are cast.

Revisions pertaining to the Appendices or any other portion of the document such as Links glossary terms, etc., only RCC Members will need to conduct the final approval ballot of the document.

This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

Emergency Operations (NPCC Directory #2)

Appendix 1 - Monitoring Procedures for Interconnected System Frequency Response

Introduction

The objective of this procedure is to provide a broader data base for further studies and to aid in the calculation of the observed frequency response. These frequency response observations are also used in determining the frequency bias settings to be used in the AGC systems of the NPCC Balancing Authorities. The NPCC Control Performance Working Group (CO-1) will monitor the results of all NPCC Balancing Authorities produced from the procedure.

Definition

For this reporting process, the system frequency deviation threshold specified for NPCC **reportable events** is used, but only those deviations occurring within 5 seconds are included in the analyses specified below.

Procedure

Balancing Authorities will record the following data for each reportable Frequency Deviation Event:

- date and time of the event
- pre-contingent Balancing Authority load
- Balancing Area response, which is the difference between the pre-contingent actual net interchange and the average actual net interchange during the post-event steady state period as defined below. (For HQTE, the Balancing Area response equals the magnitude of the **resource** loss.)
- pre-event frequency
- minimum transient frequency
- post-event steady-state frequency before AGC action.

The post event steady state period is typically between 12 seconds and 20 seconds following disturbance initiation. From this data, the following information will be derived:

- transient frequency deviation
- steady-state frequency deviation
- observed frequency response for the event

- frequency response as a percentage of pre-contingent Balancing Authority load

Data Reporting

Balancing Authorities will report events with a calculated frequency response (MW/ .1 Hz) that is less than 1% of the pre-contingent actual load on an annual basis.

To comply with NERC requirements for computing the frequency bias setting within AGC, the average value of the observed frequency response samples computed within this procedure is determined on an annual basis.

Data and results from this procedure are retained for at least 5 years.

Appendix 2 - Monitoring Procedures for Reserve Criteria

Introduction

This procedure establishes the monitoring and reporting processes for resource losses in addition to those required for meeting the NERC Disturbance Control Standard (DCS). NPCC Control Performance Working Group (CO-1) has primary responsibility for performing the monitoring and reporting processes described herein.

Monitoring Criteria

As an indication of adequacy **of ten-minute reserve**, the monitoring and reporting criteria for Balancing Authorities within NPCC focus on performance during **reportable events** where the supply side **resource** loss is equal to or less than the **first contingency loss**.

NBSO and NSPI function as a reserve sharing group for recovery from their larger losses of **resource**, the 80% threshold applies to the largest **first contingency loss** within their combined Balancing Areas.

All supply side **resource** losses that resulted in the utilization of Procedures for Simultaneous Activation of ten-minute reserve (SAR) are reported to and reviewed by CO-1.

Monthly Monitoring Procedures

For each **reportable event** not utilizing Simultaneous Activation of Reserve (SAR), an NPCC Area Trouble Report is completed by the Balancing Authority experiencing the contingency, using the appropriate reporting form. Balancing Authorities requesting SAR assistance complete the appropriate contingent SAR reporting form. Balancing Authorities providing SAR assistance complete the appropriate assistance SAR reporting form.

At the conclusion of each calendar month, NPCC Balancing Authorities review all of their **reportable events** and any SAR assistance that was provided. Each Balancing Authority sends an electronic copy of the report completed for each of their **reportable events** and any SAR assistance within a month to the Chair of CO-1 (or his/her designee). All reports in a month are due by the tenth calendar day of the following month.

Each month, CO-1 monitors the performance of the SAR program, including the timeliness of schedule changes, the successful provision of the assigned assistance, and any anomalies that may have occurred in each SAR event. CO-1 shall report any anomalies or performance shortfalls to the TFCO.

Quarterly Monitoring Procedures

The Chair (or his or her designee) of CO-1 compiles all monthly submissions at the end of each quarter to determine Disturbance Control Standard (DCS) compliance for all NPCC Balancing

Authorities. The DCS results are forwarded to the NERC office, the NPCC Compliance Committee, and to CO-1.

Annual Monitoring Procedures

CO-1 prepares an annual summary for the Task Force on Coordination of Operation (TFCO) indicating, for each Balancing Authority and for NPCC as a whole, the number of violations and the number of events for which performance was successful. The summary report also compares current year's performance with the performance of the four previous years. CO-1 provides supplementary information, as necessary, to the TFCO for their review.

The Chair of CO-1 (or his/her designee) on an annual basis produces an electronic archive of all reportable events, and distributes the archive to CO-1 members and NPCC Staff.

Appendix 3 - Procedures during Abnormal Operating Conditions

1.0 Introduction

This procedure provides specific instructions to Balancing Authorities for: making notifications upon the occurrence of deficiencies in **reserve;** restoration of **ten minute reserve**, **synchronized reserve** available within ten minutes, and **thirty minute reserve;** addressing persisting deficiencies of **ten-minute reserve;** and, addressing a regional deficiency of **ten-minute reserve.**

2.0 Objectives

2.1 To mitigate the impact of an evolving event.

2.2 To alert other Balancing Authorities and Reliability Coordinators when any Balancing Authority is deficient, or anticipates being deficient, in **reserve**.

2.3 To enhance reliability within NPCC through the sharing of resources when any Balancing Authority becomes deficient in **ten-minute reserve** and cannot restore it in a timely manner as described in section 5.2 of Directory 5.

2.4 To return to normal operating conditions as soon as possible.

3.0 Action to Mitigate Ten-Minute Reserve Shortages

Procedures to address shortages of **ten-minute reserve** are provided in this section.

3.1 Actions When Becoming Deficient in **Ten-Minute Reserve**

To minimize the magnitude and duration of **ten-minute reserve** deficiency, a Balancing Authority may implement any or all of the actions below, in no implied order:

- Commit sufficient off-line supply-side **resources** to create additional **ten-minute reserve** within the restoration period specified in section 5.2 above.
- Recall applicable exports respecting Balancing Authority operating procedures. The source Balancing Authority of the applicable exports shall give proper notification to the sink Balancing Authority**.**
- Obtain additional **resources** from outside the Balancing Authority in accordance with regional and local practices. These additional **resources** shall not be from the portion of another Balancing Authority's **reserve** that is needed to meet the other Balancing Authority's **reserve** requirements in coincident hours.
- Recall planned generator outages and coordinate with the Reliability Coordinator for possible assistance available by recalling transmission outages

(or taking other actions) that will increase **reserve** or **transfer capability** if it can reasonably be expected that additional **resources** are available to assist in reducing or eliminating the shortage.

- Count **interruptible load** (not firm **load**) that can be interrupted within ten minutes in its **ten-minute reserve**, if it has not already been counted.
- Count voltage reduction that can be implemented within ten minutes in its **ten-minute reserve**, if it has not already been counted.
- Consider the use of Public Appeals if sufficient time exists to activate them, or if the shortage is expected to last for an extended period.

3.2 Deficiencies of the **Synchronized Reserve** Available Within Ten Minutes

When a Balancing Authority becomes deficient in the **synchronized reserve** available within ten minutes but is not deficient in **ten-minute reserve**, the deficient Balancing Authority considers any or all of the following actions in no implied order to eliminate or minimize the deficiency as soon as practical:

- Activate off-line generation to increase the supply of the **synchronized reserve available within ten minutes**.
- Re-dispatch online generation to increase the supply of the **synchronized reserve** available within ten minutes.
- Obtain additional **resources** from outside the Balancing Area in accordance with regional and local practices. These **resources** cannot be from the portion of another Balancing Authority's **reserve** that is needed to meet the other Balancing Authority's **reserve** requirements in coincident hours.
- Disconnect **interruptible load** (not firm **load**), which are not contributing to the **synchronized reserve** available within ten minutes due to implementation delays in excess of ten minutes, if permitted by market and other applicable rules.

3.3 Notifications

When a Balancing Authority becomes deficient or forecasts a deficiency in either the **synchronized reserve** available within ten minutes or **ten-minute reserve**, and, the Balancing Authority cannot restore these reserves using the actions specified in section 3.1 and 3.2 of this Appendix, the following actions are required:

- The Balancing Authority informs its Reliability Coordinator.
- The Reliability Coordinator considers the need to initiate, or request NPCC Staff to initiate, an NPCC Emergency Preparedness Conference Call among the Reliability Coordinators of NPCC, and PJM and MISO if necessary.

These actions are repeated whenever there is a change in the status of the available **reserve** with respect to their corresponding restoration requirements specified above.

3.4 Persisting Deficiency of **Ten-Minute Reserve**

If the Balancing Authority remains deficient after implementing all of the applicable actions stated above, the Balancing Authority notifies its Reliability Coordinator so that the Reliability Coordinator may request that the NPCC Staff survey each Balancing Authority to complete the information in Attachment A, providing each Balancing Authority's **first contingency loss**, **ten-minute reserve** and its requirement**, thirty-minute reserve** and its requirement, and each Balancing Authority's **Total Transfer Capability (TTC)** to and from other Balancing Authorities. In response to the above notification from the Balancing Authority, its Reliability Coordinator coordinates the transfer of emergency energy between Balancing Authorities so that the deficient Balancing Authority will ultimately increase the **ten-minute reserve** available to it.

3.5 Regional Deficiency of **Ten-Minute Reserve**

When two or more NPCC Balancing Authorities are deficient in **ten-minute reserve** and all off line generation that could contribute to alleviating the shortages in the deficient Balancing Authorities has been activated, then a **Regional Reserve Deficiency** is declared. During a **Regional Reserve Deficiency**, the Regional Reserve Deficiency Coordinator performs a manual **Emergency Regional Reserve Re dispatch**, allocating **Emergency Regional Reserve Dispatch Energy** (as energy or capacity) optimally among NPCC Balancing Authorities, coordinating available resources within or between Balancing Authorities:

- To provide for greater transfer capability between the Balancing Authorities**.**
- To free transmission-constrained energy and/or capacity.
- To allocate the remaining **ten-minute reserve** among the Balancing Authorities in a manner which will improve reliability, considering each Balancing Authority's ability to control schedules at its electrical boundaries and the Balancing Authority's ability to recover from its **first contingency loss.**

An NPCC Reliability Coordinator serves as the Regional Reserve Deficiency Coordinator. To serve as the Regional Reserve Deficiency Coordinator, an NPCC Reliability Coordinator shall submit a form requesting this role as described in Appendix 7, subject to approval by TFCO.

3.6 Actions When Becoming Deficient in **Thirty-Minute Reserve**

To minimize the magnitude and duration of a **thirty-minute reserve** deficiency, a Balancing Authority may implement any or all of the actions below, in no implied order:

- Obtain additional **resources** from outside the Balancing Authority in accordance with regional and local practices. These additional **resources** shall not be from the portion of another Balancing Authority's **reserve** that is

needed to meet the other Balancing Authority's **reserve** requirements in coincident hours.

- Recall planned generator outages and coordinate with the Reliability Coordinator for possible assistance available by recalling transmission outages that will increase **reserve** or **transfer capability** if it can reasonably be expected that additional resources are available to assist in reducing or eliminating the shortage.
- Recall applicable exports or convert applicable exports to a recallable product and include this energy and/or capacity in its **thirty-minute reserve,** while respecting Balancing Authority operating procedures. The source Balancing Authority of the applicable exports gives proper notification to the sink Balancing Authority if this action is taken**.**
- Count **interruptible load** (not firm **load**) that can be interrupted within thirty minutes in its **thirty-minute reserve**, if it has not already been counted.
- Count voltage reduction that can be implemented within thirty minutes in its **thirty-minute reserve**, if it has not already been counted.

3.7 Actions When Forecasting a Deficiency Of **Thirty Minute Reserve**

- Count additional **resources** from outside the Balancing Authority in accordance with regional and local practices. These additional **resources** shall not be from the portion of another Balancing Authority's **reserve** that is needed to meet the other Balancing Authority's **reserve** requirements in coincident hours.
- Obtain additional resources from inside the Balancing Authority in accordance with regional and local practices.

Appendix 4 - Guidelines for SAR Allocation Following Radial Source Contingencies

1.0 Introduction

If the resource loss is an energy transaction being received from another Balancing Authority connecting via radial source lines and that energy can no longer be delivered at the point of delivery, the source Balancing Authority has no practical means of replacing that energy. The energy that was sinking in the other Balancing Authorities must be replaced in a timely manner.

2.0 Handling of Radial Source Contingencies with Several Balancing Authorities Receiving Energy

Radial source tie lines crossing Balancing Area boundaries may have energy delivered over these lines to more than one Balancing Authority. Handling of large contingencies on radial sources crossing Balancing Area boundaries is described in section 4 below. The methodology presented in section 4.0 below is a generic guide to be used for allocation of SAR assistance whenever a contingency occurs on a radial source tie line that results in more than one Balancing Authority losing an energy transaction. .

3.0 Radial Source Contingencies with Counter flow Transactions

Coincident with energy transactions delivered out of the Balancing Authority on radial source tie lines, countervailing transactions may be scheduled simultaneously into the Balancing Authority. The contingency loss of one of these lines when it is carrying counter flow transactions may be a relatively small net energy loss to the interconnection. However, the size of the individual counter flow transactions could be quite large. The methodology presented in section 4 below may be used for allocation of SAR assistance whenever radial line contingencies with counter flow transactions occur. In instances when the net of the scheduled transactions is less than the **reportable event** threshold, the net interchange schedules may be ramped out instead of using the SAR procedure. The SAR Coordinator and the Balancing Authorities party to the transactions may agree to this action and the duration of the ramp.

4.0 SAR Allocations for Radial Source Contingencies with More Than One Balancing Authority Receiving Energy

Some of the radial source tie lines crossing Balancing Area boundaries from HQTE to NYISO, ISO-NE, and NBSO have maximum transfer capabilities in excess of the Balancing Authority's single largest internal capacity contingency. Energy may be delivered over these lines to more than one Balancing Authority, with transmission service being provided by the Transmission Service Provider for the Balancing Authority to which the respective line is directly connected. A Balancing Authority may limit the flow such that the loss would not exceed its largest single contingency to maintain

reserve requirements at reasonable levels. Transmission restrictions in other Balancing Authorities may also limit these flows.

As the delivering entity, HQTE has no practical means to provide **reserves** from its own system in the event of the loss of a radial source tie line. When only the directly connected Balancing Authority receives the delivery, it can treat the energy as an internal source and carry reserve to cover the sudden loss. However, when the energy is delivered to more than one Balancing Authority, the responsibility for the directly connected Balancing Authority to carry all of the reserve can become overly burdensome.

This section describes the handling of large contingencies on radial sources crossing Balancing Area boundaries, such as Hydro-Québec (HQTE) to NYISO. At times, these flows may be composed of simultaneous energy deliveries to the directly connected Balancing Authority and one or more other Balancing Authorities. It allows for the use of the SAR procedure to allocate the portion of energy not designated for the directly connected receiving Balancing Authority to other Balancing Authorities participating in the Simultaneous Activation of **Ten-Minute Reserve** Procedure.

This same methodology can be applied for scenarios with simultaneous imports and exports of energy (counter flow transactions) by one or more Balancing Authorities on radial sources crossing Balancing Area boundaries. The Balancing Authority losing its ability to deliver energy may receive negative assistance shares from other Balancing Authorities. In these scenarios, affected Balancing Authorities should require smaller generation changes to restore ACE while the procedure is in effect and should have a longer period to adjust fully after the contingency. The use of negative assistance is illustrated in examples 5 and 6 in Section 4.2 below.

4.1 Management of NPCC Radial Source Contingencies

SAR support for radial source contingencies will be limited to SAR participants. Radial Source transactions will be limited to only one intermediary Balancing Authority (BA) unless all Balancing Authorities on the scheduling path are SAR participants. Non-SAR participants are expected to recover energy sinking in their respective BAs in accordance with prevailing NERC Standards.

Each hour the SAR Coordinator must be notified of scheduled wheel-through transactions among SAR participants.

Due to current software limitations, the New Brunswick Balancing Authority is exempt from the requirement to provide hourly schedule information to the SAR Coordinator. Such information will be provided at the time of the contingency.

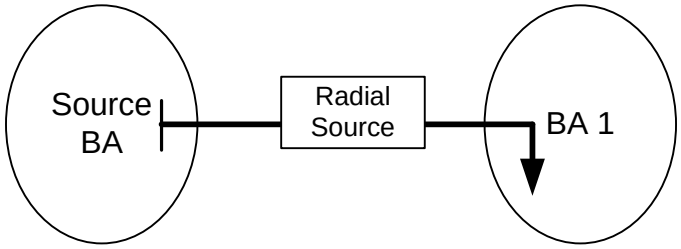
When SAR is requested, the SAR Coordinator will incorporate wheel-through transactions in its SAR software.

All ETAG(s) will be curtailed using phone communications by all applicable BAs.

E-tags will be maintained to account for the contingency and relevant SAR related activity. Four examples that apply to the management of Radial Source Contingencies that occur within NPCC for SAR and non-SAR events are provided below.

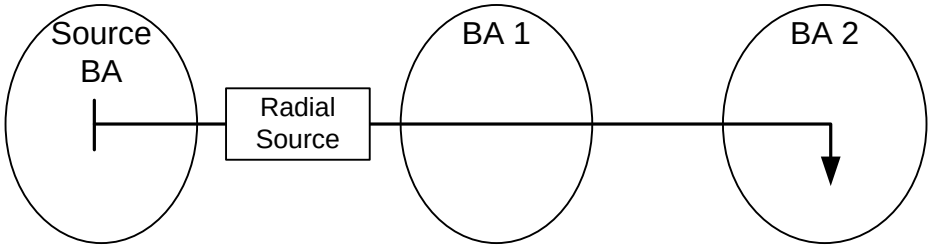
Example 1 Source BA and Sink BA1

The net energy flows from the radial Source BA and sinks in BA1 at the receiving end of that radial tie.	BA1 is responsible to recover for the entire loss as if the source was a generator inside the BA 1 footprint. Immediately following the contingency loss of the radial tie, the source and directly connected Balancing Authorities will verbally communicate. If the MW loss is greater than the NPCC reportable event threshold, or, if system conditions are stressed, BA1 may call for SAR. When SAR is requested, BA1 notifies the SAR Coordinator The ETAG(s) associated with the energy delivered to BA1 is curtailed immediately over a zero minute ramp due to the flow path being removed.



Example 2 Source BA, intermediary BA1, and sink BA2.

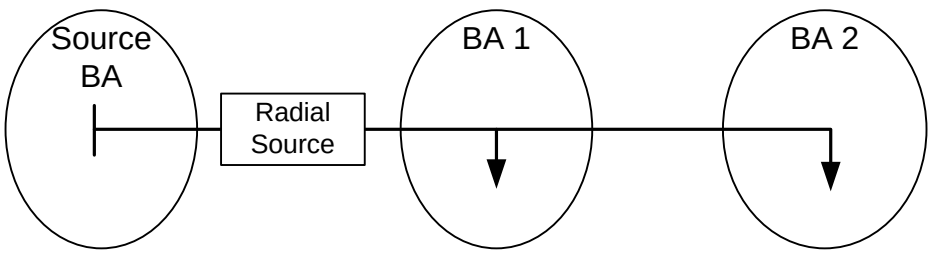
The net energy is wheeled from the radial Source BA through BA1 and sinks in BA2. This example applies to SAR participants.	BA2 is responsible to recover the MW sinking in its BA. Immediately following the contingency loss of the radial tie, the source and directly connected Balancing Authorities will verbally communicate. If the MW loss is greater than NPCC reportable event threshold, or for stressed system conditions, BA1 notifies the SAR Coordinator to request SAR activation. Verbal communications between the Balancing Authorities will be as follows: ▪ Pre-Contingency: BA1 will communicate BA2 schedule to SAR Coordinator ▪ Post Contingency: BA1 contacts SAR Coordinator to activate SAR. The SAR Coordinator issues shares. All ETAG(s) associated with the energy wheeled through BA1 and into BA2 will be curtailed upon termination of the SAR using a ten minute ramp. For non-SAR events: If SAR is not requested, all ETAG(s) associated with the energy wheeled through BA1 and into BA2 will be curtailed on a mutually agreed upon start time and ramp duration by the affected BAs.



Source
BA
Radial
Source
BA 1
BA 2

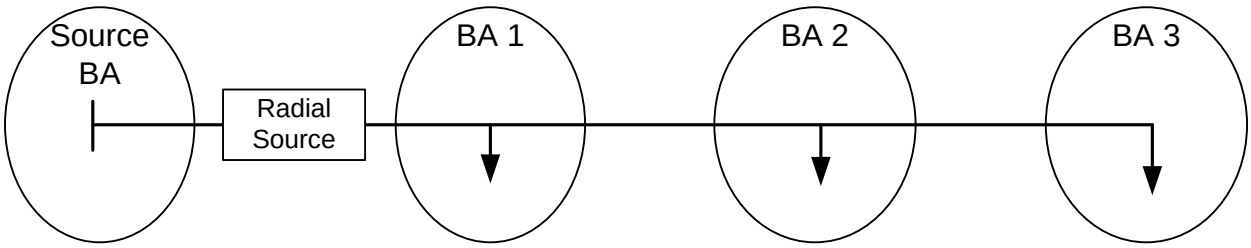
Example 3 Source BA, intermediary sink BA1, and sink BA2

The energy is flowing from the radial Source BA with portions sinking in BA1, and BA 2. This example applies to SAR participants.	BA1 and BA2 are responsible to recover the portions of the MW sinking in each of their BAs. Immediately following the contingency loss of the radial tie the source and directly connected Balancing Authorities will verbally communicate. If the net MW loss is greater than NPCC reportable event threshold, or for stressed system conditions, BA1 notifies the SAR Coordinator to request SAR activation. Verbal communications between the Balancing Authorities will be as follows: ▪ Pre-Contingency: BA1 will communicate the BA1 and BA2 schedules to SAR Coordinator ▪ Post Contingency: BA1 contacts SAR Coordinator to activate SAR. The SAR Coordinator issues shares. The ETAG(s) associated with the energy sinking in BA1 is curtailed immediately over a zero minute ramp due to the flow path being removed. The ETAG(s) associated with the energy wheeled through BA1 and sinking in BA2 will be curtailed upon termination of the SAR using a ten minute ramp. For non-SAR events: • The ETAG(s) associated with the energy sinking in BA1 is curtailed immediately over a zero minute ramp. • All ETAG(s) associated with the energy wheeled through BA1 and into BA2 will be curtailed on a mutually agreed upon start time and ramp duration by the affected BAs.



Example 4 Source BA, intermediary sink BA1, intermediary sink BA2, and sink BA3

The energy is flowing from the radial Source BA, with portions sinking in BA 1, BA 2, and BA3.	The rules governing this scenario are the same as presented in Example 3. Radial Source transactions will be limited to only one intermediary Balancing Authority (BA) unless all Balancing Authorities on the scheduling path are SAR participants.



4.2 Modification to the SAR Procedure

The SAR procedure is modified to allocate portions of the total delivery to Balancing Authorities in addition to the directly connected Balancing Authority during an ordinary simultaneous activation of reserve. When the tie line trips, the directly connected Balancing Authority activates the SAR procedure (if the loss exceeds the NPCC Reportable Event Threshold or for stressed system conditions), and then each recipient's share will be allocated to other participants based on the principle of mutual assistance, according to share allocation rules in the SAR procedure.

Each Balancing Authority receiving a portion of energy from the tie line through the directly connected Balancing Authority will contribute energy to and receive assistance for their portion of the contingency. The Balancing Authorities supplying this assistance would not have this energy replaced by the directly connected Balancing Authority when the directly connected Balancing Authority picks up its reserve to cover its energy import from HQTE. Thus, the directly connected Balancing Area's **reserve** requirement remains the greater of the largest internal contingency or its share of the respective tie line flow.

Initially, SAR shares would be calculated based on energy scheduled to the Balancing Authorities receiving energy from the tripped element. Initial shares

would be allocated to each energy recipient according to the ordinary share allocation rules in the SAR procedure. Thus each energy recipient is assigned one half of the energy received initially. A Balancing Authority would then receive additional allocations to provide assistance to each other Balancing Authority**,** until the total amount of the contingency is allocated.

Once recovery from the contingency occurs, the contingent and recipient Balancing Authorities provide the remainder of their respective **reserve** obligations. A recipient Balancing Authority uses its own generation to replace the energy initially received (unless additional alternative arrangements are made) after SAR assistance is withdrawn.

The methodology is iterative. One pass is required to allocate shares for each of the Balancing Authorities requiring assistance. Key features of the method are demonstrated in the examples below. NBSO participation is excluded from these examples for simplicity. The values shown are rounded to whole numbers.

Each SAR participant Balancing Authority receiving energy compares the energy sinking within its Balancing Authority with applicable NERC and NPCC reporting thresholds to determine their reporting requirements.

Example 1. PJM imports 400 MW from HQTE on MSC 7040, NYISO imports 1200 MW:

MSC 7040 flow = 1600 MW
HQTE – NYISO transaction = 1200 MW
HQTE – PJM transaction = 400 MW

Area	**Initial Share/ Assistance Sought**	**First Pass**	**Second Pass**	**Total Generation Picked Up When SAR Energy Is Supplied Fully**	**Total Gen. Picked Up After SAR Is Canceled And All ACEs = 0**
IESO		200	67	267	0
ISO-NE		200	67	267	0
NYISO	600		67	667	1200
PJM	200	200		400	400
Sum	800	600	200	1600	1600

Initial Shares – NYISO and PJM are initially assigned one half of their respective energy imports from HQTE. Consequently, under the ordinary SAR rules, they would be 'seeking' assistance for an equal amount. The total assistance sought is 800 MW for the entire contingency amount.

First Pass – NYISO is provided 600 MW of assistance. These shares are allocated equally, 200 MW each, among the other three participants – including PJM.

Second Pass – PJM is provided 200 MW of assistance. These shares are allocated equally, 67 MW each, among the other three participants – including NYISO.

Total Generation Picked up – The additional generation in each Balancing Authority**,** after all Balancing Authorities provided their shares, and the composite NPCC/PJM ACE is restored, and the SAR procedure is about to be canceled, is shown in the next to last column of the table above. The additional generation after the SAR procedure is canceled and each Balancing Authority returns it ACE to zero is shown in the last column.

The table below summarizes the changes in schedule and ACE from just prior to the contingency, through the cancellation of assistance and full recovery by both Balancing Authorities losing energy due to the contingency. In practice, the SAR Coordinator merges the negation of the initial schedule (third row of numeric data) and the SAR share entries (fourth row of numeric data) into a single step to promote timely implementation, achieving the same desired net effect. Note that the ACE in step 4 matches the **Total Generation Picked Up When SAR Energy Is Supplied Fully** column in the previous table, but is opposite in sign.

Time	**IESO Sch**	**IESO ACE**	**NE Sch**	**NE ACE**	**PJM to NY Sch**	**PJM ACE**	**NY to PJM Sch**	**NY ACE**	**Tot Sch**	**Tot ACE**
Pre-contingency	0	0	0	0	-400	0	+400	0	0	0
Contingency	0	0	0	0	-400	0	+400	-1600	0	-1600
Negation of PJM/NY schedule	0	0	0	0	0	-400	0	-1200	0	-1600
No response, SAR entries	+267	-267	+267	-267	-200 +200 = 0	-400	-600 +67= -533	-667	0	-1600
Full response, SAR not canceled	+267	0	+267	0	0	0	-533	0	0	0
SAR just canceled	0	+267	0	+267	0	0	0	-533	0	0
All get back to ACE = 0	0	0	0	0	0	0	0	0	0	0

Note that IESO, ISO-NE, and NBSO model their HVDC radial tie line imports as an internal generator, and their ACE will immediately reflect the loss of resource. NYISO includes HQTE HVDC interchange schedules within its AGC system, so NYISO must set that schedule to zero as soon as possible so its ACE reflects the loss of resource.

Example 2. PJM imports 1200 MW from HQTE on MSC 7040, NYISO imports 400 MW:

MSC 7040 flow = 1600 MW
HQTE – NYISO transaction = 400 MW
HQTE – PJM transaction = 1200 MW

Area	**Initial Share/ Assistance Sought**	**First Pass**	**Second Pass**	**Total Generation Picked Up When SAR Energy Is Supplied Fully**	**Total Gen. Picked Up After SAR Is Canceled And All ACEs = 0**
IESO		67	200	267	0
ISO-NE		67	200	267	0
NYISO	200		200	400	400
PJM	600	67		667	1200
Sum	800	200	600	1600	1600

Initial Shares – NYISO and PJM are initially assigned one half of their respective energy imports from HQTE. Consequently, under the ordinary SAR rules, they would be 'seeking' assistance for an equal amount. The total assistance sought is 800 MW for the entire contingency amount.

First Pass – NYISO is provided 200 MW of assistance. These shares are allocated equally, 67 MW each, among the other three participants – including PJM.

Second Pass – PJM is provided 600 MW of assistance. These shares are allocated equally, 200 MW each, among the other three participants- including NYISO.

Total Generation Picked up –The additional generation in each Balancing Authority**,** after all Balancing Authorities provided their shares, and the composite NPCC/PJM ACE is restored, and the SAR procedure is about to be canceled, is shown in the next to last column of the table above. The additional generation after the SAR procedure is canceled and each Balancing Authority returns it ACE to zero is shown in the last column.

The table below summarizes the changes in schedule and ACE from just prior to the contingency, through the cancellation of assistance and full recovery by both Balancing Authorities losing energy due to the contingency. In practice, the SAR Coordinator merges the negation of the initial schedule (third row of numeric data) and the SAR share entries (fourth row of numeric data) into a single step to promote timely implementation, achieving the same desired net effect. Note that the ACE in step 4 matches the **Total Generation Picked Up When SAR Energy Is Supplied Fully** column in the previous table, but is opposite in sign.

Time	IESO Sch	IESO ACE	NE Sch	NE ACE	PJM to NY Sch	PJM ACE	NY to PJM Sch	NY ACE	Tot Sch	Tot ACE
Pre-contingency	0	0	0	0	-1200	0	+1200	0	0	0
Contingency	0	0	0	0	-1200	0	+1200	-1600	0	-1600
Negation of PJM/NY schedule	0	0	0	0	0	-1200	0	-400	0	-1600
No response, SAR entries	+267	-267	+267	-267	-600 +67 =-533	-667	-200 +200 = 0	-400	0	-1600
Full response, SAR not canceled	+267	0	+267	0	-533	0	0	0	0	0
SAR just canceled	0	+267	0	+267	0	-533	0	0	0	0
All get back to ACE = 0	0	0	0	0	0	0	0	0	0	0

Note that IESO, ISO-NE, and NBSO model their HVDC radial tie line imports as an internal generator, and their ACE will immediately reflect the loss of resource. NYISO includes HQTE HVDC interchange schedules within its AGC system, so NYISO must set that schedule to zero as soon as possible so its ACE reflects the loss of resource.

Example 3. PJM and NYISO each import 200 MW from Québec on Sandy Pond, NE imports 1200 MW:

Sandy Pond flow =	1600 MW
HQTE – NY transaction =	200 MW
HQTE – NE transaction =	1200 MW
HQTE – PJM transaction =	200 MW

Area	**Initial Share/ Assistance Sought**	**First Pass**	**Second Pass**	**Third Pass**	**Total Generation Picked Up When SAR Energy Is Supplied Fully**	**Total Gen. Picked Up After SAR Is Canceled And All ACEs = 0**
IESO		200	33	33	267	0
ISO-NE	600		33	33	667	1200
NYISO	100	200		33	333	200
PJM	100	200	33		333	200
Sum	800	600	100	100	1600	1600

Initial Shares – ISO-NE, NYISO and PJM are initially assigned one half of their respective energy imports from HQTE. Consequently, under the ordinary SAR rules, they would be 'seeking' assistance for an equal amount. The total assistance sought is 800 MW for the entire contingency amount.

First Pass – ISO-NE is provided with 600 MW of assistance. These shares are allocated equally, 200 MW each, among the other three participants.

Second Pass – NYISO is provided 100 MW of assistance. These shares are allocated equally, 33 MW each, among the other three participants.

Third Pass – A third pass is now required to allocate assistance shares to the third component of the contingency. PJM is provided 100 MW of assistance. These shares are allocated equally, 33 MW each, among the other three participants.

Total Generation Picked up – The additional generation in each Balancing Authority**,** after all Balancing Authorities provided their shares, and the composite NPCC/PJM ACE is restored, and the SAR procedure is about to be canceled, is shown in the next to last column of the table above. The additional generation after the SAR procedure is canceled and each Balancing Authority returns it ACE to zero is shown in the last column.

The table below summarizes the changes in schedule and ACE from just prior to the contingency, through the cancellation of assistance and full recovery by both Balancing Authorities losing energy due to the contingency. In practice, the SAR Coordinator merges the negation of the initial schedules (third row of numeric data) and the SAR

share entries (fourth row of numeric data) into a single step to promote timely implementation, achieving the same desired net effect. Note that the ACE in step 4 matches the **Total Generation Picked Up When SAR Energy Is Supplied Fully** column in the previous table, but is opposite in sign.

Time	IESO Sch	IESO	NE Sch	NE ACE	PJM Sch	PJM ACE	NY Sch	NY ACE	Tot Sch	Tot ACE
Pre-contingency	0	0	+400	0	-200	0	-200	0	0	0
Contingency	0	0	+400	-1600	-200	0	-200	0	0	-1600
Negation of PJM/NY/NE schedules	0	0	0	-1200	0	-200	0	-200	0	-1600
No response, SAR entries	+267	-267	-600 +33 +33= -533	-667	-100 +200 +33= +133	-333	-100 +200 +33= +133	-333	0	-1600
Full response, SAR not canceled	+267	0	-533	0	+133	0	+133	0	0	0
SAR just canceled	0	+267	0	-533	0	+133	0	+133	0	0
All get back to ACE = 0	0	0	0	0	0	0	0	0	0	0

In the table above, NE Sch represents the sum of the energy exports wheeled from HQTE through ISO-NE to NYISO and PJM. PJM Sch represents the energy being wheeled from HQTE through ISO-NE and NYISO for PJM. NY Sch represents the energy being wheeled from HQTE through ISO-NE for NYISO.

Note that IESO, ISO-NE, and NBSO model their HVDC radial tie line imports as an internal generator, and their ACE will immediately reflect the loss of resource. NYISO includes HQTE HVDC interchange schedules within its AGC system, so NYISO must set that schedule to zero as soon as possible so its ACE reflects the loss of resource.

Example 4. ISO-NE, PJM and NYISO each import 700 MW each from Québec on Sandy Pond:

Sandy Pond flow =	2100 MW
HQTE – NYISO transaction =	700 MW
HQTE – ISONE transaction =	700 MW
HQTE – PJM transaction =	700 MW

Area	**Initial Share/ Assistance Sought**	**First Pass**	**Second Pass**	**Third Pass**	**Total Generation Picked Up When SAR Energy Is Supplied Fully**	**Total Gen. Picked Up After SAR Is Canceled And All ACEs = 0**
IESO		117	117	117	350	0
ISO-NE	350		117	117	584	700
NYISO	350	117		117	584	700
PJM	350	117	117		584	700
Sum	1050	350	350	350	2100	2100

Initial Shares – ISO-NE, NYISO, and PJM are initially assigned one half of their respective energy imports from HQTE. Consequently, under the ordinary SAR rules, they would be 'seeking' assistance for an equal amount. The total assistance sought is 1050 MW for the entire contingency amount.

First Pass – ISO-NE is provided 350 MW of assistance. These shares are allocated equally, 117 MW each, among the other three participants.

Second Pass – NYISO is provided 350 MW of assistance. These shares are allocated equally, 117 MW each, among the other three participants.

Third Pass –PJM is provided 350 MW of assistance. These shares are allocated equally, 117 MW each, among the other three participants.

Total Generation Picked up – The additional generation in each Balancing Authority after all Balancing Authorities provided their shares, and the composite NPCC/PJM ACE is restored, and the SAR procedure is about to be canceled, is shown in the next to last column of the table above. The additional generation after the SAR procedure is canceled and each Balancing Authority returns it ACE to zero is shown in the last column.

The table below summarizes the changes in schedule and ACE from just prior to the contingency, through the cancellation of assistance and full recovery by both Balancing Authorities losing energy due to the contingency. In practice, the SAR Coordinator merges the negation of the initial schedules (third row of numeric data) and the SAR

share entries (fourth row of numeric data) into a single step to promote timely implementation, achieving the same desired net effect. Note that the ACE in step 4 matches the **Total Generation Picked Up When SAR Energy Is Supplied Fully** column in the previous table, but is opposite in sign.

Time	IESO Sch	IESO ACE	NE Sch	NE ACE	PJM Sch	PJM ACE	NY Sch	NY ACE	Tot Sch	Tot ACE
Pre-contingency	0	0	+1400	0	-700	0	-700	0	0	0
Contingency	0	0	+1400	-2100	-700	0	-700	0	0	-2100
Negation of PJM/NY/NE schedules	0	0	0	-700	0	-700	0	-700	0	-2100
No response, SAR entries	+350	-350	-117	-583	-117	-583	-117	-583	0	-2100
Full response, SAR not canceled	+350	0	-117	0	-117	0	-117	0	0	0
SAR just canceled	0	+350	0	-117	0	-117	0	-117	0	0
All get back to ACE = 0	0	0	0	0	0	0	0	0	0	0

In the table above, NE Sch represents the sum of the energy exports wheeled from HQTE through ISO-NE to NYISO and PJM. PJM Sch represents the energy being wheeled from HQTE through ISO-NE and NYISO for PJM. NY Sch represents the energy being wheeled from HQTE through ISO-NE for NYISO.

Note that IESO, ISO-NE, and NBSO model their HVDC radial tie line imports as an internal generator, and their ACE will immediately reflect the loss of resource. NYISO includes HQTE HVDC interchange schedules within its AGC system, so NYISO must set that schedule to zero as soon as possible so its ACE reflects the loss of resource.

Radial Source Contingencies With Counter flow Transactions

Example 5. Counter flow Transactions on MSC 7040
PJM Exports 400 MW to HQTE on MSC 7040, NYISO Imports 1200 MW:

MSC 7040 flow =	800 MW
HQTE – NYISO transaction =	1200 MW
HQTE – PJM transaction =	-400 MW (flow is PJM to HQTE)

Area	**Initial Share/ Assistance Sought**	**First Pass**	**Second Pass**	**Total Generation Picked Up When SAR Energy Is Supplied Fully**	**Total Gen. Picked Up After SAR Is Canceled And All ACEs = 0**
IESO		200	-67	133	0
ISO-NE		200	-67	133	0
NYISO	600		-67	533	1200
PJM	-200	200		0	-400
Sum	400	600	-200	800	800

Initial Shares – NYISO and PJM are initially assigned one half of their respective energy import from and energy export to HQTE. Consequently, under the ordinary SAR rules, they would be 'seeking' assistance for both flows into and out of Québec. The total net assistance sought is 400 MW for the net contingency amount.

First Pass – NYISO is provided 600 MW of assistance. These shares are allocated equally, 200 MW each, among the other three participants – including PJM.

Second Pass – PJM is provided -200 MW of assistance. These shares are allocated equally, -67 MW each, among the other three participants – including NYISO. These negative shares reduce the net pick-ups required of the assisting Balancing Authorities**.**

Total Generation Picked up – The additional generation in each Balancing Authority**,** after all Balancing Authorities provided their shares, and the composite NPCC/PJM ACE is restored, and the SAR procedure is about to be canceled, is shown in the next to last column of the table above. The additional generation after the SAR procedure is canceled and each Balancing Authority returns it ACE to zero is shown in the last column.

The table below summarizes the changes in schedule and ACE from just prior to the contingency, through the cancellation of assistance and full recovery by both Balancing Authorities losing energy due to the. In practice, the SAR Coordinator merges the negation of the initial schedule (third row of numeric data) and the SAR share entries (fourth row of numeric data) into a single step to promote timely implementation, achieving the same desired net effect. Note that the ACE in step 4 matches the **Total Generation Picked Up When SAR Energy Is Supplied Fully** column in the previous table, but is opposite in sign.

Time	IESO Sch	IESO ACE	NE Sch	NE ACE	PJM/ NY Sch	PJM ACE	PJM/ NY Sch	NY ACE	Tot Sch	Tot ACE
Pre-contingency	0	0	0	0	+400	0	-400	0	0	0
Contingency	0	0	0	0	+400	0	-400	-800	0	-800
Negation of PJM/NY schedule	0	0	0	0	0	+400	0	-1200	0	-800
No response, SAR entries	+133	-133	+133	-133	+200 +200 =400	0	-600-67 =-667	-533	0	-800
Full response, SAR not canceled	+133	0	+133	0	400	0	-667	0	0	0
SAR just canceled	0	+133	0	+133	0	+400	0	-667	0	0
All get back to ACE = 0	0	0	0	0	0	0	0	0	0	0

Note that IESO, ISO-NE, and NBSO model their HVDC radial tie line imports as an internal generator, and their ACE will immediately reflect the loss of resource. NYISO includes HQTE HVDC interchange schedules within its AGC system, so NYISO must set that schedule to zero as soon as possible so its ACE reflects the loss of resource.

Example 6. ISO-NE imports 2000 MW from HQTE, PJM and NYISO export 500 MW each to Québec on Sandy Pond:

Sandy Pond flow =	1000 MW
NYISO - HQTE transaction =	-500 MW (flow is NY to HQTE)
HQTE – ISONE transaction =	2000 MW
PJM – HQTE transaction =	-500 MW (flow is PJM to HQTE)

Area	**Initial Share/ Assistance Sought**	**First Pass**	**Second Pass**	**Third Pass**	**Total Generation Picked Up When SAR Energy Is Supplied Fully**	**Total Gen. Picked Up After SAR Is Canceled And All ACEs = 0**
IESO		333	-83	-83	167	0
ISO-NE	1000		-83	-83	834	2000
NYISO	-250	333		-83	0	-500
PJM	-250	333	-83		0	-500
Sum	500	1000	-250	-250	1000	1000

Initial Shares – ISO-NE, NYISO and PJM are initially assigned one half of their respective energy imports from and energy exports to Québec. Consequently, under the ordinary SAR rules, they would be 'seeking' assistance for flows into and out of Québec. The total assistance sought is 500 MW for the net contingency amount.

First Pass – ISO-NE is provided 1000 MW of assistance. These shares are allocated equally, 333 MW each, among the other three participants.

Second Pass – NYISO is provided -250 MW of assistance. These shares are allocated equally, -83 MW each, among the other three participants.

Third Pass –PJM is provided -250 MW of assistance. These shares are allocated equally, -83 MW each, among the other three participants.

Total Generation Picked up – The additional generation in each Balancing Authority after all Balancing Authorities provided their shares, and the composite NPCC/PJM ACE is restored, and the SAR procedure is about to be canceled, is shown in the next to last column of the table above. The additional generation after the SAR procedure is canceled and each Balancing Authority returns its ACE to zero is shown in the last column.

The table below summarizes the changes in schedule and ACE from just prior to the contingency, through the cancellation of assistance and full recovery by both Balancing Authorities losing energy due to the contingency. In practice, the SAR Coordinator merges the negation of the initial schedules (third row of numeric data) and the SAR share entries (fourth

row of numeric data) into a single step to promote timely implementation, achieving the same desired net effect. Note that the ACE in step 4 matches the **Total Generation Picked Up When SAR Energy Is Supplied Fully** column in the previous table, but is opposite in sign.

Time	**IESO Sch**	**IESO ACE**	**NE Sch**	**NE ACE**	**PJM Sch**	**PJM ACE**	**NY Sch**	**NY ACE**	**Tot Sch**	**Tot ACE**
Pre-contingency	0	0	-1000	0	+500	0	+500	0	0	0
Contingency	0	0	-1000	-1000	+500	0	+500	0	0	-1000
Negation of NE PJM/NY schedules	0	0	0	-2000	0	+500	0	+500	0	-1000
No response, SAR entries	+167	-167	-1000-83-83 = -1166	-834	+250 +333-83 =500	0	+250 +333-83 =500	0	0	-1000
Full response, SAR not canceled	+167	0	-1166	0	500	0	500	0	0	0
SAR just canceled	0	+167	0	-1166	0	+500	0	+500	0	0
All get back to ACE = 0	0	0	0	0	0	0	0	0	0	0

In the table above, NE Sch represents the sum of the energy exports wheeled from PJM and NYISO through ISO-NE to HQTE. PJM Sch represents the energy being wheeled to HQTE through ISO-NE and NYISO for PJM. NY Sch represents the energy being wheeled to HQTE through ISO-NE for NYISO.

Note that IESO, ISO-NE, and NBSO model their HVDC radial tie line imports as an internal generator, and their ACE will immediately reflect the loss of resource. NYISO includes HQTE HVDC interchange schedules within its AGC system, so NYISO must set that schedule to zero as soon as possible so its ACE reflects the loss of resource.

Appendix 5 - NPCC Control Performance Reporting Process

Reporting Processes

a. Each Balancing Authority not receiving overlap regulation service determines their CPS 1 and CPS 2 scores for the recently completed month by the tenth day after the end of the month.
b. Each Balancing Authority's NPCC CO-1 member (or his/her designee) collects and reviews the CPS1 and CPS 2 results for accuracy.
c. Each Balancing Authority's NPCC CO-1 member (or his/her designee) sends their CPS results to the appropriate NPCC compliance monitoring personnel.
d. The NPCC CO-1 Chair (or his/her designee) summarizes recent CPS 1 and CPS 2 performance in a running annual summary.
e. The NPCC CO-1 Chair (or his/her designee) informs TFCO when a substantive change in performance has occurred for any NPCC Balancing Authority that reports CPS 1 and CPS 2 compliance.
f. NPCC CO-1 has primary responsibility for monitoring the control performance of the NPCC region.

Appendix 6 Light Load Conditions

Relatively large quantities of excess generation within a Balancing Area occurring during light load conditions may affect reliability adversely, and will cause actual interchange to deviate from scheduled interchange. Guidance to alleviate possibly adverse impacts on reliability and to lessen actual interchange deviations from schedule is provided in this appendix. A Balancing Authority that is anticipating or actually experiencing a Light Load Condition should consider implementing any of the following actions that are applicable and can lessen the adverse impacts noted above:

1. Adjust interchange schedules to reduce the import and/or increase the export of energy.
2. If permitted by operating policies, increase load by scheduling available pumped storage facilities in the pumping mode.
3. Arrange for bilateral inadvertent payback to increase the export of energy.
4. If permitted by operating policies, request that an appropriate amount of supply-side **resources** be reduced to the absolute minimum.
5. Review all supply-side **resource** "must-run" requirements. Determine if any may be temporarily removed or if other supply-side **resources** with lower limits could be brought on in place of normal "must-run" supply-side **resources**.
6. Review all supply-side **resource** "low-limits" and temporarily reduce them as low as possible.
7. De-commit sufficient ge**neration** to alleviate or minimize the excess generation condition.

Appendix 7 – Participation Request Form

Instructions

NPCC Balancing Authorities and adjacent Balancing Authorities must complete this form to request participation in the following NPCC Programs:

- Simultaneous Activation of Reserve (SAR)
- Ace Diversity Interchange (ADI)
- Regional Reserve Deficiency

This form must be completed in full and submitted to the NPCC Task Force on Coordination of Operation (TFCO) for review and approval. The form must be authorized by an officer of the company submitting the form. On review of the form, the TFCO will notify the submitting Balancing Authority of the programs that they are approved to participate in.

The Coordinator role for all programs must also be approved by the TFCO.

Participation Request Form

Balancing Authority Name: _____

The Balancing Authority named above requests participation in the following programs (check one or more):

Simultaneous Activation of Reserve: ☐

Ace Diversity Interchange: ☐

Regional Reserve Deficiency ☐

The Balancing Authority named above wishes to act as the coordinator for:

Coordinator: (SAR) ☐

Coordinator: (ADI) ☐

Coordinator:
Regional Reserve Deficiency ☐

The undersigned must be an officer of the Balancing Authority named above with the authority to authorize participation by their company.

Name: _____

Title: _____

Signature: _____

Introduction

1.1 Title Special Protection Systems

1.2 Directory Number 7

1.3 Objective

Provide the basic criteria for **Special Protection Systems** such that the **Bulk Power System** in NPCC Inc. member **Areas** is operated reliably.

1.4 Effective Date Immediately upon Approval by the NPCC Full Members

1.5 Background

This directory establishes the basic **protection** criteria for **Special Protection Systems**. It is not intended to be a design specification. It is recognized that responsible entities in certain **Areas** may choose to apply more rigid criteria because of local considerations.

Guidance for consideration in the implementation of these criteria is provided in Appendix A, and the procedure for reviewing new and revised **Special Protection Systems** is provided in Appendix B.

1.6 Applicability

1.6.1 Functional Entities

Transmission Owner, Generator Owner, Distribution Provider

1.6.2 Facilities

1.6.2.1 New Facilities

The standard requirements and criteria stipulated in this Directory apply to all new Type I and Type II **Special Protection Systems** (SPSs) as defined below. In the application of Type II SPSs, their security is the prime concern (see Section 3.3.1 of this document). As such, Sections 3.3.1.1, 3.3.2.3, 3.3.3.2, 3.3.6 and 3.3.8.1 in this document do not apply to Type II.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

1.6.2.2 Existing Facilities

It is the responsibility of individual Transmission Owners (TO), Generator Owners (GO) and Distribution Providers (DP) to assess their existing **Special Protection Systems** and to make modifications which are required to meet the intent of these standards as follows:

a. Planned Renewal or Upgrade to Existing Facilities It is recognized that there may be **SPSs,** which existed prior to each TO's, GO's and DP's adoption of the *Special Protection System Criteria* that do not meet these criteria. If any **Special Protection Systems** or sub-systems of these facilities are replaced as part of a planned renewal or upgrade to the facility and do not meet all of these criteria, then an assessment shall be conducted for those criteria that are not met. The result of this assessment shall be reported on TFSP Form #1-5.

b. SPS Re-classified to Type I or Type II

These requirements apply to all existing SPSs which are reclassified as Type I or Type II due to system changes. A mitigation plan shall be required to bring such a SPS into compliance with these criteria.

c. In-kind Replacement of SPS Equipment

If SPS equipment is replaced "in-kind" as a result of an un-planned event, then it is not required to upgrade the associated protection system to comply with these criteria.

1.6.3 Classification of **Special Protection Systems**

Special Protection Systems are sub-divided into three types. Reference can be made to the NPCC *Basic Criteria for Design and Operation of Interconnected Power Systems* (Document A-2) where design criteria contingencies are described in Section 5.0; operating criteria contingencies, in Section 6.0; and extreme contingencies, in Section 7.0 of Document A-2.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Type I	A **Special Protection System** which recognizes or anticipates abnormal system conditions resulting from design and operating criteria **contingencies**, and whose misoperation or failure to operate would have a **significant adverse impact** outside of the local area. The corrective action taken by the **Special Protection System** along with the actions taken by other **protection systems** are intended to return power system parameters to a stable and recoverable state.
Type II	A **Special Protection System** which recognizes or anticipates abnormal system conditions resulting from extreme **contingencies** or other extreme causes, and whose misoperation or failure to operate would have a **significant adverse impact** outside of the local area.
Type III	**Special Protection System** whose misoperation or failure to operate results in no **significant adverse impact** outside the local area. The practices contained in this document for a Type I SPS should be considered but are not required for a Type III SPS. It should be recognized that a Type III SPS may, due to system changes, become Type I or Type II.

2.0 Terms Defined in this Directory

The following terms are defined in this Directory. Their definitions are provided in Attachment 1.

Bulk Power System
Contingency
Fault
Operating Procedures
Protection
Special Protection System (SPS)
Teleprotection

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

3.0 Requirements

3.1 The NERC ERO Reliability Standards containing Requirements that are associated with this Directory include, but may not be limited to:

3.1.1 PRC-012-0 — Special Protection System Review Procedure

3.1.2 PRC-013-0 Special Protection System Database

3.1.3 PRC-014-0 — Special Protection System Assessment

3.1.4 PRC-015-0 — Special Protection System Data and Documentation

3.1.5 PRC-016-0 — Special Protection System Misoperations

3.1.6 PRC-017-0 - Special Protection System Maintenance and Testing

3.2 NPCC Regional Reliability Standard Requirements

None at this time. To be developed.

3.3 NPCC "Full Member", More Stringent Criteria

3.3.1 General Criteria

A **Special Protection System** shall be designed to recognize or anticipate the specific power system conditions associated with the intended function.

Due consideration shall be given to dependability and security. The relative effect on the **bulk power system** of a failure of an SPS to operate when desired versus an unintended operation shall be weighed carefully in selecting design parameters as follows:

3.3.1.1 To enhance dependability, a **Special Protection System** shall be designed with sufficient redundancy such that the **Special Protection System** is capable of performing its intended function while itself experiencing a single failure.

3.3.1.2 Multiple protection groups that are used to obtain redundancy within a **Special Protection System** shall not share the same component.

3.3.1.3 A **Special Protection System** shall be designed to avoid false operation while itself experiencing a credible failure.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

3.3.1.4 The thermal capability of all **Special Protection System** components shall be adequate to withstand the maximum short time and continuous loading conditions to which the associated power system elements may be subjected.

3.3.1.5 Communication link availability, critical control switch and test switch positions, and trip circuit integrity, shall be monitored to allow prompt attention by appropriate operating authorities.

3.3.1.6 When remote access to **Special Protection Systems** is possible, the design shall include security measures to minimize the probability of unauthorized access to the **Special Protection System**.

3.3.1.7 An SPS shall be designed to take corrective action within times determined by studies with due regard to security, dependability and selectivity.

3.3.1.8 Status of SPS arming shall be monitored to allow prompt attention by appropriate operating authorities.

3.3.1.9 An SPS shall be equipped with means to enable its arming and to independently verify the arming.

3.3.2 Current Transformer Criteria

Current transformers (CTs) associated with **Special Protection Systems** shall have adequate steady-state and transient characteristics for their intended function.

3.3.2.1 The output of each current transformer secondary winding shall be designed to remain within acceptable limits for the connected burdens under all anticipated currents, including **fault** currents, to ensure correct operation of the **Special Protection System**.

3.3.2.2 The thermal and mechanical capabilities of the CT at the operating tap shall be adequate to prevent damage under maximum **fault** conditions and normal or **emergency** system loading conditions.

3.3.2.3 For **protection groups** to be independent, they shall be supplied from separate current transformer secondary windings.

3.3.2.4 Interconnected current transformer secondary wiring shall be grounded at only one point.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

3.3.3 Voltage Transformer and Potential Device Criteria

Voltage transformers and potential devices associated with **Special Protection Systems** shall have adequate steady-state and transient characteristics for their intended functions.

3.3.3.1 Voltage transformers and potential devices shall have adequate volt-ampere capacity to supply the connected burden while maintaining their **relay** accuracy over their specified primary voltage range.

3.3.3.2 If a **Special Protection System** is designed to have multiple **protection groups** at a single location for redundancy, each of the **protection groups** shall be supplied from separate voltage sources. The **protection groups** may be supplied from separate secondary windings on one transformer or potential device, provided all of the following requirements are met:

. Complete loss of one or more phase voltages does not prevent operation of both SPS protection groups;
. Each secondary winding has sufficient capacity to permit fuse **protection** of the circuit;
. Each secondary winding circuit is adequately fuse protected.

3.3.3.3 The wiring from each voltage transformer secondary winding shall not be grounded at more than one point.

3.3.3.4 Voltage transformer installations should be designed with due regard to ferroresonance.

3.3.4 Battery and Direct Current (dc) Supply Criteria

dc supplies associated with a **Special Protection System** shall be designed to have a high degree of dependability as follows.

3.3.4.1 If a **Special Protection System** is designed to have multiple **protection groups** at a single location for redundancy, no single battery or dc power supply failure shall prevent the independent **protection groups** from performing the intended function. Each battery shall be provided with its own charger.

3.3.4.2 Each battery shall have sufficient capacity to permit operation of the **Special Protection System**, in the event of a loss of its battery charger or the ac supply source, for the period of time necessary to transfer the load to

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

the other battery or re-establish the supply source.

3.3.4.3 The battery chargers and all dc circuits shall be protected against short circuits. All protective devices should be coordinated to minimize the number of dc circuits interrupted.

3.3.4.4 dc battery systems shall be continuously monitored to detect abnormal voltage levels (both high and low), dc grounds, and loss of ac to the battery chargers in order to allow prompt attention by the appropriate operating authorities.

3.3.4.5 **Special Protection System** dc supply circuits shall be continuously monitored to detect loss of voltage in order to allow prompt attention by the appropriate operating authorities.

3.3.5 Station Service ac Supply Criteria

If a **Special Protection System** is designed to have multiple **protection groups** at a single location for redundancy, there shall be two sources of station service ac supply, each capable of carrying at least all the critical loads associated with the **Special Protection System**.

3.3.6 Circuit Breakers Criteria

Where **Special Protection System** redundancy is achieved by use of independent **protection groups** tripping the same circuit breakers without overarming, each circuit breaker shall be equipped with two independent trip coils.

3.3.7 Teleprotection Criteria

Communication facilities required for **teleprotection** shall be designed to have a level of performance consistent with that required of the **Special Protection System**, and shall meet the following:

3.3.7.1 Where the design of a **Special Protection System** is composed of multiple **protection groups** for redundancy and each group requires a communication channel, the equipment and channel for each group shall be separated physically and designed to minimize the risk of more than one **protection group** being disabled simultaneously by a single event or condition.

3.3.7.2 **Teleprotection** equipment shall be monitored to detect loss of equipment and/or channel to allow prompt attention by the appropriate operating authorities.

3.3.7.3 **Teleprotection** systems shall be designed to assure adequate signal transmission

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

during **bulk power system** disturbances, and shall be provided with means to test for proper signal adequacy.

3.3.7.4 **Teleprotection** equipment shall be powered by the substation batteries or other sources independent from the power system.

3.3.7.5 Except as identified otherwise in these criteria, the two **teleprotection** groups shall not share the same component. The use of a single communication tower for the radio communication systems used by the two SPS groups is permitted.

3.3.8 Physical Separation/Environment Criteria

3.3.8.1 In addition to the physical separation as referenced in sections 3.3.1.2 and 3.3.9.5, if a **Special Protection System** is designed to have multiple **protection groups** at a single location for redundancy, each separate protection group and **Teleprotection** of an SPS shall be on different non-adjacent vertical mounting assemblies or enclosures.

3.3.8.2 In the event a common raceway is used, cabling for separate groups of an SPS shall be separated by a fire barrier.

3.3.9 Grounding Criteria

Station grounding is critical to the correct operation of **Special Protection Systems**. The design of the ground grid directly impacts proper **Special Protection System** operation and probability of false operation from **fault** currents or transient voltages.

3.3.9.1 Each TO, GO and DP shall have established as part of its substation design procedures or specifications, a mandatory method of designing the substation ground grid, which:

. Can be traced to a recognized calculation methodology
. Considers cable shielding
. Considers equipment grounding

3.3.10 Provision for Breaker Failure Criteria

Type I SPS shall include breaker failure **protection** for each circuit breaker whose operation is critical to the adequacy of the action taken by the SPS with due regard to the power system conditions this SPS is required to detect. Options for breaker failure **protection**:

3.3.10.1 A design which recognizes that the breaker has not achieved or will not achieve the

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

intended function required by the **Special Protection System** and which takes independent action to achieve that function. This provision needs not be duplicated and can be combined with conventional breaker failure schemes if appropriate.

3.3.10.2 Overarming the **Special Protection System** such that adequate action is taken even if a single breaker fails.

3.3.10.3 The redundancy afforded by actions taken by other independent schemes or devices.

3.3.11 Testing and Maintenance Criteria

3.3.11.1 Each SPS shall be maintained in accordance with the Maintenance Criteria for Bulk Power System Protection (Document A-4).

3.3.11.2 The design of an SPS both in terms of circuitry and physical arrangement shall facilitate periodic testing and maintenance.

3.3.11.3 Test facilities or test procedures shall be designed such that they do not compromise the independence of the redundant design aspects of the SPS.

3.3.11.4 An SPS shall be functionally tested when initially placed in service and when modifications are made.

3.3.11.5 If a segmented testing approach is used, test procedures and test facilities shall be designed to ensure that related tests properly overlap. Proper overlap is ensured if each portion of circuitry is seen to perform its intended function, such as operating a relay, from either a real or test stimulus, while observing some common reliable downstream indicator.

3.3.11.6 All positive combinations of input logic shall be tested regardless of the maintenance strategy used.

3.3.11.7 Sufficient testing shall be employed to ensure that timing races do not exist within hardwired or electronic logic, and that the SPS operating time is within design limits.

3.3.11.8 Each time the SPS is maintained, its hardware shall be tested in conjunction with the control facilities, related computer equipment, software and **operating procedures** to ensure compatibility and correct operation.

3.3.12 Analysis of SPS Performance

3.3.12.1 **Bulk power system** automatic operations shall be analyzed to determine proper **Special Protection System** performance. Corrective measures must be taken promptly if the **Special Protection System** or a **protection group** within the SPS fails to operate or operates incorrectly.

3.3.12.2 Event recording capability shall be provided to permit analysis of system operations and **Special Protection System** performance.

4.0 Measures and Assessments

None developed at this time.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Prepared by:	Lead Task Force- Task Force on System Protection
Review and Approval:	Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon satisfactorily addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval. Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according to the most current "NPCC Inc. Bylaws" in effect at the time the ballots are cast. Revisions pertaining to the Appendices or any other portion of the document such as Links, Glossary Terms, etc., will only require RCC Member approval of the document. Errata may be corrected by the Lead Task Force at any time and provide the appropriate notifications to the NPCC Inc. membership. This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC Regional Reliability Standards and other NPCC documents.

Attachment 1
Definition of Terms

Bulk power system - The interconnected electrical systems within northeastern North America comprising **generation** and transmission facilities on which **faults** or **disturbances** can have a **significant adverse impact** outside of the local area. In this context, local areas are determined by the Council members.

Contingency – An event, usually involving the loss of one or more **elements,** which affects the **power** system at least momentarily.

Fault – An electrical short circuit.

Permanent Fault — A fault which prevents the affected **element** from being returned to service until physical actions are taken to effect repairs or to remove the cause of the fault.

Transient Fault — A fault which occurs for a short or limited time, or which disappears when the faulted **element** is separated from all electrical sources and which does not require repairs to be made before the **element** can be returned to service either manually or automatically.

Operating Procedures -A set of policies, practices, or system adjustments that may be automatically or manually implemented by the system operator within a specified time frame to maintain the operational integrity of the interconnected electric systems.

Automatic Operating Systems — **Special protection systems**, remedial action schemes, or other operating systems installed on the electric systems that require *no intervention* on the part of **system operators**.

Normal (Precontingency) Operating Procedures — Operating procedures that are normally invoked by the **system operator** to alleviate potential facility overloads or other potential system problems in anticipation of a **contingency**.

Postcontingency Operating Procedures — Operating procedures that may be invoked by the **system operator** to mitigate or alleviate system problems after a **contingency** has occurred.

Protection -The provisions for detecting power system **faults** or abnormal conditions and taking appropriate automatic corrective action.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Protection group — A fully integrated assembly of **protective relays** and associated equipment that is designed to perform the specified protective functions for a power system **element**, independent of other groups.

Notes:

(a) Variously identified as Main **Protection**, Primary **Protection**, Breaker Failure **Protection**, Back-Up **Protection**, Alternate **Protection**, Secondary **Protection**, A **Protection**, B **Protection**, Group A, Group B, System 1 or System 2.

(b) Pilot **protection** is considered to be one **protection group.**

Protection system

Element Basis

One or more **protection** groups; including all equipment such as instrument transformers, station wiring, circuit breakers and associated trip/close modules, and communication facilities; installed at all terminals of a power system **element** to provide the complete **protection** of that **element**.

Terminal Basis

One or more **protection** groups, as above, installed at one terminal of a power system **element**, typically a transmission line.

Pilot **Protection** — A form of line **protection** that uses a communication channel as a means to compare electrical conditions at the terminals of a line.

Significant adverse impact — With due regard for the maximum operating capability of the affected systems, one or more of the following conditions arising from **faults** or **disturbances**, shall be deemed as having **significant adverse impact**:

a. instability;
- any instability that cannot be demonstrably contained to a well defined local area.
- any loss of synchronism of generators that cannot be demonstrably contained to a well-defined local area

b. unacceptable system dynamic response;
- an oscillatory response to a **contingency** that is not demonstrated to be clearly positively damped within 30 seconds of the initiating event.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

c. unacceptable equipment tripping
   - tripping of an un-faulted **bulk power system** element (element that has already been classified as **bulk power system**) under planned system configuration due to operation of a **protection** system in response to a stable power swing
   - operation of a Type I or Type II **Special Protection System** in response to a condition for which its operation is not required

d. voltage levels in violation of applicable **emergency** limits;

e. loadings on transmission facilities in violation of applicable **emergency** limits;

Special protection system (SPS) – A **protection system** designed to detect abnormal system conditions, and take corrective action other than the isolation of faulted **elements**. Such action may include changes in **load**, **generation**, or system configuration to maintain system **stability**, acceptable voltages or power flows. Automatic underfrequency **load shedding** as defined in the *Emergency Operation Criteria* A-3, is not considered a **Special Protection System**. Conventionally switched, locally controlled shunt devices are not **Special Protection Systems**.

Teleprotection - A form of **protection** that uses a communication channel

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Appendix A
Guidance for Consideration in SPS Design

Introduction

This Appendix provides the guidance for consideration in the implementation of the **Special Protection System** design criteria stipulated in Section 3.3 of this Directory.

The general objective for any SPS is to perform its intended function (generator rejection, load rejection, etc.) in a dependable and secure manner. In this context, dependability relates to the degree of certainty that the SPS will operate correctly when required to operate. Security relates to the degree of certainty that the SPS will not operate when not required to operate.

The relative effects on the **bulk power system** of a failure to operate when desired versus an unintended operation should be weighed carefully in selecting design parameters. For example, the choice of duplication as a means of providing redundancy improves the dependability of the SPS but can also jeopardize security in that it may increase the probability of an unintended operation. This general objective can be met only if the SPS can dependably respond to the specific conditions for which it is intended to operate and differentiate these from other conditions for which action must not take place.

Close coordination should be maintained among system planning, design, operating, maintenance and **protection** functions, since both initially and throughout their life cycle, SPSs are a multi-discipline concern.

2.0 Considerations Affecting Dependability

2.1 Redundancy is normally provided by duplication. Some aspects of duplication may be achieved by overarming, which is defined as providing for more corrective action than would be necessary if no failures are considered. The redundancy requirements for an SPS apply only with respect to its response to the conditions it is required to detect.

2.2 For a **Special Protection System** that is composed of multiple **protection groups**, the risk of simultaneous failure of more than one **protection group** because of design deficiencies or equipment failure should be considered, particularly if identical equipment is used in each **protection group**. The extent and nature of these failures should be recognized in the design and operation of the **Special Protection System.**

2.3 Area of common exposure should be kept to a minimum to reduce the possibility of all groups being disabled by a single event such as fire, evacuation, water leakage, and other such incidents.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

3.0 Considerations Affecting Security

3.1 An SPS should be designed to operate only for conditions which require its specific protective or control actions.

3.2 **Special Protection Systems** should be no more complex than required for any given application.

3.3 The components and software used in **Special Protection Systems** should be of proven quality, as demonstrated either by actual experience or by stringent tests under simulated operating conditions.

3.4 **Special Protection Systems** should be designed to minimize the possibility of component failure or malfunction due to electrical transients and interference or external effects such as vibration, shock and temperature

3.5 **Special Protection Systems**, including intelligent electronic devices (IEDs) and communication systems used for **protection**, should comply with applicable industry standards for utility grade **protection** service. Utility Grade **Protection** System Equipment are equipment that are suitable for protecting transmission power system elements, that are required to operate reliably, under harsh environments normally found at substations. Utility grade equipment should meet the applicable sections of all or some of the following types of industry standards, to ensure their suitability for such applications:

- IEEE C37.90.1-2002 (oscillatory surge and fast transient)
- IEEE C37.90.1-2002 (service conditions)
- IEC 60255-22-1, 2005 (1 MHz burst, i.e. oscillatory)
- IEC 61000-4-12, 2001 (oscillatory surge)
- IEC 61000-4-4, 2004 (EFT)
- IEC 60255-22-4, 2002 (EFT)
- IEEE C37.90.2-2004 (narrow-band radiation)
- IEC 60255-22-3, 2000 (narrow-band radiation)
- IEC 61000-4-3, 2002 (narrow-band radiation)
- IEEE 1613 (communications networking devices in Electric power Substations)

3.6 **Special Protection System** circuitry and physical arrangements should be carefully designed so as to minimize the possibility of incorrect operations due to personnel error.

3.7 **Special Protection System** automatic self-checking facilities should be designed so as to not degrade the performance of the **Special Protection System**.

3.8 Consideration should be given to the consequences of loss of instrument transformer voltage inputs to **Special Protection Systems**.

3.9 Consideration should be given to the effect of the means of arming on overall security and dependability of the **Special Protection System**. Arming should have a level of security and dependability commensurate with the requirements of the SPS.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

4.0 Considerations Affecting Performance

4.1 Control Cable, Wiring and Ancillary Control Device

Control cables and wiring and ancillary control devices should be highly dependable and secure. Due consideration should be given to published codes and standards, fire hazards, current-carrying capacity, voltage drop, insulation level, mechanical strength, routing, shielding, grounding and environment.

4.2 Environment

Means should be employed to maintain environmental conditions that are favorable to the correct performance of **Special Protection Systems.**

5.0 Operating Time of an SPS

Adequate time margin should be provided taking into account study inaccuracies, differences in equipment, and **protection** operating times.

6.0 Arming of an SPS

Arming is the selection, which may be external to the **Special Protection System**, of desired output action based on power system conditions and recognized contingencies. Arming requirements of a Special Protection System are normally based upon the results of system studies which take into account recognized contingencies, operating policies/procedures and current power system load/generation conditions. For a simple **Special Protection System**, arming may be an on/off function. A **Special Protection System** can be armed either automatically or manually.

6.1 Automatic arming is implemented without human intervention.

6.2 Arming manually if the recognition, decision or implementation requires human intervention. Sufficient time with adequate margin for recognition, analysis and the taking of corrective action should be allowed.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

7.0 Maintenance Considerations

7.1 Additional periodic maintenance is recommended on the following **protection** equipment:

- On continuously monitored analog **teleprotection** channels, verify signal adequacy every twelve months.
- On non-monitored analog **teleprotection** channels, verify signal adequacy every month.
- On digital **teleprotection** systems, which are inherently monitored, verify local function every two years.
- On batteries and chargers, verify proper operation and general condition every month.
- On circuit breakers, verify ability to trip via each trip coil every two years, with due regard to critical trip paths between sensing relays and the breaker trip coils.

7.2 It is the responsibility of each TO, GO and DP to evaluate its own particular circumstances and determine if any additional maintenance should be performed on its system. More extensive maintenance may be required but not limited to:

- during the initial break-in period,
- where **protection** systems are exposed to abnormal conditions such as temperature extremes, vibration, corrosive atmosphere, etc.,
- when the operating condition of **protection** system control wiring is suspect..

7.3 The design of a **Special Protection System** both in terms of circuitry and physical arrangement should facilitate periodic testing and maintenance in a manner that mitigates the risk of inadvertent operation. As a **Special Protection System** may be complex and may interface with other protection systems or control systems, special attention should be placed on ensuring that test devices and test interfaces properly support a clearly defined maintenance strategy.

7.4 Proper overlap is ensured if each portion of circuitry is seen to perform its intended function, such as operating a relay, from either a real or test stimulus, while observing some common reliable downstream indicator.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

7.5 Whenever practicable, some of the maintenance testing requirements may be met by analyzing and documenting the detailed performance of the **Special Protection System** during actual events to demonstrate that the specific testing requirements have been fulfilled. Such an approach can reduce the probability of false operation during maintenance while effectively reducing the extent of planned maintenance.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

Appendix B
Procedure for Review of Special Protection Systems

Introduction

This Appendix provide the procedure to follow to obtain concurrence from NPCC if an entity concludes that a new **Special Protection System** or a modification of an existing **Special Protection System** will be required which affects the **bulk power system**. The procedure is also shown on the attached flow chart.

2.0 NPCC Review and Concurrence

2.1 Allowing for sufficient lead time to ensure an orderly review, the entity will notify the chairman of the Task Force on Coordination of Planning (TFCP) of its proposal to install a new **Special Protection System** or modify an existing **Special Protection System**. The entity will send copies of the complete notification to TFCO and TFSP. This notification will include statements that describe possible failure modes and whether misoperation, unintended operation or failure of the **Special Protection System** would have local, inter-company, inter-**Area** or inter-Regional consequences, when the **Special Protection System** is planned for service, how long it is expected to remain in service, the specific **contingency**(s) for which it is designed to operate and whether the **Special Protection System** will be designed according to the NPCC *Bulk Power System Protection Criteria* (Document A-5) and the *Special Protection System Criteria* and Standards requirements listed in this docment.

2.2 If the **Special Protection System** is expected to have only local consequences, TFCP will request that the Task Force on System Studies (TFSS) and the Task Force on System Protection (TFSP) review the proposal.

2.2.1 TFSP will be notified of the proposed **Special Protection System**. TFSP will advise TFCP of any concerns.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

2.2.2 TFSS will review the analyses that the proposing entity has performed. A presentation may be required from the proposing entity. The purpose of the review will be to confirm that there are no adverse inter-**Area** or inter-Regional consequences of either a failure of the **Special Protection System** to operate when and how it is required or an inadvertent or unintended operation of the **Special Protection System**. If necessary, TFSS will request that the proposing entity conduct additional analyses.

2.2.3 If the TFSS review confirms the **Special Protection System** has only local consequences, TFSS will send the information to TFCP. If TFCP concurs, they will then notify the proposing entity of NPCC's conclusions that the **Special Protection System** has only local consequences. TFCP will also notify the Reliability Coordinating Committee (RCC), all the Task Forces, the Compliance Committee (CC), the proposing entity and other Members that concurrence has been given to the proposing entity to modify an existing **Special Protection System** or install a new **Special Protection System**, at which time, the **Special Protection System** may be deployed.

2.2.4 If the TFSS review concludes that the **Special Protection System** could have inter-**Area** or inter-Regional consequences, they will inform the TFCP. Upon receipt of the TFSS conclusion or if TFCP separately determines the **Special Protection System** could have inter-**Area** or inter-Regional consequences, TFCP will arrange for an overall NPCC review as detailed in Step 3.

2.2.5 TFSS will update the NPCC **Special Protection System** list/database.

2.3 If the proposing entity expects the **Special Protection System** to have inter-**Area** or inter-Regional consequences, or if the TFSS or TFCP review concludes this to be the case, TFCP will request the Task Force on Coordination of Operation (TFCO), the Task Force on System Protection (TFSP) and TFSS to review it. Each of the Task Forces may require a presentation from the proposing entity.

2.3.1 TFSP will confirm the failure modes of the **Special Protection System**, including actions of back-up **protection**, and whether or not the **Special Protection System** complies with NPCC system **protection** standards. TFSP will review whether the new or modified **Special Protection System** is in conformance with the NPCC *Bulk Power System Protection Criteria* (Document A-5) and the *Special*

Protection System Criteria and Standards requirments listed in this document and forward a summary of their findings to TFCO, TFCP and TFSS. This summary will include a statement as to whether the **Special Protection System** is in conformance with the *Bulk Power System Protection Criteria* (Document A-5) and the *Special Protection System Criteria* and Standards requirments listed in this document and whether the Task Force has any objections to its modification or installation.

2.3.2 TFSS will review the analysis that the proposing entity has performed. The purpose of the review will be to assess the **Special Protection System** is in conformance with the *Basic Criteria for Design and Operation of Interconnected Power Systems* (Document A-2) and to determine the inter-**Area** or inter-Regional consequences of either a failure of the **Special Protection System** to operate when and how it is required or an inadvertent or unintended operation of the **Special Protection System**. If necessary, TFSS will request that the proposing entity conduct additional studies. When their review is completed, TFSS will forward a summary of their findings to TFCO, TFCP and TFSP. This summary will include a statement as to whether the **Special Protection System** is in conformance with the *Basic Criteria* (A-2) and whether the Task Force has any objections to its modification or installation.

2.3.3 TFCO will review the operability of the **Special Protection System** and forward a summary of their findings to TFCP, TFSS and TFSP. This summary will include a statement as to whether the Task Force has any objections to its modification or installation.

2.3.4 TFCP will prepare an overall summary for the RCC. This summary will include the findings of the other Task Forces and whether there are any objections to the modification of the existing **Special Protection System** or the installation of the new **Special Protection System** and as a minimum, include the following information:

. Function, i.e. GR-generation rejection etc.
. Identification
. Initiating condition
. Action(s) resulting
. Name of the **Special Protection System**, and owner, identification number
. Arming, i.e. percentage of time, system conditions for which it's needed, manual vs. automatic, etc.
. Reason for the installation
. Comments, explanations, such as "temporary until such time…"
. Company, owner
. SPS Number, drawn by NPCC staff
. Current Status, i.e. New, Changed or Removed
. Type Determination

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

- Determinations of the Task Forces' analyses
- Consequences of operation, misoperation and failure to operate
- Approximate of load or generation rejected by **Special Protection System** operation
- Proposed date of deployment
- Proposed date of retirement/deactivation

2.3.5 The RCC will review the summary report and act on the proposal to modify an existing **Special Protection System** or install a new **Special Protection System**. The RCC may also remand the review of the **Special Protection System** back to the TFCP if further analyses are determined to be needed.

2.3.6 The TFCP will notify the RCC, all the Task Forces, the CC, the proposing entity and other Members of the outcome of the review. Upon NPCC approval of the type and compliance with Criteria, the **Special Protection System** may be deployed.

2.3.7 The TFSS will then update the NPCC **Special Protection System** list/database.

3.0 Presentation and Review of Special Protection Systems

Each new or modified Type I or Type II **Special Protection System** shall be reported to the Task Force on System Protection in accordance with the following presentation and review procedure.

3.1 A presentation will be made to the TFSP on new facilities or a modification to an existing facility when requested by an NPCC Member or the TFSP.

3.2 A presentation will be made to the TFSP when the design of the **protection** facility deviates from the *Bulk Power System Protection Criteria* (Document A-5).

3.3 A presentation will be made to the TFSP when an NPCC Member is in doubt as to whether a design meets the *Protection Criteria*.

3.4 Data Required for Presentation and Review of Proposed **Special Protection System:**

3.4.1 The TO, GO or DP will advise the TFSP of the basic design of the proposed system. The data will be supplied on the attached forms, accompanied by a geographical map, a one-line diagram of all affected areas, and the associated **protection** and control function diagrams. A physical layout of **protection** panels and batteries for the purpose of illustrating physical separation will also be included.

3.4.2 The proposed **protection** system will be explained with due emphasis on

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

any special conditions or design restrictions existing on the particular power system:

3.5 Procedure for Presentation:

3.5.1 The TO, GO or DP will arrange to have a technical presentation made to the TFSP.

3.5.2 To facilitate scheduling, the chairman of the TFSP will be notified approximately four months prior to the desired date of presentation.

3.5.3 Copies of materials to be presented will be distributed to TFSP members 30 days prior to the date of the presentation.

3.6 Review by TFSP

The TFSP will review the material presented and develop a position statement concerning the proposed **protection** system. This statement will indicate one of the following:

3.6.1 The need for additional information to enable the TFSP to reach a decision.

3.6.2 Acceptance of the TO, GO or DP statement of conformance to the *Protection Criteria*.

3.6.3 Acceptance of the submitted proposal.

3.6.4 *Conditional acceptance of the submitted proposal.

3.6.5 *Rejection of the submitted proposal

* Position Statements to include an indication of areas of departure from the intent of the *protection criteria* and suggestions for modifications to bring the **protection** system into conformance with the NPCC criteria.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

3.6.6 The results of the TFSP review will be documented in the following manner.

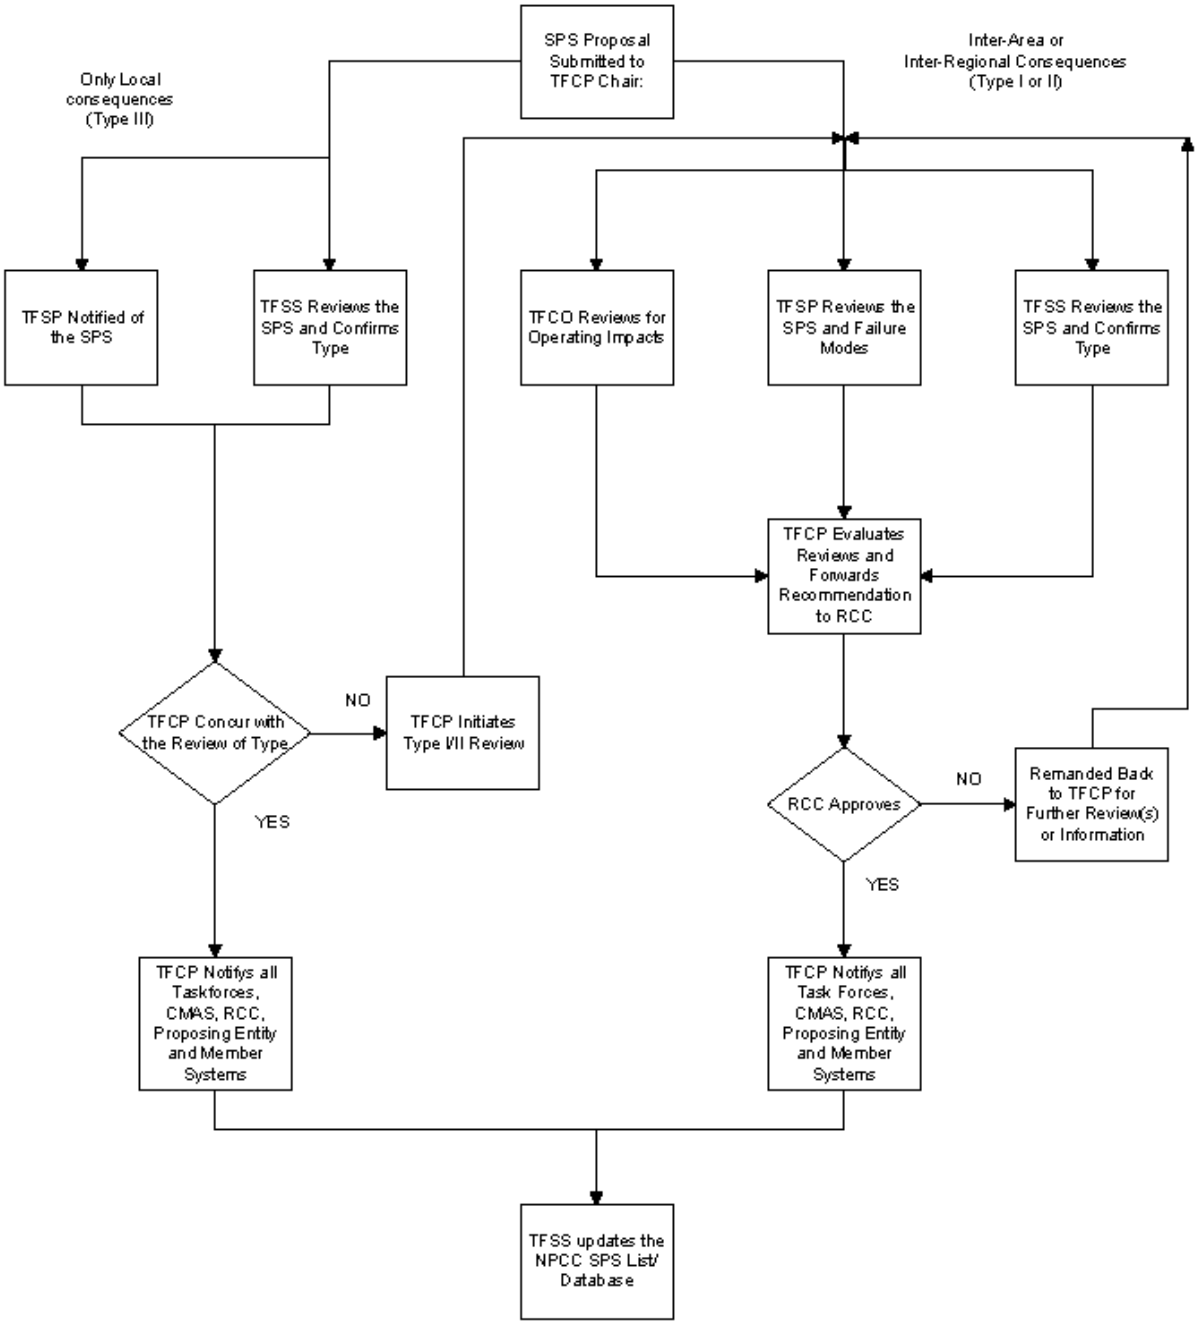
. A position statement will be included in the minutes of the meeting at which the proposed **protection** system was reviewed.

. If necessary, a letter outlining areas of nonconformance with the NPCC *Protection Criteria* and recommendations for correction will be submitted to the TO, GO or DP.

. The Task Force will maintain a record of all the reviews it has conducted.

This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

PROCEDURE FOR NPCC REVIEW OF NEW OR MODIFIED BULK POWER SYSTEM SPECIAL PROTECTION SYSTEMS (SPS)



This document, when downloaded or printed, becomes UNCONTROLLED. Users should check the NPCC website for the current CONTROLLED version of this document.

NPCC, Inc.

NORTHEAST POWER COORDINATING COUNCIL, INC.
1040 AVE OF THE AMERICAS, NEW YORK, NY 10018 TELEPHONE (212) 840-1070 FAX (212) 302-2782

September 11, 2012

NPCC Full Member Committee;

Please find attached a redlined copy of NPCC Regional Reliability Directory#12 *Underfrequency Load Shedding Program Requirements* which has been revised to incorporate certain tolerance recommendations in the five stage NPCC Automatic UFLS program and is now posted to receive your comments through the NPCC Process for Open Review.

During the recent development of the NPCC Regional Standard for Automatic UFLS *PRC- 006-NPCC-1* the Standard Drafting Team asked the SS-38 Working Group on Inter Area Dynamic Analysis to investigate the tolerances in the UFLS program and to further review the amount of margin that could be allowed at each stage.

The SS-38 Working Group observed in its simulations that using a UFLS program based on 1% tolerance bands generated more acceptable results and recommended that such tolerances be incorporated into the draft of *PRC-006-NPCC-1*.

The current version of NPCC Directory #12 which provides the criteria for the UFLS program until such time as the standard has been approved does not provide for any tolerances in its program stages.

Accordingly, this revision will synchronize the tolerance bands between Directory#12 and the UFLS Regional Standard and allow regional entities to implement a program that is consistent with the SS-38 design recommendations as part of the ongoing six year UFLS Implementation Plan.

The NPCC Task Force on System Studies (TFSS) has reviewed and approved the proposed changes and has authorized this Open Process posting.

The NPCC Open Process Review may be accessed through the following link:

https://www.npcc.org/Standards/SitePages/NonStandardsList.aspx

Comments on the proposed revision to Directory#12 will be received for forty five days through October 26, 2012 and all comments will be addressed by the TFSS.

Please contact me with any questions regarding Directory content or document review.

Thanks.

Appendix A

1.0 Introduction

1.1 Title
Under frequency Load Shedding Program

1.2 Directory Number
12

1.3 Objective

This Directory presents the basic criteria for the design and implementation of under frequency **load shedding** programs to ensure that declining frequency is arrested and recovered in accordance with established NPCC performance requirements to prevent system collapse due to load-generation imbalance.

1.4 Effective Date
June 26th, 2009

The effective date of this Directory also is the initial date of a six-year implementation plan for under frequency **load shedding** program in the portion of NPCC in the Eastern Interconnection and a three -year implementation plan in the Québec Interconnection.

1.5 Background

This Directory was developed from the automatic Under frequency **Load Shedding** requirements in NPCC Directory #2, Emergency Operations, and the recommendations and implementation plans provided in the study reports: 2006 Assessment of Under frequency Load Shedding Adequacy Part III – Assessment of Program Modifications and 2008 Assessment of Under frequency Load Shedding Adequacy – Québec Area, approved by the Reliability Coordinating Committee on November 19, 2008.

1.6 Applicability

1.6.1 Functional Entities

Balancing Authorities
Transmission Operators
Generator Owners

2.0 Terms Defined in this Directory

The definitions of terms found in this Directory appearing in bold typeface can be found in the Appendix A.

3.0 NERC ERO Reliability Standard Requirements

The NERC ERO Reliability Standards containing Requirements that are associated with this Directory include, but may not be limited to:

3.1 EOP-003: Load Shedding Plans
3.2 PRC-006: Development and Documentation of Regional UFLS Programs
3.3 PRC-007: Assuring Consistency with Regional UFLS Program Requirements

4.0 NPCC Regional Reliability Standard Requirements

None.

5.0 NPCC Full Member, More Stringent Criteria

These Criteria are in addition to, or more stringent or more specific than the NERC or any Regional Reliability standard requirements.

5.1 Under frequency Load Shedding Program – General Criteria

The intent of the NPCC automatic Under frequency **Load Shedding** program is to ensure that declining frequency is arrested and recovered in accordance with established NPCC performance requirements stipulated in this document, as follows:

5.1.1 Frequency decline is arrested at no less than 58.0 Hz for the portions of NPCC in the Eastern Interconnection and 56.0 Hz for the portion of NPCC in the Québec Interconnection.

5.1.2 Frequency does not remain below 58.5 Hz for greater than 10 seconds, and does not remain below 59.5 Hz for greater than 30 seconds, for a generation deficiency of up to 25% of the **load**.

5.2 Under frequency Load Shedding Program – Eastern Interconnection specific Requirements

Each Balancing Authority in the NPCC portion of the Eastern Interconnection shall develop an automatic Under frequency **Load Shedding** Program that meets the following requirements, unless an alternative plan is submitted by the Balancing Authority for review by the NPCC Task Forces on Coordination of Operation and System Studies and approved by the NPCC Reliability Coordinating Committee:

5.2.1 The program shall consist of five stages of **load shedding** to be provided by entities with 100 MW or more of end-use load connected to its facilities with the following attributes:

	Threshold Setting	Block Size	Cumulative Load Shed as % of TO or DP Load	Total Operating Time (1)
Stage 1	59.5 Hz	6.5-7.5~~7~~ percent	6.5-7.5	300 ms
Stage 2	59.3 Hz	6.5-7.5~~7~~ percent	13.5-14.5	300 ms
Stage 3	59.1 Hz	6.5-7.5~~7~~ percent	20.5-21.5	300 ms
Stage 4	58.9 Hz	6.5- 7.5~~7~~ percent	27.5-28.5	300 ms
Stage 5 (anti-stall)	59.5 Hz	2-3 percent	29.5-31.5	10 s

Formatted Table

Notes:

(1) Total operating time is the load-weighted average for all **load** within a Balancing Authority area, with maximum deviation for any load limited to ±50 ms.

5.2.2 The program shall consist of two stages of **load shedding** to be provided by entities with 50 MW or more and less than 100 MW of end-use load connected to its facilities with the following attributes:

	Threshold Setting	Block Size	Cumulative Load Shed as % of TO or DP Load	Total Operating Time (1)
Stage 1	59.5 Hz	14-25 percent	14-25	300 ms
Stage 2	59.1 Hz	14-25 percent	28-50	300 ms

Formatted Table

Notes:

(1) Total operating time is the load-weighted average for all **load** within a Balancing Authority area, with maximum deviation for any load limited to ±50 ms.

5.2.3 The program shall consist of one stage of **load shedding** to be provided by entities with 25 MW or more and less than 50 MW of end-use load connected to its facilities with the following attributes:

	Threshold Setting	Block Size	Cumulative Load Shed as % of TO or DP Load	Total Operating Time (1)
Stage 1	59.5 Hz	28-50 percent	28-50	300 ms

Formatted Table

Notes:

(1) Total operating time is the load-weighted average for all **load** within a Balancing Authority area, with maximum deviation for any load limited to ±50 ms.

5.2.4 Entities with less than 25 MW of end-use load connected to its facilities are exempt from providing UFLS.

5.2.5 Entities with less than 100 MW of end-use load connected to its facilities may collectively implement by mutual agreement with one or more entities within the same island[1] identified an aggregated automatic UFLS program that sheds load based on the frequency thresholds in section 5.2.1 as an alternative to implementing the applicable program in section 5.2.2 or 5.2.3.

5.2.6 Under frequency threshold **relays** shall be set to a nominal total operating time of 300 ms, from the time when frequency passes through the set point to the time of circuit breaker contact opening (including any communications time delay), with a minimum relay operating time to be no less than 100 ms when the rate of frequency decay is 0.2 Hz per second.

5.3 Under frequency Load Shedding Program – Québec Interconnection Specific Requirements

The Balancing Authority in the Québec Interconnection shall develop an automatic Under frequency **Load Shedding** Program that meets the following requirements, unless an alternative plan is submitted by the

[1] BA shall identify the appropriate island for entities participating in the program.

Balancing Authority for review by the NPCC Task Forces on Coordination of Operation and System Studies and approved by the NPCC Reliability Coordinating Committee:

5.3.1 The program shall consist of five threshold stages and four rate-of-change (slope) stages of **load shedding** as depicted in Table 2.

Table 2 – UFLS Parameters for the Québec Interconnection Portion of NPCC

	Rate	Frequency	MW at System Peak	Mvar at System Peak	Total Operating Time
Threshold Stage 1	——	58.5 Hz	1000 MW (1)	1000 Mvar	300 ms
Threshold Stage 2	——	58.0 Hz	800 MW (1)	800 Mvar	300 ms
Threshold Stage 3	——	57.5 Hz	800 MW	800 Mvar	300 ms
Threshold Stage 4	——	57.0 Hz	800 MW	800 Mvar	300 ms
Threshold Stage 5 (anti-stall)	——	59.0 Hz	500 MW	500 Mvar	20 s
Slope Stage 1	-0.3 Hz/s	58.5 Hz	400 MW	400 Mvar	300 ms
Slope Stage 2	-0.4 Hz/s	59.8 Hz	800 MW (1)	800 Mvar	300 ms
Slope Stage 3	-0.6 Hz/s	59.8 Hz	800 MW (1)	800 Mvar	300 ms
Slope Stage 4	-0.9 Hz/s	59.8 Hz	800 MW	800 Mvar	300 ms

Notes:

(1) These stages shed fixed load independent of system load level.

(2) The amount of load shedding in this table includes load shedding to compensate for generators that trip above the curve in Figure 1.

5.4 Generator Under frequency Protection Requirements

Generators shall not be tripped for under-frequency conditions in the area above the curve in Figure 1, except as provided for in Sections 5.4.1 and 5.4.2.

5.4.1 It is recognized that, in special cases, requirements may dictate generator trip in the region above the curve. In those cases, the Generator Owner shall so notify its

Balancing Authority and shall ensure through alternate arrangements, that automatic **load shedding** additional to the amount set out in Section 5.2 and in Section 5.3, equivalent (+/- 5%) to the amount of **generation** to be tripped, is provided. Such cases shall be reviewed by the Task Force on Coordination of Operation

5.4.2 Generator Owners shall not increase the under frequency trip settings or make other modifications to the existing exempt generators (that trip above the curve in Figure 1) that may cause these generators to, directly or indirectly, trip at a higher frequency.

5.5 UFLS Program Assessment Requirements

5.5.1 Studies shall be performed by the associated Transmission Operator to ensure satisfactory voltage and loading conditions after automatic **load shedding**.

5.5.2 The Task Force on System Studies shall conduct a triennial study to coordinate the Automatic Under frequency **Load Shedding** Program among the NPCC Balancing Authorities.

6.0 Measures and Assessments

None developed at this time.

7.0 Compliance Monitoring

Adherence to these Criteria shall be reported by the responsible entity in a manner and form designated by the Compliance Committee.

Prepared by: Task Force on System Studies

Review and Approval: Revision to any portion of this Directory will be posted by the lead Task Force in the NPCC Open Process for a 45 day review and comment period. Upon satisfactorily addressing all the comments in this forum, the Directory document will be sent to the remaining Task Forces for their recommendation to seek RCC approval.

Upon approval of the RCC, this Directory will be sent to the Full Member Representatives for their final approval if sections pertaining to the Requirements and Criteria portion have been revised. All voting and approvals will be conducted according

to the most current "NPCC Bylaws" in effect at the time the ballots are cast.

Revisions pertaining to the Appendices or any other portion of the document such as Links, glossary of terms, etc., will only require RCC Members' approval. Errata may be corrected by the Lead Task Force at any time and provide the appropriate notifications to the NPCC Inc. membership.

This Directory will be updated at least once every three years and as often as necessary to keep it current and consistent with NERC, Regional Reliability Standards and other NPCC documents.

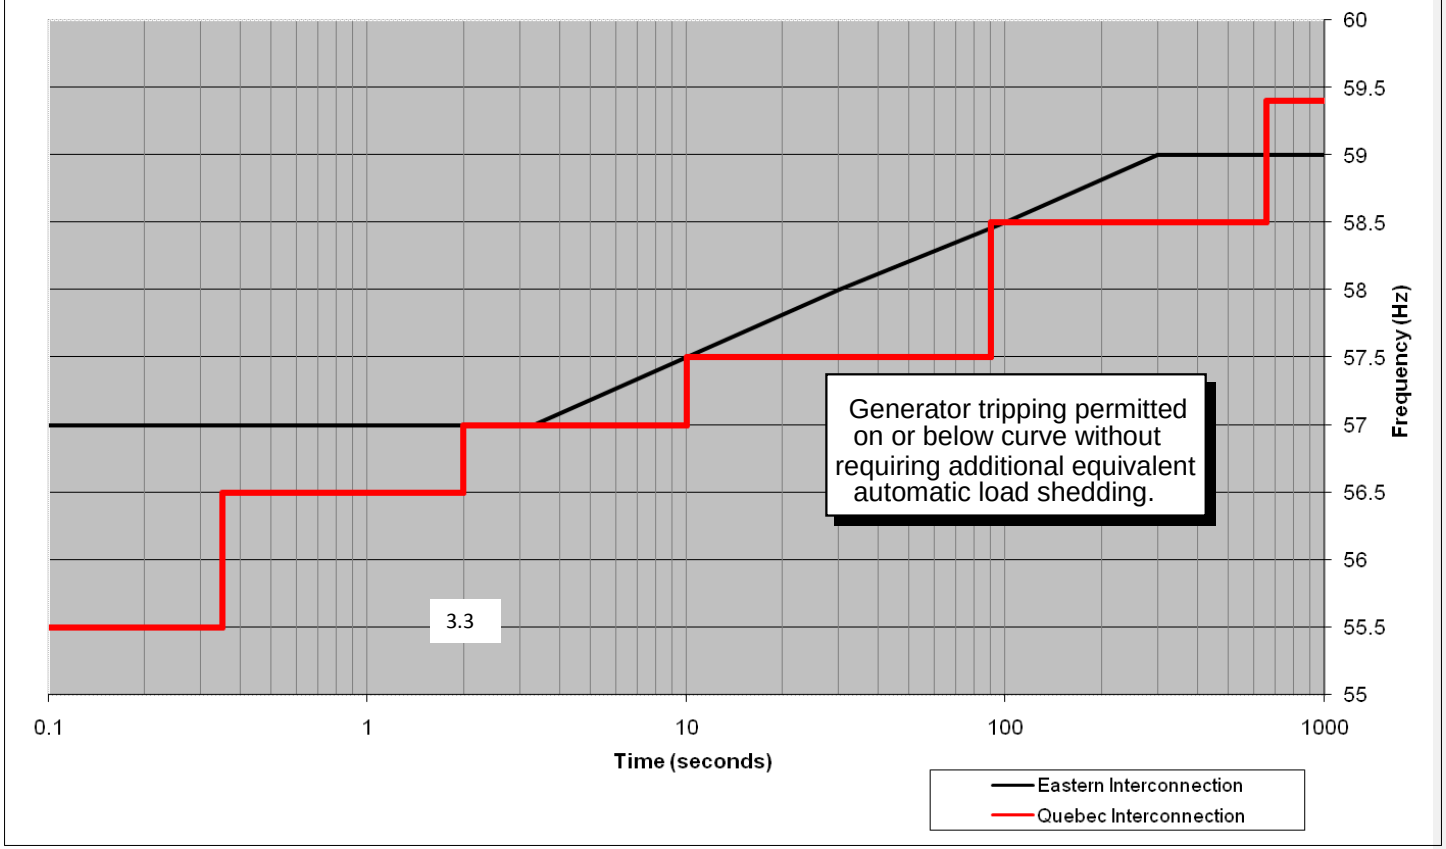
Standards for setting underfrequency trip protection for generators



Appendix A
Definition of Terms[2]

Bulk power system — The interconnected electrical systems within northeastern North America comprised of system **elements** on which **faults** or **disturbances** can have a **significant adverse impact** outside of the **local area**.

Island — A portion of a **power** system or several power systems that is electrically separated from the interconnection due to the disconnection of transmission system **elements**.

Load — The electric **power** used by devices connected to an electrical generating system. (IEEE Power Engineering). Also see **Demand**.

NPCC Specific Definitions:

Firm Load — Loads that are not **Interruptible Loads**.

Interruptible Load — Loads that are interruptible under the terms specified in a contract.

Load Shedding — The process of deliberately removing (either manually or automatically) preselected customers' **load** from a power system in response to an abnormal condition to maintain the integrity of the system and minimize overall customer outages.

Relay — An electrical device designed to respond to input conditions in a prescribed manner and after specified conditions are met to cause contact operation or similar abrupt change in associated electric control circuits. (Also: see **protective relay**).

[2] These terms will be moved and grouped under a separate Directory when all other Directories are developed.

E-mail: balband@coned.com
Identify the Directory that needs clarification:
Directory Number : Directory #3 Section 5.6.2
Directory Title: Maintenance Criteria for Bulk Power System Protection
Identify specifically what portion of the Criteria needs clarification:
Text of Requirement: For telecommunication system channels that are not continuously monitored, the signal adequacy shall be tested every month and the ability of a channel to perform its intended function shall be verified every twelve months. An example of such a system is On/Off Power Line Carrier.

What is the difference between the monthly signal adequacy test and the yearly verification of the ability of the channel to perform its intended function? Our view is that the monthly signal adequacy sufficiently verifies the ability of the channel to perform its function; therefore, no yearly additional yearly test is required. The interpretation may depend on what is the definition of the intended function of the channel. We think the intended function of the channel is to transfer the signal from one station to the other, and therefore the monthly signal adequacy test verifies if that is working.

Identify the material impact associated with this interpretation:

Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this Directory:

Unessential yearly test performed.

Identify the Directory that needs clarification:
Directory Number : **3**
Directory Title: Maintenance Criteria for Bulk Power System Protection
Identify specifically what portion of the Criteria needs clarification:
Text of Requirement: 5.7.1 **Protection group** DC circuit tests, battery bank and charger tests and breaker trip tests for **protection** required by the NPCC Automatic Underfrequency **Load Shedding**

Program, need not be performed more frequently than the **protection group** DC circuit tests, battery bank and charger tests and breaker trip tests for other **protection** on the same breaker. Because of the distributed nature of this **load shedding protection**, random failures to trip do not compromise the objectives of the NPCC Automatic Under frequency **Load Shedding** Program.

1 - What is meant where it states that DC circuit tests, battery bank and charger tests and breaker trip tests: "need not be performed more frequently than the protection group DC circuit tests, battery bank and charger tests and breaker trip tests for other protection on the same breaker"?

2 - Are DC circuit tests, battery bank and charger tests and breaker trip tests required for all protection equipment that is required by the NPCC UFLS program?

3 - Do the maintenance and testing activities and intervals from sections 5.3, 5.4, and 5.5 of NPCC Directory 3 for DC circuit tests, battery bank and charger tests and breaker trip tests, apply to all protection equipment required by the NPCC UFLS program?

Identify the material impact associated with this interpretation:

Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this Directory:

Incorrect interpretation could cause some entities to perform DC circuit tests, battery bank and charger tests and breaker trip tests on incorrect intervals, or could cause some entities to conclude that DC circuit tests, battery bank and charger tests and breaker trip tests are not required to be performed at all.

Re: NPCC Response to a Request for Criteria Interpretation on Regional Reliability Directory# 3 *Maintenance Criteria for Bulk Power System Protection*

Dear Mr. Auxier:

In accordance with the NPCC Directory Development and Revision Manual the Task Force on System Protection (TFSP) has considered your *Request for Criteria Interpretation* and has provided the attached response.

The subject request which seeks clarification of certain criteria within Directory#3 *Maintenance Criteria for Bulk Power System Protection* was reviewed and approved by the TFSP at its meeting on July 17th and 18th, 2012.

Please find attached the TFSP response along with the original Request for Interpretation.

NPCC has established an archive for this and other such requests in the Directory section of the NPCC website.

https://www.npcc.org/Standards/Directory%20Interpretations/Forms/AllItems.aspx

Please let me know if I can provide any further assistance in this matter.

Thank you.

Gerry Dunbar

Directory Title: Maintenance Criteria for Bulk Power System Protection
Identify specifically what portion of the Criteria needs clarification:
Text of Requirement:

5.6.2 Channel Health

For telecommunication system channels that are continuously monitored and continuously provide verification of trip capability to an Operator, no additional testing is necessary.

What is meant by: "continuously provide verification of trip capability to an Operator"? As an example, we have an FSK communication channel of RFL-9745 tone sets. The Guard tones are continuously monitored and Loss of Communication is alarmed to our operators. There is also a Hardware Alarm that is monitored by the operators and seems to provide verification of trip capability. Does this system meet the requirements such that no additional Channel Health testing is required? As such may the telecommunications terminal equipment be tested on the same interval as the protection assembly?

Identify the material impact associated with this interpretation:

Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this Directory:

Incorrect interpretation will cause us to test on incorrect intervals. We will either not be meeting the criteria or over-testing which is both costly and potentially detrimental to system reliability.

Question 1
Response to Question 1
Question 2
Response to Question 2

Task Force on System Protection

Response to Request for Interpretation

Directory#3 Maintenance Criteria Bulk Power System Protection

What is meant by: "continuously provide verification of trip capability to an Operator"?

What is meant here, is that the communications equipment is capable of detecting and alarming (to an operator) failure modes that could prevent the trip signal from reaching the remote end.

As an example, we have an FSK communication channel of RFL-9745 tone sets. The Guard tones are continuously monitored and Loss of Communication is alarmed to our operators.

In your FSK example, the alarming would have to give an indication of the equipment's ability to actually send a trip signal to the remote end, not just the presence of the guard tone.

There is also a Hardware Alarm that is monitored by the operators and seems to provide verification of trip capability.

It is TFSPs understanding of this RFL equipment, that the hardware alarm is not a trip capability alarm so much as it is a hardware failure alarm, which is one failure mode, but not all failure modes.

Does this system meet the requirements such that no additional Channel Health testing is required?

This system meets the channel health testing requirements but does not provide trip capability verification, which is required annually.

As such may the telecommunications terminal equipment be tested on the same interval as the protection assembly?

The Contact outputs from the telecommunications equipment can be tested on the same interval as the protection assembly. For example, your RFL equipment may pick up an auxiliary device which has contact outputs going into your protection assembly…These contacts do not fall under the telecommunications equipment testing requirements but instead under the protection assembly testing requirements.

Re: NPCC Response to a Request for Criteria Interpretation on Regional Reliability Directory# 8 *System Restoration.*

Dear Mr. Adamson:

In accordance with the NPCC Directory Development and Revision Manual the Task Force on Coordination of Operation (TFCO) has considered your *Request for Criteria Interpretation* and has provided the attached response.

The subject request, which seeks clarification of certain criteria within Directory#8 *System Restoration,* was initially reviewed by the NPCC Restoration Working Group (CO-11) and was further revised and approved by the TFCO on June 6th, 2012.

Please find attached the TFCO response along with the original Request for Interpretation and the TFCO transmittal letter.

In the future NPCC will archive these documents and other such requests in the Directory section of the NPCC website.

Please let me know if I can provide any further assistance in this matter.

Thank you.

NPCC Request for Criteria Interpretation

Note: an Interpretation cannot be used to revise a Directory.

Request for an Interpretation of a Directory
Date submitted: May 25, 2012 Date revised version submitted:
Contact information for person requesting the interpretation:
Name: Alan Adamson
Organization: New York State Reliability Council (NYSRC) Reliability Rules Subcommittee
Telephone: 518-355-1937
E-mail: aadamson@nycap.rr.com
Identify the Directory that needs clarification:
Directory Number : 8
Directory Title: System Restoration
Identify specifically what portion of the Criteria needs clarification:
Text of Requirement: Requirement 5.7.2.1 "The Generator Owner having generating facilities designated as having black start capability shall annually verify the facilities' black start capability without dependencies on power sources unavailable during a partial or complete system blackout….The number of units within a generating facility that shall be black started for this test is determined by the

Reliability Coordinator and Transmission Operator as needed by their respective system restoration plans."

Clarifications requested by the NYSRC:

1. NPCC Requirement: Designated black start facilities shall be tested annually.
   Is a power plant considered a facility or could there be more than one facility in a power plant? For example, if a power plant has two steam units and four gas turbines, and all six units are designated as black start units: (1) Are all six units defined collectively by NPCC as a single facility? or (2) Could there be more than one facility in the plant, say three units in one facility and three units in the other? If NPCC interprets that all six units make up one facility in this example, does this mean that, at a minimum, only one of the six black start units needs to tested each year? (We recognize that the RC and TO can determine to test more than the minimum number of units required by NPCC.)

2. Is the subject NPCC criterion applicable to required black start facility actions necessary for implementing a local Transmission Owner's system restoration plan?

Identify the material impact associated with this interpretation:

Identify the material impact to your organization or others caused by the lack of clarity or an incorrect interpretation of this Directory:

NYSRC policy requires that the NYSRC must be assured that the NYISO complies with NPCC standards and criteria. Also, NYSRC Reliability Rules must, at a minimum, be consistent with NPCC requirements, although they may be more stringent or specific.

An incorrect interpretation of NPCC requirements could result in incorrect conclusions regarding NYISO compliance with NPCC requirements, or NYSRC reliability rules that are inconsistent with NPCC requirements.

Interpretation: Response to Request for an Interpretation

The following interpretation of Directory#8 *System Restoration* was developed by the Task Force on Coordination of Operation (TFCO)

Directory Number: Directory#8

1. **Question 1:**

   NPCC Requirement: Designated black start facilities shall be tested annually.

   Is a power plant considered a facility or could there be more than one facility in a power plant? For example, if a power plant has two steam units and four gas turbines, and all six units are designated as black start units: (1) Are all six units defined collectively by NPCC as a single facility? or (2) Could there be more than one facility in the plant, say three units in one facility and three units in the other? If NPCC interprets that all six units make up one facility in this example, does this mean that, at a minimum, only one of the six black start units needs to tested each year? (We recognize that the RC and TO can determine to test more than the minimum number of units required by NPCC.)

Response to Question 1:

Response of the NPCC Task Force on Coordination of Operation:

A generating plant with Blackstart Capability may have black start generating units as well as generating units which are not black start capable. Citing Requirement 5.7.2.1:

"The Generator Owner having generating facilities designated as having blackstart capability shall annually verify the facilities' blackstart capability without dependencies on power sources unavailable during a partial or complete system blackout. Once the facility has been started, it shall continue to demonstrate its capability to operate in a stable condition while isolated from the power system for a minimum of ten minutes. The number of units within a generating facility that shall be blackstarted for this test is determined by the Reliability Coordinator and Transmission Operator as needed by their respective system restoration plans."

Question 2 :

Is the subject NPCC criterion applicable to required black start facility actions necessary for implementing a local Transmission Owner's system restoration plan?

Response to Question 2

Response of the NPCC Task Force on Coordination of Operation:

No. The requirements of NPCC Directory 8 are limited to Black start Capability at designated Key Facilities as identified by the Reliability Coordinator in accordance with the following definitions as found in the NPCC Glossary of Terms::

"Black start Capability — The ability of a generating unit or station to go from a shutdown condition to an operating condition and start delivering power without assistance from the electric system."

"Basic Minimum Power System — Consists of one or more generating stations, transmission lines, and substations operating in the form of an island. Such a system can be restarted independently and later synchronized to other islands or the main grid. The transmission elements included in the basic minimum power system connect the units which have black start capability to those units without black start capability which have been designated in the restoration plan to be restarted in the first stages of the restoration process. Also included are selected tie lines and corresponding substations, which are considered essential to the formation of a larger power system. The intent is to focus on the ability to create smaller electrical systems or islands, which can be expanded and synchronized to other such islands and the main grid."

"Key Facilities — Facilities required to establish a basic minimum power system following a system blackout. These facilities are essential to the restoration plan of the Control Area and include generating stations having black start units and other selected generating stations, transmission elements which are part of the basic minimum power system, control centers and telecommunication centers and telecommunication facilities which are necessary to support protection and control facilities, voice and data between and within control centers and voice and data between control centers and key generating / transmission substations."

November 9, 2012;

Daren and TFSP…… please find attached a completed Request for Interpretation which has been revised to include a second request seeking clarification on the criteria language within NPCC Directory#3 *Maintenance Criteria for Bulk Power System Protection*.

On September 28, 2012 Con Edison submitted a Request for Interpretation on language surrounding Section 5.6.2 of the document and that request is pending TFSP review.

Recently a second such request has been received from Hydro One Networks on the language in Section 5.7.1 of Directory#3 and I have incorporated and bookmarked both requests into a single attachment to facilitate the TFSP review.

Please consider reviewing both requests at your upcoming meeting next week.

Additionally and as a reminder, the TFSP recently addressed an interpretation from Bangor Hydro on Section 5.6.2 of Directory#3; however the context of the attached Con Edison request on Section 5.6.2 differs from the prior request.

Please let me know if I can assist in the TFSP review of these requests.

I've attached a link to the NPCC Directory Development and Revision Manual which contains the Criteria Interpretation process.

https://www.npcc.org/Standards/Directories/Forms/Public%20List.aspx

Thank you for your consideration.
